<td>Select a JWT signing key. For example, DocuSign JWT Keys.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.

The Standard Claims and Custom Claims related lists display.

5. Select the JWT provider created for the DocuSign spoke.

6. Enter values for iss, sub, and aud in the Standard Claims related list. See the DocuSign Developer Center for instructions.

7. Insert a record in the Custom Claims related list and complete the form.
Custom Claims related list fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Claim Name</td>
<td>scope</td>
</tr>
<tr>
<td>Claim Value Type</td>
<td>string</td>
</tr>
<tr>
<td>Claim Value</td>
<td>signature impersonation</td>
</tr>
</tbody>
</table>

8. Click Update.

Register DocuSign as OAuth Provider
Use the information generated during DocuSign account configuration to register DocuSign as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays the message What kind of OAuth application?
3. Select Connect to a third party OAuth Provider.
   The system displays a blank Application Registries form.
4. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter DocuSign OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the integrator key you generated during the DocuSign account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the client secret you generated during the DocuSign account configuration.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select JWT Bearer.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Enter <a href="https://account-d.docusign.com/oauth/token">https://account-d.docusign.com/oauth/token</a>.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click Save.
   • The system validates the OAuth credentials and populates the Redirect URL.
   • The system populates OAuth Entity Profile with Grant Type as JWT Bearer. For example, OAuth Entity Profile is created with default Name, DocuSign OAuth default_profile
6. Insert a record in the OAuth Entity Scopes related list and fill the values.

OAuth Entity Scopes related list fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>scope</td>
</tr>
<tr>
<td>OAuth Scope</td>
<td>signature impersonation</td>
</tr>
</tbody>
</table>

7. Copy the value from Redirect URL.
8. Click Update.
9. Login to your DocuSign account to edit the configuration of your custom DocuSign application. See the DocuSign Developer Center for instructions.

The instance can request OAuth 2.0 tokens for the spoke.

**Note:** When an OAuth token expires, the spoke automatically regenerates a new token in most cases. If a token expires and is not regenerated, an administrator can regenerate the spoke OAuth token.

Create Credential records for the DocuSign spoke

Create Credential records to the DocuSign custom OAuth application you created during DocuSign account configuration. The DocuSign spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter DocuSign Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom DocuSign application as an OAuth provider. For example, select DocuSign OAuth default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Save the record.
6. Click the Get OAuth Token related link to generate the OAuth token.

Create Connection records for the DocuSign spoke

Create Connection records to your DocuSign account. The DocuSign spoke connection and credential alias uses these connections to perform actions in DocuSign.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for DocuSign.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter DocuSign Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for DocuSign. For example, select DocuSign Credentials.</td>
</tr>
</tbody>
</table>
5. Click **Submit**.

Synchronize ServiceNow with DocuSign to access DocuSign accounts, templates, and envelopes from the DocuSign spoke. See *Synchronize DocuSign with ServiceNow*.

**Synchronize DocuSign with ServiceNow**

Synchronize ServiceNow with DocuSign to access DocuSign accounts, templates, and envelopes from the DocuSign spoke.

Role required: admin

- Request IntegrationHub subscription
- Activate DocuSign spoke
- **Set up DocuSign spoke**

Schedule a job to synchronize DocuSign with your ServiceNow instance daily, or synchronize data as needed.

1. **Required:** Schedule a job to synchronize DocuSign data with your ServiceNow instance.
   a) Navigate to **DocuSign > Scheduled Job**.
      The Get Accounts & Templates scheduled job opens.
   b) Select **Active**.

      The DocuSign spoke synchronizes accounts, templates, and envelopes daily.

2. **Required:** Synchronize DocuSign data as needed with a UI action.
   a) Navigate to **DocuSign > Accounts**.
      The Accounts [sn_docusign_spoke_accounts] table opens.
   b) Click the **Get Accounts** related link.

      The system synchronizes all accounts linked through an OAuth Credential record and populates the Templates and Envelopes tables with DocuSign data. Use template and envelope records when constructing flows.

**Activate DocuSign spoke catalog items**

Trigger events in DocuSign when an item is requested in the Service Catalog. For example, The Send a Document for Digital Signature catalog item triggers a sample flow that sends a DocuSign document to a designated recipient.

Role required: admin

- Request IntegrationHub subscription
- Activate DocuSign spoke

The DocuSign spoke adds catalog items for use with the DocuSign spoke sample flows. Before triggering a DocuSign spoke sample flow, activate these catalog items.

<table>
<thead>
<tr>
<th>Catalog item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send a Document for Digital Signature</td>
<td>Sends a document for digital signature in DocuSign.</td>
</tr>
<tr>
<td>Catalog item</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Demonstrate Template - Send Job Offer to Candidate</td>
<td>Sends a job offer using a DocuSign template.</td>
</tr>
</tbody>
</table>

1. Navigate to **Service Catalog > Maintain Items**.
2. Search for and select **Send a Document for Digital Signature**.
3. Click **Activate**.
4. Search for and select **Demonstrate Template - Send Job Offer to Candidate**.
5. Click **Activate**.

When one of these items is requested in the Service Catalog, the associated DocuSign spoke sample flow triggers and performs actions in DocuSign.

**How to automate on-demand signing requests**

Send DocuSign on-demand signing requests using information in your ServiceNow instance by creating flows in Flow Designer.

Role required: admin
- Request IntegrationHub subscription
- Activate DocuSign spoke
- *Set up DocuSign spoke*

**Note:** Customize flows in Flow Designer based on your requirements.

1. In Flow Designer, create a flow.
2. Specify **TRIGGER** to initiate the flow.
3. Specify the **ACTIONS** to be performed during the flow. The actions include one of the following:
   - **Send Adhoc Signature Request To User**
   - **Send Adhoc Signature Request To Users**
4. Optional: To pause the flow until the specified document is signed or rejected, select the **Wait for Signature from DocuSign** action.
5. Perform one of the following set of actions:
   - To send an embedded signing URL, select **Use Embedded Signing**, and **Embedded Signing Recipient [User]**.
   - To send a document for signing, provide details regarding DocuSign account, PDF document, recipient, email, and envelope expiry.
   - The selected document or Embedded Signing URL is sent to the recipients for signing. While signing the document, the recipient details are auto-populated.
   - An envelope record is created in the **Envelopes** table. The Envelope status and other details are updated.

**How to automate signing requests using templates**

Send DocuSign signing requests using DocuSign templates and information in your ServiceNow instance by creating flows in Flow Designer. For example, **Send employee offer**.

Role required: admin
- Request IntegrationHub subscription
• Activate DocuSign spoke
• **Set up DocuSign spoke**

**Note:** Customize flows based on your requirements.

1. In DocuSign, create document templates and specify recipient roles. For example, Candidate and Manager. The system retrieves other recipient details such as name and email, when the flow is triggered.
2. In Flow Designer, create a new flow.
3. Specify TRIGGER to initiate the flow.
4. Specify the ACTIONS to be performed during the flow and provide recipient details. The actions include:
   - Create Draft Envelope from Template
   - Get Recipient ID by Role Name
   - Add Recipient to Envelope
   - Get Recipient ID by Role Name
   - Add Recipient to Envelope
   - Get Field ID
   - Set Field Value
   - Send Envelope
   - Get Field Value

5. Optional: To pause the flow until the specified document is signed or rejected, select the **Wait for Signature from DocuSign** action.
   - The selected document or Embedded Signing URL is sent to the recipients for signing. While signing the document, the recipient details are auto-populated.
   - An envelope record is created in the **Envelopes** table. The Envelope status and other details are updated.

**F5 BIG-IP spoke**

Manage servers and pools in the F5 BIG-IP system.

**Request apps on the Store**

Visit the [ServiceNow Store](https://www.servicenow.com/store) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the [ServiceNow Store version history release notes](https://www.servicenow.com/store/history).

**IntegrationHub subscription**

This spoke requires the IntegrationHub Standard subscription package. For more information, see [Request IntegrationHub](https://www.servicenow.com/store/subscription).

**Supported version**

BIG-IP 13.1.0.
**Spoke flows**

The F5 BIG-IP spoke provides sample flows in the draft state to demonstrate automating F5 tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local Traffic Management Using F5 Big-IP</td>
<td>Creates a virtual server, associates it to a pool, and adds pool member in the BIG-IP system from a ServiceNow Service Catalog request.</td>
</tr>
</tbody>
</table>

**Spoke subflows**

The F5 BIG-IP spoke provides sample subflows to demonstrate automating F5 tasks. Available sample subflows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>F5 Server - Pool Management</td>
<td>Creates a pool in the BIG-IP system and manages it.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The F5 BIG-IP spoke provides actions to automate F5 tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pool Management</td>
<td>Create Pool</td>
<td>Creates a pool in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Add Pool Member</td>
<td>Creates a pool member in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Check Pool</td>
<td>Checks pool health in BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Delete Pool</td>
<td>Deletes a pool from the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Disable Pool Member</td>
<td>Disables a pool member in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Enable Pool Member</td>
<td>Enables a pool member of a specified pool in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Get Pool Members</td>
<td>Retrieves the list of members of a specified pool from the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Remove Pool Member</td>
<td>Deletes a pool member in the BIG-IP system.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>----------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Server Management</td>
<td>Add Profile to Virtual Server</td>
<td>Adds a profile to a virtual server in the BIG-IP system. Profiles enable you to control network traffic. For example, you can enable HTTP connections to the virtual server.</td>
</tr>
<tr>
<td></td>
<td>Create Virtual Server</td>
<td>Creates a virtual server in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Delete Virtual Server</td>
<td>Deletes a virtual server from the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Update Virtual Server</td>
<td>Updates virtual server attributes in the BIG-IP system.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Credentials and connection information*.

This spoke uses this alias record to authorize actions.

<table>
<thead>
<tr>
<th>Connection &amp; Credential alias</th>
<th>Description</th>
<th>Connection alias requirements</th>
</tr>
</thead>
</table>
| F5_BIG_IP                    | Connection to the F5 BIG-IP system. | • Connection type: HTTP  
• Connection URL: URL of the host machine where the F5 server is installed. |

To use the spoke connection alias, create an associated Connection record and an associated Credential record.

MID Server requirements

These actions use REST calls, which can run on a MID Server. Use the connection record associated with the F5 BIG-IP alias to configure where actions run as well as set MID Server selection attributes. For more information, see *MID server*.

Set up F5 BIG-IP spoke

Integrate the ServiceNow instance and F5 using basic authentication to authenticate ServiceNow requests.

• Request IntegrationHub subscription
• Activate F5 BIG-IP spoke
• Role required: admin

Create Credential records for the F5 BIG-IP spoke

Create Credential records to the F5 BIG-IP server. The F5 BIG-IP spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
The system displays the message What type of Credentials would you like to create?.

3. Select Basic Auth Credentials.
A blank Basic Auth Credentials form displays.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter F5 Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>Your F5 BIG-IP user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Your F5 BIG-IP password.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

*Create Connection records for the F5 BIG-IP spoke*
Create Connection records to your F5 BIG-IP account. The F5 BIG-IP spoke connection and credential alias uses these connections to perform actions on the F5 BIG-IP server.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for F5_BIG_IP.
3. From the Connections tab, click New.
The system displays a blank HTTP(s) Connection form.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter F5 Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for F5. For example, select F5 Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The URL of the host machine where the F5 BIG-IP server is installed.</td>
</tr>
</tbody>
</table>

5. Click Submit.

*HipChat spoke*
The HipChat spoke provides actions which post messages and ServiceNow incident, problem, and change record details to a HipChat conversation.

*IntegrationHub subscription*
This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.
**HipChat actions**

The HipChat spoke is an available integration through IntegrationHub. You can specify the following HipChat actions within a flow:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
<td>Send a message to a HipChat room. Specify the Room Notification URL, Auth Token, and Message to send.</td>
</tr>
<tr>
<td>Post Change Details</td>
<td>Send details about a ServiceNow change record to a HipChat room. Specify the Room Notification URL, Auth Token, and Change record to send.</td>
</tr>
<tr>
<td>Post Incident Details</td>
<td>Send details about a ServiceNow incident record to a HipChat room. Specify the Room Notification URL, Auth Token, and Incident record to send.</td>
</tr>
<tr>
<td>Post Problem Details</td>
<td>Send details about a ServiceNow problem record to a HipChat room. Specify the Room Notification URL, Auth Token, and Problem record to send.</td>
</tr>
</tbody>
</table>

**HipChat Inputs**

The following inputs are common to the HipChat actions:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Required] Room Notification URL</td>
<td>The HipChat notification REST API URL. Example: <a href="https://api.hipchat.com/v2/(room">https://api.hipchat.com/v2/(room</a> name)/ah-test/notification</td>
</tr>
<tr>
<td>[Required] Auth Token</td>
<td>You need an access token to send notifications. Refer to the HipChat API access token guide for details.</td>
</tr>
<tr>
<td>[Optional] Additional Message</td>
<td>Add a message to the record details.</td>
</tr>
<tr>
<td>[Optional] Override Default Field</td>
<td>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</td>
</tr>
</tbody>
</table>

**Example**

You can add a HipChat Post Incident Details action to a flow which identifies high priority incidents and who they are assigned to.
Infoblox spoke v1.0.2

Automate network management tasks in Infoblox from your ServiceNow instance. For example, register or delete IP addresses on an Infoblox server.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Supported version

Infoblox versions 2.7 and 2.9.

Spoke flows

The Infoblox spoke provides sample flows in the draft state to automate allocating IP addresses in the Infoblox grid server. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infoblox Register or Reserve IP in IPAM</td>
<td>Registers or reserves an IP address in Infoblox based on a Service Catalog item request.</td>
</tr>
</tbody>
</table>
Spoke subflows

The Infoblox spoke provides sample subflows to register and reserve IP addresses.

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Register AName Record and Get Network Details</td>
<td>Registers an AName record type in the DNS server and retrieves network details such as network options and ID.</td>
</tr>
</tbody>
</table>

Spoke actions

The Infoblox spoke provides actions to manage IP addresses and networks in Infoblox from your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DHCP</td>
<td>Delete IP Reservation</td>
<td>Deletes IP address range from an Infoblox server.</td>
</tr>
<tr>
<td></td>
<td>List IP Address Reservation</td>
<td>Lists IP address reservation in the DHCP server for a given Infoblox network view.</td>
</tr>
<tr>
<td></td>
<td>Reserve IP Address Range</td>
<td>Reserves an IP address range in the Infoblox server.</td>
</tr>
<tr>
<td>DNS</td>
<td>List CName Records</td>
<td>Lists CName records present in the Infoblox server.</td>
</tr>
<tr>
<td></td>
<td>List DNS Records</td>
<td>Lists DNS records present in the Infoblox server.</td>
</tr>
<tr>
<td></td>
<td>Register AName Record</td>
<td>Registers an AName record type in DNS server. An AName record stores mapping between the fully qualified domain name and the IP address.</td>
</tr>
<tr>
<td></td>
<td>Register CName Record</td>
<td>Registers a CName record in the Infoblox DNS Server. A CName record is an alias to the fully qualified domain name.</td>
</tr>
<tr>
<td></td>
<td>Delete DNS Record</td>
<td>Deletes a DNS record in the Grid Server.</td>
</tr>
<tr>
<td>IPAM</td>
<td>Delete IPAM IP Address Reservation</td>
<td>Deletes an IPAM IP address Reservation in Infoblox.</td>
</tr>
<tr>
<td></td>
<td>List all the IPAM Reservations</td>
<td>Lists the IP addresses within a given Infoblox Server.</td>
</tr>
<tr>
<td></td>
<td>Register IPAM IP Address</td>
<td>Registers the IP addresses within a given Infoblox Server.</td>
</tr>
<tr>
<td></td>
<td>Reserve IPAM IP Addresses</td>
<td>Reserves the IP addresses within a given Infoblox Server.</td>
</tr>
<tr>
<td>Network</td>
<td>Create Network</td>
<td>Creates a network within a given Infoblox Server.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>---------------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Delete Network</td>
<td>Deletes a network within a given Infoblox Server.</td>
</tr>
<tr>
<td></td>
<td>Get Network Details</td>
<td>Gets the network details within a given Infoblox Server.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Credentials and connection information*.

This spoke uses the Infoblox alias record to authorize actions.

<table>
<thead>
<tr>
<th>Connection &amp; Credential alias</th>
<th>Description</th>
<th>Connection alias requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infoblox</td>
<td>Connection to Infoblox server</td>
<td>• Connection type: HTTP</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Connection URL: URL of the host machine where the Infoblox server is installed.</td>
</tr>
</tbody>
</table>

To use the spoke connection alias, create an associated Connection record and an associated Credential record.

### MID Server requirements

These actions use REST calls, which must run on a MID Server. Use the connection record associated with the Infoblox alias to configure where actions run as well as set MID Server selection attributes. For more information, see *MID server*.

### Set up Infoblox spoke

Integrate the ServiceNow instance and Infoblox using basic authentication to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the Infoblox spoke.
- Role required: admin

*Create Credential records for the Infoblox spoke*

Create Credential records to the Infoblox server. The Infoblox spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **Basic Auth Credentials**.
   A blank Basic Auth Credentials form displays.
4. Enter these values.
Note: The user name and password must be for a user with permissions to perform the actions associated with the spoke, usually an administrator.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter <strong>Infoblox Credentials</strong>.</td>
</tr>
<tr>
<td>User name</td>
<td>Your Infoblox user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Your Infoblox password.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

Create Connection records for the Infoblox spoke

Create Connection records to your Infoblox account. The Infoblox spoke connection and credential alias uses these connections to perform actions on the Infoblox server.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the record for **Infoblox**.
3. Optional: Select the **Connection Attributes** tab. If necessary, edit the **Default value** of the API. The default value of the API is associated with your Infoblox application version. For example, application version 13 uses v2.9 of the API.
4. On the **Connections** tab, click **New**. The system displays a blank HTTP(s) Connection form.
5. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter <strong>Infoblox Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Infoblox. For example, select <strong>Infoblox Credentials</strong>.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The URL of the host machine where the Infoblox server is installed.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

Jenkins spoke

Manage builds, users, settings, and jobs on the Jenkins server. Retrieve Jenkins data to use in a flow.

Request apps on the Store

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the **ServiceNow Store version history release notes**.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
**IntegrationHub subscription**

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

**Supported versions**

All versions between 1.651.1 and 2.150.3.

**Spoke actions**

The Jenkins spoke provides actions to automate Jenkins tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Build Management</td>
<td>Delete Build</td>
<td>Deletes a build from a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>Get All Builds</td>
<td>Retrieves all the builds for a given Jenkins server job. Returns the URL, build number, and class of each build.</td>
</tr>
<tr>
<td></td>
<td>Get Build History</td>
<td>Retrieves a range of build history for a given job from Jenkins Server.</td>
</tr>
<tr>
<td></td>
<td>Get Build Information</td>
<td>Retrieves the build timestamp, build status, and complete build information of a given job from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get Build Number</td>
<td>Retrieves the build number for a Jenkins server job based on a pre-defined build filter, such as last successful build.</td>
</tr>
<tr>
<td></td>
<td>Perform a Build</td>
<td>Executes a job on the Jenkins server.</td>
</tr>
<tr>
<td>Configuration Management</td>
<td>Create Jenkins Credentials</td>
<td>Creates Jenkins server credentials.</td>
</tr>
<tr>
<td></td>
<td>Create Node</td>
<td>Creates a node that you can launch with Java Web Start software. A node is a machine that is part of the Jenkins environment and capable of executing jobs.</td>
</tr>
<tr>
<td></td>
<td>Delete Node</td>
<td>Deletes a node from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get CSRF Token</td>
<td>Retrieves a CSRF token if your Jenkins server has the &quot;Prevent Cross Site Request Forgery exploits&quot; option enabled.</td>
</tr>
<tr>
<td></td>
<td>Get Version</td>
<td>Retrieves the Jenkins server version.</td>
</tr>
<tr>
<td></td>
<td>Restart Jenkins</td>
<td>Restarts the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Test Connection</td>
<td>Tests the connection to the Jenkins server.</td>
</tr>
<tr>
<td>Job Management</td>
<td>Copy Job</td>
<td>Creates a job by copying an existing Jenkins server job.</td>
</tr>
</tbody>
</table>

**Note:** If your Jenkins server has CSRF protection enabled, use this action to retrieve a token for use by the rest of the flow. The action outputs the token as a data pill for use in other actions in the flow.
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Create Folder</td>
<td>Creates a Jenkins server folder to organize jobs.</td>
</tr>
<tr>
<td></td>
<td>Create Job</td>
<td>Creates a Jenkins server job from an XML file.</td>
</tr>
<tr>
<td></td>
<td>Delete Folder</td>
<td>Deletes an existing Jenkins server folder.</td>
</tr>
<tr>
<td></td>
<td>Delete Job</td>
<td>Deletes a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>Get All Jobs From Folder</td>
<td>Retrieves all the jobs from a given Jenkins server folder. Returns the class and name of each job up to the specified number of levels.</td>
</tr>
<tr>
<td></td>
<td>Get Build Timestamp</td>
<td>Retrieves the build timestamp of a specified Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>Get Console Output</td>
<td>Retrieves the build console output of a specified Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>Get Job Configuration</td>
<td>Retrieves the XML configuration for a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>Reload Job</td>
<td>Reloads a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>Rename Job</td>
<td>Renames a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates a Jenkins server user.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes an existing Jenkins server user.</td>
</tr>
<tr>
<td></td>
<td>Add Job To View</td>
<td>Adds a job to the Jenkins server view. Views are containers to organize jobs. As a Jenkins instance grows, you can create views for appropriate groups and categories. For example, you may want to create a Build view, which only displays build-specific jobs.</td>
</tr>
<tr>
<td></td>
<td>Create View</td>
<td>Creates a Jenkins server view.</td>
</tr>
<tr>
<td></td>
<td>Delete View</td>
<td>Deletes a Jenkins server view.</td>
</tr>
<tr>
<td></td>
<td>Get All Jobs From View</td>
<td>Retrieves all jobs from a Jenkins server view. Returns the class and name of top-level jobs.</td>
</tr>
<tr>
<td></td>
<td>Remove Job From View</td>
<td>Removes a job from a Jenkins server view.</td>
</tr>
</tbody>
</table>

**Support for CRSF tokens**

If your Jenkins server has the "Prevent Cross Site Request Forgery exploits" option enabled, certain actions require a unique token. Use the Get CSRF Token action to retrieve a token for use by the rest of the flow. The action outputs the token as a data pill for use in other actions in the flow.

**Connection and credential requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Credentials and connection information](#).

This spoke uses the Jenkins Connection & Credential Alias record to authorize actions. To use the spoke connection alias, create an associated Connection record and an associated Credential record.
MID Server requirements

These actions use REST calls, which run on a MID Server. Use the connection record associated with the Jenkins alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up Jenkins spoke

Integrate the ServiceNow instance and Jenkins using basic authentication to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate Jenkins spoke
- Role required: admin

Create Credential records for the Jenkins spoke

Create Credential records to the Jenkins server. The Jenkins spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select Basic Auth Credentials.
   A blank Basic Auth Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Jenkins Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>Your Jenkins user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Your Jenkins password.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection records for the Jenkins spoke

Create Connection records to your Jenkins account. The Jenkins spoke connection and credential alias uses these connections to perform actions on Jenkins.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Jenkins.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Jenkins Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Jenkins. For example, select Jenkins Credentials.</td>
</tr>
</tbody>
</table>
ServiceNow Madrid Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection URL</td>
<td>The URL of the host machine where Jenkins is installed.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Jira spoke**

Manage issues, users, stories, and groups in Jira. Retrieve Jira data to use in a flow.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

**Supported versions**

API version v2.

**Spoke actions**

Use actions in the Jira spoke in Flow Designer to automate Jira tasks when an event occurs in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Issue Management</td>
<td>Add Attachment</td>
<td>Adds an attachment to the specified issue in Jira.</td>
</tr>
<tr>
<td></td>
<td>Add Comment</td>
<td>Adds a comment to the specified issue in Jira.</td>
</tr>
<tr>
<td></td>
<td>Assign Issue</td>
<td>Assigns the issue in Jira to the user.</td>
</tr>
<tr>
<td></td>
<td>Create Issue</td>
<td>Creates an issue in Jira. Depending on how your organization is using Jira, an issue could represent a software bug, a project task, a help desk ticket, or more. An issue in Jira represents a task in the Now Platform.</td>
</tr>
<tr>
<td></td>
<td>Delete Issue</td>
<td>Deletes an issue in Jira.</td>
</tr>
<tr>
<td></td>
<td>Do Transition</td>
<td>Transitions an issue in Jira from one state to another.</td>
</tr>
<tr>
<td></td>
<td>Edit Issue</td>
<td>Updates a set number of fields of an issue in Jira with values passed as input.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Project Management</td>
<td>Get All Projects</td>
<td>Retrieves information in JSON format for all projects visible to the currently logged in user. A project in Jira is a collection of issues, and is defined according to your organization's requirements.</td>
</tr>
<tr>
<td></td>
<td>Get All Stories</td>
<td>Retrieves information in JSON format for all stories within a specified date range.</td>
</tr>
<tr>
<td></td>
<td>Get All Transitions</td>
<td>Retrieves in JSON format for all Transitions information from a given Issue ID.</td>
</tr>
<tr>
<td>SDLC Management</td>
<td>Create Story</td>
<td>Creates a story in Jira, similar to a story in Now Platform Agile Development.</td>
</tr>
<tr>
<td></td>
<td>Update Story</td>
<td>Updates a set number of fields of a story in Jira with values passed as input.</td>
</tr>
<tr>
<td>User Management</td>
<td>Get Users</td>
<td>Fetches a list in JSON format of all active JIRA users.</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates a new user in JIRA.</td>
</tr>
<tr>
<td></td>
<td>Remove User</td>
<td>Removes a user from Jira.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add User to Group</td>
<td>Adds given user to a group in Jira.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in Jira.</td>
</tr>
<tr>
<td></td>
<td>Get Users From Group</td>
<td>Retrieves a list of users who are members of the specified group and its subgroups in Jira.</td>
</tr>
<tr>
<td></td>
<td>Remove Group</td>
<td>Removes the given group from Jira.</td>
</tr>
<tr>
<td></td>
<td>Remove User from Group</td>
<td>Removes the given user from a group in Jira.</td>
</tr>
</tbody>
</table>
Jira account requirements

The Jira spoke requires generating an API token for Jira using your Atlassian Account.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Credentials and connection information.

Note: The Jira spoke in this release does not manage OAuth credentials.

This spoke uses the Jira alias record. To use these actions, you must create a Connection record and a Credential record and associate them with the Jira alias record.

These actions use REST calls, which can run on an instance. Use the connection record associated with the Jira alias to configure the endpoint against which the actions will run.

Set up Jira spoke

Integrate the ServiceNow instance and Jira using an API key to authenticate ServiceNow requests.

• Request IntegrationHub subscription
• Activate Jira spoke
• Role required: admin

Generate Jira account API token

Generate an access token from your Jira (Atlassian) account for API key authentication.

Jira requirements:

• Atlassian account
• Atlassian administrator credentials

Complete these steps from your Atlassian account. See the Atlassian Developer portal documentation for instructions on generating your API token.

1. From your Atlassian account, generate an access token to interact with Jira APIs.
2. Copy and record the access token to create Credential records on your ServiceNow instance.

Create Credential records for the Jira spoke

Create a Credential record for the Jira account. The Jira spoke connection and credential alias uses this credential to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?
3. Select Basic Auth Credentials.
   The pop-up window displays a blank Basic Auth Credentials form.
4. Enter these values, then click Submit.
Create Connection records for the Jira spoke
Create a Connection record for the Jira account. The Jira spoke connection and credential alias uses this connection to perform actions in Jira.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the alias record for Jira that shipped with the spoke.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values and click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Jira Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record created for Jira. For example, select Jira Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Search for and select the Jira alias.</td>
</tr>
</tbody>
</table>
| Connection URL | • For Jira cloud application, enter the URL of your Jira instance
  • For Jira on-premise application, enter https://<server_host>:<port>. |
| Use MID server | Option to use MID Server.                                                     |
| Active         | Enable                                                                        |

Note: This option is applicable only for Jira on-premise application.

Kubernetes spoke
Automate changes in Kubernetes when an event occurs in ServiceNow.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.
### IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

### Supported versions

API version v1.

### Spoke actions

The Kubernetes spoke provides actions to automate Kubernetes tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint Management</td>
<td>Create Endpoints</td>
<td>Creates an endpoint in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Endpoints</td>
<td>Deletes an endpoint from the Kubernetes instance.</td>
</tr>
<tr>
<td>Namespace Management</td>
<td>Create Namespace</td>
<td>Creates a namespace in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Namespace</td>
<td>Deletes a namespace from the Kubernetes instance.</td>
</tr>
<tr>
<td>Node Management</td>
<td>Create Node</td>
<td>Creates a node in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Node</td>
<td>Deletes a node in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect Node</td>
<td>Inspects a specified node in the Kubernetes instance and returns node</td>
</tr>
<tr>
<td></td>
<td></td>
<td>information and status.</td>
</tr>
<tr>
<td>Pod Management</td>
<td>Create Pod</td>
<td>Creates a Pod in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Pod</td>
<td>Deletes a pod from the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect Pod</td>
<td>Inspects the specified pod in the Kubernetes instance and returns pod</td>
</tr>
<tr>
<td></td>
<td></td>
<td>information and status.</td>
</tr>
<tr>
<td>Secret Management</td>
<td>Create Docker Hub Secret</td>
<td>Creates a secret in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Docker Hub Secret</td>
<td>Deletes a Secret from the Kubernetes instance.</td>
</tr>
<tr>
<td>Service Management</td>
<td>Create Service</td>
<td>Creates a service on a Kubernetes server.</td>
</tr>
<tr>
<td></td>
<td>Delete Service</td>
<td>Deletes a service from the Kubernetes server.</td>
</tr>
</tbody>
</table>
## Kubernetes account requirements

The Kubernetes spoke requires generating and configuring your Kubernetes account to use a web API key.

## Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Credentials and connection information](#).

This spoke uses the Kubernetes alias record to authorize actions. To use the spoke connection alias, create an associated Connection record and an associated Credential record.

## MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Kubernetes alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

## Set up Kubernetes spoke

Integrate the ServiceNow instance and Kubernetes using an API key and certificate to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Kubernetes spoke
- Role required: admin

### Generate Kubernetes API token and certificate

Generate an access token and a certificate from your Kubernetes account for API key authentication.

Kubernetes requirements:

- Kubernetes account
- Administrator credentials on the host machine where Kubernetes is installed

---

### Table: Volume Management Actions

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Volume Management</td>
<td>Create Persistent Volume</td>
<td>Creates a persistent volume in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Create Persistent Volume Claim</td>
<td>Creates a Persistent Volume Claim in a Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Persistent Volume</td>
<td>Deletes a persistent volume from the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Persistent Volume Claim</td>
<td>Deletes a persistent volume claim from the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect Persistent Volume Claim</td>
<td>Inspects a persistent volume claim in a Kubernetes instance and returns claim information and status.</td>
</tr>
</tbody>
</table>
Complete these steps from your Kubernetes host machine. See Kubernetes documentation for instructions on generating your API token and client certificate.

1. From your Kubernetes host machine, generate an access token to interact with Kubernetes APIs. This token does not expire.
2. Copy and record the access token to create Credential records on your ServiceNow instance.
3. Generate a client certificate to upload to your ServiceNow instance.

Upload Kubernetes client certificate
Upload the Kubernetes client certificate to your ServiceNow instance to authenticate API requests to the Kubernetes host machine.

1. Navigate to System LDAP > Certificates.
2. Click New.
3. Complete the form and enter the certificate in the PEM Certificate field.
   For more information about uploading certificates, see Upload a certificate to an instance.
4. Click Submit.

Create Credential records for the Kubernetes spoke
Create Credential records to your Kubernetes account. The Kubernetes spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select API Key Credentials.
   A blank API Key Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Kubernetes Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>API Key</td>
<td>Enter Bearer followed by the access token you obtained from Kubernetes. For example, Bearer {access token}.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection records for the Kubernetes spoke
Create Connection records to the Kubernetes engine. The Kubernetes spoke connection and credential alias uses these connections to perform actions in Kubernetes.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Kubernetes.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Kubernetes Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Kubernetes. For example, select Kubernetes Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The IP address and port of the host machine where Kubernetes is installed.</td>
</tr>
</tbody>
</table>

5. Click Submit.

*Turn off remote SSL host verification*

A system property prevents the Kubernetes spoke from processing Kubernetes responses. Set the `com.glide.communications.httpclient.verify_hostname` system property to false to enable the integration.

1. Enter `sys_properties.list` in the application navigator. The System Properties [sys_properties] table opens.
2. Search for the `com.glide.communications.httpclient.verify_hostname` system property.
3. Set the value to false.

**Microsoft AD spoke**

Create, delete, and manage objects in Microsoft Active Directory, such as users, groups, and computers.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Spoke requirements**

Ensure that Active Directory Web Services (ADWS) is deployed in the same server where Microsoft AD is installed. See Microsoft documentation for information about deploying ADWS.

**Spoke flows**

The Microsoft AD spoke provides sample flows in the draft state to demonstrate automating Active Directory tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Offboarding</td>
<td>Disables an AD user account and removes the user from any AD groups when a ServiceNow user record is deactivated.</td>
</tr>
<tr>
<td>User Onboarding</td>
<td>Creates and enables an AD user account when a ServiceNow user record is activated.</td>
</tr>
</tbody>
</table>
**Spoke subflows**

This spoke has no sample subflows.

**Spoke actions**

The Microsoft AD spoke provides actions to automate Microsoft Active Directory tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Delete Computer</td>
<td>Deletes a computer from Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Disable Computer</td>
<td>Disables a computer account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Enable Computer</td>
<td>Enables a computer account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Get Computer OU</td>
<td>Gets the Organizational Unit (OU) of a Computer Account.</td>
</tr>
<tr>
<td></td>
<td>Is Computer Enabled</td>
<td>Checks the status of the specified computer account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Move Computer to OU</td>
<td>Changes the Organizational Unit (OU) of a Computer Account in Active Directory.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add User To Group</td>
<td>Adds an existing Active Directory user to an Active Directory group.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes a group from Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Is User In Group</td>
<td>Checks if an existing Active Directory user is a member of an Active Directory group.</td>
</tr>
<tr>
<td></td>
<td>Lookup Group</td>
<td>Gets the details of a given group in Active Directory, including the group category, scope, and distinguished name.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes an existing user from a group in Active Directory.</td>
</tr>
<tr>
<td>Password Management</td>
<td>Change User Password</td>
<td>Changes the user password in AD. The password input must comply with Active Directory password requirements.</td>
</tr>
<tr>
<td></td>
<td>Is User Account Locked</td>
<td>Checks the locked status of the specified user account in Active Directory.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Reset AD User Password</td>
<td>Resets a user's password in Active Directory.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a user with no password in Active Directory. To enable a user to set a password, log in to AD, create a default password for the user, and enable password reset.</td>
</tr>
<tr>
<td>Delete User</td>
<td>Deletes a user from Active Directory.</td>
<td></td>
</tr>
<tr>
<td>Disable User</td>
<td>Disables a user account in Active Directory.</td>
<td></td>
</tr>
<tr>
<td>Enable User</td>
<td>Enables a user account in Active Directory.</td>
<td></td>
</tr>
<tr>
<td>Is User Enabled</td>
<td>Checks the status of a user account in Active Directory.</td>
<td></td>
</tr>
<tr>
<td>Lookup User</td>
<td>Gets the details of a given user in Active Directory.</td>
<td></td>
</tr>
<tr>
<td>Unlock AD Account</td>
<td>Unlocks a user account in Active Directory.</td>
<td></td>
</tr>
<tr>
<td>Update User</td>
<td>Updates user attributes in Active Directory.</td>
<td></td>
</tr>
<tr>
<td>Update User Home Location</td>
<td>Updates the Home Directory for a User in Active Directory.</td>
<td></td>
</tr>
<tr>
<td>Object Management</td>
<td>Create AD Object</td>
<td>Creates an object of any type supported in Active Directory.</td>
</tr>
<tr>
<td>Delete AD Object</td>
<td>Deletes an object of any type from Active Directory.</td>
<td></td>
</tr>
<tr>
<td>Query AD</td>
<td>Queries AD for objects specified by a search filter.</td>
<td></td>
</tr>
<tr>
<td>Update AD Object OU</td>
<td>Changes the Organizational Unit (OU) of an object in Active Directory.</td>
<td></td>
</tr>
<tr>
<td>Update AD Object Expiration</td>
<td>Updates the account expiration date of an object in Active Directory.</td>
<td></td>
</tr>
</tbody>
</table>

**MID server requirements**

To use these actions, your instance must have a MID Server set up and configured to use PowerShell. For more information about running actions on the MID Server, see Integration steps. For more information, see MID server.

**Note:** MID and Microsoft AD must be installed on different servers.
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the AD alias record to authorize actions in Microsoft Active Directory.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>AD</td>
<td>Connection to Microsoft Active Directory</td>
<td>The URL of the host machine where Microsoft Active Directory is installed.</td>
</tr>
</tbody>
</table>

Set up Microsoft AD spoke

Integrate the ServiceNow instance and your Microsoft AD account using Windows credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Role required: admin

Create Credential record for the Microsoft AD spoke

Create a Credential record for the Microsoft Active Directory host. The Microsoft AD spoke connection and credential alias uses this credential to authorize actions.

- Request IntegrationHub subscription
- Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
   A blank Windows Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter AD Credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>User name</td>
<td>Enter a user name with access to the target Windows host. For more information about Windows permissions, see Windows credentials.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password for the account.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection record for the Microsoft AD spoke

Create a Connection record to your Microsoft Active Directory host machine. The Microsoft AD spoke connection and credential alias uses this connection to perform actions in Microsoft Active Directory.
• Request IntegrationHub subscription
• Create Credential record for the Microsoft AD spoke
• Role required: admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for AD.
3. From the Connections tab, click New.
   The system displays a blank Basic Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter AD Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Windows Active Directory. For example, select AD Credential.</td>
</tr>
<tr>
<td>Host</td>
<td>Enter the fully qualified domain name of the target host where Microsoft Active Directory is installed. For example, &lt;host&gt;.&lt;domain&gt;.com.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Enable</td>
</tr>
<tr>
<td>Override default port</td>
<td>Enter the target port used by the connection. If blank, the system uses the default port.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Microsoft Azure AD spoke

Manage users, security groups, and office groups. Apply licenses and provision users in Office 365.

IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Spoke flows

The Microsoft Azure AD spoke spoke provides sample flows in the draft state to demonstrate automating Azure Active Directory tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Offboarding</td>
<td>Disables an Azure AD user account and removes the user from any Azure AD groups when a ServiceNow user record is deactivated.</td>
</tr>
<tr>
<td>User Onboarding</td>
<td>Creates and enables an Azure AD user account when a ServiceNow user record is activated.</td>
</tr>
</tbody>
</table>
**Spoke subflows**

The Microsoft Azure AD spoke provides sample subflows in the draft state to demonstrate automating Azure Active Directory tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add User to Group</td>
<td>Looks up the groups that a ServiceNow User record belongs to, and adds the associated Azure AD user account to the same Azure AD groups.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The Microsoft Azure AD spoke spoke provides actions to automate Azure Active Directory tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Management</td>
<td>Add Owner To Group</td>
<td>Adds an owner to an existing group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Add User to Group</td>
<td>Adds an existing user to a group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Create Office 365 Group</td>
<td>Creates an Office 365 Group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Create Security Group</td>
<td>Create a Security Group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Look Up Group ID</td>
<td>Returns the first Group ID found based on provided search criteria.</td>
</tr>
<tr>
<td></td>
<td>Look Up Group Membership</td>
<td>Retrieves a list of groups for the given user as a JSON string.</td>
</tr>
<tr>
<td></td>
<td>Remove Owner From Group</td>
<td>Removes the owner from a group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes an existing user from a group in Azure AD.</td>
</tr>
<tr>
<td>License Management</td>
<td>Assign User License</td>
<td>Assigns a license to an existing user in Azure AD and defines access to Office 365 services. For example, if the license includes access to Microsoft Exchange, the user is provisioned a mailbox and login rights.</td>
</tr>
<tr>
<td></td>

<td>Updates user properties in Azure AD with the provided details.</td>
</tr>
</tbody>
</table>

**Microsoft Azure AD account requirements**

The Microsoft Azure AD spoke requires creating a custom app on your Azure AD account to generate OAuth 2.0 tokens. See: *Create an Azure AD application*.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the AzureAD alias record to authorize actions on Microsoft Azure AD.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>AzureAD</td>
<td>Connection to Microsoft Azure AD.</td>
<td><a href="https://graph.microsoft.com">https://graph.microsoft.com</a></td>
</tr>
</tbody>
</table>

**Set up Microsoft Azure AD spoke**

Integrate the ServiceNow instance and your Microsoft Azure AD account by creating a custom OAuth application in Microsoft Azure AD to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Role required: admin

*Create an Azure AD application*

Create a custom app using your Azure portal to enable OAuth 2.0 authentication with the Azure AD spoke.

- Request IntegrationHub subscription.
- Activate Azure AD spoke.
• Azure AD requirements:
  • Azure AD account
  • Azure AD administrator credentials

• Role required: admin

Complete these steps from your Azure portal. See the Azure Active Directory for developers documentation for instructions on creating and configuring custom applications.

1. From your Azure portal, access Azure Active Directory.
2. Create an Azure AD application.
   a) In Redirect URI, enter your ServiceNow instance URL in this format: https://<Instance-Name>.servicenow.com/oauth_redirect.do. See Create an Azure Active Directory application for instructions on registering and configuring an application.
   b) Record the Directory ID to register the app as a third-party OAuth provider on your ServiceNow instance.
   c) Create a Client Secret and record the value to register the app as a third-party OAuth provider on your ServiceNow instance.
   d) Add permissions to access the APIs. Ensure that you provide these permissions:

<table>
<thead>
<tr>
<th>Permission</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Directory.AccessAsUser.All</td>
<td>Delegated</td>
</tr>
<tr>
<td>Directory.Read.All</td>
<td>Delegated</td>
</tr>
<tr>
<td>Directory.ReadWrite.All</td>
<td>Delegated</td>
</tr>
<tr>
<td>User.Read</td>
<td>Delegated</td>
</tr>
<tr>
<td>Directory.Read.All</td>
<td>Application</td>
</tr>
<tr>
<td>Directory.ReadWrite.All</td>
<td>Application</td>
</tr>
</tbody>
</table>

See Add permissions to access web APIs for more information.

   e) Grant admin consent to your application. See Understanding API permissions and admin consent UI for more information.

Register Azure AD as OAuth provider

Use the information generated during Azure Active Directory account configuration to register Box as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays the message What kind of OAuth application?
3. Select Connect to a third party OAuth Provider.
   The system displays a blank Application Registries form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Azure AD OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID you created during the Azure AD application registration.</td>
</tr>
</tbody>
</table>
ServiceNow    Madrid    Now Platform capabilities

Field | Value required
------|--------------------------------------------------------
Client Secret | Enter the Key value you created during the Azure AD application registration.
Default Grant type | Select Authorization Code.

5. In the OAuth Entity Scopes related list, create these entries

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth Scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter a unique name for the record, such as auth code.</td>
<td>Enter offline_access.</td>
</tr>
<tr>
<td>Enter a unique name for the record, such as openid</td>
<td>Enter openid.</td>
</tr>
</tbody>
</table>

6. Right-click the form header, and click Save.
The system validates the OAuth credentials and populates the Redirect URL and the OAuth Entity Profiles related list.

7. In the OAuth Entity Profiles related list, open the default profile record.

8. Verify that the openid entity scope record created in previous steps appears in the OAuth Entity Profile Scopes related list. If it does not appear, add the record.

Create Credential records for the Azure AD spoke
Create Credential records to the Azure AD custom app registration you created. The Azure AD spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Azure AD Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Azure AD application as an OAuth provider. For example, select Azure OAuth default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
</tbody>
</table>
Create Connection records for the Azure AD spoke
Create Connection records to your Azure AD account. The Azure AD spoke connection and credential aliases use these connections to perform actions in Azure AD.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the AzureAD record.
3. Click the New button in the Connections related list.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Regenerate Azure AD OAuth token
Regenerate the Azure AD OAuth token when it expires.

1. Navigate to Connections & Credentials > Credentials.
2. Select the Azure AD spoke OAuth Credential record.
   For example, select Azure AD Credentials.
3. From Related Links, click Get OAuth Token.

Microsoft Azure AD spoke action reference
Manage users, security groups, and office groups. Apply licenses and provision users in Office 365.

The Azure AD spoke is an available integration through IntegrationHub.

This spoke uses the Azure AD Connection & Credential Alias record. To use these actions, you must create a Connection record and a Credential record and associate them with the Azure AD Connection & Credential Alias record. To learn more about connections and credentials, see Introduction to credentials, connections, and aliases.

These actions use REST calls, which can run on an instance or MID Server. To determine when to run REST from the instance or a MID Server, see the design considerations in Integration steps. To learn more about the MID Server, see MID Server.

Add Owner To Group
Adds an owner to an existing group in Azure AD.
**Add User To Group**

Adds an existing user to a group in Azure AD.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to add a user to. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to add to the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Create Office 365 Group**

Creates an Office 365 Group in Azure AD.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the group.</td>
</tr>
<tr>
<td>Group Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
<tr>
<td>Email Enable</td>
<td>Group email address or distribution list associated with the group. By default set to true.</td>
</tr>
<tr>
<td>Distribution List</td>
<td></td>
</tr>
</tbody>
</table>
Create Security Group

Create a Security Group in Azure AD.

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the group.</td>
</tr>
<tr>
<td>Group Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
<tr>
<td>Description</td>
<td>Additional information about the group in Azure AD.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Group ID</td>
<td>ID of group created in Azure AD. Only populated if Status is Success.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Is User In Group

Check if an existing user is a member of a group in Azure Active Directory (Azure AD).

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>Group ID in which you wish to check the membership of the user.</td>
</tr>
<tr>
<td>User ID</td>
<td>User ID or User Principal Name of the Azure AD user.</td>
</tr>
</tbody>
</table>
### Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Will be set to Success if the request succeeds or Error if a failure in Azure AD occurs</td>
</tr>
<tr>
<td>Answer</td>
<td>True if the user is a member of the group. False if the user is not a member of the group. Populated only if Status is Success.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Look Up Group ID

Returns the first Group ID found based on provided search criteria.

#### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Mail ID</td>
<td>Group email address or distribution list associated with the group.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the group.</td>
</tr>
<tr>
<td>Group Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
</tbody>
</table>

#### Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Group ID</td>
<td>First group found with matching criteria in Azure AD.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Look Up Group Membership

Retrieves a list of groups for the given user as a JSON string.

#### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the users to retrieve the group for. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

#### Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
<tr>
<td>Output</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>---------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Groups List</td>
<td>List of groups in JSON format. For example, [{Group ID1, Group Name1}, {Group ID2, Group Name2}]. If the user is not part of any group, an empty string is returned.</td>
</tr>
<tr>
<td>Number of Groups Found</td>
<td>Total number of groups the user is a member of.</td>
</tr>
</tbody>
</table>

**Remove Owner From Group**

Removes the owner from a group in Azure AD.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to remove the owner from. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to remove as owner of the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Remove User From Group**

Removes an existing user from a group in Azure AD.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to remove the user from. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to remove from the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>
Assign User License

Assigns a license to an existing user in Azure AD and defines access to Office 365 services. For example, if the license includes access to Microsoft Exchange, the user is provisioned a mailbox and login rights.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to assign a license to. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>SKU ID</td>
<td>Licensing plan for your organization using the syntax <code>&lt; CompanyName &gt;:&lt; LicensingPlan &gt;</code>. If the SKU ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Remove User License

Removes a license from a user in Azure AD.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to remove the license from. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>SKU ID</td>
<td>Licensing plan for your organization using the syntax <code>&lt; CompanyName &gt;:&lt; LicensingPlan &gt;</code>. If the SKU ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Delete User

Deletes a user from Azure AD.
### Disable User

Disables a user in Azure AD.

#### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to disable. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

#### Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Enable User

Enables a user in Azure AD.

#### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to enable. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

#### Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>
Look Up User ID

Returns the first User ID found based on the provided search criteria.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Name</td>
<td>First name of the user.</td>
</tr>
<tr>
<td>Last Name</td>
<td>Last name of the user.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Name displayed in the address book for the user.</td>
</tr>
<tr>
<td>User Login ID</td>
<td>Login User ID is same as User Principal Name (UPN). For example, <a href="mailto:johndoe@snc.com">johndoe@snc.com</a>.</td>
</tr>
<tr>
<td>Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>User ID</td>
<td>First user found with matching criteria in Azure AD.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Update User

Updates user properties in Azure AD with the provided details.

**Note:** Azure AD does not allow updating values to null. Null or empty values are discarded in Azure AD when passed as input.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the user.</td>
</tr>
<tr>
<td>Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
<tr>
<td>User Login ID</td>
<td>Login User ID is same as User Principal Name (UPN). For example, <a href="mailto:johndoe@snc.com">johndoe@snc.com</a>. This field is mandatory</td>
</tr>
<tr>
<td>First Name</td>
<td>First name of the user.</td>
</tr>
<tr>
<td>Last Name</td>
<td>Last name of the user.</td>
</tr>
<tr>
<td>City</td>
<td>City of the user.</td>
</tr>
<tr>
<td>Country</td>
<td>Country of the user.</td>
</tr>
<tr>
<td>Department</td>
<td>Name of the department the user belongs to.</td>
</tr>
<tr>
<td>Mobile</td>
<td>Mobile phone number for the user.</td>
</tr>
<tr>
<td>Job Title</td>
<td>User job title.</td>
</tr>
<tr>
<td>Input</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Physical Delivery Office Name</td>
<td>Office location of the user.</td>
</tr>
<tr>
<td>Postal Code</td>
<td>Postal code for the user.</td>
</tr>
<tr>
<td>Preferred Language</td>
<td>Preferred language for the user.</td>
</tr>
<tr>
<td>State</td>
<td>State for the user.</td>
</tr>
<tr>
<td>Street Address</td>
<td>Street address for the user.</td>
</tr>
<tr>
<td>Telephone Number</td>
<td>Telephone number for the user.</td>
</tr>
<tr>
<td>Usage Location</td>
<td>Some Microsoft services are not available in all locations. This property</td>
</tr>
<tr>
<td></td>
<td>must be defined for the user in Azure AD before a license can be assigned</td>
</tr>
<tr>
<td></td>
<td>to them.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Microsoft OneDrive spoke**

Automate file and folder management and collaboration in Microsoft OneDrive. Adds Microsoft OneDrive data to your ServiceNow instance.

**Request apps on the Store**

Visit the [ServiceNow Store](https://www.servicenow.com/store) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the [ServiceNow Store version history release notes](https://www.servicenow.com/store).

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see [Request IntegrationHub](https://www.servicenow.com/store).

**Supported versions**

API version v1.

**Spoke subflows**

The Microsoft OneDrive spoke provides sample subflows in the draft state to demonstrate automating Microsoft OneDrive tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:
<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move a ServiceNow attachment to OneDrive</td>
<td>Copies an attachment from ServiceNow to OneDrive, records the new location of the attachment, and deletes the attachment from the ServiceNow attachment table.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The Microsoft OneDrive spoke provides actions to automate Microsoft OneDrive tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drive Management</td>
<td>Get Drive Info</td>
<td>Gets the metadata of a specific Microsoft OneDrive drive</td>
</tr>
<tr>
<td></td>
<td>List Drives</td>
<td>Retrieves all the available drives associated with a target User, Group, or Site. If you don’t provide a User, Group, or Site, then a list of root drives associated with the authenticated user is returned.</td>
</tr>
<tr>
<td>Folder Management</td>
<td>Move File Or Folder Item</td>
<td>Moves a file or folder in Microsoft OneDrive to the target location.</td>
</tr>
<tr>
<td></td>
<td>Create Folder</td>
<td>Creates a folder in Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Update File Or Folder Name</td>
<td>Updates the name for a file or folder item by ID.</td>
</tr>
<tr>
<td></td>
<td>Delete File Or Folder Item</td>
<td>Deletes a file or folder from Microsoft OneDrive.</td>
</tr>
<tr>
<td>File Management</td>
<td>Copy OneDrive File to Attachment</td>
<td>Copies a file in Microsoft OneDrive to an attachment in a record in a ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Copy Attachment to OneDrive</td>
<td>Copies an attachment record in ServiceNow to Microsoft OneDrive</td>
</tr>
<tr>
<td></td>
<td>Copy File Or Folder Item</td>
<td>Asynchronously creates a copy of a Microsoft OneDrive item (including children), under a new parent item or with a new name.</td>
</tr>
<tr>
<td></td>
<td>List Items</td>
<td>Retrieves a list of drive items from either a path or the source and source ID of a drive item.</td>
</tr>
<tr>
<td></td>
<td>Get File Or Folder Item Info By ID</td>
<td>Gets file metadata information from the file or folder ID in Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Get File Or Folder Item Info By Path</td>
<td>Gets file metadata information from the file path in Microsoft OneDrive.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>File and Folder Search</td>
<td>Search Files or</td>
<td>Searches the drive items (files or folders) based on metadata attributes such as the item name.</td>
</tr>
<tr>
<td></td>
<td>Folder Items</td>
<td></td>
</tr>
<tr>
<td>Collaboration</td>
<td>Add Collaborator</td>
<td>Adds a collaborator and their permissions to a file or a folder. You can identify the collaborator by their Azure AD Alias or an Object ID.</td>
</tr>
<tr>
<td></td>
<td>Get Collaborators</td>
<td>Lists all the collaborator details associated with a file or folder in Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Remove Collaborant</td>
<td>Removes a collaborator from a file or folder in Microsoft OneDrive.</td>
</tr>
</tbody>
</table>

**OneDrive Online account requirements**

The Microsoft OneDrive spoke requires a custom app that you create in Microsoft Azure.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Credentials and connection information*.

**Single tenant**

The OneDrive spoke includes the OneDrive alias record to authorize actions on Microsoft OneDrive. Select this alias in the Tenant record to authorize changes in Microsoft OneDrive for a single tenant.

**Multiple tenants**

The OneDrive spoke includes the OneDrive alias record to authorize actions on Microsoft OneDrive. Create a connection and credential alias record for each additional tenant site you wish to support. Select the correct alias in the Tenant record to authorize changes in Microsoft SharePoint Online. See *Create aliases for multiple tenants*.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the MicrosoftSharepointOnline alias to configure where actions run as well as set MID Server selection attributes. For more information, see *MID server*.

**Microsoft SCCM spoke**

Automate management of user collections, device collections, and application deployments on a Microsoft System Center Configuration Management (SCCM) server.
IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke flows & subflows

This spoke has no sample flows or subflows.

Spoke actions

The Microsoft System Center Configuration Management (SCCM) spoke provides actions to automate SCCM tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Management</td>
<td>Get Applications</td>
<td>Retrieves the application data from the SCCM server.</td>
</tr>
<tr>
<td>Deployment Management</td>
<td>Get Deployments</td>
<td>Retrieves deployment data from the SCCM server.</td>
</tr>
<tr>
<td>Device Management</td>
<td>Add to Device Collection</td>
<td>Adds a device to a collection in SCCM.</td>
</tr>
<tr>
<td></td>
<td>Get Device Collections</td>
<td>Retrieves device collection data from the SCCM server.</td>
</tr>
<tr>
<td></td>
<td>Is Device In Collection</td>
<td>Checks if a specified device exists in a device collection.</td>
</tr>
<tr>
<td></td>
<td>Remove From Device Collection</td>
<td>Removes a device from an existing device collection.</td>
</tr>
<tr>
<td>User Management</td>
<td>Add to User Collection</td>
<td>Adds a user to a collection in SCCM.</td>
</tr>
<tr>
<td></td>
<td>Get User Collections</td>
<td>Retrieves user collection data from the SCCM Server.</td>
</tr>
<tr>
<td></td>
<td>Is User In Collection</td>
<td>Checks if a specified user exists in a user collection.</td>
</tr>
<tr>
<td></td>
<td>Remove From User Collection</td>
<td>Removes a user from a user collection.</td>
</tr>
</tbody>
</table>

To see inputs and outputs for these activities, see SCCM activity pack.

MID server requirements

To use these actions, your instance must have a MID Server set up and configured to use PowerShell. For more information about running actions on the MID Server, see Integration steps. For more information, see MID server.
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the SCCM alias record to authorize actions on a Microsoft System Center Configuration Management (SCCM) server.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCCM</td>
<td>Connection to the SCCM server.</td>
<td>The URL of the host machine where the SCCM server is installed.</td>
</tr>
</tbody>
</table>

Set up SCCM spoke

Integrate the ServiceNow instance and SCCM using Windows credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Role required: admin
- Configure the MID Server for SCCM activities

Create Credential record for the SCCM spoke
Create a Credential record to the SCCM server. The SCCM spoke connection and credential alias uses this credential to authorize actions.

- Request IntegrationHub subscription
- Role required: admin
- Configure the MID Server for SCCM activities

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
   A blank Windows Credentials form displays.
4. Enter these values, then click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter SCCM Credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>User name</td>
<td>Enter a user name with access to the target Windows host. For more information about Windows permissions, see Windows credentials.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password for the account.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>
Create Connection record for the SCCM spoke
Create a Connection record to your SCCM host machine. The SCCM spoke connection and credential alias uses this connection to perform actions in SCCM.

- Request IntegrationHub subscription
- Create Credential record for the SCCM spoke
- Role required: admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for SCCM.
3. From the Connections tab, click New. The system displays a blank Basic Connection form.
4. Enter these values, then click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter SCCM Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Windows. For example, select SCCM Credential.</td>
</tr>
<tr>
<td>Host</td>
<td>Enter the fully qualified domain name of the target host where the SCCM server is installed. For example, &lt;host&gt;.&lt;domain&gt;.com.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Enable</td>
</tr>
<tr>
<td>Override default port</td>
<td>Enter the target port used by the connection. If blank, the system uses the default port.</td>
</tr>
</tbody>
</table>

Configure WinRM trusted hosts on MID Server

Microsoft SharePoint spoke v1.1.2
Manages sites, folders, files, groups, lists, and users in Microsoft SharePoint Online. Adds Microsoft SharePoint Online data to your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions
API version v1.
**Spoke flows**

The Microsoft SharePoint spoke provides sample flows in the draft state to demonstrate automating Microsoft SharePoint Online tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Attachment on Record creates folder, and copies attachment</td>
<td>Creates a Microsoft SharePoint Online folder with an attachment when the attachment is added to a Knowledge article in ServiceNow.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------</td>
</tr>
<tr>
<td></td>
<td>List Folders In A Folder</td>
</tr>
<tr>
<td></td>
<td>Look Up Folder</td>
</tr>
<tr>
<td></td>
<td>Rename A Folder</td>
</tr>
<tr>
<td></td>
<td>Share Folder With Group</td>
</tr>
<tr>
<td></td>
<td>Share Folder With User</td>
</tr>
<tr>
<td></td>
<td>Unshare Folder With Group</td>
</tr>
<tr>
<td></td>
<td>Unshare Folder With User</td>
</tr>
<tr>
<td></td>
<td>Attach Sharepoint File To A Record</td>
</tr>
<tr>
<td></td>
<td>Check-in File</td>
</tr>
<tr>
<td></td>
<td>Check-out File</td>
</tr>
<tr>
<td></td>
<td>Copy Attachment To Folder</td>
</tr>
<tr>
<td></td>
<td>Copy File</td>
</tr>
<tr>
<td></td>
<td>Create A Text File</td>
</tr>
<tr>
<td></td>
<td>Delete File</td>
</tr>
<tr>
<td></td>
<td>Look Up File Details</td>
</tr>
<tr>
<td></td>
<td>Move File</td>
</tr>
<tr>
<td></td>
<td>Share File With Group</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Share File With User</td>
<td>Shares a file with a Microsoft SharePoint Online user. The user must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td>Unshare File With Group</td>
<td>Unshares a file with a Microsoft SharePoint Online group. The group must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td>Unshare File With User</td>
<td>Unshares a file with a Microsoft SharePoint Online user. The user must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td>User Management</td>
<td>Look Up User Information By Login Name</td>
</tr>
<tr>
<td></td>
<td>Look Up User's Sharepoint Groups</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add Role To Site</td>
</tr>
<tr>
<td></td>
<td>Add User To Group</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
</tr>
<tr>

<td>Delete List Item By ID</td>
</tr>
<tr>
<td></td>
<td>Look Up List Item By ID</td>
</tr>
<tr>
<td></td>
<td>Look Up List Items In A List</td>
</tr>
<tr>
<td></td>
<td>Update List Item By ID</td>
</tr>
</tbody>
</table>

**Sharepoint Online account requirements**

The Microsoft SharePoint spoke requires creating a custom app on your SharePoint Online account to generate OAuth 2.0 tokens. See [Configure Microsoft SharePoint Online account](#).

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Credentials and connection information](#).

**Single tenant**

This spoke includes the MicrosoftSharepointOnline alias record to authorize actions on Microsoft SharePoint Online. Select this alias in the Tenant record to authorize changes in Microsoft SharePoint Online for a single tenant.

**Multiple tenants**

This spoke includes the MicrosoftSharepointOnline alias record to authorize actions on Microsoft SharePoint Online. Create a connection and credential alias record for each additional tenant site you wish to support. Select the correct alias in the Tenant record to authorize changes in Microsoft SharePoint Online. See [Create aliases for multiple tenants](#).

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the MicrosoftSharepointOnline alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

**Set up Microsoft SharePoint spoke**

Integrate the ServiceNow instance and Microsoft SharePoint Online by creating a custom OAuth application in Microsoft SharePoint Online to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate Microsoft SharePoint spoke
- Role required: admin
**Configure Microsoft SharePoint Online account**

Create a custom OAuth application from your Microsoft SharePoint Online account to enable OAuth 2.0 authentication with the Microsoft SharePoint spoke.

Microsoft SharePoint Online requirements:

- Microsoft SharePoint Online account
- Microsoft SharePoint Online tenant administrator credentials

Complete these steps from your Microsoft SharePoint Online account. See the *SharePoint development* documentation for instructions on creating and configuring custom applications.

1. Work with your Azure AD administrator to retrieve the Directory ID for the Azure AD Directory that is supporting the Microsoft SharePoint Online tenant you want to connect to. Record the Directory ID to use as the Tenant ID when creating a Tenant record in your ServiceNow instance.
2. In your SharePoint site, create a custom application.
3. Record the application client ID and client secret to register the app as a third-party OAuth provider on your ServiceNow instance.
4. Enable the matching SharePoint application scope permissions you want the app to support.

For example, to provide full control, enter the following XML.

```xml
<AppPermissionRequests AllowAppOnlyPolicy="true">
  <AppPermissionRequest
    Scope="http://sharepoint/content/tenant"
    Right="FullControl" />
</AppPermissionRequests>
```

**Create aliases for multiple tenants**

Create a connection and credential alias record for each additional tenant site you wish to support. Select the correct alias in the Tenant record to authorize changes in Microsoft SharePoint Online. If configuring an integration for a single tenant, use the existing MicrosoftSharepointOnline alias record.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Click New.
   A blank Connection & Credential Alias record opens
3. On the Connection & Credential Aliases form, fill the following values.

   **Connection & Credential Aliases form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>&lt;unique-name&gt;</td>
</tr>
<tr>
<td>Type</td>
<td>Connection and Credential</td>
</tr>
<tr>
<td>Connection type</td>
<td>HTTP</td>
</tr>
</tbody>
</table>

4. Click Submit.

Associate a Credential record and a Connection record with the alias to authorize actions on the SharePoint tenant site. Create an alias record and associated connection and credential records for each tenant you want to support.

**Define Microsoft SharePoint Online tenants**

Define a profile for your Microsoft SharePoint Online tenant site. The Microsoft SharePoint spoke uses the tenant record and associated Connection and Credential alias to perform actions on Microsoft SharePoint Online.

1. Navigate to Sharepoint Online > Tenants.
2. Click New.
3. Complete the form.
### ServiceNow: Madrid Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for the tenant.</td>
</tr>
<tr>
<td>Alias</td>
<td>Select a connection and credential alias.</td>
</tr>
<tr>
<td></td>
<td>If configuring the integration for a single tenant, select the <strong>MicrosoftSharepointOnline</strong> alias.</td>
</tr>
<tr>
<td></td>
<td>If configuring the integration for multiple tenants, select the desired alias.</td>
</tr>
<tr>
<td>Sharepoint Root URL</td>
<td>Enter the root SharePoint URL without the https:// prefix.</td>
</tr>
<tr>
<td></td>
<td>For example, <code>&lt;SiteName&gt;.sharepoint.com</code></td>
</tr>
<tr>
<td>Tenant Id</td>
<td>Enter the Tenant ID. This is the Directory ID for the Azure AD Directory that is supporting the Microsoft SharePoint Online tenant you want to connect to. See <a href="#">Configure Microsoft SharePoint Online account</a>.</td>
</tr>
<tr>
<td>Resource Id</td>
<td>Auto-populated with 00000003-0000-0ff1-ce00-000000000000.</td>
</tr>
</tbody>
</table>

#### 4. Click Submit.

If configuring an integration with multiple Microsoft SharePoint Online tenants, create additional tenant profiles as needed.

**Register Microsoft SharePoint Online as OAuth provider**

Use the information generated during Microsoft SharePoint Online account configuration to register Microsoft SharePoint Online as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. **Navigate to System OAuth > Application Registry.**
2. **Click New.**
   - The system displays the message **What kind of OAuth application?**
3. **Select Connect to a third party OAuth Provider.**
   - The system displays a blank Application Registries form.
4. **Enter these values.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter SharePoint OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the value, <code>&lt;ClientID&gt;@&lt;TenantId&gt;</code>.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you created during the Microsoft SharePoint Online account configuration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Select <strong>OAuthUtilSPOnline</strong>.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select <strong>Client Credentials</strong>.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Enter <a href="https://accounts.accesscontrol.windows.net/">https://accounts.accesscontrol.windows.net/</a>&lt;TenantId&gt;/tokens/OAuth/2. Replace <code>&lt;TenantId&gt;</code> with your Tenant ID.</td>
</tr>
</tbody>
</table>

5. **Right-click the form header, and click Save.**
   - The system validates the OAuth credentials and populates the **Redirect URL** and the **OAuth Entity Profiles** related list.
6. Copy the value from **Redirect URL**.
7. Login to your Microsoft SharePoint Online account to edit the configuration of your custom SharePoint application.
   See the *SharePoint development* site for instructions.
8. Paste the **Redirect URL** value into the OAuth 2.0 Redirect URI for your custom Microsoft SharePoint Online application.
   For example, paste `https://instance.service-now.com/oauth_redirect.do`.

The instance can request OAuth 2.0 tokens for the spoke.

*Create Credential records for the Microsoft SharePoint spoke*

Create Credential records to the Microsoft SharePoint Online custom OAuth application you created during Microsoft SharePoint Online account configuration. The Microsoft SharePoint spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter SharePoint Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Microsoft SharePoint Online application as an OAuth provider. For example, select SharePoint OAuth profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Save the record.
6. From Related Links, click **Get OAuth Token**.
   The system displays a confirmation message that the OAuth token flow is completed successfully. Review the details if the flow is not completed successfully.

   **Note:** Ensure that you allow pop-up windows in your browser.

*Create Connection records for the Microsoft SharePoint spoke*

Create Connection records to your Microsoft SharePoint Online account. The Microsoft SharePoint spoke connection and credential alias uses these connections to perform actions on Microsoft SharePoint Online.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the connection and credential alias used in the Tenant record. See *Define Microsoft SharePoint Online tenants* and *Create aliases for multiple tenants*.
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.
5. Click Submit.

**Microsoft Teams spoke**

The Microsoft Teams spoke provides actions which post messages and ServiceNow incident, problem, and change record details to Microsoft Teams channels.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

**Microsoft Teams actions**

The Microsoft Teams spoke is an available integration through IntegrationHub. You can specify the following Microsoft Teams actions within a flow:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
<td>Send a message to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL, Title, and Message to send.</td>
</tr>
<tr>
<td>Post Change Details</td>
<td>Send details about a ServiceNow change record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Change record to send.</td>
</tr>
<tr>
<td>Post Incident Details</td>
<td>Send details about a ServiceNow incident record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Incident record to send.</td>
</tr>
<tr>
<td>Post Problem Details</td>
<td>Send details about a ServiceNow problem record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Problem record to send.</td>
</tr>
</tbody>
</table>
Microsoft Teams Inputs

The following inputs are common to the Microsoft Teams actions:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Required] Webhook URL</td>
<td>The Microsoft Teams webhook for sending a message. Set up the webhook before configuring this action. Refer to the custom incoming webhook for Microsoft Teams documentation.</td>
</tr>
<tr>
<td>[Optional] Title</td>
<td>Title of the message.</td>
</tr>
<tr>
<td>[Optional] Additional Message</td>
<td>Add a message before the record details.</td>
</tr>
<tr>
<td>[Optional] Override Default Fields</td>
<td>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</td>
</tr>
<tr>
<td>[Optional] Theme Color (Hex)</td>
<td>Hex code value of color to highlight the message.</td>
</tr>
</tbody>
</table>

Example

You can add a Microsoft Teams Post Incident Details action to a flow which identifies newly created high priority incidents and a specified theme color.

![Diagram of a Microsoft Teams flow](image)

Microsoft Teams Graph spoke v3.2

The Microsoft Teams Graph spoke creates and manages teams and channels in Microsoft Teams. To create, manage, or delete users and groups, use the Microsoft Azure AD spoke.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

Note:

- Teams in the Microsoft Teams Graph spoke are created from the groups in Microsoft Azure AD. To create a team using the Microsoft Teams Graph spoke, the associated group must be present in Microsoft Azure AD.
- User and group management can be done using Microsoft Azure AD only and not Microsoft Teams Graph spoke.
- Teams can be created from the Microsoft Office 365 group only.
- The team ID in Microsoft Teams is the same as the group ID of the associated group in Microsoft Azure AD.

IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported version

Microsoft Graph REST API v1.0

Spoke actions

The Microsoft Teams Graph spoke provides actions to automate team and channel tasks when an incident is created in the ServiceNow instance.

Microsoft Teams Graph spoke actions

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Team Management</td>
<td>Create Team</td>
<td>Creates a team from an existing Microsoft Office 365 group.</td>
</tr>
<tr>
<td></td>
<td>Update Team</td>
<td>Updates the properties of a team.</td>
</tr>
<tr>
<td></td>
<td>Get Team</td>
<td>Retrieves the properties and relationships of a team.</td>
</tr>
<tr>
<td></td>
<td>Archive Team</td>
<td>Archives a team. Members cannot send messages on the channels of the team. However, members can be added to the group and can search the team content.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Channel Management</td>
<td>Unarchive Team</td>
<td>Restores an archived team. Members can send messages on the channels of the team.</td>
</tr>
<tr>
<td></td>
<td>Create Channel in a Team</td>
<td>Creates a channel in a team.</td>
</tr>
<tr>
<td></td>
<td>Get Channel Metadata</td>
<td>Retrieves the properties and relationships of a channel.</td>
</tr>
<tr>
<td></td>
<td>Get Messages From Channel</td>
<td>Retrieves the list of messages in a channel of a team.</td>
</tr>
<tr>
<td></td>
<td>Get Channel ID by Name</td>
<td>Retrieves the channel ID and properties.</td>
</tr>
<tr>
<td></td>
<td>Delete Channel</td>
<td>Removes the channel from a team and deletes all conversations.</td>
</tr>
<tr>
<td></td>
<td>Look Up Channels</td>
<td>Retrieves the list of channels in the specified team.</td>
</tr>
<tr>
<td>Chat Management</td>
<td>Get Messages From Chat</td>
<td>Retrieves the list of messages in a chat.</td>
</tr>
<tr>
<td></td>
<td>Look up Chats</td>
<td>Retrieves the list of chats of a user.</td>
</tr>
</tbody>
</table>

**Note:** Some of the spoke actions require the channel ID, group ID, or team ID as one of the inputs. To learn these details, log in to Microsoft Teams, navigate to Teams, and click Get link to channel for the required channel. The channel link contains the required details. For example, if the channel link is https://teams.microsoft.com/l/channel/19%3a1aa3730712e245a0af31e4095d66d613%40thread.skype/New%2520channel%2520in%2520team?groupId=7fb91938-5e8c-4968-bf7d-3987df7716f3&tenantId=a46df9b7-2e9b-49d5-8c9f-d1b3de4ba59f, the group ID and team ID are 7fb91938-5e8c-4968-bf7d-3987df7716f3, and the channel ID is 19:1aa3730712e245a0af31e4095d66d613@thread.skype or 1aa3730712e245a0af31e4095d66d613. For more information about accessing the channel ID and group ID through Microsoft Teams, see Microsoft Teams documentation.

**Microsoft Teams Graph spoke action permissions**

The Microsoft Teams Graph spoke should have the following permissions to perform the relevant actions.

<table>
<thead>
<tr>
<th>Action</th>
<th>Permission type</th>
<th>Permissions (from least to most privileged)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td>Update Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td>Action</td>
<td>Permission type</td>
<td>Permissions (from least to most privileged)</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>----------------------------------------------------------</td>
<td>--------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td>Get Team</td>
<td>Delegated (work or school account)</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td>Archive Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td>Unarchive Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td>Create Channel in a Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td>Get Channel Metadata</td>
<td>Delegated (work or school account)</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td>Get Channel ID by Name</td>
<td>Delegated (work or school account)</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td>Delete Channel</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
</tbody>
</table>

For more information about the required permissions, see Microsoft Teams documentation.

**Microsoft account requirements**

The Microsoft Teams Graph spoke requires registering an application using the Microsoft Azure portal to generate OAuth 2.0 tokens.
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Credentials and connection information.

MID Server requirements

The Microsoft Teams Graph spoke actions use REST calls, which can run on an instance or a MID Server. Use the connection record associated with the Microsoft alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up Microsoft Teams Graph spoke

Integrate the ServiceNow instance and Microsoft Teams account by creating a custom OAuth application in Microsoft Teams to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Microsoft Teams Graph spoke
- Role required: admin

Register an application using the Microsoft Azure portal

Provide authorization to the ServiceNow instance by registering an application with Azure AD.

Role required: Azure Active Directory admin

Complete these steps from the Microsoft Azure portal. For instructions on registering an application, see the Microsoft Azure documentation.

1. In the Microsoft Azure portal, copy and record the Directory ID for later use.
2. Register your application by providing the ServiceNow instance URL for the Home page.
3. Copy and record the Application ID for later use.
4. Add the Reply URLs in this format: https://<instance-name>.service-now.com/oauth_redirect.do
5. For the Required Permissions, select Microsoft Graph.
6. Record the Client Secret for use in later configurations.

The ServiceNow application is created with Microsoft Azure AD.

Register Microsoft Teams as the OAuth provider

Register Microsoft Teams as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

Use the information generated during the registration of the application in the Microsoft Azure portal.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays the message, What kind of OAuth application?
3. Select Connect to a third party OAuth Provider.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Application Registries form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MS Teams.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Client ID</td>
<td>Application ID created during application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret created during application registration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. Enter https://&lt;instance-name&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>Client credentials in the request.</td>
</tr>
</tbody>
</table>

5. Insert the following records in the OAuth Entity Scopes related list.

<table>
<thead>
<tr>
<th>Record 1 in the OAuth Entity Scopes related list</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>OAuth scope</td>
</tr>
</tbody>
</table>
Record 2 in the OAuth Entity Scopes related list

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>openid</td>
</tr>
<tr>
<td>OAuth scope</td>
<td>openid</td>
</tr>
</tbody>
</table>

6. Right-click the form header, and click Save.
   A system-generated OAuth entity profile is created and displayed in the OAuth Entity Profiles related list. For example, MS Teams default_profile.

Create Credential records for the Microsoft Teams Graph spoke
Authorize the Microsoft Teams Graph spoke actions by creating credential records for the application registered in the Microsoft Azure portal. The Microsoft Teams Graph spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message, What type of Credentials would you like to create?
3. Select OAuth 2.0 Credentials.
4. On the form, fill in the fields.

OAuth 2.0 Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MSTeamsCredentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Microsoft Teams Graph spoke as an OAuth provider. For example, MS Teams default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Save.
6. To generate the OAuth token, click the Get OAuth Token related link.

The credential record for the Microsoft Teams Graph spoke is created.

Create Connection records for the Microsoft Teams Graph spoke
Perform actions in Microsoft Teams by creating connection records for your Microsoft Teams account. The Microsoft Teams Graph spoke connection and credential alias uses these connections to perform actions.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the Microsoft Teams Graph spoke record.
3. In the Connections related list, click New.
4. On the form, fill in the fields.
HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MSTeamsConnection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Microsoft Teams. For example, MSTeamsCredentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Note: Do not select the check box.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Click Update.

The Microsoft Teams Graph spoke is set up and integrated with the ServiceNow instance.

**Regenerate the Microsoft Teams OAuth token**

Authorize the Microsoft Teams Graph spoke by regenerating the Microsoft Teams OAuth token after it expires.

Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Select the Microsoft Teams Graph spoke OAuth Credential record.
3. To regenerate the OAuth token, click the Get OAuth Token related link.

The Microsoft Teams Graph spoke receives a new OAuth access token.

**Okta spoke**

Use Okta to manage users, passwords, and groups.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.
Supported versions

API version v1.

Spoke flows

The Okta spoke provides sample flows in the draft state to demonstrate automating user and group management tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add User to Okta Group</td>
<td>When a user is created, adds the user to the specified group.</td>
</tr>
<tr>
<td>Onboard User in Okta</td>
<td>When a user is created in ServiceNow, creates and activates the user in Okta.</td>
</tr>
<tr>
<td>Remove Okta Group Membership on Deactivation</td>
<td>When a user is deactivated, removes the user from all Okta groups.</td>
</tr>
</tbody>
</table>

Note: Okta has the ServiceNow_UD application to provision users in ServiceNow. ServiceNow can also be configured to provision users in Okta. Hence, ServiceNow administrators must ensure that circular user creation does not occur.

Spoke actions

The Okta spoke provides actions to authenticate and manage users and groups. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Management</td>
<td>Activate User</td>
<td>Starts the process of activating a user in Okta by enabling new or returning users to configure their Okta account from an activation URL. This action can either have Okta send the activation URL to the user as an email, or it can return the activation URL as a data pill for use in a later action to send an email or notification.</td>
</tr>
<tr>
<td></td>
<td>Clear User Session</td>
<td>Clears all active sessions the specified user has with Okta, which forces the user to log back in the next time they use Okta.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates the specified user in Okta with the specified standard, optional, and mandatory field values.</td>
</tr>
<tr>
<td></td>
<td>Deactivate User</td>
<td>Deactivates the specified user in Okta, which removes the user's groups and application assignments, and changes the user status to DEACTIVATED. This action is commonly used when a user departs the company indefinitely.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the specified user within Okta, which completely removes the user. This action is commonly used to clean up your user base after compliance regulations have been met.</td>
</tr>
<tr>
<td></td>
<td>Is Account Locked</td>
<td>Determines if a user account is locked.</td>
</tr>
<tr>
<td></td>
<td>Lookup Okta User ID</td>
<td>Retrieves the Okta user ID for the specified Okta login ID or login short name.</td>
</tr>
<tr>
<td></td>
<td>Lookup User Account Details</td>
<td>Retrieves user details for the specified Okta user ID.</td>
</tr>
<tr>
<td></td>
<td>Lookup User Profile Information</td>
<td>Retrieves user profile details for the specified Okta user ID.</td>
</tr>
<tr>
<td></td>
<td>Restart User Activation</td>
<td>Restarts the specified user's activation within Okta. Use this action if the user did not complete their activation with the activation code or link provided by the Activate User Action.</td>
</tr>
</tbody>
</table>

**Note:** Okta has the ServiceNow_UD application to provision users in ServiceNow. ServiceNow can also be configured to provision users in Okta. Hence, ServiceNow administrators must ensure that circular user creation does not occur.

**Note:** Do not perform this action on users with a DEPROVISIONED status.
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Suspend User</td>
<td>Suspends the specified user within Okta by changing the user status from ACTIVE to SUSPENDED. For example, use this action to suspend access for users who are on temporary leave. To reactivate a suspended user, use the <strong>Unsuspend</strong> action.</td>
</tr>
<tr>
<td></td>
<td>Unsuspend User</td>
<td>Unsuspends the specified user in Okta.</td>
</tr>
<tr>
<td></td>
<td>Update User Profile</td>
<td>Updates the user profile details for the specified user in Okta.</td>
</tr>
<tr>
<td>Password Management</td>
<td>Change User's Password</td>
<td>Changes the specified user's password after validating the user's current password.</td>
</tr>
<tr>
<td></td>
<td>Expire User Password</td>
<td>Expires the specified user's password within Okta. This action is commonly used as a reaction to stop breaching attempts.</td>
</tr>
<tr>
<td></td>
<td>Reset to Temporary Password</td>
<td>Resets the specified user's password within Okta to a temporary password. This action is commonly used to get a user logged in who has forgotten their password.</td>
</tr>
<tr>
<td></td>
<td>Reset User Factors</td>
<td>Resets all of the multi-factor access devices for the specified user within Okta. This action is commonly used when a user loses their multi-factor authentication device or method.</td>
</tr>
<tr>
<td></td>
<td>Set User Password</td>
<td>Sets the specified user's password in Okta.</td>
</tr>
<tr>
<td></td>
<td>Unlock User</td>
<td>Unlocks the specified user in Okta.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add User To Group</td>
<td>Adds the specified user to the specified group in Okta.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates the specified group in Okta.</td>
</tr>
<tr>
<td></td>
<td>Is User In Group</td>
<td>Determines if the specified user is a member of the specified group in Okta.</td>
</tr>
<tr>
<td></td>
<td>Lookup Group Details</td>
<td>Retrieves group details for the specified Okta group ID.</td>
</tr>
<tr>
<td></td>
<td>Lookup Group ID By Name</td>
<td>Retrieves group details and group ID for the specified Okta group name.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes the specified user from the specified Okta group ID.</td>
</tr>
<tr>
<td></td>
<td>Update Group</td>
<td>Updates the group details for the specified Okta group ID.</td>
</tr>
</tbody>
</table>
Okta account requirements

The Okta spoke requires generating and configuring your Okta account to use a web API key.

Credential and connection alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Credentials and connection information.

This spoke uses the Okta Connection & Credential Alias record to authorize actions.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Okta alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up Okta spoke

Integrate the ServiceNow instance and your Okta account using an API key to authenticate ServiceNow requests.

• Request IntegrationHub subscription
• Activate the Okta spoke
• Role required: admin

Generate Okta account API token

Configure your Okta account to generate an access token for API key authentication.

Okta requirements:

• Okta organization or developer account
• Okta administrator credentials

Complete these steps from your Okta organization or developer account. See the Okta for developers documentation for instructions on creating and configuring your account.

1. Generate an access token to interact with Okta APIs.
2. Record the access token to create Credential records on your ServiceNow instance.

Create Credential records for the Okta spoke

Create Credential records to the Okta application you created. The Okta spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select API Key Credentials.
   A blank API Key Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Okta Credentials.</td>
</tr>
</tbody>
</table>
ServiceNow eBonding spoke

The ServiceNow eBonding spoke demonstrates some common integration design patterns through a common use case of synchronizing incidents across ServiceNow instances.

**Note:** The ServiceNow eBonding spoke is included by default in your instance and doesn't require an IntegrationHub or Orchestration subscription.

**Base system eBonding actions**

If you have multiple production instances in your environment, you might have a need to synchronize data across these instances. For example, one instance might manage internal applications (your source system) and another manages external customer facing applications (your target system). A common use case is an incident which initially opens on the source system, but it requires a correlated incident to be created and tracked on the target instance. The ServiceNow eBonding integration contains the following OOB actions to assist in creating the synchronization:

**Create Remote Incident action**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>API Key</td>
<td>Enter SSWS followed by the access token you obtained from Okta. For example, SSWS {access token}.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection records for the Okta spoke

Create a Connection record to the Okta API. The Okta spoke connection and credential alias uses these connections to perform actions in Okta.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Okta.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Okta Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Okta. For example, select Okta Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter your Okta organization URL. For example, <a href="https://dev-418994.oktapreview.com">https://dev-418994.oktapreview.com</a>.</td>
</tr>
</tbody>
</table>

5. Click Submit.
This action uses the source system incident details to create a new incident on the target instance. It passes the source incident number as the Correlation ID on the target system. It takes the target system incident number and updates the Correlation ID of the source system.

<table>
<thead>
<tr>
<th>Source</th>
<th>Target</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incident #</td>
<td>Incident #</td>
</tr>
<tr>
<td>Correlation ID</td>
<td>Correlation ID</td>
</tr>
<tr>
<td>Incident Details</td>
<td>Incident Details</td>
</tr>
</tbody>
</table>

**Lookup Remote Incident action**

This action takes the remote incident number as input and retrieves more details about that incident, such as: short description, description, priority, etc.

**Update Remote Incident action**

This action uses the source incident details to update the remote incident with details from source instance. Look up of remote incident is performed using Correlation ID in source instance’s incident.

**Credential and Connection information for eBonding**

When building actions, you must decouple the connection and credential information from the action so there is a seamless transition from distinct production environments. This also makes it easier to share content and create content through the ServiceNow store.

As part of eBonding example, you can associate an OOB connection alias (sn_ebonding_ah.ServiceNow). Create an HTTP connection record and associate it with this alias. For credentials, ServiceNow web services supports a multitude of authentication mechanisms. Create a BasicAuth credential to start with, however, that login ID must have permissions to create, read, and update an incident on your remote system. An example HTTP connection:

![HTTP connection](image)

**Additional eBonding Script**

The Payloadbuilder script is included with this example. It builds a payload by reading a set of fields from an incident table used in the REST steps for these actions.

**Slack spoke**

Use Slack to post messages and manage access to channels.
IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Spoke flows

This spoke has no sample flows.

Spoke subflows

This spoke has no sample subflows.

Spoke actions

The Slack spoke provides actions to automate Slack workspace tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel Management</td>
<td>Add User to Channel</td>
<td>Adds an existing user to the specified channel in a Slack workspace.</td>
</tr>
<tr>
<td>Note: To perform these actions, enable these Slack application scope permissions:</td>
<td>Archive Channel</td>
<td>Archives the specified channel in a Slack workspace.</td>
</tr>
<tr>
<td>• channels:write</td>
<td>Create Channel</td>
<td>Creates the specified channel in a Slack workspace.</td>
</tr>
<tr>
<td>• groups:write</td>
<td>Remove User from Channel</td>
<td>Removes a user from the specified channel in the Slack workspace.</td>
</tr>
<tr>
<td>• im:write</td>
<td>Post a Message</td>
<td>Posts a message in the specified channel.</td>
</tr>
<tr>
<td>• mpim:write</td>
<td>Post Change Details</td>
<td>Posts Change record details to the specified channel.</td>
</tr>
<tr>
<td>For more information, see Configure Slack workspace.</td>
<td>Post Incident Details</td>
<td>Posts Incident record details to the specified channel.</td>
</tr>
<tr>
<td>Note: To perform these actions, enable these Slack application scope permissions:</td>
<td>Post Problem Details</td>
<td>Posts Problem record details to the specified channel.</td>
</tr>
<tr>
<td>• chat:write</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• chat:write:bot</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• chat:write:user</td>
<td></td>
<td></td>
</tr>
<tr>
<td>For more information, see Configure Slack workspace.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a user in the specified Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Deactivate User</td>
<td>Deactivates the specified user from a Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Lookup User</td>
<td>Returns information about the specified user such as name, time zone, workspace admin rights, and team ownership.</td>
</tr>
</tbody>
</table>

**Note:** To perform the user management actions, enable these Slack application scope permissions:
- users:read.email
- users:read
- admin

For more information, see Configure Slack workspace.

**Slack account requirements**

The Slack spoke requires creating a custom app on your Slack account to generate OAuth 2.0 tokens for the Slack spoke. See Configure Slack workspace.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the Slack alias record to authorize actions on Slack.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slack</td>
<td>Connection to Slack.</td>
<td><a href="https://slack.com">https://slack.com</a></td>
</tr>
</tbody>
</table>

**Set up Slack spoke**

Integrate the ServiceNow instance and your Slack account by creating a custom OAuth application in Slack to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Role required: admin

*Configure Slack workspace*

Create a custom OAuth application on your Slack workspace to enable OAuth 2.0 authentication with the Slack spoke.

Slack requirements:

- Slack account
- Slack workspace owner credentials for admin scope permissions

Complete these steps from your Slack account. See the Slack API documentation for instructions on creating and configuring custom applications.

1. From your Slack account, create a custom OAuth application.
2. Select standard OAuth 2.0 user authentication as the application authentication method.
3. Record the application client ID and client secret to register the app as a third-party OAuth provider on your ServiceNow instance.
4. Enable the matching Slack application scope permissions you want the app to support.

<table>
<thead>
<tr>
<th>Slack application scope permission</th>
<th>Required for</th>
</tr>
</thead>
<tbody>
<tr>
<td>chat:write</td>
<td>Post Message, Post Incident Details, Post Change Details, Post Problem Details actions, and Send messages as your Slack app</td>
</tr>
<tr>
<td>chat:write:bot</td>
<td></td>
</tr>
<tr>
<td>chat:write:user</td>
<td></td>
</tr>
<tr>
<td>channels:write</td>
<td>Create Channel, Achieve Channel, Add User to Channel, and Remove User from Channel actions</td>
</tr>
<tr>
<td>groups:write</td>
<td></td>
</tr>
<tr>
<td>im:write</td>
<td></td>
</tr>
<tr>
<td>mpim:write</td>
<td></td>
</tr>
<tr>
<td>users:read.email</td>
<td>Lookup User action</td>
</tr>
<tr>
<td>users:read</td>
<td></td>
</tr>
<tr>
<td>admin (Only available to Slack workspace owners)</td>
<td>Create User and Deactivate User actions.</td>
</tr>
</tbody>
</table>

**Register Slack as OAuth provider**

Use the information generated during Slack workspace configuration to register Slack as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

- Request IntegrationHub subscription
- **Configure Slack workspace**
- Role required: admin

1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
   
The system displays the message **What kind of OAuth application?**
3. Select **Connect to a third party OAuth Provider**.
   
The system displays a blank Application Registries form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Slack OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID you created during the Slack workspace configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you created during the Slack workspace configuration.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Enter <a href="https://slack.com/api/oauth.access">https://slack.com/api/oauth.access</a>.</td>
</tr>
</tbody>
</table>
ServiceNow    Madrid    Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Token Lifespan</td>
<td>Enter a value in seconds for the access token expiration. After expiration, you must generate a new token. The maximum value is 2,144,448,000.</td>
</tr>
<tr>
<td>(Requires configuring form layout to display field)</td>
<td></td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click **Save**.
   The system validates the OAuth credentials and populates the **OAuth Entity Profiles** related list and **Redirect URL**.

6. In the **OAuth Entity Scopes** related list, create entries for the same scopes you had *configured in your Slack workspace* in this format.

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>chat:write</td>
<td>chat:write</td>
</tr>
<tr>
<td>chat:write:bot</td>
<td>chat:write:bot</td>
</tr>
<tr>
<td>chat:write:user</td>
<td>chat:write:user</td>
</tr>
<tr>
<td>channels:write</td>
<td>channels:write</td>
</tr>
<tr>
<td>groups:write</td>
<td>groups:write</td>
</tr>
<tr>
<td>im:write</td>
<td>im:write</td>
</tr>
<tr>
<td>mpim:write</td>
<td>mpim:write</td>
</tr>
<tr>
<td>users:read.email</td>
<td>users:read:email</td>
</tr>
<tr>
<td>users:read</td>
<td>users:read</td>
</tr>
<tr>
<td>admin</td>
<td>admin</td>
</tr>
</tbody>
</table>

   **Note:** This scope is available to Slack workspace owners only.

7. Open the default record in the **OAuth Entity Profiles** related list. In the **OAuth Entity Profile Scopes** related list, specify the same scopes you had earlier specified in the **OAuth Entity Scopes** related list.

8. Copy the value from **Redirect URL**.

9. Login to your Slack workspace to edit the configuration of your custom Slack application.
   See the **Slack API** for instructions.

10. Paste the **Redirect URL** value into the OAuth 2.0 Redirect URI for your custom Slack application.
    For example, paste `https://instance.service-now.com/oauth_redirect.do`.

The instance can request OAuth 2.0 tokens for the spoke.

**Note:** The spoke generates OAuth tokens that expire after 24 days. An administrator can regenerate the spoke OAuth token every 24 days.

*Create Credential record for the Slack spoke*
Create a Credential record for the Slack custom OAuth application you created during Slack workspace configuration. The Slack spoke connection and credential alias uses this credential to authorize actions.

- Request IntegrationHub subscription
- **Configure Slack workspace**
- Role required: admin

1. Navigate to **Connections & Credentials > Credentials**.
2. Click New.
The system displays the message **What type of Credentials would you like to create?**.

3. Select **OAuth 2.0 Credentials**.
The pop-up window displays a blank OAuth 2.0 Credentials form.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter <strong>Slack Credential</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Slack application as an OAuth provider. For example, select <strong>Slack OAuth default profile</strong>.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select <strong>All MID Servers</strong>.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter <strong>100</strong>.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

*Create Connection record for the Slack spoke*

Create a Connection record to your Slack workspace. The Slack spoke connection and credential alias uses this connection to perform actions on your Slack workspace.

- Request IntegrationHub subscription
- Configure **Slack workspace**
- Create Credential record for the Slack spoke
- Role required: admin

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **Slack**.
3. From the **Connections** tab, click **New**.
The system displays a blank HTTP(s) Connection form.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter <strong>Slack Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for the Slack workspace. For example, select <strong>Slack Credential</strong>.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter <strong><a href="https://api.slack.com">https://api.slack.com</a></strong>.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

*Regenerate Slack OAuth token*

Regenerate the Slack OAuth token when it expires. The Box spoke OAuth token expires every twenty four days.

- Request IntegrationHub subscription
- Create Credential record for the Slack spoke
• Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Select the Slack spoke OAuth Credential record.
   For example, select Slack Credential.
3. From Related Links, click Get OAuth Token.

The Slack spoke receives a new OAuth access token good for 24 days.

**Slack webhooks spoke**

Use Slack webhooks to post messages and record details for ServiceNow incidents, problems, and changes to Slack channels.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

**Spoke actions**

The Slack webhooks spoke is an available integration through IntegrationHub. You can specify the following Slack actions within a flow:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
<td>Send a message to a Slack channel using an Incoming Webhook. Specify the Webhook URL and Message to send.</td>
</tr>
<tr>
<td>Post Change Details</td>
<td>Send details about a ServiceNow change record to a Slack channel using a Webhook Connector. Specify the Webhook URL and Change record to send.</td>
</tr>
<tr>
<td>Post Incident Details</td>
<td>Send details about a ServiceNow incident record to a Slack channel using a Webhook Connector. Specify the Webhook URL and Incident record to send.</td>
</tr>
<tr>
<td>Post Problem Details</td>
<td>Send details about a ServiceNow problem record to a Slack channel using a Webhook Connector. Specify the Webhook URL and Problem record to send.</td>
</tr>
</tbody>
</table>

**Slack Inputs**

The following inputs are common to Slack webhooks spoke actions:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Required] Webhook URL</td>
<td>The Slack webhook for sending a message. Set up the webhook before configuring this action. Refer to the custom incoming webhook for Slack documentation.</td>
</tr>
<tr>
<td>Input</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>[Optional] Additional Message</td>
<td>Add a message before the record details.</td>
</tr>
<tr>
<td>[Optional] Channel</td>
<td>Specify the Slack channel to post information.</td>
</tr>
<tr>
<td>Username</td>
<td>Specify a username to include in your post.</td>
</tr>
<tr>
<td>[Optional] Override Default Field</td>
<td>You can provide a comma-separated list of field names to send instead of</td>
</tr>
<tr>
<td></td>
<td>the default fields. Default fields are Short Description, Category, State,</td>
</tr>
<tr>
<td></td>
<td>Priority, and Assignment Group.</td>
</tr>
<tr>
<td>[Optional] Icon</td>
<td>Add an icon to the communication.</td>
</tr>
</tbody>
</table>

**Note:** If you do not specify a Username, Channel, or Icon, it will post the message using the defaults as configured in your webhook. If you specify them here, they will override those defaults.

**Example**

You can add a Slack Post Incident Details action to a flow which identifies newly created high priority incidents, a username, and a specific slack channel.
Integration steps

Enable custom actions to integrate with external systems by activating IntegrationHub, which adds integration steps to the Action Designer interface.

Integration steps can run on the instance or a MID Server. A MID Server is required to communicate with or move data between a ServiceNow instance and external applications, data sources, and services in your network.

Steps that perform operations on record data run on the instance, while steps that integrate with systems in your network run on a MID Server. If a step requires a MID Server to run, the instance delegates flow processing to the appropriate MID Server by sending the process plan in a REST call. The MID Server executes the action or step in the process plan and returns results. View log messages and execution status from the instance or the MID Server.
Available integration steps

These integration steps are available from Action Designer.

<table>

Training

Complete a step-by-step training on using the REST step in the REST in IntegrationHub developer training.

Connection attributes

Define connection-specific variables that you can use in IntegrationHub integration steps. When using an integration step, you must establish a connection with an external system. Use a Connection & Credential alias instead of defining the connection inline. An alias enables you to update the connection details once without having to reconfigure every action. Any action step that uses an alias inherits the attributes associated with it. Flow Designer displays attributes as data pills that you can drag into your action step. For example, you can create a page size attribute that becomes a REST step query parameter. For more information about connection attributes, see Create connection attributes for IntegrationHub.

MID Server connection aliases

Action designers can set MID Server selection attributes using a connection record associated with an alias and associate the alias with an integration step. When the flow runs, the system uses the attributes to determine which MID Server runs the step. Learn more about connection and credential aliases.

MID Server selection

Flow designers should avoid shifting the execution environment between MID Servers when a flow runs. Either configure your MID Servers to perform operations on multiple endpoints, or provide multiple capabilities to the MID Servers in your network. You may need a user with the connection_admin role to update the connection records associated with an action, or a network administrator to update the MID Server network configuration. To learn more about how a MID Server is selected during runtime, see MID Server selection.
Design considerations

Design integration steps using the following guidelines.

- Avoid shifting the execution environment between the instance and the MID Server multiple times. Where possible, group similar action steps. For example, group core steps that perform record operations and integration steps that run on the MID Server.
- When creating a spoke that uses an integration step, include a Connection and Credential alias record with the appropriate connection type. Before anyone can use the spoke, a user with the connection_admin role must associate the alias record to a connection record that supports the connection type. If defining the connection inline, use inputs to enable the process analyst to define the connection information when adding the action to a flow.
- The MID Server does not have access to all the values in a GlideRecord object, it only has access to the sys_id reference. Inputs of type Reference do not work on a MID Server. Instead, create action inputs that contain the necessary GlideRecord values.

Roles

To create integration steps, a user must have the action_designer or admin roles. If running steps on a MID Server, the MID Server user must have the connection_admin and credential_admin roles to access the connection and credential information associated with the step.

Payload Builder step

Enable action designers to easily create name-value pairs in JSON and XML payloads using dynamic data.

Roles and availability

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.
## Fields

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
</table>
| Name Value Pairs     | The name-value pairs to include in the payload. Click the plus icon to add name-value pairs. Drag data pills into either field to produce dynamic payloads. The **Name** becomes a key in JSON and an element in XML. For example, suppose you create this name-value pair.  
  • **Name**: `short_description`  
  • **Value**: `[action]->$[short_description]`  
  When the system formats the name-value pair as JSON:  
  "`short_description": "[action]->$[short_description]"  
  When the system formats the name-value pair as XML:  
| Omit if empty        | The option to exclude a name-value pair if the value is empty or null. **Note**: This field is only visible after clicking the down arrow to display advanced options.                                                  |
| Output Format        | The payload file format.  
  • **JSON**: Select to format the payload as a JSON document.  
  • **XML**: Select to format the payload as an XML document.                                                                                     |
| Namespace            | The XML namespace to apply to each element. For example, when the namespace is set to `incident`:  
  **Note**: This field is only visible when the **Output Format** is set to XML.                                                                     |
<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
</table>
| Include Outer Structure      | The option to include or exclude a top level container appropriate to the output format. When the **Output Format** is JSON, curly braces contain the name-value pairs. When the **Output Format** is XML, a specified XML element contains the name-value pairs. For example, when the system formats the name-value pair as JSON:  

```json
{
   "short_description": ">
> [short_description]
```

When the system formats the name-value pair as XML:  

```xml
<xml>
   <short_description>[action]-
  >[short_description]<
  short_description>
</xml>
```

| Send Empty Structure         | The option to send valid JSON or XML structures when the payload is empty. Enable this option to include JSON or XML structural text in the payload. For example, when the system formats an empty structure as JSON:  

```json
{}
```

When the system formats an empty structure as XML:  

```xml
<xml></xml>
```

Disable this option to produce an empty payload. Empty payloads can occur when you select the **Omit if empty** option for every name-value pair, and all name-value pairs in the payload produce empty values. |
| Parent Node                  | The name of the XML element that contains the name-value pairs. The default parent node element is `xml`. **Note:** This field is only visible when the **Output Format** is set to XML and the option to Include Outer Structure is enabled. |
| Preview                      | The read-only payload the step produces.                                                                                                                                                                   |

**PowerShell step**  
Run PowerShell scripts on remote machines from your ServiceNow instance through a MID Server.
PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

**Note:** PowerShell step is not available in the base system and requires a separate IntegrationHub subscription. After the IntegrationHub plugin is activated, the step is visible under Integrations.

### Roles and availability

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.

### Fields

<tr>
<td>Input variables</td>
<td>The optional name-value pairs that represent the values of PowerShell script variables. You can use action inputs and data from other steps within the PowerShell script. Define the following fields for each variable:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Name:</strong> The name of the script variable to pass a value to. The name cannot match a reserved or prohibited PowerShell variable. Some variable names are reserved for internal processing and should not be used as input variables. See Reserved variables in PowerShell scripting variables.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> The type of PowerShell variable. Select plain text, encrypted, or boolean. If encrypted is selected, the value appears in plain text in this field and is only encrypted when it passes to the ECC Queue.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Value:</strong> The value to map to the variable. Manually enter a value, or drag a data pill into the field.</td>
</tr>
<tr>
<td>Command</td>
<td>The inline PowerShell script to run on the target host.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when the Script type is Inline script.</td>
</tr>
</tbody>
</table>

**PowerShell scripting variables**

To access input variables from the Command field, you must call them using special syntax. The syntax you use depends on the value of a system property. If the Remoting Type is **Run on a MID Server or have your script establish a remote session**, some reserved variables are available in addition to input variables.

**Input variable syntax**
By default, prefix variable names with a $ character. For example, if an input variable is named `message`, use `$message` to access the variable in script.

If the `mid.powershell.command.script.parameter_passing` parameter is set to false, prefix the variable name with `$env:SNC_`. For example, if an input variable is named `message`, use `$env:SNC_message` to access the variable in script. To learn more about the `mid.powershell.command.script.parameter_passing` parameter, see MID Server parameters.

### Reserved variables

When the Remoting Type is Run on a MID Server or have your script establish a remote session, the following variables are available for use in script. Reserved variables cannot be used as custom input variable names.

<table>
<thead>
<tr>
<th>Reserved variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>$computer</code></td>
<td>Host IP address defined in the Connection alias record.</td>
</tr>
<tr>
<td><code>$cred</code></td>
<td>Credential object that contains the credentials defined in the connection record. Use this variable with any PowerShell cmdlet that supports the credential parameter. For example, <code>New-PSSession -credential $cred</code>.</td>
</tr>
<tr>
<td><code>$log_info</code></td>
<td>If the <code>mid.property.powershell.log_info</code> property is set to true, adds logging information to a PowerShell script.</td>
</tr>
</tbody>
</table>

The following variable names are reserved for internal processing and should not be used as input variables.

- `script`
- `useCred`
- `isMid`
- `isDiscovery`
- `debug`
- `user`
- `password`
- `executingScriptDirectory`
- `midScriptDirectory`
- `hresult`

### REST step

Send an outbound REST web service request to an external system.

**Note:** REST step is not available in the base system and requires a separate IntegrationHub subscription. After the IntegrationHub plugin is activated, the step is visible under Integrations.

Outbound REST web service is a platform feature that allows you to retrieve, create, update, or delete data on a web services server that supports the REST architecture.

### Roles and availability

|                     | <strong>Note</strong>: This field is only editable when the HTTP Method is POST, PUT, PATCH, or DELETE.                                                                                                                  |
| Request Body [Text] | Enter the body of the request in JSON or XML format. The flow execution details display the response body as either a link to the embedded text viewer or the Sys ID of the attachment record containing the response. |
|                     | <strong>Note</strong>: This field is only editable when the Request Type is Text.                                                                                                                                       |
| Attachment          | Specify the Attachment record containing the request. You can look up this record in a prior step or define it as an input variable.                                                                     |
|                     | <strong>Note</strong>: This field is only visible when the Request Type is Binary.                                                                                                                                       |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Name, Type, Value   | Specify the content of a multiple part request. For each request part, specify its name, content type, and value. The name can be any valid string and the type can be any valid type. The value must match the content type.  
For attachments, specify:  
• **Type**: attachment  
• **Value**: The Sys ID of the Attachment record containing the content. You can look up this record in a prior step or define it as an input variable. |
| Note:               | These fields are only visible when the Request Type is Multipart.                                                                                                                                                    |

| Name, Value         | Specify the content of a form URL-encoded request. Specify each part of the URL-encoded request with a name-value pair.                                                                                                      |
| Note:               | These fields are only visible when the Request Type is Form URL-Encoded.                                         |

| Save As Attachment  | Specify whether to save the response as a record in the Attachment [sys_attachment] table.                                                                                                                                   |

| Attachment File Name| Specify the name of the attachment created by the REST response. For example, rest-response.txt.                                                                                                                          |
| Note:               | This field is only visible when Save Response As Attachment is enabled.                                                                                                                                   |

| Attachment File Record| Specify the target record to which the attachment is associated. Must be a data pill of type Record. For example, a specific incident record. You can look up this record in a prior step or define it as an input variable. The flow execution details display the Sys ID of the associated record. |
| Note:               | This field is only visible when Save Response As Attachment is enabled.                                                                                                                                   |

**REST response size limits**

By default, the system limits the size of REST responses that are not saved as attachments to 5 MB. Direct REST responses that exceed this limit generate an error. To support larger response sizes, either save the response as an attachment or increase the response size limit with the `glide.pf.rest.response_payload_max_size` system property. This system property supports a maximum value of 10 MB.

**SOAP step**

Enable action designers to send outbound SOAP web service requests to external systems.

*Note: SOAP step is not available in the base system and requires a separate IntegrationHub subscription. After the IntegrationHub plugin is activated, the step is visible under Integrations.*
## Roles and availability

- Available as an Action Designer action step. Subject matter experts use the action_designer role to create a custom action with one or more action steps.
- Action designers need the web_service_admin role to perform these web services tasks.
  - Select WSDL
  - Load new WSDL
  - Select a WS-Security policy
- The MID Server does not support WS-Security policies

## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Connection Details</strong></td>
<td><strong>Connection</strong></td>
</tr>
<tr>
<td></td>
<td>The type of connection to use.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Define Connection Inline</strong>: Define connection information within the action step.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Use Connection Alias</strong>: Define connection information using the Connection Alias table.</td>
</tr>
<tr>
<td></td>
<td>Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you do not have to update your custom action.</td>
</tr>
<tr>
<td></td>
<td>To learn more about connections and credentials, see credentials, connections, and aliases.</td>
</tr>
<tr>
<td><strong>Connection Alias</strong></td>
<td>Specify the Connection &amp; Credential alias record the system uses to run the action step.</td>
</tr>
<tr>
<td></td>
<td>Requires a flow designer or admin to create or select an associated Connection record.</td>
</tr>
<tr>
<td></td>
<td>Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you do not have to update your custom action.</td>
</tr>
<tr>
<td></td>
<td>To learn more about connections and credentials, see credentials, connections, and aliases.</td>
</tr>
<tr>
<td></td>
<td>Outputs the credential value to the data pane as a Password (2 Way Encrypted) data pill.</td>
</tr>
<tr>
<td><strong>Note</strong>:</td>
<td>This field is only visible when the Connection is Use Connection Alias.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Credential Alias</td>
<td>Specify the credential alias the system uses to run the action step. Requires a flow designer or admin to create or select an associated Credential record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you do not have to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. Outputs the credential value to the data pane as a Password (2 Way Encrypted) data pill.</td>
</tr>
<tr>
<td>Use MID</td>
<td>The option to use a MID Server to run the SOAP step. Select this option to display the MID Application and Capabilities fields.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>The URL endpoint for the SOAP request. If Use Connection Alias is selected, this field is read-only and displays the endpoint URL associated with alias. If Define Connection Inline is selected, enter a endpoint URL for the connection.</td>
</tr>
<tr>
<td>Request Details</td>
<td></td>
</tr>
<tr>
<td>Build Envelope</td>
<td>The method to use when building the SOAP envelope.</td>
</tr>
<tr>
<td></td>
<td>• From WSDL: Select this option to display the Select a WSDL and Operation fields.</td>
</tr>
<tr>
<td></td>
<td>• Manually: Select this option to manually enter or paste WSDL text.</td>
</tr>
<tr>
<td>Select a WSDL</td>
<td>The WSDL to use to build the SOAP envelope. Select an existing WSDL record or click Load New WSDL to download or manually enter a WSDL file. The selected WSDL populates the values of the Operation, SOAP action, and SOAP Envelope fields.</td>
</tr>
<tr>
<td>Load New WSDL</td>
<td>The option to download or manually enter a WSDL file.</td>
</tr>
<tr>
<td>Operation</td>
<td>The operation to run from the selected WSDL. Each WSDL has its own list of available operations.</td>
</tr>
<tr>
<td>SOAP action</td>
<td>The URL to run the SOAP action. If Build Envelope is set to From WSDL, this field is read-only and displays the URL to run SOAP action. If Build Envelope is set to Manually, enter a URL to run the SOAP action.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SOAP Envelope</td>
<td>The XML text sent to the endpoint. If <strong>Build Envelope</strong> is set to <strong>From WSDL</strong>, the system adds the necessary XML for the <strong>Operation</strong> you select. If <strong>Build Envelope</strong> is set to <strong>Manually</strong>, enter the XML text you want to use. Enter record values in the appropriate SOAP envelope elements. For example, enter an incident short description in the <code>&lt;short_description&gt;</code> element.</td>
</tr>
<tr>
<td>Reset Envelope</td>
<td>The option to discard all manual changes you made to the SOAP envelope. Select this option to revert the SOAP envelope to its original state.</td>
</tr>
<tr>
<td>New WSDL</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>The name of WSDL record you want to create.</td>
</tr>
<tr>
<td>Import Method</td>
<td>The method to enter WSDL.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Download from URL</strong>: Select to display the WSDL URL, <strong>User name</strong>, and <strong>Password</strong> fields to retrieve the WSDL from an external source, typically the web service provider.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Manually Populate WSDL Content</strong>: Select to display the <strong>WSDL Content</strong> field to manually enter or paste WSDL text.</td>
</tr>
<tr>
<td>WSDL URL</td>
<td>The URL to the SOAP web service.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when the <strong>Import Method</strong> is set to <strong>Download from URL</strong>.</td>
</tr>
<tr>
<td>User name</td>
<td>The user name to authenticate with the SOAP web service.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when the <strong>Import Method</strong> is set to <strong>Download from URL</strong>.</td>
</tr>
<tr>
<td>Password</td>
<td>The password to authenticate with the SOAP web service. The system always masks passwords in the user interface and prevents exporting them as plain text.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when the <strong>Import Method</strong> is set to <strong>Download from URL</strong>.</td>
</tr>
<tr>
<td>WSDL Content</td>
<td>The XML document describing the SOAP web service and its operations.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when the <strong>Import Method</strong> is set to <strong>Manually Populate WSDL Content</strong>.</td>
</tr>
</tbody>
</table>
### SOAP response size limit

The system limits the size of SOAP responses to 5 MB. Direct SOAP responses that exceed this limit generate an error. To support larger response sizes, increase the response size limit with the `glide.pf.soap.response_payload_max_size` system property. This system property supports a maximum value of 10 MB.

### Interaction Management

Interactions are a centralized location for all communication channels in the platform. Each interaction represents a request for assistance through a given channel, for example, a call or a chat.

The Now Platform offers several forms of queueing and communication management, but each system is tightly coupled to the specific area. Interactions offer an alternative, flexible, and more extensible option so that each product area can use the same framework.

#### Activate the interaction management system

An administrator can activate the Interaction Logging, Routing, and Queueing plugin [com.glide.interaction] to access the functionality.

**Interactions**

**Role required:** admin

1. Navigate to **System Definition > Plugins**.
3. Review the plugin details then click the **Activate/Repair** related link.
4. In the activate plugin window, click **Activate**.
The interaction plugin includes the following roles.

## Components installed with Interaction Management

Several types of components are installed with activation of the Interaction Logging, Routing, and Queueing plugin, including tables and user roles.

### Note:
To view all other components installed with this plugin or application, see the Application Files table. For instructions, see *Find components installed with an application*.

### Roles installed

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interaction Administrator</td>
<td>Configure interactions for users.</td>
<td>• interaction_agent</td>
</tr>
<tr>
<td>[interaction_admin]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Interaction Agent</td>
<td>Create and edit interactions. Transfer</td>
<td>None</td>
</tr>
<tr>
<td>[interaction_agent]</td>
<td>interactions to different agents or</td>
<td></td>
</tr>
<tr>
<td></td>
<td>queues.</td>
<td></td>
</tr>
</tbody>
</table>

### Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interaction</td>
<td>Table for all interaction records.</td>
</tr>
<tr>
<td>[interaction]</td>
<td></td>
</tr>
<tr>
<td>Interaction JSON blob</td>
<td>List of records that store context information for each interaction.</td>
</tr>
<tr>
<td>[interaction_json_blob]</td>
<td></td>
</tr>
<tr>
<td>Interaction related record</td>
<td>List of related records that have been associated with an interaction.</td>
</tr>
<tr>
<td>[interaction_related_record]</td>
<td></td>
</tr>
</tbody>
</table>

### Interaction configuration overview

Configure the behavior of an interaction by determining the routine behavior for each state that the interaction goes through during the life cycle.

### Interaction framework

Configure each of the following interaction components to determine the behavior and life cycle.

- Lists: Configure the interaction list view. You can also extend the interaction table.
- Forms: Configure the form view to tailor interactions for each application.
Interaction states

States determine the behavior for interactions. For each state of the interaction life cycle, you determine which routine actions to perform. For example, the **On Created** state would have a script that creates an interaction and then adds the end user as the ‘opened for’. The script then sends a message to the end user to let them know that the interaction has been opened.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New</td>
<td>An interaction is inserted into the interaction table</td>
</tr>
<tr>
<td>On Hold</td>
<td>The interaction is waiting for assignment</td>
</tr>
<tr>
<td>Work In Progress</td>
<td>An agent accepts an unassigned interaction</td>
</tr>
<tr>
<td>Closed Complete</td>
<td>The agent or consumer intentionally closes the interaction</td>
</tr>
<tr>
<td>Closed Abandoned</td>
<td>The interaction is closed because the consumer disconnects or is unresponsive</td>
</tr>
</tbody>
</table>

Interaction context and channel metadata

Context and channel metadata are document ID fields included as part of interactions. Both types of records store information about the interaction.

**Context**

Context for an interaction tracks the information for an interaction, such as the initial question, asset tagging, or device location. Context records are stored on the interaction_json_blob table by default, however you can use any table to store a context record.

**Channel metadata**

Channel metadata contains the information needed to interact with the channel on which communication is happening on, for example, the chat or phone channels. Channel metadata can be free-form JSON or a reference to another record.

Create an interaction

Most interaction creation takes place in other applications, interactions are merely a method of controlling channels. However, if needed you can create an interaction from the Interaction application.

Role required: interaction_agent

1. Navigate to **Interaction > All**.
2. Click **New**.
3. In the **Type** field, enter the way the interaction began. For example, chat, phone, or walk-up.
4. In the **Opened for** field, type the name of the user starting the interaction.
5. Include any additional information in the short description and the work notes fields.

View any incidents opened by the same user by clicking the Use the Incidents by Same Caller related list.
Associate a record with an interaction

As an agent, you might need to create a record on another table to work on an interaction. You can associate the record with the interaction.

Role required: interaction_agent

1. Navigate to Interaction > Assigned to me.
2. Open the interaction you want to associate with another record.
3. In the form header, click Associate Record.
4. In the ID of related record field, click the search icon.
5. From the Document Table list, select the table you want to associate a record from.
6. From the Document field, click the search icon.
7. Select an existing record from the list, or click New to create a record.
8. Click OK.
9. Click Submit.

The associated record appears in the Related Tasks related list for the interaction.

Knowledge Management

The ServiceNow® Knowledge Management (KM) application enables the sharing of information in knowledge bases. These knowledge bases contain articles that provide users with information such as self-help, troubleshooting, and task resolution.

Knowledge Management has significantly changed with Knowledge v3, which is enabled by default for all instances starting with the Fuji release.

The Knowledge Management Service Portal enables users to access a portal view of knowledge bases and articles. It is available by default for new customers on the Madrid and later releases. If required, existing and upgrade customers can activate the Knowledge Management Service Portal plugin.

Knowledge Management supports processes for creating, categorizing, reviewing, and approving articles. Users can search and browse articles as well as provide feedback.

To support multiple groups, knowledge bases can be assigned to individual managers. Separate workflows can be used for publishing and retiring articles, and separate access controls can be used to control reading and contributing.
Knowledge Management roles

Certain roles are required to use Knowledge Management functionality.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>knowledge</td>
<td>Users with the knowledge role can contribute to the default knowledge base and access the Knowledge application menu. The knowledge role is fulfiller role and not a requester role.</td>
</tr>
<tr>
<td>knowledge_manager</td>
<td>Knowledge managers perform administrative functions for knowledge bases they manage such as defining categories, pinning important articles, and approving changes to articles. Users selected as managers of a knowledge base receive this role automatically.</td>
</tr>
<tr>
<td>knowledge_admin</td>
<td>Knowledge administrators can create new knowledge bases and manage all knowledge bases.</td>
</tr>
<tr>
<td>knowledge_coach</td>
<td>Knowledge coaches can perform AQI surveys on articles, write, edit and review knowledge articles, and coach the team on best practices.</td>
</tr>
<tr>
<td>knowledge_domain_expert</td>
<td>Knowledge domain experts perform AQI surveys on articles and can write, edit and review knowledge management articles.</td>
</tr>
<tr>
<td>admin</td>
<td>Administrators can configure knowledge workflows, set knowledge properties, and manage knowledge forms and homepages.</td>
</tr>
<tr>
<td>knowledge_group_manager</td>
<td>Knowledge group managers can add or remove members in ownership groups managed by them. They cannot change the manager assigned in their groups. The manager can only be reassigned by the knowledge administrator. Knowledge group managers are assigned feedback tasks by default. They can reassign tasks to another group member, or group members can assign a feedback task to themselves.</td>
</tr>
<tr>
<td>knowledge_group_member</td>
<td>Knowledge group members are part of an ownership group that can be associated to knowledge articles. They can approve knowledge articles, assign feedback tasks to themselves and work on them as well as edit any knowledge articles that their ownership group is assigned to.</td>
</tr>
</tbody>
</table>
Knowledge properties

As an administrator, you can configure the look and functionality of many knowledge base features with knowledge properties.

You can access knowledge properties by navigating to Knowledge > Administration > Properties.

Knowledge portal properties

Knowledge portal properties control the look and functionality of the legacy portal page. This portal page lists recent knowledge articles and their publishing dates, organized by topic.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of columns on Knowledge portal pages.</td>
<td>Set the number of columns for arranging topics on the knowledge portal.</td>
</tr>
<tr>
<td>(glide.knowman.columns)</td>
<td>Note: This property applies only to Knowledge Management v2 pages. This property is not supported on Knowledge Management v3 pages.</td>
</tr>
<tr>
<td>Maximum number of articles per content block on the home page</td>
<td>Enter the maximum number of articles to display in the Most Useful and Most Viewed sections of the knowledge homepage.</td>
</tr>
<tr>
<td>(glide.knowman.content_block_limit)</td>
<td>Note: This property applies only to Knowledge Management v2 pages. This property is not supported on Knowledge Management v3 pages.</td>
</tr>
<tr>
<td>Omit empty Knowledge topics and categories.</td>
<td>Select the Yes check box to display topic sections only if there are articles for the topic. Clear the check box to show all topic sections, even those with no assigned articles.</td>
</tr>
<tr>
<td>(glide.knowman.show_only_populated)</td>
<td>Note: This property does not apply to the News category.</td>
</tr>
<tr>
<td></td>
<td>Note: This property applies only to the default knowledge base and the legacy knowledge portal. Knowledge Management v3 articles do not specify a topic. Therefore, this property applies only to Knowledge Management v2 pages. This property is not supported on Knowledge Management v3 pages.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Show Knowledge section descriptions. (glide.knowman.show_descriptions) | Select the **Yes** check box to display topic descriptions in the knowledge portal. To enter these descriptions:  
1. Edit an existing knowledge article.  
2. Right-click the **Topic** field label and choose **Show Choice List**.  
3. Open the record for the topic name and enter the description into the **Hint** field.  
Clear the check box to omit section descriptions from the knowledge portal.  
**Note:** This property applies only to Knowledge Management v2 pages. This property is not supported on Knowledge Management v3 pages. |
| Number of Knowledge Base items to preview in a section. (glide.knowman.section_limit) | Set the maximum number of articles per topic for the knowledge portal. The specific articles shown depends on the **Knowledge section sort field** property setting.  
**Note:** This property applies only to Knowledge Management v2 pages. This property is not supported on Knowledge Management v3 pages. |
| Knowledge section sort field. (glide.knowman.section_sort) | Select the default order for articles within each topic section on the knowledge portal.  
- **Published**: uses the date published.  
- **View count**: uses the number of times articles have been viewed during the period specified in the **Number of days used when summing article views** property (applicable only in Knowledge Management v2).  
- **Alphabetically**: uses the first letter of the article title (**Short description** field).  
**Note:** This property applies only to Knowledge Management v2 pages. This property is not supported on Knowledge Management v3 pages. |
| Knowledge Base section sort direction. (glide.knowman.section_sort_direction) | Select the order, **ascending** or **descending**, in which articles are listed within each topic section on the knowledge portal. The value used for sorting is set in the **Knowledge section sort field** property.  
**Note:** This property applies only to Knowledge Management v2 pages. This property is not supported on Knowledge Management v3 pages. |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show unpublished articles in Knowledge Base portal and topic lists. (glide.knowman.show_unpublished)</td>
<td>Select the Yes check box to allow users to see unpublished articles in the knowledge portal and knowledge search results. Use the subsequent List of roles... properties to designated which users can see articles in various unpublished states. If this is not selected, users with appropriate roles can access unpublished articles through other modules of the Knowledge Base application.</td>
</tr>
<tr>
<td>List of roles (comma separated) that can see articles in the Review workflow state in the Knowledge portal and Topic list. (glide.knowman.section.view_roles.review)</td>
<td>Enter role names exactly as they appear in User Administration &gt; Roles. If Show unpublished articles in Knowledge Base portal and topic lists is selected, users with these roles see articles in the Review workflow state in the knowledge portal, in the topic list that appears when they click a topic title on the portal, and in knowledge search results.</td>
</tr>
<tr>
<td>List of roles (comma separated) that can see articles in the Draft workflow state in the Knowledge portal and Topic list. (glide.knowman.section.view_roles.draft)</td>
<td>Enter role names exactly as they appear in User Administration &gt; Roles. If Show unpublished articles in Knowledge Base portal and topic lists is selected, users with these roles see articles in the Draft workflow state in the knowledge portal, in the topic list that appears when they click a topic title on the portal, and in knowledge search results.</td>
</tr>
<tr>
<td>Define roles that can view articles in other/custom workflow states. Do not include Draft and Review states, as they are already defined in other properties. (glide.knowman.section.view_roles.stagesAndRoles)</td>
<td>Enter role names exactly as they appear in User Administration &gt; Roles. If Show unpublished articles in Knowledge Base portal and topic lists is selected, define the custom field and role as workflow state: [roles];. The users with these roles see articles in the custom workflow state on the knowledge portal. The property is not applicable to the retired knowledge articles. Only users with the knowledge_admin role can view retired articles.</td>
</tr>
<tr>
<td>The number of articles that are asynchronously loaded when scrolling down in the new search results page. (glide.knowman.search.articles_per_page)</td>
<td>Enter the number of articles to be displayed during a search. Note: This property applies only to Knowledge Management v3 pages. This property is not supported on Knowledge Management v2 pages.</td>
</tr>
<tr>
<td>Show only Knowledge topic titles on portal page (no article links). (glide.knowman.home_titlesonly)</td>
<td>Select the Yes check box to omit all article titles from the knowledge portal and show only the topic names. Users can click the topic title to see the list of related articles. Note: This property applies only to Knowledge Management v2 pages. This property is not supported on Knowledge Management v3 pages.</td>
</tr>
</tbody>
</table>
### Knowledge search properties

Knowledge search properties give you control over the search options available to users and the presentation of search results.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Number of days used when summing article views. Views older than this are not considered when sorting articles based on view count. 0 means consider all views.</strong> <em>(glide.knowman.view_age.days)</em></td>
<td>Enter a number of days to consider when calculating view count. The View count field in the Knowledge form will be updated periodically to reflect the view count based on this property. For example, if you enter 60, the view count is the total number of views in the past 60 days. Enter 0 to have ServiceNow consider all views, regardless of date. <strong>Note:</strong> If you edit this property, run the Count Knowledge Use scheduled job to see the changes immediately. By default, the Count Knowledge Use scheduled job runs daily and updates the view counts on the knowledge articles. To view the scheduled job, navigate to System Scheduler &gt; Scheduled Jobs &gt; Scheduled Jobs.</td>
</tr>
<tr>
<td><strong>Automatically place cursor in Knowledge portal search box.</strong> <em>(glide.knowman.portal_search_focus)</em></td>
<td>Select the Yes check box to have ServiceNow place the cursor in the search field when a user opens the knowledge portal. Clear the check box to have users click in the search field before entering a search term. <strong>Note:</strong> This property applies only to Knowledge Management v2 pages. This property is not supported on Knowledge Management v3 pages.</td>
</tr>
</tbody>
</table>

Select the order for displaying search results:

- **Number of Views:** orders search results based on the Number of days used when summing article views property.
- **Relevancy:** orders search results based on content that is similar to the search term.
- **Last Modified:** orders search results based on modification date.

This property is applicable for search within the Knowledge Management application and not the Now Platform global search.
<table>
<thead>
<tr>
<th>Property</th>

### Knowledge homepage properties

Knowledge homepage properties control the featured content on the knowledge homepage.

#### Table title

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display or hide the count of articles and questions in the Knowledge Homepage.</td>
<td>Select to display or hide the count of knowledge articles and questions on the Knowledge homepage.</td>
</tr>
<tr>
<td>Default keyword for getting pinned articles</td>
<td>Enter a default keyword for pinned articles. Articles pinned with the specified keyword appear in the Featured Content section of the knowledge homepage.</td>
</tr>
<tr>
<td>Display or hide the count of articles and questions in the category and child categories</td>
<td>Select to display the count of articles and questions within each category, including subcategories, when browsing or searching knowledge bases.</td>
</tr>
<tr>
<td>Show Knowledge Home page when user has access to only one Knowledge Base</td>
<td>Select to display the Knowledge homepage when the current user has access to only one knowledge base.</td>
</tr>
<tr>
<td>Default header title for the pinned articles section on knowledge home pages.</td>
<td>Enter a title for the Featured Content section of the knowledge homepage.</td>
</tr>
</tbody>
</table>

### Other knowledge properties

Additional knowledge properties let you control general knowledge management features.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When attaching an article to an incident, copy the content into this</td>
<td>When a user searches knowledge from a task form (such as an incident, problem, or change) and clicks the Attach to Task button for an article, the system copies the article number and content into the field specified in the Value column here. This field is generally a journal field such as Comments or Work notes. Use dot walking to copy the article content into related records. If a specified field does not exist, that field is ignored. If the property has no value, comments is used.</td>
</tr>
<tr>
<td>incident. (glide.knowman.attach.fields)</td>
<td></td>
</tr>
<tr>
<td>Knowledge Management logo to display if running out of the ServiceNow</td>
<td>Click the reference lookup tool ( <img src="https://www.servicenow.com" alt="Icon Reference Lookup" />) and choose an image file to be displayed on knowledge pages that are used outside of the ServiceNow application frames. For example, the logo image selected here appears if you create a Content Management System site that includes knowledge pages. You can also enter the Name of an image stored in the database to use that image. Note: This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
</tr>
<tr>
<td>frames. (glide.knowman.frameless_logo)</td>
<td></td>
</tr>
<tr>
<td>Hide the 'Import' functionality (button and drag-n-drop) for all users.</td>
<td>Select Yes to hide the Import Articles button. If you have not yet migrated to Knowledge v3 and are using legacy Knowledge v2, you can configure the visibility of the Import Articles button to prevent users from importing articles to knowledge bases.</td>
</tr>
<tr>
<td>(glide.knowman.import.hide_import_functionality)</td>
<td></td>
</tr>
<tr>
<td>Show publish check box on the knowledge import pop-up.</td>
<td>Select No to remove the Publish check box on the knowledge import form so that an article cannot be published as part of the import process. Default is yes.</td>
</tr>
<tr>
<td>(glide.knowman.import.show_publish_check_box)</td>
<td></td>
</tr>
<tr>
<td>Use submission workflow.</td>
<td>Select the Yes check box to use the knowledge submission workflow instead of the standard knowledge workflow. If this option is selected, each time a user creates knowledge from an incident or problem, the content is placed into a submission record instead of a draft article. Transforming knowledge submissions into articles follows a specific workflow.</td>
</tr>
<tr>
<td>(glide.knowman.submission.workflow)</td>
<td></td>
</tr>
<tr>
<td>The sys_id of the knowledge base when creating knowledge from task</td>
<td>Enter the sys_id of the knowledge base to put new knowledge articles created from tasks in.</td>
</tr>
<tr>
<td>records. (glide.knowman.task_kb)</td>
<td></td>
</tr>
<tr>
<td>Before displaying an article's text in search results or the article</td>
<td>Select this check box if users must have ACL-based permission to view text fields on the Knowledge [kb_knowledge] table to read article previews in knowledge search results.</td>
</tr>
<tr>
<td>view, check field-level ACLs on appropriate field: kb_knowledge.text</td>
<td></td>
</tr>
<tr>
<td>(HTML article) or kb_knowledge.wiki (wiki text article).</td>
<td></td>
</tr>
<tr>
<td>(glide.knowman.text.check_can_read)</td>
<td></td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Defines the number of results to be considered when building the search filters (glide.knowman.search.facet_depth) | Define maximum number of knowledge articles to be considered from search results for populating search filters.  
  - Type: string  
  - Default value: 300  
  - Location: System Properties |
| When showing a list of articles through the Knowledge portal (using the kb_list UI Page), remove articles the user cannot see before building the list. (glide.knowman.list.filter) | Enter the value as true to enable removal of articles that user cannot see before building the articles list in the knowledge portal.  
  - Type: true | false  
  - Default value: false  
  - Location: System Properties  
  If you have large number of articles in your knowledge base, setting this property to true will negatively impact performance. |
| Deny access to a knowledge base when either Can Read or Can Contribute user criteria list for the knowledge base isn't specified (glide.knowman.block_access_with_no_user_criteria) | Enter the value as true to deny contribute access to a knowledge base when Can Contribute isn’t set and read access when Can Read isn’t set. The default value of this property is set to true.  
  - Type: true | false  
  - Default value: true  
  - Location: System Properties  
  Note: For Madrid patches prior to Madrid Patch 9, the default value of this property is set to false. For existing customers upgrading to at least Madrid Patch 9, the property value isn’t modified. For more information, see Madrid Patch 9.  
  - Type: true | false  
  - Default value: true  
  - Location: System Properties |
| Determines whether to apply ACLs on the search results (glide.knowman.search.apply_acls) | Enter the value as true to apply knowledge ACLs on knowledge article search results.  
  - Type: true | false  
  - Default value: true  
  - Location: System Properties  
  Note: If the glide.knowman.search.apply_acls is set to true, a knowledge base without any articles present in the search results might appear in the Knowledge Field Facet when filtering by knowledge base. For more information, see Configure filter facet widget instance options. |
Knowledge Social Q&A properties

You can set the limit for the number of times users can ask, answer, or subscribe to Social Q&A questions, or comment on the questions and answers using the Social Q&A system properties.

**Note:** To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

**Note:** If the **Value** field for any of the Social Q&A properties is left blank, then a rate limit does not apply for that particular property.

<table>

Knowledge Management setup guide for admins

Before users in your organization can start creating knowledge bases and knowledge articles, you must set up Knowledge Management. Work with stakeholders to define requirements for setting up Knowledge Management effectively to meet the needs of users.

Requirements

Role required: admin

Before you begin

Meet with the stakeholders

<table>
<thead>
<tr>
<th>Stakeholder</th>
<th>Responsibilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge manager</td>
<td>Defines and oversees the knowledge management processes for day-to-day operations related to content publishing and usage.</td>
</tr>
<tr>
<td>Knowledge admin</td>
<td>Configures advanced settings for specific Knowledge Management features</td>
</tr>
<tr>
<td>Knowledge coach</td>
<td>Enables users to adhere to content standards.</td>
</tr>
<tr>
<td>Knowledge domain expert</td>
<td>Provides domain knowledge expertise.</td>
</tr>
<tr>
<td>Version author</td>
<td>Contributor to a particular version of an article.</td>
</tr>
<tr>
<td>Content creators and reviewers</td>
<td>Create, review, and update articles in the knowledge bases.</td>
</tr>
<tr>
<td>Community managers</td>
<td>Focus on the creation and curating of social content.</td>
</tr>
<tr>
<td>Line managers</td>
<td>Manage teams that create and use knowledge articles</td>
</tr>
</tbody>
</table>

With stakeholders, determine the following requirements

- Who are the consumers of the content in the knowledge bases?
- Who are the writers, editors, and managers for the knowledge base articles?
- What are the required workflows to publish and retire articles?
- What are the unique behaviors required for your knowledge management implementation? For example, should attachments appear in search results?
- Do you want to translate knowledge articles into other languages?

What to do

Assign knowledge roles to users and groups

Determine which Knowledge Management roles are appropriate for each user, and then assign those roles.

Create custom Knowledge workflows

If the default knowledge workflows for publishing and retiring knowledge articles are not appropriate for knowledge bases, create custom workflows for those knowledge bases.
Configure Knowledge properties

If the default knowledge properties do not fulfill the requirements of users, reconfigure the properties as necessary.

Activate support for other languages besides English

If languages other than English must be supported, activate the Knowledge Management Internationalization plugins.

Coordinate with knowledge managers for knowledge base setup

Let knowledge managers and administrators know that they can start configuring their knowledge bases. For details, refer them to the Knowledge base setup guide for knowledge admins and managers.

Next steps

Depending on any other requirements for the knowledge bases, you may be asked to help with additional tasks, such as configuring knowledge homepages.

Using guided setup to implement Knowledge Management

Knowledge Management guided setup provides a sequence of tasks that help you configure Knowledge Management on your instance. To open Knowledge Management guided setup, navigate to Knowledge Management > Administration > Guided Setup.

For more information about using the guided setup interface, see Using guided setup.

Domain separation and Knowledge Management

This is an overview of domain separation and Knowledge Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Level 2

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

Domain separation works differently at different access levels of an application. In Knowledge Management, data, requester and fulfiller access to knowledge bases are domain separated.

How domain separation works in Knowledge Management

In Knowledge Management the following rules apply:

Data: At the data level of domain separation, data visibility is separated from one domain to another. Knowledge bases, user criteria, articles, categories, article feedback, article versions, article templates, and external sources are domain separated in the base system.

Note: The data in one domain cannot be seen in any other domain. For example, if you create a Knowledge Management article in a domain A using an article template which is not in domain A, the article will not be
visible in domain A. Similarly, if you create a Knowledge Management article in the global domain using a template that is not in global, the article might not be visible in all the domains.

Requester: Requester activities are supported within tenant domains. Users can search; view; comment; and rate articles of their domain, any child domain, and global domains, provided that feedback is enabled and the knowledge base settings grant them read access to articles.

- Users in the global domain can access articles in all the domains if read access is granted at knowledge base and/or article level.
- Users in the parent domain can access articles in that domain, global, and all of its child domains if read access is granted at knowledge base and/or article level.
- Users in the child domain can access articles in that domain and the global domain if read access is granted at knowledge base and/or article level.

Fulfiller: The application can be used by the Fulfiller within the tenant domains as a tenant domain-owned application. Users are allowed to author articles in knowledge bases of their domain, any child domain, and the global domain if the knowledge base has user criteria set up to grant contribute access.

- Articles are automatically saved to the user’s current domain when the article is created.

See Select user criteria for a knowledge base to learn how to control which users create, read, write, and retire knowledge articles within a knowledge base.

See Select user criteria for an article to learn how to control read access to users at the article level.

Use cases

This image demonstrates a basic domain hierarchy that is available in the base system.
### Requester use cases

<table>
<thead>
<tr>
<th>User domain</th>
<th>Knowledge base domain</th>

<td>Child domain (TOP/ACME)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>MSP domain (TOP/MSP)</td>
<td>MSP domain (TOP/MSP)</td>
<td>MSP domain (TOP/MSP)</td>
<td></td>
</tr>
</tbody>
</table>

**Known Issues**

- The following AQI tables are not domain separated:
  - AQI Checklist [kb_quality_checklist]
  - Checklist Question [kb_checklist_question]
  - Article Checklist Summary [kb_article_checklist_summary]
  - Article Checklist Answer [kb_article_checklist_answer]

  **Note:** The Article Checklist Answer table does not contain the Order field. The application shows the list in a random order.

- Comment provided by a user on an article is stored in article's domain instead of user domain.

**Knowledge base setup guide for knowledge admins and managers**

After basic Knowledge Management setup is completed, you can set up a knowledge base for users to create and publish knowledge articles.

Multiple knowledge bases can be created for different groups within your organization to share information within and between those groups.

Administrators create knowledge bases, and assign them to individual managers responsible for controlling the behavior and organization scheme of each knowledge base.

Each knowledge base contains knowledge articles that provide information for users, such as policy, release notes, or instructions for a task. Each knowledge base can also use a separate workflow for publishing and retiring articles.

**Requirements**

Role required: knowledge_administrator, knowledge_manager, or admin

**Before you begin**

**Determine the following requirements for each knowledge base that you want to set up:**

- Who are the knowledge base managers that are responsible for approving articles?
- Who are the users and contributors for that knowledge base? Access for these users is defined through user criteria.
- What are the categories to be used to classify articles? Will users be able to create categories?
• Will users of the knowledge base be able to create new content?
• Will Social Q&A be leveraged for this knowledge base?

What to do

Set up the knowledge base

1. Create the knowledge base.
2. Set up which users can read, create, or edit knowledge articles by selecting user criteria for the knowledge base.
3. Define the approval process for articles using workflows.
4. Define the knowledge categories that are needed for organizing articles in the knowledge base.
5. If you want to enable users to ask and answer questions in the knowledge base, activate Social Q&A.
6. If you want a custom knowledge homepage, ask your ServiceNow administrator to create it.

Next steps

Let users in your organization know that they can start creating and searching articles in the knowledge base. For details, refer users to the Knowledge Management guide for users.

If you have the knowledge_manager role, there are many other tasks that you can perform to maintain the knowledge base. You can pin articles so they are featured prominently in the search results and on homepages. You can also assign other users as managers of a knowledge base. For details, see Knowledge manager.

Quick start tests for Knowledge Management

Validate that Knowledge Management still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Knowledge Management quick start tests require activating the Knowledge Management Core plugin (com.glideapp.knowledge), the Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer), and the Customer Service Management Demo Data plugin (com.snc.customerservice.demo).

<table>
<thead>
<tr>
<th>Test</th>

</table>
| Create a multi-versioned standard article with approval publish workflow | Create a multi-versioned standard article with approval publish workflow.  
*Note: Requires Knowledge Management Advanced Installer.* |
| Create an article level subscription | Create an article level subscription.  
*Note: Requires Knowledge Management Advanced Installer.* |
| Create user criteria covering canRead and canContribute for knowledge base and canRead at article level | Create user criteria covering canRead and canContribute for knowledge base and canRead at article level.  
*Note: Requires Knowledge Management Core.* |
| Create a KCS article from a case | Create a KCS article from a case.  
*Note: Requires Knowledge Management Advanced Installer and Customer Service Management Demo Data.* |

**Configure Knowledge Management**

Configure various aspects of Knowledge Management based on the specific requirements of your organization. The following podcast offers additional information on using Knowledge Management.

**Create a knowledge base**

Create a knowledge base to provide a self-service platform for users to store, share, and manage content. Configure knowledge bases into product or service categories and manage user access based on permissions. Customize workflows for publishing and retiring articles in the knowledge base.

Understand the *requirements* for setting up a knowledge base.

Role required: knowledge_admin or admin

1. Navigate to **Knowledge > Administration > Knowledge bases.**
2. In the Knowledge Bases list, click **New.**
3. On the form, fill in the following fields as appropriate:

**Knowledge base form**

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Unique name for the knowledge base.</td>
</tr>
<tr>
<td>Icon</td>
<td>An image that provides a visual reference to describe the knowledge base. This image is displayed next to all articles from this knowledge base in the article search results page.</td>
</tr>
<tr>
<td>Title</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Disable commenting</td>
<td>Option to disable commenting. If selected, users cannot comment on articles in the knowledge base.</td>
</tr>
<tr>
<td>Disable suggesting</td>
<td>Option to disable edit suggestions. If selected, users cannot suggest edits to articles in the knowledge base.</td>
</tr>
<tr>
<td>Disable category editing</td>
<td>Check box to disable editing of knowledge categories. If selected, only knowledge managers can add or edit knowledge categories for the knowledge base.</td>
</tr>
<tr>
<td>Checklist</td>
<td>Checklist to evaluate the quality of articles in the knowledge base.</td>
</tr>
<tr>
<td>Owner</td>
<td>The user responsible for the knowledge base. A knowledge base owner can assign other roles to the knowledge base.</td>
</tr>
<tr>
<td>Manager</td>
<td>Users who perform administrative functions on the knowledge base.</td>
</tr>
<tr>
<td>Publish workflow</td>
<td>The workflow for publishing the articles in the knowledge base.</td>
</tr>
<tr>
<td></td>
<td>• Knowledge - Instant Publish: publishes articles in the knowledge base without requiring an approval.</td>
</tr>
<tr>
<td></td>
<td>• Knowledge - Approval Publish: requests approval from the manager of the knowledge base before moving the articles to the published state.</td>
</tr>
<tr>
<td>Retire workflow</td>
<td>The workflow for retiring the articles in the knowledge base.</td>
</tr>
<tr>
<td></td>
<td>• Knowledge - Instant Retire: retires articles in the knowledge base without requiring an approval.</td>
</tr>
<tr>
<td></td>
<td>• Knowledge - Approval Retire: requests approval from the manager of the knowledge base before moving the articles to the retired state.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to indicate that the knowledge base is active. If not selected, only users with the admin role can create or view its articles.</td>
</tr>
<tr>
<td>Enable social questions and answers</td>
<td>Option to enable social Q&amp;A for articles in the knowledge base.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description to describe the knowledge base.</td>
</tr>
<tr>
<td>Set default knowledge field values</td>
<td>Default configuration settings for the knowledge base.</td>
</tr>
<tr>
<td>Related products</td>
<td>List of products related to the knowledge base content.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click **Save**.
5. In the related list section, view or configure the following items related to the knowledge base:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge</td>
<td>List of knowledge articles stored in this knowledge base.</td>
</tr>
<tr>
<td>Questions</td>
<td>List of Social Q&amp;A questions stored in this knowledge base.</td>
</tr>
</tbody>
</table>
### ServiceNow Madrid Now Platform capabilities

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can Read</td>
<td>The Can Read user criteria list for this knowledge base.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> It is recommended to assign appropriate user criteria to secure read access. See, <em>Select user criteria for a knowledge base</em>.</td>
</tr>
<tr>
<td>Can Contribute</td>
<td>The Can Contribute user criteria list for this knowledge base.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> It is recommended to assign appropriate user criteria to secure contribute access. See, <em>Select user criteria for a knowledge base</em>.</td>
</tr>
<tr>
<td>Featured Content</td>
<td>List of knowledge articles that appear in the homepage <strong>Featured Content</strong> section based on the corresponding keyword search set for each article.</td>
</tr>
<tr>
<td>Knowledge Categories</td>
<td>List of knowledge categories associated with this knowledge base.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

### Create a custom knowledge homepage

As a system administrator, you can create a module allowing users to open a knowledge homepage for a specific knowledge base or category.

Role required: admin

1. In the application navigator, point to the application name and click the edit application icon (``).
2. In the **Modules** related list click **New**.
3. Enter a **Title** for the module.
4. In the **Link type** field, select **URL (from Arguments)**.
5. In the **Arguments** field, append one or more of the following values to `$knowledge.do#/search?`:  

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| `sysparm_kb=<knowledge base sys_id>` | Enter the sys_id of a knowledge base to show knowledge articles from that knowledge base by default.  
If the specified knowledge base does not exist, the default knowledge homepage appears when accessing the custom homepage module. |
### Option

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Note: The category passed in this parameter must belong to the knowledge base passed in the <code>sysparm_kb</code> parameter.</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_category=&lt;knowledge category sys_id&gt;</td>
<td>Enter the sys_id of a knowledge category to show knowledge articles from that category by default. If the specified category does not exist, the default category for the selected knowledge base appears when accessing the custom homepage module.</td>
<td></td>
</tr>
<tr>
<td>sysparm_order=&lt;view_count, last_modified, or relevancy&gt;</td>
<td>Enter the default sort order for articles to appear in.</td>
<td></td>
</tr>
</tbody>
</table>

To create a homepage for a *Facilities* knowledge base with a `sys_id` of `d582764047022100158b949b6c9a7145` and sorting by last modified date, enter `$knowledge.do#/search?sysparm_kb=d582764047022100158b949b6c9a7145&sysparm_order=last_modified` in the *Arguments* field on the *Module* form.

### Knowledge workflows

The publishing and retirement processes for a knowledge article are controlled by workflows defined for the knowledge base that the article belongs to.

You can assign different workflows to each knowledge base.

You can use one of the default workflows, or create your own workflows to define custom publishing and retirement processes for different types of knowledge.

For the workflows that require approval, you can configure which users can approve or reject by editing the `getApprovers()` function in the `KBWorkflow` script include.

#### Default knowledge workflows

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge - Approval Publish</td>
<td>Requests approval from a manager of the knowledge base before moving the article to the published state. The workflow is canceled and the article remains in the draft state if any manager rejects the request.</td>
</tr>
<tr>
<td>Knowledge - Approval Retire</td>
<td>Requests approval from a manager of the knowledge base before moving the article to the retired state. The workflow is canceled and the article remains in the published state if any manager rejects the request.</td>
</tr>
<tr>
<td>Knowledge - Instant Publish</td>
<td>Immediately publishes a draft article without requiring an approval.</td>
</tr>
<tr>
<td>Knowledge - Instant Retire</td>
<td>Immediately retires a published article without requiring an approval.</td>
</tr>
<tr>
<td>Knowledge - Publish Knowledge</td>
<td>A subflow that moves the knowledge article to the published state. You can use this subflow when defining your own workflow.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Knowledge - Retire Knowledge</td>
<td>A subflow that moves the knowledge article to the retired state. You can use this subflow when defining your own workflow.</td>
</tr>
</tbody>
</table>

**Note:** Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.

### Activate the Knowledge Management Advanced plugin

Activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) to enable advanced features for Knowledge Management.

Role required: admin

The Knowledge Management Advanced plugin includes feature code and demo data.

The Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer) is used to activate the Knowledge Management Advanced plugin.

**Note:** The Knowledge Management Advanced plugin is not automatically activated with the Knowledge Management v3 application.

This plugin performs two validation steps prior to activation:

- Determines if there are any active Knowledge Management v2 knowledge bases.
- Determines if there is a unique database index on the **Number** field. If a unique constraint has been added to the **Number** field, the plugin activation fails. Follow the instructions listed in KB0634959 to perform corrective steps to resolve the issue.

You need access to **HI** to be able to view KB articles.

The Knowledge Management Advanced plugin activates the following features:

- **Article versioning:** Enables maintaining multiple versions of a knowledge article. For more information, see [Article versioning](#).
  
  **Note:** Migrate to Knowledge Management v3 completely to use article versioning.

- **Article subscriptions:** Enables managing knowledge base and knowledge article subscriptions. For more information, see [Knowledge subscriptions](#).
  
- **Article quality index:** Enables maintaining consistent quality of knowledge articles within a knowledge base where articles are written by various authors. For more information, see [Article quality index for knowledge management](#).

- **Article templates:** Enables creating article templates for consistent structure of knowledge articles. For more information, see [Knowledge article templates](#).

- **Ownership group:** Enables creating ownership groups for knowledge articles. For more information, see [Enable ownership groups](#).

- **In-context article creation:** Enables creating a knowledge article from a customer service case. For more information, see [Enable creating an article from a customer service case](#).
Demo data is included as part of the Knowledge Management Advanced plugin. If the validation step performed by the Knowledge Management Advanced Installer plugin completes successfully, the Knowledge Management Advanced plugin is activated automatically. However, the demo data is not included in this activation. To load the demo data, go to the Knowledge Management Advanced plugin page, click the **Load Demo Data Only** related link, and then click **OK**.

1. Navigate to **System Applications > All Available Applications > All**.

   A banner appears to notify you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

   ![Note]

   To redirect to the legacy list view for plugins, click the link.

   ![You have been redirected to All Applications. To see the Plugins list click here]

2. Find the plugin with the filter criteria and search bar.

   You can search for the plugin by its name or ID.

   If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in **Request a plugin**.

3. Activate the plugin.

   You can activate the plugin directly from the All Applications page or view more details about the plugin before activating it.

   • If you are certain that you have the correct plugin, click **Install**, and then click **Activate** in the dialog box that appears.

   ![Activate Plugin]

   ![Plugin dependency status]

   ![Cancel Activate]

   • To view plugin details before activation:

     1. Click the plugin name.

     2. On the form, click the **Activate/Update** related link.

     3. On the dialog box that appears, review the dependent plugins.
If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.

4. If demo data is available and you want to install it, click **Load demo data**.

Some plugins include demo data, which are sample records that illustrate plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.

5. Click **Activate**.

**Knowledge article templates**

Article templates have pre-defined fields structured in a specific order. These templates help create a consistent structure for knowledge articles.

Using the Knowledge Article Templates feature, as a knowledge administrator (a user with knowledge_admin role), you can create article templates, add or customize fields in a template, and activate or deactivate a template.

As a security administrator (a user with security_admin role), you can configure field-level security in any template to make it visible to specific users.

As an author, you can create articles using pre-defined article templates or any newly created article templates.

**Pre-defined knowledge article templates**

Use either the standard template or one of the pre-defined How To, What Is, FAQ or KCS article templates.

**Note:**

When you upgrade Knowledge Management to Kingston or later releases, all existing articles from the earlier version automatically use the standard template of the upgraded version. For example, if you upgrade Knowledge Management from Jakarta to Kingston, all existing articles use the standard template available in the Kingston version.

All pre-defined templates are inactive by default. If you do not activate a template, the articles automatically use the standard template. As a knowledge admin, you can activate a template by navigating to **Knowledge > Administration > Article Templates**. Then in the article template list, set the **Active** field to true for one or more templates you would like to activate.

<table>
<thead>
<tr>
<th>Pre-defined knowledge article templates</th>
</tr>
</thead>
<tbody>
<tr>
<td>Template name</td>
</tr>
<tr>
<td>FAQ</td>
</tr>
<tr>
<td>How To</td>
</tr>
</tbody>
</table>
## Activating knowledge article templates

The Knowledge Article Templates feature is activated with the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin. For details, see [Activate the Knowledge Management Advanced plugin](#).

## Deactivating knowledge article templates

You cannot delete an article template because article templates have an associated child table. Deleting a template would also require deleting the child table. Due to the limitations on dropping tables, article templates and template columns are explicitly made non-deletable. Instead you can disable the Knowledge Article Templates feature by clearing the **Active** check box on the Article Template form.

**Note:** The Standard template is available by default and can’t be made inactive.

## Create an article template and use it to create a knowledge article

Create new article templates in addition to the pre-defined templates. Add new fields based on how you want to customize and display your content.

Role required: knowledge_admin or admin

For each new article template, a child table of the Knowledge [kb_knowledge] table is created. When you add a new field to the template, a new column is added to that table created for the template.

### 1. Navigate to Knowledge > Administration > Article Templates, and click New.

### 2. On the Article Template form, fill in fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the article template.</td>
</tr>
<tr>
<td>Description</td>
<td>Description for the article template.</td>
</tr>
</tbody>
</table>

The **Active** check box is selected by default making the template available for use.

### 3. Right-click the form header and click Save.

### 4. In the Article Templates Field related list, add fields to the template.

a) Click New.

b) On the Article Template Field form, fill in the fields.

### Table of Knowledge Article Templates

<table>
<thead>
<tr>
<th>Template name</th>
<th>Template fields</th>
<th>Maps to table</th>
<th>SEO Description Tag</th>
</tr>
</thead>
<tbody>
<tr>
<td>What Is</td>
<td>• Introduction</td>
<td>What Is [kb_template_what_is]</td>
<td>Introduction</td>
</tr>
<tr>
<td></td>
<td>• Explanation</td>
<td></td>
<td></td>
</tr>
<tr>
<td>KCS Article</td>
<td>• Issue</td>
<td>KCS Article [kb_template_kcs_article]</td>
<td>Issue</td>
</tr>
<tr>
<td></td>
<td>• Environment</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Cause</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Resolution</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Standard</td>
<td>Text</td>
<td>kb_knowledge</td>
<td>Text</td>
</tr>
</tbody>
</table>
### Article Template Field form

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Name</td>
<td>Title to display on the template form.</td>
</tr>
<tr>
<td>Field Type</td>
<td>Available field types:</td>
</tr>
<tr>
<td>Order</td>
<td>Position of the field in the article page view and the article edit view.</td>
</tr>
<tr>
<td>Article Template</td>
<td>(Read-only) Name of the article template associated with this field.</td>
</tr>
<tr>
<td>Template Table</td>
<td>(Read-only) Name of the table for this template.</td>
</tr>
<tr>
<td>Template Field</td>
<td>(Read-only) Name of the template column associated with this field.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Option to make this field as mandatory. When selected, this field is required to be filled.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to display the field on the template.</td>
</tr>
</tbody>
</table>

5.  The field is added to the template.

5. Optional: In the **SEO Description Tag** field, search for and add article template field name. The content in this field is used as meta description tags to search for articles created using this article template.

6. Configure the Knowledge form to display the fields that you added to the template.

   **Note:** You must have the admin role to configure the form layout. If the field is not available in the form layout, use the **form designer** to configure the fields.

   a) Navigate to **Knowledge > Articles > Create New**.
   
   b) Select a knowledge base, and then the newly added article template.
   
   c) Right-click the header and select **Configure > Form Layout**.
   
   d) Select and move the fields you added to the article template from the **Available** column to the **Selected** column.
   
   e) Click the up or down icon to arrange the fields in the order in which you want them to appear in the Knowledge form.
   
   f) Click **Save**.

   **Note:** Authors who started a session before a template was created or activated will see the newly added template upon their next login.
Restrict access to fields in an article template

Use encryption context to set field-level security in article templates and display the fields based on role permissions.

Activate the Encryption Support plugin to enable field-level security using an encryption context.

Role required: security_admin

1. Create an encryption context for the article template field to be encrypted.
   a) Navigate to System Security > Field Encryption > Encryption Contexts and click New.
   b) On the Encryption Context form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the encryption context.</td>
</tr>
<tr>
<td>Encryption key</td>
<td>Key used to encrypt the data. Leave this field blank to randomly generate a key. Based on the desired type of encryption, enter the exact number of characters:</td>
</tr>
<tr>
<td></td>
<td>• 16 characters for AES 128-bit</td>
</tr>
<tr>
<td></td>
<td>• 32 characters for AES 256-bit</td>
</tr>
</tbody>
</table>

   Warning: You cannot retrieve this key from the instance. If you need access to the key, save it elsewhere before clicking Submit.

<table>
<thead>
<tr>
<th>Type</th>
<th>Type of encryption used to encrypt your data:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• AES 128-bit: Advanced Encryption Standard</td>
</tr>
<tr>
<td></td>
<td>• AES 256-bit: Advanced Encryption Standard using 256-bit encryption</td>
</tr>
</tbody>
</table>

   c) Click Submit.

2. Associate the article template field with the encryption context.
   b) On the Encrypted Field Configuration form, fill in the fields.

   Encrypted Field Configuration form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table associated with the article template fields. For example, for the How to article template fields, select How To [kb_template_how_to].</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Column</td>
<td>Article template field to be encrypted. Only String, Date, Date/Time, and URL fields are supported.</td>
</tr>
<tr>
<td></td>
<td>• <strong>String and URL fields</strong>: You can add a new encryption configuration to either a parent table or a child table.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Date and Date/Time fields</strong>: You can create encrypted field configurations to encrypt existing Date and Date/Time fields. You can add a new encryption configuration to a parent table only. You cannot add a new encryption configuration to a child table.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: Depending on the number of records affected by the Date and Date/Time fields you are encrypting, it may take up to a few minutes to create the encryption configuration. Make sure that you create the encryption configuration for Date and Date/Time fields when transaction volume on the instance is low.</td>
</tr>
<tr>
<td>Encryption context</td>
<td>Encryption context you created for the article template field.</td>
</tr>
<tr>
<td>Method</td>
<td>• <strong>Single Encryption Context</strong>: Enables data to be encrypted with a single encryption context only. The field is encrypted with the encryption context defined in the Encryption context field. Users that do not have the encryption context cannot view or update field values.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Multiple Encryption Contexts</strong>: Enables data to be encrypted with more than one encryption context. The field is encrypted by the encryption context of the first user to enter data. If the user has multiple encryption contexts, the context defined in the encryption context selector is used. Because the encryption context is set on a per record basis, fields in a list can have different encryption contexts. However, within a single record, the field can be encrypted by only one context.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: Mass encryption is not available when using the Multiple Encryption Contexts method.</td>
</tr>
</tbody>
</table>
b) In the Name column, click the link to the role you want to allow to view this field.

c) In the Encrypted context field, search for and select the name of the encryption context for the article template field to apply for the selected role.

Note: You may need to configure the Role form to add the Encrypted context field.

d) Click Update.

Depending on their role permissions defined for the encrypted field, users can view the field on the article template.

Generate SEO information for articles using article templates

Improve the searchability of knowledge articles by using the content in an article template field to generate SEO tags for articles created using that template.

Role required: knowledge_admin or admin

Note: If you are using the Standard article template, the content of the Text field is used to generate the tags.

You can define the number of characters to be used as tags in the glide.knowman.seo.pages.meta_description.length system property.

1. Navigate to Knowledge > Article Templates.
2. Select an article template.
3. In the SEO Description Tag field, select an article template field.
4. Click Update.

Note: You can change which article template field is used for generating SEO. Changes are applied only to knowledge articles created or updated after the change was made. To apply the update to all existing published articles created using this template, run the Populate Meta Description on KB Articles fix script.

Article versioning

Use the Knowledge Management article versioning feature to create and maintain multiple versions of a knowledge article.

Knowledge contributors can create a new version of a knowledge article from an existing published version. This existing version can be either the latest published version or an older outdated version. All changes are stored in the new version of the article and the information in the existing article remains the same.

If you import published knowledge articles from a ServiceNow instance that does not support article versioning, you must run the Initialize Versions on Articles fix script to enable article checkout and editing.

With the article versioning feature, knowledge users can:

- Check out a published article and create another version.

  Note: Only the author, knowledge base owner, and users with the knowledge_admin role can edit an article in the Draft state.

- Select a previously published (outdated) version of an article and make it current.
- Recall an article that is being reviewed.
• Retire the latest published version of an article.

There are two types of article revisions: major and minor. Minor revisions include updates to an article that has not yet been published. Major revisions include updates to an article that has been published and is available to customers. To track the different revisions, the article versioning feature introduces version numbering.

With the article versioning feature, the knowledge article number also includes the version number. All references to knowledge articles use this number format. For example, KB0010003 v2.0.

Activation information

The article versioning feature requires the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) to be activated and the glide.knowman.versioning.enabled property to be set to true (default value). For more information, see Activate the Knowledge Management Advanced plugin and Article versioning properties.

Manually update customized files

If you have customized any of the files that are updated as part of the Knowledge Management Advanced Installer plugin, these files are skipped during plugin activation and must be updated manually.

Manually update your customization to include the article versioning-related changes.

• Add the Version field to the Knowledge form layout and the Knowledge list view, if it is not already present.
• Add the outdated choice to the Workflow choice list field on the Knowledge form, if it is not already present. Keep the value as outdated because of dependencies that article versioning functionalities have on this choice.
• Update the Knowledge > My Flagged and Self-Service > My Knowledge Articles modules to include the following condition in the Filter field, if these modules do not already reflect this change: Revised by is (dynamic) me.

If you have customized any of the Knowledge Management Overview dashboard reports, these files are also skipped during plugin activation and must be updated manually.

Article versioning changes

Article versioning introduces new actions that allow knowledge users to create and revise versions of existing articles. It also introduces new fields and related lists to the Knowledge form, new columns to the Knowledge list, and updates to Knowledge dashboard reports.

New user actions

As part of creating article versions, users can:

• Check out a published article and create another version by clicking Checkout on the Knowledge form.

  Note: Only the author, knowledge base owner, and users with the knowledge_admin role can edit an article in the Draft state.

• Recall an article that is being reviewed by clicking Recall on the Knowledge form.
• Select a previously published article in the Outdated state and make it the current published version by clicking Make this current in the Knowledge form header.

  Note: To edit a published article without having to create a new version, make sure the glide.knowman.versioning.enable_minor_edits property is enabled.
Changes to the Knowledge list

The article versioning feature adds the following to the Knowledge list:

- The **Version** column displays the article version number. The Knowledge list displays multiple versions of an article.
- The **Workflow** column includes the new **Outdated** state.

Changes to the Knowledge form

The article versioning feature adds the following to the Knowledge form:

- The **Version** field displays the article version number.
- The **Display number** field displays a combination of the article number and the version number. For example, KB0010004 v1.02. All references to a knowledge article use this display number.
- The **Base Version** field displays the knowledge article number and version on which the current article is based.
- The **Revised By** field displays the name of the user who checked out a published article and created a new version.
- The **Article Versions** related list displays a list of all versions for an article. From this list, you can:
  - Click the **Version** to view a specific version of an article.
  - Click the **View Article** related link to see the article page view.

**Note:** If necessary, configure the form to display the fields and the related list.

Changes to Knowledge modules

The article versioning feature introduces the following Knowledge module changes:

- **My Knowledge Articles**
  - For a knowledge user, this module includes records for the articles authored by the user as well as records for each article revised by the user.
  - For a knowledge reviser, this module includes records for the articles published by the user as well as records for each article revised by the user.

- **My Flagged**
  - For a knowledge user, this module includes records for each revision made to articles authored by the user.
  - For a knowledge reviser, this module includes records for each article revised by the user.

**Note:** Users that have customized these modules do not see these changes.

Changes to Knowledge Management dashboard reports

The Knowledge Management Overview dashboard reports have been updated to include article versioning-related changes when the Knowledge Management Advanced plugin is activated.

- Articles Flagged in the Last 30 Days
- Articles Marked Not Useful in the Last 30 Days
• Articles Used per Month
• Knowledge use
• Knowledge view
• Knowledge updated in past 30 days
• Knowledge flagged in past 30 days
• Knowledge by Workflow state
• Knowledge created by Author
• Knowledge created in past 30 days
• New Knowledge Articles Created in the Last 30 Days
• Knowledge Ratings for past 30 days

Versioning information available in the Knowledge Management Service Portal

Knowledge search results show the article number and the version number for each article.

Note:
To display the article version number next to the article number in the search results, enable the glide.knowman.search.show_article_number property in the Knowledge Search Properties section of the Knowledge Management Properties page.

If you are accessing an article from the base system or knowledge service portals using the URL to a KB article, you must also include the article version number in the URL. For example, to access the KB0000005 knowledge article, instead of using the https://<instance name>/sp?id=kb_article&sys_id=KB0000005 as the URL, you must use https://<instance name>/sp?id=kb_article&sys_id=KB0000005%20V1.0 to view the article.

The article view page shows a version history section for articles that have been updated. This section includes the version numbers, date updated, and the name of the author or reviser.

• Click Latest version or the version number and current state to expand the version history section.
• Click the version number to open that particular version of the article.
• When viewing an outdated article, a message informs the user that a newer updated version is available. The message includes a link to the latest version.

Feedback on article versions

With the article versioning feature, users can view and contribute to feedback on the current versions of knowledge articles.

For more information about feedback options, see Knowledge feedback.

<table>
<thead>
<tr>
<th>Feedback option</th>
<th>How this option works with article versioning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rating an article</td>
<td>The average rating for an article is carried over to the checked out version. The average rating calculation updates and displays on the current version of the article.</td>
</tr>
<tr>
<td>Marking an article as helpful</td>
<td>The helpfulness percentage of a previous version of an article is also considered for a new version when displayed in the helpfulness column on the homepage.</td>
</tr>
<tr>
<td>Comments</td>
<td>The Comments section at the bottom of an article displays comments from previous versions unless Live Feed is enabled. Live Feed only shows comments for the current version.</td>
</tr>
</tbody>
</table>
Feedback option | How this option works with article versioning
--- | ---
Flagging an article | Checking out an article or setting a previous version to the current version resets the flagged value to false.
View count | The view count is carried over to the checked out article. Any view of a version of an article increments the view count of all subsequent versions. Views to a newer version of an article do not affect the view count of previous versions.
Use count | The use count is carried over to the checked out article. Any use of a version of an article increments the use count of all subsequent versions. Any use of a newer version of an article does not affect the use count of previous versions.

Knowledge article version numbers

Knowledge article version numbers follow a specific pattern. Increments to the version number depend on the revision type.

Article version numbers follow this pattern: `<major release number.minor release number>`

The type of revision being made to an article determines the increment. A minor revision increments the version number by 0.01. A major revision, such as publishing an article, increments the version to the next whole number, for example, from version 2.02 to 3.0.

The following example illustrates the life cycle of a versioned article and the changes to the version number.

<table>
<thead>
<tr>
<th>User action</th>
<th>Article state</th>
<th>Version number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge author creates a new article</td>
<td>Draft</td>
<td>0.01</td>
</tr>
<tr>
<td>Knowledge author makes a change and updates the article.</td>
<td>Draft</td>
<td>0.01</td>
</tr>
<tr>
<td>Knowledge author submits the article for review.</td>
<td>Review</td>
<td>0.02</td>
</tr>
<tr>
<td>Knowledge author recalls the article to make another change.</td>
<td>Draft</td>
<td>0.03</td>
</tr>
<tr>
<td>Knowledge article submits the article for review</td>
<td>Review</td>
<td>0.04</td>
</tr>
<tr>
<td>Approver rejects the article and requests a change.</td>
<td>Draft</td>
<td>0.05</td>
</tr>
<tr>
<td>Knowledge author makes the change and submits the article for review.</td>
<td>Review</td>
<td>0.06</td>
</tr>
<tr>
<td>Approver approves the article</td>
<td>Published</td>
<td>1.0</td>
</tr>
<tr>
<td>Knowledge author checks out the published article.</td>
<td>Draft</td>
<td>1.01</td>
</tr>
<tr>
<td>Knowledge author submits the article for review.</td>
<td>Review</td>
<td>1.02</td>
</tr>
<tr>
<td>Approver approves the article</td>
<td>Published</td>
<td>2.0</td>
</tr>
</tbody>
</table>

Any change to the state of an article results in a version increment, except to and from the Pending retirement, Retired, and Outdated states.
Knowledge article version information

Users can view version information for a knowledge article from the Knowledge view page.

The knowledge article number and the version number appear at the top of the article, just below the title. Clicking the version number expands the version history section, which includes a list of the available article versions. User roles determine what is included in this list:

• Users with read access to a knowledge base can see the latest published version and previous major versions.
• Users with read and contribute access to a knowledge base can see the latest published version, previous major versions, and any draft or review versions.

You can view any of the previous versions of an article by clicking the version number in the list. When you view a previous version, a message at the top of the article indicates that an updated version is available.

At the bottom of a knowledge article, you can see additional information about an article, including the name of the author or revisor and the date that the article was last modified.

Knowledge article states

A versioned knowledge article can be in one of several states as it progresses through the creation cycle.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draft</td>
<td>The article is in the process of being created.</td>
</tr>
<tr>
<td>Review</td>
<td>The draft version of the article is sent to reviewers to approve or reject.</td>
</tr>
<tr>
<td>Published</td>
<td>The article is approved and published. When the state of an article changes to Published, the state of any previous published versions of that article changes to Outdated.</td>
</tr>
<tr>
<td>Pending retirement</td>
<td>The published article is selected for retirement, pending approval.</td>
</tr>
<tr>
<td>Retired</td>
<td>The published article is retired.</td>
</tr>
<tr>
<td></td>
<td>Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.</td>
</tr>
<tr>
<td>Outdated</td>
<td>A more recent version of the article has been published. End users can read published articles as well as the outdated versions.</td>
</tr>
</tbody>
</table>

Check out a published article and create a new version

Create a new version of a knowledge article by checking out the latest published version.

Users with canContribute permissions, including the knowledge owner, knowledge manager, and knowledge administrator, can check out a published article unless there is already a checked out version. If a version has been checked out, the Checkout button does not appear on the Knowledge form header.

When you check out an article, attachments from the article's base version are copied into the new article version and relative paths to these attachments are also updated.

Note: For article versions that were created in the previous releases, the relative paths to the attachments may not be updated. To update them, activate and run the Fix attachment links on article versions fix script.

1. Navigate to Knowledge > Articles > Published.
2. Select the desired article from the list.
3. Click **Checkout** in the Knowledge form header.
   The system creates a new version of the knowledge article and displays a message to the user. The article number for the new version remains the same, the version number is increased by 0.01, and the state changes to **Draft**. The new version of the article is added to the Knowledge list and to the **Article Versions** related list on the Knowledge form.

**Approve an article that is being reviewed**

Approve an article that is being reviewed and create a new published version.

When an article is in the **Review** state, only those users who are included in the **Approvals** related list can modify the article.

1. Navigate to **Knowledge** > **Articles** > **Unpublished**.
2. Open an article in the **Review** state and review the text.
3. In the **Approvals** related list, click **Requested** in the **State** column to display the Approval form for the article.
4. Click **Approve**.
   The system displays the Knowledge form. The version number of the article increments to the next whole number (for example, from 2.02 to 3.0) and the state changes to **Published**. The new published version of the article is added to the Knowledge list and to the **Article Versions** related list on the Knowledge form.

**Revert an outdated article to the current state**

Use an outdated version of an article to create a new version.

Roles required: knowledge base owner, knowledge_manager, knowledge_admin

This action is available for earlier published versions that have a state of **Outdated** and only when there is no checked out version. If a version has been checked out, the **Make this current** button does not appear on the Knowledge form header.

1. Navigate to **Knowledge** > **Articles** > **All**.
2. Open an article in the **Outdated** state.
3. Click **Make this current** in the Knowledge form header.
   The system displays the Knowledge form. The version number increments to the latest version number plus 0.01 and the state changes to **Draft**. For example, if the latest published version of an article is 3.0 and you select the outdated 1.0 version to become the current version, the version number increments to 3.01.

**Recall an article that is being reviewed**

Recall an article that is being reviewed to make additional changes.

If ownership groups is not enabled, only the author of the article, knowledge administrators, or system administrators can recall the article.

If ownership groups is enabled, the author of the article, the ownership group manager, ownership group members, knowledge administrators, or system administrators can recall an article.

Recalling an article in the **Review** state results in a minor version increment.

When a revised article is in **Review** state, only the corresponding versions reviser can recall the article to make additional changes.

1. Navigate to **Knowledge** > **Articles** > **All**.
2. Open an article in the **Review** state.
3. Click **Recall** in the Knowledge form header.
The system returns the state of the article to **Draft**, increments the version number by 0.01, and displays a message to the user.

**View all versions of an article**

View a list of all available versions for a selected knowledge article and then view the selected version in a new tab.

The list of all available versions for a selected knowledge article is displayed in the **Article Versions** related list on the Knowledge form. Users with read access can see major versions. Users with contribute access can see major and minor versions.

1. Navigate to **Knowledge** > **Articles** > **All**.
2. Open the desired article.
3. Click the **Article Versions** tab to display the related list.
4. Click **Version** to display the desired article version in a new tab.
5. If desired, click the **View Version** related link to see the article view page.

**Compare two versions of an article**

Select and compare two versions of a knowledge article.

Role required: knowledge_manager, knowledge_admin

1. Navigate to a **Knowledge** > **Articles** > **All**.
2. In the **Name** column, click the link to a knowledge article with multiple versions.
3. In the Article Versions related list, select the check boxes for the two versions of the article to compare.
4. From the Actions on selected rows list, select **Compare**.
   
   The Compare versions page opens and lists the fields for the selected article versions in a side-by-side format. Differences between the two article versions are highlighted.

<table>
<thead>
<tr>
<th>Version 2.0</th>
<th>Version 1.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td></td>
</tr>
<tr>
<td>Article type</td>
<td>HTML</td>
</tr>
<tr>
<td>Author</td>
<td>Sam Sorokin</td>
</tr>
<tr>
<td>Base Version</td>
<td>KB0000015 v1.0</td>
</tr>
</tbody>
</table>

**Compare versions page**

5. When you are finished comparing the two versions, click **Done** to return to the Knowledge form.
Retire a versioned article

You can retire the latest published version of a knowledge article. Retiring a knowledge article does not create a new version. It simply marks the article as Retired.

This action is available only when there is no checked out version. If a version has been checked out, the Retire button does not appear on the Knowledge form header.

Note: For the Knowledge - Approval Retire workflow, this happens only when the retire request is approved.

In addition to the knowledge administrator and the knowledge manager, the following users can retire a versioned article:

- knowledge owner
- latest publisher of the versioned knowledge article

Users can still access outdated articles that have been attached to incidents by navigating to the article view page with the sys_id of the article. Outdated articles include a message that an updated article is available.

If versioning is disabled, only the latest version of the article is shown in search results and list views.

Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.

1. Navigate to Knowledge > Articles > Published.
2. Open the desired article.
3. Click Retire in the Knowledge form header.

The system returns to the Knowledge list. The state of the article changes to Pending retirement and the state of previously published versions change to Outdated.

Note: You cannot check out or edit a retired article.

Disable the article versioning feature

Users with the system administrator role can disable the article versioning feature by setting a property.

Role required: admin

The Enable article versioning feature property controls the article versioning feature. Setting this property to false disables the article versioning feature. Once disabled:

- The Version field is removed from the Knowledge form. The Version column remains on the Knowledge list and can be removed manually.
- The Article Versions related list is removed from the Knowledge form.
- The Recall, Checkout, and Make this current buttons are removed from the Knowledge form.
- Outdated articles are removed from Knowledge list views.
- The version history does not appear on the article view page.

Articles continue to be versioned in the background. Minor versions are incremented until an article is published and then the version number is increased to the next major version.

Users can still access outdated articles that have been attached to incidents. Outdated articles include a message that an updated article is available.

1. Navigate to Knowledge > Administration > Properties.
2. Locate the Enable article versioning feature property in the Article Versioning Properties section.
3. Click the check box to disable the property.
4. Click Save.

Knowledge manager

Having multiple knowledge bases allows an organization to spread management responsibilities across multiple users, known as knowledge managers.

As a knowledge manager, you can assign other managers, define category structures, configure which users can read and contribute articles, move and pin articles, and modify most fields on the Knowledge Base form. You can also approve the publishing or retiring of knowledge articles in those knowledge bases. You can enable Social Q&A for your knowledge bases if the Social Q&A application is active.

The primary manager of a knowledge base is the owner of that knowledge base. Each knowledge base must have one owner. There may be any number of additional managers for each knowledge base. The owner and all managers of a knowledge base automatically receive the knowledge_manager role. If the knowledge base is made inactive later, the knowledge_manager role is not automatically removed for these users.

Add a knowledge article to featured content

Add a knowledge article to appear in the Featured content section of the knowledge homepage and at the top of knowledge search results page.

Role required: knowledge_manager, knowledge_admin, or admin

Adding a knowledge article to featured content requires associating an article to specific keywords. You can search a keyword in the knowledge service portal or search results page to display articles in the Featured content section or at the top of the knowledge search results list.

Note: The articles added to the Featured content section do not appear in the global search results and Virtual Agent conversations.

- To display articles in the Featured content section, add a default keyword in the glide.knowman.default_keyword property Value field and add the same keyword to all articles you want to display in that section.
- To display articles at the top of the knowledge search results list, add a list of keywords to each article you want to display at the top of the list.

1. Navigate to Knowledge > Knowledge Bases.
2. Select a knowledge base.
3. In the Featured content related list, click New.
4. In the Knowledge field, search for and select the desired article. If you know the article number, you can search for the article directly.
5. In the Keywords field, click the lock/unlock toggle icon.
6. Click the lookup icon to open the Knowledge keywords list.

Note: Each keyword must be a single word and cannot contain spaces.

7. Select the keyword to add for this article.
   - Add the default keyword to display this article in the Featured content section during search.
   - Add all related keywords for the article to display it at the top of the knowledge search results page during search.

Note: You can create knowledge keywords, if it does not already exist in the list, and then add it to the article.
8. Click the lock/unlock toggle icon to add the keywords to the article.
9. Click Submit.

**Create a user criteria record in Knowledge Management**

You can create or modify a user criteria record in Knowledge Management. User criteria is used to control which users, groups, roles, companies, locations, and/or departments can access knowledge bases and articles.

Role required: user_criteria_admin

1. Navigate to Knowledge > Administration > User Criteria.
2. Click New or open a record.
3. Fill out the fields on the form as required.
   
   For field descriptions, refer to *Create a user criteria record in Service Catalog*

   **Note:** Including scripts in user criteria records can impact performance, because scripts are evaluated dynamically.

   If scripted user criteria is defined for a knowledge base, user access to knowledge bases is evaluated once per session. If the script results in changes after a session cache is built, the result takes effect in the next session.

   Changes to a user role, group, company, location, or department take immediate effect.

4. Click Submit.

**Select user criteria for a knowledge base**

You can specify user criteria to control which users can create, read, and write knowledge articles within a knowledge base.

Role required: knowledge_manager, knowledge_admin, or admin

User criteria refers to knowledge base records that determine the users who can read or contribute to a knowledge base. Users who have write access can also initiate the retirement workflow for an article. So, indirectly user criteria control who can submit an article for the retirement workflow.

User criteria definitions:

- **canRead**
  users who can read all knowledge base articles

- **cantRead**
  users who cannot read, create, or modify articles in the knowledge base

- **canContribute**
  users who can read, create, and modify articles in the knowledge base

- **cantContribute**
  users who cannot create or modify articles in the knowledge base

If a knowledge base has no user criteria defined, all users (including unauthenticated users) can read its articles. Any user having at least one role can create and edit articles, unless they are members of the **cantContribute** user criteria.

If a knowledge base has **canRead** user criteria, but no **canContribute** user criteria, all users with at least one role can access and modify the knowledge base.

Explicit roles (snc_external and snc_internal) are added to your instance when you install a plugin, such as the Customer Service plugin (com.sn_customerservice), that also activates the Explicit Roles plugin. If you create a new knowledge base with the Explicit Roles plugin active, only users with snc_internal role can access the knowledge base.
base. To make all existing knowledge bases that do not have the canRead or canContribute user criteria accessible only to users with the snc_internal role, activate and run the Fix unsecured knowledge bases fix script.

Users with special privileges are evaluated based on user criteria and have access to knowledge bases and knowledge articles access.

Access of users with special privileges to knowledge bases and knowledge articles

<table>
<thead>
<tr>
<th>User</th>
<th>Access</th>
</tr>
</thead>
</table>
| Knowledge administrator           | • Contribute to and read all knowledge bases and their articles.  
                                | • Modify the definition of all knowledge bases and assign user criteria to them. |
| Owner of a knowledge base         | • Contribute to and read that knowledge base.                
                                | • Modify the definition of that knowledge base and assign user criteria to it. |
| Manager of a knowledge base       | • Contribute to and read that knowledge base.                
                                | • Modify the definition of that knowledge base and assign user criteria to it. |
| Members of an ownership group     | Read, modify, and retire that knowledge article.              |
| associated with a knowledge article |                                                            |

Note: If the knowledge article versioning feature is enabled, the manager of a knowledge base can’t modify knowledge articles of other authors that are in the Draft state.

When the Can Contribute user criteria for a knowledge base isn’t set, the glide.knowman.block_access_with_no_user_criteria property value is further evaluated to determine contribute access, as explained in the following table.

Contribute access when Can Contribute for a knowledge base isn’t set

<table>
<thead>
<tr>
<th>Property value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>No user has contribute access to the knowledge base except users with special knowledge privileges.</td>
</tr>
<tr>
<td>false</td>
<td>Users with at least one role can contribute to the knowledge base.</td>
</tr>
</tbody>
</table>

Note: If the Explicit Roles plugin is activated, users who have at least one role other than snc_internal can contribute to the knowledge base.

When the Can Read user criteria for a knowledge base isn’t set, the glide.knowman.block_access_with_no_user_criteria property value is further evaluated to determine read access, as explained in the following table.

Note: If the Explicit Roles plugin is activated, users who have at least one role other than snc_internal can contribute to the knowledge base.
### Read access when Can Read for knowledge base isn’t set

<table>
<thead>
<tr>
<th>Property value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>No user has read access except users with special knowledge privileges and users who have contribute access to the knowledge base.</td>
</tr>
<tr>
<td>false</td>
<td>All users, including unauthenticated users, have read access to the knowledge base and the article-level user criteria are further evaluated. For more information about article-level user criteria, see <a href="#">Select user criteria for an article</a>.</td>
</tr>
</tbody>
</table>

This video demonstrates how to control Knowledge Management access through user criteria.

![Important:](image) After making user criteria additions or changes, you may need to log out and back in to clear the prior configuration.

1. Navigate to **Knowledge > Knowledge Bases**.
2. Select a knowledge base you manage.
3. Access one of these related lists, and then select or create user criteria records.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can read</td>
<td>Users who meet one of these criteria can read articles in this knowledge base.</td>
</tr>
<tr>
<td>Can contribute</td>
<td>Users who meet one of these criteria can create and edit articles in this knowledge base.</td>
</tr>
</tbody>
</table>

2. User C -> Create, Read  
3. User B -> Denied Read  
4. User A -> Read |

**Note:** In the tables of rules, an implicit last rule is: All Users -> Denied Create, Read.

**Enable user criteria system property to override role read access**

Add the glide.knowman.search.apply_role_based_security system property to enable user criteria to control read access of knowledge bases or articles over roles.
Role required: admin

1. Follow the steps to Add a system property.
2. Add the `glide.knowman.search.apply_role_based_security` property, and set the property value to `false`. This enables specified user criteria to override canRead access specified for roles.

**Select user criteria for an article**

You can specify user criteria for an article to control which users can read the article.

If an article has no user criteria selected, the article is available to all users, including unauthenticated users, who have access to that knowledge base (based on the user criteria for the knowledge base). Knowledge base user criteria restrictions override article-level user criteria. For example, a knowledge base that is configured to restrict user access overrides any access granted at the article level.

If a user has contribute access to the knowledge base, article-level user criteria are not evaluated and the user can read all articles in the knowledge base. If a user has read access to the knowledge base, article-level user criteria are evaluated to determine if the user has read access to the article.

On the article level, if **Can read** user criteria is defined, only those users specified can read the article. If an article has **Cannot read** user criteria defined, those users specified are denied reading the article. **Cannot read** user criteria overrides **Can read** user criteria for articles.

1. Navigate to **Self-Service > My Knowledge Articles**.
2. Select an article.
3. Select the desired user criteria for the **Can Read** and **Cannot Read** fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can Read</td>
<td>Users who meet one of these criteria can read the article.</td>
</tr>
<tr>
<td>Cannot Read</td>
<td>Users who meet one of these criteria are denied reading the article (regardless of the <strong>Can Read</strong> setting for the user).</td>
</tr>
</tbody>
</table>

**Note:** If the **Can Read** and **Cannot Read** fields are not visible, add the fields to the form by configuring the form layout (click the form context menu icon and select **Configure > Form Layout**).
### Knowledge base level

<table>
<thead>
<tr>
<th>Access</th>
<th>Read</th>
<th>cantRead</th>
<th>canRead</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contribute</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Yes</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
<td>User -&gt; Read</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>N/A</td>
<td>N/A</td>
<td>User -&gt; Denied Read</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Access</th>
<th>Read</th>
<th>cantRead</th>
<th>canRead</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read</td>
<td>empty</td>
<td>empty</td>
<td>User</td>
<td>Only User -&gt; Read</td>
</tr>
<tr>
<td>canRead</td>
<td>User</td>
<td>empty</td>
<td>User</td>
<td>User -&gt; Denied Read</td>
</tr>
</tbody>
</table>

### Note:

- When article-level read access is assigned to an article, only the user who belongs to that particular user criteria can read the article. Other users are restricted.
- Users with contribute access to a knowledge base can also read articles even if they are not in the defined Can Read user criteria.
- Ownership group users who are either members or managers of groups assigned to an article will have access to contribute to articles even if they don’t have contribute access to the knowledge base.

### Define a knowledge article category

Each knowledge base has a hierarchy of categories that organizes the articles.

You must have CanContribute access to the knowledge base or have a knowledge_admin or admin role.

Define a hierarchy for categories by creating parent-child relationships. Each hierarchy consists of a top-level category and a structure of subcategories, which are also named the child categories. The category hierarchy is saved in the Full category field in the Knowledge Category [kb_category] table.

You can create and edit categories separately for each knowledge base.

1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Select a knowledge base you manage.
3. Create a top-level category.
   a) In the Knowledge Categories related list, click New.
   b) On the Knowledge Category form, fill in the fields.

### Knowledge Category form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Label for the category. The label appears as the name of the category.</td>
</tr>
<tr>
<td>Value</td>
<td>Value for the category you use when referencing the category in scripts.</td>
</tr>
</tbody>
</table>
ServiceNow Madrid Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent ID</td>
<td>Top-level component associated with the category. This field is automatically set to the top-level component ID.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to enable the category.</td>
</tr>
</tbody>
</table>

c) Click Submit.

4. Optional: Create a child category.
   a) Expand an existing category and click New within the expanded section.
   b) Fill in the Knowledge Category form.
   c) Click Submit.

In addition to using categories defined by a knowledge manager, knowledge contributors can add and edit categories when editing an article.

Assign a knowledge base manager

You can assign users as managers of a knowledge base.

Role required: knowledge_admin, or admin

1. Navigate to Knowledge > Knowledge Bases.
2. Select a knowledge base you manage.
3. In the Managers field, click the unlock icon.
4. Add one or more users.
5. Click Update.
   After you save the knowledge base record, users selected as managers automatically receive the knowledge_manager role if they do not have it already.

You can remove a knowledge base manager by removing that user from the Managers field. If the user is not a manager of any other knowledge base, the knowledge_manager role is removed from that user.

User criteria diagnosis for Knowledge Management

Manage user access to a knowledge base or an article using user criteria diagnostics. Understand what access users have to a knowledge base or an article and determine which user criteria define those permissions.

User access to a knowledge base or an article can be restricted based on:
- Domain separation
- Access control list (ACL) rules
- Knowledge work flows
- User criteria set for a knowledge base or an article

This feature considers domain separation and user criteria to determine the user access to knowledge bases and articles.

Activating user criteria diagnostics

The user criteria diagnostics feature is activated with Knowledge Management v3 (com.snc.knowledge3) plugin.
Diagnose user access to a knowledge base

Identify which users have access to a knowledge base and what enables that access.

Role required: knowledge_manager, knowledge_admin, or admin

1. Access the User Criteria Diagnostics landing page using one of these options:

   To access                                Navigate to
   Using the application navigator          Knowledge > Administration > User Criteria Diagnostics
   From a knowledge base                     1. Knowledge > Administration > Knowledge Bases.
                                              2. Select the knowledge base to diagnose user access.
                                              3. In the Related Links section, click Run User Criteria Diagnostics.

   The User Criteria Diagnostics landing page appears with the Select knowledge base field pre-populated.

2. To diagnose user access:
   a) In the Select user field, select a user.
   b) From the Select record type choice list, select Knowledge base.
   c) In the Select knowledge base field, select a knowledge base.
      Every time you select a different user, record type, or knowledge base, the page refreshes and displays data for the selected user.
   d) Click Diagnose.
      The page displays these details:
      • Whether the user has access to the knowledge base based on their domain. Only system administrators can view domain information and change the domain to give access to a user.
      • Which user criteria provides read or read and contribute access for this user to the knowledge base and what type of user criteria definition enables this access.
      • Whether a role that the user has (knowledge_manager, knowledge_admin, or owner of the knowledge base) enables this access.
      • For a user with no access to this knowledge base, which user criteria may be modified to grant the access.

The following image shows an example of a diagnosis where the user Alene Reback does not have access to the IT knowledge base.

Alena can get access to the knowledge base if:
• Alena is added to one of the existing user criteria defined in the knowledge base.
• Alena is added to a new user criteria that is defined and added to the knowledge base.

Click the IT knowledge base link and provide the access by adding Alena to a user criteria for this knowledge base.
User Criteria Diagnostics

- **Select user**: Alene Rabeck
- **Select record type**: Knowledge Base
- **Select knowledge base**: IT

**No Access**

Alene Rabeck does not have access to knowledge base (IT).

⚠️ If ACLs were applied to this Knowledge Base, the ACLs will override the permissions defined by user criteria.

**How to Provide Access**

To provide access to knowledge base (IT), add Alene Rabeck to one or more of the following user criteria.

<table>
<thead>
<tr>
<th>User Criteria</th>
<th>Access Type</th>
<th>Set on</th>
</tr>
</thead>
<tbody>
<tr>
<td>The ACME North America IT Department</td>
<td>Can Contribute</td>
<td>Knowledge Base</td>
</tr>
<tr>
<td>All ACME North America employees</td>
<td>Can Read</td>
<td>Knowledge Base</td>
</tr>
<tr>
<td>All ACME Corporation employees</td>
<td>Can Read</td>
<td>Knowledge Base</td>
</tr>
</tbody>
</table>

1 to 3 of 3 results
Diagnose user access to an article

Identify which users have access to an article and what enables that access.

Role required: knowledge_manager, knowledge_admin, or admin

1. Access the User Criteria Diagnostics landing page using one of these options:

<table>
<thead>
<tr>
<th>To access</th>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using the application navigator</td>
<td>Knowledge &gt; Administration &gt; User Criteria Diagnostics.</td>
</tr>
<tr>
<td>From an article</td>
<td>1. Knowledge &gt; Administration &gt; Knowledge Bases.</td>
</tr>
<tr>
<td></td>
<td>2. Select the knowledge base that has the article to diagnose for user access.</td>
</tr>
<tr>
<td></td>
<td>3. In the Knowledge related list, select the article.</td>
</tr>
<tr>
<td></td>
<td>4. In the Related Links section, click Run User Criteria Diagnostics.</td>
</tr>
</tbody>
</table>

The User Criteria Diagnostics landing page appears with the Select article field pre-populated.

2. To diagnose user access:
   a) In the Select user field, select a user.
   b) From the Select record type choice list, select Article.
   c) In the Select article field, select an article.

   Every time you select a different user, record type, or knowledge base, the page refreshes and displays data for the selected user.
   d) Click Diagnose.

The page displays these details:

- Whether or not the user has access to the knowledge article based on their domain. Only system administrators can view domain information and change the domain to give access to a user.
- Which user criteria provides read or read and contribute access for this user to the article and what type of user criteria definition enables this access.
- Whether a role of the user has (knowledge_manager, knowledge_admin, or owner of the knowledge base) enables this access.
- For a user with no access to this article, which user criteria may be modified to grant the access.

Note: Members of an ownership group are automatically given Can Contribute access to knowledge articles that their ownership group is associated with.

The following image shows an example of a diagnosis where the user Adela Cervantsz has read access to the KB article, KB0000001 v5.0, in the IT knowledge base because Adela belongs to one of the Can Read user criteria defined in the knowledge base.
User Criteria Diagnostics

- **Select user**: Adela Cervantsz
- **Select record type**: Article
- **Select article**: KB0000001 v1.0

Read Access

No user criteria is configured at article level. Adela Cervantsz has Read access to article KB0000001 in knowledge base IT, because the user has Read access to the knowledge base.

- If ACLs were applied to this Article, the ACLs will override the permissions defined by user criteria.
- The article’s publication status may also impact the user’s access to it. If diagnostic results conflict with the user’s access, please check the publication status of the article.

User Criteria Assigned

<table>
<thead>
<tr>
<th>User Criteria</th>
<th>Access Type</th>
<th>Set on</th>
</tr>
</thead>
<tbody>
<tr>
<td>All ACME North America employees</td>
<td>Can Read</td>
<td>Knowledge Base</td>
</tr>
<tr>
<td>All ACME Corporation employees</td>
<td>Can Read</td>
<td>Knowledge Base</td>
</tr>
</tbody>
</table>

I18N - Knowledge internationalization

Organizations with knowledge users who speak multiple languages can activate the optional knowledge internationalization features.

Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2).

When active, knowledge internationalization enables the knowledge management team to create language-specific knowledge articles and keep translations of the same article related to each other so they are easy to manage. Users can view and search within their own language while still being able to view articles in other languages when necessary.

Note:
To set the default language for searching articles to a language different from the logged in language of the user, specify the desired language in the glide.knowman.search.default_language system property. For example, if you are logged in using the French language and would like the default language for searched articles to be English, specify English in the system property. You can then switch to French from within the UI to see French articles. If no language is specified in the system property, articles default to the logged in language of the user.

To enable search for different languages simultaneously, navigate to Knowledge Administration > Knowledge Search > Properties > Enable multi language search. Select the Yes check box to enable the feature.

Note: If you do not enable this property, you can search in one language at a time. If the property is enabled, you can search for multiple languages simultaneously.

Refer to Search using Knowledge Management v3 for information on performing a search on all available languages simultaneously.

Social Q&A does not use language-specific questions and answers. All questions and answers appear in the language they were created in. For example, a question in English is not translated when the current user’s selected language is French.

Activate the knowledge management internationalization plugin

To enable translation of knowledge articles, you must activate multiple plugins.

- I18N:Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2). For more information, see Activate a plugin.
- Internationalization plugins for each appropriate language. For more information, see Activate a language

Note: Activating internationalization plugins for any of the available languages automatically activates the I18N: Internationalization plugin (com.glide.i18n) that instead activates the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2).

Activate a plugin

Installed Components

Activating the Knowledge Management Internationalization plugin installs these components:

- A relationship named Translated Versions that creates a related list on the Knowledge form showing other articles that have the same parent article.
• A business rule named knowledge query that automatically filters the knowledge portal and search results based on the user’s selected language.

• A UI macro named kb languages.

• Two fields, named Language and Parent, in the Knowledge [kb_knowledge] table and the Knowledge form.

Knowledge form changes

The I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) adds the following fields to the Knowledge form:

• Language: Language in which you are creating the knowledge article. The list is populated based on the languages enabled for the selected knowledge base.

• Parent: Number of the article that represents the base language article. This setting keeps translations of the same article related to each other. Consider choosing the same language consistently for the parent article.

  Note: The Parent field is used for keeping track of translations of articles.

Additionally, the Translated Versions related list is automatically added to the Knowledge form after you save an article.

Create a translation for a knowledge article

Create a translation for an article from the Translated Versions related list on the knowledge article record. Before creating a translation, activate the internationalization plugin for the desired language which, in turn, activates the I18N: Knowledge Management Internationalization Plugin v2 (com.glideapp.knowledge.i18n2).

1. Open the knowledge article record.

2. In the Translated Versions related list, click New.

3. Select the desired language for the translation in the Language field.

4. Provide a description in the Short Description field.

5. Click Submit.

The translation is created and added to the Translated Versions related list.

Enable ownership groups

Configure ownership groups and associate them with knowledge articles to maintain article quality, manage approvals, and for timely resolution of feedback.

As a knowledge administrator, you perform the following tasks to configure ownership groups.

• Activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced).

• Set the glide.knowman.ownership_group.enabled property to true.

  Note: Once you have set this property to true, it is not recommended to set it back to false. Before setting this property back to false, manually reassign all knowledge articles associated with any ownership group, close all article approvals sent to ownership groups, and resolve all open feedback tasks assigned to ownership groups.

You may also need to configure the Knowledge form to add the Ownership Group field.
Manage ownership groups

Create ownership groups and associate them to knowledge articles. Knowledge group managers or knowledge administrators can edit ownership groups.

The Knowledge Management Advanced plugin (com.snc.knowledge_advanced) must be activated.

Role required: Users with the knowledge_domain_expert or knowledge_admin roles can create ownership groups.

Users with the knowledge_group_manager or knowledge_admin roles can edit ownership groups.

Create an ownership group by adding members and a manager. Knowledge administrators approve ownership groups.

When knowledge articles are created, ownership groups can be associated to them. Ownership groups manage article approvals and feedback and can edit and retire knowledge articles that they are associated with.

Knowledge group managers can edit ownership groups managed by them by adding or removing members without the need for approval. They cannot change the manager assigned in their groups. Only knowledge administrators can reassign managers.

1. Navigate to Knowledge > Ownership Groups > Manage Group.
2. To create an ownership group, select Create Ownership Group from the Request field.

   Note: To edit an existing ownership group, select Edit Ownership Group from the Request field.

3. Fill in the fields on the form, as required.

   Manage Knowledge Ownership Group form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the ownership group.</td>
</tr>
<tr>
<td>Group email</td>
<td>An email address for the ownership group. Emails are sent to group members in these cases.</td>
</tr>
<tr>
<td></td>
<td>• Activity on articles they are associated with, for example, comments.</td>
</tr>
<tr>
<td></td>
<td>• Article quality checks (AQI) performed on articles they are associated with.</td>
</tr>
<tr>
<td></td>
<td>If no group email is defined, emails are sent to individual group member emails.</td>
</tr>
<tr>
<td>Description</td>
<td>Description that defines the ownership group.</td>
</tr>
<tr>
<td>Manager</td>
<td>Manager for the ownership group.</td>
</tr>
<tr>
<td>Group members</td>
<td>Members of the ownership group.</td>
</tr>
</tbody>
</table>

4. Click Order Now.

   The ownership group is sent to the knowledge administrator for approval. Once approved, the ownership group is ready to use and associate to a knowledge article.

   Note: You can also create an ownership group from an existing group.

   2. Click a group.
   3. In the Type field, enter Knowledge.

   Note: If the Type field does not appear on the form, configure the form layout to add it.
4. In the Manager field, enter a manager and add the role knowledge_group_manager.
5. In the Roles related list, click Edit and add the role knowledge_group_member to the group.

Configure the Knowledge Management Service Portal

The Knowledge Management Service Portal enables users to perform the same operations that are available with the Knowledge Management V3 plugin. From the portal, users can view knowledge bases and articles, search for information, sort and filter search results, and provide feedback.

- For new customers on the Madrid and later releases, the Knowledge Management Service Portal plugin (com.snc.knowledge_serviceportal) is active by default.
- For existing customers on release versions prior to Madrid, activate the plugin, if required.
- Configure the Knowledge Management Service Portal properties, including the property that directs users to the Knowledge Management Service Portal homepage.

Customizing the Knowledge Management Service Portal

System administrators can customize portal pages and configure widgets for searching, sorting, and filtering knowledge base information. The Knowledge Management Service Portal is comprised of three pages and multiple widgets. Users with the system administrator roles can customize the pages and widgets as desired.

- To customize this portal, navigate to Service Portal > Portals and click Knowledge Portal. See Service Portal for more information about creating a custom interface.
- To configure widget instance options and customize the search, sort, and filter features, see Knowledge Management Service Portal widgets.

Section 508 compliance features

Users can view and interact with the Knowledge Management Service Portal article view page using Section 508 compliance features. See Enabling accessibility features for more information.

Enable external or public users to view knowledge articles from the Knowledge Service Portal

Enable knowledge articles on the Knowledge Management Service Portal to be visible to external or public users.

The Knowledge Management Service Portal plugin (com.snc.knowledge_serviceportal) must be enabled.

Role required: admin

If you are using Knowledge Management within the Customer Service application, you can automatically make knowledge public by activating and running the Make KM Service Portal Pages Public fix script after you install the Customer Service Management plugin (com.sn_customerservice).

If you are using Knowledge Management as a standalone application, perform the steps in this procedure.

1. Navigate to Service Portal > Pages.
2. Search for kb_home and open it.
3. You have to be in the Global application to edit. If a message appears, click here to edit.
4. Perform one of the following actions.
To | Do this
---|---
Make knowledge service portal pages visible to public users | 1. Select the **Public** check box. 2. Click **Update**.

Make knowledge service portal pages visible to external users | 1. Click the edit user roles icon. 2. Select snc_external and click **Done**. 3. Click **Update**.

5. Repeat these steps for **kb_article_view** and **kb_search**.
6. Perform one of the following actions.

<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable access to the knowledge base for public users</td>
<td>Ensure that no <strong>Can Read</strong> user criteria is defined in the knowledge bases you want to give access to.</td>
</tr>
<tr>
<td>Enable access to the knowledge base for external users</td>
<td>Add <strong>Can Read</strong> access to the knowledge base.</td>
</tr>
</tbody>
</table>

**Knowledge Management Service Portal properties**

Knowledge Management Service Portal properties determine how information is displayed on the Knowledge portal. You must have the admin role to set configuration properties.

The following system properties are set to direct users to the Knowledge Management Service Portal homepage, and to specify the URL suffix for the homepage.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| **sn_km_portal.glide.knowman.serviceportal.enable_redirect** | Directs users to the desired Knowledge homepage.  
- Type: true|false  
- Default value: false  
Set to **true** to redirect users navigating to v2 or v3 pages to the Knowledge Management Service Portal homepage. |
| **sn_km_portal.glide.knowman.serviceportal.portal_url** | The URL suffix for the Knowledge Management Service Portal. The default is **kb**. |

The Knowledge Management Service Portal supports the **Knowledge Management V3 properties**. Configuring widget instance options on the portal pages can override these properties.
Knowledge Management Service Portal widgets

The Knowledge Management Service Portal uses a number of widgets to enable searches, display search results, and display articles and social Q&A.

The Knowledge Management Service Portal homepage, search results page, and article view page honor the Knowledge Management V3 system properties. If configured, widget instance options can override the system properties.

Users with the knowledge_admin or admin role can configure the widget instance options used on the Knowledge Management Service Portal pages. Use the control + right-click menu to access the widget instance options and configure a widget instance.

Note: Before configuring widget instance options, switch to the Knowledge Management - Service Portal scope.

Homepage widgets:

• Knowledge Homepage Search
  Customize search features for the homepage.
• Knowledge Bases Browse
  Displays knowledge base tiles in the homepage.
• Knowledge Featured Articles
  Displays a list of featured articles in the homepage.
• Knowledge Most Useful Articles
  Displays a list of most useful articles in the homepage.
• Knowledge Most Viewed Articles
  Displays a list of most viewed articles in the homepage.

Search results page widgets:

• Knowledge Breadcrumbs
  Displays navigation path to the current page.
• Knowledge Search
• Knowledge Facet Header
  Displays the title for the filter facets.
• Knowledge Field Facet
  Display search results filtered by knowledge base, knowledge category, and author.
• Knowledge Tags Facet
  Display search results filtered by article tags.
• Knowledge Resource Facet
  Display search results filtered by article resource.
• Knowledge Query Facet
  Display search results filtered by article rating, number of article views, and last modified.
• Knowledge Result Sort
  Displays search results filtered by sort options for returned results.
• Knowledge Selected Filter
  Displays the selected facet filters and allows you to clear the selections.
• Knowledge Result
Displays search results filtered by returned results.

Article view page widgets:

- **Knowledge Breadcrumbs**
  Displays navigation path to the current page.

- **Knowledge Article Content**
  Customize what information users can view and what actions they can perform in the article view page.

- **Knowledge Article Helpful**
  Enables users to mark the article as helpful.

- **Knowledge Article Comments**
  Enables users to add comments for the article.

- **Knowledge Attachments**
  Displays article attachments if the **Display Attachment** field for the article is enabled.

- **Knowledge Attached Tasks**
  Displays the tasks attached to the articles available in the **Attached Tasks** related list for that article.

- **Knowledge Affected Products**
  Displays the products related to the knowledge articles available in the **Affected Products** related list for the article.

- **Knowledge Most Viewed Articles**
  
- **Knowledge Most Useful Articles**
  
**Activate the Knowledge Management Service Portal plugin**

The Knowledge Management - Service Portal plugin (com.snc.knowledge_serviceportal) is active by default for customers on Madrid and later releases. Existing customers on release versions prior to Madrid can activate the plugin, if required.

Role required: admin

This plugin requires the following plugins:

- **Knowledge Management V3** (com.snc.knowledge3)
- **Service Portal for Enterprise Service Management** (com.glide.service-portal.esm)

1. **Navigate to System Applications > All Available Applications > All.**

   A banner appears to notify you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:**
   To redirect to the legacy list view for plugins, click the link.

   ![Redirect Note]

2. **Find the plugin with the filter criteria and search bar.**

   You can search for the plugin by its name or ID.

   If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in **Request a plugin.**
3. **Activate the plugin.**

You can activate the plugin directly from the All Applications page or view more details about the plugin before activating it.

- If you are certain that you have the correct plugin, click **Install**, and then click **Activate** in the dialog box that appears.

- To view plugin details before activation:
  1. Click the plugin name.
  2. On the form, click the **Activate/Update** related link.
  3. On the dialog box that appears, review the dependent plugins.
     - If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.
  4. If demo data is available and you want to install it, click **Load demo data**.
     - Some plugins include demo data, which are sample records that illustrate plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.
  5. Click **Activate**.

---

**Configure search widget instance options**

Configure widget instance options for the search widgets on the Knowledge Management Service Portal homepage and search results page.

**Role required:** sp_admin or admin

The homepage uses the Knowledge Homepage Search widget and the search results page uses the Knowledge Search widget. Use the widget instance options to customize the search feature for these pages.

1. Navigate to the Knowledge Management Service Portal homepage or search results page.
2. Control + right-click the search bar.
3. Click **Instance Options**.
4. Configure the desired settings for the search widgets.
### Instance option

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the search widget. The default for the homepage is <strong>Welcome to Knowledge</strong>.</td>
</tr>
<tr>
<td>Glyph</td>
<td>An icon that appears in the search bar.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>The color of the search widget. This field appears on the search results page only.</td>
</tr>
<tr>
<td>Bootstrap size</td>
<td>The size of the search widget. This field appears on the search results page only.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
<tr>
<td>Search Placeholder</td>
<td>Default text that appears in the search bar. This field appears on the homepage only.</td>
</tr>
<tr>
<td>Allow Empty Search</td>
<td>Allow empty knowledge base searches. The default for the homepage uses the system property. The default for the search results page is <strong>Yes</strong>. For an empty search, the search results page returns all results.</td>
</tr>
<tr>
<td>Allow Instant Search On Keypress</td>
<td>Enables instant search results as you type a search term. The default for the search results page uses the system property.</td>
</tr>
<tr>
<td>Minimum Number of Characters for Search</td>
<td>The minimum number of characters required to generate a search.</td>
</tr>
<tr>
<td>Wait time (ms) between searches, if instant search is enabled</td>
<td>The time, in milliseconds, to wait between searches if the instant search feature is enabled. The default wait time is <strong>500 ms</strong>. This field appears on the search results page only.</td>
</tr>
<tr>
<td>Alternate URL Parameters for Search</td>
<td>Alternate parameters that appear in the search results URL. By default these parameters include keyword and query.</td>
</tr>
<tr>
<td>Alternate URL Parameters for Language</td>
<td>Alternate parameters that appear in the URL denoting the selected language.</td>
</tr>
</tbody>
</table>

5. **Click Save.**

*Configure knowledge base tile widget instance options*

Configure widget instance options for the knowledge base tile widgets on the Knowledge Management Service Portal homepage.

Role required: sp_admin or admin

The homepage uses the Knowledge Bases Browse widget to display knowledge base tiles.

1. **Navigate to the Knowledge Management Service Portal homepage.**
2. **Control + right-click a knowledge base tile.**
3. **Click Instance Options.**
4. Configure the desired settings for the knowledge base tile widgets.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title that appears above the knowledge base tiles. The default is Explore our Knowledge Bases.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>The color of the widget.</td>
</tr>
<tr>
<td>CSS</td>
<td>See widget CSS for details.</td>
</tr>
<tr>
<td>Order By</td>
<td>The order in which the knowledge base tiles appear on the homepage. Use any field on the Knowledge table. If this field is empty, tiles are displayed in alphabetical order. Other available options include article_count.</td>
</tr>
<tr>
<td>Reverse Order</td>
<td>Enable this check box to display knowledge base tiles in the reverse order.</td>
</tr>
<tr>
<td>Post Question Label</td>
<td>The label on the button used to post a question. The default is Ask a Question.</td>
</tr>
<tr>
<td>Create Article Label</td>
<td>The label on the button used to create an article. The default is Create Article.</td>
</tr>
<tr>
<td>Post Question URL</td>
<td>The parameters that appear in the URL when posting a question.</td>
</tr>
<tr>
<td>Create Article URL</td>
<td>The parameters that appear in the URL when creating an article.</td>
</tr>
</tbody>
</table>

5. Click Save.

Configure the home page widget instance options

Configure widget instance options for the widgets used to display popular articles on the Knowledge Management Service Portal homepage.

Role required: sp_admin or admin

The homepage displays links to the featured, most viewed, and most useful articles using several widgets. The featured articles are displayed based on the keywords associated with the articles. For information on displaying articles in the Featured content section, see Pin a knowledge article. Most viewed and most useful articles are displayed based on the highest view and use count of the articles.

1. Navigate to the Knowledge Management Service Portal homepage.
2. Control + right-click one of the widgets.
3. Click Instance Options.
4. Configure the desired settings for the widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the widget.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>The color of the widget.</td>
</tr>
<tr>
<td>Glyph</td>
<td>An icon that appears in the widget.</td>
</tr>
<tr>
<td>CSS</td>
<td>See widget CSS for details.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that contains the Source Field used to provide the featured, most viewed, and most useful articles widget options. The default table is Knowledge (kb_knowledge).</td>
</tr>
<tr>
<td>Instance option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Display Field</td>
<td>The title displayed for each article in the list. By default, this is the article short description.</td>
</tr>
<tr>
<td>Secondary Fields</td>
<td>Additional information displayed for each article in the list below the title. By default, this information includes the author, view count, the date that the article was last modified, and the article rating.</td>
</tr>
<tr>
<td>Max number of records to show</td>
<td>The maximum number of articles to include in the list.</td>
</tr>
<tr>
<td>Show even when empty</td>
<td>Enable this check box to display the widget even if there are no articles in the list.</td>
</tr>
<tr>
<td>Show Secondary Fields Label</td>
<td>Enable this check box to display the field labels for the additional information displayed for each article.</td>
</tr>
<tr>
<td>Knowledge Base</td>
<td>To restrict the articles that appear in this list to a specific knowledge base, select the knowledge base from the knowledge base list.</td>
</tr>
</tbody>
</table>

5. Click **Save**.

*Configure sort widget instance options*
Configure widget instance options for the knowledge sort widget on the Knowledge Management Service Portal search results page.

Role required: sp_admin or admin

The search results page uses the Knowledge Result Sort widget to provide sort options for the returned list of results. Use the widget instance options to customize the sort options.

1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click the sort options at the top of the results list.
3. Click **Instance Options**.
4. Configure the desired settings for the sort widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>The color of the search widget.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
<tr>
<td>Hide Relevancy</td>
<td>Removes the relevancy sort option.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that contains the fields used to sort the list of knowledge items. The default table is <strong>Knowledge</strong>.</td>
</tr>
<tr>
<td>Sort Fields</td>
<td>The fields used for sorting the list of knowledge items.</td>
</tr>
<tr>
<td>Sort Field Labels</td>
<td>The labels for the fields that appear in the sort options. The default is Views:desc,Newest:desc,Alphabetical. The sort order for the sort field labels is ascending. To use a descending order, denote :desc.</td>
</tr>
</tbody>
</table>

5. Click **Save**.

*Configure article list widget instance options*
Configure widget instance options for the article lists on the Knowledge Management Service Portal homepage.

Role required: sp_admin or admin
The homepage uses the Article List widget to display different lists of articles, including Featured, Most Useful, and Most Viewed.

1. Navigate to the Knowledge Management Service Portal homepage.
2. Control + right-click one of the article list headers.
3. Click **Instance Options**.
4. Configure the desired settings for the article list widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the article list.</td>
</tr>
<tr>
<td>Bootstrap color</td>

5. Click **Save**.

*Configure filter facet widget instance options*
Configure widget instance options for the filter facet widgets on the Knowledge Management Service Portal search results page.

Role required: sp_admin or admin
The homepage uses several widgets to filter the items in the search results list. There are two types of facet widgets:

- Simple field facets based on the Knowledge table fields
- Advanced query facets based on custom queries of the Knowledge table

Use the widget instance options to customize these facet widgets:

- Knowledge Field Facet (for filtering by knowledge base, knowledge category, and author)
- Knowledge Tags Facet (for filtering by tag)
- Knowledge Resource Facet (for filtering by resource, such as articles and social Q&A)
- Knowledge Query Facet (for filtering by rating, last modified, and number of views)

Note: Query facets are displayed when there's at least one knowledge field facet added to the page.

1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click a filter facet widget.
3. Click **Instance Options**.
4. Configure the desired settings for the selected type of facet widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Title of the filter facet widget.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon that appears to the left of the title.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which the filter facet widgets appear on the left side of the search results page. If empty, the filter facet widgets sort alphabetically.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>Color of the filter facet widget header.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <strong>widget CSS</strong> for details.</td>
</tr>
<tr>
<td>Source Table</td>
<td>Table that contains the <strong>Source Field</strong> used to provide the filter facet widget options. The default table is Knowledge (kb_knowledge).</td>
</tr>
<tr>
<td>Source Field</td>
<td>Field in the <strong>Source Table</strong> that provides the filter facet widget options. Field types that can be used as a source field include string, choice, glide list, integer, reference, and boolean.</td>
</tr>
<tr>
<td>Facet Identifier</td>
<td>Unique name for the custom query facet that can be used in script code.</td>
</tr>
<tr>
<td>Facet Template</td>
<td>Template that determines the type of facet interaction. Knowledge Field Facet widget templates: Knowledge Query Facet widget templates:</td>
</tr>
<tr>
<td>Custom Template</td>
<td>Custom template that determines facet interaction and value selection.</td>
</tr>
</tbody>
</table>

   - **Single Select**: users can select only one filter from this widget.
   - **Multi Select**: users can select more than one filter from this widget.
   - **Dropdown Select**: users can select more than one filter from a drop-down menu.

   - **Simple Query**: shows a label for each facet value.
   - **Rating**: shows rating stars.
<table>
<thead>
<tr>

</tr>
<tr>
<td>Minimum results for showing scroll bar</td>
<td>Minimum number of results required to display a scroll bar in the filter facet widget.</td>
</tr>
<tr>
<td>Maximum length for string field</td>
<td>Maximum field length. Only fields whose length is less than this value are allowed to be added as a filter facet.</td>
</tr>
<tr>
<td>Alternate URL Parameters</td>
<td>Names of the URL parameters used to initialize this filter facet, if used in the URL as a search parameter.</td>
</tr>
<tr>
<td>Fetch Maximum Values</td>
<td>Option to fetch filter values from all knowledge articles in the search results. Selecting the Fetch Maximum Values option might impact the load time for search results. If this option is disabled, the load time improves based on the glide.knowman.search.facet_depth property value. If the glide.knowman.search.apply_acls property is set to true, a filter value can appear in a filter facet even when there are no search results for that filter value. For example, a knowledge base without any articles might appear as a value in the knowledge base filter facet.</td>
</tr>
<tr>
<td>Show Empty Value</td>
<td>If enabled, shows an empty filter facet option that users can select to filter for articles that do not have this field set. For example, if an article does not have an assigned category, clicking the empty option lists all articles with no assigned category.</td>
</tr>
<tr>
<td>Show Only Facet Values Matching Results</td>
<td>Creates a dynamic filter facet widget that displays only those filter values that match the search results rather than showing all values. If you disable this instance option, the time needed to load the filter facet data is reduced.</td>
</tr>
</tbody>
</table>

5. Click **Save**.

**Configure a user action for the article view page**

Configure a user action for the Knowledge Management Service Portal article view page.

Role required: sp_admin or admin

The article view page uses the Knowledge Article Content widget to provide user actions. Use the widget instance options to customize these actions.

Ensure that the application scope on the Now Platform is set to Knowledge Management Service Portal.
User actions available for the article view page appear in a menu after clicking the overflow icon (≡) in the article header. These actions enable users to flag an article, edit an article, or create an incident for an article.

1. Navigate to the Knowledge Management Service Portal article view page.
2. Control + right-click the article header.
3. Click **Instance Options**.
4. Configure the desired settings for the Knowledge Article Content widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>The color of the widget header.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
<tr>
<td>Hide All Actions</td>
<td>Hides the user actions in the article header including the <strong>Subscribe/Unsubscribe</strong> button and the overflow icon.</td>
</tr>
<tr>
<td>Show Version Information</td>
<td>Displays version information for the selected article. Requires the Knowledge Management Advanced plugin (com.snc.knowledge_advanced).</td>
</tr>
<tr>
<td>Show Create Incident Action</td>
<td>Displays the <strong>Create Incident</strong> user action when a user clicks the overflow icon in the article header.</td>
</tr>
<tr>
<td>Create Incident Action Label</td>
<td>The label for the user action that appears in the overflow icon menu. The default is <strong>Create Incident</strong>.</td>
</tr>
<tr>
<td>Create Incident Action URL</td>
<td>The target URL for the <strong>Create Incident</strong> user action. If no URL is specified, the system uses the URL in the glide.knowman.create_incident_link system property.</td>
</tr>
<tr>
<td>Redirect to the latest article</td>
<td>Redirects the article view page to the latest accessible version of the article, if available. Disable the <strong>Show Version Information</strong> option to hide the version information on the article view page because any version link will redirect to the latest version only.</td>
</tr>
</tbody>
</table>

5. Click **Save**.

Configure article helpful widget instance options

Configure the Knowledge Article Helpful widget instance options for the Knowledge Management Service Portal article view page.

Role required: sp_admin or admin

The article view page uses the Knowledge Article Helpful widget to allow users to provide feedback on the helpfulness of the article, display a confirmation message after a feedback is provided, and display the percentage of users who found the article to be useful. Use the widget instance options to customize these actions.

1. Navigate to the Knowledge Management Service Portal article view page.
2. Control + right-click **Helpful?**
3. Click **Instance Options**.
4. Configure the desired settings for the Knowledge Article Helpful widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>The color of the widget header.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
</tbody>
</table>
5. Click Save.

Configure article helpful comments instance options

Configure the Knowledge Article Comments widget instance options for the Knowledge Management Service Portal article view page.

Role required: sp_admin or admin

The article view page uses the Knowledge Article Comments widget to allow users to rate an article, add a comment, or view existing comments for the article. Use the widget instance options to customize these actions.

1. Navigate to the Knowledge Management Service Portal article view page.
2. Control + right-click the comments section.
3. Click Instance Options.
4. Configure the desired settings for the Knowledge Article Comments widget.

<table>
<thead>
<tr>

5. Click Save.
Search using the Knowledge Management Service Portal

Enter one or more words in the search bar on the Knowledge Management Service Portal homepage to view all search results.

Search results include items in which the short description, content, or attached files include the search term. By default, knowledge search results include articles, pinned articles, and social Q&A.

You can also filter the search results.

Enable multi-language search

The multi-language search facet is available when more than one supported language is enabled. All available languages are displayed in the facet and you can select which languages you want your search results to appear in. Your selection is maintained per session, but not across logins.

1. To enable different languages, activate the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) or activate one of the internationalization plugins for the language you require.

   ! **Note:** Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.

2. Navigate to **Knowledge > Administration > Knowledge Search Properties > Enable multi language search.**

3. Select the **Yes** check box to enable the feature.

   ! **Note:** If this property is not enabled, you can only search for one language at a time.

Search auto-correct feature

The Knowledge Management Service Portal homepage search tool also includes an auto-correct feature. When enabled, users can auto-correct a typing error in a search term by clicking one of the suggestions.

When a search term contains a misspelling, the search tool displays the search results page and includes one or more suggested terms at the top of the page under the heading **Did you mean.** Clicking one of these suggestions shows all the search results that match the selected term.

Users with the system administrator role can enable this feature.

1. Navigate to **System Properties > Text Search.**

2. Set the following properties to **true:**

   - Suggest alternate search spellings for knowledge or global search (glide.ts.dym.enable_spell_correct).
   - Suggest related searches for knowledge or global search (glide.ts.dym.enable_chain_suggest).

3. **Click Save.**

Integrating new knowledge portal pages with the service portal

Using the base system service portal, access the improved version of the knowledge portal that features an enhanced landing page with multiple knowledge bases, an article view page that includes new article widgets, and the search results page that displays global knowledge search results.

To access the **enhanced knowledge portal pages** from the service portal, as a system administrator, you can configure the following in the service portal:
Note: The knowledge portal page integrations described in this section can only be performed in the base system service portal.

- Configure the Knowledge header menu and the Knowledge Base tile widget to point to the new Knowledge Management Service Portal homepage.
- Configure the knowledge portal URL to link to the article view page.
- Add a knowledge search widget to perform a highly configurable global knowledge search in the Knowledge Management Service Portal search results page.
- Replace the Top Rated article widget with one of the new widgets provided in the Knowledge portal.

Configure the knowledge header menu and tile widget

Access the knowledge home page using the Knowledge header menu and the Knowledge Base tile widget in the service portal.

Role required: admin

The Knowledge Management - Service Portal plugin (com.snc.knowledge_serviceportal) is activated.

Note: This plugin is activated by default for customers on Madrid and later releases. Existing customers on release versions prior to Madrid must activate the plugin to perform this configuration task. For more information, see Activate the Knowledge Management Service Portal plugin.

1. Navigate to Service Portal > Portals.
2. In the Service Portals list, select the Service Portal record.
3. In the KB home page field, enter kb_home.
4. Click Update.
   When you click Knowledge in the service portal header menu, it now takes you to the new knowledge portal home page.
5. Configure the Knowledge Base tile widget to link to the knowledge portal home page.

Knowledge tile widget

a) Navigate to the service portal page.
b) Control + right-click the knowledge base tile widget and select Instance Options.
   The Knowledge Base form appears.
c) In the Page field, change the value from kb_view2 to kb_home.
d) Click Save.

When you click the Knowledge Base tile widget in the service portal page, it takes you to the knowledge portal homepage.

Configure the knowledge portal URL to link to the article view page

Use the service portal to access the new knowledge portal article view page that features type ahead search and a highly configurable search results page.

Role required: admin
You must configure the type ahead knowledge portal link and knowledge global search results link in the knowledge base search source and in the service catalog search source, to point to the new Knowledge Management Service Portal article view page.

1. Configure the type ahead knowledge portal link and the knowledge global search results link in the knowledge base search source.
   a) Navigate to Service Portal > Search Sources and click the Knowledge Bases search source.
   b) In the Search page template field, change the following line of code from:

   ```html
   "?id=kb_article&amp;sys_id={{item.sys_id}}"
   ```

   to "?id=kb_article_view&amp;sys_kb_id={{item.sys_id}}"

   ![Search Source Configuration](image)

   c) In the Data Source tab, go to the Data fetch script field and add the following line of code:

   ```javascript
   article.url = '?id=kb_article_view&amp;sys_kb_id=' + article.sys_id;
   ```
d) Right-click the form header and click Save.

2. configure the type ahead-knowledge portal link and the knowledge global search results link in the service catalog search source.
   a) Navigate to Service Portal > Search Sources and click the Catalogs search source.
   b) In the Search page template field, change the href tag to the following:

   `<a ng-if="item.content_type == 'kb'" ng-href="?id=kb_article_view&sys_kb_id={{::item.kb_article}}" class="h4 text-primary m-b-sm block">

<table>
<thead>
<tr>
<th>Name</th>
<th>Service Catalog</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>sc</td>
</tr>
<tr>
<td>Application</td>
<td>Global</td>
</tr>
</tbody>
</table>

Search page template

```html
<search-query>
<!-- Search query content here -->
</search-query>
```
c) In the **Data Source** tab, go to the **Data fetch script** field and change the following line of code from:

```
item.url = '?id=kb_article&sys_id=' + item.kb_article;
```

To:

```
item.url = '?id=kb_article_view&sys_kb_id=' + item.kb_article;
```

---

3. Click **Update**.

The knowledge results from type ahead and global search in the service portal point to the new knowledge portal article view page.

*Configure knowledge bases for a portal.*

*Add a knowledge search widget to the Service Portal*

Create and add a new widget to the service portal search results page to navigate to the enhanced knowledge search results page.

Role required: admin

Create and add a **Search Within** knowledge widget to the service portal and link it to the Knowledge global search results page.

1. **Create a new widget** named **Search Within**, using the following settings:
### Field values to create a new knowledge search widget

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
</table>
| HTML Template | `<div role="list" class="list-group">  
|             |   <span class="list-group-item active">${Search Within}</span>  
|             |   <a role="link" class="list-group-item" ng-href="{{data.url}}">${Knowledge}</a>  
|             | </div>`                                                                    |

| Server Script | `(function() {  
|               |   var q = encodeURIComponent($sp.getParameter('q'));  
|               |   var kb = $sp.getValue('kb_knowledge_base') || "";  
|               |   data.url = '/sp?id=kb_search';  
|               |   if(q)  
|               |     data.url += "&keyword="+q;  
|               |   if(kb)  
|               |     data.url += "&kb_knowledge_base="+kb;  
|               | })();  
|               | })`                                                                    |

2. Add the widget to the service portal search results page.
   a) Navigate to the service portal search page (https://<instance>.service-now.com/sp?id=search) in designer mode.
   b) In the **Filter Widget** search box, search for the **Search Within** widget and drag it into the container where you want the widget to appear in the service portal search results page.
The **Search Within** widget is added to the service portal search results page. In the service portal, when you click **Knowledge** in the **Search Within** widget, and search for a keyword, it redirects you to the knowledge global search results page.

**Add knowledge quick-access widgets**

Add Featured Articles, Most Useful Articles, and Most Rated Articles knowledge widgets to the service portal page. One or all can replace the discontinued Top Rated article widget.

Role required: admin

Replace the existing Top Rated knowledge widget in the service portal with one or more of the knowledge quick-access widgets.

The following knowledge quick-access widgets can be added to the service portal:

- Featured Articles
- Most Useful Articles
- Most Viewed Articles

1. Navigate to the service portal home page in designer mode.
2. In the **Filter Widget** search box, search for the widget you created and then drag it into the container in the service portal home page location where you want it to appear.

**Note:** You can click **Preview** to verify the location and appearance of the newly added widget.

When you click a link in the newly added quick-access widget from the service portal, it takes you to the new knowledge portal page.

Features not yet supported on Knowledge Management Service Portal

The following features are not yet supported on the Knowledge Management Service Portal:

- Article import on the Search results page
- Hierarchical categories on the Article view page
- Live Feed support for Social Q&A on the Article view page
- Tags added in Social Q&A are not honored in search results

The `glide.knowman.portal.enable_redirect` property is not honored for the following use cases:

- Contextual search in the Incident form
- Connect

Configure knowledge bases for a portal

Select which knowledge bases are displayed in a portal to view the associated knowledge articles. If no knowledge bases are configured, users can view articles from all knowledge bases in the portal.

Role required: admin

1. Navigate to Service Portal > Portals.
2. Select the portal for which you want to enable search for the desired knowledge bases.
3. In the Knowledge Bases related list, click Edit.
4. On the Edit Members form, move the desired knowledge bases from the available items in the Collection column to the Knowledge Bases List column.

5. Click Save.

Configure knowledge subscriptions

Configure knowledge subscriptions by activating the Knowledge Management Advanced plugin and setting the subscription properties.

Ensure that the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated.

**Note:** The Knowledge Management Advanced plugin activates the Subscriptions and Activity Feed Framework plugin (com.snc.activity_subscriptions).

Role required: knowledge_admin or admin

1. Navigate to Knowledge > Administration > Properties.
2. In the KM Subscription Properties section, configure the following properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable subscribe feature for KM [glide.knowman.enable_km_subscription]</td>
<td>Enables or disables the Knowledge Management knowledge subscriptions feature.</td>
</tr>
<tr>
<td>List of roles (comma-separated) who can have subscription feature [glide.knowman.enable_km_subscription.roles]</td>
<td>A comma-separated list of the roles that can use the knowledge subscriptions feature and subscribe to knowledge bases and articles.</td>
</tr>
<tr>
<td>List of workflow states (comma-separated) that can have subscription feature [glide.knowman.enable_km_subscription.workflow_state]</td>
<td>A comma-separated list of the article states for which the knowledge subscription feature is available. The default states include Draft, Review, and Published.</td>
</tr>
</tbody>
</table>

3. Click Save.

Knowledge subscription email notification templates

The knowledge subscription feature uses email notification templates to send subscription notifications to knowledge users.

<table>
<thead>
<tr>
<th>Email template</th>
<th>Subscription type</th>
</tr>
</thead>
<tbody>
<tr>
<td>KM Subscription: Article created</td>
<td>Knowledge base</td>
</tr>
<tr>
<td>KM Subscription: Article revised in KB</td>
<td>Knowledge base</td>
</tr>
<tr>
<td>KM Subscription: Article checked out</td>
<td>Knowledge article</td>
</tr>
<tr>
<td>KM Subscription: Article revised</td>
<td>Knowledge article</td>
</tr>
<tr>
<td>KM Subscription: Article commented</td>
<td>Knowledge article</td>
</tr>
</tbody>
</table>

Users with the admin or knowledge_admin role can customize these email notification templates. To locate the template, navigate to System Notifications > Email > Notifications. For more information about customizing a template, see Create an email notification.

Subscription notifications include a link at the bottom of the email to the user's Notification Preferences page.
Out-of-the-box Knowledge Management Performance Analytics Solutions

Performance Analytics Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

**Note:** You can activate Performance Analytics solutions and in-form analytics on instances that have not licensed Performance Analytics to evaluate the functionality. However, to start collecting data you must license Performance Analytics.

Performance Analytics Solutions

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With solutions, you can get value from Performance Analytics for your application with minimal setup.

**Important:** Set up and test Out-of-the-box Performance Analytics Solutions on a sub-production instance before enabling them in production. You can set up and test Performance Analytics on a sub-production instance without a subscription.

**Note:**
- Solutions include some dashboards that are inactive by default. You can activate these dashboards to make them visible to end users according to your business needs.
- Out-of-the-box solutions and in-form analytics provide all the configuration records required to analyze default applications. Customize these records for use in your production environment.

To enable the solution for Knowledge Management, an admin can navigate to Performance Analytics > Guided Setup. Click Get Started then scroll to the section for Knowledge Management. The guided setup takes you through the entire setup and configuration process.

New and deprecated versions of this solution

In London, this Solution was replaced with a new version, `com.snc.pa.knowledge_v2`. If you activated an earlier version of the Solution and then upgraded your instance, you still have and can still use the earlier Solution. You can also activate the newer version.

Knowledge Management dashboard

The Knowledge Management dashboard helps knowledge content owners and managers to determine the usage and quality of their knowledge content and ensure the proper processes and procedures are being followed for content creation.

CSM Knowledge Management dashboard indicators

The CSM Knowledge Management dashboard provides three views, into content usage, content governance, and content quality.

The Knowledge Management dashboard presents the following key performance indicators:

% of Knowledge Articles Published
A daily calculation using the formula \[
\frac{\text{Number of knowledge articles published}}{\text{Number of knowledge articles active}}
\]

% of Knowledge Articles Flagged
A daily calculation using the formula \[
\frac{\text{Number of knowledge articles flagged}}{\text{Number of knowledge articles active}}
\]

Monthly Average Article Rating
A monthly calculation of the sum of all article ratings for the month divided by the number of knowledge articles rated for the month.

Average Click Rank
A monthly calculation using the formula \[
\frac{\text{Sum of knowledge search ranks}}{\text{Number of knowledge searches with rank}}
\]

Click Through Rate
A monthly calculation using the formula \[
\frac{\text{Number of knowledge searches with rank}}{\text{Number of knowledge searches}}
\]

Article Quality Index
A monthly calculation using the formula \[
\frac{\text{Sum of AQI scores}}{\text{Number of AQI records}}
\]

Average Time to Publish
The average time to publish is recalculated daily, as a number of days. The goal of the indicator is for scores to minimize.

Sum of AQI Scores - Monthly
The sum of all Article Quality Index scores created in a month, calculated monthly. The goal is for scores to maximize.
Number of AQI Records - Monthly
The number of Article Quality Index records created in a month, calculated monthly. The goal is for the number to maximize.

Number of Active Users Who Performed Searches - Monthly
The number of knowledge searches made in a month, calculated monthly. The goal is for the number to maximize.

Sum of Knowledge Search Ranks - Monthly
The sum of feedback rankings of knowledge searches made in a month, excluding empty Highest Click Rank values. The goal is for the number to maximize.

Number of Knowledge Searches with Rank - Monthly
The number of knowledge searches in a month where the Highest Click Rank has a value higher than zero. The goal is for the number to maximize.

Number of Knowledge Searches - Monthly
The number of knowledge searches in a month. The goal is for the number to maximize.

Number of Knowledge Articles Rated - Monthly
The number of knowledge feedback records created in a month, excluding records where the Rating field is empty. The goal is for the number to maximize.

Number of Knowledge Articles Published
A daily count of the total number of knowledge articles that have entered the Published state. The goal is for the number to maximize.

Number of Knowledge Articles Flagged
A daily count of the number of active knowledge articles, with up-to-date workflows, that were flagged. The goal is for the number to maximize.

Number of Knowledge Articles Active
A daily count of the number of active knowledge articles with up-to-date workflows. The goal is for the number to maximize.

Breakdowns
The following breakdowns apply to the indicators on the dashboard:
- Time to Publish Groups
- Knowledge Base
- Knowledge Category

Reports
The dashboards include the following reports:
Integration with external knowledge sources

Use the external content integration feature to integrate content from various external sources and enable unified knowledge search results.

Users store and manage knowledge using various external sources and search each source separately for relevant results. External content integration enables acquiring and searching all WebDAV-compliant source content from a single location. This provides users with a seamless search experience across multiple knowledge sources and drives more usage to the platform.

Using this feature, knowledge administrators can define the external content to be imported into a knowledge base and periodically run a job to import the content. Knowledge users have a seamless user experience searching for relevant content across multiple knowledge sources.

Activate the External Content Integration plugin

The External Content Integration feature is activated with the Knowledge Management - External Content Integration plugin (com.snc.knowledge.external_integration).

Role required: admin

The Knowledge Management - External Content Integration plugin is not active by default.

The following plugins are automatically activated when the Knowledge Management - External Content Integration plugin is activated:

- Centralized Connection and Credentials plugin (com.snc.core.automation.connection.credential)
- Knowledge Management V3 plugin (com.snc.knowledge3)
- Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer)
The Knowledge > Administration module displays the External Knowledge Sources and External Knowledge Jobs sub-modules when the Knowledge Management - External Content Integration plugin is activated.

1. Navigate to System Applications > All Available Applications > All.

A banner appears to notify you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

2. Find the plugin with the filter criteria and search bar.

You can search for the plugin by its name or ID.

If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.

You can activate the plugin directly from the All Applications page or view more details about the plugin before activating it.

   • If you are certain that you have the correct plugin, click Install, and then click Activate in the dialog box that appears.

   • To view plugin details before activation:

      1. Click the plugin name.

      2. On the form, click the Activate/Update related link.

      3. On the dialog box that appears, review the dependent plugins.

         If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.

      4. If demo data is available and you want to install it, click Load demo data.
Some plugins include demo data, which are sample records that illustrate plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.

5. Click Activate.

Define an external knowledge source

Before you import content, create and configure the connection between the a Web Distributed Authoring and Versioning (WebDAV) - compliant external knowledge source and the ServiceNow knowledge base into which you want to import content. Define import parameters for the external knowledge source.

Define basic authentication credentials and create an HTTP connection to the external source.

Caution: This feature expects that the external source endpoint is a publicly accessible endpoint. Mid-server configuration is not supported.

Role required: admin

Only basic authentication is supported for the external content integration feature.

1. Define the connection from the external source and the target knowledge base.
   a) Navigate to Knowledge > Administration > External Knowledge Sources.
   b) Click New.
   c) Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Instruction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter unique name for the external source.</td>
</tr>
<tr>
<td>Target Knowledge Base</td>
<td>Select the knowledge base in which you want to create articles for the external content.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Select the connection alias to connect to the external source.</td>
</tr>
</tbody>
</table>

d) Right-click the form header and click Save.

2. Set import parameters for the external content.
   a) In the Parameter related list, click New.
   b) In the Name field, select the name of the parameter from the drop-down list.
   c) In the Value field, enter the desired value for the parameter.

The table below lists the parameters and the corresponding values that can be set for the external source.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum size limit (in MB) for this source</td>
<td>Set maximum allowed content size for this source. Once this limit is reached, no further content is processed. Default value is 400 MB.</td>
</tr>
<tr>
<td>Maximum size limit (in KB) per file/content in this source</td>
<td>Set maximum allowed size limit for each file from this external source. If a file exceeds this limit, that file is not processed. Default value is 4000 KB.</td>
</tr>
<tr>
<td>Parameter Name</td>
<td>Instructions</td>
</tr>
<tr>
<td>---------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Open search results in the original source system</td>
<td>Set value to <strong>true</strong> to open search results in the external source system. Set value to <strong>false</strong> to open search results in the target knowledge base. Default value is set to <strong>false</strong>.</td>
</tr>
<tr>
<td>Include folders with names that match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for folder names that need to be included from this external source.</td>
</tr>
<tr>
<td>Exclude folders with names that match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for folder names that need to be excluded from this external source.</td>
</tr>
<tr>
<td>Create articles when file names match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for file names that need to be included to create articles.</td>
</tr>
<tr>
<td>Do not create articles when file names match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for file names that need to be excluded to create articles.</td>
</tr>
<tr>
<td>Maximum retry limit</td>
<td>Maximum number of retries to send request to the external source.</td>
</tr>
</tbody>
</table>

d) Click **Submit**.

**Import content from an external knowledge source**

Run an import job manually or set up a schedule to process the integrated external content.

Role required: admin or knowledge_admin

Each external source is associated with two handlers: the **Acquire handler** and the **Process handler**, for running the import job. The acquire handler uses a WebDAV client to acquire external content to create articles. You can customize the process handler to assign categories to articles or populate additional metadata for the knowledge articles.

1. Navigate to **Knowledge > Administration > External Knowledge Sources**.
2. Select the external knowledge source from which you would like to import content.
3. In the **Handler** tab, set a schedule to run the acquire and process handlers.
4. In the Related Links section, click **Run Scheduled Job**.
5. To view all jobs scheduled to run to import content for the external source, click the **Jobs**.

You can open the most recent job to monitor the status.

For each file in the external content source, a blank knowledge article is created and the external file is added as an attachment to the article. The short description of the article is derived from the file name of the external content source.

**Open knowledge search results in source system**

Configure the URL to the external source system to open articles from search results directly in the source system.

Make sure the **Open search results in the original source system** import parameter for the external knowledge source is set to **true**.

You can follow this procedure when you have a file as a knowledge article in Microsoft SharePoint, for example.

Role required: admin

1. Navigate to **System Definition > Script Includes**.
2. Open KBWebDAVContentHandler.
3. In the Script window, override the function getFileURL using script shown below.

   The `getFileURL` function is shown below.

   ```javascript
   //fileObj.getName() - Returns name of the file
   //fileObj.getPath() - Returns path to the file from root folder
   //fileObj.getAbsolutePath() - Returns Absolute WebDAV URL of the file
   //fileObj.getCreationDate() - Returns creation date of the file as GlideDateTime object
   //fileObj.getModifiedDate() - Returns last modified date of the file as GlideDateTime object
   //fileObj.getContentType() - Returns content type of the file as GlideDateTime object
   //fileObj.getSize() - Returns size of the file

   getFileURL: function(fileObj) {
       //write your logic here
   },
   ```

4. Click Update.

Sample configuration for integrating external knowledge content

You can integrate content from multiple external sources so your users can acquire and search knowledge from a single location. Use this sample configuration to create a connection to your external account, configure external knowledge sources, and import content to enable search results for unified content.

Requirements for integrating external content

Make sure the Knowledge Management -- External Content Integration plugin (com.snc.knowledge.external_integration) is enabled and your external source is WebDAV-compliant.

**Integrate external knowledge sources into the Knowledge Management application**

Create authentication credentials and a connection alias to connect your external knowledge source to the ServiceNow Knowledge Management application. Define import parameters for your external source to import integrated content.

Role required: admin

1. Enable basic authentication on your external account.

   **Note:** Your external account password is not affected when you enable basic authentication.

2. Create the connection to your external account using the basic authentication credentials.
   a) Navigate to Connections and Credentials > Credentials.
   b) Click New.
   c) Click Basic Auth Credentials.

   Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the credential. For example, Demo_Auth.</td>
</tr>
<tr>
<td>User name</td>
<td>The external account user name created for basic authentication.</td>
</tr>
<tr>
<td>Password</td>
<td>The external account password for the user name.</td>
</tr>
</tbody>
</table>
3. Create an HTTP connection to your external account.
   a) Navigate to Connections & Credentials > Connection & Credential Aliases.
   b) Select New.
   c) In the Name field, enter the name of the connection alias. For example, Demo_Account.
   d) Right-click the form header and click Save.
   e) In the Connections related list, click New.
   Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the HTTP connection. For example, Demo_Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential created to connect to the external account. For example, Demo_Auth.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>WebDAV URL to your external account. This is the WebDAV end point of your external account. Note: You can also import contents from a specific folder by appending the folder path to the URL. For example, https://&lt;web link to your external_account&gt;/KnowledgeIT.</td>
</tr>
</tbody>
</table>

   f) Click Submit.

4. Configure the external knowledge source for importing content.
   a) Navigate to Knowledge > Administration > External Knowledge Sources.
   b) Click New and fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the external source. For example, Demo_knowledge.</td>
</tr>
<tr>
<td>Target Knowledge Base</td>
<td>Knowledge base in which you want to create articles for the external content. For example, IT.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Connection alias to connect to the external source. For example, Demo_Account.</td>
</tr>
</tbody>
</table>

c) Right-click the form header and select Save.

d) In the Parameter related list, click New.

e) On the Parameter form, select the name of the import parameter that you want to configure for your external source and then set the value for the parameter.

   The table below lists the parameters and the corresponding values that can be set for the external source.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum size limit (in MB) for this source</td>
<td>Maximum allowable content size to import from your external source. For example, 250 MB.</td>
</tr>
<tr>
<td>Parameter name</td>
<td>Value</td>
</tr>
<tr>
<td>---------------</td>
<td>-------</td>
</tr>
<tr>
<td>Maximum size limit (in KB) per file/content in this source</td>
<td>Maximum allowable size for each article, including attachments, that you can import from this external source. For example, 2000 KB.</td>
</tr>
<tr>
<td>Open search results in the original source system</td>
<td>Opens search results in the external source system if this value is set to true.</td>
</tr>
<tr>
<td>Include folders with names that match these regex patterns</td>
<td>Comma-separated list of regular expressions for folder names to include from this external source. For example, to include all folders names that start with the letters a and b, enter a.<em>,b.</em>.</td>
</tr>
<tr>
<td>Exclude folders with names that match these regex patterns</td>
<td>Comma-separated list of regular expressions for folder names to exclude from this external source. For example, to exclude all folders names that start with the letters a and b, enter a.<em>,b.</em>.</td>
</tr>
<tr>
<td>Create articles when file names match these regex patterns</td>
<td>Comma-separated list of regular expressions for file names that to include when creating articles. For example, to include all file names have .docx and .pdf extensions, enter .<em>.docx,.</em>.pdf.</td>
</tr>
<tr>
<td>Do not create articles when file names match these regex patterns</td>
<td>Comma-separated list of regular expressions for file names to exclude when creating articles. For example, to exclude file names have .docx and .pdf extensions, enter .<em>.docx,.</em>.pdf.</td>
</tr>
<tr>
<td>Maximum retry limit</td>
<td>Maximum limit for the number of times a connection request can be sent to the external source. For example, 5.</td>
</tr>
</tbody>
</table>

**Import content from an external knowledge source.**

**Use extension points for Knowledge Management**

Use UI extension points to add knowledge article headers and footers to knowledge articles and to customize the email template for notifications when a knowledge article is commented on. Use scripted extension points to customize the feedback object used in the email template for notifications when a knowledge article is commented on.

The Knowledge Management Advanced plugin (com.snc.knowledge_advanced) must be activated to view the KMFeedbackNotification UI extension point and the KMFeedbackObject scripted extension point. These notifications are part of the Subscriptions feature, which is activated with this plugin.

Role required: admin

Using extension points makes it easier to integrate customizations without actually altering the base code. You can extend standard base functionality using customized scripts.

To use UI extension points in Knowledge Management, create an implementation and change the data as required. You can create multiple implementations per extension point, but for these scenarios, the use is limited to one implementation only. Example code is provided in the extension point, which can be edited, as required.
An implementation is delivered in the base system for scripted extension points. You can change the data and add additional fields, as required.

1. To use UI extension points to customize headers and footers in knowledge articles, and the email notification that is sent when a knowledge article is commented on:
   a) Navigate to System Extension Points > UI Extension Points.
   b) Click the UI extension point you want to use.

   **Note:**
   - Use the KMArticleViewFooter and KMArticleViewHeader UI extension points to add knowledge article headers and footers to the knowledge article view pages (kb_view.do) in Knowledge Management v3.
   - Use the KMFeedbackNotification UI extension point to customize the email template for notifications when a knowledge article is commented on.

   c) Click Create Implementation.
   d) Change the data as required.
   e) Click Update.

2. To use scripted extension points to update the feedback object used in the email template for notifications when a knowledge article is commented on:
   a) Navigate to System Extension Points > Scripted Extension Points.

   **Note:** Use the KMFeedbackObject scripted extension point to customize the feedback object used in the email template for notifications when a knowledge article is commented on.

   b) In the API Name column, click global.KMFeedbackObject.
   c) In the Implementations related list, click the KMFeedbackObjectBaseImpl class.
   d) Change the data and add additional fields, as required.
   e) Click Update.

**Duplicate knowledge article numbers**

Importing knowledge articles into an instance can create articles with duplicate numbers.

The Knowledge Number field is auto-generated and is incremented every time you create a new article in an instance. The initial value for the Number field is 10,000. To customize this number:

1. Navigate to System Definition > Number Maintenance.
2. Search for Knowledge in the Table column.
3. Click the Controls related list tab.
4. Enter a new Number and click Update.

Importing knowledge articles from another instance or as part of the demo data for another application may introduce an article with a number that is already in use. Because the Knowledge Number field is not uniquely indexed, the import completes without error.
With duplicate knowledge article numbers present, links to article view pages that use the knowledge number can behave inconsistently. For example, if there are two articles with the same Knowledge number KB0000033, the following link may open either of these two articles randomly: `kb_view.do?sysparm_article=KB0000033`. This can happen in Knowledge search results where clicking on a result opens a different article instead of the article displayed in the search results.

### Avoiding duplicate Knowledge article numbers

To avoid inserting Knowledge articles with duplicate numbers into a production environment:

- Do not import demo data articles in production environment.
- Verify the numbers of the articles to be inserted to make sure they are not already in use.
- Create a before insert business rule on the Knowledge table (`kb_knowledge`) to ensure the new number is not already in use.

You can also update the initial value for the Knowledge Number field so that newly created articles do not conflict with existing articles.

1. Navigate to **System Definition > Number Maintenance**.
2. Search for **Knowledge** in the **Table** column.
3. Click the **Knowledge** link to open the Knowledge table form.
4. Click the **Controls** related list tab.
5. In the **Number** field, update the count to a number greater than the largest value already in the system.
6. Click **Update**.

### Knowledge-Centered Service configuration

Knowledge-Centered Service configuration (KCS) is a method for the creation and continuous improvement of knowledge based on the experience of agents and the patterns observed by knowledge reuse.

ServiceNow Knowledge Management is a KCS (V6) verified product. As a KCS (V6) verified product, Knowledge Management provides features to improve knowledge, such as article quality reviews, in-context knowledge capture, and feedback management.

### Article quality index for knowledge management

Assess the quality of knowledge articles with the article quality index (AQI). The AQI helps maintain consistent quality of knowledge articles attached to a knowledge base where articles are written by various authors.

Using AQI feature, a knowledge administrator (a user with knowledge_admin role) creates a checklist and adds a set of true or false questions to the checklist to assess the quality of knowledge articles. For each question, the knowledge_administrator assigns a weight based on its importance to the quality measurement and then attaches the checklist to a knowledge base.

A knowledge reviewer (a user with knowledge_coach and knowledge_domain_expert role) performs AQI review on knowledge articles attached to the knowledge base by answering the true or false questions in the checklist. The article quality is then scored based on the cumulative weight of all answers set to true in the checklist.

The average AQI scoring is displayed on the Content Quality tab of the Knowledge Management dashboard (see *Knowledge Management dashboard*).
Activating article quality index

The article quality index feature is activated with the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin. For details see, *Activate the Knowledge Management Advanced plugin.*

Create an AQI checklist

Create a checklist of questions that reviewers can use to evaluate the quality of knowledge articles.

Role required: knowledge_admin or admin

1. Navigate to **Knowledge > Article Quality Index > AQI checklists**, and click **New**.
2. Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Checklist</td>
<td>Name for the checklist.</td>
</tr>
<tr>
<td>Description</td>
<td>Description for the checklist.</td>
</tr>
</tbody>
</table>

3. Right-click the form header and click **Save**.
4. In the **Checklist Questions** related list, add questions to the checklist.

Add questions and adjust the weight of the questions until the combined weight of all questions is equal to 100. The weight defines the score that is added to the total AQI review score of the article when the answer for that question is set to **true**. The maximum score that can be applied to an article in an AQI review is 100.

**Note:** The default AQI pass score is 70. You can change the pass score in the **Article Quality Index properties**.

To add a question:

- a) Click **New**.
- b) Fill in the following fields:

**Checklist Question form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Question</td>
<td>Text for the question to evaluate articles.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description for the question.</td>
</tr>
<tr>
<td>Order</td>
<td>Value for the display order of questions in the checklist. The lower the value in the <strong>Order</strong> field, the higher the question displays in the checklist.</td>
</tr>
</tbody>
</table>

**Note:** Before you assign a value for the display order, think about how many questions you would create for the checklist. For example, if you have five questions in a checklist, you can assign the value in increments of 20. This ensures that you have enough values to assign if you add questions to the checklist later.
**Field** | **Description**
--- | ---
Weight | A value for the question to score the article quality. This value is added to the AQI score when the answer for the question is set to **true**.

**Note:**
- The combined weight of all questions cannot exceed 100.
- The sum of weights of all questions in a checklist must be equal to 100 to be assigned to a knowledge base.

c) Click **Submit**.

5. After you finish adding questions to the checklist, click **Update** on the AQI Checklist form.

After you create a checklist, **assign it to a knowledge base**.

**Assign an AQI checklist to a knowledge base**

Before a knowledge reviewer can start performing the AQI review, you must assign an AQI checklist to a knowledge base.

You can only assign a checklist to a knowledge base when the weight of all questions in the checklist is equal to 100. Each knowledge base can have one assigned checklist. However, a checklist can be assigned to more than one knowledge base.

Role required: knowledge_admin or admin

1. Navigate to **Knowledge > Administration > Knowledge Bases**.
2. Click a knowledge base to which you want to assign a checklist.
3. On the Knowledge Base form, click the search icon in the **Checklist** field and select the AQI checklist to apply.
4. Click **Update**.

After you assign an AQI checklist to a knowledge base, you can start **performing AQI reviews**.

**Remove an AQI checklist from a knowledge base**

Before you can edit a checklist that is assigned to a knowledge base, you must remove it from the knowledge base.

A checklist with pending AQI reviews cannot be removed from the knowledge base until all AQI reviews associated with the checklist are complete.

Role required: knowledge_admin or admin

1. Navigate to **Knowledge > Administration > Knowledge Bases**.
2. Click a knowledge base from which you want to remove a checklist.
3. On the Knowledge Base form, delete the name of the AQI checklist from the **Checklist** field.
4. Click **Update**.

**Delete questions from an AQI checklist**

Deleting a question in a checklist deletes the text in the question of previously performed AQI reviews that use the checklist. Deleting an AQI question from a checklist will not affect the score of the previously performed AQI reviews. However, the text of the question will not be displayed in the checklist.
You can delete questions from a checklist if the following conditions are met:

- The checklist is not attached to a knowledge base. For more information, see Remove an AQI checklist from a knowledge base.
- There are no AQI reviews using the checklist in progress.

Role required: admin

1. Navigate to Knowledge > Article Quality Index > AQI checklists.
2. Click the AQI checklist from which you want to delete one or more questions.
3. In the Checklist Questions related list, select the check box next to the questions that you want to delete.
4. From the Actions on Selected Rows choice list, select Delete.
5. In the Confirmation window, click Delete.

Perform an AQI review

Perform the AQI review to evaluate the quality of the article.

The knowledge base must have an assigned AQI checklist.

Role required: knowledge_domain_expert, knowledge_coach, knowledge_admin, or admin

Configure the glide.knowman.aqi.article_workflow_states property to set the article workflow states where you could perform AQI reviews. You can perform several AQI reviews for an article. If you perform several AQI reviews for the same version of the article, the latest AQI score appears in the Latest AQI field in the article.

1. Navigate to Knowledge > Articles and click Published.
2. Click an article link.
3. Perform the AQI review.

<table>
<thead>
<tr>
<th>Option</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>The AQI review is not yet started.</td>
<td>Click Perform AQI in the form header.</td>
</tr>
<tr>
<td>The AQI review was started and is pending.</td>
<td>Click Continue AQI in the form header.</td>
</tr>
</tbody>
</table>

4. In the Article Checklist Answers related list, read the questions and evaluate which ones are true. Double-click the Answer cell for each question that is true, select true, and click the green check mark.

Note: The associated Weighted Score is applied to the AQI score when the answer is set to true.
5. Perform one of the following actions:

<table>
<thead>
<tr>
<th>To</th>
<th>Do This</th>
</tr>
</thead>
<tbody>
<tr>
<td>Submit the completed AQI review.</td>
<td>Click Submit.</td>
</tr>
</tbody>
</table>

The form refreshes and the total score of the AQI review is displayed in the AQI score field.

The system sends an email notification as follows:

- If the AQI review was performed on the first version of the article, the system sends an email notification to the author of the article.
- If the AQI review was performed on subsequent versions of the article, the system sends an email notification to the author and creator of the article versions.

**Note:** The notification includes the AQI review score and AQI review result. You can customize the content and design of the notification emails.
To view all the AQI reviews you completed, navigate to **Knowledge > My Completed AQI Checklists**.

### View all pending and completed AQI reviews

View checklists of all users to monitor the pending and completed reviews.

**Role required:** knowledge_admin or admin

1. Navigate to **Knowledge > Article Quality Index**
2. Do one of the following:
   - To view all completed AQI checklists, select **All Completed AQI Checklists**.
   - To view all pending AQI checklists, select **All Pending AQI Checklists**

**Note:** If a performed AQI needs to be deleted, the following roles are permitted to do so:
- An AQI in a submitted state: admin or knowledge admin
- An AQI not in a submitted state: knowledge admin or the reviewer who initiated the AQI

### Delete AQI reviews

Delete an AQI review that was created by mistake or is no longer required.

**Roles required:**
- To delete an AQI in a submitted state: admin or knowledge admin
- To delete an AQI not in a submitted state: knowledge admin or the reviewer who initiated the AQI

1. Navigate to **Knowledge > Articles > My Pending AQI Checklists**.
2. Select all checklist reviews you would like to delete.
3. Click **Delete**.

### Automating feedback management to improve content

Manage high volumes of article feedback by enabling task generation for negative feedback. When an article is rated poorly or marked as unhelpful, a feedback task is generated.

If an ownership group is assigned to the article, the feedback task is assigned to the manager of the ownership group. Ownership group managers can reassign tasks to another group member, or group members can assign a feedback task to themselves.

If no ownership group is assigned to the article, the feedback task is assigned to the author or reviser of the article.

The task assignee can update the article, create a new article, request additional feedback, or reassign the task and receives notification after the feedback is updated or resolved.

**Note:** The actionable feedback feature is available in the Knowledge Management Service Portal only.
Enable actionable knowledge feedback

The actionable knowledge feedback feature is available when the Knowledge Management Service Portal (com.snc.knowledge_serviceportal) plugin is activated and the actionable knowledge feedback properties are enabled.

Role required: admin

The actionable feedback feature is available in the Knowledge Management Service Portal only.

By default, negative article feedback does not automate the triggering of feedback tasks. You must configure these properties to generate feedback tasks when an article is marked as not helpful or rated below a set value.

1. Navigate to Knowledge > Administration > Properties.
2. In the Actionable Feedback Properties section, configure the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create actionable feedback task when an article is marked as not helpful</td>
<td>Select Yes.</td>
</tr>
<tr>
<td>Create actionable feedback task when an article is rated at or lower than this value. 0 or no value indicates that actionable feedback tasks are not enabled for Rating type feedback.</td>
<td>Enter a value from 1 to 5 to specify the rating threshold for generating a feedback task. For example, if you set this value to 3, a feedback task is generated when a user selects three or less stars to rate an article.</td>
</tr>
</tbody>
</table>

Note: If you enter '0', a negative article feedback does not generate a feedback task.

3. Click Save.

Work on a feedback task

You can change the state of a task and resolve or reassign tasks generated by article feedback.

Role required: none

• If no ownership group is assigned to the article, the feedback task is available to you as the author or reviser of the article.
• If an ownership group is assigned to the article, a feedback task is assigned to you as an ownership group manager. As a manager, you can reassign the task to another group member. All group members see the feedback task in All Open Tasks. As a group member, you can reassign the task to yourself to appear in My Assigned Tasks.

1. Navigate to Knowledge > Feedback Management > My Assigned Tasks.
2. Select a feedback task.
3. Review the feedback given by the submitter.

When a feedback task is generated, the information in the article feedback form is copied to the feedback task form as follows:

<table>
<thead>
<tr>
<th>Feedback task form field</th>
<th>Information from article feedback form</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason</td>
<td>The selected reason for the feedback.</td>
</tr>
</tbody>
</table>
4. To work on the feedback task:

<table>
<thead>
<tr>
<th>Feedback task form field</th>
<th>Information from article feedback form</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Text in the Details field.</td>
</tr>
</tbody>
</table>

**Note:** If feedback is negative and the Details field is left blank, this field indicates whether the article was not helpful or rated poorly.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work in progress</td>
<td>Start working on the feedback task.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can save the feedback task and edit the article or create a new article if the information in the existing article is irrelevant or obsolete.</td>
</tr>
<tr>
<td>Awaiting information</td>
<td>Request clarification from the feedback submitter.</td>
</tr>
<tr>
<td></td>
<td><strong>In the Additional Comments field, enter information you need from the submitter and click Update. This triggers an email notification for the feedback task submitter.</strong></td>
</tr>
<tr>
<td>Resolved</td>
<td>Resolve the feedback task.</td>
</tr>
<tr>
<td></td>
<td><strong>In the Resolution Code field, select the code for resolving the article.</strong></td>
</tr>
<tr>
<td></td>
<td><strong>In the Resolution notes field, enter the reason for the resolution and click Update.</strong> An email notification is sent to the feedback submitter. The email notification includes the portal URL for the article from where the feedback submitter can accept or reject the feedback.</td>
</tr>
<tr>
<td>Closed</td>
<td>Close the feedback task without the submitter having to accept the feedback resolution.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If the submitter accepts the feedback resolution, the state for the feedback task is automatically set to Closed. You can view all closed feedback tasks in your queue by navigating to Knowledge &gt; Feedback Management &gt; My Closed Tasks.</td>
</tr>
</tbody>
</table>

**Track the progress on a feedback task**

Monitor open and closed feedback tasks and track the duration of time a feedback task remains in each state.

Role required: Owner of the knowledge base, knowledge_manager, knowledge_admin, or admin

1. Navigate to the open or closed tasks you want to track.

<table>
<thead>
<tr>
<th>To</th>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td>View open feedback tasks</td>
<td>Knowledge &gt; Feedback Management &gt; All Open Tasks and select a feedback task.</td>
</tr>
<tr>
<td>View closed feedback tasks</td>
<td>Knowledge &gt; Feedback Management &gt; All Closed Tasks and select a feedback task.</td>
</tr>
</tbody>
</table>

2. In the Knowledge Feedback Task Metrics related list section, select a feedback task metric to view the start and end time and the duration of the feedback task.
Enable creating an article from a customer service case

You can enable authors to reuse information in a case by copying case details into an article template. Use the pre-defined customer service source case table to article template target table configuration or create custom configurations between the two tables to copy information from a case to an article.

- The Knowledge Management Advanced plugin must be active.
- The KCS for Customer Services Management property must be enabled
- The pre-defined KCS article template or a newly created article template must be active.

Note: You can do one of the following to create an article from a case:

- Use the pre-defined Case KCS Article mapping as is or modify the field mappings between the case source table and article template target table.
- Create a new article template target table and map it to the case source table and customize the field mappings between them. For information on creating article templates, refer to Create an article template.
- Knowledge users use the Create Knowledge button in a case form to create an article from a case and must have "can contribute" permission for at least one active knowledge base to create an article from a case. For information on user permissions, see Knowledge Management roles.

Role required: sn_customerservice.customer_admin or admin

The pre-defined Case KCS Article mapping is stored in the CSM Table Map [csm_table_map] table. This configuration has the sn_customerservice_case source case table configured to the kb_template_kcs_article target article template table with the four field mappings pre-configured between the tables. You can customize the existing field mappings or map additional fields between the tables.

1. In the application filter navigator, type csm_table_map.list.
2. Click Case KCS Article.
3. From the Target Table list, use the pre-defined KCS article template table or select the newly created article template table.
4. Map each customer service case field that must be used to create knowledge articles.
   a) In the Basic Field Mapping related list, click New.

   To map fields, fill in the following fields:

   Customer service case table to article template target table field mapping

<table>
<thead>
<tr>
<th>Field</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Field</td>
<td>Select the field in the source case table that contains the information to be copied to the field in the article template target table.</td>
</tr>
<tr>
<td>Target Field</td>
<td>Select the field in the article template target table to which you need information copied to from the field in the source case table.</td>
</tr>
</tbody>
</table>

b) Click Submit.
c) To map fields using advanced scripts, select the **Advanced Field Mapping** check box and then map the fields between the source and the target table using advanced scripts in the **Advanced Field Mapping** tab.

**Note:**

If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.

If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

d) To customize when and how the **Create Knowledge** button is displayed, use the condition builder in the **Condition** tab or select **Use Advanced Condition** check box and configure using advanced scripts.

**Note:** If you change the target table in the **Case KCS Article** mapping, also update the scripts with the configuration changes for display of this button.

5. Click **Update**.

**Enable creating a knowledge article from an incident**

Enable users to quickly and easily reuse information from an incident in a knowledge article.

Role required: admin

Perform the following steps to enable creating a knowledge article from an incident.

**Note:** Once you have performed the configuration steps, knowledge users can select the Knowledge check box on the Incident form to create an article from an incident. They must have **Can Contribute** access to at least one active knowledge base to create an article.

**Create field mapping from an incident to a knowledge article**

Copy information from an incident into a knowledge article by creating custom mapping between the Incident table and the KCS article table.

Role required: admin

- Ensure that the Knowledge Advanced plugin (com.snc.knowledge_advanced) is active.
- Ensure that the KCS Article template is active.

1. Navigate to **Knowledge > Administration > Article Templates**.
2. Set the **Active** field to **true** for the KCS Article template.

1. In the filter navigator, type `csm_table_map.list`.
2. Click New.
3. In the **Mapping Name** field, enter **Incident KCS Article**.
4. In the **Source Table** field, enter **Incident**.
5. In the **Target Table** field, enter **KCS Article**.
6. Right-click the form header and select **Save**.
7. In the **Basic Field Mapping** related list, click **New**.
8. Create mappings for the following fields.
Note: You can create field mappings for more fields, as required.

- In the Source field, select the field in the source Incident table that contains the information to be copied to the field in the article template target table.
- In the Target field, select the field in the article template target table to which you need information copied to from the field in the source Incident table.

9. To customize when and how the Knowledge check box is displayed, click the Condition tab.

10. Select the Use Advanced Condition check box.

11. Copy and paste the following code.

```javascript
(function (source) {
    //Only if selected article type is active
    var tem = new GlideRecord("kb_article_template");
    tem.addQuery("child_table","kb_template_kcs_article");
    tem.addActiveQuery();
    tem.query();
    if(!tem.hasNext())
        return false;
    //Do not allow to create the knowledge again
    var gr = new GlideRecord("kb_knowledge");
    gr.addQuery("source",source.sys_id);
    gr.query();
    if(gr.next())
        return false;
    return true;
})(source);
```

12. To map fields using advanced scripts, select the Advanced Field Mapping check box.

13. On the Advanced field Mapping tab, paste in the following code.

```javascript
(function (source,target) {
    // Get the first comments from incident and use it as Issue description for article
    var notes = source.comments.getJournalEntry(-1);
    var entries = notes.split("\n\n");
    var comment = ";
    if(entries[entries.length-2]){
        comment = entries[entries.length-2];
        var part = comment.toString().indexOf("\n");
        if(part != -1){
            comment = comment.toString().substring(part+2).replaceAll("<br/">");
        }
    }
    if(comment)
        target.kb_issue = comment;
})(source,target);
```
The first comment on an incident is mapped to the **Issue Description** field in the knowledge article.

**Note:** If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.

If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

---

### Add a property to enable creating knowledge article from incidents

Add a property, which is required to allow users to create a knowledge article from an incident.

Role required: admin

1. In the Filter navigator, enter `sys_properties.list`.
2. Click **New**.
3. Fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>enable_kcs_incident</td>
</tr>
<tr>
<td>Description</td>
<td>Enable Knowledge Centered Services (KCS) for Incident Management.</td>
</tr>
<tr>
<td>Type</td>
<td>true/false</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

### Create a UI action to enable creating knowledge articles from incidents

Create a UI action to add the Knowledge check box to the Incident form.

Role required: admin

1. Navigate to **System UI > UI Actions**.
2. Click **New**.
3. Fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Knowledge</td>
</tr>
<tr>
<td>Table</td>
<td>Incident</td>
</tr>
<tr>
<td>Action name</td>
<td>create_knowledge</td>
</tr>
</tbody>
</table>

4. Select the **Client** check box.
5. Select the **List v3 Compatible** check box.
6. Select the **Form button** check box.
7. In the **Onclick** field, enter `createKnowledgeClient()`.
8. In the **Condition** field, enter `gs.getProperty("enable_kcs_incident") == 'true' && new global.CSMTableMapUtil (current).findMapByName("incident_kcs_article") && new global.KBKnowledge().canCreate()`.

9. In the **Script** field, enter the following code.

```javascript
function createKnowledgeClient() {
    if (g_form.modified) {
        alert(new GwtMessage().getMessage('You have unsaved changes. Please save them to continue.'));
    } else {
        // Call the UI Action again but skip the 'onclick' function
        gsftSubmit(null, g_form.getFormElement(), 'create_knowledge');
        // MUST call the 'Action name' set in this UI Action
    }
}

// Code that runs without 'onclick'
// Ensure call to server-side function with no browser errors
if (typeof window == 'undefined')
    CreateKnowledgeServer();

function CreateKnowledgeServer(){
    current.update();
    var map = new global.CSMTableMapUtil (current);
    var targetURL = map.getTargetURL();
    var referenceLink = 
        "&sysparm_collection=incident&sysparm_collectionID="+current.sys_id + 
        "&sysparm_collection_key=task&sysparm_link_collection=m2m_kb_task&sysparm_collection_related_field=kb_knowledge&sysparm_referring_url=incident.do%3fsys_id%3d"+current.sys_id;
    if(targetURL)
        action.setRedirectURL(targetURL[0]+referenceLink);
}
```

### Enable creating a knowledge article from an HR case

Enable users to quickly and easily reuse information from an HR case in a knowledge article.

**Role required:** admin

- Ensure that the Human Resources Scoped App: Core (com.sn_hr_core) plugin is active.
- Ensure that the Developer Application is set to **Human Resources: Core**.

**Note:** To check, navigate to the Settings icon and then Developer > Application.

Perform the following steps to enable creating a knowledge article from an HR case.

**Note:** Once you have performed the configuration steps, knowledge users can select the Knowledge check box on the HR Case form to create an article from an HR case. They must have Can Contribute access to at least one active knowledge base to create an article.

### Create field mapping from an HR case to a knowledge article

Copy information from an HR case into a knowledge article by creating custom mapping between the HR case table and the KCS article table.

**Role required:** admin
• Ensure that the Knowledge Advanced plugin (com.snc.knowledge_advanced) is active.
• Ensure that the Developer Application is set to **Human Resources: Core**.
• Ensure that the KCS Article template is active.

1. Navigate to **Knowledge > Administration > Article Templates**.
2. Set the **Active** field to **true** for the KCS Article template.

1. In the filter navigator, type `csm_table_map.list`.
2. Click **New**.
3. In the **Mapping Name** field, enter **HR Case KCS Article**.
4. In the **Source Table** field, enter **HR Case**.
5. In the **Target Table** field, enter **KCS Article**.
6. Right-click the form header and **Save**.
7. In the **Basic Field Mapping** related list, click **New**.
8. Create mappings for the following fields.

<table>
<thead>
<tr>
<th>Source Field</th>
<th>Target Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sys ID</td>
<td>Source Task</td>
</tr>
<tr>
<td>Short description</td>
<td>Short description</td>
</tr>
<tr>
<td>Close notes</td>
<td>Resolution</td>
</tr>
<tr>
<td>Description</td>
<td>Cause</td>
</tr>
</tbody>
</table>

**Note:** You can create field mappings for more fields, as required.

• In the **Source** field, select the field in the source HR Case table that contains the information to be copied to the field in the article template target table.
• In the **Target** field, select the field in the article template target table to which you need information copied from the field in the source Incident table.

9. To customize when and how the **Knowledge** check box is displayed, click the **Condition** tab.
10. Select the **Use Advanced Condition** check box.
11. Copy and paste the following code.

```javascript
(function (source) {
    // Get the first comments from HR case and use it as Issue description for article
    target.short_description=source.short_description+"";
    target.kb_resolution=source.close_notes+"";
    target.kb_cause=source.description+"";
    var notes = source.comments.getJournalEntry(-1);
    var entries = notes.split("\n\n");
    var comment = "";
    if(entries[entries.length-2]){
        comment = entries[entries.length-2];
        var part = comment.toString().indexOf("");)
        if(part != -1){
            comment = comment.toString().substring(part+2).replaceAll("\r\n","<br/>");
        }
    }
    if(comment)
    target.kb_issue = comment;
```

© 2020 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
//Only if selected article type is active
var tem = new GlideRecord("kb_article_template");
tem.addQuery("child_table","kb_template_kcs_article");
tem.addActiveQuery();
tem.query();
if(!tem.hasNext())
  return false;

//Do not allow to create the knowledge again
var gr = new GlideRecord("kb_knowledge");
gr.addQuery("source",source.sys_id);
gr.query();
if(gr.next())
  return false;
return true;
})(source);

12. To map fields using advanced scripts, select the Advanced Field Mapping check box.
13. On the Advanced field Mapping tab, paste in the following code.

(function (source,target) {
  // Get the first comments from HR case and use it as Issue
description for article
  var notes = source.comments.getJournalEntry(-1);
  var entries = notes.split("\n\n");
  var comment = ""
  if(entries[entries.length-2]){
    comment = entries[entries.length-2];
    var part = comment.toString().indexOf(""");
    if(part != -1){
      comment = comment.toString().substring(part+2).replaceAll("\r\n","<br/ >");
    }
  }if(comment)
    target.kb_issue = comment;
})(source,target);

The first comment on an HR case is mapped to the Issue Description field in the knowledge article.

**Note:** If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.

If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

Add a property to enable creating knowledge articles from HR cases

Add a property, which is required to allow users to create a knowledge article from an HR case.

Role required: admin

Ensure that the Developer Application is set to Human Resources: Core.

1. In the Filter navigator, enter sys_properties.list.
2. Click New.
3. Fill in the following fields.
**System Property form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>enable_kcs_hr</td>
</tr>
<tr>
<td>Description</td>
<td>Enable Knowledge Centered Services (KCS) for HR Service Delivery.</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Create a UI action to enable creating knowledge articles from HR cases**

Create a UI action to add the Knowledge check box to the HR case form.

Role required: admin

Ensure that the Developer Application is set to **Human Resources: Core**.

1. Navigate to **System UI > UI Actions**.
2. Click **New**.
3. Fill in the following fields.

   **UI Action form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Knowledge</td>
</tr>
<tr>
<td>Table</td>
<td>HR Case</td>
</tr>
<tr>
<td>Action name</td>
<td>create_knowledge</td>
</tr>
</tbody>
</table>

4. Select the **Client** check box.
5. Select the **List v3 Compatible** check box.
6. Select the **Form button** check box.
7. In the **Onclick** field, enter `createKnowledgeClient()`.
8. In the **Condition** field, enter
   ```javascript
   gs.getProperty("sn_hr_core.enable_kcs_hr") == 'true' &&
   new global.CSMTabMapUtil
   (current).findMapByName("sn_hr_core.hr_case_kcs_article") &&
   new global.KBKnowledge().canCreate().
   ```
9. In the **Script** field, enter the following code.

   ```javascript
   function createKnowledgeClient() {
   if (g_form.modified) {
      alert(new GwtMessage().getMessage('You have unsaved changes.
Please save them to continue.'));
   }else{
      //Call the UI Action again but skip the 'onclick' function
      gsftSubmit(null, g_form.getFormElement(), 'create_knowledge');
      //MUST call the 'Action name' set in this UI Action
   }
   }
   //Code that runs without 'onclick'
   //Ensure call to server-side function with no browser errors
   if (typeof window == 'undefined')
   ```
CreateKnowledgeServer();

function CreateKnowledgeServer()
{
    current.update();

    var map = new global.CSMTTableMapUtil (current);
    map.findMapByName("sn_hr_core.hr_case_kcs_article");
    var targetURL = map.getTargetURL();
    var referenceLink = 
        "&sysparm_collection=sn_hr_core_case&sysparm_collectionID="+current.sys_id
        +"&sysparm_collection_key=task&sysparm_link_collection=m2m_kb_task&sysparm_collection_related_field=kb_knowledge&sysparm_referring_url=sn_hr_core_case.do
        %3fsys_id%3d"+current.sys_id;
    if(targetURL)
        action.setRedirectURL(targetURL[0]+referenceLink);
}

10. Click Submit.

Use Knowledge Management

Share your ideas and experience by creating a knowledge article. Search and find information such as self-help, troubleshooting, and task resolution in knowledge bases. Review, provide feedback on knowledge articles, and resolve issues yourselves rather than contacting customer service or an internal helpdesk.

Role required: none

Use Knowledge Management in one or more of the following ways.

Knowledge Management guide for users

After knowledge bases are set up, you can start searching and creating articles. If Social Q&A was activated for the knowledge base, you can also submit answers or answer questions for other users.

Requirements

Role required

All users can read knowledge articles. Users with the knowledge or any other fulfiller role, such as sn_customerservice_agent, can create and edit knowledge articles in a knowledge base, unless the knowledge manager has restricted access to the knowledge base or knowledge articles

If you need these permissions, contact the knowledge manager for the knowledge base.

What to do

Create knowledge articles

If you have the required permissions for a knowledge base, you can create articles for it. You can create articles from the Self-Service application menu or by importing Word documents.

You can also create knowledge articles from incidents and problems.

Search for knowledge articles

From the Knowledge homepage, you can select a knowledge base to search for articles and answers. You can view only the knowledge bases to which you have access.

You can also search knowledge from within an incident.
Access to knowledge using *your mobile device* is supported.

**Ask and answer questions**

If *Social Q&A* was activated for a knowledge base, you can ask and answer questions. You can also browse and vote on answers.

**How to Use the Knowledge Base**

**Next steps**

After articles are created, you can perform the following tasks to make sure that articles are organized in the right knowledge bases and retired when appropriate. If existing knowledge bases do not fit your needs, you can request a new knowledge base.

- *Move a knowledge article*
- *Retire a knowledge article*
- *Request a knowledge base*

**Knowledge Management Service Portal homepage features**

The Knowledge Management Service Portal homepage displays knowledge articles and social Q&A items organized by knowledge base and category, as well as featured content and popular articles. Learn how to navigate the homepage to search for and find useful and relevant information quickly.

To use the Knowledge Management Service Portal, the Knowledge Management — Service Portal plugin (com.snc.knowledge_serviceportal) must be activated.

**Note:** It is active by default for customers on the Madrid and later releases. Existing or upgrade customers must activate the plugin and enable the glide.knowman.serviceportal.enable_redirect property.

Your organization can customize the homepage, so it may look different to the following image. You must be logged in to view the knowledge homepage.

</table>
| 7   | Other filter facet widgets                | Use filter facets to refine your search results. The selections you make filter the items displayed in the search results list. The search results list updates to display only those items that match your selections. Deleting a selection reverses the filtering in the list. Clear selected filter options by:  
  - Deleting a single option from the search results list header.  
  - Clicking **Clear all** in the search results list header.  
  - Clicking **Clear** in the filter facet widget header.  
  - **Author**: lists the names of the authors for the knowledge articles included in the search results list  
  - **Tags**: lists the available knowledge tags  
  - **Resource**: lists the types of items available, such as knowledge articles and social Q&A  
  - **Rating**: lists article ratings from 0-5 stars (clicking a rating displays articles that have the selected rating and higher)  
  - **Last Modified**: lists selections based on the timing of knowledge item modifications such as Past Month or Past Week  
  - **View Count**: lists the knowledge item view counts such as More Than 50 or Less Than 10. Set the number of days to consider when calculating view count using the `glide.knowman.view_age.days` property. |
| 8   | View additional search results            | Depending on the system setup, view additional search results using one of these options:  
  - **Standard Pagination**: displays the search results in multiple pages.  
  - **Infinite Scroll**: displays the search results while scrolling. |

**Note:** If a custom widget on the knowledge search results page uses the KnowledgeSearchService angular service, you must add the `sn.knowledgeApplication` dependency to enable the functionality of the custom widget.

1. Navigate to Service Portal > Dependencies.
2. In the Name field, search for the `sn.knowledgeApplication` dependency.
3. If a message appears, click here to edit.
   You have to be in the **Knowledge Management - Service Portal** application to edit.
4. Click Update.

**Knowledge Management Service Portal article view page features**

View the knowledge article you selected, including the article number, short description, and article content. Give feedback or comment on an article.

ℹ️ **Note:** If you select a question, the article view page displays the question, any answers to the question, and a text box for providing an answer.
Controllers and Applications

Installing the ACI Fabric Hardware

ACI Fabric Topology

The ACI fabric topology includes the following major components:

- Application Centric Infrastructure Controllers (APICs) (UCS C220-M3S servers)
- Leaf switches (Nexus 93128TQ, 9332PQ, 9372PX, 9372TQ, 9396FX, and 9396TX switches)
- Spine switches (Nexus 9336PQ, 9504, and 9508 switches)

As shown in the following figure, each APIC is connected to one or two leaf switches and each leaf switch is connected to every spine switch in the same ACI fabric.

Figure 1. ACI Fabric Topology

Connecting the Application Policy Infrastructure Controller

Depending on the type of Virtual Interface Card (VIC) installed on the controller, you must connect either optical (10-Gigabit SFP+) or copper (10BASE-T) leaf switches as follows:

- Controller with a VIC1225 (10-Gigabit SFP+ optical ports) module must be connected to leaf switches with 10-Gigabit SFP+ optical downlink ports (for example, a Nexus 9396PX switch).
- Controller with a VIC1225T (10GBASE-T port) module must be connected to leaf switches with 10GBASE-T downlink ports (for example, a Nexus 93128TX or 9396TX switch).

The connections between leaf and spine switches are made with 40-Gigabit Ethernet transceivers.

Before You Begin

- The Application Policy Infrastructure Controller (APIC), a UCS C220-M3S server, must be fully installed in its rack and powered up (see the UCS C220 Server Installation and Service Guide).

Social Q&A question view page

View the question you selected as well as any answers. Answer a question or give feedback to a question.
How long does it usually take to set up my router?

Let's face it: Each router is different, and getting the right combination of settings, while setting up the router can be confounding. For example, even some reasonably experienced PC hands may not understand the differences between security settings or know that WPA-2 offers better protection than WEP and ordinary WPA.

With these considerations in mind how long does it usually take to setup my routers?

1 Answer

Various vendors have tried to make things simpler with easy-setup CDs or one-click connection buttons, but they can not cover every possible circumstance. Router setup instructions go the extra mile by explicitly detailing the order in which you need to you plug everything in before you run the CD. (Cable modems in particular should be powered on before you connect your router to them.) That is a nice touch -- but it assumes you have read the printed instructions that came with the router. This helps in setting up the router relatively quickly.

### Knowledge feedback

You can view and contribute to feedback on knowledge articles.

### Feedback options

You can submit feedback for knowledge articles in these ways:

- Flag an article as incorrect or inappropriate.
- Provide a rating value for the article.
- Mark an article as helpful or not helpful.
- View comments, add a new comment, or reply to existing comments.

Users can view comments directly on the article. Knowledge managers can view the other types of feedback by navigating to Knowledge > Feedback.

Administrators and knowledge managers can disable some feedback options using fields on the Knowledge Base form. Administrators can configure feedback options using properties.
Flagging articles

You can flag an article for incorrect or inappropriate content. Click **Flag Article** in the article header to open a new window, allowing you to enter suggested changes.

- Flagged comments do not appear on the Article View page. Users with the admin, knowledge_admin, and knowledge_manager roles can access flagged articles by navigating to **Knowledge > Articles > All Flagged**. Users with the knowledge role can access their flagged articles by navigating to **Knowledge > Articles > My Flagged**.
- If disabled, the author of the article and users with the admin, knowledge_admin, and knowledge_manager roles can see all flagged comments. Other users can see only their own flagged comments.

**Note:** You cannot disable flagging for an article until you have disabled the flagging for all feedback comments for that article.

Flagged comments are stored in the Knowledge Feedback (kb_feedback) table but not the Live Feed Messages (live_message) table.

Rating articles

The five stars below the article title allow you to indicate the article's effectiveness on a scale of 1 to 5.

Marking articles

The question **Helpful?** at the bottom of the article allows you to indicate the usefulness of the article with a simple **Yes** or **No** answer.

Comments

Knowledge comments at the bottom of the article use live feed to enable a conversation around a knowledge article. For example, you can post replies to comments, add attachments, or Like comments. The glide.knowman.use_live_feed property controls the display of knowledge article comments. If enabled, the system uses live feed to manage and display feedback on knowledge articles.

Import a Word document to a knowledge base

Import a Word document to create a knowledge article.

You must have **Can Contribute** access to at least one active knowledge base.

Role required: none

Beginning with Madrid, the Import a Word document feature is enabled by default and the Import Articles module is displayed in the application navigator. The Import a Word document feature isn’t enabled automatically for the existing customers who can continue using the Import Articles option on the Knowledge Management v3 homepage. To enable the Import a Word document feature for existing customers prior to Madrid, an administrator must first disable the **Import Articles** option on the Knowledge Management v3 homepage by setting the glide.knowman.import.hide_import_functionality property to true and adding the Import Articles module to the application navigator.

These styles and elements are preserved when importing a .doc or .docx file into a knowledge base. Styles and elements not included in this list may not be preserved when importing a document.

- **Titles**
• Headings

Note: For any headings and subheadings with numbers, the numbers are not imported.

• Images

Note: Images may not be aligned exactly as in the Word document you import.

• Links
• Bold text
• Italic text
• Underlined text
• Ordered and unordered lists

Note: After import, the bullets in an unordered list are replaced with dots.

• Tables

Note: Only default heading settings are supported. Custom heading styles are imported using the default settings for those styles. Table styling and borders are not supported.

1. Navigate to Knowledge > Articles > Import Articles.
2. Enter the knowledge base to add the article to.
3. Optional: Select a Category from within the knowledge base.

Note: Use the category picker to add a category. The picker does not differentiate between the different category levels. You can select a category or sub category and add it to the Category field.

4. Optional: Select the Publish check box to start the publishing workflow for each imported article immediately after the import finishes.

Note: The Publish check box appears only when the Show publish checkbox on the knowledge import pop-up property is enabled. To enable the property, navigate to Knowledge > Administration > Properties and select the check box for the Show publish checkbox on the knowledge import pop-up property.

5. Select one or more Word files to import.
6. Click Import.

An article is created in the selected knowledge base and category using the content from the uploaded document.

• If you uploaded multiple documents, one article is created for each.
• If you use knowledge internationalization, the language of the article is set to the system language selected.
• When the upload completes, a pop-up window displays the number and short description of the articles. Click an article to view the full record.
• If any errors occur during the upload, a pop-up window displays the error.
• If the Publish check box is activated, knowledge articles go into Review or Published state, depending on the workflow attached to the knowledge base.
• If the Publish check box is not activated, the knowledge articles go into Draft state and are then reviewed before publishing.
Knowledge subscriptions

Subscribe to knowledge bases and knowledge articles and receive email notifications about new articles and article revisions or comments.

- Subscribed to a knowledge base:
  - Knowledge base owners are auto-subscribed to all articles in the knowledge bases they own. They receive email notifications when new articles are created or revised (published) in the knowledge base.
  - Users who subscribe to a knowledge base receive email notifications when new articles are created in the knowledge base or if the existing articles are revised (published).

- Subscribed to a knowledge article:
  - Knowledge authors are auto-subscribed to the articles they create. They receive email notifications when the articles they created are checked out or revised (published) by other authors, and if the articles receive user comments.
  - Users who subscribe to an article receive email notifications when the article is revised (published).

Users can set their Knowledge notification preferences using System Settings.

The knowledge subscription feature is available for both the Knowledge Management v3 user interface and the Knowledge Management Service Portal.

If the article versioning feature is enabled, the following notifications are sent:

- An article is checked out
- An article is revised
- A new version of an article is published

Activation information

The knowledge subscriptions feature requires the Knowledge Management Advanced plugin (com.snc.knowledge_advanced). For more information, see Configure knowledge subscriptions.

Subscribe to a knowledge base

Subscribe to a knowledge base and receive notifications when articles are added to that knowledge base.

Role required: knowledge

Users can subscribe to a knowledge base from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

1. Navigate to Knowledge > Homepage.
2. Click the Subscribe link on the knowledge base tile.
   The link changes to Subscribed and includes a check mark.

Unsubscribe from a knowledge base

Unsubscribe from a knowledge base.

Role required: knowledge

Users can unsubscribe from a knowledge base from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.
1. Navigate to Knowledge > Homepage.
2. Point to and click the Subscribed link on the knowledge base tile, which toggles to Unsubscribe.
   After unsubscribing you from the knowledge base, the link toggles to Subscribe.

**Subscribe to a knowledge article**

Subscribe to a knowledge article within a knowledge base.

Role required: knowledge

Users can subscribe to a knowledge article from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

**Note:**

Users who are already subscribed to a knowledge base are also subscribed to the articles within that knowledge base.

To subscribe to articles from the base service portal (https://<instance name>/sp?), you must navigate to the Knowledge Management Service Portal pages (for example: https://<instance name>/sp?id=kb_home) from the base service portal.

1. Navigate to Knowledge > Homepage.
2. Click Subscribe at the top of the knowledge article.
   The system displays an information message about the article subscription and the button toggles to Subscribed.

**Unsubscribe from a knowledge article**

Unsubscribe from a knowledge article.

Role required: knowledge

Users can unsubscribe from a knowledge article from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

**Note:**

If you are subscribed to a knowledge base and you unsubscribe from an article in that knowledge base, you must also unsubscribe from the parent knowledge base.

1. Navigate to Knowledge > Homepage.
2. Point to and click Subscribed, which toggles to Unsubscribe.
   If you are subscribed to the knowledge article, this action results in an information message that the article subscription has been removed. If you are also subscribed to the parent knowledge base, proceed to the next step.
3. If you are subscribed to the parent knowledge base, click Yes on the Unsubscribe pop-up window.
   This action results in an information message that the knowledge base subscription has been removed.

**Set knowledge notification preferences**

Set notification preferences for knowledge bases and knowledge articles.

Role required: knowledge

Users can set notification preferences from the Knowledge menu or from the Knowledge Management Service Portal.

1. Navigate to the Notification Settings page.
<table>
<thead>
<tr>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From the Knowledge application</td>
<td>Click the Notification Settings module.</td>
</tr>
<tr>
<td>From the Knowledge Management Service Portal</td>
<td>Click the user name in the portal header and then click Notification Settings.</td>
</tr>
</tbody>
</table>

2. Click the Notification Preferences tab.
3. Click **Knowledge Base** and enable or disable the knowledge base notification options.
4. Click **Knowledge Articles** and enable or disable the knowledge article notification options.

**Manage knowledge subscriptions**

Manage knowledge base and knowledge article subscriptions from the Notification Settings page.

Role required: knowledge

Users can manage knowledge subscriptions from the Knowledge application or from the Knowledge Management Service Portal.

1. Navigate to the Notification Settings page.

<table>
<thead>
<tr>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From the Knowledge application</td>
<td>Click the Notification Settings module.</td>
</tr>
<tr>
<td>From the Knowledge Management Service Portal</td>
<td>Click the user name in the portal header and then click Notification Settings.</td>
</tr>
</tbody>
</table>

2. Click the Subscriptions tab.
3. Click **Knowledge Base** or **Knowledge Articles** to see a list of current subscriptions.
4. To unsubscribe from a knowledge base or knowledge article, click **Subscribed**. The link toggles to **Unsubscribed**.

**Knowledge blocks**

Simplify knowledge authoring for writers and knowledge consumption for readers with knowledge blocks. Knowledge blocks are reusable pieces of content secured by user criteria that you can add to knowledge articles in a knowledge base. The user criteria controls which users can read or not read the block content in an article or search, enabling users to more easily view content that is relevant to them.

**How to use knowledge blocks**

To use knowledge blocks, a knowledge administrator or manager must enable the knowledge blocks feature for each knowledge base in which the blocks will be used.

- **Enable knowledge blocks for each knowledge base**

Knowledge contributors can create knowledge blocks and insert them into articles in a knowledge base:

- **Create a knowledge block**
- **Add knowledge blocks to a knowledge article**
- **Preview a knowledge article with knowledge blocks**

Knowledge block content can be read or not read in an article or search based on user criteria set at the knowledge base and knowledge block level. See **Select user criteria for a knowledge block** for more information.
Holiday calendar with location-specific knowledge block content

You are part of an enterprise HR organization that maintains a company knowledge base. You want to create a holiday calendar so that employees know which days of the year are company holidays. Since the company has multiple locations and holiday dates vary based on where the employee is located, there are several ways that you could create the knowledge article.

One way is that you could create a knowledge article for each location, with an article for Location A, Location B, and so on.

- Pros: simplified consumption. Employees have a single article to search for and read.
- Cons: more work for HR. HR has multiple articles to manage and update for each location where the company has employees.

Another way is that you could create a single knowledge article that includes sections for each location.

- Pros: simplified authoring. HR has a single article to manage and update.
- Cons: more work for employees. Employee must scroll through and disregard extraneous content to find the section in the article that pertains to them.

With knowledge blocks, you can create a single knowledge article with location-specific block content secured by user criteria. This approach helps to reduce the workload for both HR and employees. As an HR agent, you have a single article to manage and update. Employees have a single article to search for and read, with the user criteria ensuring that they only view content that is relevant to them.

If you are using a custom search or knowledge article viewer

If you are using a custom search or knowledge article viewer with your application, you should integrate it with the appropriate knowledge or knowledge blocks API. (Integration is only necessary if you are using a custom search or knowledge article viewer.)

- Integrating a custom search or knowledge article viewer with knowledge blocks

Activation information

To use knowledge blocks in your application, you must activate knowledge blocks. For information on what components are installed with the feature, see Components installed with knowledge blocks.

Note: Activating knowledge blocks automatically activates Knowledge Management Advanced, which enables advanced features such as article versioning. Knowledge blocks can be used with or without the article versioning feature. To disable the feature, see Disable the article versioning feature.

Activate knowledge blocks

You can activate knowledge blocks [com.snc.knowledge_blocks] if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

Knowledge blocks activates these related plugins if they are not already active.
Plugins for knowledge blocks

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Management Advanced</td>
<td>Enables advanced features for Knowledge Management, such as article versioning. For a full list of features, see activate the Knowledge Management Advanced plugin.</td>
</tr>
</tbody>
</table>

Note: Knowledge blocks can be used with or without the article versioning feature. To disable the feature, see Disable the article versioning feature.

1. Navigate to System Applications > All Available Applications > All.

A banner appears to notify you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

Note: To redirect to the legacy list view for plugins, click the link.

2. Find the plugin with the filter criteria and search bar.

You can search for the plugin by its name or ID.

If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.

You can activate the plugin directly from the All Applications page or view more details about the plugin before activating it.

- If you are certain that you have the correct plugin, click **Install**, and then click **Activate** in the dialog box that appears.
To view plugin details before activation:

1. Click the plugin name.
2. On the form, click the **Activate/Update** related link.
3. On the dialog box that appears, review the dependent plugins.
   If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.
4. If demo data is available and you want to install it, click **Load demo data**.
   Some plugins include demo data, which are sample records that illustrate plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.
5. Click **Activate**.

**Components installed with knowledge blocks**

Several types of components are installed with activation of the knowledge blocks plugin, including tables.

*Note:* To view all other components installed with this plugin or application, see the Application Files table. For instructions, see *Find components installed with an application.*

Demo data is available for this feature.

**Tables installed**

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>

For further information on table administration and how to manage data, see *Table administration*.

#### Enable knowledge blocks for each knowledge base

Enable the knowledge blocks feature for each knowledge base where you plan to use the blocks. Once enabled, you can create knowledge blocks to add to knowledge articles within a knowledge base.

Make sure that the knowledge blocks [com.snc.knowledge_blocks] plugin is activated.

Role required: knowledge_admin or knowledge_manager  

1. Navigate to **Knowledge > Administration > Knowledge Bases**.  
2. Open the knowledge base record.  
3. In the Knowledge Base form, select the **Enable blocks** check box.

**Note:** If the **Enable blocks** check box is not visible, you can add the field to the form by right-clicking the form header and navigating to **Configure > Form Layout**.
4. Click Update.

Note: If you decide to later disable the knowledge blocks feature, all knowledge blocks within the knowledge base must be deleted before you can clear the box.

Create knowledge blocks to use within the enabled knowledge base.

Create a knowledge block

Create or modify a knowledge block to define a reusable piece of content that can be inserted into knowledge articles in a knowledge base. The knowledge block is secured by user criteria, which controls what users, groups, roles, companies, locations, or departments can read or not read the content in an article or search, enabling users to more easily view content that is relevant to them.

Role required: user must have contributor access to the knowledge base.

1. Navigate to Knowledge > Knowledge Blocks > Create New.
2. Click New or open a record.
3. Fill in the fields on the form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<tr>
<td>Version</td>
<td>This field is automatically set to a version number when the article versioning feature is enabled.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Knowledge blocks can be used with or without the article versioning feature. To learn more about article versioning, including how to disable the feature, see Article versioning.</td>
</tr>
<tr>
<td>Article type</td>
<td>This field is automatically set to HTML.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Knowledge blocks are only supported with HTML knowledge articles.</td>
</tr>
<tr>
<td>Workflow</td>
<td>This field is automatically set to the publication state of the block, such as Draft, Published, or Retired.</td>
</tr>
<tr>
<td>Source task</td>
<td>Not applicable.</td>
</tr>
</tbody>
</table>

4. Click **Save** or **Update** to create or update the block.
5. Click **Publish** to publish the block.

**Note:** Any additional steps required to publish the knowledge block, such as approvals, depend on the publishing workflow for the knowledge base. See **Knowledge workflows** for more information.

After the knowledge block is published, you can add the block to an article within the knowledge base.

**Select user criteria for a knowledge block**

Control which users can read or not read knowledge block content within an article in a knowledge base by setting user criteria at the knowledge base and knowledge block level. As a knowledge contributor, you can apply user criteria at the knowledge block level.

Role required: user must have contributor access to the knowledge base.

1. Navigate to **Knowledge > Knowledge Blocks > All.**
2. Open a knowledge block.
3. Apply the desired user criteria for the **Can Read** and **Cannot Read** fields.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can Read</td>
<td>User criteria to apply for read access at the knowledge block level.</td>
</tr>
<tr>
<td>Cannot Read</td>
<td>User criteria to apply for cannot read access at the knowledge block level.</td>
</tr>
</tbody>
</table>

**Note:**
- You can use existing or create new user criteria records. To create a new record, see **Create a user criteria record in Knowledge Management**.
- If a user meets any **Can Contribute** criteria at the knowledge base level, they can read all knowledge block content, regardless of the **Can read** and **Cannot read** criteria set at the knowledge block level.
- If a user meets any **Cannot read** criteria at the knowledge block level, they cannot read the block content, regardless of the **Can read** criteria set at the knowledge block level.
Can Contribute^{1} access at knowledge base level?

Yes

Can Read^{2} access at knowledge base level?

Yes

Cannot read block

No

Can read block

No

Can read access at block level?

Yes

Cannot read block

No

Cannot read block

No

Can Read^{2} access at knowledge base level?

No

Cannot read block

1. User meets any of the following:
   - admin role
   - knowledge_admin role
   - knowledge_base owner
   - knowledge_base manager
   - Can Contribute user criteria

2. (If no user criteria is set, then any user with at least one role can contribute articles.)
4. Right-click the form header and click **Save**.

- To finish and publish the block, see *Create a knowledge block*.
- To add the block to an article, as well as preview the article by impersonating different users, see *Add knowledge blocks to a knowledge article*.

**Retire a knowledge block**

You can retire a published knowledge block so that it is no longer available for users to view or search. A knowledge block can only be retired if it is not being used in any knowledge articles.

Role required: user must have contributor access to the knowledge base.

1. Navigate to **Knowledge > Knowledge Blocks > Published**.
2. Open the applicable record.
3. In the **Articles** related list, verify that the knowledge block is not being used in any knowledge articles.

   **Note:** A knowledge block can only be retired or deleted if it is not being used in any knowledge article, including any retired article or previous version of an article.

4. Click **Retire** to retire the knowledge block.

   **Note:** Any additional steps required to retire the knowledge block, such as approvals, depend on the workflow for the knowledge base. See *Knowledge workflows* for more information.

**Add knowledge blocks to a knowledge article**

You can insert one or more knowledge blocks into a knowledge article within a knowledge base. Each knowledge block is secured by user criteria, which controls who can read or not read the content in an article.

Role required: user must have contributor access to the knowledge base.

1. Navigate to **Knowledge > Articles > All**.
2. Click **New** or open a record.
3. Fill in the fields on the form, as appropriate.

   For further details on creating a knowledge article, see *Create a knowledge article*.

   **Note:** Knowledge blocks are only supported with HTML knowledge articles. Make sure that the **Article type** field is set to **HTML**.

4. Click **Add Blocks** to open the **Add Blocks** side panel.

   **Note:** If the **Add Blocks** button is not visible, make sure that the knowledge blocks feature is enabled for the knowledge base that the article is in. See *Enable knowledge blocks for each knowledge base* for more information.
5. In the Add Blocks side panel, you can search for, do an advanced search, view, and insert blocks into the article. You can also create blocks directly from the side panel.

**Note:** If there are knowledge blocks you cannot find, make sure that the blocks are published, in the same language, and in the same knowledge base as the article.
6. Click **Save** or **Update** to create or update the article.

   **Note:** You can preview the article with the blocks by user or, if published, by date. See *Preview a knowledge article with knowledge blocks* for more information.

7. Click **Publish** to publish the article.

   **Note:** Any additional steps required to publish the knowledge article, such as approvals, depend on the publishing workflow for the knowledge base. See *Knowledge workflows* for more information.

**Preview a knowledge article with knowledge blocks**

Preview a knowledge article with knowledge blocks by user or, if published, by date. For an unpublished article, you can preview the article by user by impersonating different users to see how the article displays or hides block content.
(based on the user criteria set at the knowledge base and knowledge block level). For published articles, you can preview the article by both user and date to see how the article appears in past versions for different users.

Role required: user must have contributor access to the knowledge base.

1. Navigate to **Knowledge > Articles**, and open one of the modules, such as **Unpublished** or **Published**.
2. Open the knowledge article with knowledge blocks.
3. In the **Related Links** section, click **Preview Article with Blocks**.

![Knowledge article editor with Related Links section](image)

4. Preview the article as one of the following.

<table>
<thead>
<tr>
<th>Option</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Unpublished article</strong></td>
<td>Preview the article by user. In the <strong>View As</strong> field, you can search for and impersonate different users to see how the article appears based on the can and cannot read access of the user.</td>
</tr>
</tbody>
</table>
### Published article

Preview the article by user and date:

- In the **View As** field, you can search for and impersonate different users to see how the article appears based on the can and cannot read access of the user.
- In the **View on date** field, you can select different dates to see how the article appears in past versions.

---

**Preview a knowledge article with blocks by different users**

The author is previewing the article as different users in different locations. Ashley Aoto sees the block content for Location A, Beth Berry sees the block content for Location B, and Claire Chaganti sees the block content for Location C.
Company Holiday Calendar

Employees in Location A have the following company holidays:

- Mon, January 1 - New Year's Day
- Mon, February 19 - Presidents' Day
- Mon, May 28 - Memorial Day
- Wed, July 4 - Independence Day
- Mon, September 3 - Labor Day
- Thurs, November 22 - Thanksgiving
- Tues, December 25 - Christmas Day
- Mon, December 31 - New Year's Eve

Employees in Location B have the following company holidays:

- Mon, January 26 - Republic Day
- Fri, June 15 - Independence Day
- Wed, August 15 - Independence Day
- Thurs, September 13 - Ganesh Chaturthi
- Tues, October 2 - Ghandi Jayanthi
- Wed, November 7 - Diwali
- Tues, December 25 - Christmas Day

Employees in Location C have the following company holidays:

- Mon, January 1 - New Year's Day
- Fri, March 30 - Good Friday
- Mon, April 2 - Easter Monday
- Mon, May 7 - Early May Bank Holiday
Integrating a custom search or knowledge article viewer with knowledge blocks

If you are using a custom search or knowledge article viewer with your application, you can integrate that custom search or viewer with the appropriate knowledge or knowledge blocks API.

Note: Integration is only necessary if you are using a custom search or knowledge article viewer.

KBPortalServiceImpl - Global
The KBPortalServiceImpl API is included with Knowledge Management V3 [com.snc.knowledge3] as a script include. It provides methods to use with knowledge, such as integration with a custom search.

KBPortalServiceImpl - KBPortalServiceImpl()
Instantiates a KBPortalServiceImpl object in a global application.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

KBPortalServiceImpl - getResultData(Object request)
Returns search results based on keywords from the knowledge article and from relevant knowledge block content that the user has access to read.

If you have activated the knowledge blocks feature and are using a custom search for knowledge with your application, your search may not return relevant articles when keywords are contained in the blocks. To return search results based on keywords from the article and from relevant block content that the user has access to read, you must call the getResultData() method inside your custom search.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request</td>
<td>Object</td>
<td>JSON object to refine the search.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Array of search results in JSON format based on keywords from the knowledge article and from relevant knowledge block content that the user has access to read.</td>
</tr>
</tbody>
</table>

Integrating a custom search with knowledge blocks

```javascript
function doKeywordSearch(queryText, count, queryLocation) {
    var results = [];
    // To set up the request.
    var request = {
        keyword: queryText,
        language: "",
        // To pass data to filter on different metadata.
        variables: {
            kb_knowledge_base: ['Knowledge'],
        }
    }
```
```javascript
kb_category: '',
  author: ['',
},

// Provide the following.
  context: gs.getProperty('glide.knowman.sp.search_context',
    'Knowledge Search'),
  resource: 'Knowledge',
  order: "relevancy,true",

// Provide the pagination variables.
  start: queryLocation,
  end: queryLocation+count,
  attachment: false,

// Provide any additional metadata you want to include in your results.
  knowledge_fields: [
    "number",
    "sys_id",
    "published"
  ];

// To execute the search.
  var response = new KBPortalServiceImpl();
  response.getResultData(request);

// To send the search results back to the UI or to store results in your object.
  for (var i = 0; i < response.results.length; i++) {
    result = response.results[i];
    var article = {};
    article.sys_id = result.meta.sys_id.display_value;
    article.number = result.meta.number.display_value;
    article.short_description = article.short_description;
    article.title = result.title;
    article.published = result.meta.published.display_value;
    article.publishedUTC = result.meta.published.display_value;
    article.text = article.text;
    article.score = result.meta.score;
    article.label = article.short_description;
    article.shortDescription = article.short_description;
    results.push(article);
  }

  return results;
}
```

**KBBlock - Global**

The KBBlock API is included with knowledge blocks [com.snc.knowledge_blocks] as a script include. It provides methods to use with the knowledge blocks feature, such as integration with a custom knowledge article viewer.

**KBBlock - KBBlock()**

Instantiates a KBBlock object in a global application.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

KBBlock - getArticleContent(GlideRecord knowledgeRecord)

Gets knowledge articles with relevant knowledge block content that a user has access to read.

If you have activated the knowledge blocks feature and are using a custom knowledge article viewer with your application, your viewer may not display articles that expand the relevant block content. To expand block content that a user has access to read, you must call the getArticleContent() method inside your custom viewer.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>knowledgeRecord</td>
<td>GlideRecord</td>
<td>GlideRecord of the knowledge article to display.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Knowledge article with relevant knowledge block content that a user has access to read.</td>
</tr>
</tbody>
</table>

Integrating a custom knowledge article viewer with knowledge blocks

```javascript
function getArticleText(kbSysId) {
    var knowledgeRecord = new GlideRecord('kb_knowledge');
    var kbText='';
    if(knowledgeRecord.get(kbSysId)) {
        if(new GlidePluginManager().isActive('com.snc.knowledge_blocks')) {
            kbText = new KBBlock();
            kbText.getArticleContent(knowledgeRecord);
        }
        else
            kbText = knowledgeRecord.getValue('text');
    }
    return kbText;
}
```

// This function returns the article text with expanded block content.

Knowledge Management v3 homepage

The Knowledge Management v3 homepage displays knowledge articles and social Q&A questions organized by knowledge base and category, as well as featured content and popular articles.

To view the default knowledge homepage, navigate to Self-Service > Knowledge.
If you access knowledge from a service management application, the knowledge homepage for the associate application opens.

From the homepage, you can import a Word document to a knowledge base using the Import Articles button.

You can also create a new article using the Create An Article button, or ask a question using the Post a Question button.

- Import a Word document
- Create an article
- Ask a question

You can select a knowledge base to browse articles and questions within that knowledge base. You can view only knowledge bases you can access.

Articles and questions are organized by category or by tag. Categories are listed alphabetically. While browsing, you can filter content by type to view only knowledge articles, only social Q&A questions, or only unanswered questions. You can sort content by most recent update or by number of views.

An administrator can configure the knowledge homepage to display the number of articles and questions within each category. This count includes articles and questions from subcategories. To display the article and question count, set the knowledge homepage property Display or hide the count of articles and questions in the category and child categories (glide.knowman.show_number_on_categories) to true.

Search using Knowledge Management v3

Search for knowledge articles and social Q&A questions from the knowledge homepage using the search bar on the Knowledge Management v3 homepage.

Search results include only articles and questions you are authorized to read. The search results count do not take into consideration any security rules set for the articles. The number of articles you can access may be lower than the count displayed in the search results page. Documents that are attached to articles are also listed in the search results.

- Change how the attachments are displayed in the search results, set the How to display attachments in Knowledge Search Results glide.knowman.search.attachment property. Attachments can be displayed with a snippet, link only, or not at all.
To use wildcards in your search, navigate to Contextual Search > Search Contexts > Knowledge Base Search and select Enable wildcard searches.

Sort knowledge content by relevancy, most recent update, or number of views.

Filter results using the check boxes that appear. Filtering options appear depending on the search text.

**Filtering options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select if you want to view knowledge articles, social Q&amp;A questions, or both. This option is only available if Social Q&amp;A is enabled.</td>
</tr>
<tr>
<td>Knowledge Bases</td>
<td>Select a knowledge base to search. You can select only knowledge bases you can access. If you do not select a specific knowledge base, search results include articles and questions from all knowledge bases that you can access. You can also select a knowledge base from the choice list in the search bar. For pinned articles, only those in the selected knowledge base in the corresponding language appear.</td>
</tr>
<tr>
<td>Categories</td>
<td>Select one or more knowledge categories. Categories are listed alphabetically.</td>
</tr>
<tr>
<td>Authors</td>
<td>Select one or more authors.</td>
</tr>
</tbody>
</table>
## ServiceNow Madrid Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Language</td>
<td>The multi-language search feature is available when more than one language is enabled.</td>
</tr>
<tr>
<td></td>
<td>1. To enable multi-languages, activate the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) or activate one of the internationalization plugins for the language you require.</td>
</tr>
<tr>
<td></td>
<td>Note: Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.</td>
</tr>
<tr>
<td></td>
<td>2. To display search results in all available languages simultaneously, enable the glide.knowman.enable_multi_language_search property.</td>
</tr>
<tr>
<td></td>
<td>a. Navigate to Knowledge &gt; Administration &gt; Properties &gt; Knowledge Search Properties &gt; Enable multi language search and select the Yes check box.</td>
</tr>
<tr>
<td></td>
<td>b. Enter sys_properties.list in the filter navigator, search for the property to configure, and in the Value field, enter true.</td>
</tr>
<tr>
<td></td>
<td>Note: By default, the glide.knowman.enable_multi_language_search property is not enabled. Search results are displayed based on the language you select in the language filter on the Search page.</td>
</tr>
</tbody>
</table>

### Import a Word document to a knowledge base using Knowledge Management V3

Import a Microsoft Word document using Knowledge Management V3 to create a knowledge article. You must have user criteria "Can contribute" permission for at least one active knowledge base.

The import articles button does not appear in the following conditions:

- The Import Articles module is available in the application navigator.

**Note:** Beginning with Madrid, the Import a Word document feature is enabled by default and the Import Articles module is displayed in the application navigator. The Import a Word document feature isn’t enabled automatically for the existing customers who can continue using the Import Articles option on the Knowledge Management v3 page. For more information, see Import a Word document to a knowledge base.

- You cannot contribute to any knowledge base.
Note: An administrator can control the visibility of the Import Articles button by setting the other knowledge property Hide the 'Import' functionality (button and drag-n-drop) for all users (glide.knowman.import.hide_import_functionality) to true.

Role required: None

You can import Microsoft Word .doc and .docx files.

Note: The file extension must be lowercase.

When you import a document, text content from the document is used to create the knowledge article. The articles support all editing functions supported by the TinyMCE editor. All HTML supported by TinyMCE such as tables, lists, and links, as well as styling such as bold and italics, are preserved. Images from the document are added as attachments to the knowledge article and embedded in the article body.

Note: You can import multiple files at a time. Closing the browser or navigating away cancels any in-progress uploads but does not delete articles created from completed imports.

You cannot import documents to knowledge from mobile devices.

The following styles and elements are preserved when importing a .doc or .docx file into a knowledge base. Styles and elements not included in this list may not be preserved when importing a document.

- Titles
- Headings
  
  Note: For any headings and subheadings with numbers, the numbers are not imported.

- Images
  
  Note: Images may not be aligned exactly as in the Word document you import.

- Links
- Bold text
- Italic text
- Underlined text
- Ordered and unordered lists
  
  Note: After import, the bullets in an unordered list are replaced with dots.

- Tables
  
  Note: Only default heading settings are supported. Custom heading styles are imported using the default settings for those styles. Table styling and borders are not supported.

1. Navigate to Self-Service > Knowledge.
2. Perform one of the following actions.
   - Click Import Articles and select one or more document files.
   - Drag one or more document files onto the knowledge homepage.
3. Select the Knowledge base to add the new article to.
   
   You can select only knowledge bases you can contribute to.
4. Optional: Select a **Category** from within that knowledge base.

   **Note:** Use the category picker to add a category. The picker does not differentiate between the different category levels. You can select a category or sub category and add it to the **Category** field.

5. Optional: Select the **Publish** check box to start the publishing workflow for each imported article immediately after the import finishes.

   This check box applies only when importing to V3 knowledge bases and only if the **Show publish checkbox on the knowledge import pop-up** property is set to **Yes** on the Knowledge Management properties form. You cannot automatically publish articles imported to v2 knowledge bases.

   Knowledge v2 articles go into **Draft** state. Knowledge V3 articles go into **Review** or **Published** state, depending on the workflow attached to the knowledge base (Approval Publish or Instant Publish).

6. Click **Import**.

   A new article is created in the selected knowledge base and category using the content from the uploaded document. If you uploaded multiple documents, one article is created for each. If you use knowledge internationalization, the language of the new article is set to the currently selected system language.

   After the upload completes, a popup window appears displaying the number and short description of the newly-created articles. Click an article to view the full record.

   If any errors occur during the upload, a popup window appears to display the error.

---

**Create a knowledge article**

Knowledge contributors can create and edit knowledge articles within a knowledge base to share information across your organization.

You must have **Can Contribute** access to at least one active knowledge base.

To view an article template, you must activate the article templates feature and enable the desired templates.

Users with at least one role can create and edit knowledge articles. These users are known as knowledge contributors. Users without any role can read articles and submit feedback, but cannot create or edit articles.

Some knowledge bases may allow only certain users to contribute. For example, a member of the IT department can create knowledge articles in the IT knowledge base, such as desktop support information or articles describing company IT processes.

1. There are three ways of creating knowledge articles.

   - Navigate to **Self-Service > Knowledge** and click the Create an Article icon.
   - Navigate to **Knowledge > Articles > Create New**.
   - From the Knowledge Management homepage, click the Overflow icon and then **Create Article**.

2. On the Create new article page, select a knowledge base.

   The list of article templates to select in the next step is filtered according to the article templates available for the selected knowledge base.

   **Note:**

   On the Create new article page, you can select to **Switch to older version of this page** or **Switch to updated version of this page** (recommended).

3. Select an article template.

4. Fill in the fields on the form, as appropriate.
## Knowledge form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Base</td>
<td>The knowledge base selected for this article.</td>
</tr>
<tr>
<td></td>
<td><img src="note" alt="Note: An article can only be associated with one knowledge base." /></td>
</tr>
<tr>
<td>Category</td>
<td>The category for this article. Select a Knowledge Base before you can select a category. Articles without a category appear on the knowledge homepage in the (empty) category.</td>
</tr>
<tr>
<td>Ownership Group</td>
<td>The ownership group for this knowledge article. An ownership group consists of a group of members and a manager who are responsible for approvals, ensuring article quality, and feedback tasks. Ownership groups can publish, edit, and retire knowledge articles that they are associated with.</td>
</tr>
<tr>
<td></td>
<td><img src="note" alt="Note: If no ownership group is assigned, the article automatically goes to the knowledge administrator and knowledge manager for approval." /></td>

<tr>
<td>Parent</td>
<td>Number of the article that represents the base language article. This setting keeps translations of the same article related to each other. Consider choosing the same language consistently for the parent article. This field appears only when the I18N:Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) is activated. For more information, see <a href="#">I18N - Knowledge internationalization</a>.</td>
</tr>
<tr>
<td>Article type</td>
<td>The type of article, either HTML or wiki.</td>
</tr>
<tr>
<td>Workflow</td>
<td>[Read-Only] The publication state of the article, such as Draft or Published. When inserting a new article from an existing article, the state of the new article is reset to Draft.</td>
</tr>
<tr>
<td>Source</td>
<td>The task this knowledge article was created in response to, if any. This field is set automatically when you create the knowledge article from a task record.</td>
</tr>
<tr>
<td>Attachment link</td>
<td>Check box for downloading an attached file automatically when a user accesses the article, instead of opening the article view. Add one or more attachments to the article to use this option.</td>
</tr>
<tr>
<td>Display attachments</td>
<td>Check box for displaying attachments to users viewing this knowledge article. Attachments appear below the article text. Add one or more attachments to the article to use this option.</td>
</tr>
<tr>
<td>Short description</td>
<td>The title of the article. This title appears when browsing and searching knowledge, and at the top of the article.</td>
</tr>
<tr>
<td>Text</td>
<td>Content for the article. Use the <a href="#">HTML editor</a> to create content. A preview of the content appears when browsing and searching knowledge.</td>
</tr>
</tbody>
</table>

5. **Click Submit** to create the article.

After saving the article record, you can add tags to further organize the article.

Any additional steps required to publish the article, such as approvals, depend on the publishing workflow for the knowledge base.
• If there is no approval workflow set up, the article is immediately published.
• If there is an approval workflow set up: If the article is approved, it is published. If rejected, the article state is changed to Draft.

Edit a knowledge article

Knowledge contributors can edit/update knowledge articles within a knowledge base to update information shared across your organization.

Role required: knowledge

Users with at least one role can edit knowledge. These users are known as knowledge contributors. Users without any role can read articles and submit feedback, but cannot edit articles.

However, Knowledge managers can configure User Criteria to restrict access to certain Knowledge bases. For example, only members of the IT department can create or edit knowledge articles in the IT knowledge base, such as desktop support information or articles describing company IT processes.

Note: If you have user criteria "Can contribute" permission for the specified knowledge base, but are not the article author, and do not have a knowledge base admin or manager role: The installed Knowledge Management Advanced Installer plugin requires the glide.knowman.versioning.enabled property (from the System Property [sys_properties] table) to be set to false to enable you to be able to make changes to unpublished articles within the knowledge base.

Edit an article using one of these options.

• Edit published/unpublished articles with Versioning enabled:
  1. Navigate to Knowledge > Articles
  2. Select an article from the Published or Unpublished category.
  3. From the article, click Checkout and edit the article.
  4. To save changes to:
     • an unpublished article, and to publish it at the same time, click Publish.
     • a published article, or to save changes to an unpublished article without publishing it, click Update.

• Edit published articles from the Knowledge homepage or Service Portal:
  1. Navigate to one of the following modules:
     • Self-Service > Knowledge
     • Knowledge > Homepage
     • Knowledge Service Portal homepage
  2. From the Knowledge homepage, search for and select the article to edit.
  3. From the article, click Edit, then from the Knowledge form record, edit the desired editable fields.
4. Click Update to save changes.

If you edited an unpublished article, any additional steps required to publish an article, such as approvals, depend on the publishing workflow for the knowledge base.

**Select a knowledge article category**

Knowledge articles within a knowledge base are grouped by category. These groups can help you define the knowledge base taxonomy, and can help users find articles within that knowledge base.

As a knowledge contributor, when editing a knowledge article you can select categories using the Category picker, and add or edit categories if enabled for the knowledge base.

1. Click the reference lookup icon beside the Category field.
2. Select an existing category, or click the add category icon (+) to add a new category.
   After you select a category, you can click the pen icon to rename that category. Press the enter key or click outside the selected category to save the change.
   
   **Note:** Clicking Cancel while selecting a category cancels selecting a new category, but does not revert any changes you make to the categories such as renaming or adding new categories.

3. Fill in the fields on the form, as appropriate.
4. Optional: Select or add a subcategory.
5. Click OK.

**Move a knowledge article**

You can move articles between knowledge bases.

1. Edit a knowledge article.
2. Change the Knowledge Base field value.
   After moving an article, the Apply Default Values dialog box prompts you to populate certain fields in the article with default values from the new knowledge base. If the new knowledge base has no default values, the dialog box does not appear.
3. Click OK to overwrite fields with the default values, or Cancel to leave all fields unchanged.
A knowledge manager can define default values for articles in knowledge bases you manage using the **Set default knowledge field values** field on the Knowledge Base form.

4. Click **Update**.

**Retire a knowledge article**

You can initiate the retirement workflow to retire a knowledge article. Only administrators and knowledge administrators can view articles after they are retired.

A knowledge article has an associated retirement workflow, similar to the publishing workflow. This allows administrators to configure these workflows, defining an approval and review process for retiring knowledge if appropriate.

When editing an article, click **Retire** to launch the retirement workflow associated with that article. If the article requires approval prior to retirement, the article goes to a pending approval state, and the workflow either finishes upon approval or cancels if rejected by a required approver. The article number associated with the retired article is not available for reuse.

**Note:**

- Retired knowledge articles are not available to users except for administrators and knowledge administrators who can view them. To reuse a retired article, create a new article with the same content, which is published once approved.
- An article and its translations have a parent-child relationship. Retiring a parent article does not automatically retire all its translated child articles.
Instant retire and Approval retire workflows

Create knowledge from an incident or problem

To create knowledge from an incident or problem, select the Knowledge check box on the incident or problem form and close the incident or problem record.
For detailed information on creating knowledge from an incident, refer to Create a knowledge article from an incident

The short description from the incident or problem becomes the knowledge article title. Articles created this way are added to the knowledge base specified in the property glide.knowman.task_kb.

Depending on the value of the glide.knowman.submission.workflow property, knowledge created from an incident or problem may require additional approval. When this property is true, a submission record is created instead of a knowledge article. A user with the knowledge role must approve the submission to create a knowledge article.

Approving a submission creates a new knowledge article using the submission content.

1. Navigate to Knowledge > Open Submissions.
2. Select a submission record.
3. Review the submission to ensure the content and settings are correct.
4. Click Create Article.
   A new draft knowledge article is created. Articles created this way are added to the knowledge base specified in the property glide.knowman.task_kb.

You can edit the new knowledge article before publishing it, such as to select a category.

Create a knowledge article from a customer service case

Reuse information from a customer service case by creating knowledge articles from cases.

Your administrator must enable creation of articles from customer service cases.

Role required: sn_customerservice_agent or knowledge

1. Navigate to Customer Service > Cases > All.
2. Select a case from which you want to create a knowledge article.
3. Click Create Knowledge.
   The relevant fields are automatically copied from the case to the record that opens.
4. In the Knowledge base field, enter the name of the knowledge base in which you want this article to display.
5. Click Submit.

Request a knowledge base

If existing knowledge bases do not fit your needs, you can request a new knowledge base through the service catalog. If the request is approved, you are added as the owner of the new knowledge base.

Role required: none

If no knowledge base exists that fit your needs, all users can request a new knowledge base.

1. Navigate to Self-Service > Service Catalog.
2. Select Can We Help You?.
3. Select the Request Knowledge Base catalog item.
4. Enter the reason you want the knowledge base, and a name for the knowledge base.
5. Click Submit.

You are notified when the request is approved or rejected. If the request is approved, you are added as the owner of the new knowledge base. You can then assign managers and manage articles in the new knowledge base.

Knowledge bases created through this request process are inactive by default, so you must activate the knowledge base to make it available for users.
Use knowledge on mobile devices

All users can access knowledge from mobile devices to search for and view knowledge articles and social Q&A questions.

Browse knowledge on mobile devices

You can browse knowledge bases using a mobile device.

Navigate to SELF-SERVICE > Knowledge Base.

Mobile Knowledge View

Browse Knowledge by tapping on a category and browsing articles or subcategories.
Mobile Knowledge Categories

Note: Select the desired category and click the close icon (×) for the selected category to reflect in the search results.

View knowledge articles and questions on mobile devices

You can read knowledge content using a mobile device.
Tap a title to view the article or question.
Note: You cannot edit or add comments to knowledge articles on the mobile interface. If using Social Q&A, you can perform all functions such as adding and editing questions, answers, and comments through the mobile interface.

Mobile Knowledge Article View

Search knowledge on mobile devices

Find a specific article or question by searching on a particular term.
Mobile Knowledge Search

Migrate to Knowledge Management v3

Knowledge Management has significantly changed with the introduction of knowledge v3 starting with the Fuji release.

Knowledge Management v3 has several key differences from Knowledge Management v2, the version of Knowledge Management that was available until Eureka release. The knowledge v3 plugin is activated by default starting with the Fuji release.

The following podcast provides more information on what is new in Knowledge Management v3.

When upgrading from Eureka or earlier versions, if you intend to use the new features available in knowledge v3, you have to migrate legacy knowledge content and any customizations you have made to the Knowledge Base applications.

The following video provides more information on how to migrate from Knowledge Management v2 to v3.

Key differences

<table>
<thead>
<tr>
<th>Legacy Knowledge</th>
<th>Knowledge v3</th>
</tr>
</thead>
<tbody>
<tr>
<td>One knowledge base.</td>
<td>Multiple knowledge bases.</td>
</tr>
</tbody>
</table>
## Legacy Knowledge vs. Knowledge v3

<table>
<thead>
<tr>
<th>Legacy Knowledge</th>
<th>Knowledge v3</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single lifecycle workflow shared by all articles.</td>
<td>Separate, customizable workflows available for each knowledge base.</td>
</tr>
<tr>
<td>Two-level organizational structure with <strong>Topic</strong> and <strong>Category</strong>. A single organizational taxonomy shared by all articles.</td>
<td>Category structure with any number of levels. Each knowledge base has a unique category taxonomy.</td>
</tr>
<tr>
<td>Permissions defined per article using roles and ACLs.</td>
<td>Permissions defined per knowledge base or article using user criteria.</td>
</tr>
</tbody>
</table>

## Knowledge Management v3 migration process

When you upgrade from Eureka or earlier, consider a multi-step migration process. This process ensures you can access existing knowledge content and allows you to fully migrate at your own pace.

Review automatic changes before upgrading. These changes are applied immediately when upgrading and may impact existing functionality.

1. Migrate knowledge functionality to use your customized functionality with the Knowledge Management v3 enhancements.
2. Migrate knowledge content to use the Knowledge Management v3 enhancements with your existing knowledge articles.

## After migration to Knowledge Management v3

These items are relevant to getting the full range of new functionality after you migrate.

- You must configure knowledge access controls based on user criteria to ensure that users can access existing knowledge content. Since access control in knowledge v3 is intended to be based on user criteria alone, users may be unable to access v2 or v3 knowledge articles, or have restricted access, with preexisting ACLs.
- If the home page was customized in knowledge v2, custom layout and links are not saved in knowledge v3.
- Images added using the **Image** field in a knowledge article form do not display in the Knowledge v3 or Knowledge Service Portal pages. The article search results page displays the knowledge base icon next to all articles from the knowledge base.

## Automatic changes after Knowledge Management v3 migration

Upgrading to Knowledge Management v3 automatically changes knowledge functionality including the knowledge user interface and security model.

### Default knowledge base

When you upgrade from Eureka or earlier, a default knowledge base is created, titled Knowledge, that contains all knowledge articles from the previous version.

After the upgrade, you can add and edit articles in this knowledge base.

Articles in the default knowledge base continue to use legacy functionality, such as role-based access controls. Any customizations you made to knowledge functionality before the upgrade are preserved in the default knowledge base.

### Knowledge search changes

By default, the legacy knowledge portal uses knowledge v3 search with limited filtering options.
You can filter results only by knowledge base. Search results include only those articles the current user can view based on user criteria. ACLs do not restrict search results.

**Knowledge security changes**

Knowledge v3 manages access to articles with user criteria rather than roles and ACLs.

Existing ACLs on the Knowledge [kb_knowledge] table are preserved, but with the following changes.

- A version of 3 indicates that a knowledge base uses the knowledge v3 functionality.
- A version of 2 indicates that a knowledge base uses legacy functionality.

New ACLs introduced by knowledge v3, such as field-level controls, apply to all knowledge bases.

When you upgrade from Eureka or earlier, any custom ACLs you implemented for the Knowledge table still apply to any knowledge records in the default knowledge base. Knowledge v3 updates ACLs that exist before upgrade so they only apply to Knowledge [kb_knowledge] records where this field value is 2.

**Note:** These changes affect the default knowledge base. Even if you are not using the new knowledge functionality, the legacy knowledge behavior may change if you have made customizations to ACLs on the Knowledge [kb_knowledge] table. Ensure you configure knowledge access controls after upgrading to prevent unexpected behavior.

To control access to knowledge articles, try to use user criteria, which were introduced in Knowledge Management v3. For more information, see Select user criteria for a knowledge base.

**Knowledge article view changes**

The Knowledge application uses the kb_view UI page to display knowledge articles.

**UI page**

The following changes apply automatically when you upgrade from Eureka or earlier:

- The existing kb_view page is renamed to kb_view_customer. The kb_view_customer page is used to display articles in the default knowledge base, preserving the legacy user experience.

  **Note:** By default, the kb_view_customer page is publicly accessible. As an administrator, you can change this behavior by modifying the sys_public table record for this page and clearing the Active field in the record.

- A new kb_view page is used. This is becomes the primary page used to display articles that are not in the default knowledge base.

You should review all customizations introduced around the legacy kb_view UI page.

- URLs should not be updated as the new kb_view page redirects to the correct page depending on the article.
- Customizations made to the kb_view UI page are automatically copied to the kb_view_customer page on upgrade.
- Other customizations that affect kb_view may need to be copied or modified to apply to kb_view_customer. For example, an ACL defined for kb_view may need to be duplicated to provide security coverage for kb_view_customer.
Feedback

Legacy feedback functionality is retained for knowledge articles displayed in the legacy article view. Users can continue to use the feedback options to view, add, and reply to comments on these legacy articles. Legacy comments are retained in the Knowledge Feedback [kb_feedback] table.

To retain the legacy comment functionality with new knowledge articles, set the Use Live Feed for Knowledge feedback property (glide.knowman.use_live_feed) to false. This property is set to false by default.

Knowledge portal changes

While the legacy knowledge portal, kb_home, has not changed in Knowledge v3, we strongly recommend that you consider moving to the new Knowledge v3 home page, $knowledge.do.

UI page

You can search articles from the knowledge portal and filter search results by knowledge base, and by language if the instance uses knowledge management internationalization. This portal also appears for users on older browsers, such as Internet Explorer 9, instead of the knowledge homepage.

Navigation add-ons are available in the legacy knowledge portal. Navigation add-ons of the Link type appear in the top-right of the portal. To add navigation add-ons of the Search type, you must customize the kb_home UI page.

Search

By default, the legacy knowledge portal uses knowledge v3 search with limited filtering options. You can filter results only by knowledge base. Search results include only those articles the current user can view.

Access a knowledge base or search engine

You can add new search engines to the advanced search function or add links at the top of knowledge pages.

Role required: admin

This feature lets you configure access to a knowledge base, either public or private, or to a public search engine.

1. Navigate to Knowledge > Administration > Navigation Add-ons.
2. Click New.
3. Complete the form.

Navigation Add-on form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the search engine name or link text.</td>
</tr>
<tr>
<td>Type</td>
<td>Select Search or Link.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to indicate the sequence of this search option or link.</td>
</tr>
<tr>
<td>URL</td>
<td>For a link, enter the URL. Leave blank for a search engine.</td>
</tr>
<tr>
<td>Script</td>
<td>For a search engine, enter a script that opens the search engine's results page for the search text. Leave blank for a link.</td>
</tr>
</tbody>
</table>
4. Click **Submit**.

**Knowledge submissions**

Knowledge submissions created from tasks continue to work in knowledge v3 with minor changes.

By default, the **Topic** and **Category** fields no longer appear on the Submission form due to the knowledge v3 category changes.

The property `glide.knowman.submission.workflow` no longer appears on the knowledge properties UI page. To enable knowledge submissions, set this property to true on the System Properties [sys_properties] table.

See creating knowledge from incidents and problems for instructions on using knowledge submission in knowledge v3.

**Migrating Knowledge access controls**

Access to knowledge articles is controlled based on the user criteria for the knowledge base.

**Important:** If you do not migrate existing knowledge ACLs to user criteria, users may be unable to access knowledge articles, or may be able to access restricted articles.

User criteria records, rather than ACLs, control basic create, read, update, and delete operations for knowledge articles as well as which search results appear. This may lead to unexpected behavior if your configuration depends on ACLs to control access.

To ensure users are able to access the correct knowledge articles, migrate any ACL-based security settings to user criteria. This process may include creating additional knowledge bases and moving existing content to these knowledge bases, depending on your security model. For a detailed explanation and migration examples, refer to KB0550924 *Understanding User Criteria and ACLs in Knowledge v3*.

This video demonstrates how to manage article-level access controls during migration from Knowledge Management v2 to v3.

**Knowledge functionality migration**

You can migrate knowledge functionality to use your customized functionality with the knowledge v3 enhancements.

**Replaced knowledge modules**

When you are ready to migrate to knowledge v3, you can activate the v3 modules and deactivate the legacy modules.

Use the tables below to identify which knowledge v3 modules to activate and which legacy modules to deactivate. When activating a knowledge v3 module, deactivate the knowledge v2 module with the same name to ensure users access the correct module.

You can use the `enablev3anddisablev2menus.txt` backup script to enable knowledge v3 menus and disable knowledge v2 menus.

**Knowledge v3 modules**

</table>
Knowledge article publish and retire workflows

With knowledge v3, article state is controlled by workflows.

In the legacy knowledge base, article state was controlled by UI actions. UI actions from previous versions are available only in the default knowledge base.

To preserve your article publishing and retirement process in new knowledge bases, create workflows that follow these processes. To create these workflows, copy the default workflow that best matches your process and modify that copy. After creating workflows that use your article publishing and retirement processes, use these workflows as the Publish workflow and Retire workflow for the new knowledge bases.

Knowledge article category structure

With knowledge v3, all knowledge articles are organized by category and subcategory within knowledge bases.

The default knowledge base uses the legacy category structure; knowledge articles are organized by topics and categories.

Before you migrate articles, create a category structure for these articles in the destination knowledge bases. This structure can reproduce your legacy topic and category structure or can be extended to take advantage of the knowledge v3 category functionality.

Knowledge content migration

To use the new functionality available in knowledge v3 with legacy articles, you must migrate these articles out of the default knowledge base.

To migrate knowledge content, move articles out of the default knowledge base by changing the Knowledge Base value for each article. The state of the article remains unchanged when moving articles. After selecting a new knowledge base, assign a category to each article using the category structure defined in the new knowledge base.

After you migrate a knowledge article, the legacy feedback functionality is automatically replaced with the new knowledge feedback mechanisms. Legacy feedback is copied to the Live Feed Message [live_message] table to ensure previously submitted feedback is available for knowledge v3 articles.

Social Q&A

If Social Q&A is activated for a knowledge base, you can ask questions and respond to questions from other users. You can also vote on helpful questions and answers.

Social Q&A extends the Knowledge application. All questions and answers are associated with a knowledge base. Social Q&A uses Knowledge access controls, search, and the knowledge homepage.

Social Q&A is available on mobile devices using the mobile knowledge interface. You can perform all Social Q&A functions on mobile, such as asking and answering questions.

Note: Social Q&A is not compatible with Internet Explorer 9 or earlier. Navigating to a Social Q&A page using one of these browsers will cause a browser support warning to appear.

Enable social Q&A for a knowledge base

As a knowledge manager, you can enable social Q&A for a knowledge base you manage.
Role required: knowledge_manager

You can set the limit for the number of times users can post questions, answers, and comments, or subscribe to the questions using the Knowledge Social Q&A properties section.

All Social Q&A questions and answers are associated with a knowledge base. The Enable social questions and answers check box on the Knowledge Base form controls if users can view and ask questions.

Social Q&A uses user criteria from the knowledge base to determine which users have access to questions. A user must meet the criteria defined in the knowledge base Can Read related list to view or contribute to Social Q&A questions, answers, and comments associated with that knowledge base.

Note: The Can Contribute related list does not control the ability to contribute to Social Q&A. Users that meet the Can Read criteria for a knowledge base can also contribute questions, answers, and comments.

1. Navigate to Knowledge > Knowledge Bases.
2. Select a knowledge base you manage.
3. Select the Enable social questions and answers check box.
   This check box only appears if the Social Q&A plugin has been activated.
4. Click Update.

You can disable Q&A for a knowledge base by clearing the Enable social questions and answers check box. Disabling Q&A does not delete existing questions and answers associated with this knowledge base, but prevents users from browsing or searching for those questions and answers.

Social Q&A questions

Social Q&A organizes information by question.

You can browse and search for questions from the Knowledge homepage (Self-Service > Knowledge). Questions appear along with knowledge articles organized by knowledge base, category, and tags.

Click on a question to view the question details, as well as responses and comments. You can add responses and comments, vote on existing responses, share questions, and edit your own questions and answers from the question details. Click on a picture profile to view the user's profile.

Ask a social Q&A question

As a Social Q&A user, you can ask questions that other users can respond to.

Roles required: None

1. Navigate to Self-Service > Knowledge.
2. Click Post a Question.
3. Enter a value for the following fields.

   **Question fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Enter the question you have.</td>
</tr>
<tr>
<td>Question details</td>
<td>Enter additional details about the question that may help other users provide an answer.</td>
</tr>
<tr>
<td>Knowledge base</td>
<td>Select the knowledge base this question relates to. You can select only knowledge bases configured to allow Q&amp;A.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Category</td>
<td>Select the knowledge category this question relates to. You can select only categories within the selected knowledge base. Questions without a category appear on the knowledge homepage in the (empty) category.</td>
</tr>
<tr>
<td>Tags</td>
<td>Enter one or more tags that describe the question.</td>
</tr>
</tbody>
</table>

4. Click **Post Question**.

To accept the answer, click the **Accept** link from within the answer. The accepted answer moves to the top of the list of answers. You can unaccept an answer by clicking **Unaccept**.

**Note:** You must be the owner of the question or the knowledge manager to accept an answer.

**Answer a question**

As a user, you can answer a question another user has asked. The owner of the question can then accept the answer.

Roles required: None

As the owner of a question, you can accept an answer as the correct answer. That answer then appears above other answers for the question.

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Enter an answer in the **Your answer** field.
4. Click **Submit**.

**Comment on a question or answer**

You can comment on a question or an answer to provide additional information relevant to that question or answer.

Roles required: None

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Within the question or answer you want to comment on, click the **Comment** link.
4. Enter the comment text.
   
   Comments have a maximum length of 140 characters.
5. Click **Post comment** or press the Enter key.

**Edit a question, answer, or comment**

You can edit questions, answers and comments you submit, or in knowledge bases you manage.

Role required: None

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Within the question, answer, or comment you want to edit, click **Edit**.
4. Edit the details as needed.
5. Optional: When editing a question, click **Advanced** to make changes to the question record.
6. Click **Update**.
Click **Undo** to discard the changes and close the editor.

### Vote on a question or answer

As a Social Q&A user you can vote on a question or answer to promote it.

Role required: None

Vote up questions that you want users to answer, and answers that you believe accurately resolve questions. Alternatively, vote down questions that you do not find useful, or answers that you believe are incorrect. You can vote for each question or answer only once, but you can change your vote.

Answers with a higher score appear above answers with a lower score when viewing a question. A pinned answer appears above other answers regardless of votes.

Note: You cannot vote for your own questions or answers.

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Click the up or down arrow next to the question or answer you want to vote on.
   The score for that question or answer changes depending on your vote.

You can change your vote by clicking the other arrow.

### Subscribe to a question

You are automatically subscribed to any question you ask, so you receive notifications when another user votes on, comments on, or answers the question. If you want to receive notifications for a question asked by another use, you can manually subscribe to the question.

Role required: None

You automatically subscribe to any question you ask.

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Click the subscribe icon

If you want later to stop receiving notifications about this question, click the unsubscribe icon

### Delete a question, answer, or comment

You can delete questions, answers, or comments that you submitted.

You can delete only questions, answers, and comments you submitted. Knowledge managers can delete any question, answer, or comment within knowledge bases they manage.

Role required: none

1. Navigate to **Self-Service > Knowledge**.
2. Select a question or answer.
3. Within the question, answer, or comment you want to delete, click the Delete link.

Deleting a question also deletes all answers and comments associated with that question. Deleting an answer also deletes all comments associated with that answer.
Share a question
You can generate a URL directly to a question and related answers.
Role required: None
1. Navigate to Self-Service > Knowledge.
2. Select the question that you want to share.
3. Click Share. Some browsers do not allow adding content directly to the clipboard. You may need to manually copy the URL from the popup that appears.
Distribute the URL to share the question.

Social Q&A internationalization support
The Social Q&A questions and answers are automatically associated with the language that is set for the interface.
You can only browse and search for questions in the language currently set for the interface. For example, if a Social Q&A user has set French as the interface language, any questions that the user asks is associated with the French language. All Social Q&A users who want to view those questions must have their interface language set to French.

Note: For Social Q&A internationalization to take effect, you must clear the platform cache and browser cache after selecting the desired language.

Social Q&A search
Users can search for specific questions from the knowledge homepage.
Social Q&A uses knowledge search to provide search results. Searching knowledge returns questions that contain the search terms in the question title or the question details, or in the accepted answer.
By default, knowledge search results include both knowledge articles and questions. You can filter results using knowledge search controls, such as filtering by knowledge base or author.
Social Q&A results also appear with knowledge articles when using global search.
Social Q&A uses the Contextual Search feature to generate search results. Questions appear in Contextual Search results, such as when creating an incident. The Social QA Question Search Context and Social QA Question Searcher records define the Social Q&A search. To ensure Social Q&A search functions as intended, do not modify these records.

Social Q&A tags
Tags organize questions and provide information about the question subject matter.
Social Q&A shares available tags with other applications allowing you to organize records consistently across the instance. Tags are stored on the Tags [label] table.
You can view a list of tags and filter by tag from the knowledge homepage. Clicking on a tag displays a list of knowledge articles and questions with that tag.
Only users who can edit a question can edit the associated tags. By default, only the question owner and knowledge managers can add or remove tags on questions.

Legacy: Chat
Chat is deprecated in the Istanbul release.
**Note:** The *Connect* feature provides an updated instant messaging platform, which is activated by default for new instances. The legacy chat and Connect features should not be used concurrently. There is no migration path from legacy chat to Connect.

Chat provides real-time communication via instant messaging between users in a ServiceNow instance. Features include:

- One-to-one chats (instant messaging) between users.
- Chat rooms for conversations with multiple users. Chat rooms may be public (any user can join) or private (only invited users can join).
- Chat rooms linked to task records. Users can work together to solve issues, and conversation history can be shared by everyone who needs to reference it.
- Help desk chat. End users can access live support via instant messaging. Service desk staff can resolve basic issues in real-time or create incidents directly from chat requests for more extensive issues.
Legacy: Get started with Chat

Get started with legacy chat.

Role required: admin

1. Establish use guidelines. Social media can improve communication and aid productivity. To get the most out of these tools, establish clear and simple social media guidelines that foster information sharing and a comfortable work environment.

2. Activate the Chat plugin to enable the legacy chat and legacy Help Desk Chat features.

3. Configure security settings. Users must log in to use the legacy chat features in the base system. The standard system security settings and Social IT-specific security settings are available. To learn more about setting up these features, refer to the plugin activation pages.
   - Chat rooms may be Public (any user can join) or Private (only invited users can join).
   - Administrators can limit who can read chat messages on tasks and who can create chat rooms.

Legacy: Installed with Chat

What components are installed with legacy chat.

Demo data is available for legacy chat. The demo data creates a chat queue called Help Desk Chat that is supported by the assignment group Chat Support. Additionally, the Help Desk Chat link is added to the header of the Employee Self-Service portal. To learn more, see Set Up Chat Queues for Help Desk Chat.

Other:
- Event: A new event called chat.invite is registered to trigger an email notification when users are invited into a chat room.
- Email Notification: An email notification called Chat Room Invite is added to send when users are invited to a chat room.

Legacy: Fields installed with legacy chat

Legacy chat adds fields.

<table>
<thead>
<tr>
<th>Display name [Table name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header</td>
<td>Adds the Help Desk Chat link to the ESS portal page.</td>
</tr>
<tr>
<td>[content_block_header]</td>

Legacy: Chat use

Legacy chat allows you to interact and collaborate through real-time instant messages with other users in an instance.

Use legacy chat to:

- Initiate or participate in chat conversations with one or multiple users.
- Initiate or participate in chat conversations that are attached to task records (such as an incident).
- See when other users are available to chat.

To open the chat desktop, navigate to Social IT > Chat.

**Note:** Service desk staff may also provide live support to other users via help desk chat.
Legacy: Update your profile

Your profile identifies your contributions to legacy chat conversations.

Your profile identifies your contributions to conversations. It is created automatically the first time you use chat and consists of:

**Profile**

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>From your user account in ServiceNow. Your name appears on your messages and in the member list of any chat room you join.</td>
</tr>
<tr>
<td>Picture</td>
<td>Select any picture. Your picture appears beside your name in other users’ favorites list and at the top of your favorites list.</td>
</tr>
</tbody>
</table>

To update your profile picture:

1. Click your picture in the top of the favorites list.
2. Browse to the desired picture file and click **Open**.

**Note:** Changes to your profile picture affect legacy chat and live feed if the Live Feed plugin is activated.

Legacy: Update your status

In legacy chat, your status lets other users know whether you are available to chat.
Your status lets other users know whether you are available to chat. Your current status is indicated by the color of the icon in the upper right of your favorites list, beside your name. View the status of other users in your favorites list.

To change your status:

1. Click the status icon beside your name.
2. Select a status (see table).

### Change status

<td>Chat offline</td>
</tr>
</tbody>
</table>

### Legacy: Use your favorites list

In legacy chat, your favorites list appears on your chat desktop and provides certain functions.
Favorites list

- Users:
  - Add another user in the system to your favorites list.
  - See if your favorite users are available to chat. Users are organized alphabetically and in sections by status.
  - Start a conversation by double-clicking a name.
  - Expand or collapse a section by clicking Online or Offline.

- Rooms:
  - See the list of your favorite chat rooms.
  - Join a chat room by double-clicking its name.

- Favorites list toolbar:
  - Options (Chat window menu): access a menu with options to add a favorite user, view online users, create a chat room, and view chat rooms.
  - Add User (Add friend): add a favorite user.
  - Create Room (Add room): create a chat room.
  - Invitations (Chat invitation): respond to invitations to join chat rooms.

To expand or collapse a section in the favorites list, click the section header or click the arrows on the section header.
Legacy: Add a favorite user
How to add a user to your favorite users list in legacy chat.

1. Click the Add User button.

2. Begin typing a user name and select a user from the list, or click the reference lookup and select a user from the table.

3. Click OK.

Legacy: Remove a favorite user
How to remove a favorite user in legacy chat.

To remove a user from your favorite users list, right-click the user's name and select Remove From List.

Legacy: View an online user
How to view a list of all users who are available to chat (status of Online) in legacy chat.

1. Right-click the Users section header or click Options on the toolbar.

2. Select Show Online Users.
   - Start a one-to-one chat with a user on the list by double-clicking a name.
   - Send Message or Add To Friend List by right-clicking a name.
Online users

**Legacy: View a room**

How to view a list of all public chat rooms in legacy chat.

1. Right-click the **Rooms** section header or click **Options** on the toolbar.

   ![Chat window menu](image)

2. Select **Public Rooms**.
   
   - To join a room, double-click a name or right-click and select **Join Room**. See *Joining Chat Rooms*. 
Legacy: Start a one-to-one chat

How to start a one-to-one chat in legacy chat.

- To start a chat with one user in your favorites list, double-click the user's name or right-click and select Send Message.
- To start a chat with one available user, double-click the user's name on the online users list. See Viewing Online Users.

Send a message to start a conversation.

Legacy: Create a chat room

How to start a chat with multiple users from the legacy chat desktop.

To start a chat with multiple users from the chat desktop (requires access rights):

1. Click Create Room on the favorites list toolbar.

   ![Add room](image)

2. Enter the room details (see table).
3. Click Create Room. An invitation appears in the favorites list of all invited users and a new chat window opens on your chat desktop.
### Create Room

<table>
<thead>
<tr>
<th>Room name:</th>
<th>Chat Room for INC0000003</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description:</td>
<td>Wireless access not available on floor 3</td>
</tr>
<tr>
<td>Password:</td>
<td>*****</td>
</tr>
<tr>
<td>Room avatar:</td>
<td>![Avatar]</td>
</tr>
</tbody>
</table>

**Features:**
- **Public**: A room that can be found by any user through normal means such as searching and service discovery.
- **Members Only**: A room that a user cannot enter without being on the member list or invited.
- **Temporary**: A room that is destroyed if the last occupant exits.

**Invite:**
- Fred Ludy
- Beth Anglin
- ITIL User

**Options:**
- Assignment group
- Watch list

[Create Room] [Cancel]

<td>• Assignment group: invite all users in the assignment group for the task.</td>
</tr>
<tr>
<td></td>
<td>• Watch list: invite all users on the watch list for the task.</td>
</tr>
</tbody>
</table>

Legacy: Create a chat room for a task

How to start a legacy chat with multiple users from a task record.

Note: This procedure is not possible if the Connect feature is enabled.

1. Open the record (example, an incident on which you are working).
Chat task link

2. Click the **Create or Join Chat Room** related link.

3. If a chat room already exists, click a name to join the existing chat room. If no chat room exists, continue to the next step to create a new room.

Chat task open

4. Click the **create** link at the bottom of the window.

5. Enter the room details as you would for a **chat room**.

6. Click **Create Room**. An email notification is sent and appears in the favorites list for all invited users (the assignment group and the watch list, if selected, and additional invited users).

7. In the **New Room Created** message, click **Join Room**.
   - A new chat window opens on your chat desktop.
• All invited users are listed in the chat member list. Invited users that are not currently participating in the chat are listed in gray.

**Legacy: Join one-to-one chats**

In legacy chat, when another user starts a chat by sending a message to you, a chat window opens on your chat desktop. To join the chat, click the window.

**Legacy: Join a chat room**

How to join a chat room in legacy chat.

1. If another user invites you to join a chat room, an invitation appears in your favorites list.

    ![Chat invitation](image)

    Chat invitation

2. To respond, click the invitation.

    A window opens that displays the room name, room description, and the name of the user who invited you.

    • To join the chat, click **Join**. When the chat window opens on your chat desktop, click the window.

    • To ignore the invitation, click **Decline**.

    ![Chat Room for INC0000003 - Wireless access not available on floor 3](image)

    Emergency CAB meeting
    Review change that fixes voicemail error
    Invited By: System Administrator

    [Join] [Decline] [Join] [Decline]

    View invitations

    To rejoin a favorite chat room that you have left, click the chat room name in the Rooms section of the favorites list.

    To join a public chat room without an invitation, right-click the Rooms section header and select **Public Rooms**. Double-click a room name on the list.

**Legacy: Join a chat room for a task**

In legacy chat, if another user invites you to join a chat room from a task record, you receive an email notification.

1. Click the link in the email notification.

2. If a prompt for a password appears, enter the password listed in the email notification.

3. When the chat window opens on your chat desktop, click the window.
Legacy: Join a chat room from a task record without an invitation

How to join a chat room in legacy chat without an invitation.

Note: This procedure is not possible if the Connect feature is enabled.

1. Open the task record.
2. Click the Create or Join Chat Room related link.
3. Click a chat room name.
4. If a prompt for a password appears, contact the person who created the chat room for the password.
   
   If a chat room has a password, only users with the password can join the chat.
5. When the chat window opens on your chat desktop, click the window.

Legacy: Chat windows

In legacy chat, a chat window appears on your chat desktop for each chat conversation that you start or join.
Legacy: Send messages in legacy chat

How to send messages in legacy chat.

To chat with other users that have joined the conversation, enter your message in the text field at the bottom of the window and press **Enter**. The message appears in the other users' chat windows.

To send a link, type the full URL (example, http://www.service-now.com). When the message is sent, the text appears blue and any user in the conversation can click it to follow the link.

To send a smiley face, type a colon followed by a close parentheses (:)). When the message is sent, a smiley face appears in place of the text. For more emoticons, see *Sending Emoticons in Messages (Smileys).*

Chat activity is indicated with the following alerts:

- When a new message is posted to an inactive browser tab, the tab name blinks.
- When a new message is posted to an inactive chat window, the window header appears in yellow and blinks.
- When a user joins or leaves a room, a message appears in the other room members’ chat windows.

Legacy: Send emoticons in legacy chat messages (smileys)

How to send emoticons (smileys) in legacy chat.

To send an emoticon (smiley), type text from the following table. When your message is sent, the emoticon appears in place of the text. For example, enter colon followed by a close parentheses (:) and a smiley face appears in your message.

<table>
<thead>
<tr>
<th>Text</th>
<th>Image</th>

Legacy: Change the display

How to change the display of legacy chat.

To view the chat window menu, click the gear button (•)

Chat window menu

To change the display:

• To show or hide timestamps, select **Show Timestamps** from the chat window menu or press **F2**.
• To show or hide the chat member list, select **Show Members** from the chat window menu or press **F4**.

To resize the window, point to the lower corner (left or right). When the pointer changes shape, drag the window to the desired size.

To move the window, point to the header. When the pointer changes shape, drag the window anywhere on your chat desktop.

To close a chat window, click the **X** in the upper right corner.

Legacy: Invite a user into a chat

How to invite another user into a chat in legacy chat.

1. Select **Invite User** from the chat window menu.

Chat window menu

2. Begin typing a user name and select a user from the list, or click the reference lookup and select a user from the table.

Search icon

3. Click **OK**.

An invitation is sent to the selected user. One-to-one chats are automatically converted into temporary chat rooms.
Legacy: Add a favorite room

How to add a favorite room in legacy chat.

To add a room to your favorites, click the chat window and select Add To Favorites from the chat window menu.

Legacy: Remove a favorite room

How to remove a favorite room in legacy chat.

To remove a room from your favorites, right-click the room name and select Remove From List.

Legacy: Set your chat preferences

Use the Chat Window Preferences to set audio notifications and default chat window display options in legacy chat.

Use the Chat Window Preferences to set audio notifications and default chat window display options. The default display options control how a chat window looks when you first open it. You can still control the display options for an individual window as described in Changing the Display.

To view your chat preferences, click your name in the upper left corner of the chat desktop and select Chat Preferences.

To set your preferences, select or clear the check boxes next to the options, then click Update.
Preferences

</tbody>
</table>

Legacy: Delete a chat room

You can delete chat rooms in legacy chat.

Role required: chat_admin

Note that when you delete a chat room, the system also deletes the records for any chat members and messages.

1. In the application navigator filter, enter `chat_room.list`.
2. Delete multiple chat rooms from the list or open a chat room record and click Delete.

Legacy chat administration

Users with the chat_admin role can administer various aspects of legacy chat.

Define chat room access rights

Control the access rights for creating a chat room so that not all users can create a chat room.

Role required: chat_admin

To define the access rights for creating chat rooms:

1. Navigate to Social IT > Chat Administration > Properties.
2. Locate the property Comma-separated list of roles that are allowed to create chat rooms.
3. Enter user roles. A user must have one of the specified roles to create a chat room.

Change chat room message read access

In legacy chat, you can associate a chat room with a record, such as an incident, and add the chat messages to a Chat Activity journal field on the form.

Role required: admin

By default, a user can read the chat messages for a room if either of the following is true:

- The room is public
- The user is a member of the room

To change chat room message read access:

Modify the Chat message access control rule or create a new rule.

Read access to the messages displayed is handled by the access control list security operation chat_messages_read on the Chat room [chat_room] table.
View a legacy chat message as a journal field

You can view all chat messages in one place by viewing them as a journal field.

Chat rooms can be linked to any task record in the following ways:

• Create a room from the record.
• Create a record from a chat room, such as creating an incident from a Help Desk Chat.

To view the chat messages as a journal field:

Configure the task record form to select the **Chat Activity** field.

The maximum number of chat messages that are displayed by this field is 1000.

Chat Activity

Chat actions

Chat actions are additional items that appear in the chat window menu (requires the Chat plugin). Administrators and users with the chat_admin role can define chat actions.
Add actions to the legacy chat window menu

You can create new actions and add them to the chat window menu.

1. Navigate to Social IT > Chat Administration > Actions.
2. Select an action to edit or click New.
3. Enter the chat action details and click Update or Submit.

The following example demonstrates how to add a chat action that appears only on windows where the user is a Help Desk Agent. The action appears on the menu as Show User Type and opens a popup window that indicates a current user of queue_agent.

- **Action Name:** Show User Type
- **Active:** Select the check box.
- **Order:** 100
- **Client Show Condition:**

```java
answer = g_chat.getChatType() == 'queue_agent';
```

- **OnClick Action Script:**

```javascript
alert('The current user is: ' + g_chat.getChatType());
```
Chat Actions

- **Action name:** Show User Type
- **Active:** checked
- **Order:** 100

**Client Show Condition:**
```
answer = g_chat.getChatType() == 'queue_agent';
```

**OnClick Action Script:**
```
alert('The current user is: ' + g_chat.getChatType());
```

Help Desk Chat - System Administrator

- Thank you for contacting support. Your
- The page at http://localhost:8080 says:
- The current user is: queue_agent

Invite Another User
- Show Timestamps
- Show Members
- Create Incident from Chat

Chat action details

You can define a chat action name and the script that runs when the action is selected.

Chat action details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Name</td>
<td>Enter a label for the action as it appears in the menu.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate or clear the check box to deactivate the action. Only active actions may appear in the menu.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order in which the action appears in the menu. Standard menu items (such as Show Timestamps) always appear at the top of the chat menu, followed by chat actions in order.</td>
</tr>
<tr>
<td>Client Show Condition</td>
<td>Define the conditions under which this menu option appears. The show condition must set the pre-defined answer variable to a boolean value.</td>
</tr>
<tr>
<td>OnClick Action Script</td>
<td>Enter the JavaScript code that runs when the menu item is selected.</td>
</tr>
</tbody>
</table>

Available methods associated with the g_chat variable

The g_chat variable is a legacy chat window object that is available in the Client Show Condition and OnClick Action Script of a chat action definition.

Method Summary

The following table defines the available methods associated with this object.

<table>
<thead>
<tr>
<th>Return Object</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>getActiveUsers()</td>
</tr>
<tr>
<td></td>
<td>Returns the active users.</td>

</tr>
</tbody>
</table>
### Return Object Details

<table>
<thead>
<tr>
<th>String</th>
<th><code>getChatType()</code></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Determines the chat window type.</td>
</tr>
<tr>
<td></td>
<td>Returns:</td>
</tr>
<tr>
<td></td>
<td>String - Returns one of the following values that specifies the type of user:</td>
</tr>
<tr>
<td></td>
<td>• queue_agent: Help Desk Chat support agent</td>
</tr>
<tr>
<td></td>
<td>• queue_user: Help Desk Chat end user</td>
</tr>
<tr>
<td></td>
<td>• group_chat: The individual is a member of a chat room (multiple users)</td>
</tr>
<tr>
<td></td>
<td>• conversation: The individual is a member in a private chat with another user</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>String</th>
<th><code>getChatQueueAgent()</code></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Returns the <code>sys_id</code> for agent that is administering this thread.</td>
</tr>
<tr>
<td></td>
<td>Returns:</td>
</tr>
<tr>
<td></td>
<td>String - Returns the <code>sys_id</code> of the chat queue agent.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>String</th>
<th><code>getChatQueueUser()</code></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Returns the <code>sys_id</code> for end user of the chat queue.</td>
</tr>
<tr>
<td></td>
<td>Returns:</td>
</tr>
<tr>
<td></td>
<td>String - Returns the <code>sys_id</code> of the chat queue user.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>String</th>
<th><code>getThreadID()</code></th>
</tr>
</thead>
</table>
|        | Returns the thread ID. This returns the same value as `g_chat.getChannelJID().getID()`.
|        | Returns: |
|        | String - Returns the thread ID. |

---

**Legacy: Help desk chat**

Communicate with service desk staff using instant messaging.

Note: The **Connect Support** feature provides an updated messaging platform similar to help desk chat. The help desk chat and Connect Support features should not be used concurrently. There is no migration path from help desk chat to Connect Support.

Users can communicate directly with service desk staff using instant messaging in a ServiceNow instance (requires the Chat plugin.)

- Users access live support from the Employee Self-Service portal.
- Service desk staff provide support from the chat desktop.

---

**Legacy: Use help desk chat to get support**

You can contact service desk staff.

2. Log in to your ServiceNow account. Only logged in users can use chat.
3. In the upper right, click the **Service Desk Chat** button. A chat window opens.
4. Enter your question in the text field at the bottom of the window and press **Enter**.
   1. A message confirms that you have entered the chat queue and indicates your position and estimated wait time.
   2. When a service desk staff member accepts your chat and begins working on your question, another message appears.
5. Chat with your service desk agent via instant messaging.
   service desk staff may lead you through troubleshooting, ask clarifying questions, or create an incident record to address your question.

**Note:** Administrators can configure Service Desk Chat to be accessible on content management (CMS) pages.

---

**Service Desk Chat Window**

**Legacy: Use help desk chat to provide support**

Staff who are assigned to chat support can provide live support via instant messaging. Administrators and users with the chat_admin role can assign chat support staff (see Set Up Chat Queues for Help Desk Chat).

To provide users with live support using chat:

1. Navigate to **Social IT > Chat** to open your chat desktop.
   - A chat queue agent window appears on your chat desktop for each chat queue you are assigned to. If no agent windows appear, ask an administrator to add you as a member of the *assignment group* for a chat queue.
• The chat queue agent window displays the number of users in the queue and how long they have been waiting.
• Every member of the assignment group sees the associated chat queue agent window.

2. Click Answer Next User to answer the next user or click Answer beside a specific user in the queue. A chat window opens.
• Only the agent and the user can see the chat window.

Provide support via instant messaging. Chat queue agents can access additional support functions in the chat window menu:
• **Invite User:** invite another expert to assist with a support chat. An invitation appears in the favorites list of an invited user.
• **Create Incident from Chat:** create a new incident record with the initial question as the short description and the support chat as a linked chat room (accessible from the Create or Join Chat Room related link on the Incident form).

**Note:** Administrators can edit this action or add additional actions to the chat window menu.

Chat Queue Agent

**Legacy: Set up chat queues for help desk chat**

Help desk chat allows users to communicate directly with Service Desk staff via instant messaging in an instance.
Chat queues define the schedules, staff, and system messages for help desk chat. Administrators and users with the chat_admin role can set up chat queues.

Define a chat queue for legacy chat
How to define a chat queue for legacy chat.

Note: The Chat Queue [chat_queue] table is also used by Connect Support. Legacy chat and Connect Support should not be used concurrently.

1. Navigate to Social IT > Chat Administration > Queues.
2. Select a chat queue to edit or click New.
3. Enter the chat queue details and click Update or Submit.

Chat queue details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name that end users see as a title for the queue.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate or clear the check box to deactivate the chat queue.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>Select the group that contains the support staff for the chat queue. Every agent sees the chat queue on their chat desktop and can answer any user that is waiting in the queue. To assign staff members to the group, see Assign Service Desk Staff to a Chat Queue.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Select a schedule that defines when a queue is available (see Use Schedules). If the queue is always available, clear the field.</td>
</tr>
<tr>
<td>Question</td>
<td>Enter the initial question that end users see when they open a new Help Desk Chat. For example, How can I help you?</td>
</tr>
<tr>
<td>Confirm problem</td>
<td>(Optional) Enter the confirmation message that end users see when they enter an initial question. For example, Thank you for contacting support. Your problem has been submitted and an agent will be with you shortly.</td>
</tr>
<tr>
<td>Initial agent response</td>
<td>(Optional) Enter the message that end users see when an agent accepts their chat. For example, Thank you for waiting. I am looking into your question now and will be with you shortly.</td>
</tr>
<tr>
<td>Not available</td>
<td>Enter the message that end users see when a Help Desk Chat request is not accepted because the queue is outside its scheduled availability (defined by the Schedule field).</td>
</tr>
</tbody>
</table>

Assign service desk staff to a chat queue
Chat queue agents are Service Desk staff that are members of a chat queue's assignment group.

To assign agents to a chat queue:

1. Navigate to User Administration > Groups.
2. Select an existing assignment group or click New.
3. Enter or modify the group details (see Create a Group).
4. Right-click the header and select Save.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
5. In the **Group members** related list, click **Edit**.
6. Using the *slushbucket*, add support staff to the group.
7. Navigate to **Social IT > Chat Administration > Queues**.
8. Select the chat queue for which the group provides support.
9. In the **Assignment Group** field, select the group.

Chat queue group

*Make help desk chat accessible to an end user*

Users access live support from the Employee Self-Service Portal (ESS Portal).

Users access live support from the Employee Self-Service Portal (ESS Portal). To make a Help Desk Chat queue accessible to end users, add a link to the ESS Portal (requires the Content Management Plugin).

To change the default link in the ESS header:

1. Navigate to **Content Management > Headers**.
2. Open **Portal - Header**.
3. In the **Chat queue** field, enter the chat queue that users access by clicking the link in the ESS header. Clear the field to remove the chat queue link.
4. Click **Update**.
Chat queue link

Add a custom link elsewhere on the ESS portal

How to add a custom help desk chat link on the ESS portal.

1. Navigate to Content Management > Static HTML.
2. Click New.
3. Enter a Name.
4. In the Static content field, click Toggle HTML Source to edit the field in HTML source mode.

Link syntax

To open a Help Desk Chat queue from a custom link on the ESS Portal, you must call the CustomEvent.fire method using appropriate arguments.

API Call:

```javascript
CustomEvent.fire(LiveEvents.LIVE_EVENT,
LiveEvents.LIVE_WINDOW_JOIN_QUEUE_QUERY, CHAT_QUEUE_SYS_ID,
CHAT_QUEUE_SYS_NAME);
```

where the variables are:

- CHAT_QUEUE_SYS_ID: Specifies the sys_id for the chat queue.
- CHAT_QUEUE_SYS_NAME: Specifies the name of the chat queue (must match the value the Name field of the chat queue record).
Example: This example creates an anchor link that opens the Help Desk Chat queue.

```html
<a href="#" onclick="CustomEvent.fire(LiveEvents.LIVE_EVENT,
LiveEvents.LIVE_WINDOW_JOIN_QUEUE_QUERY,
'c54f0abf0a0b452db84664f409c79c','
'Help Desk Chat'); return false;">Help Desk Chat
</a>
```

**Monitor chat queues**

Chat queues can yield useful Key Performance Indicators (KPI) for evaluating support effectiveness.

- Queue Wait Time: amount of time a user waits in the queue before a help desk agent accepts the request.
- Percentage of Chats Abandoned: users that exit the queue before an agent responds (user stopped waiting).
- Percentage of Chats Accepted: requests that are answered by an agent.

**Note:** This information is not calculated automatically. Administrators may calculate these values based on data collected by chat queues.

**Monitor help desk chat tasks**

Help Desk Chat requests are tracked in the Chat queue entries table, which appears as a related list on the associated chat queue record.

Help Desk Chat requests are tracked in the Chat queue entries table, which appears as a related list on the associated chat queue record. Because this table extends the Task table, administrators can take advantage of core task functionality. For example, administrators can attach Service Level Agreements (SLAs) to chat queue entries to evaluate the response time of Help Desk Chat support.

**Legacy Notify**

Legacy Notify enables organizations with a Twilio account to send notifications using text and voice messages.

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

Legacy Notify also allows conference calls between ServiceNow users to enable quick communications.

When Legacy Notify is active, you can configure ServiceNow to automatically generate and send notifications to selected contacts, for instance when a new incident communication plan is raised in the incident communications management process.

Users with the notifynow_admin role can set properties and monitor message and conference call activities.

Legacy Notify has been implemented for use within Incident Communications Management. Refer to the Notify API documentation for details on how to implement Legacy Notify for use within other ServiceNow applications.

**Working with Legacy Notify**

Follow this process to enable and use Notify.

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Set up a Twilio account to provide phone connectivity for Notify.
2. Activate Notify.
3. Configure Notify to use Twilio.
4. Begin using Notify immediately within Incident Communications Management.
5. Use the Notify API with other ServiceNow applications to provide SMS, voicemail, email, and conference calls for those applications.

**View a Legacy Notify question**

Questions contain a response action and a set of response choices. Use these questions to simplify communications. Then, you can monitor the resulting communication thread.

**Role required:** notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see [Notify](#).

For example, the process can be used to ask members of a specific on-call group to acknowledge or reject an incident. Depending on the answer from the first team member, the incident is assigned to that person or an SMS question is sent to the next on-call member. In this example, the questions are used as part of a workflow.

To see a list of predefined questions both Notify and On-Call Scheduling need to be active.

1. Navigate to [Notify > Questions](#).
2. Click the question **On-Call responsibility Accept/Reject** to see the question details.
Notify Question

3. Click the Notify Response Choices related list to view or edit the choices. The person who receives the SMS question can either choose to accept or reject the assignment. If the assignment is accepted, the Response action can be that the incident is actually assigned to that person. The response action is a script that you can modify or replace. If the assignment is rejected, an SMS question may be sent to the next person in the escalation chain, and so on. You can combine questions with a workflow to automate a process like on-call scheduling escalation.

Create a question in Legacy Notify

Define a question that can be sent to users.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Questions.
2. Click New.
3. Fill in the fields, as appropriate.
Notify New Question form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a description of the question.</td>
</tr>
<tr>
<td>Question</td>
<td>Enter the question you want to send. You can enter variables in the question with the { } tags, for example, {0}. When using more than one variable, use consecutive numbering. When using multiple variables, reference them by specifying their position in the parameter list, starting from {0}. The variable is picked up by the script and translated into, for example, an incident or a problem number.</td>
</tr>
<tr>
<td>Params</td>
<td>Enter parameters which map to the fields on the record that the workflow was triggered for. This enables the message to show dynamic data. Multiple parameters should be separated by a comma. For example, number, shows the incident number in case the workflow was triggered from an incident. A second parameter could be, for example short_description.</td>
</tr>
<tr>
<td>Response Action</td>
<td>Select the action that must be taken. This is a script that can be modified, or you can create a new script by clicking the search button and selecting New. Several examples of scripts are shown. Write your own script and click Submit.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Create a new response choice in Legacy Notify

Create a new response choice to allow users to select that response for a Notify question.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Questions.
2. Open the notify question you have just created.
3. Click New to create a new notify response choice.
4. Fill in the fields, as appropriate.

Notify New Response Choice form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>The abbreviation for the response choice in the text message. For example, ACC for accept or REJ for reject.</td>
</tr>
<tr>
<td>Text</td>
<td>The text displayed for this response choice.</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating the order in the list of response choices. Choices with lower order numbers are listed before choices with higher order numbers.</td>
</tr>
</tbody>
</table>

5. Click Submit.
View Legacy Notify messages

Applications implementing Notify, such as Incident Communications Management, can send Short Message Service (SMS) text messages to relevant contacts under predefined conditions, such as when a new incident communication plan has been created.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Messages.
2. Click a message to see the message details.

SMS Outbox Details

View Legacy Notify conversations

The Notify Conversation [notifynow_conversation] table tracks bi-directional communications and adds the ability to have more than one active conversation with the same phone number at the same time.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

The thread number is combined with the phone number to link the SMS or email response to the correct conversation. Conversations remain active until a response is received or until they are automatically deactivated after the thread release time runs out. The default thread release time is 10 days. To change this value, add the `nn.thread.release.age` property.

1. Navigate to Notify > Conversations.
2. Click a conversation record to see the conversation details.
Notify Conversation Details

The State of the conversation can have one of the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ended</td>
<td>The conversation has been completed.</td>
</tr>
<tr>
<td>Failed</td>
<td>The conversation has failed.</td>
</tr>
<tr>
<td>Pending</td>
<td>The SMS or email is waiting to be sent.</td>
</tr>
<tr>
<td>Sent</td>
<td>The SMS or email has been sent.</td>
</tr>
<tr>
<td>Unanswered</td>
<td>The SMS or email has not been answered.</td>
</tr>
</tbody>
</table>

**Note:** The mode of conversation cannot be changed during one conversation thread. For example, you cannot switch between SMS and email during one conversation.

View Legacy Notify conference calls

Applications that use Notify, such as Incident Communications Management, can launch and maintain conference calls between involved parties.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Conference Calls.
   
   You can also access conference call information from the relevant record, such as the Conference Calls related list in an incident communication plan record.
2. Click a conference call in the list to view details.
3. Click the arrow beside the check box to expand a Participant entry. This shows participant session information, including details of the conference calls that the participant has been involved in.

4. Click a Participant name to see more detailed information about that participant.
Notify Conference Call Participant Details

Legacy public conference calls

A Notify conference call can be public.

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

The Private field on the conference call record indicates if a call is private (selected) or public (not selected). By default, all calls created automatically, such as those created through Incident Communications Management, are public. You can create private calls using the Notify API initiateConferenceCall method.

When created, public conference calls generate an associated Code which is sent via SMS to all invited participants. These participants can distribute the code to allow other users to join the public call. An administrator can control the format of the code using the property glide.notifynow.conference_call.code.pattern. Anyone with the code can connect to a public conference call using one of these methods:

- By calling the Twilio phone number and entering the code for that conference call.
- By sending the code in an SMS message to the Twilio phone number. Participants that join a public call this way are considered ad-hoc participants, indicated on the participant record.

Administering Legacy Notify

An administrator can set up Notify, manage Notify properties and conference call participants.

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.
Configuring legacy Notify to use the Twilio service

Each ServiceNow instance using Notify requires a valid Twilio account and telephone number. Refer to the Twilio documentation for detailed instructions.

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

After the Twilio account is set up, perform the following to use that account with Notify:

- Associate the account with Notify
- Configure Twilio with ServiceNow endpoints

**Associate a Twilio account with Legacy Notify**

Associate a Twilio account with your instance to use that account for legacy Notify.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Administration > Properties.
2. Enter the **AccountSID**, **AuthToken** and **phone number** values. These values can be obtained from the Twilio dashboard:
Twilio Dashboard

When the Twilio account details are entered in the Notify Properties page, the account status is updated.

3. [Optional] To use Notify on multiple ServiceNow instances, activate Notify on each instance and create a separate Twilio account and telephone number for each instance.

Note: Some telephone numbers are voice capable, but not SMS capable. This is shown in the Notify properties with relevant messages. Two methods are available to check this: isSMSCapable and isVoiceCapable.

Configuring the Twilio service with endpoints in legacy Notify

In order for the Twilio service to receive Notify commands, the Request URL field value for every Twilio telephone number must point to the ServiceNow instance that uses Notify with that Twilio telephone number.

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

To set these values, do one of the following:

- Define them manually in the Twilio service dashboard.
- Ensure the fields are blank in the Twilio service dashboard, then open the Notify Properties page. Notify automatically configures the correct endpoints if the Request URL fields are blank.

Set these values from within the Twilio service dashboard.
Twilio Numbers Dashboard

The `notifyusa` values underlined in the image should be replaced with your ServiceNow instance name, for:

- **Voice Request URL**: `https://notifyusa.service-now.com/NotifyNowCallProcessor.do`
• Status Callback URL: https://notifyusa.service-now.com/NotifyNowCallStatusProcessor.do
• Messaging Request URL: https://notifyusa.service-now.com/NotifyNowSmsProcessor.do

View and edit legacy Notify properties

You can view and edit Notify properties.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Administration > Properties.

![Notify Properties form](image-url)
2. Fill in the fields.

**Notify Properties form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Status</td>
<td>Information showing the status of the associated Twilio account.</td>
</tr>
<tr>
<td>Twilio AccountSID</td>
<td>The Twilio account AccountSID, acting as the user name for that account.</td>
</tr>
<tr>
<td>Twilio AuthToken</td>
<td>The Twilio account AuthToken, acting as the password for that account. See Associating a Twilio Account.</td>
</tr>
<tr>
<td>Twilio SMS and voice enabled phone number</td>
<td>The Twilio number that Notify will use. Telephone numbers must be entered in the E.164 format and need to exist under the Twilio account. See Associating a Twilio Account.</td>
</tr>
<tr>
<td>Number of frequent conference call participants to be displayed</td>
<td>The number of people to display in the frequently called list.</td>
</tr>
<tr>
<td>Voice</td>
<td>The voice used for Notify communications. Select <strong>woman</strong> or <strong>man</strong> to provide female or male voice support for English, Spanish, French, German, and Italian. Select <strong>alice</strong> to provide female voice support for a wider range of languages.</td>
</tr>
</tbody>
</table>

3. Click Submit.

**Legacy Notify account status messages**

Account status messages are visible on the Notify Properties page.

**Account Status Message Descriptions**

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Your account is ready for use</td>
<td>Notify is correctly configured and ready for use.</td>
</tr>
<tr>
<td>Your Twilio AccountSID or AuthToken are not valid</td>
<td>An incorrect value has been entered in the AccountSID or AuthToken fields in the Notify properties.</td>
</tr>
<tr>
<td>Your Twilio phone number is not valid</td>
<td>Incorrect telephone number information is defined in the Notify properties.</td>
</tr>
<tr>
<td>Your Twilio phone number does not have properly configured endpoints</td>
<td>The Request URL endpoint settings have not been properly configured.</td>
</tr>
<tr>
<td>Your Twilio account is not configured properly</td>
<td>One or more of your Twilio account settings is incorrect. Open the Twilio dashboard and check the settings.</td>
</tr>
</tbody>
</table>

**Manage Legacy Notify conference call participants**

As a Notify administrator, you can mute, unmute, and kick participants on a conference call.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see **Notify**.
Muting a participant prevents that person from speaking on the conference call but does not notify any participants, including the muted participant. Kicking a participant removes that person from the conference call and sets the Response field for the participant session to kicked.

1. Navigate to Notify > Conference Calls.
2. Select an active conference call.
3. In the Notify Conference Call Participants related list, select a participant.
4. Click the button for the action you want to perform, such as Mute to mute the participant.

You can perform these actions for multiple participants as a single operation using the Actions on selected rows choice list on the Notify Conference Call Participants related list.

Installed with Legacy Notify

Activating the Notify plugin adds or modifies tables, user roles, script includes, and other components.

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

Tables

Notify adds or modifies the following tables.

<table>
<thead>
<tr>
<th>Display Name [Table Name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Answer [notifynow_answer]</td>
<td>Information for possible answers to the SMS question sent.</td>
</tr>
<tr>
<td>Conversation [notifynow_conversation]</td>
<td>Information for the conversation thread.</td>
</tr>
<tr>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Information for conference call records.</td>
</tr>
<tr>
<td>NotifyNow Participant Session [notifynow_participant_session]</td>
<td>Information regarding conference call sessions for individual conference call participants.</td>
</tr>
<tr>
<td>Participant [notifynow_participant]</td>
<td>Information regarding individual conference call participants.</td>
</tr>
<tr>
<td>Question [notifynow_question]</td>
<td>Information for the possible questions in the SMS.</td>
</tr>
<tr>
<td>Response_action [notifynow_response_action]</td>
<td>Information for the notify response action associated with the question.</td>
</tr>
<tr>
<td>Response_choice [notifynow_response_choice]</td>
<td>Information for the notify response choice associated with the question.</td>
</tr>
<tr>
<td>SMS Messages [notifynow_message]</td>
<td>Information for the actual SMS messages sent.</td>
</tr>
</tbody>
</table>

Properties

Notify adds the following system properties.
### Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.notifynow.frequent_participant_count</td>
<td>The number of frequent conference call participants to be displayed.</td>
</tr>
<tr>
<td>glide.notifynow.voice</td>
<td>The voice used for Notify communications.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.accountsid</td>
<td>The Twilio account AccountSID.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.token</td>
<td>The Twilio account AuthToken.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.phonenumber</td>
<td>The Twilio number that Notify will use.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.answering_machine_detection</td>
<td>A boolean flag to enable or disable answering machine detection. Set to true to use answering machine detection. Set to false to continue the call.</td>
</tr>
<tr>
<td>nn.thread.release.age</td>
<td>The number of days after which the conversation thread release time runs out. Defaults to 10 days.</td>
</tr>
<tr>
<td>glide.notifynow.conference_call.code.pattern</td>
<td>The pattern used to generate a conference call code for public conference calls. Number signs (#) in the pattern are replaced with random numbers when a code is generated.</td>
</tr>
<tr>
<td>glide.notifynow.fix_invalid_phone_number</td>
<td>A boolean flag to enable or disable automatic correction of invalid phone numbers. Twilio might incorrectly prefix non-US phone numbers with 1. When this property is true, the instance automatically removes the 1 for non-US calls. When this property is false, you might be incorrectly identified when reconnecting to a call using SMS.</td>
</tr>
</tbody>
</table>

### User Roles

Notify adds the following user roles.

**User Roles**

<table>
<thead>
<tr>
<th>Role</th>
<th>Contains Roles</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifynow_admin</td>
<td>None</td>
<td>Administrator with privileges for Notify functionality.</td>
</tr>
</tbody>
</table>

### UI Actions

Notify adds the following UI actions.
UI Actions

<table>
<thead>
<tr>
<th>UI Action</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initiate Conference Call</td>
<td>Incident Communication Plan</td>
<td>Adds a link to the Incident Communication Plan form, if that plugin is activated, which displays a dialog box for starting a conference call with selected participants.</td>
</tr>
<tr>
<td>Invite to Conference Call</td>
<td>NotifyNow Conference Call</td>
<td>Adds a link to the Notify Conference Call form which displays a dialog box for adding more users to an active conference call.</td>
</tr>
</tbody>
</table>

Script Includes

Notify adds the following script includes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IncidentAlertConferenceCall</td>
<td>A utility JavaScript Prototype class allowing users to initiate the conference call and add other users to the conference call. Should be used in conjunction with the slushbucket UI page (notifynow_participant).</td>
</tr>
</tbody>
</table>

Business Rules

Notify adds the following business rules.

<table>
<thead>
<tr>
<th>Business Rule Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMS on new Incident Communication Plan</td>
<td>Incident Communication Plan</td>
<td>Sends an SMS to any default contacts added when an incident communication plan record is created.</td>
</tr>
<tr>
<td>Conference Call Allowed</td>
<td>Incident Communication Plan</td>
<td>Displays or hides the initiate conference call UI action by storing true or false in g_scratchpad.conferenceCallAllowed.</td>
</tr>
<tr>

**Workflow Activities**

Notify adds the following workflow activities.

**Workflow Activities**

<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Activity Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send Notify SMS</td>
<td>Notify</td>
<td>Sends an SMS message (maximum 1600 Characters) to an E.164 compliant mobile phone number of the selected recipients and/or groups.</td>
</tr>
<tr>
<td>Send Notify SMS Question</td>
<td>Notify</td>
<td>Sends predefined SMS Question message (maximum 1600 Characters) to an E.164 compliant mobile phone number of the selected recipients</td>
</tr>
<tr>
<td></td>
<td></td>
<td>and/or groups. This is one of two main activities for workflow On-Call Assign by Acknowledgement. In a predefined message, the</td>

</tr>
<tr>
<td></td>
<td></td>
<td>reject assignment.</td>
</tr>
</tbody>
</table>

**Legacy Notify API**

The legacy Notify API provides functionality for sending emails, sending SMS messages, and setting up conference calls.

Use this when you want to use Notify functionality with applications on your system.
**Note:** This API is included with the legacy Notify functionality. For APIs included in the current Notify feature, see the Notify, NotifyAction, NotifyPhoneNumber, and NotifyClient APIs.

### NotifyNow - getReadyState()

Indicates whether Notify is set up correctly or not.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message False when trying to run the function in a script.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if Notify is set up correctly, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
gs.log(((nn.getReadyState()) ? "OK" : "NOT OK"));
```

### NotifyNow - getStatus()

Returns the current status of Notify configuration.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message Unauthorized when trying to run the function in a script.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>One of the possible status messages.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_NUMBER_MESSAGE</td>
<td>The account does not have a telephone number set up. Ensure that you set up the telephone number for the account.</td>
</tr>
<tr>
<td>NO_ENDPOINTS_MESSAGE</td>
<td>The account does not have its endpoints set up correctly. Ensure that you set up the endpoints for the account.</td>
</tr>
<tr>
<td>ACCOUNT_OK_MESSAGE</td>
<td>The account is active and ready for use.</td>
</tr>
<tr>
<td>ACCOUNT_NO_AUTH</td>
<td>The Twilio AuthToken is not valid.</td>
</tr>
<tr>
<td>ACCOUNT_NOT_CONFIGURED</td>
<td>The Twilio AccountSID or AuthToken is not valid.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
gs.log(nn.getStatus());
```

**NotifyNow - initiateConferenceCall(String[] conferenceCallParticipants, String conferenceCallTitle)**

Initiate a new conference call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallParticipants</td>
<td>String</td>
<td>One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.</td>
</tr>
<tr>
<td>conferenceCallTitle</td>
<td>String</td>
<td>Title of the conference call. This parameter has a maximum length of 40 characters.</td>
</tr>
</tbody>
</table>
This initiates a conference call with E.164-compliant phone numbers for participants, without the optional source record parameter and and does not send any conference call details via SMS or email.

```javascript
var participants = ['+31205655548', '+31205655552', '+31652825393'];
// set up conference call
var nn = new SNC.NotifyNow();
var conferenceCall = nn.initiateConferenceCall(participants, "testing12");
gs.log('started conference call: ' + conferenceCall.getUniqueValue());
```

### NotifyNow - initiateConferenceCall(String[] conferenceCallParticipants, String conferenceCallTitle, GlideRecord sourceRecord, Boolean private)

Initiate a new conference call.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallParticipants</td>
<td>String</td>
<td>One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.</td>
</tr>
<tr>
<td>conferenceCallTitle</td>
<td>String</td>
<td>Title of the conference call. This parameter has a maximum length of 40 characters.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>Source record to associate to the conference call such as an incident or problem number.</td>
</tr>
<tr>
<td>private</td>
<td>Boolean</td>
<td>Value to control if a conference call is private. This value defaults to false.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The conference call record, or null if there was an error.</td>
</tr>
</tbody>
</table>
This initiates a conference call with participants that have a E.164-compliant phone number and participants from the sys_user table and sends conference call details via SMS and email to all participants.

```javascript
// define phone number participants
var participants = ['+31205655548', '+31205655552', '+31652825393'];

// we also want to add two Dutch sys_user participants
var user = new GlideRecord('sys_user');
user.addNotNullQuery('mobile_phone');
user.addQuery('mobile_phone', 'STARTSWITH', '+316');
user.setLimit(2);
user.query();

// add users to the participant array
while (user.hasNext() && user.next()) {
  gs.log('adding user ' + user.getValue('name') + ' with phone number ' + user.getValue('mobile_phone') + ' to the participant array');
  participants.push(user.getUniqueValue());
}

// define a source record to associate with the conference call
var source = new GlideRecord('cmdb_ci');
source.query('asset_tag', 'P1000167');
if (source.hasNext() && source.next()) {
  // set up conference call
  var nn = new SNC.NotifyNow();
  var conferenceCall = nn.initiateConferenceCall(participants, "testing 1 2", source);

  // check if the conference call was successfully created
  if (conferenceCall != null) {
    gs.log('started conference call: ' + conferenceCall.getUniqueValue());
  } else {
    gs.log('could not start the conference call :(');
  }
}
```

**NotifyNow - isCallable(String participant)**

Determines whether a user is callable or not.

A user must have a valid phone number to be callable. A user who is already in an active session is not callable.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>String or GlideRecord</td>
<td>A sys_user or notifynow_participant record, or an E.164-compliant phone number.</td>
</tr>
</tbody>
</table>
## NotifyNow - isSMSCapable()

Checks if the telephone number associated with the Twilio account is capable of sending SMS messages.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the telephone number associated with the Twilio account is capable of sending SMS messages.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
gs.log('by number: ' + nn.isCallable('+31612345678'));

var user = GlideRecord('sys_user');
user.query('sys_id', '13d39544eb5201003cf587b9d106fea9');
if (user.hasNext() && user.next())
gs.log('by user: ' + nn.isCallable(user));

var participant = GlideRecord('notifynow_participant');
participant.query('sys_id', '33b11430eb1201003cf587b9d106feb9');
if (participant.hasNext() && participant.next())
gs.log('by participant: ' + nn.isCallable(participant));
```

```javascript
gs.log('The twilio number is SMS capable: ' + ((new SNC.NotifyNow().isSMSCapable()) ? 'yes' : 'no'));
```

## NotifyNow - isSMSCapable(String userID)

Checks if a user is able to send SMS messages.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of the user you want to check for an SMS-capable phone number.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>If the user can send SMS messages.</td>
</tr>
</tbody>
</table>

```
gs.log('the user is able to send SMS messages (e.g. has a SMS device): ' + ((new SNC.NotifyNow().isSMSCapable('<user sys_id>')) ? 'yes' : 'no'));
```

**NotifyNow - isVoiceCapable()**

Checks if the telephone number associated with the Twilio account is capable of setting up phone calls.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the telephone number associated with the Twilio account is capable of setting up phone calls.</td>
</tr>
</tbody>
</table>

```
gs.log('the Twilio number is Voice capable: ' + ((new SNC.NotifyNow().isVoiceCapable()) ? 'yes' : 'no'));
```

**NotifyNow - isVoiceCapable(String userID)**

Checks if a user is able to make voice calls.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of the user you want to check for a voice-call capable phone number.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Whether the user has a voice-call capable phone number.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('the user is able to send SMS messages (e.g. has a SMS device): ' + 
    ((new SNC.NotifyNow().isVoiceCapable('someuserid')) ? 'yes' : 'no'));
```

**NotifyNow - kick(GlideRecord participant)**

Removes a participant from a conference call.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The conference call participant to remove from the call.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was removed, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = '<participant sys_id>'; var participant = new GlideRecord('notifynow_participant'); participant.get(participantId); if (participant.isValid()) { // kick participant result = new SNC.NotifyNow().kick(participant); gs.log('participant kicked: ' + result); }
```

**NotifyNow - mute(GlideRecord participant)**

Mutes a participant on a conference call.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The conference call participant to mute.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was muted, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // mute participant
    result = new SNC.NotifyNow().mute(participant);
    gs.log('participant muted: ' + result);
}
```

### NotifyNow - umute(GlideRecord participant)

Unmutes a participant on a conference call.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The muted conference call participant to unmute.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was unmuted, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // unmute participant
    result = new SNC.NotifyNow().unmute(participant);
    gs.log('participant unmuted: ' + result);
}
```
NotifyNow - sendEmailQuestion(String emailAddress, String question, GlideRecord sourceRecord, String emailSubject)

Send an email question to an email address.

The sendEmailQuestion method produces a question body and requires users to click a link to indicate their choice.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>emailAddress</td>
<td>String</td>
<td>Email address to send the question to.</td>
</tr>
<tr>
<td>question</td>
<td>String or GlideRecord</td>
<td>The question record to send or the sys_id of a question record.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>An optional source record to associate to the SMS question, such as an incident.</td>
</tr>
<tr>
<td>emailSubject</td>
<td>String</td>
<td>Optional text to override the default email subject.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The conversation sys_id.</td>
</tr>
</tbody>
</table>

This example demonstrates using the default email subject.

```java
var user = GlideRecord("sys_user");
user.get("email", "someone@somedomain.com");
new SNC.NotifyNow().sendEmailQuestion(user.getValue('email'),
"b6b34500bf3111003cf55ce2c0739ce", user);
```

This example uses dot-walking and specifies a source record and email subject.

```java
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com",
"b6071733bf111003cf55ce2c07390f", current,
"Please answer this question");
```

This example uses dot-walking and specifies an email subject but no source record.

```java
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com",
"b6071733bf111003cf55ce2c07390f",
"Please answer this question");
```
NotifyNow - sendSMS(String phoneNumber, String smsBody)

Sends an SMS message to an E.164-compliant mobile phone number.

Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>smsBody</td>
<td>String</td>
<td>The message to send, maximum 1600 characters.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
new SNC.NotifyNow().sendSMS("+31612345678", "This is a message without source record");
```

NotifyNow - sendSMS(String phoneNumber, String smsBody, GlideRecord source)

Sends an SMS message to an E.164-compliant mobile phone number.

Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>smsBody</td>
<td>String</td>
<td>The message to send, maximum 1600 characters.</td>
</tr>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>The source record to associate with this SMS message.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
var source = new GlideRecord("my_table");
source.query("my_field", "my_value");

if (source.hasNext() && source.next()) {
    // send a text message
    var nn = new SNC.NotifyNow();
    var message = "this is just a test";
    var number = "+31612345678";
    nn.sendSMS(number, message, source);
}

This example uses dot-walking and the current record as the source record.

new SNC.NotifyNow().sendSMS("+31612345678", "this is a test", current);

**NotifyNow - sendSMSQuestion(String phoneNumber, String question, GlideRecord sourceRecord)**

Sends an SMS question.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>An E.164-compliant phone number to send the message to.</td>
<td></td>
</tr>
<tr>
<td>question</td>
<td>String or GlideRecord</td>
<td>The question record to send or the sys_id of a question record.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>An optional source record to associate to the SMS question, such as an incident.</td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The conversation sys_id, or null if the SMS was not sent successfully.</td>
</tr>
</tbody>
</table>

var question = new GlideRecord("notifynow_question");
question.query();

// get the first question
if (question.hasNext() && question.next()) {
    // send the sms question
    var number = "+31612345678";
    var nn = new SNC.NotifyNow();
**NotifyNow - addConferenceCallParticipant(String conferenceCall, String participant)**

Adds ad-hoc users to an ongoing conference call.

When the method is called with a phone number for the participant parameter and there is exactly one sys_user record that matches the phone number, that sys_user record will be related to the participant. The participant's phone number field will be left blank because the phone number is in the sys_user record. If there are several sys_user records that match the phone number, or if there are no results, the participant's phone number field will be filled in, and there will be no stored reference to sys_user because the user is not known.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCall</td>
<td>String or GlideRecord</td>
<td>The sys_id or GlideRecord of an active conference call.</td>
</tr>
<tr>
<td>participant</td>
<td>String or GlideRecord</td>
<td>The sys_id or GlideRecord of a user with an E.164-compliant phone number, or an E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The participant record of the new participant that was added to the conference call.</td>
</tr>
</tbody>
</table>

```java
// add a new participant by conference call sys_id (string) and phone number (string)
var nn = new SNC.NotifyNow();
gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', '+31612345678'));

// add a new participant by conference call sys_id (string) and user record (GlideRecord)
var user = new GlideRecord('sys_user');
user.query('user_name', 'myUserName');
if (user.hasNext() && user.next()) {
    var nn = new SNC.NotifyNow();
    gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', user));
}

// you could have added the user by sys_id as well:
//
nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', user.getValue('sys_id'));
```
// add a new participant by conference call record (GlideRecord) and phone number (string)
var conferenceCall = new GlideRecord('notifynow_conference_call');
conferenceCall.query('title', 'IA0001001');
if (conferenceCall.hasNext() && conferenceCall.next()) {
    var nn = new SNC.NotifyNow();
    gs.log(nn.addConferenceCallParticipant(conferenceCall, '+31612345678'));
} else {
    gs.log('no such conference call')}

**NotifyNow - convertLocalPhoneNumberToE164(String userID, String phoneNumber)**

Converts a local phone number to an E.164-compliant phone number based on a user's location.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of a sys_user record to get location information from.</td>
</tr>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The phone number.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

```
var localPhoneNumber = '01784 221600';
var userName = 'Heath Vanalphen';

var user = new GlideRecord('sys_user');
user.get('name', userName);
var E164Number = new SNC.NotifyNow().convertLocalPhoneNumberToE164(user.getUniqueValue(), localPhoneNumber);
gs.log('converted: ' + localPhoneNumber + ' to ' + E164Number + ' based on ' + user.getValue('name') + '
's location (' + user.getValue('location') + ')');```
**NotifyNow - getConferenceCallParticipants(String conferenceCallId, Boolean isCallable)**

Returns all participants for a conference call.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallId</td>
<td>String</td>
<td>The ID of the conference call.</td>
</tr>
<tr>
<td>isCallable</td>
<td>Boolean</td>
<td>An optional flag to return either only the users you can call (true) or those you cannot call (false).</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The participants</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106fe37');
while (user.hasNext() && user.next()) {
    if (user.getValue('participant')) {
        gs.log('user: ' + user.getValue('sys_id'));
    } else {
        gs.log('phone number: ' + user.getValue('phone_number'));
    }
}
```

```javascript
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106fe37', true);
while (user.hasNext() && user.next()) {
    if (user.getValue('participant')) {
        gs.log('user: ' + user.getValue('sys_id'));
    } else {
        gs.log('phone number: ' + user.getValue('phone_number'));
    }
}
```

```javascript
var conferenceCallId = '32b11430eb1201003cf587b9d106feb8';
// get all participants
```
gs.log('all conference call participants:');
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants(conferenceCallId);
gs.log(user);

// get all callable participants
gs.log('all conference call participants we can call:');
user = nn.getConferenceCallParticipants(conferenceCallId, true);
gs.log(user);

// get all un callable participants
gs.log('all conference call participants that are already in an
active session and whom we cannot call:');
user = nn.getConferenceCallParticipants(conferenceCallId, false);
gs.log(user);

**NotifyNow - getFrequentlyCalledUsers(Number limit)**

Returns a number of frequently-called users, up to the limit parameter, in alphabetical order.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>limit</td>
<td>Number</td>
<td>The maximum number of results.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The frequently called users in alphabetical order.</td>
</tr>
</tbody>
</table>

var nn = new SNC.NotifyNow();
var fc = nn.getFrequentlyCalledUsers(10);

while (fc.hasNext() & fc.next()) {
    gs.log("got user " + fc.getValue('name') + ' - ' + fc.getValue('sys_id'));
}

**NotifyNow - getPreferredE164VoiceNumber(GlideRecord user)**

Returns a user's preferred E.164-compliant phone number for voice calls.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>
### NotifyNow - getPreferredE164VoiceNumber(GlideRecord user)

Returns a user's preferred E.164-compliant phone number for voice calls.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number or null.</td>
</tr>
</tbody>
</table>

```javascript
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164VoiceNumber(userID);
gs.log('the preferred phone number for setting up voice calls is ' + E164Number + ' for user with id: ' + userID);
```

### NotifyNow - getPreferredE164SMSNumber(GlideRecord user)

Returns a user's preferred E.164-compliant phone number for SMS messages.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number or null.</td>
</tr>
</tbody>
</table>

```javascript
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164SMSNumber(userID);
gs.log('the preferred phone number for sending SMS notifications is ' + E164Number + ' for user with id: ' + userID);
```

### NotifyNow - getPreferredEmailAddress(GlideRecord user)

Returns a user's preferred email address.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the email address from.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The preferred email address or null.</td>
</tr>
</tbody>
</table>

```javascript
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164SMSNumber(userID);
gs.log('the preferred phone number for sending SMS notifications is ' + E164Number + ' for user with id: ' + userID);
```
Live Feed

Live Feed is a social IT application that provides a place to post and share content in a ServiceNow instance.

Live Feed content forms a searchable knowledge source for sharing information within an organization. Main features include the following:

- Users can post, reply to, and rate messages, including links and images.
- Administrators can set up automatic messages that are generated when specific records are updated throughout the system.
- Users can subscribe to receive email notifications when new messages are posted.
- Users who take advantage of the accessibility options in the platform can tab through a live feed to navigate.

Live feed includes different types of feeds.

```
var userID = "some user sys id";
var email = new SNC.NotifyNow().getPreferredEmailAddress(userID);
gs.log('the preferred email address for sending email notifications is ' + email + ' for user with id: ' + userID);
```
Live Feed v2 is active for all new instances by default. If you are upgrading from an earlier version of ServiceNow, you need to activate live feed v2 to use these features.

Live feed can be domain separated at the data level only. For more information on live feed and domain separation, see [Domain separation in Live Feed](#).

### Live Feed browser support

The Live Feed v2 plugin does not support Internet Explorer 7 through 9.

Users who access the instance from those browser versions can use Live Feed v1 functionality. Users who access the instance from browsers that are compatible with HTML5 can use Live Feed v2 functionality.

### Activate Live Feed

Live Feed is active for all instances. An administrator can activate the Live Feed plugin if it is not already active.

1. Navigate to **System Applications** > **All Available Applications** > **All**.
   
   A banner appears to notify you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:**
   
   To redirect to the legacy list view for plugins, click the link.

   ![You have been redirected to All Applications. To see the Plugins list](#)

2. Find the plugin with the filter criteria and search bar.
   
   You can search for the plugin by its name or ID.

   If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in [Request a plugin](#).

3. Activate the plugin.
   
   You can activate the plugin directly from the All Applications page or view more details about the plugin before activating it.

   - If you are certain that you have the correct plugin, click **Install**, and then click **Activate** in the dialog box that appears.
• To view plugin details before activation:
  1. Click the plugin name.
  2. On the form, click the Activate/Update related link.
  3. On the dialog box that appears, review the dependent plugins.
     If your plugin requires dependent plugins, they are activated automatically when you activate your
     plugin if they are not active already.
  4. If demo data is available and you want to install it, click Load demo data.
     Some plugins include demo data, which are sample records that illustrate plugin features for common
     use cases. Load demo data when you first activate the plugin on a development or test instance. You can
     always load demo data later by clicking Load demo data only on the plugin form.
  5. Click Activate.

Administer live feed

Administrators and users with the live_feed_admin role can configure live feed security and provide access to live
feed from content management pages. Administrators can also set up live feed table notifications.

Document feeds

A document feed is a live feed group that is associated with a record, such as an incident or change.

Document feeds allow users to work on tasks and other records through the live feed interface. Users can post
messages in live feed that are automatically maintained as comments or work notes on the record, if the record has
these journal fields.

The benefits of using document feeds include the following.
  • Improving communication between users working on the same record.
  • Improving visibility into progress for end users.
  • Providing a single place to see updates on multiple records.
• Saving conversation history in the record so that knowledge is not lost in an email chain.

To use document feeds, activate the Live Feed Document plugin, which is active by default in new instances. See *Use live feed to work on records* to learn how to use this feature.

The system automatically creates a document group for the feed when a user follows or shows a record on live feed. The system also creates a document group when a user creates a new record on a table that has live feed enabled.

The following list describes features of the document feed group.

• Is unlisted; it does not appear when users view all groups on live feed.
• Automatically approves membership for every user who can access the record.
• Uses the record number as the group name.
• Uses the record short description as a group description.
• Maintains all messages posted to live feed on the record, if the record has a journal field for comments. If the record has a standard text field for comments, each live post overwrites the field value.
• Maintains all messages posted on the record in live feed if the record has a journal field for comments. When the group is created, existing messages are added to the document feed.

A user who participates in live feed becomes a member of the group.

**Add a live feed UI action on a table**

You can add UI actions on a table to allow users to follow records in live feed.

Role required: `ui_action_admin` or `admin`

1. Navigate to *System Definition > UI Actions*.
2. Open one of the live feed UI actions, for example, the *Follow on Live Feed* list UI action.
3. In the *Table* field, select the table name.
4. Right-click the header and select *Insert* to create a copy of the UI action for the desired table.
5. Repeat steps 1 – 4 for all live feed UI actions.

**Configure document feeds**

You can configure a table to support document feeds.

Role required: `personalize_dictionary` or `admin`

Configuring a table to support document feeds includes the following steps:

1. Add live feed to a form header.
2. Add *Follow on Live Feed* and *Show Live Feed* as list and form UI actions.

**Security configuration for document feeds**

Document feeds honor the access control rules (ACLs) for the associated record. Users can only view messages on the document feed if they have access to the same information on the record.

Consider the following examples.

• If an ACL allows a user to read and create comments on an incident, then the user can view and add messages posted as comments on the incident feed.
• If an ACL restricts a user from reading work notes, then the user cannot view messages posted as work notes on the incident feed.

**Note:** Access control rules are only checked when a user first accesses the document feed. After users view the feed, an administrator must remove them manually to change their access.
Disable a record feed

You can disable live feed functionality from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to System Definition > Dictionary.
2. Open the dictionary entry for the table.
3. Add live_feed=false in the Attributes field.
4. Click Update.

Note: If the Collaboration feature is activated, you can remove the show live feed icon ( ) from all form headers. Set the glide.live_feed.task_header_button property to collaboration.

Disable a document feed

You can disable a document feed from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to System Definition > Tables.
2. Open the table record.
3. Clear the Live feed check box.
4. Click Update.

Business rule installed with Live Feed Document

This business rule is installed with Live Feed Document. There are no tables, roles, or notifications installed with it.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Feed integration</td>
<td>Writes journal comments to the live feed if there is a group for this record.</td>
</tr>
</tbody>
</table>

Record feeds

A record feed is a live feed group that is associated with a record, such as an incident or change.

Record feeds allow users to work on tasks and other records through the live feed interface. Users can post messages in live feed that are automatically maintained as comments or work notes on the record if the record has these journal fields.

You can use record feeds to:

- Improve communication between users working on the same record.
- Improve visibility into progress for end users.
- Provide a single place to see updates on multiple records.
- Save feed history in the record so that knowledge is not lost in an email chain.
Live feed document

Note: Many of these features are part of live feed v2.

Activate live feed document

The Live Feed Document plugin is active by default.

Administrators can enable record feeds in an instance by activating the Live Feed Document plugin, which activates the Live Feed plugin, if it is not active. For upgrades, administrators must activate the plugin.

1. Navigate to System Applications > All Available Applications > All.

   A banner appears to notify you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

   Note:

   To redirect to the legacy list view for plugins, click the link.

2. Find the plugin with the filter criteria and search bar.

   You can search for the plugin by its name or ID.
If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.

You can activate the plugin directly from the All Applications page or view more details about the plugin before activating it.

- If you are certain that you have the correct plugin, click Install, and then click Activate in the dialog box that appears.

- To view plugin details before activation:
  1. Click the plugin name.
  2. On the form, click the Activate/Update related link.
  3. On the dialog box that appears, review the dependent plugins.
     If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.
  4. If demo data is available and you want to install it, click Load demo data.
     Some plugins include demo data, which are sample records that illustrate plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.
  5. Click Activate.

Configure record feeds

Configure a table to support record feeds. You can add the Show Live Feed button in the form header and add the UI actions Follow on Live Feed and Show Live Feed as List and Form.

By default, the Show Live Feed icon appears on the form header for all tables that extend task, including the Incident, Change Request, and Problem tables, and in the list and form context menus for all task tables.

Add live feed to a form header

Add the Live Feed button in the form header for a table.

1. Type sys_properties.list in the Application Navigator.
2. Open the record for `glide.live_feed.task_header_button`.
3. In the Value field, change the value to `both`.

   **Note:** By default, the value is `collaboration` so that the property is supported in the Collaboration (com.glide.collaboration) plugin. Changing the value to `both` allows the system property to be supported in Collaboration and Live Feed.

4. Click Update.
5. Navigate to System Definition > Tables.
6. Open the table record.
7. If the Live feed check box does not appear on the form, configure the form layout to add the Live feed field.
8. On the form, select the Live feed check box.
9. Click Update.

Alternatively, you can add `live_feed=true` to the Attributes field in the dictionary entry for the table.

The Live Feed button appears on the overflow menu of the form header.

**Add live feed to a context menu**

Add live feed UI actions on a table.

1. Navigate to System Definition > UI Actions.
2. Open one of the live feed UI action, for example, Follow on Live Feed.
3. In the Table field, select the table name.
4. Right-click the header and select Insert to create a copy of the UI action for the desired table.
5. Repeat steps 1 – 4 for all live feed UI actions.
**Disable a record feed**

You can disable live feed functionality from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to **System Definition > Dictionary**.
2. Open the dictionary entry for the table.
3. Add `live_feed=false` in the **Attributes** field.
4. Click **Update**.

**Note:** If the Collaboration feature is activated, you can remove the show live feed icon (下发) from all form headers. Set the `glide.live_feed.task_header_button` property to **collaboration**.

**Configure security**

Record feeds honor the access control rules (ACLs) for the associated record.

Users can only view messages on the record feed if they have access to the same information on the record. For example:

- If an ACL allows a user to read and create comments on an incident, then the user can view and add messages posted as comments on the incident feed.
- If an ACL restricts a user from reading work notes, then the user cannot view messages posted as work notes on the incident feed.

**Note:** Access control rules are only checked when a user first accesses the record feed. After users view the feed, an administrator must remove them manually to change their access.

**Live feed table notifications**

Live feed table notifications generate automatic live feed messages. The Live Feed plugin must be activated to use table notifications.

When a record is inserted or updated on a specific task table and the notification conditions are met, a message is generated and posted to the specified group or to the company feed. Table notifications are supported for all task tables and all task types by default.

Administrators and users with the `live_feed_admin` or `chat_admin` roles can set up table notifications for any table in an instance.

**Set up table notifications for task tables**

You can set up a table notification for a task table to enable automatic live feed messages.

Role required: `live_feed_admin` or `chat_admin`

1. Navigate to **Collaborate > Feed Administration > Table Notifications**.
2. Click **New** or select a notification to open it.
3. Complete the form.
### Live Table Notification fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the table for which notifications are generated.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The list shows only tables and database views that are in the same scope as the table notification.</td>
</tr>
<tr>
<td>Post to chat rooms</td>
<td>Select the check box to generate the notification in chat rooms that are associated with the record. This applies to task records only and requires that the Chat plugin is active.</td>
</tr>
<tr>
<td>Post to live feed</td>
<td>Select the check box to generate the notification on live feed.</td>
</tr>
<tr>
<td></td>
<td>If record feeds are not set up and the <strong>Feed group</strong> field is blank, the notification is posted to the company feed.</td>
</tr>
<tr>
<td>Record Feeds</td>
<td>Select the fields to post for record feeds.</td>
</tr>
<tr>
<td></td>
<td>This field is available only if <strong>Post to live feed</strong> is selected.</td>
</tr>
<tr>
<td>Application</td>
<td>Select the application that contains this record.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to enable the notification.</td>
</tr>
<tr>
<td>Insert</td>
<td>Select the check box to generate the notification when a record is inserted into the database.</td>
</tr>
<tr>
<td>Update</td>
<td>Select the check box to generate the notification when a record is updated.</td>
</tr>
<tr>
<td>Feed</td>
<td>Select the live feed team to which you want to post messages. This field is available only if <strong>Post to live feed</strong> is selected.</td>
</tr>
<tr>
<td></td>
<td>Clear the field to post notifications on the company feed.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Create the condition that must be met to generate the notification.</td>
</tr>
<tr>
<td></td>
<td>If you add a condition statement, the system evaluates the condition first and parses the <strong>Before script</strong> field only if the condition is met. You may choose to leave this field blank and include conditions in the script.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description of the table notification.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Message</td>
<td>Construct the automatic message you want to generate. You can include field values as variables and a link to the record. To add a variable, position the cursor in the text and then click the field name in the <em>Select variables</em> field. To add a link to the record, enter <code>${URI}</code> in the message text as shown in the following example.</td>
</tr>
<tr>
<td>Before script</td>
<td>Create a script that runs before a notification is generated. The script runs only if the condition evaluates to true or is empty. The following variables are available in the script.</td>
</tr>
<tr>
<td></td>
<td>• <code>current</code>: the GlideRecord object that triggered the notification.</td>
</tr>
<tr>
<td></td>
<td>• <code>changedFields</code>: an ArrayList of fields changed on submit. Use <code>changedFields.contains('fieldname')</code> to check for change.</td>
</tr>
<tr>
<td></td>
<td>• <code>answer</code>: set answer to false to cancel the notification.</td>
</tr>
<tr>
<td></td>
<td>• <code>profileSource</code>: set to a valid GlideRecord object to define the profile that is posting the message.</td>
</tr>
<tr>
<td></td>
<td>• <code>profileID</code>: set to a live_profile sys_id to define the profile that is posting the message; by default it is the current record. Overrides <code>profileSource</code> if both are specified.</td>
</tr>
<tr>
<td></td>
<td>Any custom variable created in the script is also exposed to the message in the form of <code>${myVariableName}</code>.</td>
</tr>
</tbody>
</table>

4. Click **Submit** or **Update**.

**Set up table notifications for non-task tables**

Table notifications are supported for all task tables by default, and you can set up a table notification for any other table.

Role required: live_feed_admin or chat_admin

1. Navigate to **System Definition > Business Rules**.
2. Open the **live feed events** business rule.
3. In the Advanced section, select and copy the text in the **Script** field.
4. Click the back arrow on the top, left to exit the record and return to the Business Rules list.
5. Click **New**.
6. Enter the following values at the top of the form.
• **Name:** Enter a name, such as *live feed events for my table.*
• **Table:** Select the table for which you are setting up a notification.
• **Active** and **Advanced:** Select these check boxes.

7. In the **When to run** section, enter the following values.
   • **When:** Select *before.*
   • **Insert, Update,** and **Delete:** Select the check boxes.

8. In the **Advanced** section, paste the script from the *live feed events* business rule into the script box.

9. Click **Submit.**

The *live feed events* business rule runs on the non-task table. It fires the *live_feed.update* event, which is associated with the **Live Feed Update** script action. The script action sets up variables and processes the table notifications.

After saving the business rule, create a *live feed table notification record* for the new table as you would for a task table.

### Live feed table notification examples

The following examples demonstrate how to set up different types of table notifications that are useful for live feed.

#### Workaround posted

This example demonstrates a table notification that generates an automatic message on live feed whenever a workaround is added to an open problem.

• **Table:** Problem [problem]
• **Active:** Select the check box.
• **Update:** Select the check box.
• **Post to live feed:** Select the check box.
• **Conditions:** [State] [is] [Open]
• **Description:** Workaround Posted
• **Message:**

```
${sys_updated_by} posted a workaround for ${URI}.
Short description: ${short_description}
```

• **Before script:**

```
// only post to live feed when the Workaround field changes
answer = changedFields.contains( "work_around" ) ;
```
Example workaround message

Problem resolved (advanced)
This advanced example demonstrates a table notification that generates an automatic message on live feed whenever a problem is closed.

It also adds a message about the assigned user and posts the message from the assignment group profile instead of the problem record.

- **Table**: Problem [problem]
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions**: [Problem State] [is] [Closed/Resolved]
- **Description**: Problem Resolved
- **Message**:

  Problem ${number} - ${short_description} has been resolved. ${fixedByMsg}

- **Before script**:

  ```javascript
  //cancel if we didn't just change the problem state if ( !changedFields.
  contains ( "problem_state" ) )
  answer  = false ;
  ```
// if we have an assigned_to value add a comment about who it was
// create a new variable fixedByMsg that we can access from the message
fixedByMsg = ""; if (!current.assigned_to.nil())
fixedByMsg = "Thank you " + current.assigned_to.getDisplayValue();

// make the message appear to come from the assignment group if we have
// one if (!current.assignment_group.nil())
profileSource = current.assignment_group.getRefRecord(); // need GlideRecord object

do { if (ProfileName == "Opportunities")
// example problem resolved message

**Opportunity won (non-task)**
This example demonstrates a table notification on a non-task table. It generates an automatic message on live feed whenever a sales opportunity is won, if you have activated the Sales Force Automation plugin.
Create a business rule on the Opportunity [sales_opportunity] table that matches the live feed events business rule on the task table.

Create a table notification with the following values:

- **Table**: Opportunity [sales_opportunity]
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions**: [State] [is] [Closed Won]
- **Description**: Opportunity won
- **Message**:

  ${owner} closed a sale with ${account}!

- **Before script**:

  //make the message appear to come from the assigned salesperson if there is one if ( !current. owner. nil ( ) )
  profileSource = current. owner. getRefRecord ( ) ; //need GlideRecord object

**Related feeds table notification**

This example demonstrates table notifications to be sent out to related feeds.
For this example, whenever the status of a story changes to **Complete**, a table notification message is sent to the related sprint, release, or epic. Messages are posted only if the related feed already exists; this notification does not create a new feed.

- **Table**: Story [rm_story]
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Record feeds**: Move Sprint, Release, and Epic to the **Selected** column.
- **Conditions**: [State] [changes to] [Complete]
- **Description**: Story is done; message to Epic, Release, and Sprint
- **Message**:

$$\text{${URI}$ status changed to ${state}$}$$

### Live feed security and table access

By default, administrators and users with the live_feed_admin role can configure live feed security and view all live feed tables.

You can also modify the following live feed tables.

- Live Table Notification [live_table_notification]: set up automatic messages that are generated when specific records are updated throughout the system.
- Live Feed Message [live_message]: modify only if necessary, such as to delete an inappropriate message or restore a message that a user accidentally deleted. This table is typically managed by system functionality.

Extending or modifying data in any live feed chat table is not recommended.

### Domain separation in Live Feed

This is an overview of domain separation and Live Feed. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

### Overview

**Support: Level 2**

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation Application support for domain.

Parent and child domains define the live feed content that can be viewed and shared with other users.

- A user in a parent domain can see users and content within their domain and within all child domains that are lower in the domain hierarchy.
- A user in a child domain can see users and content within their domain but cannot see the parent domain or other child domains at the same level in the domain hierarchy.

### Enable domain separation for live feed

Domain separation for the Live Feed application is available starting with the Eureka release. For users upgrading to Eureka, a sys_domain column is added to existing live feed-related database tables. For existing database records, the
value of the sys_domain field is set to empty (global). This allows the domain separation feature to work with existing live feed records.

**Show or hide the live feed application for a domain**

The administrator can live feed visibility for a domain. This includes:

- Displaying live feed in the application navigator.
- Following a document feed for a record.
- Viewing live feed from a record.

**Use live feed with domain separation**

All of the live feed features are available to users within a domain and work the same way, with some exceptions to visibility.

- **Posting and sharing content**
  - Users in a child domain can interact with other users in the same domain. This includes posting and replying to messages, deleting messages, attaching files and links, and rating content.
  - Users in a parent domain can interact with other users in the same domain and with users in any child domains. Messages that are added to child threads by parent users are given the visibility of the child domain, not the parent domain.

- **Viewing content**
  - Users in a child domain can view content that resides within their domain. This includes filtering by feed, sorting, searching, and viewing older messages.
  - Users in a parent domain can view content that resides within their domain and within any child domains.
  - My Feed shows messages, teams, and hashtags based on the user's domain. Showing another user's feed only shows posts visible in the current user's domain.

- **Using hashtags**
  - Hashtags are separated by domain. Users in a child domain can use all of the hashtag functions within their domain. This includes tagging messages, viewing available hashtags, changing hashtag names, and searching and filtering by hashtag.
  - Users in a parent domain can use all of the hashtag functions within their domain and can see hashtags in any child domains.

- **Using teams**
  - Teams are separated across domains. Users in a child domain can join and follow teams within their domain, and can invite other users within their domain to join teams.
  - Users in a parent domain can join and follow teams that belong to their domain or to any child domains.

- **Exceptions to teams**
  - New teams are created in the user's domain. However, if the team has a record associated with it, the team is created in record's domain.
  - New threads in an existing team are created in the domain of the existing team.
  - When a user is creating a new team from a document, if the document domain is not empty or global, the team domain needs to be changed to be the document's domain.
  - For a document-generated team, when the domain of the document changes, the domain of all related live feed records changes as well.

- **Subscribing to email notifications**
Limit live feed access by role

All active users in the instance have access to live feed by default.

live_feed_admin and admin

1. Complete the following steps to define the roles that allow users to see the Live Feed module.
   a) Perform the appropriate action for your version of the UI:
      • UI16: Navigate to System Definition > Application Menus > Collaborate and select Live Feed.
      • UI15: Right-click the icon beside the Live Feed module and select Edit Module.
   b) Enter the roles that have access in the Roles field.
   c) Click Update.

2. Complete the following steps to define the roles that allow users to see live feed from a mobile device.
   a) Navigate to System Definition > Applications (Mobile).
   b) Click Live Feed.
   c) Enter the roles that have access in the Roles field.
   d) Click Update.

3. Use the following settings in the Access Control form to create access control rules to limit who can view the live_feed pages.
   • Type: ui page
   • Operation: read
   • Name: create one access control rule record for each of the following pages
      • live_feed
      • live_feed_small
      • $live_feed
      • $live_feed_small
   • Requires role: in this related list, add roles to define who can access the live feed pages. Users who do not have these roles cannot access live feed.

Manage live feed message content

Users can remove their own messages from feeds. If necessary, administrators can remove inappropriate messages that are posted by any user.

live_feed_admin and admin

For security reasons, any HTML code is automatically stripped out of a message before it is posted. This measure ensures that users cannot modify any page settings by posting a message.

1. Navigate to Collaborate > Feed Administration > Messages.
2. Open the message to be removed.
3. In the State field, select deleted. You may need to configure the form to add this field.
4. Click Update.
Live feed team security

You can restrict who can create teams by modifying an access control rule.

Modify the following access control rule.

- **Table:** Live Group Profile [live_group_profile]
- **Operation:** create

Restrict hashtag renaming

You can restrict who can rename hashtags.

You restrict hashtag rename by modifying the following access control rule:

- **Table:** Live Tag [live_tag]
- **Operation:** write

Provide access to live feed from CMS pages

You can provide access to live feed from pages built in the Content Management System (CMS). For example, allow an end user to access your company feed via the ESS portal.

Role required: content_admin or admin

The ESS Portal template includes the Portal - Live page and Live Feed dynamic blocks. To provide access to live feed from CMS pages, add the Live Feed dynamic block to a CMS page or include Portal - Live page in a site.

1. Navigate to **Content Management > iFrames**.
2. Click **New**.
3. Enter the iFrame block details.

**iFrame block fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name such as <strong>Live Frame</strong>.</td>
</tr>
<tr>
<td>Frame Name</td>
<td>Enter a frame name, such as <strong>live_frame</strong>.</td>
</tr>
<tr>
<td>URL</td>
<td><a href="https://INSTANCE/live_feed.do?sysparm_doctype=true">https://INSTANCE/live_feed.do?sysparm_doctype=true</a> where INSTANCE is your instance URL (example, [instance name] .service-now.com)</td>
</tr>
<tr>
<td>Application</td>
<td>Displays scoping information.</td>
</tr>
<tr>
<td>Sizing</td>
<td>Select <strong>Fixed Size</strong> and enter height and width pixel dimensions according to the page where you plan to display the feed (for example, width of 1024 and height of 768).</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
5. Add the block to a page.

Components installed with live feed

Several types of components are installed with Live Feed.

Demo data is available with Live Feed.
## Tables installed with live feed

Live Feed plugin installs the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link attachments [live_link]</td>
<td>Stores links and attachments that are added to messages.</td>
</tr>
<tr>
<td>Live Favorite [live_favorite]</td>
<td>Stores the favorite conversations, user groups, and messages.</td>
</tr>
<tr>
<td>Live Follows [live_follow]</td>
<td>Maintains users' follow preferences for user feeds.</td>
</tr>
<tr>
<td>Live Group Profile [live_group_profile]</td>
<td>Stores conversation properties, including name, description, and public status. Also stored are user group properties, such as name, description, and public status.</td>
</tr>
<tr>
<td>Live Group Member [live_group_member]</td>
<td>Maintains the member lists for conversation and user group.</td>
</tr>
<tr>
<td>Live Mention [live_mention]</td>
<td>Stores the profiles mentioned in a message. References sys_user table.</td>
</tr>
<tr>
<td>Live Message Tag [live_message_tag]</td>
<td>Stores messages associated with user-created tags. Appears as a related list on Live Tag records.</td>
</tr>
<tr>
<td>Live Poll [live_poll]</td>
<td>Stores a poll question.</td>
</tr>
<tr>
<td>Live Poll Cast [live_poll_cast]</td>
<td>Stores profiles of users who voted for a particular option in a poll.</td>
</tr>
<tr>
<td>Live Poll Options [live_poll_option]</td>
<td>Stores poll options.</td>
</tr>
<tr>
<td>Live Table Notification [live_table_notification]</td>
<td>Generates automatic table notifications, such as when a user reads live feed for the first time and when a high priority incident is opened. Access at Collaborate &gt; Feed Administration &gt; Table Notifications.</td>
</tr>
</tbody>
</table>
### User roles installed with Live Feed

Live Feed plugin installs the following user roles.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
</table>
| live_feed_admin    | Can manage live feed functions. For example, users with the `live_feed_admin` role can:  
  - Set up table notifications for task tables.  
  - Set up table notifications for non-task tables.  
  - Limit live feed access by role.  
  - Manage live feed message content. |
| chat_admin         | Can manage chat functions (if the Chat plugin is activated). For example, users with the `chat_admin` role can:  
  - Change chat room message read access.  
  - Define chat room access rights. |

### Script includes installed with Live Feed

Live Feed plugin installs the following script includes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LiveMsgUtil</td>
<td>Provides helper functions for working with <code>live_message</code> records.</td>
</tr>
<tr>
<td>LiveFeedFilter</td>
<td>Queries filters for working with <code>live_feed</code> records.</td>
</tr>
<tr>
<td>LiveFeedUtil</td>
<td>Provides helper functions for working with <code>live_feed</code> records.</td>
</tr>
</tbody>
</table>

### Business rules installed with Live Feed

Live Feed plugin installs the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
</table>
| Feed Group Creator Becomes Admin | Live Group Profile  
  \[live\_group\_profile\] | Designates the group creator as the group administrator. |
| live feed events            | Task  
  \[task\] | Runs on task insert, update, and delete. Triggers event associated with the Live Feed Update Script action that processes Live Table Notifications to auto-generate live feed messages. |
<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live feed member update events</td>
<td>Live Group Member</td>
<td>Generates a notification event when member state changes (invited, accepted, declined, left, rejected, request, request_accepted).</td>
</tr>
<tr>
<td></td>
<td>[live_group_member]</td>
<td></td>
</tr>
<tr>
<td>Live feed integration</td>
<td>Journal Entry</td>
<td>Writes journal comments to the live feed if there is a group for this record.</td>
</tr>
<tr>
<td></td>
<td>[sys_journal_field]</td>
<td></td>
</tr>
<tr>
<td>Live feed new member events</td>
<td>Live Group Member</td>
<td>Generates a notification event when new members are added.</td>
</tr>
<tr>
<td></td>
<td>[live_group_member]</td>
<td></td>
</tr>
<tr>
<td>live feed profile events</td>
<td>Live Profile</td>
<td>Runs on live_profile insert/update/delete, triggers event associated with the Live Feed Update script action that processes Live Table Notifications to auto-generate live feed messages.</td>
</tr>
<tr>
<td></td>
<td>[live_profile]</td>
<td></td>
</tr>
<tr>
<td>Live Feed message events</td>
<td>Live Feed Message</td>
<td>Runs on live_message, notification event trigger for new live messages.</td>
</tr>
<tr>
<td></td>
<td>[live_message]</td>
<td></td>
</tr>
<tr>
<td>Live message like events</td>
<td>Message Liked by</td>
<td>Runs on live_message_like, notification event trigger for new like records.</td>
</tr>
<tr>
<td></td>
<td>[live_message_like]</td>
<td></td>
</tr>
<tr>
<td>LiveFeed Group Member Visibility 2.0</td>
<td>Live Group Member</td>
<td>Ensures users can only see the members list for public groups and groups they belong to.</td>
</tr>
<tr>
<td></td>
<td>[live_group_member]</td>
<td></td>
</tr>
<tr>
<td>LiveFeed Group Profile Validation</td>
<td>Live Group Profile</td>
<td>Ensures that a public group is visible.</td>
</tr>
<tr>
<td></td>
<td>[live_group_profile]</td>
<td></td>
</tr>
<tr>
<td>LiveFeed Group Profile Visibility 2.0</td>
<td>Live Group Profile</td>
<td>Ensures that the list of all groups only displays public groups, private groups that are visible, and groups the user belongs to.</td>
</tr>
<tr>
<td></td>
<td>[live_group_profile]</td>
<td></td>
</tr>
<tr>
<td>LiveFeed Membership Changes</td>
<td>Live Group Member</td>
<td>Enforces that only the group administrator and users with live_feed_admin role can manage membership for a group.</td>
</tr>
<tr>
<td></td>
<td>[live_group_member]</td>
<td></td>
</tr>
<tr>
<td>LiveFeed Single Group Membership</td>
<td>Live Group Member</td>
<td>Ensures that a user is not added multiple times to the same group.</td>
</tr>
<tr>
<td></td>
<td>[live_group_member]</td>
<td></td>
</tr>
<tr>
<td>Live Message Likes</td>
<td>Live Message Like</td>
<td>Updates the number of likes for a message.</td>
</tr>
<tr>
<td></td>
<td>[live_message_like]</td>
<td></td>
</tr>
<tr>
<td>LiveFeed Join Group Check</td>
<td>Live Group Member</td>
<td>Ensures that users can not automatically join private visible groups.</td>
</tr>
<tr>
<td></td>
<td>[live_group_member]</td>
<td></td>
</tr>
<tr>
<td>Update Follow/Follower Counts</td>
<td>Live Follow</td>
<td>Updates the following/followers counts.</td>
</tr>
<tr>
<td></td>
<td>[live_follow]</td>
<td></td>
</tr>
</tbody>
</table>
### Business rule | Table | Description
--- | --- | ---
Live Feed Group | Assessable Record [asmt_assessable_record] | Creates/Deletes a live feed group for an assessable record
Live Feed Message Visibility | Live Feed Message [live_message] | Ensures user's access to live feed messages

### Email notifications installed with Live Feed
Live Feed plugin installs the following email notifications..

<table>
<thead>
<tr>
<th>Email notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Feed Feed Member Accepted</td>
<td>Sends an email to the administrator when a user has accepted to join the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Declined</td>
<td>Sends an email to the administrator when a user has declined to join the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Invited</td>
<td>Sends an email to a user when they have been invited to join a feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Left</td>
<td>Sends an email to the administrator when a user has left the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Removed</td>
<td>Sends an email to a user when they have been removed from the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Request</td>
<td>Sends an email to administrators when an user requests to join a feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Request Accepted</td>
<td>Sends an email to the user when their request to join a feed is accepted.</td>
</tr>
<tr>
<td>Live Feed Feed Request Rejected</td>
<td>Sends an email to the user when their request to join a feed has been rejected by an administrator.</td>
</tr>
<tr>
<td>Live Feed MsgReply Subscription</td>
<td>Sends an email when a reply or reply_to_reply message is inserted into the thread of a message in a feed.</td>
</tr>
<tr>
<td>Live Feed Team Member Accepted</td>
<td>Sends an email to administrators when a user accepts an invitation to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Declined</td>
<td>Sends an email to administrators when a user declines an invitation to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Invited</td>
<td>Sends an email when a user is invited to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Left</td>
<td>Sends an email when a user leaves a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Removed</td>
<td>Sends an email when an administrator has removed a user from a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Request</td>
<td>Sends an email when a user requests to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Request Accepted</td>
<td>Sends an email when a user's request to join a team is accepted.</td>
</tr>
<tr>
<td>Live Team Member Request Rejected</td>
<td>Sends an email when a user's request to join a team is rejected.</td>
</tr>
<tr>
<td>Email notification</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Live Message All Subscription</td>
<td>Sends an email to subscribed users when any message (new or reply) is posted.</td>
</tr>
<tr>
<td>Live Message Feed Subscription</td>
<td>Sends an email when a new message is inserted into a feed.</td>
</tr>
<tr>
<td>Live Message Liked</td>
<td>Sends an email to the creator of a message when another user likes the message.</td>
</tr>
<tr>
<td>Live Message Mention</td>
<td>Sends an email to a user when that user is mentioned in a message.</td>
</tr>
<tr>
<td>Live Message New Posts Subscription</td>
<td>Sends an email to subscribed users when a new (not reply) message is posted.</td>
</tr>
<tr>
<td>Live Message Reply</td>
<td>Sends an email to all users in a feed thread when a user posts a reply (live_message.replied event).</td>
</tr>
</tbody>
</table>

Use Live Feed

Live Feed provides many methods you can use to share content with others in your organization. Depending on your role, there are several different types of feeds you can access, teams you can join and share information with, and hashtags you can use for categorizing messages.
Company Feed

We're considering using Live Feed to replace #Lync for collaboration. Thoughts?
Like · Copy Link · Hashtags (1)

Ramon Amaral
Excellent idea! So much easier to use and we already use it for everything else.

Hashtags

- 2 MacBook
- 2 Lync
- 1 Excel
- 1 WiFi
- 2 SSO
- 1 VPN
- 3 joined
- 4 Email
- 1 SAP

Attachments

- 6 Solution_set.xlsx

Links

- Check out the Wiki article!
ServiceNow Madrid Now Platform capabilities

Note: Live Feed v2 is active for all new instances by default. If you are upgrading from an earlier version of ServiceNow, you need to activate Live Feed v2 to use these features.

Use hashtags in Live Feed

Hashtags are words marked with a hash symbol (#) in messages. Hashtags are a way to categorize messages by keyword or topic for improved search results.

For example, to identify messages associated with VPN questions, add the hashtag #VPN in the message text.

Note: Many of these features are part of live feed v2. If you are using live feed v1, or have not activated live feed v2, see Legacy Live Feed.

Tag messages

To tag a keyword or topic in a message, enter a # symbol before the word. A link to the hashtag is added beneath the message and all feed users can search and filter by the hashtag to find the message.

Tips for using hashtags effectively include:

• Limit the number of hashtags per message (no more than 3 is a good guideline).
• Use hashtags only in messages that are relevant to the tagged topic.
• Write a message first, and then add hashtags only if they add value. Answer the question, "What are you working on?", rather than "What hashtags apply to what you are working on?"
• Use camel case to create a hashtag that is more than one word long. For camel case, remove the space and use an uppercase letter to start each word. For example, to create a topic about the service desk, use #ServiceDesk.
Tag

View an available hashtag

View a hashtag from any feed.

1. Navigate to Collaborate > Live Feed.
2. Click Hashtags in the sidebar.

Any hashtags already defined are displayed. Up to 36 hashtags can be displayed, and options are available for searching and sorting the hashtags. When searching, you do not need to include the hash symbol (#).
3. Click a hashtag to view all messages containing that hashtag.

Change a hashtag name and merge a hashtag

Over time, users may create many hashtags with similar names, such as competitive, competitor, and competition. To combine hashtags for better searching and filtering, change the names of similar hashtags to a standard name.

Administrators can restrict who can rename hashtags.

1. Navigate to Collaborate > Live Feed.
2. Click Hashtags in the sidebar to reveal the currently defined hashtags.
3. Turn off the filter to show all hashtags.

4. Point to the hashtag you want to change. If you have the rights to edit hashtags, an edit tag (✏️) appears.

5. Click the edit tag icon.

6. Enter a new hashtag name.

7. Press Enter.
   - If the new name is different than the other hashtags, the new hashtag name replaces the old hashtag name on the list and in the text of any messages that include the hashtag.
   - If the name is the same as one of the existing hashtags, the hashtags will be merged. For example, if you have two hashtags called Competitive and Competitors, and you change the name of Competitors to Competitive, all of the messages previously tagged Competitors are changed to Competitive and the Competitors hashtag is removed.

   **Note:** If a hashtag is removed from the message, renaming that hashtag does not change the message text.

**Add an image to a hashtag**

You can add an image at the domain level of already defined hashtags if you have the admin role.

1. Click Hashtags in the sidebar.
2. Select the appropriate hashtag.

3. Do one of the following:
   - Locate the image in your file system, and then drag-and-drop the image onto the add an image icon (🖼).
   - Click the add an image icon (🖼), select the image file, and click Open.
4. To change the image, simply drag-and-drop a new image onto the old one, or click on the existing one and select a new image. When you view a message that contains a hashtag with an image, that image appears in the hashtag heading bar.

Follow and unfollow a hashtag

You can view all postings assigned a specific hashtag by following the hashtag. You can also unfollow the hashtag if you no longer want to view those postings.

1. Navigate to Collaborate > Live Feed.
2. Click Hashtags in the sidebar.
3. Select the hashtag you want to follow.
4. Click Follow.
Follow tag

A confirmation message appears.
5. Click X to dismiss the message.

To unfollow a hashtag, repeat the same steps and click Unfollow.

Bookmark hashtags

The live feed interface uses the standard bookmarking functionality for hashtags.

In UI15, the live feed interface uses the standard *bookmarking functionality* for hashtags. You can drag-and-drop group feeds and hashtags from the Feed Summary section to the Edge for quick access.
Remove a hashtag from a posted message

As a participant in a conversation, you can remove hashtags from messages that have already been posted.

1. Navigate to the posted message.
2. Click Hashtags in the message posting.

Hashtag in post

The hashtags associated with the message are displayed, along with the removal icon.
Remove tag

3. Click the removal icon.

Use teams in Live Feed

Users can be combined into teams for the purpose of subscribing to specifically-focused feeds.

Teams can be created based on any criteria that makes sense for your organization. For example, you can create a team called IT Developers and subscribe the team to feeds such as Coding Standards, AngularJS Development, and ServiceNow Customization Best Practices. When a new developer is added to the IT Developers team, that user automatically has rights to participate in all of the feeds followed by the team.

Create a live feed team

When you create a team, you become the team administrator.

As team administrator, you can:

• Modify team properties
• Accept or reject membership requests
• Remove members from the team
• Delete the team

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. Click Create Team.

4. Enter a Name to appear at the top of the feed and in messages posted to the team. This name links to the team feed.

5. Enter a Description to appear at the top of the feed and under the team name in the list of all teams.
6. Select the access level for the team:
   - **Public Team**: In the list of all teams, any user can see the name of this team. Any user can also see the feed and join the team. Messages in a public team appear in the Company Feed with a link to the team feed.
   - **Private Team**: In the list of all teams, any user can see the name of this team, but not the feed. Messages in private teams do not appear on the Company Feed.

   When **Private Team** is selected, the **Show this team for anyone to find and request to join** check box is displayed. Select this check box to allow any user to search for this team and request to join it. Clear the check box to allow only invited users to see the feed and join the team.

7. Click **Create**.
   The team is created with you as the team administrator.

### Note:
A team administrator can create one or more group feeds specifically for the members of this team by clicking the **Group Feeds** tab and **Create Group Feed**. Additionally, the team can be invited to join a feed. Having multiple feeds for the team facilitates focused discussions on topics of interest to the team and allows the team to selectively invite other teams and members to collaborate on specific feeds.

### Automatic team creation

If you create a record on a table that has live feed enabled, such as the Incident table, and click **Follow/Show Live Feed** for the record, a record feed is created for the record.

The record feed name is based on the table name.
Join a team

You can join a public team, accept an invitation, or request access to a team.

As a team member, you can:

- **View messages** posted to the team (team feed). Non-members can also view the feed for a public team.
- **View a list of team members.**
- **Invite another team** to join the team.
- **Subscribe to team email notifications.**
- **Leave** the team.

1. Navigate to **Collaborate > Live Feed.**
2. Click **Teams** and click **All Teams.**
   - If you received an invitation, click **Accept.** You can **Decline** the invitation if you do not want to join the team.
   - If the team is public, click **Join.**
   - If the team is private, click **Request.** The team administrator receives an email notification and must accept your request before you can join the team.

View a team feed

View a team feed to see messages belonging to that team.

1. Navigate to **Collaborate > Live Feed.**
2. In the sidebar, click your profile picture, then select the **Teams** tab.
   - To view a team you belong to, select the team name.
   - To view a public team you do not belong to, select **All Teams** and then click the team name.
     You must be a member to view the feed for a private team.

View a team member

View a list of members belonging to a live feed team.

1. Navigate to **Collaborate > Live Feed.**
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
   You must be a member of the team to view the members.
4. Click **Members.**
   The list of team members appears, organized by team administrators and team members.

Invite a new member

You can invite another user to join a team.

1. Navigate to **Collaborate > Live Feed.**
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the **Pending members** tab.
5. In the **Add User** field, enter the name of the user you want to invite. The invited member’s picture appears.
Remove a member

If you are team administrator, you can remove any member from the team.

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
4. Click the Members tab.
5. Click Remove below the member name.
6. Click Remove again in the confirmation box that opens.

**Note:** You can remove members regardless of their current state. That is, you can remove members who have already joined the team or whose membership is pending.

**Subscribe to team and email notification**

Users can subscribe and unsubscribe to receive email notifications generated by feeds the team participates in.

Email notifications are generated whenever actions such as posting messages, replies, likes, polls, and @mentions are performed.

All notifications related to a top-level message, such as replies, mentions, and likes, are sent out with the same subject. The subject line defaults to Live Feed followed by the beginning of the subject line from the top-level message. For example, if the subject of the feed is IT Support, the email notification's subject will be Live Feed IT Support.

1. Navigate to Collaborate > Live Feed.
2. Click Teams and select the team name.
3. Click the subscribe icon ( ).
You can click the unsubscribe icon ( ) to stop receiving email notifications.

Subscribe a team to feed notification
A team administrator can subscribe a team to specific feeds so the members of the team receive email notifications.

1. Navigate to Collaborate > Live Feed.
2. Click Teams and select the team name. You can use the advanced search to locate team of which you are the administrator.
3. Click Feeds.
4. Click the subscribe icon ( ) beside the feed name.

You can click the unsubscribe icon ( ) to stop receiving email notifications.

Reply to email notifications using email
After receiving an email about a posted message or a reply, you can reply to live feed with your email client. The body of the reply email becomes a reply to the live feed message. Any attachments included in your reply email are included in the live feed reply.

Leave a team
You can give up membership to a team by leaving that team.

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. Click Leave beside the team name.

Modify a team
If you are team administrator, you can modify an existing team.

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
4. Click the edit icon ( ).
5. Modify the team properties as needed.
6. Click Save.

Manage a membership request
When a user requests membership to a private team, the team administrator receives an email.

If you are the team administrator, you can manage membership requests.

1. Navigate to Collaborate > Live Feed.
2. Click Teams and select the team name.
   If one or more users have been invited to the team, the Pending members tab shows the number of invitations sent.
Pending members

3. Click **Pending members**.

   This shows the users who have received invitations, but who have not yet accepted.
4. You can cancel a user's invitation by clicking **Remove**.

5. You can invite another user to the team by entering their name in the **Add user** field and clicking the **Invite member** button.

**Delete a team**

If you are the team administrator, you can delete a team.

1. Navigate to **Collaborate > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the **edit icon**.
5. Click **Delete**.
6. Click **Yes** to confirm deletion.
   
The team is deleted from live feed. Messages posted to a private team are deleted; messages posted to a public team remain on the company feed without a team link.

   If you delete a team that is associated with an active record, such as an incident that has not yet been closed, the team becomes active again when any user modifies that record or follows the record on live feed. The first user who modifies the record becomes the team administrator. The previous messages that existed as part of the record feed are not deleted.

**Use live feed to work on records**

A record feed is associated with a record, such as an incident or change.

Record feeds help users collaborate on records by providing a place for anyone who can access the record to share messages and post attachments specific to that record.

With record feeds, users can:

- Follow record feeds and post messages in live feed. These messages can also be automatically maintained in the comments or work notes journal fields on records.
- View live feed from records.
- Work on multiple records from **My Feed**.
- Access live feed team functions, such as sending invitations and subscribing to email notifications.

Any users with access to the record can also use the record feed. By default, record feeds are available on the incident, change, and problem tables. Administrators can configure record feeds for additional tables.
Live Feed Document

How Document Feeds Work

The Live Feed application creates a document group for each document feed. The document group:

- Automatically approves membership for every user who can access the record.
- Uses the record number as the group name.
- Uses the record short description as a group description.
• Maintains all messages posted on the record in live feed (if the record has a journal field for comments). When the group is created, existing messages are added to the document feed.
• Lists the group when users select View all groups on their live feed interface, unless the record associated with the document feed has been closed. When the state of the record is closed, the live feed group becomes inactive and unlisted.
• Automatically adds users to the document group when they view the record.

Document Group Creation

When a user follows or shows a record on live feed, a live feed group is automatically created and associated to the record (if one does not already exist). The user becomes a member of the group and can use live feed to work on the record. If the user can access work notes on the record, the user also becomes a group administrator.

A live feed group is also automatically created when a user creates a record on a table that uses document feeds, such as the Incident table. The user who creates the record becomes the administrator of the group, and any other user who modifies the same record automatically joins the group.

Add Live Feed to a homepage

Add live feed to a homepage so it is the first thing you see when you log in.

1. Click Add content at the top of the homepage.
2. Select Live Feed in the left panel.
3. On the bottom of the window, click Add here in the appropriate layout position, then close the window.

Note: Administrators can add live feed to a global homepage to make it available for all homepage users by default. By default, users with any role can add live feed to their homepage. Administrators can restrict this ability.
Modifying and deleting document feeds

The user who creates a record feed becomes the group administrator, which allows the user to modify the following record feed properties.

- **Name**: default value is the record number.
- **Description**: default value is the record short description.
- **Picture**: default value is a thumbnail image of the record.

Feed administrators can also delete the feed. When deleted, the feed is removed from live feed but messages remain in the journal field of the associated record.

Viewing Live Feed from records

Interact with the record feed in any form that has live feed enabled.
The record feed appears in a pop-up window. The record feed also appears on the record form's activity formatter if the administrator enables the record feed system property (glide.ui.show_live_feed_activity).

To access a record feed from the form, do one of the following:

- Click the **Show Live Feed** button in the form header. This displays the live feed pop-up.
- Right-click the form header and select **Show Live Feed**. This also displays the live feed pop-up.
- Scroll down to the activity formatter area on the form. Click one of the following tabs:
  - **Live Feed**: click to show a text box to type in the feed.
  - **Activity**: click to show the activity summary. The activity filter determines the content in the activity summary.
If the activity formatter or the Live Feed and Activity tabs are not visible, administrators can do the following:

- Configure the form layout and add Activities (filtered) to the form. This adds the activity formatter.
- Personalize the form layout and add Activities (filtered) to the form. This adds the activity formatter.
- Go to System Definition > Tables, access the table associated with the record, and verify that the live_feed dictionary attribute is set to true on the form. This adds live feed to the activity formatter.
• Go to Collaborate > Feed Administration > Properties and enable the following property: **Toggle the display of the live feed tab in the activity formatter**

**Working with record feeds**

When a user follows a record, the user becomes a member of a private group for the record.

Team members can:

• View the record feed from live feed.
• View a list of group members (other users who are following the record).
• Invite another user to join the group. Only users who have access to the record have access to the record feed.
• Subscribe to email notifications.
• Leave the team to stop following the record.

*Follow a record feed from a form*

You can follow records that have a record feed associated with them from within the record form.

1. Navigate to the record in a list or form.
2. Click the **Show on Live Feed** icon in the header.
Follow a record feed from a list
You can follow records that have a record feed associated with them when viewing a list of records. This method allows you to select multiple records to follow.

1. Navigate to a list of records (for example, Assigned to me).
2. Select the Action check box beside each record to follow.
3. In the Actions choice list, select Follow on Live Feed.
Follow My Tasks

Post a message to a record feed
Use live feed to post a message to a record feed.

1. Open the record feed in one of the following ways:
   • From your homepage (must already be following the record)
   • As a team in live feed (must already be following the record)
   • From My Live Feed (must already be following the record)
   • From the Live Feed pop-up window
   • From the Live Feed tab on the activity formatter
   • Click the Show Live Feed button

2. Compose the message and add images and links.
3. [My Live Feed only] In the To list, select the record where you want to post the message.
4. [Optional] Select the Work Notes check box to post the message as a work note. Only users with access to work notes on the record can post and see work notes. This option is only available for records that have a journal field.
5. Click Post.

Note: If the record has journal fields for comments or work notes, your message is automatically added to the appropriate field on the record. If the record has a standard text field for comments on the...
activity formatter, each live post overwrites the field value. Comments added through live feed start with #LiveFeed on the activity formatter.

Use feeds in Live Feed

Feeds allow users to create focused discussions in Live Feed.

Live feed includes different types of feeds. The user who creates a group or record feed becomes the feed administrator. This user configures the access level for the feed:

- **Public**: any user can see the name on the list of all feeds, view the feed, and join it. Messages appear on the company feed with a link to the public feed.
- **Private**: any user can see the name on the list of all feeds, but only invited members can view the feed and join. Messages do not appear on the company feed.

**Note**: The concept of groups has changed in live feed v2 (starting with the Fuji release).

Create a group feed

Group feeds are created by users so that members with similar interests can find that information in one place. Individual users or teams can join group feeds.

1. Navigate to Collaborate > Live Feed.
2. Click Group Feeds and click All Feeds.
3. Click Create Group Feed.

4. Enter the feed name and description. These will appear in the list of group feeds.
5. Indicate how members can join the feed:
   - **Public Feed**: Select this to allow anyone to view and join the group feed.
   - **Private Feed**: Select this to restrict membership to only members invited by the administrator.
When Private Feed is selected, the Show this feed for anyone to find and request to join check box is displayed. If it is selected, any user can search for this group feed and join it. If the check box is not selected, only users who are invited can see the feed and join the group feed.

6. Click Create.

Create record feeds

When a user views a record on a table that has live feed enabled, such as the Incident [incident] table, the user can click the Show live feed button at the top of the form to automatically create a record feed.

When a user who has write access to a record's work_notes journal field clicks the Show live feed button, that user becomes the record feed administrator. If, for example, a customer calls technical support to report an incident and the customer clicks Show live feed on a record, a record feed is created, but the customer is not the record feed administrator. When a support representative later opens the incident and participates in the record feed, the user becomes the feed administrator.

Record feeds are, by default, private unlisted. That is, only invited members can see the name of the record feed in the list of feeds, and join it. Record feed administrators, however, have the ability to change the access level at any time. This can be helpful if, for example, a user is working on a sales opportunity and wants customers to be able to participate in a record feed without granting them access to the records.

Control how live feed is enabled for records

A property called glide.ui.show_live-feed_activity controls whether live feed is automatically enabled for all records.

This glide record is disabled by default. If the property is enabled, a record feed is automatically created whenever a record is viewed, and you become a member of that feed.

A second property, glide.live-feed.auto_join_document_group, enables automatic membership to a record feed whenever the associated document is visited and the user clicks Show Live Feed.

View the activity stream in record feeds

When you view record feeds, live feed displays the activity stream for the document.

For example, for an incident feed, the screen displays recent activity for the incident. The activity stream is updated whenever anything is changed in the associated record.
Live feed activity stream

Note: The information in the activity stream is subject to the same ACL rules as those for viewing the underlying document.
**Participate in a feed**

When you join a feed, you become a feed member.

Feed members can:

- **View messages** posted to the feed. Non-members can also view the messages for a public feed.
- **View a list of feed members.**
- Invite another user to join the feed.
- Subscribe to feed email notifications.
- **Leave the feed.**

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then click **All Feeds**.
ServiceNow Madrid Now Platform capabilities

All feeds

- If you received an invitation, click Accept. You can Decline the invitation if you do not want to join the feed.
- If the feed is public, click Join.
- If the feed is private, click Request. The feed administrator receives an email notification and must accept your request before you can join the feed.

Mark a feed as a favorite

Top-level messages in feeds can be marked as favorites on a per user basis only.

You can also search for messages marked as favorites, and remove the favorite designation as needed.

1. Navigate to Collaborate > Live Feed.
2. Click either **Group Feeds** or **Record Feeds**, and then click **All Feeds**.

3. In the list of feeds, click the star icon (⭐️) adjacent to the feed name you want to mark as a favorite.

To unfavorite a message, click the star icon (⭐️) of a message that is already a favorite.

**View a feed**

You have several options for viewing a feed.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**.
   This displays a list of feeds you belong to and an option to view all feeds.
   - To view a feed you belong to, select the feed name.
   - To view a public feed you do not belong to, select **Show All** and then click the feed name. You must be a member to view the feed for a private feed.

   **Note:** If you navigate away from the live feed application and then back again, the system displays the feed you last visited if you are a member of it.

**View a feed member**

View a specific member of a group feed.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**.
   This displays a list of feeds you belong to and an option to view all feeds.
3. Click the feed name.
   The list of feed members appears, organized by feed administrators and members.

**Invite a new member to a group feed**

The feed administrator can invite another user or a group to join a feed.

When a team is added to a feed, all members of the team also indirectly become members of the feed. Only users, and not teams, can be the feed administrators. A team member who is following a feed can become administrator by directly inviting another user to the feed.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click the **Pending members** tab.
4. In the **Add user or team** field, begin entering a user or team name and select a user or team from the suggestion list.
   The invited user or team members receive an email notification.

**Invite a new member to a record feed**

The feed administrator can invite another user or a team to join a record feed.

When a team is added, each of the individual members of the team become members of the feed. That is, if Team ABC is added to a feed, the feed does not show that Team ABC is a member. Instead, the feed shows each of the individual members of Team ABC as members of the feed.
When users are invited, their membership state is initially **Invited**. When they accept the invitation, the system checks their access to the work_notes journal field. If they have write access, they become administrator members; otherwise, they become active members.

1. Navigate to Collaborate > Live Feed.
2. Click Record Feeds and select the record feed name.
3. Click the Pending members tab.
4. In the Add user or team field, begin entering a user or team name and select a user or team from the suggestion list.
   - If you invite a team, the individual members of the team are invited.
   - The invited users receive an email notification.

**Remove a member from a feed**

The feed administrator can remove any member from the feed.

1. Navigate to Collaborate > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click the Members tab.
4. Locate the member you want to remove and click **Remove**.
Note: You can remove members regardless of their current state. That is, you can remove members who have already joined the feed or whose membership is pending.

Subscribe to a feed

Direct members of a feed can subscribe and unsubscribe to the feed in order to receive email notifications whenever any activity in the feed occurs, such as new messages being posted, replies, likes, polls, and @mentions.

Individual indirect members—that is, members of a team that is participating in a feed—cannot subscribe or unsubscribe from a feed directly. If the team administrator subscribes the team to a feed, the individual members receive an email notification for activities in the feed such as new messages being posted, replies, likes, polls and @mentions.

All notifications related to a top-level message, such as replies, mentions, and likes, are sent out with the same subject. The subject line defaults to **Live Feed** followed by the beginning of the subject line from the top-level message. For example, if the subject of the feed is **IT Support**, the email notification’s subject will be **Live Feed IT Support**.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click the subscribe icon ( ).

You can click the unsubscribe icon ( ) to stop receiving email notifications.

Note: If a team is subscribed to receive email notifications for a feed, but a member of the team did not subscribe to the team, that member does not receive the email notifications.

Navigate between live feed and other modules

If you are participating in a feed and navigate to another module, when you return to live feed it displays the feed you were previously viewing if it is public or if it is a private feed that you are a member of.

For example, assume you are viewing a public feed and then navigate to a particular incident record. Upon returning to live feed, the feed you were previously viewing opens. If you were last viewing a private feed that you are not a member of, returning to live feed opens the Company Feed.

Leave a feed

Members can choose to leave a group feed.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click **Leave**.

Note: If you leave a feed associated with a record, such as an incident, you automatically rejoin that feed if you modify the associated record again.

Delete a feed

If you are a feed administrator, you can delete the feed.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click **Delete**.
4. Click Yes to confirm deletion.
   The feed is deleted from live feed. Messages posted to a private feed are deleted. Messages posted to a public feed remain on the Company Feed without a feed link.

Live Feed UI overview

The Live Feed user interface provides many methods you can use to share content with others in your organization.

Update your Live Feed profile

Your profile information includes a photo or image, and tabs for different types of information including messages, feeds, teams, followers, and those who are following you. You can update your profile information and picture at any time.

Note: The functionality described here applies to HTML5-compliant browsers, such as Chrome, Firefox, Safari and IE10 and above.

1. Navigate to Collaborate > Live Feed.
2. Click your name or title displayed below your picture.

Profile

The profile record opens.
ServiceNow Madrid Now Platform capabilities

Profile record

3. Click the pencil icon next to About Me and type a short description about yourself that you want to share with others who view your profile. This is text that you might not necessarily want to change on a regular basis.

4. You can change your profile photo using either of the following two methods:
   • Locate the photo file you want to use, and drag-and-drop it over the existing photo.
   • Hover over the existing picture (or tap the photo in the case of the smartphone or tablet interface) to display the Upload a picture link. Click the link, navigate to the location of the photo you want to use, and click Open.
Upload a picture

Note: Your profile picture is used by the Connect and legacy chat features as well if they are activated.

Work with Live Feed messages

This portion of the UI gives the user access to various types of messages and tools for grouping and categorizing messages. Also included are methods for identifying which user feeds you are following and which users are following you.
Tools for working with live feed messages

<table>
<thead>
<tr>
<th>Menu section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>My Live Feeds</td>
<td>These are custom feeds that allow you to customize live feed to view the content that is most important to you.</td>
</tr>
<tr>
<td>Company Feed</td>
<td>This feed displays all posts, except those posted to private or unlisted groups.</td>
</tr>
<tr>
<td>Group Feeds</td>
<td>These feeds are created by users. Record Feeds: These feeds are associated with a record, such as an incident or change.</td>
</tr>
<tr>
<td>Record Feeds</td>
<td>These feeds help users collaborate on records by providing a place for anyone who can access the record to share messages and post attachments specific to that record.</td>
</tr>
<tr>
<td>People</td>
<td>This option displays people who are following the current user and people the current user is following.</td>
</tr>
<tr>
<td>Teams</td>
<td>This option is used to combine users into groups for the purpose of subscribing to specifically-focused conversations.</td>
</tr>
<tr>
<td>Hashtags</td>
<td>Hashtags are words marked with a hash (#) symbol in messages. Hashtags are used to categorize messages by keyword or topic for improved search results messages filtered from all conversations that include specific hashtags.</td>
</tr>
</tbody>
</table>

View another Live Feed user

When a requester user, one that has no ServiceNow role, is viewing a feed and points to another user's picture, information for the user appears from the Business Card view of the User [sys_user] table.

You can customize ACLs to increase the amount of information you want displayed for users with different roles.
View profile

If you click a user's name or title, the user's profile appears. Click the tabs to view different types of information for the user.
Profile tabs

Follow other Live Feed users

As you use Live Feed, you can follow the message threads of other users.

1. Navigate to a thread that the user you want to follow is engaged in.
2. Click that user's name or point to the user's picture.
   A Follow link appears in the user's profile.
3. Click **Follow**.

4. To stop following the user, navigate to **People > Following**.
Unfollow

5. Click **Unfollow**.
6. To view people who are following you, navigate to **People > Followers**.

Select feeds

A feed is a stream of related messages. You can use the feed selector to switch between feed types and to view specific group feeds and record feeds.

1. Use the **Search** field to locate any type of feed. As you type in the **Search** field, the results are dynamically displayed. For example, if you type **INC**, records that are incidents are forced to the top of the results list.
2. You can also select the following types of feed information.

**Feeds types**

<table>
<thead>
<tr>
<th>Feed</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>My Live Feeds</td>
<td>Displays the following posts:</td>
</tr>
<tr>
<td></td>
<td>• messages from users you follow</td>
</tr>
<tr>
<td></td>
<td>• messages with hashtags you follow</td>
</tr>
<tr>
<td>Company Feed</td>
<td>Displays all posts, except those posted to private or</td>
</tr>
<tr>
<td></td>
<td>unlisted groups.</td>
</tr>
<tr>
<td>Add Group Feed</td>
<td>Allows you to add a group feed.</td>
</tr>
</tbody>
</table>
**Follow feeds**

You can view users who are following you or other users you are following.

To view users who are following you or other users you are following, click **People** in the sidebar.

The system shows 10 most recent followers or users you are following.

![People](image)

**Note:** If you are following a particular user whose profile changes, that user moves to the front of the Following list. This alerts you to changes in the profile of a user you are following.

**Bookmark feeds and hashtags**

The live feed interface uses the standard bookmarking functionality for feeds and hashtags.

In UI15, you can drag-and-drop group feeds and hashtags from the Feed Summary section to the Edge for quick access.
Bookmark a hashtag

Add Live Feed to your homepage

You can add Live Feed to your own homepage or to a global homepage.

1. Navigate to a homepage.
2. Click the add content icon in top left corner of the homepage.
3. Select Live Feed in the left panel.
4. On the bottom of the window, click Add here in the appropriate layout position, then close the window.
Post content in Live Feed

In Live Feed, you can post new messages and replies to existing messages for all users in the feed. You can also send a reply message to a team or record.

Post a live feed message

You can post a message to open a new feed.

1. Navigate to Collaborate > Live Feed.
2. Click the feed to which you want to post your message, for example My Live Feed, Company Feed, and so on.
3. Enter a message in the Share your thoughts field. Use hashtags, if you want.
4. As needed, click , , or to add a poll, attachment, or screenshot image, respectively.
5. Click Post.

Reply to a live feed message

To participate in an existing thread of a feed, you can compose and submit a reply message. By default, the message is visible to all members of the feed.

1. Navigate to Collaborate > Live Feed.
2. Locate the message you want to reply to.
3. Type your reply in the message box and click Reply.
   As needed, you can add hashtags, attachments, links, or knowledge base articles.
4. To limit who can view the reply to a single individual, select a user from the To choice list.
5. Click Reply.
6. By default, 7 replies are visible for each message. To view additional replies, click Show all replies. Any reply to a reply includes a Threads link.
7. Click Threads to view all of the replies within the selected reply in reverse chronological order within the Message Thread pop-up window, similar to an email thread.
Message Thread

Navakanth Reddy #suggestion(s) A common black vertical line just before the bars would help with this. Also, line spacing between two options should be more than single-spaced.

Also, the bar says 5 people voted and it shows up 5 people and 1 more. Is this a #bug?

Siva Dirisa simply provides feedback. We have some UI poll, or perhaps.

Nirupam Biswas I guess we need some visual distinction between the poll question and the options. After voting, I got confused for some moments why there are four options in result. See screenshot.

Shouvik Goswami We have enabled polls in Live Feed. Please review and provide #suggestions and #feedbacks.

How do you like the poll in Live Feed?

- Exactly what I was looking for
- Wanted something more
- Did not visualize it this way

Vote

Attach files, links, images, and knowledge articles to messages

In addition to entering text, you can attach files, such as images, documents, and spreadsheet files in any ServiceNow supported file type to live feed messages.

Administrators can manage attachment file settings, such as supported file types and maximum attachment file size, by editing system properties.

You can also include links to user-defined URLs and knowledge articles contained in your instance’s knowledge base.

Note: The functionality described here applies to HTML5-compliant browsers, such as Chrome, Firefox, Safari, and Internet Explorer 10 and above. Significant differences while using different browsers are highlighted.

Attach a file to a post or reply

You can attach files to a post by dragging a file into a post or pasting an image from the clipboard.

Use the paperclip icon to drag files into a post. Additionally, you can paste images into a post or reply from the clipboard.

1. Do one of the following:
   - While composing a post or reply (see Reply to a Message), locate one or more images or other supported types of files, and drag them into the message box.
   - Click the paperclip icon in the message box, navigate to the location of the files you want to attach, select them, and click Open.

2. To add more files, drag-and-drop additional files into the text box below the displayed files or images, or click the plus sign.
Attaching files

3. If you want to delete an attachment before posting the message, click the trashcan icon adjacent to the attachment.
4. Enter a comment to share your thoughts about the image.

   Note: The Post button is enabled only after you add the comment.

5. Click Post or Reply.
6. If you added files that do not contain previews and then posted the message, they will be listed in the message box with a Download link.
7. Click the link to download the files.

**Copy an image from the clipboard**

In addition to adding files to a message, you can also copy images to the clipboard and paste them into a message or reply.

1. Click into the **Comment** box and add a comment.

   ![Comment box](https://example.com/clipboard.png)

   *Here is how to drag-and-drop tags in order to bookmark them.*

   ![Tags](https://example.com/tags.png)

   ![Comments](https://example.com/comments.png)

   ![Conversation](https://example.com/conversation.png)

   ![Post](https://example.com/post.png)

**Copy paste**

2. Click the **Add an image** button.

   The **Screenshots** dialog box opens.

3. Right-click the **Paste an image here** box and select **Paste** to paste the image from the clipboard.
4. To add another image, repeat the previous steps.
5. When you finish pasting images into the message, click **Done**.
6. To change the link text, click **Pasted Image** and enter a new label.
7. When you finish, click **Post** or **Reply**.
8. To remove an image, click the trash can icon adjacent to the link.
9. To make changes to an existing image, click the edit icon (📝).
Add a link to a post or reply

Add or modify a link to a live feed post.

1. Click into the Comment box.
   The Add a link button appears.
2. Click the Add a link button.
   The URL and Link text fields appear.

3. Enter the URL and the text you want to appear as the link.
4. To add another link, click the link icon under the URL field.
5. When you have finished entering your message, click Post or Reply.

URL Saved
To remove a link, click the trash can icon adjacent to the link. To make changes to an existing link, click the edit icon.

Add a knowledge article link to a post or reply

Use the ID of a knowledge article to post it as a reply to a live feed conversation.

1. While composing a post or reply, type the ID of the knowledge article you want to link to. You do not need to identify the knowledge article ID as a hyperlink; live feed recognizes it as such and automatically converts it into a link when the message is posted.
2. When you are finished entering your message, click Post or Reply.

Add a poll to a message

When you are posting a message, you have the option of creating a poll in order to record your viewers' opinions. As users take the poll, their feedback statistics are displayed within the feed.

1. Open the feed where you want to create a message with a poll.
2. Enter the message with an invitation to take the poll in the Share your thoughts box.
3. Click the poll icon.
Poll

4. In the **Question** field, enter the question on which you are soliciting opinions.
5. In the **Option** fields, enter possible responses to the query.
6. To add more response options, click **Add more options**.
7. Click **Post**.

After the poll is posted, users who view the message can vote. After they vote, their pictures appear next to their response, with others who have voted for the same option.

*Note:* Only the poll creator can view results without casting a vote. Other members can see results only after casting a vote or if the poll is closed.
Close poll

An email notification with the poll result is sent to all participants of the poll informing them that the poll is closed.

Add mentions to a message

An @mention is any posted update that contains @username anywhere in the body of the message. The user's name, with a link to that user's feed, is inserted into the message. Additionally, the mentioned user receives an email notification about the mention. This is a great way of bringing attention to other members in a conversation. All @mentions are included in the logged-in user's My Feed.

Note: If an @mention is used by a member of a team, only members of that team appear in the auto-suggest list.

1. While entering a message or reply in a conversation, type @username anywhere in the message. As you type, an auto-suggest list appears with names and pictures of users that match your entries. For example, if you type @t, the auto-suggest list shows the pictures and names of all users with names that start with T.
2. Click the user you want to add.
   That user's name is inserted into the @mention in the body of the message.

![User addition example]

**Note:** My Feed displays @mentions of you and the teams you are a member of. Profile feeds for another user display only @mentions of that user.

### Like a message

Like a message to provide feedback to the author.

1. Navigate to Collaborate > Live Feed.
2. Click Feeds.
3. Locate the feed that contains the message you want to like.
4. Under the message title, click Like.

   If the message has previously been liked, the number of likes for a message displays next to the Like link.

   For a top-level message, the profile pictures of the first 5 users who liked a message are displayed. Any additional users who liked the message can be viewed by hovering over the # more link. If the logged-in user has liked the message, that user's image will appear first, followed by the image of the user who last liked the message.

   For a reply, you must hover your mouse pointer over the count link to view the users who liked the message.

   **Note:** After a message has been liked, it cannot be unliked.

### Delete a message

Users can delete any of their own posts or replies. A conversation administrator can also delete messages.

1. Hover over the message you want to delete.
2. Click the trash can icon in the upper-right-hand corner of the message box.
3. Click Delete in the confirmation box.
The message disappears from the feed.

**Managed Documents**

Use the ServiceNow® Managed Documents application to control electronic documents within your instance. After parameters have been set by the administrator and the Knowledge Document plugin installed, documents can move through the managed document cycle.

**Note:** Step through the process below on your test (or any non-production) instance.

**Managed Document features**

Managed Documents is a lightweight, ITIL-based solution for creating and managing electronic documents within your instance.

This application adds a layer of control around any document by providing workflow, storage, security, and categorization options. It can be used for a variety of internal documents, such as policies and procedures, compliance documentation, and knowledge articles. Because it is integrated within the instance, Managed Documents offers a seamless alternative to 3rd-party systems.

**Features**

<table>
<thead>
<tr>

<tr>
<td>Document Revisions</td>
<td>Because managed documents must have clear records of individual versions of a document, revisions (including the file) are attached to the master document record through a related list. Document revisions are controlled to keep a standard naming scheme and consistent version numbers. Once a document revision is ready, it can be submitted for review.</td>
</tr>
</tbody>
</table>
| Document Parameters     | **Attention:** Parameters do not control application or document security. Parameters only organize documents, they do not affect who can access documents. To grant access to the Managed Documents application, you can assign a role. To grant access to a specific document, set user and group permissions. Each document can be associated with predefined parameters. The parameters can help with grouping documents.  
  • Type: Defines the type of document being controlled. Documents of the same type use the same controls.  
  • Classification: Defines document restriction level, such as public, restricted, or confidential.  
  • Audience: Defines the groups with access to the document, such as internal or external.  
  • Name Formats: Defines the format of document names, ensuring that documents of the same type have the same name scheme assembled from name components.  
  • Name Components: Defines the document values used in the name formats.  
  • Approval Rules: Defines the approvals the document must have before it can be published. |

### Install the Managed Documents plugin

The Managed Documents plugin is available for activation by users with the admin role.

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.

If the plugin depends on other plugins, these plugins and their activation status are listed.

3. [Optional] Select the Load demo data check box.

Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when first activating the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.

4. Click Activate.
Managed Documents plugin

This page describes the applications and modules, database table structure, scripts, and roles.

Database table structure

The following tables are added:

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revision [dms_revision]</td>
<td>The document revisions.</td>
</tr>
<tr>
<td>Classifications [classification]</td>
<td>The document restriction level, such as public or confidential. (Does not define access to the document. Document security is set in user and group permissions.)</td>
</tr>
<tr>
<td>Type [dms_type]</td>
<td>The document purpose.</td>
</tr>
<tr>
<td>Component [dms_component]</td>
<td>The components of name formats. The value field is a dot-walking expression that is evaluated. An exception is made for the revision because it does not exist when the revision name is generated.</td>
</tr>
<tr>
<td>Name format [dms_name_format]</td>
<td>The composition of components to generate revision names.</td>
</tr>
<tr>
<td>Approval sequence [approval_sequence]</td>
<td>The approval sequences that users need to follow.</td>
</tr>
<tr>
<td>Approval Rule [dms_approval_rule]</td>
<td>The criteria that records of the dms_document table must match. Used to automatically add approvers to a document.</td>
</tr>
<tr>
<td>Collection [dms_collection]</td>
<td>The document groups created by the user.</td>
</tr>
</tbody>
</table>

Scripts

Business rules that are added to sys_script

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update Document</td>
<td>Changes the state of a document depending on its revisions.</td>
</tr>
<tr>
<td>Add Approvers</td>
<td>Populates the list of approvers in the document.</td>
</tr>
</tbody>
</table>

Script includes that will be added to sys_script_include

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DocumentManagement</td>
<td>Contains the main logics for the Managed Documents plugin.</td>
</tr>
<tr>
<td>DocumentManagementDB</td>
<td>Contains methods to perform CRUD operations on the database.</td>
</tr>
</tbody>
</table>
### ServiceNow Madrid Now Platform capabilities

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DocumentManagementSecurity</td>
<td>Helps manage the security of the Managed Documents system.</td>
</tr>
<tr>
<td>DocumentManagementAjax</td>
<td>Updates the details of the temporary revision that is created when opening the upload/check in revision form.</td>
</tr>
<tr>
<td>DocumentAttachmentAjax</td>
<td>Renames an attachment file.</td>
</tr>
<tr>
<td>DocumentRevisionWorkflowHelper</td>
<td>Helps perform basic workflow operations on a revision.</td>
</tr>
<tr>
<td>DocumentManagementApprovalMatcher</td>
<td>Helps obtain the user and group approvers for a document that matches approval rules.</td>
</tr>
<tr>
<td>DocumentApproverHelper</td>
<td>Contains logics to handle document approvers.</td>
</tr>
<tr>
<td>DocumentManagementUtils</td>
<td>Useful methods.</td>
</tr>
<tr>

<td>Static methods that return reference qualifiers.</td>
</tr>
</tbody>
</table>

**Client script that is added to sys_script_client**

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document type change</td>
<td>Updates the name format field in the revision settings section of the document. Each type has a default name format.</td>
</tr>
</tbody>
</table>

### Roles

This plugin introduces two new roles:

**Roles**

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>document_management_user</td>
<td>This role enables a user to access the Managed Documents plugin, create documents, and search for documents. Document reviewers and approvers need the document_management_user role to access the Managed Document plugin. (Please note that reviewers and approvers can also access a document revision from an approval record.)</td>
</tr>
<tr>
<td>document_management_admin</td>
<td>This role enables a user to change administrative settings for the Managed Documents plugin.</td>
</tr>
</tbody>
</table>

**Note:** Each document has individual permissions, so even if a user is given the document_management_user role and has permissions to the application, the user can only view documents to which they have been given access.
Create a new managed document record

Configure the properties and policies for a managed document.

1. Navigate to Managed Documents > Create New.
2. In the Name field, type Policy.
3. In the Requested by field, add your name.
4. In the Owner field, add your name.
5. In the Reviewer field, add your name.
6. In the Type field, select Policy.
7. In the Classification field, select Confidential.
8. In the Audience field, select Internal.
9. Under Revision Settings, select the Auto increment revision option.

10. Click Submit.

Check in a document after making changes

After making changes to a document, check the revised document into Managed Documents.

1. Open the document record.
2. Click the Upload/Check in Revision related link.
3. Click Choose File, select the revised file, and click Open.
4. Check that the Name and Revision Number contain the updated number.
5. Ensure that the Check in option is selected.
6. Click OK.
   The Document Revisions list updates to contain the most recent revision.
Check out a document to make changes

After a document is added to a managed document record, check the file out to make changes. Checking documents in and out keeps a record of document changes and ensures that only one person at a time is editing the document.

1. Open the document record.
2. Select the Check Out Document related link.

4. Click Check Out.
5. Open the file and make a small change.
6. Save the document with the same name, but a new revision number. For example, Policy_POL_02.txt.

Publish a document in Managed Documents

After the document is reviewed and approved, publish the document within Managed Documents.

1. Open the document record.
2. In the Document Revisions list, click the name of the revision that was approved and is listed in the Ready for Publishing stage.
3. In the header bar, click Publish Revision.
4. In the Publish revision dialog box, check that the name and revision number are correct and click Publish. In the Document Revisions list, the revision you just published is now in the Published stage.
Send a document out for review and approval

When a document is ready, send it out for review and approval. If a reviewer or approver is not identified in the document record, the document is moved directly to the publishing stage.

1. In the Document Revisions list, right-click the revised document and select Submit Revision.

Because you identified yourself as the reviewer, you receive an approve request email message.

2. In the email message, click the link next to Click here to view Approval Request.
3. (Optional) View the document by clicking the attachment name under Document Revision.
4. Click Approve.

The Approvals page displays and lists the document you just approved.

5. Open the document record.
6. In the Document Revisions list, the revision you approved is now in the Ready for Publishing stage.

Upload a document as an attachment

After creating a document record, add the document to the record as an attachment.

1. Open the document record.
2. Select the Upload/Check in Revision related link.

3. Click Choose File.
4. Select a simple document, such as a text file, and click Open.
5. Check that the name reads Policy_POL_0.1.
6. Click OK.

The document is listed under Document Revisions.
Defining Document Parameters

Before using the Managed Documents application, the user with the `document_management_admin` role needs to set the parameters that define the kinds of documents to be managed through the application. Managed Documents provides both base and custom parameter options.

Defining Document Parameters

The following document parameters should be defined:

- **Type**: identifies the purpose of the document. The type also determines the default document format and name format.
- **Classification**: indicates the security level assigned to the document and determines who can view or edit the document.
- **Audience**: specifies the intended readers of the document.
- **Name format**: specifies the name format to use when a document revision is added.
- **Name components**: are individual identifiers used inside a name format. Name components define a reference path (often by dot-walking) that holds the value specific to the document.
- **Approval rules**: determine which approvers are added to documents (in addition to the `Reviewers` specified on the document record).

Defining Types

To define a new type, navigate to **Managed Documents > Administration > Type** and click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the type.</td>
</tr>
<tr>
<td>Code</td>
<td>A short code for the type. Referenced as a name component for the name format.</td>
</tr>
<tr>
<td>Label</td>
<td>A label to display in the <strong>Type</strong> choice list.</td>
</tr>
<tr>
<td>Name Format</td>
<td>The name format that documents of this type will use.</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating the type's sequence in the choice list.</td>
</tr>
</tbody>
</table>

The following types are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Code</th>
<th>Label</th>
<th>Name format</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy</td>
<td>POL</td>
<td>Policy</td>
<td>Default Policy</td>
<td>2</td>
</tr>
<tr>
<td>guideline</td>
<td>GUI</td>
<td>Guideline</td>
<td>Default</td>
<td>3</td>
</tr>
<tr>
<td>procedure</td>
<td>PROC</td>
<td>Procedure</td>
<td>Default</td>
<td>4</td>
</tr>
<tr>
<td>contract</td>
<td>CON</td>
<td>Contract</td>
<td>Default</td>
<td>5</td>
</tr>
</tbody>
</table>

**Note**: For documents with a **Type** of **Contract**, a **Contracts** related list appears on the document record, listing any contracts the document is associated with.
Defining Approval Rules

To define a new approval rule, navigate to Managed Documents > Administration > Approval Rules and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique identifier for the approval rule.</td>
</tr>
<tr>
<td>Active</td>
<td>A check box indicating whether this approval rule is used.</td>
</tr>
<tr>
<td>Condition</td>
<td>A condition builder that determines which documents use this approval rule.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the approval rule.</td>
</tr>
</tbody>
</table>

Once the approval rule is saved, the Approvers related list defines which approvers are added if the conditions in the Condition field are met.

The following approval rules are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internal policy</td>
<td>type=Policy ^ audience=Internal</td>
</tr>
<tr>
<td>Development policy</td>
<td>type=Policy ^ department=Development</td>
</tr>
</tbody>
</table>

Defining Audiences

To define a new audience, navigate to Managed Documents > Administration > Audience and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audience Name</td>
<td>A unique name for the audience.</td>
</tr>
<tr>
<td>Audience Code</td>
<td>A short code for the audience. Referenced as a name component for the name format.</td>
</tr>
<tr>
<td>Label</td>
<td>A label to display in the Audience choice list.</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating this audience's sequence in the choice list.</td>
</tr>
</tbody>
</table>

The following audiences are available in the base system.

<table>
<thead>
<tr>
<th>Audience</th>
<th>Audience code</th>
<th>Label</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>internal</td>
<td>INT</td>
<td>Internal</td>
<td>1</td>
</tr>
<tr>
<td>external</td>
<td>EXT</td>
<td>External</td>
<td>2</td>
</tr>
</tbody>
</table>

Defining Classifications

Define a new classification on the Classification form.

Navigate to Managed Documents > Administration > Classification and click New.
### ServiceNow Madrid Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the classification.</td>
</tr>
<tr>
<td>Code</td>
<td>A short code for the classification. Referenced as a name component for the name format.</td>
</tr>
<tr>
<td>Label</td>
<td>A label to display in the Classification choice list.</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating this classification's sequence in the choice list.</td>
</tr>
</tbody>
</table>

The following classifications are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Code</th>
<th>Label</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>P</td>
<td>Public</td>
<td>1</td>
</tr>
<tr>
<td>restricted</td>
<td>R</td>
<td>Restricted</td>
<td>2</td>
</tr>
<tr>
<td>confidential</td>
<td>C</td>
<td>Confidential</td>
<td>3</td>
</tr>
</tbody>
</table>

### Defining Name Components

Name components define the document values used in the name format.

For example, the name component `document.audience.code` dot-walks from the document record to the audience `Code`.

To define a new name component, navigate to **Managed Documents > Administration > Components** and click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique identifier for the name component.</td>
</tr>
<tr>
<td>Short Description</td>
<td>A short description of the name component value.</td>
</tr>
<tr>
<td>Value</td>
<td>The path to the field holding the value used for the name format. Defined relative to a current revision record. For example: * Enter <code>revision</code> to use the revision <code>Number</code> field on the revision record. * Enter <code>document.name</code> to use the <code>Name</code> field on the revision's referenced document. * Enter <code>document.audience.code</code> to use the <code>Code</code> field for the audience referenced by the document.</td>
</tr>
</tbody>
</table>

This dot-walking approach makes it possible to get any value related to the revision into the name format.

**Note:** The `revision` component is a special component replaced by the appropriate revision number (rather than querying a value related to the current record). The revision is either automatically incremented or uses the latest revision number, depending on the setting on the document form.
The following components are defined in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Short description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audience code</td>
<td>Displays the code assigned to the document audience.</td>
<td>document.audience.code</td>
</tr>
<tr>
<td>Classification code</td>
<td>Displays the classification code.</td>
<td>document.classification.code</td>
</tr>
<tr>
<td>Document name</td>
<td>Displays the document name.</td>
<td>document.name</td>
</tr>
<tr>
<td>Revision</td>
<td>Displays the document revision.</td>
<td>revision</td>
</tr>
<tr>
<td>Type code</td>
<td>Displays the code assigned to the document type.</td>
<td>document.type.code</td>
</tr>
</tbody>
</table>

**Defining Name Formats**

The name format automatically generates a name for a document revision by arranging name components in a standard code to match naming conventions.

For example, a name format with the name components **Type Code**, **Document Name**, and **Revision Number** and the separator `-`, would be formatted as:

```
TYPECODE-Name-RevNumber.fileformat
```

In this example, a policy (code POL) named **IT Off-Boarding Policy**, with revision number **1.0**, and uploaded as a **.docx** file would have the name:

```
POL-IT Off-Boarding Policy-1.0.docx
```

To define a new name format, navigate to **Managed Documents > Administration > Name Formats** and click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the name format.</td>
</tr>
<tr>
<td>Separator</td>
<td>A separator to put between each of the components. Hyphens (-) and underscores (_) are commonly used. Using alphanumeric characters can create a confusing name format.</td>
</tr>
<tr>
<td>Description</td>
<td>A description of the name format.</td>
</tr>
</tbody>
</table>

Use the related list to add name components. Use the **Order** field to set the sequence in which name components are used.

The following name formats are defined in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Separator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>_</td>
<td>The default format. Document name and revision separated by an underscore.</td>
</tr>
<tr>
<td>Default Policy</td>
<td>_</td>
<td>The format for the policy document type.</td>
</tr>
<tr>
<td>Development documentation</td>
<td>(no separator)</td>
<td>The format for the software documentation type.</td>
</tr>
<tr>
<td>Name</td>
<td>Separator</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Development Sources</td>
<td>(no separator)</td>
<td>The format for the development and code sources type.</td>
</tr>
<tr>
<td>Intranet Improvement</td>
<td>(no separator)</td>
<td>The format for documents that describe intranet use.</td>
</tr>
</tbody>
</table>

**Defining Document Workflow**

In the base system, all managed documents use the **Managed Documents** workflow after the **Active** check box is selected.
Document workflow
The document parameters defined in the workflow are often used as conditions to trigger more specific workflows, such as type-specific workflows or classification-specific workflows. If different kinds of documents should follow different workflows, use the Graphical Workflow Editor to create new workflows.

Knowledge document

The Knowledge Document plugin extends the Managed Documents plugin by providing the functionality for managed documents to be published to the knowledge base.

Installed with knowledge document

These elements are installed with the knowledge document plugin.

Dependencies

The Knowledge Document plugin depends on the Managed Documents plugin. Activating Knowledge Document activates Managed Documents.

Tables

<table>
<thead>
<tr>
<th>Display Name [table_name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Records [m2m_document_knowledge]</td>
<td>A many-to-many table storing the relationship between a document and a knowledge article.</td>
</tr>
</tbody>
</table>

UI Actions

<table>
<thead>
<tr>
<th>UI action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link to Knowledge</td>
<td>Creates or updates a knowledge article related to the current document, depending on whether a knowledge article already exists.</td>
</tr>
</tbody>
</table>

Scripts

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KnowledgeDocument</td>
<td>Holds the main logic for the Knowledge Document plugin.</td>
</tr>
<tr>
<td>KnowledgeDocumentDB</td>
<td>Class that gets, inserts, and updates data for the Knowledge Document plugin.</td>
</tr>
</tbody>
</table>
## Knowledge settings fields

These fields appear on the Managed Document form Knowledge Settings section.

### Knowledge settings

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Behavior</td>
<td>Defines the process performed when the Link to Knowledge related link is clicked. Select <strong>Always create record</strong> to create a new knowledge article with the latest published revision attached. The knowledge article is then linked to the document. Select <strong>Update existing record</strong> to update the existing knowledge article to the latest published revision. If no knowledge articles exist for the document, a new knowledge article is created. The <strong>Update existing record</strong> option is not available when many knowledge articles are linked to a document.</td>
</tr>
<tr>
<td>Type</td>
<td>Specifies the type of knowledge article. Use Knowledge or any option that extends the kb_knowledge table. For example, if you have the IT GRC plugin installed to create GRC policies, select the type Policies. Note that when a knowledge article is created, the <strong>Type</strong> field becomes read-only.</td>
</tr>
<tr>
<td>Topic</td>
<td>Defines the subject of the document. Adds the topic information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Published</td>
<td>Date that the article should be published. Adds publishing date information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Valid to</td>
<td>Date that the article expires. Adds valid to date information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Short description</td>
<td>A few words or short phrase describing the knowledge article. Adds the short description to the same field in the knowledge article.</td>
</tr>
</tbody>
</table>

### View knowledge linked to a document

You can view the knowledge linked to a document from the document record.

1. Navigate to the document record.
2. Select the **Knowledge Records** related list.
3. Select the knowledge article to view.

Create a document

After Managed Documents parameters have been set by the administrator, documents can be created, requested, checked out, edited, checked in, copied, and, if necessary, rolled back to an earlier version.

Once documents have been added to the Managed Documents application, they can be grouped into document collections.

Approval process

During the approval process, the approver approves or rejects the document. A document goes through the approval process after the review process.

Approval workflow

After the document has been reviewed, submit the document for approval. If the document does not have an approver, the approval process is omitted.

When the document is Active, the workflow Document Management Default is used to manage approvals:
Document Management Default workflow
If the approver rejects the document, the author and owner are notified and the document review is cancelled. The author, owner, and approver should discuss what changes need to be made to the document. When the document is ready, a new review can be initiated.

If the final approver approves the document, the author and the owner are notified. Once final approval is successful, the document stage changes to Ready for Publishing in the Document Revisions list:

![Document Revision](image)

**Related Links**

- Show Workflow

**Process modification for multiple approvers**

If there are multiple approvers, the approval process works in sequence and multiple approvers can be assigned to a single sequence. For example:

- Sequence 1: approvers A and B
- Sequence 2: approvers C and D
- Sequence 3: approver E

Because the sequences take place in ascending chronological order, approvers A and B receive the approval request first (approvers C, D, and E are not part of the process yet). Similar to the review process, the first approver to act within a sequence dictates what happens to the document. If approver A acts first and rejects the document, the approval process stops and the state is set to Cancelled. Approver B’s status is changed to No Longer Required. If approver A acts first and approves the document, the process stops and approver B’s status is changed to No Longer Required. Then, the document moves to approval sequence 2. After at least one approver in each sequence approves the document, the author and the owner are notified that the document has been approved.
Review process

During the review process, the reviewer approves or rejects the document. Sometimes a document will have multiple reviewers.

If the reviewer rejects the document, the author and owner are notified and the review is cancelled. The author, owner, and reviewer should discuss what changes need to be made to the document. If the reviewer approves the document, the author and owner are notified that the review was successful and the document can move to the approval stage.

If multiple reviewers are assigned to a document, the first reviewer to act dictates what happens to the document. For example, there are two reviewers, A and B. If reviewer A acts first and rejects the document, the review process stops and the revision state is set to Cancelled. Reviewer B receives a notification email stating that the review was rejected and their status is changed to No Longer Required. If reviewer A acts first and approves the document, the review process stops and the document can move to the approval stage. Reviewer B's status is changed to No Longer Required.

Enable electronic signature for approval

This topic explains how to enabling electronic signatures for approval. Electronic signatures are helpful if you must obtain a digital signature for compliance or auditing purposes.

You can activate the Approval with E-Signature plugin to require that users type in a user name and password when reviewing and approving documents.

The digital signature is not tracked or stored in the document record. Users must simply type in a user name and password after clicking the Approve or Reject button.

After activating the Approval with E-Signature plugin, ensure that a row in the e-signature registry table is created for the dms_document_revision table.

1. Navigate to System Definition > e-Signature Registry.
2. Check if dms_document_revision is already listed and Enabled is set to true.
3. If not listed, click New.
4. In Table name, select Document Revision.
5. Select Enabled.
Publish an approved revision

This topic explains how to publish a document revision that has been approved.

Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

Publish the approved revision from the Document Revisions list.

1. Navigate to the document record.
2. In the Document Revisions List, click the revision marked Ready for Publishing.
3. Click Publish Revision to display the Publish dialog box.

The revision number matches the latest revision number. If your standard is to change the revision number when the document is published, such as incrementing the version number to 1.1 or 1.0.1, the change can be made on this dialog box manually.

4. Click Publish.

The published revision is highlighted in green and the stage of previous revisions is automatically changed to Retired.
Submit a revision for draft review

This topic explains how to submit a document draft for review.

Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

When a draft of the document is ready, submit the draft for review. If the document does not have reviewers identified in the Reviewers field of the document record, the review process is omitted.

1. Navigate to the document record.
2. Right-click the appropriate revision.
3. Select Submit Revision.

The revision stage is set to **Awaiting Review**.

**Note**: If the approval and publishing process is repeated, the published revision is retired when the new revision is published. Any workflows running against previous revisions are canceled when the document is published.
The document name and parameters are changed to read-only. The document state is set to **Active**.

![Document Revisions](image)

**Document state Active**

### Create or request a new document

Once an administrator has set parameters for the Managed Documents application, you can create or request new documents.

1. Navigate to Managed Documents > Create New.
2. Complete the following fields:

   **New document fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>An identifying number for the document.</td>
</tr>
<tr>
<td></td>
<td>Automatically generated using number maintenance.</td>
</tr>
</tbody>
</table>

© 2020 ServiceNow, Inc. All rights reserved.
### Field | Input value
--- | ---
**Name** | A name for the document. Note that the name for the document is combined with other naming components (as defined by the name format) to create the names for each document revision.

**Requested by** | The person asking that the document be created or updated.

**Owner** | The approver of the document request. Also responsible for setting completion date with requesters and authors.

**Reviewers** | The user or users who review the document and provide feedback to owners and authors.

**Department** | The department responsible for the document.

**Type** | The document purpose. This is a choice list derived from the type parameters.

**Classification** | The document classification, based on security, audience, and confidentiality. This is a choice list derived from the classification parameters.

**Audience** | The document readers, such as external or internal. This is a choice list derived from the audience parameters.

**State** | The current status of the document in the editing and publication process.

**Checked out by** | The user who currently has the document checked out.

**Description** | A short description of the document.

### Revision Settings

**Name format** | The format for the name of each individual revision of the document. For more information, see Defining Name Formats.

**Revision format** | A choice between the two digit (0.x) or the three digit (0.0.x) revision format.

**Auto increment revision** | If selected, the revision number automatically increments each time the document is revised.

### The User Permissions related list determines which users have rights to view and contribute to the document:

#### User permissions

| Field | Input value |
--- | --- |
**User** | A reference to a user who is entitled to read and contribute to the document. |

**Type** | A choice list describing how the user can interact with the document. Options are:
- Reader - The user can read the document versions.
- Editor - The user can upload new versions.
- Owner - The user can edit the document.
The **Group Permissions** related list determines which groups have rights to view and contribute to the document:

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group</td>
<td>A reference to a group of users who are entitled to read and contribute to the document.</td>
</tr>
<tr>
<td>Type</td>
<td>A choice list describing how group members can interact with the document. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Reader - Group members can read the document versions.</td>
</tr>
<tr>
<td></td>
<td>• Editor - Group members can upload new versions.</td>
</tr>
<tr>
<td></td>
<td>• Owner - Group members can edit the document.</td>
</tr>
</tbody>
</table>

**Specify an approver**

You can specify approvers for a document record after you save it.

You can have one approver or multiple approvers. For example, set multiple approvers to have one person do a quality check of the document and a different individual to serve as a final approver. Approvers are assigned a number. The lowest number (usually number one) approver always goes first, then any other approvers in ascending chronological order. Multiple approvers can have the same sequence number. For example, two approvers can do a quality check and be assigned sequence number 1. Then, two individuals can be final approvers and be assigned sequence number 2.

1. Navigate to the document record.
2. Right-click in the document header bar and select **Add Approver**.
3. Add a user name.
4. Select a sequence number from the drop-down list. (Lower numbers approve before higher numbers. For example, approver number one approves before number two.)
5. Click **Add User**.
6. Repeat steps 2-5 to add more approvers.

**Check in a document**

Check in the document after you revise it so other users can check out the document.

1. Navigate to the document record.
2. Select the **Upload/Check In Revision** related link.
3. Click **Browse** and navigate to the revised file.
4. Click **Open**.
5. Check the Name and Revision Number.
6. Click **OK**.

The **Document Revisions** related list updates to contain the most recent revision:
Copy a document

A document can be duplicated at any time. This is useful if you have an existing document that you want to use as a base for a new document.

1. Navigate to the document record.
2. Right-click the header bar and select **Copy Document**.

   An information message with a link to the new document displays:

3. Click **OK**.

   The new document is renamed and includes the word "Copy."

   **Note:** Only the latest revision is copied.

Deactivate a document

To change the document state to **Inactive**, deactivate the document. This is useful when changes to a document have been put on hold. An inactive document can be reopened at any time.

1. Navigate to the document record.
2. Right-click the header bar and select **Deactivate Document**.

   **Note:** To activate a document, right-click on the header and click **Reopen Document**.

Reopen a deactivated document

A document that has been deactivated can be reopened.

1. Navigate to the document record.
2. Right-click the header bar and select **Reopen Document**.
Roll back a document

A document can be rolled back to an earlier revision at any time. Before rolling back to an earlier revision, ensure that the document is not checked out and that you have Editor or Owner permissions for the document.

1. Navigate to the document record.
2. In the Document Revisions list, click the revision to which you want to roll back.
3. Right-click the header bar and select Rollback. The Rollback to Revision dialog box displays. The name and revision number are new. The note specifies the revision to which you are rolling back.

4. Change any information on the Rollback to Revision dialog box as necessary.
5. Click OK. The latest revision is now the revision you selected for rollback.

Cancel a document

Change the document state to Cancelled when no more changes will be made to the document.

When canceling a document, there is no confirmation message, so ensure that you want to cancel the document.

1. Navigate to the document record.
2. Right-click the header bar and select Cancel Document.

An info message confirms the cancellation:

The State is set to Cancelled:
Check out a document

Documents in the Managed Documents application can only be revised by one user at a time. Check out the document to revise it.

1. Navigate to the document record.
2. Select the Check Out Document related link.
3. Select Download file to download the current version of the document when it is checked out.

4. Click Check Out.

After checking out a document, you can edit the document and make any necessary changes.

Create a document collection

A document collection is a set of individual documents. After documents have been uploaded into Managed Documents, organize the documents by grouping them into collections.

1. Navigate to Managed Documents > Document > My Collections.
2. Select New.
3. Type in a Name.
4. (Optional) Type in a Description.
5. Click Submit.
6. Click the name of the collection you created.
7. Click Edit.
8. On the left, double-click an available document or select a document and click Add.
9. Click Save. The Document Collection page displays and the individual documents in the collection are listed:
Document collection

Upload a document

Upload a document into a saved record. You can upload text files, spreadsheets, presentations, PDF files, and more.

1. Navigate to the document record.
2. Click the **Upload/Check In Revision** related link.
3. Click **Choose File** and navigate to the file.
4. Click **Open**.
5. Check the Name and Revision Number.
6. Click **OK**.

After the initial document is uploaded, subsequent revisions can be created by checking out the document.

Domain separation and Managed Documents

This is an overview of domain separation in Managed Documents. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Overview

Support: Data only

Domain separation in this application is supported at the Data only level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see Application support for domain separation.

MetricBase application

Use the MetricBase application to collect, retain, analyze, and visualize time series data on the Now Platform.

Time series data is a collection of values for an item taken at specific time intervals. Time series data is stored in a separate database, called the MetricBase database. An example is collecting CPU usage values for a computer every hour. You can then use the time series data to evaluate system capacity issues.

The MetricBase application is integrated with the Now Platform making it easy to handle time series data for applications on the Now Platform. The MetricBase database saves values as floating-point numbers.

You can create a trigger that is used with Flow Designer to define when a flow is to be run. A MetricBase trigger can be created with the MetricBase application, or from the Flow Designer.

MetricBase data can be accessed through the Performance Analytics and Reporting application. See the Create time series reports from MetricBase data topic to create advanced reports.

A demonstration plugin is available that contains a user created table with metric fields, triggers, a scheduled job to create data, and the Data Explorer that provides a place to experiment with transform APIs. See MetricBase demonstration application for more information.

The MetricBase product is available as a separate subscription. For more information, see Request the MetricBase product.

Request the MetricBase product

The MetricBase product requires a separate subscription and must be activated by ServiceNow personnel. A demonstration plugin with sample tables, metrics, triggers, and data is available. Be sure to request the MetricBase Demo plugin with the MetricBase product.

Role required: none

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and sub-production instances, generally within a few days.

View time series retention policies

The MetricBase application provides pre-defined retention policies that define the data collection interval for a metric.

Role required: clotho_admin

How often time series data is collected and how long the time series data is retained are important parameters for each metric. The MetricBase application provides pre-defined retention policies. You cannot create retention policies.

A retention policy is a series of time periods and collection rates. An example is 8d@1h, which means for eight days data is collected at one hour intervals. A retention policy is a series of these time periods with longer intervals for each subsequent time period. For example, 8d@1m, 94d@10m, 397d@1h.

Retention policies define the collection interval, which changes with the age of the data. Older data is compacted and stored with lower fidelity. You can see the available retention policies with the Retention Policies module. The 8d@1m, 31d@30m, 397d@1h retention policy means...
• For the last eight days, data points are available at 1-minute intervals.
• Data points from 9 through 31 days are compressed to 30-minute intervals.
• Data points older than 32 days are compressed to 1-hour intervals.
• If data is ingested at 30-second intervals in the last eight days, one data point is lost. Data in the last eight days are always stored at 1-minute intervals.
• If data is ingested at 2-minute intervals in the last eight days, the missing data points are stored as NaN. Data in the last eight days are always stored at 1-minute intervals.

Create a time series metric

Create a time series metric record for each item for which time series data is to be collected. You must define the table, metric field name, and the retention policy.

Role required: clotho_admin

1. Navigate to MetricBase > Retention Policies.
2. Click a policy to view the collection interval specification.

4. Click New.
5. Complete the time series metric definition form then click Submit.

<table>
<thead>

Creates a time series metric record.

MetricBase triggers

Use MetricBase triggers with the Flow Designer to determine when flows should run.

The MetricBase application supports three kinds of triggers.

• Band trigger — Used to detect when a metric value meets a certain threshold or is within a range.
• Linear Predictor trigger — Used to detect when a series of metric values follows an upward or downward trend, and is expected to reach a specified threshold.
• Gap trigger — Used to detect when no data is received for a metric.

For each trigger, you define levels that are available when the trigger runs. The levels can be considered severity levels that indicate which threshold has been crossed or range has been entered (band trigger), how long before a threshold value is expected to be reached (linear predictor trigger), or how long it has been since a data value has been received (gap trigger).

Legacy triggers

Legacy triggers are used to create a band trigger that evaluates data and executes a script when the trigger criteria are met. See Create a legacy MetricBase trigger for the steps to create a legacy trigger.

Note: Legacy triggers are not available in new instances.

Create a MetricBase band trigger

Create a MetricBase band trigger to use with Flow Designer to detect when a metric value meets a certain threshold or is within a range.

Role required: admin

Define a band trigger to detect when a metric value meets a certain threshold or is within a specified range. You define threshold values and ranges. The level defines which threshold or range has been met.

1. Navigate to MetricBase > MetricBase Triggers > Trigger Definitions, and click New. The MetricBase Trigger Creation form is shown.
2. Click Band Trigger - Detects and takes action when metric value meet certain threshold or is within a range.
3. Fill in the fields as needed.

MetricBase Band trigger form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the trigger.</td>
</tr>
<tr>
<td>Aggregator</td>
<td>Specify the aggregation to be done, or none.</td>
</tr>
<tr>
<td>Table name</td>
<td>Specify the table that contains the metric. Only tables that have a metric field are shown in the list.</td>
</tr>
<tr>

<td>The value to cause a trigger. If no band function is selected, the trigger is a fixed number.</td>
</tr>
<tr>
<td>Band Value</td>
<td>The second value used to define a range. When a band function is selected, this value is required. This field appears when <strong>Greater than, Less than, Greater than or is, or Less than or is</strong> is selected from the Band Function field.</td>
</tr>
<tr>
<td>Tolerance</td>
<td>A range plus or minus around a trigger value or band. After a trigger event has occurred, subsequent calculated values must be outside the value or band plus or minus the tolerance before a second event is triggered.</td>
</tr>
</tbody>
</table>

6. **Click Update.**

**Create a MetricBase linear predictor trigger**

Create a MetricBase linear predictor trigger to use with Flow Designer to detect when a metric value is expected to cross a specified threshold within a specified time with a specified confidence level.

Role required: admin

Define a linear predictor trigger to do a linear prediction on metrics that are expected to have an upward or downward trend. You define a time window, confidence interval, expected slope, threshold, and severity level. The severity level defines how soon the metric data is expected to reach the threshold value.

The linear predictor trigger uses the most recent data within the defined window to generate a linear formula \((y = a*X + b)\). The confidence interval is used to determine when the results are significant enough to be used.

When the confidence interval is met, the linear predictor trigger predicts how soon the data is expected to reach the threshold. The generated regression model slope is checked to see if it is the same as the user-defined slope. A trigger transition is generated when a severity level is met.

If the most recent data point exceeds the threshold, a trigger transition is generated regardless of the calculations.

The confidence level and the trigger levels are two different things. The confidence level is the result of the prediction algorithm, and the trigger levels are what you define for the trigger criteria.

1. **Navigate to MetricBase > MetricBase Triggers > Trigger Definitions**, and click **New.**

The **MetricBase Trigger Creation** form is shown.
2. Click Linear Predictor Trigger - Predicts and takes action when a metric follows an upward or downward trend and is expected to reach a given threshold in the future.
3. Fill in the fields as needed.

**MetricBase Linear Predictor Trigger form**

<table>
<thead>
<tr>

</tr>
<tr>
<td>Function</td>
<td>Function to use on the value.</td>
</tr>
<tr>
<td>Window</td>
<td>Length of time to use in the calculations.</td>
</tr>
</tbody>
</table>

6. Click Update.

**Create a MetricBase gap trigger**

Create a MetricBase gap trigger to use with Flow Designer to detect when new metric values have not been stored for a metric for a specified period.

Role required: admin
Define a gap trigger to determine when no data is received for a metric within a time window. You can define severity levels for different gap periods. There must be at least 10 minutes between gap periods, for example, 30 minutes for level 1 and 40 minutes for level 2.

The frequency the system checks for gap triggers is determined by the minimum difference between two levels, divided by 2. If a gap trigger defines level 1 as 30 minutes and level 2 as 50 minutes, the difference between the two is 20 minutes. Dividing 20 minutes by 2 gives the frequency of 10 minutes. If more than two levels are defined, the smallest gap between levels is used in the calculation.

The frequency the system checks for a gap trigger is at least every 30 minutes, but no more often than every 5 minutes.

The gap trigger may happen after the gap period. For example, when the frequency of checking for gaps in data is 10 minutes, and a gap period is 30 minutes, the trigger may occur as late as 40 minutes after the last data value was received.

1. Navigate to MetricBase > MetricBase Triggers > Trigger Definitions, and click New. The MetricBase Trigger Creation form is shown.
2. Click Gap Trigger - Detects and takes action when no data is received for a metric.
3. Fill in the fields as needed.

<table>
<thead>
<tr>
<th>MetricBase gap trigger form</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Table name</td>
</tr>
<tr>
<td>Metric</td>
</tr>
<tr>
<td>Active</td>
</tr>
<tr>
<td>Description</td>
</tr>
</tbody>
</table>

4. Click Save.
   The MetricBase Gap Trigger Levels area is added to the form.
5. Do one of the following to add a threshold or a range.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
</tbody>
</table>

   | Click New. The MetricBase Gap Trigger Level form is shown. |

   | Edit the cells in the table row. |

<table>
<thead>
<tr>
<th>MetricBase Gap Trigger Level form</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Trigger</td>
</tr>
<tr>
<td>Level</td>
</tr>
<tr>
<td>Function</td>
</tr>
</tbody>
</table>
6. Click Update.

Create a legacy MetricBase trigger

Create a trigger to run a script. The trigger is based on static thresholds you create. Data is checked when added to the MetricBase database.

Role required: admin

**Note:** The legacy MetricBase trigger is deprecated and is unavailable for new instances, but is still available on instances upgraded from a previous release.

To create a trigger, select the metric, create a filter to select the records to be evaluated against the trigger criteria, define the trigger criteria, and write the script to run when the trigger criteria are met.

**Note:** The script is not used to determine when the trigger is triggered.

After the trigger has been created, you can specify the trigger levels. Trigger levels define a value or range of values and are part of the trigger criteria. The trigger level whose criteria has been met is one of the parameters to the trigger script. You can define one or more trigger levels for a trigger.

You can use the condition builder to use any field in the table containing the metric to specify the records to be used by the trigger criteria.

A trigger script should have a short execution time. Do not write a script that performs significant amounts of processing. Instead, update a field or create an event and then exit.

1. Navigate to **MetricBase > Trigger Definitions**, and click **New**.
   The **MetricBase Trigger New Record** form is shown.
2. Fill in the fields as needed.

**MetricBase trigger form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the trigger.</td>
</tr>
<tr>
<td>Aggregator</td>
<td>Specify the aggregation to be done, or none.</td>
</tr>
<tr>
<td>Window</td>
<td>Specify the time period to use for the aggregation. This field appears when Min, Max, or Average is selected from the Aggregator field.</td>
</tr>
<tr>
<td>Table name</td>
<td>Specify the table that contains the metric. Only tables that have a metric field are shown in the list.</td>
</tr>
<tr>
<td>Metric</td>
<td>Specify the metric. When you select a metric, the Table name field is updated for the selected metric.</td>
</tr>
<tr>
<td>Active</td>
<td>Specify if the trigger is to be used.</td>
</tr>
<tr>
<td>Filter</td>
<td>Specify the criteria for selecting records from the table.</td>
</tr>
<tr>
<td>Description</td>
<td>Describe the trigger.</td>
</tr>
</tbody>
</table>
3. Click Submit.

Create a legacy MetricBase trigger level

Define levels or ranges for a trigger.

Role required: admin

The trigger must be defined before you can create a trigger level. Trigger bands must not overlap.

**Note:** The legacy MetricBase trigger level is deprecated and is unavailable for new instances, but is still available on instances upgraded from a previous release.

1. Navigate to MetricBase > Trigger Definitions, and click the trigger for which you want to add a trigger level. The MetricBase Trigger form is shown.

2. Scroll down to the MetricBase Trigger Levels list, and click New. The MetricBase Trigger Level New record form is shown.

3. Fill in the fields as needed.

<table>
<thead>
<tr>
<th>MetricBase trigger form</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>Trigger</td>
<td>This field is pre-filled with the trigger on which you were working. Use the lookup list to select a different trigger.</td>
<td></td>
</tr>
<tr>
<td>Level</td>
<td>Level number. Set to the next available number. You can change the number.</td>
<td></td>
</tr>
<tr>
<td>Function</td>
<td>Function to use on the value.</td>
<td></td>
</tr>
<tr>
<td>Band Function</td>
<td>To define a range, select the function to be applied to the second value.</td>
<td></td>
</tr>
<tr>
<td>Value</td>
<td>Value to cause a trigger. If no band function is selected, the trigger is a fixed number.</td>
<td></td>
</tr>
<tr>
<td>Band Value</td>
<td>Second value to use to define a range. When a band function is selected, this value is required. This field appears when Greater than, Less than, Greater than or is, or Less than or is is selected from the Band Function field.</td>
<td></td>
</tr>
<tr>
<td>Tolerance</td>
<td>Range plus or minus around a trigger value or band. After a trigger event has occurred, subsequent calculated values must be outside the value or band plus or minus the tolerance before a second event is triggered.</td>
<td></td>
</tr>
</tbody>
</table>

4. Click Submit.
Create an Action Condition

An Action Condition is a script that is run when trigger conditions are met, but before the Flow actions begin. If the Action Condition script returns true, the Flow actions are executed. If the Action Condition script returns false, the Flow actions are not executed.

Role required: admin

Use the Action Condition to check for duplicate triggers. You can determine if the record that the flow action is going to update has already been updated, and return false to prevent the flow action from being executed.

In the Flow Designer, use the Additional Filtering field to assign the Action Condition to a flow.

1. Navigate to MetricBase > MetricBase Triggers > Trigger Moderators, and click New. The Additional MetricBase Trigger Filtering and Moderation form is shown.
2. Fill in the fields as needed.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the Action Condition.</td>
</tr>
<tr>
<td>Application</td>
<td>Application for which the Action Condition is defined.</td>
</tr>
<tr>
<td>Description</td>
<td>Describe the Action Condition.</td>
</tr>
<tr>
<td>Script</td>
<td>Specify the script. The trigger definition record, the record containing the metric that created the trigger, the date and time the trigger occurred, and the band level for the trigger are input parameters to the script. If the script returns true, the Flow action is executed.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Store time series data

Use JavaScript, REST, or scriptable REST APIs to add time series data to a metric field.

It is recommended that you use the REST APIs to store time series data.

For information on the MetricBase REST APIs, see the REST API Explorer on an instance with the MetricBase application installed, or see the Clotho Time Series API.

For information on the MetricBase JavaScript APIs, see Client, Data, DataBuilder, Transformer, TransformPart, TransformResult.

In practice, for performance reasons, batch multiple series of multiple data points and store them at one time, do not insert each data point individually.

Store time series data using REST APIs

```
curl -v "https://<your_instance.servicenow.com>/api/now/v1/clotho/put" --request POST --header "Accept:application/json" --header "Content-Type:application/json" --data "{{"seriesRef":{{"subject":"","table":"\"","data "}},"subject":\"","table":"\"","data "}},"table":"\"","data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}},"data "}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}}{}
Store time series data using JavaScript APIs

```javascript
/*metric":"svlt_sys_load_count"},"values":
["timestamp":"2017-04-06T20:22:20Z", "value":0],
["timestamp":"2017-04-06T20:22:20Z", "value":1.1],
["timestamp":"2017-04-06T20:23:20Z", "value":1.4],
["timestamp":"2017-04-06T20:24:20Z", "value":1.1],
["timestamp":"2017-04-06T20:25:20Z", "value":1]}"
--user 'admin':"admin"
```

Analyze time series data

Use JavaScript or REST APIs to extract time series data from the MetricBase database, and to run transforms on the data.

For information on the MetricBase REST APIs, see the REST API Explorer on an instance with the MetricBase application installed, or see the Clotho Time Series API.

For information on the MetricBase JavaScript APIs, see Client, Data, DataBuilder, Transformer, TransformPart, TransformResult.

To use MetricBase time series data in report visualizations, see Create time series reports from MetricBase data.

Analyze time series data with JavaScript APIs

This example returns the average CPU usage over the specified time for each XYZ computer.

```javascript
// Query the cmdb_ci_computer table for the records for
var gr = new GlideRecord('cmdb_ci_computer');
gr.addEncodedQuery('manufacturer=xyz');
gr.query();

// Create a DataSelector object and specify the metric
// (cpu_percentage), // the transform (avg), and label (avg cpu)
var transform = new
sn_clotho.Transformer(gr).addMetric('cpu_percentage').avg()
.label('avg-cpu-percentage');

// Run the transform between startTime and endTime.
// startTime and endTime are GlideDateTime
var data = transform.execute(startTime, endTime);
var values = data['avg-cpu-percentage'].getValues();
```
Filter data

Glide developers can use SQL WHERE clauses in transformation scripts to filter data in report visualizations. Transformations in clotho aggregate and apply mathematical functions on metric records. Use SQL WHERE clauses in transformation scripts to filter data. In the following example, the WHERE clause filters out all results except those where mb_demo_mt_speed equals 100.

```javascript
var eqCon = new sn_clotho.Condition().eq(100);
var builder = new sn_clotho.Transformer(drones);
var fit = builder.metric("mb_demo_mt_speed").where(eqCon);
```

View time series data

You can view time series data for a metric. A metric is defined for all records in a table, and you can view the time series data for all records.

Role required: admin

See the [Create time series reports from MetricBase data](#) topic to create advanced reports.

1. Navigate to the table containing the metric.
   In the Filter Navigator, type `<table name>.list` and hit enter.
2. Click the menu icon above the metric column, and select Time Series Chart.
3. Change the Time Span and Transform fields to evaluate the data.
   When you select the Add, Multiply, or Divide transforms, the Value field and Submit button are shown. Enter a value and click Submit to view the adjusted data. The adjusted data is not saved to the MetricBase database.

View MetricBase status

You can view the status of the MetricBase database.

Role required: admin

1. Navigate to MetricBase > MetricBase Status.
   A list of MetricBase statistics is shown. Each item is information about the MetricBase database. Use the personalize icon to add fields to the form. Then, click on a metric to view the time series data.
2. Set up the list to show the information that you want to check.
   a) Click the Update Personalized List icon.
   b) Use the slushbucket to move the desired metric to the display, and click OK.
3. Click the metric value to view the time series data for that statistic.

Debug MetricBase

You can use session debug tools and statistics to debug issues.

Role required: admin

1. To use MetricBase session debug.
   a) Navigate to System Diagnostics > Session Debug > Debug MetricBase.
      Session debug tracking for MetricBase activities starts.
   b) Navigate to MetricBase > MetricBase Status, and scroll to the bottom of the list.
Debug information is listed below the list.

2. To view MetricBase statistics
   a) Navigate to System Diagnostics > Stats > Stats
   b) Scroll down to find MetricBase Statistics

**MetricBase demonstration application**

Investigate an example application that uses MetricBase features. The demonstration application is in the MetricBase Demo plugin.

The demonstration application contains a table that has metric fields defined. Triggers have been created for evaluating data as it is added to the MetricBase database. A scheduled job that runs every five minutes adds data to the MetricBase database. You can use the Data Explorer module to experiment with transform APIs.

The MetricBase Demo application has these modules.

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drones</td>
<td>Table created for this application. You can add records.</td>
</tr>
<tr>
<td>Fleets</td>
<td>Table created for this application. It provides a mechanism for grouping drones. You can add records.</td>
</tr>
<tr>
<td>Data Generators</td>
<td>Table defining how data is created for the drone records. This is provided for informational purposes. You cannot change or add records.</td>
</tr>
<tr>
<td>Metrics</td>
<td>Shows the metrics defined for the system. This is the same table as MetricBase &gt; Time Series Metrics. You can add metric fields.</td>
</tr>
<tr>
<td>Scheduled Jobs</td>
<td>Shows the scheduled job created for the demonstration application. The job runs every five minutes to add data to the MetricBase database. You can change the schedule.</td>
</tr>
<tr>
<td>Triggers</td>
<td>Shows the triggers defined for the system. This is the same table as MetricBase &gt; MetricBase Triggers &gt; Trigger Definitions. You can create triggers.</td>
</tr>
<tr>
<td>Anomaly Logs</td>
<td>Shows a list of anomaly logs. The Low-Flying Drone trigger creates the anomaly logs.</td>
</tr>
<tr>
<td>Data Explorer</td>
<td>Provides a form for experimenting with MetricBase APIs using the demonstration application's data. See MetricBase Data Explorer for more information.</td>
</tr>
</tbody>
</table>

**MetricBase Data Explorer**

Experiment with MetricBase APIs using the data created by the demonstration application.
Role required: admin

The Data Explorer screen has the following sections:

- **Data Explorer Script Result Display** — Displays the results of the script.
- **Data Explorer Script** — Contains a script that you can run.
- **Server Output** — Add `gs.info()` statements to scripts to display debug information in this section.

**Note:** You may need to scroll down to see the bottom sections.

**Example Script** is a list of sample scripts. You can use these scripts, modify them, or write your own.

**Note:** To keep a modified script, save it.

1. Navigate to **MetricBase Demo > Data Explorer**.
2. To execute a script, click **Run**.
3. To change the script:
   a) Select a script from the **Example Script** list.
   b) Click **Load Example**.
   c) Click **Run**.

### Domain separation and MetricBase

This is an overview of domain separation and the MetricBase application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

#### Overview

**Support: Data only**

Domain separation in this application is supported at the **Data only** level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see [Application support for domain separation](#).

### MID Server

The ServiceNow® MID Server application facilitates communication and movement of data between the platform and external applications, data sources, and services.

Introducing the MID Server

The Management, Instrumentation, and Discovery (MID) Server is a Java application that runs as a Windows service or UNIX daemon on a server in your local network.

The MID Server facilitates communication and the movement of data between a ServiceNow instance and external applications, data sources, and services.

This video gives you an overview of the MID Server:

Applications that use MID Servers

<table>
<thead>
<tr>

<td>• Service Assurance</td>
</tr>
</tbody>
</table>

Communicating with the MID Server

The MID Server initiates all communications with the ServiceNow® instance. The instance never initiates communications with the MID Server. This communication is recorded as records in the ECC queue, which is essentially the communication log between the instance and the MID Server. See The MID Server ECC Queue for more information.

MID Server selection

An application can select a MID Server in these ways.

• **Auto-selection**: The application can automatically find an appropriate MID Server that meets the necessary selection criteria. The criteria is different for each application.

• **Default selection**: The application defaults to a single MID Server that you can specify for each application.
• **Manual selection**: The application selects a single MID Server that you specify. Not every application allows for manual selection.

See *MID Server selection* for details.

**Asynchronous Message Bus**

The MID Server opens a persistent connection to the instance through the Asynchronous Message Bus (AMB) Client and listens on the `/mid/server/<mid_sys_id>` AMB channel. When an output record is inserted into the Queue [ecc_queue] table, an AMB message is sent to the MID Server's channel. The MID Server receives this message and immediately polls the ecc_queue table for work.

The MID Server polls the ECC queue on the regular interval defined in the `mid.poll.time` configuration parameter, regardless of AMB message activity. The default polling interval is set to 40 seconds, but can be reconfigured. This polling of the ECC queue at a regular interval is done in case the AMB connection is dropped.
ServiceNow Madrid Now Platform capabilities

Note: The AMB client on the MID Server does not work in all environments and might need to be disabled to avoid performance issues. To disable AMB in your environment, set the `mid.disable_amb` parameter to `true`. When you disable AMB, the MID Server reverts to a default polling interval of 5 seconds, unless the `mid.poll.time` parameter is set to a different value.
System clones and the MID server

See KB0547597 for information on what to do with MID Servers when you are cloning your instance.

Using guided setup to implement a MID Server

MID Server guided setup provides a sequence of tasks that help you configure a MID Server on your ServiceNow instance. To open MID Server guided setup navigate to Guided Setup > ITOM Guided Setup.

For more information about using the guided setup interface, see Using guided setup.

MID Server heartbeat

The Now Platform checks the MID Server for a response every 5 minutes, using a synthetic transaction monitoring system.

Checking for a heartbeat

ServiceNow instances send a synthetic transaction via the Heartbeat probe to every MID Server every 5 minutes. The Heartbeat probe functions exactly as a normal probe does and is sent by writing an output record to the ECC queue. A MID Server retrieves the record when it queries the ECC queue for work. The MID Server processes the probe just as it would any other probe and responds back to the instance. If the instance does not detect a response from a MID Server, the instance marks that MID Server as Down. If the MID Server responds, the instance considers the MID Server to be Down and is communicating properly with the instance.

Note: Make sure that your MID Server can communicate on port 443. See Configure MID Server network connectivity and MID Server system requirements for more information.

System events

When a MID Server transitions from one state to another, one of these events is triggered:

- **mid_server.up**: The MID Server goes from a status of Down, Paused, or Upgrading to a status of Up.
- **mid_server.down**: The MID Server goes from a status of Up to a status of Down.
- **mid_server.paused**: The MID Server is paused.
- **mid_server.upgrading**: The MID Server is being automatically upgraded because the instance is being upgraded.

You can use these events to send notifications or trigger actions that you specify in scripts.

Scheduled job

To change the trigger interval for the Heartbeat probe, navigate to System Scheduler > Scheduled Jobs > Scheduled Jobs. Open the MID Server Monitor record and edit the interval.
MID Server heartbeat trigger interval

MID Server system requirements

Use these minimum system requirements to allocate resources for computers hosting MID Servers.
**MID Server supported systems**

The following systems support the MID Server.

  **Note**: .NET Framework version 3.5, 4.0, 4.5, 4.6, or 4.7 is required for Service Mapping support and for Windows pattern-based discovery.

- **Linux**: The MID Server is supported on Linux Red Hat 6 and above, Ubuntu 1404 (Ubuntu 14) and above, and CentOS 6 and above. Linux MID Servers support virtual machines and 64-bit systems. On 64-bit Linux systems, you must install the 32-bit *GNU C library* (**glibc**). The installation command for CentOS is: `yum install glibc.i686`.

  **Note**: Operating systems at their End of Life are no longer supported by the ServiceNow MID Server.

**Java version support**

OpenJDK version 1.8.0_231 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures OpenJDK to run in your environment. No additional configuration is required. This version supports both 32 bit and 64 bit MID Servers. For the best performance, install the 64 bit MID Server for your operating system. The MID Server requires a minimum JRE version 1.8.0_161, and recommended version 1.8.0_231. If you are using a lower version than 1.8.0_161, you may see encryption related issues.

  **Note**: ServiceNow will discontinue support for 32 bit MID Servers in a future release.

Testing showed that the MID Server works as expected with Oracle JRE 8 version 1.8.0_231. However, this version requires the workaround described in the HI Knowledge Base article *MID Server running Oracle JRE version 8 [KB0784442]*.

Upgraded MID Servers might use different Java versions depending on their release level.

- MID Servers upgraded from Kingston and earlier use the OpenJDK provided with the MID Server installer. This version of the OpenJDK was tested and certified for use with these MID Servers.
- MID Servers upgraded from London continue to use the same JRE you configured for London. The MID Server supports JRE 1.8.

**Java Service Wrapper**

The MID Server installer includes the Tanuki Java Service Wrapper, version 3.5.34.

**PowerShell version support**

Windows MID Servers require a minimum PowerShell version of 2.0, and support up to PowerShell version 5.1. However other applications such as *Discovery and Service Mapping* may have different version requirements.

  **Note**: PowerShell version 2.0 will not be supported in the Orlando release.
Setting the JVM Memory size

The MID Server installs with 1 GB of JVM memory. If the suggested memory size for your product is greater than 1 GB, see *Set the MID Server JVM memory size* for the procedure to override the default setting.

Deployment types

System requirements for your instance are determined by the needs of the individual products you use that require a MID Server.

**Standard deployments**

The following products are considered "standard" because their MID Servers share the same minimum disk space and memory requirements:

- Discovery
- Event Management
- Integrations
- Orchestration
- Service Mapping

The minimum standard requirements pertain to both a single product and a combined product deployment. You can deploy a single MID Server for multiple standard products without significantly increasing the disk or memory requirements.

**High resource deployments**

Cloud Management Platform (CMP), alert aggregation and RCA, and Operational Intelligence are processing intensive and require more resources for each MID Server than the standard products. Install MID Servers for these products on dedicated hosts that do not support MID Servers for other products.

**Recommended MID Server minimum requirements**

All configurations listed here require a quad core processor with a speed of 2 GHz or greater and were calculated for a Windows Server 2012 R2 host.

*Note:* The MID Server minimum system requirements for 25 concurrent threads includes resource overhead that is independent of the number of threads. As a result, the system requirements for 200 threads do not require a linear increase in resources. You can set the MID Server to use as few as 5 threads without issue.

To increase the speed of the MID Server if the host is powerful enough or lightly loaded with other programs, you can increase the threads setting. The threads setting depends on the limitation of the CPU speed, memory, and operating system of the host machine. You might have to experiment to find the optimal threads count that works best when the MID Server is busy so it does not exhaust the host machine’s hardware limitations. This means you may have to refine the thread count to best meet your situation. Important: You can set threads.max as high as 200, however, this setting may need to be changed depending on the OS. For example, Windows-based MID Servers running Discovery uses Powershell which is resource intensive. In this case, you may exhaust the CPU power of the host machine with just 50 threads count.
## MID Server minimum system requirements for 25 concurrent threads (base system)

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>
</tr>
<tr>
<td>Alert aggregation and RCA</td>
<td>36 GB</td>
<td>10 GB</td>
</tr>
<tr>
<td>Cloud Management Platform (CMP)</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
<tr>
<td>Operational Intelligence</td>
<td>36 GB</td>
<td>16 GB</td>
</tr>
<tr>
<td>Standard</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
</tbody>
</table>

## MID Server minimum system requirements for 200 concurrent threads (customer configured)

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>
</tr>

<td>Operational Intelligence</td>
<td>36 GB</td>
<td>16 GB</td>
</tr>
<tr>
<td>Standard</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
</tbody>
</table>

### Use case 1: Single MID Server deployed for multiple standard products

In this example, Service Mapping, Discovery, and Orchestration share a MID Server with 25 threads that is installed on a dedicated host. The disk space and memory requirements specified here satisfy the minimum recommended requirements for the combined product deployment.
One MID Server for multiple standard products

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>
</tr>
<tr>
<td>Service Mapping + Discovery + Orchestration</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
</tbody>
</table>

Use case 2: Multiple MID Servers deployed to a single host

In this example, three MID Servers (not clustered) are assigned to different standard products. All three MID Servers are deployed to a single host, where each MID Server has 25 threads. The required resources are calculated as follows:

- **Total disk space required**: Add the recommended disk space for the operating system from the OS column to the sum of the values in the MID Server + product column for all products mapped.
- **Total memory required**: Add the recommended memory for the operating system from the OS memory column to the sum of the values in the JVM memory column for all products mapped.

Monitoring performance

To ensure that the MID Server resource allocations are sufficient for your environment, monitor performance during peak periods of product execution from the MID Server dashboard.
MID Server version compatibility

The version of the MID Server must be compatible with the version of the instance. Otherwise, the MID Server cannot process commands or communicate with the instance.

The instance determines which version of the MID Server is allowed. The MID Server version must at minimum belong to the same major release, such as Helsinki. If the MID Server version belongs to the same major release, it can, but does not have to, belong to the same minor version, such as Helsinki Patch 1. In this case, communication with the instance might still be possible, but it is always suggested that you upgrade to the latest version.

**Caution:** You can pin the MID Server to a specific version using the `mid.version.override` property, but you should be aware that the version might become out of date.

For more information on upgrades, see [MID Server upgrade](#).

Version indicators

If the version is not compatible, the MID Server status is not changed to **Down** in the MID Server dashboard. So it might still appear to be processing commands when it actually is not doing so. You must check the MID Server **Version** on the dashboard, which is available starting with the Istanbul release.

The icons in the **Version** column indicates the following:

- **Red:** Incompatible. The MID Server and instance do not belong to the same release. You must upgrade the MID Server and verify that it is not pinned to an older version with the `mid.version.override` property. The MID Server will not be upgraded until the parameter is cleared.
- **Yellow:** Compatible, but an upgrade is recommended. This indicates that the MID Server version belongs to the same family as the instance, but not the same version.
- **Green:** Compatible. No upgrade necessary.
- **Gray:** Incompatible. The instance cannot detect the version.

See [KB0597571](#) for additional MID Server troubleshooting information.

MID Server installation

The installation of the MID Server requires you to satisfy certain connection prerequisites and create a MID Server user before you download and install the MID Server on a host machine. All MID Servers must be validated before they can be used.

Using guided setup to implement a MID Server

MID Server guided setup provides a sequence of tasks that help you configure a MID Server on your ServiceNow instance. To open MID Server guided setup, navigate to Guided Setup > ITOM Guided Setup. For more information about using the guided setup interface, see Using guided setup.

MID Server installation and setup process

To install and configure a MID Server, perform these tasks in the order shown here:

1. Configure communication between the MID Server and the instance on the appropriate port and enable the required web services. See Configure MID Server network connectivity for details.
2. *Create the MID Server user* and grant that user the mid_server role.
3. Download the installer file for the host machine.

4. Install the MID Server on a Linux or Windows host.

5. Test the MID Server connection to the instance.

6. Validate the MID Server to ensure that it is trusted to access credentials used by the instance for automations.

7. Configure MID Server parameters, which control various aspects of MID Server functionality, including proxy servers, debugging, and upgrade.

**MID Server connection prerequisites**

Before you install the MID Server, perform the necessary prerequisites that it needs to connect to elements inside and outside your network. This includes network privileges and security considerations.

**Network privileges**

The host machine must have these network privileges:

- Firewall access: Configure any firewalls between the MID Server and the target devices to allow a connection. If your network uses a DMZ, and if your network security protocols limit port access from within the network to the DMZ, you might have to deploy a MID Server to a machine within the DMZ to probe the devices there.
- Network access: Configure target devices to allow the MID Server probe to connect. If network security prevents you from configuring new machines that can connect to the targets, install the MID Server on an existing machine with connection privileges.
- Network account: Install the MID Server with the proper account, either local or domain administrator.

Additionally, for the MID Server to access your ServiceNow instance, satisfy these prerequisites:

- Network access to the ServiceNow instance: Configure the network that the MID Server uses to allow traffic over TCP port 443.
- A MID user: Create a ServiceNow user record for the MID Server to use. This user record must have the mid_server and import_admin roles.

**Note:** Verify that the baseline public page InstanceInfo is active for the MID Server to connect to the instance.

**Security considerations**

Sometimes computers or devices have additional security measures configured, and these measures may interfere with the MID Server’s ability to run commands or queries on those systems.

For example, a Linux server might be configured to allow only certain IP address to connect to it via SSH. Similarly, a network router might be configured to allow only certain IP address to query SNMP on it. To allow access in such cases, use one of the following methods:

- Update the configuration of those computers or devices to allow the desired MID Server to run commands or query them. For example, a network router may be configured to only allow the network management systems to query SNMP on it. In that case, add the MID Server as though it were another network management system.
- Install a MID Server on a computer that already has access to the computers or network devices with such restrictions. For example, to use Discovery within a DMZ (where communication from outside the DMZ will be severely restricted), install a MID Server on a computer that is already in the DMZ.
External connectivity requirements

These requirements are specifically for the use of MID Servers with the ServiceNow Discovery and Orchestration products.

The MID Server communicates securely on port 443 to the instance and requires no inbound connections. In some cases, it might be necessary to allow this communication through the firewall if the MID Server fails to register on the instance. To determine if the application or a network security restriction is to blame for connection failure, attempt to telnet to the instance on port 443 from the server that is hosting the MID Server application. If this connection fails, then the problem could be a web proxy (since 443 is an https connection) or a Firewall rule preventing external TCP connections from that host. Contact network security personnel for the proxy information to add to the config.xml file, or request that the firewall be configured to allow access using one of the following syntaxes:

- `<source IP> to <any>`
- `<source IP> to <ServiceNow> any established`
- `<source IP> to <instance_name.service-now.com> 443`

**Important:** Ensure that the MID Server host computer can connect to install.service-now.com to download the installer and upgrade automatically.

If you have a self-hosted ServiceNow environment that blocks access to the install.service-now.com download site, you must import the MID Server installer package into your network manually and then transfer it to your MID Server host machine. For instructions, see KB0760123 in the Self-Hosted knowledge base.

Internal connectivity requirements

These methods are used for discovering various devices on a network and are specifically for the use of MID Servers with the ServiceNow Discovery and Orchestration products.

- **SSH:** For UNIX-like machines, Discovery and Orchestration use SSH protocol, version 2 to access target machines. SSH is a network protocol that allows data to be exchanged using a secure channel between two networked devices. SSH communicates on port 22 within an encrypted datastream and requires a login to access the targets using two available methods of authentication: a user name and password combination and a user name and shared private key. Specify SSH authentication information and type in the Credentials module. If multiple credentials are entered, the platform tries one after the other until a successful connection is established or all are ultimately denied. To provide for application relationships a limited number of SUDO commands must be available to be run. Additional details to these requirements can be found in UNIX/Linux commands requiring root privileges for Discovery and Orchestration.

- **WMI:** For Windows machines, Discovery uses the Windows Management Instrumentation (WMI) interface to query devices. Due to security restrictions for WMI, the MID Server application executing the WMI queries must run as a domain user with local (target) administrator privileges. When Discovery detects activity on port 135, it launches a WMI query. The response from the Windows device is sent over a Distributed Component Object Model (DCOM) port configured for WMI on Windows machines. This can be any port. Ensure that the MID Server application host machine has access to the targets on all ports due to the unique nature of the WMI requirements.

- **Windows PowerShell:** PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. Orchestration uses PowerShell to run Workflow activities on Windows machines. PowerShell must be installed on any MID Server that executes these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 2.0 and 3.0. Orchestration activities for PowerShell require a credentials Type of Windows.

- **SNMP - Network:** For network devices, Discovery uses an SNMP scan to get device specific MIBs and OIDs. SNMP is a common protocol used on most routers, switches, printers, load balancers and various other network
enabled devices. Use a **community string** (password) for authentication when scanning a device via SNMP. Many devices have a default community string of **public** which Discovery uses by default when querying a target. Define additional community strings in the **SNMP credentials** form which are tried in succession, along with **public**, until a successful query returns. In addition to the credentials, the platform also requires the ability to make SNMP requests on port 161 from the MID Server to the target. If Access Control Lists (ACLs) are in place to control the IP addresses that can make these queries, ensure that the IP address of the MID Server is in the ACL. ServiceNow Discovery supports SNMP versions 1, 2c, and 3.

- **WBEM:** Web-Based Enterprise Management (WBEM) defines a particular implementation of the Common Information Model (CIM) including protocols for discovering and accessing each CIM implementation. WBEM requires either of two ports, 5989 or 5988 and uses the HTTP transport protocol. WBEM supports SSL encryption and uses CIM user name/password credentials. ServiceNow Discovery launches a WBEM port probe to detect activity on the target ports and to append gathered data to a classification probe that explores CIM Servers.

### Configure MID Server network connectivity

Before attempting to install and configure the MID Server, prepare your network to allow the MID Server to connect with the ServiceNow® instance.

**Role required:** admin

1. Configure the network to allow MID Server network connectivity to the ServiceNow instance over TCP port **443**.
2. Configure basic authentication for SOAP communications with the ServiceNow instance.
3. Navigate to **System Web Services > Scripted Web Services > Scripted SOAP Services**.
4. Confirm that the following web services are active:
   - GetMIDInfo
   - InstanceInfo
   - MIDAssignedPackages
   - MIDFieldForFileProvider
   - MIDFileSyncSnapshot
   - MIDServeCheck
   - MIDServeFileProvider
5. Type `sys_public.list` in the navigation search field and press **Enter**. The Public Pages record list appears.
6. Verify that the **InstanceInfo** public page is active, to allow the MID Server to validate its version.

### Create the MID Server user and grant the role

Create the MID Server user ID and grant this user the role it needs to communicate with the instance.

**Role required:** admin

The MID Server connects to an instance by using the SOAP web service. To allow authentication with the instance, create a separate user account for each MID Server or share the same account across multiple MID Servers. Grant each MID Server user the mid_server role, which is required for the MID Server user on any instance on which basic authentication is enabled. The mid_server role allows the MID Server to access protected tables when strict SOAP security is in place. The system adds the necessary SOAP roles automatically with this role.

**Note:** The strict SOAP security feature, enabled by default for any instance that uses basic authentication, protects all tables with Access Control Lists (ACL).

1. From the instance, navigate to **User Administration > Users**.
2. Click **New**.
3. Complete the fields in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>User name for the MID Server user. This name is specified in the <code>mid.instance.username</code> parameter of the configuration file that the MID Server installer creates. For details, see <em>MID Server parameters</em>.</td>
</tr>
<tr>
<td>First name</td>
<td>The user's first name.</td>
</tr>
<tr>
<td>Last name</td>
<td>The user's last name.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for the MID Server user. This password is specified in the <code>mid.instance.password</code> parameter of the configuration file that the MID Server installer creates.</td>
</tr>
</tbody>
</table>

4. Right-click the header and select **Save**.
5. Under the **Roles** related list, click **Edit**.
6. Select the **mid_server** role for this user.
   Each MID Server account must have this role to access protected tables.
7. Click **Save**.
8. Confirm that the MID Server account was created successfully and the account has connectivity to the instance.
   a) On the host machine where you intend to install the MID Server, open a browser and navigate to the instance.
   b) Use your new MID Server user credentials to log in.
      If the login is successful, then any MID Servers you install on that host will be able to connect to the instance.

*Download* the MID Server files for your operating system.

**MID Server role validation**

Real-time system validation of MID Server role assignments prevents incompatible settings.

To prevent MID Server validation failure and ensure that your MID Server is configured correctly, the system runs several business rules that monitor the roles and settings you select for your MID Server user. The instance displays a warning and blocks the change when you attempt to save an incompatible configuration.

**Elevated privileges not permitted**

The mid_server role cannot be configured for elevated privileges. The *Invalid MID Server settings* business rule runs on the Role [sys_user_role] table and prevents the `elevated_privileges` field from being set to true for the mid_server role.
Warning for elevated privileges on the mid_server role

Relationship table protection

The User Role [sys_user_has_role] table creates the relationship between the [sys_user] and the [sys_user_role] tables.

- **Incompatible role**

  The mid_server and security_admin roles are incompatible and cannot be assigned to the same user. The system determines the user's current role and runs the Security Admin incompatible with MID business rule on the User Role [sys_user_has_role] table. This rule prevents an administrator from adding the security_admin role for a user who currently has the mid_server role.
Warnings for incompatible security_admin role assignment

- **Incompatible user role and user record settings**

  The **Incompatible MID Server user role** business rule runs on the User Role [sys_user_has_role] table to protect its data from incompatible configurations. Validation for this related table ensures that an administrator cannot assign the mid_server role to a user who already holds the security_admin role.

**Download the MID Server files**

Your ServiceNow instance downloads the MID Server installer package from install.service-now.com and makes it available to the MID Server host for installation.

Role required: admin

If you have a self-hosted ServiceNow environment that blocks access to the install.service-now.com download site, you must import the MID Server installer package into your network manually and then transfer it to your MID Server host machine. For instructions, see KB0760123 in the Self-Hosted knowledge base.

ℹ️ **Note:** Download the MID Server first and then enable Discovery, Orchestration, or any integration that requires the use of the MID Server.

1. On the ServiceNow instance, navigate to **Mid Server > Downloads**.
2. Select and download the MID Server for the appropriate operating system.
   
   For the best performance, install the 64-bit MID Server for your operating system.

ℹ️ **Note:** ServiceNow will discontinue support for 32 bit MID Servers in a future release.
MID Server downloads

3. Save the download file to a temporary file on the local drive.
4. Move the file into the designated MID Server folder you create for your operating system and run the installer from that location.

You can manually verify the signature of an installation package with the jarsigner tool to ensure its authenticity. For more information about verifying the signature, see the MID Server upgrades section on manual verification.

Install the MID Server on the host computer.

- **Linux**
- **Windows**

**Install a MID Server on Linux**

The MID Server installer automates the installation of a MID Server on a Linux computer.

Verify that the host computer satisfies the MID Server system requirements.

Role required: admin, mid_server

OpenJDK version 1.8.0_231 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures OpenJDK to run in your environment. No additional configuration is required. This version supports both 32 bit and 64 bit MID Servers. For the best performance, install the 64 bit MID Server for your operating system. The MID Server requires a minimum JRE version 1.8.0_161, and recommended version 1.8.0_231. If you are using a lower version than 1.8.0_161, you may see encryption related issues.
Note: ServiceNow will discontinue support for 32 bit MID Servers in a future release.

Testing showed that the MID Server works as expected with Oracle JRE 8 version 1.8.0_231. However, this version requires the workaround described in the HI Knowledge Base article MID Server running Oracle JRE version 8 [KB0784442].

Upgraded MID Servers might use different Java versions depending on their release level.

- MID Servers upgraded from Kingston and earlier use the OpenJDK provided with the MID Server installer. This version of the OpenJDK was tested and certified for use with these MID Servers.
- MID Servers upgraded from London continue to use the same JRE you configured for London. The MID Server supports JRE 1.8.

Click this link to view the installation video:

1. From the Linux command line, type `mkdir -p /servicenow/mid server name` to create the installation directory. You need to have read/write/execute permissions on this folder.
2. Extract the downloaded MID Server archive file, `mid.os.zip` into the `servicenow/mid server name` directory. Use the MID Server name created in the instance or create a new name that you will use for this MID Server moving forward.
   The resulting directory structure is `/servicenow/<mid server name>/agent`.
3. Change to the `servicenow/mid server name /agent` directory, and enter the following command to start the MID Server installer: `./installer.sh`.
   If you prefer to manually configure the MID Server instead, skip to step 13.
4. Use the installer to enter the following information.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNow instance URL</td>
<td>Enter the full URL of your instance, for example:</td>
</tr>
<tr>
<td></td>
<td><a href="https://mycompanyinstance.service-now.com">https://mycompanyinstance.service-now.com</a></td>
</tr>
<tr>
<td>ServiceNow MID Server username</td>
<td>Enter the user name of the MID Server user that you already created. The MID Server user must have the mid_server role.</td>
</tr>
<tr>
<td>ServiceNow MID Server password</td>
<td>Enter the password for the user in the ServiceNow MID Server username.</td>
</tr>
<tr>
<td>Use proxy</td>
<td>Select this check box if your MID Server communicates through a proxy to connect to the instance.</td>
</tr>
</tbody>
</table>

**Note:** Your proxy server must use Basic Authentication for the MID server to connect to the instance.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy host</td>
<td>Enter the proxy server host name or IP address. Do not include the protocol in the host name. For example, enter proxyserver.domain.com, not <a href="https://proxyserver.domain.com">https://proxyserver.domain.com</a>.</td>
</tr>
<tr>
<td>Proxy port</td>
<td>Enter the port through which the proxy server communicates. If you leave this field blank, it should use the proxy server's default port number.</td>
</tr>
<tr>
<td>Proxy username</td>
<td>Enter the user name that has administrator rights to the proxy server.</td>
</tr>
<tr>
<td>Proxy password</td>
<td>Enter the password for the user name.</td>
</tr>
</tbody>
</table>

5. Click **Test your connection** to validate the credentials and instance information. If you encounter any errors, verify the information that you input.

6. Click **Next**.

7. Configure the MID name parameters (see table).

The wrapper settings are not applicable for Linux operating systems and are disabled for this installation.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server name</td>
<td>Enter a MID Server name.</td>
</tr>
<tr>
<td></td>
<td>Caution: MID Server names cannot begin with mid.server.</td>
</tr>
<tr>
<td>MID Service wrapper name</td>
<td>Modify this field if necessary. It is populated automatically by prefixing</td>
</tr>
<tr>
<td></td>
<td>snc_mid_ to the MID Server name. In most cases, you do not need to modify</td>
</tr>
<tr>
<td></td>
<td>this.</td>
</tr>
<tr>
<td>MID Server wrapper display name</td>
<td>Modify this field if necessary. It is populated automatically by prefixing</td>
</tr>
<tr>
<td></td>
<td>ServiceNow MID Server_ to the MID Server name. In most cases, you do not</td>
</tr>
<tr>
<td></td>
<td>need to modify this.</td>
</tr>
</tbody>
</table>

8. Click **Next** to view the summary.
9. Click **Start MID Server**.  
The local host starts the MID Server.  
When the MID Server service starts, it verifies that it is the only active (not down) MID Server with that name.  
If the MID Server discovers another active MID Server with the same name, the starting MID Server waits 5 minutes and sends another query. The MID Server repeats this query three times and logs each attempt in the agent log. If the MID Server still detects a duplicate after this cycle, it creates a record in the **MID Server Issue [ecc_agent_issue] table** and shuts down.  

**Note:** The record in the MID Server Issue [ecc_agent_issue] table cannot be resolved automatically by the instance. Close this record manually for accounting purposes. Either mark the issue **Resolved** or delete it.

10. Click **Mid Servers List Page**.  
The installer opens the MID Server list from your instance.  

11. Select the MID Server name from the list.  

**Note:** It may take a few seconds for the MID Server time to establish a connection with your instance. 

The system displays the MID Server record.  

12. From **Related Links**, click **Validate**.  
The MID Server **Validated** changes to **Yes**.  

13. To configure the MID Server manually, change to the servicenow/mid server name /agent directory, and then edit the config.xml file as follows:  

a) Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` and change the value to the URL of your instance.  
b) Enter the MID user credentials in the `mid.instance.username` and `mid.instance.password` parameters.  
   By default, the MID Server, uses basic authentication for SOAP messages. The password value is also encrypted authentication.  
c) Find the `<parameter name="name" value="YOUR_MIDSERVER_NAME_GOES_HERE" />` element and change the value for the MID Server name.  
d) Optional: Enter connection information for the proxy server. Remove the appropriate comment tags from the proxy configuration information.  
   For example, you can configure these parameters:  
   - `mid.proxy.use_proxy`  
   - `mid.proxy.host`  
   - `mid.proxy.port`  
   - `mid.proxy.username`  
   - `mid.proxy.password`  

14. Start the MID Server and verify that it is active.  

a) In the MID Server home directory (agent), execute the shell script `start.sh` to start the new MID Server.  
b) Log into the instance and navigate to **MID Servers > Servers** to verify that your new MID Server has a **Status** or **Up**.  
   Additional log information appears here:  
   - The MID Server log on the instance.  
   - The corresponding `agent0.log.0` and wrapper logs (`wrapper.log`) in the MID Server `agentNlogs` folder.
15. To configure the MID Server to restart automatically when the host is restarted, run
   
   `${base_install_dir}/agent/bin/mid.sh install`
as root.

   This command installs the MID Server as a daemon service and adds the auto start scripts to the `init.d`
directory.

   **Note:** You cannot install more than one MID Server service as a daemon on a Linux host. This is a
   limitation of the Tanuki wrapper service.

16. To stop the MID Server, navigate to the MID Server home (`agent`) directory and execute the `stop.sh`
   shell script.

17. To restart a stopped MID Server, navigate to the MID Server home (`agent`) directory and execute the
   `restart-service.sh` script, using one of these commands:
   - `./restart-service.sh`
   - `sh restart-service.sh`
   - `bash restart-service.sh`

Configure **MID Server parameters**, which control several aspects of MID Server functionality, including proxy
servers, debugging, and upgrade.

**Configure a Linux MID Server to use an existing JRE**

You can choose to use an existing JRE for your MID Server rather than the OpenJDK provided with the MID Server
installer.

Ensure that your JRE version is supported. See **MID Server system requirements** for details.

Role required: admin

By electing to use your own JRE, you are responsible for upgrading it as necessary. For a detailed procedure and
cautions regarding changing the JRE, see [KB0778272](https://service-now.com/doc/KB0778272).

1. Navigate to this file in the MID Server installation directory:
   
   `agent/conf/wrapper-override.conf`

2. To specify the existing Java executable that you want to use, add this line to the file:
   
   `wrapper.java.command={your_java_executable}`
   
   For more information, see the Java service wrapper property documentation.

3. Save the file.

**Uninstall a Linux MID Server**

The MID Server runs as a stand-alone service. You can remove a stand-alone MID Server service to accommodate
such tasks as redeploying the MID Server to another host machine or changing the unique name of a MID Server
when deploying multiple MID Servers.

Role required: admin

1. From the MID Server home directory (`agent` directory) type `stop.sh`.
2. From a command prompt, go to the `\agent\bin` directory in the MID Server installation directory.
3. Confirm that the MID Server is stopped by executing the `bin/mid.sh status` shell script.
4. After the MID Server stops, delete the files in the `agent` directory.

**Install a MID Server on Windows**

The MID Server installer automates the installation of a MID Server on a Windows computer.

- Verify that the host computer satisfies the **MID Server system requirements**.
The Microsoft Application Experience Lookup Service must be enabled on the MID Server host to allow auto-upgrades. For information on managing issues with the Application Experience service, see KB0597552.

Note: Starting in the Orlando release, the MID Server will require the minimum PowerShell version 3.0 and will support versions up to PowerShell 5.1.

Role required: admin or mid_server

OpenJDK version 1.8.0_231 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures OpenJDK to run in your environment. No additional configuration is required. This version supports both 32 bit and 64 bit MID Servers. For the best performance, install the 64 bit MID Server for your operating system. The MID Server requires a minimum JRE version 1.8.0_161, and recommended version 1.8.0_231. If you are using a lower version than 1.8.0_161, you may see encryption related issues.

Note: ServiceNow will discontinue support for 32 bit MID Servers in a future release.

Testing showed that the MID Server works as expected with Oracle JRE 8 version 1.8.0_231. However, this version requires the workaround described in the HI Knowledge Base article MID Server running Oracle JRE version 8 [KB0784442].

Upgraded MID Servers might use different Java versions depending on their release level.

- MID Servers upgraded from Kingston and earlier use the OpenJDK provided with the MID Server installer. This version of the OpenJDK was tested and certified for use with these MID Servers.
- MID Servers upgraded from London continue to use the same JRE you configured for London. The MID Server supports JRE 1.8.

Click this link to view the installation video:

1. Log in to the Windows host machine where you want to install the MID Server.
2. Create a folder for the MID Server on the top level of the drive such as ServiceNow\MID Server1.
3. Download the MID archive file into the new folder.
4. Right-click the archive and select Extract All.
5. Navigate to the service-now\<mid server name>\agent folder that was created when the file was extracted.
6. Run installer.bat to start the MID Server installer.
   To configure the MID Server manually, skip to step 16.
7. Use the installer to enter the following information.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNow instance URL</td>
<td>Enter the full URL of your instance, for example: <a href="https://mycompanyinstance.service-now.com">https://mycompanyinstance.service-now.com</a></td>
</tr>
<tr>
<td>ServiceNow MID Server username</td>
<td>Enter the name of the MID Server user that you already created. The MID Server user must have the mid_server role.</td>
</tr>
<tr>
<td>ServiceNow MID Server password</td>
<td>Enter the password for the user in the ServiceNow MID Server username.</td>
</tr>
<tr>
<td>Use proxy</td>
<td>Select this check box if your MID Server communicates through a proxy to connect to the instance.</td>
</tr>
</tbody>
</table>

*Note:* Your proxy server must use Basic Authentication for the MID server to connect to the instance.
### Field | Description
--- | ---
Proxy host | Enter the proxy server host name or IP address. Do not include the protocol in the host name. For example, enter `proxyserver.domain.com`, not `https://proxyserver.domain.com`.
Proxy port | Enter the port through which the proxy server communicates. If you leave this field blank, it should use the proxy server's default port number.
Proxy username | Enter the user name that has administrator rights to the proxy server.
Proxy password | Enter the password for the user name.

8. Click **Test your connection** to validate the credentials and instance information. If you encounter any errors, verify the information that you input.

9. Click **Next**.

10. Configure the MID name parameters (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server name</td>
<td>Enter a MID Server name. Caution: MID Server names cannot begin with mid.server.</td>
</tr>
<tr>
<td>MID Service wrapper name</td>
<td>Modify this field if necessary. It is populated automatically by prefixing snc_mid_ to the MID Server name. In most cases, you do not need to modify this.</td>
</tr>
<tr>
<td>MID Server wrapper display name</td>
<td>Modify this field if necessary. It is populated automatically by prefixing ServiceNow MID Server_ to the MID Server name. In most cases, you do not need to modify this.</td>
</tr>
</tbody>
</table>

11. Click **Next** to view the summary.

12. Click **Start MID Server**.
The local host starts the MID Server.

When the MID Server service starts, it verifies that it is the only active (not down) MID Server with that name. If the MID Server discovers another active MID Server with the same name, the starting MID Server waits 5 minutes and sends another query. The MID Server repeats this query three times and logs each attempt in the agent log. If the MID Server still detects a duplicate after this cycle, it creates a record in the MID Server Issue [ecc_agent_issue] table and shuts down.

**Note:** The record in the MID Server Issue [ecc_agent_issue] table cannot be resolved automatically by the instance. Close this record manually for accounting purposes. Either mark the issue Resolved or delete it.

13. Click **Mid Servers List Page**.

The installer opens the MID Server list from your instance.

14. Select the MID Server name from the list.

**Note:** It may take a few seconds for the MID Server time to establish a connection with your instance.

The system displays the MID Server record.

15. From **Related Links**, click **Validate**.

The MID Server Validated changes to Yes.

16. To configure the MID Server manually, edit the config.xml file with a text editor such as WordPad:

   a) Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` element and change the value to the URL of your instance.

   b) Enter the MID user credentials in the `mid.instance.username` and `mid.instance.password` parameters.

   By default, the MID Server, uses basic authentication for SOAP messages. The password value is also encrypted authentication.

   c) Optional: Find the `<parameter name="name" value="YOUR_MIDSERVER_NAME_GOES_HERE" />` element and change the value for the MID Server name.

   d) Optional: Enter connection information for the proxy server. Remove the appropriate comment tags from the proxy configuration information.

   For example, you can configure these parameters:

   - `mid.proxy.use_proxy`
   - `mid.proxy.host`
   - `mid.proxy.port`
   - `mid.proxy.username`
   - `mid.proxy.password`

17. Start the MID Server and verify that it is active.

   a) In the MID Server home directory (agent), execute the batch file `start.bat` to start the new MID Server.

   b) Log into the instance and navigate to MID Servers > Servers to verify that the Status of your new MID Server is Up.

   Additional log information appears here:

   - The MID Server log on the instance.
   - The corresponding `agent0.log.0` and wrapper logs (`wrapper.log`) in the MID Server `agent/logs` folder.
18. To stop the MID Server, use either of these procedures:
   • Windows command line: From the MID Server home directory (agent) run stop.bat.
   • Windows Services console: Right click ServiceNow <MID Server name>, and then select Stop.

19. To restart a stopped MID Server, use either of these procedures:
   • Windows command line: In the MID Server home directory (agent), run Restart.bat.
   • Windows Services console: Right click ServiceNow <MID Server name>, and then select Start.

Configure MID Server parameters, which control several aspects of MID Server functionality, including proxy servers, debugging, and upgrade.

Manually install a MID Server as a Windows Service

If you did not start the MID server at the end of the installation procedure, you can manually install the MID Server to run as a Windows service.

Role required: admin

You can install a MID Server as a Windows service in these operating systems:

• Windows Server 2008
• Windows Server 2012
• Windows Server 2016
• Windows Server 2019

1. Open the agent directory in the directory you created for the MID Server installation files. For example, the path might be C:\ServiceNow\MID Server1\agent.
2. Right-click the start.bat file, and select Properties.
3. Select the option to Run as administrator.
4. Double-click the start.bat file to install the Windows service.

Configure a MID Server on Windows to use an existing JRE

You can choose to use an existing JRE for your MID Server rather than the OpenJDK provided with the MID Server installer.

Ensure that your JRE version is supported. See MID Server system requirements for details.

Role required: admin

By electing to use your own JRE, you are responsible for upgrading it as necessary. For a detailed procedure and cautions regarding changing the JRE, see KB0778272.

1. Navigate to this file in the MID Server installation directory:
   agent/conf/wrapper-override.conf
2. To specify the existing Java executable that you want to use, add this line to the file:
   wrapper.java.command={your_java_executable}
   For more information, see the Java service wrapper property documentation.
3. Save the file.

Uninstall a Windows MID Server

The MID Server runs as a stand-alone service. You can remove a stand-alone MID Server service to accommodate such tasks as redeploying the MID Server to another host machine or changing the unique name of a MID Server when deploying multiple MID Servers.
Role required: admin

1. Stop the running MID Server service, using one of these procedures:
   - **Windows command line**: From the MID Server home directory, for example from the `agent` folder, type `stop.bat`.
   - **Windows Services console**: From the Windows Services console, right-click the ServiceNow MID Server name and then select stop.

2. From a command prompt, go to the `\agent\bin` directory in the MID Server installation directory.
3. Double-click the `UninstallMID-NT.bat` file.
4. Check in the Windows Services console for a service named ServiceNow WMI Collector. If it is running, open a command prompt, navigate to `agent\bin\sw_wmi\tools`, and double-click `uninstall_wmi.bat`.

**Test MID Server connectivity**

Confirm network connectivity to the MID Server host or to the instance for automatic upgrades, and then ensure that the MID Server can communicate with the instance.

Role required: admin

The MID Server host computer must have access to the ServiceNow download site at `install.service-now.com` to upgrade automatically. Ensure that the host can access one of these URLs:

- **HTTPS**: `https://install.service-now.com` on the default HTTPS port (443)
- **HTTP**: `http://install.service-now.com` on the default HTTPS port (80)

**Important**: If you have a self-hosted ServiceNow environment that blocks access to the `install.service-now.com` download site, you must import the MID Server installer package into your network manually and then transfer it to your MID Server host machine. For instructions, see KB0760123 in the Self-Hosted knowledge base.

1. Use PING to test connectivity with the host on the network (`ping<host IP>`).
2. If no ping response is returned, use TRACEROUTE to see where traffic might be stopped (`traceroute<host>`).
3. Use TELNET to connect to any of the TCP ports (`telnet<host> <port>`).
4. Use an SNMP scanning tool to determine if a potential network device is responsive.
5. Resolve the most likely issues around network connectivity:
   - **Routing**: Confirm that the MID Server host has network access to the IP ranges you are attempting to discover.
   - **Firewalls**: Confirm access to the physical firewalls that protect a large environment such as the Data Center. Confirm access to any logical firewalls that protect an individual computer. MID Server communications are initiated inside the firewall and therefore do not require any special firewall rules or VPNs.
   - **Access Control Lists (ACL)**: Confirm that ACLs contain the IP addresses based list on SNMP network devices that allows communication to a particular target.
   - **Resolve all issues with your network teams to better understand your topology**: Deploy additional MID Servers if necessary to help keep your network secure. Configure access from your existing MID Server host to networking components.

6. Verify that the MID Server service is running on the host:
   - **Windows**: In the Windows Services console, locate the ServiceNow [MID Server name] and confirm that each MID Server has the Started Status value.
   - **Linux**: Ensure that the `agent0.log.0.lck` appears in the `/servicenow/ MID Server name]/agent folder.

7. After each MID Server restart, open the `agent0.log.0` and address all error messages.
8. From the ServiceNow instance, navigate to MID Server > Servers.
9. Review and verify that all MID Servers that are connected to the instance are listed.
10. Verify that the Status is Up for the MID Servers.

Validate the MID Server

You must manually validate the MID Server after it is installed to enable it to execute automation tasks. You can invalidate a MID Server you suspect has been compromised to prevent it from accessing automation credentials in the instance or executing outbound ECC probes.

Role required: agent_admin, admin

Make sure that the MID Server version is compatible with the instance.

Validation restricts access to automation credentials to trusted MID servers only.

You can specify that the MID should be used for all capabilities, applications, and IP ranges when you validate a MID Server. You will be prompted to set the initial selection criteria when you validate MID Servers that do not already have capabilities, applications, or IP ranges already configured. You do not have to set the initial selection criteria to actually validate the MID Server. See MID Server selection for more information on capabilities, applications, and IP ranges.

Note: When you upgrade, MID Servers that are already configured in your instance are automatically validated. This prevents the interruption of automation tasks that MID Servers might be performing. See MID Server upgrade for more information.

1. Install the MID Server using the instructions in MID Server installation.
   This creates a record in the MID Server [ecc_agent] table.
2. Navigate to MID Server > Servers.
3. Open the new MID Server from the list of MID Servers.
4. Under Related Links click Validate.
   The Set Initial Selection Criteria window appears if there are no records in the Supported Applications, IP Ranges, or Capabilities related lists.
5. On the Set Initial Selection Criteria window, use the switches to enable or disable selection criteria for this MID Server:
   • Allow ALL capabilities: Allow all capabilities for Orchestration and Event Management use this MID Server.
     Note: Service Mapping and Event Management alert aggregation and RCA, which used capabilities in previous releases, rely on the application for MID Server selection.
   • Allow ALL applications: Allow all applications that use MID Servers use this MID Server.
   • Allow ALL IP ranges: Make all IP ranges valid for this MID Server, meaning that it can target any IP address.
Setting initial selection criteria

If you click **Cancel**, the validation continues but none of the capabilities, applications, or IP ranges are added.

6. Click **OK**.

The **Validated** field on the dashboard is set to **Validating**, and then set to **Yes** after the validation completes.

7. To invalidate a MID Server, open the record for the MID Server you suspect has a security issue.

8. Under **Related Links**, click **Invalidate**.

Invalidating a MID Server forces it to clear its memory and restart. The MID Server generates a new keypair on restart.

*Configure service credentials* on a Windows host to manage the MID Server service and allows automatic upgrades.

### Multiple MID Server deployments

Depending upon how you use the MID Server (for an external integration, Discovery, Service Mapping or Orchestration) and the load placed on it, you might find it necessary to deploy multiple MID Servers in your network.

Factors determining the number of MID Servers your network will require to support external applications that integrate with ServiceNow include the following:

- The security constraints in your network.
- Your network policies.
- The amount of traffic between ServiceNow and the integrations.
- The reliability of the MID Server machines.

### Network policies and security

Security policies in your network (firewalls between network segments, for example) might make direct communication impossible between your instance and an integration's data source (JDBC, LDAP, etc.). To retrieve data for the instance, you can install a MID Server that has access to both the data source and the instance.

These network policies can determine if you need to install multiple MID Servers in your environment:

- **Access control lists (ACL)**: If your security policy controls access to network devices (e.g. switches and routers) with an ACL, it might be necessary to install one or more MID Servers on a machine in the network that is already on the ACL.
- **DMZ**: Your network policy might require you to install one or more MID Servers in your DMZ to probe the devices there. This is common in networks that tightly regulate the ports that are opened on the inside firewall.
• **Probe types**: If you are conducting probes of different operating systems, your network policy might require a separate MID Server for each type of probe (e.g., one MID server for Windows WMI probes and another for SSH probes on UNIX).

**Load balancing**

Deploy multiple MID Servers where capacity is an issue, as when Discovery has to gather information about thousands of configuration items quickly. In a high volume environment, it might be necessary to deploy multiple MID Servers as load balancers for certain transactions. For example, JDBC data transfers can tie up the resources of a MID Server, making it unable to respond to other requests. The following operations between an integration might require separate MID Servers in a busy network:

- File exports
- Running scripts
- JDBC data sources
- Reading files

**High availability model**

Avoid installing MID Servers for critical integrations on a machine that might experience any type of planned outage or an outage caused by overloaded processes. If necessary for reliability, consider deploying these types of MID Servers to dedicated machines for high reliability.

**Note:** Do not integrate with an external application on a MID Server provisioned for ServiceNow Discovery or Orchestration.

**Wide area network (WAN)**

When determining where to deploy MID Servers in a WAN, consider the bandwidth available between your local area networks. In most cases, install a MID Server on each LAN to probe devices locally, rather than deploying MID Servers that must probe devices across slow WAN connections. An alternative to this type of deployment is to install MID Servers that probe other LANs via VPN connections that take advantage of fast Internet connections. If the bandwidth of your WAN connections is comparable to that of your Internet connection, then there is no performance impact in running MID Server probes across WAN connections.

**Domain separation**

In deployments where domain separation is enabled and domains are configured to form a hierarchy, place the MID Servers at the lowest domain level.
Deploying MID Servers with domain separation

Install multiple MID Servers on a single system

You can install multiple MID Servers on the same host computer.

Role required: admin, mid_server

You can install multiple MID Servers on a Linux or Windows host or on a virtual machine. Installing multiple MID Servers may involve other setup steps depending on your network configuration.

Important: Only one MID Server service can be a daemon on a Linux host. This is a limitation of the Tanuki wrapper service.

1. Log in to the host system or virtual machine where you want to install multiple MID Servers.
2. Create a directory for each MID Server on the top level of the drive.

Make sure you create a unique and descriptive name for each MID Server, such as MIDServer_SMS_Int or MIDServer_Disc1.
3. Extract the downloaded MID Server archive file into each MID Server directory. When the extract completes, there should be a directory path that resembles the following for each MID Server. For example, ServiceNow<MID Server name>\agent.

4. For each MID Server, run the installer appropriate to the host's operating system.

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Installer path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>/agent/installer.bat</td>
</tr>
<tr>
<td>Linux</td>
<td>/agent/installer.sh</td>
</tr>
</tbody>
</table>

5. Use the installer to enter the following information.

- URL to your instance
- User credentials to run the MID Server
- Proxy server connection details
- MID server name
- MID server service wrapper name and display name (Windows systems only)

Note: The MID Server user must have the mid_server role.

6. From the installer, click Start MID Server.
The local host starts the MID Server.

7. Click **Mid Servers List Page**.
   The installer opens the MID Server list from your instance.

8. Select the MID Server name from the list.

   ![ServiceNow MID Server Installer](image)

   **Note:** It may take a few seconds for the MID Server time to establish a connection with your instance.

   The system displays the MID Server record.

9. From **Related Links**, click **Validate**.
   The MID Server **Validated** changes to **Yes**.

**Configure Windows MID Server service credentials**

MID Server service credentials are required to manage the MID Server service on the host machine, including its ability to successfully auto-upgrade.
By default, the MID Server service runs as a **Local System** account. This account has privileges to create and run the MID Server service and to download, create, and move files for the MID Server auto-upgrade process.

Windows service credentials are not the same as the MID Server user credentials, which allow communication between the MID Server and the instance. You must configure both of these credentials separately. See *Create the MID Server user and grant the role* for instructions on MID Server user credentials.

**Attention:** This procedure is optional. Allowing the MID Server service to run as a Local System account is sufficient for a majority of users.

1. Open the Windows Services console.
2. Double-click the **ServiceNow <MID Server name>** service for each MID Server.
3. Select the **Log On** tab.
4. Set **Log on as** privileges with the user account (local or on a domain) that has local admin access to the MID Server host.
   The MID Server upgrade process deploys a temporary Windows service which requires local administrator privileges.
5. In the **General** tab, set the **Startup type**. The field is set to **Automatic** by default.
6. Click **OK**.
7. Restart the **ServiceNow <MID Server name>** service, and make sure that **ServiceNow\<MID Server name>\agent\logs\agent0.log** does not have error messages. If the MID Server does not start, see the ServiceNow knowledge article Review the agent log for MID Server errors (article KB0535148).
8. On the instance to which this MID Server is connected, navigate to **MID Server > Servers**. If Discovery is installed, alternately navigate to **Discovery > MID Servers**. All MID Servers connected to this instance are listed.
9. Make sure that the Status of the MID Server you just installed is **Up**.

If necessary, *deploy multiple MID Servers* in your environment.

**Monitor the MID Server**

Monitoring MID Servers involves verifying entries in log files, confirming network connectivity, and checking MID server status.

Role required: **agent_admin** or **admin**

You can monitor MID Servers hosted by Windows or Linux MID servers.

1. **For Windows only,** navigate to the Windows Services console, locate the service name that matches the name that appears from the `wrapper-override.conf` file. If the MID Server process is the only Java process running on the host, monitor the memory used by `java.exe` and alert on less than the maximum configured memory defined in the `{\~agent\conf\wrapper-override.conf} folder.
2. Ensure that the `agent0.log.0.lck` file appears in the `{\~agent\logs}\folder to confirm that the MID Server running and logging system activity in the `agent0.log.0` file.
3. Review the following logs for warning, critical, and severe errors:
   - `{\~agent\logs\agent0.log.0}
   - `{\~agent\logs\wrapper.txt}

   See *Manage ECC Queue content for a MID Server* to see how to open log entries from the instance.

4. **Confirm network connectivity.**
5. From the MID Server instance, navigate to the **MID Servers** page, and review the status of the MID Server. For additional information, click a **Name**.
6. Use Windows or Linux tools to monitor:
   - CPU
   - Disk utilization
   - Events
   - Memory
   - syslog

Set up email, SMS, and push notifications to alert you when issues occur with MID servers. The MID Server Down notification is enabled by default. See Notifications for details.

**MID Server upgrade**

MID Servers are automatically upgraded through the MID Server host computer. You can also manually upgrade each MID Server.

⚠️ **Warning:** The MID Server cannot auto-upgrade on a Windows host if the Windows Application Experience service is disabled. For information on the error that is displayed and instructions for re-enabling this service, see KB0597552.

**Access to the MID Server download site**

The MID Server host computer must have access to the ServiceNow download site at install.service-now.com to upgrade automatically. If you have a self-hosted ServiceNow environment that blocks access to the install.service-now.com download site, you must import the MID Server installer package into your network manually and then transfer it to your MID Server host machine. For instructions, see KB0760123 in the Self-Hosted knowledge base.

These system properties control access to the MID Server download site:

- **mid.download.through.instance:** Enables the MID Server download through the instance. This property is set to true for all new instances and sends all auto-upgrade requests through the instance. For instances upgraded from Kingston or earlier, the property is set to false which retains the previous behavior of sending upgrade requests from the MID Server host. To configure MID Server auto-upgrades through the instance, add this property to the System Property [sys_properties] table and set it to true.

- **concurrent.dist.download:** Sets the number of concurrent MID Server auto-upgrades permitted by the instance. The default value of this property is 2, which allows the MID Server to use 2 of the 4 semaphores available on the instance for upgrading. If your instance has more than 4 INT semaphores, you can increase the value in this property to allow more concurrent upgrades.

**Upgrade methods**

- **Automatic:** Allow the instance to automatically upgrade the MID Server. This functionality is available by default. Automatic upgrade occurs:
  - Every hour, when the MID Server checks with the instance to see if there is a different version available for upgrade. You cannot modify this time period.
  - When the instance is upgraded and the MID Server for that version is different than the version currently on the MID Server.
  - When the MID Server pre-upgrade test passes without an error. Any errors encountered during this automatic test prevent the upgrade from occurring until the issues are resolved. The pre-upgrade test is enabled by default, but can be disabled by adding and setting a system property.
During an automatic upgrade, the MID Server automatically verifies the digital signature of upgrade packages to ensure they haven’t been tampered with. The MID Server downloads upgrade patches one by one and stores them in the file system. After a patch is downloaded, the MID Server verifies its digital signature and throws an exception if the verification fails. The error will be recorded in the agent log and the MID Server issue table. Set the property `mid.log.level=trace` to see detailed verification debug messages.

**Manual:** Manually start the upgrade by clicking a related link on the MID Server record. Use this method when you do not want to wait until the next hourly automatic update or if your upgrade failed and you want to force an upgrade. See Upgrade the MID Server manually for instructions.

To manually verify the signature of an installation or upgrade package, use the jarsigner tool which is available for free with JDK. The following is the jarsigner command to initiate the verification: `Jarsigner -verify -verbose -certs -strict <zip-file>`

The output should be similar to the following example:

```
- Signed by "CN=ServiceNow Inc., O=ServiceNow Inc., L=Santa Clara, ST=California, C=US"
  Digest algorithm: SHA-256
  Signature algorithm: SHA256withRSA, 2048-bit key
  Timestamp digest algorithm: SHA-256
  Timestamp signature algorithm: SHA256withRSA, 2048-bit key
  jar verified.

  The signer certificate will expire on 2021-08-09.
  The timestamp will expire on 2029-03-22.
```

**The Upgrade state**

The instance initiates the upgrade by sending the `autoUpgrade` system command to the MID Server. Starting with MID Servers upgrading from an Istanbul version MID Server, the MID Server Status is changed to Upgrading while the upgrade is running. The Upgrading state is similar to the Paused state. This is done to avoid potential miscommunication between the new version of the instance and the previous version of the MID Server during upgrade. For the upgrade to run, MID servers must be in the Up state and must be validated.

While in the Upgrading state, you cannot resume or restart the MID Server. However, you can perform the same actions that you can when the MID Server is in the Paused state. After a successful upgrade, the queued output is sent to the instance and the MID Server starts retrieving new commands to process. The status also changes to Up.

When the instance sends the `autoUpgrade` system command to the MID Server, if it is Down or Paused, or if it has not been validated, the command remains in the ECC Queue until the MID Server status changes to Up. Then the command is processed.

**Note:** If you are using an Istanbul instance but you are upgrading a pre-Istanbul MID Server to Istanbul, these upgrade states are not available. They are available only for MID Servers that are already on Istanbul.

**Failed upgrades**

Failed upgrades are handled differently based on the version you are upgrading to:

- Upgrade to another major release: (such as Istanbul to the next full release): the status changes to Upgrade Failed.
• Upgrade from a minor version within a release (such as Jakarta patch 1 to patch 2): the MID Server continues using the version it is currently running. It does not perform the upgrade and the status eventually changes to Up, assuming the MID Server was already functioning properly.

Upgrading MID Servers in the Down state

If a MID Server is in the Down state, it cannot process the upgrade command. When the MID Server changes to Up, it immediately checks to see if an upgrade is necessary. If it does need to upgrade, the upgrade process starts before the MID Server processes any other commands.

Upgrade error messages

The MID Server can display the following upgrade error messages.

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unable to refresh packages</td>
<td>Generic error when the error is not handled by a defined error message.</td>
</tr>
<tr>
<td>Failed to query instance for MID Server buildstamp</td>
<td>Instance is unavailable or there is a major version mismatch between the MID Server and the instance.</td>
</tr>
<tr>
<td>Not a valid package buildstamp</td>
<td>InstanceInfo returned an assigned buildstamp that was not in the correct format, such as a version mismatch.</td>
</tr>
<tr>
<td>Method failed (&lt;instance URL&gt;) HTTP/1.1 409 Conflict with code: 409</td>
<td>MID Server auto-upgrade request rejected when number of concurrent upgrades exceeds 2. The configured number of available semaphores for MID Server upgrades on the instance is set at 2 to prevent performance degradation.</td>
</tr>
</tbody>
</table>

**Note:** The MID Server re-sends the request every 20 seconds until it can get the semaphore.

MID Server pre-upgrade check

The instance automatically tests the MID Server's ability to upgrade on your system prior to the actual upgrade, to identify issues that could cause a MID Server outage or require re-installation.

Each MID Server contains an AutoUpgrade monitor that compares the MID Server version with that of the instance to determine if the MID Server needs to upgrade. If the AutoUpgrade monitor discovers that the MID Server version is out of date, the monitor runs pre-upgrade validation tests for that MID Server. If an issue is detected, a message is logged to the MID Server Issue [ecc_agent_issue] table, and the upgrade is blocked. The AutoUpgrade monitor continues to run every hour, until the tests all pass. If there are no blocking issues, the MID Server requests the appropriate upgrade package and begins the upgrade process.

**Attention:** MID Servers upgraded from the London release send upgrade requests to the instance, which then retrieves the installer package from install.service-now.com. MID Servers for instances upgraded from Kingston or earlier cannot request upgrades from the instance and must have access to the download site. After the initial upgrade, however, these MID Servers can be configured to request upgrades through the instance. See *MID Server upgrade* for details.
Failed tests leave the MID Server in one of these states:

- **Upgrade Failed**: For upgrades to a different release family, such as from London to Madrid.
- **Up**: For upgrades within the same release family, such as an upgrade to a patch.

Errors, such as insufficient disk space for the installer or lack of connectivity to the download server, are written to both the MID Server agent log and to the MID Server Issue [ecc_agent_issue] table. These errors are published before the actual MID Server upgrade occurs and must be resolved before the upgrade can continue. You can view issues from the MID Server Issue [ecc_agent_issue] table in any of these locations:

- **MID Server Issues** related list in a MID Server record.
- **MID Server > Server Issues** navigation module.
- **MID Server Issues** gauge on the MID Server dashboard.

### Pre-upgrade tests

The pre-upgrade validation tests check these requirements:

- At least 1GB of free disk space.
- Access to the download site at install.service-now.com. The pre-upgrade test evaluates connectivity to the download site for either the instance or the MID Server host, depending on the version being upgraded.
- Permission to execute these file operations:
  - Extract a ZIP archive to a `temp` folder.
  - Copy files from the `temp` folder to the `agent` folder.
  - Read a text file.
  - Delete the pre-upgrade contents.

- For Windows, ensure that the Log On As user for the Windows service is either LocalSystem or a user that is part of the local Administrator group. By default, domain administrators are added to the local Administrator group when joining a computer to a domain. If the PowerShell script that performs this test does not return the expected output, the system logs a warning to the MID Server Issue [ecc_agent_issue] table, but the test passes.

### Data provided

When the instance encounters issues during the pre-upgrade check, it populates these fields in the MID Server Issue [ecc_agent_issue] table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last detected</td>
<td>Date and time the issue was last detected.</td>
</tr>
<tr>
<td>Short description</td>
<td>Contents of the generated message that specifies a possible issue with available disk space, download server access, or file permissions.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Name of the MID Server affected by a pre-upgrade test failure.</td>
</tr>
<tr>
<td>Issue source</td>
<td>The process that identified the issue. For all issues with MID Server pre-upgrade testing, the source is UpgradeCheck.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the issue. Possible states are:</td>
</tr>
<tr>
<td></td>
<td>• New: Starting state when the instance creates the issue.</td>
</tr>
<tr>
<td></td>
<td>• Acknowledged: State set by the administrator when he or she first examines the issue.</td>
</tr>
<tr>
<td></td>
<td>• Resolved: Ending state, set by the instance, indicating that the issue has been resolved. If the scheduled job does not encounter the issue when it runs again, the instance automatically sets the state to this value.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain for the MID Server. For all issues derived from MID Server pre-upgrade testing, the domain value is inherited from the domain of the MID Server user.</td>
</tr>
<tr>
<td>Count</td>
<td>Number of times an issue has been detected. Each time the pre-upgrade tests run and encounter the same issue, the AutoUpgrade monitor increments this field.</td>
</tr>
</tbody>
</table>

**Errors that block the upgrade**

These messages describe issues detected by the pre-upgrade test and published to the MID Server Issue [ecc_agent_issue] table. Failure of any of these tests blocks the upgrade.

- **Not enough free disk space. The system reports <n> bytes free**: This message is displayed when less than 1GB of free disk space is detected on the MID Server host. This error is also written to the MID Server agent log.
- **Unable to download updates from the install server**: This message indicates that either the instance or MID Server host does not have permission to download the installation package from install.service-now.com, or network problems prevent connection. This error is also written to the MID Server agent log.
- **Unable to extract contents of pre upgrade check zip**: This message indicates that the service account on the MID Server host does not have permission to extract the pre-upgrade ZIP archive to the temporary folder specified by the system property, java.io.tmpdir. On a UNIX host, the value for this property is typically /tmp or /var/tmp. On Microsoft Windows hosts, the path is c:\\WINNT\\TEMP.
- **Unable to create folder <upgrade check file path>**: This message indicates that the MID Server service account does not have permission to create the upgradeCheck folder for the pre-upgrade checking files in the agent/package path.
- **Unable to verify file permissions: <message>**: This message indicates an exception has occurred when checking file permissions, such as a file that does not exist or access failure.
- **MID Server Windows Service is not running as LocalSystem or a local Administrator**: This message warns that the Windows service is not running with the desired permissions.

**Non-blocking warnings**

These warnings are displayed in the MID Server Issue [ecc_agent_issue] table and do not prevent a Windows MID Server from upgrading:

- **WARN: Unable to parse $logOnAsUser**: This message warns that the Log On As User value for the Windows service is not in either of these expected formats:
  - user@domain.company.com
  - domain\user
• **WARN: Unable to look up Log On As user's groups**: When the instance attempts to look up the logged on user's group memberships, it executes the `net user <username>` command. The instance expects a certain output structure by the Windows service from this command and issues this warning if the expected output does not match the actual output.

These PowerShell warnings are written to the MID Server agent log only. Because PowerShell is not required to use a MID Server, these configuration issues do not prevent a Windows MID Server from upgrading. However, these warnings might indicate issues in your environment that require attention.

• **Skipping PowerShell upgrade checks since PowerShell is not usable**: PowerShell 2.0 (at a minimum) is not installed or `powershell.exe` is not available to the MID Server service user.

• **Continuing with upgrade, but the following issue was encountered during upgradeCheck: <exception message>**: This message indicates that there was an issue running the PowerShell portion of the pre-upgrade tests.

**Disabling the pre-upgrade check**

A MID Server configuration parameter called `mid.upgrade.run_precheck` is set to `true` by default, which allows the automatic pre-upgrade test to run. To disable these tests for a single MID Server, add this parameter to that MID Server's `config.xml` file and set it to `false`. To disable these tests for all MID Servers, add a new record to the MID Server Property [ecc_agent_property] table called `mid.upgrade.run_precheck`. Set the value of this property to `false` and leave the MID Server field blank.

**MID Server version selection**

You can pin all the MID Servers in your environment to a specific version by setting a system property, or you can configure specific versions for individual MID Servers.

**Note:** Do not pin the MID Server to a specific version for a significant amount of time, especially if you upgrade the instance. Under most circumstances, let the instance determine which MID Server version to use.

**Version control properties**

These properties control the version for all MID Servers:

• **mid.buildstamp**: Identifies the MID Server version with an identifier based on the date of the build. This property uses the format of `mm-dd-yyyy-hhmm`. The MID Server checks for version information hourly. If no override version is configured, the MID Server looks at the `mid.buildstamp` property for the version to use. This property resets itself to the default version (the version that matches your instance version) when the instance is restarted or upgraded, so any user changes are lost at that time. The system appends the release name and patch information to the date and time format.

**Caution:** This property is not visible by default and should not be configured.

• **mid.version.override**: Sets an override condition for the current version for all MID Servers in your environment. This action pins the MID Servers to a single version and disables the automatic upgrade feature. This property is not visible in the base system and must be added to the System Property [sys_properties] table when it is set. For details, see [Add a property using sys_properties.list](#).

When the MID Servers check the version each hour, they look at the `mid.version.override` property first. If this property is empty, the MID Servers get their version information from the `mid.buildstamp` property. If an override version is configured, the MID Servers use this value and ignore the version information in the `mid.buildstamp` property. This override value remains when the instance is restarted and is passed to the MID Servers.
Attention: The value in the `mid.version.override` property is cleared during an upgrade, which forces the MID Server to reset itself to the version in the `mid.buildstamp` property.

**Version control configuration parameter**

To pin specific MID Servers on a desired version, set the `mid.pinned.version` parameter with the name of that version in the `config.xml` file of each MID Server. Use the format `<version>-mm-dd-yyyy`. This setting overrides the property setting for the pinned MID Server version. For instructions, see Add a MID Server parameter.

Note: The value set in this parameter is not affected by an upgrade.

**Upgrade the MID Server manually**

You can manually upgrade MID Servers at any time if you do not want to wait for the automatic upgrade.

Role required: mid_server or admin

For the upgrade to run, MID servers must be in the Up state and must be `validated`.

The MID Server is upgraded to the version specified by build stamp on the instance, or by the `upgrade property` that you specify.

1. Navigate to Discovery > MID Servers or Orchestration > MID Server Configuration > MID Servers.
2. Open the record of the MID Server that you want to upgrade.
3. Click Upgrade MID under Related Links.
4. Confirm that you want to perform the upgrade.

**MID Server configuration**

Administrators must configure a MID Server to ensure that it has access to sufficient system resources, probes the proper data sources, and communicates with the instance as expected.

You must complete all the steps in MID Server Installation before attempting any of the configuration steps explained here.

Restart a MID Server after any configuration change for the changes to take effect.

Note: All new MID Servers must be validated before use. Validation ensures that the MID Server is trusted to access credentials used by the instance for automations. For instructions, see Validate and invalidate the MID Server.

**MID Server Records that cannot be altered**

These records cannot be modified or deleted.

**Using special characters in an XML file**

The XML specification defines five predefined entities that represent special characters, and requires that all XML processors honor them. If these characters are used in a password, you will experience unexpected results.

The following characters represent the five pre-defined entities:

- "
- &
- '
- <
- >

If you use the pre-defined entity characters in an XML file, such as the MID Server configuration file, you need to encode them. To encode pre-defined entities into an XML document:

- replace " with &quot;
- replace & with &amp;
- replace ' with &apos;
- replace < with &lt;
- replace > with &gt;

For example, to specify the password as test& in the MID Server config.xml file:

```xml
<parameter encrypt="true" name="mid.instance.password" value="test&amp;"/>
```

**The MID Server dashboard**

The MID Server dashboard is a central place for MID Server users to monitor ongoing operations. The dashboard consists of reports and gauges that display information from the MID Server Status table.

The MID Server Dashboard is available from the **MID Server > Dashboard** module.

**The MID Server status gauge**

The MID Server Status gauge on the dashboard displays basic information about each MID Server. This information comes from the MID Server Status [ecc_agent_status] table.

| Version| The version of the MID Server. An icon indicates the validity of the MID Server:  
  - **Red**: Incompatible. The MID Server and instance do not belong to the same release. You must [upgrade the MID Server](#) and verify that it is not pinned to an older version with the `mid.version.override` property. The MID Server will not be upgraded until the parameter is cleared.  
  - **Yellow**: Compatible, but an upgrade is recommended. This indicates that the MID Server version belongs to the same family as the instance, but not the same version.  
  - **Green**: Compatible. No upgrade necessary.  
  - **Gray**: Incompatible. The instance cannot detect the version. |
| User   | The login name of the user. An icon indicates the validity of the user:  
  - **Red**: Incompatible. The user does not have the `mid_server role` or the user does not match the value in the `mid.instance.username` parameter (in the `config.xml` configuration file). Reconfigure the MID Server user and [verify that it works](#).  
  - **Green**: Compatible. The user has the `mid_server role` and matches the user in the configuration file.  
  - **Note**: The user can also have any of the SOAP roles that the `mid_server role` inherits. |

### CPU and maximum memory usage

This graph shows the average percentage of CPU usage on all the systems that host MID Servers in the last 30 days.
This graph shows the average percentage of maximum memory used by all the systems that host MID Servers in the last 30 days.
**MID Server selection**

You can configure MID Server selection by application, IP address ranges, network capability, or behavior.
MID Server criteria

MID Servers offer these types of criteria that help an application determine which MID Server to use:

- **Application**: The application that you specify on the MID Server. You can designate these applications for a specific MID Server:
  - Discovery
  - Orchestration
  - Service Mapping
  - Event Management
  - Operational Intelligence
  - Cloud Management

  An **ALL** application option is also available. By default, this option includes all applications except Event Management alert aggregation and RCA, which requires an exclusive MID Server. You can configure which applications are included in the **ALL** designation.

- **IP address or range**: The IP address or the IP ranges that the MID Server is allowed to work within. You can specify an IP address or IP range in the application, such as on a Discovery schedule or an Orchestration activity, and for the MID Server. If the IP configured in the application matches the IP address or falls within the allowable IP range configured on the MID Server, a match is possible, and that MID Server passes this criteria. To have the instance automatically assign IP ranges (subnets) to available MID Servers, see **MID Server IP range auto-assignment**.

- **Capabilities**: The network capability an application needs to use, such as the PowerShell Orchestration activity or the Flow Designer PowerShell step. Some applications, like Cloud Management and alert aggregation and RCA, require a specific capability.

  **Note**: Discovery and Service Mapping can also use behaviors, which determine the type of port probes used during the port scan phase of Discovery. Both Discovery and Service Mapping use a behavior to discover load balancers running on Linux. Other applications do not use behaviors. Behaviors are not used for auto-selection, default MID Servers, or specific MID Servers as described below. See **Discovery behaviors** for more information.

How an application selects a MID Server

If you do not specify a specific MID Server for an application to use, the application tries to select one. Each application relies on different criteria to select an appropriate MID Server.

<table>
<thead>
<tr>
<th>Application</th>
<th>Supported Application on the MID Server</th>
<th>IP address range</th>
<th>Capability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery</td>
<td>The <strong>Discovery</strong> or <strong>ALL</strong> application must be specified on the MID Server.</td>
<td>Discovery uses IP ranges that you configure on the <strong>Discovery Schedule form</strong> to see if they fall within the IP ranges that you configure on the MID Server, or the <strong>ALL</strong> IP ranges option must be selected on the MID Server.</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Note**: Any configured behaviors are ignored.
<table>
<thead>
<tr>
<th>Application</th>
<th>Supported Application on the MID Server</th>
<th>IP address range</th>
<th>Capability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Orchestration</td>
<td>The <strong>Orchestration</strong> or <strong>ALL</strong> application must be specified on the MID Server.</td>
<td>The target IP address that you configure in an Orchestration activity must fall within the IP ranges that you configure on the MID Server, or the <strong>ALL</strong> option must be selected on the MID Server.</td>
<td>The capability that is required for an Orchestration activity must match the capabilities you configure on the MID Server, or the MID Server capability must be set to <strong>ALL</strong>.</td>
</tr>
<tr>
<td>Alert aggregation and RCA (as part of Event management)</td>
<td>The <strong>Service Analytics</strong> application must be specified on the MID Server.</td>
<td>N/A</td>
<td>One of these capabilities must be present on the MID Server: the <strong>RCA</strong> capability for alert aggregation and RCA and the <strong>Metrics</strong> capability for Operational Intelligence.</td>
</tr>
<tr>
<td>Service Mapping</td>
<td>The <strong>Service Mapping</strong> or <strong>ALL</strong> application must be specified on the MID Server.</td>
<td>The endpoint IP address must fall within the IP range that you configure on the MID Server, or the <strong>ALL</strong> option must be selected on the MID Server.</td>
<td>One of the supported Service Mapping capabilities (for new installs) must be configured on the MID Server, or the MID Server capability must be set to <strong>ALL</strong>.</td>
</tr>
<tr>
<td>Event Management</td>
<td>The <strong>Event Management</strong> or <strong>ALL</strong> application must be specified on the MID Server.</td>
<td>The IP configured in the event connector instances, such as <strong>HPOM</strong>, must fall within the IP range configured on the MID Server.</td>
<td></td>
</tr>
<tr>
<td>Cloud Management</td>
<td>N/A</td>
<td>N/A</td>
<td>The <strong>Cloud Management</strong> or <strong>ALL</strong> capability must be added.</td>
</tr>
</tbody>
</table>

**Using a specific MID Server**

Discovery and Event Management can use a MID Server that you specifically call out.

**Note:** Selecting a specific MID Server is not the same as specifying the **default MID Server for an application**. A specific MID Server is always used. If it is **Down** or not validated, the application does not execute commands against the MID Server. A default MID Server is fallback that is used when the auto-selection of MID Servers does not find any eligible MID Server.

<table>
<thead>
<tr>
<th>Application</th>
<th>How you specify a specific MID Server</th>
<th>Criteria that the default MID Server must meet</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery</td>
<td>Choose the MID Server on the Discovery schedule.</td>
<td>You can use any MID Server as long as it does not have the <strong>RCA</strong> capability. If you select a MID Server without the **Discovery or <strong>ALL</strong> application, it automatically adds the <strong>Discovery</strong> application.</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>

**Note:** If a MID Server manages resources within defined IP ranges for Orchestration, you must map the fully-qualified domain name (FQDN) of a server with its IP address to run certain activities, such as *Exchange activities*.

**Domain separation**

If you are using domain separation, you can configure MID Servers to be in separate domains. The domain that the MID Server is in affects how the application selects the domain:

- **Discovery and Service Mapping**: On the Discovery schedule, the MID Servers and clusters that available for selection are limited to the same domain of the user who is configuring the schedule. This also applies to the auto-selection option: only MID Servers in the same domain as the user can be automatically selected.
- **Alert aggregation and RCA (Event Management)**: The metrics for a business service is done on the MID Server that is in the same domain as the business service. Otherwise, a MID Server from the global domain is used.

**MID Server selection test**

If Service Mapping is active, you can preview which MID Server that Service Mapping uses for a specific target device or computer. To do this, navigate to *Service Mapping > MID Servers* and click *MID Selection Test*. Enter the IP address and an optional application and capability, and then click *OK*. The name of the MID Server that Service Mapping will use appears in the window.

**Configure a default MID Server for each application**

You can configure a default MID Server that an application can use if all other possible MID Servers are unavailable.

Role required: agent_admin or admin

Applications are only available when their respective plugins are activated.

The default MID Server is used when applications fail to find a suitable MID Server that matches configured criteria during auto-select. The default MID Server for the ALL application is used if the default MID Server for the specific application is not available. Some applications also offer a property to set the default MID Server.

**Important:** If you configure a MID Server for ALL IP ranges (type *Include*) and also create an IP range of type: *Exclude* for the same MID Server, the system ignores the excluded IP range for that MID Server.

The default MID Server does not need to meet any criteria (application, IP range, behavior, or capability) to be used. Specifying a default MID Server is optional, and you can use a MID Server as the default for more than one application.
<table>
<thead>
<tr>
<th>Application</th>
<th>Additional notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery</td>
<td>Discovery attempts to use the default MID Server when the Discovery schedule specifies <strong>Auto-Select MID Server</strong> and Discovery cannot find any MID Servers with the correct application and IP range.</td>
</tr>
<tr>
<td>Orchestration</td>
<td>Orchestration attempts to use the default MID Server when it cannot find any MID Servers with the capabilities that you define in the Orchestration activity. You can also specify a default MID Server. The value in that property automatically synchronizes with the default MID Server you select in the Orchestration application.</td>
</tr>
<tr>
<td>Alert aggregation and RCA</td>
<td>Not applicable. The MID Server is selected if it has the RCA capability. Route to right MID by domain.</td>
</tr>
<tr>
<td>Service Mapping</td>
<td>If there are no MID Servers with matching application, capability, or IP range, Service Mapping uses the default MID Server.</td>
</tr>
<tr>
<td>Event Management</td>
<td>You can specify a default MID Server for Event Management using the mid.server.connector_default system property. Event Management does not use the default MID Server in the application record.</td>
</tr>
<tr>
<td>Cloud Management</td>
<td>N/A</td>
</tr>
</tbody>
</table>

1. Navigate to **MID Server > Applications**. The list of installed applications that can use MID Servers appears.
2. Click the name of an installed application.
3. Select a MID Server from the list in the **Default MID Server** field.
4. To select additional MID Servers for this application, click **Edit** in the **MID Servers** related list and select alternate MID Servers that this application is allowed to use.
5. Click **Update**.

**Configure an IP address range for the MID Server**

You can manually configure an IP address range for the MID Server to explore.

Role required: agent_admin or admin

Applications, such as Discovery and Orchestration, can specify an IP range or the specific IP address of a target. When the application looks for a MID Server to use during auto-selection, it chooses a MID Server whose IP range includes the application's range or specific IP address. Applications also use other criteria, such as the MID Server's supported application or capability. See **MID Server selection** for more information.

**Note:** This is a manual configuration procedure. To learn how the system can assign IP address ranges to selected MID Servers automatically, see **MID Server IP range auto-assignment**.

These applications use IP ranges as follows:

- **Orchestration:** Use the IP address of the target machine (together with the capability) to select the correct MID Server for Orchestration activities. Refer to the procedure in this topic to configure the IP address.
- **Service Mapping:** Select the MID Server whose IP address range matches the IP in the discovery request. See **MID Server configuration for Service Mapping** for more information.
- **Discovery:** Can select an IP address range using the same criteria as Service Mapping. Discovery can also use a **quick IP range** that you specify in the Discovery schedule.

**Tip:** You can also use the **ALL** IP range, which allows the MID Server to be used with any range of IP addresses that an application specifies. This only allows the MID Server to access IP ranges, it does not mean...
that the MID Server can actually reach all of the IP ranges. To function with an application, the MID server must have access to the IP ranges that the application needs.

Valid IP address ranges can be as follows:

- An IP address in dotted decimal or hexadecimal format. The hexadecimal format can be explicitly prefixed with 0x, this is not mandatory. Here are examples:
  - 10.11.144.155
  - 0xA0B909B
  - A0B909B

- An IP address range in dotted decimal or hexadecimal format. Here are examples:
  - 10.11.144.150-10.11.144.160
  - 0xA0B9096-0xA0B90A0
  - 10.11.144.150-0xA0B90A0

- An IP network address with the net mask specified after a slash (/) in regular notation (0-32 inclusive) or in IP address notation. Dotted decimal or hexadecimal format is not allowed. Here are examples:
  - 10.11.144.0/24 10.11.144.0/255.255.255.0
  - 10.11.144.0/0xFFFFFFFF00
  - 0xA0B9000/24
  - 0xA0B9000/0xFFFFFFFF00

1. Navigate to MID Server > IP Ranges.
2. Click New.
3. Complete the form, using the fields in the table.
### IP address ranges

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for this IP range. The default is Global.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Type  | Select the type of range:  
  - **Include**: Include the specified IP range.  
  - **Exclude**: Exclude the IP address range.  |
| Range | Enter the range in a valid format.  |
| Related list | The MID Servers that can use this IP address range.  |

### 4. Click Save.

**Important**: IP ranges assigned manually prior to using auto-assignment in the Discovery Quick Start are affected as follows:

- Individual IP ranges are retained and appended to the ranges assigned automatically by the system for the designated MID Server.
- If the MID Server was configured with the **ALL** ranges selection, the auto-assignment feature overwrites that designation with the ranges it finds.

Open the **ALL** IP range record and configure the MID Servers that you want to use with any set of IP addresses.

### Select applications to include in the definition of **ALL** for a MID Server

You can narrow down the list of applications that are included in the definition of **ALL**.

Role required: agent_admin or admin

You can specify the **ALL** application for a MID Server, which means that the MID Server is allowed to work with any of the applications that require MID Servers, such as Discovery, Event Management, Service Mapping, and so on. But you might not want all applications to be included in the definition of **ALL**. For example, you might want to exclude Service Mapping from the **ALL** definition if you already have a dedicated MID Server to work with Service Mapping.

1. Navigate to **MID Server > Applications**.  
   The list of installed applications that can use MID Servers appear.
2. If you do not see the **Included in application **ALL** column, you can personalize the list and add it.
3. For each application, double-click the value in the **Included in application ALL** column.

4. Change the value to **true** (to include) or **false** (to exclude).

**Override the MID Server selection filter**

You can use the override feature to write your own filter condition that overrides the normal MID Server selection criteria for an application. An override has precedent over the default filter and can be defined for a specific selection condition.

Before attempting to create an override filter, be sure you understand the criteria the platform uses to select MID Servers. See *MID Server selection* for details.

Role required: admin

**Note:** The override feature is intended for Cloud Management and Cloud Discovery only. The **Override by capability** filter is provided by default.

There are four MID Server selection filters included in the base ServiceNow system. These filters are applied to all MID Servers in order until the system finds a matching condition:

- Status Filter
- App Filter
- Capability Filter
- IP Filter

**Important:** The override feature allows multiple filter types but only one override filter for each filter type. The **Override selector** filter type overrides all other filters and takes complete control of the MID Server selection. If this type is active, it is the only filter applied.

1. Navigate to **MID Server > Mid Selector Override.**
   The list of MID Server overrides appears.
2. Click **New** to create a new filter.
3. Complete these fields:
   - **Name:** Unique name for this override. Ensure that you can identify the override type by the name.
   - **Script:** Condition for this filter. Create the MID Server selection logic for your override in this field, using the directions provided in the function template. Look at the **Override by capability** filter as an example before starting to create your filter.
- **Type**: Type of override being configured. Select one of the four default filters to override with your condition, or select **Override selector** to create a filter that overrides all the others.

4. Click **Submit**.
```javascript
function filter(candidateList) {
  return functionMidList.length > 0
    return defaultSelectedMidList;

  if (this.cloudCapability) {
    if (this != null) {
      var error = "MD Selection filter on cloudCapability could not find a capability for provider!";
      this.warn(error);
    }
    return defaultSelectedMidList;
  }

  var ids = getMidsWithCapability(capability);
  var ids = getMidsWithoutCapability(ids, capability);
}
MID Server IP range auto-assignment

IP ranges that represent a subnet can be automatically assigned to qualified MID Servers by the Discovery Quick Start feature.

To be automatically assigned to a subnet, a MID Server must be:

- In a running (Up) state.
- Successfully validated.
- Able to access one or more subnets in your network.

The subnet assignments that the instance makes for your MID Servers are stored in the Automation Status Set [automation_status_set] table. For details about MID Server auto-assignment, see Discovery Quick Start.

Important: You must auto-assign at least one MID Server to create a schedule automatically.

Required SNMP OIDs for MID Server IP range auto-assignment

Customers who use network service providers must request specific SNMP access to use MID Server IP range auto-assignment.

IP range auto-assignment requires SNMP credentials for read-only access to all routers that Discovery uses to identify subnets. In addition, your service provider must grant the following SNMPWALK access:

- iso.org.dod.internet.mgmt.mib-2.ip.ipRouteTable (1.3.6.1.2.1.4.21)
  - ipRouteDest (1.3.6.1.2.1.4.21.1.1)
  - ipRouteNextHop (1.3.6.1.2.1.4.21.1.7)
  - ipRouteType (1.3.6.1.2.1.4.21.1.8)
  - ipRouteMask (1.3.6.1.2.1.4.21.1.11)
- iso.org.dod.internet.mgmt.mib-2.ip.ipForward.ipCidrRouteTable (1.3.6.1.2.1.4.24.4)
  - ipCidrRouteDest (1.3.6.1.2.1.4.24.4.1.1)
  - ipCidrRouteMask (1.3.6.1.2.1.4.24.4.1.2)
  - ipCidrRouteNextHop (1.3.6.1.2.1.4.24.4.1.4)
  - ipCidrRouteType (1.3.6.1.2.1.4.24.4.1.6)

View automation status sets and IP range assignments

The Automation Status Set form shows summary details of a subnet Discovery and the subsequent IP range assignments for MID Servers selected for automatic subnet assignment.

Role required: admin

1. Navigate to MID Server > Automation Status Sets.
2. Select a status record for a subnet Discovery you want to view.
   The form contains read-only status information about the selected Discovery, the subnets found, and the range assignment process for the MID Servers you selected for auto assignment.

   Important: IP ranges assigned manually prior to using auto-assignment in the Discovery Quick Start are affected as follows:
   - Individual IP ranges are retained and appended to the ranges assigned automatically by the system for the designated MID Server.
• If the MID Server was configured with the **ALL** ranges selection, the auto-assignment feature overwrites that designation with the ranges it finds.
The Automation Status Set shows the IP range assignments for the MIO Servers selected for automatic range configuration. All auto-populated MIO Server ranges from this process are subnets only. This form includes summary details of the Discovery that identified the available subnets and their ranges.

4. Select the **IP Range Assignments** related list to view the IP ranges that were assigned to a MID Server.

**Caution:** IP ranges identified by Discovery are stored in the IP collection [ip_address_collection] table, which is only used for MID Server IP range auto-assignment in the Jakarta release. This table is intended for future development and should **not** be used in any customizations, including column additions, business rules, or scripting actions.
MID Server properties

Properties control the behavior of all MID Servers or a particular MID Server.

The MID Server properties are in the MID Server Property [ecc_agent_property] table and can be accessed by navigating to MID Server > Properties. To set these properties, you must add them, if they are not already present.

### MID Server properties

<table>

</tr>
<tr>
<td>You can also configure this as a configuration parameter on a individual MID Server.</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| mid.property.jdbc_operations                                | Tells the JDBCOrchestrationProbe what JDBC operations it is allowed to execute. Edit this property value to allow JDBC Orchestration activities to perform more operations. All operations are comma separated. Select a MID Server in the MID server field to define specific operations for that MID Server, or leave the field empty to apply the list of operations to all MID Servers. This property requires the Orchestration plugin.  
  **Type**: string  
  **Default value**: select,update,insert,delete,show,create,describe,begin,if,end,not,exists |
| mid.property.jms.command.allowed_factory_names              | Comma delimited list of Java Messaging Service (JMS) connection factories that the MID Server requires for a custom JMS activity or action. This property requires the Orchestration plugin.  
  **Type**: string  
  **Default value**: connectionFactory, queueConnectionFactory, topicConnectionFactory |
| mid.property.ssh.use_snc                                    | Enables the use of the SNCSSH client for Discovery and Orchestration. Change this property to false to use J2SSH. This property applies to all MID Servers connected to the instance.  
  **Important**: If you upgrade from Dublin or earlier and want to use the SNCSSH client, you must add this property to the MID Server Properties [ecc_agent_property] table and set it to true. If you do not set this property, all the MID Servers in the upgraded system will use J2SSH.  
  **Type**: true | false  
  **Default value**: true |
| mid.servicewatch.max_concurrent_connections                | Defines the maximum number of concurrent tasks sent to an individual host by a single MID Server.  
  **Type**: integer  
  **Default value**: 7 |
| glide.stored_proc.data_type.validation                     | Stops validation of data types in stored procedure parameters. Use this property if you use Orchestration to run a stored procedure on MySQL, Oracle DB, and MS-SQL databases and you want to avoid performing data type validation. Restart the MID Server service after you change the value of this property.  
  **Type**: true | false  
  **Default value**: false |
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| mid.process_flow.log_listener.max_size | Sets the maximum size in bytes of memory available to save log messages for Flow Designer actions running on a MID Server. The MID Server stores up to the limit in memory and discards additional log messages, then sends the messages back to the instance along with the execution plan.  
  - **Type**: integer (bytes)  
  - **Default value**: 10485760 |
| mid.sa.prefer_powershell | Enables MID Server to use PowerShell Remoting.  
  - **Type**: True | False  
  - **Default value**: false |
| mid.sm.discolog.max_object_size | Limits the length of the object in the Horizontal Discovery Log. Objects in the log statement are truncated to the number of characters set by this property's value. This property only affects the object character size in the Horizontal Discovery Log. The following message appears if an object is limited by this property “The max object size reached the maximum limit of [value]. To adjust this use the mid property mid.sm.discolog.max_object_size.”  
  - **Type**: integer (characters)  
  - **Default value**: 1000 |
| mid.snmp.use_getbulk | Specifies whether to use GETBULK to receive a large amount of data in batches. This can be used to globally configure all MID Servers. (This is available in version Madrid patch 2 and later.)  
  - **Type**: true | false  
  - **Default value**: true  
  
  GETBULK can also be set at the probe level or for an individual MID Server. Settings are listed in the order of precedence:  
  - *SNMP probe parameter*  
  - *MID Server configuration parameter*  
  - *MID Server properties* |

Create a MID Server property

Use a MID Server property to control either the behavior of all MID Servers or a particular MID Server.

Role required: admin

You set MID Server properties to override MID Server parameters. Configure MID Server properties in the MID Server plugin. Do not configure MID Server properties in the glide.properties file that is located in the properties folder of the agent. The glide.properties file gets overwritten during the upgrade process.

1. Navigate to MID Server > Properties.
2. Click New.
3. Fill in the fields, as appropriate (see table).

### MID Server properties fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the property name.</td>
</tr>
</tbody>
</table>
| Value    | You can enter the value you want the property to have.  

*Note:* If you are amending JDBC operations through the mid.property.jdbc_operations properties, you can enter verbs like BEGIN, END, IF, or common PL/SQL block statements. This will assist in being able to run CREATE or ALTER statements. You might have to restart the MID server before running some of the statements.

| MID Server | Leave this field blank to set a MID Server property that affects all MID Servers. To set a MID Server property for a particular MID Server, select the MID Server. |

4. After setting any MID Server properties, restart the MID Server to ensure the properties sync with the instance.

### MID Server parameters

Parameters control the behavior of a particular MID Server and have lower precedence than MID Server properties.

To add a parameter to a MID Server, see *Add a MID Server parameter*

*Important:* Changes to parameters only take effect when the MID Server is started (or restarted).

*Note:* The value of any MID Server parameter in the config.xml file can be encrypted. See *Encrypt or decrypt MID Server configuration file values* for more information.

### Required parameters

*Note:* Using special characters in an XML configuration file requires you to encode them.

<table>
<thead>
<tr>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| url   | Specifies the URL to the associated instance. Normally the URL is similar to https://instance.service-now.com, where you replace instance with the instance name. If you host your own instance, use the URL set by your organization.  
  - Type: string  
  - Default value: none |
### ServiceNow Madrid Now Platform capabilities

#### Names

<table>
<thead>
<tr>
<th>mid_sys_id</th>
<th>Records the MID Server record's unique identifier. This parameter should be empty when you initially configure a MID Server. Do not change the value.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: automatically set (GUID)</td>
</tr>
<tr>
<td>name</td>
<td>Use this parameter to supply a name that is meaningful for you. If you do not supply this parameter, the MID Server uses the default value.</td>
</tr>
<tr>
<td></td>
<td>A set of business rules synchronizes the name in the configuration file with the name in the MID Server record. The business rules ensure that changing the name in one location also changes the name in the other location.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: YOUR_MIDSERVER_NAME_GOES_HERE</td>
</tr>
<tr>
<td>mid.instance.username or glide.glidesoap.username</td>
<td>If the ServiceNow instance has authentication enabled, as it is by default, set this parameter to define the user name the MID Server should use to log in to the instance. This user should have the mid_server role on the ServiceNow instance in order to access necessary tables and fields. You can use this parameter to define user names with special characters.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: none</td>
</tr>
<tr>
<td>mid.instance.password or glide.glidesoap.password</td>
<td>If your ServiceNow instance has authentication enabled, as it is by default, set this parameter to define the password the MID Server should use to log in to the instance. You can use this parameter to define passwords with special characters.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: none</td>
</tr>
</tbody>
</table>

### CIM parameters

<table>
<thead>
<tr>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid.cim.batch.size</td>
<td>Specifies the maximum number of messages sent at once to a CIM server.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 1</td>
</tr>
<tr>
<td>mid.cim.request.interval</td>
<td>Specifies the number of milliseconds to wait between requests to the same Common Information Model Object Manager (CIMOM).</td>
</tr>
<tr>
<td></td>
<td>• Type: integer (milliseconds)</td>
</tr>
<tr>
<td></td>
<td>• Default value: 0</td>
</tr>
</tbody>
</table>
### Names | Description
--- | ---
mid.cim.host.connection.limit | Specifies the maximum number of simultaneous connections to each Common Information Model Object Manager (CIMOM). A value of zero disables simultaneous connections.
- Type: integer (number of connections)
- Default value: 0

### Connection parameters

### Names | Description
--- | ---
glide.mid.fast.responses | Instructs the MID Server to try sending messages to the instance as soon as they are ready. Normally the MID Servers ends message to the ServiceNow instance serially (that is, one message at a time). Since many probes can be run in parallel, there can be multiple messages simultaneously transmitted to the instance. Setting this parameter to true may decrease the time between a probe's completion and its response arriving at the instance. However, the multiple simultaneous messages consume resources, decreasing the overall instance responsiveness. If there are communications problems, this parameter's value can also cause a logjam on the MID Server, as threads normally used for running probes may become consumed for sending messages. Generally, leave this parameter out of your configuration. Setting it to true is meaningful only under very special circumstances.
- Type: true | false
- Default value: false

glide.mid.max.sender.queue.size | Places an upper limit on how large the queue is allowed to get. The MID Server starts deleting queued messages if this limit is exceeded. When the MID Server generates messages to the ServiceNow instance faster than it can send them, it queues them temporarily on the file system of the MID Server's host. This queue is normally quite small, and is completely emptied as soon as the MID Server processing slows for a short period. However, this queue can grow in size when there are communication problems between the MID Server and the instance, and especially if there is an integration running on the MID Server.

The parameter is of the form `{number}{multiplier}`, where `{number}` is any positive decimal number including non-integers, and the optional multiplier is any spelling of bytes, kilobytes, megabytes, gigabytes, or terabytes (only the first character is tested, and the test is case-insensitive). The default multiplier is bytes. White space is liberally tolerated. The following strings all represent valid parameters: "1000000000", "0.5m", "5 GB", "7.67gigas", "145.69392 meg", and "1.1 terra".
- Type: string
- Default value: 0.5 GB
<table>
<thead>
<tr>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| instance.date.format        | Specifies the format the instance uses for dates and times. The primary impact of setting this parameter is to allow the MID Server to correctly refresh its start and stop times on the MID Server record in ServiceNow. The format of this date/time string is identical to that used by the Java SimpleDateFormat class.  
  - Type: string (Date format)  
  - Default value: yyyy-MM-dd HH:mm:ss |
| mid.disable_amb             | Disables the Asynchronous Message Bus (AMB) Client. When AMB is enabled, the MID Server uses a default polling interval of 40 seconds. When the AMB client is disabled, the default polling interval switches to 5 seconds. If you set a polling interval with the mid.poll.time parameter, the MID Server uses that value whether or not the AMB client is enabled.  
  - Type: true | false  
  - Default value: false          |
| mid.https.truststore.password | Sets the trustStore password that is required for HTTPS connections with the Asynchronous Message Bus (AMB) Client.                                                                                               
  - Type: string                  
  - Default value: none           |
| mid.https.truststore.path   | Path to the trustStore to be used by the MID Server for TLS transactions (Asynchronous Message Bus (AMB) Client). Add this parameter only if you want to change the default path.  
  - Type: string                  
  - Default: Path to the JRE trustStore bundled with the MID Server |
| mid.jmx.enabled             | Enables a JMX server on the MID Server, which exposes some management information to JMX consoles. Implementing JMX requires additional configuration of the Java runtime environment. Setting this parameter to true is only recommended for those with detailed knowledge of the Java security architecture and a specific need for JMX.  
  - Type: true | false  
  - Default value: false          |
<table>
<thead>
<tr>

<td>Specifies whether to debug file probe templates.</td>
</tr>
<tr>
<td></td>
<td>• Type: True</td>
</tr>
<tr>
<td></td>
<td>• Default: false</td>
</tr>
<tr>
<td>mid.cim.debug</td>
<td>Specifies whether to enable debug logging for CIM, WBEM, SLP, or SMI-S.</td>
</tr>
<tr>
<td></td>
<td>• Type: True</td>
</tr>
<tr>
<td></td>
<td>• Default: false</td>
</tr>
<tr>
<td>Names</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>mid.ssh.debug</td>
<td>Enables SSH debug information in the log file. The parameter usage depends on whether the ServiceNow SSH client is enabled. When the ServiceNow SSH client is enabled, the parameter functions as follows: • Type: String • Default value: false The following string values are valid for the ServiceNow SSH client: • true: Enables SSH debug information in the log file. • false: Disables SSH debug information in the log file. • &lt;IP Addresses&gt;: Specify which IP ranges to enable SSH debug information in the log file. You can enter IP addresses in the following formats: • An IP range defined by a slash and the number of bits in the subnetwork. For example, the string 10.10.10.0/24 scans 24 bits of IP addresses from 10.10.10.0 to 10.10.10.254. • An IP range defined by a dash. For example, the string 10.10.11.0-10.10.11.165 scans the IP addresses from 10.10.11.0 to 10.10.11.165. • A comma-separated list of specific IP addresses. For example, the string 10.10.11.200,10.10.11.235 scans the IP addresses 10.10.11.200 and 10.10.11.235. • deferred: Logs SSH debug information in memory unless an error or warning occurs. If an error or warning occurs, the platform publishes the debug information to the log file. This ensures that only the part of the log file pertaining to the error or warning is recorded. If no error or warning is detected, the platform deletes the unused log data from memory when the session closes. Each session stores up to 1000 log messages. If the session exceeds 1000 log messages, the deferred log discards the oldest log message to make room for the newest log message. When the ServiceNow SSH client is disabled, the parameter enables or disables SSH debug information in the log file: • Type: True</td>
</tr>
<tr>
<td>Names</td>

<tr>
<td>disable_monitors</td>
<td>Specifies whether to disable the MID Server from actively checking for monitors on the instance.</td>
</tr>
<tr>
<td></td>
<td>• Type: True</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td>mid.show.queries</td>
<td>Instructs the MID Server whether to log details about every query it makes to the ServiceNow instance. Typically this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.</td>
</tr>
<tr>
<td></td>
<td>• Type: True</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
</tbody>
</table>
ServiceNow Madrid Now Platform capabilities

<table>
<thead>
<tr>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| disable.remote.logging | Prevents the MID Server from logging any information to the MID Server log on the instance. Relatively little information is logged on the instance in any case, but setting this parameter to true eliminates all logging to the instance.  
  - Type: True | False  
  - Default value: false |
| disable.status         | Prevents the MID Server from sending a status report to the instance every 10 minutes.  
  - Type: True | False  
  - Default value: false |

Proxy server parameters

<table>
<thead>
<tr>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
</table>
| mid.instance.use_proxy or mid.proxy.use_proxy | If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to true to instruct the MID Server to use the proxy. You must also set the proxy server's host and port, and perhaps the user name and password as well.  
  - Type: True | False  
  - Default value: false |
| mid.proxy.host         | If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to define the proxy's host.  
  - Type: String  
  - Default value: none |
| mid.proxy.password     | If your MID Server must go through a web proxy to access the ServiceNow instance, and your proxy requires a password, set this parameter to define that password.  
  - Type: String  
  - Default value: none |
| mid.proxy.port         | If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to define the proxy's port.  
  - Type: Integer (0-65535)  
  - Default value: 80 |
### Shazzam parameters

<table>
<thead>
<tr>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid.shazzam.regulator.interval_ms</td>
<td>Sets the interval, in milliseconds, in which Shazzam can launch packets. This parameter works with the mid.shazzam.regulator.packets_per_interval parameter to set the number of packets allowed in this interval. By default, Shazzam launches one packet each millisecond.</td>
</tr>
<tr>
<td></td>
<td>• Type: Integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 1</td>
</tr>
<tr>
<td>mid.shazzam.regulator.packets_per_interval</td>
<td>Sets the number of packets that Shazzam can launch in the configured time interval. This parameter works with the mid.shazzam.regulator.interval_ms parameter, which sets that interval. By default, Shazzam launches one packet each millisecond.</td>
</tr>
<tr>
<td></td>
<td>• Type: Integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 1</td>
</tr>
<tr>
<td>mid.shazzam.chunk_size</td>
<td>Specifies the maximum number of IP addresses that Shazzam scans in parallel. This parameter primarily controls outbound port consumption.</td>
</tr>
<tr>
<td></td>
<td>• Type: Integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 100</td>
</tr>
</tbody>
</table>

### SNMP configuration parameters

<table>
<thead>
<tr>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid.snmp.enable_auto_public</td>
<td>Specifies whether to use the SNMP public community string automatically if no other SNMP credentials were successful.</td>
</tr>
<tr>
<td></td>
<td>• Type: True</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td>Names</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| mid.snmp.request.timeout | Specifies the timeout value for the first OID request, in milliseconds. For subsequent requests (for example, table OIDs), the mid.snmp.session.timeout configuration parameter (see below) takes effect.  

- **Note:** You can override this parameter with the **timeout** SNMP probe parameter.  
  - Type: Integer  
  - Default value: 1500  

| mid.snmp.session.timeout | Specifies the timeout value for subsequent OID request, in milliseconds. SNMP communication is stateless and does not have a session or connection in the normal sense. The system regards a positive response from the first OID request as a sign that it should expect prompt responses to subsequent requests. While the default is short, it may be useful to increase this parameter value to the same value as that used for mid.snmp.request.timeout.  

- **Note:** You can override this parameter with the **establish_session_timeout** SNMP probe parameter.  
  - Type: Integer  
  - Default value: 500  

| mid.snmp.use_getbulk | Specifies whether to use GETBULK to receive a large amount of data in batches. This can be used to configure an individual MID Server. (This is available in version Madrid patch 2 and later.)  

- Type: True | False  
- Default value: true  

GETBULK can also be set at the probe level or globally for all MID servers. Settings are listed in the order of precedence:  
  - SNMP probe parameter  
  - MID Server configuration parameter  
  - MID Server properties  

| mid.snmp.use_snmp4j | Use the Snmp4j library for SNMP communication. This is a strict requirement for SNMPv3. This parameter should only be set to **false** based on advice from ServiceNow Technical Support.  

- Type: True | False  
- Default value: true

#### SSH Discovery parameters

By default, the MID Server is configured to search for SSH commands in the following paths and the logged-on user's default paths:

- /usr/sbin
- /usr/bin
- /bin
- /sbin

<table>
<thead>
<tr>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid.connection_cache</td>
<td>Specifies whether to cache connections. Set to <code>false</code> to disable connection caching. This parameter applies to SSH connections only.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td>mid.ssh.set_path</td>
<td>Specifies whether to set the PATH environment variable for SSH commands.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td>mid.ssh.local</td>
<td>Specifies whether to execute commands for the MID Server host machine (localhost) via SSH rather than from a console. This allows long-running commands to execute properly. This parameter applies to the legacy SSH client only.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td>Names</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>mid.ssh_connections_per_host</td>
<td>Controls the number of concurrent probes the MID Server can run against a given host. Lowering the number of concurrent connections can slow Discovery.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value:</td>
</tr>
<tr>
<td></td>
<td>• 7 for the ServiceNow client</td>
</tr>
<tr>
<td></td>
<td>• 3 for the legacy SSH client</td>
</tr>
<tr>
<td>mid.ssh.sudo_preserve_environment</td>
<td>Specifies whether to use sudo to preserve the environment for SSH.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td>mid.ssh.path_override</td>
<td>Overrides the default paths set before executing a command. Enter one or more override paths delimited by a colon (:). The default path is /usr/sbin: /usr/bin: /bin: /sbin.</td>
</tr>
<tr>
<td></td>
<td>The ServiceNow SSH client accepts the following prefixes in front of the path_override value.</td>
</tr>
<tr>
<td></td>
<td>• append: Appends the override path to the end of the host’s path.</td>
</tr>
<tr>
<td></td>
<td>This is the default behavior.</td>
</tr>
<tr>
<td></td>
<td>• replace: Replaces the host path with the path_override value.</td>
</tr>
<tr>
<td></td>
<td>• prepend: Appends the override path to the front of the host path.</td>
</tr>
<tr>
<td></td>
<td>• Type: string (a colon-separated list of directories)</td>
</tr>
<tr>
<td></td>
<td>• Default value: None</td>
</tr>
<tr>
<td>mid.ssh.use_snc</td>
<td>Enables the ServiceNow SSH client (SNCSSH) on individual MID Servers. SNCSSH is a ServiceNow implementation of an SSH client and is active by default for all MID Servers on new instances, via a MID Server property. Enabling the ServiceNow SSH client disables the legacy J2SSH client.</td>
</tr>
<tr>
<td></td>
<td><strong>Important:</strong> Mixing SSH client types for MID Servers connected to the same instance is not a good practice.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td>mid.ssh.max_retries</td>
<td>Specifies the maximum amount of times to retry an SSH operation after a time-out. The system sleeps two seconds between each connection attempt. By default, the MID Server retries once only. Set the parameter to 0 to disable retries.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>

<tr>
<td>mid.ssh.alt_rm</td>
<td>Sets a different SSH remove file command.</td>
</tr>
<tr>
<td></td>
<td>- Type: string</td>
</tr>
<tr>
<td></td>
<td>- Default value: none</td>
</tr>
<tr>
<td>mid.ssh.initial_delay_ms</td>
<td>Delays sending any SSH probe commands to a server after connecting to the target for the time specified, in milliseconds. This parameter applies to the legacy SSH client only.</td>
</tr>
<tr>
<td></td>
<td>- Type: integer (milliseconds)</td>
</tr>
<tr>
<td></td>
<td>- Default value: 0</td>
</tr>
<tr>
<td>mid.ssh.suppress_history</td>
<td>Suppresses the generation of the SSH history file. This parameter applies to the legacy SSH client only.</td>
</tr>
<tr>
<td></td>
<td>- Type: true</td>
</tr>
<tr>
<td></td>
<td>- Default value: false</td>
</tr>
<tr>
<td>mid.ssh.socket_timeout</td>
<td>Specifies the timeout value for the SSH socket to prevent issues created by a socket timeout. Some devices, such as systems with embedded controllers like UPSs and PDUs, that have SSH enabled require more time to respond to an authentication request. The default value of 2 minutes ensures such requests do not timeout prematurely.</td>
</tr>
<tr>
<td></td>
<td>- Type: integer (milliseconds)</td>
</tr>
<tr>
<td></td>
<td>- Default value: 120000 (2 minutes)</td>
</tr>
<tr>
<td>mid.ssh.channel_timeout</td>
<td>Specifies the amount of time that the MID Server waits for activity on the SSH socket before closing the connection. If there has been no activity on the SSH socket for the specified timeout value, the MID Server closes the connection. Some devices, such as systems with embedded controllers like UPSs and PDUs, that have SSH enabled may require more time to respond to an authentication request.</td>
</tr>
<tr>
<td></td>
<td>- Type: integer (milliseconds)</td>
</tr>
<tr>
<td></td>
<td>- Default value: 120000 (2 minutes)</td>
</tr>
<tr>
<td>mid.ssh.session_timeout</td>
<td>Specifies the amount of time that a cached session remains in memory after last use. Excessively small values tend to decrease performance. This parameter applies to the ServiceNow SSH client only.</td>
</tr>
<tr>
<td></td>
<td>- Type: integer (milliseconds)</td>
</tr>
<tr>
<td></td>
<td>- Default value: 300000 (5 minutes)</td>
</tr>
<tr>
<td>mid.ssh.command_timeout_ms</td>
<td>The timeout duration, in milliseconds, for the execution of an SSH command.</td>
</tr>
<tr>
<td></td>
<td>- Type: integer (milliseconds)</td>
</tr>
<tr>
<td></td>
<td>- Default value: 300000 (5 minutes)</td>
</tr>
<tr>
<td>Names</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| mid.ssh.use_keyboard_interactive | Uses the keyboard interactive authentication mode in SSH daemons on which it is activated.  
• Type: true | false  
• Default value: false  
**Caution:** An issue exists in Mac OS X Sierra and later with the authentication order of the **password** and **keyboard-interactive** modes that can cause Discovery to fail. For details about this issue and the configuration required for proper SSH authentication, see KB0623600. |
| mid.ssh.dh_group_length_min   | Specifies the minimum group length in bits used for generating a "shared secret" key in Diffie-Hillman key exchange. The larger the key the more secure the SSH connection is but at the cost of performance.  
• Type: integer (bits)  
• Default value: 1024 |
| mid.ssh.dh_group_length_max   | Specifies the maximum group length in bits used for generating a "shared secret" key in Diffie-Hillman key exchange. The larger the key the more secure the SSH connection is but at the cost of performance.  
• Type: integer (bits)  
• Default value: 2048 |
| mid.ssh.shells_supported      | Defines the bourne-compatible shells supported by the MID Server. This value is a comma-separated list of supported shells, such as ksh, dsh, bash and sh.  
• Type: string  
• Default value: ksh,bash,sh |
| mid.ssh.discard_lrc_error     | Discard long running command error output, emulating legacy behavior.  
• Type: String  
• Default value: j2ssh - true, snssh - false |
| mid.ssh.pool_thread_ratio     | Ratio of the SSH session pool capacity to the configured MID Server thread number (threads.max), expressed as a percentage. The number of permitted pool capacity sessions is set in this parameter. Regardless of the value set in this parameter, the system never permits the pool capacity to fall below 25 sessions.  
• Type: Integer  
• Default value: 150 |
<table>
<thead>
<tr>
<th>Names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid.ssh.disable_privilege_check</td>
<td>This parameter has no effect if the target is using a privileged command other than &quot;sudo.&quot; For more information, see <em>MID Server privileged commands</em>. The remainder of this section only applies to targets which run sudo. When this parameter is set to true, the MID Server assumes that the user configured in the credential has the privilege to run the given command using sudo. The MID Server assumes the target user can run any command string following sudo on the target. When this parameter is set to false, the MID Server runs &quot;sudo -l&quot; on the target to verify the command which follows sudo has permission to run on the target. Regardless of this parameter's value, the MID Server always validates that &quot;sudo&quot; by itself can be run on the target. Some releases do not show this parameter in the MID Configuration Parameters pull down list. In this case, you may optionally add this parameter in MID Properties.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>

</tr>
<tr>
<td></td>
<td>• Default value: 25</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Setting or changing this parameter requires restarting the MID Server.</td>
</tr>
<tr>
<td>mid.powershell_api.session_pool.target.max_size</td>
<td>Specifies the maximum number of sessions allowed in the pool per target host.</td>
</tr>
<tr>
<td></td>
<td>• Type: Integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 2</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Setting or changing this parameter requires restarting the MID Server.</td>
</tr>
<tr>
<td>mid.powershell_api.winrm.use_ssl</td>
<td>Requires the use of SSL certificates for HTTPS connections using WinRM.</td>
</tr>
<tr>
<td></td>
<td>• Type: True</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| mid.powershell_api.winrm.remote_https_port | Configures the port for connecting to Windows servers using PowerShell over HTTPS.  
  • Type: Integer  
  • Default value: 5986 |
| mid.powershell_api.winrm.remote_port     | Configures the port for connecting to Windows servers using PowerShell over HTTP.  
  • Type: Integer  
  • Default value: 5985 |
| mid.powershell_api.winrm.skip_ssl_cert_check | Skips the SSL certificate check when using WinRM for HTTPS connections.  
  • Type: True | False  
  • Default value: false |
| mid.powershell_api.winrm.skip_ssl_cert_check_options | Skips specific SSL certificate checks when using WinRM for HTTPS connections. Configure the MID Server to skip checks for certificates from a Certification Authority (CA), from the Common Name (CN) that identifies the host associated with the certificate, and for revoked certificates.  
  • Type: String  
  • Default value: -SkipCACheck -SkipCNCheck - SkipRevocationCheck |
| mid.powershell.use_credentials           | Determines the credentials to use for Discovery with PowerShell. A setting of true directs the MID Server to run probes with the Windows credentials from the credentials table. To run probes with the credentials of the user for the MID Server service, set this parameter to false.  
  • Type: true | false  
  • Default value: true |
| mid.use_powershell                       | Enables or disables PowerShell for Discovery. Restart the MID Server after changing the value. If PowerShell is not installed or the version installed is less than version 2.0, Discovery reverts to using WMIRunner.  
  • Type: true | false  
  • Default value: true, in the Fuji release.  
  • Default value: false, in releases prior to Fuji. |
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid.powershell.path</td>
<td>Enables an administrator to point to a specific PowerShell on a MID Server in cases where more than one PowerShell is installed. Supply the path to the folder containing the PowerShell executable, for example, <code>C:\mypowershell</code> or <code>C:\mypowershell\</code>. ServiceNow automatically appends the string <code>powershell.exe</code> to the path. Configure this parameter when both a 32-bit and 64-bit PowerShells are active on the same MID Server, and it becomes necessary to launch the correct PowerShell for the context. 64-bit Windows employs file system redirection and the MID Server runs as a 32-bit application. If trying to specify a path in <code>%WinDir%\System32</code>, Windows automatically redirects to <code>%WinDir%\SysWoW64</code>. To avoid redirection, specify the path as <code>%WinDir%\Sysnative</code>. For example, instead of <code>C:\WINDOWS\system32\WindowsPowerShell\v1.0</code>, specify <code>C:\WINDOWS\sysnative\WindowsPowerShell\v1.0</code>. Note: On a 64-bit version of Windows XP, a Microsoft hotfix may be required to enable this. To discover applications running on a 64-bit Windows machine, the MID Server must be running on a 64-bit Windows host machine.  • Type: string (path)  • Default value: none</td>
</tr>
<tr>
<td>mid.powershell.enforce_utf8</td>
<td>Enable this parameter to force commands on a target Windows system to return UTF-8 encoded output. Disabling it allows the target system to use its default encoding. This parameter is only valid when PowerShell is enabled. Setting this value to false may result in incorrect values in the CMDB when non-ASCII characters are returned by a probe.  • Type: true</td>
</tr>
<tr>
<td>mid.powershell.local_mid_service_credential_fallback</td>
<td>Enables automatically falling back to MID Server service credentials if all other credentials fail.  • Type: true</td>
</tr>
<tr>
<td>mid.powershell_api.idle_session_timeout</td>
<td>Specifies the timeout value of idle PowerShell sessions in seconds. Note: Setting or changing this parameter requires restarting the MID Server.  • Type: Integer  • Default value: 60</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>

Add a MID Server parameter

Use a MID Server parameter to control the behavior of a particular MID Server.
Role required: admin

1. Navigate to MID Server > Servers.
2. From the list of MID Servers, select a MID Server to configure.
3. Select the Configuration Parameters related list.

This related list shows all the parameters currently in the MID Server’s configuration file. If there are any passwords, they are displayed in asterisks for security reasons. See MID Server parameters for a list of available parameters.

Defining MID Server configuration parameters
4. To add parameters, click New, and then complete the form.

After the form is submitted, the configuration file for that MID Server is modified to include the new parameter. Changes to existing parameters are reflected in the MID Server configuration file as well. Changes made to the MID Server configuration file do not take place immediately, but rather the next time the MID Server is restarted. The MID Server form has a related link for restarting the MID Server.

**Note:** ServiceNow prevents you from saving changes, such as modifying or deleting parameters, that would cause the MID Server to lose communications with the instance. For example, you cannot change the url parameter. Any changes to these protected properties must be made directly in the `config.xml` file for that MID Server.

### Setting Parameters from the `config.xml` File

MID Server configuration is controlled by an XML file called `config.xml`. This file is located in the `\agent` directory, immediately under the directory where the MID Server is installed. Edit this file directly to make any configuration changes to protected parameters. Many configuration changes, such as those that do not disrupt communication between the MID Server and the ServiceNow instance, may also be made from the instance.

The structure of the `config.xml` file is simply an outer `parameters` tag and a series of inner `parameter` tags. Each parameter tag has name and `value` attributes.

- To change the value of a parameter, edit the `value` attribute.
- To add a parameter, add another parameter tag with its name and `value`.
- To delete a parameter, delete the entire parameter tag.

The order of the parameters within the file is not important. Notice the green comment sections in the sample. Use these elements to add useful comments to the configuration file.

**Note:** When configuring the MID Server for use with a proxy server, be sure to remove the comment tags around the proxy sections that you configure.
MID Server config.xml file

Note: The sample file here is from a Firefox browser. Conventional text editors, such as Notepad, WordPad, or TextEdit, do not display colors and variable fonts.

MID Server pause

The MID server can be put into a **Paused** state to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

You might want to pause the MID Server when your network infrastructure is undergoing changes. This prevents applications like Discovery from throwing errors during a particular maintenance window.

A paused MID Server continues processing commands that it had already retrieved before it was paused. When you resume the MID Server, the MID Server starts retrieving new commands to process.
Note: Discovery continues to assign jobs to MID Servers that are Paused. MID Servers that are Down are not assigned jobs.

Unlike stopping the MID Server from the Windows or Linux server command line on the MID Server machine, pausing the MID server is something that you can do from the instance. The MID Server pause feature is available starting with the Istanbul release.

Note: You can only pause validated MID Servers.

You can still perform these actions when the MID Server is paused:

- Access the MID Server logs and delete log entries.
- View MID server statistics. While the MID Server is in the Paused state it stops generating statistics. But you can still view the statistics generated before you paused the MID Server.
- Retrieve the MID Server thread dump.
- Make and save configuration changes and property changes to the server. The changes take effect after the MID Server is resumed.
- Clear the ECC queue.

The MID server heartbeat continues to function while the MID Server is in the Paused state. If the MID Server is upgraded while it is in the Paused state, the MID Server state automatically changes to Up after successful upgrade. It does not return to the Paused state.

During MID Server selection, paused MID Server can still be selected but are prioritized below MID Servers that are not paused.

Events that occur during MID Server pause

The vCenter and SNMP event collectors, continue to run and process events when you pause the MID Server. These events are not part of the normal synchronous communication that the MID Server has with the instance that you see in the ECC queue. Events are still relayed to the instance and can even trigger actions on records in the instance, such as a CI update. For example, if vCenter detects that a virtual machine goes down or is deleted, a vCenter event makes a change to the status of the corresponding CI record for that virtual machine.

To prevent these events from being processed, stop the extensions from running. See:

- Configure and run the vCenter event collector extension
- Configure the SNMP Trap Collector Extension

Pause the MID Server

Pause the MID Server to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

Role required: agent_admin

You can only pause validated MID Servers.

1. Open the MID server record.
2. Select a running MID Server that has been validated.
3. On the MID Server form, select Pause MID under Related Links.

The state of the MID Server changes to Paused.
A paused MID server

4. To resume MID Server processing, select Resume MID under Related Links.

MID Server domain separation

MID Servers can be configured in separate domains.

The records that can be read, updated, or created by a MID Server are determined by the credentials configured for that MID Server in the config.xml file. These are the user credentials that a MID Server uses to access the instance and specify which domain's records that MID Server can access.

You can create versions of these specific MID Server policy records that only a MID Server from the same domain can use. This process separation is supported for records in tables that extend MID Server Synchronized Files [ecc_agent_sync_file]:

- MID Server MIB File [ecc_agent_mib]
- MID Server JAR File [ecc_agent_jar]
- MID Server Script File [ecc_agent_script_files]

See Set up domain separation for MID servers for instructions on setting up domain separation through the MID server.

Note: Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. The attachments do not appear because the Attachments [sys_attachment] table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

Set up domain separation for MID servers

Set up domain separation through the MID server user role and the MID Server configuration file.

Role required: admin, agent_admin

1. Configure a MID Server user within a specified domain with the proper mid_server role.
2. Specify this user within the MID Server config.xml file. When you set the MID Server user credentials in the config.xml file, make sure they are in the proper domain.

If you must change the MID Server domain:

1. Stop the MID Server and delete the ecc_agent record.
2. Update the MID Server config.xml with the new user in the new domain and restart the MID Server service.

If you need to create versions of specific MID Server files that only MID Servers in your domain can use:

1. Open or create a record in one of these MID Server modules:
   - SNMP MIBs
**ServiceNow Madrid Now Platform capabilities**

- JAR Files
- Script Files

2. Update an existing domain policy or submit a new record.

**Note:** Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. The attachments do not appear because the Attachments [sys_attachment] table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

---

**Configure a multi-domain MID Server**

You can create a MID Server in the global domain that can explore targets in other domains.

Before configuring a multi-domain MID Server:

- Ensure that your instance is domain separated.

**Role required:** admin

1. Type `sys_properties.list` in the navigation filter and press Enter.
2. Locate the `glide.ecc.enable_multidomain_mid` property.
3. Set the value of the property to true.

**Note:** Enabling this property has no effect on existing MID Servers. MID Servers in a domain prior to setting this property, remain in that domain.

4. Create a MID Server in the global domain.

   A MID Server created in the global domain after this property is set to true can explore any domain for which it has the credentials. However, this MID Server is restricted to trying only the credentials for the target domains requested by ECC Queue inputs.

   **Caution:** If you reset the `glide.ecc.enable_multidomain_mid` property to false after creating a multi-domain MID Server in the global domain, that MID Server writes all the data it receives to the global domain and not to the correct domains.

---

**MID Server privileged commands**

To discover certain information on a host server, the MID Server must run SSH commands with higher privileges. The platform provides default privileged commands for the MID Server to use and the ability to add additional commands to the system.

An example of information that requires elevated privileges is information about storage disks on a host server, retrieved with the `fdisk -l` command. If your system cannot use `sudo` commands, you must configure the hosts in your network to use one of the other privileged commands. You can have different privileged commands set up for different hosts. However, Discovery supports only one privileged command per host.

**Important:** You can edit supported privileged commands, but do not delete them.

For a list of possible SSH commands requiring root privileges, see *[SSH credentials]*.
## SSH privileged escalation command requirements

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **sudo** | - Host must support the `sudo -S -p <password>` command and return the correct list of allowed SSH commands.  
- Credentials provided for Discovery must be able to run the command `sudo -S -p <password> <commands>`. |
| **pbrun** | - Host must support the `pbrun -v` command and return the correct version of PowerBroker.  
- Credentials provided for Discovery must be able to run `pbrun <commands>`.  
- Discovery does not support any other `pbrun` - options, such as a password prompt.  
- The instance must be able to reach the target host via SSH. |
| **pfexec** | - Host must support the `pfexec id -a` command and return the correct ID.  
- Credentials provided for Discovery must be able to run `pfexec <commands>`.  
- Discovery does not support any other `pfexec` - options, such as a password prompt. |
| **dzdo** | - Host must support the `dzdo -v` command and return the path to dzdo in standard output.  
- Credentials provided for Discovery must be able to run `dzdo <commands>`.  
- Discovery does not support any other `dzdo` - options, but Discovery supports password authentication for dzdo. |

## Long-running commands with sudo

Configure J2SSH and ServiceNow SSH to prevent long running commands using sudo from failing when the MID Server disconnects.

ServiceNow SSH allows probes to run sudo against individual commands or an entire, long-running script. This is also supported for the `pbrun` and `pfexec` privileged commands.

### Sudo for individual commands

You can run sudo against individual commands within a probe, but only if all the following sudoer configurations are performed on the target:

- The `!requiretty` option is required.
- Allow individual commands to be run by the user in the provided credential with `NOPASSWD` configured.
- The target specifies an individual sudo call in the command or referenced scripts. For example, set sudo as "`sudo fdisk -I`" or "`${sudo:fdisk -I}`" rather than "`must_sudo`" for the entire script.
Note: Running sudo against individual commands with ServiceNow SSH produces detailed and useful entries in the sudo logs on the target computer.

Running sudo on an entire script

If any of the required sudoer configuration requirements for individual commands is not in place, Discovery applies sudo to the initial and complete probes, and does not execute sudo remotely inside the command. This condition can be forced by setting `must_sudo` on the probe and eliminating any sudo commands within the probe.

This approach prevents long running commands from failing when the probe disconnects, but cannot specify individual commands in the sudoers configuration.

Logging

The logs from ServiceNow SSH sudo activity run against an entire script show cryptic entries, such as `/tmp/.run.aef13123fe124123`, which prevent administrators from controlling permissible commands and knowing the exact command that was run. Sudo run against individual commands produces more detailed log entries, such as `/sbin/fdisk -l`.

Add a new privileged command for use by the MID Server

Add a new privileged command to the Privileged Command `[privileged_command]` table that is available to your MID Servers.

Role required: admin

Important: Do not delete any of the supported commands.

1. Navigate to MID Server > Privileged Command and click New.
2. Complete these fields:
   - Command: The name of the privileged command.
   - Password Prompt: The password prompt displayed to the user for this privileged command, or a regular expression that matches this password prompt. If this field is empty, no password is required for this privileged command, and no prompt is displayed. SUDO commands do not require a password prompt.
3. Click Submit.

Configure the MID Server to use specific privileged commands

You can configure the MID Server to use specific commands in a defined order.

Role required: admin

1. Navigate to the list of MID Servers using one of the following paths:
   - MID Server > Servers
   - Discovery > MID Servers
   - Orchestration > MID Servers
2. Select the MID Server you want to configure.
3. Click the menu icon in the header bar and select View > Advanced from the context menu.
4. In the Privileged Command related list, click Edit.
5. Select the command you want this MID Server to use and click Save.

The default order of privileged commands is 100, but you can change the order as necessary. The privileged command with the smallest order number is tried first.
Create a pbrun profile privileged command

You can create a special configuration for the pbrun privileged command that allows it to run as a profile.

Role required: discovery_admin, admin

Of all the privileged commands, only the pbrun command can be configured to run as a profile, and only one of these special pbrun configurations can function on a MID Server.

Important: Edit the existing pbrun record for this purpose. The system ignores any additional commands you create for pbrun.

1. Navigate to MID Server > Privileged Command.
2. Select pbrun from the list.
3. In the Privileged Command record, edit the value in the Command field to use the format pbrun -u <profile>.
   For example, you can set pbrun -u admin as a command to run with an admin profile.
4. Click Update.

Map an IP address to a DNS name

Associate the IP address to a DNS name to ensure the appropriate MID Server is selected. The IP Address range configuration determines which MID Server is selected. If the MID Server manages resources within defined IP ranges, all host servers must have their DNS names mapped to an IP address.

Role required: admin

The association of an IP address to a DNS name ensures that the appropriate MID Sever is selected based on the IP Address range configuration. If this is not done, Orchestration reverts to the default MID Server.
If Discovery cannot discover the server and resolve the DNS name to an IP address, you must create the mapping manually.

**Important:** The platform does not map `localhost` to 127.0.0.1 automatically. You must create that mapping using this procedure.

1. Enter `cmdb_ci_dns_name.list` in the navigation filter.
   A list of DNS names appears.
2. Check the list for your host server.
   If the server does not appear in the list, continue with this procedure.
3. Click **New**.
4. Enter the fully-qualified domain name (FQDN) of the host server in the **Name** field.
5. Right-click in the form header and select **Save** from the context menu.
6. In the **IP Address** related list, click **New**.
7. In the **IP Address** field, enter the IP address of your host server.
8. In the **Nic** field, select `eth0` or your preferred network interface controller.
9. Leave the **Netmask** field blank.
10. Click **Submit**.

**MID Server security and encryption**

After configuring your MID Server, you can add security by encrypting MID Server parameter values in the `config.xml` file. Encryption protects data that the MID Server returns to the ECC Queue. Other available security options include the authorization of SOAP requests, restricting access to the MID Server configuration file, and establishing secure socket layer (SSL) connections.

**How MID Server password encryption works**

The **username** and **password** are initially set in the `config.xml` file on the MID server. When the MID server retrieves the credentials, it replaces the clear-text password with an encrypted password automatically, using an AES128 encryption algorithm. The MID server also maintains an encryption key that is generated each time it starts and remains in memory and not on the hard disk. When credentials need to be sent from the instance to the MID server, the following process takes place:

1. The instance retrieves the encrypted **password** and the unencrypted **username** from the instance database table.
2. The instance decrypts the encrypted **password**, and then re-encrypts it using the MID server encryption key.
3. The **username** and re-encrypted **password** are sent to the MID Server through the encrypted TLS session was already established between the MID server and the instance.
4. The MID server receives the credentials and decrypts the **password** in memory before using the credentials for remote operations. At no point is the credential password stored on the disk in an unencrypted format.

**MID Server encryption keypairs**

Automation credentials are secured by encrypting them in the instance with the MID Server’s trusted public key prior to transmission. When the MID Server is created, it generates a keypair, consisting of a public and private key. After the MID Server is validated, it can use the private key to decrypt automation credentials. You should occasionally rekey the MID Server to meet your organizations security requirements. See **Rekey a MID Server** for instructions.
SSL certificates

You can add certificates to the MID Server if you want communication to occur over SSL. You can add these certificates to the `cacerts` keystore file:

- Signing Certificate Authority (CA) certificate
- MID Server certificate

See [Add SSL certificates for the MID Server](#) for instructions.

**Note:** The MID Server does not support SSL when importing data from an integration, such as an LDAP server.

Basic authentication credentials and SOAP requests

You can enforce basic authentication on each request. The MID Server is not able to communicate through a proxy server if the proxy server supports only NTLM authentication. You can use basic authentication with a proxy server or create an exception for the MID server host.

Supplying basic authentication information, regardless of whether it is required, has an added advantage. The web service invocation creates or updates data using the supplied credentials. For example, when you create an incident record, the journal fields have the user id of the basic authenticated user instead of the default Guest user. This behavior allows you to identify data added by a specific MID Server.

You can set basic authentication credentials for SOAP requests. See [Require basic authorization for incoming SOAP requests](#) for instructions. Each SOAP request contains an Authorization header as specified in the Basic Authentication protocol.

**Note:** The setting for enforcing strict security controls how the instance uses the credentials you provide for the MID Server. When the setting is enabled, you must provide a user ID with access to the tables the MID Server is trying to access. When the setting is disabled, any valid user ID allows the MID Server to access to all tables.

Encrypt or decrypt MID Server configuration file values

The value of any MID Server parameter in the `config.xml` file can be encrypted. The attributes for all encrypted values are managed from within the configuration file, including the security attribute of the login password.

**Role required:** admin

1. Navigate to the `agent` directory that was created when the MID Server was installed and open the `config.xml` file using a text editor such as WordPad.
2. Locate or add the parameter you want to encrypt.
   For example, you might want to protect your proxy server passwords by configuring this parameter:
   
   `<parameter name="mid.proxy.password" value="securepassw0rd"/>
   
   3. Add the encryption attribute `secure="true"`:
   
   `<parameter name="mid.proxy.password" secure="true" value="securepassw0rd"/>
   
   4. Restart the MID Server.
5. Open the `config.xml` file
The encrypted password appears as follows:

```xml
<parameter name="mid.proxy.password" secure="true" value="encrypted:rhrfUNYRzZAI8/BkTtZmNA=="/>
```

6. To decrypt this or any other value in the config.xml file and allow the value to appear in clear text:
   a) Stop the MID Server.
   b) Set the `secure="true"` attribute to `false`.
   c) Replace the encrypted value with the clear text value.
   d) Restart the MID Server.

**ECC queue data encryption with the automation API**

The automation API encrypts sensitive probe data that is sent from an instance to the MID Server through the ECC Queue.

You can use the automation API to encrypt data that you send from a custom application to the ECC queue and prevent that data from appearing in clear text. For example, you can encrypt a password used by a MID Server to authenticate on a REST endpoint.

**Methods**

The API provides these methods:

- `encrypt()`
- `isEncrypted()`

The following example shows how you might call these methods:

```javascript
var automation_api = new sn_automation.AutomationAPI();
var password = 'xyz';
var encrypted_password;
if (automation_api.isEncrypted(password))
    encrypted_password = password;
else
    encrypted_password = automation_api.encrypt(password);
```

The `encrypted_password` value can then be passed safely to the ECC Queue and on to the desired MID Server.

**MID Server configuration file security**

Sensitive MID Server configuration data can be protected using several different schemes, including internal and external data encryption and external data storage.

The MID Server provides the following built-in security options for content in the config.xml file:

- **Default security provider**: Secures the data in the config.xml file by encryption. When the MID Server is restarted, any unencrypted data is encrypted and written to the config.xml file. The default security provider offers these encryption options:
  - **Default encryptor**: Default process for encrypting data in the MID Server config.xml file. See Encrypt or decrypt MID Server configuration file values for details.
  - **Windows Data Protection API (DPAPI)**: The operating system performs the data encryption, rather than the MID Server. DPAPI encryption is based on the logged in user's account. When this scheme is used, the data can only be decrypted by the same user account. If the account changes, the data must be re-encrypted.
- **Custom encryption**: Implement the `IMidServerEncrypter interface` to create your own custom encryption scheme to manage sensitive `config.xml` data.

- **CyberArk**: Data security is provided by CyberArk's Privileged Account Security system, which moves sensitive data from the `config.xml` file to a secure CyberArk vault. This solution does not encrypt the data.

- **Custom external storage**: Implement the `ISecuredConfigProvider interface` to create your own custom external storage system to manage sensitive `config.xml` data.

---

**Secured content and encryption schemes**

*Encrypt MID Server configuration data with DPAPI*

Windows Data Protection API (DPAPI) encrypts sensitive data from the `config.xml` file, based on the MID Server user account.

Role required: admin

DPAPI encryption provides another level of security for data such as credentials, IP addresses, and URLs in the MID Server `config.xml` file. The operating system performs the data encryption, rather than the MID Server. DPAPI...
encryption is based on the logged in user's account. When this scheme is used, the data can only be decrypted by the same user account. If the account changes, the data must be re-encrypted.

1. Open the `config.xml` file in a text editor.

   This file is located in the `/agent` folder in your MID Server installation path.

2. Enable this parameter and value:

   ```xml
   <parameter name="mid.secure_encrypter" value="com.service_now.mid.services.config.WindowsDPAPIEncrypter"/>
   ```

3. Save the configuration file.

4. Restart the MID Server.

   Any values in clear text in the `config.xml` file are encrypted by the operating system.

5. Follow this procedure if you need to change the MID Server user account that is used for encryption.

   a) Stop the MID Server service.

   b) Open the `config.xml` file in a text editor.

      This file is located in the `/agent` folder in your MID Server installation path.

   c) Re-enter all the encrypted values in clear text.

   d) Make the changes to the MID Server user account in the ServiceNow® instance.

   e) Restart the MID Server service.

      The data is re-encrypted by the operating system, based the new MID Server user account.

Use CyberArk as a secure configuration provider

You can use a CyberArk vault to secure any sensitive data from the MID Server `config.xml` file.

Role required: admin

CyberArk is commonly used to secure credentials in its external vault. However, a MID Server parameter in the `config.xml` file enables you to store other types of data in CyberArk.

1. Open the `config.xml` file in a text editor.

   This file is located in the `/agent` folder in your MID Server installation path.

2. Enable this parameter and value:

   ```xml
   <parameter name="mid.secure_config.provider" value="com.service_now.mid.services.config.CyberArkSecuredConfigProvider"/>
   ```

3. Configure specific data to secure in the CyberArk vault, as shown in these examples.

   a) Secure the MID Server credentials by setting this parameter to match the ID and Type for that data in your CyberArk configuration.

      ```xml
      <parameter name="mid.instance.username" secure="true" value="cyberark:id=<CyberArk ID>, type=<CyberArk type>"/>
      <parameter name="mid.instance.password" secure="true" value="cyberark:id=<CyberArk ID>, type=<CyberArk type>"/>
      ```

   b) Secure the URL of the instance by setting this parameter to match the ID and Type for that data in your CyberArk configuration.

      ```xml
      <parameter name="url" secure="true" value="cyberark:id=<CyberArk ID>, type=<CyberArk type>"/>
      ```

4. Save the configuration file.

5. Restart the MID Server.
Change MID Server configuration file security schemes

The MID Server provides several schemes for securing sensitive data in the `config.xml` file and allows you to switch between these options to suit your security requirements.

Role required: admin

1. Stop the MID Server service.
2. Open the `config.xml` file in a text editor.
   - This file is located in the `/agent` folder in your MID Server installation path.
3. Re-enter all the encrypted values in clear text.
4. Disable the previous security scheme and configure the MID Server to use the new provider.
5. Restart the MID Server service.
   - The data is re-secured or encrypted, based on the security scheme you have selected.

MID Server `ISecuredConfigProvider` interface

Use the methods in this interface to create custom providers that manage secured parameter values in the MID Server `config.xml` file.

**Note:** These methods are contained in the `snc-automation-api.jar` file, located in the MID Server installation folder.

### initialize

This method initializes the provider with additional configuration parameters and does not return a value.

**Example**

```java
void initialize(java.util.Properties properties, 
                IMidServerEncrypter encrypter) 
           throws java.lang.Exception
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>Initialization properties.</td>
</tr>
<tr>
<td>encrypter</td>
<td>Encrypter to use if the provider is encryption based.</td>
</tr>
</tbody>
</table>

**Exception**

`java.lang.Exception`

### isParameterValueSecured

This method checks to see if the parameter value has been secured or not. This method returns a `boolean` type value.
Example

```java
boolean isParameterValueSecured(java.lang.String paramValue)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>paramValue</td>
<td>The parameter value.</td>
</tr>
</tbody>
</table>

Returns

The parameter returns `true` if the parameter value is secured.

secureParameterValue

This method secures the parameter value if it has not been secured. This method returns a `string` type value.

Example

```java
java.lang.String secureParameterValue(java.lang.String unsecuredParameterValue) throws java.lang.Exception
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unsecuredParameterValue</td>
<td>The unsecured parameter value.</td>
</tr>
</tbody>
</table>

Returns

This method returns the unsecured parameter value.

Exception

```java
java.lang.Exception
```

unsecuredParameterValue

This method returns the unsecured value of the parameter. This method returns a `string` type value.
Example

```java
java.lang.String unsecuredParameterValue(java.lang.String parameterName)
    throws java.lang.Exception
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameterName</td>
<td>The parameter name.</td>
</tr>
</tbody>
</table>

Returns

This parameter returns the unsecured value.

Exception

`java.lang.Exception`

**MID Server IMidServerEncrypter interface**

Use the methods in this interface to create a custom external encrypter for the MID Server `config.xml` file.

**Note:** These methods are contained in the `snc-automation-api.jar` file, located in the MID Server installation folder.

**initialize**

This method initializes the encrypter with additional configuration parameters and does not return a value.

Example

```java
void initialize(java.util.Properties properties)
    throws java.lang.Exception
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>Initialization properties.</td>
</tr>
</tbody>
</table>

Exception

`java.lang.Exception`
encrypt

This method encrypts the unencrypted data and returns a byte[ ] type value.

Example

```java
byte[] encrypt(byte[] unencryptedData)
  throws java.lang.Exception
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unencryptedData</td>
<td>The data unencrypted.</td>
</tr>
</tbody>
</table>

Returns

Encrypted data

Exception

java.lang.Exception

decrypt

This method decrypts encrypted data and returns a byte[ ] type value.

Example

```java
byte[] decrypt(byte[] encryptedData)
  throws java.lang.Exception
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>encryptedData</td>
<td>The data decrypted.</td>
</tr>
</tbody>
</table>

Returns

Decrypted data.
Rekey a MID Server

Rekeying a MID Server forces it to restart and generate a new private key. Typically, this is only necessary if the MID Server keystore is compromised.

Role required: admin

When the MID Server comes back online, the system automatically validates the new key, and the MID Server resumes processing automation tasks.

1. Navigate to MID Server > Servers.
2. Open the MID Server whose keypairs you want to rotate.

Add SSL certificates for the MID Server

Configure the MID Server to connect to a source over SSL.

Role required: admin

You can add certificates to the MID Server if you want communication to occur over SSL. You can add these certificates to the cacerts keystore file:

- Signing Certificate Authority (CA) certificate
- MID Server certificate

1. Open a command prompt and navigate to the folder containing the JRE keytool.
   This is the location of the JRE you installed. An example path might be: C:\Program Files\Java\jre1.8.0_161\bin
2. Import a certificate into the MID Server's cacerts keystore, using this command:
   keytool -import -alias <certificate alias> -file "<path to certificate>" -keystore "<path to the JRE>\lib\security\cacerts"
   For example, you might enter: keytool -import -alias MyCA -file "C:\myca.cer" -keystore "C:\Program Files\Java\jre1.8.0_161\lib\security\cacerts"

   Note: The keytool prompts you for a certificate password. If the certificate is for a CA, the keytool also asks whether to trust the certificate authority. To add a certificate to an instance, see Upload a certificate to an instance.

Require basic authorization for incoming SOAP requests

For added security, you can enforce basic authentication on each incoming SOAP request to the MID Server.

Role required: admin

1. Navigate to System Properties > Web Services.
2. Select the check box for Require basic authorization for incoming SOAP requests.
3. Click Save.
4. To provide basic authentication credentials for a MID Server, navigate to C:\Program Files\ServiceNow\<MID Server name>\agent and edit the config.xml file, as follows:
   a) Find the element <parameter name="mid.instance.username" value=""/> and enter the instance administrator user name as the value.
Configure WinRM trusted hosts on MID Server

In environments using Windows Remote Management (WinRM), Discovery or Service Mapping can discover servers using the WinRM protocol. Add servers, which are part of WinRM, as trusted hosts on all MID Servers that Discovery or Service Mapping use for discovery.

Role required: mid_admin

MID Server cannot access servers using the WinRM protocol unless these servers are configured as trusted hosts for this MID Server.

Perform this procedure on each MID Server used by Service Mapping or Discovery.

1. On the MID Server, open the command-line shell.
2. To add all servers to the TrustedHosts lists, run the following command:
   ```
   winrm s winrm/config/client @{TrustedHosts="*"}
   ```
3. To add specific servers to the TrustedHosts list, run the command with the comma-separated hosts instead of the asterisk (*), for example:
   ```
   winrm s winrm/config/client @{TrustedHosts="serverA,serverB,serverC"}
   ```

Advanced MID Server configuration

There are several advanced options available for you to customize and configure the MID Server.

Install and uninstall Nmap on a MID Server

If you decide to use credential-less Discovery in your network, you must install Nmap on each Windows MID Server that you want to use for this purpose. Self-hosted customers whose network security does not permit downloads from install.service-now.com must use a specific manual process to install and configure Nmap.

- Assign MID Server IP ranges to all deployed MID Servers. The quickest and most reliable way to do this is with the MID Server IP range auto-assignment feature available in the Discovery Quick Start wizard. This method ensures that the set of MID Servers configured to access an IP address range is comprehensive.
- Identify the IP ranges you want to explore with credential-less Discovery. Ensure that these ranges can only be accessed by MID Servers with Nmap installed, running on supported Windows hosts.
- Use the All option for selecting IP ranges and observe these requirements:
  - Restrict the use of this feature to Windows MID Servers only.
  - Ensure that Nmap is installed on each of these MID Servers.
  - Ensure that the MID Servers can access the entire customer network.
- When you create a Discovery schedule with Nmap enabled, observe these requirements for the MID Server selection options:
  - **Specific MID Cluster**: Verify that Nmap is installed on all MID Servers in the cluster, where each MID Server in the cluster is configured to access the same set of IP ranges.
  - **Auto-Select Mid Server**: When running horizontal Discovery, verify that Nmap is installed on at least one of the MID Servers that can access the Discovery schedule’s configured MID Server IP ranges.
**Specific MID Server:** Verify that Nmap is installed on each MID Server that can access the schedule’s configured MID Server IP Ranges.

*Note:* To use credential-less Discovery for Service Mapping, install Nmap on all MID Servers that can access the Discovery schedule’s configured MID Server IP ranges.

• The Nmap installer download process has changed for new instances in the London release. Access to install.service-now.com is no longer required for the MID Server host machines on which Nmap is installed. When you request Nmap for a MID Server, the download is performed by the instance, not the MID Server host. This change does not require any additional configuration. Customer instances within a ServiceNow® datacenter have access to install.service-now.com automatically.

**Role required: agent_admin**

The Discovery - IP Based [com.snc.discovery.ip_based] plugin provides connection to the installer for Nmap and the programming elements that allow a Windows MID Server to run approved scripts on target CIs for credential-less Discovery. MID Servers on which Nmap is installed can execute an Nmap command configured to perform reverse DNS name resolution, discover MAC addresses, or gather OS information on target CIs without using credentials. The Discovery - IP Based plugin is activated automatically when the Discovery [com.snc.discovery] or Event Management and Service Mapping Core [com.snc.service-watch] plugins are activated.

**Service Mapping and Nmap**

Service Mapping does not check for the presence of the Nmap capability and selects the MID Server based on the IP address only. To ensure that Service Mapping does not select a MID Server without the Nmap capability, install Nmap on all MID Servers assigned to the IP address ranges for which you want credential-less Discovery to be available. If Service Mapping selects a MID Server for credential-less Discovery that does not have Nmap capabilities, this error message appears in the map at the site of the CI being discovered: Nmap is not installed on MID Server. Verify all MIDs configured to handle selected IP Address have Nmap Capability. Nmap root directory path does not exist: <path>

**Amazon Web Service AWS**

Running Nmap scans to or from any resource within the Amazon Web Service AWS environment is tightly regulated and requires the permission of AWS through the AWS Vulnerability/Penetration Testing Request form. AWS only permits testing of EC2 and RDS instances that you own. Tests against any other AWS services or AWS-owned resources are prohibited. In addition, any Nmap scan of a permitted instance must be performed within an approved time window. For these reasons, credential-less Discovery within an AWS environment is not appropriate, and if a violation of their policy occurs, could result in expulsion from the service.

**Supported operating systems**

Nmap is supported on all editions of these operating systems, including virtual machines and 64 bit systems:

• Windows 2008
• Windows 2012
• Windows 2016

**MID Server requirements**

Nmap can be installed on MID Servers that meet these requirements:

• Status is Up.
• MID Server is validated.
• MID Server does not already have the Nmap capability.

**Warning:** The MID Server installation path must not contain the following characters:
The Nmap installer replaces these characters with spaces. This prevents the installer from finding the correct path, and the installation fails. An example of a path that will fail is C:\MIDServers MID(1)\agent.

1. Navigate to MID Server > Servers.
2. Open the desired MID Server record.
3. Under Related Links, select Enable Credential-less Discovery. A confirmation dialog box appears.

4. Click Yes to continue with the installation.

The instance runs the Nmap installer from https://install.service-now.com, a site within a ServiceNow datacenter that contains installers for the platform. This progress notice appears during installation:

The Logs tab in the MID Server record shows the message: Running system command: installNmap.

5. Click OK if you want to hide the dialog box while the installer continues to run in the background.

Installing Nmap also installs Npcap on the host, if it is not already installed. Npcap is Nmap's packet capture library for Windows that allows Nmap to perform port scans quickly and to identify the family of the operating system running on the target. Npcap is installed once on the host and can be used by any other application that requires it, such as Wireshark.
Note: If a more recent version of Npcap is already installed on the Windows MID Server host, Nmap is installed without Npcap. If an older version of Npcap is installed on the host, the Nmap installer upgrades it to the newer version.

The installation process has either of these outcomes:

- **Success**: These conditions indicate a successful installation:
  - The version of Nmap that is installed appears in the **Nmap version** field in the MID Server record
  - The **Related Link** changes to Disable Credential-less Discovery.
  - The **Nmap** capability is assigned to the MID Server and appears in the **Capabilities** tab of the MID Server record.

- **Failure**: If the installation fails, an error message is logged to the **MID Server Issue [ecc_agent_issue]** table. If you run the installer again with success, the issue is marked as **Resolved**.

6. To uninstall Nmap for a selected MID Server, select **Disable Credential-less Discovery** under Related Links in the MID Server record.

   This dialog appears during the uninstallation process:

   ![Disable Credential-less Discovery](image)

   The **Logs** tab in the MID Server record shows the message: Running system command: uninstallNmap.

   **Attention**: Because Npcap can be used by other applications, uninstalling Nmap does not automatically uninstall Npcap. You must uninstall Npcap manually, after determining that no other dependencies exist.

### Install Nmap on a self-hosted system

Use this procedure to install Nmap on MID Server host machines in a self-hosted environment that does not allow network access to the ServiceNow® install.service-now.com download site.

Role required: admin, maint

You must install Nmap manually on each MID Server host, and then configure the instance to execute credential-less Discovery.

Note: This procedure does not apply to self-hosted customers whose instance can access install.service-now.com from within their network.

1. Navigate to **MID Server > Properties** (MID Server Property [ecc_agent_property] table) and open the record for the **mid.nmap.version** property.

   This property contains the version of Nmap that you must install. Record the version number.

2. Download the correct installer executable from one of these URLs:
   - https://nmap.org/dist/: If the Nmap version in the property is 7.50, the executable you need is https://nmap.org/dist/nmap-7.50-setup.exe.
3. Create a folder called `nmap` in the MID Server agent folder of every MID Server you want to use for credential-less Discovery.

4. Copy the Nmap installer file that you downloaded to the `nmap` folder and rename it to `nmapInstaller.exe`.

5. Run the `agent\scripts\PowerShell\NmapInstallation.ps1` script and pass it the following parameters in the order in which they appear.

   This script runs the `nmapInstaller.exe` file.
1. **$operation**: Task that NmapInstallations.ps1 will process. To install Nmap, the task is `install`.

2. **$nmap_root_path**: Complete path for the `nmap` folder that you create in step 4.

3. **$nmap_self_installer**: Complete path for `nmapInstaller.exe` file that you copied in step 5.

4. **$nmap_command**: Complete path for the Nmap install command. The NmapInstallations.ps1 script installs Nmap in the `nmap` folder created in step 4. This parameter is `$nmap_root_path\nmap.exe`.

5. **$nmap_uninstall_command**: Complete path for the Nmap uninstall command. This command is `$nmap_root_path\Uninstall.exe`.

6. **$nmap_npcap_version**: The Npcap version installed with Nmap. This value must be the same as the value of the `mid.nmap.npcap.version` property in the MID Server Property [ecc_agent_property] table.

7. **$nmap_safe_scripts**: List of safe scripts that Nmap uses. You can retrieve this list from the `mid.nmap.safe.scripts` property in the MID Server Property [ecc_agent_property] table.

6. Set up the parameters in the NmapInstallation.ps1 script in this order:

   ```
   .\NmapInstallations.ps1 $operation $nmap_root_path $nmap_self_installer $nmap_command $nmap_uninstall_command $nmap_npcap_version $nmap_safe_scripts
   ```

   For example, the script might look like this:

   ```
   PS C:\MidServers\mid1\agent\scripts\PowerShell> .\NmapInstallations.ps1 "install" "C:\MidServers\mid1\agent\nmap" "C:\MidServers\mid1\agent\nmap\nmapInstaller.exe" "C:\MidServers\mid1\agent\nmap\nmap.exe" "C:\MidServers\mid1\agent\nmap\Uninstall.exe" "0.91" "allseeingeye-info.nse,amqp-info.nse,db2-das-info.nse,drda-info.nse,freelancer-info.nse,ike-version.nse,mcafee-epo-agent.nse,mqtt-subscribe.nse,openlookup-info.nse,oracle-tns-version.nse,quakel-info.nse,quake3-info.nse,rfc868-time.nse,rpcinfo.nse,snmp-info.nse,ventrilo-info.nse,weblogic-t3-info.nse,xmpp-info.nse"
   ```

7. After installation is complete, add the Nmap capability to each MID Server you want to use for credential-less Discovery.

   **Attention**: Only a maint user can add the Nmap capability to a MID Server. Contact ServiceNow Technical Support to request temporary maint access to your instance.

   a) On the instance, open the maint record.
   b) Select the Capabilities related list.
c) Click **Edit**.
d) Select **Nmap** from the list of available capabilities and click **Save**.

![Image](image-url)

**Uninstall Nmap on a self-hosted system**

Use this procedure to uninstall Nmap in a self-hosted environment that does not allow network access to the ServiceNow `install.service-now.com` download site.

Role required: admin, maint

Nmap must be manually uninstalled from each MID Server host machine and then disabled on the ServiceNow instance.

1. Run **Uninstall.exe** in the `nmap` folder on each MID Server host configured for credential-less Discovery.
2. After uninstallation is complete, delete the `nmap` folder from the `agent` folder.
3. Remove the **Nmap** capability from each MID Server record.

**Attention:** Only a maint user can remove the **Nmap** capability from a MID Server. Contact ServiceNow Technical Support to request temporary maint access to your instance.

a) On the instance, open the MID Server record.
b) Select the **Capabilities** related list.
c) Click **Edit**.
d) Remove **Nmap** from the active capabilities list and click **Save**.

**Enable script file synchronization for Windows enhanced security**

Windows Internet Explorer enhanced security blocks downloaded files that it determines are potentially dangerous.

Enhanced security in Windows browsers, such as Internet Explorer, blocks downloaded files that it determines are potentially dangerous. This would block files downloaded for use by the MID Server. You would need to unblock each file manually through the browser.

To get around this issue, use file synchronization. File synchronization requires you to proactively take script files from your instance and save them on the MID Server. The files on the instance and the MID server stay synchronized, but there is no longer any need for the MID Server to download the whole file. File synchronization also protects any updates you make in those script files from being overwritten during the upgrade of an instance.
Script files synchronized with the MID Server are stored on the instance in the MID Server Script File table, which you can access in the MID Server > Script Files module.

When the MID Server first connects to the instance, the instance creates a directory called \scripts in the MID Server root. The instance then creates a parent directory in the path \scripts\<parent name> using definitions from the ecc_agent_script_file table. Finally, the instance creates the script files themselves inside the parent directory using the records from the ecc_agent_script_file table.

The record for the parent directory looks like this:

![Parent Directory Record](image)

The instance creates each script file in the parent directory on the MID Server using the record Name from the ecc_agent_script_file table as the file name and the Script field payload as the file contents. A script file record looks like this:

![Script File Record](image)
The synchronization of the script file continues to work as if the script was manually added to the form.

See Attach a script file to a MID Server for instructions on how to attach a script file.

**Note:** The MID Server Script File [ecc_agent_script_file] table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see Set up domain separation for MID servers.

---

### Attach a script file to a MID Server

You can attach a script file to synchronize to a connected MID Server, to enable using the script file attachment.

Role required: **admin**

You can attach multiple files, but the last attached file gets synchronized to the MID Server. If you delete the attachment, the script file becomes inactive, and the synchronized file is deleted from MID Server.

1. Navigate to **MID Server > Script Files**.
2. Open the file to which you would like to attach the script file, or click **New** to create a new file.
3. Select **Use attachment**, and then click the paperclip icon to add the attachment.

**Note:** When **Use attachment** is checked, an attached script file overrides the script contained in the **Script** field. If this check box is cleared, the script in the **Script** field is used instead of the attachment.
The script file attachment name must match the MID Server script file name, since the record can contain other attachments.

4. Click Update to initiate the synchronization process. Ensure that the file name matches the script name.

**Note:** If you receive the error message: *File type not permitted or mime type does not match the file content*, request that your administrator turn off mime type validation on attachments. The system property `glide.security.file.mime_type.validation` controls this setting.

Configure a MID Server for RCA for business services

To enable the Event Management root cause analysis (RCA) for business services capability, configure at least one dedicated MID Server with the ServiceAnalytics as a supported application, and with the RCA capability. To ensure uninterrupted services, you can configure a failover MID Server cluster for RCA.

If the Domain Support - Domain Extensions Installer plugin is activated, then you can configure a dedicated MID Server with the RCA for business services capability per domain. In this case, RCA for a business service is done on the MID Server that is in the same domain as the business service. Otherwise, a MID Server from the global domain is used.

**Hardware requirements**

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Memory</td>
<td>• Minimum: 4 GB&lt;br&gt;• Recommended: 8 GB</td>
</tr>
<tr>
<td>Processor</td>
<td>• Minimum: Either of the following:&lt;br&gt;• Core 2+&lt;br&gt;• Xeon processor with a speed over 2 GHz&lt;br&gt;• Recommended: Quad-core</td>
</tr>
<tr>
<td>Disk space (for 100 discovered services)</td>
<td>• Minimum: 8 GB&lt;br&gt;• Recommended: 10 GB</td>
</tr>
</tbody>
</table>

**Software requirements**

<table>
<thead>
<tr>
<th>OS</th>
<th>Supported OS versions</th>
<th>Additional requirements</th>
</tr>
</thead>
</table>
Role required: admin

The RCA for business services MID Server supports the Event Management RCA for business services process by hosting the RCA Learner and the real-time RCA query handler. On the RCA for business services MID Server, the system builds models that support responses to root cause queries. The learner data on the RCA for business services MID Server persists by default for a maximum of 90 days.

By default, the MID Server is set up as a dedicated MID Server for Event Management RCA for business services, and an attempt to add additional supported applications to the same MID Server is prevented. You should implement Operational Intelligence with its own dedicated Operational Intelligence MID Server. This ensures a high level of performance. However, if needed, you can modify this default behavior and configure the RCA for business services MID Server or the Operational Intelligence MID Server with additional supported applications. For information about modifying the behavior of the ALL option when selecting supported applications, see Select applications to include in the definition of ALL for a MID Server.

1. Ensure that the MID Server is validated.
   For more information, see Validate the MID Server.
2. Navigate to MID Server > Servers.
3. Double-click the MID Server that you want to configure as an RCA for business services MID Server.
4. Add the ServiceAnalytics application:
   a) At the center of the MID Server form, click Supported Applications.
   b) In the Supported Applications section click Edit.
   c) In the slushbucket select ServiceAnalytics and click the > add button.
   d) click Save.

If the MID Server needs to support ServiceAnalytics as well as one or more other applications, you can modify the definition of the ALL option to include these applications, and then select ALL in the slushbucket. ALL is the only option to which it is valid to add the ServiceAnalytics option. Performance might be compromised with these settings.

5. Add the RCA capability:
   a) At the center of the MID Server form, click Capabilities.
   b) In the Capabilities section click Edit.
   c) In the slushbucket select RCA and click the ’>’ add button.
   d) click Save.
6. Click Update.

The RCA for business services MID Server is automatically configured with a Discovery IP range set to 0.0.0.0-0.0.0.0.

Create a failover cluster for RCA. In this cluster, add the MID Servers that were configured for RCA for business services. For more information, see Configure a MID Server cluster.
**MIDSystem methods**

MIDSystem variables (referred to by the variable name ms.) provide a variety of methods to get information about the MID Server.

<table>
<thead>
<tr>
<th>Method summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log(String message)</td>
<td>Logs the given message with a standard prefix to indicate that the message was generated by JavaScript.</td>
</tr>
<tr>
<td>getConfigParameter(String parameter name)</td>
<td>Returns the value of the named configuration parameter.</td>
</tr>
<tr>
<td>include(String script include)</td>
<td>Include the MID Server script include with the given name into the current context.</td>
</tr>
<tr>
<td>getName()</td>
<td>Returns the name of the MID Server.</td>
</tr>
<tr>
<td>getSysID()</td>
<td>Returns the sys_id of the MID Server.</td>
</tr>
<tr>
<td>toJavaScript(Object)</td>
<td>Converts the given Java object into the equivalent JavaScript object.</td>
</tr>
</tbody>
</table>

This example writes a message to the log:

```javascript
ms.log('Attempting to log in with user: ' + this.getParameter('user'));
```

**Synchronize a JAR file to MID Servers**

You can upload a JAR file to an instance and synchronize it to all MID Servers, or write custom probes that use the synchronized JAR file.

Role required: admin, agent_admin

The MID Server JAR File [ecc_agent_jar] table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see [Set up domain separation for MID servers](#).

**Caution:** Synchronizing a JAR file with this procedure causes all MID Servers connected to the instance to restart automatically.

1. Navigate to MID Server > JAR Files.
2. Click New.
3. Complete the following fields:
   - **Name:** A unique and descriptive name for identifying the file in the instance.
   - **Version:** A version number for the file, if one is available.
   - **Source:** Location of the JAR file for reference purposes. Source information is not used by the system.
   - **Description:** Short description of the JAR file and its purpose in the instance.
4. Click the paper clip icon in the banner.
5. In the Attachments dialog box, click **Browse** and select the file you want to attach.

   The platform attaches the JAR file to the record and restarts the MID Servers to synchronize the file. It is not necessary to update the record to attach the file.

**Set the MID Server JVM memory size**

The MID Server starts with a default JVM memory allocation, but you can modify this setting in the configuration file.

Role required: admin

In the base ServiceNow system, the MID Server JVM memory is set to 1024MB, which is configured in the `\agent\conf\wrapper-override.conf` file in the MID Server installation directory. This setting might not be appropriate for the way your organization uses the MID Server. If you want the MID Server to work harder, allocate more resources to it. If the MID Server is located in a small branch office and runs in an environment where memory allocation is shared between a print server, mail server, or web proxy server, the allocation might have to be reduced.

![Attach a file](image)

**Note:** For a complete list of minimum MID Server requirements, see **MID Server system requirements.**

1. Open the `\ServiceNow\<MID Server name>\agent\conf\wrapper-override.conf` file in a text editor.

   For more information about this file, see **Installing Multiple MID Servers on a Single System.**

2. Locate the following lines in the file:

   ```
   # OPTIONAL: Maximum Java Heap Size (in MB)
   wrapper.java.maxmemory=1024
   ```

3. Edit the memory allocation.

4. Remove the comment tag (#) from the memory allocation parameter.

5. Save the file.

6. Restart the MID Server service.

**Set MID Server thread use**

The three parameters: `threads.interactive.max`, `threads.expedited.max`, and `threads.max` define the maximum numbers of worker threads that can run simultaneously in each pool. Change the number of threads used by the MID Server according to performance requirements. MID Servers which compete with other programs for CPU time can use
fewer threads than the default. MID Servers which need more speed, and have a host computer powerful enough, can use more threads.

Role required: admin

Changing the thread parameters can affect the MID Server performance. The interactive thread pool is designed for executing interactive messages including system commands and heartbeats. They are typically lightweight, so usually there is no need to change the default value. The expedited thread pool is designed for executing messages that have higher priority than the standard ones but less than interactive ones. Unless you have applications that produce a lot of expedited messages, there is no need to change the default value for threads.expedited.max. The standard thread pool is the busiest pool. Most probes are using it and they can take a lot of system resources such as CPU, memory, and so on. You can set the MID Server to use as few as five threads without issues. If the MID Server needs more speed, and the host is powerful enough or lightly loaded with other programs, raise the thread setting. The thread limit depends on the hardware and the operating system of the host. You might have to experiment to find the optimal value for your situation. The following general observations may be useful:

• PowerShell is resource intensive and threads may not scale linearly.
• Most MID Server tasks require file handles to do their job.
  • Windows: On the Windows operating system, file handles are available in a fixed quantity. If you configure too many MID Server threads on a Windows host, the MID Server can consume all the file handles before approaching maximum CPU usage. This situation appears as an Out of file handles error in the MID Server log and indicates that the MID Server is trying to use too many threads.
  • UNIX and Linux: UNIX and Linux hosts have a much different scheme for allocating file handles. Generally, you can increase MID Server thread use on these operating systems until the CPU of the host is overloaded. See your OS documentation for monitoring CPU usage.

• Each thread on the MID Server requires some memory. Exactly how much memory varies considerably from task to task and depends on the equipment being discovered. To increase the number of threads, you might have to increase the amount of memory that Java uses. If you configure insufficient memory, an Out of memory error appears in the MID Server log.
• You can set threads.max as high as 200, however, this setting may need to be changed depending on the OS. For example, Windows-based MID Servers running Discovery uses Powershell which is resource intensive. In this case, you may exhaust the CPU power of the host machine with just 50 threads count.

Follow the steps below to change the config.xml file. Alternatively, use the threads.max connection parameter.

1. Open the agent\config.xml file using any text editor.
2. Locate the following lines:

```xml
<!-- MID Server Threads --><parameter name="threads.max" value="25"/>
```

3. Edit the value. Keep in mind the cautions described above.
4. Save the record.
5. Restart the MID Server service.

**ECC queue retry policy**

Define retry policies for outbound Web Services that are executed via the ECC Queue table.

Retry policies specify a matching error condition for ECC Queue input records that are a result or response of an output queue record, the interval for retry, and the maximum number of retries. Because it matches on the input queue record, the retry policies only work when an input ECC Queue record is expected, and therefore requires that the outbound messages are queued on the ECC Queue table as well. Advanced matching criteria may be specified using script.
Retry activity

The retry activity records document each attempt to retry the output queue record.

When the current policy is being retried, the Status of the activity will indicate Retrying. When all retries are exhausted, e.g. the maximum number of retries have occurred and the output queue still failed, the Status field will indicate a Failed state. Otherwise, at anytime during the retry, if the request then becomes successful, it indicates Succeeded.

Queue Retry Activity

You may also display the current list of retry activities and their states by selecting the Queue Retry Activity module.
<table>
<thead>
<tr>
<th>Status</th>
<th>Retry Count</th>
<th>Input Queue</th>
<th>retry count</th>
<th>retry queue entry</th>
<th>policy</th>
<th>Created</th>
<th>Queue Retry Activities</th>
</tr>
</thead>
</table>

Queue Retry Activities

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Retry policy example

This retry policy defines the matching criteria when an UnknownHostException response is received during a SOAPClient (outbound SOAP message invocation) call.

Default Queue Retry Policy

The policy will only match if the Agent, Topic, ECC Name (matches the Name field), and Source fields match that of an input ECC queue record. Additionally, the Condition and Condition script criteria will also have to match "State == error" and the error_string field contains the text java.net.UnknownHostException.

When these conditions are met, and an input record is matched, it will retry the originating output queue record after 15 seconds, and for a maximum of 3 times.

The MID Server ECC Queue

The External Communication Channel (ECC) Queue is a connection point between an instance and the MID Server. Jobs that the MID Server needs to perform are saved in this queue until the MID Server is ready to handle them.

The MID Server subscribes to messages published by the Asynchronous Message Bus (AMB), which notifies the MID Server that it has pending tasks in the ECC Queue. If a job exists in the ECC Queue for that MID Server, the MID Server sets the status to "I'm working on it." When finished working on a requested job, the MID Server reports back to the ECC queue with the results.
You can access the ECC Queue by navigating any of these paths:

• **Discovery > Output and Artifacts > ECC Queue**
• **Discovery > Discovery Schedules > {schedule name} > {Discovery status record}**
• **ECC > Queue**
• **{Discovery Status record} > ECC Queue**

### ECC Queue fields

An ECC Queue provides the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Agent</strong></td>
<td>The name of the external system that this message is either from or to. If the message is from or to a MID Server, the agent name is in the form <code>mid.server.xxx</code>, where <code>xxx</code> is the name of a particular MID Server.</td>
</tr>
<tr>
<td><strong>Topic</strong></td>
<td>The name of the probe the MID server ran. If you are using a pattern for discovery, the <em>Horizontal Pattern probe</em> appears.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>The actual command the probe ran. For example, if <strong>Topic</strong> is SSHCommand, then the <strong>Name</strong> field contains the actual shell command to run. If you are using a pattern for discovery, the following appears: <em>Pattern Launcher</em>: followed by the name of the pattern and the multipage number.</td>
</tr>
<tr>
<td><strong>Source</strong></td>
<td>The IP address that the discovery is to run against. A few probes run against multiple IP addresses; in those cases, this field contains a human-readable description.</td>
</tr>
<tr>
<td><strong>Response to</strong></td>
<td>This optional field contains a reference (sys_id) to the ECC Queue message that this message is in response to. Discovery makes extensive use of this field to track the hierarchy of messages that result from a given scheduled Discovery. Click the record icon for the value in this field to open the ECC Queue record for the activity that spawned the current probe or sensor record.</td>
</tr>
<tr>
<td><strong>Queue</strong></td>
<td>An indicator of whether this message was an input message or an output message.</td>
</tr>
<tr>
<td><strong>State</strong></td>
<td>The state of the current ECC queue record. States update automatically.</td>
</tr>
<tr>
<td><strong>Processed</strong></td>
<td>The time when this message was processed.</td>
</tr>
<tr>
<td><strong>Created</strong></td>
<td>The time when this message was created.</td>
</tr>
<tr>
<td><strong>Sequence</strong></td>
<td>The unique sequence number for this message. This value is automatically generated when an ECC Queue record is inserted. Its use is deprecated.</td>
</tr>
<tr>
<td><strong>Error string</strong></td>
<td>An error message, if an error occurred during processing. This field is hidden on the standard form unless there was an error.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>--------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Payload</td>
<td>The body of the message in XML format. The returned XML has a root tag of <code>&lt;results&gt;</code> containing one or more <code>&lt;result&gt;</code> tags and a single <code>&lt;parameters&gt;</code> tag. The parameters are simply an echo of those sent to the MID server in the probe; they vary from probe to probe, but in general they tell the probe the details of what it is to do and how it should behave. The result tags are the most interesting ones: they contain the actual data generated by the probe.</td>
</tr>
</tbody>
</table>

**ECC queue controls**

The ECC Queue form contains these related links:

<table>
<thead>
<tr>
<th>Related link</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run again</td>
<td>Runs the probe again. You can re-run probes when you encounter a failed discovery or other unexpected results.</td>
</tr>
<tr>
<td>Go to CMDB item</td>
<td>Open the CI record for the CI that was updated during the discovery.</td>
</tr>
<tr>
<td>Go to Sensor</td>
<td>Open the record for the associated sensor.</td>
</tr>
</tbody>
</table>

**Manage ECC Queue content for a MID Server**

The ECC Queue allows you to create ECC Queue messages, access MID Server log entries, and retrieve statistics from an individual MID Server record.

Role required: admin, mid_server

1. Send remote commands through a MID Server to a hosting device directly from the ECC Queue without running Discovery.
   a) Navigate to the ECC Queue and click New.
   b) Create a message with these settings:
      - **Agent**: The name of the MID Server that executes the command.
      - **Topic**: Command
      - **Name**: The actual command that you want to process. For Windows, this is expressed in a DOS command line structure. For Linux, the structure could be a bash command line entry.
      - **Queue**: Output
      - **Payload**: With proper XML tags, you can specify the command here instead of in the Name field. The advantage to this is that the command is not restricted by the Name field length of 120 characters. Use the following XML format for the command:

```
<parameters>
  <parameter name="name" value="ACTUAL_COMMAND_LINE"/>
</parameters>
```

2. Access entries in the ECC Queue that show agent0.log.0 logs and wrapper.log logs for an individual MID Server.
a) Open a MID Server record.
b) Under Related Links, click Grab MID Logs.

ECC queue records appear in the list using the following filter:

- [Topic] [is] [SystemCommand]
- [Source] [is] [grabLog]
- [Agent] [is] [your MID Server]

Only agent0.log.0 and wrapper.log entries appear. These logs are also accessible in the ~\agent\logs\ file path.
c) To open a log entry, click the link under the Created column.

3. Access the queue.stats topic for useful information about individual MID Servers, such as memory and CPU usage data.
   a) Open a MID Server record.
   b) Under Related Links, click MID Statistics.

ECC queue records appear in the list using the following filter:

- [Topic] [is] [queue.stats]
- [Agent] [is] [your MID Server]

**MID Server cluster configuration**

MID Server clusters enable multiple MID Servers with the appropriate capabilities to be grouped together for load balancing and fail-over protection.

**External data sources**

For performance and reliability reasons, these data sources should not be used with MID Server clusters:
- LDAP
- Export sets
- JDBC data sources

These external data sources should only be used with dedicated MID Servers.

![Note:](image)

**How clusters work**

MID Servers in clusters must be able to connect to the instance and to all the devices with which they are expected to communicate. If all MID Servers in a cluster are down, the discovery is canceled. Make sure all the MID Servers are added to any Access Control List (ACL) in use. MID Server clusters are managed by a business rule called MID...
Server Cluster Management, which checks to see if the MID Server assigned to a job in the ECC Queue belongs to a cluster.

**Load balancing**

If the cluster business rule determines that a MID Server is part of a load balancing cluster, the application using the MID Server automatically balances the work between the MID Servers in that cluster. It is good practice to put MID Servers with the same capabilities in a load balancing cluster.

**Fail-over protection**

MID Servers in a fail-over cluster each have a configured order that the platform uses to determine which MID Server to use next in case of failure. MID Servers in a fail-over cluster work independently and do not load balance with other MID Servers in that cluster (although they might also be members of load balancing clusters). When a MID Server fails, the MID Server Cluster Management business rule selects the highest available MID Server in the order to take over the work. The selected MID Server checks the ECC Queue and starts with jobs that are either Processing or Ready.

**Note:** MID Server clustering does not support the ECC queue topics Command or SystemCommand. If these commands are received, the clustered MID Servers do not redirect the ECC queue to another MID Server. The ECC queue records stay on the ECC queue without being processed.

Configure a fail-over MID Server with at least the same capabilities as the MID Server it is intended to relieve.

**Note:** If a MID Server fails while the Shazzam probe is running and auto-selection is configured, failover is not available. The Shazzam discovery stops. Discovery does not automatically choose another MID Server.

**MID Server cluster event**

The following event is triggered when the platform cannot find a MID Server with the appropriate capabilities to replace a MID Server in a fail-over cluster. Use this event to create an email to notify appropriate users that the cluster has failed.

**MID Server cluster event**

<table>
<thead>
<tr>
<th>Event</th>
<th>Table</th>
<th>Description</th>
<th>Business Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid_server.cluster.down</td>
<td>MID Server Cluster [ecc_agent_cluster]</td>
<td>A MID Server cluster has failed</td>
<td>MID Server Cluster Management</td>
</tr>
</tbody>
</table>

**Combining clusters**

A MID Server can be added to both types of clusters at the same time. This diagram shows a scenario in which a MID Server from a load balancing cluster (MID Server D) is also present in a fail-over cluster. If MID Server D fails, MID Server E in the failover cluster is available to the load balancing cluster to perform the tasks previously assigned to MID Server D.
Specifying a specific MID Server cluster

You can specify a specific MID Server cluster for a Discovery schedule. The discovery process uses that cluster only. You cannot chain clusters or specify a single MID Server that belongs to multiple clusters.

Distributed MID Server clusters for Operational Intelligence

The distributed MID Server cluster type is used exclusively in Operational Intelligence, which analyzes Event Management events and generates anomaly alerts. These MID Servers communicate with one another to distribute and balance the workload. For details, see MID Server distributed clusters for Operational Intelligence

Configure a MID Server cluster

Configure a cluster of MID Servers for either failover or load balancing.

Role required: admin

You can select a MID Server cluster from the Discovery Schedule form.

1. Navigate to MID Server > Clusters.
2. Click New.
3. Name the cluster and select the cluster type: Failover or Load Balance.
4. Right click in the header bar and select Save from the context menu.
5. Click Edit in the Includes MID Servers Related List.
6. Select appropriate MID Servers for this cluster from the slushbucket.

Note: All MID Servers in a cluster should have capabilities defined. Ensure that each MID Server has the appropriate capabilities for the job. A MID Server in a fail-over cluster must have the same capabilities (or expanded capabilities) as the MID Server it is expected to replace.

MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range.

Several applications, such as Discovery, Service Mapping, Cloud Management, and Orchestration can use capabilities, IP ranges, and MID Server selection to narrow the pool of MID Servers the applications need.

Note: At least one capability is required for each MID Server used by Orchestration. See MID Servers for Orchestration for more information.
The following capabilities are available by default with Discovery:

- All
- Cloud Management
- Nmap
- PowerShell
- Resolve DNS
- REST
- SNMP
- SOAP
- SSH
- VMware
- WMI

Nmap capability

The Nmap capability is only assigned to MID Servers for which the Network Mapper (Nmap) scanner has been installed for credential-less Discovery. This capability cannot be added to or removed from any MID Server manually. For instructions on installing or uninstalling Nmap, see Install and uninstall Nmap on a MID Server.

MID Server capability values

Capabilities provided in the base system do not have a defined value string. A MID Server configured to use a capability that has no value can locate any device using that capability's protocol. If a capability has a defined value, the MID Server using that capability finds only those devices using that protocol that match the value string exactly. The exception to this is the Resolve DNS capability, which is configured to resolve any DNS name into an IP address using a partial string match.

Starting with the madrid release, the [capability name]:[value] combination appears in the slushbucket when you add a capability to a MID Server. This combination allows you to see all the capabilities that have different values, even if the capability name is the same. For example, if you are using the Cloud Management capability, and you use the value field to specify the us-west logical datacenter on one of the capability records, you can see the combination in the Collection list.
Scripted MID Server capability value matching

You can use value tests to create capabilities that find devices using values without requiring exact string matching. Action on these values is controlled by a user-defined script.

The Resolve DNS capability is provided in the base system and is configured to resolve DNS names into IP addresses for devices whose names end with a specified domain name. The capability Value entered is automatically prefaced with a dot during processing to match domain syntax. This value can contain one or more sub-domains, but must include the end of the domain string. Matching devices must end with the identical syntax. The script for the Resolve DNS capability determines if a device name matches the criteria defined by Value. If a match exists, the platform performs the address resolution automatically. For example, if the value for the Resolve DNS capability is service-now.com, the MID Server with this capability finds lnxlab01.sandiego.service-now.com and dbserv101.sanjose.service-now.com. If the value is changed to sandiego.service-now.com, then the MID Server finds only lnxlab01.

Note: If Value in the Resolve DNS capability is blank, then all domains match.

To view the script for evaluating this capability, navigate to MID Server > Capability Value Tests and select Resolve DNS from the list.
Configure MID Server capabilities

A capability is required for each MID Server to work with Orchestration, Cloud Management, Service Mapping, and alert aggregation and RCA.

Role required: admin or sm_admin

1. Navigate to MID Server > Capabilities.
2. Select an existing capability. You can also select **ALL** to include all capabilities.

> **Note:** Ensure that each IP address range has MID Servers with the necessary capabilities to complete the Orchestration activities on that network segment.

3. Create a new capability:
   a) Click **New**.
   b) Configure the value for a custom capability.
      An example is a capability for **DOMAIN**, with a value of **service-now**.
   c) Click **Submit**.

4. Click **Edit** in the MID Servers related list to add MID Servers to the capability.
5. Select one or more MID Servers for this capability from the slushbucket.
6. Click **Save**.
   The capability defined here also appears in the primary record for this MID Server.

**MID Server troubleshooting**

The Knowledge Base on Hi contains several articles to help you troubleshoot MID Server issues.

<table>
<thead>
<tr>
<th>The MID Server Troubleshooting Guide</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>KB0597571</strong></td>
</tr>
<tr>
<td>Start here if you are experiencing symptoms such as the MID Server going down or not responding, or CIs being duplicated during discovery.</td>
</tr>
</tbody>
</table>

You can also see the following video on NOWsupport YouTube channel: **How to set up a MID Server**

**MID Server active issues**

The ServiceNow® instance has a dedicated table that publishes active issues with MID Servers and alerts administrators when a MID Server is in danger of exceeding its resources.

The MID Server Issue [ecc_agent_issue] table displays a number of common issues that a MID Server can experience, as they occur. Error checking processes attempt to pinpoint the most likely cause of the issue. Informative error messages name the affected MID Server and explain the possible cause of the issue. The ecc_agent_issue table retains its records for 30 days.

To access records in this table, navigate to **MID Server > Server Issues**.

Supported MID Server active issues:
- Bad user credentials after instance cloning.
- Unsupported Java Runtime Environment (JRE) on the MID Server host.
- Approaching resource thresholds for CPU usage and JVM memory.
- Errors detected during **pre-upgrade testing**.
- User authentication and authorization failures.
- Network connectivity interruptions and role configuration errors.
Example MID Server Issue record

Active MID Server post-cloning credential issues

The system provides automatic processes to detect and notify you of possible MID Server credential issues after instance cloning.

During an instance clone, the MID Server [ecc_agent] table is not copied from the source instance, but the User [sys_user] table is copied. As a result, the source MID Server user credentials copied into the target instance might not match those used by the existing set of MID Servers used by the target. Bad credentials can cause those MID Servers to be down for the target instance. Processes on the instance notify you if a MID Server is down from suspected bad credentials following an instance clone.

Table for post-cloning credential issues

The MID Server Issue [ecc_agent_issue] table stores active MID Server issues after an instance clone. Records in this table show a MID Server’s current state, evaluation times, and the Issue source. For cases in which a MID Server for a cloned instance is down because of possible bad credentials, the Issue source is InstanceClone. Data from the MID
Server Issue [ecc_agent_issue] table are displayed in a related list on a MID Server record. Records in this table are removed after 10 days, regardless of their state. Ongoing issues reappear as they occur.

**Post-cloning cleanup script and scheduled jobs**

A cleanup script called Bad MID Server credentials after clone runs on the target instance after cloning and calls a script include called BadMIDCredentialAfterClone. This script include schedules the execution of the following jobs on the Schedule Item [sys_trigger] table:

- BadMIDCredentialAfterClone-1: Runs 15 minutes after clone execution.
- BadMIDCredentialAfterClone-2: Runs 75 minutes after clone execution.

These jobs log to the MID Server Issue [ecc_agent_issue] table any MID Servers that existed on the target instance prior to the clone that are in the Down state. These MID Servers are not ready for normal processing and might be down due to invalid credentials resulting from the cloning process. The state of MID Servers added to the target instance after the clone is not evaluated.

ℹ️ **Note:** The MID Server log shows that the MID Server user associated with the target instance could not be authenticated or was missing the proper role.

**Business rule that checks for bad credentials**

The Check for bad MID credential after clone business rule monitors the MID Server [ecc_agent] table for MID Servers that are transitioning from Down to Up. If the business rule finds a MID Server making that transition, the rule attempts to find a matching MID Server in the MID Server Issue [ecc_agent_issue] table that has an issue source of InstanceClone and a state other than Resolved. If a match is found, the business rule updates the state of the MID Server in the [ecc_agent_issue] table to Resolved.

**Resolving MID Server issues**

The error message in the MID Server Issue [ecc_agent_issue] table names the affected MID Server user. This message appears each time the business rule runs and finds a MID Server that is down from suspected bad credentials:MID Server not operational (status: Down), possibly due to recent clone. Verify credentials for logged in User 'local-midserver'.

Attempt to resolve the issue first by comparing the user's credentials with the credentials that the affected MID Server is expecting. If the credentials are incorrect, fix the problem and check the MID Server status again. If the credentials are correct, but the MID Server remains down, check the Knowledge Base for other possible causes.

**MID Server resource threshold alerts**

The instance displays warnings when a MID Server breaches its resource thresholds for CPU and JVM memory usage, enabling users to create email notifications or custom scripts when a breach occurs.

The MID Server Issue [ecc_agent_issue] table warns users when a MID Server exceeds configured thresholds of its allocated CPU and memory resources. These warnings are published before the MID Server experiences performance degradation or an out-of-memory error, enabling the administrator to increase resources and avoid downtime. Administrators can use a registered event to send email notification to selected recipients, advising them of any threshold breaches, or to create a custom script to do some other type of work. The instance continues to update the MID Server Issue [ecc_agent_issue] table to keep unresolved issues current.

By default, CPU and memory threshold alerts are disabled and no alerts are published to the MID Server Issue [ecc_agent_issue] table. To enable both types of alerting, add these properties to the System Property [sys_properties] table, and then set their values to true:
• mid.threshold.resource.breach.enable.cpu.alerts
• mid.threshold.resource.breach.enable.memory.alerts

For details on adding system properties to the platform, see Add a property using sys_properties.list.

Evaluation process

This processing occurs whether or not alerting is enabled:

1. Every 10 minutes, each MID Server transmits its CPU and memory consumption metrics to the instance. The instance inserts CPU metrics into the Mean CPU used % field of the ECC Agent Scalar Metrics [ecc_agent_scalar_metric] table and memory metrics into the Max memory used % field of the ECC Agent Memory Metrics [ecc_agent_memory_metric] table.

2. After a successful insert, the following business rules run on each table, invoking a script include that calls an appropriate function. Each function takes an average of the metric sets inserted into the tables, based on the configured sampling intervals.
   • Update cpu mean on MID Server Status: Calls the MIDResourceThresholdBreach.checkCpuUsage() script include.
   • Update max memory on MID Server Status: Calls the MIDResourceThresholdBreach.checkMemoryUsage script include.

Each function takes an average of the metric sets inserted into the tables, based on the configured thresholds and sampling intervals. The instance first looks at each MID Server for configuration parameters that set custom threshold values or sampling intervals for that MID Server. If no configuration parameters for these attributes are found, the instance looks in the System Properties [sys_properties] table for custom values to use. If no properties are found, the instance uses the default threshold and interval values from the code.

Note: Both the threshold percentages and the sampling intervals are configurable. See Configuring thresholds and sampling intervals for details.

Alerting process

When alerting for CPU or memory thresholds is enabled, this processing occurs:

1. If the aggregated average metric value equals or exceeds the configured percent threshold, the instance triggers the mid.threshold.resource.breach event. Administrators can use this event to create email notifications for threshold breach alerts or to create a custom script.

2. The instance inserts a record of the breach into the MID Server Issue [ecc_agent_issue] table with a State value of New and a Count of 1, and then publishes a message containing all the pertinent details of the breach. An example of this message is Mean CPU used % has exceeded threshold (96>=91) for a 40 minute interval span, occurring after start date 2017-01-11 14:25:19. This message appears in the Short description field of the MID Server Issue form and in the event. You can copy any part of the message into your email notifications.

MID Server issue states

When the administrator first examines an issue in the MID Server Issue [ecc_agent_issue] table, the administrator can change the State of the issue to Acknowledged to indicate that the issue is being addressed. Each time the instance detects a breach, it attempts to match the breach with an existing issue. If a MID Server already has an issue record
for that breach in a State of **New** or **Acknowledged**, the instance updates the **Last Detected** field with the current date/time and increments the **Count** field in the existing record. This prevents the creation of duplicate records in the MID Server Issue [ecc_agent_issue] table and records the number of times after the initial incident that the breach reoccurred. The administrator can increase MID Server resources gradually and watch the effect on the **Count** field. When the counter stops incrementing, the administrator knows that the MID Server has adequate resources. When the MID Server resource have been adjusted appropriately, the administrator sets the **State** to **Resolved**. If a new threshold breach is logged that matches a MID Server issue with a **State** of **Resolved**, the instance creates a new issue record.

![Note: Any record in the MID Server Issue [ecc_agent_issue] table that has not been updated in 30 days is deleted, regardless of its state.](image)

### Recommendations for resolving resource issues

Administrators have the opportunity to resolve any resource issues with a MID Server when they receive notification of the event. Follow these recommendations for reducing the strain on MID Server resources:

- **JVM memory**:
  - Allocate more max memory to the MID Server. For more information, see [*Set the MID Server JVM memory size*](#).
  - Add additional MID Servers to share the workload. For more information, see [*MID Server cluster configuration*](#).
  - Reduce the amount of concurrent processing for the MID Server. This includes segmenting IP Address ranges into smaller segments for a Discovery schedule or loading smaller segments of data within an import job.

- **CPU**: Reduce the activity on the host or migrate the MID Server to a new host with more available resources.
### Tables used for resource threshold evaluation

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
</table>
| MID Server Issue [ecc_agent_issue]                | Stores data on various types of MID Server issues, including breaches of configured CPU and memory thresholds. Fields used for resource threshold breaches are:  
  - **count**: Number of times a previously reported threshold breach occurs, if the event is not marked Resolved.  
  - **last_detected**: Current date and time a threshold breach is detected. This field is updated each time a previously detected breach is found, if it is not marked Resolved.  
  - **message**: Descriptive message summarizing the conditions that triggered the threshold breach event. This message includes the actual percentage of CPU and memory calculated and the configured thresholds that were breached.  
  - **mid_server**: Name of the MID Server experiencing the resource threshold breach.  
  - **source**: The issue source for the breach. These are the possible sources:  
    - **CpuMIDResourceThresholdBreach**: CPU threshold issue sources.  
    - **MemoryMIDResourceThresholdBreach**: Memory threshold issue sources. |
| MID Server Status [ecc_agent_status]              | Stores the percentages used for the CPU and memory resources, averaged over configurable intervals for each resource. The fields used are:  
  - Mean CPU used %  
  - Max Memory used % |
| ECC Agent Scalar Metric [ecc_agent_scalar_metric] | Stores the CPU usage data inserted by each MID Server every 10 minutes. The table field used by resource threshold alerting is **mean**. |
| ECC Agent Memory Metric [ecc_agent_memory_metric] | Stores the memory usage data inserted by each MID Server every 10 minutes. The table field used by resource threshold alerting is **max_used_pct**. |
### Business rules that check for threshold breaches

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update cpu mean on MID Server Status</td>
<td>Runs after the MID Server inserts a record into the ECC Agent Scalar Metric [ecc_agent_scalar_metric] table. This business rule triggers the MIDResourceThresholdBreach script include function that evaluates threshold settings to determine if the MID Server has breached its configured CPU resource thresholds.</td>
</tr>
<tr>
<td>Update max memory on MID Server Status</td>
<td>Runs after the MID Server inserts a record into the ECC Agent Memory Metric [ecc_agent_memory_metric] table. This business rule triggers the MIDResourceThresholdBreach script include function that evaluates threshold settings to determine if the MID Server has breached its configured memory resource thresholds.</td>
</tr>
</tbody>
</table>

### Configuring thresholds and sampling intervals

You can use the default threshold percentages and sampling intervals or configure custom values using either of these methods:

- Add system properties to the instance and change the default values for all MID Servers.
- Add configuration parameters to change the default resource values for individual MID Servers.

The system properties and the configuration parameters use the same names.

<table>
<thead>
<tr>
<th>Property/configuration parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid.threshold.mean_cpu.aggregate_interval_span</td>
<td>Number of 10 minute units in the interval for sampling CPU usage data. The default interval is 30 minutes (3 x 10 min.)</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> 3</td>
</tr>
<tr>
<td>mid.threshold.mean_cpu.percent</td>
<td>Usage percentage of the total CPU resources that initiates a threshold breach alert.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> 95</td>
</tr>
<tr>
<td>mid.threshold.mean_max_memory.aggregate_interval_span</td>
<td>Number of 10 minute units in the interval for sampling memory usage data. The default interval is 30 minutes (3 x 10 min.)</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> 3</td>
</tr>
<tr>
<td>mid.threshold.mean_max_memory.percent</td>
<td>Usage percentage of the total memory resources that initiates a threshold breach alert.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> 95</td>
</tr>
</tbody>
</table>
MID Server resource reporting

The *MID Server dashboard* contains two reports that give you views into the consumption of CPU and JVM memory resources. These reports show usage over the previous 30 days.

- **Avg Percentage of CPU Used**: Trending the daily average on CPU usage helps illustrate the amount of CPU processing that the MID Server host consumes. MID Servers deployed on the same host will report the same CPU usage.
- **Avg Percentage of Max Memory Used**: The maximum used percentage (`max_used_pct`) is a useful metric for determining if the MID Server has enough memory resources. This metric is a percentage of the max used memory over the total available memory. Trending this over time provides a visualization of how much memory is needed by the MID Server.

MID Server user connectivity issues

The instance writes issues involving MID Server user logins and network connectivity to the MID Server Issue [ecc_agent_issue] table and creates events you can use in custom scripts or to send email notifications.

Records in the MID Server Issue [ecc_agent_issue] table can provide insight into why your MID Server user cannot log in or why a MID Server cannot connect to the instance. The system displays records for connectivity problems in this table that include informative error messages suggesting possible causes. By default, a scheduled job called MIDUserConnectivity runs every four hours and launches the MIDUserConnectivity script include to evaluate MID Server connection activity. Records in the MID Server Issue [ecc_agent_issue] table reflect the status of MID Server login attempts and connectivity at the time the scheduled job runs.

From the perspective of the instance, the MID Server is **Down** when:

- User authentication fails
- User authorization fails.
- Network issues prevent MID Server from establishing a TCP/IP connection.

**Note:** To associate a user with a MID Server, navigate to the `servicenow/<mid_server_name>/agent/config.xml` file and enter the user credentials in the `mid.instance.username` and `mid.instance.password` parameters. Make sure to restart the MID Server to activate your changes.

How issues are logged

User authentication failures and authorization issues are logged automatically to the MID Server `agent log file`. The message for both is the same: **User cannot be authenticated or is missing the proper roles.** If the issue is related to authorization, the `agent.log` file shows the list of missing roles.

When debugging is enabled, MID Server issues are logged to the system log (syslog) and are available for display in either a **summary or a detailed** format. You can also change the sampling interval from the default 4 hours to something shorter for tracking your remediation efforts. For instructions on enabling and configuring debugging for MID Server user issues, see **Test remediation efforts for MID Server user connectivity issues**.

Data provided

When the instance encounters user connectivity issues, it opens a record in the MID Server Issue [ecc_agent_issue] table.
Example user authentication error message

The MID Server Issue table contains these fields:

**MID Server issue fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last detected</td>
<td>Date and time the issue was last detected.</td>
</tr>
<tr>
<td>Short description</td>
<td>Contents of the generated message that specifies a possible issue with the named user or the MID Server.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Empty in the Jakarta release.</td>
</tr>
<tr>
<td>Issue source</td>
<td>The process that identified the issue. For all issues with MID Server user connectivity, the source is MIDUserConnectivity.</td>
</tr>
</tbody>
</table>
### User authentication failure

The credentials that the instance uses to authenticate a MID Server user are configured in the MID Server Configuration Parameters [ecc_agent_config] table. If the MID Server user attempts to log into the instance with invalid credentials, the instance rejects the connection, and writes the login.failed event to the Events [sysevents] table for the user. Administrators can use this event in a custom script or in email notifications for authentication failure.

**Note:** If user authentication fails, user authorization is not attempted.

### User accounts associated with a MID Server

Either of the following messages in the MID Server Issue [ecc_agent_issue] table indicate authentication failure for user accounts that are associated with a MID Server:

- **Login authentication failure for User <user name> associated with 1 down MID Server. Check password on MID server.**
- **Login authentication failure for User <user name> associated with <n> down MID Servers. Check password on MID servers.**

The necessary conditions for these messages to appear are:

- The **Status** field in the MID Servers [ecc_agent] table that is associated with the MID Server indicates that the MID Server is **Down**.
- The user identified in the MID Server Configuration Parameters [ecc_agent_config] table is the user that one or more MID Servers is configured to use for authentication and authorization when connecting to the instance. The record in the [ecc_agent_config] table must have these values:
  - Parameter name [param_name] field set to **mid.instance.username**.
  - Value [value] field set to the user’s name, corresponding to the User ID [user_name] field in Users [sys_user] table.
- The Events [sysevent] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The record created in the [sysevent] table contains these field values:
  - Event Name [name] field is set to **login.failed**.
  - Parm1 [parm1] field is set to the user’s name.
User accounts with the mid-server role not associated with a MID Server

The following message appears when a user with the mid_server role who is not associated with a MID Server fails to authenticate: **Login authentication failure for User <user name> with mid_server role not associated with a MID Server.**

The necessary conditions for this message to appear are:

- The User Roles [sys_user_has_role] table contains a record linking the sys_id associated with the user record stored in the [sys_user] table, with the sys_id associated with the mid_server role record stored in the [sys_user_role] table.
- The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events [sysevent] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period.
  - The [sysevent] table contains a record with the Event Name [name] field set to **login.failed**.
  - The Parm1 [parm1] field is set to the user’s name, corresponding to the User ID [user_name] field in Users [sys_user] table.

User authorization failure

The user authorization check occurs after the MID Server has successfully authenticated on the instance. In this step, the system ensures that the user account associated with a MID Server is granted the minimum roles required. A SOAP web service called **MIDServerCheck** performs the role checking on the instance. If the MID Server user has the proper roles, the connection is allowed and a **login** event is written to the Events [sysevents] table. If the user does not have the proper roles, the instance writes a **login.authorization.failed** event to the Events [sysevents] table. This event provides a comma separated list of the user's missing roles. Administrators can use this event in custom scripts or in email notifications for authorization failure.

Authorization can fail if a user is missing the mid_server role or any of the important SOAP roles, as in these cases:

- If the user has the soap_script role, the **MIDServerCheck** SOAP web service runs to check for the appropriate MID Server roles. If the user lacks the mid_server role or any of the other SOAP roles, authorization fails, and the **login.authorization.failed** event is created.
- If the user is missing the soap_script role, that user is not authorized to launch the **MIDServerCheck** SOAP web service, which checks for all required MID Server roles. Authorization fails, but the **login.authorization.failed** event is not created. When this occurs, the instance displays this message: **Connectivity of MID Server user <user name> cannot be detected by the instance.**

Users associated with one or more down MID Servers

Either of the following messages in the MID Server Issue [ecc_agent_issue] table indicate authorization failure for user accounts that are associated with a MID Server that is **Down**:

- **Login authorization failure for User <user name> associated with 1 down MID Server. Re-assign mid_server role to grant all required roles.**
• Login authorization failure for User <user name> associated with <n> down MID Servers. Re-assign mid_server role to grant all required roles.

The MIDUserConnectivity script include identifies active users associated with one or more down MID Servers whose last login attempt within the reporting period failed user authorization. This message is generated when user authorization failures are detected and reported by the MIDServerCheck scripted web service. However, user authorization failures are not reported for users who are not assigned the soap_script role. Should this occur, problems with the user are reported by the network connectivity message.

This message appears in the MID Server Issue [ecc_agent_issue] table when:
• The user may or may not have the mid_server role.
• The user is identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
• The Events [sys_event] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The [sys_event] table contains a record with these settings:
  • Event Name [name] field set to login.authorization.failed.
  • Parm1 [parm1] field set to the user’s name, corresponding to the User ID [user_name] field in Users [sys_user] table.

**Note:** The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

Users with the proper role not associated with a MID Server

The following message appears when a user with the mid_server role who is not associated with a MID Server fails authorization: Login authorization failure for User <user name> with mid_server role not associated with a MID Server.

This message is generated when user authorization failures are detected in which the user account, with the mid_server role, is not identified as a configured MID Server user in the [ecc_agent_config] table. It is possible that the user account was associated with a MID Server at the time of the failure.

This message appears in the MID Server Issue [ecc_agent_issue] table when:
• The user has the mid_server role. The User Roles [sys_user_has_role] table has a record linking the sys_id associated with the user record stored in the [sys_user] table, with the sys_id associated with the mid_server role record stored in the [sys_user_role] table.
• The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
• The Events [sys_event] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The [sys_event] table contains a record with these settings:
  • Event Name [name] field set to login.authorization.failed.
  • Parm1 [parm1] field set to the user’s name, corresponding to the User ID [user_name] field in Users [sys_user] table.

**Note:** The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).
Network issues

A network issue can prevent the MID Server from connecting to the instance's TCP/IP server to begin a session. In this case, the instance marks the MID Server as **Down**, because the instance failed to receive the MID Server heartbeat within the prescribed 5 minute interval.

**Users associated with down MID Servers who have not attempted to log in**

Either of the following messages in the MID Server Issue [ecc_agent_issue] table name users associated with MID Servers who have not attempted to log in during the reporting period:

- User `<user name>` is associated with 1 down MID Server. No login attempts within reporting period.
- User `<user name>` is associated with `<n>` down MID Servers. No login attempts within reporting period.

The MIDUserConnectivity script include reports active users associated with down MID Servers where network connectivity cannot be detected by the instance.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

- The user may or may not have the mid_server role.
- The user is identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user which one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- There are no login attempts, either failed or successful, recorded in the Events [sysevent] table for the user during the scheduled reporting period.

**Note:** The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

**Users not associated with MID Servers who have not attempted to log in**

The following message appears when a user with the mid_server role who is not associated with a MID Server has not attempted to login during the configured reporting interval: **User `<user name>` with mid_server role is not associated with a MID Server. No login attempts within reporting period.**

The MIDUserConnectivity script include reports active users with the mid_server role not associated with a MID Server, where connectivity cannot be detected by the instance.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

- The user has the mid_server role. The User Roles [sys_user_has_role] table has a record linking the sys_id associated with the user record stored in the [sys_user] table, with the sys_id associated with the mid_server role record stored in the [sys_user_role] table.
- The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- There are no login attempts, either failed or successful, recorded in the Events [sysevent] table for the user during the scheduled reporting period.

**Note:** The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

Configuration issues

Any of the following messages, discussed above, can indicate a configuration issue:

- **Login authentication failure for User `<user name>` with mid_server role not associated with a MID Server.**
• Login authorization failure for User <user name> with mid_server role not associated with a MID Server.
• User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.

These are some common configuration errors:

• An administrator neglected to associate the user record with the MID Server record as shown in the MID Server Configuration Parameters [ecc_agent_config] table. This table is read-only and cannot be updated directly. To associate a user with a MID Server, configure the user name and password in the MID Server's config.xml file and restart the MID Server.
• During the process of reconfiguring a MID Server to use a different account for TCP/IP connection, the administrator has not yet removed the mid_server role from the account or deleted the account.
• A multipurpose user account was created and granted a large number of roles, including the mid_server role, although this account was never intended to be used as a MID Server account.

User who successfully authenticates and authorizes but might not need mid_server role

The following message appears when a user with the mid_server role who is not associated with a MID Server successfully logs in: User <user name> with mid_server role successfully connected but not associated with a MID Server. The mid_server role should be reserved for MID Server use only.

The MIDUserConnectivity script include reports active users with the mid_server role who are not identified as a configured MID Server user, and whose last login attempt was successful during the scheduled time period. This message suggests that the user’s credentials are being used by a system administrator or a process that is not running on a MID Server. The assumption here is that the mid_server role should only be used for applications deployed to a MID Server. The presence of this message reminds the system administrator to remove extraneous mid_server roles from user accounts that do not require them.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

• The user has the mid_server role.
• The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
• The Events [sysevent] table contains posts showing that the last login attempt associated with the user succeeded during the scheduled time period. The [sysevent] table contains a record with these settings:
  • Event Name [name] field set to login.
  • Parm1 [parm1] field set to the user’s name, corresponding to the User ID [user_name] field in Users [sys_user] table.

Note: The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

Test remediation efforts for MID Server user connectivity issues

After attempting to resolve a user connectivity issue that appears in the MID Server Issue [ecc_agent_issue] table, you can test your remediation efforts without having to wait until the next scheduled reporting period by shortening the sampling interval.

Role required: admin

Reconfigure the sampling interval using this procedure and then examine the results in the MID Server Issue [ecc_agent_issue] table. You can set any time span for the sample, but you should define a window of not less than 5 minutes, since this is the default interval of the MID Server heartbeat that reports its status. The recommended method for configuring a shorter sampling interval is to copy and modify the code from the MIDUserConnectivity scheduled job, and then run it manually in the background script utility.
**Caution:** Avoid editing the script in the MIDUserConnectivity schedule record. If you make any change to this record, it will not be updated when you upgrade the instance.

1. Navigate to **System Definition > Scheduled Jobs**.
2. Open the MIDUserConnectivity scheduled job.
3. Copy this line from the **Run this script** field:
   
   ```java
   MIDUserConnectivity(0).checkConnectivity(4 * (60 * 60 * 1000));
   ```
   
   This code sets the 4 hour sampling interval in milliseconds and turns debugging off with the MIDUserConnectivity(0) value.
4. Navigate to **System Definition > Scripts - Background**.
5. Paste the code from the scheduled job into the **Run script** field.
6. Set the sampling interval to 5 minutes by changing the time calculation to `(5 * 60 * 1000)`.
   
   The modified command looks like this: `MIDUserConnectivity(0).checkConnectivity (5 * 60 * 1000);`
7. Click **Run script**.
8. Open the record of the MID Server that had the issue and select the **MID Server Issues** related list.
   
   The issue is updated as follows:
   - If the issue persists, the **Count** column is incremented, and the **Last detected** column shows the current date and time.
   - If the issue no longer exists, the system changes the **State** to **Resolved**.
9. Optionally, you can enable debugging by selecting a level, and then run the script again to see the breakdown for each condition evaluated.
   
   Use these settings to select a debugging level:
   - For a summary view, enter `MIDUserConnectivity(1)`.
   - For a detailed view, enter `MIDUserConnectivity(2)`.

   For details about the type of debugging information provided, see [Interpreting MID Server user debugging output](#).

**Interpreting MID Server user debugging output**

Debugging output from the system log is available in either a summary or detailed view for MID Server user issues, but must be enabled manually.

To enable debugging and display all connectivity issues in either of the available formats, you must run a method manually on your instance. For instructions on enabling debugging, see [Test remediation efforts for MID Server user connectivity issues](#). For information about each error condition and how records are created in the MID Server Issue [ecc_agent_issue] table, see [MID Server user connectivity issues](#).

**Available formats**

You can configure the instance to generate a simple summary of the issue or a detailed output that identifies users and MID Servers. Summaries provide a quick look at the issue conditions, by count, while the detailed view allows you to examine roles, MID Server associations, and login activity by named users.

In this summary example of an authorization issue, the instance evaluates each condition and indicates how many users met that condition. You can see that a MID Server is down and that one of two users configured for a MID Server failed authorization. Because this is a summary, neither the MID Server nor the users are named.
Authentication failure

When a MID Server user cannot authenticate on the instance, the system displays these error messages in the detailed output:

- Login authentication failure for User <user name> associated with 1 down MID Server. Check password on MID server.
- Login authentication failure for User <user name> associated with <n> down MID Servers. Check password on MID servers.
- Login authentication failure for User <user name> with mid_server role not associated with a MID Server.

In this example, three users with the mid_server role, midserver2, local-midserver, and ardis.maison, failed to authenticate. Two of these users were configured for MID Servers that were Down, and the other user was not configured for any MID Servers. Each of these users has an authentication failure and is named in the appropriate error message.

**MID Server ID map**

The debugging output lists all MID Servers that are marked as **Down** and maps them to their user accounts by the MID Server sys_id. This map includes all user accounts that have the mid_server role, whether or not they are associated with a MID Server. If there are no **Down** MID Servers, the map is not displayed in the debugging output.

The map is presented in three sections:

- User accounts not associated with any MID Servers.
- User accounts associated with **Down** MID Servers, identified by their sys_id.
- The sys_id of each **Down** MID Server, identified by name.

---

**Authorization failure**

If a user is missing any of the required roles, the instance generates these authorization failure messages:

- **Login authorization failure for User <user name> associated with 1 down MID Server.** Re-assign mid_server role to grant all required roles.
- **Login authorization failure for User <user name> associated with <n> down MID Servers.** Re-assign mid_server role to grant all required roles.
- **Login authorization failure for User <user name> with mid_server role not associated with a MID Server.**

In this example, three users with the mid_server role, **midserver2**, **local-midserver**, and **ardis.maison** have failed authorization. One user is not associated with any MID Server, but the other two users are. The system has logged an authorization failure, indicating that the user is missing at least one critical role. To see what roles are missing, look at the comma separated list in the Parm2 field in the login.authorization.failed event record. This record is the most recent login attempt in the Event [sysevent] table for the user account within the reporting period.
The document contains a code snippet from ServiceNow, which details the handling of authorization failures and debugging logs in the Now Platform. The code is written in JavaScript and shows various objects and methods used for authorization and logging in the ServiceNow environment.

Key points from the code snippet:
- `activeUserDnInMIDServerRole` is an object used to manage user roles in the MID server.
- `admin_mails` is an object that likely contains administrative mail addresses.
- `local-midserver` and `midserver2` are objects representing different server configurations.
- The code includes methods for handling authorization failures and logging detailed information.

The code snippet demonstrates the complexity and depth of the ServiceNow authorization and logging functionality, highlighting how it manages various server roles and user access.
Network issues

Network issues may exist for these users who are associated with MID Servers, but who have not attempted to log in during the reporting period:

- User `<user name>` is associated with 1 down MID Server. No login attempts within reporting period.
- User `<user name>` is associated with `<n>` down MID Servers. No login attempts within reporting period.

Network issues may also exist for these users who are NOT associated with MID Servers, and who have not attempted to log in during the reporting period: **User `<user name>` with mid_server role is not associated with a MID Server. No login attempts within reporting period.**

In this example, no login attempts have been detected for `midserver2`, `local-midserver`, and `ardin.maison`, all of whom have the mid_server role. Two of those users are associated with MID Servers that are marked **Down**. The other user is not associated with any MID Server. None of these users has attempted to log in to the system within the configured reporting interval. The system assumes that these users would make an attempt to log in unless network issues prevented them from doing so.

---

**Note:** By default, the sampling period is 4 hours. However, during debugging or remediation, the sampling period can be reset to a value that matches the MID Server heartbeat interval of 5 minutes, or greater.
Configuration issues

Any of the following messages can indicate a user configuration issue:

- Login authentication failure for User <user name> with mid_server role not associated with a MID Server.
- Login authorization failure for User <user name> with mid_server role not associated with a MID Server.
- User <user name> with mid_server role successfully connected but not associated with a MID Server. The mid-server role should be reserved for MID Server use only.
- User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.

In this example, a user with the mid_server role has logged in successfully within the configured sampling interval. However, this user is not configured for a MID Server and might have the role in error.

- Configure message content
- Create a messaging notification
- Link your ServiceNow user account to your Slack or MS Teams account for Now Actions
- Configure your notification system settings for the third-party messaging apps

**Troubleshoot and get help**
- Ask or answer questions in the Platform forum
- Search the HI knowledge base for known error articles
- Contact ServiceNow Technical Support

**Email and SMS notifications**

Use email notifications to send selected users email or SMS notifications about specific activities in the system, such as updates to incidents or change requests.

Email notifications allow administrators to specify:

- When to send the notification
- Who receives the notification
- What content is in the notification
- Whether the notification can be delivered in an email digest and if so, the digest content

Additional email notification options are available. Users can subscribe to notifications, and administrators can make some notifications mandatory.

Administrators also have the option of converting existing email notifications to a rich HTML format. This format provides several advantages, including:

- Raw HTML content is converted into a WYSIWYG format.
- The content can be edited in a feature-rich HTML editor.
- Mail scripts are condensed into a single, easy-to-read line that can be reused in multiple email notifications.
- To prevent broken links, items like images and incidents, that are linked with URLs relative to an instance are converted to absolute links. For example, if an incident is linked using a relative URL, the link is converted to an absolute link.

**Note:** The rich HTML format is the default for all new email notifications.
Note: Instances cannot send or receive encrypted email messages. The system strips out the body of the encrypted email because it cannot process the encrypted content in plain text or HTML.

An email notification can also send as an SMS notification if the recipient has subscribed to the notification on an SMS channel. The system uses the subject line of the email notification and converts it to an SMS message. If the administrator doesn't want to use the email notification subject for the SMS notification, they can define an alternate SMS message in the email template form or email notification form. For more information, see Create an email notification.

For more information on creating an SMS channel, see Create notification channels.

If you want to change how the instance processes incoming email, see Inbound email actions. See System email log and mailboxes for examples of messages the system displays when notifications or inbound email actions are not processed.

Email setup

All email notifications use the email properties that you define for your instance and the email accounts that you set up. Your email service can also affect the successful transmission of incoming and outgoing email.

Email accounts

Email administrators set up email accounts to allow the system to connect to external mail services such as POP3, SMTP, or IMAP servers. You can use the ServiceNow-provided email accounts or create your own accounts for your own email services.

Email properties

Use Email Properties to configure settings for inbound and outbound email. Email properties apply to all email accounts.

Email service size restrictions

Your email service, whether you are using a standard ServiceNow email configuration or an alternate email configuration, determines the successful transmission of incoming or outgoing emails based on a maximum email size. An email configuration consists of your instance, email server, and email client.

- Standard email configurations – For instances that use the standard email configuration, the ServiceNow mail servers cannot send or receive emails larger than approximately 50 MB (before encoding), including the email header, body text, and attachments. Email messages are encoded by an email client, which increases total email message size. The maximum ServiceNow mail server size restriction is 75 MB (after encoding). The maximum email size limit is enforced regardless of any configured attachment size limits.

- Alternate email configurations – If your email service uses a company-owned or third-party server, the approximate size restriction of 50 MB (including the email header, body text, and attachments) may still apply. However, your service might support different maximum total file sizes for inbound and outbound emails. Check with the email administrator of your email service to verify email size limits.

For details on how encoding can affect email message size and email transmission, see KB0521772.
Email service availability

Email service is intentionally shut down on instance clones to prevent resending already delivered email. Upgrades no longer require an extended interruption of email service. Instances continue to process email during an upgrade. For a possible explanation for undelivered emails, see the blog post Whitelisting emails sent from the ServiceNow infrastructure by a ServiceNow Technical Support Engineer in the Now Community.

For instructions on creating and sending custom emails when events on the instance occur, see the tasks in Email and SMS notifications.

Instance-to-instance communication via email

Use Web services to communicate between two instances.

Designate blacklisted and whitelisted email domains

Using Instance Security Center, you can monitor the blocked and allowed incoming email metrics for your instance. For more information, see Designate email domains as blacklisted or whitelisted.

Basic email setup

All production instances can send and receive email using ServiceNow-provided resources. The instance has an email address of instance@service-now.com.
Network layout for standard email configuration
Basic email services and features

- Mail servers maintained by ServiceNow.
- Encrypt mail with opportunistic TLS (Transport Layer Security) if supported by your mail servers.
  
  If your internal mail servers send and receive messages via a TLS-encrypted channel, ServiceNow mail servers support that communication.
- Provide a dedicated mailbox for your instance.
- Pre-configured email accounts to connect to ServiceNow mail servers.
  
  - An SMTP account sends email to your primary Mail Exchange (MX) server from your instance email address of instance@service-now.com.
  - A POP3 account receives email sent to your instance email address of instance@service-now.com.
- High availability features from ServiceNow datacenters.
- Spam detection for incoming email.

Administrators who want to use basic email services can do so by enabling the email properties for sending and receiving email.

*Enable basic email*

Enable basic email to use ServiceNow-provided email servers and accounts.

Role required: admin

1. Navigate to **System Properties > Email**.
2. Configure these email properties and click **Save**.

Advanced email setup

With an advanced email setup, you can use your own SMTP server, POP3 server, or both.

Setting up your own email environment can be useful if you want to use existing filtering, retention, or compliance aspects of your own email architecture. You can set up email in several ways:

- Use your own SMTP server to forward email to ServiceNow servers.
- Use your own SMTP server to send email.
- Use your own POP3 server to receive email.
- Use your own SMTP and POP3 servers to send and receive email.
- Use an OAuth 2.0-enabled SMTP server to send email from a third-party service.
- Use an OAuth 2.0-enabled IMAP server to receive email from a third-party service.

The following procedures assume that you *enabled basic email properties*.

*Enable using your own SMTP server*

Enable using your own SMTP server so that you can leverage the existing filtering, retention, or compliance aspects of your own SMTP server while also using the ServiceNow POP3 server.
• Role required: admin
• Email server required: SMTP
• Basic email properties: enabled

You can combine your own internal email architecture with the ServiceNow email architecture to handle email. The following diagram demonstrates how you would use your own SMTP server alongside the ServiceNow POP3 server.
1. Navigate to System Mailboxes > Administration > Email Accounts.
The system displays the list of available email accounts.

2. Locate the record for **ServiceNow SMTP** and change **Active** to **false**.

3. Click **New**.

4. Create an email account record for your SMTP server where the **Type** is **SMTP**.

5. From **Related Links**, click **Test Connection**.
   
   If the email account is valid, the system returns a success message.

Configure the SMTP server in your internal email architecture to forward email from the custom email address to the instance email address. Implement a spam filter on the custom email address.
**Enable using your own POP3 server**

You can use your own POP3 server to store and receive email for the instance.

- Role required: admin
- Email server required: POP3
- **Basic email properties:** enabled

1. On your POP3 server, create a mailbox for your instance that has a custom email address. For example, create a mailbox for service-desk@company.com.
2. Navigate to **System Mailboxes > Administration > Email Accounts.**
   The system displays the list of available email accounts.
3. Optional: If you do not want to receive email sent to the instance@service-now.com mailbox, locate the record for **ServiceNow POP3** and change **Active** to **false.**
   An instance can receive email from multiple POP3 accounts at the same time. Leaving the **ServiceNow POP3** account active allows the instance to receive email sent to the instance default email address.

![Email Accounts screen](image)

4. Click **New.**
   The system displays a blank Email Account form.
5. Create an email account record for your POP3 server where the **Type** is **POP3.**
6. From **Related Links,** click **Test Connection.**
   If the email account is valid, the system returns a success message.
Connection Test

Connection Successful

Enable using your own SMTP and POP3 servers
You can use your own SMTP and POP3 servers to send email from the instance and to store and receive email for the instance.

- Role required: admin
- Email servers required:
  - SMTP
  - POP3

- Basic email properties: enabled

1. On your POP3 server, create a mailbox for your instance. For example, create a mailbox for service-desk@company.com.
2. Navigate to System Mailboxes > Administration > Email Accounts.
The system displays the list of available email accounts.
3. Locate the record for ServiceNow SMTP and change Active to false.

4. Optional: If you do not want to receive email sent to the instance@service-now.com mailbox, locate the record for ServiceNow POP3 and change Active to false.

An instance can receive email from multiple POP3 accounts at the same time. Leaving the ServiceNow POP3 account active means that the instance receives email sent to its default email address.
5. Click New.
   The system displays a blank Email Account form.

6. Create an email account record for your SMTP server where the **Type** is **SMTP**.

7. From **Related Links**, click **Test Connection**.
   If the email account is valid, the system returns a success message.

8. Click New.
   The system displays a blank Email Account form.

9. Create an email account record for your POP3 server where the **Type** is **POP3**.

10. From **Related Links**, click **Test Connection**.
If the email account is valid, the system returns a success message.

![Connection Test](image)

Connection Successful

Close
OAuth email authentication

OAuth enables your instance to receive and send email through a third-party email account.

Open Authentication (OAuth) is an open standard for authorization that provides administrators with an authorization method when connecting to incoming IMAP and outgoing SMTP servers. OAuth enables an instance to receive and send email from a third-party account, such as Gmail, without having to enter the credentials for that account.

The OAuth 2.0 implementation requires you to obtain an access and refresh token from your third-party email provider for each third-party email account. The tokens are automatically saved to the instance database. They provide authorization for all email communication between the instance and the authorized third-party account. A scheduled job regularly checks to see if email access tokens are valid. If the access token is not valid, but the refresh token is, the instance automatically regenerates a new access token.

OAuth 2.0 support is available starting with the Geneva release. The OAuth implementation supports IMAP and SMTP accounts only. POP3 is not supported. OAuth 1.0 is no longer supported.

Note: Customer email accounts configured to use OAuth 1.0 authentication with Gmail cease to function as of April 20, 2015. See KB0546976 for more information.

Activating the Email - OAuth support for IMAP and SMTP plugin allows you to use OAuth with email. If you upgrade to Geneva or later instances and are already using OAuth 1.0, activate the plugin again.

See Outbound REST with OAuth 2.0 profile tutorial - integrating with Google Contacts API for an example of using an OAuth 2.0 profile to authenticate an outbound REST message with Google to retrieve contact information. Also see OAuth 2.0 for more information on OAuth 2.0 support in the instance.

Activate the OAuth email authentication plugin

OAuth email authentication requires the Email - OAuth support for IMAP and SMTP plugin.

Role required: admin

1. Navigate to System Applications > All Available Applications > All.

A banner appears to notify you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

Note:
To redirect to the legacy list view for plugins, click the link.

2. Find the plugin with the filter criteria and search bar.

You can search for the plugin by its name or ID.

If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.

You can activate the plugin directly from the All Applications page or view more details about the plugin before activating it.

• If you are certain that you have the correct plugin, click Install, and then click Activate in the dialog box that appears.
To view plugin details before activation:

1. Click the plugin name.
2. On the form, click the **Activate/Update** related link.
3. On the dialog box that appears, review the dependent plugins.
   
   If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.
4. If demo data is available and you want to install it, click **Load demo data**.
   
   Some plugins include demo data, which are sample records that illustrate plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.
5. Click **Activate**.

Enable OAuth 2.0 for email

Setting up OAuth 2.0 for email requires you to obtain access and refresh tokens from your email provider.

- Role required: admin
- Plugin required: Email - OAuth support for IMAP and SMTP

1. Log in to your third-party email account, such as Gmail, and enable OAuth 2.0.
2. Obtain the following from your third-party email account:
   
   - client ID
   - client secret
   - authorization URL
   - token URL
   - redirect URL
   - token revocation URL
3. Navigate to **System OAuth > Application Registry**.
4. Click **New**.
5. Click **Connect to a third party OAuth Provider** to create an application registry record that email uses.
6. Use the information you obtained from your third-party email account to fill in the fields on the form. See *Use a third-party OAuth provider* for instructions. Create the OAuth application registry record and its associated OAuth Entity Profile and OAuth Entity Scope records.

7. Click Submit.

8. Navigate to System Mailboxes > Administration > Email Accounts. The system displays the list of available email accounts.

9. Optional: If you do not want to receive email sent to the default instance email address, locate the record for ServiceNow POP3 and change **Active** to **false**.

   The system can receive email from multiple POP3 and IMAP email accounts.

10. Locate the records for ServiceNow SMTP and change **Active** to **false**.

![Email Accounts](image)

11. Click New. The system displays a blank Email Account form.

12. Create an email account record for your OAuth 2.0 SMTP server where the **Type** is SMTP.

13. For **Authentication**, select **OAuth 2.0**.

14. For **OAuth Profile**, select the application registry record you created.

15. Click **Authorize Email Account Access** to obtain the access and refresh tokens.

   Another browser window opens asking you to authorize the account access on the third-party email account.

16. Authorize the access.

   After the authorization is successful and the tokens are saved to the instance, the **Authorize Email Account Access** button no longer appears on the Email Account form.

17. Click New. The system displays a blank Email Account form.

18. Create an email account record for your OAuth 2.0 IMAP server where the **Type** is IMAP.

   Use the same **Authentication** and **OAuth profile** settings as the OAuth SMTP email account.
Email accounts

Email accounts store the connection details and credentials the system uses to access external email servers and services.

By default, instances come with email accounts for ServiceNow-managed SMTP and POP3 servers to send and receive email. These accounts cannot be modified, but can be deactivated if you do not want to use them. To connect to other email servers and services you must create email accounts for them. You can create email accounts for servers and services that use these protocols:

- SMTP
- POP3
- IMAP

**Note:** The system only allows one SMTP email account to be active at a time and sends all email through this account. You can however receive email from multiple POP3 or IMAP accounts.

The system stores individual email accounts in the `sys_email_account` table. Create separate email accounts to send and receive email. Use `email properties` to define how the system processes email for all email accounts.

By default, the ServiceNow POP3 server provides each instance with its own mailbox at the address `instance@service-now.com`. Likewise, the ServiceNow SMTP server sends email from the address `instance@service-now.com`. To create another mailbox, provision your own POP3 or IMAP server and create an email account to the server on the instance. To change the sent from email address, update the address in the email account you use for sending email.

Emails received via a POP3 or IMAP server account are stored in the Email `[sys_email]` table and then deleted from the account.
A ServiceNow configured email account

Configure an email account
You can create email accounts in addition to the accounts provisioned for you.

- Role required: admin
- Email server: a compatible email server
  - SMTP
  - POP3
  - IMAP
**Warning:** An SMTP server that uses a localhost or loopback (127.0.0.1) IP address is not accepted as a compatible email server. For more information, see KB0724199.

1. Navigate to **System Mailboxes > Administration > Email Accounts**.
2. Click **New**.
3. Fill in the fields on the form (see table).

### Email Account fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to identify this Email Account.</td>
</tr>
</tbody>
</table>
| Type              | Mail server type. The choices are:  
|                   |  - Email Reader  
|                   |  - POP3  
|                   |  - IMAP  
|                   |  - Email Sender  
|                   |  - SMTP (only one active account permitted)  |
| Authentication    | The type of authentication used for the email account to connect to the email server. The choices are **Password**, **OAUTH**, and **OAUTH 2.0**. The Email - OAuth support for IMAP and SMTP plugin must be active for the OAuth options to be visible.  |
| OAuth Provider    | Select the OAuth application registry record for this account. This field appears if you selected **OAUTH 2.0**.  |
| Server            | Remote server to which this account connects. To activate a server for an on-premise installation, enter the full address (FQDN) of the node (for example, node.customerdomain).  |
| Active            | Determines if this Email Account is active. |
| ServiceNow Configured | Indicates if this account is provisioned by ServiceNow. This field is read-only. If you create an account, this option is not selected. |
| Email user label  | A display value used for outgoing messages. This field is for SMTP type accounts only. |
| User name         | The user name or ID to authenticate an email address. The value in this field is also the **From** address when the instance sends email. If you are using SMTP, this must be a full email address. The value in the **From** field can override this (for SMTP accounts).  |

**Note:** The address in the **From** field on the Notification form takes precedence over this field.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password</td>
<td>Password when <strong>Authentication</strong> type is <strong>Password</strong>. <strong>Note</strong>: You may need to increase the size of this field to accommodate longer passwords. By default, this field has a size of 40.</td>
</tr>
<tr>
<td>From</td>
<td>(SMTP only) The From address used for notifications sent with this account. This address takes precedence over the <strong>User name</strong> field. If nothing is present in this field, the User name is used as the return address for notifications sent from the instance.</td>
</tr>
<tr>
<td>Connection Security</td>
<td>The type of secure connection. Choose a setting:</td>
</tr>
<tr>
<td></td>
<td>• None: No secure protocol is used.</td>
</tr>
<tr>
<td></td>
<td>• STARTTLS: Upgrades an insecure connection to a secure connection using the SSL/TLS encryption protocol, if your email server supports TLS.</td>
</tr>
<tr>
<td></td>
<td>• SSL/TLS: Connect to an SSL/TLS encrypted port to secure the connection. Email is encrypted between the ServiceNow instance and your mail server.</td>
</tr>
<tr>
<td></td>
<td><strong>Warning</strong>: Selecting a less secure protocol like <strong>STARTTLS</strong> or <strong>None</strong> may expose your data. To better ensure the security of data in your email server, select <strong>SSL/TLS</strong>.</td>
</tr>
<tr>
<td>Port</td>
<td>Connection TCP port.</td>
</tr>
</tbody>
</table>
4. Click **Submit**.

5. Click the test connection link at the bottom to test the SMTP, POP3, or IMAP account.

   The system displays a pop-up window with the results of the connection test.

   ![Connection Test](image)

   **Connection Successful**

   If the test succeeds, click **Close** to return to the email account record. If the test fails, click **View Logs** to display more information about the test results.
The system uses the email account to send or receive email.

Enable the system to send or receive email.

*Multiple email readers*

Organize POP3/IMAP email accounts into email account groups (subsets of email accounts) that can be processed by multiple email reader jobs. To improve the performance of inbound email account processing, you can incrementally add email account groups and if needed, email reader jobs to process email account groups concurrently.

**How email account group processing works**

By default, the email reader job processes POP3/IMAP email accounts serially, which can result in longer processing times when you have many email accounts. It can also be difficult to identify any problematic email accounts that might contribute to slower processing times.

To reduce email account processing time, you can create one or more email account groups that contain subsets of your email accounts. Organizing your email accounts into groups enables the default email reader job to process each email account group separately. After creating one or more email account groups, you can then add another email reader job to process account groups concurrently.

Use the `glide.email.inbound.account_group_processing` system property to activate email account group processing.

During email account group processing:

- The system stores the email accounts in the Email Account Groups [sys_email_account_group] table.
- The default email reader job runs every two minutes. The email reader chooses the account group to be processed based on the account group processing state and the date and time that the group was last processed.
  - Claimed state: If an account group has a claimed state, the email reader is processing the account group. If you defined other email reader jobs, no other email reader job can claim the group for processing.
  - Unclaimed state: If an account group is unclaimed, the account group is available for processing by the email reader.
- The email reader job processes the email accounts contained in the selected account group.
- The email reader job chooses the next available account group for processing and continues processing that account group.

You can monitor the processing of each email account group by using the Email Account Groups [sys_email_account_group] table. Each account group record includes the processing duration (how long it takes for the email reader to process all the accounts in the group).

After you review the processing times for your email account groups, determine whether to make further adjustments in email account group processing. For example, you can create another email account group or create another email reader job to process your email account groups in parallel. You define additional email reader jobs using the Schedule [sys_trigger] table.

**Set up email account group processing**

To set up email account group processing, you must have the email_account_admin or admin role.

1. **Create email account groups.**

   Define one or more email account groups that contain a subset of your POP3/IMAP email accounts. Your base system includes a default email account group. Any POP3/IMAP accounts not contained in an email account group are processed as part of the default email account group.

2. **Enable email account group processing**
Navigate to sys_properties.list and locate the `glide.email.inbound.account_group_processing` system property. Set the Value to true. The email reader job starts processing the email account groups that you created.

3. **Monitor email account group processing.**

Check the status of your email account groups to see if processing time has been reduced. Determine whether the additional groups sufficiently reduce account processing time or consider adding another email reader job to further reduce processing time.

4. **Create an email reader job.**

As part of fine-tuning email account group processing, create an email reader job to process email account groups concurrently, in addition to the default email reader job.

Create email account groups
Define an email account group that contains a subset of your POP3/IMAP email accounts. The email reader job automatically processes each email account group as scheduled.

Role required: admin or email_account_admin

1. Navigate to **System Mailboxes > Administration > Email Account Groups** and click New.
2. Fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the account group.</td>
</tr>
<tr>
<td>Email Accounts</td>
<td>A subset of POP3/IMAP email accounts. Select the email accounts that make up the group.</td>
</tr>
<tr>
<td>Note:</td>
<td>When you add an email account to a group, it cannot be reused in other account groups.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that enables the email account group for processing. New account groups are active by default.</td>
</tr>
<tr>
<td>Default</td>
<td>Read only. Check box that indicates the account is the default email account.</td>
</tr>
<tr>
<td>Status</td>
<td>Read only. Processing state of the email account group: Unclaimed or Claimed.</td>
</tr>
<tr>
<td>Claimed by</td>
<td>Read only. ID of the email reader job currently in progress.</td>
</tr>
<tr>
<td>Last Processed</td>
<td>Read only. The last time that the email reader job processed this group.</td>
</tr>
<tr>
<td>Processing Duration</td>
<td>Read only. The length of time taken by an email reader job to process the account group.</td>
</tr>
</tbody>
</table>

3. Click Create.

The system updates the Email Account Group [sys_email_account_group] table with the new account group. Use the this table to monitor email account group processing.

- Review email account group processing.
- Determine if you want to continue fine-tuning email account processing. You could add another email account group or another email reader job to process email account groups concurrently.

Enable email account group processing
Enable the email reader job to start processing your email account groups so that you can reduce the time it takes to process inbound email accounts.
Create email account groups.

Role required: admin

1. In the Navigation filter, enter sys_properties.list.
   The entire list of properties in the System Properties [sys_properties] table appears.
2. On the list, find and open the glide.email.inbound.account_group_processing system property.
3. On the form, set the Value to true.
4. Click Update.

Check the status of your email account groups to see if processing time has been reduced. For more information, see Monitor email account groups.

To further reduce processing time, consider creating another email reader job to process inbound email accounts. For more information, see Create an email reader job.

Monitor email account groups

Use the Email Account Groups [sys_email_account] table to check the status of email account groups processed by email reader jobs.

1. Create email account groups.
2. Enable email account group processing.

Role required: email_account_admin or admin

1. Navigate to System Mailboxes > Administration > Email Account Groups.
2. Review the processing details for each account group:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the email account group.</td>
</tr>
<tr>
<td>Active</td>
<td>The operational state of the email account group. The value true indicates that the account is enabled for email account processing.</td>
</tr>
<tr>
<td>Claimed by</td>
<td>The ID of the email reader job if the job is running on the account group.</td>
</tr>
<tr>
<td>Default</td>
<td>The default indicator. The value true indicates that the email account group is the default.</td>
</tr>
<tr>
<td>Email Accounts</td>
<td>The names of the email accounts contained in the email account group.</td>
</tr>
<tr>
<td>Last Processed</td>
<td>The day and time that the email reader job last processed this account group.</td>
</tr>
<tr>
<td>Processing Duration</td>
<td>The length of time (in hours, minutes, seconds) to process the account group.</td>
</tr>
<tr>
<td>Status</td>
<td>Processing state of the email account group:</td>
</tr>
<tr>
<td></td>
<td>• Unclaimed: The account group is available for processing by the next email reader job.</td>
</tr>
<tr>
<td></td>
<td>• Claimed: An email reader job is processing the current account group.</td>
</tr>
</tbody>
</table>
If fine-tuning email accounts, consider doing one of the following:

- Create another email account group.
- Create another email reader job to process email account groups concurrently.

Create an email reader job

If you created email account groups to fine-tune inbound email account processing, you can create an email reader job to process those account groups concurrently, in addition to the default email reader job.

1. Create email account groups.
2. Enable email account group processing
Role required: email_account_admin or admin

1. In the Navigation filter, type `sys_trigger.list`.
2. In the `sys_trigger` table, select the Email Reader job record.
3. In the Email Reader job form:
   1. Enter a unique name for the email reader job to be added so that you can differentiate it from the default email reader job.
   2. If needed, change the time interval for this email reader job.
4. From the form context menu, click `Insert`.
   Another email reader job is created. This job runs concurrently with the default email reader job to process email account groups.

*Monitor email account group processing* and determine if the additional reader job reduces processing time. If needed, you can continue fine-tuning email account processing. For example, you might consider adding another email account group.

**Email properties**

The Email Properties page is where you can configure settings for inbound and outbound email.

Email properties are available from either of these modules:

- **System Mailboxes > Email Properties**
- **System Properties > Email Properties**
Email accounts are configured in the **System Mailboxes > Administration > Email Accounts** module. For more information and instructions, see *Configure an email account*.

Email diagnostics are available from the **System Mailboxes > Email Diagnostics** module.

> **Note:** To learn more about the security properties that affect email processing, see *Email security (instance security hardening)* and *SMTP authentication (deprecated)* in the Instance Security Hardening Guide.

Outbound mail configuration

The **Outbound Mail Configuration** section of the Email Properties page contains properties for sending email.
Outbound Email Configuration

Email sending enabled  
☑ Yes | No

Send all email to this test email address (non-production testing)  

Append timezone to dates and times in sent email  
☑ Yes | No

Create visible watermark in sent email. If false, create invisible watermark via hidden div tag.  

☑ Yes | No

Resend email if server returns these SMTP error codes  
421,450,451,452

Do not resend email if server returns these SMTP error codes  
500,501,502,503,504,550,551,552,553,554

Resend email when server returns unknown SMTP error codes.  
☑ Yes | No

Roles that can view email in the Activity formatter when including "Sent/Received Emails"  
itil

Number of journal entries (Additional comments, Work notes, etc.) included in email notifications (-1 means all).  

Outbound email properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>

## Inbound email properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.read.active</td>
<td>Email receiving enabled</td>
<td>Specifies whether to enable or disable the inbound mail server.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td>glide.email.reply_subject_prefix</td>
<td>Identify email as a reply by these subject prefixes</td>
<td>Specifies the comma-separated list of prefixes in the subject line that identify an email reply.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: re:, aw:, r:, Accepted:, Tentative:, Declined:</td>
</tr>
</tbody>
</table>

**Note:** The case of the reply prefix in the email, for example RE:, must exactly match the case of the prefixes defined in this property. If, for example, an email contains the Re: prefix and only RE: is defined in the property, the email will not be recognized as a reply. Therefore, it is a best practice to define multiple versions of the prefix, including mixed-case versions, such as RE:, Re:, and so on.
<table>

|                              |                                                 | • Default value: 

-----Original Message-----,

 _____

From:                                                                                                                                                                                                                                                                                                                                 |

**Note:** Some email service providers don't support this default format. If your reply emails aren't formatting as expected, edit this property manually.
### Property | Label | Description
--- | --- | ---
`glide.pop3readerjob.create_caller` | Automatically create users for incoming emails from trusted domains | Controls the behavior when an instance receives an email from an email address not associated with a user record. If this property is set to `true`, the instance creates a new user record for the email address and places that new user in the `Caller` field of any tickets created. If the property is set to `false`, the instance places `Guest` in the `Caller` field of any tickets created.
- **Type:** true | false
- **Default value:** false
- **Learn More:** Enabling Automatic User Creation

`glide.user.default_password` | Default password for users created from email sent from trusted domains. (must reset upon login) | Specifies the password for new users created from incoming email. Users must reset the password at first login.
- **Type:** string
- **Default value:** password
- **Learn More:** Enabling Automatic User Creation

`glide.user.trusted_domain` | Trusted domains when creating users from incoming email. | Comma-separated list of trusted domains for which the instance automatically creates a user based on incoming emails. Use an asterisk (*) to trust all domains. If an email is not from a trusted domain, the instance processes the inbound email as a “guest user” but it does not create a guest user in the instance.
- **Type:** string
- **Default value:** asterisk (*)
- **Learn More:** Enabling Automatic User Creation

---

**Note:** To learn more about the security properties that affect email processing, see *Email security (instance security hardening)* in the Instance Security Hardening Guide.

**Email image filtering properties**

Use email image filtering properties to control how inbound email images attach to a target record.

When a user sends an email to the system, email images (such as logos or email signatures) attach to the target record by default. These images are also visible in the activity stream of the target record. The system then replicates these images, which can cause duplicate image attachments to the target record and also duplicate images in the activity stream.

To filter images from emails and reduce duplicate image attachments to target records, configure the following properties in the System Properties [sys_properties] table. Use these properties to:
• Specify the email image sizes eligible for filtering.
• Choose an action that controls image attachment behavior and image visibility in the activity stream.

**Note:** These properties do not delete attachments. You can verify attachment records in the Attachments [sys_attachment] table.

### Email image filtering properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.inbound.image_sys_attachment.filter.minimum_bytes</td>
<td>Sets the minimum image size in bytes for inbound email images to attach to the target record. Any image that is below this size limit is subject to the image filtering behavior that you set in the glide.email.inbound.image_sys_attachment.filter.action property. To disable image filtering entirely and attach all email images to the target record, set the minimum byte size to 0.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Type: Integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 0</td>
</tr>
<tr>
<td>glide.email.inbound.image_sys_attachment.filter.action</td>
<td>Specifies the image filtering behavior.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Regardless of the action you select, the image is visible when you choose to Preview HTML Email or Show Email Details in the activity formatter.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Type: Choice list</td>
</tr>
<tr>
<td></td>
<td>• AttachTarget - Associate the image to the target record. The image is visible in the activity formatter and in the attachment to the target record.</td>
</tr>
<tr>
<td></td>
<td>• AttachEmail - Attach the image to the email record. The image is not visible in the activity formatter of the target record nor in the attachment to the target record.</td>
</tr>
<tr>
<td></td>
<td>• AttachNone - Do not attach the image to a record. You can select this option to attach the image manually at a later time.</td>
</tr>
<tr>
<td></td>
<td>• Default value: AttachTarget</td>
</tr>
</tbody>
</table>

### Email digest properties

Several properties are available to manage digest intervals for email digests.

The following properties are available for the *email digest feature*.

**Note:** To open the System Properties [sys_properties] table, enter sys_properties.list in the navigation filter.
### Properties for email digest intervals

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.digest.default_interval</td>
<td>The sys_id of the default email digest interval available to users.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: string</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value</strong>: 28d157e07f1332007f005212bdfa9116</td>
</tr>
<tr>
<td></td>
<td>• <strong>Location</strong>: System Property [sys_properties] table</td>
</tr>
<tr>
<td>glide.email.digest.max_intervals</td>
<td>The maximum number of email digest intervals that can be defined.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value</strong>: 100</td>
</tr>
<tr>
<td></td>
<td>• <strong>Location</strong>: System Property [sys_properties] table</td>
</tr>
</tbody>
</table>

*Learn more: For details on digest intervals, see Create or modify email digest intervals.*

### Additional email properties

There are several advanced email properties that you can use to fine tune the way your instance sends or receives email.

You must add these properties to the System Property [sys_properties] table before they can be used to overwrite the defaults.

**Additional properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.glide.email.max_read</td>
<td>Specifies the maximum number of emails a POP3 reader should process concurrently.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: integer</td>

<td>• Inline: Store the calendar data as text in the email Body field.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: Attach</td>
</tr>
<tr>
<td>glide.email.inbound.convert_html_inline_attachment_references</td>
<td>Specifies whether to convert inbound email HTML so email images appear in the email HTML body preview. The system displays broken cid (content ID) links in place of images received when this property is disabled. The format in which the system displays an email image depends on the property setting at the time the email is received, not the current property setting.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td>glide.email.inbound.generate.missing.html.part</td>
<td>Enables the system to generate HTML text for inbound emails that contain only a plain text message.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td>glide.email.inbound.generate.missing.text.part</td>
<td>Enables the system to generate plain text for inbound emails that contain only an HTML message.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td>glide.email.inbound.max_attachment_count</td>
<td>Sets the maximum number of attachments allowed per inbound email. This property is available starting with the Eureka Patch 4 release.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 30</td>
</tr>
<tr>
<td></td>
<td>• Location: System Property [sys_properties] table</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| glide.email.inbound.max_body_chars           | Sets the maximum body size in characters allowed per inbound email.  
  - Type: integer  
  - Default value: 524288                                                                 |
| glide.email.inbound.max_total_attachment_size_bytes | Sets the maximum total attachment size in bytes allowed per inbound email. This property is available starting with the Eureka Patch 4 release.  
  - Type: integer  
  - Default value: 18874368  
  - Location: System Property [sys_properties] table |
| glide.email.mail_to                          | Specifies the email address for sending notifications that use the ${mailto:} variable.  
  - Type: string  
  - Default value: SMTP email address that is active by default                                                                                   |
| glide.email.name_split                       | Specifies the delimiter used between first and last names in an email address. For example, a delimiter of "," (period) in the email address john.smith@company.com tells the system to look for a user record for John Smith.  
  - Type: string  
  - Default value: period (.)                                                                                                                       |
| glide.email.notification.save_when_no_recipients | Controls whether a notification-generated sys_mail record is saved even if there are no recipients. Used in conjunction with other notification recipient logging properties, this property enables troubleshooting problems with notifications.  
  - Type: true | false  
  - Default value: false                                                                                                                          |
| glide.email.outbound.header.auto_submitted   | Stores the value used in the "Auto-submitted" outbound email header. Clear the property value to remove the "Auto-submitted" header from all outbound emails. Some spam filters flag auto-generated email as spam.  
  - Type: string  
  - Default value: auto-generated                                                                                                                   |
| glide.email.outbound.max_attachment_count    | Sets the maximum number of attachments allowed per outbound email. This property is available starting with the Eureka Patch 4 release.  
  - Type: integer  
  - Default value: 30  
  - Location: System Property [sys_properties] table                                                                                               |
<table>
<thead>
<tr>

</tbody>
</table>
### Property | Description
---|---
**glide.smtp.timeformat** | Specify the time format to use for outgoing email notifications.  
  • Type: string  
  • Default value: time format listed in email sender's user record \([sys_user.time_format]\)

**glide.ui.activity.email.use_display** | Specifies whether to display email addresses or user IDs (display value from the User table) in email headers. If true, the instance searches for a user record with a matching email address. If it cannot find a matching user record, it displays the email address.  
  • Type: true | false  
  • Default value: false

**glide.ui.email_client.email_address.disambiguator** | Sets the columns from the User \([sys_user]\) table that the autocomplete list displays. Separate each column name with a semicolon character (;).  
  • Type: string  
  • Default value: name  
  • Learn more: Displaying Additional Information in the Email Client Autocomplete

**glide.ui.incident_activity.max_addresses** | Specifies the maximum number of addresses to list in an email audit record. If the number of addresses exceeds this limit, the instance truncates the list after the maximum value and displays an ellipsis character (...).  
  • Type: string  
  • Default value: 5

**NotifyAffectedCI.max_rel_level** | Sets a value used by the **Affected ci notifications** business rule, which notifies subscribers when configuration items (CIs) are affected by tasks. The business rule generates notifications for parent CIs up to the level defined by this property. You might need to adjust the property value according to the complexity and depth of your CI relationships.  
  • Type: integer  
  • Default value: 5

---

**Email size limits**

To prevent issues with large email messages, the system enforces configured limits on the maximum allowed email body size, total attachment file size, and number of attachments per email.

An email or attachment that exceeds the system capacity may not be processed as expected. To ensure that your emails and attachments are processed as expected, you can configure properties that limit the size of emails and attachments.

**Message body size limit properties**  
Add properties to control the maximum email body size allowed for inbound and outbound email messages.
Properties

By default, the system processes up to 524,000 characters in the email body and body_text fields (524 KB each).

You can add and configure system properties glide.email.inbound.max_body_chars and glide.email.outbound.max_body_chars to increase or decrease the email body size limits. The system truncates the email body when it exceeds the configured limit. For example, if you configure the body size limit of glide.email.inbound.max_body_chars to 1,000 characters but receive an inbound email that is 2,000 characters, then the system truncates the email body at 1,000 characters.

Also note that the system cannot process email body or body text larger than 16 MB.

Message body size limit properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.inbound.max_body_chars</td>
<td>Sets the maximum body size in characters allowed per inbound email.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 524288</td>
</tr>
<tr>
<td>glide.email.outbound.max_body_chars</td>
<td>Sets the maximum body size in characters allowed per outbound email.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 524288</td>
</tr>
</tbody>
</table>

Note: A different property, com.glide.attachment.max_size, sets the maximum file size allowed for any attachment in the system and overrides any larger values of glide.email.inbound.max_total_attachment_size_bytes and glide.email.outbound.max_total_attachment_size_bytes.

Inbound email body processing

For inbound emails, the system enforces the maximum body size as set by the glide.email.inbound.max_body_chars property. When the body size exceeds the configured value:

• The system does not run inbound email actions that would otherwise be triggered by the email.
• The system truncates the Body text on the Email form.
• The system logs a warning and sets the Error string field on the Email form. The log message for such an email might look like this: Email set to receive-ignored because its size exceeds the value set in glide.email.inbound.max_body_chars. 1995 character(s) were truncated from the body field.

Outbound email body processing

For outbound emails, the system enforces the maximum body size as set by the glide.email.outbound.max_body_chars property. When the body size exceeds the configured value:

• The system does not send the email.
• The system truncates the Body text on the Email form.
• The system logs a warning and sets the Error string field on the Email form. The log message for such an email might look like this: Email set to send ignored because its size exceeds the value set in glide.email.outbound.max_body_chars. 1337 character(s) were truncated from the body field.

Attachment limit properties
Several properties control email attachment limits.

Properties

All the properties are located in the System Property [sys_properties] table. Setting any of the following properties to an excessively large value may cause performance issues.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>glide.email.inbound.max_attachment_count</strong></td>
<td>Sets the maximum number of attachments allowed per inbound email.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value</strong>: 30</td>
</tr>
<tr>
<td></td>
<td>• <strong>Learn more</strong>: Inbound Email Attachment Processing</td>
</tr>
<tr>
<td><strong>glide.email.inbound.max_total_attachment_size_bytes</strong></td>
<td>Sets the maximum total attachment size in bytes allowed per inbound email.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value</strong>: 18874368</td>
</tr>
<tr>
<td></td>
<td>• <strong>Learn more</strong>: Inbound Email Attachment Processing</td>
</tr>
<tr>
<td><strong>glide.email.outbound.max_attachment_count</strong></td>
<td>Sets the maximum number of attachments allowed per outbound email.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value</strong>: 30</td>
</tr>
<tr>
<td></td>
<td>• <strong>Learn more</strong>: Outbound Email Attachment Processing</td>
</tr>
<tr>
<td><strong>glide.email.outbound.max_total_attachment_size_bytes</strong></td>
<td>Sets the maximum total attachment size in bytes allowed per outbound email.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value</strong>: 18874368</td>
</tr>
<tr>
<td></td>
<td>• <strong>Learn more</strong>: Outbound Email Attachment Processing</td>
</tr>
</tbody>
</table>

Note: A different property, com.glide.attachment.max_size, sets the maximum file size allowed for any attachment in the system and overrides any larger.
Inbound email attachment processing

For inbound emails, the system enforces the maximum number and size of attachments as set by the `glide.email.inbound.max_attachment_count` and `glide.email.inbound.max_total_attachment_size_bytes` properties. When the attachments for an inbound email exceed either value, the system logs a warning and discards the excess attachments. The order in which the system processes the attachments determines which attachments are discarded. This order may not be consistent from email to email.

Outbound email attachment processing

For outbound emails, the system enforces the maximum number and size of attachments as set by the `glide.email.outbound.max_attachment_count` and `glide.email.outbound.max_total_attachment_size_bytes` properties. Email records are created from various sources and may exceed the configured attachment limits.

Emails that are ready to be sent from the Email [sys_email] table are subject to the outbound attachment limits. Emails that exceed either limit trigger a warning in the email system log and are sent with attachments up to the maximum number or total file size.

The log message for such an email might look like this: **Maximum combined attachment size exceeded. (max:15728640 bytes). One or more attachment records ignored.**

Emails for notifications, scheduled reports, and exported tables

Notifications can be set to include all the attachments from the record that triggers the notification. If the attachments exceed either of the outbound email attachment limits, the system excludes the excess attachments from the email and logs a warning message.

Reports can be scheduled for email distribution as attachments. Large reports may exceed the outbound attachment size limit. In this case, the system sends the scheduled report email without the report attached and logs a warning message. To avoid the issue, send links to large reports instead of sending the reports as attachments.

If a user attempts to export numerous records from a list that exceeds a configured warning threshold, a dialog box offers the option to email the exported records as an attachment. If the attachment exceeds the outbound attachment size limit, the system sends the email without the exported record list attached and logs a warning message.

Domain separation and Notifications

This is an overview of domain separation and the Notifications application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Level 2

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation Application support for domain.

Domain separation is specifically supported in Notifications but not in email accounts. Notifications are not data-separated but they are process-separated. Notifications are also triggered by specific actions.
How domain separation works in Notifications

There are two basic components of domain separation and Notifications.

- Notifications are process-separated (not data-separated).
- Notifications are triggered in two main ways:
  1. When a record is Inserted or Updated
     a. Notifications with matching conditions AND in the same domain as the inserted/updated record are processed.
  2. When an event defined in the notification is triggered
     a. Events typically have a target record. For example, [incident.inserted] event references the incident record being inserted.
     b. When an event is fired, notifications configured for that event in the same domain as the event’s target record are processed.

Domains and email accounts

Domain separation is not supported in email accounts for these reasons:

1. Sending mail: There is only one SMTP sender per account. This prohibits providing domains for each account, and they are not configurable.

2. For receiving Inbound mail: You can set up multiple email accounts but cannot meaningfully set the domain of an inbound email action. Inbound Actions are processed in the domain of the user who sent the email. For example: User_A in Domain A sends an email to a ServiceNow email account which executes the “Create an incident” inbound email action. The resulting new incident created by the inbound action is in Domain A.

To learn more see Inbound email actions.

Note: If the number of email accounts exceeds 20, reception of email slows down.

Use case

- If an instance is using the Domain separation plugin and a new email notification is defined for a domain that has the same event as the notification on the global domain, the user receives two emails for the same event.

  Solution: Set the [sys_overrides] field on the notification that belongs to the domain so it overrides the setting on global. For more information, see Delegated administration.

Next steps after enabling email

After enabling email on your instance, consider performing several of these important tasks.

- Test the email configuration by routing all email to a single user (set the glide.email.test.user property).
- Review the baseline notification categories, email notifications, and templates to determine if they meet your business needs.
- Review the baseline inbound email actions to determine if they meet your business needs.
- Determine if you want to use email layouts to add consistent content elements.
- Determine if you want to use email filters to restrict the email the instance receives.
• Determine if you want to implement a retention policy to archive and destroy email at certain intervals.
• Determine what kind of watermarks outbound email uses to associate records with email messages.
• Determine if you want to create users when the instance receives an email from an unrecognized user.
• Set the precedence of outgoing mail. By default, the instance sends email with a precedence of bulk (set the glide.smtp.precedence_bulk property).
• Consider preventing untrusted users from triggering inbound actions to prevent unwanted email from affecting your instance.
• Implement a spam filter to restrict unwanted messages sent to your custom email addresses.

Create notification categories
You can create notification categories to identify and group related notifications that are listed in the notification settings for your users.

Role required: admin
Before adding new categories, review the base system notification categories in the Notification Categories [sys_notification_category] table to determine if you need a new category.

1. Navigate to System Notification > Email > Notification Categories.
2. Click New.
3. Enter the Name of the category to identify the family of notifications. Provide a category name that is meaningful to your users, so that they can easily find their notifications under the appropriate category in their notification settings.
4. Enter a Short description to identify the category.
5. Click Submit.

The system adds the new category to the Notification Categories [sys_notification_category] table. After you create at least one, active notification that uses the new category, the category and notification are listed in the notification settings for users (Notifications tab in the System Settings window).

Create an email notification
Creating an email notification involves specifying when to send it, who receives it, what it contains, and if it can be delivered in an email digest.

Role required: admin
Consider the following items when you create or update a notification:
• Your notification recipients must be active users and have a valid email address defined.

ServiceNow users or members of groups must be defined as active users in the User [sys_user] table. They must also have a valid email address defined for their primary channel (device) in the Notification Device [cmn_notif_device] table. If users do not have an active profile and a valid email address, they will not receive notifications.
• Your notification recipients must have the appropriate notification preferences enabled.

If the notification is subscribable, each ServiceNow user or group member must have the notification and channels (devices) for the notification enabled in their notification preferences. Admins can impersonate users to review and configure their notification preferences.
• To have your email notification also send as an SMS notification, recipients must subscribe to the notification on an SMS channel. For more information on creating an SMS channel, see Create notification channels.
• After you create or update the notification, use the Preview Notification option to examine it. For example, you can test links that you may have added and verify the notification recipients. For details, see Preview email notifications.
Use the following tabs in the Notification form to configure an email notification:

- **When to send** — Conditions required to send the notification.
- **Who will receive** — Recipients of the notification.
- **What it will contain** — Contents of the notification.
- **What Digest will contain** — Contents of the email digest if the notification can be delivered in a digest.

**Note:** If you do not see all the fields on the form, switch to the Advanced view.

Watch this six-minute video to learn about the actions that the instance can take in response to messages from users and shows how to create or modify email notifications to users. In the video, skip to 3:29 for details on configuring email notifications.

1. Navigate to **System Notification > Email > Notifications**.
2. Click **New**.

3. Fill in the fields at the top of the Notification form, as appropriate.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the email notification. Descriptive names help identify the purpose of the email notification. For example, Incident Opened &amp; Unassigned.</td>
</tr>
</tbody>
</table>
| Table      | Select the database table to link the notification to, for example Incident [incident].  

**Attention:** Do not select the Task [task] table. This table is for extending other tables. Notifications that run on the Task table directly are not supported.  

**Note:** Only tables and database views that are in the same application scope appear in the list. |
| Type       | Select the type of notification you are creating: EMAIL or Meeting Invitation.  

**Note:** Do not leave the category as Uncategorized, as users may not be able to find the notification in their list of notifications.  

If you need a new category, see Create notification categories. |
| Active     | Select the check box to enable the email notification.  

| Category   | Category to which this notification belongs. A category identifies and groups related notifications. This notification, if active and subscribable, is listed in the selected Category in the notification preferences for each user (Notifications tab in the System Settings window).  

**Note:** Do not leave the category as Uncategorized, as users may not be able to find the notification in their list of notifications.  

If you need a new category, see Create notification categories. |
| Allow Digest | Select the check box if an email digest is to be created for the notification. If selected, the What Digest will contain tab is displayed for creating the digest content. |
| Description | Type a description for this notification.  

4. Fill in the fields on the **When to send** tab.
**Note:** If the same trigger generates multiple notifications, the system only sends one notification. The system considers all other notifications, even if they have a different subject and body, as duplicates. The Ignore Duplicates business rule controls this functionality.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send when</td>
<td>Select under what condition the notification is sent:</td>
</tr>
<tr>
<td></td>
<td>• When a record is inserted or updated</td>
</tr>
<tr>
<td></td>
<td>• When a particular event is fired</td>
</tr>
<tr>
<td></td>
<td>• When triggered as an action step in Flow Designer</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Weight</td>
<td>[Required] Set a numerical value for the notification priority relative to duplicate notifications. Notifications that have the same target table and recipients, or the same subject and body, are considered duplicates. When there are duplicate notifications, the system only sends the notification with the highest weight. All other notifications are moved from the Outbox to the Skipped mailbox. The default value 0 causes the system to always send the notification (assuming the conditions are met). For example, suppose that a service desk agent adds a comment to an incident and shortly thereafter closes it. By default, these actions trigger both the Incident commented and Incident Closed notifications. However, both notifications are from the Incident table and also notify the incident caller. The system only sends the notification with the highest weight, which in this case is the Incident Closed notification.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Use the condition builder to select the conditions under which this notification is sent. For example, select <strong>Priority &gt; greater than &gt; 3 - Moderate</strong> to send the notification only for High and Critical priority incidents.</td>
</tr>
<tr>
<td>Inserted</td>
<td>Select the check box to enable email notification when a record is inserted. This field appears when you set the <strong>Send when</strong> field to <strong>Record inserted or updated</strong>.</td>
</tr>
<tr>
<td>Updated</td>
<td>Select the check box to enable email notification when a record is updated. This field appears when you set the <strong>Send when</strong> field to <strong>Record inserted or updated</strong>.</td>
</tr>
<tr>
<td>Event name</td>
<td>Select the event that triggers this notification. This field appears when you set the <strong>Send when</strong> field to <strong>Event is fired</strong>.</td>
</tr>
</tbody>
</table>
Create a script to perform certain actions, like sending a notification based on the current email record, changing field values, or changing system properties.

The advanced condition script must return `true` or set a global answer variable to `true` to send the notification.

The advanced condition script uses the following global variables:
- `current`: Contains the current record from the table to which the notification is linked.
- `event`: Contains the event that triggered the notification.

**Note:** The Advanced condition field is evaluated in addition to other conditions you set on the notification. Both the condition and advanced condition must evaluate to `true` to send the notification.

5. Fill in the fields on the **Who will receive** tab.

The following example shows the default view of the tab. The advanced view contains additional fields (see table).

**Tip:** Consider limiting the recipient list of any notification to 1000 users. By default, if a notification has more than 100 intended recipients, the system creates multiple notification messages with up to 100 recipients each. If you want to change the recipient limit, set the system property `glide.email.smtp.max_recipients`.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced condition</td>
<td>Create a script to perform certain actions, like sending a notification based on the current email record, changing field values, or changing system properties. The advanced condition script must return <code>true</code> or set a global answer variable to <code>true</code> to send the notification. The advanced condition script uses the following global variables: <code>current</code>: Contains the current record from the table to which the notification is linked. <code>event</code>: Contains the event that triggered the notification. <strong>Note:</strong> The Advanced condition field is evaluated in addition to other conditions you set on the notification. Both the condition and advanced condition must evaluate to <code>true</code> to send the notification.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users</td>
<td>Select the users you want to receive the email notification. You can search for users with the reference lookup icon or manually add their email addresses. This list of users is static.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Users/groups in fields</td>
<td>Select fields from the target record that reference the User [sys_user] or Group [sys_user_group] tables. The system sends the notification to users or groups in each field that you select. For example, if a notification uses the Incident [incident] table, you can select the Opened by field to send the notification to users or groups who opened the incident. This list of users or groups is variable and depends upon the values of the associated task record. You can also select a field that includes an email address string to send a notification to that address. Note: You can dot-walk to values in reference fields by clicking the plus sign in the field selector and then selecting the related field. If you address the notification to a user with an inactive record in the User [sys_user] table, the system does not send the notification to that user.</td>
</tr>
<tr>
<td>Groups</td>
<td>Select the groups you want to receive the email notification. You can search for groups with the reference lookup icon or by manually entering the group name. This list of groups is static. Note: Group members receive individual notifications only if Include members is selected in the group record.</td>
</tr>
<tr>
<td>Exclude delegates</td>
<td>Select this option to prevent the instance from sending email notifications to delegates of the users and members of the groups you selected.</td>
</tr>
<tr>
<td>Send to event creator</td>
<td>Select this check box to send the notification to the person who performed the action that started the notification process if the person is also a recipient. If the event creator is not specified in one of the recipient fields, the event creator does not receive a notification regardless of the setting in this field. For new notifications, this option is selected by default. If you want to know why you may not be receiving certain email notifications, see the blog post Troubleshooting email notifications - Send to the Event Creator by a ServiceNow Technical Support Engineer in the ServiceNow Now Community.</td>
</tr>
<tr>
<td>Event parm 1 contains recipient</td>
<td>Select this check box if the event parameter 1 contains one or more notification recipients (in a comma separated-list). This field is visible only when the Send when field is set to Event is fired.</td>
</tr>
<tr>
<td>Event parm 2 contains recipient</td>
<td>Select this check box if the event parameter 2 contains one or more notification recipients (in a comma-separated list). This field is visible only when the Send when field is set to Event is fired.</td>
</tr>
</tbody>
</table>
The system does not exclude recipients based on access controls. Recipients can receive email about records that they cannot normally access from the user interface. For example, requesters can receive email about incidents and catalog requests opened on their behalf even though they normally do not have access to these records. If a notification includes record details, verify that all recipients need these details.

**Note:** By default, the system does not send email notifications to itself. For example, an email notification from instanceABC@service-now.com does not send to instanceABC@service-now.com. The system prevents this behavior to avoid looping.

6. Fill in the fields on the **What it will contain** tab.

   The following example shows the default view of the tab. The advanced view contains additional fields (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Email template  | If you want to reuse existing content, select an email template to add content to the email notification. You can only select an email template that meets one of the following conditions:  
* shares the same scope and table as the notification  
* shares the same scope but has no specified table  
* shares the same table and is in the global scope   |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subject</td>
<td>Enter the subject line for the email message. The subject can include variables from the Select variables column. If empty, the system uses the Subject value from the Email template. If you enter a value in this field, it overrides the template value. If your recipients subscribe to the email notification on an SMS channel, then the system sends the email notification subject as an SMS message. To send a different SMS message, fill in the SMS alternate field on the email template form or the email notification form.</td>
</tr>
<tr>
<td>Message HTML</td>
<td>Enter the content of the email notification message. The message can include variables from the Select variables column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. The Message HTML field is visible only if you set the content type to HTML and plain text or HTML only. If empty, the system uses the Message HTML value from the Email template. If you enter a value in this field, it overrides the template value. To prevent adding extra &lt;p&gt; and &lt;div&gt; elements to your email notifications, see the blog post Extra line spacing with paragraph tags in email client by a ServiceNow employee in the ServiceNow Now Community.</td>
</tr>
<tr>
<td>SMS alternate</td>
<td>Enter the notification message to send to an SMS device. The SMS alternate message is limited to 140 characters. If empty, the system uses the SMS alternate value from the Email template. If you enter a value in this field, it overrides the template value. If you don't fill in the SMS alternate field on this form or the email template, then the system uses the email notification subject as the SMS message.</td>
</tr>
<tr>
<td>Importance</td>
<td>Set the importance of the email message to low or high.</td>
</tr>
<tr>
<td>Content type</td>
<td>Select the content type for the email notification: HTML and plain text, HTML only, Plain text only. By default, HTML only is enabled.</td>
</tr>
<tr>
<td>Include attachments</td>
<td>Select this check box to send all attachments from the triggering record as email attachments.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Omit watermark</td>
<td>Use this check box to apply or remove the watermark attached to each email. If the email does not contain a watermark, the system reviews the conditions of the inbound actions to create or update task records. For more information, and an alternative way to hide watermarks, see <a href="#">Watermarks on notification emails</a>.</td>
</tr>
<tr>
<td>Message Text</td>
<td>Enter the notification message to send in plain text. This field appears when you set the content type to <a href="#">HTML and plain text</a> or <a href="#">Plain text only</a>. If empty, the system uses the Message Text value from the Email template. If you enter a value in this field, it overrides the template value.</td>
</tr>
<tr>
<td>From</td>
<td>Enter the email address that you want the email notification to use in the From field. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email must be in a valid format, otherwise a notification message appears near the field. Changing this address may require an advanced email setup such as enabling email forwarding, for example when using Sender Policy Framework (SPF) records for spam detection.</td>
</tr>
<tr>
<td>Reply to</td>
<td>Enter the email address you want people to use when replying to the email notification. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email must be in a valid format, otherwise a notification message appears near the field. You can add no more than one email address in this field. Changing this address requires an advanced email setup such as enabling email forwarding.</td>
</tr>
<tr>
<td>Push message only</td>
<td>Select this option to send this notification only as a push notification to a mobile device. The Push Notification feature must be active.</td>
</tr>
<tr>
<td>Push messages</td>
<td>Associate one or more push messages with this notification. The Push Notification feature must be active.</td>
</tr>
</tbody>
</table>

7. If you selected the **Allow Digest** check box, fill in the fields on the **What Digest will contain** tab to create the email digest content for the notification. The following example shows the default view of the tab. The advanced view contains additional fields (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digest Template</td>
<td>If you want to reuse existing content, such as headers or footers, select an email template to add content to the email digest.</td>
</tr>
<tr>
<td>Digest Subject</td>
<td>Enter the subject line for the email digest. The subject can include variables from the Select variables column.</td>
</tr>
<tr>
<td></td>
<td>If empty, the system uses the Subject value from the Email template. If you enter a value in this field, it overrides the template value.</td>
</tr>
<tr>
<td>Digest HTML</td>
<td>Enter the recurring content for the email digest. The digest content can include variables from the Select variables column.</td>
</tr>
<tr>
<td></td>
<td>Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes.</td>
</tr>
<tr>

</tr>
</tbody>
</table>
When you save or update the notification, the *email Digest option is available for the notification* in the notification settings of your users.

8. When you finish creating the notification, click **Submit**. Or, if you are done modifying the notification, click **Update**.

Use the **Preview Notification** option to **check your notification**. For example, you can see:

- How the **Subject** and **Message** fields are displayed.
- Which users will or will not receive the notification, including the reasons why users will not receive it.

*Convert legacy email notifications to rich HTML*

By default, new email notifications are created in the rich HTML format. But you can also convert legacy notifications to rich HTML.

Role required: admin

1. Navigate to **System Notification > Email > Notifications**.
2. On the **Email Notifications** list screen, click the name of the email notification you want to convert.
3. Click the **What it will contain** tab.
You have been assigned to complete tests on $metric_type$. Please follow the link below and complete the tests by $due_date$. You can save your results until you are ready to submit them. When you have completed the test, and filled in all final results, submit the test.

Click here to begin the test:

```html
<mail_script>
var link = new AssessmentUtil().getAssessmentInstanceURL(current_sys_id);
var url = "a.href=" + link + "";template.print(url);
</mail_script>

To view your test queue at any time, sign in and navigate to Sell > My Tests.
4. Click **Switch to Rich HTML Editor**.

The system copies any raw HTML from the **Message** field and converts it to rich HTML in the **Message HTML** field. Additionally, any mail scripts in the body are automatically saved to the Email Script [sys_script_email] table and are replaced in the notification body with an embedded script tag. This makes the notification body easier to read.
<table>

You have been assigned to complete tests on $(metric_type). Please follow the link below and complete the tests by $(due_date). You can save your results until you are ready to submit them. When you have completed the test, and filled in all final results, submit the test.

Click here to begin the test:
$(mail_script:Notify test case user_script_1)

To view your test queue at any time, sign in and navigate to Self-Service > My Tests.
When you convert an email notification that was created in a version prior to Eureka to rich HTML, mail scripts are automatically moved to the Email Script [sys_script_email] table and an embedded script tag with the name of the script is automatically inserted into the body of the notification.

When creating new email notifications, write mail scripts using System Notification > Email > Notification Email Scripts. When the scripts are completed, add a $\{\text{mail_script:script name}\}$ embedded script tag to the email notification body. This makes it easy to use the same scripts in multiple email notifications. All you need to do is copy and paste from one notification to the next is the embedded script tag.

If you manually enter a mail script, any text bounded by <mail_script> </mail_script> in the body of a new or converted email notification or template which is saved to the record, a message asks whether the mail script should be converted.

In many cases, an unconverted mail script fails to run from inside the HTML editor. If you select Yes, the script is added to the Email Script [sys_script_email] table and is automatically replaced in the body with an embedded script tag. You can view the mail scripts in their original form by opening the email notification and clicking the Show Notification Scripts related link.

Control visibility to email records generated by notifications

Define conditions that restrict read access to target email records containing sensitive information.

Role required: admin

Use the Email Access Restriction [email_access_restriction] table to define conditions that control read access to an email record generated by a notification containing sensitive information. These conditions are processed by the base system ACL for the Email [sys_email] table.

When you specify conditions to restrict access for a notification, the email records are visible only to users that match the conditions specified for the notification.

1. Navigate to System Notification > Email Access Restriction.
2. Click New.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notification</td>
<td>Choose the notification that generates the email record that should be restricted.</td>
</tr>
</tbody>
</table>
### Application Table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Displays the application scope.</td>
</tr>
<tr>
<td>Table</td>
<td>Displays the target table for the notification that you selected.</td>
</tr>
<tr>
<td>Condition</td>
<td>Use the condition builder to determine who can access the email record. The conditions must evaluate to true to enable read access to the email record.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a short description of the read access restriction.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Advanced conditions for email notifications**

Use an advanced condition to send a notification based on the current email record, changing field values, or system properties.

To send a notification using an advanced condition, you can:

- Call a function that returns a value, or
- Set the global variable `answer` using a script

For example, in the following code, you call a function to prevent the system from sending an email notification if the sender of a self-service request is a member of the XYZ group:

```javascript
(function() {
    var groupMember = gs.getUser();
    return !groupMember.isMemberOf('XYZ');
})();
```

Alternatively, you can script the same advanced condition by using the `answer` variable:

```javascript
var groupMember = gs.getUser();
if(groupMember.isMemberOf('XYZ')){
    answer = false;
} else {
    answer = true;
};
```

Note that the script must set the `answer` variable to **true** to send the notification. If you script no conditionals, the value of `answer` is equal to the last value that you set for the variable.

You can add a script-based condition in the **Advanced condition** field by configuring the Email Notification form and adding the field. You can access the field in the **Advanced** view without configuring the form.

The advanced condition script uses the following business rule global variables:

- `current`: contains the current record from the table to which the notification is linked.
- `event`: contains the event that triggered the notification.

**Note:** The **Advanced condition** field is evaluated in addition to other conditions you set on the notification. Both the **Condition** and **Advanced condition** must evaluate to true in order to send the notification.

**Edit HTML content in an email notification**

For added control over the content of an email notification, you can edit the underlying HTML.

Role required: admin

1. Navigate to **System Notification > Email > Notifications**.
2. Open an email notification record.
3. On the form, open the **What it will contain** tab.

4. In the **Message HTML** field, click the source code icon (>): to open the HTML source code editor.

5. Make the needed changes to the HTML.

6. On the window, click **Ok**.

7. On the form, click **Update**.

*Document attachments on an email notification*

You can attach documents and reports to email notifications by scripting or linking to the sys ID of the record.

You can include all attachments from the source record with the notification. For example, if an incident update generates a notification, you can include all attachments from the incident record with the notification. To include all attachments from the source record, select the check box for the **Include attachments** field. Note that email messages, including attachments, cannot exceed the maximum email size. This size includes MIME encoding. For details on MIME encoding, see *Email service size restrictions*. 
Attaching documents with scripting

Using scripting, you can attach documents by linking to them, or you can attach various types of reports by specifying their IDs in the system.

Linking to an attachment

You can add an attachment to a notification by linking to the attachment record in the message of the notification. Upon clicking the link, email recipients log in to the instance to view the attachment record.

Linking to attachment records in this fashion requires using email notification scripting. For example:

```javascript
template.print ( 'Attachment: <a href="/sys_attachment.do?sys_id=' + gr. sys_id + '">' + gr. file_name + '</a>
 ' ) ;
```

Attaching reports using the Sys ID

You can also attach various types of reports, including gauges, dashboards, and charts, to a notification. The scripts to attach these reports take the following syntax:

```javascript
${report:X:Y}
```

where:

X is the type of report you want to attach (reportID, gaugeID, dashboardID, or chartID).
Y is the sys ID of the report, gauge, dashboard, or chart to be attached.

For example:

- `${report:reportID:<abc123>}`
- `${report:gaugeID:<abc123>}`
- `${report:dashboardID:<abc123>}`
- `${report:chartID:<abc123>}

**Note:** Multilevel pivot reports can’t attach to email notifications.

Line breaks in email notifications and rich HTML

Rich HTML provides additional control over line breaks in your email notifications and templates.

To provide control over line breaks, a **Newlines to HTML** check box is available in the **Email Script** form.
Newlines to HTML option

Selecting the **Newlines to HTML** check box indicates that the method for handling line breaks in earlier versions carries forward for email notifications and templates. When an email notification or template is converted to rich HTML, the **Newlines to HTML** check box is automatically selected.

For new mail scripts, add correct HTML line breaks to template.print() statements.

If an email notification or template is not converted to rich HTML, newlines are automatically wrapped with `<div>` tags, the same as previous versions. The old mail scripts still work. However, the administrator does not enjoy the benefits of working in the rich HTML format, and does not have as much control over exact HTML formatting.

**HTML line breaks in new scripts**

When writing new scripts, insert explicit HTML line breaks and clear the **Newlines to HTML** check box so that no HTML tags are injected when email notifications are generated. For existing notifications and templates, replace template.print("\n") JavaScript function calls with template.print("<br />"). This replacement gives you better control over the HTML formatting of your email notifications.
Preview email notifications
You can preview what notifications look like before you actually enable the instance to send them.

Role required: admin

You can preview both types of notifications as specified by the **Send when** field on the Notification form:

- **Record inserted or updated**: A change to record in the instance triggers the notification.
- **Event is fired**: An event, such as expiration of a certificate or an inbound email action, triggers the notification.

1. Navigate to **System Notification > Email > Notifications**.
2. Open the notification or create one.
   You must save the record before you can view the preview accurately.
3. Click **Preview Notification** on the form header.
4. On the Notification Preview window, verify that the notification works as expected.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Preview records for this breakdown source | The type of event that triggers the notification. This choice list appears if you preview an event-triggered notification. Select one of the following:  
  - **Generated Event**: Preview the notification with a generic event that the previewer creates. This does not actually generate an event record.  
  - **Existing Event**: Preview with an existing event record in the instance. If you select this option, select the event in the **Event Record** field. |
| Event Record                 | An existing event to preview an event-created notification. This option appears if you select **Existing Event** as the event type (for event-triggered notifications only). |
| Event Creator                | The user triggering the notification for the purpose of the preview. The event creator defaults to the user who clicked **Preview Notification**.  
   You can change the creator as needed. You can change the preview record as needed to see the changes in the notification content. |
| Preview Record               | The record triggering the notification for the purpose of the preview. The preview record defaults to one of the records in the table specified in the **Table** field on the Email Notification form.  
   You can change the preview record as needed to see the changes in the notification content. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users</td>
<td>The users who will receive the notification, as specified in the <strong>Who will receive</strong> section of the Email Notification form:&lt;br&gt;• All users that you specify on the form appear, but only the users that will actually receive the notification with the current preview settings appear in black text.&lt;br&gt;• Users that are specified but for whatever reason will not receive the notification appear in red, strikethrough text. Place the cursor over any of these names to see the reason the user will not receive the notification. For example, one reason could be that the user's notification settings are disabled.</td>
</tr>
<tr>
<td>Subject and Body</td>
<td>The content of the notification as defined by the template. The <strong>Subject</strong> and <strong>Body</strong> sections on the preview display the content in the corresponding <strong>Subject</strong> and <strong>Message</strong> fields on the template.&lt;br&gt;If the template includes a link to the record that triggered the notification, the <strong>Preview Record</strong> link is used. Click the link to go to that record.</td>
</tr>
</tbody>
</table>

5. After you have reviewed the notification, exit the preview window.
6. Make the necessary changes to the notification or template, if necessary.

*Time zone for email notifications*
A system property controls the time zone that the instance uses for the date and time stamp of a message.

The date and time stamp of a notification uses the system time zone, not the time zone of any recipient. The email property `glide.email.append.timezone` controls whether to append the time zone. If true, the system time zone of the instance is appended to any Date/Time fields in outbound email messages (for example, `2018-07-02 04:01:14 PST`).

*Specify alternative outbound email addresses for notifications*
By default, the system sends all outbound email notifications from the default email address of the instance, but you can specify an alternative address.

Role required: admin

For organizations that need to send email messages from specific email addresses, such as from multiple service desks, or they want to send notifications in different languages, the platform supports configuring multiple outbound addresses.

1. Navigate to **System Notification > Email > Notifications**.
2. Select an existing notification record for the desired event, such as **Incident Closed**.
3. Create a copy of this notification for each outbound email address.
4. Open one of the notification copies, and click the **Advanced view** related link.
5. In the **What it will contain** section, add an email address to the From field that is different from the default instance address.<br>For more information on how to construct the From address, refer to section 3.6.2 of *RFC 2822*.
6. Add a different email address than the **From** address to the **Reply to** field if you want replies to this notification to go to a different address.
The system checks the From field for an address. If this field is empty, then the system uses the default address for the instance. If the Reply to field is empty, then all replies are sent to the address from which the notification was sent. If the Reply to field contains an email address, then the system sends all replies to the notification to this address.

7. Create mutually-exclusive conditions for notifications of the same type, so only the desired notification is sent when the event is fired.

For example, if the Company is a certain value, then the notification comes from a unique email address entered in the From field.

8. Click Update.

Specify an outbound email address for a particular language
You can specify a different email address for each language your instance supports.

Role required: admin

1. Create or copy a notification record for the desired event.
2. In the What will it contain section, enter a new email address in the From field.
3. Create the Subject and Message content in the desired language.
4. In the When to send section, create a condition as follows:

   1. In the list of Condition fields, select Show Related Fields from the bottom of the choice list.
   2. From the choice list of Related Fields, select the field that identifies the recipient.
      For example, select Caller > User fields to send the notification to the user who called in an incident, or Assigned to > User fields to send the notification to the user to whom an incident is assigned.
   3. From the choice list of user fields, select Language.
   4. Select the is operator.
   5. Complete the condition by selecting the language of the desired user.

5. Click Update.

All notifications for that event originate from the specified email address and go out in the language of the recipient.

Notification variables
Use notification variables to display dynamic information in the body of a notification such as a field value, a link to a record, or a link to system preferences.

Syntax
Specify a notification variable using this syntax:

```$\{variable-name+variable-parameters}\$
```

The variable-name portion is always required. Not all notification variables support the variable-parameters portion. When available, most variable parameters are optional. See the list of available notification variables for variable names and available parameters.

Available variables

The system provides these notification variables.
Available notification variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>${field-name}</td>
<td>Display the value of the specified field.</td>
<td>None</td>
</tr>
<tr>
<td>${image-field-name}</td>
<td>Display an image associated with a record. This</td>
<td>None</td>
</tr>
<tr>
<td></td>

</tbody>
</table>
Links to records in email notifications
Adding the ${URI} parameter to an outbound email body or template creates a link to a specific record.

When a user clicks the word LINK, the instance prompts the user to log in if not already logged in, and then redirects the user to the record specified in the URI.

The ${URI} parameter has an extension called the ${URI+} format to specify additional arguments in the email link, such as sysparm terms, in addition to the automatically created URI. For example (whitespace added for improved readability):

```text
${URI+&sysparm_scriptlet=current.assigned_to=gs.getUserID()
 &sysparm_scriptlet_condition=current.assigned_to.nil()
 &sysparm_view=incident_active}
```

This example executes the JavaScript:

```text
current.assigned_to=gs.getUserID()
```

when the condition of

```text
current.assigned_to.nil()
```

is satisfied. Additionally, the script sets the view to incident_active.

Linking to a record in Workspace

The ${URI} and ${URI_REF} variables don't apply to records in Workspace. To link to a record in Workspace, create a mail script and reference it in your notification. For more information on using mail scripts, see JavaScript in emails.

The mail script that you create should print a URL to the notification. The URL must have the following format:

```text
https://<instance_name>/now/workspace/<workspace_name>/record/<table_name>/
<sys_id>
```

The following example script shows the logic that a mail script must include to create a link to a record in Workspace.

```javascript
// Dynamically construct an Agent Workspace URL and insert a link in the
notification
var agentURL = '<a href="' + gs.getProperty('glide.servlet.uri') + '/now/
workspace/agent/record/'+ current.getTableName() + '/' + current.sys_id +
'">' + current.number + '</a>';
template.print(agentURL + '<br />');
```

Enable links to records
Adding the special ${URI} parameter to an outbound email body or template creates a link to a specific record.
When a user clicks the word **LINK**, the instance prompts the user to log in if not already logged in, and then redirects the user to the record specified in the URI.

### URI email notification

The `${URI}` parameter has an extension called the `${URI+}` format to specify additional arguments in the email link, such as sysparm terms, in addition to the automatically created URI. For example (whitespace added for improved readability):

```
${URI+&sysparm_scriptlet=current.assigned_to=gs.getUserID()
 &sysparm_scriptlet_condition=current.assigned_to.nil()
 &sysparm_view=incident_active}
```

This example executes the JavaScript:

```
current.assigned_to=gs.getUserID()
```

when the condition of

```
current.assigned_to.nil()
```

is satisfied. Additionally, the script sets the view to **incident_active**.

**Change the link text**

To show the display value of the record as the link text instead of the word LINK, use the `${URI_REF}` parameter instead of the `${ URI }` parameter.

### URI_REF email notification

For example, if the URL displays an incident record, the link text is the incident number, which is the display value for incidents. If the URL displays a user record, then the link text is the user name.

### Link to related records

A notification can link to a related record by specifying a reference field in front of the `${URI}` or `${URI_REF}` parameters.

Format the related record link as follows:

- `${<reference field that contains the related record you want to display}>.URI}`
• ${<reference field that contains the related record you want to display>.URI_REF}

For example:

**Related records**

<table>
<thead>
<tr>
<th>Related record to provide link to</th>
<th>Notification record table</th>
<th>Reference field</th>
<th>Samples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Related task record to be approved from an approval notification</td>
<td>Approval</td>
<td>Approval for [sysapproval]</td>
<td>• ${sysapproval.URI}  • ${sysapproval.URI_REF}</td>
</tr>
<tr>
<td>Related problem record in an incident notification</td>
<td>Incident</td>
<td>Problem [problem_id]</td>
<td>• ${problem_id.URI}  • ${problem_id.URI_REF}</td>
</tr>
</tbody>
</table>

For example, the following notification template produces the email links in the picture below:

Click here to view Incident: ${URI_REF}
Click here to view Related Problem: ${problem_id.URI_REF}

![Click here to view Incident: INC0010002
Click here to view Related Problem: PRB0040001](image)

**Related record link**

**Content page links in email notifications**

Links to CMS pages can be put in notifications to make it easy for the reader to access the pages.

The link takes the following format: `${CMS_URI+<site>/<page>}`.

For example, to link the email recipient to a page called Incident in the content site ESS, with the current incident as the target document, use the following format: `${CMS_URI+ess/incident_detail}`

The resulting email URL has this format:

https://<instance name>.service-now.com/ess/incident_detail.do?
sysparm_document_key=incident,46e18c0fa9fe19810066a0083f76bd56

**Email unsubscribe**

Administrators can add unsubscribe links to notifications so that users can stop receiving particular email messages.

**Note:** The base system notifications include unsubscribe and notification preferences links.

The system offers two types of macros to create unsubscribe links.

- An unsubscribe link that creates an email message to the instance.
- An unsubscribe link that opens the notification preferences for the user on the instance.
Available unsubscribe macros

<table>
<thead>
<tr>
<th>Unsubscribe type</th>
<th>Macro used</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unsubscribe by email (Unauthenticated)</td>
<td>${NOTIF_UNSUB}</td>
<td>The system generates an <a href="mailto">mailto hyperlink</a>. When users click the link, their browser or email client creates a pre-formatted unsubscribe email message to the instance.</td>
<td>link_text: specify the text to display as a link within quotation marks.</td>
</tr>
<tr>
<td>Unsubscribe by notification preferences (Authenticated)</td>
<td>${NOTIF_PREFS}</td>
<td>The system generates an instance link directly to the notification preferences for this notification type.</td>
<td>link_text: specify the text to display as a link within quotation marks.</td>
</tr>
</tbody>
</table>

Administrators can add unsubscribe macros to any notification record type such as:

- Email layouts
- Email templates
- Email notifications

**Unsubscribe by email**

Unsubscribe by email requires the user email client or browser to create a pre-formatted email message containing these elements:

- The **To** field has the email address of the instance.
- The **Subject** starts with the string **Unsubscribe from**.
- The **Body** has a JSON string with a name-value pair of **Unsubscribe** and an array value that contains two more name-value pairs.
  - The **notification_id** parameter specifies the Sys ID of the notification the user wants to unsubscribe from.
  - The **unsub_token** parameter specifies an instance ID the system uses to verify that the email came from a ServiceNow instance.

**Note:** Some email clients and web browsers, such as GMail on Chrome, require extra client configuration to support mailto hyperlinks. Administrators can provide an alternative unsubscribe method for users whose email client or browser does not support mailto links. See [RFC6068](https://tools.ietf.org/html/rfc6068) for information about the mailto URI scheme.

The **Unsubscribe from Notification** inbound action processes the email and unsubscribes the sender from the listed notification.

**Note:** Unsubscribing by email message does not require users to authenticate with the instance first.

**Unsubscribe by notification preferences**

Unsubscribe by notification preferences requires the user’s browser to navigate to the notification preferences page on the instance. After logging in, the system displays the notification preferences for this particular notification.

Users can set preferences for this notification such as disabling notifications for a particular device. Users must save their notification preferences for changes to take effect.
Unsubscribe links

This email layout adds several unsubscribe links to the bottom of each email notification.

${NOTIF_UNSUB} from this notification by email or ${NOTIF_UNSUB +link_text="click here"}.
Manage your ${NOTIF_PREFS} or ${NOTIF_PREFS+link_text="click here"}.

When rendered in an email notification, the unsubscribe links only display the link text.
<table>

**Users**

Beth Anglin

**Subject**

Incident INC0000060 commented

**Body**

You can view all the details of the incident by following the link below:

[Go to Instance]

[Unsubscribe | Manage Preferences]
If a user clicks the **Unsubscribe** link, the email client creates a message such as this:

![Unsubscribe email message](image)

**Sample unsubscribe by email message**

**Scripting for email notifications**

Email scripts allow for business rule-like scripting within an outbound email message.

With mail scripts, you can dynamically change the email output of your system based on different criteria. Mail scripts allow you to perform simple tasks, such as displaying incident data, and complex ones, such as making advanced database queries.

You can add a `$mail_script:script_name` embedded script tag to the body of the email notification or template, replacing `script_name` with the name of the script you created. This makes it easy to use the same scripts in multiple email notifications or templates.

If you manually enter a mail script bounded by `<mail_script>` and `</mail_script>` in the body of a new or converted email notification or template, and then attempt to save the record, a message asks whether the mail script should be converted. In many cases, an unconverted mail script fails to run from inside the HTML editor. If you select **Yes**, the script is added to the Email Script [sys_script_email] table and is automatically replaced in the body with an embedded script tag (${mail_script:script_name}).

**JavaScript in emails**

Create mail scripts in **System Notifications > Email > Notification Email Script**, and refer to them by using `${mail_script:script_name}` in the script field.

To print text into the body of the message, use the `template.print("a string")` function.
JavaScript in templates

The `event.parm1` and `event.parm2` parameters that come from the originating event can also be used.

Mail script API

Certain variables are available when processing mail_script scripts.

**Mail script variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Object Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template</td>
<td>Handles printing from the mail script to the email message.</td>
</tr>
<tr>
<td></td>
<td><code>template.print(&quot;message&quot;);</code> //outputs message to the email body.</td>
</tr>
<tr>
<td></td>
<td><code>template.space(&quot;number of spaces&quot;);</code> //outputs spaces to the email body.</td>
</tr>
<tr>
<td>email_action</td>
<td>GlideRecord object for the email notification (sysevent_email_action).</td>
</tr>
<tr>
<td>event</td>
<td>GlideRecord object for the event that fired the notification (sysevent).</td>
</tr>
</tbody>
</table>
**Example scripting for email notifications**

Examples of scripting for email notifications.

**Scripting examples for email notifications**

A simple text string is the most basic example of the way a mail script works. This script prints out "Incident number - INC00001".

```java
template.print("Incident number - " + current.number);
```

More advanced scripts, like this one, can be found by browsing through the base system email templates.

```java
template.print("Summary of Requested items:<br />
var gr = new GlideRecord("sc_req_item");
gr.addQuery("request", current.sysapproval);
gr.query();
while(gr.next()) {
  template.print(gr.number + ":  " + gr.quantity + " X " +
  gr.cat_item.getDisplayValue()
  + " at " + gr.cat_item.price.getDisplayValue() + " each
  <br />
}
```

To dynamically change field values within an email, use the following functions within `<mail_script>` syntax:

```java
...
email.setFrom(current.caller_id.email);
email.setReplyTo("joe.employee@yourcompany.com");
email.setSubject("This is the new subject line");
email.setBody("This is the new body");
...
```
Using the `instance_name` property ensures that the notification still works when migrated between instances.

```javascript
function dothis()
{
  var gr = new GlideRecord('sys_attachment');
  gr.addQuery('table_sys_id', current.sys_id);
  gr.query();
  while (gr.next())
  {
    template.print('Attachment: <a href="https://' +
    gs.getProperty('instance_name') + '.service-now.com/sys_attachment.do?sys_id=' +
    gr.sys_id + '">' +
    gr.file_name + '</a>);
  }
}
```

You can specify copied and blind copied recipients by using the email object within a mail script.

```javascript
//email.addAddress(type, address, displayname);
email.addAddress("cc", "john.copy@example.com", "John Roberts");
email.addAddress("bcc", "john.secret@example.com", "John Roberts");
```

The following is an example script to add users from `watch_list` as copied recipients.

```javascript
if(!current.watch_list.nil())
{
  //get watch list addresses and add to cc
  var watcherIds = current.watch_list.split(",");

  //get user records
  var user = new GlideRecord("sys_user");
  user.addQuery("sys_id", watcherIds);
  user.addQuery("notification", 2);
  //email
  user.addQuery("email", ",!="", ");
  user.query();
  while (user.next())
  {
    //add to cc list
    email.addAddress("cc", user.email, user.getDisplayValue());
  }
}
```

**Useful attachment scripts**

This is a searchable version of the Useful Attachment Scripts.

**Caution:** The customization described here was developed for use in specific instances, and is not supported by ServiceNow Technical Support. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.

**Copy attachments from record to record**

Use the following script to copy an attachment from one record to another record:

```javascript
GlideSysAttachment.copy('sourcetable','sys_id','destinationtable','sys_id');
```

**Note:** GlideSysAttachment.copy copies all attachments; it cannot select specific attachments.
Delete duplicate attachments

Use the following script in a business rule, scheduled job, or background script to delete duplicate attachments located in the Attachments [sys_attachment] table:

```javascript
function fixDuplicateImages(){
    var gr = new GlideRecord('sys_attachment');
    gr.addQuery('table_name', 'LIKE', 'ZZ_YY%');
    gr.orderBy('table_sys_id');
    gr.orderByDesc('sys_created_on');
    gr.query();
    var lastID = 'not_a_match';
    var lastFile = 'not_a_match';
    while (gr.next()) {
        var isDuplicate = (lastID == gr.table_sys_id) && (lastFile == gr.file_name);
        lastID = gr.table_sys_id;
        lastFile = gr.file_name;
        gs.print(gr.table_sys_id + ' ' + gr.table_name + ' ' + gr.file_name + ' ' + gr.sys_created_on + ' ' + isDuplicate);
        if (isDuplicate)
            gr.deleteRecord();
    }
}
```

Display whether tasks have attachments in list view

Use the following script in a business rule to display whether tasks have attachments when viewed in the record list view. Note that the script needs a custom field on the Has Attachments [u_has_attachments] table.

```javascript
function checkAttachment(){
    // if inserting then the task has an attachment
    if (current.operation() == 'insert') {
        hasAttachment('true');
    } // if deleting attachment check for other attachments
    else if (current.operation() == 'delete') {
        var timeNow3 = new GlideDateTime();
        gs.log('has_attachment br: gliderecord query start date time is: ' + timeNow3.getNumericValue(), 'jwtest');
        var attachCount = new GlideAggregate('sys_attachment');
        attachCount.addQuery('table_sys_id', current.sys_id);
        attachCount.addAggregate('COUNT');
        attachCount.query();

        var numAttachments = '0';
        if (attachCount.next()) {
            numAttachments = attachCount.getAggregate("COUNT");
            if (numAttachments > 0) {
                hasAttachment = 'true';
            } else {
                hasAttachment = 'false';
            }
            var timeNow4 = new GlideDateTime();
            gs.log('has_attachment br: gliderecord query start date time is: ' + timeNow4.getNumericValue(), 'jwtest');
        }
    }

    function hasAttachment(answer) {
        var task = new GlideRecord('task');
        task.addQuery('sys_id', current.table_sys_id);
        task.query();

        if (task.next()) {
            task.u_has_attachment = answer;
            task.autoSysFields(false); // Don't set the lastUpdatedTime or the Simultaneous Update Alert will likely get triggered
            task.setWorkflow(false); // Don't allow other business rules to run, otherwise multiple notifications will likely be sent
        }
    }
}
```
Link to attachments in an email notification

Use the following script in an email notification or template to include links to attachments:

```javascript
printattachments();
function printattachments(){var gr =new GlideRecord('sys_attachment');
gr.addQuery('table_sys_id', current.sys_id);
gr.query();while(gr.next()){    template.print('Attachment: <a href="http://'+gs.getProperty("instance_name")+'.service-now.com/sys_attachment.do?sys_id='+ gr.sys_id+'">'+ gr.file_name+'</a>');}
}
```

Note: Replace "instance_name" with your instance name.

Attachment Logging

Whenever a user downloads an attachment, the action writes an attachment.read event record to the event log. If desired, you can process these events with a Script Action or an Email Notification. This can be useful if you want to do something when an attachment is read. For example, you can record when and by whom certain attachments are downloaded. For this functionality, the current variable must point to a sys_attachment record, and the event record must use the following parameters:

- parm1: File name
- parm2: Table name

Baseline email notifications

The baseline system provides several email notifications.

Some events listed in this table do not appear in a business rule and are fired by other conditions in the platform. Some events are hardcoded and are not user configurable.

Baseline email notification descriptions

<table>
<thead>
<tr>
<th>Email notification</th>

#### Notification example: notify task assignees
Notify users who are assigned a Task [task] record.

Role required: admin

Set up your email as a test email address. Navigate to **System Properties > Email Properties**, and then enter your email address under **Send all email to this test email address**.

1. Navigate to **System Notification > Email > Notifications**, and then click **New**.
2. On the form, enter the following values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Task Assigned</td>
</tr>
<tr>
<td>Table</td>
<td>Task [task]</td>
</tr>
<tr>
<td>Active</td>
<td>Selected</td>
</tr>
<tr>
<td>Category</td>
<td>Uncategorized</td>
</tr>
<tr>
<td>Send when</td>
<td>Record inserted or updated</td>
</tr>
<tr>
<td>Inserted</td>
<td>Selected</td>
</tr>
<tr>
<td>Updated</td>
<td>Selected</td>
</tr>
<tr>
<td>Conditions</td>
<td>[Assigned to][changes]</td>
</tr>
<tr>
<td>Users/Groups in fields</td>
<td>Assigned to</td>
</tr>
<tr>
<td>Subject</td>
<td>Task Assigned</td>
</tr>
</tbody>
</table>

3. In the **Message HTML** field, add a message to send to whomever the task is assigned to.
4. From the form context menu, click **Save**.
5. To see a mock version of the system email that you created, click **Preview Notification** on the notification form.
6. Test the notification sends to a task assignee.
   a) Assign some task records.
   b) Check your email for assignment notifications.

#### Notification example: notify an assignment group of updates to Priority 1 Incidents
Notify users by email when there are updates to high priority incidents.
Role required: admin

Send emails to an assignment group whenever there are updates to an incident in which the **Priority** is **1 - Critical**. Include information that is of interest to the recipients, such as the incident number, category, assignees, and any comments that were added to the incident.

1. **Navigate to** System Notification > Email > Notifications, and then click **New**.
2. **On the email notification form, enter the following values:**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Priority 1 Incident Updated</td>
</tr>
<tr>
<td>Table</td>
<td>Incident [incident]</td>
</tr>
<tr>
<td>Active</td>
<td>Selected</td>
</tr>
<tr>
<td>Category</td>
<td>Incident Alert</td>
</tr>
<tr>
<td>Send when</td>
<td>Record inserted or updated</td>
</tr>
<tr>
<td>Inserted</td>
<td>Selected</td>
</tr>
<tr>
<td>Updated</td>
<td>Selected</td>
</tr>
<tr>
<td>Conditions</td>
<td>[Priority][is][1 - Critical] AND [Updated][changes]</td>
</tr>
<tr>
<td>Users/Groups in fields</td>
<td>Assignment group</td>
</tr>
<tr>
<td>Subject</td>
<td>Priority ${priority} Incident updated</td>
</tr>
</tbody>
</table>

**Note:** In this notification, the variable ${priority} returns the value **1 - Critical**.

3. **In the Message HTML field**, enter the following message and script:

```html
Short Description: ${short_description}
Click here to view incident: ${URI}
Incident number: ${number}
Category: ${category}
Assigned to: ${assigned_to}
Assignment group: ${assignment_group}
<hr/>
Comments:
${comments}
```

4. From the form context menu, click **Save**.
5. **Preview the email notification to ensure it includes all the needed information.**
   a) On the notifications form, click **Preview Notification**.
   b) **Note that the email includes the following information:**
      - Short description
      - A link to the incident record
      - Incident number
      - Category
      - The name of the user to whom the incident is assigned
      - The group assigned to the incident
      - Comments from the incident record
6. Test that the email notification sends to an assignment group when its Priority 1 Incident is updated.
   a) Create a user who has an email address that you can monitor, and then create a group that includes the user that you created.
   b) Navigate to Incident > Open, and then open an incident in which the Priority is 1 - Critical.
   c) In the Assignment group field, enter the group that you created.
   d) From the form context menu, click Save.
   e) Add comments to the form to update the incident, and then click Update.
   f) Check the email account of the user member in the assignment group.

Email templates

Email templates enable administrators to create reusable content for the subject line and message body of email notifications.

Templates deliver consistent information on specific system activities and improve the efficiency of creating multiple email notifications for similar actions. If necessary, you can make minor changes on the fly to an email that uses a template by overriding the subject line and message body content in the notification form. A common practice is to define the message body in a template and create new subject lines for different types of recipients. There is no limit to the number of templates that you can create.

Email templates are created in rich HTML format, and administrators have the option of converting existing email templates to rich HTML (starting with the Eureka release). This format provides several advantages, including:

- Raw HTML content is converted into a WYSIWYG format.
- The content can be edited in a feature-rich HTML editor.
- Mail scripts are condensed into a single, easy-to-read line that can be reused in multiple email notifications.
- To prevent broken links, images linked using URLs relative to a particular instance are converted to absolute links.

Create an email template

You can create an email template with rich HTML formatting, rather than plain text.

Role required: admin

1. Navigate to System Policy > Email > Templates.
2. Click New.
3. Fill in the form fields (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the template. For example, change.update.risk.</td>
</tr>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
<tr>
<td>Email layout</td>
<td>If the message body for the template is to be formatted using a predefined email layout, select the layout.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the name of the table involved. For example, Change Request [change_request].</td>
</tr>
<tr>
<td>Subject</td>
<td>Enter a subject line that explains the purpose of the email. Select the appropriate variables for the subject line from the fields available on the selected table. Place the cursor where you want the variable to appear, and click the field name in the Select variables column. For example: ( ${sys_class_name} ) ${number} ) with ( ${risk} ) risk has been assigned to you.</td>
</tr>
</tbody>
</table>
| Message HTML| Enter the content of the email template message. You can use the HTML editor toolbar to format the HTML, and you can include variables from the Select variables column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. Notes:  
  • When a template is applied to a notification, the contents of this field are used when you select HTML and plain text or HTML in the Content Type field in the Email Notification form.  
  • You cannot use HTML code to control the appearance of the contents in the \( ${comments} \) variable.  
  • If you want to include a link to the record that triggered the notification, see Enable links to records. |
| Message Text| Enter the notification message to send in plain text. Note: When a template is applied to a notification, the contents of this field are used when you select HTML and plain text or Text in the Content Type field in the Email Notification form.                                                                 |

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMS alternate</td>
<td>Create a different message to be delivered to an SMS device. Enter a brief message, showing the most important information only. If this message field is blank, the contents of the Message Text field are used for the SMS message.</td>
</tr>
</tbody>
</table>

**Note:** The message in this field is used when the message is sent to a device configured as SMS.

---

**Apply a template to an email notification**

After you create an email template, you can apply it to a notification.

Role required: admin

1. Navigate to System Notification > Email > Notifications.
2. Open the email notification record that should use the template.
3. Navigate to the What it will contain section.
4. From the Email template field, select the appropriate template.
5. Click Update.

**Convert an email template to rich HTML**

If you have an email template created prior to the Eureka release, you can convert it to rich HTML.

Role required: admin

1. Navigate to System Policy > Email > Templates.
2. Open the email template you want to convert.
<table>
<thead>
<tr>
<th><strong>Name</strong></th>
<th>notify.change</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table</strong></td>
<td>Incident[incident]</td>
</tr>
<tr>
<td><strong>Email layout</strong></td>
<td>Unsubscribe and Preferences</td>
</tr>
<tr>
<td><strong>Subject</strong></td>
<td>${TABLE_NAME} ${DISPLAY_VALUE} Change Notification</td>
</tr>
<tr>
<td><strong>Message</strong></td>
<td>Click here to view ${TABLE_NAME}: ${URI}</td>
</tr>
<tr>
<td><strong>SMS alternate</strong></td>
<td></td>
</tr>
</tbody>
</table>

Select variables:
- Fields
3. Click **Switch to Rich HTML Editor**.

When content is converted, these changes are made to the content:

- **HTML Editor**: Any raw HTML in the *Message* field is rendered as WYSIWYG text in the *Message* HTML field. The content can be edited in a feature-rich HTML editor.
- **Simplified Mail Scripts**: Any mail scripts in the body are automatically saved to the Email Script [sys_script_email] table and are replaced in the notification body with an embedded script tag. This makes the template body easier to read and makes it easier to reuse scripts in multiple email templates.
<table>
<thead>
<tr>
<th>Name</th>
<th>notify.change</th>
<th>Table</th>
<th>Incident [incident]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email layout</td>
<td>Unsubscribe and Preferences</td>
<td>Subject</td>
<td>${TABLE_NAME} ${DISPLAY_VALUE} Change Notification</td>
</tr>
<tr>
<td>Message HTML</td>
<td>B</td>
<td>U</td>
<td>&lt;</td>
</tr>
</tbody>
</table>
4. Modify the message text, as needed, using the WYSIWYG editor or by editing the underlying HTML.

**Note:** The letter "P" at the bottom of the screen shows the location of your cursor within the Message field. In this case, the cursor is in a line containing an <HTML> tag.

**Note:** Email templates that are already formatted with rich HTML do not show the Switch to Rich HTML Editor button.

Whether you are working with templates converted from earlier versions or creating new templates in the rich HTML format, it is a good practice to write mail scripts in System Notification > Email > Notification Email Scripts. When the scripts are completed, a ${mail_script:script name} embedded script tag should be added to the email template body. This makes it easy to use the same scripts in multiple email templates. All that needs to be copied and pasted from one template to the next is the embedded script tag.

If you manually enter a mail script in the body of a new or converted email notification or template, and then attempt to save the record, a message asks whether the mail script should be converted. Unconverted mail scripts often fail to run from inside the HTML editor. If you select Yes, the script is added to the Email Script [sys_script_email] table and is automatically replaced in the body with an embedded script tag.

You can view the mail scripts in their original form by opening the email template and clicking the Show Notification Scripts related link.

*Construct an email message with a template*

Email templates provide a list of the fields from database tables that are available for constructing an email message.

An email template can include a **mailto** automatic response link, which enables the email recipient to simply choose a link that sends a preformatted response back to the instance. An example is the email template used for notification that an approval is required. The following example shows the base email:
### Notification - Approval Request [Advanced view]

<table>
<thead>
<tr>
<th>Name</th>
<th>Approval Request</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>EMAIL</td>
</tr>
<tr>
<td>Table</td>
<td>Approval [sysapproval_approver]</td>
</tr>
<tr>
<td>Active</td>
<td>checked</td>
</tr>
<tr>
<td>Category</td>
<td>Approval</td>
</tr>
<tr>
<td>Description</td>
<td></td>
</tr>
</tbody>
</table>

#### When to send

<table>
<thead>
<tr>
<th>Content type</th>
<th>HTML and plain text</th>
</tr>
</thead>
<tbody>
<tr>
<td>Importance</td>
<td>-- None --</td>
</tr>
</tbody>
</table>

#### Email template

- Email template: `change.itl.approve.role`

#### Message HTML

- Use fields like `Fields` for customization.
In this case, when a change request approval is requested, an update is made to the `sysapproval_approval` table. The "approval events" business rule is then executed, which creates the "approval.inserted" event. The "Approval Request" email event is defined to process the approval.inserted event, and this email event is defined to use the following change.itil.approve.role email template. Notice that this template has two mailto: items specified. One for "mailto.approval" and one for "mailto.rejection." This email template builds an automatic response that lets the email receiver simply click a link in the email to either approve or reject the change request.

Here is what the `change.itil.approve.role` template looks like using the rich HTML editor:
Email Template
c CHANGE ITIL APPROVE ROLE

Name: change.itl.approve.role
Application: Global

Email layout: Unsubscribe and Preferences
Table: Approval [sysapproval.approver]

Subject: ${sysapproval.sys_class_name} ${sysapproval} Approval Request

Message HTML

Short Description: ${sysapproval.short_description}
Priority: ${sysapproval.priority}
Category: ${sysapproval.category}

${mail_script:change_request_summary}
Comments:
${sysapproval.description}

${mailto:mailto.approval}

${mailto:mailto.rejection}

Click here to view Approval Request: ${URI}
Click here to view: ${sysapproval.sys_class_name}: ${sysapproval.URI}

div
The selection list on the right shows the available fields from the `sysapproval_approver` table. Notice the `change.itil.approve.role` template also uses a predefined email layout (Unsubscribe and Preferences), which provides links for the recipient to unsubscribe from approval notifications and set notification preferences.

And here is the `mailto.approval` template:

```
Click here to approve ${sysapproval}:
```

**Note:** If you put text on the lines following the `Click here to approve ${sysapproval}` line, this text forms the actual body of the email.

The combination of templates used would generate an email similar to the following example:
Template generated email message

Notice that the email recipient can use the following links in the mail:

- A link to view all the details of the change request
- A link to view the approval record
- A link that generates an automatic email response to approve the change
- A link that generates an automatic email response to reject the change
- A link to unsubscribe from approval notifications and another link to set notification preferences

Add blank lines in an email template

You can easily add blank lines in an email template using HTML tags.

Judicious use of these HTML tags can make your email easier to read.

- You can use `<br/>` to insert a line break
- You can wrap paragraphs in `<p>` . . . `</p>` tags to format your email nicely.

Calendar integration

With email notifications, you can use import export maps to leverage information about records and integrate with Outlook or another calendar.

For example, an email notification can create a calendar event based on the planned start and end dates of a change request. To enable integration with a calendar, the following iCalendar variables are available to be added to an email template message and reference the email template from the notification. The variables must be added to the `Message Text` field.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$(dstart)</td>
<td>Start Date</td>
</tr>
<tr>
<td>$(dtend)</td>
<td>End Date</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------</td>
</tr>
<tr>
<td>${location}</td>
<td>Location</td>
</tr>
<tr>
<td>${alarm_time}</td>
<td>Alert or reminder time</td>
</tr>
</tbody>
</table>

By default, the instance computes the value of iCalendar variables using import and export maps for the Appointment [itil_appointment] and Change Request [change_request] tables. The instance also uses import and export maps for other tables, depending on which plugins you activate. For example, if you activate the Incident (com.snc.incident) plugin, the instance uses the import and export maps of the Incident [incident] table.

**Import export maps**

Each import export map can specify a different set of iCalendar fields. For example, the icalendar.change_request import export map only maps two iCalendar fields.
iCalendar change request mappings

The instance uses the **External Name** value as the variable name in the email template. For example, the `icalendar.change_request` import export map defines the `dtstart` and `dtend` variables.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Associated variable</th>
<th>Table</th>
<th>Field mapped</th>
<th>Field label</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dtstart</code></td>
<td><code>${dtstart}</code></td>
<td><code>change_request</code></td>
<td>start_date</td>
<td>Planned start date</td>
</tr>
<tr>
<td><code>dtend</code></td>
<td><code>${dtend}</code></td>
<td><code>change_request</code></td>
<td>end_date</td>
<td>Planned end date</td>
</tr>
</tbody>
</table>

Map date fields to iCalendar variables

You can specify what fields provide the date information in calendar invitation notifications by changing the field mappings of the `dtstart` and `dtend` variables in the import export map for the iCalendar invitation.

Role required: admin

1. In the navigation filter, enter `sys_impex_map.list`.
2. Open a map to edit.
3. In the Field Maps related list, click either the **end_date** or **start_date** mapped field to change the mapping for `dtstart` or `dtend`, as needed.
4. Change the **Database** field to the field you want to use to set the start date or end date.
5. Click **Update**.

Create iCalendar invitations for custom tables

To generate iCalendar invitations that use field values from custom tables, create an import export map that computes the values of the iCalendar fields.

Role required: admin

1. Create the custom table and fields using the **Date/Time** field type for the fields that map to the `${dtstart}` and `${dtend}` variables.
2. In the navigation filter, enter `sys_impex_map.list`.
3. Click **New**.
4. Set the following fields:
   - **Name**: Use the following naming convention: `icalendar.<table name>`. For example, `icalendar.u_my_custom_table`.
   - **Table**: Select the custom table you created.
   - **Type**: Select `icalendar`.
5. Right-click the form header and select **Save**.
6. In the Field Maps related list, click **New**.
7. In the Mapping Entry Wizard, select **Mapping to a Database Field**.
8. Create field mappings for `dtstart` and `dtend`. These variables are required.
   - For example, map the **External Name** `dtstart` to the `u_meeting_start_time` field in `u_my_custom_table`.
9. Click **Submit**.
10. Create field mappings for any other iCalendar fields as necessary.
11. Click **Update**.

Here are sample field mappings between iCalendar variables and custom fields in a custom table, `u_my_custom_table`:  

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>icalendar_change_request</td>
<td></td>
<td>icalendar</td>
<td>Calendar Map for Change Requests</td>
</tr>
<tr>
<td>icalendar.till_appointment</td>
<td>Appointment [till_appointment]</td>
<td>icalendar</td>
<td>Calendar mapping for appointments</td>
</tr>
</tbody>
</table>
Sample field mappings

<table>
<thead>
<tr>
<th>External name</th>
<th>Database field</th>
<th>Type</th>
<th>Map</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtstart</td>
<td>u_meeting_start_time</td>
<td>field</td>
<td>icalendar.u_my_custom_table</td>
</tr>
<tr>
<td>dtend</td>
<td>u_meeting_end_time</td>
<td>field</td>
<td>icalendar.u_my_custom_table</td>
</tr>
<tr>
<td>description</td>
<td>u_meeting_description</td>
<td>field</td>
<td>icalendar.u_my_custom_table</td>
</tr>
</tbody>
</table>

12. Create an email template that defines what to include in the iCalendar invitation.
   
   a) Set the Table field to the custom table you created.
   
   b) In the Message text field, use the following format to define the iCalendar invitation.

   ```
   BEGIN:VCALENDAR
   PRODID:--Service-now.com//Outlook 11.0 MIMEDIR//EN
   VERSION:2.0
   METHOD:REQUEST
   BEGIN:VEVENT
   ATTENDEE;ROLE=REQ-PARTICIPANT;RSVP=TRUE:MAILTO:${to}
   DTSTART:${dtstart}
   DTEND:${dtend}
   UID:${sys_id}
   DTSTAMP:${dtstamp}
   DESCRIPTION:${description}
   SUMMARY:${u_meeting_summary}
   END:VEVENT
   END:VCALENDAR
   ```

   **Note:** Mail script is not allowed or processed in meeting invitation email templates.

iCalendar invitation template details

<table>
<thead>
<tr>
<th>iCalendar template line</th>
<th>Required?</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEGIN:VCALENDAR</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>PRODID:--Service-now.com//Outlook 11.0 MIMEDIR//EN</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>VERSION:2.0</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>METHOD:REQUEST</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>BEGIN:VEVENT</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>ATTENDEE;ROLE=REQ-PARTICIPANT;RSVP=TRUE:MAILTO: ${to}</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>DTSTART:${dtstart}</td>
<td>Yes</td>
<td>You must use the import export map to map dtstart to a start time field on the custom table.</td>
</tr>
<tr>
<td>DTEND:${dtend}</td>
<td>Yes</td>
<td>You must use the import export map to map dtend to an end time field on the custom table.</td>
</tr>
<tr>
<td>iCalendar template line</td>
<td>Required?</td>
<td>Notes</td>
</tr>
<tr>
<td>----------------------------------------</td>
<td>-----------</td>
<td>-------</td>
</tr>
<tr>
<td>UID: ${sys_id}</td>
<td>Yes</td>
<td>You must provide the name of a field that uniquely identifies the record, such as the sys_id or the record number field.</td>
</tr>
<tr>
<td>DTSTAMP: ${dtstamp}</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>DESCRIPTION: ${description}</td>
<td>No</td>
<td>To include a multiple line description, you must use the import export map to map description to a text field on the custom table. The field mapping ensures that the system encodes line breaks correctly for the iCalendar file format.</td>
</tr>
<tr>
<td>SUMMARY: ${u_meeting_summary}</td>
<td>No</td>
<td>To include a summary from a text field on the custom table, provide the name of the field, such as u_meeting_summary. The summary field value must not contain line breaks. You do not need to create a field mapping.</td>
</tr>
<tr>
<td>END:VEVENT</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>END:VCALENDAR</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

13. Create an email notification to trigger the iCalendar invitation and ensure the following fields are set accordingly:

- **Table**: Select the custom table.
- **Type**: Select **Meeting Invitation**.
- **Content type**: Select **Plain text** only.
- **Email template**: Select the template you created.

**Email layouts**

Create reusable content for the message body of email templates.
Administrators can use email layouts to:

- Ensure all email notifications have a consistent layout such as always displaying a header, body, and footer.
- Display static content on all email notifications such as a company logo or a background.
- Declare inline styles available for use in the message body of an email template such as setting a text font, size, and color.
- Provide users with links to common response actions such as unsubscribe from a notification or manage notification preferences.

**Note:** To display dynamic content such as mail scripts, use email templates. For more information, see [Create an email template](#).

Email layouts insert HTML elements into the message body of email templates. Any style elements you define in the email layout are available to the email template. Email layouts support style sheets in these formats:

- Internal style sheets defined within a `<style>` element.
- Inline styles within a `style` attribute.

By default, the system includes several sample layouts administrators can use to create their own layouts. Administrators can create email layouts using an inline HTML editor or manually entering HTML code. The system stores email layout records in the Email Layout [sys_email_layout] table.

**Create an email layout**

Create an email layout to specify the HTML content you want to appear in the body of one or more email templates.

- Role required: admin
- Record required: email template record

1. Navigate to System Policy > Email > Layouts. The system displays the list of existing email layouts.
2. Click New. The system displays a blank email layout form.
3. Fill in the form.

**Email layout fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specify a unique name for the record.</td>
</tr>
<tr>
<td>Application</td>
<td>Lists the parent application to which this record belongs.</td>
</tr>
<tr>
<td>Description</td>
<td>Specify an optional description of the layout.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select whether to display the Advanced Layout field.</td>
</tr>
<tr>
<td>Layout</td>
<td>Use the inline editor to add HTML elements. The system displays HTML from this field in the body of any email template that uses the layout. Include notification variables to show content from the related record. For more information notification variables see Notification variables.</td>
</tr>
</tbody>
</table>

**Note:** The editor automatically formats any HTML code you enter from the Source code view.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced Layout</td>
<td>Use this field to manually enter HTML code. The system displays HTML from this field in the body of any email template that uses the layout.</td>
</tr>
</tbody>
</table>

**Note:** To enter text in this field, select Click here to disable syntax highlighting and script formatting.

4. Click **Submit**. The system creates the email layout record.
5. Navigate to **System Policy > Email > Templates**. The system displays the list of existing email templates.
6. Select the email template which you want to use an email layout. The system displays the email template record.
7. In **Email layout**, select the email layout you want to use to format the body of email messages.
8. Click **Update**. The email template uses the selected email layout to format the body of email messages.

**Inbound email actions**

Inbound email actions enable you to define the actions an instance takes when receiving email.

Inbound email actions are similar to business rules: both use conditions and scripts that take action on a target table. An inbound email action checks the email for a watermark that associates it with a task and checks for other conditions. If the conditions are met, the system takes the inbound email action that you configure. The system can take two types of actions:

- Record action: setting a value for a field in the target table.
- Email reply: sending an email back to the source that triggered the action.

By default, if an email has no identifiable watermark, an inbound email action attempts to create an incident from the message. If the email has a watermark of an existing incident, an inbound email action updates the existing incident according to the action’s script.

Watch this six-minute video to learn about the actions that the instance can take in response to messages from users and shows how to create or modify email notifications to users.

**Inbound email action types**

The system classifies all incoming email into one of three types: forward, reply, or new.
## Inbound action classifications

<table>
<thead>
<tr>
<th>Order</th>
<th>Type</th>
<th>Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Forward</td>
<td>The system classifies an email as a forward only when it meets all these criteria:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The <em>subject line</em> contains a recognized forward prefix such as FW:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The <em>email body</em> contains a recognized forward string such as From:.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The system classifies any email that meets these criteria as a forward, even if the message contains a watermark or record number that otherwise classifies it as a reply.</td>
</tr>
<tr>
<td>2</td>
<td>Reply</td>
<td>The system classifies an email as a reply when it fails to match it to the forward inbound action type and it meets any one of these criteria:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The subject line or email body contains a recognized <em>watermark</em> such as Ref:MSG0000008.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• There is no watermark and the <em>Reply-To header</em> contains a recognized message ID of an email with a target record.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• There is no watermark and the subject line contains a recognized reply prefix such as RE: and a recognized record number such as INC0005574</td>
</tr>
<tr>
<td>3</td>
<td>New</td>
<td>The system classifies an email as new when it fails to match it to the forward and reply inbound action types.</td>
</tr>
</tbody>
</table>
Determining the type of incoming email

Attachments

If an inbound email contains one or more email attachments, the inbound email action adds the attachments to the first record the action produces.

Character encoding

- If the email encoding is ASCII-7 or UTF-8, inbound email actions preserve the character encoding in any associated task records they produce.
- If the email encoding is ISO-8859-1, the inbound email action attempts to convert the email to Windows 1252.
• Inbound email actions convert any other encodings (for example, Mac OS Roman) to plain text, which may or may not be readable.

See the System email log and mailboxes for examples of what you might see if a notification or inbound email action is not processed.

**Note:** The state of all incoming emails that have been run against inbound email actions, even if there is no matching action, is changed to **Processed**.

### Domain separation

The system ignores the domain that the inbound email action record is in when it creates a record based on the inbound email action. Keep inbound actions in the global domain. For example, if your inbound email action creates an incident, the system creates the incident in the same domain as the user in the **Caller** field. If that user is not in the User [sys_user] table, the incident is in the global domain.

**Inbound email processing**

The system determines which inbound actions to run by comparing the inbound email type and inbound action conditions to the incoming email message. Certain properties are available to set the reply and forwarding prefixes in the email subject lines that your instance recognizes when processing inbound emails.

The system follows this processing flow to determine whether to run an inbound action.
Inbound action processing work flow

The system only runs an inbound action when:

- The incoming email type matches the inbound action Type.
- If present, the watermark or record number refers to a record in the Target table.
• The inbound action **Conditions** evaluates to true.

If any of these criteria are not met, the system skips the current inbound action and evaluates the next active inbound action. The system processes inbound actions from the lowest to highest **Order** value. If the inbound action has **Stop processing** enabled, the system updates the **State** of the email record to **Processed** after running the inbound action **Script**.

The following video shows how an inbound action condition prevents an incident from being created.

**Prefixes recognized in email subject lines**

**Email reply prefixes**

When no watermark is present or the In-Reply-To email header is present, the instance recognizes email containing a prefix from the `glide.email.reply_subject_prefix` property as reply email. You can use this property to set non-standard reply prefixes in your email system.

```plaintext
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.reply_subject_prefix</td>
<td>Specifies the list of prefixes (comma-separated) in the subject line that identify an email reply.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: re:, aw:, r:</td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Properties [sys_properties] table</td>
</tr>
</tbody>
</table>
```

**Note:** Prefixes are case insensitive.

**Email forward prefixes**

Emails with certain prefixes trigger the forward type of inbound email action. The instance recognizes any email whose subject line contains a prefix from the `glide.email.forward_subject_prefix` property as forwarded email. Emails with these prefixes trigger inbound email actions of the type forward. Use this property to set non-standard forward prefixes in your email system or you want email forwards to behave like replies. If the value of the system property is empty, then the system reverts to using the values `fw:` and `fwd:`.

```plaintext
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.forward_subject_prefix</td>
<td>Specifies the list of prefixes (comma-separated) in the subject line that identify a forwarded email.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: fw:, fwd:</td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Properties [sys_properties] table</td>
</tr>
</tbody>
</table>
```

**Note:** Prefixes are case insensitive.

**Email forwards as replies**
Properties are available to force inbound actions to process forwarded mail as replied mail. These properties control the subject prefix that the inbound actions use.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value needed</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.reply_subject_prefix</td>
<td>re:, Re:, aw:, r:, fw:, fwd:, Fwd:, FWD:</td>
</tr>
<tr>
<td>glide.email.forward_subject_prefix</td>
<td>[any text that is not a forward prefix]</td>
</tr>
</tbody>
</table>

These properties cause the Update Incident inbound action to process all forwarded and replied-to mail.

**Note:** The `glide.email.forward_subject_prefix` property must contain some text so that the forwarded email can be processed as a Reply. It can be any text except a forward prefix (that is, fw:, f...wd:, FWD:).

**Matching a sender email address to a user**

The instance matches a senders email address to an active user in the User [sys_user] table using inbound actions.

**Note:** The Email Automatic User Creation plugin must be active.

When processing an email, the instance sets the current user to the user whose email address matches `email.from`. Inbound actions can then reference that current user. For example, the base system inbound action Create Incident sets the `caller_id` of the incident to the value returned by `gs.getUserID()`.

If multiple users have the same email address, the instance first searches for an active user with the email address. The instance does not match inactive users.

**Note:** Each user record must have a unique email address so that the instance can reliably match the email to the correct user.

If a unique email address for each user is not possible, assign a shared email address to only one active user so that the instance always matches incoming email from that address to the active user.

**Matching watermarks in the Subject line or Body**

The following examples illustrate how the instance matches randomized watermarks in an email subject line or body.

**Note:** For instances upgraded from a release before Jakarta, the system can recognize both randomized and non-randomized watermarks during a watermark transition period.

**Examples of matching watermarks in the Subject line or body**

<table>
<thead>
<tr>
<th>Subject Line or Body Contents</th>
<th>Matching Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ref: MSG0000008_aLJe130zDhCVuh3spXmt</td>
<td>The instance recognizes this string as a watermark and searches the Email Watermarks [sys_watermark] table for a record with the number MSG0000008_aLJe130zDhCVuh3spXmt. If this watermark exists, the instance matches the email to the associated record. If this watermark does not exist, the system processes inbound email messages as described in <em>Criteria for matching email to inbound actions.</em></td>
</tr>
</tbody>
</table>
### Matching record numbers in the Subject line or Body

The following examples illustrate how the instance matches record numbers in the subject line of an email to an existing record when no watermark is present.

#### Examples of matching record numbers in the Subject line

<table>
<thead>
<tr>
<th>Subject line contents</th>
<th>Matching results</th>
</tr>
</thead>
<tbody>
<tr>
<td>RE: Example INC0005574</td>
<td>The instance recognizes this subject line as a reply and recognizes the INC prefix as belonging to the Incident table. The instance searches the Incident table for an existing record INC0005574. If this incident exists, the email is associated with this incident. If this incident record does not exist, the instance uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: Example &quot;INC0005574&quot;</td>
<td>The instance recognizes this subject line as a reply but does not recognize the &quot;INC prefix as belonging to the Incident table because of the quotation mark. The same error occurs for any character other than a space before the record number. The instance instead uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: Example INC0005574*</td>
<td>The instance recognizes this subject line as a reply and recognizes the INC prefix as belonging to the Incident table. The instance searches the Incident table for an existing record INC0005574&quot;, which it cannot find because of the quotation mark. The same error occurs for any character other than a space at the end of the record number. The instance instead uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: &quot;Example INC0005574&quot;</td>
<td>The instance recognizes this subject line as a reply and recognizes the INC prefix as belonging to the Incident table. The instance searches the Incident table for an existing record INC0005574&quot;, which it cannot find because of the quotation mark. The same error occurs for any character other than a space at the end of the record number. The instance instead uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: Example INC0005574*</td>
<td>The instance recognizes this subject line as a reply and recognizes the INC prefix as belonging to the Incident table. The instance searches the Incident table for an existing record INC0005574&quot;, which it cannot find because of the quotation mark. The same error occurs for any character other than a space at the end of the record number. The instance instead uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
</tbody>
</table>
The instance recognizes this subject line as a reply and recognizes one, but not both, of the number prefixes. There is no way to predict which prefix the instance matches first. Whichever prefix it matches, it searches the corresponding table for a matching record. If the record exists, the email is associated with the table. If the record does not exist, the instance uses the inbound action for new emails to create an incident and associates the new incident with the email.

Note: The instance does not support processing email with multiple numbers in the subject line because there is no way to predict which record the instance matches first. For this reason, do not include more than one $number variable in your notifications.

The instance recognizes this subject line as a forward because of the FW: prefix. It uses the inbound action for forwarded emails to create an incident and associates the new incident with the email.

The instance recognizes this subject as a new email because it does not contain a matching reply or forward prefix. It uses the inbound action for new emails to create an incident and associates the new incident with the email.

Criteria for matching email to inbound actions
The system matches incoming email to the conditions of the active inbound actions.
The default inbound actions create or update task record under these conditions.
Default matching criteria

If you customize or deactivate the default inbound actions, the system checks the conditions of the active inbound actions. If the system cannot find an inbound action with matching conditions, it sets the state to **Processed**.
Custom matching criteria
### Inbound action type criteria

<table>
<thead>
<tr>
<th>Inbound email action type</th>
<th>Required matching criteria</th>
<th>Name of default action (Incident table)</th>
<th>Result of default action</th>
</tr>
</thead>
</table>
| Forward                   | The email contains the following conditions:  
  1. A subject starting with a recognized forward prefix (even if a watermark or an In-Reply-To header is present).  
  2. From <user email> appears anywhere in the email body. | Create Incident (Forwarded) | Create new record |
| Reply                     | The email contains one of the following conditions and the table specified in the email matches the table of the inbound action:  
  1. A valid watermark that matches an existing record.  
  2. An In-Reply-To email header (when no watermark is present) that matches an existing record.  
  3. A subject line starting with a recognized reply prefix (when neither a watermark nor an In-Reply-To header is present) and a valid record number that matches an existing record. | Update Incident (BP) | Update existing record |
| New                       | The email does not meet the conditions for either a reply or forward type inbound email action | Create Incident | Create new record |

If more than one inbound action is available for a particular type, the instance uses the Table field to match the email to a particular table. If there is also more than one action for the inbound action's table, the instance uses the **Order** field to determine the order in which the actions run.

Create an inbound email action

You can create inbound email actions to define the actions that the system takes when an email is received.
Role required: admin

1. Navigate to System Policy > Email > Inbound Actions.
2. Click New.
3. Fill in the fields as described in the table.
### Inbound Email Actions form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When to run</td>
<td>Enter a descriptive name for this email action.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a descriptive name for this email action.</td>
</tr>
<tr>
<td>Target table</td>
<td>Select the table where the action adds or updates records.</td>
</tr>
<tr>
<td>Action type</td>
<td>Select the type of action the instance takes. Select <strong>Record Action</strong> to modify a record in the instance, or select <strong>Reply Email</strong> to have the instance send an email back to the source of the inbound email.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate the inbound email action. Clear the check box to disable the action.</td>
</tr>
<tr>
<td>Stop processing</td>
<td>Select this check box to prevent the system from running additional inbound email actions after this action runs.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the message type required to run the action. The action runs only if the inbound email is of the selected type. Available types are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>New</strong>: An email that is not recognized as a reply or forward.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Reply</strong>: An email with a watermark with an In-Reply-To email header, or whose subject line begins with a recognized reply prefix.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Forward</strong>: An email whose subject line begins with a recognized forward prefix, even if the email also contains a watermark or In-Reply-To header.</td>
</tr>
<tr>
<td>Note:</td>
<td>By default, inbound emails of the <strong>Forward</strong> type always generate new incidents regardless of the presence of a watermark. If this behavior does not match your business logic, you can change the recognized reply and forward prefixes to treat forwards like replies.</td>
</tr>
<tr>
<td>Required roles</td>
<td>Specify required roles the sender must have to trigger the inbound action.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number that specifies when this inbound action runs relative to other inbound actions that use the same target table. The instance processes the action with the lowest order number first.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>From</td>
<td>Select the user required to run the action. If a user is selected, the action runs only when the email sender matches the user name. Leave this field blank to perform the action for all users.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If the selected user is later archived or deleted, the restriction is removed and anyone can trigger the inbound email action.</td>
</tr>
<tr>
<td>Condition</td>
<td>Specify the condition that must evaluate to true to trigger the inbound action. Build a condition with the choice lists or enter a statement that determines when the inbound email action runs. For example:</td>
</tr>
<tr>
<td></td>
<td>email.subject. startsWith ( &quot;chg:&quot; )</td>
</tr>
<tr>
<td>Actions</td>
<td></td>
</tr>
<tr>
<td>Field actions</td>
<td>This field appears if the <strong>Action type is Record Action.</strong> Specify how information in the email is inserted into the record.</td>
</tr>
<tr>
<td></td>
<td>For example, select [Created by] [From email] [Sender], so that when the request is inserted, you can see who it is for.</td>
</tr>
<tr>
<td>Reply email</td>
<td>This field appears if the <strong>Action type is Reply Email.</strong> compose the email message to send to the source that triggered the inbound email action.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Script</td>
<td>Enter the script the action runs. Typically, this script uses the validators script include and email variables. A template is provided:</td>
</tr>
</tbody>
</table>

```
(function runAction(/
 *GlideRecord*/ current, /
 *GlideRecord*/ event, /
 *EmailWrapper*/ email, /
 *ScopedEmailLogger*/ logger) {

   // Implement email action here

})(current, event, email, logger);
```

The following objects are available:

- **current**: access the record referred to by the inbound email. For example, `current.assigned_to` accesses the person assigned to the task.
- **event**: access one of the parameters of the originating event. For example, `event.parm1` accesses the first parameter of the event or `event.parm2` for the second parameter. See **Events** for more information.
- **email**: access the inbound current email record. For example, `email.subject` accesses the content in the subject line of the email. See **Accessing email object variables** for more information.
- **logger**: add a message to the log file with the source set to `email.<Sys ID of incoming email>`. For example: `logger.log("Some information")`

<table>
<thead>
<tr>
<th>Description</th>
<th>Enter a detailed explanation of what this inbound email action does.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Other fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Enter a number to define the order in which this email action should be processed. Actions with lower numbers are processed first. The Ordered Email Processing plugin does not install this field.</td>
</tr>
</tbody>
</table>

**Accessing email object variables**

An inbound email action script contains the email object to access various pieces of an inbound email through variables. You can use the global variable `sys_email` with inbound email actions.
## Accessing email objects with variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>email.to</code></td>
<td>Contains a comma-separated list of email addresses in the To: and Cc: boxes.</td>
</tr>
<tr>
<td><code>email.direct</code></td>
<td>Contains a comma-separated list of email addresses in the To: box.</td>
</tr>
<tr>
<td><code>email.copied</code></td>
<td>Contains a comma-separated list of email addresses in the Cc: box.</td>
</tr>
<tr>
<td><code>email.body_text</code></td>
<td>Contains the body of the email as a plain text string.</td>
</tr>
<tr>
<td><code>email.body_html</code></td>
<td>Contains the body of the email as an HTML string.</td>
</tr>
<tr>
<td><code>email.from</code></td>
<td>Contains an email address that depends on the following conditions:</td>
</tr>
<tr>
<td></td>
<td>• If the address listed in the email Headers field matches an existing user's Email address, this variable contains the user's email address.</td>
</tr>
<tr>
<td></td>
<td>• If the address listed in the email Headers field does not match an existing user's Email address, this variable contains the address listed in the email Headers field.</td>
</tr>
<tr>
<td><code>email.from_sys_id</code></td>
<td>Contains the Sys ID of the user who sent the email to the instance.</td>
</tr>
<tr>
<td><code>email.origemail</code></td>
<td>Contains the address of the email sender as listed in the email Headers field.</td>
</tr>
<tr>
<td><code>email.subject</code></td>
<td>Contains the subject of the email as a plain text string.</td>
</tr>
<tr>
<td><code>email.recipients</code></td>
<td>Contains a comma-separated list of recipient addresses as a plain text string.</td>
</tr>
<tr>
<td><code>email.recipients_array</code></td>
<td>Contains the recipient addresses as an array.</td>
</tr>
<tr>
<td><code>email.content_type</code></td>
<td>Contains the MIME content type of the email (for example, text/plain; charset=&quot;us-ascii&quot; or text/html; charset=&quot;us-ascii&quot;).</td>
</tr>
<tr>
<td><code>email.headers</code></td>
<td>Contains details about the sender, route, and receiver as a plain text string in the format of the sending email client.</td>
</tr>
<tr>
<td><code>email.importance</code></td>
<td>Contains an indication from the sender about how important a message is. The value can be High, Low, or empty.</td>
</tr>
</tbody>
</table>

**Note:** The instance follows RFC 2822 (Internet Message Format), which requires multiple email addresses in a group to be separated by commas, not semicolons. The instance can set the values of the `email.to`, `email.direct`, and `email.copied` variables only if emails addressed to groups follow the expected RFC format.
Inbound *email.recipient* variables

The recipients variables (*email.recipients, email.recipients-array*) allow processing of inbound email based on the email recipients. For example, you can create a script to process email based on the array values:

```javascript
var rarray = email.recipients_array; for ( var i = 0 ; i < rarray.length ; i ++ ) { var recipient = rarray [i] ; // do something with it }
```

The *sys_email* variable

This variable lets you access the received sys_email record that triggered the inbound email action. It can be used to reference fields on the email record, such as *uid, sys_id, content_type*, and so on.

Email user matching

When the instance receives an email message, the system searches for an existing user record with the same email address as the sender.

<table>
<thead>
<tr>
<th>Value of <em>email.from</em> Variable</th>
<th>Matching User ID</th>
<th>Email Address</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td>Michael Tossi</td>
</tr>
<tr>
<td>&quot;Michael Tossi&quot; <a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td>Michael Tossi</td>
</tr>
<tr>
<td>&quot;Tossi, Michael&quot; <a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td>Michael Tossi</td>
</tr>
<tr>
<td>&quot;Tossi&quot; <a href="mailto:mtossi@company.com">mtossi@company.com</a></td>
<td><a href="mailto:mtossi@company.com">mtossi@company.com</a></td>
<td><a href="mailto:mtossi@company.com">mtossi@company.com</a></td>
<td>Tossi</td>
</tr>
</tbody>
</table>

*i* Note: This functionality requires that you activate the Email Automatic User Creation plugin.

Inbound Email Action scripts no longer support the *gs.createUser()* method. Use either the automatically-generated email variables or the *gs.GetUserID()* method instead.

User impersonations and inbound actions

When the instance receives an email, it can take a variety of actions by impersonating the sender.

If the sender of an incoming email matches an existing user, the instance impersonates the matching user to complete any inbound email actions. If the sender does not match an existing user, the instance impersonates the Guest user to complete any inbound email actions. If the impersonated user is locked out, the inbound email action fails.

*i* Note: If inbound email comes from an untrusted domain, the instance impersonates the Guest user unless you explicitly prevent users from untrusted domains from triggering inbound actions. For more information on filtering domains, see *Designate email domains as blacklisted or whitelisted*.

Enable automatic user creation

An administrator can set an email property to automatically create users from incoming email. The administrator provides a list of trusted domains to prevent untrusted users from being automatically created.

Role required: admin
For example, you can prevent email from users outside your company domain from creating incidents. When an instance receives a message and there is no matching email address from the sender, the instance can create a user with the User ID [sys_user.user_name] set to the sender's full email address.

Users in your instance must still have write and update access to the records that they create or update through inbound email actions.

**Creating users from incoming email**

<table>
<thead>
<tr>
<th>Value of email.from Variable</th>
<th>User ID Created</th>
<th>Email Address</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;New User&quot; <a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;User, New&quot; <a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;User&quot; <a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td><a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td><a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td>User</td>
</tr>
</tbody>
</table>

1. Navigate to **System Properties > Email Properties**.
2. Select the check box for **Automatically create users for incoming email from trusted domains** ([glide.pop3readerjob.create_caller]).

3. Enter the list of trusted domains in **Trusted domains for creating users from incoming emails** ([glide.user.trusted_domain]).

**Note:** The [glide.user.trusted_domain] property only prevents user creation if the sender is not from a trusted domain. The system processes the inbound actions of the email as a guest user. If you want...
the system to ignore these email messages, use the email filters plugin, specifically the "ignore sender" setting. You can also prevent untrusted users from triggering inbound actions by locking out the guest user.

4. Click **Save**.

5. Optional: Complete the following steps to lock out the guest user.
   a) Navigate to **User Administration > Users** and select the user **guest**.
   b) Select the **Locked out** field to disable the guest account.

When the property `glide.pop3readerjob.create_caller` is set to **false**, the instance runs inbound actions from users who do not match an existing user by impersonating the guest user.

If the property `glide.pop3readerjob.create_caller` is set to **true**, but a user has a valid email address associated with a non-primary device, the instance creates a new user record for that email address if there is no matching email address in the Users [sys_user] table. The instance does not validate non-primary email addresses against the Notification Devices [cmn_notif_device] table.

The method the instance uses to create users can be upgraded to use the full email address by activating the Email Automatic User Creation plugin.

The plugin sets the property `glide.email.create_userid_from_email` to **true** by default. After activating the plugin, enable automatic user creation from email.

**Warning:** Review your existing user records to reconcile any that contain identical email addresses. If you activate the plugin prior to reconciling email addresses, your instance cannot distinguish between users with identical email addresses and randomly selects one of the users with the matching email address.

Allowing locked out users to process inbound email actions

A property is available to allow locked out users to trigger inbound actions. For example, enabling the property can allow locked out users to reset their password and send email to the instance asking for assistance.

**Property allowing locked out users to trigger inbound email actions**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>glide.pop3.process_locked_out</code></td>
<td>Enables (true) or disables (false) the ability for locked out users to trigger inbound actions.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td></td>
<td>• System Properties [sys_properties] table</td>
</tr>
</tbody>
</table>

**Warning:** Enabling this property (`glide.pop3.process_locked_out`) also enables users from untrusted domains to trigger inbound actions.

Redirecting email to the instance POP3 account

Configure other mailboxes to forward email to the instance's POP3 account.

By default, the **POP Reader** scheduled job checks for new email every two minutes. It connects to the mail server and account specified in email properties. The **POP Reader** downloads any email waiting on the mail server and creates `email.read` events. After the instance processes the events, the inbound email actions run.

The **POP Reader** shows the number of emails processed during the reader's last run. The message shows the number of emails the reader processed or **0 processed** if no emails were available. The reader resets the status each time it runs.
While it is not possible to specify more than one POP3 account for the instance, you can forward other mailboxes to the designated POP3 account. This script can be added to the Create Incident inbound email action to differentiate the content based on the original recipient, and then set an assignment_group value.

```javascript
if(email.direct.indexOf('facilities@anycorp.com')>-1)
current.assignment_group.setDisplayValue('Facilities Management');
```

Setting field values from the email body
Values in an inbound email can set field values in a task record.

Any name:value pair in an inbound email body gets parsed into a variable/value pair in the inbound email script. The name:value pair must be on its own line. Note that most email clients limit the number of characters allowed per line and may truncate excessively long name:value pairs.

**Tip:** To prevent unexpected parsing, ensure that all the names in the name:value pairs are unique.

To populate a reference field, use `setDisplayValue()` instead. See [Redirecting Emails](#) for an example of using `setDisplayValue()` in an inbound email action.

**Note:** The action always generates a lowercase variable name. Also, this functionality does not work on reference fields.

For example, if an email body contains this line:

```plaintext
Foo:bar
```

The inbound email script creates the variable `email.body.foo` with the value of `bar`. You can use these variables to create conditions such as:

```javascript
if(email.body.foo!=undefined){
    current.[field]=email.body.foo;
}
```

In this example, the script sets the value of `[field]` to the value `bar`.

**Note:** Spaces are rendered as underscores when a name:value pair gets parsed into a variable/value pair. For example, if an email body contains a line with spaces like `my variable:data`, then the inbound email script creates the variable `email.body.my_variable`. The value of the variable is `data`.

Integrate inbound events
This example illustrates how to create a notification from an inbound JSON request.

**Role required:** admin

When complete, you will be able to:

- Send a JSON request to the [imp_notification] web service import set with the JSON processor
- Create a new import set in the [imp_notification] table in the instance using data from the JSON request

The following example steps assume you have your own demonstration instance.

1. Activate the JSON Web Service plugin.
2. Install the RESTClient Firefox plugin.
3. Open the RESTClient.
4. Create the following JSON request.

   ```json
   • Method: POST
   • URL: http://<instance name>.service-now.com/imp_notification.do?JSON
   • Headers: Authorization: Basic
   ```
5. Click **Send**.
6. Navigate to **Response > Response Body (Raw)**.
7. Verify that the instance sends back a response with a **sys_id**.

8. Login to your development instance.
9. In Navigation filter, enter **imp_notification.list**.
10. Verify that the import set table has an event matching your JSON request.
Reprocess received emails

When a email has been processed incorrectly, fix the underlying problem, then reprocess the email. You can reprocess emails individually or in a batch.

Role required: admin

Various scenarios can result in improperly processed emails. After taking corrective action, reprocess the emails to get correct email records. Two of the most common scenarios are:

- The inbound action failed to trigger correctly. After you update or fix the inbound action, reprocess the affected emails to create the correct records.
- Emails have accidentally ended up on a development instance, usually due to the username or password of a production or test instance being reused on the development instance. In this case, you first export the emails from the development instance as XML and import them to the correct instance. On the correct instance, reprocess the imported emails to obtain correct email records.

You can reprocess emails with the types received or received-ignored. Such emails are processed to the system mailboxes Received and Junk, respectively.

Take the following steps only after fixing the underlying problem. This procedure only reprocesses the emails.

1. Navigate to the relevant System Mailbox or navigate to System Logs > Email.
2. Decide whether to reprocess emails individually or in a batch.
   - To reprocess an individual email, open that email and click Reprocess
To reprocess several emails at once, select them from the mailbox or the email log and apply the **Reprocess received emails** action.

Remember that you can reprocess only received or received-ignored emails.

**Inbound email action examples**

Various examples of inbound email actions are available to help you build your own inbound email actions. These examples show how to set up inbound email actions to handle email replies, create (log) a problem record, request a change, and update an incident.

**Inbound email action example: handling email replies**

This example shows you how to set up inbound email actions to handle replies that users send back to the instance.

Role required: admin

The inbound email action parses the email and responds using a script. By default, an email received by the instance creates a new incident, and the body of the email is added to the **Additional Comments** text box. More refined Inbound Email Actions can create incident tickets with more data, thus saving the incident management team valuable time.

Normally, when a user responds to an email sent by the instance, the inbound email action matches the watermark to an existing incident, and updates the incident rather than creating a new record. However, if the watermark is missing, this inbound email action attempts to match a reply to the original incident.

1. Navigate to **System Policy > Inbound Actions** and click **New**.
2. Populate the form as follows:
### Inbound action field values

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Update Incident</td>
</tr>
<tr>
<td>Type</td>
<td>Reply</td>
</tr>
<tr>
<td>Target table</td>
<td>Incident [incident]</td>
</tr>
</tbody>
</table>

3. **In Script**, enter this code.

```javascript
gs.include('validators');

//Note: current.caller_id and current.opened_by are already set to the first UserID that matches the From: email address

if (current.getTableName() == "incident") {
    current.comments = "reply from: " + email.origemail + "\n\n" + email.body_text;
    if (email.body.assign != undefined)
        current.assigned_to = email.body.assign;
    if (email.body.priority != undefined && isNumeric(email.body.priority))
        current.priority = email.body.priority;
    if (email.body.category != undefined)
        current.category = email.body.category;
    if (email.body.short_description != undefined)
        current.short_description = email.body.short_description;
    current.update();
}
```

Inbound email action example: logging a problem

This example shows you how to set up inbound email actions to create a problem record.

**Role required:** admin

Inbound email actions allow users to log or update incidents on an instance via email. The inbound email action parses the email and responds using a script.

1. Navigate to **System Policy > Inbound Actions** and click **New**.
2. Populate the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Log Problem</td>
</tr>
<tr>
<td>Type</td>
<td>New</td>
</tr>
<tr>
<td>Active</td>
<td>True</td>
</tr>
</tbody>
</table>
### Inbound email action example: requesting a change

This example shows you how to set up inbound email actions to create a change request record.

**Role required:** admin

Inbound Email Actions allow users to log or update incidents on an instance via email. The inbound email action parses the email and responds using a script.

1. Navigate to **System Policy > Inbound Actions** and click **New**.
2. Populate the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Request Change</td>
</tr>
<tr>
<td>Type</td>
<td>New</td>
</tr>
<tr>
<td>Active</td>
<td>True</td>
</tr>
<tr>
<td>Target Table</td>
<td>Change Request [change_request]</td>
</tr>
<tr>
<td>Condition</td>
<td>email.subject.indexOf(&quot;Change Request: &quot;) == 0</td>
</tr>
<tr>
<td>Script</td>
<td>current.comments = email.body_text;</td>
</tr>
<tr>
<td></td>
<td>current.short_description = email.subject;</td>
</tr>
<tr>
<td></td>
<td>current.notify = 2;</td>
</tr>
<tr>
<td></td>
<td>if (email.body_text.assign != undefined)</td>
</tr>
<tr>
<td></td>
<td>current.assigned_to = email.body_text.assign;</td>
</tr>
</tbody>
</table>

© 2020 ServiceNow, Inc. All rights reserved.

Values automatically set from incoming email

The default inbound action for the Incident table automatically sets the following field values when it receives an incoming email.

<table>
<thead>
<tr>
<th>Field value set</th>
<th>Value used from incoming email</th>
</tr>
</thead>
<tbody>
<tr>
<td>current.caller_id</td>
<td>User ID of the first user whose email address matches the email.from variable.</td>
</tr>
<tr>
<td>current.opened_by</td>
<td>User ID of the first user whose email address matches the email.from variable.</td>
</tr>
</tbody>
</table>

If multiple users have the same email address, the instance first searches for an active user with the email address. Use unique email addresses for each user record whenever possible. If not, having only one active user with the shared email address guarantees that the instance always matches incoming email from this address to the active user.

Specifying the inbound email processing order

You can configure a processing order for inbound email actions and use the order to manage multiple filters in inbound email actions.

The Ordered Email Processing (com.glide.email_ordered_processing) plugin is enabled by default for new instances. Users with the admin role can activate the plugin for upgraded instances. The plugin adds the Order column to the Rules [sysrule] table, which the instance uses to determine when to process emails. Admins can also add a command to an action script that halts processing after the script runs.

Configure the processing order

Configure the processing order for inbound email actions to force them to run in a prescribed order.

Role required: admin

1. Navigate to **System Policy > Email > Inbound Actions**.
2. Open an existing inbound action or create one.
3. Complete the form and assign an order number to the **Order** field to establish when this inbound rule should run in relation to other rules. If you upgraded and activated the plugin, the **Order** field might be named **Execution Order**.

   **Note:** Ensure each inbound action has a unique **Order** value to ensure the system stops processing as expected. If multiple inbound actions have the same **Order** value, the system might evaluate all of the inbound actions, even if one of them contains the `event.state="stop_processing";` script or has the **Stop processing** option selected.

4. To stop rule processing when an inbound email action runs successfully: add the following line to the bottom of the script:
• Select the **Stop processing** check box.
• Add the following line to the bottom of the **Actions** script:

```javascript
event.state="stop_processing";
```
Inbound Email Actions
Create Incident

Name: Create Incident
Application: Global
Active: On
Stop processing: On

When to run:
- Type: New
- Execution Order: 100
- Condition:

Required roles: 
From:

Conditions:
- Add Filter Condition
- Add "OR" Clause
- -- choose field --
- -- oper --
- -- value --

Condition:
Manage multiple filters in an inbound email action

Use process ordering and the `stop_processing` command to manage multiple filters in inbound email actions.

Role required: admin

In this example, you can create new problem records when `prb:` appears in the subject line and new change requests when `chg:` appears in the subject line. All other emails are used to create an incident. The actions are set up as follows:

1. Create an action with a condition of `Subject > starts with > chg:` and the `event.state="stop_processing";` command appended to the script.
2. Assign this action an Order value of 100.
3. Create an action with a condition of `Subject > starts with > prb:` and the `event.state="stop_processing";` command appended to the script.
4. Assign this action an Order value of 200.
5. Create an action for incident with no conditions and an Order value of 300.

It is not necessary to add the `stop_processing` command to the script for the incident action unless you want processing to stop at this rule to avoid continuing to another action.

If either a change request or a problem is created, the `stop_processing` command stops processing, and no incident record is created. If neither a change request nor a problem is created, the inbound email action for incident creates a record.

Email filters

Email filters enable administrators to specify when to move email to particular mailboxes or to ignore it using a condition builder or a condition script. The Email Filters (com.glide.email_filter) plugin is active by default.

When an email is ignored, the email is saved to your instance but is not processed. You can access an ignored email by viewing its Email [sys_email] record.

Default email filters

By default, the following filters are available from the System Mailboxes > Filters module:

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore VCAL</td>
<td>Ignores all email containing vCalendar requests. This filter prevents inbound email actions from creating unnecessary incident records when the instance receives a response to sent email. vCalendar requests in email responses are identified by the EmailUtils script include.</td>
</tr>
<tr>
<td>Ignore header</td>
<td>Ignores email that contains specific headers. This filter overrides the glide.pop3.ignore_headers property.</td>
</tr>
<tr>
<td>Ignore sender</td>
<td>Ignores email from specific senders. This filter overrides the glide.pop3.ignore_senders property.</td>
</tr>
<tr>
<td>Ignore subject</td>
<td>Ignores email with specific terms or phrases in the subject line. This filter overrides the glide.pop3.ignore_subjects property. This filter might not apply to emails arriving from unknown users. Unknown users can be locked out.</td>
</tr>
<tr>
<td>Filter</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Move spam to junk folder</td>
<td>Moves email identified as spam to the Junk folder. This filter checks for the value of the ServiceNow spam header. If the header is X-ServiceNow-Spam-Status:Yes, the filter moves the email to the Junk folder.</td>
</tr>
</tbody>
</table>

**Note:** To learn more about enabling spam scoring and filtering, see *Email spam scoring and filtering (instance security hardening)* in the Instance Security Hardening Guide.

**Email filter script include**

Email filters use a script include called *EmailUtils* that contains a simple utility function to determine if *vCalendar* is in the body of the response email. The results of this query are used in a condition script in the *Ignore VCAL* email filter.

**Spam scoring and virus scanning**

Every message sent through email servers is assessed for the likelihood of being spam. Based on this assessment, the instance adds headers to each message that can be used for filtering within the customer instance using the Email Filters plugin.

The system also adds the *X-ServiceNow-Virus:INFECTED* header to an email that contains one or more virus-infected attachments. The system ignores the email.

Spam scoring and virus scanning are available only for instances that use the ServiceNow email infrastructure. For more information on spam scoring and filtering, see *KB0549426*.

**Activate email filters**

Administrators can activate the Email Filters plugin (com.glide.email_filter).

Role required: admin

1. Navigate to System Applications > All Available Applications > All.

   A banner appears to notify you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:** To redirect to the legacy list view for plugins, click the link.

   ![Redirected](redirected.png)

2. Find the plugin with the filter criteria and search bar.

   You can search for the plugin by its name or ID.

   If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in *Request a plugin*.

3. Activate the plugin.
You can activate the plugin directly from the All Applications page or view more details about the plugin before activating it.

- If you are certain that you have the correct plugin, click **Install**, and then click **Activate** in the dialog box that appears.

  ![Activate Plugin Dialog]

- To view plugin details before activation:
  1. Click the plugin name.
  2. On the form, click the **Activate/Update** related link.
  3. On the dialog box that appears, review the dependent plugins.

    If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.

  4. If demo data is available and you want to install it, click **Load demo data**.

    Some plugins include demo data, which are sample records that illustrate plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.

  5. Click **Activate**.

*Create an email filter*

You can create email filters to apply a custom action script or filter actions when email matches your filter's conditions.

Role required: admin

1. Navigate to **System Mailboxes > Administration > Filters**.
2. Click **New**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the email filter.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the email filter.</td>
</tr>
</tbody>
</table>
ServiceNow Madrid Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Priority that the email filter takes over other filters for the same table. To give the filter higher priority over other filters, enter a lower number.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the email filter.</td>
</tr>
<tr>
<td>Short description</td>
<td>Description of what the filter does.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions to define which emails to filter. Note that conditions are case sensitive.</td>
</tr>
<tr>
<td>Condition script</td>
<td>Script to define which emails to filter. Use this script to access other tables, variables, or methods. For example, the condition script for the Ignore VCAL filter looks for the results of the EmailUtils script include, which detects vCalendar attachments.</td>
</tr>
<tr>
<td>Action script</td>
<td>Script to define additional behavior to be performed when the filter condition evaluates to true. This might include an email action not included in the default filter actions. In the base system, the action script is used to produce the error string that is published to the email log (System Logs &gt; Email).</td>
</tr>
</tbody>
</table>

4. Right-click in the header bar and select **Save** from the context menu.

The **Filter Actions** related list appears.

5. Click **New** in the related list.

6. Select how the system should react when the conditions of this filter evaluate to true.

   The two choices in the base system are: **Mark as Ignored** and **Move to Junk**. You can use the **Action script** to perform additional email tasks.

   **Note:** Before creating additional email actions with a script, see **Inbound Email Actions**. Like business rules, inbound email actions use both conditions and scripts and can provide a number of useful actions on emails the instance receives.

---

**Email retention**

You can archive and eventually destroy email messages that you no longer need or if your Email table is excessively large.

Email retention is available starting with the Helsinki release.

**Email archive and destruction plugins**

The email archiving and destruction feature uses the **Data Archiving** and **Email Retention** plugins. The Data Archiving plugin must be active to archive and destroy email records. The Email Retention plugin provides a set of rules that specify when the system archives and destroys email records.

**Note:** The Email Retention plugin also prevents the system from deleting watermarks, which are required for inbound email actions to continue to function.

The Email Retention plugin and associated archive and destroy rules are active by default on new instances. On upgraded instances, you must manually activate both the plugin and the archive and destroy rules. ServiceNow recommends that you review and approve these rules before activating them.

If your instance already has a process to manage email records, you do not need to activate the Email Retention plugin. If you want to replace your current process with Email Retention, be sure to deactivate the current process before activating the archive and destroy rules.
Archiving and destroying email records

Archiving means moving records from the Email [sys_email] table to the Archive Email [ar_sys_email] table when they exceed the archive rule time limit. Destroying means deleting records in the Archive Email table when they exceed the destroy rule time limit.

Note: When a destroy rule deletes email records, associated watermarks are not deleted. They are preserved to ensure that your inbound email actions continue to function.

Default archive and destroy rules

Email Retention provides these email archive rules:

- **Emails - Ignored and over 90 days old**: archives email message records that were created more than 90 days prior to the current date and are of type received-ignored or sent-ignored.
- **Emails - Over a year old**: archives email message records that were created more than 365 days prior to the current date.

Email Retention also provides this email destroy rule:

- **Email Archive - Over a year old**: destroys email records that have been archived for more than 365 days prior to the current date.

With these default settings, your email messages are kept on the instance for a total of two years: one year in the Email table, and one year in the Email archive table. At the end of this period, the system deletes the expired email records from the Email archive table.

Note: By default these rules are active on new instances and inactive on upgrades. The system runs archive and destroy rules when you activate them.

Compatibility with other record management implementations

If you are already using another method to manage email records, such as table cleaners, you do not have to use the Email Retention feature. To prevent unexpected record deletion, ServiceNow recommends that you avoid using multiple email management processes on the same instance at the same time.

Note: For assistance replacing your existing record management implementation with Email Retention, contact your professional services or sales representative.

Effects of archiving and deleting email records

Inbound email actions copy the body of an email to the work notes of the related record. If the inbound email record is later deleted, the work notes still contain a text copy of the email.

When the system sends an email message about a record, the activity formatter displays a Sent Email section with a link to the email message. If the system archives the email message, the activity formatter removes Sent Email section. When the system deletes the email message, it is no longer visible in the activity formatter nor the work notes.
Archiving email records changes the methods available to the system to identify inbound email as a reply. After archiving an email record, the system can no longer use the **In-Reply-To** field to match an incoming email to an email record. However, the system can still match incoming email to an existing record from a record number or watermark.

**Activate the Email Retention plugin**

The Email Retention plugin provides archive and destruction rules for email messages. It is active by default for new instances, but must be activated for upgrades.

Required role: admin

The Email Retention plugin requires these plugins:

- **Data Archiving**
- **System Mailboxes**

1. Navigate to **System Applications > All Available Applications > All.**

   A banner appears to notify you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:**
   
   To redirect to the legacy list view for plugins, click the link.

2. Find the plugin with the filter criteria and search bar.

   You can search for the plugin by its name or ID.

   If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in **Request a plugin.**

3. Activate the plugin.

   You can activate the plugin directly from the All Applications page or view more details about the plugin before activating it.

   - If you are certain that you have the correct plugin, click **Install**, and then click **Activate** in the dialog box that appears.
• To view plugin details before activation:
  1. Click the plugin name.
  2. On the form, click the **Activate/Update** related link.
  3. On the dialog box that appears, review the dependent plugins.
     If your plugin requires dependent plugins, they are activated automatically when you activate your
     plugin if they are not active already.
  4. If demo data is available and you want to install it, click **Load demo data**.
     Some plugins include demo data, which are sample records that illustrate plugin features for common
     use cases. Load demo data when you first activate the plugin on a development or test instance. You can
     always load demo data later by clicking **Load demo data only** on the plugin form.
  5. Click **Activate**.

*Archive email manually*

You can archive email messages manually on demand instead of waiting for the instance to archive them based on a
scheduled job.

Role required: admin

Email Retention provides these email archive rules:

- **Emails - Ignored and over 90 days old**: archives email message records that were created more than 90 days prior to the current date and are of type **received-ignored** or **sent-ignored**.
- **Emails - Over a year old**: archives email message records that were created more than 365 days prior to the current date.

You can manually archive email messages that meet these archive rules or any additional archive rules that you create.

**Note:** An archive record must be active for the instance to be able to process records with it.

1. Navigate to **System Archiving > Archive Rules**.
2. Open the email archiving rule that you want to modify.
3. Click **Recalculate Estimate** to see how many records in the Email [sys_email] table are going to be archived. The estimate appears in the **Record estimate** field.

4. Click **Run Archive Now**.

   **Note:** You can also **archive related records**.

---

**Watermarks on notification emails**

By default, the system generates a watermark label at the bottom of each notification email to allow matching incoming email to existing records. Each watermark includes a random 20-character string that makes it unique.

Starting with the Jakarta release, the system automatically generates randomized watermarks for notification emails in base systems. The random 20-character string reduces the possibility of a watermark being guessed or coincidentally matching the watermark of an email from another instance.

   **Note:** If you are upgrading from a release before Jakarta, random watermark support is optional and requires the Random Watermark Support plugin to be activated.

---

**Watermark format**

The email watermark always begins with "**Ref:**" to identify the label as a watermark. After this identifier, the default label is 31 characters in length and consists of:

- **Customizable prefix** — The default prefix is **MSG**.
- **Auto-numbered identifier** — The numeric string identifying the source record, such as incident, problem, or change request.
- An underscore character followed by a random 20-character string

---

**Randomized watermark example**

When inbound emails are processed, the system matches random watermarks to the appropriate source records.
Watermark configuration

Watermarks are always generated, but you can configure them to:

- Create a custom watermark prefix for each instance to prevent accidentally triggering events in the wrong instance.
- Have custom prefix characters after MSG
- Be hidden globally
- Be omitted from individual email messages

If watermarks are omitted from email notifications, inbound email actions might not work properly. Without a watermark, the system processes inbound email messages as described in *Criteria for matching email to inbound actions*.

**Note:** Email clients that use the plain text version of the email still show the watermark.

*Create a custom watermark prefix for email notifications*
By default, email notifications use the watermark prefix MSG, but you can create a custom watermark prefix.

Role required: admin

Any email notifications that are forwarded from one instance to another might be more easily distinguished with different prefixes for each instance. To avoid unintentionally triggering events in the wrong instance, create a unique watermark prefix for each instance.

**Note:** Do not use colons (:) in custom watermark prefixes. Colons are a reserved character and may cause the watermark to be ignored.

1. Navigate to **System Definition > Number Maintenance**.
2. Open the MSG record in the Email Watermark [sys_watermark] table.
3. Enter the unique **Prefix** for this instance.
4. **Click Update.**

Your custom watermark applies to all new email notifications. Email notifications that existed before you created a custom watermark keep the same watermarks as before.

*Omit an email notification watermark*

You can omit watermarks on email notifications if you do not want the instance to match the notification to an existing record.

Role required: admin

1. Navigate to **System Notification > Email > Notifications.**
2. Select the email notification to update.
3. Click the **Advanced View** related link.
4. In the **What it will contain** section, select the **Omit watermark** check box.

When incoming email does not contain a watermark, the system searches the subject line and message body for a record number. The system attempts to match any record number that it finds to an existing record. If there is a matching record number, the system updates the record with the values in the incoming email. To ensure that response email messages don't update records, remove the record number variable `${number}` from the **Subject** and **Message HTML** fields.

*Hide email watermarks globally*

Rather than omitting watermarks, it is possible to hide watermarks on a global basis using HTML markup.

Role required: admin

Watermarks can only be hidden in the HTML message. The text version of the message, because it does not have markup allowing show/hide semantics, will always have the watermark.

1. Navigate to **sys_properties.list** in the **Application Navigator.**
2. Create a new property named `glide.email.watermark.visible` and set it to **false.**
This ensures that all watermarks are hidden on all email messages. This cannot be done on a per-email basis.

System mailboxes

Email messages can be seen in the System Mailboxes menu, which gives you access to the system Inbox, Outbox, and Sent mail box.

Each provides a filtered view of emails to let you see only what you need to at any given time, including list fields applicable to each. The system mailboxes menu shows your current POP and SMTP status.

The System Mailbox is hosted by ServiceNow, who have sole access to the mailboxes. By default, once the instance pulls an email message, it is deleted from the mail server and stored in the application on the Email [sys_email] table.

For information about the fields that are shown in the System Mailbox, see System email log and mailboxes. You can configure the layout of a system mailbox to show any of the email log fields, not only the ones that are shown by default.

• **Inbound emails**: All inbound mail is placed into the Inbox until it is processed. After it is cleared, the email moves to the Received state. If the email message matches the criteria in an inbound email action, the email is changed to Processed. If not, it is changed to Ready. If the system is restarted for any reason (such as during a system upgrade), all inbound mail waits on the external mail server until the system can request delivery.

• **Outbound emails**: All outbound mail is placed into the Outbox until it is processed. Once cleared, it is moved to Sent (if sent) or Skipped (not sent, as in the case of no valid recipients). If the system is restarted for any reason (such as during a system upgrade), all outbound mail waits in the instance database until the system comes online, and the scheduler looks for mail to deliver.

The email client

The email client enables you to send email directly from any record, such as an incident, change request, problem, or user record.

The email client is available by default, and enabled by default on the incident table.

The email client can be useful in cases where you want to send an email:

• To engage more people in a piece of work
• That includes Cc and Bcc recipients
• That includes personalized comments
• To a third party who doesn't have an account in your instance
• To someone about an incident where you don't have an email notification set up to do exactly what you want

The email client always uses the multipart/mixed content type and supports HTML markup in the message body.

*Note:* Line breaks do not appear for multi-line fields such as ${description} and ${comments} in the email client template.

**Enable the email client for a table**

Enable the email client for a table so that users can send emails directly from the table record.

Role required: admin

The email client is enabled by default on the Incident [incident] table. You can enable the email client for another table by adding the email_client dictionary attribute to the table.

*Note:* This capability is not inherited by tables that extend the current table. For example, enabling the email client on the Task table does not enable it for the Incident or Problem tables.

1. Open a record in the table that you want to enable the email client for.
For example, to enable the email client for the Problem [problem] table, navigate to Problem > Open, and then open any problem record.

2. On the form, click the menu icon
   ( ) and then click Configure > Dictionary.

3. On the Dictionary Entries list, open the first record. The first record has the record type Collection and does not have any entry for Column name.

4. On the form, in the Related Links section, click Advanced view.

5. In the Attributes field, enter email_client=true. If there are other values in the field, separate the attribute with a comma.

6. Click Update.

Components installed with the email client
Several types of components are installed with activation of the Email Client (com.glide.email_client) and Email Client Template (com.glide.email_client_template) plugins, including tables and user roles.

Note: To view all other components installed with this plugin or application, see the Application Files table. For instructions, see Find components installed with an application.

Roles installed

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>

Email client interface

The instance's email client interface looks like a standard email interface, which contains a toolbar for text formatting and adding attachments.

Users see an email icon based on the UI version.

- UI16: The email icon (✉️) appears in the more options menu.
- UI15: The email icon (✉️) appears in the form header.

Users click the email icon to launch the email client as a pop-up window.

This is an email message using the TinyMCE editor.
Email client configurations

Use email client configurations to manage the behavior of your email client. Each configuration consists of different controls for setting allowable email recipients and email addresses.

In new and upgraded instances, the Email Client Configuration module is activated by default through the Email Client (com.glide.email_client) and Email Address Filter (com.glide.email_address_filter) plugins.

Note: If you upgraded to the Madrid release, a default email client configuration is created automatically during upgrade. This default email configuration is used if you do not define any other email client configurations. Also, if you previously defined certain email client properties to control email address autocomplete, disambiguation, and the display of the From and Reply-To email addresses, those settings are retained in the default email client configuration.

How email client configurations work

Email client configurations determine how your email client behaves, such as whether the From address or Reply-To address should be displayed, and the allowable addresses that can be entered by your users. A configuration applies to a specific ServiceNow table, which enables you to define email client behavior for a specific context, purpose, or application. For example, if you have email client users who send email about Customer Service case records, you can create a configuration that applies email client controls specific to customer service. You can select the email client recipient qualifiers for controlling the autocomplete recipient results from a selected table, such as the Customer Contact table. You can also set email address filters that determine the allowable addresses from a table, such as the Customer Contact table.

An email client configuration consists of the following components:

Email client recipient qualifiers

Recipient qualifiers control the email recipients returned in the autocomplete results for the To, Cc, and Bcc fields of the email client. You can provide additional qualifiers displayed in the autocomplete results to differentiate recipients that have the same names and narrow the results.

Email client From addresses

This control enables the display of the From and Reply-To addresses. Use the Email Client Template to create a set of allowable From addresses that can be used when a user sends an email with the email client. You can provide a specific From address to be used in the email client, or you can choose to hide it entirely.

Email address filters

Email address filters allow or disallow certain email addresses that users can enter in the email client. You can specify an email whitelist that specifies allowable domains or an email blacklist that disallows certain domains.

You can also use an Email Client Template to define the content of an email client message and set other message characteristics, such as an email sender (From address) configuration.

Email client configuration process

Users with the admin role define and edit email client configurations. Users with the email_client_admin role can edit configuration information in selected tables.

1. Build the various email client controls that can be used to create an email client configuration.
• Define email client recipient qualifiers.
• Set email address filters that allow or disallow email addresses that can be entered in the email client.

2. Create the email client configuration.

Define an email client configuration that determines how your email client behaves when users create an email message.

Define email client recipient qualifiers

Create a configuration that controls the auto-complete list of recipients displayed in the email client. You can specify recipient qualifiers that display additional fields (from a selected ServiceNow table) in the auto-complete list. These fields differentiate email recipients who have the same first and last names.

Role required: email_client_admin or admin

Use the following tabs in the Email Client Recipient Qualifier form to define a recipient configuration.

• Display Configuration – Set up the email recipient auto-complete behavior and optionally select additional fields to differentiate recipients who have the same name. The additional fields ensure that users select the proper recipient for an email.
• Query Configuration – Specify a condition or script that queries the selected table and filters the recipient results returned.

You can define different recipient configurations, which can be used in an email client configuration.

1. Navigate to Email Client > Email Client Recipient Qualifier and click New.
2. Fill in the fields at the top of the Recipient Qualifier form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for this email client recipient configuration.</td>
</tr>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
<tr>
<td>Table</td>
<td>The ServiceNow table to be queried for recipients.</td>
</tr>
<tr>
<td>Description</td>
<td>A brief description of this recipient configuration.</td>
</tr>
</tbody>
</table>

3. Fill in the fields in the Display Configuration tab to control the autocomplete display in the email client.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Address field</td>
<td>The field on the table that contains the recipient email address.</td>
</tr>
<tr>
<td>Display Name Field</td>
<td>The field on the table used for the recipient name displayed.</td>
</tr>
<tr>
<td>Order</td>
<td>The order of results returned relative to other recipient qualifiers defined.</td>
</tr>
<tr>
<td>Additional Display Fields</td>
<td>A content list for choosing additional fields from the table to be displayed in the auto-complete list. Differentiates recipients who share the same name.</td>
</tr>
<tr>
<td>Search Additional Fields</td>
<td>A checkbox for enabling additional fields to be searched. Expands the recipients returned in the auto-complete list by querying (searching) the Additional Display Fields.</td>
</tr>
</tbody>
</table>

4. Fill in the fields in the Query Configuration tab.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select the method for filtering the recipients returned in the auto-complete list:</td>
</tr>
<tr>
<td></td>
<td>• Condition</td>
</tr>
<tr>
<td></td>
<td>• Script</td>
</tr>
<tr>
<td>Conditions</td>
<td>If you selected Condition for the Type, use the condition builder to specify the conditions that must be met to return the appropriate recipients.</td>
</tr>
<tr>
<td>Script</td>
<td>If you selected Script for the Type, enter a script that uses these variables to return the appropriate recipients:</td>
</tr>
<tr>
<td></td>
<td>• recipientQuery: GlideRecord for the table being queried.</td>
</tr>
<tr>
<td></td>
<td>• targetRecord: GlideRecord for the target record from which the email client was opened.</td>
</tr>
</tbody>
</table>

For example, this recipientQuery is a GlideRecord that represents the Customer Contact table. The targetRecord variable is a Customer Service case from which the email client was opened. This query limits the email client autocomplete results to contacts who belong to the same account as the Customer Service case.

```javascript
(function (recipientQuery, targetRecord) {
  // Limit results to contacts belonging to the account for the case.
  var account = targetRecord.getValue('account');
  recipientQuery.addQuery('account', account);
})
```

5. Click Submit.
   The recipient qualifier configuration is added to the Recipient Qualifier [sys_recipient_qualifier] table and is available for use in an email client configuration.

Define email client from addresses
Set an allowable email address that is displayed in the From address of a message sent from the email client.

Role required: admin

1. Navigate to Email Client > Email Client From Address and click New.
2. In the Display name, enter the name to be displayed in the From field of the email client message.
3. Enter a valid Email address for the From address in the email client.
4. Click Submit.
   The From address is added to the Email Client From Address [sys_email_client_from_address] table.
Set email address filters

Define email filters that restrict the email recipients that users can enter in the email client. You can filter by domain or by specifying certain addresses.

Role required: email_client_admin or admin

You can specify two types of email address filters:

- Whitelist: A list of allowed domains for email recipients who can be selected in the email client.
- Blacklist: A list of disallowed domains for email recipients who cannot be selected in the email client.

You can also specify email address exceptions to the allowed or disallowed domain.

1. Navigate to Email Client > Email Address Filters, and then click New.
2. Enter the Name of the address filter.
3. Select the filter Type:
   - Whitelist: Allow all specified domains. All other domains are disallowed.
   - Blacklist: Disallow all specified domains. All domains that do not match the blacklisted domains are allowed.
4. In the Domains field:
   a) Click the lock icon to unlock it and access the domains controlled by this filter.
   b) Select an existing domain or enter a new domain:
      - If the filter Type is Whitelist, click the Search icon. Select the domains for which all email addresses are allowed. To add a new domain, click New, enter the Domain, and click Submit.
      - If the filter Type is Blacklist, click the Search icon. Select the domains for which all email addresses are disallowed. To add a new domain, click New, enter the Domain, and click Submit.
   c) Click the lock icon to lock the Domains field.
5. Specify any email addresses that are Exceptions to the domains specified in step 4.
   a) Click the lock icon to open the Email Address Filter Exceptions [sys_email_address_filt_except] table.
   b) Click the search icon to choose an existing email address. To add a new email address, click New, enter the email address exception, and click Submit.
   c) Click the lock icon to lock the Exceptions field.
      The exception is added to the Email Address Filter Exceptions [sys_email_address_filt_except] table.
6. Click Submit.
   The email address filter is added to the Email Address Filters [sys_email_address_filter] table.
Create an email client configuration

Define a configuration that controls the display and behavior of the email client based on a selected ServiceNow table. The configuration determines the recipient autocomplete results displayed, email addresses that can be entered, and a set of allowable From addresses to be used when sending a message with the client.

Role required: email_client_admin or admin

Role required: email_client_admin or admin

You can create one email client configuration per ServiceNow table.

1. Navigate to **Email Client > Email Client From Address** and click **New**.
2. Fill in the fields at the top of the Email Client Configuration form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for this email client configuration.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
<tr>
<td>Active</td>
<td>A checkbox indicating the configuration is active. The configuration is active by default.</td>
</tr>
<tr>
<td>Table</td>
<td>The ServiceNow table that this client configuration applies to. Select a table from the list.</td>
</tr>
</tbody>
</table>

3. In the Recipient Configuration section, select the **Recipient Qualifiers** to be used for this client configuration.
   a) Unlock the lock icon. By default, two types of recipients are available: Active Users with email accounts and Active Groups with email accounts.
   b) Click the search icon and select a recipient configuration from the list of available recipient configurations.
   c) Click the lock icon to lock it.

4. In the Display Configuration section:
   a) Select the **Display From** check box to display the From email address in the email client. To hide the From email address in the email client, leave this box unchecked.
   b) Select the **Display Reply-To** check box to display the Reply To address in the email client. To hide the Reply To email address in the email client, leave this box unchecked.

5. In the Filter Configuration section, select the **Email Address Filters** to be applied to the email client.
   a) Unlock the lock icon.
   b) Click the search icon and select one or more Email Address Filters.
   c) Click the lock icon to lock the **Email Address Filters**

   Each filter that you select evaluates a given email address and determines whether or not the given address is valid to apply to an outbound email.

6. Click **Submit**.
   The configuration is added to the Email Client Configuration [sys_email_client_configuration] table.

---

### Customize the email client

The email client has default properties and values that you can customize to suit your needs.

#### Email client default properties and values

<table>
<thead>
<tr>
<th>Property</th>
<th>Default Value</th>
<th>How to Customize</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACL access</td>
<td>Defaults to allowing only users with the itil role to access the email client. Change the ACL rule to control access to the email client.</td>
<td>To control who can see the email client, see Control access to the email client.</td>
</tr>
<tr>
<td>Email icon</td>
<td>Allows only users with write access to the current table to see the email icon.</td>
<td>To remove the email icon, see Email icon display.</td>
</tr>
<tr>
<td>To</td>
<td>Defaults to the email address of the caller.</td>
<td>To edit the default value, create an email client template.</td>
</tr>
<tr>
<td>Cc</td>
<td>Defaults to the email addresses of the user who opened the incident and all users in the watch_list.</td>
<td>To edit the default value, create an email client template.</td>
</tr>
<tr>
<td>Property</td>
<td>Default Value</td>
<td>How to Customize</td>
</tr>
<tr>
<td>------------------</td>
<td>----------------------------------------------------</td>
<td>--------------------------------------------------------</td>
</tr>
<tr>
<td>Subject</td>
<td>Defaults to the incident number and short description.</td>
<td>To edit the default value, create an email client template.</td>
</tr>
</tbody>
</table>

**Control access to the email client**
You can control access to the email client by changing an ACL rule.

Only users with the itil role can access the email client. The following ACL rule controls this access:

**ACL rule**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>EmailClientProcessor</td>
<td>processor</td>
<td>execute</td>
</tr>
</tbody>
</table>

**Note:** Because the visibility of the email icon is determined by whether the current user has write access to the table, it is possible that a user may be able to see the email icon and still not open the email client.

**Create an email client template**
You can create a different template for each table that uses the email client.

Role required: admin

The email client uses its own email templates to define default values for fields. Use the following sections in the Email Client Template form to build a client template:

- **Content:** The message body.
- **Recipients:** The email addresses of users receiving the email message. The email addresses are displayed in the To, Cc, and Bcc fields of the message.
- **Sender Configuration:** The method used to generate the email sender (From email address) of the message.

1. Navigate to System Policy > Email > Client Templates.
2. Click New.
3. Fill in the fields at the top of the Email Client Template form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique template name.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that the template applies to. Enable the email client for the same table.</td>
</tr>
<tr>
<td>Conditions</td>
<td>The conditions that determine when this client template is used. Use the condition builder to identify the target record that must match before this template is applied to the email client.</td>
</tr>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
<tr>
<td>Execution Order</td>
<td>A number that indicates the order in which template conditions are evaluated.</td>
</tr>
</tbody>
</table>

4. Fill in the fields in the Content tab.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subject</td>
<td>Enter a description of the email.</td>
</tr>
<tr>
<td>Content Type</td>
<td>Select the format of the message body content: HTML or plain text.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Body HTML</td>
<td>If you selected HTML for the <strong>Content type</strong>, enter the content of the message body using the HTML editor toolbar to format the HTML. You can call a mail script by using <code>$(mail_script:script name)</code> in the <strong>Body HTML</strong> field.</td>
</tr>
<tr>
<td>Body text</td>
<td>If you selected plain text for the <strong>Content type</strong>, enter any text or mail script that you want to appear in the message body. You can insert a mail script in the <strong>Body text</strong> field by using the following syntax: <code>&lt;mail_script&gt; [code] &lt;/mail_script&gt;</code></td>
</tr>
</tbody>
</table>

5. Fill in the fields in the **Recipients** tab.
Field | Description
---|---
**To** | Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the **To** field. Your script must start with the `javascript:` prefix. The script must return email addresses in a comma-separated string.

**Cc** | Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the **Cc** field. Your script must start with the `javascript:` prefix. The script must return email addresses in a comma-separated string. This field cannot have the same addresses as the **To** field.

**Bcc** | Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the **Bcc** field. Your script must start with the `javascript:` prefix. The script must return email addresses in a comma-separated string. This field cannot have the same addresses as the **To** or **Cc** fields.

6. In the **Sender Configuration** tab, select the **From Generation Type** to determine how the sender (From address) in the email client message is generated.

Use this field only if you want a different From address than the one defined in your SMTP email account.

- None: The From address is not generated in the email client message.
- SMTP Email Account: Use the From address of the SMTP email account for the instance as the sender.
- Select From List: Choose from a list of allowable From addresses defined in the Email Client From Address [sys_email_client_from_address] table.
- Script: Run a GlideRecord query on the Email Client From Address [sys_email_client_from_address] table.
  For example, the following script sets the From address based on the location of the incident caller:

```javascript
(function (fromAddressQuery, targetRecord) {
  // targetRecord is incident for this template
  var location = targetRecord.caller_id.country;

  if (location == 'us')
    fromAddressQuery.addQuery('email_address', 'servicedesk.us@example.com');
  else if (location == 'japan')
    fromAddressQuery.addQuery('email_address', 'servicedesk.jp@example.com');
  else if (location == 'uk')
    fromAddressQuery.addQuery('email_address', 'servicedesk.uk@example.com');

  fromAddressQuery.query();
})(fromAddressQuery, targetRecord);
```

- Text: Enter the email From address to be used in the client.
Note: The From email address does not appear in the email client unless you configure email client to display the From address. For more information on managing the behavior of email client, see Email client configurations.

Note: If the domain for the From address is not the domain of the SMTP email account server, the owner of the From domain must configure the SPF record for the domain. The owner changes the domain settings to allow the instance to send email as if from that domain. For details on using SPF records, see ServiceNow KB0535456.

7. Click Submit.
   The template is added to the Email Client Templates [sys_email_client_template] table.

SMS delivery with the email client
A property is available that lets the user select an option to send a notification via SMS.

The Subscription Based Notifications plugin activates the following system property:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email_client.show_sms_option</td>
<td>Specify whether a check box appears in the email client for sending the message to the user’s SMS device. If no SMS device exists, the email client sends the message to the primary email device.</td>
</tr>
</tbody>
</table>
Configuring the email client
Quick messages
Quick messages allow you to insert predefined text into the message body of the email client.

Role required: admin

Selecting a quick message fills the **Message Text** field with the **body** specified in the quick message. After you define one or more quick messages, the Quick Message selector appears in the email client. Use the following syntax: `${variable_name}`.

**Note:** If you add attachments to the Quick Message templates, the attachments are not sent as part of the email distribution.

1. Navigate to **System Policy > Email > Quick Messages**.
2. Click **New**.
3. Fill in the Email Client Canned Messages form.

### Email client canned messages form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Enter a name to appear in the Quick Message selector.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the quick message available for selection. Clear this check box to remove the message from the Quick Message selector.</td>
</tr>
<tr>
<td>User</td>
<td>Select the user who has access to this quick message. Selecting a user restricts access to that user only. Leave the field blank to have no user-based restrictions.</td>
</tr>
<tr>
<td>Group</td>
<td>Select the group whose members have access to this quick message. Selecting a group restricts access to members of that group only. Leave the field blank to have no group-based restrictions.</td>
</tr>
<tr>
<td>Body</td>
<td>Enter the text you want to insert into the Message Text field. By default, the field supports HTML format.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
Email icon display

You can use access control rules to hide or display the email icon on forms.

Users with write access to the current table can see the email icon. To remove the icon, remove the user's write access to the table. Typically you do this in one of two ways:

- Make the user an Employee Self-Service (ESS) user. ESS users do not have a user role, and without a role they do not have write access to the Incident table. Making a user an ESS users, therefore, hides the email icon on the Incident form.
- Create a custom ACL rule and user role that does not have write access to the table. The default ACL rule for the email client checks to see if the user has the itil role. If you grant users a custom role other than itil, then any such users will not see the email icon.
Remove or display the email icon for a table by setting the `email_client` dictionary attribute to true or false on the table's collection record. This will not display the email icon for users without write access to the table. For more detail see `Dictionary attributes`.

**Email Service**

Email Service installs the Email API on the instance.

By default, Email Service only allows admin users to access the `Email API`. Administrators can `grant access to the Email API` by:

1. Adding an access control for creating records in the Email [sys_email] table linked to the email_api_send role.
2. Assigning the email_api_send role to the non-admin user.
3. Verifying the non-admin user has read access to the notification target table. For example, an email notification for an incident, requires read access to the Incident table.

Non-admin users with the email_api_send role can access the Email API from the `REST API Explorer`.

**Activate Email Service**

Users with the admin role can activate the Email Service plugin (com.glide.email.service) to enable the Email API.

Role required: admin

1. Navigate to `System Applications` > `All Available Applications` > `All`.
   A banner appears to notify you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

   ![Note: To redirect to the legacy list view for plugins, click the link.](image)

2. Find the plugin with the filter criteria and search bar.
   You can search for the plugin by its name or ID.
   If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in `Request a plugin`.

3. Activate the plugin.
   You can activate the plugin directly from the All Applications page or view more details about the plugin before activating it.
   - If you are certain that you have the correct plugin, click `Install`, and then click `Activate` in the dialog box that appears.
• To view plugin details before activation:
  1. Click the plugin name.
  2. On the form, click the **Activate/Update** related link.
  3. On the dialog box that appears, review the dependent plugins.
     If your plugin requires dependent plugins, they are activated automatically when you activate your
     plugin if they are not active already.
  4. If demo data is available and you want to install it, click **Load demo data**.
     Some plugins include demo data, which are sample records that illustrate plugin features for common
     use cases. Load demo data when you first activate the plugin on a development or test instance. You can
     always load demo data later by clicking **Load demo data only** on the plugin form.
  5. Click **Activate**.

*Grant access to the Email API*
To grant non-admin users access to the Email API, administrators must create an access control and assign a special
role.

Role required: admin

For additional details, see *Email API*.

1. Elevate privileges to security_admin.
2. Navigate to **System Security > Access Control (ACL)**.
3. Click **New**.
4. Create an access control for the Email [sys_email] table.

<table>
<thead>
<tr>
<th>Access control values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Operation</td>
</tr>
</tbody>
</table>
### ServiceNow Madrid Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin overrides</td>
<td>Selected</td>
</tr>
<tr>
<td>Name</td>
<td>sys_email</td>
</tr>
<tr>
<td>Requires role</td>
<td>email_api_send</td>
</tr>
</tbody>
</table>

#### 5. Assign the email_api_send role to the non-admin user.

#### 6. Verify the non-admin user either has read access to all records in the notification target table or has read access to a specific record in the table.

For example, to work with incident notifications the non-admin user needs access to the Incident table. You can provide record access by:

- Granting the user an appropriate role, such as the itil role.
- Selecting a specific incident that was opened on behalf of the user.

---

### Troubleshooting notification emails

Logs and diagnostics are provided to help determine whether notification emails are being sent and received successfully, what any issues are, and who receives the email.

Diagnostics help monitor the overall health of the system and troubleshoot general problems, such as not receiving any incoming mail. Logs help identify problems with individual emails, and different logs are useful for diagnosing different types of problems.

#### Log checking scenarios

<table>
<thead>
<tr>
<th>Problem</th>
<th>Log</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Need to check whether an individual notification email was successfully sent</strong></td>
<td><strong>Check the</strong> <a href="#">Sent System Mailbox</a> for that email. Also check the <a href="#">Failed System Mailbox</a> for failure notifications.</td>
</tr>
<tr>
<td><strong>Individual email failed</strong></td>
<td><strong>Check the</strong> <a href="#">message log</a> of the individual email.  <strong>Check the</strong> <a href="#">Error string</a> field of the email record.</td>
</tr>
<tr>
<td><strong>Email not received by end user</strong></td>
<td><strong>Check the</strong> <a href="#">Junk System Mailbox</a> for notifications about returned emails. These emails also appear in the Emails log with a <strong>Type</strong> of received-ignored.  <strong>Check the</strong> <a href="#">Error string</a> field of the email record.</td>
</tr>
</tbody>
</table>

**Warning:** Some email servers do not return error strings

</tr>
<tr>
<td>Email from Outlook produces an empty Incident record containing an attachment named winmail.dat.</td>
<td>Configure the local Outlook client or Exchange server to not send Rich Text formatted (RTF) data to the instance.</td>
</tr>
</tbody>
</table>

Email diagnostics

The Diagnostics and Connection page provides information on the current state of your email configuration. This page includes status on email properties, scheduled jobs, and email account connections that affect how your instance receives and sends email.

Email diagnostic information can help you identify problems with inbound or outbound email. The following video shows different steps to determine why your instance is not receiving inbound emails. One of the steps uses email diagnostics to check the email connection status and email reader scheduled job.

Navigate to the Diagnostics and Connection page from either of these modules:

- **System Mailboxes > Email Diagnostics**
- **System Diagnostics > Email Diagnostics**

Email Diagnostics and Connection page
### Email Sending is Operational

<table>
<thead>
<tr>

**System email log and mailboxes**

The system email log records all emails that the instance creates or receives. System mailboxes are filtered views of this log.

Every notification email that the instance creates or receives is recorded in an Email [sys_email] record. You can navigate to a log of these records at System Logs > Emails.

The System Mailboxes are filtered views of the Emails [sys_email] table. The instance assigns an email record to a system mailbox depending on the values of the **Type** and **State** fields. For more information, see System mailboxes.

The following fields can be included in the layout of the system log and any of the system mailboxes:

**Email log**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mailbox</td>
<td>The system mailbox that lists this email record. The instance sets the value of this field according to the values of the <strong>Type</strong> and <strong>State</strong> fields.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the email (Error, Ignored, Processed, or Ready).</td>
</tr>
<tr>
<td>Receive type</td>
<td>The type of inbound email (None, Forward, New, or Reply).</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type</td>
<td>The status of the email. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• received: The server received this email.</td>
</tr>
<tr>
<td></td>
<td>• received - ignored: The server received this email, but it was ignored by the instance for inbound email action purposes. Typically, these emails are either spam or auto-replies. See the Error String field for details.</td>
</tr>
<tr>
<td></td>
<td>• send - failed: The server has attempted to send the email and failed. See the Error String field for details.</td>
</tr>
<tr>
<td></td>
<td>• send - ignored: The server skipped sending this email. Typically, this is for an email which was generated but lacked a recipient email address or is a duplicate email. See the Error String field for details.</td>
</tr>
<tr>
<td></td>
<td>• send - ready: The email is ready to be sent, but has not been sent out by the mail server. Typically, an email remains in this state for only a short time.</td>
</tr>
<tr>
<td></td>
<td>• sent: The email was sent by the instance without any errors or issues.</td>
</tr>
<tr>
<td>Target</td>
<td>A Document ID reference to the record if the email is generated by an insert, update, or delete of a particular record.</td>
</tr>
<tr>
<td>User</td>
<td>The name of the user, from the user record, of the instance from which the email notification was sent.</td>
</tr>
<tr>
<td>Note: This is a string field.</td>
<td></td>
</tr>
<tr>
<td>Notification Type</td>
<td>The type of notification. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• None</td>
</tr>
<tr>
<td></td>
<td>• SMS</td>
</tr>
<tr>
<td></td>
<td>• SMTP</td>
</tr>
<tr>
<td>UID</td>
<td>The unique ID of the email stored on the server.</td>
</tr>
<tr>
<td>Created</td>
<td>The date and time of the email activity for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Deleted</td>
<td>For inbound email, indicates whether the email was deleted from the email server.</td>
</tr>
<tr>
<td>Weight</td>
<td>The weight of the email, which determines the sending priority relative to other notifications on the same table.</td>
</tr>
<tr>
<td>Importance</td>
<td>An indication that the email was sent with a changed level of importance, such as Urgent.</td>
</tr>
<tr>
<td>Originating Event and Notification</td>
<td>For emails generated by notifications, an embedded list that stores the event and notification that created the email.</td>
</tr>
<tr>
<td>Subject</td>
<td>The email subject. For notifications, you create the subject text in System Notification &gt; Email &gt; Notifications.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Error String</td>
<td>The error string captured from the email server to determine why the email was not sent. This is logged only if the email is send-failed.</td>
</tr>
<tr>
<td>Recipients</td>
<td>The email addresses of the recipients.</td>
</tr>
<tr>
<td>Body</td>
<td>The body of the email, displayed in raw HTML markup. Use the related link Preview HTML Body to see the body text as rendered HTML.</td>
</tr>
<tr>
<td>Content type</td>
<td>The email content type.</td>
</tr>
<tr>
<td>Headers</td>
<td>Any headers embedded in the email.</td>
</tr>
</tbody>
</table>

**Message logs for individual emails**

The email log entries for an individual notification email are accessible as a related list in the email record. The **Error string** field in the email record can provide additional information.

Every email record contains an **Email Log** related list. This list shows the Email Log Entry [syslog_email] records. For troubleshooting purposes, the most useful fields are probably **Level** and **Message**.

To diagnose problems with outbound emails, also examine the **Error string** field in the email record. However, not every receiving email server sends back an error string.

**Note:** The Email Log Entry record is available for only 7 days after the email record is created.

**Inbound actions on received emails**

Check these logs as the first step to diagnose issues with inbound actions. The logs show which inbound action did or did not apply and for what reason.

**Note:** If an inbound action did not update any field on the target record, the log indicates that the inbound action was skipped.
Inbound email log

Reasons for including or excluding recipients

For outbound notifications, the email system log provides reasons that recipients were included or excluded.

Each log entry corresponds to a reason for inclusion or exclusion. For example, all users who were excluded because they are inactive appear in a single log entry.
A series of system properties can be used to fine-tune the information to be logged. Two master switch properties, `glide.notification.recipient.include_logging` and `glide.notification.recipient.exclude_logging`, control all recipient inclusion and exclusion logging. Several other properties allow you to tailor the information reported in the logs to meet your needs. All of the properties are enabled by default.

### Outbound email log

#### Push notifications

In addition to sending email and SMS notifications, an instance can send push notifications to mobile devices. A push notification is a text message that appears on a user's mobile device to alert them about something important or to ask them to perform an action. Your instance supports push notifications.
An example push notification

Use push notifications to send messages to users when certain conditions are triggered on your instance, such as the assignment of an incident to the user. A push notification can even ask for a reply, and the instance can process the reply by acting on the related records. For example, you can have the instance send an approval request for a Change to a user. You can let the user approve or deny the Change by clicking a response button on the push notification. The user's response can then update the status of the Change record.

You can set up push notifications in a similar manner to email and SMS notifications. Determine:

• who to send the notification to
• when it should be sent
• what it should contain

The ServiceNow mobile app is available as ServiceNow Classic and as ServiceNow Agent. By default, ServiceNow Classic supports push notifications, but you can also develop your own push application and configure your instance to send push notifications to it. For more information on setting up push notifications in ServiceNow Agent, go to Mobile push notifications.
Push notification setup

Push notification setup differs depending on the mobile or push application that you want your users to use. For an overview, see:

- Push notification setup with the ServiceNow Classic mobile app

  Note: Push notifications for on-premise instances are not supported.

- Push notification setup with a custom push application. If you create your own application, you must understand how push notifications and the Apple Push Notification Service system work. For more information, see the APNs Overview in the Local and Remote Notification Programming Guide for Apple developers.

Attention: Apple does not guarantee delivery of all push notifications. Review the Quality of Service (QoS) information in the Local and Remote Notification Programming Guide for Apple developers.

Push notification system

The push notification system involves several key elements that manage the delivery of push messages, push notification responses, and push feedback.

Customer instance

Your ServiceNow instance.

Push proxy

An instance that collects all push notifications that go to the ServiceNow Classic mobile application and forwards them to the ServiceNow applications for Apple iOS or Android. If you create a custom push application, you do not use the push proxy.

Push provider

The provider of push messages, which is the Apple Push Notification service (APNs) or Firebase Cloud Messaging (FCM) service, for the ServiceNow Classic mobile app or custom mobile apps.

Feedback provider

The provider of feedback messages, which tells the instance what devices are no longer valid. The Apple feedback or FCM server handles feedback messages for the ServiceNow Classic mobile app on iOS and Android devices respectively.

Feedback proxy

The ServiceNow instance that handles feedback messages from the Apple feedback server.

Push application on a mobile device

The application, such as the ServiceNow Classic mobile application. You can also build and customize your own push application.

Push notification process

The push notification process is as follows:

1. Activity on the instance triggers a push notification.

2. The instance looks for who to send the notification to and checks the user notification preferences to find their push device settings.
3. The instance sends the push notification to the push notification service, either the Apple Push Notification service (APNs) or Firebase Cloud Messaging (FCM) service. If you are using the ServiceNow Classic mobile app, the instance sends the notification through a push proxy instance, which then forwards the notification to the APNs or FCM service.

4. The push notification service sends the notification to the user's push application. When the instance sends the notification to the push notification service, it includes message content along with the instance name and ID. This information ensures that a response to the notification is sent back to the correct instance. If the user can reply to the notification, such as sending an approval to a change request, the response is sent via REST message back to the instance.

5. The instance identifies a script to run to handle the response.

6. The script performs an action on the instance, such as marking a change request approved. If there is invalid JSON or if the script fails, an error response is sent back to the device.

The following diagram shows the elements of the push notification system with the ServiceNow Classic mobile application. Within the ServiceNow infrastructure is your instance, the optional push proxy instance, and the ServiceNow feedback proxy. External to ServiceNow are the messaging services (APNs or FCM) and user mobile devices, which include the application that is registered to receive push notifications. See *Push feedback* for an explanation of the feedback service.

*Push notification system with the ServiceNow Classic mobile app*
Push notification responses

With custom push applications, you can have your users act on records in the instance by responding to a push notification.

The actions that they can take are defined in a script that you associate with the notification message. The response is sent to the instance in this format:

```
https://{instance_name}/api/now/v1/push/{application Name}/action/{action}
```

The application name is the push application the user is using. The application name must match the application name in the Push Application [sys_push_application] table. The action is the Sys ID of the action in the Push Notifications Actions [sys_push_notif_act_script] table.

Push feedback

Feedback refers to the information about failed iOS message delivery and the iOS push applications that can no longer receive push notifications.

The instance uses a scheduled job to pull feedback data every hour from the APNs. When the APNs determines that a device can no longer receive push messages, the corresponding device is set to inactive, making it unable to receive push notification messages. The Push Feedback [sys_push_feedback] table shows the token for the device that failed. If the same device is again able to receive push notifications, the device might receive the same token from the APNs. A new record is inserted into the Push Notification Installation [sys_push_notif_app_install] table.

Activate push notifications

Several plugins must be activated to use push notifications. If you have the Mobile UI (com.glide.ui.m) plugin active, push notification plugins are automatically activated.

Role required: admin

Ensure the following plugins are active on your instance:

- Push Notification: Provides the necessary components and REST APIs to send push notifications to mobile devices.
- Notification System Push Addon: Adds support for push notifications to the existing notification system.
- Push Feedback: Handles feedback from Apple on which devices are no longer valid so they do not keep receiving push notifications.

1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click Request Plugin to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>and time you would like this plugin to be enabled</td>
<td>Note: Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Installed with push notifications

Several types of components are installed with the push notifications plugins.

Tables installed with push notifications

These tables are installed with push notifications.

<table>
<thead>
<tr>
<th>Table name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Push Applications [sys_push_application]</td>
<td>Push applications registered to the instance to receive push messages.</td>
</tr>
<tr>
<td>Push Default Registrations [sys_push_notif_default_reg]</td>
<td>Contains all the notifications users are automatically subscribed to for a given push application. You can add notifications to this table on the Push Default Registrations related list on the Push Application form.</td>
</tr>
<tr>
<td>Table name</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Push Feedbacks [sys_push_feedback]</td>
<td>Feedback from the APNs that tells the instance which push devices can no longer receive push messages. The feedback is handled either on the same instance where your notifications are triggered, or on a central instance that uses a REST call to tell your instance which push applications to deactivate.</td>
</tr>
<tr>
<td>Push Message Attribute Definitions [sys_push_notif_msg_attr_def]</td>
<td>The attribute definitions used for push message content specification.</td>
</tr>
<tr>
<td>Push Message Attribute Values [sys_push_notif_msg_attr_val]</td>
<td>The values associated with push messages.</td>
</tr>
<tr>
<td>Push Notifications [sys_push_notification]</td>
<td>The push notifications that the instance attempted to send to users.</td>
</tr>
<tr>
<td>Push Notification Actions [sys_push_notif_act_script]</td>
<td>The action scripts that the instance uses in response to an actionable push message.</td>
</tr>
<tr>
<td>Push Notification Installations [sys_push_notif_app_install]</td>
<td>The devices with push apps where users agreed to receive push notifications. This table lists the records by the token for the push app. The instance uses this information to know which push device and app to send notifications to. Records are created in this table when a user logs on an instance with the push app. The Mobile Devices [sys_mobile_devices] table, which is installed with the Mobile UI plugin, contains all the user devices that logged in to the instance with the ServiceNow Classic mobile application.</td>
</tr>
<tr>
<td>Push Notification Messages [sys_push_notif_msg]</td>
<td>Messages customized for push notifications. These messages can be associated with a notification.</td>
</tr>
<tr>
<td>Push Notification Message Contents [sys_push_notif_msg_content]</td>
<td>The entire content, including JSON, for push messages.</td>
</tr>
<tr>
<td>Push Platforms [sys_push_platform]</td>
<td>The platforms that are supported for push notifications, and the maximum payload size.</td>
</tr>
</tbody>
</table>

### Business rules installed with push notifications

These business rules are installed with push notifications.

<thead>
<tr>
<th>Push notifications</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectMessagePushNotification</td>
<td>Live Feed Message [live_message]</td>
<td>Sends a push notification when a new live feed message</td>
</tr>
</tbody>
</table>
Push notification properties

Push notifications provides several properties to customize the setup.
Add these properties to the System Properties [sys_properties] table.

**glide.push.debug**

Creates entries in the system log for push notification errors.
- Type: true | false
- Default value: false

**glide.push.feedback.debug**

Creates entries in the system log for feedback sent by the APNs for custom iOS push applications.
- Type: true | false
- Default value: false

**glide.push.notification.ttl_seconds**

Specifies the number of seconds after which a queued push notification expires. After a push notification is triggered, it is queued and finally processed by a scheduled job. If the time the notification sits in the queue exceeds this value, the notification is not sent. Check the Push Notifications log for more information.
- Type: integer
- Default value: 21600

**glide.push.enabled**

Enables or disables push notifications.
- Type: true | false
- Default value: true

Push notification setup with the ServiceNow Classic mobile app

The ServiceNow Classic mobile application automatically enables push notifications and configures mobile devices for push notifications when users initially log in to the instance with ServiceNow Classic.

**Note:** Push notifications with the ServiceNow Classic mobile application are not supported in on-premise instances.

Setting up push notifications involves both the system administrator and users.
- Admin creates or updates push notifications for the ServiceNow Classic mobile app. The admin does not need to set up the mobile devices for users nor update their user preferences for receiving push notifications.
- Users install the ServiceNow Classic mobile app on their iOS or Android mobile devices and set their preferences for receiving notifications on the ServiceNow Classic mobile app.
What to do — admins

Admins create push notifications, similar to setting up email notifications. A push notification has two main parts: the push message and the notification, which includes the push message.

⚠️ Note: The push message and notification must be for the same table.

Create the push message

Before creating a push notification, create the `push message` with the actual message content (JSON payload) to be included in the push notification.

Create the push notification that includes the push message

Create the `push notification` that includes the push message and message content. A push notification specifically sends the push message. You can update a standard platform notification and use it as a push notification that includes the push message.

Add the new push notification to the Push Default Registration table
To ensure that a new push notification is included and enabled in the notification preferences of your users, register a new push notification in the Push Default Registration table. The notification is listed in the notification preferences of your users the next time that they log in to the ServiceNow Classic mobile app.

What to do — ServiceNow Classic mobile app users

Download the ServiceNow Classic mobile app

Install the ServiceNow Classic mobile app on an iOS or Android mobile device.

Agree to accept push notifications

After installing the ServiceNow Classic mobile app, users are asked to accept push notifications. When the instance receives the push notification acceptance message from a user, it creates a record in the Push Notification Installations [sys_push_notif_app_install] table. This record is what the instance uses to identify the device + mobile application combination necessary to identify a push notification recipient.

The device then performs the following actions:

- Obtains a token that identifies the device.
- Triggers the creation of the device in the user notification preferences.

Log in to the company instance from the ServiceNow Classic mobile app

Logging in automatically subscribes users to the push-specific notifications registered in the Push Default Registration table.

Update preferences for receiving notifications on the ServiceNow Classic mobile app

Users can enable or disable notifications through Notification Settings in the ServiceNow Classic mobile app. They can set additional notification preferences, such as conditions or filters that affect notification delivery, by using the System Settings window on a desktop or mobile browser. For details, see Setting notification preferences in UI16.

Next steps

If you are an admin, review the base system notifications and determine if new push message content and push notifications are needed.

Create a push message

Before you create a push notification, create the push message with the actual message content for the notification.

The Push notification plugin must be active. The plugin is active by default.

Role required: admin

The push message and notification must be for the same table.

2. Fill out the fields on the form (see table).
3. Click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the message.</td>
</tr>
</tbody>
</table>
## ServiceNow Madrid Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Push App</td>
<td>Select the ServiceNow Classic mobile application.</td>
</tr>
<tr>
<td>Push Message Content</td>
<td>Select the JSON content to be included in the push notification payload.</td>
</tr>
<tr>
<td>Note: For details on defining payloads that control push notification behavior, see KB0622333. For example, you can specify predefined button pairs (Yes/No, Approve/Reject, Accept/Decline) as part of the push message content.</td>
<td></td>
</tr>
<tr>
<td>Message</td>
<td>Enter the message. You can add variables just as you would for other notifications. Any message you enter here overrides the message in the notification.</td>
</tr>
<tr>
<td>Related list</td>
<td>Push Message Attribute Values Optional. Select the attributes that apply to this notification. For details, see Create an attribute value or action for a push message.</td>
</tr>
</tbody>
</table>

**Set up the push notification** that contains the message created or update an existing push notification to use the push message.

### Create a notification using a push message

Email administrators can create a notification that specifically sends a push notification.

Configure the **push message** before performing these steps.

**Role required:** admin

You can associate a push message with a standard notification. A push message specifies the text the system sends as part of the push notification to the mobile device.

1. Navigate to **System Notification > Create Push Notification**.
2. Fill out the notification form as necessary (see Create an email notification for descriptions of the form fields).
3. Click the **What it will contain** tab.
4. Next to **Push Messages**, click the lock icon and select a push message.

**Note:** The push message and notification must be for the same table.

5. If you want this notification to be sent only as a push notification and not as any other type of notification, select **Push Message Only**.
6. Click **Submit**.

If the notification fails, the user is not notified. If the message fails to send because it exceeds the maximum payload, the instance logs the failure in the System Log.

**Add the push notification to the Push Defaults Registrations table** so that the push notification is listed in the notification preferences for users. Users can then select which notifications they want to receive for the ServiceNow Classic mobile app.
Add a push notification to the Push Default Registrations table

After you create a new push notification, add it to the Push Default Registration table. Push notifications registered in this table are listed and automatically enabled in the notification settings of your ServiceNow Classic mobile app users.

Role required: admin

2. Select the ServiceNow Classic Mobile Application.
3. In the Push Application form for the ServiceNow Classic mobile app, select the Push Default Registrations tab and click New.
4. In the Push Default Registration New record, select the notification to be registered.
5. Click Submit.

The next time that users log in to their instance, the new push notification is included in their list of notifications.
Push notification setup with a custom push application

If you are using your own custom mobile or push application, you must configure your app for use and set up the push contents.

Setting up a push notification infrastructure that uses a custom push app involves a push admin (also called push app developer or mobile app developer) and system administrator. When push admins create a customized push app, they also configure the app, its push message content (payload generators), and optional attributes, such as push action scripts. The admin creates and updates the push notifications for the custom push app. After users install the custom push app and initially log in to their instance from their mobile device, the system automatically creates a device (channel) for the custom app.

Note: These instructions are intended for users who develop their own customized push application. You do not need to configure the ServiceNow Classic mobile application.
Before you begin

Complete the steps in *Activate push notifications*. The Push Feedback (com.glide.push.feedback) plugin enables the system to receive push feedback from Apple and is required if you have an iOS app.

Assign the push_admin role to your organization's mobile app developer.

What to do — push admin

Configure push notifications for your custom push app. This process differs for iOS and Android devices.

1. (iOS only) *Upload a push certificate to your instance*
Upload a push certificate to your instance so that you can use it later to connect your iOS device to the push notification system.

2. **Create a push application record for your custom app**
   Register your customized mobile application with your instance to receive push notifications for the application. The instance uses this push application record to identify the device + push application combination necessary to determine a push notification recipient.

3. **Create push message content**
   Create a JSON content payload for different types of push notifications. The content determines how a push notification appears on the push application, and whether the user can send a message in response to the push notification. The push admin can create attribute definitions that specify a default push action script or string, for use in the push message content.

4. **(Optional) Create a push message attribute definition**
   Push message attribute definitions allow you to create reusable properties for push message content specification.

5. **(Optional) Create an attribute value or action for a push message**
   You can create attribute values that override the default attribute definitions used in the push message content.

6. **(Optional) Create a push action**
   A push action is a server-side script that runs when the instance receives a response to an actionable push message.

### What to do — admin

#### Create the push messages and push notifications

The administrator creates the push messages, sets up push notifications for the custom push app, and if desired, the content.

#### Next steps

Use the Push Installation API to opt users in to receive push notifications. For more information, see [Push Installation API](#).

Monitor push feedback to track push notifications that are failing to send to your custom push app. For more information, see [Monitor push feedback](#).

### Upload a push certificate to your instance

Upload a push certificate to your instance so that you can use it later to connect your iOS device to the push notification system.

Using your Apple developer environment, create a push certificate and convert it to a PKCS (.p12) file. For details on generating the .p12 file with the required certificate and private key, see [Enable push notifications](#) and [Communicate with APNs using a TLS certificate](#) in the Apple documentation.

**Note:** Ensure that your certificate is a push certificate and not a developer certificate. Also, if you're developing an app for testing purposes, ensure that you create a Sandbox certificate. If you're developing an app that you plan to launch in the Apple App Store, ensure that you create a Production certificate.

Role required: push_admin or admin
After you create a PKCS (.p12) file that contains the iPhone developer certificate and the private key used to sign the certificate, you need to upload the file to your instance. The system uses the information in the PKCS file to communicate with the APNs.

1. Navigate to System Definition > Certificates, and then click New.
2. On the form, fill in the following fields:
   - Name: Enter a certificate name.
   - Type: Select PKCS12 Key Store.
3. Attach the PKCS (.p12) file to the record.
4. Click Submit.

Create a push application record for your custom app

Register your customized mobile application with your instance to receive push notifications for the application.

Complete the following:

1. Activate push notifications
2. (iOS only) Upload a push certificate to your instance

Role required: admin or push_admin

Push notifications are application-specific: They are sent to one type of mobile application, regardless of how many users have this application installed. If you develop your own mobile application, you must configure it for use by creating a record for it in the Push Application [sys_push_application] table. By default, the ServiceNow Classic mobile application is automatically set up and ready to use.

2. Fill out the fields on the form (see table).
3. Click Submit.

</table>

Create push message content that contains the JSON content in the push notification payload.

**Create push message content**

Push message content specifies additional JSON content in the push notification payload that is sent to the push provider.

Complete the following:

1. **Activate push notifications**
2. (iOS only) **Upload a push certificate to your instance**
3. **Create a push application record for your custom app**

You must know how to use JSON with push messages.

Role required: admin or push_admin
Push message content defines the style of push notification that can be sent out for your custom app. You can add custom content, such as a picture, icons, or action buttons for the user to respond to the notification. Use the following variables in the script:

- `current`: properties of the current record.
- `message`: push message sent as the body of the entire push content.
- `attributes`: object of the push message attributes that you define.

2. In the Push Notification Message Contents table, click New.
3. Fill out the fields on the Push Notifications Message Content form (see table).
4. Click Submit.
```javascript
(function buildJSONRecord(current, message, attributes) {
  var json = {
    "type": "default",
    "record": {
      "table": current.getTableName(),
      "sys_id": current.sys_id
    }
  };
  return json;
})(current, message, attributes);
```
Notification Message form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the message content.</td>
</tr>
<tr>
<td>Push app</td>
<td>The push application the content can be used with.</td>
</tr>
<tr>
<td>Push Message Generation</td>
<td>Enter a script that determines the message content. See the example scripts.</td>
</tr>
<tr>
<td>Related list</td>
<td></td>
</tr>
</tbody>
</table>
| Push Message Attribute Definitions | Select the attributes that apply to this notification. Attributes can  be a value or an action. These attributes are used as default values for the content items you create in the content script. However, any attributes you create with the push message can override these attributes. See [Create a push message attribute definition](#) for information on creating attributes.

The following is an example of a content record that creates a two-button layout, one to approve something, such as a change request, and one to decline it.

```javascript
var json = {
  "table" : current.getTableName(),
  "sys_id" : current.sys_id,
  "template" : {
    "type": "2 button",
    "button1" : {
      "title" : "Approve",
      "action" : attributes.button_action,
      "parameters" : {
        "response" : "approve"
      }
    },
    "button2" : {
      "title" : "Decline",
      "action" : attributes.button_action,
      "parameters" : { "response" : "decline"
    }
  }
};
json;
```

*Define a push message attribute* to specify a default push action script or string that you can use in the push message content.

**Create a push message attribute definition**

Push message attribute definitions allow you to create reusable properties for push message content specification.

1. *Activate push notifications*
2. *(iOS only) Upload a push certificate to your instance*
3. *Create a push application record for your custom app*
4. **Create push message content**

Role required: admin or push_admin

Use an attribute definition to specify a default push action script or string that you can then use in the push message content.

You can override these attributes by creating any *push message attribute values.*

1. Navigate to **System Notification > Push > Push Message Content.**
2. Select a content record or script record.
3. In the Push Message Attribute Definitions related list, click **New.**
4. Fill out the fields on the form (see table).
5. Click **Submit.**

---

### Push Message Attribute Definition form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute Name</td>
<td>Enter a descriptive name for the layout.</td>
</tr>
</tbody>
</table>
| Attribute Type | Select the type of attribute:  
  - **Action**: An action to take on the instance, as defined by a script.  
  - **String**: An arbitrary string to send as part of the message content. The string can specify items like a button label in the message. |
| Default Script | Select the mobile action script that tells the instance what to do when it receives a response from the push notification. This option appears if you select **Action** for the Type. |
Field | Description
---|---
Default Value | Specify an arbitrary string value to be placed in the attribute that is used by the message content. For example, the string could specify a button label. This option appears if you select String for the Type.

If you want to override default attribute definitions, see *Create an attribute value or action for a push message*.

**Create an attribute value or action for a push message**

Attribute values are associated with push messages to provide a way for the message to include certain types of information in the push notification.

Complete the following:

1. *Activate push notifications*
2. *(iOS only) Upload a push certificate to your instance*
3. *Create a push application record for your custom app*
4. *Create push message content*
5. *Create a push message attribute definition*

Role required: admin or push_admin

These push message attribute values override values that you set in an *attribute definition* on the Push Content form.

1. Navigate to **System Notification > Push > Push Messages**.
2. Select a message.
3. In the Push Message Attribute Values related list, click **New**.
4. Fill out the fields on the form (see table).
5. Click **Submit**.
Push Message Attribute Values form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute</td>
<td>Select a push message attribute definition.</td>
</tr>
<tr>
<td>Value/Action</td>
<td>Enter the value for the attribute or select the push action. This field changes to Value or Action depending on the type of attribute you select in the Attribute field.</td>
</tr>
</tbody>
</table>

(Optional) *Create a push action* to perform an action on the instance.

**Create a push action**

A push action is a server-side script that runs when the instance receives a response to an actionable push message.

Complete the following:

1. *Activate push notifications*
2. (iOS only) *Upload a push certificate to your instance*
3. *Create a push application record for your custom app*
4. *Create push message content*
5. **Create a push message attribute definition**

6. **Create an attribute value or action for a push message**

Role required: admin or push_admin

Create a push action to perform an action on the instance. For example, you might have an actionable push message that lets the user approve a change request. The action that handles the response should update the **Approval** field on the relevant Change Request record.

You can use global variables or, optionally, current variables and parameters passed through the **JSON content**.

1. Navigate to **System Notification > Push > Push Action**.
2. Fill in the form fields (see table).
3. Click **Submit**.

<table>
<thead>
<tr>
<th>Push Notification Action form fields</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Script</td>
</tr>
</tbody>
</table>

**Monitor push feedback**

Monitor push feedback to track push notifications that are failing to send to your custom push app.

Complete the steps in **Activate push notifications**. The Push Feedback (com.glide.push.feedback) plugin enables the system to receive push feedback from Apple and is required if you have an iOS app.

Role required: push_admin or admin

The information presented on the Push Feedback table is delivered to your system by the push notification service that is associated with your device. If you linked your instance to an iOS device, the information is delivered via the Apple Push Notification service (APNs). If you linked your instance to an Android device, the information is delivered via Firebase Cloud Messaging (FCM).

**Note:** The push feedback received from the APNs uses what Apple refers to as its "legacy binary protocol." For more information on how the legacy binary protocol works, see the Apple documentation.

1. In the navigation filter, enter **sys_push_feedback.list**.
2. On the list header, click the gear icon (⚙) and add the following columns to the list view:
   - Sys push application ID
   - Push Platform
3. On the list, refer to the following columns to monitor push feedback:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Failure updated on</td>
<td>Date and time when the push feedback arrived to the system from Apple or Google.</td>
</tr>
<tr>
<td>Token</td>
<td>Unique key to identify the device + push application combination that the system sends the push notification to. The token is generated by Apple or Google.</td>
</tr>
<tr>
<td>When failed</td>
<td>Date and time when Apple or Google reported the push delivery failure.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sys push application ID</td>
<td>Sys_id of the push application record that identifies the push app.</td>
</tr>
<tr>
<td>Push Platform</td>
<td>Provider of the push notification service that delivers the push feedback. The provider is either Apple, Apple Sandbox, or Google.</td>
</tr>
</tbody>
</table>

### Requeue failed push notification messages

Push notification delivery might fail for various reasons. You can view which messages failed and requeue them to be sent out if necessary.

Role required: admin

**Note:** There is no way for the instance to guarantee or confirm push message delivery. For more information on how Apple handles push notifications, see the [Local and Remote Notification Programming Guide](#) for Apple developers.

Messages can also fail to send for several reasons, such as a large message queue or other issue with the instance. You can use a [system property](#) to control how long the instance queues a push notification after it is triggered.

Push notification message payload size is limited by provider:

- Apple iOS: 2,048 bytes
- Google: 4,096 bytes

Your instance does not send push messages that exceed this limitation. System logs save any failed messages. For details on Apple payload limitations, see the [Local and Remote Notification Programming Guide](#) for Apple developers.

1. Navigate to **System Logs > Push Notifications**.
   - By default, the messages that were created today appear. You can change the filter if necessary. The Type column can have these values:
     - **failure**: The message could not be sent.
     - **pending**: The message is queued for processing.
     - **success**: The message was successfully sent, although not necessarily received by the mobile device.

2. Put any failed messages back into the queue to be resent by selecting the check boxes next to the failed messages, and then selecting **Re-queue failed push notifications** from the choice list.

3. If some push notifications continue to fail, consider increasing the value in the `glide.push.notification.ttl_seconds` property. See [Push notification properties](#) for more information.

### Push notification retention

You can archive and eventually destroy push notifications that you no longer need or if your Push Notification table is excessively large.

Push notification retention is available starting with the Jakarta release.

### Push notification archive and destruction plugins

The push notification archiving and destruction feature uses the [Data Archiving](#) and Push Retention plugins. The Data Archiving plugin must be active to archive and destroy push notification records. The Push Retention plugin provides a set of rules that specify when the system archives and destroys push notification records.
In new instances, the Push Retention plugin and associated archive and destroy rules are active by default. On upgraded instances, you must manually activate both the plugin and the archive and destroy rules. Be sure to review and approve the archive and destroy rules before activating them.

If your instance already has a process for managing push notification records, you do not need to activate the Push Retention plugin. If you want to replace your current process with Push Retention, be sure to deactivate the current process before activating the archive and destroy rules.

**Archiving and destroying push notification records**

Archiving means moving records from the Push Notification [sys_push_notification] table to the Push Notification Archive [ar_sys_push_notification] table when they exceed the archive rule time limit. Destroying means deleting records in the Push Notification Archive table when they exceed the destroy rule time limit.

**Default archive and destroy rules**

Push retention provides the following push archive rules:

- **Push Notification - Over a year old**: archives push notification records that were created more than 365 days prior to the current date.
- **Push Notification Archive - Over a year old**: destroys push notification records that have been archived for more than 365 days prior to the current date.

With these default settings, your messages are kept on the instance for a total of two years: one year in the Push Notification table, and one year in the Push Notification Archive table. At the end of the period, the system deletes the expired notification records from the Push Notification Archive table.

**Note:** By default these rules are active on new instances and inactive on upgrades. The system runs archive and destroy rules when you activate them.

**Compatibility with other record management implementations**

If you are already using another method for managing push notification records, such as table cleaners, you do not have to use the Push Retention feature. To prevent unexpected record deletion, avoid using multiple push notification management processes on the same instance at the same time.

**Note:** For assistance replacing your existing record management implementation with push notification retention, contact your professional services or sales representative.

**Activate the Push Retention plugin**

The Push Retention plugin (com.glide.push_retention) provides the retention policy for push notifications, so that you can specify when the system archives and destroys push notification records.

Role required: admin

The Push Retention plugin requires the Data Archiving plugin.

1. Navigate to System Applications > All Available Applications > All.

A banner appears to notify you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

**Note:**
2. Find the plugin with the filter criteria and search bar.

You can search for the plugin by its name or ID.

If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.

You can activate the plugin directly from the All Applications page or view more details about the plugin before activating it.

- If you are certain that you have the correct plugin, click Install, and then click Activate in the dialog box that appears.

• To view plugin details before activation:
  1. Click the plugin name.
  2. On the form, click the Activate/Update related link.
  3. On the dialog box that appears, review the dependent plugins.
     - If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.
  4. If demo data is available and you want to install it, click Load demo data.
     - Some plugins include demo data, which are sample records that illustrate plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.
  5. Click Activate.
Archive push notifications manually

You can manually archive push notifications on demand instead of waiting for the instance to archive them based on a scheduled job.

Role required: admin

Push retention provides these push notification archive rules:

- **Push Notification - Over a year old**: archives push notification records that were created more than 365 days prior to the current date.
- **Push Notification Archive - Over a year old**: destroys push notification records that have been archived for more than 365 days prior to the current date.

You can manually archive push notification messages that meet the default archive and destroy rules or any additional archive rules that you create.

1. Navigate to **System Archiving > Archive Rules**.
2. Open the push notification archiving rule, for example **Push Notification - Over a year old**
3. Click **Recalculate Estimate** to see how many records in the Push Notification [sys_push_notification] table are going to be archived. The estimate appears in the **Record estimate** field.
4. Click **Run Archive Now**.

Subscription-based notifications

Subscription-based notifications enable users to proactively subscribe to items that interest them and unsubscribe from messages that are not mandatory.

Users can also specify additional notification channels that each of their notifications can be configured to use.

Before users can manage the notifications that are sent to them, administrators must create email notifications to which users can subscribe. Administrators can also make subscription-based notifications mandatory so users cannot unsubscribe to them. Then users can subscribe or unsubscribe to the notifications, and add schedules and filters to the subscription to limit the notifications that can be received.

Notifications that administrators mark as subscribable are automatically available in user notification settings. Users are limited to one subscription per notification.

Administrators should create subscription-based notifications when they do not want to specify users for a notification and want to let users proactively subscribe to the notification.

**Note**: Subscription-based notifications are not domain aware and cannot support domain-specific settings.

Subscriptions 2.0 plugin

The **Subscription Based Notifications 2.0** plugin must be active to use subscribable notifications. This plugin is active by default on all new and upgraded instances.

The plugin installs the Notification Subscription [sys_notif_subscription] table, which holds user subscriptions to all notifications.

Subscriptions and notification preferences

Users can subscribe to notifications available to them through their notification preferences. In the UI16 interface, all users can set and modify their notification preferences through the **Notifications** tab of the System Settings.
window. In the UI15 interface and earlier, admins and users set their notification preferences through the Notification Preferences link in the User form.

**Setting notification preferences in UI16**

You can set your own notification preferences, including personal subscriptions and channels for receiving them. All users can set these preferences through the Notifications tab of the System Settings window.

With the Notifications tab, you can:

- Search for a specific notification in the list of your notifications.
- Use a global switch to enable or disable all your notifications.
- Enable or disable a particular channel for receiving notifications, as well as create, edit, or delete channels.
- Control the notifications that you receive and apply conditions to restrict notification delivery.
- Create personal notifications, which are subscriptions to notifications that are important to you.

**Comparison between notification preferences in UI16 and earlier interfaces**

In new and upgraded instances that use the UI16 interface, the System Settings window is the central location for managing your notification preferences. The Notification Preference User Interface (com.glide.notification.preference.ui) plugin is activated by default.
Notification preferences in UI16 and UI15

In UI15 and earlier interfaces:

- Users set notification preferences through the **Notification Preferences** link in the User form (Self service > My Notification Preferences).
• Admins created user devices and set notification preferences for users through the Notification Preferences link in the User form, accessed through the User Administration module (User Administration > Users).

Note: Admins can revert to the UI15 notification preferences interface by setting the glide.notification.preference.UI.enabled property to false.

Manage your notification preferences in UI16

To access your notification preferences, click the gear icon (⚙️) in the banner frame, and in the System Settings window, click the Notifications tab. You can also access the System Settings by navigating to Self Service > My Notification Preferences.
In the **Notifications** tab, use the following settings to manage your notifications:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search</td>
<td>Search bar for finding notifications.</td>
</tr>
<tr>
<td></td>
<td>To find a notification:</td>
</tr>
<tr>
<td></td>
<td>• Enter the name of the notification you are searching for. When you type the first three characters, the system automatically returns a list of notifications matching the characters entered.</td>
</tr>
<tr>
<td></td>
<td>• Enter two asterisks to return a list of all notifications in alphabetic order (the notifications are not organized by category).</td>
</tr>
<tr>
<td>Allow notifications</td>
<td>Global switch for enabling or disabling all notifications.</td>
</tr>
<tr>
<td>Notification channels</td>
<td>List of your channels for receiving notifications. Use this section to:</td>
</tr>
<tr>
<td></td>
<td>• Enable or disable a channel by using its toggle switch. If you disable a channel, notifications are not delivered through that channel.</td>
</tr>
<tr>
<td></td>
<td>• <em>Add channels</em> using the <strong>Create Channel</strong> option.</td>
</tr>
<tr>
<td></td>
<td>• <em>Modify channel information</em>. Click the channel row or the right arrow (&gt;) next to the appropriate channel to edit or delete it.</td>
</tr>
<tr>
<td>Notifications by category</td>
<td>List of notification categories that identify and group related notifications. Each category contains the notifications that you can subscribe to.</td>
</tr>
<tr>
<td></td>
<td>To view the notifications in a given category, click the category row or the right arrow (&gt;) next to the appropriate category. You can:</td>
</tr>
<tr>
<td></td>
<td>• Edit settings for a notification:</td>
</tr>
<tr>
<td></td>
<td>• Enable or disable channels for the selected notification.</td>
</tr>
<tr>
<td></td>
<td>• <em>Apply notification conditions</em>, such as schedules and filters, that affect the delivery of the notification.</td>
</tr>
<tr>
<td></td>
<td>• <em>Create personal notifications</em>, which are subscriptions to specific notifications that matter to you.</td>
</tr>
</tbody>
</table>

**Create notification channels**

You can add channels to receive your notifications. A notification channel is an email account or voice message system that you have access to.

Role required: none

Notification channels include email addresses, service providers for SMS messages, and mobile applications. You can create voice notification channels to support applications like Notify.

**Note:** If you are using the ServiceNow mobile application or a custom push application, you do not need to create a push channel for your mobile device. The system automatically creates a channel for the mobile app after you initially log in to your instance from your mobile device.

1. Click the gear icon 🔄 in the banner frame to open the System Settings window, and click the **Notifications** tab.
2. Click **Create Channel**.
3. Complete the fields on the New Channel form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name for the channel, such as the device or email account.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type</td>
<td>The type of channel:</td>
</tr>
<tr>
<td></td>
<td>• Email: for email messages.</td>
</tr>
<tr>

<tr>
<td>Phone number</td>
<td>The phone number for SMS messages or for voice messages.</td>
</tr>
<tr>
<td>Service provider</td>
<td>The service provider for SMS messages.</td>
</tr>
</tbody>
</table>

4. Click **Save**.

The system creates and enables the channel, and adds it to the list of notification channels.

To receive notifications on your new notification channel, you must enable the channel for individual notifications. After you enable the channel for a notification, you can set conditions to further control the notifications that you receive on the channel. For more information, see *Apply notification conditions*.

**Modify notification channels**

You can update channel information for your notifications.

Role required: none

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.
2. In the Notification Channels section, click the channel row or the right arrow (►) next to the channel name.
3. In the Edit Channel form, update the fields (see *Create notification channels* for descriptions of the form fields).
4. Click **Save**.

The system updates and saves the channel information that you modified.

**Delete a notification channel**

Delete a notification channel so that you no longer receive notifications through the channel.

Role required: admin

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.
2. In the Notification Channels section, click the channel row or the right arrow (►) next to the channel name.
3. On the Edit Channel form, click **Delete**.
The system deletes the channel from the list of notification channels and no longer delivers notifications to that channel.

Apply notification conditions

You can set various conditions and filters to control the notifications you receive. You can also enable or disable an email digest and the delivery of individual notifications by channel.

Role required: none

You can choose to enable certain features and set different conditions that control the notifications you receive. You can:

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
• Enable or disable an email digest if a digest is available for the notification. An email digest is a single email that summarizes the activity for the notification during a time interval that you specify. Admins configure the email digest content for a notification.
• Enable or disable a channel on which the notification is received.
• Set preconfigured schedules and filters that determine when you receive your notifications.
• Set more advanced filter conditions to limit the notifications delivered to you.

1. Click the gear icon (🔧) in the banner frame to open the System Settings window, and click the Notifications tab.

2. Select the notification:
   a) In the Notifications By Category section, click the row or right arrow (►) of the category that you want to view.
   b) In the list of notifications for the category, click the row or right arrow (►) next to the notification that you want to edit.

3. To enable or disable an email digest for the notification, if an email digest is available:
   a) Click the Email Digest switch.
      The email digest is enabled when the switch is green and disabled when the switch is grey.
   b) If you enabled the digest, select the Interval (length of time) during which the notifications are accumulated.
The interval begins with the first occurrence of notification activity during the specified interval. For example, if you selected the Daily interval and the first notification occurs at 07:00, the system begins accumulating notifications at 07:00 and stops at 07:00 the next day. Soon after the interval ends, the system sends the email digest instead of sending the individual notifications that were triggered during the digest interval. If you disabled the digest, the system immediately stops accumulating the notifications and does not send the email digest.

4. To enable or disable a channel on which the notification is received, click the switch for the channel. The notification is enabled when the switch is green and disabled when the switch is grey. If you previously disabled an entire channel, you cannot enable that channel for the notification.

5. To set more criteria for notification delivery, click the row or the right arrow (>) next to the channel for the notification.
   a) Complete the Apply Conditions form (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schedule</td>
<td>Select a schedule that determines when the notification can and cannot be received.</td>
</tr>
<tr>
<td>Filter</td>
<td>Select a pre-configured filter with the criteria that determines when the notification can be sent. For example, you might select a filter whose conditions send notifications when an incident with a priority of <strong>1 - Critical</strong> is opened for a network issue.</td>
</tr>
<tr>
<td>Advanced filter</td>
<td>Select this check box to use the condition builder to create additional criteria. When you select the check box, the <strong>Table</strong> and <strong>Conditions</strong> fields are displayed.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the table for the notification. For example, if you selected an incident-related notification, you might select the Incident [incident] table.</td>
</tr>
</tbody>
</table>
Create personal notifications

You can create personal notifications, which are subscriptions to notifications of importance to you. You can apply conditions that control specific content included in your personal notification, and also enable or disable the channels for delivery.

Role required: none

A personal notification is a subscribable notification that you can customize. You can assign the notification a name that is meaningful to you and filter the information received in that notification.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td>Define as many conditions as needed to limit the notifications you receive. For example, you can choose to be notified only when an incident communication plan is created for a specific configuration item.</td>
</tr>
</tbody>
</table>

**b) Click Save.**

To navigate back, click the left arrow (<) at the top of the Notifications window.

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.
2. Click **Create Personal Notification**.
3. Complete the New Personal Notification form (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name for your personal notification. Use a meaningful name to distinguish it from system notifications.</td>
</tr>
<tr>
<td>Notification</td>
<td>The notification to subscribe to. You can subscribe only to notifications that are configured to allow subscriptions. Depending on the notification you select, the Table, Affected record, and Send when fields are displayed.</td>
</tr>
<tr>
<td>Table</td>
<td>The database table that the notification is linked to.</td>
</tr>
<tr>
<td>Affected record</td>
<td>The specific record that the notification is based on. This field appears when you select a notification that has an affected record (for example, a notification for a problem record that has multiple affected CIs). Click the lookup icon, select the table and specific document (record) in that table, and click OK.</td>
</tr>
</tbody>
</table>
### Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send when</td>
<td>Another condition that must be met to send the notification. For example, you might create a filter whose conditions send notifications when an incident with a priority of 1 - Critical is opened for a network issue.</td>
</tr>
</tbody>
</table>

4. **Click Save.** The system creates the personal notification and adds it to the appropriate notification category. In the following example, notice the category in which the system placed the personal notification.

5. **Enable or disable the channels for your personal notification.**

6. **Navigate back to the list of notifications for the category by clicking the left back arrow (<) at the top of the form.**

Notice that your Personal Notifications are listed above the System Notifications in the given category.
7. Navigate back by clicking the left back arrow (<) at the top of the form or by clicking the Notifications tab.

User notification preferences in UI15 and earlier

In UI15 and earlier interfaces, use the Notification Preferences link in the User form to manage the notifications that you can subscribe to.

The following instructions explain how to use Notification Preferences to manage notifications.

Set up a notification device in UI15 and earlier

You can add devices for a user to receive notifications. A device is a mobile device, email account, or voice message system that the user has access to.

Role required: admin

Notification devices include email addresses, service providers for SMS messages, and mobile applications.

1. Navigate to User Administration > Users.
2. Select a user.
3. Click Notification Preferences.
4. Click Create New Device.
5. Fill in the fields on the form (see table).
6. Click Submit.

### New Device form

<table>
<thead>
<tr>
<th>Field</th>

</tr>
</tbody>
</table>
### Field: Notification Device Variables

**Description:** Additional, optional attributes of an SMS device used inside an advanced script from the SMS service provider. These attributes are generally used to deliver SMS notifications to an internal SMS distribution technology. This advanced scripting procedure is not necessary for configuring external SMS providers.

---

**Note:** If you inactivate a device, it still appears in the user preferences, but the switches that allow users to **select the notifications** are grayed out for that device column.

---

**Edit a notification device in UI15 and earlier**

All users can edit their notification preferences, including notification devices.

**Role required:** none

1. Navigate to **Self-Service > My Profile.**
2. Click **Notification Preferences.**
3. Click the name of the existing device.

The device form opens allowing you to make certain modifications, depending on your user role. See *Set up a notification device in UI15 and earlier* for a description of all fields.

---

**Add personal subscriptions in UI15 and earlier**

After setting up your devices, you can subscribe to notifications that are configured as subscribable.

The Subscription Based Notifications 2.0 plugin must be active.

If you have subscribed to messages, your list of notification messages can build over time. You can create preferences for how and when these messages are delivered, or unsubscribe to messages that are not configured as mandatory.

**Note:** Conditions that you apply to personal subscriptions do not override the filters that the administrator creates for the **subscribable notifications.** Your conditions are evaluated after the conditions on the subscribable notification are met. If the notification filter set by the administrator fails, the filter conditions on your personal subscription are not evaluated.

1. Navigate to **Self-Service > My Profile** to open your user profile.
2. Click the **Notification Preferences** related link.
   The Notification Preferences page opens. You can see your personal subscriptions and the general notifications that you are subscribed to.
3. Click **Subscriptions.**
4. Click **Add Personal Subscriptions.**
5. Fill in the fields as described in the table.
Add personal subscriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name for the subscription.</td>
</tr>
<tr>
<td>Notification</td>
<td>The notification to subscribe to. You can only subscribe to notifications that are configured to allow subscriptions.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that the incident is configured to run on. You cannot modify the table from this form. To select another table, configure the notification. See Create an email notification.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box indicating whether the subscription is active. Users can receive notifications for subscriptions only if the subscription is active. If it is not active, the on-off switch for the subscription is set to off and is read-only.</td>
</tr>
<tr>
<td>Send to</td>
<td>The devices that this subscription is sent to. Selecting the devices in this field is the same as turning on the switch for the subscription on the Subscriptions page.</td>
</tr>
<tr>
<td>Affected record</td>
<td>The specific record that the subscription is based on. Click the lookup icon, and then select the table and the specific record in that table.</td>
</tr>
<tr>
<td>Send when</td>
<td>Another condition that must be met to send the notification. For example, you might select a filter whose conditions send notifications when an incident with a priority of 1 - Critical is opened for a network issue. The system evaluates the conditions in this filter after the conditions set in the notification filter by the administrator.</td>
</tr>
</tbody>
</table>

6. Click Submit.
7. You can turn the subscription for active subscribable notifications on or off using the switch on the Subscriptions management section of the Notification Preferences page.

![Notification Preferences](image)

**Personal subscriptions**

Personal subscriptions are saved in the Notification Subscriptions [sys_notif_subscription] table. The records in this table are made active or inactive when you click the switch to subscribe or unsubscribe from the notification.

8. You can edit the subscription at any time by clicking **Edit** next to it.

**Select notifications in UI15 and earlier**

Administrators can configure notification preferences for each user and users can also select which notifications they want to receive for various devices.

1. Navigate to **Self-Service > My Profile** to select your own notifications, or if you have admin access, navigate to **User Administration > Users** to select notifications for another user.
2. Click a user record to open it.
3. On the User form, click **Notification Preferences** under Related Links.

The notification preferences page appears. The preferences pages show all the notifications available to the user and the devices that the user has configured, such as email or mobile phone. If a user does not have read access to the table on which the notification is based, the notification does not appear.

Every user has the **Primary email** device, where subscriptions to email notifications can be enabled.

![Notification Preferences](image)
4. Click the switch next to the notification to subscribe the user to it.

**Modify notifications for a user device in UI15 and earlier**

After you set up the devices through which users receive notifications, you can assign the notifications to each device and add advanced conditions to limit what notifications are received.

Role required: admin

1. On the **Notification Preferences** page for a user, find the notification from the list of notifications.
2. Click **Edit** next to the notification. The preferences for that notification appear.
3. Fill in the fields on the form (see table).
4. Click **Submit**.

![Notification Preferences](image)

</tr>
<tr>
<td>Conditions</td>
<td>Define as many conditions as needed to limit the notifications you receive.</td>
</tr>
</tbody>
</table>

Create a service provider

Administrators can configure service providers for devices that use SMS.

Role required: admin

Administrators also have the option of configuring how a device's service provider affects the construction of the device's email address.

1. Navigate to the Notification Service Provider [cmn_notif_service_provider] table by typing cmn_notif_service_provider.list in the application navigator filter.
2. Fill out or change the fields on the form (see table).
3. Click Update.
4. Click Save on the Notification Preferences page.
<table>
<thead>
<tr>
<th>Name</th>
<th>AT&amp;T</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>SMS</td>
</tr>
<tr>
<td>Active</td>
<td></td>
</tr>
</tbody>
</table>

The Notification Service Provider form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Configured name of the service provider.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of device, in this case SMS.</td>
</tr>
<tr>
<td>Active</td>
<td>Enables or disables this notification device.</td>
</tr>
<tr>
<td>Advanced notification</td>
<td>Removes all the previous options and displays the Advanced script field.</td>
</tr>
<tr>
<td>Advanced script</td>
<td>Used for custom notifications that run a script rather than construct a traditional SMS/email. This is generally used when all outbound SMS messages must run through a central SMS hub, as opposed to being sent directly from the instance to the SMS provider. Advanced users can construct a script in this field that will send a notification to an old style numeric pager that cannot receive SMS communications. This field is rarely used and employs advanced scripts. Contact your representative to assist you with any advanced SMS scripting.</td>
</tr>
<tr>
<td>Construct address manually</td>
<td>Removes the prefix and suffix options and displays the Construction script field.</td>
</tr>
<tr>
<td>Construction script</td>
<td>Allows you to script the email address construction as you would in a business rule. For example, abc + current.phone_number + <a href="mailto:def@text.att.net">def@text.att.net</a> would construct an email address of <a href="mailto:abc2223334444def@text.att.net">abc2223334444def@text.att.net</a>. <strong>NOTE:</strong> Current is a reference to the device, not the service provider, hence the current.phone_number variable that uses the device's phone_number value.</td>
</tr>
<tr>
<td>SMS Provider Email Prefix</td>
<td>Places the provided text before the device's specified phone number; for example: <a href="mailto:PREFIX2223334444@text.att.net">PREFIX2223334444@text.att.net</a></td>
</tr>
<tr>
<td>SMS Provider Email Suffix</td>
<td>Places the provided text after '@' sign; for example: 2223334444@SUFFIX</td>
</tr>
<tr>
<td>Notification Device Variables</td>
<td>Additional, optional attributes of an SMS device used inside an SMS service provider's Advanced script. This is generally used to deliver SMS notifications to an internal SMS distribution technology. This is an advanced scripting procedure and is not necessary for configuring external SMS providers.</td>
</tr>
</tbody>
</table>

Select a service provider

You can configure how a device's service provider affects the construction of the device's email address.

Role required: admin

1. Navigate to User Administration > Users and open any user's record.
2. Under Related Links, click Notification Preferences, and then click an SMS notification device.
3. If no SMS device is present, click New Device and configure one.
4. Select the appropriate service provider, and then click the reference icon for the **Service provider** field. The service providers are saved in the Notification Service Provider [cmn_notif_service_provider] table. Only active providers are visible.

**SMS notification advanced scripting**

You can use these objects and their attributes in your advanced notification scripts on the SMS Notification Service Provider form.

**Objects and attributes**

          • email.importance |
### Make a notification mandatory

To prevent users from turning off or deleting a subscription to a notification, make the notification mandatory.

**Role required:** admin

When you make a notification mandatory, the notification is locked in user notification preferences, preventing the user from removing or unsubscribing to the notification, filtering it, or changing the schedule.

Users receive mandatory notifications even if they disable notifications.

**Note:** Mandatory notifications apply to only the primary device of the user. You cannot make a notification mandatory for secondary devices.

1. **Navigate to** System Notification > Email > Notifications.
2. **Open the appropriate notification.**
3. **Configure the form and add the Mandatory field.** This field does not display by default.
   a) Click the context menu icon ( ) and select Configure > Form Layout.
   b) Using the slushbucket, select the Mandatory field and the order in which you want the field to appear.
   c) Click Save.
4. **Select the Mandatory check box.**

   When a user checks their notification preferences, the control button for the mandatory notification is on and is read only.
**Force a notification to be sent**

To force a notification to be sent to the specified users, enable forced delivery.

Role required: admin

Forcing a notification means that the relevant users receive the notification, even if they have not subscribed to the notification or have turned off the subscription. In addition, the users receive the notification even if the **Notification** field is set to **Disable**.

**Note:** Forced delivery applies to only the primary device of the user. You cannot force a notification to be sent to secondary devices.

1. Navigate to **System Notification** > **Email** > **Notifications**.
2. Open the appropriate notification.
3. Configure the form and add the **Force delivery** field.
4. Select the **Force delivery** check box.
5. Click **Update**.

   Unlike using the **Mandatory** option, forcing the delivery does not lock the user's preference or prevent the user from unsubscribing from the notification.

**Create a notification filter**

Notification filters enable a user to control the delivery of messages by creating special conditions on multiple tables in a single, reusable filter.

Role required: admin

For example, you can create a filter that controls message delivery when active incidents, problems, and change requests for network issues reach a critical state. For UI15 and earlier interfaces, notification filters are available for selection in the **Filter** field of a user's Notification Preferences form. For UI16, filters for notifications or channels are set through the Notifications tab of the System Settings window. For details, see **Apply notification conditions**.

**Note:** The system applies the user's filter conditions after the administrator's conditions have been evaluated. If the administrator's conditions fail, the system ignores notification filters.

1. Navigate to **System Notification > Email > Notification Filters** and create a record.
2. In the **Notification conditions** related list of the new record, create and submit filter conditions on one or more tables.

3. Repeat the procedure to create additional conditions on other tables for this filter.
Filter device notifications using a schedule

You can associate devices, such as Email, SMS, and Voice, to schedules that define when the devices can and cannot receive notifications.

Role required: admin

Notifications that are triggered outside of the scheduled days and times for the device are not queued up for delivery at a later time. For example, if an administrator selects the **Weekdays** schedule for an email device, the device receives email notifications triggered between Monday and Friday. If notifications are triggered on Saturday, they are not delivered to the device.

1. Define schedules as needed using **System Scheduler > Schedules > Schedules**.
2. Add or edit a device.
3. Configure the New Device for System Administrator form and add the Schedule field.
4. In the Schedule field, select the schedule for the device.
5. Click Submit.

**Edit the schedule or filter of an existing notification message**

You can update a schedule or filter that was previously created for an email notification.

Role required: admin

To edit the schedule or filter of an existing notification message:

1. In the Notification Preferences screen, click the message to edit.
   - You cannot edit any attributes of a mandatory message.
2. Make the appropriate changes in the form.
3. Click Update.

**Email unsubscribe**

Administrators can add unsubscribe links to notifications so that users can stop receiving particular email messages.

ℹ️ **Note:** The base system notifications include unsubscribe and notification preferences links.

The system offers two types of macros to create unsubscribe links.

- An unsubscribe link that creates an email message to the instance.
- An unsubscribe link that opens the notification preferences for the user on the instance.

**Available unsubscribe macros**

<table>
<thead>
<tr>
<th>Unsubscribe type</th>
<th>Macro used</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unsubscribe by email (Unauthenticated)</td>
<td>${NOTIF_UNSUB}</td>
<td>The system generates an HTML mailto hyperlink. When users click the link, their browser or email client creates a pre-formatted unsubscribe email message to the instance.</td>
<td>link_text: specify the text to display as a link within quotation marks.</td>
</tr>
<tr>
<td>Unsubscribe by notification preferences (Authenticated)</td>
<td>${NOTIF_PREFS}</td>
<td>The system generates an instance link directly to the notification preferences for this notification type.</td>
<td>link_text: specify the text to display as a link within quotation marks.</td>
</tr>
</tbody>
</table>

Administrators can add unsubscribe macros to any notification record type such as:

- Email layouts
- Email templates
- Email notifications

**Unsubscribe by email**

Unsubscribe by email requires the user email client or browser to create a pre-formatted email message containing these elements:
• The To field has the email address of the instance.
• The Subject starts with the string Unsubscribe from.
• The Body has a JSON string with a name-value pair of Unsubscribe and an array value that contains two more name-value pairs.
  • The notification_id parameter specifies the Sys ID of the notification the user wants to unsubscribe from.
  • The unsub_token parameter specifies an instance ID the system uses to verify that the email came from a ServiceNow instance.

Note: Some email clients and web browsers, such as GMail on Chrome, require extra client configuration to support mailto hyperlinks. Administrators can provide an alternative unsubscribe method for users whose email client or browser does not support mailto links. See RFC6068 for information about the mailto URI scheme.

The Unsubscribe from Notification inbound action processes the email and unsubscribes the sender from the listed notification.

Note: Unsubscribing by email message does not require users to authenticate with the instance first.

Unsubscribe by notification preferences

Unsubscribe by notification preferences requires the user's browser to navigate to the notification preferences page on the instance. After logging in, the system displays the notification preferences for this particular notification.

Users can set preferences for this notification such as disabling notifications for a particular device. Users must save their notification preferences for changes to take effect.

Unsubscribe links

This email layout adds several unsubscribe links to the bottom of each email notification.

${NOTIF_UNSUB} from this notification by email or ${NOTIF_UNSUB+link_text="click here"}.
Manage your ${NOTIF_PREFS} or ${NOTIF_PREFS+link_text="click here"}.

When rendered in an email notification, the unsubscribe links only display the link text.
Notification Preview

Unsubscribe | Manage Preferences
If a user clicks the **Unsubscribe** link, the email client creates a message such as this:

![Sample unsubscribe by email message](image)

### Notifications in messaging applications

Enable users to receive their ServiceNow platform notifications in Slack or Microsoft Teams messaging applications. Use the Now Actions app to configure the messaging apps for your instance.

### Admin setup

To enable ServiceNow notifications within Slack or Teams, you must be an administrator for both ServiceNow and the third-party application.

1. **Request IntegrationHub**

   Integrations with third-party systems require a separate IntegrationHub subscription. To activate IntegrationHub, see *Request an IntegrationHub plugin*.

2. **Request the Messaging Notification plugin**

   To activate this feature, request the Messaging Notification plugin (com.glide.notification.messaging) through the HI Customer Service system. This plugin activates related plugins if they are not already active.
3. Install the Now Actions messaging app for Slack or Teams

As an administrator for both ServiceNow and the third-party application, find and install the Now Actions app. Install the application in ServiceNow to associate the app with your instance.

Note: The primary owner of a Slack workspace or organization owns and manages the application. To avoid losing admin access to the workspace or organization, transfer primary ownership before any administration changes occur. If you transfer primary ownership, update the JSON payload for the Slack installation in the Notification Integration page. For more information about editing the Slack installation, see Install the Now Actions messaging app.

If the Now Actions app is uninstalled, the workspace or team displays as inactive in the Notification Integration page. To view the Notification Integration page, navigate to System Notification > Messaging > Messaging Integration Configuration.

4. Configure message content

Create a message in the Message Contents [messaging_content] table that you can use in multiple notifications. Messages can be informative, or they can request action from an individual Slack or Teams user. For example, the Approval Request message includes Approve and Reject buttons to take the associated action in ServiceNow. Only users that have linked their Slack or Teams account with their ServiceNow account can take action in ServiceNow from the third-party application.

5. Create a messaging notification

Notifications define when a message is sent, who it is sent to, and what it contains. To send a notification to Slack or Teams, add a messaging content record to the notification and configure the notification messaging channel. Notifications that require action must be sent to individual users instead of groups.

User setup

To enable individual ServiceNow notifications in Slack or Teams, and to take action on notifications, configure your system settings and link your user accounts.

Link your ServiceNow user account to your Slack or Teams account

Link your ServiceNow account to your Slack or Teams account to take action on ServiceNow notifications from within Slack or Teams. If you do not link accounts, you can still receive notifications within group channels. However, you cannot to approve ServiceNow requests or take action on notifications from within Slack or Teams.

Configure system settings

Each user can enable ServiceNow notifications in a third-party application by configuring the communication channel in their system settings. Opt in to receive approval requests and other actionable notifications in third-party channels.

Notification channels

In ServiceNow, a notification channel is a method or device for receiving notifications. For example, in the base system you can elect to receive notifications through email or SMS channels. If messaging applications are enabled on your instance, you can enable notifications to Slack and Teams using Notification Channels in your system settings.
Actions and events

The Message Actions [messaging_observer_handler] table processes communication channel events, such as adding or deleting a Slack channel, to keep the instance and the third-party application in sync. Only developers creating Slack or Teams applications should add actions to this table. Register new actions with the instance through the Message Event Registry [messaging_observable] table. To remove a base system action, clear the active flag instead of deleting the record.

Logging

The Inbound and Outbound message logs contain information on actions, events, and activities between ServiceNow and the third-party application. Use the logs to identify the content, state, and origin of communications to and from your instance.

Request the Messaging Notification plugin

To activate this feature, request the Messaging Notification plugin (com.glide.notification.messaging) through the HI Customer Service system. This plugin activates related plugins if they are not already active.

Role required: admin

There are two ways to request a plugin:

- Access the HI Service Catalog directly by clicking Service Catalog > Activate Plugin on HI.
- Access the HI Service Catalog through the All Applications page on your instance by following these steps.

1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click Request Plugin to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.

| Reason/Comments | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments. |

5. Click Submit.

**Install the Now Actions messaging app**

As an administrator for both ServiceNow and the third-party application, find and install the Now Actions app. Install the application in ServiceNow to associate the app with your instance.

To activate this feature, request the Messaging Notification plugin (com.glide.notification.messaging) through the HI Customer Service system. This plugin activates related plugins if they are not already active. For more information, see Request the Messaging Notification plugin.

Roles required:
- Admin or messaging_admin in ServiceNow
- Administrator for Slack or Teams

**Install the Now Actions messaging app for Slack**

Install the Now Actions messaging app from the Slack App Directory and associate the app with your instance.

1. Install the Now Actions app from the Slack App Directory.
a) Find and install the Now Actions app in the Slack App Directory.

b) Click Authorize when prompted.

c) Enter a customized name, app description, and icon (optional).

d) Configure your Now Actions web address. This is the base URL for your instance. For example, https://<instance_name>.service-now.com/.

e) Copy the JSON configuration found in the Add your Slack credentials to your app section for use in later steps.

2. Associate your Slack app with your instance.
   a) Navigate to System Notification # Messaging Integration Configuration.
   b) Click the Install button next to Slack.
   c) In the JSON Configuration pop-up, paste in the JSON configuration you copied in earlier steps.

3. Check for installation verification. The Slack workspace should appear below the Slack heading on the Notification Integration page.

During installation, the instance synchronizes with all public Slack channels in the workspace. New public channels added after installation will automatically synchronize with the instance. You can browse to System Notification > Messaging Channels on your instance to verify that the new channel appears on the instance.

To update the app after installation, use the Configure JSON Payload and Settings on Slack icons on the Notification Integration page. You can view the JSON payload, view app credentials, change app appearance, or delete the app.

Install the Now Actions messaging app for Microsoft Teams

Associate the Now Actions messaging app with your instance.

1. Associate your Microsoft Teams app with your instance.
   a) Navigate to System Notification # Messaging Integration Configuration.
   b) Click the Install button next to Microsoft Teams.
   c) A pop-up message appears to confirm redirection to Microsoft Teams to verify your identity. Click OK.
d) When prompted, log in to Microsoft Teams with your Teams admin account.

e) Click **Accept** to accept the permissions for the app.
f) If the selected workspace has already been assigned, you are asked whether you want to proceed to overwrite the previous assignment. Click **Override** to change the workspace, or click **Cancel** to leave the current assignment in place.

g) After authentication, installation will start in the background. Once installation completes, a message appears confirming the installation.
h) Click the **app package** link to access a knowledge base article [KB0690098](#), containing the application package for Microsoft Teams. Follow the steps in the article to make this package available for your Microsoft Teams users.

2. Check for installation verification. The new team should appear below the Teams heading on the Notification Integration page.
During installation, the instance synchronizes with all public Teams channels. To add channels created after the install, open Microsoft Teams and @mention the app from the new channel. You can browse to System Notification > Messaging Channels on your instance to verify that the new channel appears on the instance.

To receive a ServiceNow notification in Microsoft Teams, create a message and a notification. See Configure message content and Create a messaging notification.

### Configure message content

Create a message in the Message Contents [messaging_content] table that you can use in multiple notifications. Messages can be informative, or they can request action from an individual Slack or Teams user. For example, the Approval Request message includes Approve and Reject buttons to take the associated action in ServiceNow.

Role required: admin or messaging_admin

To enable users to take actions in Slack or Teams, use the Buttons message type and define scripted behavior. Only users that have linked their Slack or Teams account with their ServiceNow account can take action in ServiceNow from the third-party application.

1. Navigate to System Notification > Messaging Content.
2. Open an existing notification record or click New to create a new record.
3. Fill in or modify the fields as appropriate.

#### Messaging content fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the message.</td>
</tr>
<tr>
<td>Type</td>
<td>Select a type of message.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Simple</strong>: Send an informative message to an entire Team or Slack channel.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Buttons</strong>: Send a message to an individual user in Slack or Teams and define the desired behavior in the Script field. Associate buttons in the message with actions in ServiceNow. Use the Approval Request as an example.</td>
</tr>
<tr>
<td>Target table</td>
<td>To use record content in your message, select the appropriate table.</td>
</tr>
<tr>
<td>Note:</td>
<td>Notifications running on the Task [task] table are not supported. Instead, use a table extended from task.</td>
</tr>
<tr>
<td>Fields</td>
<td>Select which fields from the Target table appear in a simple message. Changing the order of the fields changes the display order in the notification.</td>
</tr>
<tr>
<td>Message heading</td>
<td>Enter text to appear at the top of the message.</td>
</tr>
<tr>
<td>Message</td>
<td>Enter the content of the message. Use notification variables to include dynamic information in your message. For example, use Incident $ (number) to include the incident number in the message. For available variables, see Notification variables.</td>
</tr>
<tr>
<td>Buttons</td>
<td>Select or create buttons to use on the form. After selecting or creating a button, you must define button behavior in the Script field. Only visible when Buttons is selected in the Type field</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>Script</strong></td>
<td>This field is only visible when Buttons is selected in the <strong>Type</strong> field. Enter a script to define what happens in your instance when a user selects a button in Slack or Microsoft Teams. Use the <code>actions.get</code> method to return the name of the button selected by the user.</td>
</tr>
</tbody>
</table>
|       | if (actions.get('button') == 'Approve') {  
|       |     target.state = 'approved';  
|       |     target.update();  
|       | }  
|       | In this example, the script conditionally executes when the "Approve" button is selected. |
|       | Use the method `sn_notification.Messaging.send` to send information to the messaging window. |
|       | var content = new GlideRecord("messaging_content");  
|       | content.get("1bb10839572213007f004758ef94f9c4");  
|       | sn_notification.Messaging.send(application, userId,  
|       |     content, target);  
|       | In this example, the script stores a Message Content record in the `content` variable. It then posts a message from that Message Content record. |

| Application | Select the application scope for this notification. |

4. **Click Submit**

This example shows the output of a message in Microsoft Teams. This message is of the buttons type, which shows buttons and performs scripted actions based on the user selection. In this case, the script uses the `sn_notification.Messaging.send` method to display the change in state for the record.
Use the message in a notification. For more information about creating notifications, see *Create a messaging notification*.

**Create a messaging notification**

Notifications define when a message is sent, who it is sent to, and what it contains. To send a notification to Slack or Teams, add a messaging content record to the notification and configure the notification messaging channel. Notifications that require action must be sent to individual users instead of groups.

Role required: admin

1. Navigate to **System Notification > Messaging > Messaging Notifications**.
2. Click New.
3. Fill in or modify the fields as appropriate.
### Messaging notification fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the notification. Use descriptive names to ensure that your users are able to easily distinguish between notifications.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table to trigger the message. Must be a table or database view within the same application scope.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Notifications running on the task [task] table are not supported. Instead, use a table extended from task.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category for the notification. A category groups related notifications in the system settings.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Do not leave the category as Uncategorised, as users may not be able to find the notification in their list of notifications.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description for this notification.</td>
</tr>
</tbody>
</table>

**Note:** Notification records are shared between messaging, email, and push notifications. Some fields on the form are not relevant to messaging notification records. Leave fields not described here at their default values.

4. Click **Advanced view** under **Related links** to switch the advanced view. Switching to the Advanced view saves the current record.

5. Open the **When to send** tab and complete the form.
**Note:** If the same trigger generates multiple notifications, the system only sends one notification. The system considers all other notifications, even if they have a different subject and body, as duplicates. The Ignore Duplicates business rule controls this functionality.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Send when | Select under what condition the notification is sent:  
- When a record is inserted or updated  
- When a particular event is fired  
- When *triggered as an action step in Flow Designer* |
| Weight    | Set a numerical value for the notification priority relative to other notifications with the same target table and recipients. The system only sends the notification with the highest weight. The default value 0 causes the system to always send the notification (assuming the conditions are met). |
| Conditions| Use the condition builder to select the conditions under which this notification is sent. For example, select **Priority > greater than > 3 - Moderate** to send the notification only for High and Critical priority incidents. |
| Inserted  | Select the check box to enable messaging notification when a record is inserted. This field appears when you set the **Send when** field to **Record inserted or updated**. |
| Updated   | Select the check box to enable messaging notification when a record is updated. This field appears when you set the **Send when** field to **Record inserted or updated**. |
| Event name| Select the event that triggers this notification. This field appears when you set the **Send when** field to **Event is fired**. |
Field | Description
---|---
Advanced condition | Create a script to define more filter conditions, like sending a notification based on the current messaging record, changing field values, or changing system properties.

The advanced condition script must return **true** or set a global answer variable to **true** to send the notification.

The advanced condition script uses the following global variables:
- **current**: Contains the current record from the table to which the notification is linked.
- **event**: Contains the event that triggered the notification.

**Note**: The **Advanced condition** field is evaluated in addition to other conditions you set on the notification. Both the condition and advanced condition must evaluate to **true** to send the notification.

6. Open the **Who will receive** tab and fill in or modify the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Messaging Channels</td>
<td>Select the messaging channels to receive the messaging notification. Only complete this field if creating a simple notification to send to a channel. Simple notifications use a Messaging Content record of Type <strong>Simple</strong>.</td>
</tr>
<tr>
<td>Users</td>
<td>Select the users you want to receive the messaging notification. Only complete this field if creating a notification that requires user action. Notifications that require user action use a Messaging Content record of Type <strong>Buttons</strong>.</td>
</tr>
<tr>
<td>Users/groups in fields</td>
<td>Select users or groups from reference fields. For example, if a notification uses the Incident [incident] table, you can select users or groups from incident fields like <strong>Opened by</strong> and <strong>Assignment group</strong>.</td>
</tr>
<tr>
<td>Groups</td>
<td>Select the groups you want to receive the messaging notification. You can search for groups with the reference lookup icon or by manually entering the group name. This list of groups is static.</td>
</tr>
</tbody>
</table>

**Note**: You can dot-walk to values in reference fields by clicking the plus sign in the field selector and then selecting the related field.

If you address the notification to a user with an inactive record in the User [sys_user] table, the system does not send the notification to that user.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send to event creator</td>
<td>Select this check box to send the notification to the person who performed the action that started the notification process if the person is also a recipient. If the event creator is not specified in one of the recipient fields, the event creator does not receive a notification, regardless of the setting in this field. For new notifications, this option is selected by default.</td>
</tr>
<tr>
<td>Event parm 1 contains recipient</td>
<td>Select this check box if the event parameter 1 contains one or more notification recipients (in a comma separated-list). This field is visible only when the <strong>Send when</strong> field is set to <strong>Event is fired</strong>.</td>
</tr>
<tr>
<td>Event parm 2 contains recipient</td>
<td>Select this check box if the event parameter 2 contains one or more notification recipients (in a comma-separated list). This field is visible only when the <strong>Send when</strong> field is set to <strong>Event is fired</strong>.</td>
</tr>
</tbody>
</table>

7. Open the **What it will contain** tab and fill in or modify the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Messaging content</td>
<td>Select a messaging content record to be used in this notification.</td>
</tr>
</tbody>
</table>

8. Click **Update**.

**Link your ServiceNow user account to your Slack or MS Teams account for Now Actions**

Link your ServiceNow account to your Slack or Teams account to take action on ServiceNow notifications from within Slack or Teams. If you do not link accounts, you can still receive notifications within group channels. However, you cannot to approve ServiceNow requests or take action on notifications from within Slack or Teams.

Role required: none

1. Open the Slack or Teams application
2. Find the Now Actions bot. This bot is found in the left panel of Slack under Apps, and in the left panel of Teams in the **Chat** tab.
3. Start a conversation with the Now Actions bot. The bot then presents a link to authenticate.
4. **Click the Connect to ServiceNow link.**
   A new browser tab opens and prompts the user to Deny or Confirm the connect between your Slack or Teams account and your ServiceNow account. This link will expire five minutes after it is displayed.

5. **Click Confirm** to link the accounts.

6. After confirmation, you are directed to the instance user record. A confirmation message is displayed at the top of the screen.
Configure system settings

Each user can enable ServiceNow notifications in a third-party application by configuring the communication channel in their system settings. Opt in to receive approval requests and other actionable notifications in third-party channels. You can only enable notifications in notification channels you have permission to access.

1. Select the gear icon in the banner frame to access the System Settings window.
2. Select the Notifications tab.
3. Under Notification Channels, enable notifications for the desired channels.

4. Opt in to individual notifications.

To receive notifications for Button type messages, you must opt in for each individual notification that you wish to receive. For example, to receive an approval request as a direct message in Slack, you must find the notification and set the Slack workspace as an enabled channel for that specific notification.

Note: To receive notifications for Simple type messages, you need only to enable the notification channel. You don't need to opt in for individual notifications. For more information on message types, see Configure message content.
a) In the Notifications by Category section, select the category containing the notification you want to enable. The category is defined on the notification record. You can also search notifications to find individual notifications by name.

b) Select the notification you wish to enable a channel for.

c) Enable the notification channels where you want to receive this notification.

### Unlink your ServiceNow user account from your Slack or MS Teams account for Now Actions

Unlink your ServiceNow account from your Slack or MS Teams account to stop receiving actionable ServiceNow notifications in Slack or Teams.

**Role required:** none

If you unlink your account to a messaging app for Now Actions, you must also disable the corresponding messaging channel in your notification preferences.

1. Navigate to **Self-Service > My Profile**.
2. Click the **View Linked Accounts** related link.
3. In the Linked Accounts page, check the selection box for the messaging integration to be unlinked.
4. Select **Actions on selected rows...**, then click **Unlink account**.

   Your ServiceNow account is unlinked from the Now Actions messaging integration (the link is inactive).

   **Note:** Even though you unlinked your account, you still receive notifications in any group channels to which you belong.

5. Disable the messaging channel in your Notification Preferences.
   a) Select the gear icon in the banner frame to access the System Settings window.
   b) Under Notification Channels, disable the appropriate messaging channel.

   **Note:** If you want to link your ServiceNow account again, follow the steps in **Link your ServiceNow user account to your Slack or MS Teams account for Now Actions**.

### Email digests

An email digest is a single email that summarizes the activity for a selected notification and its target record during a specified time interval. You can enable an email digest to reduce the number of notifications received when frequent updates to the associated record occur within a short time period.
Example email digest

Note: Email digests apply to email notifications only and are not supported for SMS messages, push notifications, and activity streams.

How email digests work

In new and upgraded instances, the Email digest (com.glide.email_digest) plugin is activated by default. Your instance must use the UI16 interface, since the email digest feature involves setting user notification preferences in the System Settings window.

Admins determine which notifications can be delivered in an email digest and configure the digest content for those notifications. Admins can also control the intervals for digests. An interval is the length of time that notifications are collected for the digest, such as daily or hourly.
Users enable the digest and select the digest interval for a specific notification in their notification preferences. The system accumulates the notifications that normally would be sent during the specified interval and summarizes them in the email digest.

When processing an email digest, the system:

- Stores the digest configuration for the notification in the Notifications [sysevent_email_action] table.
- Temporarily stores the notification content accumulated for a user in the Email Digest Parts [sys_email_digest_part] table and the Email Digest Part Users [sys_email_digest_part_user] table.
- Runs an email digest job every 15 minutes to check when a digest is ready to be sent to a user.

The system uses the digest interval to determine when the digest is ready to be sent. The digest interval begins when the first notification is triggered for the user and stops at the end of the interval time.

- Sends the email digest to the user soon after the selected digest interval ends.

For example, if a user selects an hourly digest interval and the first notification is triggered at 08:15, the interval starts at 08:15. When the digest interval ends, the system generates the email digest approximately one hour later, at about 09:15 or shortly after, depending on when the email digest job ran.

**Set up email digests**

**What to do — admins**

1. Review the base system digest intervals and if needed, *create or modify intervals*.

   The base system digest intervals are one day (24 hours), one hour, every four hours, and seven days (weekly).

2. Determine the email notifications that can be delivered in a digest and *configure the email digest content* for those notifications.

   When determining which notifications are appropriate for an email digest, consider the notification content and intervals that your users can select. For example, digests that can be generated weekly might be better suited for notifications that are non-urgent.

**What to do — all users**

For a notification that can be delivered in an email digest, *enable the email digest in your notification preferences* (Notifications tab in the System Settings window). You also specify the interval time that the notifications are accumulated.

**Next step**

If you are an admin, begin the digest setup process by reviewing the base system email digest intervals and *create or modify the intervals*.

**Create or modify email digest intervals**

Admins can create or modify the email digest intervals (length of time) during which activity for a selected notification is accumulated in an email digest. Users select a digest interval when they enable an email digest in their notification preferences.

**Role required: admin**

Before adding an email digest interval, review the base system digest intervals in the Digest Intervals [sys_email_digest_interval] table. You can modify intervals, including the base system intervals, which are one day (24 hours), one hour, every four hours, and seven days (weekly).

1. Navigate to **System Notification > Email > Digest Intervals**.
<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To add an interval</td>
<td>Click <strong>New</strong>.</td>
</tr>
<tr>
<td>To modify an interval</td>
<td>Select the interval to be changed.</td>
</tr>
</tbody>
</table>

2. Enter the new or changed interval information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Interval name that describes the interval length of time, for example: Every 2 hours.</td>
</tr>
<tr>
<td>Interval</td>
<td>Length of the interval, either number of <strong>Days</strong> or <strong>Hours</strong> (hours, minutes, and seconds). The minimum time length allowed is one hour, and the maximum time length allowed is seven days (one week).</td>
</tr>
</tbody>
</table>

3. If you created an interval, click **Submit**. Or, if you changed an interval, click **Update**.

The system updates the Digest Intervals [sys_email_digest_interval] table with the new or modified interval. The digest interval is listed as an option in the notification preferences (**Notifications** tab in the System Settings window) when a user enables a digest for the notification. For example:
4. To delete an interval, select the interval to be deleted in the Digest Intervals [sys_email_digest_interval] table and click **Delete**.

   **Note:** If the interval is in use, the system does not remove the interval.

Determine the email notifications that can be delivered in a digest and configure the email digest content for those notifications.

**Configure email digests**

Use the Notification form to create or modify the content of an email digest for a notification. You can also disable the email digest for a notification so that it is not available in the notification preferences of your users.

Role required: admin
When you *create or update a notification*, use the **What Digest will contain** tab of the Notification form to configure the email digest for the notification. After you define the digest content, the digest option for the notification is available in the notification settings of your users.

1. Navigate to **System Notification > Email > Notifications**.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you are creating a notification</td>
<td>Click <strong>New</strong> to open the Notification form.</td>
</tr>
<tr>
<td>If you are modifying a notification</td>
<td>Select the notification to be changed.</td>
</tr>
</tbody>
</table>

2. In the Notification form, select the **Allow Digest** check box to display the **What Digest will contain** tab and define the digest content.

3. Complete the fields in the **What Digest will contain** tab. The example shows the default view of the tab. The advanced view contains additional fields (see table).
<table>
<thead>
<tr>
<th>When to send</th>
<th>Who will receive</th>
<th>What it will contain</th>
<th>What Digest will contain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digest Template</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Digest Subject</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Digest HTML</td>
<td>-</td>
<td>+</td>
<td>Select variables:</td>
</tr>
</tbody>
</table>

Fields:
- Active
- Activity due
- Actual end
- Actual start
- Additional
- assignee list
- Additional
- comments
- Approval
- Approval history
- Approval set

<table>
<thead>
<tr>
<th>Digest Separator</th>
<th>(HTML)</th>
<th>-</th>
<th>+</th>
<th>Select variables:</th>
</tr>
</thead>
</table>

Fields:
- Active
- Activity due
- Actual end
- Actual start
- Additional
- assignee list
- Additional
- comments
- Approval
- Approval history
- Approval set
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digest Template</td>
<td>If you want to reuse existing content, such as headers or footers, select an email template to add content to the email digest.</td>
</tr>
<tr>
<td>Digest Subject</td>
<td>Enter the subject line for the email digest. The subject can include variables from the Select variables column. If empty, the system uses the Subject value from the Email template. If you enter a value in this field, it overrides the template value.</td>
</tr>
<tr>
<td>Digest HTML</td>
<td>Enter the recurring content for the email digest. The digest content can include variables from the Select variables column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. To prevent adding extra <code>&lt;p&gt;</code> and <code>&lt;div&gt;</code> elements to your email digest, see the blog post Extra line spacing with paragraph tags in email client by a ServiceNow employee in the ServiceNow Community.</td>
</tr>
<tr>
<td>Digest Separator (HTML)</td>
<td>Use the line to separate each item summarized in the digest.</td>
</tr>
<tr>
<td>Digest From</td>
<td>Enter the email address to be used in the From field of the email digest. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email address must be in a valid format, otherwise a notification message appears near the field. Changing this address requires an advanced email setup such as enabling email forwarding.</td>
</tr>
<tr>
<td>Digest Reply To</td>
<td>Enter the email address that you want people to use when replying to the email digest. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email must be in a valid format, otherwise a notification message appears near the field. Changing this address requires an advanced email setup such as enabling email forwarding.</td>
</tr>
<tr>
<td>Digest Text</td>
<td>Enter the recurring content of the email digest to send in plain text. This field appears when you set the content type to HTML and plain text or Plain text only.</td>
</tr>
<tr>
<td>Digest Separator (text)</td>
<td>[Optional] Use the dash character as a line to separate each item summarized in the digest. This field appears when you set the content type to HTML and plain text or Plain text only.</td>
</tr>
</tbody>
</table>

4. When you finish creating the notification, click Submit. Or, if you are done modifying the notification, click Update.
The email Digest option is displayed in the notification settings of your users.

Note: The email recipients identified in the Who will receive tab will receive the digest after they enable the digest in their notification preferences. If the user is not a designated recipient for the notification, a digest is not generated even though the user may have the digest enabled for a notification. In this case, the user receives the actual notifications when they are generated.

5. [Optional]. To disable the email digest for a notification, unselect the Allow Digest check box and click Update when you finish your changes to the notification.

When you disable the digest content, the digest option is also no longer available for the notification and is not listed in the notification preferences for your users. If a user previously enabled the digest option for the notification, the system stops collecting those notifications for a digest and does not generate the digest.

Note: If you disabled the digest and want to make the digest available again, select the Allow Digest check box. The system retains the previously saved digest content and displays it in the What Digest will contain tab.

Enable an email digest

In your notification preferences, you can enable an email digest that summarizes the activity for a selected notification during a specified time interval. The digest is a single email that you receive instead of the individual notifications generated during the specified interval.

Role required: none

The email digest option is available for a notification (in your notification preferences) only when your admin has configured the email digest content for that notification.

Consider enabling an email digest to reduce the number of emails you would normally receive when the target record for a notification is frequently updated within a short time period.

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the Notifications tab.

2. Select the notification:
   a) In the Notifications By Category section, click the row or right arrow (›) of the category that you want to view.
   b) In the list of notifications for the category, click the row or right arrow (›) next to the notification that you want to edit.

3. To enable or disable an email digest for the notification, if an email digest is available:
   a) Click the Email Digest switch.
      The email digest is enabled when the switch is green and disabled when the switch is grey.
   b) If you enabled the digest, select the Interval (length of time) during which the notifications are accumulated.
The digest interval begins with the first occurrence of notification activity. For example, if you select the daily (1 Day) interval and the first notification occurs at 07:00, the system begins accumulating notifications at 07:00 and stops at 07:00 the next day.

Soon after the interval ends, the system sends the email digest to you instead of sending the individual notifications generated during the digest interval. If you disabled the digest, the system immediately stops accumulating the notifications for the digest and does not send the email digest. The system resumes sending the notifications as they are generated.

Notify

Notify provides support for SMS and voice channels on the ServiceNow platform for communicating internally with team members and externally with customers and contractors.

Notify provides a way for applications to start and manage a conference, send/receive SMS, send/receive calls and present them with IVR like system.
Notify provides APIs and workflow activities to achieve the above. Some customers directly make use of the APIs in their products others via products like Major Incident Management, On-Call and CTI Softphone.

**Activate Notify**

The Notify (com.snc.notify) plugin requires a separate subscription. This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

Notify activates these related plugins if they are not already active.

**Plugins for Notify**

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>E164 Compliant Phone Number [com.glide.phone_number]</td>
<td>Provides E-164 compliant phone number support.</td>
</tr>
<tr>
<td>Notify-Twilio Direct Driver [com.snc.notify.twilio_direct]</td>
<td>Provides Notify support for Twilio. This is a pure JavaScript driver that is more customizable and has more features. Requires a separate contract with Twilio for SMS/Voice capabilities.</td>
</tr>
</tbody>
</table>

**Note:** If you are upgrading from an earlier version of Notify, the Notify-Twilio driver remains active.

To purchase a subscription, contact your ServiceNow account manager. After purchasing the subscription, activate the plugin within the production instance.

You can evaluate the feature on a sub-production instance without charge by requesting it from the HI Customer Service System.

1. Navigate to **System Applications > All Available Applications > All**.
   
   A banner appears to notify you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:** To redirect to the legacy list view for plugins, click the link.

2. Find the plugin with the filter criteria and search bar.

   You can search for the plugin by its name or ID.

   If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in **Request a plugin**.

3. Activate the plugin.

   You can activate the plugin directly from the All Applications page or view more details about the plugin before activating it.

   - If you are certain that you have the correct plugin, click **Install**, and then click **Activate** in the dialog box that appears.
• To view plugin details before activation:

1. Click the plugin name.
2. On the form, click the **Activate/Update** related link.
3. On the dialog box that appears, review the dependent plugins.
   If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.
4. If demo data is available and you want to install it, click **Load demo data**.
   Some plugins include demo data, which are sample records that illustrate plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.
5. Click **Activate**.

**Differences between Notify and Legacy Notify**

Describes the differences between the Notify and Legacy Notify applications, including architecture, workflows, Twilio support, and task-initiated conference calls.

<table>
<thead>
<tr>
<th>Legacy Notify (com.snc.notifynow)</th>
<th>Notify (com.snc.notify)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is deprecated. Supported only telephony services.</td>
<td>Supports pure conferencing solutions such as Zoom in addition to the Telephony providers like Twilio.</td>
</tr>
<tr>
<td>Manage a single number from a Twilio account per instance.</td>
<td>Provides support for multiple numbers per Twilio account, especially cross-geographical scenarios.</td>
</tr>
<tr>
<td>Does not include support for customizable workflows for Voice and SMS incoming or outgoing scenarios.</td>
<td>Workflow-driven approach for handling incoming and outgoing Voice and SMS events, making the integration easy to customize.</td>
</tr>
<tr>
<td>Hard-coded join conference SMS and IVR prompts for joining a conference call.</td>
<td>Includes a configurable workflow for handling SMS and Voice IVR prompts.</td>
</tr>
</tbody>
</table>
**Migrating from Legacy Notify**

When migrating to Notify from the Legacy Notify functionality, several changes are made to the instance.

If the Legacy Notify functionality is already enabled, several automatic changes occur when you activate Notify:

- The Legacy Notify menu is removed from the application navigator.
- Two separators are added to the new Notify menu: **Legacy Notify** and **Legacy Notify Admin**. New modules that replace the Legacy Notify modules are added to these sections.

  **Note:** The added modules are not the same modules that were in the Legacy Notify menu. Any customizations made to the Legacy Notify modules are not preserved.

- The notify_admin role allows access to Notify modules.
- The notifynow_admin role allows access to Legacy Notify modules.
- All workflow activities from the Legacy Notify application are moved to the **Legacy Notify** group.

**Notify-Twilio Direct driver**

The Notify-Twilio integration with the Notify-Twilio Direct driver provides APIs and workflow activities for applications to handle various notification features.

The Notify-Twilio Direct driver provides these notification features:

- Start and manage a conference
- Send and receive SMS messages
- Send and receive calls

Notify automatically creates a TwiML application in the Twilio account and configures the application to use the instance as an endpoint. Phone numbers associated with the Twilio account are imported to Notify.

To manage phone numbers per instance, set up one Twilio account for each instance and configure all relevant phone numbers for the instance under that account.

  **Note:** Only one Twilio account (or subaccount) can be configured on a given Notify driver at a time. Both the old and new driver can be used simultaneously because they can be configured with different accounts.

**Activation Information**

For new customers, only the Notify-Twilio Direct driver is available by default. For customers upgrading to the latest version, both the Notify-Twilio Direct and Notify-Twilio drivers are available.

The Notify plugin must be active to access Notify.

**Differences between Notify-Twilio and Notify-Twilio Direct**

Describes the differences between the Notify-Twilio and Notify-Twilio Direct drivers, including architecture, workflows, Twilio support, and task-initiated conference calls.
### Differences between Notify-Twilio and Notify-Twilio Direct

<table>
<thead>
<tr>
<th>Notify-Twilio (com.snc.notify.twilio)</th>
<th>Notify-Twilio Direct (com.snc.notify.twilio_direct)</th>
</tr>
</thead>
<tbody>
<tr>
<td>This plugin is deprecated. Notify - Twilio Direct Driver now replaces this plugin.</td>
<td>Provides next generation integration with Twilio and Notify.</td>
</tr>
<tr>
<td>Uses Java SDK based integration with Twilio.</td>
<td>It is a JavaScript based driver which uses platform provided outbound REST APIs to connect to Twilio.</td>
</tr>
<tr>
<td>NA</td>
<td>Adds support for various advanced SMS features such as Co-pilot messaging, Twilio Notify bulk SMS.</td>
</tr>
<tr>
<td>NA</td>
<td>Adds support for various functionalities in conference calls such as view the participant who is speaking on the conference call, disable beep when someone enters/exits a conference, advanced call features like machine detection and so on.</td>
</tr>
</tbody>
</table>

### Migrate to Notify-Twilio Direct driver

Migrating to Notify-Twilio Direct driver provides next-generation integration with Twilio and Notify.

Role required: notify_admin

You must have an SID and authentication token for an active Twilio account (https://www.twilio.com/). You must have a separate contract with Twilio. You must be connected to Twilio using the Notify Twilio Driver.

1. Click **Migrate Now**.
2. Click **Ok** on the confirmation dialog.
   A disconnection of the Twilio driver is initiated and the Account SID and Auth Token are copied to Twilio Direct's configuration page. Twilio Direct is then autoconnected to that account, and you are redirected to the driver's config page.

### Configure Notify with Twilio

Configure Notify to use the Twilio telephony service.

You must have an SID and authentication token for an active Twilio account (https://www.twilio.com/). You must have a separate contract with Twilio.

**Important:** Ensure that each instance on which you configure Notify uses a different Twilio account. Each account specifies a unique account SID, authentication token, telephone numbers, and endpoint. Using the same account across multiple instances may cause your Twilio service configuration to be overwritten.

**Note:** Account and sub-account are Twilio categorizations, and both act the same for a ServiceNow instance.

Role required: notify_admin

1. Navigate to **Notify > Administration > Twilio Direct Configuration**.
2. On the Twilio Account Properties page, enter your **Account SID**.
3. Enter your **Auth Token**.
4. Click **Connect**.
   If the account is not associated with an instance and the connection is successful, a read-only list of E.164 and short code phone numbers associated with this Twilio account appears. This list displays the phone number, supported capabilities such as voice or SMS, the country for each Twilio number, and the Notify number group to which the number belongs.
If the account is already associated with an instance, the system displays an error message. To connect to this account,

- **Disconnect the account from the instance.**
- Delete the TwiML apps in the Twilio account.

**Note:** If you buy or release numbers on the Twilio account, open the configuration page again to refresh the list of numbers. Numbers removed from the Twilio service remain as Notify Number records, but with the **Active** field set to false. Use only active phone numbers for inbound or outbound communication.

Phone numbers and short codes are provided by Twilio once the account is successfully connected and are stored on the Notify Phone Numbers [notify_number] table. Assign each number to a number group. Number groups allow you to control which workflows run when using the phone numbers in each number group.

**Advanced configuration for voice and SMS**

Configure advanced SMS and voice features provided by the Twilio Configure Advanced SMS and Voice Feature on the Twilio Direct Configuration page.

Role required: notify_admin

1. Navigate to **Notify > Twilio Configuration**.
2. On the Twilio Account Properties page, enter your **Account SID**.
3. Enter your **Auth Token**.
4. Click **Connect**.
5. On the **Advance SMS Features** tab, check the **Intelligent SMS Handling** box.

**Note:** This feature can be configured directly from the Twilio console.

6. On the **Advance SMS Features** tab, check the **Twilio Notify Bulk SMS** box.

**Note:** This feature uses Twilio Notify feature and might have an associated cost. Contact Twilio Support for more details.

7. On the **Advance Voice Features** tab, check the **Detect answering machine** box.
8. On the **Advance Voice Features** tab, check the **Machine detection timeout** box.

**Note:** To populate this feature correctly, enable the "Is human" flag.

**Disconnect from a Twilio account**

If a Twilio account is already associated with a different system, disconnect the account from the other system before connecting to the current instance.

Role required: notify_admin

1. Navigate to **Notify > Administration > Twilio Configuration**.
2. On the Twilio Account Properties page, click **Disconnect**.
3. In the Disconnecting Twilio account pop-up window, click **OK**.

The account is disconnected from the instance. The system clears the **Account SID** and **Auth Token** fields and deactivates the list of associated phone numbers.
Public URLs

The properties for Notify call back processors require specific URLs.

The Notify-Twilio drivers (both new and old) require that specific URLs on the instance be accessible from the Internet by the Twilio server without authentication. If the instance is within a private network, you need to either port forward or set up a reverse proxy.

On-premise customers should ensure that the URLs are accessible from the Internet for the Notify-Twilio driver to work correctly.

For the Notify-Twilio driver, the URLs are:

- /NotifyTwilioCallProcessor.do
- /NotifyTwilioCallStatusProcessor.do
- /NotifyTwilioSMSProcessor.do
- /NotifyTwilioDialStatusProcessor.do
- /NotifyTwilioEventProcessor.do
- /NotifyTwilioDialProcessor.do
- /NotifyTwilioRecordingProcessor.do

For the Notify-Twilio Direct driver, the URLs are:

- /api/sn_twilio_direct/twilio_callbacks/process/twiml/{callback_name}
- /api/sn_twilio_direct/twilio_callbacks/process/xml/{callback_name}

**Note:** The `glide.notify.endpoint` property needs to be set to an Internet visible name because the instance name inside a private network can be different from the Internet domain.

Components installed with Twilio Direct driver

Several types of components are installed with the Twilio Direct driver for integration with Notify.

Tables installed with Twilio Direct driver

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[sn_twilio_direct_callback_processor]</td>
<td>Extends the application file. Contains scripts which process callback payloads from Twilio and generate appropriate response XML or TwiML document. <strong>Note:</strong> Use caution when editing, deleting or adding new Callback Processor scripts as they are one of the key core components of the driver.</td>
</tr>
<tr>
<td>[sn_twilio_direct_twilio_config]</td>
<td>Extends the application file. Contains configuration option values for the driver.</td>
</tr>
<tr>
<td>[sn_twilio_direct_basic_auth]</td>
<td>Extends the basic auth credentials. The Account SID and Auth token are stored in this table.</td>
</tr>
</tbody>
</table>

Business rules installed with Twilio Direct driver

Twilio installs the following business rules:
<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Connected Disconnected Message</td>
<td>[sn_twilio_direct_twilio_config]</td>
<td>Verifies if Twilio is completely configured and displays an info message.</td>
</tr>
<tr>
<td>Machine detection timeout range check</td>
<td>[sn_twilio_direct_twilio_config]</td>
<td>Verifies the timeout values for detecting the answering machine if the Detect answering machine is enabled. The valid range of the timeout is 3-120 seconds.</td>
</tr>
<tr>
<td>Move credentials</td>
<td>[sn_twilio_direct_twilio_config]</td>
<td>Moves the account credentials to [sn_twilio_direct_basic_auth]</td>
</tr>
<tr>
<td>Populate Credentials</td>
<td>[sn_twilio_direct_twilio_config]</td>
<td>Populates the current SID and Auth token from the [sn_twilio_direct_basic_auth] table to display them.</td>
</tr>
<tr>
<td>Set outbound calculated fields &amp; auth</td>
<td>[sn_twilio_direct_twilio_config]</td>
<td>Sets the account credentials in the basic auth profile</td>
</tr>
<tr>
<td>Validate &amp; set inbound calculated fields</td>
<td>[sn_twilio_direct_twilio_config]</td>
<td>Populates the callback_endpoint field based on the inbound rest field value. Displays an error message if the endpoint URLs are not in the correct format.</td>
</tr>
<tr>
<td>Validate Fast Bulk SMS option</td>
<td>[sn_twilio_direct_twilio_config]</td>
<td>When Twilio Notify bulk SMS is enabled, validates the Twilio messaging and Notify service id.</td>
</tr>
<tr>
<td>Validate Intelligent SMS option</td>
<td>[sn_twilio_direct_twilio_config]</td>
<td>When Intelligent SMS handling is enabled, validates the Twilio messaging service id.</td>
</tr>
</tbody>
</table>

**Notify voice and SMS capabilities**

Notify provides support for SMS and voice channels for communicating internally with team members and externally with customers and contractors.

Notify Notify provides a way for applications to start and manage a conference, send/receive SMS, send/receive calls and present them with IVR like system.

**How Notify processes incoming calls**

Notify processes incoming calls using workflow activities.

Any Notify activity that manages incoming phone calls creates a record on the Notify Workflow Activity [notify_wf_activity] table. Each notify_wf_activity record is associated with a single call. These records store JSON data detailing the actions to send to the telephony provider.

Notify processes incoming calls in the following way:

1. A person calls a Notify phone number.
2. Notify launches the incoming call workflow associated with that Notify phone number.
3. The workflow reaches a Notify activity and invokes the activity `onExecute()` function.
4. The activity creates a new notify_wf_activity record detailing any actions to take, with a **State** value of execute.
5. Notify sends the specified actions to the telephony provider.
6. The notify_wf_activity record **State** changes to processed.
7. The telephony provider sends a response.
8. Response arguments, such as user input or recording info, are stored as JSON data in the notify_wf_activity **response_args** field.
9. The notify_wf_activity **State** changes to complete.
10. The JSON data from the notify_wf_activity record is copied to the **Last action** field in the Notify call record that triggered the workflow.
11. The workflow invokes the `onUpdate()` function in executing activities.
12. The activity confirms that the associated notify_wf_activity record has completed, and changes the activity state to finished.
13. The workflow transitions to the next activity.

**Notify conference calls**

Notify administrators, major incident managers, or communications managers can manage conference calls.

Conference call records are stored on the Notify Conference Calls [notify_conference_call] table. Conference call participant records are stored on the Notify Conference Call Participants [notify_participant] table.

Conference call and participant records are created automatically when starting and connecting to a conference call. Most fields, such as the **Duration** of a call, are set automatically using business rules.

**Note:** If a participant attempts to join a conference call using an invalid phone number, the caller is added to the participant list and the phone number is marked with a status of **Invalid**.

Notify administrators, major incident managers, or communications managers can manage conference call participants.

Several conference call workflows are available by default. These workflows can be used for incoming and outgoing calls and incoming SMS messages. Conference call workflows are:

- Notify: (Re)join Conference Call
- Notify: (Re)join Conference Call with muting
- Notify: Join Conference Call Via SMS

The number groups Conference Call Group and Notify On Task Group use these conference call workflows by default.

**Start a conference call**

Start a conference call from a task or an incident communication plan by inviting one or more users to join a call. The conference will not start until at least two participants join.

Call participants can include:

- Users who have been assigned specific responsibilities
- Ad-hoc user contacts
- Other involved parties who are not recorded as users, such as third-party contacts

1. Navigate to **Incident Communications Management > Open**.
2. Open the relevant incident communication plan.
3. Click the **Initiate Conference Call** related link.
4. Within the dialog box that appears, select the participants for the conference.

![Initiate conference call](image)

**Initiate a conference call**

The dialog box displays the **Recommended** and **Selected** participants for the conference. All users from the **User Contacts** list in the incident communication plan are in the **Recommended** section by default. The user who initiates the conference call is added to the selected list of participants.

If a shift exists for the group contacts, the primary and secondary on-call resources are shown in the **Recommended** list.

Calls are placed to the number in the **Mobile** phone field on the user record. If that information is blank, the user cannot be contacted through Notify. The mobile phone number has to be an E.164 compliant phone number. If the phone number is a local number, without the + prefix, the number will be retrieved based on the user's location and, if possible, converted into a valid E.164 number.

5. To select ad-hoc participants,
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click the reference lookup icon, and select the relevant user.</td>
<td>Click Add to selected.</td>
</tr>
<tr>
<td>Enter the participant's phone number</td>
<td>Click Add to selected.</td>
</tr>
</tbody>
</table>

6. After the participant list is finalized, click **Start Call**.
   The conference call starts and a **Conference call initiated** message is displayed at the top of the incident communication plan form. Each user is called and can accept the call to join the conference.

7. Click the **Conference call initiated** message to see details of that conference call.
   When the final participant leaves the conference, the conference call closes.

**Note:** VoIP phone systems, which do not use touch tone phones, may encounter issues with recognizing key presses. To avoid problems, ensure that conference call users use touch tone phones, or configure your VoIP system settings to recognize key presses, as described in your VoIP system documentation.

---

**Add participants to a conference call**

Add a participant to a conference call using Notify

Role required: notify_admin, major_incident_manager, or communication_manager

You can add the following participants:

- Users who have been assigned specific responsibilities
- Required ad-hoc user contacts
- Other involved parties who are not recorded as users, such as third-party contacts

1. Navigate to **Notify > Conference Calls**.
2. Open the conference call that you want to add a participant to.
3. Click the **Add Participant** related link.
4. In the dialog box that appears, select the participants you want to add to the conference.
   You can add a single participant, a group of participants, or a phone number.
5. Click **Add Participant**.
   The selected user, group, or phone number is added to the selected conference call.

**Mute or unmute all participants**

As a communications manager or a conference call host, mute/unmute all the conference participants from the workbench.

Role required: notify_admin, major_incident_manager, or communications_manager

Before starting this procedure, ensure there is an active conference call with one or more participants.

1. Navigate to **Major Incident Management** in the application filters.
2. Select the incident that you are trying to resolve.
3. On the incident, click **View Workbench**
4. In the **Conferences** tab, select a conference

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mute All</td>
<td>Click this button to mute all the participants in the conference</td>
</tr>
<tr>
<td>Unmute All</td>
<td>Click this button to unmute all the participants in the conference</td>
</tr>
</tbody>
</table>

Mute All
Unmute All

Mute or kick a conference call participant

As a communications manager, you can mute or kick conference call participants.
Role required: notify_admin, major_incident_manager, or communication_manager

Before starting this procedure, ensure there is an active conference call with one or more participants.

Note: Any participant with the host flag set to active, can mute or kick a participant from a conference call.

1. Navigate to Notify > Conference Calls.
2. Select a conference call.
3. In the Notify Conference Call Participants related list, select a participant.
4. Click Mute or Kick.

Viewing conference call information

Conference calls are listed as system activities in the Activity section of the Incident Communication Plan form and also are listed in the Conference Calls related list.
Use SMS with Notify

Send and receive SMS messages using Notify.

Notify stores inbound and outbound SMS messages in the Notify Messages [notify_message] table.

Notify supports sending concatenated SMS messages. Messages that exceed 160 characters, or 70 unicode characters, are split into multiple messages. This may affect your total telephony cost because each message can incur a cost. Some mobile carriers, such as Sprint, do not support concatenated SMS messages.

To send SMS messages to an individual recipient, use the Notify API sendSMS method. This method takes one recipient as an input parameter. You can also use the send SMS workflow activity.

To send SMS messages to one or more recipients, use the Notify API sendBulkSMS method. This method takes a list as an input parameter and uses one API call to send multiple messages. Include the list of phone numbers in an array in the API call. This method improves performance by streamlining platform checks and Notify number validation.

Note: When using SNC.Notify.sendBulkSMS API, instead of simply iterating over the numbers, all the given numbers will be sent for SMS to Twilio in one API call.

The Notify-Twilio integration provides programmable SMS outbound message status tracking with Status Callbacks. These callbacks can be helpful to see if a message has been delivered, failed, or ran into some other delivery issues.

SMS Statuses

Every Twilio SMS or MMS message request has a status value which describes the current state of the message. Use this information for troubleshooting SMS related incidents/ issues. Here are few descriptions of possible statuses of SMS sent from Notify through Twilio REST API.

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queued</td>
<td>The message has been queued by the provider to be sent to the carrier network.</td>
</tr>
<tr>
<td>accepted</td>
<td>The message is being processed by the provider before sending it to the carrier network.</td>
</tr>
<tr>
<td>sending</td>
<td>The message is being forwarded to the carrier network.</td>
</tr>
<tr>
<td>sent</td>
<td>The message has been successfully forwarded to the carrier network.</td>
</tr>
<tr>
<td>receiving</td>
<td>The provider has received an incoming message from the carrier network and is processing it.</td>
</tr>
<tr>
<td>received</td>
<td>ServiceNow has received the incoming message from the provider.</td>
</tr>
<tr>
<td>delivered</td>
<td>The message has been delivered to the target device.</td>
</tr>
<tr>
<td>undelivered</td>
<td>The message could not be delivered to the target device.</td>
</tr>
<tr>
<td>failed</td>
<td>The message failed to be forwarded to the carrier network.</td>
</tr>
</tbody>
</table>

Note: A provider may not be able to report this status if the upstream carrier does not report this.
List of Notify calls

If you are a Notify administrator, you can view a list of calls and the status of a call made to or from Notify. The call records help in reporting and analytics.

To view a list of calls, navigate to Notify > Calls.

Call records are generated automatically when a user calls a Notify number or when a user makes an outbound call through Notify. You cannot create call records manually.

Note: Although you can delete a call record, doing so may result in cascade deletion of related records.

For Notify calls where the source is specified, such as a task number, the source is added to the Notify Calls [notify_call] table in the Source column. For Notify conference calls where the source is specified, the source is added to the records for each of the calls in the conference.

<table>
<thead>
<tr>
<th>Call status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>initiated</td>
<td>The number has just been dialed</td>
</tr>
<tr>
<td>ringing</td>
<td>The call is currently ringing.</td>
</tr>
<tr>
<td>in-progress</td>
<td>The call was answered and is currently in progress.</td>
</tr>
<tr>
<td>no_answer</td>
<td>The call was not answered.</td>
</tr>
<tr>
<td>completed</td>
<td>The call was answered and has ended normally.</td>
</tr>
<tr>
<td>busy</td>
<td>The caller received a busy signal.</td>
</tr>
<tr>
<td>failed</td>
<td>The call could not be completed as dialed, most likely because the phone number was non-existent.</td>
</tr>
<tr>
<td>invalid</td>
<td>The call could not be connected since input is invalid.</td>
</tr>
<tr>
<td>unknown</td>
<td>The driver does not support the status</td>
</tr>
</tbody>
</table>

Outbound communication requirements

Outbound communications initiated through Notify, such as phone calls and SMS messages, must satisfy recipient number requirements.

Recipient number requirements

These requirements apply to any number that receives a Notify phone call or message.

- The number must be E.164 compliant.
- The number must be different than the phone number used to initiate the call or message.

These requirements apply to all outbound communication initiated through Notify, such as by using Notify workflow activities or the Notify JavaScript API.

Invalid numbers prevent Notify workflows from running and cause an error to be logged. Set the glide.notify.debug property to true to create detailed error logs.
Using Notify with tasks

Notify allows you to initiate conference calls and send SMS alerts from task records.

This functionality is available for all tables that extend the Task table, such as incident, problem, or change request. All calls and messages made from tasks are initiated using a single Notify phone number (E.164 or short code). You can configure which phone number is used by setting the property `glide.notify.task.phone_number`.

Send an SMS alert from a task

Use Notify to send SMS alerts from a task record.

Role required: itil

Notify must be set up before you can use Notify on task. Ensure there are Notify phone numbers (E.164 or short code) in number groups with SMS workflows. Also ensure the property `glide.notify.task.phone_number` is set to one of these Notify phone numbers with outgoing SMS capability.

1. Navigate to any task record, such as an incident or change request.
2. Click the Send SMS related link.
3. Select one or more Recipients to receive the SMS.
4. Enter the Message to send.
   The task record number is added to the message automatically.
5. Click Send.
   Any SMS records created from a task are associated with that task. You can view associated SMS messages from the task record in the SMS Messages related list. You may need to configure the form to add the related list.

Start a conference call from a task

Use Notify to start conference calls from a task record.

Role required: itil

Notify must be set up before you can use Notify on task. Ensure there are Notify phone numbers (E.164 or short code) in number groups with phone call workflows. Also ensure the property `glide.notify.task.phone_number` is set to one of these Notify phone numbers.

1. Navigate to any task record, such as an incident or change request.
2. Click the Start conference call related link.
3. Select one or more Recipients to participate in the conference call.
4. Click Start.
   Any conference call records created from a task are associated with that task. You can view associated conference calls from the task record in the Conference calls related list. You may need to configure the form to add the related list.

Using Notify with Incident Communications Management

Use Notify with incident communication plan to send SMS messages or start conference calls.

Certain configuration steps are required to use Notify with an incident communication plan.

- Both Notify and Incident Communications Management must be active.
- Notify must be configured and able to initiate and receive phone calls and SMS messages.
- The property `com.snc.iam.notify_number` must be set to an active Notify number with outgoing voice and SMS capability.
• This Notify number must belong to a number group configured with inbound and outbound conference call workflows.

**Note:** The Conference Call Group number group is configured with conference call workflows by default.

## Start a conference call from incident communication plan

Use Notify to initiate a conference call from an incident communication plan by inviting one or more users. Call participants can include:

- Users who have been assigned specific responsibilities
- Ad-hoc user contacts
- Other involved parties who are not recorded as users, such as third-party contacts

1. Navigate to **Incident Communications Management > Open**.
2. Open the relevant incident communication plan.
3. Click the **Initiate Conference Call** related link.
4. Within the dialog box that appears, select the participants for the conference.
Initiate a conference call

The dialog box displays the Recommended and Selected participants for the conference. All users from the User Contacts list in the incident communication plan are in the recommended section by default. The user who initiates the conference call is added to the selected list of participants.

If an on-call shift exists for the group contacts, on-call users based on the escalation policy are shown in the Recommended list. Calls are placed to the number on the user record.

The mobile phone number must be an E.164 compliant phone number.

5. To select ad-hoc participants,

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click the reference lookup icon, and select the relevant user.</td>
<td>Click Add to selected.</td>
</tr>
<tr>
<td>Enter the participant’s phone number</td>
<td>Click Add to selected.</td>
</tr>
</tbody>
</table>

6. After the participant list is finalized, click Start Call.
The conference call starts and a Conference call initiated message is displayed at the top of the incident communication plan form. Each user is called and can accept the call to join the conference. Several response types are possible from users invited to join the conference call, apart from Accepted.

7. After the participant list is finalized, click Start Call.
   The conference call starts and a Conference call initiated message is displayed at the top of the incident communication plan form. Each user is called and can accept the call to join the conference.

8. Click the Conference call initiated message to see details of that conference call.
   When the final participant leaves the conference, the conference call closes.

Note: VoIP phone systems, which do not use touch tone phones, may encounter issues with recognizing key presses. To avoid problems, ensure that conference call users use touch tone phones, or configure your VoIP system settings to recognize key presses, as described in your VoIP system documentation.

Join or end a conference call

After a conference call is initiated, a user with the itil role can join the conference call.

Role required:

itil, ia_admin

About this task

If you have the ia_admin role or you are an ITIL user who is assigned to an Incident Communication Plan, you are also the conference leader and can join or end the conference call on the Incident Communication Task.

1. Navigate to Incident Communication > Open.
2. In the related list, click the Incident Communication Plans tab.
3. Click the relevant Incident Communication Plan
4. In the related list, click the Incident Communication Tasks tab.
5. Click the relevant Incident Communication Task for which the conference call is initiated.
6. Perform one of the following actions:
   • Click Join Conference Call related link to join the ongoing conference call.
   • Click End Conference Call related link to join the ongoing conference call.

Viewing conference call information

Conference calls are listed as system activities in the Activity section of the Incident Communication Plan form and also are listed in the Conference Calls related list.
### Conference Call Information

- **Number**: CONF12345
- **Source**: Incident Communication Plan 123456789
- **Active**: False
- **Duration**: 10 minutes
Send an SMS notification for an incident communications plan

Notify sends an SMS to the users defined as default contacts for an alert.

You can use SMS as a channel for sending notifications using Incident Communication plans, e.g., Initial and status update notifications for a major incident.

This text message is sent to the user's mobile phone number: **ICP<number>: a <Severity> severity <Event Type> incident communication plan for <CI Name> has been opened.**

Administrators can modify the content of this message by editing the **SMS on new Incident Communication Plan** business rule.

Using Notify with On-Call Scheduling

When using both Notify and On-Call Scheduling, you can send On-call escalation notifications as SMS messages, in addition to emails.

Certain configuration steps are required to use Notify with On-Call Scheduling.

- You must add at least one Notify phone number to the On-Call Group number group. This group is configured by default to handle inbound SMS responses (via On-Call: Check Assignment Response) that accepts or rejects an on-call assignment and to handle outbound voice calls (via On-Call: Assign by Acknowledgement Voice) to accept or reject assignments.
- You must configure workflows, such as the On-Call: Assign by Acknowledgement to drive escalations via SMS and Voice.

Set up Notify with On-Call Scheduling

You can configure on-call scheduling to use Notify functionality to send SMS alerts and assign users to tasks based on the SMS responses.

Ensure that the Notify and On-Call Scheduling plugins on your instance are activated.

Role required: admin

Set up Notify with On-Call Scheduling for the first time or migrate from On-Call Scheduling with NotifyNow.

1. Navigate to **Notify > Numbers**.
2. Select the phone number you want to use to send and receive on-call scheduling messages.
3. In the **Notify group** field, select the **On-Call Group**.
   The On-Call Group is configured with the on-call workflows: **On-Call: Check Assignment Response** and **On-Call: Assign by Acknowledgement Voice** by default.
4. Navigate to **Workflow > Workflow Editor**.
5. Select the **On-Call: Assign by Acknowledgement** workflow.
   If migrating from NotifyNow, and you have previously customized this workflow, you must import the new version of the workflow manually. See **KB0551603** for more information.
6. Click the workflow menu icon in the title bar and select **Copy** to copy the **On-Call: Assign by Acknowledgement per rota** workflow. Save the copied workflow under a different name than what it is named by default.

   **Note:** You must avoid modifying default workflows and instead choose to copy and then modify the required workflow.
7. Select a **Send SMS** activity.
8. In the **To (script)** field, modify the `getRecipientsAndNumberToSendFrom()` to use the correct from number's sys ID.
9. Close the **Workflow Editor**
10. Navigate to **On-Call Scheduling > Trigger Rules**.
11. Select a trigger rule that launches an assignment workflow
12. In the **Trigger action** field, select **Workflow**.
13. In the **Trigger workflow** field, select the On-call: Assign by Acknowledgement workflow.
14. Click **Update**.
15. Repeat the previous 3 steps for each assignment trigger rule.
   Each time the conditions for one of these trigger rules is met, the On-call: Assign by Acknowledgement workflow runs.

**Controlling the on-call communication channel with Notify**

Configure On-Call Scheduling with Notify to always use a user's preferred communication channel.

If **Force communication channel** is specified in the **Escalation settings** for rosters, the preferred user device is used, either SMS, Voice or email.

For example, if the preferred device is SMS, and the on-call member does not have an SMS device defined, the user is not contacted even if the user has an email address. When forcing a communication channel on an escalation level does not succeed, no further communication attempts are made. The fact that the user could not be reached is logged.

**On-call: Assign by Acknowledgement workflow**

The **On-Call: Assign by Acknowledgement** workflow is provided with Notify.

The workflow uses data from the escalation settings, including overlapping shifts and custom escalation settings, of shifts and rosters. Depending on these escalation settings, the workflow iterates through the defined escalation chain and sends notifications by SMS, email, or voice to users asking them for incident assignment. The workflow respects time-off as specified in the rosters. People who have time-off are not included in the escalation chain and no notifications are sent to them.

When you install both On-Call Scheduling and Notify, the message_number column is added to the Notify Messages [notify_messages] table to track responses to on-call assignment requests. This column indicates if the contacted user accepted or rejected the assignment. Before you can send notifications, you must define trigger rules. Trigger rules determine the conditions that must be met before a notification is sent and what action must be taken.

**Call a user from the WebRTC UI**

Make outbound calls and receive a voice call in the browser through the WebRTC interface from On-Call Schedules landing page, Roster and Escalation Details modal and on-call calendar.

Role required: itil

1. Navigate to **On Call scheduling > On Call calendars**.
2. In the calendar that opens, click the name of the user you want to call.
3. Choose **Call** to call the user.
Key differences between on-call scheduling with NotifyNow and with Notify

There are key differences between on-call scheduling with NotifyNow and on-call scheduling with Notify.

Tracking responses to questions

The On call:Assign by Acknowledgement workflow no longer uses the Notify Question tables to track assignment responses. When you install On-Call Scheduling with Notify, the message_number column is added to the Notify Messages [notify_messages] table to track responses to on-call assignment requests. This column indicates if the contacted user accepted or rejected the assignment.

Notify administration

As a Notify administrator, you can create number and number groups, create and modify workflows, update the tables and so on.
Numbers and number groups

Number groups allow you to group Notify phone numbers and share workflows across grouped numbers.

Each phone number within Notify has an associated number group. Numbers within a group use the same workflows for handling incoming and outgoing calls and SMS messages.

Numbers associated with a group appear on the Notify Phone Numbers related list on the Notify Phone Number Group form.

If the number group workflows have incorrect conditions, a warning appears.

Create a number group

Group Notify phone numbers and share workflows across grouped numbers.

Role required: notify_admin

Each phone number within Notify has an associated number group. Numbers within a group use the same workflows for handling incoming and outgoing calls and SMS messages.

Numbers associated with a group appear on the Notify Phone Numbers related list on the Notify Phone Number Group form.

1. Navigate to Notify > Number Groups.
2. Click New.

3. Enter a Name, and select Notify: (Re)join Conference Call for the Incoming call workflow field.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the number group.</td>
</tr>
<tr>
<td>Incoming call workflow</td>
<td>Workflow to run when there is an incoming phone call for this group.</td>
</tr>
<tr>
<td>Incoming SMS workflow</td>
<td>Workflow to run when there is an incoming SMS message for this group.</td>
</tr>
<tr>
<td>Outgoing call workflow</td>
<td>Workflow to run when there is an outgoing phone call for this group.</td>
</tr>
<tr>
<td>Outgoing SMS workflow</td>
<td>Workflow to run when there is an outgoing SMS message for this group.</td>
</tr>
</tbody>
</table>

Short codes can only be associated with SMS workflow groups. You cannot add an incoming or outgoing call to a short code group.

4. Click Submit.

**Associate a number to a number group**

After creating a number group, associate numbers with that group to use the selected workflows.

**Note:** Each phone number can only be associated with one number group.

**Associate a number to a number group**

Associate a Notify number to a number group to use inbound and outbound workflows.
Role required: notify_admin

1. Navigate to Notify > Numbers.

2. Click the listed phone number and assign it to a **Number Group**, as appropriate.

   **Note:** Each phone number can only be associated with one number group.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Number for the entry.</td>
</tr>
<tr>
<td>Phone number</td>
<td>E.164 phone number, if applicable.</td>
</tr>
<tr>
<td>Notify group</td>
<td>(Optional) Group to which this number is assigned.</td>
</tr>
<tr>
<td>Number owner</td>
<td>Service provider of the number.</td>
</tr>
<tr>
<td>Short Code</td>
<td>Short code number, if applicable.</td>
</tr>
</tbody>
</table>
### Notify workflow activities

Notify workflow activities manage calls and SMS messages in Notify.

All Notify workflows that manage a phone call must run on the notify_call table. Call-related Notify activities can be added only to workflows where the **Table** field value is **Notify Call [notify_call]**.

You can identify if an outbound call was answered by a human or by an answering machine from within a Notify workflow by evaluating the `current.is_human` variable, such as with an **If** workflow activity. This variable is set by the telephony provider when an outbound call is answered. This variable is always true for inbound calls.

**Note:** Do not add a **Timer** activity between multiple Notify activities that interact with active phone calls.

**Important:** When creating a Notify workflow, set the workflow **If condition matches** field to **-- None --**. Notify controls which workflow to run based on the configured number groups.

### Join conference call workflow activity

The **Join Conference Call** activity connects an incoming or outgoing call to a Notify conference call.

Notify includes the workflows Notify: (Re)join Conference Call and Notify: Join Conference Call Via SMS to demonstrate how to use the **join conference call** activity to connect inbound and outbound calls, and inbound SMS messages to a conference call.

### Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced</td>
<td>Select this check box to display advanced configuration options.</td>
</tr>
<tr>
<td>Script</td>
<td>Specify advanced configuration options using JavaScript, such as if the new participant should be muted upon joining the conference call. You can access values from the workflow scratchpad.</td>
</tr>
<tr>
<td>beepOnEnter</td>
<td>When the current participant joins the conference then a “beep” sound is played.</td>
</tr>
<tr>
<td>beepOnExit</td>
<td>When the current participant leaves the conference then a “beep” sound is played.</td>
</tr>
</tbody>
</table>
### Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enableImmediateInput</td>
<td>This option has no effect if hangUpOnStar is false. Setting this to true will immediately put Twilio into “Input Gather” mode after star “*” key is pressed in a conference. This is useful to implement features like dialing *6 to mute/unmute self in a conference.</td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity. The **join conference call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the conference_call scratchpad variable is not set.

### Scratchpad entries

The activity uses the workflow scratchpad to read persistent values.

**Values read from scratchpad**

<table>
<thead>
<tr>
<th>Scratchpad variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.conference_call</td>
<td>A GlideRecord for a single conference call record. A call processed by this activity is added to this conference call. If this value is not specified, the <strong>join conference call</strong> activity will log an error. When initiating an outgoing call workflow using the Notify API call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall) method, this scratchpad value is set automatically to the conference call GlideRecord. For incoming call workflows, or workflows initiated using a different mechanism, you must explicitly set this scratchpad value.</td>
</tr>
</tbody>
</table>

### Enable different attributes available with Join Conference Call activity

System administrators can enable any or all of the below attributes and use them in the Join Conference Call workflow activity.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hangupOnStar</td>
<td>When hangupOnStar is enabled (set to true), participants in a conference call can press the * button to disconnect from the call. Control is returned to the workflow, which can be used to trigger customer-defined actions.</td>
</tr>
<tr>
<td>muted</td>
<td>When muted is enabled (set to true), the participant will join the conference in a muted state.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>beepOnEnter</td>
<td>When beepOnEnter is enabled (set to true), a notification beep is played when a user joins the conference.</td>
</tr>
<tr>
<td>beepOnExit</td>
<td>When beepOnExit is enabled (set to true), a notification beep is played when a user leaves the conference.</td>
</tr>
<tr>
<td>enableImmediateInput</td>
<td>When enableImmediateInput is enabled (set to true), it allows input of a single digit immediately after the conference ends for this user and sets that in workflow.scratchpad.confDigits. This option will be ignored if hangupOnStar is false.</td>
</tr>
</tbody>
</table>

To enable any of the above attributes, perform the following steps:

1. Navigate to Workflow > Administration > Workflow Versions.
2. Open the Notify: (Re)join Conference Call workflow.
3. Click the Show Workflow related link.
4. To modify the workflow, click the WorkFlow Actions icon and click Checkout.
5. Open the Join Conference Call workflow activity.
6. Enable the Advanced check box to display the Script field.
7. Set the hangupOnStar attribute to true in the config variable in the script. The default setting is false.
8. Click Update.
9. Click the WorkFlow Actions icon and click Publish to save the changes.

Similarly, you can enable the other attributes.

**Call workflow activity**

The Call activity makes outbound phone calls using a Notify workflow. This workflow activity can be added to any table.

**Input variables**

Input variables determine the initial behavior of the activity.

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify Number</td>
<td>The Notify phone number to make the call from. When you initiate a call, the outgoing call workflow for the number group associated with this number runs.</td>
</tr>
<tr>
<td>Phone number to call</td>
<td>The E.164-compliant phone number to call.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine number to call, and the Notify number to call from instead of using the Phone number to call and Notify Number variables.</td>
</tr>
</tbody>
</table>
**Variable** | **Description**
--- | ---
Script | Define a script that controls which number to call. This script should return a string listing the Notify number sys_id, as well as the phone number to call, such as `{notify_number: 'sys_id', phone_number: '+'316...'}`

**Conditions**

The conditions determine which transition comes after this activity. The call activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the call could not be set up due to invalid data returned by the advanced script.

**Send SMS workflow activity**

The send SMS workflow activity to send short text messages using Notify to users' phones. This workflow activity can be added to any table.

**Input variables**

Input variables determine the initial behavior of the activity.

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>Select the Notify phone number to use to send the SMS message.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use JavaScript to determine which numbers to send the message to, and the Notify number to use to send the message.</td>
</tr>
<tr>
<td>To</td>
<td>Select any number of users to send the message to. The user record must have a E.164-compliant phone number or notification device configured for SMS messages.</td>
</tr>
<tr>
<td>To (groups)</td>
<td>Select any number of groups to send the message to. All members of that group with an E.164-compliant phone number or SMS notification device receive the message.</td>
</tr>
<tr>
<td>Message</td>
<td>Enter the message to send. You can add field values from the current record by using the Select variables box. You can also add values from the workflow scratchpad. If a field and a scratchpad variable have the same name, the field value is used. Because you can use variables in this message, it is not possible to determine the length of the message at design time. If the activity sends a message that is longer than supported by the telephony provider, the message is truncated and the instance logs a warning.</td>
</tr>
</tbody>
</table>
### Variable

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To (script)</td>
<td>Enter a script to determine which numbers to send the message to, and the Notify number to use to send the message. The script should return a JavaScript object with the format `{notify_number: '...sys_id...', users: [...], groups: [...], numbers: [...]}. Specify the users or groups to send the message to as an array of sys_id values. Specify other numbers as an array of E.164-compliant phone numbers. This field appears only if Advanced is selected.</td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity. This activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the Notify number used to make the call is not configured correctly or unable to send SMS messages, or if an error occurs while sending the SMS.

### Forward call workflow activity

The **Forward Call** activity forwards a Notify call to an E.164-compliant phone number.

If the person receiving a forwarded call hangs up, the **forward call** activity completes and transitions to the next activity. Any further Notify activities in the workflow run for the caller only.

### Input variables

Input variables determine the initial behavior of the activity.

#### Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phone number to call</td>
<td>Enter the phone number to forward the call to.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be answered before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the conversation.</td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity. The **forward call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the phone number to call is invalid.
**Input workflow activity**

The **Input** activity creates a phone menu by presenting a list of options on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.

**Input Variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of digits</td>
<td>Specify the maximum number of digits the caller can enter. A caller can enter fewer digits than the maximum and press the <strong>Finish key</strong> to complete the entry.</td>
</tr>
<tr>
<td>Finish key</td>
<td>Specify the key a caller can press on their phone when finished selecting a menu option.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Specify the amount of time to wait before closing the menu automatically when the caller does not select a menu option.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to build the phone menu, instead of using the activity conditions.</td>
</tr>
</tbody>
</table>

**Script**

Define the script to build the phone menu. The script must specify an **answer** variable as a JavaScript object with the following format:

```javascript
answer = {
  1": {
    "say": "https://some_url.com/options/one.mp3",
    "myCustomData": "some data here"
  },
  "2": {
    "say": "type 2 to speak to a representative",
    "language": "en-US",
    "myCustomData": "some more data here"
  }
};
```

The script may specify either a text-to-speech string and language code or the URL of a prerecorded message for each entry. You can also add optional attributes to store related information, such as **myCustomData** in the example above.

**Conditions**

The conditions determine the transition that comes after this activity.
The **input** activity does not specify any conditions by default. You must define conditions to build the phone menu. Each condition is one option on the phone menu. Notify reads the text from each condition **Name** to the caller, up to 100 characters per condition.

You can specify a language for each condition by prefixing the message with the language code, in the format `xx-XX:<Message>`. For example, add `fr-CA:` for Canadian French. Available languages are stored on the Notify Language [notify_language] table.

The condition that the activity transitions through depends on the digits entered by the caller. Set the condition **Condition** value to `parseInt(workflow.scratchpad.digits) == <expected digits>`. For example, to transition through a condition when the caller presses the number 3, set the **Condition** to `parseInt(workflow.scratchpad.digits) == 3`.

You can add an error condition to this activity. The activity transitions through the error condition if the advanced script returns an invalid value, or if the text to say for a condition is empty.

### Scratchpad Entries

The activity uses the workflow scratchpad to write persistent values.

#### Values written to scratchpad

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.digits</td>
<td>The digits entered by the caller, as a string.</td>
</tr>
<tr>
<td>workflow.scratchpad.menu&lt;activity name&gt;</td>
<td>The entire <strong>answer</strong> variable, if using the advanced script option. You can access this menu from other activities after this activity successfully executes. For example, if the activity name is choices, you can access values from the menu using: var previousActivity = &quot;choices&quot;; var choicesMenu = workflow.scratchpad.menu[previousActivity]; var menuItem = choicesMenu[workflow.scratchpad.digits]; // Selects the menu item based on the caller's input. var selectedValue = menuItem.myCustomData; // get the custom data for the selected menu item.</td>
</tr>
</tbody>
</table>

### Hangup workflow activity

The **Hangup** activity disconnects an active Notify phone call.

You can use the **hangup** activity to disconnect only calls that have been answered. Use the **reject** activity to disconnect calls that have not been answered.

### Play workflow activity

The **Play** activity plays a sound file on a Notify call.

### Input Variables

Input variables determine the initial behavior of the activity.
Input Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the URL of a sound file to play. If the URL is inaccessible, or if the audio file mime type is not supported by the telephony provider, the play activity is skipped.</td>
</tr>
<tr>
<td>Loop</td>
<td>Enter the number of times the sound file should play.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity. The play activity does not specify any conditions by default.

You can create an error condition to handle errors with the sound file. The activity transitions through the error condition if the specified sound file is not available, or has an unsupported mime type. Supported mime types are listed on the Notify Audio MIME Types [notify_mime_type] table.

Record workflow activity

The Record workflow activity records audio from a user on a Notify call.

Note: The Record workflow activity records Notify call but not the Notify conference call.

Input Variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max duration (in seconds)</td>
<td>Enter the maximum duration, in seconds, allowed for a recording.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait before ending a recording automatically when the caller is silent.</td>
</tr>
<tr>
<td>Finish Key</td>
<td>Specify the key a caller can press on their phone to end the recording.</td>
</tr>
</tbody>
</table>

Scratchpad Entries

The activity uses the workflow scratchpad to store persistent values.

The record activity adds the recording variable to the workflow scratchpad. This variable stores metadata about the recording, such as URI, ID, and duration. You can access the following values from this variable.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recording.recordingDuration</td>
<td>The duration of the recording, in seconds.</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>recording.from_number</td>
<td>The caller's phone number, including country code.</td>
</tr>
<tr>
<td>recording.notify_number</td>
<td>The Notify phone number used to respond to the call, including country code.</td>
</tr>
<tr>
<td>recording.recordingID</td>
<td>The ID used by the telephony provider to identify the recording.</td>
</tr>
<tr>
<td>recording.recordingURL</td>
<td>The URL from the telephony provider to access the recording.</td>
</tr>
</tbody>
</table>

**Reject workflow**

The **Reject** workflow activity rejects an incoming Notify call.

You can use the **reject** activity to disconnect only calls that have not yet been answered. Use the **hang up** activity to disconnect calls that have been answered.

**Input variables**

Input variables determine the initial behavior of the activity.

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reason</td>
<td>Select a reason for rejecting the call, such as <strong>busy</strong>.</td>
</tr>
</tbody>
</table>

**Say workflow activity**

The **say** workflow activity allows you to play a message, using text to speech, on a Notify call.

**Input variables**

Input variables determine the initial behavior of the activity.

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text to say</td>
<td>Specify the text to read.</td>
</tr>
<tr>
<td>Language</td>
<td>Select the language and locale to use when reading text.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to define the language and message, instead of using the <strong>Text to say</strong> and <strong>Language</strong> values.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script to set what text is read on the call. The script must return a string that defines the language and the text to read. For example, to play an English-language message, return `{language: 'en-US', text: 'Text to read'}.</td>
</tr>
</tbody>
</table>
Forward to notify client workflow activity

The **forward to notify client** workflow activity connects a phone call to a Notify WebRTC client.

### Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Select the user to connect the call to.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine which client to connect to, instead of using the User variable.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which client to connect to. This script should return a GlideRecord for a single User [sys_user] record.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be connected before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the call.</td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity. The **Forward to Notify Client** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if there is an issue with the Notify client.

**Queue workflow activity**

The **Queue** activity places an active Notify call in a queue.

Add the **Queue** activity to a workflow on the Notify Call [notify_call] table to put the current call on hold. This activity does not specify any input variables.

The queue that the call is added to is given a random ID.

**Notify activity event handlers**

Notify workflow activities provide JavaScript functions that are invoked automatically when your telephony provider broadcasts certain events.

When the telephony provider broadcasts an event related to a Notify call, such as the caller hanging up, the event is processed by the workflow associated with that Notify call. All currently-executing Notify activities in that workflow invoke a JavaScript function associated with that event.

Not all activities that support an event provide a default event handler implementation. You can provide an implementation for those event handlers when creating custom Notify activities.

**Creating Notify activities**

Default Notify workflow generally performs a single action, such as initiating a phone call. You can create custom Notify workflow activities to implement more complex functionality.
Use event handler functions in each Notify activity definition to design your own activity behavior. For example, you can set the activity result if the caller hangs up by using the `onCompleted` function.

```javascript
onCompleted: function() {
  activity.result = 'call_ended';
},
```

When creating a new Notify workflow activity, follow these design principles.

- Within `onExecute` event handler function, create a new NotifyAction object. Use this object to create a simple or complex action, then serialize the object to the `notify_wf_activity` table.
- Within the `onUpdate` event handler function, deserialize the NotifyAction object from the `notify_wf_activity` table and use this object to perform any other operations.
- Use the other event handler functions and the Notify as needed to implement the desired activity behavior.

### Notify languages

Notify supports multiple languages when using text-to-speech.

For example, when using the `input` or `say` workflow activities, you can specify which language to use when reading the text.

The list of available languages is stored on the Notify Languages `[notify_language]` table. By default, languages supported by all Notify telephony providers are available. You can add additional languages if they are supported by your specific telephony provider.

### Available Notify activity event handlers

When creating Notify workflow activities, you can use event-handler functions to respond to events from a telephony provider.

Not all activities or telephony providers support all events. For example, the `Reject` activity ends the call before the caller connects so the `onNoAnswer` function is never invoked from this activity.

⚠️ **Note:** When configuring an activity to respond to an event, ensure that your telephony provider supports that event.

The following table describes available event handlers and lists the Notify workflow activities that can invoke each handler.

<table>
<thead>
<tr>
<th>Event handlers</th>
<th>Description</th>
<th>Activities</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>onExecute</code></td>
<td>Runs when the activity first runs.</td>
<td>All call-related activities</td>
</tr>
<tr>
<td><code>onUpdate</code></td>
<td>Runs when the call record associated with the workflow is updated.</td>
<td>All call-related activities</td>
</tr>
<tr>
<td><code>onCompleted</code></td>
<td>Runs when a call ends.</td>
<td>All call-related activities</td>
</tr>
<tr>
<td><code>onRinging</code></td>
<td>Runs when a call starts ringing.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
<tr>
<td><code>onInProgress</code></td>
<td>Runs when both parties are connected on a call.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
<tr>
<td><code>onNoAnswer</code></td>
<td>Runs when a call is not answered.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
</tbody>
</table>
### ServiceNow Madrid Now Platform capabilities

<table>
<thead>
<tr>
<th>Handler</th>
<th>Description</th>
<th>Activities</th>
</tr>
</thead>
<tbody>
<tr>
<td>onBusy</td>
<td>Runs when a called number is busy.</td>
<td>Forward call, call, join conference call, forward to notify client</td>

<tr>
<td>onFailed</td>
<td>Runs when an error occurs.</td>
<td>All call-related activities</td>
</tr>
</tbody>
</table>

**Components installed with Notify**

Several types of components are installed with the Notify application.

**Roles installed with Notify**

Notify adds the following roles.

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
</table>
| Notify administrator [notify_admin] | Administrator with privileges for Notify 2 functionality. | • workflow_admin  
• workflow_creator  
• workflow_publisher |
| Notify viewer [notify_view] | Can view notify content. This role has read-only access to the Notify Conference Calls table [notify_conference_call] and the Notify Conference Call Participants table [notify_participant]. The itil role inherits the notify_view role when the Incident Communications Management and the Notify plugins are activated. | |

**Tables installed with Notify**

Notify adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify Conference Calls [notify_conference_call]</td>
<td>A list of conference calls started using Notify</td>
</tr>
<tr>
<td>Notify Calls [notify_call]</td>
<td>A list of calls started using Notify</td>
</tr>
<tr>
<td>Notify Call Queue [notify_queue]</td>
<td>A list of calls that are in queue</td>
</tr>
<tr>
<td>Notify Call Status [notify_call_status]</td>
<td>List of possible statuses of calls, such as: initiated, ringing, etc.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Notify Client Connected Sessions [notify_client_session]</td>
<td>List of the connected sessions</td>
</tr>
<tr>
<td>Notify Conference Call Participants [notify_participant]</td>
<td>List of the participants in a conference call</td>
</tr>
<tr>
<td>Notify Conference Call Participant Sessions [notify_participant_session]</td>
<td>List of the associations of a call record and Notify participant record</td>
</tr>
<tr>
<td>Notify Messages [notify_message]</td>
<td>List of messages sent from/to Notify</td>
</tr>
<tr>
<td>Notify Phone Numbers [notify_number]</td>
<td>List of phone numbers used by Notify to make calls and send messages</td>
</tr>
<tr>
<td>Notify Phone Number Groups [notify_group]</td>
<td>List of phone number groups used by Notify to make calls and send messages</td>
</tr>
<tr>
<td>Notify Languages [notify_language]</td>
<td>List of the languages that Notify supports when using text-to-speech workflow activities.</td>
</tr>
<tr>
<td>Notify Recordings [notify_recording]</td>
<td>List of conference call recordings</td>
</tr>
<tr>
<td>Notify Workflow Activity [notify_wf_activity]</td>
<td>List of Notify workflow activities</td>
</tr>
<tr>
<td>Notify Audio MIME Types [notify_mime_type]</td>
<td>List of audio file formats</td>
</tr>
<tr>
<td>Temporary Serialized Notify Action Cache [notify_action]</td>
<td>List of serialized Notify actions waiting to be processed</td>
</tr>
<tr>
<td>Notify SMS Template [notify_sms_template]</td>
<td>Contains the templates which are used while sending a Notify SMS.</td>
</tr>
</tbody>
</table>
### Notify call sequence

### Properties installed with Notify

Notify adds the following properties.

**Properties for Notify**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn_twilio_driver.max_conference_participants</td>
<td>Twilio maximum limit for number of participants in the conference call.</td>
</tr>
<tr>
<td>com.snc.iam.notify_number</td>
<td>The Notify number to use for conference calls.</td>
</tr>
</tbody>
</table>

*Note:* This number must have a group configured with conference call workflows.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.notify.task.phone_number</td>
<td>Notify phone number used for sending SMS-s and starting conference calls from any record that belongs to the task table (or a table that extends the task table). The number must be entered in E.164-compliant format.</td>
</tr>
<tr>
<td>glide.notify.sms.max_concatenation</td>
<td>The maximum number of concatenated messages that can be sent to a receiver's mobile phone.</td>
</tr>
</tbody>
</table>

**Business rules installed with Notify**

Notify adds the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No Call Workflows for Shortcodes</td>
<td>[notify_group]</td>
<td>Checks and displays an error if the call is being triggered by a short code.</td>
</tr>
<tr>
<td>Trigger conference end</td>
<td>[notify_conference_call]</td>
<td>When a conference call ends, triggers the notify.conference.end event</td>
</tr>
<tr>
<td>Update Call Active State</td>
<td>[notify_call_status]</td>
<td>Updates the status of the call in notify_call_status with the status received from Twilio.</td>
</tr>
<tr>
<td>Update Conference Call Active State</td>
<td>[notify_participant]</td>
<td>Updates the active flag in notify_participant table. Also calculates the duration when the call is ended by a participant.</td>
</tr>
<tr>
<td>Update Participant Active State</td>
<td>[notify_participant_session]</td>
<td>Updates the active flag for the participant (notify_participant), and calculates the total time on the call upon disconnecting from the call.</td>
</tr>
<tr>
<td>Update Participant Session Active State</td>
<td>[notify_call]</td>
<td>Synchronizes the state of the call between notify_call and notify_participant_session. Upon disconnecting from the call, updates notify_participant_session with the duration of the call.</td>
</tr>
<tr>
<td>Warn for incorrectly configured workflow</td>
<td>[notify_group]</td>
<td>Checks notify_group table and displays an error if the a workflow is not configured correctly</td>
</tr>
</tbody>
</table>

**Orchestration**

ServiceNow® Orchestration extends the workflow engine to manage processes and to automate things outside of a ServiceNow instance.

Orchestration is available as a separate subscription from the rest of the ServiceNow platform. See *Activate Orchestration* for details.

**Explore**
- Introduction to Orchestration
- Orchestration applications

**Set up**
- Activate Orchestration
- MID Servers for Orchestration

**Administer**
- List of Orchestration plugins
Introduction to Orchestration

Orchestration automates simple or complex multi-system tasks on remote services, servers, applications, and hardware.

An Orchestration process can cross all management disciplines and interact with hosted services and all types of infrastructure elements. These capabilities provide a powerful system for managing IT and Business processes quickly and reliably.

Orchestrated solutions aide collaboration among teams by providing reusable data and versioning for both the workflows and the activities within them. Subject matter experts can create activities that are reusable to numerous workflow developers. When an activity requires a change, developers can see the downstream implication of the change immediately by knowing which workflows use the activity. Well-designed orchestrations never fail and apply human tasks to address errors as they arise.

Orchestration tools

Orchestration can make calls outside of a ServiceNow instance, directly to web services or through a MID Server to systems within corporate firewall. Orchestration also enables the creation reusable activities that wrapper Java Script functions for manipulating things inside the platform. Orchestration extends the Workflow editor by providing these features:

- **Activity packs** containing ready-to-use activities.
- **Activity Designer**, which enables developers to create custom activities without an over dependence to create scripts to orchestrate to third-party systems.
- Ability to create activity packs using **Scoped Applications**.
- A **Databus** for following the flow of data across orchestration activities.

Orchestration Core provides entitlements to use specific applications:

**Client Software Distribution**

An application that automates software delivery from the Service Catalog. Provides OOB support for SCCM. Partner solutions support Macs using JAMF. Other third-party solutions provide support through the extension framework.

**Password Reset**

An application for users to reset their password in Active Directory. It can expand to communicate with other third-party systems.

**Orchestration ROI**
Enables users to evaluate estimated costs and actual costs for tasks, automate these tasks, and track the ROI of these tasks.

**Systems that Orchestration can automate**

Orchestration can automate tasks such as employee onboarding, user access rights, server management, managed file transfers, and *Security Operations Orchestration activities*. For example, you might use the Active Directory and Exchange activities provided in the base Orchestration system to set up network accounts and mailboxes for new employees.

If Orchestration does not provide the activities you need for an integration, create the necessary activities using the templates in the *Orchestration Activity Designer*. The external systems that Orchestration can automate for:

- Any system exposing web services (*SOAP, REST*)
- Any system accessible from the command line (such as a UNIX system accessible through *SSH*, a Windows system enabled for *PowerShell* remoting or WMI)
- Numerous proprietary services: Windows *Active Directory*, Microsoft *Exchange* mail servers, *InfoBlox*, and *F5 Networks*.

**Note:** For a full list of Activity Pack service offerings, see *Orchestration Core Activity Packs*.

- Any filesystem accessible by *SFTP*
- Any database with a compliant *JDBC* driver
- Additional Activity Packs are also available with other ServiceNow products, such as Security Operations
Orchestration capabilities
Orchestration workflow

When an Orchestration activity starts within a workflow, Orchestration launches a probe and writes a probe record to the ECC Queue. The workflow pauses as the MID Server picks up the request and executes the probe. When the probe reports back, the workflow resumes as the results are analyzed. The workflow can exit or continue at this point.

Orchestration video tutorial

Watch the introductory video for Orchestration.

Domain separation in Orchestration

This is an overview of domain separation and Orchestration. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Data only

Domain separation in this application is supported at the Data only level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see Application support for domain separation.

Activate Orchestration

The Orchestration (com.snc.runbook_automation) plugin is available as a separate subscription from the rest of the ServiceNow platform.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

Role required: none

1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click Request Plugin to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time</td>
<td>The date and time must be at least two business days from the current time</td>
</tr>
<tr>
<td></td>
<td>Note: Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.</td>
</tr>
</tbody>
</table>

| Reason/Comments | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments. |

5. Click Submit.

List of Orchestration plugins

This table lists all plugins available for Orchestration and their dependencies. These Orchestration plugins are available for purchase or can be requested as part of your Orchestration subscription. Contact your account representative for details.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Dependencies</th>
</tr>
</thead>
</table>
| Orchestration [com.snc.runbook_automation] | Main plugin for the Orchestration feature. This plugin extends Workflow to automate operations with external systems. Use this plugin to orchestrate business services, applications, and infrastructure. This plugin automates operations such as deployments, configurations, and information gathering. Orchestration can automate Web Services and uses MID Servers to execute commands on devices inside an enterprise’s network. | • Orchestration - ROI  
• Orchestration - Runtime |
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Dependencies</th>
</tr>
</thead>
<tbody>
<tr>
<td>Orchestration - Active Directory [com.snc.orchestration.ad]</td>
<td>Installs the Active Directory activity pack. These activities create, delete, and manage objects in Windows Active Directory.</td>
<td>Orchestration</td>
</tr>
<tr>
<td>Orchestration - Asset Lease Management [com.snc.orchestration.asset_lease_management]</td>
<td>Provides the software lease functionality for Client Software Distribution. Allows users to select the start and end dates of software leases and to request an extension of a lease. <strong>Note:</strong> This plugin is not automatically enabled when Orchestration is active.</td>
<td>None</td>
</tr>
<tr>
<td>Orchestration - Azure Active Directory [com.snc.orchestration.azure.ad]</td>
<td>Installs the Azure AD activity pack. These activities automate employee onboarding and offboarding functions on Azure Active Directory and manage Office 365 licensing.</td>
<td>Orchestration</td>
</tr>
<tr>

<td>Orchestration - System Center Configuration Manager</td>
<td>Installs the System Center Configuration Manager (SCCM) activity pack. These activities manage software deployments and collections on an SCCM server.</td>
<td>Orchestration</td>
</tr>
</tbody>
</table>

**Orchestration Runtime plugin**

The Orchestration – Runtime plugin enables other applications on the ServiceNow® platform to automate tasks, without requiring an Orchestration subscription.

The Orchestration – Runtime plugin can be activated as part of another plugin or application. It is used by strategic technology partners and ServiceNow applications to distribute activity packs to customers who may not own Orchestration. For example, the Security Incident Response Management (SIRM) application provides orchestration content, which includes activities that are available from the Packs tab in the Workflow Editor. Customers who purchase SIRM can consume and modify the activities that SIRM ships without having to purchase an Orchestration license.

**Included with the plugin**

The Orchestration – Runtime plugin provides access to the Packs and Data tabs in the Workflow Editor. This plugin gives users access to custom activities for their applications and enables them to reuse data from the Databus. This plugin does not provide access to custom Orchestration activity packs or to the activity designer. The Custom tab in the Workflow Editor is not available without an Orchestration subscription.
Orchestration plugin relationships

Dependencies

The Orchestration – Runtime plugin activates these application plugins:

- Security Incident Response Orchestration
- Service Release Automation

Access to activities

Custom activities shipped with ServiceNow® applications are available in the Packs tab of the Workflow Editor for use in workflows. To edit these activities, navigate to Orchestration > Activity Designer Activities and select the activity you want to modify. For information about the provider templates used to create these activities, see Orchestration custom activity templates.
List of Orchestration activities

Use Orchestration activities in a Workflow to integrate with third-party systems.

Several Orchestration activities have been rewritten as scoped activities using the activity designer and grouped into activity packs. Other non-scoped activities are deprecated and may or may not appear in the Workflow Editor. However, all deprecated activities still function in existing workflows that use them.

Global activities

These activities run in the global scope only. Any activities you create in the global scope are organized in the Global category in the Packs and Custom tabs in the Workflow Editor.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test Server Alive</td>
<td>Runs a command (including shell scripts) on a Linux or UNIX computer via SSH to validate whether the target system is alive.</td>
</tr>
</tbody>
</table>

Active Directory (AD) activities

All AD Orchestration activities were rewritten in the Geneva release as scoped activities and are available in the Active Directory activity pack. All previous version AD activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create AD Object</td>
<td>Creates a user account in Windows Active Directory when a user account is created in a ServiceNow instance.</td>
</tr>
<tr>
<td>Disable AD User Account</td>
<td>Marks a Windows Active Directory user account disabled, making it inactive.</td>
</tr>
<tr>
<td>Enable AD User Account</td>
<td>Enables a Windows Active Directory user account, making it active.</td>
</tr>
<tr>
<td>Query AD</td>
<td>Retrieves entries from the Windows Active Directory based on a search filter.</td>
</tr>
<tr>
<td>Remove AD Object</td>
<td>Deletes a user account from Windows Active Directory.</td>
</tr>
<tr>
<td>Reset AD User Password</td>
<td>Resets the password of a user account in Windows Active Directory.</td>
</tr>
<tr>
<td>Change AD User Password</td>
<td>Changes the password of a user account in Windows Active Directory.</td>

<tr>
<td>Update AD Object</td>
<td>Updates a user account in Windows Active Directory.</td>
</tr>
<tr>
<td>Is AD Account Locked</td>
<td>Determines if an Active Directory user account is locked.</td>
</tr>
<tr>
<td>Unlock AD Account</td>
<td>Unlocks a locked Active Directory user account.</td>
</tr>
</tbody>
</table>

Azure AD

All these activities are scoped and part of the Azure AD activity pack. They do not have legacy versions.
<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add User to Group</td>
<td>Adds a user to an existing security group in Azure Active Directory.</td>
</tr>
<tr>
<td>Assign User License</td>
<td>Assigns an extra Office 365 software license to the named user.</td>
</tr>
<tr>
<td>Create User</td>
<td>Creates a user for the Azure Active Directory tenant.</td>
</tr>
<tr>
<td>Delete User</td>
<td>Deletes the named user's account from the Azure Active Directory tenant.</td>
</tr>
<tr>
<td>Get User Info</td>
<td>Returns the named user's information from the Azure Active Directory.</td>
</tr>
<tr>
<td>Remove User from Group</td>
<td>Removes an existing user from a security group in Azure Active Directory.</td>
</tr>
<tr>
<td>Remove User License</td>
<td>Revokes the specified Office 365 software license for the named user.</td>
</tr>
<tr>
<td>Reset User Password</td>
<td>Changes the named user's Azure Active Directory password.</td>
</tr>
</tbody>
</table>

**F5 Network Management activities**

All these activities are scoped and part of the F5 Network Management activity pack. They do not have legacy versions.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add F5 Pool</td>
<td>Creates the load balancer pool.</td>
</tr>
<tr>
<td>Check F5 Pool</td>
<td>Checks the status of a pool to validate whether it is available to accept traffic.</td>

<td>Deletes IP reservations in DHCP using either an IPv4 or IPv6 address range.</td>
</tr>
<tr>
<td>DHCP List IP Reservations</td>
<td>Generates a list of all the DHCP range reservations on a specific Infoblox server.</td>
</tr>
<tr>
<td>List DNS C-records</td>
<td>Retrieves all canonical (CNAME) records from a specified Infoblox server.</td>
</tr>
<tr>
<td>Register DNS A-record</td>
<td>Creates a DNS A record on a specified Infoblox server.</td>
</tr>
<tr>
<td>Register DNS C-Record</td>
<td>Creates a DNS canonical (CNAME) record on a specified Infoblox server.</td>
</tr>
<tr>
<td>List DNS Record</td>
<td>Generates a list of all the DNS entries on a specific Infoblox server.</td>
</tr>
<tr>
<td>DNS Delete</td>
<td>Deletes DNS records of any type from in Infoblox server, such as C and A records.</td>
</tr>
<tr>
<td>IPAM Register IP Address</td>
<td>Registers an IP address in a network using Infoblox IPAM.</td>
</tr>
<tr>
<td>IPAM Reserve IP Address</td>
<td>Reserves an IP address in a network using Infoblox IPAM.</td>
</tr>
<tr>
<td>IPAM List IP Reservations</td>
<td>Returns an array of all IP Address within the named Infoblox Server.</td>
</tr>
<tr>
<td>IPAM Delete</td>
<td>Deletes an IP Address within a named Infoblox server.</td>
</tr>
<tr>
<td>Create Network</td>
<td>Creates networks on a specified Infoblox server.</td>
</tr>
<tr>
<td>Get Network Details</td>
<td>Retrieves the information about a specific network on an Infoblox server.</td>
</tr>
<tr>
<td>Delete Network</td>
<td>Deletes a network from an Infoblox server.</td>
</tr>
<tr>
<td>List Registered Networks</td>
<td>Retrieves all the networks associated with an Infoblox server.</td>
</tr>
</tbody>
</table>

**Microsoft Exchange activities**

All Exchange Orchestration activities were rewritten in the Geneva release as scoped activities and are available in the Exchange activity pack. All previous version Exchange activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Address List</td>
<td>Creates an address list that acts as an alias for emailing all users in the group. This alias cannot be used to manage user permissions.</td>
</tr>
<tr>
<td>Delete Address List</td>
<td>Removes an existing address list from an Exchange server.</td>
</tr>
<tr>
<td>Get Address List</td>
<td>Retrieves all attributes from the specified Exchange address list.</td>
</tr>
<tr>
<td>Move Address List</td>
<td>Moves an Exchange address list to another location in the address hierarchy.</td>
</tr>
<tr>
<td>Set Address List</td>
<td>Modifies an Exchange address list.</td>
</tr>
</tbody>
</table>
### ServiceNow Madrid Now Platform capabilities

<table>

<tr>
<td>Disable Mailbox</td>
<td>Disables the mailbox associated with a specified Active Directory account.</td>
</tr>
<tr>
<td>Enable Mailbox</td>
<td>Creates a mailbox for an existing Active Directory user.</td>
</tr>
<tr>
<td>Get Mailbox</td>
<td>Gets the mailbox for the specified user or all mailboxes on an Exchange server.</td>
</tr>
<tr>
<td>Set Mailbox</td>
<td>Modifies the settings of an existing Exchange mailbox.</td>
</tr>
</tbody>
</table>

**PowerShell activities**

These PowerShell activities were rewritten as scoped activities and are available in the PowerShell activity pack. All previous version PowerShell activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Install Windows App</td>
<td>Installs an application on a Windows target machine.</td>
</tr>
<tr>
<td>Join Domain</td>
<td>Joins a Windows machine to a domain.</td>
</tr>
<tr>
<td>Uninstall Windows App</td>
<td>Uninstalls an application from a Windows target machine.</td>
</tr>
<tr>
<td>Change Service State</td>
<td>Starts or stops a Windows service on a remote system.</td>
</tr>
</tbody>
</table>

**Probe activities**

These probe activities were rewritten as scoped activities and are available in the Probe activity pack. All previous versions of these activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resolve DNS Name</td>
<td>Resolves an IP address or a fully qualified domain name (FQDN) into one or more IP addresses.</td>
</tr>
<tr>
<td>SNMP Query</td>
<td>Queries an SNMP device.</td>
</tr>
</tbody>
</table>

**SCCM activities**

All these activities are scoped and part of the SCCM activity pack. They do not have legacy versions.
<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add to Device Collection</td>
<td>Adds a device to a Microsoft System Center Configuration Manager (SCCM) device collection.</td>
</tr>
<tr>
<td>Add to User Collection</td>
<td>Adds a user to a Microsoft System Center Configuration Manager (SCCM) user collection.</td>
</tr>
<tr>
<td>Get Applications</td>
<td>Returns a list of all the applications available on a Microsoft System Center Configuration Manager (SCCM) server.</td>
</tr>
<tr>
<td>Get Deployments</td>
<td>Returns the list of deployments performed by Orchestration using a Microsoft System Center Configuration Manager (SCCM) server.</td>
</tr>
<tr>
<td>Get Device Collections</td>
<td>Returns the list of available device collections on a Microsoft System Center Configuration Manager (SCCM) host.</td>
</tr>
<tr>
<td>Get User Collections</td>
<td>Returns the list of available user collections on a Microsoft System Center Configuration Manager (SCCM) host.</td>
</tr>
<tr>
<td>Remove from Device Collection</td>
<td>Removes a device from a Microsoft System Center Configuration Manager (SCCM) device collection.</td>
</tr>
<tr>
<td>Remove from User Collection</td>
<td>Removes a user from a Microsoft System Center Configuration Manager (SCCM) user collection.</td>
</tr>
</tbody>
</table>

**SSH activities**

These SSH activities were rewritten as scoped activities and are available in the SSH activity pack. The SSH activities not converted to scoped activities were moved to the Orchestration - Deprecated category, but are still available for all workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Copy</td>
<td>Copies a file on a Linux or Unix computer, via SSH.</td>
</tr>
<tr>
<td>File Read</td>
<td>Reads a file on a Linux or Unix computer, via SSH.</td>
</tr>
<tr>
<td>File Write</td>
<td>Writes a file on a Linux or UNIX computer.</td>
</tr>
<tr>
<td>File Replace String</td>
<td>Finds and replaces a string in a file on a Linux or UNIX computer.</td>
</tr>
<tr>
<td>Files Compare</td>
<td>Compares two files on a Linux or Unix computer, via SSH.</td>
</tr>
<tr>
<td>Reset Linux User Password</td>
<td>Resets the password for a given user on a Linux computer.</td>
</tr>
</tbody>
</table>
### Secure Copy
Copies a file from one host to another, without storing the copied file on the MID Server.

### SFTP activities
All these activities are scoped and part of the SFTP File Transfer activity pack. They do not have legacy versions.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copy File</td>
<td>Copies a file from an SFTP server (source host) to another SFTP server (target host).</td>
</tr>
<tr>
<td>Create Directory</td>
<td>Creates a directory on an SFTP server.</td>
</tr>
<tr>
<td>Get File List</td>
<td>Returns a list of files from a given directory and its subdirectories on an SFTP server (source host).</td>
</tr>
<tr>
<td>Remove File or Directory</td>
<td>Removes a file or a directory on an SFTP server, including subdirectories, when configured.</td>
</tr>
<tr>
<td>Rename File or Directory</td>
<td>Renames a file or directory to a new name on an SFTP server.</td>
</tr>
<tr>
<td>Set File Attributes</td>
<td>Sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.</td>
</tr>
</tbody>
</table>

### Deprecated activities
These activities have been removed from the Workflow Editor and are not available for new workflows, but continue to work normally in existing workflows. You can reactivate the deprecated activity or duplicate the functionality of a deprecated activity as a scoped activity by recreating it using the activity designer.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run Probe</td>
<td>Launches a MID Server probe on behalf of a document.</td>
</tr>
<tr>
<td>SOAP Request</td>
<td>Executes a SOAP request on a target server. The SOAP Message activity replaces this activity.</td>
</tr>
<tr>
<td>Run Command</td>
<td>Runs a command (including shell scripts) on a Linux or UNIX computer.</td>
</tr>
<tr>
<td>Run SCP</td>
<td>Uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides. The Secure Copy activity replaces the Run SCP activity.</td>
</tr>
<tr>
<td>Run Powershell</td>
<td>Executes Windows PowerShell commands on a MID Server.</td>
</tr>
</tbody>
</table>

### Available activity packs
Activity packs are available with your subscription to Orchestration.

Role required: admin

The following activity packs are available and active with your Orchestration subscription:

- **Orchestration - Active Directory** (com.snc.orchestration.ad)
• **Orchestration - Azure Active Directory** (com.snc.orchestration.azure.ad)
• **Orchestration - Exchange** (com.snc.orchestration.exchange)
• **Orchestration - SFTP** (com.snc.orchestration.sftp)
• **Orchestration - Infoblox DDI Activity Pack** (com.snc.orchestration.infoblox)
• **F5 Network Management activity pack** (com.snc.orchestration.f5)
• **Orchestration - SSH** (com.snc.orchestration.ssh)
• **Orchestration - PowerShell** (com.snc.orchestration.powershell)
• **Orchestration - System Center Configuration Manager** (com.snc.orchestration.sccm_mgnt)

1. Navigate to **System Applications > All Available Applications > All**.
2. On the All Applications page, click **Request Plugin** to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

| Reason/Comments | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments. |

5. Click Submit.

**Deprecated Orchestration activities**

These Orchestration activities have been deprecated.

**Run Probe**

The Run Probe activity launches a MID Server probe on behalf of a document. All Orchestration activities that launch a probe on a target machine are based on the Run Probe activity. Your ServiceNow instance must have access to a MID Server configured to use SSH to run this activity.

**Attention:** This activity is deprecated and is unavailable for new workflows. To replace the functionality of this probe, use the `Probe activity template` to create a custom activity. Workflows from a previous release that use the Run Probe activity can continue to do so.
Run Probe input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Probe</td>
<td>Select a MID Server probe from the list. This is the name of the probe as it appears in the discovery_probes table.</td>
</tr>
<tr>
<td>Source for probe</td>
<td>Enter the IP address of the host system against which the probe runs (the probe's target).</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called output. Any error from the probe is contained in a variable called error.</td>
</tr>
</tbody>
</table>

SOAP Request

The SOAP Request activity executes a SOAP request on a target server.

**Attention:** This activity is deprecated and is replaced by the SOAP Message workflow activity. Workflows from a previous release that use the SOAP Request activity can continue to do so. However, this activity is not available for new workflows.

SOAP Request input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP URL</td>
<td>The SOAP endpoint.</td>
</tr>
<tr>
<td>Username</td>
<td>User name for basic authentication credentials.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for basic authentication credentials.</td>
</tr>
<tr>
<td>Envelope Script</td>
<td>Script for setting up parameters for the web service.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>The script to execute after the request has been made and a response has been received.</td>
</tr>
</tbody>
</table>

Reactivate a deprecated activity

Orchestration activities that were converted to activity packs are deprecated for upgraded and new instances but can be reactivated for use in new workflows.

Role required: workflow_admin, admin

**Note:** Reactivation of deprecated activities for use in new workflows is discouraged. Legacy activities cannot use the unique features of the scoped applications, such as reuse of data from the databus and input variable testing.

1. Navigate to **Workflow > Administration > Activity Definitions**.
2. In the list of activities, clear the condition **Category != deprecated** from the filter.
3. Open the definition record for the activity you want to reactivate.
4. Select the What to Display tab.
5. In the Category field, replace the value deprecated with another category.
   This can be an arbitrary string.
6. Click Update.
   The system creates a new category using the value provided and reactivates the activity, which becomes available in the Core tab of the Workflow Editor.

SOAP Message workflow activity

The SOAP Message activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.

Your instance must have access to a MID Server configured to use SOAP.

Input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP Message</td>
<td>soap_message</td>
<td>The SOAP Message defined under the System Web Services plugin's Outbound SOAP Message [sys_soap_message] table. (System Web Services &gt; Outbound &gt; SOAP Message)</td>
</tr>
<tr>
<td>SOAP Message Function</td>
<td>soap_message_function</td>
<td>The function to call that is defined in the SOAP Message. Functions are listed in the SOAP Message Functions related list in each SOAP Message record.</td>
</tr>
<tr>
<td>SOAP Endpoint</td>
<td>soap_endpoint</td>
<td>Endpoint to use instead of the SOAP endpoint value in the SOAP Message Function record. Leave this field blank to use the defined endpoint in the SOAP Message Function record.</td>
</tr>
<tr>
<td>Field</td>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Variables</td>
<td>variables</td>
<td>Variables to substitute into the SOAP Envelope defined in the SOAP Message Function record. Use this format for the string: name1=value1, name2=value2, ...</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If either the name or value contains a comma or equal sign, escape these characters with a backslash.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>use_midserver</td>
<td>Check box for using a MID Server to send the SOAP message. A MID Server might be necessary to reach an endpoint within a firewall or a sub-network that is not visible from the instance. If this check box is selected (true), but no MID Server is defined in the MID Server field, workflow automatically attempts to find a MID Server.</td>
</tr>
<tr>
<td>MID Server</td>
<td>midserver</td>
<td>Name of the MID Server to use. This field appears when you select the Use MID Server check box. The workflow ignores this parameter if the use_midserver parameter is disabled.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>sensor_script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full XML response body from the activity.output object.</td>
</tr>
</tbody>
</table>

**Probes used by Orchestration**

Certain probes, controlled by MID Servers, perform Orchestration tasks on remote computers, such as restarting a server or creating virtual machines from templates.

**How Orchestration probes work**

When a Workflow executes an Orchestration activity, that activity launches a probe, which writes an output record to the ECC Queue. The MID Server selected for the activity checks the ECC Queue for assignments, and then executes
the appropriate probe to do the work on the target machine. The information about the activity (machine restarted, files copied, etc.) that is returned from the target machine by the probe is written to the ECC Queue as an input record. This information is then sent from the ECC Queue to a sensor that is built into the Workflow activity. The Workflow is updated, and the next activity is executed.

**Note:** The probe parameters are set by the activities that launch the probe.

How Orchestration uses probes

### Probe List

The base system includes the following Orchestration probes ([Orchestration > Definition > Probes](#)).

<table>
<thead>
<tr>
<th>Probe Name</th>
<th>ECC Queue Topic</th>
<th>ECC Queue Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>Command</td>
<td>Command</td>
<td>A probe that runs a local command on the MID server.</td>
</tr>
<tr>
<td>DNS Name Resolver</td>
<td>DNSNameResolver</td>
<td>DNSNameResolver</td>
<td>A probe that resolves a fully qualified domain name (FQDN) into an IP address.</td>
</tr>
<tr>
<td>SCPCommand</td>
<td>SCPCommand</td>
<td>SCPCommand</td>
<td>A probe that copies files securely from one machine to another. The copy function is performed using the MID Server as a tunnel.</td>
</tr>
<tr>
<td>Shazzam</td>
<td>Shazzam</td>
<td>Shazzam</td>
<td>A probe that identifies active devices.</td>
</tr>
<tr>
<td>SNMPProbe</td>
<td>SNMP</td>
<td>SNMP Query</td>
<td>This is a generic SNMP probe.</td>
</tr>
<tr>
<td>SOAPProbe</td>
<td>SOAPProbe</td>
<td>SOAPProbe</td>
<td>A probe that sends a SOAP request to target machine.</td>
</tr>
<tr>
<td>Probe Name</td>
<td>ECC Queue Topic</td>
<td>ECC Queue Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>----------------</td>
<td>----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SSHCommand</td>
<td>SSHCommand</td>
<td></td>
<td>A probe that executes shell scripts from a command line after logging in to a target machine via SSH.</td>
</tr>
<tr>
<td>SSHCommandLong</td>
<td>SSHCommandLong</td>
<td></td>
<td>A probe that executes long running shell scripts from a command line after logging in to a target machine via SSH.</td>
</tr>
<tr>
<td>VMWare</td>
<td>VMWareProbe</td>
<td></td>
<td>A generic VMware probe that executes the MID Server script include in the ECC queue name that is set by a VMware Orchestration activity. This probe can run any MID Server script include.</td>
</tr>
</tbody>
</table>
| Windows - PowerShell | PowerShell    | Windows - PowerShell | A probe that runs a Windows PowerShell script on the MID Server. The PowerShell script is provided as the value of a parameter with name ending in .ps1. Two variables are available to the script:  
  - $computer: The computer pointed to as the source for this probe  
  - $cred: A PowerShell credential, using a user name and password from the Credentials table, that logs into $computer successfully. |

**PowerShell activities**

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

PowerShell must be installed on any MID Server that uses these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

The ServiceNow Orchestration plugin adds these basic PowerShell activities to workflows. For instructions on using activities from the PowerShell activity pack, see [PowerShell activity pack](#).

*Legacy Run PowerShell activity*

The Run PowerShell activity executes Windows PowerShell commands on a MID Server.
Attention: This activity is deprecated and is unavailable for new workflows. To replace the functionality of this activity, use the PowerShell activity template to create a custom, scoped activity. Workflows from a previous release that use the Run PowerShell activity can continue to do so.

Result Values

The workflow designer can assign a result value using activity.result from within a script field of the activity. By default, the success or failure of the PowerShell commands used determines the result value of the Run PowerShell activity. Possible result values are:

- Success
- Failure

Scratchpad Entries

Information written to stdout by the executing script is captured and returned to the activity in the activity.output variable. This information can be parsed, processed, or saved (to a scratchpad variable, for example) for future processing in the activity’s sensor script.

An example would be to run the get-date command to get the MID Server’s current time. This sensor script saves the full output received, but we can process it to return and save only the time.

```
$mid_server = Get-Location
$mid_server = Join-Path $mid_server Path 'get-date'
$mid_server
```

PowerShell activity

Note: This is an over-simplified example. In most cases, the script operates against some remote Windows computer. However, the principal is the same – whatever is written to stdout is returned in activity.output and available to process.
Input Variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>IP address of the target Windows machine. This value is mapped to the $computer variable for use in commands (see the example in the Command field). A PowerShell credential variable called $cred that is based on information in the ServiceNow Credentials table will authenticate on the computer pointed to by Hostname.</td>
</tr>
<tr>
<td>Command</td>
<td>Enter the PowerShell command to run. For example, to execute a simple WMI query against a remote machine pointed to by the hostname variable, the command is: get-wmiobject &lt;class&gt; -computer $computer -credential $cred If no credentials authenticate on the computer, the command runs in the context of the MID Server user. You cannot run both a command and a script file. Specifying a command hides the Script file variable.</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called output. Any error from the probe is contained in a variable called error.</td>
</tr>
<tr>
<td>Script file</td>
<td>The MID Server script file to run. You cannot run both a script file and a command. Selecting a script file hides the Command variable.</td>
</tr>
<tr>
<td>PowerShell script variables</td>
<td>Additional parameters, in JSON format, used by the specified script file.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was cancelled.</td>
</tr>
</tbody>
</table>
Add workflow variables for the command line using the normal workflow variable syntax. In the example above, if the `<class>` was in a workflow input variable called `myclass`, the command would look like:

```powershell
get-wmiobject \{workflow. inputs. myclass \} -computer $computer -credential $cred
```

Similarly, if the variable is a scratchpad variable named `myclass`, the command would look like:

```powershell
get-wmiobject \{workflow. scratchpad. myclass \} -computer $computer -credential $cred
```

**HResult codes**

When a PowerShell script encounters an error, the Windows machine may return an HResult code as part of the error message.

PowerShell activities can read and interpret this code. Not all PowerShell errors include an HResult code. In the event of a failed PowerShell script, you can use the HResult code to move the workflow through a specific condition.

For example, when resetting an Active Directory password to a password that does not meet policy requirements, such as minimum length or complexity, the PowerShell script returns the HResult code `-2146022651`. To use this code, create an activity condition with the **Condition** value of `activity.hresult = -2146022651`. If the PowerShell script returns this code when the activity runs, the workflow transitions through this new condition.

**SSH activities**

SSH activities allow workflows to perform operations on Linux and Unix computers.

Your ServiceNow instance must have access to a MID Server configured to use SSH to run these Orchestration activities.

**Run Command activity**

The **Run Command** activity runs a command (including shell scripts) on a Linux or UNIX computer.

**Attention:** The Run Command activity is deprecated in this release. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading to Helsinki. However, to use this functionality in a new workflow, you must create a custom activity using the **SSH activity template** in the ServiceNow® activity designer.

**Input variables**

**Run command input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Long running</td>
<td>Select this check box to disable the SSH connection timeout if you think the command will take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.</td>
</tr>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of destination server for SSH activity.</td>
</tr>
<tr>
<td>Directory</td>
<td>Name of the working directory.</td>
</tr>
<tr>
<td>Command</td>
<td>The command to run from this activity.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Sudo</td>
<td>Select this check box to use <code>sudo</code> to run the command on the host machine.</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called <code>output</code>. Any error from the probe is contained in a variable called <code>error</code>.</td>
</tr>
</tbody>
</table>

**Run SCP activity**
The Run SCP activity uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides.

**Note:** This activity is deprecated in the Geneva release and is not available for use in new workflows. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading. The custom *Secure Copy activity* replaces the Run SCP activity in the Geneva release.

**Input variables**

**Run SCP input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Host</td>
<td>Hostname or IP address of the source computer.</td>
</tr>
<tr>
<td>From File</td>
<td>Absolute path to the file to copy. This value can be a directory.</td>
</tr>
<tr>
<td>To Host</td>
<td>Hostname or IP address of the target computer.</td>
</tr>
<tr>
<td>To File</td>
<td>Path to the target file. This path can be absolute or relative to the logged in user's home directory. The specified directory must already exist on the target computer.</td>
</tr>
<tr>
<td>Copy Directory</td>
<td>Check box to copy a directory defined in the From File variable and all files contained in that directory.</td>
</tr>
</tbody>
</table>

**Orchestration applications**

Orchestration provides several applications with your subscription.

**Orchestration ROI**

The Orchestration ROI application allows you to estimate and compute cost savings for tasks in your system that could be automated with Orchestration.

After you automate the tasks, you can track cost savings by associating Orchestration workflows with corresponding task areas. Configuration in the application allows you to select the hourly rate for performing the task manually, the rules the system uses to select tasks for evaluation, and the time period of the evaluation. Orchestration ROI estimates your savings by multiplying the cost of performing repetitive tasks manually by the estimated number of times the system performs those tasks automatically during a specific date/time range. The system also calculates the actual savings of your automations. Orchestration ROI is included with the base Orchestration subscription.
Orchestration ROI reports offer a number of views of the comparative data and allow you to access the associated records directly from the reports. The standard reports included with the Orchestration - ROI plugin provide summaries, estimated costs, and calculated costs for automated processes. The ROI premium dashboard uses Performance Analytics to provide detailed reports on calculated savings over time. Performance Analytics requires a different plugin and subscription.

**Note:** When Orchestration ROI is activated as a dependent plugin of Orchestration, demo data is not installed. If you want to use demo data as a template for your own ROI evaluation, submit a request to ServiceNow® technical support for an Orchestration ROI plugin upgrade with demo data selected.

To set up Orchestration ROI, complete the configuration tasks in the order shown here.

### Create Orchestration ROI labor rate cards

Before calculating your Orchestration ROI, you must create labor rate cards for the manual work that would be required to complete the tasks correlated to the ROI calculations.

Role required: orchestration_manager

The hourly rates defined in the rate cards are used to determine the savings from your orchestrated tasks.

1. Navigate to Orchestration > ROI > Labor Rate Cards.
2. Complete the fields in the form using the descriptions in Manage a labor rate card.
3. Click Submit.
4. Create additional rate cards as needed.

### Create an Orchestration ROI automation entry record

The ROI automation entry record couples the cost of performing a task with the specific workflow that automates the task, for the purpose of calculating the resulting savings.

Role required: orchestration_manager

Before starting this procedure, verify that the appropriate labor rate cards were created.

Use this record to apply a manual hourly rate to a task that is performed automatically by your instance. To determine the savings realized from orchestrating a task, the system can evaluate whether those savings were estimated or calculated.

- **Estimated savings:** Uses the labor rate, the time estimates for completion of the task, and the number of automations that have been run to determine savings.
- **Calculated savings:** Uses the labor rate, the time calculated for completion of the task, based on the configured evaluation period, and the number of automations that have been run to determine savings.

1. Navigate to Orchestration > ROI > Automation Entry Form.
2. Fill in the fields on the form, as appropriate.
### Automation Entry Form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Category of the selected workflow automation. The following categories are provided in the base Orchestration - ROI system:</td>
</tr>
<tr>
<td></td>
<td>• Access &amp; Identity Management</td>
</tr>
<tr>
<td></td>
<td>• Datacenter Automation</td>
</tr>
<tr>
<td></td>
<td>• IT Service Management</td>
</tr>
<tr>
<td></td>
<td>• Other</td>
</tr>
<tr>
<td>Note:</td>
<td>To create a category, open the dictionary record for the Automation Entry Form [automation_entry_form] table and add an option to the choice list.</td>
</tr>
<tr>
<td>Item</td>
<td>Unique name for the specific task within the category. This value represents the work to which the labor rate card applies, such as <strong>Password Reset</strong>.</td>
</tr>
<tr>
<td>Resource</td>
<td>Labor rate card to apply to this automation entry. You must have IT Cost Management active on the instance for this field to appear.</td>
</tr>
<tr>
<td>Associated Workflows</td>
<td>Workflow automations created to automate this manual task. The system uses this field to identify the number of automations that have been run.</td>
</tr>
<tr>
<td>Estimated Duration (min) per Task</td>
<td>Estimated time to perform this task manually.</td>
</tr>
<tr>
<td>Estimated Volume per Month</td>
<td>Estimated number of times needed to perform this task manually per month.</td>
</tr>
<tr>
<td>Read-only fields</td>
<td></td>
</tr>
<tr>
<td>Start time</td>
<td>Start time for the evaluation period. Configure this value in the Time Range for Calculated Averages module.</td>
</tr>
<tr>
<td>End time</td>
<td>End time of the evaluation period. Configure this value in the Time Range for Calculated Averages module.</td>
</tr>
<tr>
<td>Calculated average duration per task (min)</td>
<td>Actual time required to perform this task manually.</td>
</tr>
<tr>
<td>Calculated average volume per month</td>
<td>Actual average number of times this task is performed manually per month.</td>
</tr>
</tbody>
</table>

3. Select one of these submission options:
   - **Submit**: Saves the record to the table without running any calculations.
   - **Submit and process now**: Saves the record and calculates the savings based on the hourly rate and the number of workflow contexts for this automation entry.

### Create an Orchestration ROI correlated task rule

The correlated task rule applies configurable conditions to fields in a selected table that tell the instance which manual tasks correspond to an automation entry record.
Role required: orchestration_manager

Before starting this procedure, make sure you have created labor rate cards and the appropriate automation entry records for the automated tasks you want to evaluate.

Create conditions that the system can use to correlate manual tasks to the automation entry. For example, a rule on the Incident [incident] table uses these conditions to correlate the employee on-boarding task to values configured in the Employee OnBoarding automation entry record:

- [Subcategory] [is] [Employee OnBoarding]
- [Sort description] [contains] [new employee]

When a new employee opens an incident to request services or assets which are typically handled manually, Orchestration applies the usual labor rate for the manual work to the potential automated solution, and then computes the actual savings.

1. Navigate to Orchestration > ROI Task Correlation > Correlated Tasks Rules.
2. Click New.
3. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automation entry</td>
<td>Automation entry record that correlates to the manual task defined by these conditions. The entry record names the workflow used to automate the task and defines the labor rate used to calculate the cost of the task.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to filter, using these conditions. The rule selects records from this table that match the conditions. Information from these records is used to calculate the actual time to perform a manual task and the actual volume for that manual task.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder to use to filter records for this table. Use these conditions to identify all manual tasks correlated to this automation entry.</td>
</tr>
<tr>
<td>Processed on</td>
<td>Date and time that the system performs the matching records lookup. The system automatically searches for new manual tasks matching these conditions.</td>
</tr>
</tbody>
</table>

4. Select one of these submission options:
   - **Submit**: Saves the record to the table without running any calculations.
   - **Submit and process now**: Saves the record, looks up all matching tasks, and saves matching record information to the Correlated Tasks [manual_mapping_records] table.

5. To view a rule, select the link in the **Table** column of the **Correlated Tasks Rules** related list for the automation entry you want to see.

6. To view the list of tasks that match all correlated rules in the system, navigate to Orchestration > ROI Task Correlation > Correlated Tasks.

7. To view the list of tasks that match this rule in the system, click **Correlated Tasks** under Related Links in this form.

**Configure the time range for Orchestration ROI calculations**

Select a date range to calculate the average number of tasks and the duration per month for the correlated tasks.
Role required: orchestration_manager

By default, the system creates a range ending at the current date and time and extending back over the previous month. You can change this range at any time and recalculate the ROI instantly.

1. **Navigate to** Orchestration > ROI Task Correlation > Time Range for Calculated Averages.
2. **Enter a new start or end date and time or click the icon to select a date using the calendar.**
3. **Click Calculate** to recalculate the ROI based on the new time range and to save your settings.

### Installed with Orchestration ROI

Several types of components are installed with the Orchestration - ROI plugin (com.snc.runbook_automation.roi).

_Tables installed with Orchestration ROI_

Tables are added with activation of Orchestration ROI.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expense and Savings</td>
<td>Contains the data for the reports in Orchestration &gt; ROI Reports &gt; Predicted Savings.</td>
</tr>
<tr>
<td>[run_rate_predicted_savings]</td>
<td></td>
</tr>
<tr>
<td>Savings Report</td>
<td>Contains the number of automations that have been run before the date specified in the Processed On column, based on:</td>
</tr>
<tr>
<td>[savings_report]</td>
<td>• Each automation entry’s associated workflows</td>
</tr>
<tr>
<td></td>
<td>• Estimated savings based on the estimated duration per task.</td>
</tr>
<tr>
<td></td>
<td>• Calculated savings based on calculated duration.</td>
</tr>
<tr>
<td>Detailed Savings Report</td>
<td>Contains a detailed list for the Savings Report [savings_report] table. This list contains each automation’s run date and savings for that automation.</td>
</tr>
<tr>
<td>[detailed_savings_report]</td>
<td></td>
</tr>
<tr>
<td>Automation Entries</td>
<td>Contains automation entries that couple labor resources to specific manual tasks. You can specify the estimated duration to perform a task manually and the estimated number of times that a task is performed per month. If this automation entry already has workflow automations implemented, you can specify the associated workflows. The system calculates the savings, based on the labor rate card and the number of workflow automations that have been performed.</td>
</tr>
<tr>
<td>[automation_entry_form]</td>
<td></td>
</tr>
<tr>
<td>Roadmap Planning</td>
<td>Contains roadmap planning for each automation entry to be implemented. You can provide estimated hours to implement a workflow automation, the automation percentage anticipated by the end of the year, and the starting month to implement the workflow.</td>
</tr>
<tr>
<td>[roadmap_planning]</td>
<td></td>
</tr>
<tr>
<td>Correlated Tasks</td>
<td>Contains all matching manual tasks for each automation entry. Each task’s information is stored in this table for the system to use to calculate the actual duration and volume for each manual task.</td>
</tr>
<tr>
<td>[manual_mapping_records]</td>
<td></td>
</tr>
<tr>
<td>Correlated Tasks Rules</td>
<td>Contains the correlated task rules the system uses to look up manual tasks corresponding to each automation entry.</td>
</tr>
<tr>
<td>[manual_mapping_conditions]</td>
<td></td>
</tr>

Orchestration ROI reports
Orchestration ROI provides a collection of standard and premium reports to help you calculate savings from automating services in your organization.

The ROI standard reports are included with Orchestration ROI. The premium reports provide enhanced views generated with Performance Analytics and require the Orchestration - ROI Premium plugin.
**Orchestration ROI standard reports**

The dashboard of standard ROI reports provides summaries, estimated costs, and calculated costs for automated processes. To access the ROI standard dashboard, navigate to **Orchestration > ROI Reports > Dashboard**.

**Summary tab**

The Summary tab contains four reports on automation categories.

Schedule Orchestration ROI calculations for standard reports

The scheduled job that calculates Orchestration ROI standard reports is active by default and controlled by system properties.

Role required: orchestration_manager, admin

The system provides a default scheduled job called Processing ROI Schedule that allows you to configure when Orchestration calculates the ROI for standard reports. This schedule allows scripting for advanced conditions. To modify the schedule or write a script to run, open Processing ROI Schedule from System Scheduler > Scheduled Jobs > Scheduled Jobs and click Configure Job Definition. To execute the schedule directly from the job definition, click Execute Now.

To control the running of the schedule job with the Orchestration properties.

1. Navigate to Orchestration ROI > Properties.
2. Configure the following properties:
### ROI schedule properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>roi.processing.active</td>
<td>Activate scheduled job for ROI processing. This property activates the Processing ROI Schedule scheduled job.</td>
</tr>
</tbody>
</table>
|                          | • Type: true | false  
|                          | • Default: true                                                                                                                                     |
| roi.processing.interval  | Scheduled ROI processing interval (hours). This property sets the repeat interval for the scheduled job that processes savings reports and correlated tasks. |
|                          | • Type: integer                                                                                                                                |
|                          | • Default: 24                                                                                                                                  |

3. Click **Save** to save your changes.

**Orchestration ROI premium reports**

The premium dashboard provides detailed reports on calculated savings over time.

The ROI premium reports require the Orchestration - ROI Premium plugin and are built using *Performance Analytics concepts*. The Orchestration - ROI Premium plugin is dependent on the *Performance Analytics - Premium* plugin which requires a separate subscription.

**Important:** You must activate the Performance Analytics *scheduled collection job* before Orchestration ROI premium can display data.

To access the ROI premium dashboard, navigate to **Orchestration > ROI Reports > Premium Dashboard**.

**ROI By Category tab**

The ROI By Category tab contains three reports showing the calculated savings over time by category.
Calculated savings monthly by category

Premium reports for calculated savings over time by category

<table>
<thead>
<tr>
<th>Report</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROI - Monthly By Category</td>
<td>Shows the calculated savings each month by category. The chart displays the total calculated savings against the calculated savings for each category.</td>

</tr>
</tbody>
</table>

Activate Orchestration ROI premium reports

To view the Orchestration ROI premium reports, you must activate the Orchestration - ROI Premium (com.snc.runbook_automation.roi_premium) plugin.
The Orchestration - ROI Premium plugin requires the *Performance Analytics - Premium* plugin, which must be purchased separately.

Role required: admin

The Orchestration - ROI Premium plugin is included with an Orchestration subscription, but must be activated by request.

1. Navigate to **System Applications > All Available Applications > All**.
2. On the All Applications page, click **Request Plugin** to open the request form on HI.

3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time. Note: Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Schedule Orchestration ROI calculations for premium reports

Orchestration ROI premium reports use a Performance Analytics job that must be activated before premium reports can be generated.

Role required: orchestration_manager, admin

The scheduled job required to calculate premium ROI reports is called [PA ROI] Historic Data Collection and is installed with the Orchestration - ROI Premium [com.snc.runbook_automation.roi_premium] plugin. This job is not active by default.

1. Navigate to Performance Analytics > Data Collector > Jobs.
2. Search for the [PA ROI] Historic Data Collection job.
3. Select the Active check box.
4. The scheduling options appear for the value selected in the Run field.
   For instructions on creating a schedule, see Create or schedule a data collection job.
5. To execute the schedule directly from the job definition, click Execute Now.
6. Click Update.
Client Software Distribution

The Client Software Distribution (CSD) application allows administrators to distribute software from the service catalog using third-party management systems.

CSD allows an administrator to create all the records necessary to deploy software from service catalog requests, including software models and catalog items. You can use the CSD application to automate the deployment and revocation of software from an SCCM host using the custom SCCM activity pack. You can define lease periods for software distributed from the Service Catalog and allow lease extensions in some cases, pending approvals. Deployment is accomplished using Orchestration activities and workflows.

CSD also integrates with Software Asset Management to manage license counts for deployed software.
CSD process flow using SCCM

Activate client software distribution

Client software distribution requires the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution), which is available by request with a subscription to Orchestration.
The Orchestration - Client Software Distribution plugin activates the Orchestration - System Center Configuration Manager plugin that contains the custom SCCM activities used to deploy or revoke software using an SCCM server. For additional plugin dependencies, see Plugins installed with client software distribution.

**Note:** The Orchestration - Client Software Distribution plugin runs in its own application scope.

1. Navigate to **System Applications > All Available Applications > All.**
2. On the All Applications page, click **Request Plugin** to open the request form on HI.

3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

| Reason/Comments | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments. |

5. Click Submit.

### Installed with client software distribution

Several types of components are installed with client software distribution (CSD).

**Tables installed with client software distribution**

These tables are installed with the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution).

#### Client software distribution tables

This workflow moves either the user or the device from the SCCM collection into the appropriate uninstall collection.</td>
</tr>
</tbody>
</table>

**Create licenses and counters for distributed software**

Licenses and software counters are associated with the software model and must be created if you want to track the license for software deployed by client software distribution (CSD).

Role required: sam or admin

You can create software licenses and counters in Software Asset Management for software items deployed from the service catalog by CSD. CSD depends on the software counter result to determine if the license is available for the
requested software. If the license **Valuation** is greater than 0, and the license type is **Not allocated**, CSD assumes that the license is available for the software.

1. Navigate to **Software Asset > Software Licenses**.
2. Add a new software license for the software model you used in CSD.
3. Navigate to **Software Asset > Reconciliation > Software Counters**.
4. Create a software counter for the software model you created.
5. Run the counter to retrieve the software license information.

**Client software distribution ordering process**

Software deployed by Client Software Distribution (CSD) can be ordered from the service catalog by individual users or by approved users on behalf of others.

Client Software Distribution catalog items have different options, depending on how ordering is configured.

**Lease start and end dates**

All software deployed by CSD requires users to specify the beginning date for the lease. This is enforced by the Orchestration - Asset Lease Management plugin that is activated automatically with CSD. The system prepopulates the **Lease start** field with the current date and time.

If the catalog item is configured for revocation (uninstall), the form displays the **Lease end** field, which allows the requester to define an end date and time for the lease. The system validates user input in these fields to ensure that the dates selected define a future window. The **Lease end** field is not mandatory and can be left blank to order software with no end date.

**Note:** For systems deploying software from Microsoft System Center Configuration Management (SCCM), the **Lease end** field is only available if the **SCCM configuration** specifies an uninstall collection.

**Software offered only to the logged in user**

If the **software catalog item** is configured with the **Order on behalf of** check box cleared, the **User** field does not appear on the order form. The logged in user selects the device on which to deploy the software from the **Device to install this software on** field. Only those devices assigned to the logged in user appear in the list.

In this example, a user has logged into the service catalog to order Firefox for a computer that is assigned to her. She selects the machine from a list of devices she owns and selects the date and time the lease should begin. This software is deployed through Microsoft System Center Configuration Management (SCCM), but does not have an uninstall collection configured and cannot be revoked automatically by the system. As a result, the **Lease end** field is not available.
Ordering software as the logged in user

Software ordered on behalf of another user

If the software catalog item is configured with the Order on behalf of check box selected, the User field appears on the form. The logged in user can select any user from this field. The Device to install this software on field only lists the devices assigned to the user selected in the User field. If an approval is required for software ordered on behalf of another user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requester is the named user's manager.

In this example, a manager is ordering Google Chrome for a contractor. The manager selects the contractor from the User field and then chooses a computer from the list of devices assigned to the contractor. This software has an SCCM uninstall collection configured, which allows the manager to select an end date for the lease that coincides with the end of the user's contract. When the lease expires, SCCM automatically uninstalls the software from the device.
Defining software lease window

Extend a software lease

Users of software deployed by Client Software Distribution (CSD) can request the extension of a lease window, if the software is revocable by a software distribution system.

Role required: Any system user

If your software has a lease end date defined, and the software status is Installed, you can request an extension of the lease, pending any approvals your organization requires.

1. Navigate to Service Catalog > My Requested Software.
   The list shows only the software you have requested from the service catalog.
2. Select the record for the installed software whose lease you want to extend.
3. Under Related Links click Extend Lease.
Requested Software form

4. In the dialog box that appears, select a new lease end date in the calendar and click OK.

You must select a date later than the current date.

If the lease extension is subject to manager approval, you are notified of the decision. If the request is approved, a notification shows the new lease end date. If the new end date is within 5 days (the default notification period) of the date when you made the request, CSD sends an immediate end-of-lease notification.

**Important:** If lease extensions in your organization require approval, make sure the approver is available and has enough time to process your extension request. If the extension cannot be approved before the original end date expires, the software is revoked.

**Client software distribution from SCCM**

You can use Client Software Distribution (CSD) to deploy and revoke software deployments from Microsoft System Center Configuration Management (SCCM) and manage distributions on SCCM hosts.
The SCCM activity pack contains Orchestration activities that CSD uses to deploy software from a service catalog request and manage user and device collections on SCCM servers. In addition, CSD can manage license counts for deployed software using ServiceNow Software Asset Management, revoke software deployed by SCCM without user interaction, and manage lease periods.

Configuring SCCM

Follow the SCCM configuration procedures in the order shown.

Configure the Application Administrator role on the SCCM server

To deploy software using ServiceNow® Client Software Distribution (CSD), ensure that an SCCM administrative user has the correct permissions to deploy software and that PowerShell is properly configured.

SCCM role required: Application Administrator

These instructions are for Microsoft 2012 R2 Server.

1. In the System Center Configuration Manager console, navigate to Administration > Security > Administrative Users.
2. Right-click the user to whom you want to grant the Application Administrator role.
3. Select Properties from the drop-down menu.
4. In the Properties dialog box, select the Security Roles tab.
5. Ensure that the user has the Application Administrator role.
6. If the user does not already have this role, click Add, select this role from the list, and click OK.
Granting the Application Administrator role on the SCCM server
7. Log into SCCM as the user with the Application Administrator role.
8. Open the menu from the upper left corner of the console and select **Connect via Windows PowerShell**.

![System Center Configuration Manager](image)

**Connect to PowerShell**

9. Ensure that the user can access the CM console. This action establishes the environment path to PowerShell for the logged in Application Administrator user.

**Update the SCCM cmdlet libraries**

Ensure that the System Center Configuration Manager SCCM Cmdlet Library is up-to-date.

SCCM role required: Either current user or system administrator, depending on settings.

The System Center Configuration Manager SCCM Cmdlet Library installs and updates the Windows PowerShell module for SCCM. SCCM checks for library updates on a daily basis. Out-of-date libraries can cause Discovery of the SCCM server to fail, because the system cannot parse the SCCM activity output. This warning message appears in the ECC queue input records for the SCCM GET activities:

```
WARNING: An update to the System Center 2012 Configuration Manager Cmdlet Library is available. Please go to 'http://go.microsoft.com/fwlink/?LinkId=528947' to download the latest version.
Running cmdlet version: 5.0.8231.1004 Latest cmdlet version: 5.0.8328.1155
```

If you elect to use an earlier version library, use this procedure to disable the CM update check, which allows Discovery to proceed without issues.

1. Log into the SCCM console as an administrator.
2. Open the menu from the upper left corner of the console.
4. Run one of these commands to disable the update check:
   • **Per-user**: Set-CMCmdletUpdateCheck -CurrentUser -IsUpdateCheckEnabled 0
   • **Per-system**: Set-CMCmdletUpdateCheck -System -IsUpdateCheckEnabled 0

   **Important:** The per-system cmdlet must run in an elevated Windows PowerShell session.

5. Run the Get-CMCmdletUpdateCheck command to refresh the console and check the settings.
6. Ensure that the value of the *IsEnabled* configuration variable has changed to **False**.
   This indicates that the warning for an out of date cmdlet library is disabled for the users specified.
7. To re-enable the update check, run the -IsUpdateCheckEnabled 1 command for either the current user or for the system.

**Configure the MID Server for SCCM activities**

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

**Role required:** admin

1. In the navigation filter, enter *cmdb_ci_dns_name.list*.
2. Click **New**.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the *Name* field.
4. Right-click in the form header and select **Save**.
5. In the *IP Address* related list, click **New**.
6. In the *IP Address* field, enter the IP address of the SCCM server.
7. In the *Nic* field, select *eth0* or your preferred network interface controller.
8. Leave the *Netmask* field blank.
9. Click **Submit**.

**Create Windows credentials for SCCM deployments**

Microsoft System Center Configuration Manager (SCCM) requires the appropriate credentials to deploy applications using the Client Software Distribution application.

**Role required:** sn_client_sf_dist.csd_admin or admin

Client software distribution requires Windows credentials that have administrative rights on the SCCM server.

1. Navigate to **Orchestraton > Credentials**.
2. Click **New**.
3. In the list of credential types, select **Windows Credentials**.
4. Provide a user name and password with administrative rights on the SCCM server.

   **Important:** Ensure the following:
   • This user must have the Application Administrator role on the SCCM server.
5. Fill in the other fields on the form, as appropriate.
   For details, see Windows credentials.
6. Click Submit.

Retrieve SCCM data for client software distribution
Retrieve the collections and the list of applications available for deployment from your SCCM servers.

Role required: sn_client_sf_dist.csd_admin or admin

Before starting this procedure:

- Set up your Microsoft System Center Configuration Manager (SCCM) server, create the applications and collections, and configure the deployments you need. For information, see your SCCM documentation.
- Configure a user with the Application Deployment Manager role on the SCCM server.
- Set up the MID Server to communicate with the SCCM server.
- Add Powershell credentials to the ServiceNow Credentials [discovery_credentials] table for the SCCM user who has the Application Deployment Manager role.

To populate the Client Software Distribution application with SCCM data:

1. Navigate to Client Software Distribution > SCCM > SCCM Server Instance.
2. Click New.
3. In the SCCM Server Instance form, identify the server by name and provide the fully qualified domain name.
4. Click Submit.
   The new SCCM server appears in the list.
5. Open the new SCCM record and click Discover now under Related links.
   The system runs the Discover SCCM workflow that retrieves the application, collection, and deployment data from the SCCM server.
Retrieving SCCM data with Discovery

SCCM server Discovery for client software distribution

A Discovery workflow populates ServiceNow tables with collection, application, and deployment data retrieved from SCCM servers.

Users run the **Discover SCCM** workflow from an **SCCM Server Instance record** to populate the following ServiceNow tables:

**SCCM data populated in ServiceNow tables**

<table>
<thead>
<tr>
<th>Table</th>
<th>Fields</th>
</tr>
</thead>
</table>
| SCCM Application [sn_client_sf_dist_sccm_application] | • name  
• publisher  
• version  
• model  
• sccm_server               |
| SCCM Collection [sn_client_sf_dist_sccm_collection]   | • name  
• type  
• sccm_server               |
| SCCM Deployment [sn_client_sf_dist_sccm_deployment] | • application  
• collection  
• type |
Set up a software model for an SCCM application

Using the applications discovered on the SCCM server, set up a software model used by the Software Asset Management application to manage licenses.

Role required: sn_client_sf_dist.csd_admin or admin

Before creating software models, you must discover the applications available for deployment on the SCCM server. See *Retrieve SCCM data for client software distribution* for details.

You can link an SCCM application to an existing software model or create a new model.

1. Navigate to **Client Software Distribution > SCCM > SCCM Applications**.
   A list of applications discovered on the SCCM server appears.

2. Open an SCCM application record.

3. To link to an existing model, click the magnifying glass icon in the **Model** field and select a model from the list.

4. To create a model, click **Create Software Model** under **Related Links**.
   a) Complete the software model fields.
      See for details.
   b) Click **Submit**.
      The view returns to the SCCM Applications form.

Define an SCCM configuration

To create catalog items for SCCM software deployment or to configure your instance to revoke software through SCCM, you must first associate that software with a collection through an SCCM configuration.
Before you create an SCCM configuration record, make sure you have discovered the SCCM applications, collections, and deployments and set up the necessary software models.

Role required: sn_client_sf_dist.csd_admin or admin

The SCCM configuration process associates software with SCCM collections. To deploy software from an SCCM server, the user or device must be a member of an SCCM collection associated with an install deployment. Client Software Distribution (CSD) allows you to revoke unentitled software using an SCCM server when that software can be removed using an uninstall collection. Users requesting revokable software from the Service Catalog also have the ability to define lease start and stop dates and request lease extensions.
SCCM table references

1. Navigate to **Client Software Distribution > SCCM > SCCM Applications**.
2. Open an application that has a configured software model.
3. Under **Related Links**, click **Create Software Configuration**.
4. Complete the form, using the fields in the table.
### SCCM configuration form

#### SCCM configuration fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Recognizable name for this SCCM software configuration.</td>
</tr>
<tr>
<td>SCCM application</td>
<td>Name of an application hosted on the SCCM server.</td>
</tr>
<tr>
<td>SCCM collection</td>
<td>Name of the collection associated with the install deployment for the selected application on the SCCM server. Only those collections associated with the application are available for selection.</td>
</tr>
</tbody>
</table>
| SCCM uninstall collection | Name of the collection associated with the uninstall deployment for the selected application on the SCCM server. You must specify an uninstall collection to:  
  • Define a lease end date for deployed software.  
  • Allow lease extensions.  
  • Revoke software from a user's machine. |

Create a catalog item for an SCCM application

Using the applications discovered on the SCCM server, create a catalog item for an application you want to offer for distribution from the service catalog.
Role required: sn_client_sf_dist.csd_admin or admin

Before creating a catalog item, you must link the application to a software model and create at least one software configuration.

1. Navigate to **Client Software Distribution > SCCM > SCCM Applications**.
   
   A list of applications discovered on the SCCM server appears.

2. Open a record for an SCCM application.

3. Under **Related Links**, click **Create Catalog Item**.
   
   A new SCCM Application Catalog Item record appears with preconfigured information.
4. Add price information and complete the following fields added to the Client Software Distribution Catalog Item [sn_client_sf_dist_cat_item] table by the Orchestration - Client Software Distribution plugin:

**SCCM fields in the catalog item form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skip approval (skip_approval)</td>
<td>Check box that allows skipping approval for this item by the requester's manager when a user orders it from the service catalog. Use this field in conjunction with the Order on behalf of field to ensure that software ordered by a logged in user on behalf of another user is subject to approval. By default, this check box is cleared, requiring manager approval for all new catalog items.</td>
</tr>
<tr>
<td>Check license compliance</td>
<td>Check box that forces the system to determine if deploying this item is allowed under the current license.</td>
</tr>
</tbody>
</table>
| Order on behalf of                         | Check box that allows the logged-in user to order this software from the service catalog for another user. This permits service desk personnel to order SCCM deployments for other users in the system. By default, this feature is enabled. To prevent unauthorized users from ordering software, ensure that approvals are required for this type of deployment by clearing the Skip approval check box. If an approval is required for software ordered on behalf of a user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requestor is the named user's manager. Software items requested from the service catalog on behalf of a different user require the following information:  
  • User: User selected for deployment. This field is automatically populated with the name of the logged in user. You can select another user from the list.  
  • Device to install this software on: Device belonging to the selected user on which to deploy the software. Only devices belonging to that user appear in the choice list.  
  • Lease start: Date and time to deploy the software. This is the start time for the lease. A lease can be open-ended or have a lease end time. |

**Note:** There are two levels of approval possible. By default, all category items require group approval for items in excess of $1000. If that approval is given or skipped, the system evaluates the Skip approval check box to determine if the software item requires approval by the requester's manager.
5. If the catalog item requires approval because of cost, be sure to configure an approval group in the Approved By Group related list. By default, the Service Catalog Request workflow runs when an item costing more than $1000 is ordered and looks for an appropriate approval group. If no approval group is configured for the item, this workflow skips approval altogether and ends. The system then runs the Order Client Software workflow, which evaluates the Skip approval check box to determine if approval by the requestor's manager is required.

6. Click Update. The view returns to the SCCM Applications list.

7. To see all client software distribution (CSD) catalog items, navigate to Client Software Distribution > Maintain Items > Software Items.

Workflow process for SCCM deployment
Ordering an SCCM application from a client software distribution (CSD) catalog item in the service catalog triggers the Order Client Software workflow.

This process deploys an SCCM application to a user or device through a service catalog order:

1. If the Skip approval check box is cleared in the software catalog item, the Order Client Software workflow sends the catalog request to the requesting user's manager for approval.

2. If the Check license compliance check box is selected in the software catalog item, the workflow performs a software license check. If there is no license available, the workflow creates a catalog task to procure more licenses and assigns the task to the Client Software Distribution Administrators group.

3. The Order Client Software workflow triggers the Deploy SCCM Application workflow as a subflow. This workflow adds either the user or the device to the SCCM collection using the Add to User Collection or Add to Device Collection SCCM activity.

4. If the software configuration specifies SCCM uninstall collection in the software catalog item, the Deploy SCCM Application workflow checks if the user or device exists in the uninstall collection. The workflow uses the Is Device in Collection or Is User in Collection SCCM activity. If the user or device exists in the uninstall collection, the workflow removes the device or user. The workflow uses the Remove from Device Collection or Remove from User Collection SCCM activity before adding it to the SCCM install collection.

Client software distribution validation process
After SCCM deploys software to a target computer, client software distribution (CSD) detects the installation and validates its status.

Client software distribution uses the following methods for detecting software installed on the target machine:

- **Discovery**: CSD is configured to leverage Discovery to detect software installations. You can run Discovery manually at any time, or by a scheduled job.

- **Microsoft SCCM Integration**: You can import SCCM data into the CMDB using the features in the Integration - Microsoft SCCM plugin if Discovery is not active on the instance.

The instance uses the data gathered by Discovery or the SCCM integration plugin to populate the Software Installation [cmdb_sam_sw_install] table. To validate installations using this data, CSD runs a scheduled job called Reconcile Requested Software that uses CSD property settings. This process reconciles the software installation data accumulated in the CMDB and makes these status updates:
• **Not installed** to **Installed**: The user has installed the requested software within the time limit configured in the `sn_client_sf_dist.softwareInstallExpDays` property.

• **Not installed** to **Status check expired**: The time limit has expired for the user to install the requested software. The system stops checking for installation when the time limit expires.

**SCCM software revocation**

An administrator can revoke software without any user interaction using Microsoft System Center Configuration Manager (SCCM) if the software configuration specifies an SCCM uninstall collection, even if the software was installed by some other process or user.

Revoke software deployed through the service catalog

Software deployed by SCCM can be revoked, but only when the software's status is **Installed** and the application associated with the software configuration has an uninstall collection configured.

• Create an **SCCM configuration record** for the application that names an appropriate uninstall collection.

• Associate the **CSD catalog item** for the application with the SCCM configuration that specifies the uninstall collection.

Role required: `sn_client_sf_dist.csd_admin` or `admin`

A workflow called **Revoke SCCM Application** moves either the user or the device from its respective collection and adds it to the appropriate uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

1. Navigate to **Client Software Distribution > Reports > Requested Software**.
2. Open the record for the SCCM software package you want to revoke.
   The package must have a **Status** of **Installed** to be revocable.
3. Under **Related Links**, click **Revoke software**.
   This action runs the Revoke Client Software workflow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

Revoke unentitled software

An administrator can revoke software using Microsoft System Center Configuration Manager (SCCM) that a user is not entitled to use even if the software was installed by some other process or user.

To revoke software using SCCM, you must create an **SCCM configuration record** for the application, in which the appropriate software Discovery model is defined. See **Software discovery models**.

Role required: `sn_client_sf_dist.csd_admin` or `admin`

Client Software Distribution (CSD) uses **Software Asset Management (SAM)** to identify unentitled software installations. Discovery detects the software on the user's machine, and SAM determines if the user or device is entitled to use that software. This might include software that was not installed through a catalog request or software that the user installed without approval. If the software installation's Discovery model is associated with an SCCM software configuration that has an uninstall collection defined, then an administrator can use CSD to revoke that software from the user's machine without involving the user.

1. Navigate to **Client Software Distribution > Reports > Installed Software Not Entitled**.
2. Select the record for the installation that has unentitled users.
3. Under **Related Links**, click **Revoke software**.
   This action runs the Revoke Client Software workflow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.
Revoking a software installation

SCCM software revocation workflow

The Revoke SCCM Application workflow moves a user or device from an install collection to an uninstall collection to revoke software installed from Microsoft System Center Configuration Manager (SCCM).

For the revocation workflow to run, the software package must have a status of *Installed* and must be pre-configured for an appropriate uninstall collection. See *Revoke software deployed through the service catalog* for configuration.
instructions. When an administrator initiates the revocation process, the system launches the Revoke SCCM Application workflow to move the user or device collection associated with installation to the appropriate SCCM uninstall collection. When the SCCM server performs a policy check, it finds the additions to the user or device uninstall collection and revokes the software package associated with that collection.

The workflow employs two custom activities, Remove from User Collection and Remove from Device Collection, to remove either the user or the device from its original collection. The workflow then adds the user or device to the appropriate uninstall collection on the SCCM server with the Add to User Collection or Add to Device Collection activity.

**Note:** This workflow is triggered by the Revoke Client Software workflow as a subflow.

### Client software distribution dashboard

The CSD dashboard provides a collection of visual reports for the Client Software Distribution application. To access the CSD dashboard, navigate to **Client Software Distribution > Requested Software > Dashboard**.

**Sample report from CSD dashboard**

**Client software distribution reports**

<table>
<thead>
<tr>
<th>Report</th>

**Client software distribution extension framework**

Client software distribution (CSD) provides built-in extension points for integrating a ServiceNow instance with client software distribution providers, such as Casper, Altiris, or LANDesk.

**Caution:** The use of CSD extension points is an advanced procedure intended for use by experienced Now Platform developers only. Instructions for customizing your instance to deploy and revoke software from a software distribution provider can be found in the CSD Extension Implementation Guide.

*Configure client software distribution providers*

Identify the provider and specify the workflows and extension points for a customized software distribution process.

Perform the development tasks described in the CSD Extension Implementation Guide before attempting this procedure.
Role required: sn_client_sf_dist.csd_admin, admin

1. Navigate to Client Software Distribution > Extensions > Providers.
2. Click New.
3. Complete the form using the fields in the table.

![Client Software Distribution Provider - Casper](image)

Provider information for Casper integration

### Client software distribution provider fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the provider.</td>
</tr>
<tr>
<td>Provider server</td>
<td>Table name of the provider server. You must create this table as an extension of the Configuration Item [cmdb_ci] table. For example, you might call your table Casper Server Instance [cmdb_ci_casper_server_instance].</td>
</tr>
<tr>
<td>Discovery workflow</td>
<td>Workflow that discovers the provider server and returns the data from that server back to the instance. This is the workflow you create with custom activities that query the provider server.</td>
</tr>
<tr>
<td>Software configuration</td>
<td>Table name of the software configuration for this provider. You create this table as an extension of the Client Software Distribution Software Configuration [sn_client_sf_dist_software_config] table. For example, you might create a table called Casper Software Configuration [sn_client_sf_dist_casper_sf_config].</td>
</tr>
<tr>
<td>Deployment extension key</td>
<td>The SetDeploymentData key provided with CSD. This key sets up the data for the software ordering and deployment workflow.</td>
</tr>
<tr>
<td>Deployment workflow</td>
<td>Workflow that deploys software from the provider server. This is the workflow you created with custom activities that tells the provider where to deploy an application requested from the service catalog.</td>
</tr>
<tr>
<td>Revocation extension key</td>
<td>The SetRevocationData key provided with CSD. This key sets up the data for installation revocation.</td>
</tr>
</tbody>
</table>
### ServiceNow Madrid Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revocation workflow</td>
<td>Workflow that revokes an installation from a provider server. This is the workflow you created with custom activities that tells the provider which application to remove from a device.</td>
</tr>
</tbody>
</table>

**Client software distribution extension keys**

Client software distribution (CSD) extension keys allow you to customize the deployment and revocation of software from distribution providers.

These pre-defined keys allow you to generate input variables for workflows that deploy and revoke software from external distribution providers:

- **SetDeploymentData**: Sets the software order information and generates the input variables for the deployment workflow.
- **SetRevocationData**: Generates the input variables for the revocation workflow.
- **CheckRevocable**: Specifies the conditions that determine if an installation can be revoked. If the software configuration associated with the installed software allows uninstallation, the installed software can be revoked.

**Client software distribution extension points**

The client software distribution (CSD) extension points create the customization code for the specific provider and the extension keys.

The purpose of the extension points is to associate extension keys with a specific provider, and then create a script that sets input variables for your custom deployment and revocation workflows. Another extension point script tells CSD if the provider has the capability to revoke software. If this is the case, CSD enables the UI action that triggers revocation from the provider.

**SetDeploymentData**

The script associated with this extension key must set the `csdExtensionResult` object with these attributes:

- **deploymentWorkflowInputs**: Object that specifies the deployment workflow input variables.
- **softwareModel**: Software model sys_id.
- **deploymentType**: An integer. Use 1 for deployment to a user and 2 for deployment to a device.
- **softwareApplication**: Software application sys_id.

**CheckRevocable**

The script associated with this extension key gets the input parameter `csdExtensionInputs.softwareConfiguration`, which is a Client Software Distribution record in the Software Configuration [sn_client_sf_dist_software_config] table. All providers' software configurations are extended from this table, but may have different attributes.

This script must set the `csdExtensionResult` object to `true` or `false`, depending on whether the software configuration specifies uninstallation.

**SetRevocationData**

The script associated with this extension key gets the input parameter `csdExtensionInputs.softwareConfiguration`, which is a Client Software Distribution record in the Software Configuration [sn_client_sf_dist_software_config] table. All providers' software configurations are extended from this table, but may have different attributes.

The script must set the `csdExtensionResult` object with these attributes:
• **revocationWorkflowInput**: Object that specifies the revocation workflow input variables.
• **softwareModel**: Software model sys_id.
• **deploymentType**: An integer. Use 1 for deployment to a user and 2 for deployment to a device.

**Orchestration examples**

These examples demonstrate how Orchestration can be used to automate common tasks.

**Active Directory automation example**

A set of six Orchestration Active Directory activities enables organizations to automate their on-boarding/off-boarding processes with auditable, self-documenting workflows that save time and eliminate mistakes.

The activities in the *Active Directory activity pack* are designed to manage user accounts and reset user passwords. The following activities cover the most common use cases administrators encounter when managing Active Directory user accounts:

- Create AD User Account
- Update AD User Account
- Remove AD User Account
- Disable AD User Account
- Query AD
- Reset AD User Password.

These activities share a common design, have complementary functionality, and share a common set of parameters. They can be used singly or together to create consistent workflows for provisioning and de-provisioning user accounts.

**Update Active Directory with Orchestration**

An organization plans to make their ServiceNow instance the single system of record for user account data and wants to update Active Directory with the latest changes.

The solution is to create an Orchestration workflow that pushes changes from the ServiceNow user record down to the Active Directory to create a new user record or update an existing record. This is accomplished by creating an Orchestration workflow that can create and update records in Active Directory based on the data in the ServiceNow User [sys_user] table.

**Note**: This example workflow assumes that ServiceNow is configured for LDAP and an LDAP server is configured to accept the new user accounts. The Active Directory user management activities are not dependent on LDAP, but the presence of LDAP makes this example workflow much easier. You must provide the domain controller's IP address to the workflow, either by hardcoding it, adding another workflow input, or using a script to look it up from the CMDB.

1. Navigate to **Workflow > Workflow Editor**.
2. In the **Workflow** tab, click the + icon to create a new workflow using these variables:
   - **Name**: Sync AD User
   - **Table**: Global [global]
3. Click **Submit**.
   A basic workflow with a Begin and End point appears on the canvas.
4. Click the menu icon in the upper left corner of the canvas and select **Edit Inputs** from the context menu.
5. In the Workflow Inputs form, click **New** in the **Variables** record list, and create a new variable, using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Reference</td>
</tr>
<tr>
<td>Label</td>
<td>User</td>
</tr>
<tr>
<td>Column name</td>
<td>u_user</td>
</tr>
<tr>
<td>Reference Specification &gt; Reference</td>
<td>User (sys_user)</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

7. In the **Custom** tab, expand **Custom Activities > Active Directory**.
8. Drag and drop the Update AD Object activity onto the transition line between the Begin and End points of the new workflow. This action automatically links the activity with the end point and opens the Workflow Activity property form.

9. Complete the form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as <strong>Update user data.</strong></td>
</tr>
</tbody>
</table>
| Domain controller   | The ServiceNow LDAP integration adds a reference to the LDAP server to which the user's account is linked. To identify the LDAP server, enter the following statement:  
  \[ $(workflow.inputs.u_user.ldap_server.server_url) \] |
| Type                | Type of AD object. In this case, the type is **User**, which is the default. |
| Object name         | This example assumes that the ServiceNow user name matches the Active Directory sAMAccountName. Enter the following:  
  \[ $(workflow.inputs.u_user.user_name) \] |
| Object data         | Updates the user's account in Active Directory, if the user exists. In this example, the user's title is updated:  
  \{ "title" : "QA" \} |

10. Click **Submit**.

The workflow looks like this:

![Workflow diagram]

**Updating an AD user**

11. Attach both activity outcomes (Success and Failure) to the end point.

At this point, the workflow takes a ServiceNow user record as input and updates the First Name, Last Name, and Title of the corresponding Active Directory account. If the account does not exist in Active Directory, the workflow fails.
Note: In a normal workflow, some type of alternate action is desirable upon failure. For example, you might send an email notification if the workflow failed to update the record.

12. To prevent the workflow from failing, add a Create AD Object activity to the transition lines between Begin and the Update AD Object activity.

13. Complete the Workflow Activity property form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as <em>Create user data</em>.</td>
</tr>
<tr>
<td>Domain controller</td>
<td>Same as for the update activity. ${workflow.inputs.u_user.ldap_server.server_url}$</td>
</tr>
<tr>
<td>Ou</td>
<td>The organizational unit to which this object belongs. For the purpose of this example, you can enter <em>OU=HQ,OU=Managed Objects</em>.</td>
</tr>
<tr>
<td>Object name</td>
<td>Same as for the update activity. ${workflow.inputs.u_user.user_name}$</td>
</tr>
<tr>
<td>Object data</td>
<td>Creates an account with only the user name in it. For the purpose of this example, you can enter <em>{&quot;givenName&quot; : &quot;${workflow.inputs.u_user.first_name}$&quot;, &quot;SN&quot; : &quot;${workflow.inputs.u_user.last_name}$</em>}</td>
</tr>
</tbody>
</table>
workflow based on the results of the query. If an account already exists, then the workflow should update the account. If the account does not exist, then the workflow should create the account in Active Directory.

16. Drag and drop the Query AD activity onto the transition between Begin and Create AD Object.

17. Complete the Workflow Activity property form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as <strong>Search for existing account</strong>.</td>
</tr>
<tr>
<td>Domain controller</td>
<td><code>${workflow.inputs.u_user.ldap_server.server_url}</code></td>
</tr>
<tr>
<td>Properties</td>
<td>A comma-separated list of Active Directory properties to return. For example, givenName, SN, title. If the parameter field is blank, then all properties are returned. In this workflow, we leave the field blank.</td>
</tr>
</tbody>
</table>
| Search filter  | An LDAP filter string that defines the search parameters. Use any valid LDAP filtering criteria. To find user accounts matching the input record, we use: 

(samaccountname=${workflow.inputs.u_user.user_name}) |

18. Click **Submit**.

19. Connect the Failure outcome for the query activity to the End point.

Remember that we are ignoring errors in this workflow.

20. Connect the Success outcome of the query activity to the Update AD Object activity.

The workflow now looks like this:

Querying AD for user accounts

The Query AD activity returns its results as a JSON string in the workflow **data bus**. This JSON string is always an array of objects. Each object corresponds to an Active Directory entry that matched the query. Our workflow should branch, whether that array is empty or not.
21. Drag a standard **If** activity from the **Conditions** folder in the **Core** tab and drop it onto the transition between Query AD and Update AD Object.

22. Complete the Workflow Activity properties form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as <em>Account exists.</em></td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to open the <em>Script</em> field.</td>
</tr>
<tr>
<td><strong>Script</strong></td>
<td>For the If activity to work correctly, we must return a <em>yes</em> or <em>no</em> in the answer variable (var) which corresponds to the Yes and No outcomes of the query activity. Line 1 converts the Query AD results from a JSON string into a Javascript array called queryResults. Line 2 checks the length of that array. If the array is more than 0, a match to the account was found, and we set our answer to yes. Otherwise, the answer is no.</td>
</tr>
</tbody>
</table>

```javascript
var queryResults = JSON().decode(data.get(5).output);
answer = ( queryResults.length>0 ? 'yes' : 'no' );
```

**Note:** The expression `data.get(5)` in this script identifies the Query AD output in the Databus by order number, since it was the fifth activity added to the workflow.
Query AD outputs in the Databus

23. Click Submit.
24. In the canvas, create a transition from the Yes outcome of the If activity to the Update AD Object activity.
25. Create a transition from the No outcome of the If activity to the Create AD Object activity.

This is the final step. This workflow will query Active Directory to determine if an account already exists. If an account exists, the workflow updates that account. If an account does not exist, the workflow creates the account and then updates the Active Directory with the configured user data set.
Creating the conditional paths

**Orchestration activity packs**

The base Orchestration system includes packs of custom activities you can use to automate typical IT and business processes in your network.

Activity packs allow you to automate several common business processes, such as managing Active Directory accounts and Exchange server mailboxes. Activity packs can also automate IT functions such as starting and stopping Windows servers, joining domains, assigning IP addresses, and configuring load balancers.

**Use an activity pack**

The Packs tab of the Workflow Editor contains any activity packs downloaded from the ServiceNow Store and any activity packs that you create.

Roles required: admin, activity_admin, activity_creator

You can organize custom activities into packs and upload them to the ServiceNow Store. Your custom packs do not appear in the tree until at least one activity in the pack is published. Activities added to an existing pack are not displayed until they are published. Activity packs from any application scope can appear in the Packs tab, regardless of the current scope setting for the instance.

1. In the Workflow Editor palette, select the Packs tab.
2. Click the download icon.

The hierarchy in the tab organizes packs by vendor, scope, category, and activity.
Active Directory activity pack

The Active Directory (AD) activity pack enables an administrator to create, delete, and manage objects in Windows Active Directory, such as users, groups, and computers, using a ServiceNow Orchestration workflow. Activities in this pack can reset a password automatically from a user request or manage any user account in Active Directory, whether or not it was created by an Orchestration workflow.

Domain controllers are identified by the IP address of the host machine. To use the hostname of the domain controller, add the Resolve DNS Name activity to resolve the hostname into an IP, and then pass the IP into the Active Directory activity.

Your instance must have access to a MID Server configured to use PowerShell to run these activities.

**Note:** All Active Directory activities pass through error messages returned from Active Directory. To view these error messages, point to the failed activity in the workflow canvas or select the Workflow Log tab in a Workflow Context record.

Custom Active Directory activities

Orchestration provides custom Active Directory activities that were created with the Orchestration **Create a PowerShell activity**, starting with the Geneva release. These activities perform the same functions as AD activities by
the same name from previous releases and replace those activities for all new workflows. Existing workflows from
earlier versions that were created with legacy AD activities continue to function normally after an upgrade to Istanbul.
However, all new workflows must use these custom AD activities. The Powershell activity template gives workflow
administrators the ability to store input and output variables from the Query AD activity in the Databus.

**Note:** To use the Active Directory custom activities, you must request activation of the Orchestration -
Active Directory plugin.

**Active Directory credentials with LDAP**

If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do
not use the user name and password configured on LDAP Servers. You must create a Windows type orchestration
credential record. The username and password in the credentials record is used for LDAP queries that Orchestration
and workflow activities perform.

**Connection port used by AD Orchestration activities**

All Active Directory activities use port 389 for LDAP access. If you are using AD activities with Oracle Virtual
Directory (OVD) as a proxy, set up pass-through on port 389 only.

**Add User to Group AD activity**

The Add User to Group activity adds a user to a group in Windows Active Directory.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities >
Active Directory.

**Input variables**

Add User to Group input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>UserName</td>
<td>Name of the user to add to the group.</td>
</tr>
<tr>
<td>GroupName</td>
<td>Name of the group to which this user is added.</td>
</tr>
</tbody>
</table>

**Output variables**

Add User to Group output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Either success or failure.</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources.</td>
</tr>
</tbody>
</table>
Conditions

Add User to Group conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>User was successfully added to group.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to add the user to the group. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Change AD User Password activity

The Change AD User Password activity changes the password for an Active Directory user account.

This activity requires the user's current password to run, unlike the Reset AD User Password activity. If the new password violates any Active Directory password requirements, such as length or character combinations, the activity fails and returns the appropriate error message. This error message appears in the ECC queue and in hint text when a user points to the activity in the Workflow Editor.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Change AD User Password input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>User</td>
<td>The sAMAccountName of the Active Directory user account.</td>
</tr>
<tr>
<td>New_password</td>
<td>The new password to assign this user.</td>
</tr>
<tr>
<td>Old_password</td>
<td>The user's current password.</td>
</tr>
</tbody>
</table>
Output variables

Change AD User Password output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>One of the following outcomes:</td>
</tr>
<tr>
<td></td>
<td>• failure</td>
</tr>
<tr>
<td></td>
<td>• success</td>
</tr>
<tr>
<td></td>
<td>• Policy Failure</td>
</tr>
<tr>
<td></td>
<td>• Incorrect old password</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources.</td>
</tr>
<tr>
<td>hresult</td>
<td>Powershell command result.</td>
</tr>
</tbody>
</table>

Conditions

The activity provides the following conditions:

Change AD User Password conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Password successfully reset.</td>
</tr>
<tr>
<td>Policy Failure</td>
<td>Password does not comply with the organization's Active Directory requirements.</td>
</tr>
<tr>
<td>Incorrect old password</td>
<td>Password being changed was not entered correctly.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to change the password. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Active Directory credentials with LDAP

If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do not use the user name and password configured on LDAP Servers. You must create a Windows type orchestration credential record. The username and password in the credentials record is used for LDAP queries that Orchestration and workflow activities perform.

Create AD Object activity

The Create AD Object activity creates an object in Windows Active Directory.

This activity fails if it finds an existing object with matching input variables.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to
Instanbul. However, all new workflows must use the custom version of this activity, which was built with the
PowerShell activity designer.

Input variables

Create AD Object input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>Type</td>
<td>The object type to create: user, group, or computer.</td>
</tr>
<tr>
<td>OU</td>
<td>The organizational unit to which this object belongs.</td>
</tr>
<tr>
<td>ObjectName</td>
<td>The sAMAccountName of the Active Directory object. Object name is also used for the name attribute in Active Directory. This behavior is available in ActiveDirectory.psm1. Whatever is passed as the Object name becomes both the samAccountName and the name of the new user in Active Directory.</td>
</tr>
<tr>
<td>ObjectData</td>
<td>A JSON object containing Active Directory property names and their corresponding values. For example:</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;givenName&quot; : &quot;John&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;SN&quot; : &quot;Doe&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;title&quot; : &quot;Sr. Account Specialist&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;allowLogin&quot; : true</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td>This example sets the first name (givenName), last name (SN), and title on the Active Directory user account and allows that user to log in (allowLogin). This field allows expression evaluation via the ${} variable substitution syntax.</td>
</tr>
</tbody>
</table>

Output variables

Disable AD User Account activity

The Disable AD User Account activity disables a Windows Active Directory user account, making it inactive.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Active Directory**.

**Note**: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the **PowerShell activity designer**.

### Is AD Account Locked activity

The Is AD Account Locked activity determines whether an Active Directory user account is locked. An account may be locked automatically if a user enters an incorrect password more times than allowed by the Active Directory security policy. You can unlock an account using the *Unlock AD User Account* activity.

To access this activity in the Workflow Editor, select the *Custom* tab, and then navigate to *Custom Activities > Active Directory*.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity, which was built with the *PowerShell activity designer*.

</table>

Query AD activity

The Query AD activity retrieves entries from the Windows Active Directory based on an LDAP search filter and stores the results as a JSON string that can be used in the data bus.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory > .

Note: This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul and will continue to save query results to the scratchpad. However, all new workflows must use the custom version of this activity. This activity was built with the Create a PowerShell activity, which stores input and output variables in the databus instead of the scratchpad.

Input variables

</tr>
</tbody>
</table>

### Reset AD User Password activity

The Reset AD User Password activity resets the password of a user account in Windows Active Directory. If the new password violates any Active Directory password requirements, such as length or character combinations, the reset activity fails and returns the appropriate error message. This error appears in the ECC Queue and when you point to the activity in the Workflow Editor.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Unlock AD Account activity

The Unlock AD Account activity unlocks a locked Active Directory user account.

You can use the Is AD Account Locked activity activity to determine if an account is locked.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

</table>

Update AD Object activity

The Update AD Object activity updates an object in Windows Active Directory.

This activity only replaces existing values with new values. It cannot add new values to AD records such as adding a new group member to an AD group. For complex AD operations, use the `Run PowerShell activity` instead. The activity fails if it cannot find an existing account with matching object name and data.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Active Directory**.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity, which was built with the `PowerShell activity designer`.

### Azure AD activity pack

The Azure AD activity pack enables an administrator to automate employee onboarding and offboarding functions on Azure AD and manage Office 365 licensing.

Use the Azure AD activities to add and remove users to Azure Active Directory, manage security group membership, and assign or remove Office 365 licenses for individual users.

The Azure AD activities were created with the Orchestration **REST Web Service activity template**.

### Add User to Group Azure AD activity

The Add User to Group activity adds a user to an existing security group in Azure Active Directory.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Azure AD**. This activity was built with the **REST web service activity template**.
Important: The REST message used for this activity must be configured to use OAuth2 authentication.

Input variables

Add User to Group input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_id</td>
<td>Object ID (GUID) of the member to be added.</td>
</tr>
<tr>
<td>group_id</td>
<td>Object ID (GUID) of the target group.</td>
</tr>
</tbody>
</table>

Output variables

Add User to Group output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error</td>
<td>Returns the error string from the REST message. If there are no errors, this variable returns a null value.</td>
</tr>
<tr>
<td>body</td>
<td>Contains a string value representing the output from the REST message.</td>
</tr>
<tr>
<td>status_code</td>
<td>Contains the status code returned from the Web service.</td>
</tr>
</tbody>
</table>

<tr>
<td>Failure</td>
<td>Activity failed to update the group's membership, or the activity failed to connect to Azure AD.</td>
</tr>
</tbody>
</table>

Assign User License Azure AD activity

The Assign User License activity assigns an additional Office 365 software license to the named user.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Azure AD. This activity was built with the REST web service activity template.

Important: The REST message used for this activity must be configured to use OAuth2 authentication.
### Input variables

**Assign User License input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_id</td>
<td>The object ID (GUID) or the user principal name of the target user. An example of a user principal name is <code>someuser@a830edad9050849NDA1.onmicrosoft.com</code>.</td>
</tr>
<tr>
<td>sku_id</td>
<td>Subscription SKU ID associated with the tenant's enterprise agreement.</td>
</tr>
</tbody>
</table>

### Output variables

**Assign User License output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>

</tr>
<tr>
<td>Failure</td>
<td>Activity failed to assign an Office 365 license to a user, or the activity failed to connect to Azure AD.</td>
</tr>
</tbody>
</table>

### Create User Azure AD activity

The Create User activity creates a user for the Azure Active Directory tenant.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Azure AD**. This activity was built with the **REST web service activity template**.

**Important:** The REST message used for this activity must be configured to use OAuth2 authentication.
## Create User input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>display_name</td>
<td>Name of the Azure AD user in the accepted display format, such as <code>jacinto.gawron</code>.</td>

</tr>
</tbody>
</table>
Exchange activity pack

The Exchange activity pack allows workflows to manage Microsoft Exchange mail systems.

The use of Orchestration Exchange activities requires the following:

- Microsoft Exchange 2010 or 2013.
- A MID Server configured to run PowerShell 2.0
- A target Exchange server in the same Active Directory domain as the instance.
- Powershell Remoting enabled on the target Exchange server.

**Note:** These activities cannot be used to interact with Microsoft Exchange Online.

Orchestration provides custom Exchange activities that were created with the Orchestration activity designer template. These activities perform the same functions as Exchange activities by the same name from previous releases and replace those activities for all new workflows. The custom Exchange activities were built with a *Powershell activity template*, which gives workflow administrators the ability to store input and output variables in the *databus*.

**Note:** Existing workflows from earlier versions that were created with legacy Exchange activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom Exchange activities.

To use the Microsoft Exchange custom activities, you must *request activation* of the Orchestration - Exchange plugin. The custom Exchange activities are available in the Workflow Editor on the *Custom* tab. Expand the *Custom Activities* tree and select the *Exchange* category for the activity you want to use.
Accessing custom Exchange activities

**Configure MID Server for Exchange**

Configure a MID Server with defined IP ranges to use Exchange.
If the MID Server manages resources within defined IP ranges, instead of all computers on your network, you must perform additional configuration steps to run Exchange activities. You do not need to perform these steps if your MID Server uses the default configuration.

1. In the navigation filter, enter `cmdb_ci_dns_name.list`.
2. Click **New**.
3. Enter the fully-qualified domain name (FQDN) of your Exchange server in the **Name** field.
4. Right-click the form header and select **Save**.
5. In the **IP Address** related list, click **New**.
6. In the **IP Address** field, enter the IP address of your Exchange server.
7. In the **Nic** field, select `eth0` or your preferred network interface controller.
8. Leave the **Netmask** field blank.
9. Click **Submit**.

**Pass multivalued properties with an Exchange activity**

To set a multivalued property using an Exchange activity, you must use a specific parameter format.

The Optional parameters shared input variable allows you to set **multivalued properties**.

- To set a multivalued property, replacing any existing values, use this format: "PropertyName":"(value1, value2, value3)"
- To add values, use this format: "PropertyName":"+(value1, value2, value3);"
- To remove values, use this format: "PropertyName":"-(value1, value2, value3);"
- To both add and remove values, use this format: "PropertyName":"-(value1, value2, value3);+(value1, value2, value3);"

**Create Address List activity**

The Create Address List activity creates a new address list that acts as an alias for emailing all users in the group. This alias cannot be used to manage user permissions. This activity implements the Microsoft Exchange `New-AddressList` command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Address List**.

---

**Input variables**

**Create Address List input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.</td>
</tr>
<tr>
<td>domain</td>
<td>The name of the Exchange server's assigned domain.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the new address list to create.</td>
</tr>
</tbody>
</table>
### Variable parameters

Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear.

**Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format "parameter":"true".

### Output variables

**Create Address List output variables**

<table>
<thead>
<tr>
<th>Variable</th>

Move Address List activity

The Move Address List activity moves a Microsoft Exchange address list to another location in the address hierarchy.

This activity implements the Microsoft Exchange Move-AddressList command.

The Exchange server caches the changes from this activity but does not immediately apply them. Use the Update Address List activity after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Address List.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

### Set Address List activity

The Set Address List activity modifies a Microsoft Exchange address list.

Use the Optional parameters variable to pass specific values to the Microsoft Exchange `Set-AddressList` command.

The Exchange server caches the changes from this activity but does not immediately apply them. Use the `Update Address List` after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Address List.
Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the *PowerShell activity designer*, which gives workflow administrators the ability to store input and output variables in the *databus*.

Update Address List activity

The Update Address List activity adds or removes users from the specified address list and immediately applies any cached address list changes to the server.

Use the optional parameters variable to specify which users to add or remove. This activity implements the Microsoft Exchange `Update-AddressList` command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Address List.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Create Mailbox activity

The Create Mailbox activity creates a new Active Directory user, if that user does not already exist, and a Microsoft Exchange mailbox for that user.

This activity implements the Microsoft Exchange *New-Mailbox* command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Mailbox**.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. **Variable** | **Description**
---|---
parameters | Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear.

**Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format "parameter":"true".

**Output variables**

**Delete Mailbox output variables**

| Variable | Description |
---|---|
result | Either success or failure. |
error | Error message if the operation fails. |

**Conditions**

**Delete Mailbox conditions**

| Condition | Description |
---|---|
Success | The activity succeeded in deleting the specified user's mailbox. |
Failure | The activity failed to delete the specified user's mailbox. |

**Disable Mailbox activity**

The Disable Mailbox activity disables the mailbox associated with a specified Active Directory account.

This activity implements the Microsoft Exchange Disable-Mailbox command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Mailbox.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom activities.
version of this activity. This activity was built with the *PowerShell activity designer*, which gives workflow administrators the ability to store input and output variables in the *databus*.

</table>

Enable Mailbox activity

The Enable Mailbox activity creates a new mailbox for an existing Active Directory user.

This activity implements the Microsoft Exchange *Enable-Mailbox* command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Mailbox**.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the *PowerShell activity designer*, which gives workflow administrators the ability to store input and output variables in the *databus*.

### Get Mailbox activity

The Get Mailbox activity gets the mailbox for the specified user or all mailboxes on a Microsoft Exchange server.

This activity implements the Microsoft Exchange Get-Mailbox command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Mailbox.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom
version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

### F5 Network Management activity pack

Orchestration provides custom activities for configuring elements of an F5 load balancer, including pools, pool members, and the virtual servers contained in the pool.

All F5 custom activities are in the F5 Network Management Application *scope* and are activated by the Orchestration - F5 network management plugin, which must be *activated by request*.

ServiceNow provides custom F5 activities, built from the *REST web service activity template*, that you can use to perform the following tasks:
- Add, delete, or verify pools.
• Add, delete, or identify pool members.
• Add or delete virtual servers.
• Add a profile to a virtual server.
• Configure the virtual server for vlans, irules, pool, and persistence.

Add F5 Pool Member activity

The Add F5 Pool Member activity adds a member to an F5 load balancer pool.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

REST settings

• REST message: F5 POOL Membership Management
• REST function: post

Input variables

Add F5 Pool Member input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PoolName</td>
<td>Name of this pool, such as testPool.</td>
</tr>
<tr>
<td>F5IPAddress</td>
<td>IP address of the F5 console.</td>
</tr>
<tr>
<td>MemberName</td>
<td>Pool member IP address and port, such as 192.168.2.19:80.</td>
</tr>
</tbody>
</table>

Output variables

Add F5 Pool Member output variables

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully added an F5 load balancer pool member.</td>
</tr>
</tbody>
</table>
### Get F5 Pool Member activity

The Get F5 Pool Member activity returns the pool members and verifies the pool's status.

Use this activity to verify that a pool member was created properly.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Infoblox DDI activity pack

This activity pack supports Infoblox DDI management through ServiceNow Orchestration.

The Infoblox DDI activity pack manages the IP addresses used in a network by integrating DNS and DHCP. Custom Orchestration activities use Infoblox Web API (WAPI) REST web services to access the Infoblox GRID server.

**Important:** Managing IP addresses through the Infoblox server requires a fully functional MID Server.

Starting with the Jakarta release, the Infoblox activity pack updates to version 2. This update supports Infoblox network views, which can restrict the visibility of network data. The view parameter can be passed as a query parameter or payload content, to do operations in a specific view. Version 2 also supports specifying the version of WAPI to use in integration endpoints.

Supported for Infoblox:
- WAPI version 2.0 for REST messages
- NIOS appliance version 7.0

**Note:** To use the Infoblox DDI activities and workflow, you must request activation of the Orchestration - Infoblox DDI Activity Pack plugin.

Create a REST credential for Infoblox activities

All Infoblox activities require a REST credential to manage IP addresses from the Infoblox DDI server.

Before starting this procedure, make sure you have the following:

- A properly configured and running Infoblox DDI Grid Server.
- REST credentials defined on the Infoblox DDI server.
Role required: admin

You must create a REST credential record on the ServiceNow instance that each Infoblox activity can use to access management features on the Infoblox server.

1. Navigate to Orchestration > Credentials and click New.
2. In the list of credential types, select Basic Auth Credentials.
3. Create the credential record with a logical name, such as InfobloxCred.
4. Right-click in the header bar of your new credential record and select Copy sys_id from the context menu. Follow browser instructions to copy the sys_id if browser security measures restrict this function.
5. Paste the sys_id into the restCredentials input field of each activity you use.

Infoblox workflows

The Infobox DDI activity pack includes two default workflows, one that reserves and registers IP addresses and another that releases IP addresses.

To access these workflows, navigate to Workflow > Workflow Editor and select the Workflows tab. Click on a workflow to open it, and then click the information icon in the workflow header to display the properties dialog box.

Infoblox Reserve/Register IP in IPAM

Use this workflow to register IPv4 addresses or request the next available IP address on IPAM. Optionally, you can use it to register IP addresses on DNS. The custom Infoblox activities used in this workflow are:

- **IPAM Register IP Address**
- **IPAM Reserve IP Address**
- **Register DNS A-Record**
- **Get Network Details**

Infoblox Reserve/Register IP input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infoblox Server</td>
<td>IP address of the Infoblox DDI server.</td>
</tr>
<tr>
<td>Network</td>
<td>Network containing the target IP address.</td>
</tr>
<tr>
<td>Zone</td>
<td>The DNS zone for the IP address being registered.</td>
</tr>
<tr>
<td>Rest Credentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>DNS Host Name</td>
<td>Name of the DNS server machine on which the IP address is being registered.</td>
</tr>
<tr>
<td>IPv4 Address</td>
<td>IP address being reserved or registered.</td>
</tr>
</tbody>
</table>

Infoblox Release IPAM Reservations

Use this workflow to release (delete) all the IPAM reservations associated with an IPv4 address. The custom Infoblox activities used in this workflow are:

- **IPAM List IP Reservations**
- **List DNS Record**
- **DNS Delete**
• **IPAM Delete**

**Infoblox Release IPAM Reservations input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rest Credentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>IP to Delete</td>
<td>IP address to release.</td>
</tr>
<tr>
<td>Infoblox Server</td>
<td>IP address of the Infoblox DDI server.</td>
</tr>
</tbody>
</table>

**Infoblox roles and permissions**

Define the roles and permissions that the Infoblox activities need to access the various resources on the Infoblox server.

**Admin groups**

There are three types of admin groups on an Infoblox server:

- Superuser
- Default
- Limited Access

To perform specific operations on the Infoblox server, the Limited Access user must have a minimum set of privileges for the desired resources, using either the user interface or an API. These privileges are based on read and read/write access. For more information, refer to the "About Admin Groups" section in the Infoblox NIOS Administrator Guide.

**Permission hierarchy**

1. **User**: A user can be part of multiple groups.
2. **Group**: A group can have many roles.
3. **Role**: Each role consists of specific resource permissions.

**Required permissions**

The ServiceNow Infoblox activity pack requires appropriate read and read/write privileges for these resources:

- Network
- DHCP
- DNS
- IPAM

This example shows a default DHCP admin role, its resources, and the related permissions for each.
Infoblox permissions
Infoblox DHCP activities

The Infoblox DHCP activities manage the IP addresses reserved for DHCP in your network. Use these activities to reserve, list, or delete IP addresses that are used for DHCP assignment in your network.

**DHCP Reserve IP v4 Address Range activity**

The DHCP Reserve IP v4 Address Range activity reserves an IP address range for DHCP use.

The DHCP activities use the *REST web service activity template* to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Infoblox DDI > DHCP**.

## Input variables

**DHCP Reserve IP v4 Address Range input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InfobloxServer</td>
<td>Name of the Infoblox DDI Grid Server.</td>
</tr>
<tr>
<td>startIpAddress</td>
<td>Beginning IPv4 address of the range to reserve.</td>
</tr>
<tr>
<td>endIpAddress</td>
<td>Ending IPv4 address of the range to reserve.</td>
</tr>
<tr>
<td>restCredentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
</tbody>
</table>

**api_version**

Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**.

*Note:* This field is mandatory. If the field is empty, the orchestration activity will fail.

**view**

Name of the Infoblox network view. The default value is **default**.

*Note:* If the field is empty, the operation is treated as happening in the default view.

## Output variables

**DHCP Reserve IP v4 Address Range output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DHCPIpAddressRange</td>
<td>Range of reserved IPv4 addresses.</td>
</tr>
<tr>
<td>error</td>
<td>Displays the message for any REST error encountered.</td>
</tr>
</tbody>
</table>
## Conditions

### DHCP Reserve IP v4 Address Range conditions

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully reserved the specified IPv4 address range.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to reserve the specified IPv4 address range.</td>
</tr>
</tbody>
</table>

### DHCP Delete IP Reservation activity

The DHCP Delete IP Reservation activity deletes IP reservations in DHCP using either an IPv4 or IPv6 address range.

An automation can obtain an Infoblox DHCP object to delete from either of these activities:

- **DHCP List IP Reservations**
- **DHCP Reserve IPv4 Address Range**

The DHCP activities use the *REST web service activity template* to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **DHCP**.

## Input variables

### DHCP Delete IP Reservation input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

DHCP List IP Reservations activity

The DHCP List IP Reservations activity generates a list of all the DHCP range reservations on a specific InfoBlox server.

The DHCP activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DHCP.

Input variables

</tbody>
</table>

### Infoblox DNS activities

The Infoblox DNS activities manage DNS records in your network using an Infoblox DDI Grid Server.

Use these activities to register, list, or delete DNS records managed on an Infoblox server.

*List DNS C-records activity*

The List DNS C-records activity retrieves all canonical (CNAME) records from a specified Infoblox server.

The DNS activities use the `REST web service activity` template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DNS.
## Input variables

</tbody>
</table>

Register DNS A-record activity

The Register DNS A-record activity creates a DNS A record on a specified Infoblox server.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DNS.

Input variables

**Infoblox IPAM activities**

The Infoblox IPAM activities manage IP addresses in your network using an Infoblox DDI Grid Server.

Use these activities to register, reserve, list, or delete IP addresses.

**IPAM Register IP Address activity**

The IPAM Register IP Address activity registers an IP address in a network using Infoblox IPAM.

The output of this activity produces an InfoBlox IP address record that can be used for other IPAM functions in the format `fixedaddress/<encrypted key>:<reserved ip address>/<view>`.

The IPAM activities use the *REST web service activity template* to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Infoblox DDI > IPAM**.

</tr>
</tbody>
</table>
### IPAM Delete activity

The IPAM Delete activity deletes an IP Address within a named InfoBlox server.

The IPAM activities use the *REST web service activity template* to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Infoblox DDI > IPAM**.

#### Input variables

**IPAM Delete input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InfobloxServer</td>
<td>Name of the Infoblox DDI Grid Server.</td>
</tr>
</tbody>
</table>
| itemToDelete   | The IP address to delete, in the format `fixedaddress/<encrypted key>:<reserved ip address>/<view>`.
| restCredentials| The sys_id of the REST credentials from the ServiceNow instance.             |
| api_version    | Defines the version of WAPI to use for the integration endpoints. The default value is 2.0. |

*Note:* This field is mandatory. If the field is empty, the orchestration activity will fail.

#### Output variables

**IPAM Delete output variables**

<table>
<thead>

Infoblox network activities

The Infoblox network activities manage networks using an Infoblox DDI Grid Server.

Use these activities to create, list, or delete networks on an Infoblox server.

Create Network activity

The Create Network activity creates new networks on a specified Infoblox server.

The network activities use the REST web service activity template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > Network.

Input variables

Create Network input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InfobloxServer</td>
<td>Name of the Infoblox DDI Grid Server.</td>
</tr>
<tr>
<td>network</td>
<td>Address of the network to create.</td>
</tr>
<tr>
<td>restCredentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>api_version</td>
<td>Defines the version of WAPI to use for the integration endpoints. The default value is 2.0.</td>
</tr>
</tbody>
</table>

Note: This field is mandatory. If the field is empty, the orchestration activity will fail.

| view | Name of the Infoblox network view. The default value is default. |

Note: If the field is empty, the operation is treated as happening in the default view.

</tbody>
</table>

Get Network Details activity

The Get Network Details activity retrieves the information about a specific network on an Infoblox server.

The network activities use the REST web service activity template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > Network.

Input variables

Get Network Details input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InfobloxServer</td>
<td>Name of the Infoblox DDI Grid Server.</td>
</tr>
<tr>
<td>network</td>
<td>Address of the network whose details you want to see.</td>
</tr>
<tr>
<td>restCredentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>api_version</td>
<td>Defines the version of WAPI to use for the integration endpoints. The default value is 2.0.</td>
</tr>
</tbody>
</table>

Note: This field is mandatory. If the field is empty, the orchestration activity will fail.
ServiceNow Madrid Now Platform capabilities

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>view</td>
<td>Name of the Infoblox network view. The default value is default.</td>
</tr>
</tbody>
</table>

**Note:** If the field is empty, the operation is treated as happening in the default view.

Output variables

The output variables from this activity are objects on the Infoblox server used to identify network details. For more information, refer to the Infoblox documentation.

**Get Network Details output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error</td>
<td>Displays the message for any REST error encountered.</td>
</tr>
</tbody>
</table>

The `NetworkOptions` array contains these attributes:

- **reference**: Reference value for the network requested. This value is in the form of `network/ZG5zLm5ldHvcmSkMTAuMS4wLjAvMTYvMA:10.1.0.0%2F1`.
- **options**: The `options` array contains these attributes:
  - **name**: Name of the network option returned, such as `domain-name-server`.
  - **num**: Index number of the option. For example, the index for `domain-name-server` is 6.
  - **use_option**: Indicates whether a DHCP option is used at that level in the network hierarchy. Set this value to `True` to override the Grid Level DHCP option with this option at the network level.
  - **value**: Value to use for this option. For example, the value for the `domain-name-server` option is the IP address of the server machine.
  - **vendor_class**: The class of the network object. The options are `DHCP`, `DNS`, or `IPAM`.

Conditions

---

**PowerShell activity pack**

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

Orchestration provides custom PowerShell activities that were created with the PowerShell activity designer template. These activities perform the same functions as PowerShell activities by the same name from previous releases and replace those activities for all new workflows. These custom activities give workflow administrators the ability to store input and output variables in the **databus**.

**Note:** Existing workflows from earlier versions that were created with legacy PowerShell activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom PowerShell activities.

Starting with the Madrid release, there are the following updates to the PowerShell activity pack:

- A new PowerShell probe (V2), which takes advantage of IntegrationHub functionality
- The ability to insert debug statements in the PowerShell scripts and produce the resulting messages at runtime

To use the PowerShell custom activities, you must request activation of the Orchestration - PowerShell plugin. These activities are available in the Workflow Editor on the Custom tab. Expand the **Custom Activities** tree and select the PowerShell category for the activity you want to use.

ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

**PowerShell activity designer**

PowerShell activities are configured to return data to a workflow from a host using Microsoft PowerShell.

You must purchase Orchestration to use this template. For specific information about using the tools in the activity designer, refer to these resources:

- Orchestration activity designer
- Create input variables
- Create a parsing rule

ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.
PowerShell protocols and troubleshooting

PowerShell uses the Windows Management Instrumentation (WMI) and Windows Remote Management (WinRM) protocols to enable Orchestration activities to run commands on remote Windows hosts.

Windows Management Instrumentation (WMI)

WMI provides a uniform interface for any local or remote applications or scripts that obtain management data from a computer system, a network, or an enterprise. WMI contains these components:

- **Managed objects and WMI providers**: A WMI provider is a COM object that monitors one or more managed objects for WMI. A managed object is a logical or physical enterprise component, such as a hard disk drive, network adapter, database system, operating system, process, or service.

- **WMI infrastructure**: The WMI infrastructure is a Microsoft Windows operating system component know as the WMI service (winmgmt). The WMI infrastructure is composed of the WMI Core and the WMI repository. The WMI repository is organized by WMI namespaces. The WMI service creates namespaces, such as root\default, root\cimv2, and root\subscription, at system startup and preinstalls a default set of class definitions, including the Win32 Classes, the WMI System Classes, and others. The remaining namespaces found on your system are created by providers for other parts of the operating system or products.

- **WMI consumers**: A WMI consumer is a management application or script that interacts with the WMI infrastructure. A management application can query, enumerate data, run provider methods, or subscribe to events by calling either the COM API or the Scripting API for WMI.

WMI installation and configuration

For the MID Server to successfully make a remote connection to the target host, TCP port 135 must be open. The Windows firewall automatically creates an inbound rule for WMI connectivity called Windows Management Instrumentation (DCOM-In).

Windows Remote Management (WinRM)

WinRM is the Microsoft implementation of WS-Management Protocol, a standard Simple Object Access Protocol (SOAP) protocol that allows hardware and operating systems from different vendors to interoperate.

WinRM contains these components:

- **WinRM Scripting API**: This scripting API enables Orchestration to obtain data from remote computers, using scripts that perform WS-Management protocol operations.

- **WMI Service**: The WMI service continues to run side-by-side with WinRM and provides requested data or control through the WMI plug-in. You can continue to obtain data from standard WMI classes, such as as Win32_Process.

WinRM configuration

WinRM is automatically installed on Windows 2008 R2 and above operating systems, but must be configured before use.

1. In a command prompt, enter `winrm quickconfig`. This command is not case sensitive.

2. When the console displays **Make these changes [y/n]?**, enter `y`.

© 2020 ServiceNow, Inc. All rights reserved.
The `winrm quickconfig` command performs the following operations:

- Starts the WinRM service, and sets the service startup type to **auto start**.
- Configures a listener for the ports that send and receive WS-Management protocol, using either HTTP or HTTPS on any IP address.
- Creates a firewall exception for the current user profile.

*MID Server PowerShell files*

PowerShell functions are stored in script files (*.ps1) that use a PowerShell Script module (*.psm1) file name extension.

The PowerShell functions are used by the PowerShell MID Server script files included in these activity packs:

- Active Directory
- Exchange
- SCCM
- PowerShell

**PSScript.ps1**

This script performs a few tasks, such as credential testing, password encryption, and the execution of scripts configured in the Orchestration Activity Designer or in MID Script Files. However, this document focuses on how PSScript.ps1 uses the `credential.psm1` module for testing access to remote hosts.

The PowerShell variables are generally used directly in the *PowerShell execution command* or as arguments in the MID Server script file you specify. There are special variables that are passed to PSScript.ps1, such as `credType`. 
**ServiceNow Madrid Now Platform capabilities**

**Using credType in execution parameters**

Drag variable from the left to template fields below to create associations to the template inputs below.

<table>
<thead>
<tr>
<th>Target host</th>
<th>$activity.input.sccmServer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script type</td>
<td>MID Server script file</td>
</tr>
<tr>
<td>MID Server script file</td>
<td>AddToDeviceCollection.ps1</td>
</tr>
</tbody>
</table>

### Powershell variables

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>collection</td>
<td>$activity.input.collection</td>
<td>Plain</td>
</tr>
<tr>
<td>device</td>
<td>$activity.input.device</td>
<td>Plain</td>
</tr>
</tbody>
</table>

- credType: SCCM

Continue
PowerShell credTypes

The PowerShell credential types:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WMI</td>
<td>testCredentialWMI</td>
</tr>
<tr>
<td>Exchange</td>
<td>testCredentialExchange</td>
</tr>
<tr>
<td>AD</td>
<td>testCredentialAD</td>
</tr>
<tr>
<td>SCCM</td>
<td>testCredentialSCCM</td>
</tr>
</tbody>
</table>

If no credential type is passed to the PSScrip.ps1 script, the MID Server defaults to the WMI test function to test access to the target host. If there is a credential type used, the MID Server runs the corresponding test function for that credential type.

Exit codes

These exit codes are returned from the PSScript.ps1 script and logged in the MID Server log file.

PSScript.ps1 exit codes

<table>
<thead>
<tr>
<th>Type</th>
<th>Test function</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>PowerShell command/script ran successfully.</td>
</tr>
<tr>
<td>1</td>
<td>Test finished successfully, but the command/script failed to execute.</td>
</tr>
<tr>
<td>2</td>
<td>Incorrect syntax passed to script.</td>
</tr>
<tr>
<td>3</td>
<td>All credentials including MID Server service account failed to execute the command/script.</td>
</tr>
<tr>
<td>4</td>
<td>Passed test and executed the activity, but an error was returned. Example user cannot be found.</td>
</tr>
</tbody>
</table>

DiagnosticsUtil.psm1

The MID Server uses this module file to perform PowerShell logging that assists debugging any Orchestration activity using PowerShell scripting. You can also add debugging statements directly to custom scripts.

PowerShell diagnostic utilities

<table>
<thead>
<tr>
<th>Utility</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNCLog-DebugInfo</td>
<td>Log a debug message for a PowerShell script or PowerShell Orchestration activity. Examples:</td>
</tr>
<tr>
<td></td>
<td>• SNCLog-DebugInfo -message &quot;My debug message...&quot;</td>
</tr>
<tr>
<td></td>
<td>• SNCLog-DebugInfo &quot;My debug message&quot;</td>
</tr>
</tbody>
</table>
### Utility

<table>
<thead>
<tr>
<th>Utility</th>
<th>Description</th>
</tr>
</thead>
</table>
| SNCLog-ParameterInfo       | Log a function parameter value. For "function getHostName{ param( [String] $target ) }", the first value to the PowerShell hashtable is a string to indicate which function executes, and the values for each of the function parameters. Examples:  
  - Function with single parameter: SNCLog-ParameterInfo @("Running getHostName", $target) 
    
    **Note:** The debug message shows, 'Running getHostName $target:{actual value of $target}'.  
  - Function with multiple parameters: SNCLog-ParameterInfo @("Running functionName", $param1, $param2, $param3)  

| SNCObfuscate-Value         | Use this utility to encrypt values for security purposes. The function displays "$variableName":***, where *** is the obfuscated value. Example:  
  - SNCObfuscate-Value $password  
    
    **Note:** The debug message reads: "$password : ***". |

### Credentials.psm1

The MID Server uses this module file to test access to a target host. The MID Server loops through all Windows credentials stored in its credentials table using the following access type functions, unless the PowerShell activity has a credential type (credType) defined. All ServiceNow® authored PowerShell activities are hard-coded to use a specific credential type. As a result, the MID Server only tests credential access against the designated function.

#### PowerShell test functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>testCredentialWMI</td>
<td>Tests the given user and password on the target host using the Get-WMI object.</td>
</tr>
<tr>
<td>testCredentialAD</td>
<td>Tests the given user and password on the target host using the built-in DirectoryEntry object.</td>
</tr>
<tr>
<td>testCredentialExchange</td>
<td>Tests the given user and password to create a session on an Exchange host. This test uses the built-in PowerShell remoting feature on a remote host. WinRM is configured on Exchange servers by default.</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>testCredentialSCCM</td>
<td>Tests the given user and password to create a session on an SCCM server. This test uses the built-in PowerShell remoting feature on a remote host. This test requires WinRM to be configured.</td>
</tr>
<tr>
<td>testNoCredentialAccessWMI</td>
<td>Tests the given user and password on the target host, using the <code>Get-WMI</code> object. This test is used when no <code>credType</code> is used.</td>
</tr>
</tbody>
</table>

**Note:** If the test passes using one of these functions, that credential is used to run the PowerShell script/command. If the tests fail to access the target host using these functions, the MID Server runs the PowerShell script/command under the account of the MID Server service.

This diagram illustrates the dependency of the credential selection behavior on the host being targeted by the PowerShell activity. If the target host is the IP address or host name of the MID Server, the MID Server bypasses all credentials in the Credentials table and uses the account of the MID Server service. If the target host is not the MID Server, then all Windows credentials are used first. If all credentials in the Credentials table are unsuccessful in running the PowerShell activity, then the MID Server uses the MID Server service account.
PowerShell credential selection criteria
ActiveDirectory.psm1

This module file stores the functions used by the PowerShell scripts shipped with the Active Directory activity pack.

Exchange.psm1

This module file stores the functions used by the PowerShell scripts shipped with the Exchange activity pack.

SCCM.psm1

This module file stores the functions used by the PowerShell scripts shipped with the SCCM activity pack.

Set up credential tags for a PowerShell activity

Credential tagging gives an administrator more control over the credentials used in a PowerShell activity.

Role required: admin, activity_creator or workflow_admin

Tagging is useful when the activity requires specific credentials to perform a task. By populating the Credential tag field you are telling the activity to use a credential that has a specific tag set for it. Additionally, credential tagging allows you to use a different underlying credential in development, testing, and production systems without having to change the activity for a given target system. For example, you can use the SCCMCred tag and have it point to both a development and test instance.

1. Navigate to Orchestration > Credentials.
2. Select the credential you want to tag.
3. Enter a unique name in the Tag field that is descriptive of the credentials purpose.
4. Click Update.
5. Open the Workflow Editor and select the PowerShell activity you want to tag.
6. In the activity's Execution Command, add the name of the tag you created to the Credential tag field.
Adding a credential tag to an activity:

- Input variables:
  - abc: DomainController
  - abc: User

- Credential tag: AD User Admin

- Required MID Server capabilities: PowerShell
**PowerShell troubleshooting**

Authentication and access denied errors can prevent PowerShell activities from running a command on a target host.

Use these procedures for troubleshooting authentication failures with Orchestration PowerShell activities and when the Remote Procedure Call (RPC) server is unavailable or when access is denied. The authentication failure error displays when all credentials, including those of the local MID Server service account, do not have the correct permissions to run the Powershell script/command. The same error displays when the target host is unreachable.

**Authentication error message**

Authentication failure in an Active Directory activity

This example uses the Create AD Object activity to illustrate troubleshooting authentication failure in PowerShell.

Role required: Permissions to access and create accounts on Active Directory

Validate that the account you are using has the proper permissions to run the activity.

1. Log on to the target machine using the account under which you want to run the activity.
   
   Active Directory tools must be installed on this machine.

2. Launch the Active Directory Users and Computers application.

3. Navigate to the OU under which you want to create the Active Directory object.

4. Attempt to create the object.

If this procedure is successful under the specified user, the following might be the cause of the authentication failure:

- User name is invalid.
- Password entered incorrectly.
- Domain controller is unreachable.

**Note:** The majority of the return codes listed in the MID Server log for this error are 1s and 3s. This is because the Active Directory activities use the ADSI provider and not WMI or WinRM. An error code of 1 means the account was able to connect with the test account, but running the script failed.
An error code of 3 means that the MID Server attempted to run the PowerShell activity under the MID Server service account but failed.

Authentication failure in an Exchange activity

This example uses the Create Mailbox activity to illustrate troubleshooting authentication failure in PowerShell.

Role required: Permissions to access and create mailboxes on the Exchange server

1. Validate that the account you are using has the proper permissions to run the PowerShell activity.
2. Log on to a machine that has the Exchange Management Shell (EMS) installed.
3. Create a user using the `New-mailbox` Exchange commandlet.
Creating a new user in Exchange

If this procedure is successful under the specified credential, the following is the likely cause of the failure:

• User name is invalid.
• Password entered incorrectly.
• Exchange server is unreachable.

4. If the Exchange server is unreachable, examine the MID Server logs.

Because the Exchange activities use WinRM to access the Exchange server, the logs can provide more troubleshooting information.

Note: Ensure that the error is NOT WinRM cannot process the request.

Remote Procedure Call (RPC) server unavailable or access denied

Typically, this error is logged when running a PowerShell script/command that uses WinRM or WMI.

Possible causes of error

The target host might have one of these issues:

• WinRM isn’t configured.
• Firewall is blocking access to the host over TCP port 135 (WMI) or HTTP/HTTPs and TCP port 5985 (WinRM).
• Kerberos issue, caused by hopping to multiple hosts using WMI.
Example WinRM error

The Create Mailbox activity from the Exchange activity pack has generated an error in the ECC queue involving authentication using the MID Server service credential. This occurred because the MID Server credential is the last to be used if the targeted host is not the MID Server.

Authentication failure error message

The MID Server log shows that the MID Server tried to run the activity under specific credentials, but wasn’t successful and received an exit code of 1.

MID Server error code
**Join Domain activity**

The Join Domain activity joins a Windows computer to a domain.

If the computer is already a member of a domain, this activity completes without modifying the computer. Joining a domain requires a username and password. This user must have domain administration privileges or privileges to join a computer to the domain.

**Note:** This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the *PowerShell activity designer*, which gives workflow administrators the ability to store input and output variables in the *databus*.

**Input variables**

<table>
<thead>
<tr>
<th>Variables</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of the Windows server that is joining the domain.</td>
</tr>
<tr>
<td>Domain</td>
<td>Name of the domain to join.</td>
</tr>
<tr>
<td>Domain_user</td>
<td>The name of a user who has domain administration privileges or privileges to join a computer to the domain.</td>
</tr>
<tr>
<td>Domain_user_password</td>
<td>The password for the user who has domain administration privileges or privileges to join a computer to the domain.</td>
</tr>
</tbody>
</table>

**Output variables**

<table>
<thead>
<tr>
<th>Variables</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Either <em>success</em> or <em>failure</em>.</td>

<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to join the computer to the domain.</td>
</tr>
</tbody>
</table>

**Install Windows App activity**

The Install Windows App activity installs an application from an MSI package on a Windows target machine.

**Note:** This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the *PowerShell activity designer*, which gives workflow administrators the ability to store input and output variables in the *databus*.

**Input variables**

### Install Windows App input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS <em>MID Server capability</em> to resolve hostnames into IP addresses.</td>
</tr>
<tr>
<td>installerpath</td>
<td>Path to the installer. The installer can be on any machine that is visible to both the MID Server and the target machine (local drive, UNC path, mapped drive, etc.).</td>
</tr>
<tr>
<td>installer</td>
<td>Name of the installer file, such as <em>winzip150.msi</em>. The installer must be an MSI package.</td>
</tr>
<tr>
<td>arguments</td>
<td>The parameter that contains the command line arguments to the MSI package. These are name=value pairs, separated by a space. For example, the argument might appear as: <code>INSTALLDIR=c:\myinstallfolder ADDDESKTOPICON=0</code>. These arguments are dependent on what the actual MSI being installed defines. If there are no arguments, leave the field empty.</td>
</tr>
</tbody>
</table>

**Output variables**

### Install Windows App output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Either <em>success</em> or <em>failure</em>.</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The <em>executionResult.errorMessages</em> from the <em>Activity designer parsing sources</em>.</td>
</tr>
</tbody>
</table>
Conditions

The activity state tells the workflow engine what to do with the activity.

### Install Windows App conditions

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The Windows application was successfully installed on the target machine.</td>
</tr>
<tr>
<td>Failure</td>
<td>The Windows application failed to install on the target machine</td>
</tr>
</tbody>
</table>

**Enable WMI Windows Installer provider**

To install software on Windows machines using the Install Windows App activity, enable WMI Windows Installer provider on all target machines.

- It is recommended that the MID Server, the target machine, and the installer source machine be on the same Active Directory domain. However, if these computers are on separate domains, those domains must have a trust relationship established between them.
- If the installer path is a UNC file sharing machine, the Active Directory account of the target computer must be trusted for delegation. For instructions on this configuration, see the posting on the community for installing and uninstalling Windows applications.

**Note:** See WMI Providers for a list of Windows operating systems that provide this tool by default.

1. Open the Control Panel.
2. Go to Add or Remove Programs.
3. Select Add/Remove Windows Components.
   - This action opens a secondary window displaying additional selections.
5. Select WMI Windows Installer Provider check box.
6. Click OK to return to the Windows Components Wizard window.
7. Click Next.
   - You might be asked for the Windows installation CD to complete this process.

**Change Service State activity**

The Change Service State activity starts or stops a Windows service on a remote system.

This activity replaces a Powershell activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity template, which gives workflow administrators the ability to store input and output variables in the databus.
**Input Variables**

**Change Service State input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS activity to resolve hostnames into IP addresses.</td>
</tr>
<tr>
<td>service</td>
<td>Name of the Windows service to start or stop. The <code>service</code> parameter is the service name, not the display name of the service affected.</td>
</tr>
<tr>
<td>state</td>
<td>There are two actions to select for a service state change: StartService or StopService.</td>
</tr>
</tbody>
</table>

**Output variables**

**Change Service State output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorMessage</td>
<td>The <code>executionResult.errorMessages</code> from the Activity designer parsing sources. If there is no error, this value is null.</td>
</tr>
</tbody>
</table>

**Conditions**

**Change Service State conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The target service was successfully started or stopped.</td>
</tr>
<tr>
<td>Failure</td>
<td>The update to the target service was unsuccessful, or the service was not found on the target system.</td>
</tr>
</tbody>
</table>

**Restart Windows Server activity**

The Restart Windows Server activity stops and then restarts a Windows server using Powershell.

**Note:** This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity template, which gives workflow administrators the ability to store input and output variables in the databus.
Input variables

Restart Windows Server input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of the Windows server to restart.</td>
</tr>
</tbody>
</table>

Output variables

Restart Windows Server output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>

<td>The activity succeeded in restarting the Windows server.</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to restart the Windows server.</td>
</tr>
</tbody>
</table>

Uninstall Windows App activity

The Uninstall Windows App activity uninstalls an application from a Windows target machine.

The only applications that can be uninstalled using this activity are those that were installed by a Windows Installer.

Note: This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

<tbody>
<tr>
<td>Success</td>
<td>The activity succeeded in uninstalling the application from the Windows server.</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to uninstall the application from the Windows server.</td>
</tr>
</tbody>
</table>

### Probe activity pack

Orchestration provides an activity pack customized using the ServiceNow activity designer that runs probes on target hosts to return specific information.

These custom activities were built with the Create a probe activity, which gives workflow administrators the ability to store input and output variables in the databus.

To use the custom probe activities, you must request activation of the Orchestration - Probe plugin.

### Resolve DNS Name activity

The Resolve DNS Name activity takes an IP address or a fully qualified domain name (FQDN), which it resolves into one or more IP addresses.

The domain name is sent through the MID Server to the domain name system (DNS) to resolve the name. If a single IP address is returned, it is stored in two variables: `resolved_ip` and `resolved_ips`. If multiple IP addresses are returned, the first IP address is stored in the `resolved_ip` variable, and all the addresses are stored in the `resolved_ips` variable. If an IP address is provided instead of an FQDN, this address is output directly to both variables. Your ServiceNow instance must have access to a MID Server configured to use Resolve DNS to run this activity.

This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was
built with the *Probe activity template*, which gives workflow administrators the ability to store input and output variables in the *databus*.

**Input variables**

**Resolve DNS Name input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FQDN</td>
<td>The fully qualified domain name to resolve or an IP address.</td>
</tr>
</tbody>
</table>

**Output variables**

**Resolve DNS Name output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>The first IP address of the resolved DNS name.</td>
</tr>
<tr>
<td>ips</td>
<td>Comma separated list of resolved IP addresses.</td>
</tr>
</tbody>
</table>
| result   | One of the following:  
• resolved: Able to resolve the specified DNS name.  
• unresolved: Unable to resolve the specified DNS name. |

**Conditions**

**Resolve DNS Name conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully resolved the DNS name.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to resolve the DNS name.</td>
</tr>
</tbody>
</table>

**SNMP Query activity**

The SNMP Query activity queries an SNMP device.

Your ServiceNow instance must have access to a MID Server configured to use SNMP to run this activity.

This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the *Probe activity template*, which gives workflow administrators the ability to store input and output variables in the *databus*. 
Input variables

SNMP Query input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the SNMP device being queried.</td>
</tr>
<tr>
<td>oids</td>
<td>A list of unique object identifiers used to identify SNMP devices.</td>
</tr>
</tbody>
</table>

Output variables

SNMP Query output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>Description of the SNMP object.</td>
</tr>
<tr>
<td>timeout</td>
<td>Boolean value indicating whether or not the query timed out.</td>
</tr>
<tr>
<td>error</td>
<td>Indicates any error that occurred. If no error occurred, this value is null.</td>
</tr>
<tr>
<td>oid_data</td>
<td>An array of data objects for all unique object identifiers.</td>
</tr>
</tbody>
</table>

Conditions

</tr>
<tr>
<td>Failure</td>
<td>Activity failed to run the query on the target device. Failure could be caused by invalid credentials or a device that is not accessible.</td>
</tr>
</tbody>
</table>

SCCM activity pack

The Microsoft System Center Configuration Management (SCCM) activity pack provides Orchestration activities you can use to manage software deployments and collections on an SCCM server.

You can use SCCM Orchestration activities to deploy and revoke software from an SCCM server or manage user and device collections. The system manages software on an SCCM server using Orchestration activities and workflows.

Client software distribution requires:

- SCCM 2012 R2 and later.
- Powershell 3.x.
- Powershell Remoting enabled.
- The Windows PowerShell x86 execution policy must be set to unrestricted mode.
• Latest version of the SCCM cmdlet library installed on the SCCM server.
• Use the credentials to log onto the SCCM Server and connect via Windows PowerShell from the System Center Configuration Manager console at least once to set the path variable for that credential.

Activate SCCM activities

The Orchestration - System Center Configuration Manager plugin installs the SCCM activity pack that deploys software from an SCCM host and manages user and device collections.

The SCCM plugin is activated automatically when the Orchestration - Client Software Distribution [com.snc.orchestration.sccm_mgnt] plugin is activated, but can be activated separately.

Note: The activities in the SCCM plugin run in the System Center Configuration Manager scope.

1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click Request Plugin to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

![Note: Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.]

| Reason/Comments | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments. |

5. Click Submit.

Configure the MID Server for SCCM activities
