2. From **Type**, select **Object**.
3. Expand the Advanced options for the Object variable whose data structure you want to replace.
4. From **Structure**, select **Start from Template**.
   Flow Designer displays the **Template** field.
5. From **Template**, select the template containing the template you want to load.
   If the Object variable has no existing data structure, Flow Designer loads the data structure into it. If the Object variable has an existing data structure, Flow Designer displays a confirmation dialog to replace the existing structure.
Create a custom action to generate an object from a record

Generate an object from a User record. Learn how to use an Action output to create an object from record values.

Role required: admin

Use this example to see demonstrations of these operations and steps.

- Create action inputs for the User record fields First name, Last name, and Email.
- Lookup a User record matching the action input values.
- Create an action output for a contact object.
- Save the contact object as a template.
- Map contact object values to User record field values.
- Test the action with a sample user.

1. Create an application to store your work.
   Use the Guided Application Creator.
   For example, create My Application.

   The system displays the Flow Designer landing page.

3. Select New > Action
   The system displays the Action Properties dialog.

4. Enter these sample values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Contact Object From User</td>
</tr>
<tr>
<td>Application</td>
<td>My Application</td>
</tr>
<tr>
<td>Accessible From</td>
<td>All application scopes</td>
</tr>
</tbody>
</table>

5. Select Submit.
   The system displays the Action Designer interface.

6. From the Action Outline, select Inputs > Create Input
   The system displays a new action input.

7. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>First name</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Mandatory</td>
<td>True</td>
</tr>
</tbody>
</table>

8. From the Action Outline, select Inputs > Create Input
   The system displays a new action input.

9. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Last name</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Mandatory</td>
<td>True</td>
</tr>
</tbody>
</table>

10. From the Action Outline, select Inputs > Create Input
The system displays a new action input.

11. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Email address</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Mandatory</td>
<td>False</td>
</tr>
</tbody>
</table>

12. From Action Outline, select **Outputs > Create Output**.

   The system displays a new action output.

13. Configure the output variable with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>contact</td>
<td>contact</td>
<td>Object</td>
<td>False</td>
</tr>
</tbody>
</table>

14. From the row for the contact Object, select **Add Child Item**.

15. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>First name</td>
<td>first_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

16. From the row for the contact Object, select **Add Child Item**.

17. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last name</td>
<td>last_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

18. From the row for the contact Object, select **Add Child Item**.

19. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email address</td>
<td>email_address</td>
<td>String</td>
<td>False</td>
</tr>
</tbody>
</table>

20. From the row for the contact Object, select **Toggle Advanced Inputs**.

21. From the Advanced Options, select **Save As Template**.

   The system displays the Save As Template dialog.

22. For **Enter a Name**, enter contact.

23. Click Save.

24. Select **Exit Edit Mode**.

   The System displays the output fields you created.

25. Configure the outputs with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>First name</td>
<td>(step-&gt;Look Up Record step-&gt;Record-&gt;First name)</td>
</tr>
<tr>
<td>Last name</td>
<td>(step-&gt;Look Up Record step-&gt;Record-&gt;Last name)</td>
</tr>
<tr>
<td>Email Address</td>
<td>(step-&gt;Look Up Record step-&gt;Record-&gt;Email)</td>
</tr>
</tbody>
</table>
Note: You can select data pills from the Data pane or from the Data Pill Picker button.

26. Select **Save**.
27. Select **Test**.
   The system displays the Test Action dialog.
28. Enter these test values.
   **Input** | **Value**
   ---|---
   First name | Abel
   Last name | Tuter

29. Select **Run Test**.
   The system runs the action with the test values provided.
30. Select **Action has executed. To view the action, click here**.
   The system displays the action execution details.
31. Review the runtime value for the action **Output data**.
   For example, sample contact object JSON for the user Abel Tuter.
   ```
   { 
     "contact": { 
       "email_address": "abel.tuter@example.com",
       "last_name": "Tuter",
       "first_name": "Abel"
     }
   }
   ```

You have a custom action that looks up a User record and converts it into a contact object.
Customize the action to use your own logic.

**Create a custom flow to generate an object for each record in a list**

Generate an object for each User record in a list. Learn how to use flow logic to iterate through a list of records.
- Role required: admin
- **Create a custom action to generate an object from a record**

Use this example to see demonstrations of these operations and steps.
- Create a flow that runs on a daily schedule.
- Look up User records filtered by the Department provided as an input.
- Add flow logic that runs for each User record you looked up previously.
- Create a contact object for each User record using the custom action you created previously.
- Create a log message for each User record.

1. Navigate to **Flow Designer > Designer**.
   The system displays the Flow Designer landing page.
2. Select **New > Flow**
   The system displays the Flow Properties dialog.
3. Enter these sample values.
4. Select **Submit**.
   The system displays the Flow Designer interface.

5. Select **Click to add a Trigger > Date > Daily**.

6. Select **Done** to close the trigger.

7. Select **Click to add an Action, Flow Logic, or Subflow > Action > ServiceNow Core > Look Up Records**.
   The system adds the action to the flow.

8. For **Table**, select **User (sys_user)**.

9. For **Conditions**, add these values.
   - (Department)(is)(Development) (AND)
   - (Email)(is not empty)

10. Configure these field values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ordder by</td>
<td>Name</td>
</tr>
<tr>
<td>Sort</td>
<td>a to z</td>
</tr>
<tr>
<td>Max Results</td>
<td>1000</td>
</tr>
</tbody>
</table>

11. Select **Done** to close the action.

12. Select **Click to add an Action, Flow Logic, or Subflow > Flow Logic > For Each**.
   The system adds the flow logic to the flow.

13. For **Items**, select **(1->User Records)**.

    **Note:** You can select the Action 1 **User Records** data pill from the Data pane or from the Data Pill Picker button.

14. Select **Done** to close the flow logic.

15. Select the plus icon to add a child item to the For Each flow logic.

16. Select **Action > My Application > Create Contact Object**.

17. For **userRecord (User)**, select **(2->User Record)**.

    **Note:** You can select the Action 2 **User Record** data pill from the Data pane or from the Data Pill Picker button.

18. Select **Done** to close the flow logic action.

19. Select the plus icon to add a child item to the For Each flow logic.

20. Select **Action > ServiceNow Core > Log**.

21. For **Message**, select **(2.1->contact)**.

    **Note:** You can select the Action 2.1 **contact** data pill from the Data pane or from the Data Pill Picker button.

22. Select **Done** to close the flow logic action.

23. Select **Save**.
Script support for complex data

Create and reference complex data from a script. Use a script when your source data comes from a data stream, a REST step response, or a Look Up Records step.

Use script to create complex data when data comes from these sources.

<table>
<thead>
<tr>
<th>Data source</th>
<th>Create/map complex data from</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Stream action response stream</td>
<td>Script Parser step</td>
</tr>
<tr>
<td>REST step response</td>
<td>Script step</td>
</tr>
<tr>
<td>Look Up Records step</td>
<td></td>
</tr>
</tbody>
</table>

Data Stream action response stream

Data Stream actions use a parser script to map stream item values to complex object values. When writing a parser script, use JavaScript methods appropriate to the data stream format. For example, use the `JSON - Scoped` class to parse or encode a JSON data stream.

Parser scripts have access to the data stream input and output objects as well as a `targetObject` property. See Data Stream actions and pagination for more information about parsing a response stream to create complex data.

REST step response

You can convert a REST step response into one or more complex objects by parsing it with a Script step. To access a response from a Script step, you must create an input script variable and map it to the response payload from the prior REST step. See Script step for more information about creating script input variables.

Write a script that maps REST response values to complex object values. When writing REST response script, use JavaScript methods appropriate to the response format such as the JSON `parse()` method.

Note: When you use complex data as the source of a string input, Flow Designer automatically converts it into a JSON string.

You do not need to use a Script step to create a REST request from complex data. You can generate complex data in a prior action or step and then map it to a string input of the REST step. At run time, the action or flow converts the complex data into a JSON representation.

Look Up Records step

While flows can use `For each` flow logic to process a list of records, actions require a Script step. The Script step replaces the `For each` flow logic with JavaScript such as a `For` or `While` loop.

To access record data from a Script step, you must create an input script variable and map it to the record data from the prior look up step. See Script step for more information about creating script input variables.

See Create a custom action to generate an array of objects from a list of records for an example action that converts a list of user records into an array of contact objects.
**Note:** The Look Up Records action does not require a Script step to convert record data into complex data. You can create a custom action to convert a record into an object and apply For each flow logic to the custom action. See [Create a custom action to generate an object from a record](#) and [Create a custom flow to generate an object for each record in a list](#) for an example of creating a complex object without using script.

### Dot-walking object structures

You can reference elements from the structure of an object by dot-walking the path of the structure. All complex data paths start with the name of the data source, which is either the global object for inputs, the global object for outputs, or the name of the array or object you created in script.

Next in the path are the names of each structural element referenced separated by period characters (also known as dots). Listing the names of structural elements is identical to dot-walking a reference field where you list the table structure to a particular reference field.

**Note:** A dot-walk path always lists the name of a structural element rather than its label.

For example, suppose that you define a contact object as an Output variable. The object has the following structure.
Output Variables

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact</td>
<td>contact</td>
<td>Object</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>First name</td>
<td>first_name</td>
<td>String</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Last name</td>
<td>last_name</td>
<td>String</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Email Addresses</td>
<td>email_addresses</td>
<td>Array.Object</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Email Address</td>
<td>email_address</td>
<td>Object</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>type</td>
<td>Choice</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Email</td>
<td>email</td>
<td>String</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Telephone Numbers</td>
<td>telephone_numbers</td>
<td>Array.Object</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Mailing Addresses</td>
<td>mailing_addresses</td>
<td>Array.Object</td>
</tr>
</tbody>
</table>

Sample Contact object

<table>
<thead>
<tr>
<th>Place in structure</th>
<th>Label</th>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent</td>
<td>Contact</td>
<td>contact</td>
<td>Object</td>
</tr>
</tbody>
</table>
The dot-walk path to the **First name** structural element would be `outputs.contact.first_name` while the path to the **Email** structural element would be `outputs.contact.email_addresses[0].email` since you must specify an individual element of the array by its JavaScript index value.

---

**Note:** A dot-walk path omits the name of the repeated element within the array. For example, an array of objects does not have to specify the object element name. However, since objects are containers for other elements, you can specify a child element of the object within a dot-walk path.

---

**Design considerations**

Keep these design considerations in mind when scripting with complex data.

**Use string inputs to convert complex data into a JSON string**

When you map complex data to a string input, Flow Designer automatically converts it into a JSON string. Instead of writing a script, you can add a string input to a REST step and map it to complex data from a prior action or step.

**Save your objects as templates**

Save your objects as templates so you can reuse them in other actions, flows, and Script steps.

**Create script input variables to access prior data**

Create a script input variable for any data you want to access from the action input or a prior step. Map the script input variable to the input or step data pill. For example, map the script input variable to a list of user records you looked up in a prior step.

**Create a script output variable to store complex data**

Create a script output variable to store any complex data your script creates. The script output variable data structure, data types, and names must match the values defined in the script. For example, create a contacts array of objects to store multiple contact objects. Save the contact object as a template so you can reuse it.

**Map the action output to the script output variable**

When you want a custom action to output complex data, add an action output and map it to the data pill for your Script step output variable. For example, create a contacts array and load the contact object template you saved earlier. Map the action output to the contacts array produced by your Script step.
Create a custom action to generate an array of objects from a list of records

Generate an array of objects from a list of User records. Learn how to use a Script step to iterate through a list of records.

Role required: admin

Use this example to see demonstrations of these operations and steps.

- Create an action input for a Department record.
- Look up a maximum of three User records for the Department action input.
- Configure a Script step to process a list of User records.
- Create a script input variable containing the list of User records.
- Write script that creates an empty contacts array.
- Write script that iterates through the list of User records.
- Write script that creates a contact object and maps User record field values to the contact object.
- Write script that populates the contacts array with the current contact object.
- Create script output variables for the contacts array and child contact object.
- Save the contact object as a template.
- Output the generated contacts array of objects as a data pill.
- Test the action with a sample department.

1. Create an application to store your work.
   Use the Guided Application Creator.
   For example, create My Application.
   The system displays the Flow Designer landing page.
3. Select New > Action
   The system displays the Action Properties dialog.
4. Enter these sample values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Contacts Array Of Objects</td>
</tr>
<tr>
<td>Application</td>
<td>My Application</td>
</tr>
<tr>
<td>Accessible From</td>
<td>All application scopes</td>
</tr>
</tbody>
</table>

5. Select Submit.
   The system displays the Action Designer interface.
6. From the Action Outline, select Inputs > Create Input
   The system displays a new action input.
7. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Department</td>
</tr>
<tr>
<td>Type</td>
<td>Record.Department</td>
</tr>
<tr>
<td></td>
<td>(Reference.cmn_department)</td>
</tr>
<tr>
<td>Mandatory</td>
<td>True</td>
</tr>
</tbody>
</table>

8. From the Action Outline, select Add a new step.
   The system displays a list of available steps.
9. Select Look Up Records
10. Configure the step with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>User (sys_user)</td>
</tr>
<tr>
<td>Conditions</td>
<td>(Department)(is)(action-&gt;Department)</td>
</tr>
<tr>
<td>Order by</td>
<td>Name</td>
</tr>
<tr>
<td>Sort Type</td>
<td>a to z</td>
</tr>
<tr>
<td>Max Results</td>
<td>3</td>
</tr>
</tbody>
</table>

**Note:** This example limits the Max Results setting to three records just for demonstration purposes.

11. From the Action Outline, select **Add a new step**. The system displays a list of available steps.

12. Select **Script**.

13. For **Required Runtime**, select **Instance**.

14. From the Input Variables section, select **Create Variable**.

15. Configure the input variable with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>userRecords</td>
</tr>
<tr>
<td>Value</td>
<td>(step-&gt;Look Up Records step-&gt;Records)</td>
</tr>
</tbody>
</table>

**Note:** You can select the **User records** data pill from the Data pane or from the Data Pill Picker button.

16. For **Script**, enter the following text.

```javascript
(function execute(inputs, outputs) {
    //Create an empty array
    var contactsArray = [];
    var i = 0;
    //Iterate through the list of User records
    while(inputs.userRecords.next()) {
        //Create an empty object for each iteration
        var contactObject = {};
        //Query User records to assign object values
        contactObject.first_name = inputs.userRecords.getValue('first_name');
        contactObject.last_name = inputs.userRecords.getValue('last_name');
        contactObject.email_address = inputs.userRecords.getValue('email');
        //Add current object to array
        contactsArray[i] = contactObject;
        i += 1;
    }
    outputs.contacts = contactsArray;
})(inputs, outputs);
```

17. From Output Variables, select **Create Variable**.

18. Configure the output variable with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>contacts</td>
<td>contacts</td>
<td>Array.Object</td>
<td>True</td>
</tr>
</tbody>
</table>
19. From the row for the contact Object, select Add Child Item.
20. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>first name</td>
<td>first_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

21. From the row for the contact Object, select Add Child Item.
22. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>last name</td>
<td>last_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

23. From the row for the contact Object, select Add Child Item.
24. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>email address</td>
<td>email_address</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

25. From the row for the contact Object, select Toggle Advanced Inputs.
26. From the Advanced Options, select Save As Template.
   The system displays the Save As Template dialog.
27. For Enter a Name, enter contact.
28. Click Save.
29. From the Action Outline, select Outputs > Create Output.
30. Configure the Action Output with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>contacts</td>
<td>contacts</td>
<td>Array.Object</td>
<td>True</td>
</tr>
<tr>
<td>contact</td>
<td>contact</td>
<td>Object</td>
<td>False</td>
</tr>
</tbody>
</table>

31. From the row for the contact Object, select Toggle Advanced Inputs.
32. From the Advanced Options, select Structure > Start from Template.
   The system displays Template.
33. For Template, select the template you previously saved.
   For example, select My application: contact.
34. Select Exit Edit Mode.
   The System displays the output fields you created.
35. For contact, select (step->Script step->contacts).
   Note: You can select the Script step contacts data pill from the Data pane or from the Data Pill Picker button.
36. Select OK to confirm structure change.
   The system makes all array of objects child items read-only because they will get their value from the parent object.
37. Click Save.
38. Select Test.
   The system displays the Test Action dialog.
39. Enter these test values.

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Department</td>
<td>Development</td>
</tr>
</tbody>
</table>

40. Select Run Test.

The system runs the action with the test values provided.

41. Select Action has executed. To view the action, click here.

The system displays the action execution details.

42. Review the runtime value for the action Output data.

The system displays output data in JSON format.

For example, sample contacts array of objects JSON for the Development department.

```json
{
  "contacts": [
  {
    "email_address": "allyson.gillispie@example.com",
    "last_name": "Gillispie",
    "first_name": "Allyson"
  },
  {
    "email_address": "alva.pennigton@example.com",
    "last_name": "Pennigton",
    "first_name": "Alva"
  },
  {
    "email_address": "andrew.och@example.com",
    "last_name": "Och",
    "first_name": "Andrew"
  }
]
}
```

You have a custom action that looks up the Users for a given department and converts those users into an array of contact objects.

Customize the action to use your own logic.

**Inline scripts**

Enable users with coding experience to write inline scripts that set and modify input values during the configuration of an action or flow. Use inline scripts to modify input values that require small format conversions, data transformations, or math operations.

Flow Designer displays a Script button when you configure these components.

- Action instance inputs when you configure the action for a flow
- Action instance outputs when you configure the action for a flow
- Flow logic inputs when you configure the flow logic for a flow
- Flow logic outputs when you configure the flow logic for a flow
- Step inputs when you configure the step for an action.
- Subflow inputs when you configure the subflow for a flow.
- Subflow outputs when you configure the subflow for a flow.

Inline scripts must return values in the same data type as the input expects. For example, an inline script for a Record input must return a GlideRecord object and an inline script for a Date input...
must return a date-time value. Always test actions and flows containing inline scripts, and verify
that there are no runtime errors in the flow execution details.

Script writers should be familiar with Now Platform table structures and field types. In addition, they
should know how to work with record and system data using the ServiceNow API.

**Benefits**

Inline scripts offer these benefits.

- Enable simple data conversion or transformation without having to create custom actions or
  flows.
- Identify which input data a script affects.
- Restricted access to scripting features to users or groups who are knowledgeable with the
  available ServiceNow APIs.

**Access to inline script**

You can grant users access to online scripting by either granting them the flow_designer_scripting
role or the Allow Scripting delegated development permission. Both the role and the developer
permission display a script button field for each Flow Designer input.

**Script button**

When you enable a user to create inline scripts, Flow Designer displays a script button next to flow
and step inputs.

Clicking the **Script** button opens the Script editor, which replaces the standard input interface.
Enter a script to compute the input value. Script writers can use the `fd_data` object to access
data from previous actions and steps. Ensure your script includes a `return` statement with the
results of your script. For example, `return shortDesc;` returns the value of the `shortDesc` variable.

Clicking the **Collapse Script** button hides the Script editor and displays a read-only version of the input. Clicking the **Expand Script** button displays the Script editor and allows you to edit the script.
Design considerations

Follow these design guidelines to create reusable and maintainable inline scripts.

**Write inline script for small non-reusable logic**

Use inline script to format or modify the data for specific inputs and use cases. For reusable logic, create an action or subflow instead.

**Create custom actions or subflows for reusable code rather than inline script**

Create custom actions or subflows for reusable or complex data logic such as changing the data type of source data. You may also want to provide custom actions or subflows for flow designers who are not comfortable with code.

**Avoid duplicating action and flow functionality**

Avoid writing inline script that duplicates action and flow functionality. For example, rather than write inline script to perform record operations, use the create and update record baseline actions.

**Avoid data type changes**

Avoid runtime errors by verifying that your inline script provides information in the same data type as the input or output expects.

**Create variables by declaring them with the `var` keyword**

Use the `var` keyword to declare variables so that they remain within the proper JavaScript scope. When you create a variable by assigning it a value, JavaScript may attach it to the global object, which can result in variable values persisting outside of the local scope and causing errors.

**Use type ahead suggestions to generate references to flow and action data.**
Create references to flow and action data using the fd_data object. The script editor displays type ahead suggestions for existing flow and action data when you type fd_data. Select a suggestion to build references to flow and action data.

**Note:** References to data in a flow For Each loop use an item object, which is unique to inline scripts.

### Licensing considerations

Inline scripts that call integration APIs are subject to IntegrationHub licensing.

### Code editor

The code editor provides text editor support for inline scripts.

The code editor has these features for the supported language services and scripts.

- Syntax coloring, indentation, line numbers, and automatic creation of closing braces and quotes
- Auto-suggestions and auto-completions

```plaintext
info

1 /*
2 **Access Flow/Action data using the fd_data object.
3 **example: var shortDesc = fd_data.trigger.current.
4 **return shortDesc;
5 */
6 return(math.sqrt(64));
```

### Code editor

### Editing tips

- To insert a fixed space anywhere in your code, press Tab.
- To indent a single line of code, click in the leading white space of the line and then press Tab.
- To indent one or more lines of code, select the code and then press Tab. To decrease the indentation, press Shift+Tab.
• To remove one tab from the start of a line of code, click in the line and press Shift+Tab.
• To declare variables, use the `var` keyword so that they remain within the proper JavaScript scope.

**Action Designer**

Automate a task with a sequence of related steps such as lookup a record, create a record, and log details about the record creation. Actions separate complexity from the Flow Designer environment, enabling flow designers to add actions to multiple flows with minimal configuration.

Using Action Designer, subject matter experts can:

- Create application-specific actions with pre-set configuration details, enabling process analysts to easily add actions to a flow with little configuration.
- Create scripted actions that appear code-less when added to a flow.
- Build integrations using IntegrationHub.

**Custom actions**

Unlike core actions where flow designers must manually configure flow logic, custom actions always use the same configuration when added to a flow. If your flow designers often use an action with the same configuration, you might create a reusable action.

A reusable action includes these components.

**Inputs**

Inputs are data variables used in your action. For example, if an action step creates a record in the incident table, your input might be a reference to the incident table. Once added as an input, the table and its fields are available to steps and outputs in the flow.

Each input you define for an action becomes a configuration option in the Flow Designer interface. To use the action in a flow, flow designers must define a value for each mandatory input. The more inputs an action has, the more data flow designers must define and the more familiar they must be with the underlying data model to use the action effectively.

Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring an action to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see [field types](#).

**Action steps**

An action step or step is a single reusable operation within an action. For example, the Create Record step allows action designers to specify the table and field values to use during record creation. Action steps require subject matter expertise with application tables, fields, and business logic. Application developers or IT generalists add action steps to actions from the Action Designer design environment. Flow Designer provides a set of core action steps to automate Now Platform processes. You can add application-specific action steps by activating the associated spoke.

**Outputs**

Outputs are data variables that represent the results of the action. These results are available to other actions in a flow.
**Action Designer environment**

Subject matter experts build custom actions in Action Designer.

Create and edit actions by defining inputs and adding action steps. Test actions to verify if they complete successfully and review the runtime values they generate. Copy actions to use existing actions as templates. Publish actions to activate them, which makes them available to activated flows and to preserve their current action steps, variables, and sequence as a snapshot separate from further configuration changes.

**Testing actions**

After adding inputs and action steps, users with the flow_designer role can test an action. To test an action, users must provide the required inputs.

---

**Note:** Inputs must be provided for all the mandatory fields.

Flow designers should always test actions on non-production instances containing relevant demonstration data since testing an action creates or changes records on the instance.

---

**Note:** User must have the flow_designer or admin role to view the executions.

**Roles**

To create custom actions, a user must have the action_designer or admin roles.

**Action input and output data types**

You can define input variables for your Flow Designer actions. Input variables and data used in action steps can be defined as output variables.

Action inputs are data variables with a name and data type. You must associate some data types with a reference table, which makes the record and fields available to the action steps. Available data types include:

- Array
  - Array.Boolean
  - Array.Choice
  - Array.Datetime
  - Array.Integer
  - Array.Object
• Array.String
• Audio
• Choice
• Color
• Condition String
• Conditions – Reference table required
• Currency
• Data Structure
• Date
• Date/Time
• Document ID – Reference table required
• Due Date
• Duration
• Dynamic Choice
• Dynamic Template
• Encrypted Text
• Field Name
• Floating Point Number
• HTML
• IP Address (Validated IPV4, IPV6)
• Icon
• Image
• Integer
• Journal
• Journal Input
• Journal List
• List
• Long
• Name-Value Pairs
• Password (1 Way Encrypted)
• Password (2 Way Encrypted)
• Percent Complete
• Phone Number (E164)
• Price
• Records – Reference table required
• Reference – Reference table required
• Script
• Script (Plain)
• String
• String (Full UTF-8)
• Table Name
• Template Value – Reference table required
• Time
• Translated HTML
• Translated Text
• True/False
• URL
• Video
• Wiki
Advanced options for action inputs

Use advanced options to further configure your inputs.

All

The following options are available for all advanced inputs.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name that identifies the array in script calls.</td>
</tr>
<tr>
<td>Hint</td>
<td>Text to display to flow designers so they know what information the array contains.</td>
</tr>
<tr>
<td>Default Value</td>
<td>The value used when an input value is not provided. For example, the default selection of a choice field or a default string in a string field.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>The input requires a value.</td>
</tr>
</tbody>
</table>

Some action inputs have additional options. The details of these options are listed below.

Array

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max Rows</td>
<td>The maximum number of rows you want to display in the user interface. This does not set a limit on the maximum number of rows in the array object.</td>
</tr>
</tbody>
</table>

Array.Choice

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max length</td>
<td>The maximum length the system stores for an input choice value. Use this option to restrict the length of input values stored during action design.</td>
</tr>
</tbody>
</table>
| Choice | Select from:  
  - Dropdown with --None--  
  - Dropdown without --None-- |
### Choice list

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select from:</td>
<td></td>
</tr>
<tr>
<td>Create New Choice list to manually create choices. Use the add button (+) to create a choice with Name, Value, and Order values.</td>
<td></td>
</tr>
<tr>
<td>Reference existing choice list on a table to select a choice list from and field on an existing table using the Choice Table and Choice field buttons.</td>
<td></td>
</tr>
</tbody>
</table>

### Array.Object

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Structure</td>
<td>Select from:</td>
</tr>
<tr>
<td>Create Structure Manually</td>
<td></td>
</tr>
<tr>
<td>Start from Template</td>
<td></td>
</tr>
<tr>
<td>Template</td>
<td>Select a template to use for this array.</td>
</tr>
<tr>
<td>Save as Template</td>
<td>Save the current array as a template.</td>
</tr>
</tbody>
</table>

### Array.String

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max Length</td>
<td>The maximum length the system stores for an input string value. Use this option to restrict the length of input values stored during action design.</td>
</tr>
</tbody>
</table>

### Password (2 Way Encrypted) design considerations

Follow these guidelines when designing flows containing Password (2 Way Encrypted) data.

- To specify the encryption algorithm and the roles allowed to access encrypted data, see [Setup encryption contexts](#).
- Flow Designer prevents manual entries in Password (2 Way Encrypted) values in flow inputs.
- Fields containing Password 2 data cannot be used in conditions.
- To assign a value to a password2 field, drag an existing password2 data pill. Dragging values from other field types is not supported. Flow Designer presents a warning message when password2 data is required.
Flow Designer prevents dragging Password2 data pills into other field types, and presents a warning message when the field is incompatible type.

Flow Designer only allows Password2 data pills to be dragged into the following field types.

- Email body fields
- HTML fields
- Password 2 Fields
- PowerShell Input Variables
- REST fields
  - Variables
  - REST payload body
  - Query parameters
  - Headers
  - REST multi-part form values
  - Form URL-encoded values
- SOAP fields
  - Headers
  - Envelope

Flow Designer performs a validation check when a user saves, publishes, or tests actions and flows. This check shows an alert for any data pills dropped in restricted field types and prevents the action or flow from executing. Update the action or flow to remove the invalid data pill and then retry the action.

**Retry policy**

Automatically retry failed requests when a step encounters an intermittent issue such as a network failure or request rate limit. Set a retry policy to prevent having to manually triggering the step again.

**Features**

Retry policies can be:
• Created to support connection timeouts or failed requests based on header, status, response body, error, and HTTP method.
• Applied to all actions that use a given connection alias.
• Applied directly to an action step

Retry policies can be used to define:
• The conditions that must be met to retry a step.
• The time interval to wait before retrying a step.
• The maximum number of retry attempts the step makes before stopping.

Associate a default retry policy to a Connection & Credentials alias and apply the retry policy to all HTTP connections.

**Note:** You can only create retry policies for REST and SOAP steps.

### Create a retry policy

Role required: flow_designer or admin

1. Navigate to **IntegrationHub > Retry Policy > Create New**.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the retry policy.</td>
</tr>
<tr>
<td>Connection Type</td>
<td>HTTP</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions that must be met to trigger the retry policy. Conditions that trigger a retry policy include the <code>is</code>, <code>is not</code>, <code>contains</code>, and <code>contains not</code> operators.</td>
</tr>
<tr>
<td>Retry Strategy</td>
<td><strong>Exponential Backoff</strong> Option to exponentially increase the time interval for the subsequent retry attempts. The multiplier is 2. <strong>Fixed Interval</strong>: Option to specify a fixed time interval after which a retry attempt should be made.</td>
</tr>
<tr>
<td>Interval (seconds)</td>
<td>Time interval in seconds after which a retry attempt should be made.</td>
</tr>
</tbody>
</table>

**Note:** If Retry Strategy is **Exponential Backoff**, the time interval exponentially increases after every retry attempt till the maximum numbers of attempts is reached.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Maximum number of retry attempts. If no value is specified, the maximum number of retry attempts is based on the value provided in the <code>glide.fdih.retry.max_count</code> system property. Default value of the <code>glide.fdih.retry.max_count</code> system property is 0. For more information about system properties, see <a href="#">Available system properties.</a></td>
</tr>
</tbody>
</table>

3. Click **Submit**.
Retry policy with Retry Strategy as Exponential Backoff

In this example, the policy is defined to attempt retry when one of these conditions is met:

- HTTP Method is GET and Error is Connection Timeout
- HTTP Method is GET and Status Code is 429

When the condition is met, retry attempts are made for a maximum number of three times. The time interval between the retry attempts is exponentially
increased. The time intervals in this example are 10 seconds, 20 seconds, and 40 seconds.

- **Create Connection & Credential alias**, if you do not have the required alias.
- Assign the retry policy as **Default Retry Policy** to the required Connection & Credential alias.

  **Note:** A default retry policy is provided and is selected as **Default Retry Policy**. If you have created retry policies, you can select the required policy as **Default Retry Policy**.

- Create an HTTP(s) Connection in the Connections related list for the Connection & Credential alias. For more information, see **credentials, connections, and aliases**.
- Verify and view the details of the retry attempts by navigating to **System Logs > Outbound HTTP Requests**.

**Dynamic inputs**

Build dynamic choice and template inputs for an action. Dynamically display and assign values to the inputs during flow design.

  **Note:** Dynamic inputs are not available in the base system. To use dynamic inputs in Flow Designer, you must request a **ServiceNow® IntegrationHub Enterprise Pack subscription**.

During flow design, dynamic inputs retrieve values and display them as inputs within an action dynamically. Dynamic input types include:

- Dynamic choice
- Dynamic template

A dynamic input must point to a data gathering action that collects the data it displays. For example, a data gathering action can retrieve values from a third-party system and populate a dynamic choice for an action that runs in an IntegrationHub spoke. To use a dynamic input in Flow Designer:

1. An action designer creates a data gathering action.
2. An action designer creates a parent action with a dynamic input that points to the child data gathering action.
3. A flow designer adds the parent action to a flow.

**Data gathering actions**

A data gathering action collects data, typically from a third-party system via a REST call, and dynamically builds its output based on the returned payload. A data gathering action must:

- Have a **script step** that contains an output variable of type JSON.
- Have an action output named **output** of type JSON whose value is derived from the script step's JSON output variable.

  **Note:** The action can have multiple outputs, but there can only be one of type JSON.

- Format the payload in the script step so that **output** has a property named **data**.
- Wait for up to 300 seconds (5 minutes) to gather data before it times out.
Dynamic choice

A dynamic choice displays gathered data as a list of choice values during flow design. For more information on building a dynamic choice, see Create a data gathering action for a dynamic choice.

Dynamic template

A dynamic template displays a gathered list of fields whose associated values can be specified during flow design. Since the list of fields populates using a dynamic action, there is no need to change the flow if new fields are added to or removed from the table accessed in the data gathering action. For more information on building a dynamic template, see Create a data gathering action for a dynamic template.

Design considerations

Consider dynamic inputs for third-party integrations

Dynamic inputs allow you to create flows that fetch data dynamically from external sources. In third-party integrations, dynamic inputs can provide data values pertaining to a particular endpoint. For more information on setting up third-party integrations with Flow Designer, see IntegrationHub.

Be aware of time required to retrieve large amounts of data

By default, dynamic inputs have up to 300 seconds to gather data before they time out. If your data gathering action needs more time to gather data, set the \texttt{sn\_flow\_designer.sync\_action\_execution\_timeout\_in\_seconds} system property to a higher value. Long timeout values are not recommended for interactive flows where an end user must enter or select a value for the flow to continue.

Be aware of scripting errors

Since all data gathering actions use a script step, be aware of any potential errors that could arise from scripting. When using scripts to output JSON variables for your dynamic inputs, you may encounter errors which prevent inputs from receiving the JSON values they need. When a dynamic input scripting error occurs, the following warning message may appear.

![Warning: A dynamic action error occurred.](image)

Message displayed for scripting error
Getting started with dynamic inputs

Create a sample action that builds a dynamic choice and dynamic template for use in a flow.

Role required: action_designer or admin

In this task, you will create a custom action that dynamically generates a list of tables and associated fields in your instance. To accomplish this, you will create two data gathering actions: one that collects a list of tables in your instance, and another that collects a list of fields for the selected table. Each data gathering action will consist of the following:

- A REST step to gather table and field data from your instance.
- A script step to construct the payload from the REST step's **Response Body**.
- An output variable named **output** of type JSON.

You will then use these data gathering actions to build a dynamic choice and a dynamic template. Finally, you will create a custom action that calls the data gathering action during flow design.

---

**Note:** This task recreates the demo actions that are installed when you request a ServiceNow® IntegrationHub Enterprise Pack subscription for your instance.

1. Navigate to **Flow Designer > Designer**.
2. Click the **New** button and select **New Action**.
   a) Enter **Get ServiceNow Tables (Dynamic)** for the **Name**.
   b) Click **Submit**.
3. Under **Action Outline**, click the **Add a new step** icon under **Inputs** and select the **REST** step. Enter the following information.

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Leave <strong>Use Connection Alias</strong> selected</td>
</tr>
<tr>
<td>Connection Alias</td>
<td></td>
</tr>
<tr>
<td>Build Request</td>
<td>Leave <strong>Manually</strong> selected</td>
</tr>
<tr>
<td>Resource Path</td>
<td>Enter api/now/doc/table/schema</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>Enter GET</td>
</tr>
</tbody>
</table>

4. Under **Action Outline**, click the **Add a new step** icon under your REST step and select the **Script** step.
   a) In the **Input Variables** section, click **Create Variable**.
b) Enter payload as the Name.

c) For the Value, click the data pill picker ( ) and select REST Step > Response Body.

d) Enter the following code for the Script.

```javascript
(function execute(inputs, outputs) {
  var payload = JSON.parse(inputs.payload);
  var tables = payload.result
    .filter(function(table) { return table.value.indexOf('_') < 0; }) // Filter the tables we want
    .map(function(table) {
      return { label: table.label, name: table.value };
    });
  outputs.tables = { data: tables }; // Final, properly formatted output
})(inputs, outputs);
```

e) In the Output Variables section, click Create Variable.

f) Enter tables for the Label and Name.

g) Select JSON as the Type.

5. Under Action Outline, click Outputs.

a) Click Create Output.

b) Enter output for the Label and Name.

c) Select JSON as the Type.

d) Click Exit Edit Mode.

e) For the Value, click the data pill picker ( ) and select Script Step > tables.

6. Click Save and then test the action.

a) Click Run Test.

b) Check the action's execution details. Your data gathering action runs successfully if the runtime value for tables is a complex object containing an array of key-value pairs for label and name as shown in the following abbreviated example.

```json
{
  "data": [
    {
      "name": "sla",
      "label": "Agreement"
    },
    {
      "name": "announcement",
      "label": "Announcement"
    },
    {
      "name": "cmdb",
      "label": "Base Configuration Item"
    },
    {
      "name": "checklist",
      "label": "Checklist"
    }
  ]
}
```
7. Click **Publish** to make the Get ServiceNow Tables (Dynamic) action available to other flows and actions within the Global scope.

8. Click the **Create flow, subflow, or action** icon and select **Action**.
   a) Enter Get ServiceNow Fields (Dynamic) for the **Name**.
   b) Click **Submit**.

9. Under **Action Outline**, click **Inputs**.
   a) Click **Create Input**.
   b) Enter **Table** for the **Label** and **Name**.
   c) Select **String** as the **Type**.
   d) Toggle the **Mandatory** slider so that it is active.

10. Under **Action Outline**, click the **Add a new step** icon under **Inputs** and select the **REST** step. Enter the following information.

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Leave Use Connection Alias selected</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Click the <strong>Create new record</strong> icon to create a new HTTP(s) connection, or use an existing connection for your instance. The Credential for the HTTP(s) connection must use basic auth. Additionally, the Connection URL must be the base URL for your instance, including the forward slash at the end.</td>
</tr>
<tr>
<td>Build Request</td>
<td>Leave Manually selected</td>
</tr>
<tr>
<td>Resource Path</td>
<td>Enter api/now/table/ and then click the data pill picker (.), Select Inputs &gt; Table.</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>Enter GET</td>
</tr>
</tbody>
</table>

11. Under **Action Outline**, click the **Add a new step** icon under your REST step and select the **Script** step.
   a) In the **Input Variables** section, click **Create Variable**.
   b) Enter **payload** as the **Name**.
   c) For the **Value**, click the data pill picker (.) and select **REST Step > Response Body**.
   d) Enter the following code for the **Script**.

```javascript
(function execute(inputs, outputs) {
  var payload = JSON.parse(inputs.payload);
  var fields = Object.keys(payload.result[0])
  })
```
.map(function(property) {
    return {
        label: property.charAt(0).toUpperCase() +
        property.slice(1).replace(/_/g, ' '),
        name: property,
        value: '' // value is always empty
    };
    })
outputs.fields = { data: fields }; // final properly formatted output
})(inputs, outputs);

e) In the **Output Variables** section, click **Create Variable**.

f) Enter **fields** for the **Label** and **Name**.

g) Select **JSON** as the **Type**.

12. Under **Action Outline**, click **Outputs**.

a) Click **Create Output**.

b) Enter **output** for the **Label** and **Name**.

c) Select **JSON** as the **Type**.

d) Click **Exit Edit Mode**.

e) For the **Value**, click the data pill picker ( ) and select **Script Step > fields**.

13. Click **Save** and then **test the action**.

a) Enter **incident** for the **Table** input.

b) Click **Run Test**.

c) Check the action's execution details. Your data gathering action runs successfully if the runtime value for **fields** is a complex object containing an array of key-value pairs for **label**, **name**, and **value** as shown in the following abbreviated example.

```json
{
  "data": [
    {
      "name": "Parent",
      "label": "parent",
      "value": ""
    },
    {
      "name": "Made sla",
      "label": "made_sla",
      "value": ""
    },
    {
      "name": "Caused by",
      "label": "caused_by",
      "value": ""
    },
    {
      "name": "Watch list",
      "label": "watch_list",
      "value": ""
    }, ...
  ]
}
```
14. Click **Publish** to make the **Get ServiceNow Fields (Dynamic)** action available to other actions within the Global scope.

15. Click the **Create flow, subflow, or action** icon and select **Action**.
   a) Enter **Create ServiceNow Record (Dynamic)** for the **Name**.
   b) Click **Submit**.

16. Under **Action Outline**, click **Inputs**.
   a) Click **Create Input**.
   b) Enter **Table** for the **Label** and **Name**.
   c) Select **Dynamic Choice** as the **Type**.
   d) Toggle the **Mandatory** slider so that it is active.
   e) Expand the **Advanced options**.
   f) Under **Dynamic Options**, select **Get ServiceNow Tables (Dynamic)** as the **Action**.
   g) Click **Create Input** to create another action input.
   h) Enter **Fields** for the **Label** and **Name**.
   i) Select **Dynamic Template** as the **Type**.
   j) Toggle the **Mandatory** slider so that it is active.
   k) Expand the **Advanced options**.
   l) Under **Dynamic Options**, select **Get ServiceNow Fields (Dynamic)** as the **Action**.
   m) Toggle the **Depends-On Another Input** slider to make it active.
   n) Select **Table** for the **Table** input.

17. Under **Action Outline**, click the **Add a new step** icon under **Inputs** and select the **Script** step.
   a) In the **Input Variables** section, click **Create Variable**.
   b) Enter **table** as the **Name**.
   c) For the **Value**, click the data pill picker and select **Inputs > Table**.
   d) Click **Create Variable** to create another input variable.
   e) Enter **fields** as the **Name** and **String**.
   f) For the **Value**, click the data pill picker and select **Inputs > Fields**.
   g) Enter the following code for the **Script**.

   ```javascript
   (function execute(inputs, outputs) {
   var gr = new GlideRecord(inputs.table);
   gr.applyEncodedQuery(inputs.fields);
   gr.insert();
   })(inputs, outputs);
   ```

18. Click **Save** and then **test the action**.
   a) Select any dynamically-generated choice value for the **Table** input.
b) Click **Add Field Value**. Then, select a field and enter any value.

c) Click **Run Test**.

d) Check the action’s execution details. Your action runs successfully if the runtime values for Table and Field match the values you entered for the test.

19. Click **Publish** to make the **Create ServiceNow Record (Dynamic)** action available to flows within the Global scope.

You can now add the **Create ServiceNow Record (Dynamic)** action to a flow in Flow Designer. This sample action dynamically generates a list of tables and associated fields in your instance whose values you can assign during flow design.

**Create a data gathering action for a dynamic choice**

Create an action to collect input values to pass to a parent action as a dynamic choice.
Role required: action_designer or admin

1. Navigate to Flow Designer > Designer.
2. Click the New button and select New Action.
3. Enter a Name for your action and choose the proper Application scope. Then, click Submit.
4. Under Action Outline, click the Add a new step(+) icon under Inputs and select the REST step. Configure your REST step to get data from the proper Base URL and Resource Path with any applicable Query Parameters for the HTTP Method GET. For more information on using the REST step in IntegrationHub, see REST step and REST in IntegrationHub.
5. Under Action Outline, click the Add a new step(+) icon under your REST step and select the Script step. This script step must transform the REST step’s Response Body into a format that can be used as a dynamic choice for a parent action. Format the JSON output variable so that it contains a property named data with a structure similar to the following example.

```json
{
    data: [
        {
            label: "Choice Option 1",
            name: "choice_option_1"
        },
        {
            label: "Choice Option 2",
            name: "choice_option_2"
        },
        {
            label: "Choice Option 3",
            name: "choice_option_3"
        }
    ]
}
```

6. Under Action Outline, click Outputs. Create an output named output of type JSON. Then, use the data pill picker ( ) to assign the data pill for the JSON output variable from your script step to the action output’s Value.

Note: The action can have multiple outputs, but there can only be one of type JSON.

7. Click Save and test the action. In the execution details, your data gathering action runs successfully if the runtime value for output contains the data property in the proper format.
8. Click Publish to make the action available to other flows and actions within the same application scope.
You can now use your data gathering action to populate the options that appear for a dynamic choice input in a parent action.

Create a data gathering action for a dynamic template

Create an action to collect input values to pass to a parent action as a dynamic template.

Role required: action_designer or admin

1. Navigate to Flow Designer > Designer.
2. Click the New button and select New Action.
3. Enter a Name for your action and choose the proper Application scope. Then, click Submit.
4. Under **Action Outline**, click the **Add a new step** icon under **Inputs** and select the **REST step**. Configure your REST step to get data from the proper **Base URL** and **Resource Path** with any applicable **Query Parameters** for the **HTTP Method** GET. For more information on using the REST step in IntegrationHub, see **REST step** and **REST in IntegrationHub**.

5. Under **Action Outline**, click the **Add a new step** icon under your REST step and select the **Script step**. This script step must transform the REST step's **Response Body** into a format that can be used as a dynamic choice for a parent action. Format the JSON output variable so that it contains a property named **data** with a structure similar to the following example.

```json
{
  data: [
    {
      label: "Template Option 1",
      name: "template_option_1",
      value: "",
    },
    {
      label: "Template Option 2",
      name: "template_option_2",
    },
    {
      label: "Template Option 3",
      name: "template_option_3",
      value: "",
      type: "choice",
      choices: [
        { label: "Choice 1", value: "choice_1" },
        { label: "Choice 2", value: "choice_2" }
      ]
    }
  ]
}
```

**Note:** The JSON output structure for a dynamic template can include the optional properties **type** and **choices**.

- **type**: Specify a valid field type to render the appropriate UI control for the dynamic template.
- **choices**: If specifying choice for the type property, you can then specify an array of choice options that will render in a list for the dynamic template.

6. Under **Action Outline**, click **Outputs**. Create an output named **output** of type **JSON**. Then, use the data pill picker to assign the data pill for the JSON output variable from your script step to the action output's **Value**.

**Note:** The action can have multiple outputs, but there can only be one of type **JSON**.

7. Click **Save** and **test the action**. In the execution details, your data gathering action runs successfully if the runtime value for **output** contains the **data** property in the proper format.

8. Click **Publish** to make the action available to other flows or actions within the same application scope.
You can now use your data gathering action to populate the options that appear for a dynamic template input in a parent action.

**Dynamic input configuration options**

Use these options to configure your dynamic inputs for a parent action.

**Dynamic input configuration**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter a label that will appear for the action input when the action is added to a flow.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the dynamic choice or template.</td>
</tr>
<tr>
<td>Max length</td>
<td>Enter the maximum character length for one choice or template field value.</td>
</tr>
<tr>
<td>Hint</td>
<td>Enter a hint to display for the dynamic input.</td>
</tr>
<tr>
<td>Choice</td>
<td>Select from: Dropdown with --None--.</td>
</tr>
<tr>
<td></td>
<td>Dropdown without --None--</td>
</tr>
<tr>
<td>Default Value</td>
<td>Enter a string value to use as a default for the dynamic input.</td>
</tr>
<tr>
<td>Action</td>
<td>Select a data gathering action that generates values as JSON output.</td>
</tr>
<tr>
<td>Depends-on Another Input</td>
<td>Enable this option to require an input value from the parent action to be passed as an input to the data gathering action. If enabled, select a dependent input from the parent action.</td>
</tr>
</tbody>
</table>

### Create an action

Create a reusable component to automate one or more steps of a process.

- Setting up an application in Guided Application Creator to store Flow Designer content.
- Role required: flow_designer, action_designer or admin

Action designers should know the application table structure and be aware of any existing business logic associated with the target tables of an action. Be sure to disable any conflicting business rules or workflows before creating an action.

Creating a custom application to contain your Flow Designer content enables you to deploy it using the application repository or the ServiceNow Store.

1. Navigate to Flow Designer > Designer.
2. Click the Actions tab and select New Action.
3. Fill in the Action Properties and click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of action.</td>
</tr>
<tr>
<td>Accessible From</td>
<td>Accessible from all application scoped or only within the specified application scope.</td>
</tr>
<tr>
<td>Category</td>
<td>Defined category within the application scope for an action.</td>
</tr>
<tr>
<td>Protection</td>
<td>Select whether the action is read-only. You can only select a value when you create the action in an application scope you own. The default value is None.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the action.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the action.</td>
</tr>
<tr>
<td>In-Flow Annotation</td>
<td>Help text that appears under the action title in Flow Designer to help flow designers understand what the action does when used in a flow.</td>
</tr>
</tbody>
</table>
An empty action opens.

4. Define action inputs to make data available to the action steps and outputs.
   a) Select + Create Input and complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the input. This value is used as the name of the data pill in the right-hand pane.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type of the input. For supported data types, see Action input and output data types.</td>
</tr>
<tr>
<td>Reference Table</td>
<td>Reference table for the data type. Only required for the following data types:</td>
</tr>
<tr>
<td></td>
<td>• Conditions</td>
</tr>
<tr>
<td></td>
<td>• Document ID</td>
</tr>
<tr>
<td></td>
<td>• Records</td>
</tr>
<tr>
<td></td>
<td>• Reference</td>
</tr>
<tr>
<td></td>
<td>• Template Value</td>
</tr>
<tr>
<td>Advanced options</td>
<td>Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring an action to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see field types.</td>
</tr>
</tbody>
</table>

Click to view the advanced options and define values.

Inputs are represented as data pills in the right-hand pane. You can add inputs to steps and outputs in the flow by dragging and dropping data pills.

5. Add an action step to perform an operation on the action inputs.
   a) Click the + underneath Inputs in the Action Outline.
   b) Select the step you would like to perform.
   c) Complete the fields in the step.

6. Add action outputs to make data available to a flow.
   a) Select + Create Outputs and complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the output. This value is the name of the data pill in the right-hand pane when the action is added to a flow.</td>
</tr>
<tr>
<td>Value</td>
<td>Data used previously in the action either in a step or input. Adding a variable to the output makes the value available to the flow.</td>
</tr>
</tbody>
</table>

7. Click Save.
   Action Designer saves a draft of the action.
Test the action until it is ready to be published.

**Note:** By default, the system only runs published actions.

**Test an action**

Test an action before publishing it for other users.

- [Create an action](#) and save it.
- Role required: flow_designer, flow_operator, action_designer, or admin.

Flow designers should always test actions on non-production instances containing relevant demonstration data since testing an action creates or changes records on the instance.

1. Navigate to Flow Designer > Designer.
2. Click the Actions tab and select the action you want to test.
3. Click Test.
   The system displays the Test Action dialog. The Test Action dialog contains all the inputs.
4. Provide the inputs for the action.

   **Note:** Inputs must be provided for all the mandatory fields.

5. Click Run Test.

   Click Action has been executed. To view the action, click here to view the action execution details. See [Flow execution details](#) for information about the executions.

   **Note:** Users must have the flow_operator or admin role to view the executions.

**Ask for Approval step**

Request approval for a record with an approval field. You can configure a rule set for an approval, rejection, or cancellation. If a due date is added to an approval, the approval is automatically approved, rejected, or canceled if the approvers have not responded by the designated time.

*Approvals* is a platform feature that enables users or groups to approve or reject a task.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Select a record under the data panel and drag the record pill into the Record field. If selecting a table with an approval field already configured, the Approval field is set to the correct field.</td>
</tr>
<tr>
<td>Table</td>
<td>Set to the table name associated with the record.</td>
</tr>
<tr>
<td>Approval field</td>
<td>Select a field from the designated table to use for approval.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Journal field</td>
<td>Select a field from the designated table to use for journal.</td>
</tr>
</tbody>
</table>
| Rules      | Define the approval and rejection rules. Approval rules determine which users can approve or reject requests, and what happens after approval or rejection. Approval or rejection rules include:  
  • Anyone approves  
  • All users approve  
  • All responded and anyone approves  
  • % of users approve  
  • # of users approve  
  In the field beside the approval rule, add the desired approvers. To add approvers:  
  • Select individual users or groups.  
  • Drag-and-drop or select a field from a record.  
  • Select to allow a manual approver to process an approval or rejection. A manual approver is a user manually added to the Approvers related list who can then approve the request. For example, you can manually add a subject matter expert to a task to approve the request. To learn more about adding manual approvers, see Generate approvals using the approvers related list.  
  Define rejection rules by adding another OR rule set. When defining approvals, include rejection rules that run when there are no matching approvals. Such rejection rules prevent the flow from remaining in a waiting state. For example, if an approval can be approved by anyone, create a time-based rejection rule in case no one approves it.  
  Note: If you set an approval rule with no rejection rule (or vice versa) and the expected approval state is not met, the runtime value will be canceled.  
| Due Date   | Define a due date to ensure that the flow does not remain in a waiting state if the request is not approved or denied.  
  • None: The approval is not dependent on a specific date.  
  • Approve: Automatically approve the step if an action is still pending by the specified date.  
  • Reject: Automatically reject the step if an action is still pending by the specified date.  
  • Cancel: Automatically cancel the step if an action is still pending by the specified date. |
Example

### Create Record step

Creates a record on any table. You can dynamically add and configure fields for the record.

### Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
</tbody>
</table>
Create or Update Record step

Create or update a record in a ServiceNow table by determining if it already exists. Add records that do not exist, and update existing ones. Identify existing records by selecting unique fields. Set field values dynamically and enforce server-side validation rules (data policy, business rules, dictionary-defined mandatory fields). UI policy does not apply.

Roles and availability

Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Values</td>
<td>Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select <strong>Short description</strong> and set the desired value. To add dynamic values, see <a href="#">Allow flow designers to dynamically set field values</a>.</td>
</tr>
</tbody>
</table>

Create Task step

Create a task on any ServiceNow task table. After you choose the task table, you can dynamically select the fields to configure the action. Defining the Parent field associates the task to a parent record.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Table | Select a task table.  
- Catalog Task (sc_task)  
- Change Phase (change_phase)  
- Change Request (change_request)  
- Chat Queue Entry (chat_queue_entry)  
- Feature Task (release_task)  
- Follow On Task (cert_follow_on_task)  
- Group approval (sysapproval_group)  
- Guided Setup Task (gsw_task)  
- IMAC (change_request_imac)  
- Incident (incident)  
- Incident Task (incident_task)  
- KB Submission (kb_submission)  
- Orphan CI Remediation (orphan_ci_remediation)  
- Private Task (vtb_task)  
- Problem (problem)  
- Problem Task (problem_task)  
- Reclassification Task (reclassification_task)  
- Recommended Field Remediation (recommended_field_remediation)  
- Remediating Duplicate Task (reconcile_duplicate_task)  
- Release Phase (release_phase)  
- Renew Lease Task (statemgmt_renew_lease_task)  
- Request (sc_request)  
- Request new Knowledge Base  
- (kb_knowledge_base_request)  
- Requested Item (sc_req_item)  
- Required Field Remediation (required_field_remediation)  
- Security Case (sn_ti_case)  
- Security Incident (sn_si_incident)  
- Security Incident Response Task (sn_si_task)  
- Security Request (sn_si_scan_request)  
- Service Order (sm_order)  
- Service Order Task (sm_task)  
- Service Task (service_task)  
- Stale CI Remediation (stale_ci_remediation)  
- Standard Change Proposal (std_change_proposal)  
- Ticket (ticket) |

### Field Values

Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select **Short description** and set the desired value.

To add dynamic values, see [Allow flow designers to dynamically set field values](#).

To associate the task with a parent record, define the **Parent** field.
Delete Record step

Deletes a record on any table.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be deleted. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
</tbody>
</table>

Log step

Logs a message in the Flow Designer log table.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log level</td>
<td>Level of importance of the log message.</td>
</tr>
<tr>
<td></td>
<td>- Error</td>
</tr>
<tr>
<td></td>
<td>- Warn</td>
</tr>
<tr>
<td></td>
<td>- Info</td>
</tr>
<tr>
<td>Log message</td>
<td>Message to display in the log. Enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>
Look Up Record step
Look up a record from any table based on defined conditions.

Roles and availability
- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the Conditions field. When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format (reference field)(is)(Reference type data pill-&gt;Sys ID). For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition (Requested by)(is)(action-&gt;incident-&gt;Caller-&gt;Sys ID) where incident is an input variable for an incident record.</td>
</tr>
<tr>
<td>Order by</td>
<td>Determines how to sort results when more than one record matches the defined conditions. Select the field you want to use to sort results.</td>
</tr>
<tr>
<td>Sort Type</td>
<td>Select whether to sort alphabetically in ascending or descending order.</td>
</tr>
<tr>
<td>If multiple records are found</td>
<td>Determines what is returned if more than one record matches the defined conditions.</td>
</tr>
<tr>
<td></td>
<td>• Return only the first record</td>
</tr>
<tr>
<td></td>
<td>• Fail the step</td>
</tr>
</tbody>
</table>
Example

1. Look Up Record step

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Incident [incident]</td>
</tr>
<tr>
<td>Condition</td>
<td>All of these conditions must be met</td>
</tr>
<tr>
<td>Active</td>
<td>is</td>
</tr>
<tr>
<td>State</td>
<td>is</td>
</tr>
<tr>
<td>Short description</td>
<td>is</td>
</tr>
<tr>
<td>Order by</td>
<td>Short description</td>
</tr>
<tr>
<td>Sort Type</td>
<td>a to z</td>
</tr>
<tr>
<td>If multiple records are found</td>
<td>Return only the first record</td>
</tr>
</tbody>
</table>

Look Up Records step

Look up multiple records on any table using defined conditions.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Conditions</td>
<td>Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the Conditions field. When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format (reference field)(is)(Reference type data pill-&gt;Sys ID). For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition (Requested by)(is)(action-&gt;incident-&gt;Caller-&gt;Sys ID) where incident is an input variable for an incident record.</td>

<tr>
<td></td>
<td>State ▼ is ▼ New</td>
</tr>
<tr>
<td></td>
<td>or</td>
</tr>
<tr>
<td></td>
<td>New Criteria</td>
</tr>
<tr>
<td>Order by</td>
<td>Short description</td>
</tr>
<tr>
<td>Sort Type</td>
<td>a to z</td>
</tr>
<tr>
<td>Max Results</td>
<td>1000</td>
</tr>
</tbody>
</table>
Notification step

Trigger a notification as a step within an action by selecting a record (such as an incident, change request, problem, or user record) to trigger a notification and defining the associated notification.

**Notifications** is a platform feature. Before triggering a notification as an action step in Flow Designer, ensure that the notification is set up for use in the platform.

- When you [create or update the notification](#), set the **Send when** field in the **When to send** tab of the Notification form to **Triggered**.
- Verify that your users have an active primary email channel and that all their notifications are active.

Roles and availability

- Available as an Action Designer action step. Users with the **action_designer** role can create a custom action with one or more action steps.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Record     | Drag-and-drop an input record or a record from a previous step. This is the record that will trigger a notification.  
**Note:** Some notifications are not associated with a specific record or table, such as the **Passwords Require Updating** notification. If configuring such a notification, leave this field blank. |
| Table name | Read-only. Set to the table of the triggering record. |
| Notification | Select the notification to be triggered. The notifications that can be selected are associated with the table of the specified record. If no record was selected, you can select a notification that does not have an associated record or table. To create notifications, see [Create an email notification](#). |

### Example

1. **Notification step**

   ![Notification step example](image)
## Payload Builder step

Enable action designers to easily create name-value pairs in JSON and XML payloads using dynamic data.

### Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

### Fields

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
</table>
| Name Value Pairs     | The name-value pairs to include in the payload. Click the plus icon to add name-value pairs. Drag data pills into either field to produce dynamic payloads. The Name becomes a key in JSON and an element in XML. For example, suppose you create this name-value pair.  
- **Name**: `short_description`
- **Value**: `[action]->[short_description]`

When the system formats the name-value pair as JSON:

```json
"short_description": "[action]->[short_description]"
```

When the system formats the name-value pair as XML:

```xml
```

<table>
<thead>
<tr>
<th>Omit if empty</th>
<th>The option to exclude a name-value pair if the value is empty or null.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> This field is only visible after clicking the down arrow to display advanced options.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output Format</th>
<th>The payload file format.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>JSON</strong>: Select to format the payload as a JSON document.</td>
<td></td>
</tr>
<tr>
<td><strong>XML</strong>: Select to format the payload as an XML document.</td>
<td></td>
</tr>
<tr>
<td><strong>Fields</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>-------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Namespace</td>
<td>The XML namespace to apply to each element. For example, when the namespace is set to <code>incident</code>:</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when the <strong>Output Format</strong> is set to <strong>XML</strong>.</td>
</tr>
<tr>
<td>Include Outer Structure</td>
<td>The option to include or exclude a top level container appropriate to the output format. When the <strong>Output Format</strong> is JSON, curly braces contain the name-value pairs. When the <strong>Output Format</strong> is XML, a specified XML element contains the name-value pairs.</td>
</tr>
<tr>
<td></td>
<td>For example, when the system formats the name-value pair as JSON:</td>
</tr>
<tr>
<td></td>
<td><code>{  &quot;short_description&quot;: &quot;[action]-[short_description]&quot; }</code></td>
</tr>
<tr>
<td></td>
<td>When the system formats the name-value pair as XML:</td>
</tr>
</tbody>
</table>
|                               | `<xml>
    <short_description>[action]-[short_description]</short_description>
  </xml>`                                                                                                                                                                                                     |
| Send Empty Structure          | The option to send valid JSON or XML structures when the payload is empty. Enable this option to include JSON or XML structural text in the payload.                                                                 |
|                               | For example, when the system formats an empty structure as JSON:                                                                                                                                                           |
|                               | `{ }`                                                                                                                                                                                                                     |
|                               | When the system formats an empty structure as XML:                                                                                                                                                                         |
|                               | `<xml></xml>`                                                                                                                                                                                                            |
|                               | Disable this option to produce an empty payload.                                                                                                                                                                            |
|                               | Empty payloads can occur when you select the **Omit if empty** option for every name-value pair, and all name-value pairs in the payload produce empty values.                                                      |

</table>

### PowerShell step

Run PowerShell scripts on remote machines from your ServiceNow instance through a MID Server. PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

**Note:** PowerShell step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

### Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Type of connection to use.</td>
</tr>
<tr>
<td></td>
<td><strong>Define Connection Inline:</strong> Define connection information within the action step.</td>
</tr>
<tr>
<td></td>
<td><strong>Use Connection Alias:</strong> Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don’t need to update your custom action.</td>
</tr>
</tbody>
</table>

To learn more about connections and credentials, see credentials, connections, and aliases.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Connection Alias    | Connection & Credential alias record the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don’t need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.  
**Note:** This field is only visible when the Connection is Use Connection Alias. |
| Credential Alias    | Credential alias the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don’t need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.  
**Note:** This field is only visible when the Connection is Define Connection Inline. |
| Host                | Specify the fully-qualified domain name of the target host where the system runs the action step. For example, host.domain.com.  
**Note:** This field is only visible when the Connection is Define Connection Inline. |
| Port                | Specify the communications port on which the target host listens for connections. For example, 5985. Leave blank to use the default port.  
**Note:** This field is only visible when the Connection is Define Connection Inline. |
| MID Application     | Specify the application the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected application.  
**Note:** This field is only visible when the Connection is Define Connection Inline. |
| Capabilities        | Specify the capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities.  
**Note:** This field is only visible when the Connection is Define Connection Inline. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Remoting Type       | The location where the PowerShell script runs such as the MID or a remote server.  
  - **Explicit Remoting (Most Common)**: Establish a connection with and run the script on a remote server.  
  - **Implicit Remoting (Advanced)**: Run a script on a MID Server while importing necessary modules from a remote server. If selected, define the **Remote name prefix** and **Modules to import** fields. For optimal performance, only import modules necessary to the step. If blank, all available modules are imported from the server.  
  - **Run on a MID Server or have your script establish a remote session**: Run a script directly on a MID Server, or define remoting specifications within the script. This value is the default. |
| Remote name prefix  | The file path, excluding file names, to the modules to load from the remote server.  
  **Note**: This field is only visible when the **Remoting Type** is **Implicit Remoting (Advanced)**. |
| Modules to import   | The comma-separated list of modules to import from the remote server at the defined file path.  
  **Note**: This field is only visible when the **Remoting Type** is **Explicit Remoting (Most Common)** or **Implicit Remoting (Advanced)**. |
| Script type         | The type of script to run on the PowerShell host.  
  - **Inline script**: Enter the script to run in the **Command** field of the step.  
  - **MID Server Script File**: Select the PowerShell script to run from the MID Server Script Files (ecc_agent_script_file) table. This is the default value and separates scripting logic from the action, enabling you to update the script without having to modify and redeploy the action. |
| MID Server Script   | Pre-defined PowerShell script from the MID Server Script Files table (ecc_agent_script_file).  
  **Note**: This field is only available if the **Script type** is **MID Server Script File**. |
| Script path         | Read-only path to the selected MID Server script.  
  **Note**: This field is only visible when the **Script type** is **MID Server Script File**. |
### Input variables

The optional name-value pairs that represent the values of PowerShell script variables. You can use action inputs and data from other steps within the PowerShell script. Define the following fields for each variable:

- **Name**: The name of the script variable to pass a value to. The name cannot match a reserved or prohibited PowerShell variable. Some variable names are reserved for internal processing and should not be used as input variables. See **Reserved variables** in PowerShell scripting variables.
- **Type**: The type of PowerShell variable. Select plain text, encrypted, or boolean. If encrypted is selected, the value appears in plain text in this field and is only encrypted when it passes to the ECC Queue.
- **Value**: The value to map to the variable. Manually enter a value, or drag a data pill into the field.

### Command

The inline PowerShell script to run on the target host.

**Note**: This field is only visible when the Script type is **Inline script**.

---

**PowerShell scripting variables**

To access input variables from the **Command** field, you must call them using special syntax. The syntax you use depends on the value of a system property. If the **Remoting Type** is **Run on a MID Server** or have your script establish a remote session, some reserved variables are available in addition to input variables.

**Input variable syntax**

By default, prefix variable names with a `$` character. For example, if an input variable is named `message`, use `$message` to access the variable in script.

If the `mid.powershell.command.script.parameter_passing` parameter is set to false, prefix the variable name with `$env:SNC_`. For example, if an input variable is named `message`, use `$env:SNC_message` to access the variable in script. To learn more about the `mid.powershell.command.script.parameter_passing` parameter, see **MID Server parameters**.

**Reserved variables**

When the **Remoting Type** is **Run on a MID Server** or have your script establish a remote session, the following variables are available for use in script. Reserved variables cannot be used as custom input variable names.

<table>
<thead>
<tr>
<th>Reserved variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$computer</td>
<td>Host IP address defined in the Connection alias record.</td>
</tr>
<tr>
<td>$cred</td>
<td>Credential object that contains the credentials defined in the connection record. Use this variable with any PowerShell cmdlet that supports the credential parameter. For example, <code>New-PSSession -credential $cred</code>.</td>
</tr>
<tr>
<td>$log_info</td>
<td>If the <code>mid.property.powershell.log_info</code> property is set to true, adds logging information to a PowerShell script.</td>
</tr>
</tbody>
</table>

The following variable names are reserved for internal processing and should not be used as input variables.
REST step

Send an outbound REST web service request to an external system.

**Note:** REST step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

Outbound REST web service is a platform feature that allows you to retrieve, create, update, or delete data on a web services server that supports the REST architecture.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>

Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane. <strong>Note:</strong> This field is only visible when the Connection is Define Connection Inline.</td>
</tr>
<tr>
<td>Use MID</td>
<td>The option to use a MID Server to run the REST step. Select this option to display the MID Application and Capabilities fields.</td>
</tr>
<tr>
<td>Base URL</td>
<td>The base URL for the REST request. If Use Connection Alias is selected, this field is read-only and displays the base URL associated with alias. If Define Connection Inline is selected, enter a base URL for the connection.</td>
</tr>
<tr>
<td>MID Application</td>
<td>Specify the capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities. <strong>Note:</strong> This field is only visible when Use MID is enabled.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>Specify the capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities. <strong>Note:</strong> This field is only visible when Use MID is enabled.</td>
</tr>
<tr>
<td>Build Request</td>
<td>Create the request manually, or import an OpenAPI Specification.</td>
</tr>
<tr>
<td></td>
<td>- Manually: Create action inputs and complete the REST step form manually.</td>
</tr>
<tr>
<td></td>
<td>- From OpenAPI specification: Import an OpenAPI Specification to generate action inputs and complete the REST step form. For more information, see OpenAPI support in the REST step.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>API Source</td>
<td>Select an OpenAPI Specification used to construct the request, or select <strong>Import OpenAPI</strong> to import a new OpenAPI Specification. You can import specifications by providing a URL to the YAML or JSON, or copying and pasting content. <strong>Note:</strong> This field is only visible when <strong>Build Request</strong> is set to <strong>From OpenAPI specification.</strong></td>
</tr>
<tr>
<td>API Operation</td>
<td>Select an operation from the list. Available operations are provided by the OpenAPI Specification in the <strong>API Source</strong> field. <strong>Note:</strong> This field is only visible when <strong>Build Request</strong> is set to <strong>From OpenAPI specification.</strong></td>
</tr>
<tr>
<td>Resource Path</td>
<td>Specify the path for the resource.</td>
</tr>
</tbody>
</table>
| HTTP Method      | Specify the HTTP method to process the request.  
- GET  
- POST  
- PUT  
- PATCH  
- DELETE                                                                                                                                                                                                                                                                 |
<p>| Query Parameters | Specify the name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag input variables into the parameter fields, and then assign a value. <strong>Note:</strong> When importing an OpenAPI Specification, the system adds all parameters and headers present in the specification to the REST step. Review the final REST step values and remove parameters you do not want to send in the request. For example, if the API accepts content type headers for both JSON and XML, the system adds both headers to the REST step. You must remove one depending on the content type you want to receive in the response. |
| Headers          | Specify the headers to send with the request. You can create headers manually, or drag input variables into the parameter fields, and then assign a value. <strong>Note:</strong> When importing an OpenAPI Specification, the system adds all parameters and headers present in the specification to the REST step. Review the final REST step values and remove parameters you do not want to send in the request. For example, if the API accepts content type headers for both JSON and XML, the system adds both headers to the REST step. You must remove one depending on the content type you want to receive in the response. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request Type</td>
<td>Specify the format of the request. Options include.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Text</strong>: A request in JSON, XML, or other text format.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Binary</strong>: A request in a binary file format.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Multipart</strong>: A request consisting of multiple content types.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Form URL-Encoded</strong>: A request in a URL-encoded query.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only editable when the <strong>HTTP Method</strong> is POST, PUT, PATCH, or DELETE.</td>
</tr>
<tr>
<td>Request Body (Text)</td>
<td>Enter the body of the request in JSON or XML format. The flow execution details display the response body as either a link to the embedded text viewer or the Sys ID of the attachment record containing the response.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only editable when the <strong>Request Type</strong> is <strong>Text</strong>.</td>
</tr>
<tr>
<td>Attachment</td>
<td>Specify the Attachment record containing the request. You can look up this record in a prior step or define it as an input variable.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when the <strong>Request Type</strong> is <strong>Binary</strong>.</td>
</tr>
<tr>
<td>Name, Type, Value</td>
<td>Specify the content of a multiple part request. For each request part, specify its name, content type, and value. The name can be any valid string and the type can be any valid type. The value must match the content type.</td>
</tr>
<tr>
<td></td>
<td>For attachments, specify:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: attachment</td>
</tr>
<tr>
<td></td>
<td>- <strong>Value</strong>: The Sys ID of the Attachment record containing the content. You can look up this record in a prior step or define it as an input variable.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: These fields are only visible when the <strong>Request Type</strong> is <strong>Multipart</strong>.</td>
</tr>
<tr>
<td>Name, Value</td>
<td>Specify the content of a form URL-encoded request. Specify each part of the URL-encoded request with a name-value pair.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: These fields are only visible when the <strong>Request Type</strong> is <strong>Form URL-Encoded</strong>.</td>
</tr>
<tr>
<td>Enable Retry Policy</td>
<td>Option to enable the retry policy. For more information, see Retry policy.</td>
</tr>
<tr>
<td>Override Default Policy for Alias</td>
<td>Option to override the default retry policy. This option is not applicable when Define Connection Inline is selected from the Connection list.</td>
</tr>
<tr>
<td>Retry Policy</td>
<td>Default retry policy associated with Connection Alias. If Override Default Policy for Alias is selected, you can override the default retry policy and select another existing retry policy based on your requirement.</td>
</tr>
</tbody>
</table>
### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save As Attachment</td>
<td>Specify whether to save the response as a record in the Attachment (sys_attachment) table.</td>
</tr>
<tr>
<td>Attachment File Name</td>
<td>Specify the name of the attachment created by the REST response. For example, <code>rest-response.txt</code>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when <strong>Save Response As Attachment</strong> is enabled.</td>
</tr>
<tr>
<td>Attachment File Record</td>
<td>Specify the target record to which the attachment is associated. Must be a data pill of type Record. For example, a specific incident record. You can look up this record in a prior step or define it as an input variable. The flow execution details display the Sys ID of the associated record.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when <strong>Save Response As Attachment</strong> is enabled.</td>
</tr>
</tbody>
</table>

#### REST response size limits

By default, the system limits the size of REST responses that are not saved as attachments to 5 MB. Direct REST responses that exceed this limit generate an error. To support larger response sizes, either save the response as an attachment or increase the response size limit with the `glide.plf.rest.response_payload_max_size` system property. This system property supports a maximum value of 10 MB.

#### Script step

Add custom JavaScript to execute within a reusable action. While most core actions and steps fit common use cases, you can build a Script step to execute behavior not satisfied by the core steps.

**Note:** The IntegrationHub plugin further enhances the Script step to enable you to create integrations with external systems.

#### Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

#### Fields

The JavaScript step includes separate input and output variables that enable you to map JavaScript data to Flow Designer data. By defining input and output variables within the step, you can define what Flow Designer data is available within your script, and which scripting variables are available to other steps in your action.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required Runtime</td>
<td>The runtime environment required to support the script. Choices include:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Instance</strong>: The action step runs the script from instance. Select this option when the script needs access to the ServiceNow API or instance data. This is the default value.</td>
</tr>
<tr>
<td></td>
<td>- <strong>MID</strong>: The action step runs the script from the MID Server. Select this option when the script needs access to MID Server script files and APIs. Selecting this option displays the Select MID Server Using field.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Vanilla (Core JavaScript)</strong>: The action step runs the script from either the instance or MID Server. Select this option when the script only needs the core JavaScript APIs and not the ServiceNow API or instance data. The runtime you select determines the JavaScript objects and methods displayed in the Context-sensitive help.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when IntegrationHub is activated.</td>
</tr>
<tr>
<td>Select MID Server Using</td>
<td>Specify the MID Server selection process to use. Choices include:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Any MID</strong>: The system runs the action step from any available MID Server.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Use Connection Alias</strong>: The system runs the action using the connection alias you specify. Selecting this option displays the Connection Alias field.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Use Inline Selection</strong>: The system runs the action using the connection details you specify in the action. Selecting this option displays the Host, MID Application, and Capabilities fields.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when IntegrationHub is activated, and you select MID from Required Runtime.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Connection &amp; Credential alias record the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don’t need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. Only aliases of connection type Basic are supported.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when IntegrationHub is activated, and you select Use Connection Alias from Select MID Server Using.</td>
</tr>
<tr>
<td>Host</td>
<td>The fully-qualified domain name of the MID Server where the system runs the action step. For example, mid-server.domain.com.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when IntegrationHub is activated, and you select Use Inline Selection from Select MID Server Using.</td>
</tr>
<tr>
<td>MID Application</td>
<td>Specify the application the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected application.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when IntegrationHub is activated, and you select Use Inline Selection from Select MID Server Using.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Capabilities</td>
<td>Specify the capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when IntegrationHub is activated, and you select <strong>Use Inline Selection</strong> from <strong>Select MID Server Using</strong>.</td>
</tr>
<tr>
<td>Input variables</td>
<td>Name-value pairs that represent data from the action, enabling you to use action inputs and data from other steps within a script.</td>
</tr>
<tr>
<td>Script</td>
<td>Script that executes within the action. To access input and output variables in your script, use the global objects <code>inputs</code> and <code>outputs</code>. For example, <code>inputs.myVariable</code>.</td>
</tr>
<tr>
<td></td>
<td>Scripts in Flow Designer execute either on the instance or from a MID Server.</td>
</tr>
<tr>
<td></td>
<td>For available classes and methods, see the JavaScript API Context-sensitive help or the JavaScript API reference.</td>
</tr>
<tr>
<td>Output variables</td>
<td>Map JavaScript output to Flow Designer data pills. Define output variables when you want other steps in the action to use the script output.</td>
</tr>
</tbody>
</table>

### Example

This example builds a JSON payload that can be easily updated or changed and added to a subsequent REST step.

**Note:** REST step is not available in the base system and requires the ServiceNow® IntegrationHub subscription.
By creating an output variable that represents the payload, you can drag the (Payload) data pill into the REST step **Body** field.

**Send Email step**

Send an email to specified users or groups as an action in a flow.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Record</td>
<td>Record that the email is associated to. When a user sends a reply to your email, the target record is updated with the reply email content.</td>
</tr>
<tr>
<td>Table</td>
<td>Table of the target record.</td>
</tr>
<tr>
<td>Include Watermark</td>
<td>Option to apply a watermark to the email that is sent. To include a watermark, you must set a target record.</td>
</tr>
<tr>
<td>To</td>
<td>The main recipients of the email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field, such as a User record. For example, if your action involves an incident record and you want to send an email to the group assigned to the incident, drag the (Assignment group) data pill from the data panel.</td>
</tr>
<tr>
<td>CC</td>
<td>Additional recipients copied on this email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>BCC</td>
<td>Additional recipients of this email, who are visible only to the sender (blind copied). Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>Subject</td>
<td>Subject of the email. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
<tr>
<td>Body</td>
<td>The content of the message body. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>

*Note:* Flow Designer does not support the `${URI}` parameter for creating a link to a record in the email message body. Instead, consider inserting the information from the record in the email body using data pills, or create a notification step.

## Testing the email step

To verify that the email was generated when testing the action, review the email record in the Email (sys_email) table. The **Headers** field indicates whether the email was successfully generated. For example:

```
X-ServiceNow-Source:FlowDesigner-9ad2747b0b710300f4eb8bf637673a1e
Message-ID:<193756824.0.1508534586438@[10.0.66.70]>
X-ServiceNow-Generated:true
```

## SSH step

The SSH step executes SSH commands on an external *nix system through a ServiceNow® MID Server. The step also stores scripts and commands for the *nix systems.
Note:
- The SSH step is not available in the base system. The step requires the subscription to ServiceNow® IntegrationHub and activation of IntegrationHub Professional Pack Installer (com.glide.hub.integrations.professional) or later. For more information about the IntegrationHub subscription packages, see IntegrationHub usage and subscription. After you activate the required plugin, the step is visible under Integrations.
- IntegrationHub supports ServiceNow SSH only.

Roles and availability

The SSH step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Sanitizing arguments using the escape class and function

Escape all user inputs to eliminate the possibility of a malicious user executing arbitrary commands on your target server. Escape and validate data pills before the command field uses them by sanitizing arguments using a preprocessing Script step. Precede the SSH step with a Script step, which takes the arguments that are used to construct a command in the SSH step.

In the Script step, use the escape class, GlideShellEscapeUtils and escape function, escapeBashShellArg. The escaped arguments are the output of the Script step. Use this escaped output as the arguments of the commands used in the SSH step. The escaped values should contain arguments of a command.

Escape APIs

<table>
<thead>
<tr>
<th>Escape class/function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideShellEscapeUtils</td>
<td>Provides scripted APIs to escape the shell arguments. For example,</td>
</tr>
<tr>
<td></td>
<td>var escapedArgument = SNC.GlideShellEscapeUtils.escapeBashShellArg('/etc &amp; &amp; cat myfile.txt'); The escaped argument is, '/etc &amp; &amp; cat myfile.txt'.</td>
</tr>
<tr>
<td>escapeBashShellArg</td>
<td>• Adds single quotes around a string.</td>
</tr>
<tr>
<td></td>
<td>• Escapes any existing single quotes within a string enabling you to pass the string directly to a shell function and treat the string as a single safe argument.</td>
</tr>
</tbody>
</table>

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Details</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Connection</td>
<td>Type of connection to use.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Define Connection Inline</strong>: Define connection information within the action step.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Use Connection Alias</strong>: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see <a href="#">credentials, connections, and aliases</a>.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Connection &amp; Credential alias record the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see <a href="#">credentials, connections, and aliases</a>. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane. This field is available when <strong>Use Connection Alias</strong> is selected from the Connection list.</td>
</tr>
<tr>
<td>Credential Alias</td>
<td>Credential alias the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see <a href="#">credentials, connections, and aliases</a>. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane. This field is available when <strong>Define Connection Inline</strong> is selected from the Connection list.</td>
</tr>
<tr>
<td>Host</td>
<td>Host name or IP address of the target server. This field is available when <strong>Define Connection Inline</strong> is selected from the Connection list.</td>

<tr>
<td>Note:</td>
<td>Escape and validate data pills before the command field uses them by sanitizing arguments using a preprocessing Script step. For more information, see Sanitizing arguments using the escape class and function.</td>
</tr>
<tr>
<td>Long Running</td>
<td>Option to disable the SSH connection timeout for commands that might take longer than the default time of 120 seconds to run. When selected, the engine detaches from the execution thread until completion.</td>
</tr>
<tr>
<td>Sudo Mode</td>
<td>Option to elevate privileges to execute the script.</td>
</tr>
</tbody>
</table>

For more information, see SSH credentials.

**Advanced SSH script options**

To run a MID Server script on the target host, specify the script type and pass the name of the script into the ${syncFile()} parameter. The system uses this parameter to locate the named script in the MID Server Script File (ecc_agent_script_file) table and run it on the target host. For example, a bash script can be expressed as:

```
bash ${syncFile("<MID script name>")} argument1 argument2 argument3
```

A base script (main_script.bash) can reference another script (my_include.bash) as well as a separate file (.my_profile) located on the target host. Both scripts and the file referenced must be synced to the MID Server, using the ${syncFile()} parameter, to execute properly.

```
source ${syncFile(".my_profile")}
cp ${syncFile("my_include.bash")} /usr/ssmith/my_include.bash
bash ${syncFile("main_script.bash")} one two three four five six
rm /usr/ssmith/my_include.bash
```

A Python example with inline comments might look like this:

```
set $LIB_DIR=/usr/bin;;
# Sync a file that is referenced inside myF5CreateLBPool.py
cp ${syncFile("specialFunctions.py")} ~/specialFunctions.py
# set up environment variables
source ${syncFile(".python_profile")}
# call script that sets up dependencies on the box from remote package repos
python ${syncFile("setupPythonDependencies.py")} pycontrol
# call a script that requires functions from the package as well as a function from myIncludedFile
python ${syncFile("myF5CreateLBPool.py")} snow_pool myActualValue
# user is responsible for their own cleanup
```
To see the list of available MID Server scripts, navigate to MID Server > Script Files.

**JDBC step**

Create a reusable action to send SQL commands to a relational database.

**Note:**

- The JDBC step is not available in the base system and requires the subscription to IntegrationHub Standard Pack Installer (com.glide.hub.integrations.standard) or later. For more information about the ServiceNow® IntegrationHub subscription packages, see [IntegrationHub usage and subscription](#). After the required plugin is activated, the step is visible under Integrations.
- The JDBC step runs only on a ServiceNow® MID Server with JDBC step capabilities. Activate the plugin, IntegrationHub Standard Pack Installer (com.glide.hub.integrations.standard) or later to use the JDBC capability for the MID Server.

**Roles and availability**

The JDBC step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

**Sanitizing inputs using the escape functions**

Escape all user inputs to eliminate the possibility of a malicious user from executing malicious SQL statements, resulting in SQL injection on your target database. When you use data pills in JDBC step SQL statements, sanitize them first using a preprocessing Script step.

In the Script step, use the escape APIs, escapeSQLIdentifier and escapeSQLValue. These APIs are available as static methods of the server-side script class, SNC.GlideSQLEscapeUtils. For example,

```javascript
var escapedValue = SNC.GlideSQLEscapeUtils.escapeSQLValue("MYSQL", "Georgi's Birthday");
```

The escaped values from the escape APIs are the output of the Script step. Use this escaped output in the SQL statements of the JDBC step.
Escape APIs

<table>
<thead>
<tr>
<th>Escape API</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>escapeSQLIdentifier</td>
<td>• Escapes special characters and injected values in the SQL identifiers.</td>
</tr>
<tr>
<td></td>
<td>• Validates input for a period character. Throws an SQLException error when a period character is encountered.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> To join SQL identifiers using a period, use two pills, which are ID escaped, joined by the period.</td>
</tr>
<tr>
<td>escapeSQLValue</td>
<td>Escapes special characters and injected values in SQL values by wrapping the input in database-specific quotes.</td>
</tr>
</tbody>
</table>

Whitelisting SQL operations

By default, you can run the following SQL operations.

- SELECT
- INSERT
- UPDATE
- DELETE
- SHOW
- DESCRIBE

To enable only some of these SQL operations that the JDBC step can perform, create a MID Server property, `mid.property.jdbc_operations` and enter the whitelisted SQL operations, separated by comma. To learn more about MID Server properties, see [MID Server properties](#).

Fields

<td>Maximum elapsed time, in seconds, that the query is allowed to run without a response. This field is available when Define Connection Inline is selected from the Connection list.</td>
</tr>
<tr>
<td>JDBC Configuration</td>
<td></td>
</tr>
</tbody>
</table>
### Test JDBC step

Test the JDBC step before testing or publishing an action that contains the JDBC step. It is mandatory that you test the JDBC step before testing the action. Testing ensures that the relevant complex object output schema is created from table columns, which can be used as data pills in subsequent steps.

1. Navigate to Flow Designer > Designer.
2. Create an action with a JDBC step.
3. Click Test JDBC Step.  
The Test JDBC Step pop-up window is displayed.
4. If the JDBC step takes an action input or output of the previous step as its input, provide required input values in the Step input pills field to test the JDBC step.

   **Note:** Input values in the Step input pills fields are not needed when records are updated, inserted, or deleted.

5. Click Run Test.
   - When a SELECT query is executed, Sample Result is displayed in the Test JDBC Step pop-up window. Sample Result includes column names, columns types, and the values of the first row.
   - When an UPDATE, INSERT, or DELETE query is executed, a message is displayed mentioning the number of rows affected.
6. To use the sample result as the JDBC step output, click Use Result.
   **Note:** Use Result is not displayed when records are updated, inserted, or deleted.
7. To retrieve schema of a different table when a SELECT query is executed in the JDBC step, enter the required value in the Step input pills field and click Run Test.

When a SELECT query is executed in the JDBC step, `ResultSet` is displayed under `Outputs`. The relevant complex object output is populated. To learn more about complex objects, see [Complex data](#).

Test and publish the action.

**SOAP step**

Enable action designers to send outbound SOAP web service requests to external systems.

**Note:** SOAP step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

**Roles and availability**

- Available as an Action Designer action step. Users with the `action_designer` role can create a custom action with one or more action steps.
- Action designers need the `web_service_admin` role to perform these web services tasks.
  - Select WSDL
  - Load new WSDL
  - Select a WS-Security policy
- The MID Server does not support WS-Security policies

<td>The name-value pairs to include in the SOAP message as HTTP headers. Click the plus icon to add headers. Add a <strong>Name</strong> and <strong>Value</strong> for each HTTP header.</td>
</tr>
<tr>
<td>Headers</td>
<td></td>
</tr>
</tbody>
</table>
### SOAP response size limit

The system limits the size of SOAP responses to 5 MB. Direct SOAP responses that exceed this limit generate an error. To support larger response sizes, increase the response size limit with the `glide.pf.soap.response_payload_max_size` system property. This system property supports a maximum value of 10 MB.

### Update Record step

Update an existing record in a table. You can dynamically add and configure fields for the record, or use a template to set field values.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be updated. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>

Example

1. **Wait For Condition step**

   - **Record**: action→incident
   - **Table**: Incident [incident]
   - **Conditions**: All of these conditions must be met
     - State is Closed

Domain separation and Flow Designer

Flow Designer supports domain separation of business logic, which lets each tenant domain have its own flows, actions, and subflows. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

**Support: Level 2**

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be
domain separated. To learn more, see [Application support for domain separation](#).  

**How domain separation works in Flow Designer**

The system domain separates Flow Designer content according to these rules.

**Flow Designer content inherits the domain of the user who creates them**

Flows, actions, and subflows belong to the domain of the user who creates them. For example, when a Service Provider (SP) administrator in the TOP domain creates a flow, it belongs to the TOP domain.

**Note:** The domain selected from the domain picker overrides the domain the user belongs to. For example, when an SP administrator in the TOP domain selects the ACME domain from the domain picker, any content created belongs to the ACME domain.

**Flow Designer content runs from the domain from which it is triggered or initiated**

Flows, actions, and subflows run from the domain of the record or user who initiates them. For example, when a user from the child domain ACME triggers a flow belonging to the parent domain TOP, the flow runs in the context of the child domain ACME.

<table>
<thead>
<tr>
<th>Trigger type</th>
<th>Domain assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>API call</td>
<td>Domain of the user making API call</td>
</tr>
<tr>
<td>Email trigger</td>
<td>Domain of the email sender</td>
</tr>
<tr>
<td>Record trigger</td>
<td>Domain of the triggering record</td>
</tr>
<tr>
<td>Scheduled trigger</td>
<td>Domain of the flow</td>
</tr>
<tr>
<td>Service Catalog trigger</td>
<td>Domain of the requested item record</td>
</tr>
</tbody>
</table>

**Flow Designer only runs content accessible from the current domain context**

The system can only run content to which the current domain context allows access. See [Understanding domain separation](#) to understand data separation and the domain hierarchy. For example, a user in the child domain ACME can trigger flows belonging to the parent domain TOP, but cannot trigger flows belonging to a sibling domain such as INITECH.

Flow Designer runs record operations from the current user domain context. A read operation such as the Lookup Records action returns records based on the currently selected domain and its children. For example, if the currently selected domain is the TOP domain, you will see records from the TOP domain and all its children such as the ACME and INITECH domains. If the currently selected domain is the ACME domain, you will see records from the ACME domain and its children, but you will not see records from the parent TOP domain.

**Note:** Record operations use the data or process separation rules applied to the table the record belongs to. For example, suppose you have process-separated the Business Rule table. If you add a business rule to the TOP domain, the business rule will be accessible to record operations in child domains such as the ACME domain because process separation allows access to records from parent domains.
Flows that call another application such as a decision table or workflow also run from the current user domain context.

**Flow Designer runs all flows whose trigger conditions are met**

A flow in one domain cannot override or prevent a flow from another domain from running. Flow Designer runs any flow that is visible to the current user and whose trigger conditions have been met. For example, a flow belonging to the TOP domain that is triggered by the creation of an incident record runs anytime an incident is created, regardless of whether the incident is created in the ACME or INITECH child domains.

**Design considerations**

Follow these design considerations when using domain separation with Flow Designer.

**Have a Service Provider (SP) administrator in the TOP domain author and manage tenant flows, actions, and subflows**

Since tenants cannot override Flow Designer content, an SP administrator from the TOP domain must author and manage them to ensure they run properly for all domains. While you can create domain-specific flows, be aware that users working from domains higher in the hierarchy may trigger multiple child domain flows. For example, a user working in the TOP domain can trigger flows in child domains such as ACME and INITECH.

Note: Flow authors can see only Flow Designer content available from their current domain and any parent domains in the hierarchy. Flow Designer does not display content visible from Contains domains.

**Provide a unique name for each flow, action, and subflow**

Since all domains share the same Flow Designer content, have an SP administrator in the TOP domain uniquely name each flow, action, and subflow to ensure that a flow intended for one domain does not duplicate the name of a flow in another domain. For example, add the domain to the flow name such as **Validate incidents - TOP**, **Validate incidents - ACME**, and **Validate incidents - INITECH**.

**Ensure flows and actions only contain artifacts available from the current or parent domains**

Flow Designer prevents the activation of any flow containing artifacts unavailable to the current or parent domains. For example, if you create a domain-specific flow that belongs to the ACME domain, it cannot contain actions or subflows belonging to the sibling domain INITECH.

**Edit Flow Designer content in the domain to which it belongs**

While users in a parent domain can see flows, actions, and subflows in a child domain, they must edit them in the domain they belong to. For example, an administrator in the TOP domain can see flows from the ACME domain but must switch to the ACME domain to edit it.

**User access to Flow Designer**

Administrators can grant users access to Flow Designer by assigning delegated development permissions or directly assigning a user role.

**Access by delegated development permissions**

Administrators can grant users access to Flow Designer by creating an application and assigning users as developers with the Flow Designer **delegated development** permission. Delegated
development allows administrators to control whether flow designers can access features normally restricted to admin users such as assigning user roles, creating access controls, or creating scripts. See Developer and deployment permissions.

Access by user roles

Administrators can also grant access to Flow Designer by directly assigning users the flow_designer user role, which includes the role to view flow execution details.

Warning: Directly granting a user the flow_designer role is equivalent to giving the user the admin role, because Flow Designer can run flows as the System user, which has access to all tables and all database operations.

Flow Designer roles

Grant users one or more Flow Designer roles to enable them to create flows and subflows, to see flow execution details, and to create actions.

<table>
<thead>
<tr>
<th>Role title (name)</th>
<th>Description</th>
<th>Contains Roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>flow_designer</td>
<td>Enables a user to launch the Flow Designer design environment to create and edit flows and subflows.</td>
<td>flow_operator</td>
</tr>
<tr>
<td>flow_operator</td>
<td>Enables a user to view flow execution details, dashboards, and logs. Administrators can grant this role to users they want to be able to view flow results but not create, change, or test them.</td>
<td>none</td>
</tr>
<tr>
<td>action_designer</td>
<td>Enables a user to launch the Action Designer design environment to create and edit actions.</td>
<td>none</td>
</tr>
</tbody>
</table>

API access to Flow Designer

Application developers can access Flow Designer functionality through APIs for flows, subflows, and actions. Flow designers can enable individual flows, subflows, and actions to be client callable during design.

Available Flow Designer APIs

Trigger flows, subflows, and actions using these APIs from server or client scripts.

Server side

FlowAPI: Trigger a flow, subflow, or action using synchronous or asynchronous methods, with or without execution details.

Client side
**GlideFlow**: Perform client-side interactions with actions, flows, and subflows. Flow designers must enable a flow, subflow, and action to be called from the client.

**FlowAPI quick methods**

Use quick methods in the *FlowAPI* class to run an action, flow, or subflow from a server-side script without creating execution details or other related records. Use these methods to increase the speed of high-volume processing in a production environment, and to improve performance by eliminating record-keeping overhead. Methods include:

- `executeActionQuick()`, `executeFlowQuick()`, `executeSubflowQuick()`: Run an action, flow, or subflow from a server-side script synchronously from the current user session.
- `startActionQuick()`, `startFlowQuick()`, `startSubflowQuick()`: Run an action, flow, or subflow from a server-side script asynchronously.

**Client callable APIs**

By default, the flows, subflows, and actions can only be called by the FlowAPI within a server script. Flow and action designers can make individual flows, subflows, or actions available to client calls by enabling the **Client callable** option during design.

**Code snippets**

Application developers can generate a JavaScript function that calls a specific flow, subflow, or action with the **Code Snippet** option. Use the code snippet in scripts such as business rules or the Scripts - Background module to call specific Flow Designer elements. The system only generates code snippets for published flows, subflows, and actions. Flow Designer elements in the draft or modified status do not generate code snippets.

**Create code snippets for flows, sub-flows, and actions**

Generate a code snippet to call a specific flow, subflow or action.

- Role required: flow_designer or admin
- Activate the flow or subflow you want to call.
- Publish the action you want to call.

1. Navigate to *Flow Designer > Designer*.
2. Open a flow, subflow, or action.
3. Click the **More Actions** icon in the upper right corner of the flow designer.
4. Select **Code Snippet**.
5. A modal window appears containing the code snippet. The text of the snippet is selected by default. To copy the code, manually copy the code from the pop-up modal, or click the **Copy Code Snippet Clipboard** button.

**Create a client callable flow, subflow, or action**

Enable a client script to trigger a flow, subflow, or action.

- Role required: security_admin
• Consider the implications of making a flow, subflow, or action client callable, such as whether it exposes protected data or bypasses validation logic.

By default, the flows, subflows, and actions can only be called by the FlowAPI within a server script. Flow and action designers can make individual flows, subflows, or actions available to client calls by enabling the **Client callable** option during design.

1. Elevate privileges to security_admin.
2. Navigate to **System Security > Access Control (ACL)**.
3. Click **New**.
4. Create an access control.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>client_callable_flow_object</td>
</tr>
<tr>
<td>Operation</td>
<td>create</td>
</tr>
<tr>
<td>Admin overrides</td>
<td>Selected</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a name for the ACL</td>
</tr>
<tr>
<td>Requires role</td>
<td>Create a role to provide access to the APIs. For example, create a flow_api_access role.</td>
</tr>
</tbody>
</table>

5. Assign the role to the user you would like to grant access to.
6. Enable a client script to trigger the flow, subflow, or action.
   a) Open the flow, subflow, or action you want to make client callable.
   b) In the **More Actions** menu, select **Manage security**.
   c) Select **Callable by Client API**.
   d) Add the access control record created earlier to the **ACLs** field.
   e) Click **Update**.

The user with the designated permissions can trigger a client callable flow, subflow, or action from a client script using the GlideFlow API.

**Spokes**

Add application-specific content to Flow Designer by installing spokes.

A **spoke** is a scoped application containing Flow Designer content dedicated to a particular application or record type. For example, the **ITSM Spoke** contains actions for managing Task records such as the **Create Task** action. Spokes are activated when their parent application is activated. For example, the **ITSM Spoke** is activated when the Incident, Problem, and Change applications are activated. Creating a spoke requires familiarity with application development as developers must add Flow Designer content to a scoped application.

**Default spokes available**

<table>
<thead>
<tr>
<th>Spoke</th>
<th>Description</th>
<th>Plugin</th>

<tr>
<td>Add User to Task Conversation</td>
<td>Create a task conversation, and add a user to it.</td>
</tr>
<tr>
<td>Send Message to Task Conversation</td>
<td>Send a message to all users of a task conversation.</td>
</tr>
</tbody>
</table>

**Customer Service Spoke**

Provides actions for flow designers to use when creating Customer Service Management business processes. Requires the Customer Service Management (com.sn_customerservice) plugin.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Case</td>
<td>Retrieve a case record using the case number. If multiple records are found, only the first record is returned.</td>
</tr>
<tr>
<td>Create Case</td>
<td>Create a case using one or more attributes. This action mimics the structure of the Case table (sn_customerservice_case) and exposes the fields present on the Case table.</td>
</tr>
<tr>
<td>Create Quick Case</td>
<td>Create a case using the customer, description, channel, priority, and category attributes.</td>
</tr>
<tr>
<td>Create Task on Case</td>
<td>Create a case task and optionally associate it with a case.</td>
</tr>
<tr>
<td>Update Case</td>
<td>Update a case by providing the case reference and the fields that you want to update.</td>
</tr>
<tr>
<td>Assign Case</td>
<td>Assign a case using matching rules. To use this action, you must first define the matching rules that match cases with resources (assignment groups, agents).</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Escalate Case</td>
<td>Request case escalation. This action does not automatically approve escalation. Approval is based on the selected escalation template.</td>
</tr>
<tr>
<td>Escalate Account</td>
<td>Request account escalation. This action does not automatically approve escalation. Approval is based on the selected escalation template.</td>
</tr>
<tr>
<td>Add Work Note to Task</td>
<td>Add a work note to a task or to task extended objects (for example, a case or case task).</td>
</tr>
<tr>
<td>Add Comment to Task</td>
<td>Add a comment to a task or to task extended objects (for example, a case or case task).</td>
</tr>
</tbody>
</table>

**Field Service Spoke**

Provides actions for flow designers to use when creating Field Service Management business processes.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Work Order</td>
<td>Retrieve a work order record using the work order number. If multiple records are found, only the first record is returned.</td>
</tr>
<tr>
<td>Create Work Order</td>
<td>Create a work order and optionally associate it with a case.</td>
</tr>
<tr>
<td>Update Work Order</td>
<td>Update a work order by providing the work order reference and the fields that you want to update.</td>
</tr>
<tr>
<td>Get Work Order Task</td>
<td>Retrieve a work order task record using the work order task number. If multiple records are found, only the first record is returned.</td>
</tr>
<tr>
<td>Create Work Order Task</td>
<td>Create a work order task and optionally associate it with a work order.</td>
</tr>
<tr>
<td>Update Work Order Task</td>
<td>Update a work order task by providing the work order task reference and the fields that you want to update.</td>
</tr>
<tr>
<td>Add Work Note to Task</td>
<td>Add a work note to a task or to task extended objects (for example, a work order or work order task).</td>
</tr>
</tbody>
</table>

**External Related Files**

External Related Files stores information about files in third-party systems and helps you manage the information.

**External Related Files spoke tables**

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>External Provider (sn_ext_files_spoke_provider)</td>
<td>Stores information about the external provider. For example, Box or DocuSign services.</td>
</tr>
</tbody>
</table>
## External Related Files

<table>
<thead>
<tr>
<th>Description</th>
<th>Note: If you extend the table, ensure that you perform the data separation for the scoped applications</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stores metadata information about the files in third-party systems. This table is extensible.</td>
<td>• To store metadata information of files in a specific third-party system, create a table with a column that contains a reference field to the External Related Files table. For more information about reference fields, see <a href="#">reference field type</a>.</td>
</tr>
<tr>
<td>• To establish a relationship between a specific ServiceNow table and External Related Files table, <a href="#">create defined related lists</a>.</td>

<tr>
<td>Create Catalog Task on Request Item</td>
<td>Creates a Catalog Task record from a Request Item record.</td>
</tr>
<tr>
<td>Create Change Task on Change Request</td>
<td>Creates a Change Task record from a Change Request record.</td>
</tr>
<tr>
<td>Create Emergency Change Request</td>
<td>Creates a Change Request record of type Emergency.</td>
</tr>
<tr>
<td>Create Emergency Request from Incident</td>
<td>Creates a Change Request record of type Emergency from an Incident record.</td>
</tr>
<tr>
<td>Create Incident</td>
<td>Creates an Incident record.</td>
</tr>
<tr>
<td>Create Incident Task on Incident</td>
<td>Creates an Incident Task record from an Incident record.</td>
</tr>
<tr>
<td>Create Normal Change Request from Incident</td>
<td>Creates a Change Request record of type Normal from an Incident record.</td>
</tr>
<tr>
<td>Create Outage</td>
<td>Creates a cmdb_ci outage record for a configuration item. The Task field is populated only if the source is a task record. If the source is non-task record such as an alert record, the Task field is empty.</td>
</tr>
<tr>
<td>Create Problem from Incident</td>
<td>Creates a Problem record from an Incident record.</td>
</tr>
<tr>
<td>Create Request</td>
<td>Creates a Request record.</td>
</tr>
<tr>
<td>Create Standard Change Request</td>
<td>Creates a Change Request record of type Standard.</td>
</tr>
<tr>
<td>Create Task</td>
<td>Creates a child task record for a Task table record. For example, creates an Incident Task record for an Incident record.</td>
</tr>
<tr>
<td>Create Task Outage Relationship</td>
<td>Creates a Task Outage Relationship record where cmdb_ci outage record and task record are inputs to the action.</td>
</tr>
<tr>
<td>Create Standard Change Request from Incident</td>
<td>Creates a Change Request record of type Standard from an Incident record.</td>
</tr>
<tr>
<td>Update Assignee</td>
<td>Updates the Assigned to field of a Task table record.</td>
</tr>
<tr>
<td>Update Assignment Group</td>
<td>Updates the Assignment Group field of a Task table record.</td>
</tr>
</tbody>
</table>

**Security Operations spoke**

**Security Incident Response flow templates**

The Security Incident Response flow templates are created using the [Flow Designer](#).
### Note:
Each of the flows is triggered when the **Category** in a security incident is set or changed.

<table>
<thead>
<tr>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security Incident Confidential Data Exposure flow template</td>
<td>Perform a series of tasks designed to handle the exposure of sensitive data.</td>
</tr>
<tr>
<td>Security Incident Denial of Service flow template</td>
<td>Perform a series of tasks designed to handle Denial of Service (DOS) attacks.</td>
</tr>
<tr>
<td>Security Incident Lost Equipment flow template</td>
<td>Perform a series of tasks designed to handle lost equipment.</td>
</tr>
<tr>
<td>Security Incident Malicious Software flow template</td>
<td>Perform a series of tasks designed to handle malicious software on your network.</td>
</tr>
<tr>
<td>Security Incident Phishing flow template</td>
<td>Perform a series of tasks designed to handle spear phishing emails on your network.</td>
</tr>
<tr>
<td>Security Incident Policy Violation flow template</td>
<td>Perform a series of tasks designed to handle security policy violations.</td>
</tr>
<tr>
<td>Security Incident Reconnaissance flow template</td>
<td>Perform a series of tasks designed to handle reconnaissance on your network.</td>
</tr>
<tr>
<td>Security Incident Rogue Server or Service flow template</td>
<td>Perform a series of tasks designed to handle activity from rogue servers or services affecting your network.</td>
</tr>
<tr>
<td>Security Incident Spam flow template</td>
<td>Perform a series of tasks designed to handle email spam on your network.</td>
</tr>
<tr>
<td>Security Incident Unauthorized Access flow template</td>
<td>Perform a series of tasks designed to handle unauthorized access to your network.</td>
</tr>
<tr>
<td>Security Incident Web/BBS Defacement flow template</td>
<td>Perform a series of tasks designed to handle vandalism directed against one of your BBS or web sites.</td>
</tr>
</tbody>
</table>

### Visual Task Board (VTB) Spoke
Provides VTB actions for flow designers to manage the boards, lanes, cards, board members, and assignees.

#### Board Management Actions

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Inputs</th>
<th>Action Outputs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Freeform VTB Action</td>
<td>Creates a Freeform VTB for any task type. The default lanes are: Todo, Doing, and Done. These lanes can be modified with actions: Add Lane, Rename Lane, Reorder Lane, and Delete Lane</td>
<td>Name, Board Owner, Default view, Label visibility, Picker visibility, Background color</td>
<td>Board record</td>

<tr>
<td>Create Flexible VTB Action</td>
<td>Creates a Flexible VTB bound to a single Task table. The default lanes are: Todo, Doing, and Done. These lanes can be modified with actions: Add Lane, Rename Lane, Reorder Lane, and Delete Lane</td>
<td>Name, Task table, Filter, Board Owner, Default view, Label visibility, Picker visibility, Background color</td>
<td>Board record</td>
</tr>
<tr>
<td>Create Guided VTB Action</td>
<td>Creates a data-driven VTB bound to a single Task table along with the fields the lanes are derived.</td>
<td>Name, Task table, Land field, Filter, Board Owner, Default view, Label visibility, Picker visibility, Background color</td>
<td>Board record</td>
</tr>
<tr>
<td>Add VTB Member Action</td>
<td>Add a user to a VTB. Only members of the VTB can access the board. Any VTB member can add other members.</td>
<td>Board record, User record</td>
<td>N/A</td>
</tr>
<tr>
<td>Remove VTB Member Action</td>
<td>Remove a user from a VTB. Only members of a VTB can access the board. Any VTB member can remove other members.</td>
<td>Board record, User record</td>
<td>N/A</td>
</tr>
</tbody>
</table>

### Lane Management Actions

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Steps</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add VTB lane</td>
<td>Add a lane to a Freeform or Flexible VTB. This action does not apply to Guided boards, which are constrained to fixed lanes based on fields configured.</td>
<td>Board record, Lane name</td>
<td>VTB lane record</td>
</tr>
<tr>
<td>Rename VTB Lane</td>
<td>Rename an existing lane on a Freeform or Flexible VTB.</td>
<td>Lane record, New lane name</td>
<td>N/A</td>
</tr>
<tr>
<td>Reorder VTB Lane</td>
<td>Reorder lanes on any VTB.</td>
<td>Lane record, New lane name</td>
<td>N/A</td>
</tr>
<tr>
<td>Delete VTB Lane</td>
<td>Delete an existing lane from a Freeform or Flexible VTB.</td>
<td>Lane record</td>
<td>N/A</td>
</tr>
</tbody>
</table>
### Card Management Actions

<table>
<thead>
<tr>
<th>Flow/Action</th>
<th>Description</th>
<th>Action Steps</th>
<th>State</th>

<tr>
<td>Assign VTB Card</td>
<td>Assign a user to a VTB card.</td>
<td>• Card record</td>
<td>N/A</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• User record</td>
<td></td>
</tr>
<tr>
<td>Move VTB Card</td>
<td>Move a VTB card from one lane to another lane.</td>
<td>• Card record</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Lane record</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For Flexible boards, use the Update Record action to change the state of the underlying task. For Guided boards, this action changes the field on the task associated with that card.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Remove Assignee from VTB Card</td>
<td>Remove an assignee from a card.</td>
<td>• Card record</td>
<td>N/A</td>
</tr>
</tbody>
</table>

### Instance Data Replication

Instance Data Replication (IDR) copies data updates from one instance to one or more other instances. IDR facilitates maintaining consistent data across different organizations in your company.

IDR provides a one-to-many replication, which enables one instance to propagate data across different departments and business units to keep data in sync. IDR can also modify data during replication, for example, to localize the data.

**Benefits**

- Automatic replication of data to one or more other instances.
- Producer data can be modified and mapped to any table and table column on consumer instances, for example, to localize data for different locales.
- Data updated on consumer instances can be replicated to the producer instance.

This feature enables you to give data, such as problem requests, on consumer instances to third parties, which can update the problem issue and return it to the consumer instance. That updated data can then be updated on the producer.

- Business rules can trigger post-replication workflows, such as generating notifications or validating the replication.
- Data in transit during a crash is recoverable.
How Instance Data Replication works

Use the Instance Data Replication plugin to replicate data updates on one instance, called the producer instance, to one or more other instances, called consumer instances.

A producer replication set specifies the tables and table columns on the producer instance to replicate. A consumer data set specifies the tables and table columns on consumer instances that receive the producer replication set data.

Activating both producer and consumer replication sets turns on IDR functionality. Data updated in a producer replication set automatically updates the corresponding data in consumer replication sets.

Syncing producer and consumer replication sets involves a one-time seeding of all the producer replication set data to the consumer instances. Future replications involve data updates only.

By default, table data on a producer instance goes into tables of the same name on consumer instances. Transformation is the process of replicating producer data in differently-named tables or table columns on consumer instances.

IDR adapters modify data before storing it on consumer instances. Adapters perform string and mathematical operations, such as converting one currency to another, or converting one time zone to another.
IDR overview

**Warning:** IDR overwrites data on instances and can replicate sensitive data. Given the potential for data loss and data exposure, test your IDR implementation in a pre-production environment.

Domain separation

IDR runs in ServiceNow data centers only. It functions at the data level so IDR does not explicitly support domain separation. Data moves from a producer to a consumer without regard to domain. However, you can use business rules to convert from one domain to another. For more information, see [About Before Query business rules](#).

When not to use IDR

- Do not use IDR to clone instances.

  IDR does not replicate metadata tables, child metadata tables, and most user and system tables. IDR is designed to replicate data, not clone instances.
- Do not use IDR if your use case breaks any of the following IDR limitations:
  - Replication must not take longer than 7 days to complete.
  - Initial seeding of the tables must be less than 3 million records per replication set.
  - Producer and consumer instances must be in the same geographic region.

**What to do next**

Get an overview of [setting up IDR](#).

**Set up Instance Data Replication**

Instance Data Replication (IDR) requires a separate subscription and only ServiceNow personnel can install the plugin. Once the plugin activates, you can configure the producer and consumer instances.

Role required: admin

The following procedure provides an overview of the required and optional tasks you complete to set up IDR. Links in each step provide details for completing the tasks.

1. **Request that ServiceNow install** the IDR plugin.
2. **Create and activate a producer replication set.**
   - A producer replication set specifies the tables and table columns you want to replicate to one or more consumer instances.
3. **Create and activate one or more consumer replication sets and request data from the producer.**
   A consumer replication set specifies the tables and table columns on consumer instances that receive producer data updates. Replicated data overwrites corresponding consumer instance data. Consumers must apply to producers to receive replication data.

4. If you have the producer replication admin role, [approve or deny consumer requests](#) to access replication data on your producer instance.

5. Optional: [Map replicated data into different tables or table columns](#) on consumer instances.

6. Optional: [Modify the records](#) during replication.
   Possible modifications include changing time zones and currencies.

7. Optional: Set up [bi-directional replication](#).

Request that ServiceNow personnel [install IDR](#).

### Request an Instance Data Replication subscription

The Instance Data Replication (IDR) plugin requires a separate subscription and must be activated by ServiceNow personnel.

**Role required:** admin

London is the earliest version that supports IDR. The IDR plugin ID is com.glide.idr. When purchasing an IDR subscription, ServiceNow personnel also activate the following plugins that IDR depends upon:

- com.snc.db.data_replicate
- com.glide.transform
- com.glide.kmf

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

1. From your instance, navigate to **System Definition > Plugins**.
2. On the All Applications page, click **Request Plugin** to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you</td>
<td>Date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>would like this plugin to be enabled</td>
<td></td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create and activate a producer replication set.

Create a producer replication set

Create a producer replication set, which is your first step in configuring Instance Data Replication (IDR). You can use a producer replication set to specify the tables and table columns to replicate on consumer instances.

- You purchased an IDR subscription and ServiceNow personnel installed the IDR plugin.
- Verify that the producer and consumer instances are in the same geographic region and belong to the same customer.
- Role required: idr_admin or admin

Seeding is the initial download of all the records in the producer replication set to the tables in the consumer replication set. After seeding, IDR only replicates data updates. When creating a replication set, you must observe the following seeding limitations:

- Maximum record size is 32 MB.
- Maximum seeding size is 3 million records.

Note: If your replication set contains more than 3 million records, seeding will not even start. To remedy this situation, break the replication set into multiple replication sets with fewer records in each.
- Maximum seeding time is 7 days.

1. On the producer instance, navigate to **Instance Data Replication > Producer Replication Sets** and click **New** to create a new replication set.

2. In the **Name** and **Description** fields, add a name and description and then click **Submit**. Names can only contain alphanumeric characters and hyphens. The consumer replication set must have the same name as the producer replication set, so you may not want to have “producer” in the title.

In the Producer Replication Set form, the system auto-generates the producer ID, which you can't edit. The **Producer ID** field identifies the producer instance in the system.
3. Optional: Select **Require Consumer Sync** to enable bidirectional replication on consumer instances.

© 2019 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Bidirectional replication replicates changes made directly on consumer instances back to the producer instance. For bidirectional replication to happen, the consumer replication set must synchronize the configuration changes. Bidirectional replication only works for records that originated on the producer. For more information, see Bidirectional replication.

4. Identify the table and the table columns to include in the replication set.
   a) On the Replication Entries tab, click New.
b) In the **Source Table name** field, select one of the tables on the producer instance to replicate. For example, select **Incident**.

c) Optional: Select the **Include Attachments** option to replicate files that are associated with the records that are being replicated.

d) Optional: To prevent a group of records in selected table from being replicated, create a filter by clicking **Add Filter Condition** and selecting filter criteria in the **Filter** section. For example, you might want to replicate only active records. In that case, select **Active** in the **choose field** list, **Is** in the **oper** list, and **True** in the **value** list. If you do not use a filter, all the fields in the producer replication set table appear in the Available column.

---

**Note:** The Available column contains the fields in the Source Table that you specified. That table may not contain the **Active** field.

---

e) In the Included Fields columns, use the arrows to move table fields into the Selected column to replicate them or into the Available column to prevent replicating them, and then click **Submit**.
Note: Some fields, such as SYS ID (Mandatory), must be replicated. Other fields, such as Edge Encrypted and Password1, can't be replicated and do not appear in either column.

5. Repeat step 4 for each table you want to include in the replication set.
6. Click **Activate**.
   Replication can’t happen until you link the producer replication set to one or more consumer replication sets. Activation just makes the producer data available for replication.

7. Click the **Replication Setup Instructions** related link to view the information and close the modal.
   The Replication Setup Instructions modal shows important configuration information that you use to associate this producer instance with its consumer instances.

8. Click the **Notification Configuration** related link and configure who receives replication notifications.
   a) On the **When to send** tab, specify the conditions for sending a notification.
   b) On the **Who will receive** tab, specify who receives the notifications.
      The fields that are displayed on the tab vary with the **Send when** value:
      - **Record inserted or updated**—The **Updated** and **Inserted** options, when selected, send notifications when records are updated or inserted.
      - **Event fired**—The Event Name specifies the event type that sends the notification.
      - **Triggered**—A notification is sent when triggered by a Flow Designer flow. For more information, see [Flow Designer](#).
      The **Updated** and **Inserted** options, when selected, send notifications when records are updated or inserted.
   c) On the **What it will contain** tab, specify the notification content.
   d) Click **Update**.

The producer is ready to send the data that is specified in the replication set to one or more consumer instances.

**Note:** If you believe that a consumer set should no longer receive replication data, you can **revoke the consumer set's access**.

- **Create and activate a consumer replication set.**
- **Grant access to replication data.**

After creating a consumer replication set, you must ask for permission to receive the producer’s replication data. See [Grant access to replication data](#) to see how to grant or deny access.

**Reconfigure a replication set in Instance Data Replication (IDR)**

You can reconfigure replication sets on the producer instance if you need to change or update your original replication set.

**Role required:** idr_admin or admin

After activating a revised producer replication set, update the producer replication set's name, shared key, producer ID, and producer set ID on each consumer instance.

1. Make sure a seeding request is not in progress.
2. Reconfigure a producer instance:
a) On the producer instance, navigate to **Instance Data Replication > Producer Replication Sets**.

b) Select a producer replication set and make one or more of the following changes to the set:

- On the Replication Entries tab, click **New** to add a table to the set.
- On the Replication Entries tab, click a replication set and in the Replication Entry form, modify the columns included in the replication set and click **Update**.
- On the Replication Entries tab, click a replication set and click **Delete** to remove the table from the replication set.
- Click **Generate New Shared Key** to change the shared encryption key.

You only generate new shared keys when you discover that they have been compromised or if you want to stop sending data to a consumer. After changing the encryption key on the producer instance, consumers that have the Consumer Approved Status of Denied must reapply for access to the producer replication set. For more information, see **Grant access to replication data**.

These changes stop replication and produce this status message on the consumer instance: "Producer Replication Set configuration has been modified." On the consumer instance, click **Synchronize Replication Configuration** and then click **Activate with Seeding**.

3. To update consumers with the changes made on the producer, on each consumer instance, navigate to **Instance Data Replication > Consumer Replication Sets** and click the consumer replication set you want to update. The status of the replication set is **Replication Error**. Use the table to take action according to the **Status Message**.

<table>
<thead>
<tr>
<th>Status Message</th>
<th>What to do</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval was denied by producer instance</td>
<td>The producer changed the shared key and this consumer’s access to the replication data was revoked. Replication stops. Click <strong>Request shared key</strong> under Related Links. The producer must approve your request. For more information, see <strong>Grant access to replication data</strong>. If the consumer’s access was not revoked, replication continues; nothing needs to be done on the consumer instance.</td>
</tr>
<tr>
<td>Producer Replication Set configuration has been modified.</td>
<td>The producer added or subtracted tables or table columns in the producer replication set. Replication stops. Click <strong>Synchronize Replication Configuration</strong> and then <strong>Activate with Seeding</strong>. If the producer set contains fewer tables, you can click <strong>Activate Without Seeding</strong> instead. The tables on the consumer instance that the producer instance no longer replicates are not deleted.</td>
</tr>
</tbody>
</table>

4. Optional: Delete a replication set.

- To delete a producer replication set from the producer instance, navigate to **Instance Data Replication > Producer Replication Sets**, click the producer replication set you want to delete, and then click **Delete**.
- To delete a consumer replication set on a consumer instance, navigate to **Instance Data Replication > Consumer Replication Sets**, click the consumer replication set you want to delete, and then click **Delete**.
Create a consumer replication set

After configuring a producer replication set, the second step in configuring Instance Data Replication (IDR) is creating a consumer replication set. The consumer replication set specifies the tables and columns on a consumer instance that receive the producer data.

- **Create and activate a producer replication set.**
- Make sure the producer and consumer instances are in the same geographic region and belong to the same customer.
- Role required: admin or idr_admin

Create a consumer replication set and link it to a producer replication set. Data from the producer replicates into tables and table columns of the same name on the consumer instance. The admin of the producer replication set must grant the consumer instance access to replication data.

If in the future the producer replication set admin generates a new encryption key, which is responsible for encrypting the replication data, the encryption key value stored in the consumer replication set may or may not be automatically updated. If not, replication stops. To restore access, see [*Restore access to replication data*](#).

1. On a consumer instance, navigate to **Instance Data Replication > Consumer Replication Sets**.
2. Click **New** to create a new replication set.

The Consumer Replication Set form appears. The values associate the consumer instance with a specific producer instance.

3. Get the values for the form from the producer administrator. Alternately, if you have access to the producer instance:
   a) On the producer instance, navigate to **Instance Data Replication > Producer Replication Sets**.
   b) Select a producer replication set.
   c) Under Related Links, click **Replication Setup Instructions**.

© 2019 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The values for the Consumer Replication Set form appear.

4. Copy and paste all the information exactly as it is in the producer instance into the Consumer Replication Set form and click **Submit**. This action sends a request to the producer replication set admin to approve or deny your request for a shared encryption key.

    **Warning:** Do not change any of the values, including the name.

The list of all consumer replication sets appears.

5. Click the replication set.

    The **Consumer Replication Set** pane appears.
Notice that **Consumer Approval Status** says **Approval Pending**. The producer admin must approve your request to be a consumer.

**Note:** If you receive an error that your encryption key does not work, call ServiceNow support.

6. Wait until the producer admin approves the request. The **Consumer Approval Status** changes to **Approved**. For more information, see [Grant access to replication data](#).

7. After you receive confirmation, click **Synchronize Replication Configuration** under **Related Links**. If you do not see this option, refresh the page.

   A modal confirms the synchronization. The tables selected for replication in the producer replication set are replicated in the consumer replication set and appear on the Consumer Replication Entries tab. The initial seeding of all the table data may take some time. In the future, only data updates are replicated to consumer replication sets. For more information about seeding, see [Seed a consumer instance](#).

   a) On the **When to send** tab, specify the trigger for sending a notification.

   b) On the **Who will receive** tab, specify who receives the notifications.

   c) On the **What it will contain** tab, specify the notification content.

   d) Click **Update**.

9. Activate the consumer replication set by selecting the check box next to the replication set you want to activate and clicking one of the following buttons on the **Consumer Replication Entries** tab:

   - **Activate with Seeding** — Makes the replication set ready to take producer updates and replicates the current records (only) specified in the producer replication set.

   - **Activate with Seeding (Include History)** — Same as **Activate with Seeding** but also replicates the entire history of record updates.

   With both seeding options, IDR generates audit trails of all record updates going forward. If you encounter an error during seeding, see [Fix seeding errors](#). For more information about seeding, see [Seed a consumer instance](#).

   **Note:** **Activate without Seeding** under **Related Links** makes the replication set ready to take producer updates but does not download any data from the producer. Do not use this option when setting up replication. Always start with seeding the consumer instance. Use this option, for example, after updating the producer's ID, producer set ID, or encryption key.

10. Optional: To cancel a seeding request:

    a) On the **Seeding Requests** tab, click a seeding request.

    b) On the Seeding Request form, click **Cancel**.

11. Optional: To modify the behavior of the consumer, on the **Consumer Replication Entries** tab, click a source table name.

    a) Optional: On the Consumer Replication Entry form, select the **Preserve Modified By** check box to add the name of a user to an **Activities** entry.

    **Preserve Modified By** preserves on consumers the name of the person who updated a field of type Activity in a record. For example, the **Work notes** field is of type Activity in change request records. When someone updates a change request, the work note...
moves into the Activities stream. If the check box is unselected, the Activities entry attributes the update to Instance Data Replication in consumer records. With the check box selected, the person who updated the change request is identified in the entry; “IDR.” is prepended to their name. The following image shows the Activities entry with (top) and without (bottom) the Preserve Modified By check box selected.

b) Optional: To run business workflows after a replication, select the Run Business Rule check box.

A business rule is a server-side script associated with a table. Use business rules to trigger workflows associated with replications, such as sending a notification or validating the replicated data. For more information, see Trigger workflows after replication.

c) Optional: To replicate data from the producer tables into tables of different names on the consumer, click Enable Transform.

For more information, see Transform replication data.

d) If you made any changes, click Update.

12. Optional: Repeat this entire procedure on other consumer instances.

The consumer instances contain, at a minimum, the current data in producer replication set tables, and the consumers are ready to accept replicated data updates. By default, the data in producer tables is replicated into tables and table columns of the same name on the consumer
instances. *Transform replicated data* describes how to map the data into different tables and table columns, and how to modify the data as it is replicated.

- *Map the replication data to different tables* on the consumer instance.
- *Modify the values* during replication.
- Set up business rules to *trigger post-replication workflows*.

### Grant access to replication data

Admins of consumer sets must apply to receive replication data. As the producer replication set administrator, you must approve or deny that request.

Role required: admin for a producer replication set

You can review consumer access requests for all of your producer replication sets or for a specific producer replication set.

1. To review and approve consumer access requests for all of your producer replication sets:
   a) On the producer instance, navigate to **Instance Data Replication > Consumers Pending Approval**. All of the consumer replication sets pending approval appear.
   b) Select the check box for each consumer replication set you want to approve.
   c) On the **Actions on selected rows...** drop-down, select **Approve**. The approved consumer sets start receiving replicated data.

   Note: In the future, you can change the Consumer Approval Status to *Denied* to prevent the consumer from receiving replication data.

2. To review and approve a consumer access request for a specific producer replication set:
   a) On the producer instance, navigate to **Instance Data Replication > Producer Replication Sets**.
   b) Select the producer replication set where you want to approve consumer access.
   c) Under **Related Links**, on the **Consumer Subscriptions** tab, select the check box for the consumer replication set you want to approve.
   d) On the **Actions on selected rows...** drop-down, select **Approve**. The approved consumer set starts receiving replicated data.

   Note: In the future, you can change the Consumer Approval Status to *Denied* to prevent the consumer from receiving replication data.

### Revoke access to replication data

If you believe that a consumer should no longer receive replicated data, you can revoke the consumer’s access.

Role required: producer instance admin

When you generate a new, shared encryption key, approved consumer sets automatically receive the new key and data replication is not interrupted. Any consumer set with a status of *Denied* or *Pending Approval* will not receive the new encryption key, and replication ceases.

1. On the producer instance, navigate to **Instance Data Replication > Producer Replication Sets**
2. Select the producer replication set that has consumers whose access needs to be revoked. The Producer Replication Set page appears.

3. On the **Consumer Subscriptions** tab, select the check box for the consumer instance whose permissions you want to revoke.

4. On **Actions on selected rows...**, select **Revoke**.

Instance Data Replication generates a new encryption key and shares it with all approved consumer sets. All other consumer sets stop receiving replication data. Admins of those consumer replication sets must **reapply to restore access to the replication data**.

**Restore access to replication data**

If the producer replication set admin generates a new encryption key, all consumer sets stop receiving replication data if the consumer's status is **Denied** or **Pending Approval**. To restore access, the consumer set admin must send a request.

Role required: consumer instance admin

When the producer replication set admin generates a new encryption key, approved consumer sets automatically receive the new key, and data replication is uninterrupted. Consumer sets with
a status of **Denied** or **Pending Approval** do not receive the new encryption key and replication ceases.

1. On the consumer instance, navigate to **Instance Data Replication > Consumer Replication Sets**.
2. Select the consumer replication set to restore access to.
3. Under **Related Links**, click **Request Shared Key**.
   A request is sent to the producer replication set admin. If you are granted access, the consumer's **Approval Status** changes to **Approved**.
5. On the **Consumer Replication Entries** tab, select all of the tables and in click **Activate with Seeding** to get the latest data in the producer's replication set.

**Transform replication data**

An IDR transform maps producer data to tables or table columns named differently on consumer instances. Adapters modify the data before storing it on consumer instances. Use adapters, for example, to localize data, and transforms to create the producer as a single source of truth for various business systems (consumer instances) that refer to the same entity by different names.

- **Create and activate a producer replication set**.
- **Create, activate, and seed one or more consumer replication sets**.
- Role required: admin or idr_admin

By default, replicated data from producer tables and table columns goes into tables and table columns of the same name on consumer instances. You can, however, map producer data into any table or table column on consumer instances. You might replicate the data to a different table or table column because existing tables or table columns you replicate to have different names.

You can also use adapters to modify producer data during replication, for example, to localize the data, or to populate data that has been labeled differently in consumer tables.

Transformations have the following limitations:

- sys_created, sys_created_by, sys_domain, sys_updated_by, sys_id, and sys_mod_count are automatically mapped to the consumer and cannot be remapped.
  No other sys_ fields can be replicated.
- Adapters cannot operate on the sys_journal field type, for example, on **Comments** or **Worknotes** columns in a Task table.
- Calculated fields cannot be transformed.
  For example, sys_user is a combination of first and last name fields. If the source and target fields have the same names, the calculated fields are replicated. Attempting to remap calculated fields breaks the calculation.

1. On the consumer instance, click **Instance Data Replication > Consumer Replication Sets** and click a consumer replication set.
2. On the **Consumer Replication Entries** tab, click a consumer replication entry. The Consumer Replication Entry form appears.
3. Select the **Enable Transform** check box.
4. In **Target Table Name**, select the table into which to replicate the source table data and click **Update**.
5. On the **Consumer Replication Entries** tab, click the same consumer replication entry.
6. Click the lock icon next to **Transform Map** to unlock it.
   
   The **Transform Map** appears. Field names from the source table appear in the left column. The middle column shows matching field names in the target table. All fields that do not have the
same names in both tables appear in the – choose source field – or – choose target field – drop-downs.

Note: If a table in a producer replication set is not on a consumer instance, the table is created on the consumer instance. If there are no entries in the – choose source field – and – choose target field – columns, the producer and consumer tables do not have identically named columns. Grayed out values are not configurable.

7. To map a producer column to a consumer column that has a different name:
   a) Click – choose source field – and select the source field you want to map.
   b) Click – choose target field –, select the target field into which you want to map the data, and then click Add.
   c) If you want to remove a field from replicating from the producer to the consumer, click the X at the end of the row to delete the field.

8. To modify the producer data before replicating it in the consumer instance, click Add Adapter.
   The What kind of Adapter Rule do you want to create? page appears.
What kind of Adapter Rule do you want to create?

- Concatenate String Adapter Rule
- Replace Adapter Rule
- Split Adapter Rule
- Fixed-Width Format Adapter Rule
- Pattern Adapter Rule
- Task Number Adapter Rule
- Calculation Adapter Rule
- Map Adapter Rule
- Time Zone Conversion Adapter Rule

9. Click the adapter you want to use and configure it. For more information about configuring adapters, see Adapter descriptions.

Producer data replicates into different tables or table columns on the consumer instance, or the data is modified, or both.

Note: Adapters do not modify data on the producer instance.

Bi-directional replication

Replicate updated data on a consumer instance to the producer instance.

Role required: admin or idr_admin

By default, replicated data flows from a producer to consumer instances. Bi-directional replication reverses that flow. For example, a company might outsource its networking issues. The third party receives the networking incident records from consumer instances, fixes the networking issues, updates the records, and returns them to the consumer instance. Bi-directional replication then updates the incident records on the producer instance. Bi-directional replication only works for records that originated on the producer.

To make data flow bi-directionally behind the scenes on the consumer instance, the system creates a producer on the consumer instance and a consumer on the producer instance.
Choosing bi-directional replication creates producer and consumer instances

If you look at the replication sets on the original producer instance, you see the replication set name and the automatically generated consumer instance. It has the same name appended with the suffix, -<long-number>-reverse, where <long-number> is a randomly generated number. For example, if Test is the replication set name on the producer, Test-2034802-reverse might be the name of the consumer replication set automatically generated on the same instance. On the original consumer instance, you see the same names. Replication sets with the reverse suffix are read-only.

You can see the automatic creation of a consumer on a producer instance, and a producer on a consumer instance by running https://<producer-instance-name>/xmlstats.do?include=idr and https://<consumer-instance-name>/xmlstats.do?include=idr on the producer and consumer instances, respectively. In the following image, the original producer instance is on the left and the original consumer instance is on the right.
Bi-directional replication has the following limitations:

- Auto-conflict resolution is unsupported.
- Merge conflicts happen if producer and consumer instances modify the same record at the same time.
  The most recent update wins, which means the data on the consumer and producer tables might be different.
- Deleting data on a consumer instance does not delete the same data on the producer instance.
- Bi-replication supports the **Number** adapter but none of the others.

1. On a producer instance, navigate to **Instance Data Replication > Producer Replication Sets** and click a producer replication set.
2. On the Producer Replication Set pane, select the **Require Consumer Sync** check box to enable bi-directional replication.
3. On a consumer instance, navigate to **Instance Data Replication > Consumer Replication Sets** and click a consumer replication set connected to the producer replication set.
4. On the Consumer Replication Set pane, click the **Synchronize Replication Configuration** under **Related Links**.
   A check appears in the **Require Consumer Sync** check box.

Data updated on this consumer instance automatically replicates on the producer instance, which in turn replicates the updates to its other consumer instances.

**Seed a consumer instance**

Seeding refers to downloading records specified in a producer replication set to tables specified in consumer replication sets. The administrator can elect to seed all or just some of the tables in replication sets.

Role required: admin or idr_admin
Administrators initiate seeding requests on a consumer instance while activating a consumer replication set. Once seeded, producer instances send only record updates rather than all the records in the producer replication set. Audit trails contain a history of those record updates.

Seeding continues even if errors occur on some consumer tables. The admin can restart seeding specifically on the tables that have errors, or on all tables in a replication set.

During seeding:

- Records that exist on the producer instance and not on the consumer instance are copied to the consumer instance.
- If the identical record exists on a consumer instance, the record on the consumer instance is not modified.
- The sys ID of the record identifies the record on both instances.
- If a replication set changes and no longer includes a table, the records in the corresponding table on the consumer instances are not altered.
- The producer instance handles one seeding request at a time. When the producer instance is busy with a seeding request, subsequent seeding requests are queued and initiated in the order received.

**Note:** In bi-directional replication, the same rules apply in reverse.

Seeding requests have the following limitations:

- Maximum record size is 32 MB.
- Maximum seeding size is 3 million records.

**Note:** If your replication set contains more than 3 million records, seeding will not even start. To remedy this situation, break the replication set into multiple replication sets with fewer records in each.

- Maximum seeding time is 7 days.

1. On the consumer instance, navigate to Instance Data Replication > Consumer Replication Sets and click a consumer replication set.
2. On the Consumer Replication Entries tab, select the check box next to the tables to seed.
3. Click either Activate with Seeding to download only the current field values from the producer or Activate with Seeding (Include History) to download the current field values and the history of all field updates.
   
   Once seeded, the consumer instance maintains a history of all field updates.
4. To cancel a seeding request:
   a) On the Seeding Requests tab, click a seeding request.
   b) On the Seeding Request form, click Cancel.
5. If you encounter an error during seeding, see Fix seeding errors.

In a successful seeding, all selected data on a producer instance is replicated on a consumer instance.

**Trigger workflows after replications**

Use platform business rules to trigger workflows after replications.

Role required: admin or idr_admin
A business rule is a server-side script associated with a table. Use business rules to trigger workflows associated with replications, such as sending a notification or validating the replicated data.

Business rules are part of the Now Platform®. For more information, see Business rules.

1. On a consumer instance, navigate to Instance Data Replication > Consumer Replication Sets and click a consumer replication set.
2. On the Consumer Replication Entries tab, click a replication set table.
3. Select the Run Business Rule check box.
4. Optionally, repeat this procedure for other tables in the replication set.
5. Click Update.
.IDR invokes the business rules associated with the specified table after replicating data to the table.

Error resolution

Review and solve common issues.
Role required: admin or idr_admin

Check for common issues

Find solutions for common IDR issues.
Role required: admin or idr_admin

1. Make sure that the Name, Shared Key, Producer ID, and Producer Set ID are exactly the same on the producer and consumer instances. The names must match.
2. On the producer instance, navigate to Instance Data Replication > Producer Replication Sets.
3. Select a producer replication set and make sure that the producer replication set status is Active Replication.
   If the status is In Draft, click Activate. Only active producer and consumer replication sets replicate.
4. After creating the consumer replication set, make sure that you click Synchronize Replication Configuration.
   On the Consumer Replication Set page, if there are no tables on the Consumer Replication Entries tab, click Synchronize Replication Configuration.
5. Confirm that the producer and consumer instances are connected:
   a) On the producer instance, navigate to Instance Data Replication > Producer replication set
   b) Select a producer replication set.
   c) Under Related Links, click Open Metadata Logs.
   d) See if the Payload Type INIT_TOPIC has the status Sent.
      If not, the producer instance is not connected to the consumer instances. To connect them, see Create a consumer replication set.
   e) Repeat the procedure on the consumer instance and see if there are any records where INIT_TOPIC had the status Sent. If not, the consumer instance is not connected to the producer instance. To connect the consumer instance to the producer instance, see Create a consumer replication set.
6. See if the producer-side and consumer-side replication jobs are running by navigating to Instance Data Replication > Replication Log and checking the entries in the Source column.
The entries should have IDRProducerJob and IDRConsumerJob. The Created column specifies when the jobs ran. Make sure the jobs ran recently.

7. Check for payload errors by navigating to Instance Data Replication > Replication Payload Error. Review the error messages.

Find Instance Data Replication errors

You can view metadata for messages between producer and consumer instances, payload error logs, and a message log.

Role required: admin or idr_admin

1. To view producer metadata logs on the producer instance:
   a) Navigate to Instance Data Replication > Producer Replication Sets.
   b) Select a producer replication set and under Related Links click Open Metadata Logs.

2. To view consumer metadata logs on the consumer instance:
   a) Navigate to Instance Data Replication > Consumer Replication Sets.
   b) Select a consumer replication set and under Related Links click Open Metadata Logs.

3. On either the producer instance or the consumer instance, to view transformation errors and replications that failed to load:
   a) Navigate to Instance Data Replication > Replication Payload Error.
      In the Replication Payload Error table, if the Source value is Seeding, the error happened during seeding. If the source value is different, the error occurred during a replication set update. If any column breaks during transformation, transformation for the entire table breaks and data is not replicated in the table.
   b) Select an error in the Created column.
      The Error Message field on the Payload Error pane describes the payload error.

4. To view the replication log on either the producer instance or the consumer instance:
   a) Navigate to Instance Data Replication > Replication Log.
   b) Select an entry.
      The Instance Data Replication Log form shows the message and message level.

Review synchronization errors

Synchronization errors appear in the Status field on the consumer instance as Replication Error.

Role required: admin or idr_admin

Synchronization errors occur when a producer does not send data or a consumer does not receive data.

1. After completing the tasks in Check for common issues, determine if the consumer successfully sent the synchronize request to the producer.
   a) On the consumer instance, navigate to Instance Data Replication > Consumer Replication Sets.
   b) Select a consumer replication set.
   c) Under Related Links, click Open Metadata Logs.
d) Sort the logs in descending order based on the **Log Sequence** column.

e) Find the most recent payload with the REPL_SET_DETAIL_REQUEST type.
   If you do not see this payload type, refresh the log until you see REPL_SET_DETAIL_REQUEST.

f) Verify that the **To** column shows the correct producer instance ID.
   If the producer instance ID is incorrect, **update the ID** and click **Activate Without Seeding** under the Related Links.

g) Verify that the **Status** column says **Sent**.
   If it does not, the producer did not send updates.

2. Determine if the producer received the synchronize request from the consumer.
   a) On the producer instance, click **Instance Data Replication > Producer Replication Sets**.
   b) Select a producer replication set.
   c) Under Related Links, click **Open Metadata Logs**.
   d) Sort the logs in descending order based on the **Log Sequence** column.
   e) Find the most recent payload with the REPL_SET_DETAIL_REQUEST type.
      If you do not see this payload type, refresh the log until you see REPL_SET_DETAIL_REQUEST.
   f) Verify that the **From** column shows the correct consumer instance ID.
      If the correct consumer instance ID is incorrect, **update the ID**.
   g) Verify that the **Status** column says **Received**.

**Fix seeding errors**

Retry seeding on tables with seeding errors.

Role required: admin or idr_admin

Seeding continues even when seeding fails on individual tables. Failure can be the result of various errors, for example network problems and failed inserts. You can reseed some or all tables where seeding failed. The maximum for a partial reseeding request is 10,000 errors. If you have more, perform a **full seeding**.

Do not retry seeding if the errors include any of the following problems:

- Record size exceeds 32 MB.
- Seeding request exceeds 3 million records.
- Replication takes longer than 7 days to complete.

To fix these problems, reduce the number of tables in the seeding request or reduce the size of the records.

1. On the consumer instance, navigate to **Instance Data Replication > Consumer Replication sets**
2. Select a consumer replication set.
3. On the Seeding Requests tab of the Consumer Replication Set pane, click a seeding request that failed.

4. On the **Seeding Request** pane, click the **Payload Errors** tab and examine the values in the **Message** column.

5. Either click **Retry All Errors** or select the check boxes next to the errors to retry, and then click **Retry Selected Errors**.

Diagnose replication delays

Use xmlstats to discover if data replication is taking longer than expected.

Role required: admin

The job, IDRProducerJob, runs periodically on producer instances to detect data updates. When IDRProducerJob finds updates, it sends the updates to consumers.

The job, IDRConsumerJob runs periodically on consumer instances to detect data updates from a producer. When IDRConsumerJob finds updates, it updates the data in consumer tables.

It takes some time for data updates in a producer replication set to appear in consumer replication sets. Abnormally long times suggest there might be a problem. You can use xmlstats to see the time taken in each step as data updates move from a producer to consumers.

Instances can be both producers and consumers. In that case, running xmlstats shows analytics for both. In Bi-directional replication, you can see an example.

If you have significant data delays, please contact ServiceNow Technical Support.

1. To view the time lag on a producer, in a browser enter https://<producer-instance-name>/xmlstats.do?include=idr.

   The producer’s xmlstats appear.

   ```xml
   <xmlstats
     created="Thu Jun 13 13:26:50 PDT 2019"
     includes="idr"
     version="5.0"
   >
     <producer
       producer_last_run="2019-06-13T20:26:45.077Z"
       replication_queue_reading_lag="00:25:20"
       replset_last_message_sent_on="2019-06-13 13:24:06"
       last_position="0"
       last_sent_message_id="2dd8e70190233005aef572807dbf5c" name=""
       topic_name="idr.m43124941233005bd460e0b33dace.65892e5ff023"
     >
       <consumer
         consumer_last_run="2019-06-13T20:26:45.075Z"...
       </consumer>
     </producer>
   </xmlstats>
   ```

   - `producer_last_run`—Last time the replication job ran on the producer’s side. Times are in the ISO format, so they’re GMT.

     When IDR detects updated data in producer replication sets, the replication job sends the updates to the network. If the job has not run for a while, something might be wrong.

   - `replication_queue_reading_lag`—How long it takes the data to go from the producer to the network.
The timer starts when data is updated on a producer instance. The timer stops when IDRProducerJob sends the data updates to the network.

- For each replication set on the producer, there is a `<repset>` that contains:
  - `name`—Name of the replication set.
  - `status`—Current health of the replication set, either `active` or `error`.
  - `last_message_sent_on`—Last time the producer sent updated data to consumers.

  Times are in the ISO format, so they’re GMT. Old timestamps suggest that either data was not updated in this producer replication set or there might be a problem.

2. To view the time lag on a consumer, in a browser enter `https://<consumer-instance-name>/xmlstats.do?include=idr`. The consumer’s xmlstats appear.

   • `consumer_last_run`—Last time the consumer job ran that picks up the changes from the producer.

   Times are in the ISO format, so they’re GMT. Old timestamps suggest that there might be a problem.

   • For each replication set on the consumer, there is a `<repset>` that contains:
     - `name`—Name of the replication set.
     - `status`—Current health of the replication set, either `active` or `error`.
     - `data_lag`—How long the consumer has not received data updates from the producer.

     Long durations suggest a problem.

     • `last_heartbeat_received_on`—Timestamp that shows when the consumer last received a heartbeat from the producer.

     Times are in the ISO format, so they’re GMT. Producers send heartbeats roughly every minute. Old timestamps suggest that there might be a problem.

---

**Check for replication entries not populated**

Verify that the producer is replicating data.

Role required: admin or idr_admin

1. Perform the steps in [Check for common issues](#).
3. Enter `data_replication_state.LIST` in the navigation pane.
4. In the `data_replication_state` table, look for the record named `idr.replication.queue.cursor`.
5. Confirm that the value of `Updated by` is `idr.system`, and note the value of `Updated`.
6. If `queue_reading_lag` is greater than 0 and the **Producer cursor last updated time** is less than 60 minutes, the producer encountered an error.
7. If there is an error, look in the syslog, replication log, and localhost log for errors that occurred after the most recent **Producer cursor last updated time**.
   a) To look in the replication log, click **Instance Data Replication > Replication Log**.

**Status messages**

Review status messages with recovery information.

- **All Producer Replication Sets have been deactivated due to fatal replication error**
  
  All consumer replication sets are moved to the error state. Contact ServiceNow Technical Support.

- **Error while seeding data. Please refer to the Replication Payload Error table for details**
  
  On the consumer instance, more than one record failed to seed. To recover, go to the **Replication Payload Error** table to find and fix the error, then **activate the replication set**.

- **Error while seeding data. Please retry seeding this table**
  
  To recover, **reseed the table**.

- **Producer has encountered an error while seeding**
  
  To recover, contact the admin of the producer instance to determine the cause of the problem.

- **Producer Replication Set configuration has been modified**
  
  To recover, activate the replication set on the consumer instance, either with seeding or without seeding.

- **Producer Replication Set has been deactivated due to replication error**
  
  Contact ServiceNow Technical Support.

- **Producer Replication Set has been deactivated**
  
  To recover, **activate the producer replication set**, and then **activate the consumer replication**.

- **Producer Replication Set has been deleted**
  
  To recover, delete the consumer replication set.

- **Producer Replication Set is inactive**
To recover, **activate the producer replication set**, and then **synchronize and activate the consumer replication set**.

- **Producer Replication Set not found**

  To recover, delete the consumer replication set.

- **Replication Set Paused**

  To recover, click **Resume** or **Activate with Seeding**.

- **Replication set was in pause/error/seeding pause state for more than 7 days**

  The consumer replication set has been in the pause state, in an error state, or seeding pause state for more than the timeout period. The replication set is put into the **Disabled** state. To recover, **check for seeding errors** and **activate the replication with seeding**.

- **Seeding has been terminated due to timeout**

  To recover, retry the seeding request or contact ServiceNow Technical Support.

- **Seeding request for a Producer Replication Set containing more than X number of records is not supported**

  To recover, change the filter criteria to reduce the number of records to be seeded. The default limit is 10 million records. Contact ServiceNow Technical Support to change the default limit.

- **Seeding was cancelled by a consumer admin**

  To recover, **activate the replication set** with or without seeding.

- **Seeding was cancelled by a producer admin**

  To recover, **activate the consumer replication set** with or without seeding. Only seeding requests in Queued, Paused, or Started states can be canceled. In this case, the consumer replication state is **Replication Error**.

- **Shared key not matching**

  The producer and consumer replication sets have different shared keys. To recover, **copy the shared encryption key on the producer replication set, paste it into the consumer replication set**, and activate the replication set.

### Adapter descriptions

During replication, adapters modify producer data before inserting it on consumer instances.

### Adapter fields

Each adapter has **Name** and **Description** fields. The name appears in the **Adapter** column on the A. Use the **Description** field to explain the purpose of the data conversion.

### Calculation adapter

Performs the specified mathematical calculation on producer data. Specify the operation and the value used in the operation.
Parameter examples

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operation: Multiply</td>
<td>10</td>
<td>10.80</td>
</tr>
<tr>
<td>Constant Value: 1.08</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Operation: Max</td>
<td>1020</td>
<td>1000</td>
</tr>
<tr>
<td>Constant Value: 1000</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Operation: Floor</td>
<td>5.5</td>
<td>5</td>
</tr>
<tr>
<td>Constant Value: 0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Max and Min specify the highest and lowest possible values. Values above or below those limits are set to those limits. Value types such as int and long have maximum and minimum values. Values above or below cause precision errors.

Concatenate String adapter

Appends a specified string to the source data.

Parameter example

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td>String: _v2</td>
<td>Patch10236</td>
<td>Patch10236_v2</td>
</tr>
</tbody>
</table>

Fixed-Width Format adapter

Reformats fixed-width input data. Use # to represent any positive integer, @ to represent any character, and \ as the literal escape character.

Parameter examples

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Match: #</td>
<td>7605551212</td>
<td>(760) 555-1212</td>
</tr>
<tr>
<td>Output: (##) #</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Match: #</td>
<td>10000</td>
<td>100.00</td>
</tr>
<tr>
<td>Output: #</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Match: ,#</td>
<td>10,000</td>
<td>10000</td>
</tr>
<tr>
<td>Output: #</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Map adapter

Use comma-separated pairs of literals to map source-to-target conversions. Matches must be exact. For example, PRB=TASK would not convert PRB1000 to TASK1000.
### Pattern adapter

Use regular expressions to identify input patterns. Use parentheses in the *Regex* to identify groups. In *Output Pattern*, use $ to specify groups. $0 represents the entire input, $1 represents the first group, $2 represents the second group, and so on. You can also insert, prefix, and append literal characters, including spaces so they appear in the adapter output.

#### Parameter examples

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Map</strong>: PRB=TASK, done=complete</td>
<td>PRB</td>
<td>TASK</td>
</tr>
<tr>
<td><strong>Map</strong>: PRB=TASK, done=complete</td>
<td>done</td>
<td>complete</td>
</tr>
<tr>
<td><strong>Map</strong>: PRB=TASK, done=complete</td>
<td>PRB1000</td>
<td>(no mapping)</td>
</tr>
</tbody>
</table>

In the second example, the match is ABC followed by two letters, followed by ABC and two letters. $1$ of this input is ABCDE. $2$ of this input is ABCFG. $0$ is the entire input string. So $1$ $0$ is ABCDE ABCDEABCFG.

### Replace adapter

Replaces a specified input string or substring with a specified string. Use $ to replace only some of the occurrences of the string. $1$ replaces only the first occurrence; $2$ replaces only the second. Use curly braces to replace the first N occurrences. For example, $\{3\}$ replaces the first three occurrences.

#### Parameter examples

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Find</strong>: London</td>
<td>The product is London. The product is London.</td>
<td>The product is Madrid. The product is Madrid.</td>
</tr>
<tr>
<td><strong>Replace</strong>: Madrid</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Split adapter

Uses a specified delimiter, for example, a space, to break a string into two or more strings. In **Output Pattern**, use `$` to specify groups. `$0` represents the entire input, `$1` represents the first group, `$2` represents the second group, and so on. You can repeat a group in an output pattern, for example, `$2, $1, $1`. Multiple instances of a delimiter in source data create three or more groups.

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Find:</strong> $2 London</td>
<td>The product is London.</td>
<td>The product is Madrid.</td>
</tr>
<tr>
<td><strong>Replace:</strong> Madrid</td>
<td>The product is London.</td>
<td>The product is London.</td>
</tr>
<tr>
<td><strong>Find:</strong> $2(2) London</td>
<td>The product is London.</td>
<td>The product is Madrid.</td>
</tr>
<tr>
<td><strong>Replace:</strong> Madrid</td>
<td>The product is London.</td>
<td>The product is London.</td>
</tr>
</tbody>
</table>

#### Parameter examples

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Delimiter:</strong> <code> </code></td>
<td>John Smith</td>
<td>Smith, John</td>
</tr>
<tr>
<td><strong>Output Pattern:</strong> <code>$2, $1</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Delimiter:</strong> <code> </code></td>
<td>John Harry Smith</td>
<td>Harry, John, John</td>
</tr>
<tr>
<td><strong>Output Pattern:</strong> <code>$2, $1, $1</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Delimiter:</strong> <code> </code></td>
<td>John Harry Smith</td>
<td>Smith</td>
</tr>
<tr>
<td><strong>Output Pattern:</strong> <code>$3</code></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Task Number adapter

Adds a prefix or suffix to a task number or replaces the task number’s prefix.

#### Parameter examples

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Modification:</strong> Replace</td>
<td>PRB80899</td>
<td>STRY80899</td>
</tr>
<tr>
<td><strong>Number Prefix:</strong> PRB</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>New Number Prefix:</strong> STRY</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Modification:</strong> Add Prefix</td>
<td>08099</td>
<td>STRY80899</td>
</tr>
<tr>
<td><strong>Prefix:</strong> STRY</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Time Zone Conversion adapter

Converts one time zone to another.
Parameter example

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output time zone: PDT</td>
<td>07:00:00 am GMT</td>
<td>00:00:00 am PDT</td>
</tr>
</tbody>
</table>

Instance Data Replication blacklisted tables

Some tables cannot be included in replication sets. Child tables of blacklisted tables are also blacklisted.

Blacklisted tables

- Tables with the prefixes V_PREFIX, SYSX_, sys, ts_, ua_, usageanalytics_, wf_, ecc_, clone_, jrobin_, rrd_, imp_, pf_, pfd_, idr_
  - There are a few exceptions, for example, sys_domain.
- Rotated tables, including syslog, sys_querystat, ecc_queue, ecc_event, cmdb_metric, sysevent
- Tables without a sys_id
- sso_federation
- saml2_update1_properties
- sso_properties
- digest_properties
- Instance

IntegrationHub

Automate integration tasks using ServiceNow-built components for Flow Designer, or develop custom integrations. Requires a separate subscription.

Capabilities

IntegrationHub enables execution of third-party APIs as a part of a flow when a specific event occurs in ServiceNow. These integrations, referred to as spokes, are easy to configure and enable you to quickly add powerful actions without the need to write a script. For example, you can post a message and incident details in a Slack channel when a high priority incident is created.

IntegrationHub provides the following functionality:

Spokes for base system integrations

Using IntegrationHub actions in Flow Designer, you can:

- Post messages and ServiceNow incident, problem, and change record details to HipChat, Slack spoke, or Microsoft Teams spoke communications channels.
- Synchronize data across multiple production instances using the eBonding spoke as an example.

Create custom integrations

Build custom integrations with Action Designer using a REST step or a Script step.

Automate the administration of servers and applications in your network.
Use custom actions to delegate Flow Designer processes to a MID Server in your network. For example, actions that use the PowerShell step or REST step.

Connection and Credentials

IntegrationHub takes advantage of aliases to manage connection information and credentials when integrating with external systems. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. IntegrationHub only requires an alias, which then resolves to use the correct credentials and connection information during runtime. Learn more about Introduction to credentials, connections, and aliases.

Benefits

IntegrationHub provides process owners and developers these benefits.

- Consolidates multiple Now Platform automation capabilities into a single environment so process owners and developers can build and visualize business processes and integrations from a single interface.
- Extends Flow Designer content to integrate business processes with external systems.
- Promotes business process automation by enabling subject matter experts to develop and share spokes with flow designers.
- Provides natural-language-descriptions of integration logic to help non-technical users understand triggers, actions, inputs, and outputs.

Development process

When developing a custom integration, develop all actions for the integration within a scoped application. When deployed to a target instance, these actions are grouped as a spoke in Flow Designer. Brand the spoke by adding a custom icon to the application record. To learn more about application development, see Applications.

When developing spokes, flow and action designers typically perform these application development tasks.

1. Create a scoped application on a development instance to build spokes.
2. Publish a test version of the scoped application to the application repository.
3. Deploy the scoped application to a test instance from the application repository.
4. Test the scoped application on the test instance.
5. When working as expected, publish the scoped application in one of the following ways.
   - Publish to the application repository for deployment on production instances.
   - Publish to the ServiceNow Store as an application that customers can request for their environments.
   - Publish to ServiceNow Share to provide content to other customers in the ServiceNow community.

Review Flow Designer design considerations in the Architecture Overview.
Request IntegrationHub

IntegrationHub lets you build reusable integrations with third-party systems and call them from anywhere in the platform. For example, request IntegrationHub to call external systems using integration APIs from the Action Designer Script step, run the Script step on the Mid Server, and activate protocol steps like REST, SOAP, and PowerShell.

Flow Designer is a Now Platform feature that enables you to automate processes within a single ServiceNow instance. Without an IntegrationHub subscription, you can use base system actions or steps, including the Script step, to manipulate records, send emails, trigger notifications, and perform operations within the instance. Request IntegrationHub to automate and create integrations with external systems from the Flow Designer interface.

IntegrationHub usage and subscription

Choose an IntegrationHub subscription package to build reusable integrations with third-party systems. Use the usage dashboard to view the number of transactions used within your current subscription, and to view transaction details.

<table>
<thead>
<tr>
<th>IntegrationHub subscription packages</th>
</tr>
</thead>
<tbody>

**IntegrationHub usage overview**

Navigate to **IntegrationHub > Usage Overview** to view the current transaction count for your instance.

**Request an IntegrationHub plugin**

IntegrationHub plugins require a separate subscription and must be activated by ServiceNow personnel.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

1. From your instance, navigate to **System Definition > Plugins**.
2. On the All Applications page, click **Request Plugin** to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
Activate Plugin

In order to enhance the user experience, we have redesigned Activate a Plugin service item. You can also use Manage Instances page on Service Portal to Activate a Plugin.

[Take me to the HI Service Portal Activate a Plugin Service Catalog.]

4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments.</td>
</tr>
</tbody>
</table>

5. Click Submit.

IntegrationHub plugins

Request IntegrationHub plugins included in your subscription.

ServiceNow IntegrationHub plugins

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>

</table>

**Note:** Because the eBonding Example spoke includes sample actions to demonstrate integrating with a remote instance, it does not require a subscription package.

**Box spoke**

Move attachments to Box where they can be managed as shared documents.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.
IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions

API version v2.

Spoke flows

The Box spoke provides sample flows in the draft state to demonstrate automating Box tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move Attachment when created to Box</td>
<td>Moves attachment files from ServiceNow to Box when a new attachment record is added. Updates the trigger record with a shared link to the moved attachment file on Box.</td>
</tr>
<tr>
<td>On-boarding user</td>
<td>Creates a user in Box when you create a ServiceNow user in the Box User group.</td>
</tr>
</tbody>
</table>

Spoke actions

The Box spoke provides actions to automate Box tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document Management</td>
<td>Add Metadata to File</td>
<td>Specifies custom data for a particular file or folder.</td>
</tr>
<tr>
<td></td>
<td>Copy File to ServiceNow Attachment</td>
<td>Copies a file from Box and attaches it to the specified ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Lookup File ID</td>
<td>Retrieves the ID of the specified file in Box.</td>
</tr>
<tr>
<td></td>
<td>Move Owned Item</td>
<td>Moves all items owned by the specified user in Box to the specified folder.</td>
</tr>
<tr>
<td></td>
<td>Remove File</td>
<td>Removes the specified file from Box.</td>
</tr>
<tr>
<td></td>
<td>Upload File</td>
<td>Uploads the specified file to Box.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Document Sharing</td>
<td>Add Collaborator</td>
<td>Grants a user or group a specified level of access to a particular file or folder. Collaborators have one of these access levels.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· Co-Owner</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· Editor</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· Previewer</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· Preview Uploader</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· Uploader</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· Viewer</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· Viewer Uploader</td>
</tr>
<tr>
<td></td>
<td>Create Shared Link</td>
<td>Create a direct and read-only link to a file or folder in Box.</td>
</tr>
<tr>
<td></td>
<td>Get Folder Collaborators</td>
<td>Retrieves the collaborators associated with the specified folder in Box.</td>
</tr>
<tr>
<td></td>
<td>Remove Collaborator</td>
<td>Removes the specified collaboration from a file or folder in Box.</td>
</tr>
<tr>
<td>Folder Management</td>
<td>Create Folder</td>
<td>Creates a folder in Box on behalf of the specified Box user account.</td>
</tr>
<tr>
<td></td>
<td>Delete Folder</td>
<td>Deletes the specified folder in Box.</td>
</tr>
<tr>
<td></td>
<td>Lookup Folder ID</td>
<td>Retrieves the ID of the specified folder in Box.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> Items added to Box require ten minutes to become accessible. For example, if one action creates a folder, a Lookup Folder ID action will not return results until after ten minutes have passed.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Create Group</td>
<td>Creates a group in Box with the specified invitation preferences.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes the specified group in Box.</td>
</tr>
<tr>
<td></td>
<td>Update Group</td>
<td>Updates the specified group in Box with the specified preferences.</td>
</tr>
<tr>
<td>User Management</td>
<td>Add User to Group</td>
<td>Adds the specified user to the specified group in Box.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Create App User</td>
<td>Creates an Enterprise App User in Box, which the spoke uses to act on behalf of other Box users. An Enterprise App User account cannot login directly to Box.</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates a new user account in Box.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the specified user in Box.</td>
</tr>
<tr>
<td></td>
<td>Disable User</td>
<td>Sets the status of the specified user in Box to inactive.</td>
</tr>
<tr>
<td></td>
<td>Enable User</td>
<td>Sets the status of the specified user in Box to active.</td>
</tr>
<tr>
<td></td>
<td>Lookup User ID</td>
<td>Retrieves the ID of the specified user in Box.</td>
</tr>
<tr>
<td></td>
<td>Update User</td>
<td>Updates the specified user in Box with the specified role changes.</td>
</tr>
</tbody>
</table>

**Box account requirements**

The Box spoke requires creating a custom app on your Box account to generate OAuth 2.0 tokens. See [Configure Box account](#).

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Credentials and connection information](#).

This spoke uses these alias records to authorize actions.

<table>
<thead>
<tr>
<th>Connection &amp; Credential alias</th>
<th>Description</th>
<th>Connection alias requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Box</td>
<td>Connection to the Box Collaboration and File Management APIs.</td>
<td>• Connection type: HTTP&lt;br&gt;• Connection URL: <a href="https://api.box.com">https://api.box.com</a></td>
</tr>
<tr>
<td>Box Upload</td>
<td>Connection to the Box upload service.</td>
<td>• Connection type: HTTP&lt;br&gt;• Connection URL: <a href="https://upload.box.com">https://upload.box.com</a></td>
</tr>
</tbody>
</table>

To use the spoke connection aliases, create an associated Connection record and an associated Credential record for each alias.
Set up Box spoke

Integrate the ServiceNow instance and Box by creating a custom OAuth application in Box to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Box spoke
- Role required: admin

Configure Box account

Create a custom OAuth application from your Box account to enable OAuth 2.0 authentication with the Box spoke.

Box requirements:
- Box account
- Box administrator credentials

Complete these steps from your Box account. See the Box Developer Portal documentation for instructions on creating and configuring custom applications.

1. From your Box account, create a custom OAuth application.
2. Select standard OAuth 2.0 user authentication as the application authentication method.
3. Record the application client ID and client secret to register the app as a third-party OAuth provider on your ServiceNow instance.
4. Enable the matching Box application scope permissions you want the app to support.

<table>
<thead>
<tr>
<th>Box application scope permission</th>
<th>Required for</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read and write all files and folders stored in Box</td>
<td>Document management, document sharing, and folder management actions</td>
</tr>
<tr>
<td>Manage users</td>
<td>User management actions</td>
</tr>
<tr>
<td>Manage groups</td>
<td>Group management actions</td>
</tr>
<tr>
<td>Manage enterprise properties</td>
<td>Document sharing, group management, and user management actions</td>
</tr>
</tbody>
</table>

Register Box as OAuth provider

Use the information generated during Box account configuration to register Box as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays the message What kind of OAuth application?
3. Select Connect to a third party OAuth Provider.
   The system displays a blank Application Registries form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Box OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID you created during the Box account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you created during the Box account configuration.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select <strong>Authorization Code</strong>.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click **Save**.
The system validates the OAuth credentials and populates the **Redirect URL** and the **OAuth Entity Profiles** related list.

6. Copy the value from **Redirect URL**.

7. Login to your Box account to edit the configuration of your custom Box application.
   See the [Box Developer Portal](https://www.box.com) for instructions.

8. Paste the **Redirect URL** value into the OAuth 2.0 Redirect URI for your custom Box application. For example, paste `https://instance.service-now.com/oauth_redirect.do`.

The instance can request OAuth 2.0 tokens for the spoke.

*Note:* The spoke generates OAuth tokens that expire after 30 days. An administrator can regenerate the spoke OAuth token every 30 days.

**Create Credential records for the Box spoke**
Create Credential records to the Box custom OAuth application you created during Box account configuration. The Box spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter <strong>Box API Credentials</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Box application as an OAuth provider. For example, select <strong>Box OAuth default profile</strong>.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select <strong>All MID Servers</strong>.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter <strong>100</strong>.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.
6. Click **New**.
The system displays the message **What type of Credentials would you like to create?**.
7. **Select OAuth 2.0 Credentials.**
   The pop-up window displays a blank OAuth 2.0 Credentials form.

8. **Enter these values.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Box Upload Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Box application as an OAuth provider. For example, select Box OAuth default profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

9. **Click Submit.**

**Create Connection records for the Box spoke**
Create Connection records to your Box account and the Box APIs. The Box spoke connection and credential aliases use these connections to perform actions on Box.

1. **Navigate to Connections & Credentials > Connection & Credential Aliases.**
2. **Open for the record for Box.**
3. From the Connections tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. **Enter these values.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Box API Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for the Box API. For example, select Box API Credentials.</td>
</tr>
</tbody>
</table>

5. **Click Submit.**
6. **Open for the record for Box Upload.**
7. From the Connections tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
8. **Enter these values.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Box Upload Connection.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Box upload. For example, select Box Upload Credentials.</td>
</tr>
</tbody>
</table>

9. Click **Submit**.

**Regenerate Box OAuth token**
Regenerate the Box OAuth token when it expires. The Box spoke OAuth token expires every thirty days.

1. Navigate to **Connections & Credentials > Credentials**.
2. Select the Box spoke OAuth Credential record. For example, select **Box API Credentials**.
3. From Related Links, click **Get OAuth Token**.

The Box spoke receives a new OAuth access token good for 30 days.

**Docker spoke**
Lookup Docker data from your ServiceNow instance. Automate changes in the Docker engine when an event occurs in ServiceNow.

**Request apps on the Store**
Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the **ServiceNow Store version history release notes**.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Standard subscription package. For more information, see **Request IntegrationHub**.

**Supported versions**
Community Edition version 18.09.0.

**Spoke actions**
The Docker spoke provides actions to automate Docker tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Images Management</td>
<td>Create An Image</td>
<td>Creates an image in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>List Images</td>
<td>Lists images from the Docker instance.</td>
</tr>
<tr>

<td>Removes a Docker instance from a swarm.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't
need to update any actions that use the connection. For more information, see Credentials and connection information.

This spoke uses the Docker alias record to authorize actions. To use the spoke connection alias, create an associated Connection record. This spoke does not require a credential record.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Docker alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Create Connection records for the Docker spoke

Create Connection records to the Docker engine. The Docker spoke connection and credential alias uses these connections to perform actions on Docker.

- Request IntegrationHub subscription
- Activate Docker spoke
- Role required: admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Docker.
3. From the Connections tab, click New.
   - The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Docker Connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The IP address and port of the host machine where Docker is installed.</td>
</tr>
</tbody>
</table>

5. Click Submit.

DocuSign spoke

Automate the process of sending a document to an individual or list of recipients for digital signature using DocuSign. For example, automate employee onboarding and offboarding, or send non-disclosure agreements, legal agreements, and statements of work. Use ServiceNow data in document templates and enable users to upload documents for signature as needed.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.
IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Compatible versions

This spoke was built for DocuSign API version v2, but may be compatible with later versions.

Key features

DocuSign spoke enables a flow designer to:

- Automate the process of sending a document from a ServiceNow attachment or DocuSign template to an individual or recipient list for digital signature.
- Discover and synchronize DocuSign accounts and templates in ServiceNow.
  - Retrieve a list of accounts and associated templates from DocuSign and then insert or update them as records in the Accounts (sn_docusign_spoke_accounts) and Templates (sn_docusign_spoke_docusign_templates) tables using the Get Accounts subflow.
  - Retrieve templates associated with a specified DocuSign account and then insert or update them as records in the Templates (sn_docusign_spoke_docusign_templates) table using the Get Templates Per Account subflow.
- Copy and customize sample flows for sending templates and on-demand document requests.
- Pause a flow until a document is signed. A scripted REST API webhook waits for the recipient to sign the document.
- Use values from a signed document in a flow.
- Attach a completed DocuSign document to a ServiceNow record for auditing purposes.
- Manage envelopes and users.

Spoke requirements

- DocuSign account
- DocuSign administrator credentials
- DocuSign application configured to integrate with ServiceNow
- DocuSign application details such as client ID, integrator key, secret keys, and RSA keypairs
- IntegrationHub subscription

See the DocuSign Developer Center documentation for instructions on creating and configuring custom applications.

Spoke flows

The DocuSign spoke provides sample flows to demonstrate automating DocuSign tasks. Use DocuSign spoke actions to automate any tasks desired by your organization. To customize a sample flow, copy it to a new application scope. Available sample flows include:
<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send a Document for Digital Signature</td>
<td>Sends a document to DocuSign for a digital signature when a Service Catalog request is created by the Send a Document for Digital Signature item. Before using this flow, activate the Send a Document for Digital Signature catalog item.</td>
</tr>
<tr>
<td>Send employment offer to candidate using DocuSign template</td>
<td>Sends a DocuSign envelope to a user using a template. For example, use this flow to send a job offer to a candidate. Before using this flow, activate the Demonstrate Template - Send Job Offer to Candidate catalog item.</td>
</tr>
</tbody>
</table>

The DocuSign spoke adds catalog items for use with the DocuSign spoke sample flows. Before triggering a DocuSign spoke sample flow, activate these catalog items.

<table>
<thead>
<tr>
<th>Catalog item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send a Document for Digital Signature</td>
<td>Sends a document for digital signature in DocuSign.</td>
</tr>
<tr>
<td>Demonstrate Template - Send Job Offer to Candidate</td>
<td>Sends a job offer using a DocuSign template.</td>
</tr>
</tbody>
</table>

**Spoke subflows**

The DocuSign spoke provides a sample subflow to demonstrate automating DocuSign tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflow is, Get & Set DocuSign Field Data. The subflow processes a list of catalog item variables and updates a draft envelope with each variable value.

**Spoke actions**

The DocuSign spoke provides actions to automate DocuSign tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Management</td>
<td>Get Accounts</td>
<td>Retrieves accounts associated with the spoke Connection and Credential alias record.</td>
</tr>
<tr>
<td>Document Signature</td>
<td>Get Embedded Signing URL</td>
<td>Creates a signing URL that is embedded into an application. User can sign the document without leaving the application.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> Signing URL is active for 300 seconds and can be sent to one recipient at a time.</td>
</tr>
<tr>
<td>Document Management</td>
<td>Attach DocuSign Document to Record</td>
<td>Retrieves a signed DocuSign document and attaches it to a ServiceNow record.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get Document ID by Name</td>
<td>Retrieves the document ID from an envelope using the specified document name.</td>
</tr>
<tr>
<td>Envelope Management</td>
<td>Add Recipient to Envelope</td>
<td>Adds the specified recipient to the specified envelope.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>· Recipient ID used in this action is associated with the envelope and is different from the Recipient ID used in the Get All Template Fields action.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· Administrator enters a numeric value for this Recipient ID.</td>
</tr>
<tr>
<td></td>
<td>Create Draft Envelope from Template</td>
<td>Creates a draft envelope from an existing DocuSign template.</td>
</tr>
<tr>
<td></td>
<td>Get Field ID</td>
<td>Retrieves the ID of the specified field from the specified draft envelope.</td>
</tr>
<tr>
<td></td>
<td>Get Field Value</td>
<td>Retrieves the value of the specified field from the specified envelope.</td>
</tr>
<tr>
<td></td>
<td>Get Recipient ID by Role Name</td>
<td>Retrieves the recipient ID of the specified role name from the specified envelope.</td>
</tr>
<tr>
<td></td>
<td>Send Adhoc Signature Request to User</td>
<td>Sends a DocuSign document associated with the specified ServiceNow record to the specified recipient for signature.</td>
</tr>
<tr>
<td></td>
<td>Send Adhoc Signature Request to Users</td>
<td>Sends a DocuSign document associated with the specified ServiceNow record to the specified multiple recipients for signatures at a time.</td>
</tr>
<tr>
<td></td>
<td>Send Envelope</td>
<td>Sends an envelope to the specified recipients.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> All recipient details must be provided before sending an envelope.</td>
</tr>
<tr>
<td></td>
<td>Set Field Value</td>
<td>Sets the value of the specified field in the specified draft envelope.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Wait for Signature from DocuSign</td>
<td>Pauses a flow until the specified document has been signed or rejected. Returns the status of the document to the flow for further processing.</td>
</tr>
<tr>
<td>Template Management</td>
<td>Get Templates Per Account</td>
<td>Retrieves the templates associated with the specified DocuSign account.</td>
</tr>
<tr>
<td></td>
<td>Get Template Fields</td>
<td>Retrieves all fields in a template that is defined for a recipient.</td>
</tr>
<tr>
<td></td>
<td>Get Template Recipients</td>
<td>Retrieves all recipients defined for a template.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a DocuSign user with the specified user details.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the specified DocuSign user.</td>
</tr>
</tbody>
</table>

**Note:**
- Recipient ID used in this action is associated with the template and is different from the Recipient ID used in the Add Recipient to Envelope action.
- Value of the Recipient ID is a unique system-generated number.

**Spoke module**

The DocuSign spoke adds a DocuSign module to your ServiceNow instance. The DocuSign spoke synchronizes and stores templates and envelopes in ServiceNow. The DocuSign spoke includes these tables and records.

<table>
<thead>
<tr>
<th>Table/Record</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Aliases</td>
<td>The DocuSign connection alias.</td>
</tr>
<tr>
<td>Scheduled Job</td>
<td>The Get Accounts &amp; Templates scheduled job that synchronizes templates and envelopes with your DocuSign account.</td>
</tr>
<tr>
<td>Accounts</td>
<td>DocuSign accounts synchronized with your ServiceNow instance. To synchronize accounts, see <a href="#">Synchronize DocuSign with ServiceNow</a>. The Get Accounts subflow retrieves a list of accounts and associated templates from DocuSign and then inserts or updates them as records in the Accounts (sn_docusign_spoke_accounts) and Templates (sn_docusign_spoke_docusign_templates) tables.</td>
</tr>
</tbody>
</table>
Table/Record | Description
--- | ---
Templates | DocuSign templates from synchronized DocuSign accounts. The Get Templates Per Account subflow retrieves templates associated with a specified DocuSign account and then inserts or updates them as records in the Templates (sn_docusign_spoke_docusign_templates) table.
Envelopes | DocuSign envelopes from synchronized DocuSign accounts. Records in the Envelopes table are updated only when webhook is configured for the DocuSign account.

The DocuSign spoke tables include these fields.

<table>
<thead>
<tr>
<th>Table</th>
<th>Fields</th>
</tr>
</thead>
</table>
| Accounts (sn_docusign_spoke_accounts) | • Account ID  
• Account Name  
• Description  
• Email  
• Alias  
• Display Name |
| Templates (sn_docusign_spoke_docusign_templates) | • Account  
• Template ID  
• Name  
• Description  
• Last Modified  
• Display Name |
| Envelopes (sn_docusign_spoke_envelopes) | • Account  
• ID  
• Status  
• Signed Date  
• Declined Reason  
• Display name  
• Embedded Signing  
• Signed Date Time Zone  
• Template |

**DocuSign account requirements**

The DocuSign spoke requires configuring your DocuSign account to generate an OAuth 2.0 JWT Bearer Grant token.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see *Credentials and connection information.*
This spoke uses the DocuSign Connection & Credential Alias record to authorize actions.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the DocuSign alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

**Set up DocuSign spoke**

Integrate your DocuSign account with your ServiceNow instance. Create a custom OAuth application in DocuSign and authenticate requests from ServiceNow.

Role required: admin
- Request IntegrationHub subscription
- Activate DocuSign spoke

**Configure DocuSign account and webhook**

Create a custom OAuth application from your DocuSign account to enable OAuth 2.0 authentication with the DocuSign spoke. Configure the webhook in your DocuSign account to enable DocuSign to send data to ServiceNow when a recipient signs a document.

DocuSign requirements:
- DocuSign account
- DocuSign administrator credentials
- DocuSign app configured to integrate with ServiceNow

Complete these steps from your DocuSign account. See the [DocuSign Developer Center](#) documentation for instructions on creating and configuring custom applications. DocuSign uses a scripted webhook to send signed document data to ServiceNow. This enables flow designers to pause a flow until a document is signed, and use document data in the flow.

1. From your DocuSign account, register your application and generate an integrator key.
2. Generate a secret key.
3. Record the integrator key and secret key to register the app as a third-party OAuth provider on your ServiceNow instance.
4. Connect a custom configuration to enable your DocuSign application to share events and data with your ServiceNow instance.
   a) Add your ServiceNow instance URL in this format: `https://{instance-name}.service-now.com/api/sn_docusign_spoke/docusign_webhook`.
   b) Include basic authorization in the header and add your ServiceNow credentials.
   c) Enable DocuSign to share envelope events with ServiceNow.
      - Envelope Sent
      - Envelope Delivered
      - Envelope Signed/Completed
      - Envelope Declined
      - Envelope Voided

**Attach a Java Key Store certificate to the DocuSign spoke**

Enable the JWT Bearer Grant token authentication by attaching a valid Java KeyStore (JKS) certificate to the DocuSign spoke.
Role required: admin

- Obtain DocuSign administrator consent for internal applications
- Ensure the availability of a valid Java KeyStore certificate

1. Navigate to System Definition > Certificates.
2. Click New.
3. Complete the form.

**X.509 Certificate form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name to uniquely identify the record. For example, DocuSign Certificate.</td>
</tr>
<tr>
<td>Notify on expiration</td>
<td>Define users to be notified when the certificate expires.</td>
</tr>
<tr>
<td>Warn in days to expire</td>
<td>Enter the number of days to send a notification before the certificate expires.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Type</td>
<td>Select Java Key Store.</td>
</tr>
<tr>
<td>Expires in days</td>
<td>Enter the number of days until the certificate expires.</td>
</tr>
<tr>
<td>Key store password</td>
<td>Enter a password associated with the certificate.</td>
</tr>
<tr>
<td>Short description</td>
<td>Enter a summary about the certificate.</td>
</tr>
</tbody>
</table>

4. Click the attachments icon (_attach) and attach a JKS certificate.

5. Click Validate Stores/Certificates.

Create a JWT signing key for the DocuSign spoke
Create a JSON Web Token (JWT) signing key to assign to your Java KeyStore certificate.

1. Navigate to System OAuth > JWT Keys.
2. Click New.
3. Complete the form.

**JWT Keys form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name to uniquely identify the JWT signing key. For example, DocuSign JWT Keys.</td>
</tr>
<tr>
<td>Signing Keystore</td>
<td>Select the valid JKS certificate attached in the previous task. For example, DocuSign Certificate.</td>
</tr>
<tr>
<td>Key Id</td>
<td>Enter a key Id to identify which key is used when multiple keys are used to sign tokens.</td>
</tr>
<tr>
<td>Signing Algorithm</td>
<td>Select an algorithm to sign with the JWT key.</td>
</tr>
<tr>
<td>Signing Key Password</td>
<td>Enter a password associated with the signing key.</td>
</tr>
</tbody>
</table>
4. Click **Submit**.

*Create a JWT provider for the DocuSign spoke*
Add a JSON Web Token (JWT) provider to your ServiceNow instance.

1. Navigate to **System OAuth > JWT Providers**.
2. Click **New**.
3. On the **JWT Provider** form, fill the values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name to uniquely identify the JWT provider. For example, DocuSign JWT Provider.</td>
</tr>
<tr>
<td>Expiry Interval (sec)</td>
<td>Enter a number in seconds to set the lifespan of JWT provider tokens.</td>
</tr>
<tr>
<td>Signing Configuration</td>
<td>Select a JWT signing key. For example, DocuSign JWT Keys.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.
The Standard Claims and Custom Claims related lists display.

5. Select the JWT provider created for the DocuSign spoke.

6. Enter values for **iss**, **sub**, and **aud** in the **Standard Claims** related list. See the [DocuSign Developer Center](https://developer.docusign.com) for instructions.

7. Insert a record in the **Custom Claims** related list and complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Claim Name</td>
<td>scope</td>
</tr>
<tr>
<td>Claim Value Type</td>
<td>string</td>
</tr>
<tr>
<td>Claim Value</td>
<td>signature impersonation</td>
</tr>
</tbody>
</table>

8. Click **Update**.

*Register DocuSign as OAuth Provider*
Use the information generated during DocuSign account configuration to register DocuSign as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
The system displays the message **What kind of OAuth application?**

3. Select **Connect to a third party OAuth Provider**.
The system displays a blank Application Registries form.

4. Complete the form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter DocuSign OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the integrator key you generated during the DocuSign account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the client secret you generated during the DocuSign account configuration.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select JWT Bearer.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Enter <a href="https://account-d.docusign.com/oauth/token">https://account-d.docusign.com/oauth/token</a>.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click Save.
   - The system validates the OAuth credentials and populates the Redirect URL.
   - The system populates OAuth Entity Profile with Grant Type as JWT Bearer. For example, OAuth Entity Profile is created with default Name, DocuSign OAuth default_profile.

6. Insert a record in the OAuth Entity Scopes related list and fill the values.

   OAuth Entity Scopes related list fields
   
<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>scope</td>
</tr>
<tr>
<td>OAuth Scope</td>
<td>signature impersonation</td>
</tr>
</tbody>
</table>

7. Copy the value from Redirect URL.
8. Click Update.
9. Login to your DocuSign account to edit the configuration of your custom DocuSign application. See the DocuSign Developer Center for instructions.

The instance can request OAuth 2.0 tokens for the spoke.

Note: When an OAuth token expires, the spoke automatically regenerates a new token in most cases. If a token expires and is not regenerated, an administrator can regenerate the spoke OAuth token.

Create Credential records for the DocuSign spoke
Create Credential records to the DocuSign custom OAuth application you created during DocuSign account configuration. The DocuSign spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   - The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
   - The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Fill these values.
### Create Connection records for the DocuSign spoke

Create Connection records to your DocuSign account. The DocuSign spoke connection and credential alias uses these connections to perform actions in DocuSign.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **DocuSign**.
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter DocuSign Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for DocuSign. For example, select DocuSign Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter <a href="https://demo.docusign.net">https://demo.docusign.net</a>.</td>
</tr>
</tbody>
</table>

5. **Click Submit**.

Synchronize ServiceNow with DocuSign to access DocuSign accounts, templates, and envelopes from the DocuSign spoke. See [Synchronize DocuSign with ServiceNow](#).

### Synchronize DocuSign with ServiceNow

Synchronize ServiceNow with DocuSign to access DocuSign accounts, templates, and envelopes from the DocuSign spoke.

Role required: admin
- Request IntegrationHub subscription
- Activate DocuSign spoke
  - [Set up DocuSign spoke](#)
Schedule a job to synchronize DocuSign with your ServiceNow instance daily, or synchronize data as needed.

1. Required: Schedule a job to synchronize DocuSign data with your ServiceNow instance.
   a) Navigate to **DocuSign > Scheduled Job**.
      The Get Accounts & Templates scheduled job opens.
   b) Select **Active**.

   The DocuSign spoke synchronizes accounts, templates, and envelopes daily.

2. Required: Synchronize DocuSign data as needed with a UI action.
   a) Navigate to **DocuSign > Accounts**.
      The Accounts (sn_docusign_spoke_accounts) table opens.
   b) Click the **Get Accounts** related link.

   The system synchronizes all accounts linked through an OAuth Credential record and populates the Templates and Envelopes tables with DocuSign data. Use template and envelope records when constructing flows.

### Activate DocuSign spoke catalog items

Trigger events in DocuSign when an item is requested in the Service Catalog. For example, The Send a Document for Digital Signature catalog item triggers a sample flow that sends a DocuSign document to a designated recipient.

Role required: admin
- Request IntegrationHub subscription
- Activate DocuSign spoke

The DocuSign spoke adds catalog items for use with the DocuSign spoke sample flows. Before triggering a DocuSign spoke sample flow, activate these catalog items.

<table>
<thead>
<tr>
<th>Catalog item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send a Document for Digital Signature</td>
<td>Sends a document for digital signature in DocuSign.</td>
</tr>
<tr>
<td>Demonstrate Template - Send Job Offer to Candidate</td>
<td>Sends a job offer using a DocuSign template.</td>
</tr>
</tbody>
</table>

1. Navigate to **Service Catalog > Maintain Items**.
2. Search for and select **Send a Document for Digital Signature**.
3. Click **Activate**.
4. Search for and select **Demonstrate Template - Send Job Offer to Candidate**.
5. Click **Activate**.

When one of these items is requested in the Service Catalog, the associated DocuSign spoke sample flow triggers and performs actions in DocuSign.

### How to automate on-demand signing requests

Send DocuSign on-demand signing requests using information in your ServiceNow instance by creating flows in Flow Designer.

Role required: admin
- Request IntegrationHub subscription
• Activate DocuSign spoke
• Set up DocuSign spoke

**Note:** Customize flows in Flow Designer based on your requirements.

1. In Flow Designer, create a flow.
2. Specify **TRIGGER** to initiate the flow.
3. Specify the **ACTIONS** to be performed during the flow. The actions include one of the following:
   • Send Adhoc Signature Request To User
   • Send Adhoc Signature Request To Users
4. Optional: To pause the flow until the specified document is signed or rejected, select the **Wait for Signature from DocuSign** action.
5. Perform one of the following set of actions:
   • To send an embedded signing URL, select **Use Embedded Signing**, and **Embedded Signing Recipient (User)**.
   • To send a document for signing, provide details regarding DocuSign account, PDF document, recipient, email, and envelope expiry.

   • The selected document or Embedded Signing URL is sent to the recipients for signing. While signing the document, the recipient details are auto-populated.
   • An envelope record is created in the **Envelopes** table. The Envelope status and other details are updated.

### How to automate signing requests using templates

Send DocuSign signing requests using DocuSign templates and information in your ServiceNow instance by creating flows in Flow Designer. For example, **Send employee offer**.

**Role required:** admin

• Request IntegrationHub subscription
• Activate DocuSign spoke
• Set up DocuSign spoke

**Note:** Customize flows based on your requirements.

1. In DocuSign, create document templates and specify recipient roles. For example, **Candidate** and **Manager**. The system retrieves other recipient details such as name and email, when the flow is triggered.
2. In Flow Designer, create a new flow.
3. Specify **TRIGGER** to initiate the flow.
4. Specify the **ACTIONS** to be performed during the flow and provide recipient details. The actions include:
   • Create Draft Envelope from Template
   • Get Recipient ID by Role Name
   • Add Recipient to Envelope
   • Get Recipient ID by Role Name
   • Add Recipient to Envelope
   • Get Field ID

© 2019 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
5. Optional: To pause the flow until the specified document is signed or rejected, select the **Wait for Signature from DocuSign** action.

   - The selected document or Embedded Signing URL is sent to the recipients for signing. While signing the document, the recipient details are auto-populated.
   - An envelope record is created in the **Envelopes** table. The Envelope status and other details are updated.

**DocuSign spoke v1.2**

Automate the process of sending a document to an individual or list of recipients for digital signature using DocuSign. For example, automate employee onboarding and offboarding, or send non-disclosure agreements, legal agreements, and statements of work. Use ServiceNow data in document templates and enable users to upload documents for signature as needed.

**Request apps on the Store**

Visit the [ServiceNow Store](https://www.servicenow.com) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the [ServiceNow Store version history release notes](https://www.servicenow.com).

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see [Request IntegrationHub](https://www.servicenow.com).

**Compatible versions**

This spoke was built for DocuSign API version v2 or v2.1, but may be compatible with later versions.

**Key features**

DocuSign spoke enables a flow designer to:

- Automate the process of sending a document from a ServiceNow attachment or DocuSign template to an individual or recipient list for digital signature.
- Restrict access to DocuSign data based on a user's role. For example, your company may have one DocuSign account used by the HR team and another used by the Legal team. To keep the data separate between these two accounts, you can create a role for each account and add it to the accounts record.
- Discover and synchronize DocuSign accounts and templates in ServiceNow.
- Retrieve a list of accounts and associated templates from DocuSign and then insert or update them as records in the Accounts (sn_docusign_spoke_accounts) and Templates (sn_docusign_spoke_docusign_templates) tables.
- Retrieve templates associated with a specified DocuSign account and then insert or update them as records in the Templates (sn_docusign_spoke_docusign_templates) table.
• Copy and customize sample flows for sending templates and on-demand document requests.
• Pause a flow until a document is signed. A scripted REST API webhook waits for the recipient to sign the document.
• Use values from a signed document in a flow.
• Attach a completed DocuSign document to a ServiceNow record for auditing purposes.
• Manage envelopes and users.

Spoke requirements

• DocuSign account
• DocuSign administrator credentials
• DocuSign application configured to integrate with ServiceNow
• DocuSign application details such as client ID, integrator key, secret keys, and RSA keypairs
• IntegrationHub subscription

See the DocuSign Developer Center documentation for instructions on creating and configuring custom applications.

Spoke flows

The DocuSign spoke provides sample flows to demonstrate automating DocuSign tasks. Use DocuSign spoke actions to automate any tasks desired by your organization. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send a Document for Digital Signature</td>
<td>Sends a document to DocuSign for a digital signature when a Service Catalog request is created by the Send a Document for Digital Signature item. Before using this flow, activate the Send a Document for Digital Signature catalog item.</td>
</tr>
<tr>
<td>Send employment offer to candidate using</td>
<td>Sends a DocuSign envelope to a user using a template. For example, use this flow to send a job offer to a candidate. Before using this flow, activate the Demonstrate Template - Send Job Offer to Candidate catalog item.</td>
</tr>
<tr>
<td>DocuSign template</td>
<td></td>
</tr>
</tbody>
</table>

The DocuSign spoke adds catalog items for use with the DocuSign spoke sample flows. Before triggering a DocuSign spoke sample flow, activate these catalog items.

<table>
<thead>
<tr>
<th>Catalog item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send a Document for Digital Signature</td>
<td>Sends a document for digital signature in DocuSign.</td>
</tr>
<tr>
<td>Demonstrate Template - Send Job Offer to Candidate</td>
<td>Sends a job offer using a DocuSign template.</td>
</tr>
</tbody>
</table>
Spoke subflows

The DocuSign spoke provides sample subflows to demonstrate automating DocuSign tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attach DocuSign Envelope To ServiceNow Record</td>
<td>Attaches all the documents in an envelope to a ServiceNow record.</td>
</tr>
<tr>
<td>Get &amp; Set DocuSign Field Data</td>
<td>Processes a list of catalog item variables and updates a draft envelope with each variable value.</td>
</tr>
</tbody>
</table>

Spoke actions

The DocuSign spoke provides actions to automate DocuSign tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Management</td>
<td>Get Accounts</td>
<td>Retrieves accounts associated with the spoke Connection and Credential alias record.</td>
</tr>
<tr>
<td>Document Signature</td>
<td>Get Embedded Signing URL</td>
<td>Creates a signing URL that is embedded into an application. User can sign the document without leaving the application.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> Signing URL is active for 300 seconds and can be sent to one recipient at a time.</td>
</tr>
<tr>
<td>Document Management</td>
<td>Attach DocuSign Document to Record</td>
<td>Retrieves a signed DocuSign document and attaches it to a ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Get Document ID by Name</td>
<td>Retrieves the document ID from an envelope using the specified document name.</td>
</tr>
<tr>
<td></td>
<td>Get Documents In An Envelope</td>
<td>Returns a list of documents with an ID and name in the given DocuSign envelope.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Envelope Management</td>
<td>Add Recipient to Envelope</td>
<td>Adds the specified recipient to the specified envelope.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Recipient ID used in this action is associated with the envelope and is</td>
</tr>
<tr>
<td></td>
<td></td>
<td>different from the Recipient ID used in the Get All Template Fields action.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Administrator enters a numeric value for this Recipient ID.</td>
</tr>
<tr>
<td></td>
<td>Create Draft Envelope from Template</td>
<td>Creates a draft envelope from an existing DocuSign template.</td>
</tr>
<tr>
<td></td>
<td>Get Field ID</td>
<td>Retrieves the ID of the specified field from the specified draft envelope.</td>
</tr>
<tr>
<td></td>
<td>Get Field Value</td>
<td>Retrieves the value of the specified field from the specified envelope.</td>
</tr>
<tr>
<td></td>
<td>Get Recipient ID by Role Name</td>
<td>Retrieves the recipient ID of the specified role name from the specified</td>
</tr>
<tr>
<td></td>
<td>Get Recipients In An Envelope</td>
<td>Returns a list of recipients with a Recipient ID and Role Name in the given DocuSign envelope.</td>
</tr>
<tr>
<td></td>
<td>Send Adhoc Signature Request to User</td>
<td>Sends a DocuSign document associated with the specified ServiceNow record to the specified recipient for signature.</td>
</tr>
<tr>
<td></td>
<td>Send Adhoc Signature Request to Users</td>
<td>Sends a DocuSign document associated with the specified ServiceNow record to the specified multiple recipients for signatures at a time.</td>
</tr>
<tr>
<td></td>
<td>Send Envelope</td>
<td>Sends an envelope to the specified recipients.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> All recipient details must be provided before sending an envelope.</td>
</tr>
<tr>
<td></td>
<td>Set Field Value</td>
<td>Sets the value of the specified field in the specified draft envelope.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Wait for Signature from DocuSign</td>
<td>Pauses a flow until the specified document has been signed or rejected. Returns the status of the document to the flow for further processing.</td>
<td></td>
</tr>
<tr>
<td>Get List Of Documents</td>
<td>Gets the list of all DocuSign documents in an envelope.</td>
<td></td>
</tr>
<tr>
<td>Get Templates Per Account</td>
<td>Retrieves the templates associated with the specified DocuSign account.</td>
<td></td>
</tr>
<tr>
<td>Get Template Fields</td>
<td>Retrieves all fields in a template that is defined for a recipient.</td>
<td></td>
</tr>
<tr>
<td>Get Template Recipients</td>
<td>Retrieves all recipients defined for a template.</td>
<td></td>
</tr>
<tr>
<td>Create User</td>
<td>Creates a DocuSign user with the specified user details.</td>
<td></td>
</tr>
<tr>
<td>Delete User</td>
<td>Deletes the specified DocuSign user.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:**
- Recipient ID used in this action is associated with the template and is different from the Recipient ID used in the Add Recipient to Envelope action.
- Value of the Recipient ID is a unique system-generated number.

**Spoke module**

The DocuSign spoke adds a DocuSign module to your ServiceNow instance. The DocuSign spoke synchronizes and stores templates and envelopes in ServiceNow. The DocuSign spoke includes these tables and records.

<table>
<thead>
<tr>
<th>Table/Record</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Aliases</td>
<td>The DocuSign connection alias.</td>
</tr>
<tr>
<td>Scheduled Job</td>
<td>The Get Accounts &amp; Templates scheduled job that synchronizes templates and envelopes with your DocuSign account.</td>
</tr>
<tr>
<td>Accounts</td>
<td>DocuSign accounts synchronized with your ServiceNow instance. To synchronize accounts, see <a href="#">Synchronize DocuSign with ServiceNow</a>. The Get Accounts subflow retrieves a list of accounts and associated templates from DocuSign and then inserts or updates them as records in the Accounts (sn_docusign_spoke_accounts) and Templates (sn_docusign_spoke_docusign_templates) tables.</td>
</tr>
<tr>
<td>Table/Record</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Templates</td>
<td>DocuSign templates from synchronized DocuSign accounts. The Get Templates Per Account subflow retrieves templates associated with a specified DocuSign account and then inserts or updates them as records in the Templates (sn_docusign_spoke_docusign_templates) table.</td>
</tr>
<tr>
<td>Envelopes</td>
<td>DocuSign envelopes from synchronized DocuSign accounts, including a Recipients related list that includes information about who the envelopes were sent to and the envelope status. Records in the Envelopes table are updated only when webhook is configured for the DocuSign account.</td>
</tr>
</tbody>
</table>

The DocuSign spoke tables include these fields.

<table>
<thead>
<tr>
<th>Table</th>
<th>Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accounts (sn_docusign_spoke_accounts)</td>
<td>• Account ID&lt;br&gt;• Account Name&lt;br&gt;• Description&lt;br&gt;• Email&lt;br&gt;• Alias&lt;br&gt;• Display Name</td>
</tr>
<tr>
<td>Templates (sn_docusign_spoke_docusign_templates)</td>
<td>• Account&lt;br&gt;• Template ID&lt;br&gt;• Name&lt;br&gt;• Description&lt;br&gt;• Last Modified&lt;br&gt;• Display Name</td>
</tr>
<tr>
<td>Envelopes (sn_docusign_spoke_envelopes)</td>
<td>• Account&lt;br&gt;• ID&lt;br&gt;• Status&lt;br&gt;• Signed Date&lt;br&gt;• Declined Reason&lt;br&gt;• Display name&lt;br&gt;• Embedded Signing&lt;br&gt;• Signed Date Time Zone&lt;br&gt;• Template</td>
</tr>
</tbody>
</table>

**DocuSign account requirements**

The DocuSign spoke requires configuring your DocuSign account to generate an OAuth 2.0 JWT Bearer Grant token.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Credentials and connection information](#).
This spoke uses the DocuSign Connection & Credential Alias record to authorize actions.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the DocuSign alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

**Create connection aliases for additional DocuSign accounts**

If your DocuSign implementation includes multiple DocuSign accounts, create a connection alias for each account.

Role required: admin

Your company may have a DocuSign account for each department that uses DocuSign. To use multiple accounts with this spoke, create an alias for each account. At runtime, the system identifies the alias associated with the account and sends the correct connection and credential information in the request.

If your company only has one account, you can use the default DocuSign alias provided with the spoke and proceed to [Set up DocuSign spoke](#).

1. Navigate to **DocuSign > Connection Aliases**.
2. Select **New**.
3. In the **Name** field, add a descriptive name for the account. For example, DocuSign HR account.
4. Save the record.

[Set up DocuSign spoke](#) for each connection alias in your DocuSign implementation.

**Set up DocuSign spoke**

Integrate your DocuSign account with your ServiceNow instance. Create a custom OAuth application in DocuSign and authenticate requests from ServiceNow.

Role required: admin

- Request IntegrationHub subscription
- Activate DocuSign spoke

Perform these set up tasks for each connection alias in your DocuSign implementation.

**Configure DocuSign account and webhook**

Create a custom OAuth application from your DocuSign account to enable OAuth 2.0 authentication with the DocuSign spoke. Configure the webhook in your DocuSign account to enable DocuSign to send data to ServiceNow when a recipient signs a document.

DocuSign requirements:

- DocuSign account
- DocuSign administrator credentials
- DocuSign app configured to integrate with ServiceNow

Complete these steps from your DocuSign account. See the [DocuSign Developer Center documentation](#) for instructions on creating and configuring custom applications. DocuSign uses a scripted webhook to send signed document data to ServiceNow. This enables flow designers to pause a flow until a document is signed, and use document data in the flow.

1. From your DocuSign account, register your application and generate an integrator key.
2. Generate a secret key.
3. Record the integrator key and secret key to register the app as a third-party OAuth provider on your ServiceNow instance.
4. Connect a custom configuration to enable your DocuSign application to share events and data with your ServiceNow instance.
   a) Add your ServiceNow instance URL in this format: https://{instance-name}.service-now.com/api/sn_docusign_spoke/docusign_webhook.
   b) Include basic authorization in the header and add your ServiceNow credentials.
   c) Enable DocuSign to share envelope events with ServiceNow.
      - Envelope Sent
      - Envelope Delivered
      - Envelope Signed/Completed
      - Envelope Declined
      - Envelope Voided

Attach a Java Key Store certificate to the DocuSign spoke
Enable the JWT Bearer Grant token authentication by attaching a valid Java KeyStore (JKS) certificate to the DocuSign spoke.

Role required: admin
- Obtain DocuSign administrator consent for internal applications
- Ensure the availability of a valid Java KeyStore certificate

1. Navigate to System Definition > Certificates.
2. Click New.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name to uniquely identify the record. For example, DocuSign Certificate.</td>
</tr>
<tr>
<td>Notify on expiration</td>
<td>Define users to be notified when the certificate expires.</td>
</tr>
<tr>
<td>Warn in days to expire</td>
<td>Enter the number of days to send a notification before the certificate expires.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Type</td>
<td>Select Java Key Store.</td>
</tr>
<tr>
<td>Expires in days</td>
<td>Enter the number of days until the certificate expires.</td>
</tr>
<tr>
<td>Key store password</td>
<td>Enter a password associated with the certificate.</td>
</tr>
<tr>
<td>Short description</td>
<td>Enter a summary about the certificate.</td>
</tr>
</tbody>
</table>

4. Click the attachments icon (     ) and attach a JKS certificate.
5. Click Validate Stores/Certificates.
Create a JWT signing key for the DocuSign spoke
Create a JSON Web Token (JWT) signing key to assign to your Java KeyStore certificate.

1. Navigate to **System OAuth > JWT Keys**.
2. Click **New**.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name to uniquely identify the JWT signing key. For example, DocuSign JWT Keys.</td>
</tr>
<tr>
<td>Signing Keystore</td>
<td>Select the valid JKS certificate attached in the previous task. For example, DocuSign Certificate.</td>
</tr>
<tr>
<td>Key Id</td>
<td>Enter a key id to identify which key is used when multiple keys are used to sign tokens.</td>
</tr>
<tr>
<td>Signing Algorithm</td>
<td>Select an algorithm to sign with the JWT key.</td>
</tr>
<tr>
<td>Signing Key Password</td>
<td>Enter a password associated with the signing key.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

Create a JWT provider for the DocuSign spoke
Add a JSON Web Token (JWT) provider to your ServiceNow instance.

1. Navigate to **System OAuth > JWT Providers**.
2. Click **New**.
3. On the **JWT Provider** form, fill the values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name to uniquely identify the JWT provider. For example, DocuSign JWT Provider.</td>
</tr>
<tr>
<td>Expiry Interval (sec)</td>
<td>Enter a number in seconds to set the lifespan of JWT provider tokens.</td>
</tr>
<tr>
<td>Signing Configuration</td>
<td>Select a JWT signing key. For example, DocuSign JWT Keys.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.
   The Standard Claims and Custom Claims related lists display.
5. Select the JWT provider created for the DocuSign spoke.
6. Enter values for **iss**, **sub**, and **aud** in the **Standard Claims** related list. See the **DocuSign Developer Center** for instructions.
7. Insert a record in the **Custom Claims** related list and complete the form.
Custom Claims related list fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Claim Name</td>
<td>scope</td>
</tr>
<tr>
<td>Claim Value Type</td>
<td>string</td>
</tr>
<tr>
<td>Claim Value</td>
<td>signature impersonation</td>
</tr>
</tbody>
</table>

8. Click Update.

Register DocuSign as OAuth Provider
Use the information generated during DocuSign account configuration to register DocuSign as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays the message What kind of OAuth application?
3. Select Connect to a third party OAuth Provider.
   The system displays a blank Application Registries form.
4. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter DocuSign OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the integrator key you generated during the DocuSign account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the client secret you generated during the DocuSign account configuration.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select JWT Bearer.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Enter <a href="https://account-d.docusign.com/oauth/token">https://account-d.docusign.com/oauth/token</a>.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click Save.
   • The system validates the OAuth credentials and populates the Redirect URL.
   • The system populates OAuth Entity Profile with Grant Type as JWT Bearer. For example, OAuth Entity Profile is created with default Name, DocuSign OAuth default_profile

6. Insert a record in the OAuth Entity Scopes related list and fill the values.

OAuth Entity Scopes related list fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>scope</td>
</tr>
<tr>
<td>OAuth Scope</td>
<td>signature impersonation</td>
</tr>
</tbody>
</table>

7. Copy the value from Redirect URL.
8. Click Update.
9. Login to your DocuSign account to edit the configuration of your custom DocuSign application. See the DocuSign Developer Center for instructions.

The instance can request OAuth 2.0 tokens for the spoke.

**Note:** When an OAuth token expires, the spoke automatically regenerates a new token in most cases. If a token expires and is not regenerated, an administrator can regenerate the spoke OAuth token.

---

Create Credential records for the DocuSign spoke

Create Credential records to the DocuSign custom OAuth application you created during DocuSign account configuration. The DocuSign spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
   The pop-up window displays a blank OAuth 2.0 Credentials form.

   4. Fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter DocuSign Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom DocuSign application as an OAuth provider. For example, select DocuSign OAuth default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Save the record.
6. Click the **Get OAuth Token** related link to generate the OAuth token.

---

Create Connection records for the DocuSign spoke

Create Connection records to your DocuSign account. The DocuSign spoke connection and credential alias uses these connections to perform actions in DocuSign.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for DocuSign alias.
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.
5. Click Submit.

Synchronize ServiceNow with DocuSign to access DocuSign accounts, templates, and envelopes from the DocuSign spoke. See Synchronize DocuSign with ServiceNow.

### Synchronize DocuSign with ServiceNow

Synchronize ServiceNow with DocuSign to access DocuSign accounts, templates, and envelopes from the DocuSign spoke.

**Role required:** admin

- Request IntegrationHub subscription
- Activate DocuSign spoke
- [Set up DocuSign spoke](#)

Schedule a job to synchronize DocuSign with your ServiceNow instance daily, or synchronize data as needed.

1. Required: Schedule a job to synchronize DocuSign data with your ServiceNow instance.
   a) Navigate to DocuSign > Scheduled Job.
      The Get Accounts & Templates scheduled job opens.
   b) Select Active.

   The DocuSign spoke synchronizes accounts, templates, and envelopes daily.

2. Required: Synchronize DocuSign data as needed with a UI action.
   a) Navigate to DocuSign > Accounts.
      The Accounts (sn_docusign_spoke_accounts) table opens.
   b) Click the Get Accounts related link.

   The system synchronizes all accounts linked through an OAuth Credential record and populates the Templates and Envelopes tables with DocuSign data. Use template and envelope records when constructing flows.

### Activate DocuSign spoke catalog items

Trigger events in DocuSign when an item is requested in the Service Catalog. For example, The Send a Document for Digital Signature catalog item triggers a sample flow that sends a DocuSign document to a designated recipient.

**Role required:** admin

- Request IntegrationHub subscription
- Activate DocuSign spoke
The DocuSign spoke adds catalog items for use with the DocuSign spoke sample flows. Before triggering a DocuSign spoke sample flow, activate these catalog items.

<table>
<thead>
<tr>
<th>Catalog item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send a Document for Digital Signature</td>
<td>Sends a document for digital signature in DocuSign.</td>
</tr>
<tr>
<td>Demonstrate Template - Send Job Offer to Candidate</td>
<td>Sends a job offer using a DocuSign template.</td>
</tr>
</tbody>
</table>

1. Navigate to **Service Catalog > Maintain Items**.
2. Search for and select **Send a Document for Digital Signature**.
3. Click **Activate**.
4. Search for and select **Demonstrate Template - Send Job Offer to Candidate**.
5. Click **Activate**.

When one of these items is requested in the Service Catalog, the associated DocuSign spoke sample flow triggers and performs actions in DocuSign.

**Change the DocuSign API version**

By default, the DocuSign spoke sends REST API requests to DocuSign API v2. For forward compatibility and to take advantage of DocuSign’s newer API, you can update a connection attribute to send API requests to DocuSign API v2.1.

Role required: admin

To understand the difference between the two APIs, see the DocuSign Developer site.

1. Navigate to **DocuSign > Connection Aliases**.
2. Open the connection alias that you want to update the version for.
   - Only requests sent using this alias use the new API version. For example, if you want to update the API version for all requests and your implementation uses multiple connection aliases, you must update each connection alias.
3. In the **Connection Attributes** related list, add or edit the **API Version** record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Label</td>
<td>API Version</td>
</tr>
<tr>
<td>Column name</td>
<td>api_version</td>
</tr>
<tr>
<td>Default value</td>
<td>v2.1</td>
</tr>
</tbody>
</table>

4. Save or submit the record.

When the DocuSign spoke makes an API request, it uses the API version designated in the connection attribute **Default value** field.

**How to automate on-demand signing requests**

Send DocuSign on-demand signing requests using information in your ServiceNow instance. Send signing requests within an email, or create an embedded signing URL to use in an application.

Role required: admin
- Request IntegrationHub subscription
• Activate DocuSign spoke
• Set up DocuSign spoke

Note: Customize flows in Flow Designer based on your requirements.

1. In Flow Designer, create a flow and a trigger.
2. Add one of the following actions to send a signing request:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send Adhoc Signature Request To User</td>
<td>Send a document to a single user for signing using email or an embedded signing URL. To send an embedded signing URL, select Use Embedded Signing and add the recipient to the Embedded Signing Recipient (User) field.</td>
</tr>
<tr>
<td>Send Adhoc Signature Request To Users</td>
<td>Send a document to multiple users for signing using email or an embedded signing URL. To send an embedded signing URL, select Use Embedded Signing.</td>
</tr>
</tbody>
</table>

3. Optional: If using embedded signing, add the Get Embedded Signing URL action to get the signing URL as an action output. You can then embed the URL in an application.
4. Optional: To pause the flow until the specified document is signed or rejected, select the Wait for Signature from DocuSign action.

The system sends the document to the recipient or list of recipients, or generates an embedded signing URL. The recipient details are auto-populated in the document. The system creates an envelope record in the Envelopes table.

How to automate signing requests using templates

Send DocuSign signing requests using DocuSign templates and information in your ServiceNow instance by creating flows in Flow Designer. For example, Send employee offer.

Role required: admin
• Request IntegrationHub subscription
• Activate DocuSign spoke
• Set up DocuSign spoke

Note: Customize flows based on your requirements.

1. In DocuSign, create document templates and specify recipient roles. For example, Candidate and Manager. The system retrieves other recipient details such as name and email, when the flow is triggered.
2. In Flow Designer, create a new flow.
3. Specify TRIGGER to initiate the flow.
4. Specify the ACTIONS to be performed during the flow and provide recipient details. The actions include:
   • Create Draft Envelope from Template
   • Get Recipient ID by Role Name
   • Add Recipient to Envelope
   • Get Recipient ID by Role Name
   • Add Recipient to Envelope
   • Get Field ID
   • Set Field Value
5. Optional: To pause the flow until the specified document is signed or rejected, select the **Wait for Signature from DocuSign** action.
   - The selected document or Embedded Signing URL is sent to the recipients for signing. While signing the document, the recipient details are auto-populated.
   - An envelope record is created in the **Envelopes** table. The Envelope status and other details are updated.

**How to separate DocuSign account data**

Restrict access to DocuSign data based on a user's role. For example, your company may have one DocuSign account used by the HR team and another used by the Legal team. To keep the data separate between these two accounts, you can create a role for each account and add it to the accounts record.

- Request IntegrationHub subscription
- Activate DocuSign spoke
- **Create connection aliases for additional DocuSign accounts**
- **Set up DocuSign spoke**

1. Create a role for each DocuSign account that you want to restrict access to.
   a) Navigate to **System Security > Users and Groups > Roles**.
   b) In the Roles (sys_user_role) table, select **New**.
   c) Check that the value of the **Application** field is **DocuSign Spoke**. If a different scope is listed, change the scope to **DocuSign Spoke**.
   d) In the **Suffix** field, add a name to indicate the account that the role is for. For example, **Legal**.
   e) Save the record.
   f) Note the name of the role you just created. For example, **sn_docusign_spoke.legal**.

2. Add the role to the associated account in the accounts table.
   a) Navigate to **DocuSign > Accounts**.
   b) Open the account record that you want to restrict access to.
   c) In the **Role** field, add the associated role.
   d) Click **Update**.

3. Grant the role to the desired users.
   a) Navigate to **System Security > Users and Groups > Users**.
   b) Open the record for the user you want to provide access.
   c) Add the role you created to the Roles related list.

Only users with the designated role have access to DocuSign data associated with the account.

**F5 BIG-IP spoke**

Manage servers and pools in the F5 BIG-IP system.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Supported version

BIG-IP 13.1.0.

Spoke flows

The F5 BIG-IP spoke provides sample flows in the draft state to demonstrate automating F5 tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local Traffic Management Using F5 Big-IP</td>
<td>Creates a virtual server, associates it to a pool, and adds pool member in the BIG-IP system from a ServiceNow Service Catalog request.</td>
</tr>
</tbody>
</table>

Spoke subflows

The F5 BIG-IP spoke provides sample subflows to demonstrate automating F5 tasks. Available sample subflows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>F5 Server - Pool Management</td>
<td>Creates a pool in the BIG-IP system and manages it.</td>
</tr>
</tbody>
</table>

Spoke actions

The F5 BIG-IP spoke provides actions to automate F5 tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pool Management</td>
<td>Create Pool</td>
<td>Creates a pool in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Add Pool Member</td>
<td>Creates a pool member in the BIG-IP system.</td>
</tr>
</tbody>
</table>
## ServiceNow New York Now Platform Capabilities

<table>

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Check Pool</td>
<td>Checks pool health in BIG-IP system. Returns whether the pool is available, unavailable, offline, or if the status is unknown.</td>
</tr>
<tr>
<td></td>
<td>Delete Pool</td>
<td>Deletes a pool from the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Disable Pool Member</td>
<td>Disables a pool member in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Enable Pool Member</td>
<td>Enables a pool member of a specified pool in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Get Pool Members</td>
<td>Retrieves the list of members of a specified pool from the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Remove Pool Member</td>
<td>Deletes a pool member in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Add Profile to Virtual Server</td>
<td>Adds a profile to a virtual server in the BIG-IP system. Profiles enable you to control network traffic. For example, you can enable HTTP connections to the virtual server.</td>
</tr>
<tr>
<td></td>
<td>Create Virtual Server</td>
<td>Creates a virtual server in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Delete Virtual Server</td>
<td>Deletes a virtual server from the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Update Virtual Server</td>
<td>Updates virtual server attributes in the BIG-IP system.</td>
</tr>
</tbody>
</table>

### Server Management

- **Add Profile to Virtual Server**
  - Adds a profile to a virtual server in the BIG-IP system. Profiles enable you to control network traffic. For example, you can enable HTTP connections to the virtual server.
- **Create Virtual Server**
  - Creates a virtual server in the BIG-IP system.
- **Delete Virtual Server**
  - Deletes a virtual server from the BIG-IP system.
- **Update Virtual Server**
  - Updates virtual server attributes in the BIG-IP system.

## Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Credentials and connection information](#).

This spoke uses this alias record to authorize actions.

<table>
<thead>
<tr>
<th>Connection &amp; Credential alias</th>
<th>Description</th>
<th>Connection alias requirements</th>
</tr>
</thead>
</table>
| F5_BIG_IP                    | Connection to the F5 BIG-IP system. | - Connection type: HTTP  
- Connection URL: URL of the host machine where the F5 server is installed. |

To use the spoke connection alias, create an associated Connection record and an associated Credential record.
**MID Server requirements**

These actions use REST calls, which can run on a MID Server. Use the connection record associated with the F5 BIG-IP alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

**Set up F5 BIG-IP spoke**

Integrate the ServiceNow instance and F5 using basic authentication to authenticate ServiceNow requests.
- Request IntegrationHub subscription
- Activate F5 BIG-IP spoke
- Role required: admin

Create Credential records for the F5 BIG-IP spoke
Create Credential records to the F5 BIG-IP server. The F5 BIG-IP spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **Basic Auth Credentials**.
   A blank Basic Auth Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter F5 Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>Your F5 BIG-IP user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Your F5 BIG-IP password.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

Create Connection records for the F5 BIG-IP spoke
Create Connection records to your F5 BIG-IP account. The F5 BIG-IP spoke connection and credential alias uses these connections to perform actions on the F5 BIG-IP server.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **F5_BIG_IP**.
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter F5 Connection.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>--------------</td>
<td>--------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for F5. For example, select F5 Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The URL of the host machine where the F5 BIG-IP server is installed.</td>
</tr>
</tbody>
</table>

5. Click Submit.

**HipChat spoke**

The HipChat spoke provides actions which post messages and ServiceNow incident, problem, and change record details to a HipChat conversation.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

**HipChat actions**

The HipChat spoke is an available integration through IntegrationHub. You can specify the following HipChat actions within a flow:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
<td>Send a message to a HipChat room. Specify the Room Notification URL, Auth Token, and Message to send.</td>
</tr>
<tr>
<td>Post Change Details</td>
<td>Send details about a ServiceNow change record to a HipChat room. Specify the Room Notification URL, Auth Token, and Change record to send.</td>
</tr>
<tr>
<td>Post Incident Details</td>
<td>Send details about a ServiceNow incident record to a HipChat room. Specify the Room Notification URL, Auth Token, and Incident record to send.</td>
</tr>
<tr>
<td>Post Problem Details</td>
<td>Send details about a ServiceNow problem record to a HipChat room. Specify the Room Notification URL, Auth Token, and Problem record to send.</td>
</tr>
</tbody>
</table>

**HipChat Inputs**

The following inputs are common to the HipChat actions:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Required) Room Notification URL</td>
<td>The HipChat notification REST API URL. Example: <a href="https://api.hipchat.com/v2/(room">https://api.hipchat.com/v2/(room</a> name)/ah-test/notification</td>
</tr>
<tr>
<td>Input</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>(Required) Auth Token</td>
<td>You need an access token to send notifications. Refer to the HipChat API access token guide for details.</td>
</tr>
<tr>
<td>(Optional) Additional Message</td>
<td>Add a message to the record details.</td>
</tr>
<tr>
<td>(Optional) Override Default Field</td>
<td>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</td>
</tr>
</tbody>
</table>

**Example**

You can add a HipChat Post Incident Details action to a flow which identifies high priority incidents and who they are assigned to.

![Flow Diagram](image)

**Infoblox spoke**

Automate network management tasks in Infoblox from your ServiceNow instance. For example, register or delete IP addresses on an Infoblox server.

**Request apps on the Store**

Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the [ServiceNow Store version history release notes](#).

**IntegrationHub subscription**

This spoke requires the IntegrationHub Standard subscription package. For more information, see [Request IntegrationHub](#).
Supported version

Infoblox versions 2.7 and 2.9.

Spoke flows

The Infoblox spoke provides sample flows in the draft state to automate allocating IP addresses in the Infoblox grid server. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infoblox Register or Reserve IP in IPAM</td>
<td>Registers or reserves an IP address in Infoblox based on a Service Catalog item request.</td>
</tr>
</tbody>
</table>

Spoke subflows

The Infoblox spoke provides sample subflows to register and reserve IP addresses.

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Register AName Record and Get Network Details</td>
<td>Registers an AName record type in the DNS server and retrieves network details such as network options and ID.</td>
</tr>
</tbody>
</table>

Spoke actions

The Infoblox spoke provides actions to manage IP addresses and networks in Infoblox from your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DHCP</td>
<td>Delete IP Reservation</td>
<td>Deletes IP address range from an Infoblox server.</td>
</tr>
<tr>
<td></td>
<td>List IP Address Reservation</td>
<td>Lists IP address reservation in the DHCP server for a given Infoblox network view.</td>
</tr>
<tr>
<td></td>
<td>Reserve IP Address Range</td>
<td>Reserves an IP address range in the Infoblox server.</td>
</tr>
<tr>
<td>DNS</td>
<td>List CName Records</td>
<td>Lists CName records present in the Infoblox server.</td>
</tr>
<tr>
<td></td>
<td>List DNS Records</td>
<td>Lists DNS records present in the Infoblox server.</td>
</tr>
<tr>
<td></td>
<td>Register AName Record</td>
<td>Registers an AName record type in DNS server. An AName record stores mapping between the fully qualified domain name and the IP address.</td>
</tr>
</tbody>
</table>
## ServiceNow New York Now Platform Capabilities

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Register CName Record</td>
<td>Registers a CName record in the Infoblox DNS Server. A CName record is an alias to the fully qualified domain name.</td>
</tr>
<tr>
<td></td>
<td>Delete DNS Record</td>
<td>Deletes a DNS record in the Grid Server.</td>
</tr>
<tr>
<td></td>
<td>Reserve IPAM IP Address</td>
<td>Reserves the next available IP address within a network provided in a given Infoblox server if no IP address is provided in a catalog item request.</td>
</tr>
<tr>
<td>IPAM</td>
<td>Delete IPAM IP Address Reservation</td>
<td>Deletes an IPAM IP address Reservation in Infoblox.</td>
</tr>
<tr>
<td></td>
<td>List all the IPAM Reservations</td>
<td>Lists the IP addresses within a given Infoblox Server.</td>
</tr>
<tr>
<td></td>
<td>Register IPAM IP Address</td>
<td>Registers the IP addresses within a given Infoblox Server.</td>
</tr>
<tr>
<td></td>
<td>Reserve IPAM IP Addresses</td>
<td>Reserves the IP addresses within a given Infoblox Server.</td>
</tr>
<tr>
<td>Network</td>
<td>Create Network</td>
<td>Creates a network within a given Infoblox Server.</td>
</tr>
<tr>
<td></td>
<td>Delete Network</td>
<td>Deletes a network within a given Infoblox Server.</td>
</tr>
<tr>
<td></td>
<td>Get Network Details</td>
<td>Gets the network details within a given Infoblox Server.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Credentials and connection information](#).

This spoke uses the Infoblox alias record to authorize actions.

<table>
<thead>
<tr>
<th>Connection &amp; Credential alias</th>
<th>Description</th>
<th>Connection alias requirements</th>
</tr>
</thead>
</table>
| Infoblox                      | Connection to Infoblox server | • Connection type: HTTP  
• Connection URL: URL of the host machine where the Infoblox server is installed. |

To use the spoke connection alias, create an associated Connection record and an associated Credential record.
MID Server requirements

These actions use REST calls, which must run on a MID Server. Use the connection record associated with the Infoblox alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up Infoblox spoke

Integrate the ServiceNow instance and Infoblox using basic authentication to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the Infoblox spoke.
- Role required: admin

Create Credential records for the Infoblox spoke

Create Credential records to the Infoblox server. The Infoblox spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select Basic Auth Credentials.
   A blank Basic Auth Credentials form displays.
4. Enter these values.

   **Note:** The user name and password must be for a user with permissions to perform the actions associated with the spoke, usually an administrator.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Infoblox Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>Your Infoblox user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Your Infoblox password.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 1.00.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection records for the Infoblox spoke

Create Connection records to your Infoblox account. The Infoblox spoke connection and credential alias uses these connections to perform actions on the Infoblox server.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Infoblox.
3. Optional: Select the Connection Attributes tab. If necessary, edit the Default value of the API. The default value of the API is associated with your Infoblox application version. For example, application version 13 uses v2.9 of the API.
   The system displays a blank HTTP(s) Connection form.
5. Enter these values.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Infoblox Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Infoblox. For example, select Infoblox Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The URL of the host machine where the Infoblox server is installed.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

**Google Cloud Translator Service Spoke**

Provides subflows and actions to dynamically translate the user-entered text, and to detect the language of the text using Google’s translation services.

**Request apps on the Store**

Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the [ServiceNow Store version history release notes](#).

**Subscription**

This spoke requires one of the following subscriptions:

- Any ServiceNow subscription that is Professional or above, and includes Dynamic Translation.
- IntegrationHub Professional subscription package. For more information see, [Request IntegrationHub](#).

**Supported versions**

Google Translate API version v3beta1

**Scope of the spoke in the Dynamic Translation framework**

To use Google Cloud Translator Service Spoke in the Dynamic Translation framework, ensure that the spoke is installed in ServiceNow Store and the Dynamic Translation plugin is active. For more information, see [Dynamic Translation](#).

**Spoke flows**

This spoke has no sample flows.
Spoke subflows

The Google Cloud Translator Service Spoke provides subflows in the Published state to integrate with Google’s translation services. These subflows can be used as part of other subflows and flows.

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detect Language</td>
<td>Contains a set of inputs, actions, and outputs to detect the language of the input text.</td>
</tr>
<tr>
<td>Translate Text To Multiple Languages</td>
<td>Contains a set of inputs, actions, and outputs to translate the input text to multiple languages.</td>
</tr>
</tbody>
</table>

Spoke actions

The Google Cloud Translator Service Spoke provides actions to integrate with Google’s translation services. Available actions include:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detect Language</td>
<td>Detects the language of the input text.</td>
</tr>
<tr>
<td>Translate Text To Single Language</td>
<td>Translates the input text to a single language.</td>
</tr>
<tr>
<td>Translate Text To Multiple Languages</td>
<td>Translates the input text to multiple languages.</td>
</tr>
</tbody>
</table>

Google account requirements

The Google Cloud Translator Service Spoke requires configuring your Google Cloud account to generate an OAuth 2.0 JWT Bearer Grant token.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Credentials and connection information.

This spoke uses the GoogleTranslation alias record (sn_google_trans.GoogleTranslation) to authorize actions.

Set up Google Cloud Translator Service Spoke

Integrate your Google account with your ServiceNow instance.

- Role required: admin
- Create a service account on Google Cloud and generate a service account key of JSON type. For information on creating the service account key, see the Google documentation.
- Enable the Cloud Translation API service. For information on enabling a service, see the Google documentation.

Create a Java KeyStore certificate

Encrypt the security certificates obtained from Google by creating a Java KeyStore (JKS) file.
- Role required: admin
- Create a JSON file containing security account key from Google. For information on creating the JSON file, see the Google documentation.

1. Use the openssl command to create a PKCS 12 file using the private key and certificate available in the JSON file obtained from Google.

   ```bash
   ```

   For example, if certificate.pem is the certificate and privatekey.pem is the private key:

   ```bash
   openssl pkcs12 -export -in certificate.pem -inkey privatekey.pem -certfile certificate.pem -out testkeystore.p12
   ```

   A PKCS 12 file, testkeystore.p12, is created.

2. Specify an export password or source keystore password.

   **Note:** You should specify this password when creating a JWT key for Google Cloud Translator Service Spoke.

3. Use the keytool command to create a JKS file from the PKCS 12 file.

   ```bash
   keytool -importkeystore -srckeystore testkeystore.p12 -srcstoretype pkcs12 -destkeystore wso2carbon.jks -deststoretype JKS
   ```

   **Note:** testKeyStore.p12 is the PKCS 12 file and wso2carbon.jks is the JKS file.

4. Specify a destination keystore password.

   **Note:** You should specify this password when attaching a JKS certificate to Google Cloud Translator Service Spoke.

---

**Attach a Java KeyStore certificate to Google Cloud Translator Service Spoke**

Enable the JWT client authentication by attaching a valid Java KeyStore (JKS) certificate to Google Cloud Translator Service Spoke.

- Role required: admin
- Valid Java KeyStore certificate

1. Navigate to System Definition > Certificates.
2. Click New.
3. On the form, fill in the fields.

**X.509 Certificate form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the certificate.</td>
</tr>
<tr>
<td>Notify on expiration</td>
<td>Users to be notified when the certificate expires.</td>
</tr>
<tr>
<td>Warn in days to expire</td>
<td>Number of days to send a notification before the certificate expires.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the certificate.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of the certificate. Select <strong>Java Key Store</strong>.</td>
</tr>
</tbody>
</table>
4. Click the manage attachments icon (_attach) and attach a JKS certificate.

5. To validate the JKS certificate, click **Validate Stores/Certificates**.

6. Click **Submit**.

**Create a JWT signing key for Google Cloud Translator Service Spoke**

Assign a JSON Web Token (JWT) signing key to your Java KeyStore certificate.

*Role required: admin*

1. Navigate to **System OAuth > JWT Keys**.
2. Click **New**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the JWT signing key.</td>
</tr>
<tr>
<td>Signing Keystore</td>
<td>Valid JKS certificate for which you want to assign the key.</td>
</tr>
<tr>
<td>Key Id</td>
<td>Key ID to identify which key is used when multiple keys are used to sign tokens.</td>
</tr>
<tr>
<td>Signing Algorithm</td>
<td>Algorithm to sign with the key.</td>
</tr>
<tr>
<td>Signing Key Password</td>
<td>Password associated with the key. Use the export password or the source keystore password specified when creating the JKS certificate. For more information on this password, see <strong>Create a Java KeyStore certificate</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the key.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Create a JWT provider for Google Cloud Translator Service Spoke**

Add a JSON Web Token (JWT) provider to Google Cloud Translator Service Spoke.

*Role required: admin*

1. Navigate to **System OAuth > JWT Providers**.
2. Click **New**.
3. On the form, fill in the fields.
JWT Provider form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the JWT provider.</td>
</tr>
<tr>
<td>Expiry Interval (sec)</td>
<td>Number of seconds that indicate the lifespan of the JWT provider token. Specify 3600.</td>
</tr>
<tr>
<td>Signing Configuration</td>
<td>JWT signing key.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.
5. In the Standard Claims related list, enter the values for these claims.

<table>
<thead>
<tr>
<th>Claim name</th>
<th>Claim value</th>
</tr>
</thead>
<tbody>
<tr>
<td>aud</td>
<td><a href="https://www.googleapis.com/oauth2/v4/token">https://www.googleapis.com/oauth2/v4/token</a></td>
</tr>
<tr>
<td>iss</td>
<td>client_email value from the JSON file.</td>
</tr>
</tbody>
</table>

6. In the Custom Claims related list, create the scope claim and enter its value as https://www.googleapis.com/auth/cloud-translation.
7. Click Update.

Configure the credential for the GoogleTranslation alias
Authorize actions of Google Cloud Translator Service Spoke by configuring the Google OAuth 2.0 credential.
Role required: admin
1. Navigate to Connections & Credentials > Credentials.
2. Select the Google OAuth 2.0 credential.
3. Open the record specified in the OAuth Entity Profile field.
4. In the JWT Provider field, specify the JWT provider that you want to use.
5. Click Update.
6. To verify if an OAuth Access token is generated to connect to Google’s translation services, click the Get OAuth Token related link of the Google OAuth 2.0 credential.

Configure the connection attributes for the GoogleTranslation alias
Connect to the Google’s translation service by configuring the Google connection. Provide information that is used by HTTP(s) actions or activities to connect to that service.
Role required: connection_admin
1. Navigate to Connections & Credentials > Connections.
2. Open for the record for Google.
3. In the Attributes related list of the HTTP(S) Connection form, fill in the fields.

HTTP(S) Connection form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>Location of the customer. If the value is not specified when creating an account on Google Cloud, then specify global.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>------------</td>
<td>--------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>project_id</td>
<td>Identifier of a project. Specify the <code>project_id</code> value from the JSON file.</td>
</tr>
<tr>
<td>version</td>
<td>API version that the related spokes are built for. The default value is <code>v3beta1</code>. Do not edit this value.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click **Save**.

### Google Drive spoke

Use Google Drive as file storage in place of attachments in ServiceNow. Adds Google Drive storage to your ServiceNow instance and enables users to reference Google Drive files in ServiceNow records.

### Request apps on the Store

Visit the [ServiceNow Store](https://www.servicenow.com/) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the [ServiceNow Store version history release notes](https://www.servicenow.com/).

### IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see [Request IntegrationHub](https://www.servicenow.com/).

### Supported versions

API version `v1`.

### Spoke subflows

The Google Drive spoke provides sample subflows in the draft state to demonstrate automating Google Drive tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move a ServiceNow attachment to Google Drive</td>
<td>Copies an attachment from ServiceNow to Google Drive, records the new location of the attachment, and deletes the attachment from the ServiceNow attachment table.</td>
</tr>
</tbody>
</table>

### Spoke actions

The Google Drive spoke provides actions to perform Google Drive tasks when events occur in ServiceNow. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File and Folder Management</td>
<td>Copy Attachment to Drive</td>
<td>Copies a ServiceNow attachment to a Google Drive folder. It either copies to the root drive of the current account or to the specified folder. To change the file name during the copy, use the optional file name.</td>
</tr>
<tr>
<td></td>
<td>Copy Drive File</td>
<td>Creates a copy of a Google Drive File and applies any metadata updates like a change in file name, file description, parent folder location, if file is starred, or shared by users with writer permissions.</td>
</tr>
<tr>
<td></td>
<td>Copy Drive File To Attachment</td>
<td>Copies a drive file to a ServiceNow attachment. If a ServiceNow record is supplied as input, the record should be attached to it.</td>
</tr>
<tr>
<td></td>
<td>Create Folder</td>
<td>Creates a Google Drive folder that can be nested within other folders.</td>
</tr>
<tr>
<td></td>
<td>Delete Drive File Or Folder</td>
<td>Permanently deletes a drive file or folder owned by the Google Drive account user without moving it to the trash. To delete folders the user must be the owner of folder and its contents.</td>
</tr>
<tr>
<td></td>
<td>Look Up Folders</td>
<td>Returns a list of Google Drive folder IDs based on given search parameters.</td>
</tr>
<tr>
<td></td>
<td>Update Attachment To Drive</td>
<td>Updates the contents of a file, but maintains the previous versions and metadata. This action only updates the content of the Google Drive file. It does not update metadata.</td>
</tr>
<tr>
<td></td>
<td>Update File Or Folder Metadata</td>
<td>Updates the metadata on a file or folder. This can be a file name change, change to the file description, a move to a new parent folder, a change in starred status, or a change to sharing permissions.</td>
</tr>
</tbody>
</table>
### Google Drive Online account requirements

The Google Drive spoke requires a custom app that you create in Google Drive Enterprise or [Google G Suite](https://www.google.com/gsuite).

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Credentials and connection information](https://docs.servicenow.com/index.html).

### MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Google Drive alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](https://docs.servicenow.com/index.html).

### Set up Google Drive spoke

Integrate a ServiceNow instance and Google Drive spoke by using Google Drive credentials to authenticate ServiceNow requests.

- Install the Google Drive spoke.

---

© 2019 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Configure Google Drive application

Create a custom OAuth application from your Google Drive account to enable OAuth 2.0 authentication with the Google Drive spoke.

Google Drive integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in GSuite or Google Drive.
- A Google G Suite or Google Drive login created with the domain.
- A Google Drive account.

Complete these steps from your Google G Suite or Google Drive account. See the G Suite product documentation for instructions on creating and configuring custom applications.

2. Enter your business name, the number of employees, and your country, and click Next.
3. Enter the administrator contact name, email address and business phone number, and click Next.
4. Enter the domain associated with this spoke.
5. Provide the user name and password for your domain.
6. Add users to the G Suite account.
7. Verify your domain and email address.
   Users must create their own logins by navigating to the Google documentation.
9. Search for the Google Drive API and enable it.
10. Create a Credentials application and save the Client ID and Client secret.
    The Client Secret is only displayed in plain text for a short time. Copy the Client ID and the Client Secret to a text file so that you can use them when you Register Google Drive as an OAuth provider.

Register Google Drive as an OAuth provider

Use the information generated during Google Drive account configuration to register the Google Drive application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

- Request IntegrationHub subscription.
- Activate Google Drive spoke.
- Create Google Drive application.

Role required: admin

1. In ServiceNow, navigate to System OAuth > Application Registry.
2. Click New.
3. On the screen titled What kind of OAuth application, select Connect to a third-party OAuth Provider.
4. Enter these values in the Application Registries form:
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record, for example GoogleDrive.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID of the Google Drive application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Click the search icon (🔍) and select OAuthUtilGoogleDrive.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Authorization Code.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Click the lock icon, enter <a href="https://accounts.google.com/o/oauth2/auth">https://accounts.google.com/o/oauth2/auth</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Click the lock icon, enter <a href="https://www.googleapis.com/oauth2/v4/token">https://www.googleapis.com/oauth2/v4/token</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon, enter https://&lt;instance&gt;.service-now.com/oauth_redirect.do, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

5. Optional: In the OAuth Entity Scopes related list, add any scopes required by your application. The Google Drive spoke includes these scopes by default:

- appdata
- drive
- drivereadonly
- file
- filetransfer
- metadata
- metadatereadonly
- photosreadonly
- scripts
- user
Click **Insert a new row** and enter the name and the OAuth scope of the permission. The name and the OAuth scope are often the same.

![Table of OAuth scopes](image)

- **Calendars.ReadWrite**
- **Calendars.ReadWrite.Shared**
- **email**
- **Files.Read**
- **Files.Read.All**

6. Right-click the form header, and click **Save**. The system validates the OAuth credentials.

**Create Credential record for the Google Drive spoke.**

**Create Credential record for the Google Drive spoke**

Create Credential records to connect the Google Drive custom OAuth application you created during Google Drive account configuration. The Google Drive spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials** and click **New**.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, **gDrive Cred**.
4. Click the **OAuth Entity Profile** search icon (🔍) and select the profile with the name of the OAuth application registry you created when you registered the Google Drive service as an OAuth provider.

5. Click **Get OAuth Token**.

### Create Connection record for the Google Drive spoke

Create connection records to a Google Drive account. A connection alias resolves your Google Drive connection and credential at runtime. Only one connection is active per Connection Alias at a time.

1. **Navigate to Connections & Credentials > Connection & Credential Aliases.**
2. Select the Google Drive connection.
3. On the Connection Attributes related list, set the default value of the API version to **v3**.
   
   **If there are no connection attributes, click New and create a connection attribute with this information:**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>API version</td>
</tr>
<tr>
<td>Column name</td>
<td>u_api_version</td>
</tr>
<tr>
<td>Mandatory</td>
<td>False</td>
</tr>
<tr>
<td>Read only</td>
<td>False</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Reference</td>
<td>(empty)</td>
</tr>
<tr>
<td>Default value</td>
<td>v3</td>
</tr>
</tbody>
</table>

4. In the Connections related list, select **gDrive Connection**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name gDrive Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential name you specified when you created the Credential record. The value used in the steps above is gDrive Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the value sn_googledrive_spoke.Google_Drive</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the URL <a href="https://www.googleapis.com/">https://www.googleapis.com/</a></td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Client Credentials.</td>
</tr>
</tbody>
</table>

5. **Return to IntegrationHub > Connections & Credentials > Credentials** and select googledrive_cred.

6. From Related Links, click **Get OAuth Token**.
   
   A confirmation message indicates that the OAuth token flow has completed successfully. Review the details if the flow is not successful.
The Google Drive spoke is set up and integrated with the ServiceNow instance.

**Jenkins spoke**

Manage builds, users, settings, and jobs on the Jenkins server. Retrieve Jenkins data to use in a flow.

**Request apps on the Store**

Visit the [ServiceNow Store](https://store.servicenow.com) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the [ServiceNow Store version history release notes](https://store.servicenow.com/).

**IntegrationHub subscription**

This spoke requires the IntegrationHub Standard subscription package. For more information, see [Request IntegrationHub](https://store.servicenow.com/).

**Supported versions**

All versions between 1.651.1 and 2.150.3.

**Spoke actions**

The Jenkins spoke provides actions to automate Jenkins tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Build Management</td>
<td>Get All Builds</td>
<td>Retrieves all the builds for a given Jenkins server job. Returns the URL, build number, and class of each build.</td>
</tr>
<tr>
<td></td>
<td>Get Build History</td>
<td>Retrieves a range of build history for a given job from Jenkins Server.</td>
</tr>
<tr>
<td></td>
<td>Get Build Information</td>
<td>Retrieves the build timestamp, build status, and complete build information of a given job from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get Build Number</td>
<td>Retrieves the build number for a Jenkins server job based on a pre-defined build filter, such as last successful build.</td>
</tr>
<tr>
<td></td>
<td>Perform a Build</td>
<td>Executes a job on the Jenkins server.</td>
</tr>
<tr>
<td>Configuration Management</td>
<td>Create Jenkins Credentials</td>
<td>Creates Jenkins server credentials.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Create Node</strong></td>
<td><strong>Create Node</strong></td>
<td>Creates a node that you can launch with Java Web Start software. A node is</td>
</tr>
<tr>
<td></td>
<td></td>
<td>part of the Jenkins environment and capable of executing jobs.</td>
</tr>
<tr>
<td></td>
<td><strong>Delete Node</strong></td>
<td>Deletes a node from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td><strong>Get CSRF Token</strong></td>
<td>Retrieves a CSRF token if your Jenkins server has the 'Prevent Cross Site</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Request Forgery exploits' option enabled.</td>
</tr>
<tr>
<td></td>
<td><strong>Get Version</strong></td>
<td>Retrieves the Jenkins server version.</td>
</tr>
<tr>
<td></td>
<td><strong>Restart Jenkins</strong></td>
<td>Restarts the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td><strong>Test Connection</strong></td>
<td>Tests the connection to the Jenkins server.</td>
</tr>
<tr>
<td><strong>Job Management</strong></td>
<td><strong>Copy Job</strong></td>
<td>Creates a job by copying an existing Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td><strong>Create Folder</strong></td>
<td>Creates a Jenkins server folder to organize jobs.</td>
</tr>
<tr>
<td></td>
<td><strong>Create Job</strong></td>
<td>Creates a Jenkins server job from an XML file.</td>
</tr>
<tr>
<td></td>
<td><strong>Delete Folder</strong></td>
<td>Deletes an existing Jenkins server folder.</td>
</tr>
<tr>
<td></td>
<td><strong>Delete Job</strong></td>
<td>Deletes a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td><strong>Get All Jobs From Folder</strong></td>
<td>Retrieves all the jobs from a given Jenkins server folder. Returns the</td>
</tr>
<tr>
<td></td>
<td></td>
<td>class and name of each job up to the specified number of levels.</td>
</tr>
<tr>
<td></td>
<td><strong>Get Build Timestamp</strong></td>
<td>Retrieves the build timestamp of a specified Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td><strong>Get Console Output</strong></td>
<td>Retrieves the build console output of a specified Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td><strong>Get Job Configuration</strong></td>
<td>Retrieves the XML configuration for a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td><strong>Reload Job</strong></td>
<td>Reloads a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td><strong>Rename Job</strong></td>
<td>Renames a Jenkins server job.</td>
</tr>
<tr>
<td><strong>User Management</strong></td>
<td><strong>Create User</strong></td>
<td>Creates a Jenkins server user.</td>
</tr>
<tr>
<td></td>
<td><strong>Delete User</strong></td>
<td>Deletes an existing Jenkins server user.</td>
</tr>
<tr>
<td><strong>View Management</strong></td>
<td><strong>Add Job To View</strong></td>
<td>Adds a job to the Jenkins server view. Views are containers to organize</td>
</tr>
<tr>
<td></td>
<td></td>
<td>jobs. As a Jenkins instance grows, you can create views for appropriate</td>
</tr>
<tr>
<td></td>
<td></td>
<td>groups and categories. For example, you may want to create a Build view,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>which only displays build-specific jobs.</td>
</tr>
<tr>
<td></td>
<td><strong>Create View</strong></td>
<td>Creates a Jenkins server view.</td>
</tr>
<tr>
<td></td>
<td><strong>Delete View</strong></td>
<td>Deletes a Jenkins server view.</td>
</tr>
</tbody>
</table>

**Note:** If your Jenkins server has CSRF protection enabled, use this action to retrieve a token for use by the rest of the flow. The action outputs the token as a data pill for use in other actions in the flow.
## Support for CRSF tokens

If your Jenkins server has the “Prevent Cross Site Request Forgery exploits” option enabled, certain actions require a unique token. Use the Get CSRF Token action to retrieve a token for use by the rest of the flow. The action outputs the token as a data pill for use in other actions in the flow.

## Connection and credential requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Credentials and connection information](#).

This spoke uses the Jenkins Connection & Credential Alias record to authorize actions. To use the spoke connection alias, create an associated Connection record and an associated Credential record.

## MID Server requirements

These actions use REST calls, which run on a MID Server. Use the connection record associated with the Jenkins alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

## Set up Jenkins spoke

Integrate the ServiceNow instance and Jenkins using basic authentication to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate Jenkins spoke
- Role required: admin

### Create Credential records for the Jenkins spoke

Create Credential records to the Jenkins server. The Jenkins spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   - The system displays the message *What type of Credentials would you like to create?*.
3. Select **Basic Auth Credentials**.
   - A blank Basic Auth Credentials form displays.
4. Enter these values.
5. Click Submit.

Create Connection records for the Jenkins spoke
Create Connection records to your Jenkins account. The Jenkins spoke connection and credential alias uses these connections to perform actions on Jenkins.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Jenkins.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Jenkins Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>Your Jenkins user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Your Jenkins password.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Jira spoke
Manage issues, users, stories, and groups in Jira. Retrieve Jira data to use in a flow.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

Note: This version of the Jira spoke is deprecated. See Jira spoke v2.5 for information about the next version of the spoke.
IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Supported versions

API version v2.

Spoke actions

Use actions in the Jira spoke in Flow Designer to automate Jira tasks when an event occurs in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Issue Management</td>
<td>Add Attachment</td>
<td>Adds an attachment to the specified issue in Jira.</td>
</tr>
<tr>
<td></td>
<td>Add Comment</td>
<td>Adds a comment to the specified issue in Jira.</td>
</tr>
<tr>
<td></td>
<td>Assign Issue</td>
<td>Assigns the issue in Jira to the user.</td>
</tr>
<tr>
<td></td>
<td>Create Issue</td>
<td>Creates an issue in Jira. Depending on how your organization is using Jira, an issue could represent a software bug, a project task, a help desk ticket, or more. An issue in Jira represents a task in the Now Platform.</td>
</tr>
<tr>
<td></td>
<td>Delete Issue</td>
<td>Deletes an issue in Jira.</td>
</tr>
<tr>
<td></td>
<td>Do Transition</td>
<td>Transitions an issue in Jira from one state to another.</td>
</tr>
<tr>
<td></td>
<td>Edit Issue</td>
<td>Updates a set number of fields of an issue in Jira with values passed as input.</td>
</tr>
<tr>
<td>Project Management</td>
<td>Get All Projects</td>
<td>Retrieves information in JSON format for all projects visible to the currently logged in user. A project in Jira is a collection of issues, and is defined according to your organization's requirements.</td>
</tr>
<tr>
<td></td>
<td>Get All Stories</td>
<td>Retrieves information in JSON format for all stories within a specified date range.</td>
</tr>
<tr>
<td></td>
<td>Get All Transitions</td>
<td>Retrieves in JSON format for all Transitions information from a given Issue ID.</td>
</tr>
<tr>
<td>SDLC Management</td>
<td>Create Story</td>
<td>Creates a story in Jira, similar to a story in Now Platform Agile Development.</td>
</tr>
<tr>
<td></td>
<td>Update Story</td>
<td>Updates a set number of fields of a story in Jira with values passed as input.</td>
</tr>
<tr>
<td>User Management</td>
<td>Get Users</td>
<td>Fetches a list in JSON format of all active JIRA users.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates a new user in JIRA.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• This action uses an experimental API and hence, is not officially supported.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Upon deleting an existing user, if a new user is created with the same</td>
</tr>
<tr>
<td></td>
<td></td>
<td>previously deleted email address but with different name and username,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>the newly created user record contains the details of the deleted user.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Also, an error is displayed in the flow execution details.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Set <strong>Show draft actions</strong> to true from the More Actions menu to use this</td>
</tr>
<tr>
<td></td>
<td>Remove User</td>
<td>Removes a user from Jira.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• This action uses an experimental API and hence, is not officially supported.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Set <strong>Show draft actions</strong> to true from the More Actions menu to use this</td>
</tr>
<tr>
<td></td>
<td>Add User to Group</td>
<td>Adds given user to a group in Jira.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in Jira.</td>
</tr>
<tr>
<td></td>
<td>Get Users From Group</td>
<td>Retrieves a list of users who are members of the specified group and its</td>
</tr>
<tr>
<td></td>
<td>Remove User from Group</td>
<td>subgroups in Jira.</td>
</tr>
<tr>
<td></td>
<td>Remove Group</td>
<td>Removes the given group from Jira.</td>
</tr>
<tr>
<td></td>
<td>Remove User from Group</td>
<td>Removes the given user from a group in Jira.</td>
</tr>
</tbody>
</table>

### Jira account requirements

The Jira spoke requires generating an API token for Jira using your Atlassian Account.

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Credentials and connection information](#).
Note: The Jira spoke in this release does not manage OAuth credentials.

This spoke uses the Jira alias record. To use these actions, you must create a Connection record and a Credential record and associate them with the Jira alias record.

These actions use REST calls, which can run on an instance. Use the connection record associated with the Jira alias to configure the endpoint against which the actions will run.

Set up Jira spoke
Integrate the ServiceNow instance and Jira using an API key to authenticate ServiceNow requests.
- Request IntegrationHub subscription
- Activate Jira spoke
- Role required: admin

Generate Jira account API token
Generate an access token from your Jira (Atlassian) account for API key authentication.

Jira requirements:
- Atlassian account
- Atlassian administrator credentials

Complete these steps from your Atlassian account. See the Atlassian Developer portal documentation for instructions on generating your API token.

1. From your Atlassian account, generate an access token to interact with Jira APIs.
2. Copy and record the access token to create Credential records on your ServiceNow instance.

Create Credential records for the Jira spoke
Create a Credential record for the Jira account. The Jira spoke connection and credential alias uses this credential to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?
3. Select Basic Auth Credentials.
   The pop-up window displays a blank Basic Auth Credentials form.
4. Enter these values, then click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Jira Credentials.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the user name for the Jira account.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the API token you generated for Jira.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Search for and select the Jira credential alias.</td>
</tr>
</tbody>
</table>
Create Connection records for the Jira spoke
Create a Connection record for the Jira account. The Jira spoke connection and credential alias uses this connection to perform actions in Jira.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the alias record for **Jira** that shipped with the spoke.
3. From the **Connections** tab, click **New**. The system displays a blank HTTP(s) Connection form.
4. Enter these values and click **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Jira Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record created for Jira. For example, select Jira Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Search for and select the Jira alias.</td>
</tr>
</tbody>
</table>
| Connection URL      | • For Jira cloud application, enter the URL of your Jira instance
                     | • For Jira on-premise application, enter https://<server_host>:<port>.       |
| Use MID server      | Option to use MID Server.                                                      |
| **Note**: This option is applicable only for Jira on-premise application. |
| Active              | Enable                                                                        |

**Jira spoke v2.5**
Manage issues, users, stories, and groups in Jira. Retrieve Jira data to use in a flow. Use bi-directional webhooks and subscribe to Jira with a ServiceNow callback URL.

**Request apps on the Store**
Visit the [ServiceNow Store](https://store.servicenow.com/) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the [ServiceNow Store version history release notes](https://store.servicenow.com/).  

**IntegrationHub subscription**
This spoke requires the IntegrationHub Standard subscription package. For more information, see [Request IntegrationHub](https://store.servicenow.com/).  

**Supported versions**
This spoke was built for API version v2, but may be compatible with later versions.
Note: If your Jira instance supports another API version, specify the API version in API Version under the Attributes related list. By default, API Version is 2. See Create Connection records for the Jira spoke for information about creating a Connection record.

Spoke requirements

Activate the Integrations - External Authentication Framework (com.glide.external.app) plugin.

Jira Webhooks module

Bi-directional webhooks can be setup to be notified about the required events. Routing policy defines conditions that must be met to notify the ServiceNow app. These conditions are based on the events in Jira for which you wish to be notified about. When the conditions are met, routing policy triggers the associated subflow, which in turn automates the Jira tasks.

The bi-directional webhooks requires separate setup and can be used independently without using the spoke actions. By default, the Jira Webhooks application is available in the Jira spoke and has the following modules:

- Jira Webhook Registries
- Jira WebHook Routing Policies

Use the Jira Webhook Registries module to assign a token and provide the API path. You must generate Callback URL here and provide this URL in Jira. A default routing policy is provided in the Jira WebHook Routing Policies module. The default routing policy supports these fields:

<table>
<thead>
<tr>
<th>Category</th>
<th>Field</th>
</tr>
</thead>
</table>
| Issue    | - Jira Instance URL  
          | - Webhook Event  
          | - Issue Description  
          | - Created  
          | - Updated  
          | - Issue Resolution  
          | - Previous Issue Resolution  
          | - Issue Summary  
          | - Issue Type  
          | - Previous Issue Type  
          | - Issue Priority  
          | - Previous Issue Priority  
          | - Issue Status  
          | - Previous Issue Status  
          | - Issue Status Category  
          | - Previous Issue Status Category  
          | - Project |

|            | - Worklog Time Spent  
|            | - Created  
|            | - Updated  |
| Attachment | - Jira Instance URL  
|            | - Webhook Event  
|            | - Created  
|            | - Attachment File Name  
|            | - Attachment Size  
|            | - Attachment Mime Type  |
| Project    | - Jira Instance URL  
|            | - Webhook Event  
|            | - Project  |
| Version    | - Jira Instance URL  
|            | - Webhook Event  
|            | - Version  
|            | - Version Description  
|            | - Merged To Version  
|            | - Merged To Version Description  |

To use other conditions in the routing policy, create routing policy in the Jira WebHook Routing Policies module and specify conditions as per your requirement. See [Set up bi-directional webhook](#) for information regarding setting up and configuring the webhooks.

**Spoke subflow**

The Jira spoke provides a sample subflow to handle various Jira webhook events. Available sample subflow is, Process Jira Webhooks. The Process Jira Webhooks subflow supports these fields:
### Spoke actions

Use actions in the Jira spoke in Flow Designer to automate Jira tasks when an event occurs in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Issue Management</td>
<td>Copy Attachment</td>
<td>Copies the required attachment associated with ServiceNow record to the required issue in Jira.</td>
</tr>
<tr>
<td></td>
<td>Add Comment</td>
<td>Adds a comment to the specified issue in Jira.</td>
</tr>
<tr>
<td></td>
<td>Assign Issue</td>
<td>Assigns the issue in Jira to the user.</td>
</tr>
</tbody>
</table>

---

**Note:** This is the entire Jira payload.

To customize the default subflow, you must create a copy of the sample subflow, parse the payload, and customize the subflow as per your requirement. Payload is one of the inputs to the subflow.

While customizing subflows, you must ensure that the subflows are configured to avoid infinite loops.

**Note:**
- You must configure webhooks to use the spoke subflow. See [Set up bi-directional webhook](#) for information regarding setting up and configuring the webhook.
- The sample subflow runs as a user by default. It can be configured to run as system.
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Create Issue</td>
<td>Creates an issue in Jira. Depending on how your organization is using Jira, an issue could represent a software bug, a project task, a help desk ticket, or more. An issue in Jira represents a task in the Now Platform.</td>

<td>Get Projects</td>
<td>Retrieves the list of all Jira projects.</td>
</tr>
</tbody>
</table>
Jira account requirements

The Jira spoke requires generating an API token for Jira using your Atlassian Account.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Credentials and connection information.

This spoke uses the Jira alias record. To use these actions, you must create a Connection record and a Credential record and associate them with the Jira alias record.

These actions use REST calls, which can run on an instance. Use the connection record associated with the Jira alias to configure the endpoint against which the actions will run.

Set up Jira spoke V2.5

Integrate the ServiceNow instance and Jira using an API key to authenticate ServiceNow requests.

- Request IntegrationHub Standard subscription
- Activate the Jira spoke V2.5
- Role required: admin

You can integrate ServiceNow instance with multiple Jira instances. For this, you must create a connection and credential alias record and connection record for each Jira instance.

Generate Jira account API token

Jira requirements:

- Atlassian account
- Atlassian administrator credentials

Complete these steps from your Atlassian account. See the Atlassian Developer portal documentation for instructions on generating your API token.

1. From your Atlassian account, generate an access token to interact with Jira APIs.
2. Copy and record the access token to create Credential records on your ServiceNow instance.

Create Credential records for the Jira spoke

Create a Credential record for the Jira account. The Jira spoke connection and credential alias uses this credential to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?
3. Select Basic Auth Credentials.
   The pop-up window displays a blank Basic Auth Credentials form.
4. Enter these values, then click Submit.
Create Connection records for the Jira spoke
Create a Connection record for the Jira account. The Jira spoke connection and credential alias uses this connection to perform actions in Jira.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the alias record for Jira that shipped with the spoke.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values and click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Jira Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record created for Jira. For example, select Jira Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Search for and select the Jira alias.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the URL of your Jira instance.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
</tbody>
</table>

5. Optional: If you create a credential record to integrate ServiceNow instance with another Jira instance, ensure that api_version under the Attributes related list in the associated connection record is set to 2.

**Note:** If your Jira instance supports another API version, specify the API version in API Version under the Attributes related list. By default, API Version is 2.

Set up bi-directional webhook
Configure webhook to subscribe to Jira with a ServiceNow callback URL.

- Request IntegrationHub Standard subscription
- Activate the Jira spoke V2.5
- Role required: admin

Create token
Create token to embedded in the Jira webhook URL.
Role required: admin

1. In the filter navigator, enter `token_verification.list`.
   The system displays records in the Token Verifications table.
2. Click **New**.
3. On the form, fill the fields.

**Token Verification form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the token. For example, Jira token.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the token.</td>
</tr>
<tr>
<td>Token</td>
<td>Authentication token. This token is encrypted and embedded in the URL.</td>
</tr>
</tbody>
</table>

**Register Jira webhook in ServiceNow**

Register Jira webhook in ServiceNow to notify the ServiceNow app when certain events occur in Jira.

Role required: admin

1. Navigate to **Jira Webhooks > Jira Webhook Registries**.
2. Click **New**.
3. On the form, fill in the fields.

**Jira Webhook Registry form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the record. For example, Jira webhook.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the record.</td>
</tr>
<tr>
<td>Token</td>
<td>Authentication token. This token is encrypted and embedded in the URL. For example, Jira token.</td>
</tr>
<tr>
<td>Path</td>
<td>Jira webhook path. By default, this is set to api/sn_jira_spoke/jira_webhook_callbacks/wh_entry.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click **Save**.
5. Click **Callback URL**.
   The system displays the Webhook Callback URL.
6. Copy and record the Webhook Callback URL.

The Jira webhook is registered in your ServiceNow instance.

**Add Callback URL in Jira**

Provide Webhook Callback URL in Jira Atlassian account to create webhook.

Role required: admin

1. Log in to your Jira Atlassian account.
2. Create a webhook in your Atlassian account.
3. Enter Webhook Callback URL in URL. See the Atlassian Developer portal documentation for instructions on creating a webhook.

The Callback URL is added in the Jira Atlassian account. You can create routing policies and subflows as per your requirement. See Customize bi-directional webhook for information regarding creating new routing policies and subflows. Customize bi-directional webhook
Create webhook routing policy and subflow as per your requirement.

Role required: admin
The default routing policy in the Jira WebHook Routing Policies modules triggers the Process Jira Webhooks subflow and notifies the ServiceNow app when certain events occur in Jira. See Jira spoke v2.5 for information about the fields that the default routing policy and subflows support. To use any other fields in your custom subflow and customize conditions in the routing policy, perform these steps.

1. Navigate to Flow Designer > Designer.
2. Click Subflows.
3. Create a copy of the default subflow, Process Jira Webhooks.
4. Customize the subflow as per your requirement and publish it. See Subflows for more information about creating and using subflows and Jira spoke v2.5 for information about the fields that the default routing policy and subflows support.
6. Click New.
7. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
<tr>
<td>Default answer</td>
<td>Option to specify if this is the default answer. Default answer is applicable when the conditions are not met.</td>
</tr>
<tr>
<td></td>
<td>1. Click the Lookup icon.</td>
</tr>
<tr>
<td></td>
<td>2. Select the required subflow from the Document: list.</td>
</tr>
<tr>
<td>Note:</td>
<td>Ensure that the Table name is Flow [sys_hub_flow].</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions to be met when the required events occur in Jira. See Jira webhooks for information about the supported fields.</td>
</tr>
<tr>
<td>Answer</td>
<td>Subflow that has to be triggered when the specified conditions are met.</td>
</tr>
</tbody>
</table>

8. Click Submit.

Note: These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

Routing policy and subflow are created.
Kubernetes spoke
Automate changes in Kubernetes when an event occurs in ServiceNow.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Supported versions
API version v1.

Spoke actions
The Kubernetes spoke provides actions to automate Kubernetes tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint Management</td>
<td>Create Endpoints</td>
<td>Creates an endpoint in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Endpoints</td>
<td>Deletes an endpoint from the Kubernetes instance.</td>
</tr>
<tr>
<td>Namespace Management</td>
<td>Create Namespace</td>
<td>Creates a namespace in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Namespace</td>
<td>Deletes a namespace from the Kubernetes instance.</td>
</tr>
<tr>
<td>Node Management</td>
<td>Create Node</td>
<td>Creates a node in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Node</td>
<td>Deletes a node in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect Node</td>
<td>Inspects a specified node in the Kubernetes instance and returns node information and status.</td>
</tr>
<tr>
<td>Pod Management</td>
<td>Create Pod</td>
<td>Creates a Pod in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Pod</td>
<td>Deletes a pod from the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect Pod</td>
<td>Inspects the specified pod in the Kubernetes instance and returns pod information and status.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Secret Management</td>
<td>Create Docker Hub Secret</td>
<td>Creates a secret in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Docker Hub Secret</td>
<td>Deletes a Secret from the Kubernetes instance.</td>
</tr>
<tr>
<td>Service Management</td>
<td>Create Service</td>
<td>Creates a service on a Kubernetes server.</td>
</tr>
<tr>
<td></td>
<td>Delete Service</td>
<td>Deletes a service from the Kubernetes server.</td>
</tr>
<tr>
<td>Volume Management</td>
<td>Create Persistent Volume</td>
<td>Creates a persistent volume in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Create Persistent Volume Claim</td>
<td>Creates a Persistent Volume Claim in a Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Persistent Volume</td>
<td>Deletes a persistent volume from the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Persistent Volume Claim</td>
<td>Deletes a persistent volume claim from the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect Persistent Volume Claim</td>
<td>Inspects a persistent volume claim in a Kubernetes instance and returns claim information and status.</td>
</tr>
</tbody>
</table>

**Kubernetes account requirements**

The Kubernetes spoke requires generating and configuring your Kubernetes account to use a web API key.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Credentials and connection information](#).

This spoke uses the Kubernetes alias record to authorize actions. To use the spoke connection alias, create an associated Connection record and an associated Credential record.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Kubernetes alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

**Set up Kubernetes spoke**

Integrate the ServiceNow instance and Kubernetes using an API key and certificate to authenticate ServiceNow requests.
- Request IntegrationHub subscription
- Activate the Kubernetes spoke
- Role required: admin

**Generate Kubernetes API token and certificate**
Generate an access token and a certificate from your Kubernetes account for API key authentication.

**Kubernetes requirements:**
- Kubernetes account
- Administrator credentials on the host machine where Kubernetes is installed

Complete these steps from your Kubernetes host machine. See Kubernetes documentation for instructions on generating your API token and client certificate.

1. From your Kubernetes host machine, generate an access token to interact with Kubernetes APIs. This token does not expire.
2. Copy and record the access token to create Credential records on your ServiceNow instance.
3. Generate a client certificate to upload to your ServiceNow instance.

**Upload Kubernetes client certificate**
Upload the Kubernetes client certificate to your ServiceNow instance to authenticate API requests to the Kubernetes host machine.

1. Navigate to **System LDAP > Certificates**.
2. Click **New**.
3. Complete the form and enter the certificate in the **PEM Certificate** field.
   
   For more information about uploading certificates, see Upload a certificate to an instance.
4. Click **Submit**.

**Create Credential records for the Kubernetes spoke**
Create Credential records to your Kubernetes account. The Kubernetes spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   
The system displays the message **What type of Credentials would you like to create?**.
3. Select **API Key Credentials**.
   
   A blank API Key Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Kubernetes Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>API Key</td>
<td>Enter Bearer followed by the access token you obtained from Kubernetes. For example, Bearer {access token}.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select <strong>All MID Servers</strong>.</td>
</tr>
</tbody>
</table>
Create Connection records for the Kubernetes spoke
Create Connection records to the Kubernetes engine. The Kubernetes spoke connection and credential alias uses these connections to perform actions in Kubernetes.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Kubernetes.
3. From the Connections tab, click New.
   - The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Turn off remote SSL host verification
A system property prevents the Kubernetes spoke from processing Kubernetes responses. Set the com.glide.communications.httpclient.verify_hostname system property to false to enable the integration.

1. Enter sys_properties.list in the application navigator.
   - The System Properties (sys_properties) table opens.
2. Search for the com.glide.communications.httpclient.verify_hostname system property.
3. Set the value to false.

Microsoft AD spoke
Create, delete, and manage objects in Microsoft Active Directory, such as users, groups, and computers.

IntegrationHub subscription
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.
Spoke flows

The Microsoft AD spoke provides sample flows in the draft state to demonstrate automating Active Directory tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Offboarding</td>
<td>Disables an AD user account and removes the user from any AD groups when a ServiceNow user record is deactivated.</td>
</tr>
<tr>
<td>User Onboarding</td>
<td>Creates and enables an AD user account when a ServiceNow user record is activated.</td>
</tr>
</tbody>
</table>

Spoke subflows

This spoke has no sample subflows.

Spoke actions

The Microsoft AD spoke provides actions to automate Microsoft Active Directory tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Delete Computer</td>
<td>Deletes a computer from Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Disable Computer</td>
<td>Disables a computer account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Enable Computer</td>
<td>Enables a computer account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Get Computer OU</td>
<td>Gets the Organizational Unit (OU) of a Computer Account.</td>
</tr>
<tr>
<td></td>
<td>Is Computer Enabled</td>
<td>Checks the status of the specified computer account in Active Directory.</td>
</tr>
<tr>
<td>Move Computer to OU</td>
<td></td>
<td>Changes the Organizational Unit (OU) of a Computer Account in Active Directory.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add User To Group</td>
<td>Adds an existing Active Directory user to an Active Directory group.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes a group from Active Directory.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Is User In Group</td>
<td>Checks if an existing Active Directory user is a member of an Active Directory group.</td>
</tr>
<tr>
<td></td>
<td>Lookup Group</td>
<td>Gets the details of a given group in Active Directory, including the group category, scope, and distinguished name.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes an existing user from a group in Active Directory.</td>
</tr>
<tr>
<td>Password Management</td>
<td>Change User Password</td>
<td>Changes the user password in AD. The password input must comply with Active Directory password requirements.</td>
</tr>
<tr>
<td></td>
<td>Is User Account Locked</td>
<td>Checks the locked status of the specified user account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Reset AD User Password</td>
<td>Resets a user’s password in Active Directory.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a user with no password in Active Directory. To enable a user to set a password, log in to AD, create a default password for the user, and enable password reset.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes a user from Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Disable User</td>
<td>Disables a user account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Enable User</td>
<td>Enables a user account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Is User Enabled</td>
<td>Checks the status of a user account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Lookup User</td>
<td>Gets the details of a given user in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Unlock AD Account</td>
<td>Unlocks a user account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Update User</td>
<td>Updates user attributes in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Update User Home Location</td>
<td>Updates the Home Directory for a User in Active Directory.</td>
</tr>
<tr>
<td>Object Management</td>
<td>Create AD Object</td>
<td>Creates an object of any type supported in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Delete AD Object</td>
<td>Deletes an object of any type from Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Query AD</td>
<td>Queries AD for objects specified by a search filter.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>Update AD Object OU</td>
<td>Changes the Organizational Unit (OU) of an object in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Update AD Object Expiration</td>
<td>Update the account expiration date of an object in Active Directory.</td>
</tr>
</tbody>
</table>

**MID server requirements**

To use these actions, your instance must have a MID Server set up and configured to use PowerShell. For more information about running actions on the MID Server, see Integration steps. For information, see MID Server.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the AD alias record to authorize actions in Microsoft Active Directory.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>AD</td>
<td>Connection to Microsoft Active Directory.</td>
<td>The URL of the host machine where Microsoft Active Directory is installed.</td>
</tr>
</tbody>
</table>

**Set up Microsoft AD spoke**

Integrate the ServiceNow instance and your Microsoft AD account using Windows credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Role required: admin

*Create Credential record for the Microsoft AD spoke*

Create a Credential record for the Microsoft Active Directory host. The Microsoft AD spoke connection and credential alias uses this credential to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message *What type of Credentials would you like to create?*.
   A blank Windows Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter AD Credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
</tbody>
</table>

Create Connection record for the Microsoft AD spoke
Create a Connection record to your Microsoft Active Directory host machine. The Microsoft AD spoke connection and credential alias uses this connection to perform actions in Microsoft Active Directory.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for AD.
3. From the Connections tab, click New.
   The system displays a blank Basic Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter AD Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Windows Active Directory. For example, select AD Credential.</td>
</tr>
<tr>
<td>Host</td>
<td>Enter the fully qualified domain name of the target host where Microsoft Active Directory is installed. For example, &lt;host&gt;.&lt;domain&gt;.com.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Enable</td>
</tr>
<tr>
<td>Override default port</td>
<td>Enter the target port used by the connection. If blank, the system uses the default port.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Microsoft Azure AD spoke
Manage users, security groups, and office groups. Apply licenses and provision users in Office 365.

IntegrationHub subscription
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.
Spoke flows

The Microsoft Azure AD spoke provides sample flows in the draft state to demonstrate automating Azure Active Directory tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Offboarding</td>
<td>Disables an Azure AD user account and removes the user from any Azure AD groups when a ServiceNow user record is deactivated.</td>
</tr>
<tr>
<td>User Onboarding</td>
<td>Creates and enables an Azure AD user account when a ServiceNow user record is activated.</td>
</tr>
</tbody>
</table>

Spoke subflows

The Microsoft Azure AD spoke provides sample subflows in the draft state to demonstrate automating Azure Active Directory tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add User to Group</td>
<td>Looks up the groups that a ServiceNow User record belongs to, and adds the associated Azure AD user account to the same Azure AD groups.</td>
</tr>
</tbody>
</table>

Spoke actions

The Microsoft Azure AD spoke provides actions to automate Azure Active Directory tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Management</td>
<td>Add Owner To Group</td>
<td>Adds an owner to an existing group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Add User to Group</td>
<td>Adds an existing user to a group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Create Office 365 Group</td>
<td>Creates an Office 365 Group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Create Security Group</td>
<td>Create a Security Group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Look Up Group ID</td>
<td>Returns the first Group ID found based on provided search criteria.</td>
</tr>
<tr>
<td></td>
<td>Look Up Group Membership</td>
<td>Retrieves a list of groups for the given user as a JSON string.</td>
</tr>
<tr>
<td></td>
<td>Remove Owner From Group</td>
<td>Removes the owner from a group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes an existing user from a group in Azure AD.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>License Management</td>
<td>Assign User License</td>
<td>Assigns a license to an existing user in Azure AD and defines access to Office 365 services. For example, if the license includes access to Microsoft Exchange, the user is provisioned a mailbox and login rights.</td>
</tr>
<tr>
<td></td>
<td>Remove User License</td>
<td>Removes a license from a user in Azure AD.</td>
</tr>
<tr>
<td>Password Management</td>
<td>Reset User Password</td>
<td>Resets the password of the specified Azure AD user account.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates an Azure AD user account using the specified account details.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes a user from Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Disable User</td>
<td>Disables a user in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Enable User</td>
<td>Enables a user in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Is User Enabled</td>
<td>Checks whether the specified user account is enabled in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Is User In Group</td>
<td>Checks whether the specified user account is a member of the specified group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Look Up User ID</td>
<td>Returns the first User ID found based on the provided search criteria.</td>
</tr>
<tr>
<td></td>
<td>Update User</td>
<td>Updates user properties in Azure AD with the provided details.</td>
</tr>
</tbody>
</table>

**Note:** Azure AD does not allow updating values to null. Null or empty values are discarded in Azure AD when passed as input.

**Microsoft Azure AD account requirements**

The Microsoft Azure AD spoke requires creating a custom app on your Azure AD account to generate OAuth 2.0 tokens. See: [Configure an app registration for Azure AD](#).

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles.
when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the AzureAD alias record to authorize actions on Microsoft Azure AD.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>AzureAD</td>
<td>Connection to Microsoft Azure AD.</td>
<td><a href="https://graph.microsoft.com">https://graph.microsoft.com</a></td>
</tr>
</tbody>
</table>

**Set up Microsoft Azure AD spoke**

Integrate the ServiceNow instance and your Microsoft Azure AD account by creating a custom OAuth application in Microsoft Azure AD to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Role required: admin

*Configure an app registration for Azure AD*

Create a custom app from your Azure AD account to enable OAuth 2.0 authentication with the Azure AD spoke

**Azure AD requirements:**

- Azure AD account
- Azure AD administrator credentials

Complete these steps from your Azure AD account. See the *Azure Active Directory for developers* documentation for instructions on creating and configuring custom applications.

1. From your Azure Active Directory account, access your Azure Active Directory.
2. Record the Directory ID to register the app as a third-party OAuth provider on your ServiceNow instance.
3. Create an app registration in your Azure Active Directory.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Enter Web app/API.</td>
</tr>
<tr>
<td>Sign on URL</td>
<td>Enter your instance URL. For example, <a href="https://hi.servicenow.com">https://hi.servicenow.com</a>.</td>
</tr>
<tr>
<td>Reply URL</td>
<td>Add a reply URL using your instance URL, with /oauth_redirect.do added to the end, for example. <a href="https://hi.servicenow.com/oauth_redirect.do">https://hi.servicenow.com/oauth_redirect.do</a>.</td>
</tr>
<tr>
<td>Required permissions</td>
<td>Add the Microsoft Graph API as a required permission.</td>
</tr>
</tbody>
</table>

4. Generate a key and record the value to register the app as a third-party OAuth provider on your ServiceNow instance.

*Register Azure AD as OAuth provider*

Use the information generated during Azure Active Directory account configuration to register Box as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   
The system displays the message *What kind of OAuth application?*
3. Select **Connect to a third party OAuth Provider**.
The system displays a blank Application Registries form.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Azure AD OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID you created during the Azure AD application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Key value you created during the Azure AD application registration.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Authorization Code.</td>
</tr>
</tbody>
</table>

5. In the **OAuth Entity Scopes** related list, create these entries

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth Scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter a unique name for the record, such as auth code.</td>
<td>Enter offline_access.</td>
</tr>
<tr>
<td>Enter a unique name for the record, such as openid.</td>
<td>Enter openid.</td>
</tr>
</tbody>
</table>

6. Right-click the form header, and click **Save**.
The system validates the OAuth credentials and populates the **Redirect URL** and the **OAuth Entity Profiles** related list.

7. In the **OAuth Entity Profiles** related list, open the default profile record.

8. Verify that the openid entity scope record created in previous steps appears in the **OAuth Entity Profile Scopes** related list. If it does not appear, add the record.

Create Credential records for the Azure AD spoke
Create Credential records to the Azure AD custom app registration you created. The Azure AD spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.
Create Connection records for the Azure AD spoke

Create Connection records to your Azure AD account. The Azure AD spoke connection and credential aliases use these connections to perform actions in Azure AD.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the **AzureAD** record.
3. Click the **New** button in the **Connections** related list.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Azure AD Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Azure AD. For example, select Azure AD Credentials.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

Regenerate Azure AD OAuth token

Regenerate the Azure AD OAuth token when it expires.

1. Navigate to **Connections & Credentials > Credentials**.
2. Select the Azure AD spoke OAuth Credential record. For example, select Azure AD Credentials.
3. From Related Links, click Get OAuth Token.

Microsoft Azure AD spoke action reference

Manage users, security groups, and office groups. Apply licenses and provision users in Office 365.

The Azure AD spoke is an available integration through IntegrationHub.

This spoke uses the Azure AD Connection & Credential Alias record. To use these actions, you must create a Connection record and a Credential record and associate them with the Azure
AD Connection & Credential Alias record. To learn more about connections and credentials, see Introduction to credentials, connections, and aliases.

These actions use REST calls, which can run on an instance or MID Server. To determine when to run REST from the instance or a MID Server, see the design considerations in Integration steps. To learn more about the MID Server, see MID Server.

**Add Owner To Group**

Adds an owner to an existing group in Azure AD.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to add an owner to. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to make owner of the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Add User To Group**

Adds an existing user to a group in Azure AD.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to add a user to. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to add to the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Create Office 365 Group**

Creates an Office 365 Group in Azure AD.
Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the group.</td>
</tr>
<tr>
<td>Group Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
<tr>
<td>Email Enable</td>
<td></td>
</tr>
<tr>
<td>Distribution List</td>
<td>Group email address or distribution list associated with the group. By default set to true.</td>
</tr>
<tr>
<td>Description</td>
<td>Additional information about the group in Azure AD.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Group ID</td>
<td>ID of group created in Azure AD. Only populated if Status is Success.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Create Security Group

Create a Security Group in Azure AD.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the group.</td>
</tr>
<tr>
<td>Group Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
<tr>
<td>Description</td>
<td>Additional information about the group in Azure AD.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Group ID</td>
<td>ID of group created in Azure AD. Only populated if Status is Success.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Is User In Group

Check if an existing user is a member of a group in Azure Active Directory (Azure AD).

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>Group ID in which you wish to check the membership of the user.</td>
</tr>
<tr>
<td>Input</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User ID</td>
<td>User ID or User Principal Name of the Azure AD user.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Will be set to Success if the request succeeds or Error if a failure in Azure AD occurs</td>
</tr>
<tr>
<td>Answer</td>
<td>True if the user is a member of the group. False if the user is not a member of the group. Populated only if Status is Success.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Look Up Group ID**

Returns the first Group ID found based on provided search criteria.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Mail ID</td>
<td>Group email address or distribution list associated with the group.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the group.</td>
</tr>
<tr>
<td>Group Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Group ID</td>
<td>First group found with matching criteria in Azure AD.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Look Up Group Membership**

Retrieves a list of groups for the given user as a JSON string.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the users to retrieve the group for. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>
## Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>
| Groups List | List of groups in JSON format. For example, 

\[
\text{Groups List} = \begin{cases}  
\text{Group ID1, Group Name1}, \\
\text{Group ID2, Group Name2}   
\end{cases}.
\]

...If the user is not part of any group, an empty string is returned. |
| Number of Groups Found | Total number of groups the user is a member of. |

### Remove Owner From Group

Removes the owner from a group in Azure AD.

## Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to remove the owner from. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to remove as owner of the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

## Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Remove User From Group

Removes an existing user from a group in Azure AD.

## Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to remove the user from. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to remove from the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

## Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Output</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Assign User License**

Assigns a license to an existing user in Azure AD and defines access to Office 365 services. For example, if the license includes access to Microsoft Exchange, the user is provisioned a mailbox and login rights.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to assign a license to. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>SKU ID</td>
<td>Licensing plan for your organization using the syntax <code>&lt; CompanyName &gt;:&lt; LicensingPlan &gt;</code>. If the SKU ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Remove User License**

Removes a license from a user in Azure AD.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to remove the license from. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>SKU ID</td>
<td>Licensing plan for your organization using the syntax <code>&lt; CompanyName &gt;:&lt; LicensingPlan &gt;</code>. If the SKU ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>
Delete User

Deletes a user from Azure AD.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to delete. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Disable User

Disables a user in Azure AD.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to disable. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Enable User

Enables a user in Azure AD.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to enable. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Output</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Look Up User ID

Returns the first User ID found based on the provided search criteria.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Name</td>
<td>First name of the user.</td>
</tr>
<tr>
<td>Last Name</td>
<td>Last name of the user.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Name displayed in the address book for the user.</td>
</tr>
<tr>
<td>User Login ID</td>
<td>Login User ID is same as User Principal Name (UPN). For example, <a href="mailto:johndoe@snc.com">johndoe@snc.com</a>.</td>
</tr>
<tr>
<td>Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>User ID</td>
<td>First user found with matching criteria in Azure AD.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Update User

Updates user properties in Azure AD with the provided details.

Note: Azure AD does not allow updating values to null. Null or empty values are discarded in Azure AD when passed as input.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the user.</td>
</tr>
<tr>
<td>Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
<tr>
<td>User Login ID</td>
<td>Login User ID is same as User Principal Name (UPN). For example, <a href="mailto:johndoe@snc.com">johndoe@snc.com</a>. This field is mandatory</td>
</tr>
<tr>
<td>First Name</td>
<td>First name of the user.</td>
</tr>
<tr>
<td>Last Name</td>
<td>Last name of the user.</td>
</tr>
<tr>
<td>City</td>
<td>City of the user.</td>
</tr>
</tbody>
</table>

**Microsoft Dynamics CRM spoke**

Provide the baseline actions to interact with Microsoft Dynamic Entities through introspection.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see [Request IntegrationHub](#).

**Spoke flows & subflows**

This spoke ships with one subflow, Process Dynamics CRM Webhook. See [Configure Microsoft Dynamics CRM webhook details](#).

**Spoke actions**

The Microsoft Dynamics CRM spoke provides the baseline actions to interact with Microsoft Dynamic Entities through introspection.
## Available Microsoft Dynamics CRM spoke actions

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Account Management</strong></td>
<td>Create Account</td>
<td>Create an account in Microsoft Dynamics CRM.</td>
</tr>
<tr>
<td></td>
<td>Get Account Details</td>
<td>Retrieve the details of the required account in Microsoft Dynamics CRM.</td>
</tr>
<tr>
<td><strong>Case Management</strong></td>
<td>Create Case</td>
<td>Create case in Microsoft Dynamics CRM.</td>
</tr>
<tr>
<td></td>
<td>Get Case Details</td>
<td>Retrieve details of the required case in Microsoft Dynamics CRM.</td>

<tr>
<td></td>
<td>Update Record</td>
<td>Update a record in Microsoft Dynamics CRM.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Credentials and connection information](#).

This spoke uses the Microsoft_Dynamics_CRM alias record to authorize actions.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Microsoft_Dynamics_CRM</td>
<td>Connection to Microsoft Dynamics CRM</td>
<td>URL configured when you create your application in Azure. This URL ends with dynamics.com.</td>
</tr>
</tbody>
</table>

### Set up Microsoft Dynamics CRM spoke

Integrate the ServiceNow instance and Microsoft Dynamics CRM by using the Windows credentials to authenticate ServiceNow requests.

- Install Microsoft AD
- Request IntegrationHub subscription.
- Activate the Microsoft Dynamics CRM spoke.
- Role required: admin.

- Perform these steps to use all Microsoft Dynamics CRM spoke actions.

Configure Microsoft Dynamics CRM application
Create a custom OAuth application from your Microsoft Dynamics CRM account to enable OAuth 2.0 authentication with the Microsoft Dynamics CRM.

Microsoft Dynamics CRM requirements:
- Microsoft Dynamics CRM account
- [Microsoft Azure](#) account
- Microsoft Dynamics CRM credentials

Complete these steps from your Azure Developer account. See the [Azure](#) product documentation for instructions on creating and configuring custom applications.

1. Log in to the [Microsoft Azure App registration portal](#) with your organization credentials.
2. Register a new custom application. Fill in the application name, the supported account type, and the redirect URI, and then click **Register**. An overview of the application’s basic information is shown.

3. Copy the application ID to a text file. You will use this ID and the client secret generated in the next step to register the app as a third-party OAuth provider on your ServiceNow instance. You use the application ID as the client ID when you connect the application to ServiceNow.

4. Add a client secret.
   a) In Microsoft Azure, navigate to **Manage > Certificates & secrets**.
   b) Provide a description and an expiration date and click **Add**.

   **Note:** The client secret is only displayed in plain text for a short time. You use the client secret when you connect the application to ServiceNow.

5. Enable the permissions you want the application to support. For more information, see the [Microsoft Graph permissions reference](#).
   a) In Microsoft Azure, navigate to **Manage > API permissions**.
   b) Click the Microsoft Graph tile.
   c) Select the Delegated or Application permissions that the application supports.
      Delegated permissions enable the application to access the API as a signed-in user. Application permissions enable the application to run as a background service or daemon without a signed-in user.
   d) Click **Add permissions**.

---

**Register Microsoft Dynamics CRM as OAuth provider.**

**Register Microsoft Dynamics CRM as OAuth provider**

Use the information generated during Microsoft Dynamics CRM account configuration to register Microsoft Dynamics CRM as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

- Request IntegrationHub subscription.
- Activate Microsoft Dynamics CRM.
- Create a Microsoft Dynamics CRM application.

**Role required:** admin.

1. In ServiceNow, navigate to **System OAuth > Application Registry**.
2. Click **New**.
3. On the screen titled **What kind of OAuth application**, select **Connect to a third-party OAuth Provider**.
4. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record, for example <strong>Dynamics CRM OAuth profile</strong>.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Application ID of the Microsoft Dynamics CRM application you created in Azure.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>--------------------</td>
<td>--------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you generated when you created the application in Azure.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Click the lock icon (🔒), enter <code>https://login.microsoftonline.com/common/oauth2/v2.0/authorize</code> followed by a question mark and the resource attribute of your instance, and then click the lock icon again. The resource attribute of the URL. For example, <code>?resource=https://mycompany.crm.dynamics.com</code>. This attribute is the URL of your Microsoft application.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Click the lock icon (🔒), enter <code>https://login.microsoftonline.com/common/oauth2/v2.0/token</code>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon (🔒), enter <code>https://&lt;instance&gt;.service-now.com/oauth_redirect.do</code>, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

5. In the **OAuth Entity Scopes** related list, edit the provided entity scope to include the URL of your Microsoft Dynamics CRM application. The name and the OAuth scope are often the same string.
6. Right-click the form header, and click **Save**. The system validates the OAuth credentials.

Create credential record for Microsoft Dynamics CRM.

Create Credential records for the Microsoft Dynamics CRM spoke

Create Credential records for the Microsoft Dynamics CRM custom OAuth application you created during Microsoft Dynamics CRM account configuration. The Microsoft Dynamics CRM spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**. The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**. The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Dynamics Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Microsoft Dynamics CRM application as an OAuth provider. For example, select Dynamics OAuth profile.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Save the record.
6. From Related Links, click **Get OAuth Token**.
   The system displays a confirmation message that the OAuth token flow is completed successfully. Review the details if the flow is not completed successfully.

**Note:** Ensure that you allow pop-up windows in your browser.

---

**Create Connection records for the Microsoft Dynamics CRM spoke**
Create Connection records to your Microsoft Azure account. The Microsoft Dynamics CRM spoke connection and credential alias uses these connections to perform actions on Microsoft Dynamics CRM.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the connection and credential alias for the Microsoft Dynamics CRM application.
3. On the **Connections** tab, click **New**.
   The system displays a blank **HTTP(s) Connection** form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter <strong>MS Dynamics CRM Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Microsoft Dynamics CRM. For example, select <strong>MS Dynamics Credentials</strong>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the Connection alias record you created for Microsoft Dynamics CRM.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the root Dynamics URL. For example, https://&lt;SiteName&gt;.dynamics.com.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Configure Microsoft Dynamics CRM webhook details**
Register Microsoft Dynamics CRM webhook in ServiceNow to notify the ServiceNow application when certain events occur in Microsoft Dynamics CRM.

Role required: admin

- Microsoft Dynamics CRM requires registration through the Windows Plugin Registration Tool. To install the Windows Plugin Registration Tool, see the Microsoft document [Download tools from NuGet](#).
- The Endpoint URL is the ServiceNow instance URL to which event information is posted. For example, https://<instance-name>.service-now.com/api/sn_ms_crm_spoke/dynamics_webhook_callbacks.
- The key-value pair you use to register the webhook in the Plugin Registration Tool is the same as the Name and Authorization Key in Dynamics CRM Webhook Details.

1. Navigate to **Dynamics CRM Webhook Details > Client Details**.
2. Click **New**.
3. In the **Name** field, enter the webhook's plugin key. In the **Authorization Key** field, enter the value from the webhook's key-value pair.

Configure Microsoft Dynamics CRM webhook decision policy

Create webhook routing policy and subflow according to your requirements.

1. Navigate to **Flow Designer > Designer**
2. Click **Subflows**.
3. Create a copy of the default subflow, Process Dynamics CRM Webhook.
4. Customize the subflow according to your requirement and publish it. See **Subflows** for more information about creating and using subflows.
5. Navigate to **Dynamics CRM Webhook Details > Decision Policy**.
6. On the **Decisions** tab, click **New**.
7. On the form, fill in the fields.

**Decision form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
</tbody>
</table>
| Answer      | Option to specify if this answer is the default answer. Default answer is applicable when the conditions are not met.  
1. Click the Lookup icon.  
2. Select the required subflow from the Document: list.  
**Note:** Ensure that the Table name is Dynamics CRM Webhook Answer Subflow [sn_ms_crm_spoke_dynamics_crm_webhook_answer_subflow]. |
| Condition   | Conditions to be met when the required events occur in Microsoft Dynamics CRM. |

8. Click **Submit**.

**Note:** These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

Decision policy and subflow are created.

**Microsoft Exchange Online spoke**

The Microsoft Exchange Online spoke creates and manages calendar and mail in Microsoft Exchange Online. To create, manage, or delete users and groups, use the Microsoft Azure AD spoke.

**Note:** User and group management can be done using Microsoft Azure AD only and not Microsoft Exchange Online spoke.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported version

Microsoft Graph REST API v1.0

Spoke actions

The Microsoft Exchange Online spoke provides actions to automate calendar and mail tasks when an incident is created in the ServiceNow instance.

Microsoft Exchange Online spoke actions

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calendar Management</td>
<td>Copy Attachment To Calendar Event</td>
<td>Copies a ServiceNow attachment to an Exchange calendar event.</td>
</tr>
<tr>
<td></td>
<td>Create Calendar Event</td>
<td>Creates an event in the user’s default calendar and specifies the time zone for the start and end times of the event.</td>
</tr>
<tr>
<td></td>
<td>Create Recurring Calendar Events</td>
<td>Creates a recurring event in the user’s default calendar and specifies the time zone for the start and end times of the event.</td>
</tr>
<tr>
<td></td>
<td>Delete Calendar Event</td>
<td>Deletes a calendar event.</td>
</tr>
<tr>
<td></td>
<td>Get Events by User ID</td>
<td>Retrieves the list of event objects in the user’s mailbox.</td>
</tr>
<tr>
<td></td>
<td>Update Calendar Event</td>
<td>Updates the properties of an event object.</td>
</tr>
<tr>
<td>Mail Management</td>
<td>Delete Message</td>
<td>Deletes the message in user’s inbox or from a custom folder.</td>
</tr>
<tr>
<td></td>
<td>Look Up Mail Folders By User ID</td>
<td>Retrieves all the mail folders for a specified User ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Messages By Mail Folder ID</td>
<td>Retrieves all the messages in a mail folder.</td>
</tr>
<tr>
<td></td>
<td>Look Up Messages By User ID</td>
<td>Retrieves all the messages in the inbox folder of the user.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get Time Zones</td>
<td>Retrieves the list of all available time zones.</td>
</tr>
</tbody>
</table>

**Microsoft account requirements**

The Microsoft Exchange Online spoke requires registering an application using the Microsoft Azure portal to generate OAuth 2.0 tokens.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Credentials and connection information*.

**Set up Microsoft Exchange Online spoke**

Integrate the ServiceNow instance and Microsoft Exchange Online account by creating a custom OAuth application in Microsoft Exchange Online to authenticate ServiceNow requests.

- Request IntegrationHub Professional subscription
- Activate the Microsoft Exchange Online spoke
- Role required: admin

*Register an application using the Microsoft Azure portal*

Provide authorization to the ServiceNow instance by registering an application with Azure AD.

Role required: Azure Active Directory admin

Complete these steps from the Microsoft Azure portal. For instructions on registering an application, see the *Microsoft Azure documentation*.

1. In the Microsoft Azure portal, add the **Redirect URIs** in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`
2. For the **Required Permissions**, select Microsoft Graph.
3. Record the **Client Secret** for use in later configurations.

The ServiceNow application is created with Microsoft Azure AD.

*Register Microsoft Exchange Online as the OAuth provider*

Register Microsoft Exchange Online as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

Use the information generated during the registration of the application in the Microsoft Azure portal.

1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
   - The system displays the message, *What kind of OAuth application?*
3. Select **Connect to a third party OAuth Provider**.
4. On the form, fill in the fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Microsoft Exchange Online.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Application ID created during application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret created during application registration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. Enter https://&lt;instance-name&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>Client credentials in the request.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click Save.
A system-generated OAuth entity profile is created and displayed in the OAuth Entity Profiles related list. For example, Microsoft Exchange Online default_profile.

Create Credential records for the Microsoft Exchange Online spoke
Authorize the Microsoft Exchange Online spoke actions by creating credential records for the application registered in the Microsoft Azure portal. The Microsoft Exchange Online connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message, What type of Credentials would you like to create?
3. Select OAuth 2.0 Credentials.
4. On the form, fill in the fields.

   **OAuth 2.0 Credentials form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Exchange_Online_Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Microsoft Exchange Online spoke as an OAuth provider. For example, Microsoft Exchange Online.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Save.
6. To generate the OAuth token, click the Get OAuth Token related link.

The credential record for the Microsoft Exchange Online spoke is created.

Create Connection records for the Microsoft Exchange Online spoke
Perform actions in Microsoft Exchange Online by creating connection records for your Microsoft Exchange Online account. The Microsoft Exchange Online spoke connection and credential alias uses these connections to perform actions.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the Microsoft Exchange Online spoke record.
3. In the Connections related list, click New.
4. On the form, fill in the fields.

   **HTTP(s) Connection form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Exchange_Online_Connection.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Microsoft Exchange Online. For example, Exchange_Online_Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Click **Update**.

The Microsoft Exchange Online spoke is set up and integrated with the ServiceNow instance.

**Regenerate the Microsoft Exchange Online OAuth token**

Authorize the Microsoft Exchange Online spoke by regenerating the Microsoft Exchange Online OAuth token after it expires.

Role required: admin

1. Navigate to **Connections & Credentials > Credentials**.
2. Select the Microsoft Exchange Online spoke OAuth Credential record.
3. To regenerate the OAuth token, click the **Get OAuth Token** related link.

The Microsoft Exchange Online spoke receives a new OAuth access token.

**Microsoft Exchange Server spoke**

The Microsoft Exchange Server spoke creates and manages address lists, mailbox, and calendar events in Microsoft Exchange mail system.

The Microsoft Exchange Server spoke requires an IntegrationHub subscription.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, refer to the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.
Supported versions

- Exchange Server 2016 installed on Windows Server 2016

  Note: The Create Calendar Event For User action is supported only on Exchange Server 2013.

- Exchange Server 2013 installed on Windows Server 2012 R2

This spoke may be compatible with the earlier versions of Microsoft Exchange Server.

Spoke requirements

Powershell remoting must be enabled on the target Exchange Server.

Spoke actions

The Microsoft Exchange Server spoke provides actions to automate address list, mailbox, and calendar event tasks.

Microsoft Exchange Server spoke actions

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address List Management</td>
<td>Create Address List Using Included Recipients</td>
<td>Creates a new address list in Exchange Server using the <strong>Included Recipients</strong> field.</td>
</tr>
<tr>
<td></td>
<td>Create Address List Using Recipient Filter</td>
<td>Creates a new address list in Exchange Server using the <strong>Recipient</strong> field.</td>
</tr>
<tr>
<td></td>
<td>Delete Address List</td>
<td>Deletes the required address list on a required Exchange Server.</td>
</tr>
<tr>
<td></td>
<td>Get Address List Details</td>
<td>Retrieves the details of a required address list on a required Exchange Server.</td>
</tr>
<tr>
<td></td>
<td>Look Up Address List</td>
<td>Retrieves the address list details on a required Exchange Server using a search query.</td>
</tr>
<tr>
<td></td>
<td>Move Address List</td>
<td>Moves an address list to another location in the address hierarchy.</td>
</tr>
<tr>
<td></td>
<td>Synchronize Address List</td>
<td>Refreshes email clients with the latest details, for a required address list in Exchange Server.</td>
</tr>
<tr>
<td></td>
<td>Update Address List Using Included Recipients</td>
<td>Updates details and recipients of a required address list using the <strong>Included Recipients</strong> field.</td>
</tr>
<tr>
<td></td>
<td>Update Address List Using Recipient Filter</td>
<td>Updates details and recipients of a required address list details using the <strong>Recipient Filter</strong> field.</td>
</tr>

<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Mailbox Management</td>
<td>Create Calendar Event For User</td>
<td>Creates a calendar event in Exchange Server. Calendar event can be either a meeting or appointment.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>· This action is supported only on Exchange Server 2013.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· This action uses the Exchange_https connection and credential alias.</td>
</tr>
<tr>
<td></td>
<td>Create Mailbox</td>
<td>Creates mailboxes and user accounts simultaneously.</td>
</tr>
<tr>
<td></td>
<td>Delete Mailbox</td>
<td>Deletes a mailbox in Exchange Server.</td>
</tr>
<tr>
<td></td>
<td>Disable Mailbox</td>
<td>Disables a mailbox in Exchange Server.</td>
</tr>
<tr>
<td></td>
<td>Enable Mailbox</td>
<td>Enables a mailbox in Exchange Server.</td>
</tr>
<tr>
<td></td>
<td>Get Mailbox</td>
<td>Retrieves the properties of a mailbox in Exchange Server.</td>
</tr>
<tr>
<td></td>
<td>Set Mailbox</td>
<td>Modifies the properties of a mailbox in Exchange Server.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Credentials and connection information](#).

Two connection and credential aliases are created when the Microsoft Exchange Server spoke is activated, Exchange and Exchange_https.

**Note:**

- The Exchange_https alias is supported only on Exchange Server 2013.
- The Exchange_https alias is required to use the Create Calendar Event For User action.
MID Server requirements

Your instance must have a MID Server set up and configured to run PowerShell 2.0. Use the connection record associated with the Microsoft Exchange alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

Set up Microsoft Exchange Server spoke

Integrate the ServiceNow instance and Exchange Server by using the Windows credentials to authenticate ServiceNow requests.

- Install Microsoft AD
- Request IntegrationHub subscription
- Activate the Microsoft Exchange Server spoke
- Role required: admin

- Perform these steps to use all Microsoft Exchange Server spoke actions except the Create Calendar Event For User action.
- To use the Create Calendar Event For User action, perform the same steps again for the Exchange_https connection and credential alias. MID Server is not necessary to perform this action.

**Note:** The Create Calendar Event For User action is supported only on Exchange Server 2013.

Create Credential record for Microsoft Exchange Server spoke

Authorize the Microsoft Exchange Server spoke actions by creating Windows credential record for the Exchange Server host. The Microsoft Exchange Server spoke connection and credential alias uses these credentials to authorize actions.

Create two credential records, one for each connection and credential alias.

1. Navigate to **Connections & Credentials > Credentials.**
2. Click **New.**
   The system displays the message, What type of Credentials would you like to create?
3. Select **Windows Credentials.**
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MSExchangeCredentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>User name</td>
<td>User name with access to the target Windows host. For more information about Windows permissions, see <a href="#">Windows credentials</a>.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for the account.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
</tbody>
</table>
5. Click Submit.

The Windows credential record for the Microsoft Exchange Server spoke is created. Create Connection record for Microsoft Exchange Server spoke
Perform actions in Microsoft Exchange Server spoke by creating connection records. The Microsoft Exchange Server spoke connection and credential alias uses these connections to perform actions.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the Microsoft Exchange Server spoke record.
3. In the Connections related list, click New.
4. On the form, fill in the fields.

Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Exchange Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for the Microsoft Exchange Server spoke. For example, MSExchangeCredentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Host</td>
<td>Fully qualified domain name or IP address of the target host where Exchange Server is installed.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
<tr>
<td>Override default port</td>
<td>Target port that the connection uses.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
</tbody>
</table>

**Note:** MID Server is necessary for all the Microsoft Exchange Server spoke actions except the Create Calendar Event For User action.

5. Click Submit.

The Microsoft Exchange Server spoke is set up and integrated with the ServiceNow instance.

### Microsoft OneDrive spoke

Automate file and folder management and collaboration in Microsoft OneDrive. Adds Microsoft OneDrive data to your ServiceNow instance.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions

API version v1.

Spoke subflows

The Microsoft OneDrive spoke provides sample subflows in the draft state to demonstrate automating Microsoft OneDrive tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move a ServiceNow attachment to OneDrive</td>
<td>Copies an attachment from ServiceNow to OneDrive, records the new location of the attachment, and deletes the attachment from the ServiceNow attachment table.</td>
</tr>
</tbody>
</table>

Spoke actions

The Microsoft OneDrive spoke provides actions to automate Microsoft OneDrive tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drive Management</td>
<td>Get Drive Info</td>
<td>Gets the metadata of a specific Microsoft OneDrive drive</td>
</tr>
<tr>
<td></td>
<td>List Drives</td>
<td>Retrieves all the available drives associated with a target User, Group, or Site. If you don’t provide a User, Group, or Site, then a list of root drives associated with the authenticated user is returned.</td>
</tr>
<tr>
<td>Folder Management</td>
<td>Move File Or Folder Item</td>
<td>Moves a file or folder in Microsoft OneDrive to the target location.</td>
</tr>
<tr>
<td></td>
<td>Create Folder</td>
<td>Creates a folder in Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Update File Or Folder Name</td>
<td>Updates the name for a file or folder item by ID.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>File Management</td>
<td>Delete File Or Folder Item</td>
<td>Deletes a file or folder from Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Copy OneDrive File to Attachment</td>
<td>Copies a file in Microsoft OneDrive to an attachment in a record in a ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Copy Attachment to OneDrive</td>
<td>Copies an attachment record from ServiceNow to Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Copy File Or Folder Item</td>
<td>Asynchronously creates a copy of a Microsoft OneDrive item (including children), under a new parent item or with a new name.</td>
</tr>
<tr>
<td></td>
<td>List Items</td>
<td>Retrieves a list of drive items from either a path or the source and source ID of a drive item.</td>
</tr>
<tr>
<td></td>
<td>Get File Or Folder Item Info By ID</td>
<td>Gets file metadata information from the file or folder ID in Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Get File Or Folder Item Info By Path</td>
<td>Gets file metadata information from the file path in Microsoft OneDrive.</td>
</tr>
<tr>
<td>File and Folder Search</td>
<td>Search Files or Folder Items</td>
<td>Searches the drive items (files or folders) based on metadata attributes such as the item name.</td>
</tr>
<tr>
<td>Collaboration</td>
<td>Add Collaborator</td>
<td>Adds a collaborator and their permissions to a file or a folder. You can identify the collaborator by their Azure AD Alias or an Object ID.</td>
</tr>
<tr>
<td></td>
<td>Get Collaborators</td>
<td>Lists all the collaborator details associated with a file or folder in Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Remove Collaborator</td>
<td>Removes a collaborator from a file or folder in Microsoft OneDrive.</td>
</tr>
</tbody>
</table>

**OneDrive Online account requirements**

The Microsoft OneDrive spoke requires a custom app that you create in Microsoft Azure.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t
need to update any actions that use the connection. For more information, see Credentials and connection information.

**Single tenant**

The OneDrive spoke includes the OneDrive alias record to authorize actions on Microsoft OneDrive. Select this alias in the Tenant record to authorize changes in Microsoft OneDrive for a single tenant.

**Multiple tenants**

The OneDrive spoke includes the OneDrive alias record to authorize actions on Microsoft OneDrive. Create a connection and credential alias record for each additional tenant site you wish to support. Select the correct alias in the Tenant record to authorize changes in Microsoft SharePoint Online. See Create aliases for multiple tenants.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the MicrosoftSharepointOnline alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

**Microsoft SCCM spoke**

Automate management of user collections, device collections, and application deployments on a Microsoft System Center Configuration Management (SCCM) server.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Spoke flows & subflows**

This spoke has no sample flows or subflows.

**Spoke actions**

The Microsoft System Center Configuration Management (SCCM) spoke provides actions to automate SCCM tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Management</td>
<td>Get Applications</td>
<td>Retrieves the application data from the SCCM server.</td>
</tr>
<tr>
<td>Deployment Management</td>
<td>Get Deployments</td>
<td>Retrieves deployment data from the SCCM server.</td>
</tr>
<tr>
<td>Device Management</td>
<td>Add to Device Collection</td>
<td>Adds a device to a collection in SCCM.</td>
</tr>
<tr>
<td></td>
<td>Get Device Collections</td>
<td>Retrieves device collection data from the SCCM server.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Is Device In Collection</td>
<td>Checks if a specified device exists in a device collection.</td>
</tr>
<tr>
<td></td>
<td>Remove From Device Collection</td>
<td>Removes a device from an existing device collection.</td>
</tr>
<tr>
<td>User Management</td>
<td>Add to User Collection</td>
<td>Adds a user to a collection in SCCM.</td>
</tr>
<tr>
<td></td>
<td>Get User Collections</td>
<td>Retrieves user collection data from the SCCM Server.</td>
</tr>
<tr>
<td></td>
<td>Is User In Collection</td>
<td>Checks if a specified user exists in a user collection.</td>
</tr>
<tr>
<td></td>
<td>Remove From User Collection</td>
<td>Removes a user from a user collection.</td>
</tr>
</tbody>
</table>

To see inputs and outputs for these activities, see [SCCM activity pack](#).

**MID server requirements**

To use these actions, your instance must have a MID Server set up and configured to use PowerShell. For more information about running actions on the MID Server, see [Integration steps](#). For more information, see [MID server](#).

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the SCCM alias record to authorize actions on a Microsoft System Center Configuration Management (SCCM) server.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCCM</td>
<td>Connection to the SCCM server.</td>
<td>The URL of the host machine where the SCCM server is installed.</td>
</tr>
</tbody>
</table>

**Set up SCCM spoke**

Integrate the ServiceNow instance and SCCM using Windows credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Role required: admin
  - Configure the MID Server for SCCM activities

Create **Credential record for the SCCM spoke**
Create a Credential record to the SCCM server. The SCCM spoke connection and credential alias uses this credential to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**. The system displays the message *What type of Credentials would you like to create?*

4. Enter these values, then click **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter SCCM Credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>User name</td>
<td>Enter a user name with access to the target Windows host. For more information about Windows permissions, see <a href="https://www.example.com">Windows credentials</a>.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password for the account.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select <strong>All MID servers</strong>.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

*Create Connection record for the SCCM spoke*

Create a Connection record to your SCCM host machine. The SCCM spoke connection and credential alias uses this connection to perform actions in SCCM.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **SCCM**.
3. From the **Connections** tab, click **New**. The system displays a blank Basic Connection form.
4. Enter these values, then click **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter SCCM Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Windows. For example, select SCCM Credential.</td>
</tr>
<tr>
<td>Host</td>
<td>Enter the fully qualified domain name of the target host where the SCCM server is installed. For example, &lt;host&gt;.&lt;domain&gt;.com.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Enable</td>
</tr>
<tr>
<td>Override default port</td>
<td>Enter the target port used by the connection. If blank, the system uses the default port.</td>
</tr>
</tbody>
</table>

*Configure MID Server as WinRM trusted host*
Microsoft SharePoint Online spoke

Manages sites, folders, files, groups, lists, and users in Microsoft SharePoint Online. Adds Microsoft SharePoint Online data to your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions

API version v1.

Spoke flows

The Microsoft SharePoint Online spoke provides sample flows in the draft state to demonstrate automating Microsoft SharePoint Online tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Attachment on Record creates folder, and copies attachment</td>
<td>Creates a Microsoft SharePoint Online folder with an attachment when the attachment is added to a Knowledge article in ServiceNow.</td>
</tr>
<tr>
<td>Create Site For Knowledge Base</td>
<td>Creates a Microsoft SharePoint Online site when a Knowledge Base is created in ServiceNow.</td>
</tr>
</tbody>
</table>

Spoke subflows

The Microsoft SharePoint Online spoke provides sample subflows in the draft state to demonstrate automating Microsoft SharePoint Online tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remove Then Add A User To A Group</td>
<td>Removes a previous owner from a Microsoft SharePoint Online group and adds the new owner.</td>
</tr>
</tbody>
</table>
## Spoke actions

The Microsoft SharePoint Online spoke provides actions to automate Microsoft SharePoint Online tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Site Management</td>
<td>Create Site</td>
<td>Creates a site or subsite in Microsoft SharePoint Online.</td>
</tr>
<tr>
<td></td>
<td>Delete Site</td>
<td>Removes a site or subsite from Microsoft SharePoint Online.</td>
</tr>
<tr>
<td></td>
<td>Look Up Site Collection ID</td>
<td>Looks up a specific site ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Sites</td>
<td>Looks up the sites in a given Microsoft SharePoint Online site.</td>
</tr>
<tr>
<td></td>
<td>Look Up Subsite Details</td>
<td>Looks up information about a subsite.</td>
</tr>
<tr>
<td></td>
<td>Update Site Information</td>
<td>Updates a Microsoft SharePoint Online site.</td>
</tr>
<tr>
<td>Folder Management</td>
<td>Create Folder</td>
<td>Creates a folder in a document library on a Microsoft SharePoint Online site.</td>
</tr>
<tr>
<td></td>
<td>Delete Folder</td>
<td>Deletes a folder in Microsoft SharePoint Online.</td>
</tr>
<tr>
<td></td>
<td>List Files In A Folder</td>
<td>Gets a list of files in a folder.</td>
</tr>
<tr>
<td></td>
<td>List Folders In A Folder</td>
<td>Gets a list of folders in a folder.</td>
</tr>
<tr>
<td></td>
<td>Look Up Folder</td>
<td>Looks up a folder in Microsoft SharePoint Online and returns folder properties. For example, use this action to return the relative URL to enter as input in the Rename A Folder action.</td>
</tr>
<tr>
<td></td>
<td>Rename A Folder</td>
<td>Renames a folder in Microsoft SharePoint Online.</td>
</tr>
<tr>
<td></td>
<td>Share Folder With Group</td>
<td>Shares a folder with a group in Microsoft SharePoint Online. The group must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td></td>
<td>Share Folder With User</td>
<td>Shares a folder with a user in Microsoft SharePoint Online. The user must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td></td>
<td>Unshare Folder With Group</td>
<td>Unshares a folder with a group. The group must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td></td>
<td>Unshare Folder With User</td>
<td>Unshares a folder with a user. The user must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>File Management</td>
<td>Attach Sharepoint File To A Record</td>
<td>Attaches a Microsoft SharePoint Online file to a ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Check-in File</td>
<td>Checks in a file to Microsoft SharePoint Online using the Application Service user.</td>
</tr>
<tr>
<td></td>
<td>Check-out File</td>
<td>Checks a file out of Microsoft SharePoint Online using the Application Service user.</td>
</tr>
<tr>
<td></td>
<td>Copy Attachment To Folder</td>
<td>Copies a ServiceNow attachment to a Microsoft SharePoint Online folder.</td>
</tr>
<tr>
<td></td>
<td>Copy File</td>
<td>Copies a file with a new name.</td>
</tr>
<tr>
<td></td>
<td>Create A Text File</td>
<td>Uploads a text file to Microsoft SharePoint Online.</td>
</tr>
<tr>
<td></td>
<td>Delete File</td>
<td>Deletes a file in Microsoft SharePoint Online.</td>
</tr>
<tr>
<td></td>
<td>Look Up File Details</td>
<td>Looks up file details in Microsoft SharePoint Online.</td>
</tr>
<tr>
<td></td>
<td>Move File</td>
<td>Moves a file to another location in Microsoft SharePoint Online.</td>
</tr>
<tr>
<td></td>
<td>Share File With Group</td>
<td>Shares a file with a group in Microsoft SharePoint Online. The group must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td></td>
<td>Share File With User</td>
<td>Shares a file with a Microsoft SharePoint Online user. The user must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td></td>
<td>Unshare File With Group</td>
<td>Unshares a file with a Microsoft SharePoint Online group. The group must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td></td>
<td>Unshare File With User</td>
<td>Unshares a file with a Microsoft SharePoint Online user. The user must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td>User Management</td>
<td>Look Up User Information By Login Name</td>
<td>Searches the Microsoft SharePoint Online site for a given user and returns information about the user account.</td>
</tr>
<tr>
<td></td>
<td>Look Up User's Sharepoint Groups</td>
<td>Searches the Microsoft SharePoint Online site for a given user and returns the user's Microsoft SharePoint Online groups regardless of which site or subsite the group is a part of.</td>
</tr>
</tbody>
</table>
## Sharepoint Online account requirements

The Microsoft SharePoint Online spoke requires creating a custom app on your SharePoint Online account to generate OAuth 2.0 tokens. See Configure Microsoft SharePoint Online account.

## Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Management</td>
<td>Add Role To Site</td>
<td>Adds a role to a Microsoft SharePoint Online site.</td>
</tr>
<tr>
<td></td>
<td>Add User To Group</td>
<td>Adds a User to a Microsoft SharePoint Online site group.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in a Microsoft SharePoint Online site.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes a group on a Microsoft SharePoint Online site.</td>
</tr>
<tr>
<td></td>
<td>Look Up Group By Name</td>
<td>Looks up a group by name in the specified site location. If no site location is specified, the spoke searches the tenant root site.</td>
</tr>
<tr>
<td></td>
<td>Remove Role From Site</td>
<td>Removes permissions from a group or user.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes a user from a Microsoft SharePoint Online site group.</td>
</tr>
<tr>
<td></td>
<td>Update Group Owner (User)</td>
<td>Updates a group owner.</td>
</tr>
<tr>
<td>List Management</td>
<td>Create List</td>
<td>Creates a list in a Microsoft SharePoint Online site.</td>
</tr>
<tr>
<td></td>
<td>Delete List By ID</td>
<td>Deletes a list in a Microsoft SharePoint Online site.</td>
</tr>
<tr>
<td></td>
<td>Look Up List Details By ID</td>
<td>Looks up a list in a Microsoft SharePoint Online site by ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up List ID By Title</td>
<td>Looks up a list in a Microsoft SharePoint Online site by title.</td>
</tr>
<tr>
<td></td>
<td>Update List Details</td>
<td>Updates a list in a Microsoft SharePoint Online site.</td>
</tr>
<tr>
<td>List Item Management</td>
<td>Create List Item</td>
<td>Creates a list item inside a list.</td>
</tr>
<tr>
<td></td>
<td>Delete List Item By ID</td>
<td>Deletes a list item.</td>
</tr>
<tr>
<td></td>
<td>Look Up List Item By ID</td>
<td>Looks up a list item.</td>
</tr>
<tr>
<td></td>
<td>Look Up List Items In A List</td>
<td>Looks up items in a specified list in various useful formats.</td>
</tr>
<tr>
<td></td>
<td>Update List Item By ID</td>
<td>Updates a list item title with the ID.</td>
</tr>
</tbody>
</table>
using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Credentials and connection information.

Single tenant

This spoke includes the MicrosoftSharepointOnline alias record to authorize actions on Microsoft Sharepoint Online. Select this alias in the Tenant record to authorize changes in Microsoft SharePoint Online for a single tenant.

Multiple tenants

This spoke includes the MicrosoftSharepointOnline alias record to authorize actions on Microsoft Sharepoint Online. Create a connection and credential alias record for each additional tenant site you wish to support. Select the correct alias in the Tenant record to authorize changes in Microsoft SharePoint Online. See Create aliases for multiple tenants.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the MicrosoftSharepointOnline alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up Microsoft SharePoint Online spoke

Integrate the ServiceNow instance and Microsoft SharePoint Online by creating a custom OAuth application in Microsoft SharePoint Online to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate Microsoft SharePoint Online spoke
- Role required: admin

Configure Microsoft SharePoint Online account

Create a custom OAuth application from your Microsoft SharePoint Online account to enable OAuth 2.0 authentication with the Microsoft SharePoint Online spoke.

Microsoft SharePoint Online requirements:

- Microsoft SharePoint Online account
- Microsoft SharePoint Online tenant administrator credentials

Complete these steps from your Microsoft SharePoint Online account. See the SharePoint development documentation for instructions on creating and configuring custom applications.

1. Work with your Azure AD administrator to retrieve the Directory ID for the Azure AD Directory that is supporting the Microsoft SharePoint Online tenant you want to connect to. Record the Directory ID to use as the Tenant ID when creating a Tenant record in your ServiceNow instance.
2. In your SharePoint site, create a custom application.
3. Record the application client ID and client secret to register the app as a third-party OAuth provider on your ServiceNow instance.
4. Enable the matching SharePoint application scope permissions you want the app to support.

For example, to provide full control, enter the following XML.

```xml
<AppPermissionRequests AllowAppOnlyPolicy="true">
  <AppPermissionRequest Scope="http://sharepoint/content/tenant" Right="FullControl" />
</AppPermissionRequests>
```
Create aliases for multiple tenants
Create a connection and credential alias record for each additional tenant site you wish to support. Select the correct alias in the Tenant record to authorize changes in Microsoft SharePoint Online. If configuring an integration for a single tenant, use the existing MicrosoftSharepointOnline alias record.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Click New.
   A blank Connection & Credential Alias record opens
3. On the Connection & Credential Aliases form, fill the following values.

   **Connection & Credential Aliases form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>&lt;unique-name&gt;</td>
</tr>
<tr>
<td>Type</td>
<td>Connection and Credential</td>
</tr>
<tr>
<td>Connection type</td>
<td>HTTP</td>
</tr>
</tbody>
</table>

4. Click Submit.

Associate a Credential record and a Connection record with the alias to authorize actions on the SharePoint tenant site. Create an alias record and associated connection and credential records for each tenant you want to support.

Define Microsoft SharePoint Online tenants
Define a profile for your Microsoft SharePoint Online tenant site. The Microsoft SharePoint Online spoke uses the tenant record and associated Connection and Credential alias to perform actions on Microsoft SharePoint Online.

1. Navigate to Sharepoint Online > Tenants.
2. Click New.
3. Complete the form.

   **Tenant form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for the tenant.</td>
</tr>
<tr>
<td>Alias</td>
<td>Select a connection and credential alias. If configuring for single tenant, select the MicrosoftSharepointOnline alias. If configuring for multiple tenants, select the desired alias.</td>
</tr>
<tr>
<td>Sharepoint Root URL</td>
<td>Enter the root SharePoint URL without the https:// prefix. For example, &lt;SiteName&gt;.sharepoint.com</td>
</tr>
<tr>
<td>Tenant Id</td>
<td>Enter the Tenant ID. This is the Directory ID for the Azure AD Directory that is supporting the Microsoft SharePoint Online tenant you want to connect to. See Configure Microsoft SharePoint Online account.</td>
</tr>
<tr>
<td>Resource Id</td>
<td>Auto-populated with 00000003-0000-0ff1-ce00-00000000000.</td>
</tr>
</tbody>
</table>
4. Click Submit.

If configuring an integration with multiple Microsoft SharePoint Online tenants, create additional tenant profiles as needed.

Register Microsoft SharePoint Online as OAuth provider

Use the information generated during Microsoft SharePoint Online account configuration to register Microsoft SharePoint Online as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays the message What kind of OAuth application?
3. Select Connect to a third party OAuth Provider.
   The system displays a blank Application Registries form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter SharePoint OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the value, &lt;ClientID&gt;@&lt;TenantID&gt;.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you created during the Microsoft SharePoint Online account configuration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Select OAuthUtilSPOnline.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Client Credentials.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Enter <a href="https://accounts.accesscontrol.windows.net/">https://accounts.accesscontrol.windows.net/</a>&lt;TenantID&gt;/tokens/OAuth/2. Replace &lt;TenantID&gt; with your Tenant ID.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click Save.
   The system validates the OAuth credentials and populates the Redirect URL and the OAuth Entity Profiles related list.
6. Copy the value from Redirect URL.
7. Login to your Microsoft SharePoint Online account to edit the configuration of your custom SharePoint application.
   See the SharePoint development site for instructions.
8. Paste the Redirect URL value into the OAuth 2.0 Redirect URI for your custom Microsoft SharePoint Online application.
   For example, paste https://instance.service-now.com/oauth_redirect.do.

The instance can request OAuth 2.0 tokens for the spoke.

Create Credential records for the Microsoft SharePoint Online spoke

Create Credential records to the Microsoft SharePoint Online custom OAuth application you created during Microsoft SharePoint Online account configuration. The Microsoft SharePoint Online spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?
3. Select OAuth 2.0 Credentials.
The pop-up window displays a blank OAuth 2.0 Credentials form.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter SharePoint</td>
</tr>
<tr>
<td></td>
<td>Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Microsoft</td>
</tr>
<tr>
<td></td>
<td>SharePoint Online application as an OAuth provider. For example, select</td>
</tr>
<tr>
<td></td>
<td>SharePoint OAuth profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All</td>
</tr>
<tr>
<td></td>
<td>MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Save the record.

6. From Related Links, click **Get OAuth Token**.
   The system displays a confirmation message that the OAuth token flow is completed successfully. Review the details if the flow is not completed successfully.

   Note: Ensure that you allow pop-up windows in your browser.

Create **Connection records for the Microsoft SharePoint Online spoke**
Create connection records to your Microsoft SharePoint Online account. The Microsoft SharePoint Online spoke connection and credential alias uses these connections to perform actions on Microsoft SharePoint Online.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the connection and credential alias used in the Tenant record. See [Define Microsoft SharePoint Online tenants](#) and [Create aliases for multiple tenants](#).
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter</td>
</tr>
<tr>
<td></td>
<td>SharePoint Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Microsoft SharePoint Online. For</td>
</tr>
<tr>
<td></td>
<td>example, select SharePoint Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the Connection alias record you created for Microsoft SharePoint Online.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the root SharePoint URL. For example, https://&lt;SiteName&gt;.sharepoint.com.</td>
</tr>
</tbody>
</table>
5. Click Submit.

**Microsoft Teams spoke**

The Microsoft Teams spoke provides actions which post messages and ServiceNow incident, problem, and change record details to Microsoft Teams channels.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Starter subscription package. For more information, see [Request IntegrationHub](#).

**Microsoft Teams actions**

The Microsoft Teams spoke is an available integration through IntegrationHub. You can specify the following Microsoft Teams actions within a flow:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
<td>Send a message to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL, Title, and Message to send.</td>
</tr>
<tr>
<td>Post Change Details</td>
<td>Send details about a ServiceNow change record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Change record to send.</td>
</tr>
<tr>
<td>Post Incident Details</td>
<td>Send details about a ServiceNow incident record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Incident record to send.</td>
</tr>
<tr>
<td>Post Problem Details</td>
<td>Send details about a ServiceNow problem record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Problem record to send.</td>
</tr>
</tbody>
</table>

**Microsoft Teams Inputs**

The following inputs are common to the Microsoft Teams actions:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Required) Webhook URL</td>
<td>The Microsoft Teams webhook for sending a message. Set up the webhook before configuring this action. Refer to the custom incoming webhook for Microsoft Teams documentation.</td>
</tr>
<tr>
<td>(Optional) Title</td>
<td>Title of the message.</td>
</tr>
<tr>
<td>(Optional) Additional Message</td>
<td>Add a message before the record details.</td>
</tr>
</tbody>
</table>
### Input Description

<table>
<thead>
<tr>
<th>(Optional) Override Default Fields</th>
<th>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Optional) Theme Color (Hex)</td>
<td>Hex code value of color to highlight the message.</td>
</tr>
</tbody>
</table>

### Example

You can add a Microsoft Teams Post Incident Details action to a flow which identifies newly created high priority incidents and a specified theme color.

![Microsoft Teams Graph spoke](image)

#### Microsoft Teams Graph spoke

The Microsoft Teams Graph spoke creates and manages teams and channels in Microsoft Teams. To create, manage, or delete users and groups, use the Microsoft Azure AD spoke.

#### Request apps on the Store

Visit the [ServiceNow Store](https://store.servicenow.com) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the [ServiceNow Store version history release notes](https://store.servicenow.com).

### Note:

- Teams in the Microsoft Teams Graph spoke are created from the groups in Microsoft Azure AD. To create a team using the Microsoft Teams Graph spoke, the associated group must be present in Microsoft Azure AD.
- User and group management can be done using Microsoft Azure AD only and not Microsoft Teams Graph spoke.
- Teams can be created from the Microsoft Office 365 group only.
The team ID in Microsoft Teams is the same as the group ID of the associated group in Microsoft Azure AD.

IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported version

Microsoft Graph REST API v1.0

Spoke actions

The Microsoft Teams Graph spoke provides actions to automate team and channel tasks when an incident is created in the ServiceNow instance.

**Microsoft Teams Graph spoke actions**

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Team Management</td>
<td>Create Team</td>
<td>Creates a team from an existing Microsoft Office 365 group.</td>
</tr>
<tr>
<td></td>
<td>Note:</td>
<td>The team ID is the same as the group ID.</td>
</tr>
<tr>
<td></td>
<td>Update Team</td>
<td>Updates the properties of a team.</td>
</tr>
<tr>
<td></td>
<td>Get Team</td>
<td>Retrieves the properties and relationships of a team.</td>
</tr>
<tr>
<td></td>
<td>Archive Team</td>
<td>Archives a team. Members cannot send messages on the channels of the team.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>However, members can be added to the group and can search the team content.</td>
</tr>
<tr>
<td></td>
<td>Unarchive Team</td>
<td>Restores an archived team. Members can send messages on the channels of the team.</td>
</tr>
<tr>
<td>Channel Management</td>
<td>Create Channel in a Team</td>
<td>Creates a channel in a team.</td>
</tr>
<tr>
<td></td>
<td>Get Channel Metadata</td>
<td>Retrieves the properties and relationships of a channel.</td>
</tr>
<tr>
<td></td>
<td>Get Channel ID by Name</td>
<td>Retrieves the channel ID and properties.</td>
</tr>
<tr>
<td></td>
<td>Delete Channel</td>
<td>Removes the channel from a team and deletes all conversations.</td>
</tr>
</tbody>
</table>

© 2019 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Note: Some of the spoke actions require the channel ID, group ID, or team ID as one of the inputs. To learn these details, log in to Microsoft Teams, navigate to Teams, and click Get link to channel for the required channel. The channel link contains the required details. For example, if the channel link is https://teams.microsoft.com/l/channel/19%3a1aa3730712e245a0af31e4095d66d613@thread.skype/New%2520channel%2520in%2520team?groupId=7fb91938-5e8c-4968-bf7d-3987df7716f3&tenantId=a46df9b7-2c9b-49d5-8c9f-db3de4ba59f, the group ID and team ID are 7fb91938-5e8c-4968-bf7d-3987df7716f3, and the channel ID is 19:1aa3730712e245a0af31e4095d66d613@thread.skype or 1aa3730712e245a0af31e4095d66d613.

For more information about accessing the channel ID and group ID through Microsoft Teams, see Microsoft Teams documentation.

Microsoft Teams Graph spoke action permissions

The Microsoft Teams Graph spoke should have the following permissions to perform the relevant actions.

<table>
<thead>
<tr>
<th>Action</th>
<th>Permission type</th>
<th>Permissions (from least to most privileged)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td>Update Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td>Get Team</td>
<td>Delegated (work or school account)</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td>Archive Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td>Unarchive Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td>Action</td>
<td>Permission type</td>
<td>Permissions (from least to most privileged)</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>----------------------------------</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td>Create Channel in a Team</td>

</tbody>
</table>

For more information about the required permissions, see [Microsoft Teams documentation](#).

**Microsoft account requirements**

The Microsoft Teams Graph spoke requires registering an application using the Microsoft Azure portal to generate OAuth 2.0 tokens.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Credentials and connection information](#).

**MID Server requirements**

The Microsoft Teams Graph spoke actions use REST calls, which can run on an instance or a MID Server. Use the connection record associated with the Microsoft alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).
Set up Microsoft Teams Graph spoke

Integrate the ServiceNow instance and Microsoft Teams account by creating a custom OAuth application in Microsoft Teams to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Microsoft Teams Graph spoke
- Role required: admin

Register an application using the Microsoft Azure portal
Provide authorization to the ServiceNow instance by registering an application with Azure AD.

Role required: Azure Active Directory admin

Complete these steps from the Microsoft Azure portal. For instructions on registering an application, see the Microsoft Azure documentation.

1. In the Microsoft Azure portal, copy and record the Directory ID for later use.
2. Register your application by providing the ServiceNow instance URL for the Home page.
3. Copy and record the Application ID for later use.
4. Add the Reply URLs in this format: https://<instance-name>.service-now.com/oauth_redirect.do
5. For the Required Permissions, select Microsoft Graph.
6. Record the Client Secret for use in later configurations.

The ServiceNow application is created with Microsoft Azure AD.

Register Microsoft Teams as the OAuth provider
Register Microsoft Teams as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

Use the information generated during the registration of the application in the Microsoft Azure portal.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays the message, What kind of OAuth application?
3. Select Connect to a third party OAuth Provider.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MS Teams.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Application ID created during application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret created during application registration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can use only <strong>Authorization Code</strong> as the Default Grant type when PKCE is enabled.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. Enter <code>https://&lt;instance-name&gt;.service-now.com/oauth_redirect.do</code></td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>Client credentials in the request.</td>
</tr>
</tbody>
</table>

5. Insert the following records in the OAuth Entity Scopes related list.

**Record 1 in the OAuth Entity Scopes related list**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>auth_code</td>
</tr>
<tr>
<td>OAuth scope</td>
<td>offline_access</td>
</tr>
</tbody>
</table>

**Record 2 in the OAuth Entity Scopes related list**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>openid</td>
</tr>
<tr>
<td>OAuth scope</td>
<td>openid</td>
</tr>
</tbody>
</table>

6. Right-click the form header, and click **Save**.
A system-generated OAuth entity profile is created and displayed in the OAuth Entity Profiles related list. For example, MS Teams default_profile.

Create Credential records for the Microsoft Teams Graph spoke
Authorize the Microsoft Teams Graph spoke actions by creating credential records for the application registered in the Microsoft Azure portal. The Microsoft Teams Graph spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?
3. Select OAuth 2.0 Credentials.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>OAuth 2.0 Credentials form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MSTeamsCredentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Microsoft Teams Graph spoke as an OAuth provider. For example, MS Teams default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Save.
6. To generate the OAuth token, click the Get OAuth Token related link.

The credential record for the Microsoft Teams Graph spoke is created.

Create Connection records for the Microsoft Teams Graph spoke
Perform actions in Microsoft Teams by creating connection records for your Microsoft Teams account. The Microsoft Teams Graph spoke connection and credential alias uses these connections to perform actions.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the Microsoft Teams Graph spoke record.
3. In the Connections related list, click New.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>HTTP(s) Connection form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MSTeamsConnection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Microsoft Teams. For example, MSTeamsCredentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>URL builder</td>
<td><strong>Note:</strong> Do not select the check box.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Click **Update**.

The Microsoft Teams Graph spoke is set up and integrated with the ServiceNow instance.

**Regenerate the Microsoft Teams OAuth token**

Authorize the Microsoft Teams Graph spoke by regenerating the Microsoft Teams OAuth token after it expires.

Role required: admin

1. Navigate to **Connections & Credentials > Credentials**.
2. Select the Microsoft Teams Graph spoke OAuth Credential record.
3. To regenerate the OAuth token, click the **Get OAuth Token** related link.

The Microsoft Teams Graph spoke receives a new OAuth access token.

**Okta spoke**

Use Okta to manage users, passwords, and groups.

**Request apps on the Store**

Visit the [ServiceNow Store](https://store.servicenow.com) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the [ServiceNow Store version history release notes](https://s3.amazonaws.com/snowstore-s3-bucket/snowstore-versionhistory-releasenotes-06122017.pdf).

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see [Request IntegrationHub](https://www.servicenow.com/collaborativechangemanagement.html).

**Supported versions**

API version v1.
Spoke flows

The Okta spoke provides sample flows in the draft state to demonstrate automating user and group management tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add User to Okta Group</td>
<td>When a user is created, adds the user to the specified group.</td>
</tr>
<tr>
<td>Onboard User in Okta</td>
<td>When a user is created in ServiceNow, creates and activates the user in Okta.</td>
</tr>
<tr>
<td>Remove Okta Group Membership on Deactivation</td>
<td>When a user is deactivated, removes the user from all Okta groups.</td>
</tr>
</tbody>
</table>

Note: Okta has the ServiceNow_UD application to provision users in ServiceNow. ServiceNow can also be configured to provision users in Okta. Hence, ServiceNow administrators must ensure that circular user creation does not occur.

Spoke actions

The Okta spoke provides actions to authenticate and manage users and groups. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Management</td>
<td>Activate User</td>
<td>Starts the process of activating a user in Okta by enabling new or returning users to configure their Okta account from an activation URL. This action can either have Okta send the activation URL to the user as an email, or it can return the activation URL as a data pill for use in a later action to send an email or notification.</td>
</tr>
<tr>
<td></td>
<td>Clear User Session</td>
<td>Clears all active sessions the specified user has with Okta, which forces the user to log back in the next time they use Okta.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
|          | Create User | Creates the specified user in Okta with the specified standard, optional, and mandatory field values.  
**Note:** Okta has the ServiceNow_UD application to provision users in ServiceNow. ServiceNow can also be configured to provision users in Okta. Hence, ServiceNow administrators must ensure that circular user creation does not occur. |
|          | Deactivate User | Deactivates the specified user in Okta, which removes the user's groups and application assignments, and changes the user status to DEACTIVATED. This action is commonly used when a user departs the company indefinitely.  
**Note:** Do not perform this action on users with a DEPROVISIONED status. |
<p>|          | Delete User | Deletes the specified user within Okta, which completely removes the user. This action is commonly used to clean up your user base after compliance regulations have been met. |
|          | Is Account Locked | Determines if a user account is locked. |
|          | Lookup Okta User ID | Retrieves the Okta user ID for the specified Okta login ID or login short name. |
|          | Lookup User Account Details | Retrieves user details for the specified Okta user ID. |
|          | Lookup User Profile Information | Retrieves user profile details for the specified Okta user ID. |
|          | Restart User Activation | Restarts the specified user's activation within Okta. Use this action if the user did not complete their activation with the activation code or link provided by the <strong>Activate User</strong> Action. |</p>
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Suspend User</td>
<td>Suspends the specified user within Okta by changing the user status from ACTIVE to SUSPENDED. For example, use this action to suspend access for users who are on temporary leave. To reactivate a suspended user, use the <strong>Unsuspend</strong> action.</td>
</tr>
<tr>
<td></td>
<td>Unsuspend User</td>
<td>Unsuspends the specified user in Okta.</td>
</tr>
<tr>
<td></td>
<td>Update User Profile</td>
<td>Updates the user profile details for the specified user in Okta.</td>
</tr>
<tr>
<td>Password Management</td>
<td>Change User’s Password</td>
<td>Changes the specified user’s password after validating the user’s current password.</td>
</tr>
<tr>
<td></td>
<td>Expire User Password</td>
<td>Expires the specified user’s password within Okta. This action is commonly used as a reaction to stop breaching attempts.</td>
</tr>
<tr>
<td></td>
<td>Reset to Temporary Password</td>
<td>Resets the specified user’s password within Okta to a temporary password. This action is commonly used to get a user logged in who has forgotten their password.</td>
</tr>
<tr>
<td></td>
<td>Reset User Factors</td>
<td>Resets all of the multi-factor access devices for the specified user within Okta. This action is commonly used when a user loses their multi-factor authentication device or method.</td>
</tr>
<tr>
<td></td>
<td>Set User Password</td>
<td>Sets the specified user’s password in Okta.</td>
</tr>
<tr>
<td></td>
<td>Unlock User</td>
<td>Unlocks the specified user in Okta.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add User To Group</td>
<td>Adds the specified user to the specified group in Okta.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates the specified group in Okta.</td>
</tr>
<tr>
<td></td>
<td>Is User In Group</td>
<td>Determines if the specified user is a member of the specified group in Okta.</td>
</tr>
<tr>
<td></td>
<td>Lookup Group Details</td>
<td>Retrieves group details for the specified Okta group ID.</td>
</tr>
<tr>
<td></td>
<td>Lookup Group ID By Name</td>
<td>Retrieves group details and group ID for the specified Okta group name.</td>
</tr>
</tbody>
</table>
### Okta account requirements

The Okta spoke requires generating and configuring your Okta account to use a web API key.

### Credential and connection alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Credentials and connection information](#).

This spoke uses the Okta Connection & Credential Alias record to authorize actions.

### MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Okta alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

### Set up Okta spoke

Integrate the ServiceNow instance and your Okta account using an API key to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Okta spoke
- Role required: admin

#### Generate Okta account API token

Configure your Okta account to generate an access token for API key authentication.

Okta requirements:

- Okta organization or developer account
- Okta administrator credentials

Complete these steps from your Okta organization or developer account. See the [Okta for developers](#) documentation for instructions on creating and configuring your account.

1. Generate an access token to interact with Okta APIs.
2. Record the access token to create Credential records on your ServiceNow instance.

#### Create Credential records for the Okta spoke

Create Credential records to the Okta application you created. The Okta spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click New.
The system displays the message **What type of Credentials would you like to create?**

3. Select **API Key Credentials**.
A blank API Key Credentials form displays.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Okta Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>API Key</td>
<td>Enter SSWS followed by the access token you obtained from Okta. For example, SSWS {access token}.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

**Create Connection records for the Okta spoke**
Create a Connection record to the Okta API. The Okta spoke connection and credential alias uses these connections to perform actions in Okta.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **Okta**.
3. From the **Connections** tab, click New.
The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Okta Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Okta. For example, select Okta Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter your Okta organization URL. For example, <a href="https://dev-418994.oktapreview.com">https://dev-418994.oktapreview.com</a>.</td>
</tr>
</tbody>
</table>

5. Click Submit.

**Okta spoke v1.1.1**
Use Okta to manage users, passwords, and groups.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions

API version v1.

Spoke flows

The Okta spoke provides sample flows in the draft state to demonstrate automating user and group management tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add User to Okta Group</td>
<td>When a user is created, adds the user to the specified group.</td>
</tr>
<tr>
<td>Onboard User in Okta</td>
<td>When a user is created in ServiceNow, creates and activates the user in Okta.</td>
</tr>
<tr>
<td>Remove Okta Group Membership on Deactivation</td>
<td>When a user is deactivated, removes the user from all Okta groups.</td>
</tr>
</tbody>
</table>

Note: Okta has the ServiceNow_UD application to provision users in ServiceNow. ServiceNow can also be configured to provision users in Okta. Hence, ServiceNow administrators must ensure that circular user creation does not occur.

Spoke actions

The Okta spoke provides actions to authenticate and manage users and groups. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>

### Okta account requirements

The Okta spoke requires generating and configuring your Okta account to use a web API key.

### Credential and connection alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Credentials and connection information](#).

This spoke uses the Okta Connection & Credential Alias record to authorize actions.

### MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Okta alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

### Set up Okta spoke v1.1.1

Integrate the ServiceNow instance and your Okta account using an API key to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Okta spoke
- Role required: admin

© 2019 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
**Generate Okta account API token**
Configure your Okta account to generate an access token for API key authentication.

Okta requirements:
- Okta organization or developer account
- Okta administrator credentials

Complete these steps from your Okta organization or developer account. See the [Okta for developers](#) documentation for instructions on creating and configuring your account.

1. Generate an access token to interact with Okta APIs.
2. Record the access token to create Credential records on your ServiceNow instance.

**Create Credential records for the Okta spoke v1.1.1**
Create Credential records to the Okta application you created. The Okta spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   - The system displays the message **What type of Credentials would you like to create?**.
3. Select **API Key Credentials**.
   - A blank API Key Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Okta Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>API Key</td>
<td>Enter SSWS followed by the access token you obtained from Okta. For example, SSWS {access token}.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Create Connection records for the Okta spoke v1.1.1**
Create a Connection record to the Okta API. The Okta spoke connection and credential alias uses these connections to perform actions in Okta.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **Okta**.
3. From the **Connections** tab, click **New**.
   - The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Okta Connection.</td>
</tr>
</tbody>
</table>
5. Click Submit.

Fetch Okta groups

Fetch Okta groups into your instance so that you can assign them to different users. You can fetch the groups on an as-needed or scheduled basis.

Role required: okta.admin

1. To fetch Okta groups on an as-needed basis.
   a) Navigate to Okta spoke > Okta groups.
   b) Click Fetch Okta groups.
   c) From the Okta groups list, you can review the following:

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the Okta group.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the Okta group.</td>
</tr>
<tr>
<td>Group ID</td>
<td>Group ID of the Okta group.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of the Okta group.</td>
</tr>
<tr>
<td>Group creation date</td>
<td>Date when Okta group was created.</td>
</tr>
<tr>
<td>Group last updated date</td>
<td>Date when Okta group was last updated.</td>
</tr>
<tr>
<td>Created</td>
<td>Date when Okta group was first synchronized with your ServiceNow instance.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date when Okta group was last synchronized with your ServiceNow instance.</td>
</tr>
</tbody>
</table>

2. To fetch Okta groups on a scheduled basis.
   a) Navigate to System Definition > Scheduled Jobs.
   b) Open the Fetch Okta Groups record.
   c) Update the fields, as needed.

   Note: Make sure that the Active option is selected so that the scheduled job is activated for use.
   d) Click Update.
Salesforce spoke

Access and manage data in the Account, Contact, Case, Lead, Opportunity, Order, and User objects of your Salesforce instance from the ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported version

This spoke was built for the Salesforce API version v45.0, but may be compatible with later versions.

Spoke requirements

- Salesforce account
- Salesforce admin credentials
- Salesforce connected app configured to integrate with ServiceNow
- Salesforce connected app details such as, consumer key and consumer secret
- IntegrationHub subscription

Spoke actions

The Salesforce spoke provides actions to access and manage data in the Salesforce objects, Account, Contact, Case, Lead, Opportunity, Order, and User.

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Management</td>
<td>Create Account</td>
<td>Creates an account in Salesforce.</td>
</tr>
<tr>
<td></td>
<td>Get Account Fields</td>
<td>Retrieves a list of fields in the Salesforce Account object.</td>
</tr>
<tr>
<td></td>
<td>Get Account Types</td>
<td>Retrieves a list of account types in Salesforce. The value field of the account type from the Salesforce response body is mapped to the name field in JSON output.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get All Accounts</td>
<td>Retrieves a list of accounts in Salesforce. The name and ID fields of the accounts from the Salesforce response body are mapped to the label and name fields respectively in the JSON output.</td>
</tr>
<tr>
<td></td>
<td>Get Industries for Account</td>
<td>Retrieves a list of industries in the Salesforce Lead object. The value field of the industry from the Salesforce response body is mapped to the name field in JSON output.</td>
</tr>
<tr>
<td>All Record Management</td>
<td>Create Record</td>
<td>Creates a record in Salesforce.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> Ensure that you use relevant actions to create record for Account, Contact, Case, Lead, Opportunity, Order, and User.</td>
</tr>
<tr>
<td></td>
<td>Delete Record</td>
<td>Deletes a record in Salesforce.</td>
</tr>
<tr>
<td></td>
<td>Get Record Details</td>
<td>Retrieves the specific record in Salesforce by Record ID.</td>

<tr>
<td></td>
<td>Look Up Records Using SOQL</td>
<td>Looks up records in Salesforce using the Salesforce Object Query Language (SOQL).</td>
</tr>
</tbody>
</table>

**Note:**
This action is not published and is available only in the draft state. Use this action only as a reference implementation.

Flow designers must exercise caution when using this action. As per Salesforce documentation, SOQL injection can occur in the Apex code when an application relies on user input to construct a dynamic SOQL statement and the inputs aren’t handled properly.

The recommended guidelines for addressing SOQL injection are:

- Create a copy of the action and customize the copy as per your requirement.
- Narrow down the query to a specific business use case.
- Validate the data originating from user for data type and expected format. For example, if the dynamic value used in the query is a date, validate that it is a date before passing it to the SOQL query.
- Escape data pills and then, make SOQL call to Salesforce.
- Ensure that the Salesforce credential used to perform this action, has limited rights to access only those objects that are needed in your
<table>

<td>Get User Time Zones</td>
<td>Retrieves list of time zones in the Salesforce User object. The value field of the time zone from the Salesforce response body is mapped to the name field in JSON output.</td>
</tr>
</tbody>
</table>

**Salesforce account requirements**

The Salesforce spoke requires configuring your Salesforce account to generate an OAuth 2.0 JWT Bearer Grant token.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Credentials and connection information](#).

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Salesforce alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).
Set up Salesforce spoke

Integrate your Salesforce account with your ServiceNow instance. Create a custom OAuth application in Salesforce and authenticate requests from ServiceNow.

- Request IntegrationHub subscription
- Activate Salesforce spoke
- Role required: admin

Create a connected app in Salesforce
Create a connected app in your Salesforce account to enable OAuth 2.0 authentication with the Salesforce spoke.

- Salesforce account
- Role required: Salesforce admin

Complete these steps from your Salesforce account. See the Salesforce Trailblazer Community documentation for instructions on creating and configuring connected apps.

1. From your Salesforce account, create a connected app.
2. Configure the connected app to enable your Salesforce application to share data with your ServiceNow instance.
   a) Select Enable OAuth Settings and configure the authentication settings.
   b) Select Use Digital Signatures and upload a Java KeyStore (JKS) certificate.
   c) Select the OAuth scopes:
      - Access and manage your data (api)
      - Perform requests on your behalf at any time (refresh_token, offline_access)
   d) After creating the connected app, in OAuth Policies, set the Permitted Users to Admin approved users are pre-authorized.
   e) Configure user provisioning for the connected app as per your requirement.

3. Record the values of Consumer Key and Consumer Secret.

The connected app is created in Salesforce.

Attach a Java Key Store certificate to the Salesforce spoke
Enable the JWT Bearer Grant token authentication by attaching a valid Java KeyStore (JKS) certificate to the Salesforce spoke.

- Valid Java KeyStore certificate
- Role required: admin

1. Navigate to System Definition > Certificates.
2. Click New.
3. On the form, fill in the fields.

X.509 Certificate form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Salesforce Certificate.</td>
</tr>
<tr>
<td>Expiration notification</td>
<td>Option to send a notification when the certificate is about to expire.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Notify on expiration</td>
<td>Users to be notified when the certificate expires.</td>
</tr>
<tr>
<td>Warn in days to expire</td>
<td>Number of days to send a notification before the certificate expires.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the certificate.</td>
</tr>
<tr>
<td>Format</td>
<td>Certificate format. The instance supports the PEM and DER formats.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of certificate. Select <strong>Java Key Store</strong>.</td>
</tr>
<tr>
<td>Valid from</td>
<td>Date from which the certificate is valid.</td>
</tr>
<tr>
<td>Expires</td>
<td>Date on which the certificate expires.</td>
</tr>
<tr>
<td>Expires in days</td>
<td>Number of days until the certificate expires.</td>
</tr>
<tr>
<td>Key store password</td>
<td>Password associated with the certificate.</td>
</tr>
<tr>
<td>Short description</td>
<td>Summary about the certificate.</td>
</tr>
<tr>
<td>PEM Certificate</td>
<td>Contents of the X509 certificate.</td>
</tr>
</tbody>
</table>

4. Click the attachments icon (_attach) and attach a JKS certificate.

5. **Click Validate Stores/Certificates.**

The JKS certificate is created and attached to the Salesforce spoke.

*Create a JWT signing key for the Salesforce spoke*

Create a JSON Web Token (JWT) signing key to assign to your Java KeyStore certificate.

Role required: admin

1. **Navigate to System OAuth > JWT Keys.**
2. **Click New.**
3. **On the form, fill in the fields.**

**JWT Keys form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the JWT signing key. For example, <strong>Salesforce JWT Keys</strong>.</td>
</tr>
<tr>
<td>Signing Keystore</td>
<td>Valid JKS certificate attached in the previous task. For example, <strong>Salesforce Certificate</strong>.</td>
</tr>
<tr>
<td>Key Id</td>
<td>Key ID to identify which key is used when multiple keys are used to sign tokens.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select Salesforce spoke.</td>
</tr>
<tr>
<td>Signing Algorithm</td>
<td>Algorithm to sign with the JWT key.</td>
</tr>
<tr>
<td>Signing Key Password</td>
<td>Password associated with the signing key.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the certificate.</td>
</tr>
</tbody>
</table>

4. **Click Submit.**
The JWT key is created and assigned to the JKS certificate.  

Create a JWT provider for the Salesforce spoke  

Add a JSON Web Token (JWT) provider to your ServiceNow instance.

Role required: admin

1. Navigate to **System OAuth > JWT Providers**.
2. Click **New**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the JWT provider. For example, Salesforce JWT Provider.</td>
</tr>
<tr>
<td>Expiry Interval (sec)</td>
<td>Number in seconds to set the lifespan of JWT provider tokens.</td>
</tr>
<tr>
<td>Signing Configuration</td>
<td>JWT signing key from the previous step. For example, Salesforce JWT Keys.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**. 
The Standard Claims and Custom Claims related lists are displayed.

5. Enter values for **iss**, **sub**, and **aud** in the **Standard Claims** related list. See the Salesforce Trailblazer Community documentation for instructions.

6. Click **Update**.

The JWT provider is added to your ServiceNow instance.  

Register Salesforce as OAuth Provider  

Use the information generated during Salesforce connected app configuration to register Salesforce as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Role required: admin

1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
   The system displays the message **What kind of OAuth application?**
3. Select **Connect to a third party OAuth Provider**.   
The system displays a blank Application Registries form.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Salesforce OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Consumer key you generated during the Salesforce connected app configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Consumer secret you generated during the Salesforce connected app configuration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td></td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select JWT Bearer.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>------------------------------</td>
<td>--------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
<tr>
<td></td>
<td>Note: You can use only <strong>Authorization Code</strong> as the Default Grant type when PKCE is enabled.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select Salesforce.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>This field should be left blank.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>This field should be left blank.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>This field should be left blank.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>Client credentials in the request.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click **Save**.
   - The system validates the OAuth credentials and populates the **Redirect URL**.
   - The system populates **OAuth Entity Profile** with **Grant Type** as **JWT Bearer**. For example, **OAuth Entity Profile** is created with default **Name**, **Salesforce JWT provider default_profile**.

6. Copy the value from **Redirect URL**.
7. Click **Update**.
8. Login to your Salesforce account to edit the configuration of your connected app. See the [Salesforce Trailblazer Community documentation](https://trailhead.salesforce.com) for instructions.
9. Paste the Redirect URL value into the Callback URL of your Salesforce connected app. For example, paste [https://instance.service-now.com/oauth_redirect.do](https://instance.service-now.com/oauth_redirect.do).

The instance can request OAuth 2.0 tokens for the spoke.

**Note:** When an OAuth token expires, the spoke automatically regenerates a new token in most cases. If a token expires and is not regenerated, an administrator can regenerate the spoke OAuth token.

**Create Credential records for the Salesforce spoke**
Create Credential records to the Salesforce connected app you created. The Salesforce spoke connection and credential alias uses these credentials to authorize actions.
Role required: admin

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter <strong>Salesforce Credentials</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile you created when you registered the Salesforce connected app as an OAuth provider. For example, select <strong>Salesforce OAuth default_profile</strong>.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select <strong>All MID Servers</strong>.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter <strong>100</strong>.</td>
</tr>
</tbody>
</table>

5. Save the record.
6. Click the **Get OAuth Token** related link to generate the OAuth token.

The credential record for the Salesforce spoke is created.

*Create Connection records for the Salesforce spoke*

Create Connection records to your Salesforce account. The Salesforce spoke connection and credential alias uses these connections to perform actions in Salesforce.

Role required: admin

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **Salesforce**.
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <strong>Salesforce Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Salesforce. For example, select <strong>Salesforce Credentials</strong>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td><strong>Note</strong>: Do not select the check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to your Salesforce instance.</td>
</tr>
</tbody>
</table>
### ServiceNow eBonding spoke

The ServiceNow eBonding spoke demonstrates some common integration design patterns through a common use case of synchronizing incidents across ServiceNow instances.

**Note:** Because the eBonding Example spoke includes sample actions to demonstrate integrating with a remote instance, it does not require a subscription package.

### Base system eBonding actions

If you have multiple production instances in your environment, you might have a need to synchronize data across these instances. For example, one instance might manage internal applications (your source system) and another manages external customer facing applications (your target system). A common use case is an incident which initially opens on the source system, but it requires a correlated incident to be created and tracked on the target instance. The ServiceNow eBonding integration contains the following OOB actions to assist in creating the synchronization:

#### Create Remote Incident action

This action uses the source system incident details to create a new incident on the target instance. It passes the source incident number as the Correlation ID on the target system. It takes the target system incident number and updates the Correlation ID of the source system.

#### Lookup Remote Incident action

This action takes the remote incident number as input and retrieves more details about that incident, such as: short description, description, priority, etc.

#### Update Remote Incident action

This action uses the source incident details to update the remote incident with details from source instance. Look up of remote incident is performed using Correlation ID in source instance’s incident.
Credential and Connection information for eBonding

When building actions, you must decouple the connection and credential information from the action so there is a seamless transition from distinct production environments. This also makes it easier to share content and create content through the ServiceNow store.

As part of eBonding example, you can associate an OOB connection alias (sn_ebonding_ah.ServiceNow). Create an HTTP connection record and associate it with this alias. For credentials, ServiceNow web services supports a multitude of authentication mechanisms. Create a BasicAuth credential to start with, however, that login ID must have permissions to create, read, and update an incident on your remote system. An example HTTP connection:

![HTTP Connection](image)

Additional eBonding Script

The Payloadbuilder script is included with this example. It builds a payload by reading a set of fields from an incident table used in the REST steps for these actions.

Slack spoke

Use Slack to post messages and manage access to channels.

IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see [Request IntegrationHub](#).

Spoke flows

This spoke has no sample flows.

Spoke subflows

This spoke has no sample subflows.

Spoke actions

The Slack spoke provides actions to automate Slack workspace tasks when events occurs in ServiceNow. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel Management</td>
<td>Add User to Channel</td>
<td>Adds an existing user to the specified channel in a Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Archive Channel</td>
<td>Archives the specified channel in a Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Create Channel</td>
<td>Creates the specified channel in a Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Remove User from Channel</td>
<td>Removes a user from the specified channel in the Slack workspace.</td>
</tr>
<tr>
<td>Notification Management</td>
<td>Post a Message</td>
<td>Posts a message in the specified channel.</td>
</tr>
<tr>
<td></td>
<td>Post Change Details</td>
<td>Posts Change record details to the specified channel.</td>
</tr>
<tr>
<td></td>
<td>Post Incident Details</td>
<td>Posts Incident record details to the specified channel.</td>
</tr>
<tr>
<td></td>
<td>Post Problem Details</td>
<td>Posts Problem record details to the specified channel.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a user in the specified Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Deactivate User</td>
<td>Deactivates the specified user from a Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Lookup User</td>
<td>Returns information about the specified user such as name, time zone, workspace admin rights, and team ownership.</td>
</tr>
</tbody>
</table>

### Slack account requirements

The Slack spoke requires creating a custom app on your Slack account to generate OAuth 2.0 tokens for the Slack spoke. See [Configure Slack workspace](#).

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the Slack alias record to authorize actions on Slack.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slack</td>
<td>Connection to Slack.</td>
<td><a href="https://slack.com">https://slack.com</a></td>
</tr>
</tbody>
</table>

### Set up Slack spoke

Integrate the ServiceNow instance and your Slack account by creating a custom OAuth application in Slack to authenticate ServiceNow requests.
Configure Slack workspace
Create a custom OAuth application on your Slack workspace to enable OAuth 2.0 authentication with the Slack spoke.

Slack requirements:
- Slack account
- Slack workspace owner credentials for admin scope permissions

Complete these steps from your Slack account. See the Slack API documentation for instructions on creating and configuring custom applications.

1. From your Slack account, create a custom OAuth application.
2. Select standard OAuth 2.0 user authentication as the application authentication method.
3. Record the application client ID and client secret to register the app as a third-party OAuth provider on your ServiceNow instance.
4. Enable the matching Slack application scope permissions you want the app to support.

<table>
<thead>
<tr>
<th>Slack application scope permission</th>
<th>Required for</th>
</tr>
</thead>
<tbody>
<tr>
<td>chat:write</td>
<td>Post Message, Post Incident Details, Post Change Details, and Post Problem Details actions</td>
</tr>
<tr>
<td>chat:write:user</td>
<td></td>
</tr>
<tr>
<td>channels:write</td>
<td>Create Channel, Achieve Channel, Add User to Channel, and Remove User from Channel actions</td>
</tr>
<tr>
<td>groups:write</td>
<td></td>
</tr>
<tr>
<td>users:read.email</td>
<td>Lookup User action</td>
</tr>
<tr>
<td>users:read</td>
<td></td>
</tr>
<tr>
<td>admin (Only available to Slack workspace owners)</td>
<td>Create User and Deactivate User actions</td>
</tr>
</tbody>
</table>

Register Slack as OAuth provider
Use the information generated during Slack workspace configuration to register Slack as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
The system displays the message What kind of OAuth application?
3. Select Connect to a third party OAuth Provider.
The system displays a blank Application Registries form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Slack OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID you created during the Slack workspace configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you created during the Slack workspace configuration.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Authorization Code.</td>
</tr>
</tbody>
</table>
ServiceNow  New York  Now Platform Capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Token URL</td>
<td>Enter <a href="https://slack.com/api/oauth_access">https://slack.com/api/oauth_access</a>.</td>
</tr>
<tr>
<td>Access Token Lifespan</td>
<td>Enter a value in seconds for the access token expiration. After expiration, you must generate a new token. The maximum value is 2,144,448,000.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click **Save**. The system validates the OAuth credentials and populates the **Redirect URL** and the **OAuth Entity Profiles** related list.

6. Copy the value from **Redirect URL**.

7. Login to your Slack workspace to edit the configuration of your custom Slack application. See the [Slack API](#) for instructions.

8. Paste the **Redirect URL** value into the OAuth 2.0 Redirect URI for your custom Slack application. For example, paste `https://instance.service-now.com/oauth_redirect.do`.

The instance can request OAuth 2.0 tokens for the spoke.

---

**Note:** The spoke generates OAuth tokens that expire after 24 days. An administrator can regenerate the spoke OAuth token every 24 days.

**Create Credential record for the Slack spoke**

Create a Credential record for the Slack custom OAuth application you created during Slack workspace configuration. The Slack spoke connection and credential alias uses this credential to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**. The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**. The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Enter any name to uniquely identify the record. For example, enter Slack Credential.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Enable</td>
</tr>
<tr>
<td><strong>OAuth Entity Profile</strong></td>
<td>Select the OAuth profile you created when you registered the custom Slack application as an OAuth provider. For example, select Slack OAuth default profile.</td>
</tr>
<tr>
<td><strong>Applies to</strong></td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td><strong>Order</strong></td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>
5. Click Submit.

Create Connection record for the Slack spoke

Create a Connection record to your Slack workspace. The Slack spoke connection and credential alias uses this connection to perform actions on your Slack workspace.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for Slack.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Slack Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for the Slack workspace. For example, select Slack Credential.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Regenerate Slack OAuth token

Regenerate the Slack OAuth token when it expires. The Box spoke OAuth token expires every twenty four days.

1. Navigate to Connections & Credentials > Credentials.
2. Select the Slack spoke OAuth Credential record. For example, select Slack Credential.
3. From Related Links, click Get OAuth Token.

The Slack spoke receives a new OAuth access token good for 24 days.

Slack webhooks spoke

Use Slack webhooks to post messages and record details for ServiceNow incidents, problems, and changes to Slack channels.

IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Spoke actions

The Slack webhooks spoke is an available integration through IntegrationHub. You can specify the following Slack actions within a flow:
<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
<td>Send a message to a Slack channel using an Incoming Webhook. Specify the Webhook URL and Message to send.</td>
</tr>
<tr>
<td>Post Change Details</td>
<td>Send details about a ServiceNow change record to a Slack channel using a Webhook Connector. Specify the Webhook URL and Change record to send.</td>
</tr>
<tr>
<td>Post Incident Details</td>
<td>Send details about a ServiceNow incident record to a Slack channel using a Webhook Connector. Specify the Webhook URL and Incident record to send.</td>
</tr>
<tr>
<td>Post Problem Details</td>
<td>Send details about a ServiceNow problem record to a Slack channel using a Webhook Connector. Specify the Webhook URL and Problem record to send.</td>
</tr>
</tbody>
</table>

**Slack Inputs**

The following inputs are common to Slack webhooks spoke actions:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Required) Webhook URL</td>
<td>The Slack webhook for sending a message. Set up the webhook before configuring this action. Refer to the custom incoming webhook for Slack documentation.</td>
</tr>
<tr>
<td>(Optional) Message</td>
<td>Title of the message.</td>
</tr>
<tr>
<td>(Optional) Additional Message</td>
<td>Add a message before the record details.</td>
</tr>
<tr>
<td>(Optional) Channel</td>
<td>Specify the Slack channel to post information.</td>
</tr>
<tr>
<td>Username</td>
<td>Specify a username to include in your post.</td>
</tr>
<tr>
<td>(Optional) Override Default Field</td>
<td>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</td>
</tr>
<tr>
<td>(Optional) Icon</td>
<td>Add an icon to the communication.</td>
</tr>
</tbody>
</table>

**Note:** If you do not specify a Username, Channel, or Icon, it will post the message using the defaults as configured in your webhook. If you specify them here, they will override those defaults.

**Example**

You can add a Slack Post Incident Details action to a flow which identifies newly created high priority incidents, a username, and a specific slack channel.
Twilio spoke

Use the Twilio spoke to send SMS, make voice calls, create conference calls, manage calls, manage short codes, notify services, and messaging services.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.
IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for Twilio Base version 2010-04-01, Twilio Messaging version v1, and Twilio Notify version v1, but may be compatible with later versions.

Spoke requirements

- Twilio account
- **AccountSid** and **AuthToken** of the account
- Activate these plugins:
  - ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
  - ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
  - ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

See Twilio documentation for instructions on creating an account.

Spoke actions

The Twilio spoke provides actions to automate sending SMS, making voice calls, and creating conference calls when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Management</td>
<td>Create Application</td>
<td>Creates an application resource in a Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Delete Application</td>
<td>Deletes an application resource from a Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Get Application</td>
<td>Retrieves the required application resource.</td>
</tr>
<tr>
<td>Look Up Accounts</td>
<td></td>
<td>Retrieves the account resources in a Twilio account. The list includes the account and its sub-account resources.</td>
</tr>
<tr>
<td>Look Up Applications</td>
<td></td>
<td>Retrieves the application resources in a Twilio account.</td>
</tr>
<tr>
<td>Update Application</td>
<td></td>
<td>Updates properties of an application resource in a Twilio account.</td>
</tr>
<tr>
<td>Call Management</td>
<td>Dequeue Call</td>
<td>Removes a call from a queue.</td>
</tr>
<tr>
<td></td>
<td>Get Call</td>
<td>Retrieves the required call resource.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Get Incoming Phone Number</td>
<td>Retrieve the incoming phone number</td>
<td></td>
</tr>
<tr>
<td>Hang Up Call</td>
<td>End a call in progress.</td>
<td></td>
</tr>
<tr>
<td>Look Up Incoming Phone Numbers</td>
<td>Retrieve the incoming phone number</td>
<td></td>
</tr>
<tr>
<td>Make a Call With Recording</td>
<td>Place a call to a phone number and</td>
<td></td>
</tr>
<tr>
<td>Make a Call Without Recording</td>
<td>Place a call to a phone number and</td>
<td></td>
</tr>
<tr>
<td>Modify Call</td>
<td>Modify a call in progress.</td>
<td></td>
</tr>
<tr>
<td>Mute Or Unmute Participant</td>
<td>Mutes or unmutes a participant</td>
<td></td>
</tr>
<tr>
<td>Remove Participant From</td>
<td>Removes a participant resource from</td>
<td></td>
</tr>
<tr>
<td>Conference Call</td>
<td>a conference call.</td>
<td></td>
</tr>
<tr>
<td>Update Incoming Phone Number</td>
<td>Update properties of an incoming</td>
<td></td>
</tr>
<tr>
<td></td>
<td>phone number resource in a Twilio</td>
<td></td>
</tr>
<tr>
<td></td>
<td>account.</td>
<td></td>
</tr>
<tr>
<td>Messaging Service Management</td>
<td>Add Phone Number To Messaging Service</td>
<td>Add a phone number resource to the messaging service.</td>
</tr>
<tr>
<td></td>
<td>Add Short Code To Messaging Service</td>
<td>Add a short code resource to the messaging service.</td>
</tr>
<tr>
<td></td>
<td>Create Messaging Service</td>
<td>Creates a new messaging service resource in a Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Delete Messaging Service</td>
<td>Deletes a messaging service resource from a Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Look Up Messaging Service Phone</td>
<td>Retrieve the phone number resource in a messaging service.</td>
</tr>
<tr>
<td></td>
<td>Numbers</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Look Up Messaging Service Short Codes</td>
<td>Retrieve the short code resources associated with a messaging service.</td>
</tr>
<tr>
<td></td>
<td>Look Up Messaging Services</td>
<td>Retrieve the messaging service resources in a Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Remove Phone Number From Messaging</td>
<td>Remove a phone number resource from a messaging service.</td>
</tr>
<tr>
<td></td>
<td>Service</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Remove Short Code From Messaging</td>
<td>Remove a short code resource from a messaging service.</td>
</tr>
<tr>
<td></td>
<td>Service</td>
<td></td>
</tr>
<tr>
<td>Notification Service</td>
<td>Create Notify Service</td>
<td>Create a new notify service resource in a Twilio account.</td>
</tr>
<tr>
<td>Management</td>
<td>Delete Notify Service</td>
<td>Delete a notify service resource from Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Look Up Notify Services</td>
<td>Retrieve the notify service resources in a Twilio account.</td>
</tr>
</tbody>
</table>
### ServiceNow    New York    Now Platform Capabilities

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<td>Send SMS</td>
<td>Sends an SMS to a phone number.</td>
</tr>
</tbody>
</table>

**Note:** To receive information about Status Callbacks, you must configure webhooks in Twilio. See Twilio documentation for instructions on creating and configuring webhooks.

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Credentials and connection information.

**Note:** Three connection and credential alias records are needed for the Twilio spoke; one each for Twilio Base, Twilio Notify, and Twilio Messaging. Each alias should be associated with the respective Twilio API.

### Set up Twilio spoke

Integrate the ServiceNow instance and Twilio using basic authentication to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate Twilio spoke
- Role required: admin

**Create Credential records for the Twilio spoke**

Create Credential records to the Twilio server. The Twilio spoke connection and credential alias uses these credentials to authorize actions.

Create three credential records for the Twilio spoke; one each for Twilio Base, Twilio Notify, and Twilio Messaging. Each credential should be associated with the respective Twilio API.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **Basic Auth Credentials**.
4. On the form, fill these values.
5. Click Submit.

The three required credential records are created for Twilio Base, Twilio Notify, and Twilio Messaging.

*Create Connection records for the Twilio spoke*
Create Connection records to your Twilio account. The Twilio spoke connection and credential alias uses these connections to perform actions on Twilio.

Create three connection records for the Twilio spoke; one each for Twilio Base, Twilio Notify, and Twilio Messaging. Each connection record should be associated with the respective Twilio API.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open record of the Twilio spoke.
3. From the **Connections** tab, click **New**.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <strong>Twilio Base Connection</strong>, <strong>Twilio Notify Connection</strong>, or <strong>Twilio Messaging Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Twilio. For example, select <strong>Twilio Base</strong> for <strong>Twilio Base Connection</strong>.</td>
</tr>
</tbody>
</table>
| Connection URL | Connection URL.  
  - If the connection record is for Twilio Base, enter https://api.twilio.com/.  
  - If the connection record is for Twilio Notify, enter https://notify.twilio.com/.  
  - If the connection record is for Twilio Messaging, enter https://messaging.twilio.com/. |

5. In the Attributes related list:
   - For the connection record of Twilio Base, enter **Account SID**.
   - Enter **Page size**.
   - Don't modify the default value of the **Version**.

6. Click Submit.
The three connection records are created. The ServiceNow instance and Twilio are integrated.

**Twitter spoke**

Use the Twitter spoke to automatically tweet messages or media in your Twitter account from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

**Supported versions**

API version v1.1.

**Spoke requirements**

- Twitter developer account
- Twitter developer app to access the Twitter APIs
- Access token and secret of your Twitter developer app
- Consumer key and secret from your Twitter developer app

See the Twitter Developers documentation for instructions on creating the developer application and gathering the required details.

**Spoke actions**

The Twitter spoke provides actions to automate tweeting when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
</table>
| Tweet  | Tweets a message or media. Messages and media are tweeted as per Twitter limits.  
  
  **Note:** If you wish to tweet media, use the Look Up Attachment Records action before this action in your custom flow to retrieve the required media. |
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Credentials and connection information.

**Note:** Two connection and credential alias records are needed for the Twitter spoke; one for tweeting messages and other for tweeting media. Each alias should be associated with the respective Twitter API.

Create Credential records for the Twitter spoke

Authorize the Twitter spoke actions by creating credential records for the application registered in the Twitter developer account. The Twitter spoke connection and credential alias uses these credentials to authorize actions.

You must create two credential records; one for tweeting messages and other for tweeting media.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message, What type of Credentials would you like to create?
3. Select Twitter Credentials.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, TwitterCredentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Consumer Key</td>
<td>Consumer key of your Twitter developer app.</td>
</tr>
<tr>
<td>Consumer Secret</td>
<td>Consumer secret of your Twitter developer app.</td>
</tr>
<tr>
<td>Access Token</td>
<td>Access token of your Twitter developer app.</td>
</tr>
<tr>
<td>Access Token Secret</td>
<td>Access token secret of your Twitter developer app.</td>
</tr>
</tbody>
</table>
### Create Connection records for the Twitter spoke

Perform actions in Twitter by creating connection records for your Twitter account. The Twitter spoke connection and credential alias uses these connections to perform actions.

Two connection and credential alias records are available by default: one for tweeting messages and other for tweeting media. Perform these steps to associate each alias with the respective Twitter API.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the required Twitter spoke record.

   **Note:** There are two connection and credential records: **Twitter** and **Twitter_Media**. The **Twitter** record is for tweeting messages and **Twitter_Media** is for tweeting media.

3. In the Connections related list of the required record, click **New**.
4. On the form, fill in the fields.

### HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <strong>Twitter Base</strong> or <strong>Twitter Media</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Twitter spoke. For example, <strong>Twitter</strong>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** Do not select the check box.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Connection URL      | Connection URL.  
  - If the connection record is for tweeting messages, enter https://api.twitter.com.  
  - If the connection record is for tweeting media, enter https://uoload.twitter.com. |
| Use MID server      | Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list. |
| Active              | Option to actively use the connection.                                      |
| Domain              | Domain that the action or activity runs in.                                 |

5. Click **Update**.

The Twitter spoke is set up and integrated with the ServiceNow instance.

**Workplace by Facebook spoke**

Manage users, groups, and notifications in Facebook Workplace.

**Request apps on the Store**

Visit the [ServiceNow Store](https://servicenow.com/store) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the [ServiceNow Store version history release notes](https://servicenow.com/store/)

**IntegrationHub subscription**

This spoke requires the IntegrationHub Starter subscription package. For more information, see [Request IntegrationHub](https://servicenow.com/store/)

**Spoke flows**

The Workplace by Facebook spoke provides sample flows in the draft state to demonstrate automating user and group management tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P1 Incident</td>
<td>When a P1 incident is created in ServiceNow, creates a Facebook Workplace group that includes the ServiceNow assignment group members.</td>
</tr>
</tbody>
</table>
Spoke actions

The Workplace by Facebook spoke provides actions to manage users, groups, and notifications. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Management</td>
<td>Add User To Group</td>
<td>Adds a user to a group in Facebook Workplace.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in Facebook Workplace.</td>
</tr>
<tr>
<td></td>
<td>Lookup Group ID</td>
<td>Retrieves the group ID for a given group name in Facebook Workplace.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes a user from a group in Facebook Workplace.</td>
</tr>
<tr>
<td>Notification Management</td>
<td>Post a Message</td>
<td>Posts a message to a Facebook Workplace group.</td>
</tr>
<tr>
<td></td>
<td>Post Change Details</td>
<td>Posts change request details in a Facebook Workplace group.</td>
</tr>
<tr>
<td></td>
<td>Post Incident Details</td>
<td>Posts incident details in a Facebook Workplace group.</td>
</tr>
<tr>
<td></td>
<td>Post Problem Details</td>
<td>Posts problem details in a Facebook Workplace group.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a user in Facebook Workplace.</td>
</tr>
<tr>
<td></td>
<td>Deactivate User</td>
<td>Deactivates a user in Facebook workplace.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes a user in Facebook Workplace.</td>
</tr>
<tr>
<td></td>
<td>Lookup User ID</td>
<td>Retrieves the user ID from a registered email in Facebook Workplace.</td>
</tr>
</tbody>
</table>

Workplace by Facebook spoke requirements

The Workplace by Facebook spoke requires creating a Facebook Workplace application and generating an access token for API key authentication.

Credential and connection alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Credentials and connection information.

This spoke uses these Connection & Credential Alias records to authorize actions.
### Set up Workplace by Facebook spoke

Integrate the ServiceNow instance and your Workplace by Facebook using an API key to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Workplace by Facebook spoke
- Role required: admin

#### Configure Facebook Workplace

Create a custom application from your Facebook account to generate an access token for API key authentication.

Facebook requirements:

- Facebook Workplace account
- Facebook Workplace administrator credentials

Complete these steps from your Facebook account. See the Facebook for developers documentation for instructions on creating and configuring custom applications.

1. From your Facebook account, create a custom third-party application.
2. Generate an access token to interact with Facebook APIs.
3. Record the access token to create Credential records on your ServiceNow instance.

#### Create Credential records for the Workplace by Facebook spoke

Create Credential records to the Facebook Workplace application you created. The Facebook Workplace spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?
3. Select API Key Credentials.
   A blank API Key Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Facebook Workplace Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>API Key</td>
<td>Enter Bearer followed by the access token you obtained from Facebook Workplace. For example, Bearer {access_token}.</td>
</tr>
</tbody>
</table>
5. Click Submit.
6. Click New.
The system displays the message What type of Credentials would you like to create?.
7. Select API Key Credentials.
   A blank API Key Credentials form displays.
8. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Facebook Workplace Account Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>API Key</td>
<td>Enter Bearer followed by the access token you obtained from Facebook Workplace. For example, Bearer {access token}.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

Create Connection records for the Workplace by Facebook spoke
Create Connection records to your Facebook Workplace account. The Facebook Workplace spoke connection and credential aliases use these connections to perform actions in Facebook Workplace.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Facebook_Workplace.
3. From the Connections tab, click New.
The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Facebook Workplace Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Facebook Workplace. For example, select Facebook Workplace Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter <a href="https://work.facebook.com/">https://work.facebook.com/</a>.</td>
</tr>
</tbody>
</table>

5. Click Submit.
6. Open for the record for Facebook_Workplace_Account.
7. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
8. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Facebook Workplace Account Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Facebook Workplace user management. For example, select Facebook Workplace Account Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter <a href="https://work.facebook.com/">https://work.facebook.com/</a></td>
</tr>
</tbody>
</table>

9. Click **Submit**.

**Zoom spoke**

The Zoom spoke helps you create and manage meetings. Add participants, retrieve details, end or delete a meeting. Use the spoke to fetch the participant details of a conference.

**Request apps on the Store**

Visit the [ServiceNow Store](https://store.servicenow.com) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the [ServiceNow Store version history release notes](https://store.servicenow.com/).  

**IntegrationHub subscription**

This spoke requires the IntegrationHub Starter subscription package. For more information, see [Request IntegrationHub](https://store.servicenow.com/).

**Supported versions**

Zoom API version v2.0.

**Spoke flows**

This spoke has no sample flows.

**Spoke subflows**

This spoke has no sample subflows.
Spoke actions

The Zoom spoke provides actions to automate Zoom tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Meeting Management</td>
<td>Create Meeting</td>
<td>Create a meeting for a user using their Zoom user ID or the email address.</td>
</tr>
<tr>
<td></td>
<td>Delete Meeting</td>
<td>Delete a specific meeting by using its meeting ID</td>
</tr>
<tr>
<td></td>
<td>Get Meeting Details</td>
<td>Get details of a specific meeting by its meeting ID</td>
</tr>
<tr>
<td></td>
<td>Look Up Live Meetings by User (Data Stream)</td>
<td>Lists all the live or ongoing meetings for a specific user.</td>
</tr>
<tr>
<td></td>
<td>Add Meeting Registrant</td>
<td>Register a participant for a specific meeting.</td>
</tr>
<tr>
<td></td>
<td>End Meeting</td>
<td>Ends an ongoing meeting.</td>
</tr>
</tbody>
</table>

| User Management           | Look Up Users (Data Stream)                      | Lists all the users on your Zoom account.                                                           |
|                           | Get User Details                                 | Get details of a specific user on your account with their user ID.                                   |

Zoom account requirements

The Zoom spoke requires configuring your Zoom account to generate an OAuth 2.0 token.

Zoom spoke requirements

These actions use REST calls, which can run on an instance or Zoom spoke. Use the connection record associated with the Zoom alias to configure where actions run as well as set Zoom spoke selection attributes.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Credentials and connection information.

This spoke uses the Zoom Connection & Credential Alias record to authorize actions.

Setup Zoom spoke

Integrate your Zoom account with your ServiceNow instance. Create a custom OAuth application in Zoom and authenticate requests from ServiceNow.

Role required: admin
• Request IntegrationHub subscription
• Activate Zoom spoke

Create a connected app in Zoom
Create a connected app in your Zoom account to enable OAuth 2.0 authentication with the Zoom spoke

1. Zoom account
2. Role required: Zoom admin

Complete the following steps from your Zoom account to enable OAuth 2.0 authentication with the Zoom spoke.

1. Login to [Zoom marketplace](#)
2. Navigate to Develop > Build App
3. Choose OAuth card from the available cards.
4. Use the toggle button to disable the option: Would you like to publish this app on Zoom App Marketplace?
5. Click Create.
6. Name the app and choose the app type as Account-level app. Account level apps must be installed by admin and can manage all users in the account.
7. Optionally, in the subsequent screens, enter the details as appropriate. For example, basic information, description and so on.
8. In the Add Scopes screen, add the actions in the scope as in the screenshot.
Add scopes

Search the scope type

- Meeting
  - Webinar
  - Recording
  - User
  - Account
  - Billing
  - Contacts
  - Dashboard
  - Group
  - Devices (H323)

- View and manage meeting:master
- View all user meeting:read:access
- View and manage meeting:write:access
Note: The next step is to register Zoom as an OAuth provider. However, ServiceNow ships Zoom as a registered OAuth provider in the Application Registry.

Record the **Client ID** and the **Client Secret** from the App credentials screen to use them for the application registry.

**Register Zoom as OAuth provider**

Use the information generated during Zoom account configuration to register Zoom spoke as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Role required: admin

1. Navigate to **System OAuth > Application Registry**.
2. Click **Zoom**.
3. On the form, fill in the fields.

### Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID created during application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret created during application registration.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. This is set to 473,040,000 seconds.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. Enter <code>https://&lt;instance-name&gt;.service-now.com/oauth_redirect.do</code></td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. Specify the profile for the mutual authentication.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>Client credentials in the request.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.

The instance can request OAuth 2.0 tokens for the spoke.

**Create credential records for the Zoom spoke**

Create credential records for the Zoom spoke. The Zoom spoke connection and credential alias uses these credentials to authorize actions.

Role required: admin, Zoom admin

1. Navigate to **Connections & Credentials > Credentials**.

2. Click **New**.

   The system displays the message **What type of Credentials would you like to create?**.

3. Select **OAuth 2.0 Credentials**.

   The pop-up window displays a blank OAuth 2.0 Credentials form.

4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. Enter <strong>Zoom Credentials</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile you created when you registered the Zoom connected app as an OAuth provider. Select <strong>Zoom default_profile</strong>.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. Select <strong>All MID Servers</strong>.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. Enter <strong>100</strong>.</td>
</tr>
</tbody>
</table>

5. Save the record.

6. Click the **Get OAuth Token** related link to generate the OAuth token.

**Create connection records for the Zoom spoke**

Create connection records to your Zoom account. The Zoom spoke connection and credential alias uses these connections to perform actions in Zoom.
Role required: admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Zoom.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. Enter Zoom Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Zoom. Select Zoom Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Note: Do not select the check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to your Zoom instance. Enter <a href="https://api.zoom.us">https://api.zoom.us</a></td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Option to use a MID Server. Define the fields in the Advanced MID Server Configuration related list if you select this option.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Save.

Data Stream actions and pagination

Send REST or SOAP requests from Flow Designer to APIs that return a stream of response data larger than 10 MB, or that return paginated results. Parse stream data into a series of complex object outputs and use the data pills in other actions in a flow.

For example, create a Data Stream action to import a large quantity of employee data from a third-party HR site. The Data Stream action sends a REST request to the third-party site and processes the response to populate records in the User (sys_user) table.

Benefits

Data Stream actions offer these benefits.

- Parse and format a stream of response data larger than 10 MB.
- Automatically send multiple requests to APIs that paginate results.
- Enable flow designers to process large requests without complex coding or configuration.
- Enable flow designers to process each object within a data stream using For each flow logic.

For example, you might create a Data Stream action that imports document data from a third-party site. When you add the action to a flow, Flow Designer automatically adds the action to

For each flow logic block, enabling flow designers to easily create a record in ServiceNow for each object in the data stream. See Use a Data Stream action in a flow.
Limitations

Use Data Stream actions with these limitations in mind.

- Running a Data Stream action on a MID Server is not currently supported.
- Nesting Data Stream actions is not supported.
- You cannot execute a Data Stream action from script. For example, you cannot use `FlowAPI.executeAction()` to run a Data Stream action.
- Adding actions with wait conditions to Data Stream For Each flow logic blocks is not supported. For example, you cannot use the Ask for Approval or Wait for Condition actions within Data Stream For Each flow logic.

Action outline

Data Stream actions follow a set structure. Follow prompts to add and remove steps from the action outline. You cannot manually add steps to a Data Stream action.
Note: Clearing an option in a configuration page removes the step from the Data Stream outline and deletes all data associated with the step.

**Action Preprocessing**

Use the Action Preprocessing category to run a preprocessing script before the action sends the initial API request. For example, validate action inputs or set default values. Preprocessing executes once per action, before the first API request.

Selecting this option adds a script step to the Data Stream action. For more information, see *Script step*.

This is an optional Data Stream action component.

**Request**

Use the Request category to configure how the action sends API requests. The Request section executes once per page of results. Request components provide these configuration options.

**Pagination Setup step**

Request results in batches. Once one page of data is processed, the Data Stream action runs the request section again to return the next set of results. Use the pagination setup step to set up pagination options required by the API.

Note: For licensing purposes, each request counts as one transaction, including each request for the next page of results.

The value of the reserved, read-only `getNextPage` variable determines whether to request another page of results. As long as the `getNextPage` variable is true, the action continues to send requests for the next page.

This is an optional Request component.

**Script step**

Run a script before every request for the next page of results. Use this script for data validation and transformation when calling a paginated API. For example, generate a JSON payload for the next page request. Selecting this option adds a script step to the Data Stream action. For more information, see *Script step*.

This is an optional Request component.

**REST or SOAP step**

Send a REST or SOAP request to a third-party API. Select a data format to add an associated step to the Data Stream action. For more information, see *REST step* and *SOAP step*.

This is a mandatory Request component.

**Parsing**

Use the Parsing category to configure how the action separates data stream elements into complex data objects. Use the Splitter step to identify and separate items from an XML or JSON
stream, and use the Script Parser step to transform each item into a complex object. The Parsing section executes once per item in the stream.
For more information about complex data, see [Complex data](#). Parsing components provide these configuration options.

**Splitter step**

Identify the parent node in the response stream to map to a complex object. For example, identify a user element in an XML payload to create a complex object for each user in the response stream.

Select a splitter type to identify and separate repeated items in an XML or JSON data stream.

- **JSON**: Identifies objects in a stream of JSON data.
- **XML**: Identifies objects in an XML document.

This is a mandatory Parsing component.

**Script Parser step**

Use JavaScript and ServiceNow APIs to map items in the response stream to a complex object output represented by the `targetObject` global object. For example, map incident record elements identified in the splitter step to a complex object containing incident fields. If the data stream includes siblings to the item identified in the splitter step that you do not want mapped to a complex object, include conditions to exclude those items.

This is a mandatory Parsing component.

**Data Stream outputs**

When designing a Data Stream action, you must create a single output of type Object. The Script Parser step maps items in the stream to this object using the `targetObject` global object.

At runtime, the system splits and parses the stream of response data according to the Data Stream configuration. Each item in the stream maps to the complex object structure defined by the Script Parser step and the object output, resulting in a large series of complex objects. For more information about complex data, see [Complex data](#).

**Design considerations**

Create Data Stream actions with these considerations in mind.

**Write pagination logic according to third-party requirements**

Evaluate and understand the format required by your third-party endpoint. For example, you may need to write a script that sets the read-only `getNextPage` variable to true as long as there is a `nextPage` token in the response. If the response does not contain the token, then set the variable to false. Access variables in script using bracket or dot notation. For example, `variables['getNextPage']`. This variable only accepts the Boolean data type. The default value is false.

**Convert pagination variable data types to perform math operations**
Pagination variables only support the string data type. To perform math operations, you must convert the value to an integer, perform any required operations, then convert it back to a string.

```javascript
variables['offset'] = (parseInt(variables['offset']) + parseInt(variables['limit'])).toString();
```

**Ensure that the pagination script has an end condition**

Avoid infinite loops in pagination requests by creating a condition that sets the `getNextPage` variable to false. Cancel any long-running flows. Always test Data Stream actions before using them in production.

**Do not add wait conditions to a Data Stream For Each logic block**

Actions that wait, for example the Wait For Condition action, result in an error when used in a Data Stream For Each logic block. For example, suppose that you add a Data Stream action to a flow that processes a stream of expense records. You want to request approval for expenses over a certain dollar amount. Using the Ask for Approval action within the Data Stream For Each flow logic block is not supported.

**Clear configuration page options carefully**

Clearing an option in a configuration page removes the step from the Data Stream outline and deletes all data associated with the step.

**MID Server support**

Data Stream actions are not currently supported on a MID Server and generate an error when run from a MID Server. Data Stream actions cannot contain REST or SOAP steps that run on a MID Server. To prevent a flow from switching environments multiple times between the MID Server and the instance, avoid adding Data Stream actions between actions that run on the MID Server. For more information about when an action runs on the MID Server, see Integration steps.

**Execution details**

View the configuration and runtime results for each item processed by a Data Stream action. Select a record number to see its configuration and runtime details. By default, the execution details include requests for the first 1000 items. To change the number of items in the execution details, update the `com.snc.process_flow.reporting.datastream.item.lastn` system property.
### Flow Designer

**Trigger**

- **Execution Time:** Daily at 16:00:00

**Actions**

<table>
<thead>

#### Data Stream Summary

- **Page Count:** 7
- **Total Item Count:** 599
- **Error Count:** 0

**Logs**

- **Log Page:** 3 of 7 of the last 5

**Configuration Details**

- **Variable Name:** Level Message
  - **Type:** Choice String
  - **Configuration Info:** User Name: User, First Name: User, Last Name: User
  - **Runtime Value Info:** User Name: lucius.bagnoli, First Name: Lucius, Last Name: Bagnoli

**Logs**
View an overview of the execution that includes this information.

- **Page count**: Number of pages returned by a paginated API.
- **Total item count**: Number of items in the response stream mapped to complex object outputs.
- **Error count**: Number of errors encountered.

**Page details**

View runtime data for each step within the Data Stream action. Select a page to view runtime details for each request to a paginated API. By default, the execution details include requests for the first five pages. To change the number of requests in the execution details, update the `com.snc.process_flow.page.reporting.lastn` system property. Set the value to 0 to remove pages from the execution details and -1 to include all pages.

**Note:** Including all pages can affect performance and is not recommended.
### Page Details

Create a Data Stream action

Create a reusable action to process a stream of response data within a flow.

- Setting up an application in Guided Application Creator to store Flow Designer content.
- Disable any conflicting business rules or workflows before creating an action.
- Role required: action_designer or admin

**Note:** Clearing an option in a configuration page removes the step from the Data Stream outline and deletes all data associated with the step.

Creating a custom application to contain your Flow Designer content enables you to deploy it using the application repository or the ServiceNow Store.

1. Navigate to **Flow Designer > Designer**.
2. Click the **Actions** tab and select **New Data Stream**.
3. Fill in the Action Properties and click **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of action.</td>
</tr>
<tr>
<td>Accessible From</td>
<td>Accessible from all application scoped or only within the specified application scope.</td>
</tr>
<tr>
<td>Category</td>
<td>Defined category within the application scope for an action.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the action.</td>
</tr>
<tr>
<td>Protection</td>
<td>Select whether the action is read-only. You can only select a value when you create the action in an application scope you own. The default value is None.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the action.</td>
</tr>
<tr>
<td>In-Flow Annotation</td>
<td>Help text that appears under the action title in Flow Designer to help flow designers understand what the action does when used in a flow.</td>
</tr>
</tbody>
</table>

An empty Data Stream action opens.

4. Define action inputs to make data available to the action steps.
   a) Select **+ Create Input** and complete the fields. For more information about action inputs, see **Action Designer**.
      Inputs are represented as data pills in the right-hand pane. You can add inputs to steps and outputs in the flow by dragging and dropping data pills.

5. Click **Action Preprocessing** in the Data Stream outline and configure the desired options.
   a) Select **Enable preprocessing script** to run a preprocessing script before the action sends the initial API request. For example, validate action inputs or set default values. Preprocessing executes once per action, before the first API request.
      Selecting this option adds a script step to the Data Stream action. For more information, see **Script step**.

6. Click **Request** in the Data Stream outline and configure the desired options.
   a) In the **How will you get data** field, select **REST Step** or **SOAP step**. Selecting an option adds the associated step to the Data Stream action. For more information, see **REST step** and **SOAP step**.

© 2019 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
b) Select **Enable pagination** to request results in batches. Once one page of data is processed, the Data Stream action runs the request section again to return the next set of results. This option adds a Pagination Setup step to the Data Stream outline.

c) Select **Run a script before each request** to run a script before every request for the next page when calling a paginated API. For example, write a script to transform variable data types from the initial response before sending a request for the next page. Selecting this option adds a script step to the Data Stream action. For more information, see [Script step](#).

**Note:** Data Stream actions are not currently supported on a MID Server and generate an error when run from a MID Server. Data Stream actions cannot contain REST or SOAP steps that run on a MID Server.

7. Optional: If pagination is enabled, configure the Pagination Setup step.

   a) Create pagination variables. For example, if the third-party API takes a `limit` parameter in the request, create the `limit` variable and set the initial value to limit the number of results per page. The initial value is only used in the first request. `getNextPage` is a reserved, read-only variable. As long as the `getNextPage` variable is true, the action continues to send requests for the next page.

   b) In the **Next Value From** field, define how pagination variables receive a value for subsequent requests.

      Choose from:

      - **Script**: Write a Pagination Variables Script to define how variables are populated. Pagination variables only support the string data type. To perform math operations, you must convert the value to an integer, perform any required operations, then convert it back to a string.

      - **Response Body**: Use a value in the response from the previous request to populate the variable. If the response is JSON format, set **Extract value using** to **JSONPath Expression** and provide the path to the value in the **Expression** field. If the response is XML format, set **Extract value using** to **XPath Expression** and provide the path to the value.

In this example, the `getNextPage` variable is true until the `nextOffset` variable reaches the total count value returned in the API response header. As long as the `getNextPage` variable is true, the action continues to send requests for the next page. This example includes a common limit/offset pagination configuration. The third-party APIs that your Data Stream action interacts with may use a page token or other method.
1. Pagination Setup step

Pagination Variables

<table>
<thead>
<tr>
<th>Name</th>
<th>Initial Value</th>
<th>Next Value From</th>
</tr>
</thead>
<tbody>
<tr>
<td>getNextPage</td>
<td>false</td>
<td>Script</td>
</tr>
<tr>
<td>limit</td>
<td>100</td>
<td>Script</td>
</tr>
<tr>
<td>offset</td>
<td>0</td>
<td>Script</td>
</tr>
</tbody>
</table>

Pagination Variables Script

```javascript
function paginate(variables, pageResponse) {
    var limit = parseInt(variables.limit);
    var totalCount = parseInt(pageResponse.response_headers['X-Total-Count']);
    var currentOffset = parseInt(variables.offset);
    var nextOffset = currentOffset + limit;
    if (nextOffset < totalCount) {
        variables.getNextPage = true;
        variables.offset = nextOffset.toString();
    } else {
        variables.getNextPage = false;
    }
}(variables, pageResponse);
```
Important: Avoid infinite loops in pagination requests by creating a condition that sets the `getNextPage` variable to false. Cancel any long-running flows. Always test Data Stream actions before using them in production.

8. Click Parsing in the Data Stream outline and configure the desired options.
   a) In the How will you identify each record field, select JSON/XML Splitter. This adds a Splitter step to the Data Stream outline.
   b) In the How will you parse each item into an object field, select Script Parser. This adds a Script Parser step to the Data Stream outline.

9. Configure the Splitter step. This step identifies the parent node in the response stream to map to a complex object. For example, identify a user element in an XML payload to create a complex object for each user in the response stream.
   a) In the Source Format field, select the format returned by the Request section.
      - JSON: Identifies objects in a stream of JSON data.
   b) In the Item Path field, define the absolute path to the object. For example, use `.result` in JSON or `/result` in XML to separate a result object.

Note: The system ignores XML namespaces.

If the REST step returns the following JSON content, you would enter `.response.result.companies` as the item path to process each company object.

```
{
  "response": {
    "result": {
      "companies": [
        {
          "name": "company1"
        },
        {
          "name": "company2"
        },
        {
          "name": "company3"
        }
      ],
      "metadata": {
        "token": 1558666526
      }
    }
  }
}
```

If the REST step returns the following XML document, you would enter `/response/result/companies/company` as the item path to process each company object.

```
<response>
  <result>
    <companies>
      <company>
        <!-- company 1 info -->
      </company>
      <company>
        <!-- company 2 info -->
      </company>
    </companies>
  </result>
</response>
```
10. In the Script Parser step, use JavaScript and ServiceNow APIs to map items in the response stream to a complex object output represented by the `targetObject` global object. For example, map incident record elements identified in the splitter step to a complex object containing incident fields. If the data stream includes siblings to the item identified in the splitter step that you do not want mapped to a complex object, include conditions to exclude those items.

An example script that parses a JSON response.

```javascript
(function parse(inputs, outputs) {
    var record = JSON.parse(inputs.sourceItem);
    outputs.targetObject.id = record.number;
    outputs.targetObject.name = record.short_description;
})(inputs, outputs)
```

An example script that parses an XML response.

```javascript
(function parse(inputs, outputs) {
    var xmlDoc = new XMLDocument(inputs.sourceItem, false);
    outputs.targetObject.id = xmlDoc.getNodeText("/result/number");
    outputs.targetObject.name = xmlDoc.getNodeText("/result/short_description");
})(inputs, outputs)
```

11. Create a complex object output.
   a) Select Outputs in the Action Outline and click + to create an output.
   b) Update the Label field to represent the object. For example, if the action parses a stream of company records, add the Company label.
   c) Update the Type field to Object. This is the complex object output represented by the `targetObject` global object in the Script Parser step.
   d) Add child fields to the complex object using the + icon.
   e) Make the name of each child field more user-friendly so that you can meaningfully refer to it in script. The value in the Name field is the internal name used in the Script Parser step. For example, to refer to the City output in the Script Parser step, you would use `outputs.targetObject.city`.

**Warning:** After saving the Data Stream action, you cannot change values in the Name field.

12. Click **Save**. Action Designer saves a draft of the action.

*Use a Data Stream action in a flow.*

**Use a Data Stream action in a flow**

Data Stream actions use the **For each** flow logic option to process stream data in a flow. For example, suppose that you want to use a Data Stream action that imports document data from a third-party site. When added to a flow, the action appears as a **For each** flow logic block, enabling flow designers to easily create a record in ServiceNow for each object in the data stream.

Role required: flow_designer or admin

1. Open the flow you want to add the Data Stream action to.
2. Add the Data Stream action to the flow.

**Note:** Data Stream actions are not currently supported on a MID Server and generate an error when run from a MID Server. Data Stream actions cannot contain REST or SOAP steps that run on a MID Server. To prevent a flow from switching environments multiple times between the MID Server and the instance, avoid adding Data Stream actions between actions that run on the MID Server. For more information about when an action runs on the MID Server, see *Integration steps.*

The action appears as a **For Each** flow logic block.
3. Add a child action within the For Each flow logic block. This action runs on each object within the data stream.

**Note:** Adding actions with wait conditions to Data Stream For Each flow logic blocks is not supported. For example, you cannot use the Ask for Approval or Wait for Condition actions within Data Stream For Each flow logic.

4. Click **Save**.
   
   Flow Designer saves a draft of the flow, trigger, and actions.

   Test the flow until it is ready to be activated.

   **Note:** The system only triggers active flows.

**Integration steps**

Enable custom actions to integrate with external systems by activating IntegrationHub, which adds integration steps to the Action Designer interface.

Integration steps can run on the instance or a MID Server. A MID Server is required to communicate with or move data between a ServiceNow instance and external applications, data sources, and services in your network.

**Note:** Only Flow Designer admin and Connection admin can execute flows using IntegrationHub.

Steps that perform operations on record data run on the instance, while steps that integrate with systems in your network run on a MID Server. If a step requires a MID Server to run, the instance
delegates flow processing to the appropriate MID Server by sending the process plan in a REST call. The MID Server executes the action or step in the process plan and returns results. View log messages and execution status from the instance or the MID Server.

Available integration steps

These integration steps are available from Action Designer.

<table>
<thead>
<tr>
<th>Integration step</th>
<th>Description</th>
<th>Step runs from</th>
</tr>
</thead>
<tbody>
<tr>
<td>JDBC step</td>
<td>Create a reusable action to send SQL commands to a relational database.</td>
<td>MID Server</td>
</tr>
<tr>
<td>Payload Builder step</td>
<td>Enable action designers to easily create name-value pairs in JSON and XML payloads using dynamic data.</td>
<td>Instance, MID Server</td>
</tr>
<tr>
<td>PowerShell step</td>
<td>Run PowerShell scripts on remote machines from your ServiceNow instance through a MID Server.</td>
<td>MID Server</td>
</tr>
<tr>
<td>REST step</td>
<td>Send an outbound REST web service request to an external system.</td>
<td>Instance, MID Server</td>
</tr>
<tr>
<td>SOAP step</td>
<td>Enable action designers to send outbound SOAP web service requests to external systems.</td>
<td>Instance, MID Server</td>
</tr>
<tr>
<td>SSH step</td>
<td>The SSH step executes SSH commands on an external *nix system through a ServiceNow® MID Server. The step also stores scripts and commands for the *nix systems.</td>
<td>MID Server</td>
</tr>
<tr>
<td>XML parser step</td>
<td>Identify structured data from an XML payload without having to write script. Map incoming XML elements to a complex object output that you can use in other steps or actions. At runtime, values from an XML payload populate the complex object output.</td>
<td>Instance, MID Server</td>
</tr>
</tbody>
</table>

Training

Complete a step-by-step training on using the REST step in the REST in IntegrationHub developer training.

Connection attributes

Define connection-specific variables that you can use in IntegrationHub integration steps. When using an integration step, you must establish a connection with an external system. Use a Connection & Credential alias instead of defining the connection inline. An alias enables you to
update the connection details once without having to reconfigure every action. Any action step that uses an alias inherits the attributes associated with it. Flow Designer displays attributes as data pills that you can drag into your action step. For example, you can create a page size attribute that becomes a REST step query parameter. For more information about connection attributes, see Create connection attributes for IntegrationHub.

**MID Server connection aliases**

Action designers can set MID Server selection attributes using a connection record associated with an alias and associate the alias with an integration step. When the flow runs, the system uses the attributes to determine which MID Server runs the step. Learn more about connection and credential aliases.

**MID Server selection**

Flow designers should avoid shifting the execution environment between MID Servers when a flow runs. Either configure your MID Servers to perform operations on multiple endpoints, or provide multiple capabilities to the MID Servers in your network. You may need a user with the connection_admin role to update the connection records associated with an action, or a network administrator to update the MID Server network configuration. To learn more about how a MID Server is selected during runtime, see MID Server selection.

**Design considerations**

Design integration steps using the following guidelines.

- Avoid shifting the execution environment between the instance and the MID Server multiple times. Where possible, group similar action steps. For example, group core steps that perform record operations and integration steps that run on the MID Server.
- When creating a spoke that uses an integration step, include a Connection and Credential alias record with the appropriate connection type. Before anyone can use the spoke, a user with the connection_admin role must associate the alias record to a connection record that supports the connection type. If defining the connection inline, use inputs to enable the process analyst to define the connection information when adding the action to a flow.
- The MID Server does not have access to all the values in a GlideRecord object, it only has access to the sys_id reference. Inputs of type Reference do not work on a MID Server. Instead, create action inputs that contain the necessary GlideRecord values.

**Roles**

To create integration steps, a user must have the action_designer or admin roles. If running steps on a MID Server, the MID Server user must have the connection_admin and credential_admin roles to access the connection and credential information associated with the step.

**JDBC step**

Create a reusable action to send SQL commands to a relational database.

**Note:**

- The JDBC step is not available in the base system and requires the subscription to IntegrationHub Standard Pack Installer (com.glide.hub.integrations.standard) or later.
For more information about the ServiceNow®IntegrationHub subscription packages, see IntegrationHub usage and subscription. After the required plugin is activated, the step is visible under Integrations.

- The JDBC step runs only on a ServiceNow® MID Server with JDBC step capabilities. Activate the plugin, IntegrationHub Standard Pack Installer (com.glide.hub.integrations.standard) or later to use the JDBC capability for the MID Server.

Roles and availability

The JDBC step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Sanitizing inputs using the escape functions

Escape all user inputs to eliminate the possibility of a malicious user from executing malicious SQL statements, resulting in SQL injection on your target database. When you use data pills in JDBC step SQL statements, sanitize them first using a preprocessing Script step.

In the Script step, use the escape APIs, escapeSQLIdentifier and escapeSQLValue. These APIs are available as static methods of the server-side script class, SNC.GlideSQLEscapeUtils. For example,

```javascript
var escapedValue = SNC.GlideSQLEscapeUtils.escapeSQLValue("MYSQL", "Georgi's Birthday");
```

The escaped values from the escape APIs are the output of the Script step. Use this escaped output in the SQL statements of the JDBC step.

<table>
<thead>
<tr>
<th>Escape API</th>
<th>Description</th>
</tr>
</thead>
</table>
| escapeSQLIdentifier | • Escapes special characters and injected values in the SQL identifiers.  
                        • Validates input for a period character. Throws an SQLEscapeException error when a period character is encountered.                           |
|                   | **Note:** To join SQL identifiers using a period, use two pills, which are ID escaped, joined by the period.                                   |
| escapeSQLValue      | Escapes special characters and injected values in SQL values by wrapping the input in database-specific quotes.                        |

Whitelisting SQL operations

By default, you can run the following SQL operations.

- SELECT
To enable only some of these SQL operations that the JDBC step can perform, create a MID Server property, `mid.property.jdbc_operations` and enter the whitelisted SQL operations, separated by comma. To learn more about MID Server properties, see "MID Server properties",

| Database Type               | Database type for this connection. The choices are:  
  - MySQL  
  - Oracle  
  - SQLServer  
  - Custom  
  
  The default choice is Custom. This field is available when Define Connection Inline is selected from the Connection list.                                                                                                                                                             |
| JDBC Driver                 | Driver to use for this connection when it's not a default database type such as DB2 Universal and Sybase. The database Type is Custom. This field is available when Define Connection Inline is selected from the Connection list and Custom is selected from the Database Type list.                                                                                     |
| Connection URL              | URL that the MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases. This field is available when Define Connection Inline is selected from the Connection list and Custom is selected from the Database Type list.                          |
| MID Application             | Application that the MID Server must support to be eligible for selection. This field is available when Define Connection Inline is selected from the Connection list.                                                                                                                                                                                  |
| Capabilities                | Capability of the MID Server. Select JDBC. This field is available when Define Connection Inline is selected from the Connection list.                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                 |
| Connection Timeout          | Maximum elapsed time, in seconds, for the activity to wait while attempting to connect to the target database. This field is available when Define Connection Inline is selected from the Connection list.                                                                                                                                                                                                 |
| Query Timeout               | Maximum elapsed time, in seconds, that the query is allowed to run without a response. This field is available when Define Connection Inline is selected from the Connection list.                                                                                                                                                                                                 |
| JDBC Configuration          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SQL Statement               | SQL statement that the step executes.  
  **Note:** When you use data pills in step SQL statements, sanitize them first using a preprocessing Script step. For more information, see Sanitizing inputs using the escape functions.                                                                                                                                                                                                 |
| Maximum Rows                | Maximum number of rows to be returned from the SQL statement. The default value is 1000.                                                                                                                                                                                                                                                                                                                   |
| Maximum Payload Size (KB)   | Maximum allowable payload size, in KB, to be returned from the SQL statement. The default payload size is 5120 KB. The maximum payload size is 5 MB.                                                                                                                                                                                                                                                                                        |
| Retry Policy                | Option to enable the retry policy. For more information, see Retry policy.                                                                                                                                                                                                                                                                                                                                                                                         |
| Override Default Policy for Alias | Option to override the default retry policy. This option is not applicable when Define Connection Inline is selected from the Connection list.                                                                                                                                                                                                                     |
| Retry Policy                | Default retry policy associated with Connection Alias. If Override Default Policy for Alias is selected, you can override the default retry policy and select another existing retry policy based on your requirement.                                                                                                                                                                                     |

**Test JDBC step**

Test the JDBC step before testing or publishing an action that contains the JDBC step.

It is mandatory that you test the JDBC step before testing the action. Testing ensures that the relevant complex object output schema is created from table columns, which can be used as data pills in subsequent steps.

1. Navigate to **Flow Designer > Designer**.
2. **Create an action** with a **JDBC step**.
3. Click **Test JDBC Step**. The **Test JDBC Step** pop-up window is displayed.
4. If the JDBC step takes an action input or output of the previous step as its input, provide required input values in the **Step input pills** field to test the JDBC step.

   **Note:** Input values in the **Step input pills** fields are not needed when records are updated, inserted, or deleted.

5. Click **Run Test**.
   - When a SELECT query is executed, **Sample Result** is displayed in the **Test JDBC Step** pop-up window. **Sample Result** includes column names, columns types, and the values of the first row.
   - When an UPDATE, INSERT, or DELETE query is executed, a message is displayed mentioning the number of rows affected.

6. To use the sample result as the JDBC step output, click **Use Result**.
   **Note:** **Use Result** is not displayed when records are updated, inserted, or deleted.

7. To retrieve schema of a different table when a SELECT query is executed in the JDBC step, enter the required value in the **Step input pills** field and click **Run Test**.

   When a SELECT query is executed in the JDBC step, **ResultSet** is displayed under **Outputs**. The relevant complex object output is populated. To learn more about complex objects, see **Complex data**.

Test and publish the action.

**Payload Builder step**

Enable action designers to easily create name-value pairs in JSON and XML payloads using dynamic data.

**Roles and availability**

- Available as an Action Designer action step. Users with the `action_designer` role can create a custom action with one or more action steps.
# Fields

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>

</tbody>
</table>
| Include Outer Structure      | The option to include or exclude a top level container appropriate to the output format. When the Output Format is JSON, curly braces contain the name-value pairs. When the Output Format is XML, a specified XML element contains the name-value pairs. For example, when the system formats the name-value pair as JSON:  
```
{
    "short_description": "[action]->[short_description]"
}
```
When the system formats the name-value pair as XML:  
```
<xml>
    <short_description>[action]->[short_description]
</short_description>
</xml>
```
| Send Empty Structure         | The option to send valid JSON or XML structures when the payload is empty. Enable this option to include JSON or XML structural text in the payload. For example, when the system formats an empty structure as JSON:  
```
{}
```
When the system formats an empty structure as XML:  
```
<xml></xml>
```
Disable this option to produce an empty payload. Empty payloads can occur when you select the Omit if empty option for every name-value pair, and all name-value pairs in the payload produce empty values. |
| Parent Node                  | The name of the XML element that contains the name-value pairs. The default parent node element is xml.  
**Note:** This field is only visible when the Output Format is set to XML and the option to Include Outer Structure is enabled.                                                                                                                                                                                                                                 |
| Preview                      | The read-only payload the step produces.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
PowerShell step

Run PowerShell scripts on remote machines from your ServiceNow instance through a MID Server.

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

**Note:** PowerShell step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Type of connection to use.</td>
</tr>
<tr>
<td></td>
<td><strong>Define Connection Inline:</strong> Define connection information within the action step.</td>
</tr>
<tr>
<td></td>
<td><strong>Use Connection Alias:</strong> Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don’t need to update your custom action.</td>
</tr>
<tr>
<td></td>
<td>To learn more about connections and credentials, see credentials, connections, and aliases.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Connection &amp; Credential alias record the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don’t need to update your custom action.</td>
</tr>
<tr>
<td></td>
<td>To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when the Connection is Use Connection Alias.</td>
</tr>
<tr>

<tr>
<td>Credential Alias</td>
<td>Credential alias the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don’t need to update your custom action. To learn more about connections and credentials, see <a href="#">credentials, connections, and aliases</a>. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.</td>
</tr>
<tr>
<td><strong>Note:</strong> This field is only visible when the Connection is Define Connection Inline.</td>
<td></td>
</tr>
<tr>
<td>Host</td>
<td>Specify the fully-qualified domain name of the target host where the system runs the action step. For example, host.domain.com.</td>
</tr>
<tr>
<td><strong>Note:</strong> This field is only visible when the Connection is Define Connection Inline.</td>
<td></td>
</tr>
<tr>
<td>Port</td>
<td>Specify the communications port on which the target host listens for connections. For example, 5985. Leave blank to use the default port.</td>
</tr>
<tr>
<td><strong>Note:</strong> This field is only visible when the Connection is Define Connection Inline.</td>
<td></td>
</tr>
<tr>
<td>MID Application</td>
<td>Specify the application the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected application.</td>
</tr>
<tr>
<td><strong>Note:</strong> This field is only visible when the Connection is Define Connection Inline.</td>
<td></td>
</tr>
<tr>
<td>Capabilities</td>
<td>Specify the capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities.</td>
</tr>
<tr>
<td><strong>Note:</strong> This field is only visible when the Connection is Define Connection Inline.</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Remoting Type</td>
<td>The location where the PowerShell script runs such as the MID or a remote server.</td>
</tr>
<tr>
<td></td>
<td>• Explicit Remoting (Most Common): Establish a connection with and run the script on a remote server.</td>
</tr>
<tr>
<td></td>
<td>• Implicit Remoting (Advanced): Run a script on a MID Server while importing necessary modules from a remote server. If selected, define the <strong>Remote name prefix</strong> and <strong>Modules to import</strong> fields. For optimal performance, only import modules necessary to the step. If blank, all available modules are imported from the server.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Run on a MID Server or have your script establish a remote session:</strong> Run a script directly on a MID Server, or define remoting specifications within the script. This value is the default.</td>
</tr>
<tr>
<td>Remote name prefix</td>
<td>The file path, excluding file names, to the modules to load from the remote server.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when the <strong>Remoting Type</strong> is <strong>Implicit Remoting (Advanced)</strong>.</td>
</tr>
<tr>
<td>Modules to import</td>
<td>The comma-separated list of modules to import from the remote server at the defined file path.</td>
</tr>
<tr>
<td>Script type</td>
<td>The type of script to run on the PowerShell host.</td>
</tr>
<tr>
<td></td>
<td>• Inline script: Enter the script to run in the <strong>Command</strong> field of the step.</td>
</tr>
<tr>
<td></td>
<td>• MID Server Script File: Select the PowerShell script to run from the MID Server Script Files (ecc_agent_script_file) table. This is the default value and separates scripting logic from the action, enabling you to update the script without having to modify and redeploy the action.</td>
</tr>
<tr>
<td>MID Server Script</td>
<td>Pre-defined PowerShell script from the MID Server Script Files table (ecc_agent_script_file).</td>
</tr>
<tr>
<td>Script path</td>
<td>Read-only path to the selected MID Server script.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when the <strong>Script type</strong> is <strong>MID Server Script File</strong>.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
**Input variables** | The optional name-value pairs that represent the values of PowerShell script variables. You can use action inputs and data from other steps within the PowerShell script. Define the following fields for each variable:  
- **Name**: The name of the script variable to pass a value to. The name cannot match a reserved or prohibited PowerShell variable. Some variable names are reserved for internal processing and should not be used as input variables. See **Reserved variables** in *PowerShell scripting variables*.  
- **Type**: The type of PowerShell variable. Select plain text, encrypted, or boolean. If encrypted is selected, the value appears in plain text in this field and is only encrypted when it passes to the ECC Queue.  
- **Value**: The value to map to the variable. Manually enter a value, or drag a data pill into the field.

**Command** | The inline PowerShell script to run on the target host.

**Note**: This field is only visible when the **Script type** is **Inline script**.

---

### PowerShell scripting variables

To access input variables from the **Command** field, you must call them using special syntax. The syntax you use depends on the value of a system property. If the **Remoting Type** is **Run on a MID Server** or have your script establish a remote session, some reserved variables are available in addition to input variables.

#### Input variable syntax

By default, prefix variable names with a $ character. For example, if an input variable is named `message`, use `$message` to access the variable in script.

If the `mid.powershell.command.script.parameter_passing` parameter is set to false, prefix the variable name with `$env:SNC_`. For example, if an input variable is named `message`, use `$env:SNC_message` to access the variable in script. To learn more about the `mid.powershell.command.script.parameter_passing` parameter, see **MID Server parameters**.

#### Reserved variables

When the **Remoting Type** is **Run on a MID Server** or have your script establish a remote session, the following variables are available for use in script. Reserved variables cannot be used as custom input variable names.

<table>
<thead>
<tr>
<th>Reserved variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>$computer</code></td>
<td>Host IP address defined in the Connection alias record.</td>
</tr>
<tr>
<td><code>$cred</code></td>
<td>Credential object that contains the credentials defined in the connection record. Use this variable with any PowerShell cmdlet that supports the credential parameter. For example, <code>New-PSSession -credential $cred</code>.</td>
</tr>
<tr>
<td><code>$log_info</code></td>
<td>If the <code>mid.property.powershell.log_info</code> property is set to true, adds logging information to a PowerShell script.</td>
</tr>
</tbody>
</table>

The following variable names are reserved for internal processing and should not be used as input variables.

REST step
Send an outbound REST web service request to an external system.

**Note:** REST step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

*Outbound REST web service* is a platform feature that allows you to retrieve, create, update, or delete data on a web services server that supports the REST architecture.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

**Fields**

<td>Specify the capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when Use MID is enabled.</td>
</tr>
<tr>
<td><strong>Capabilities</strong></td>
<td>Specify the capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when Use MID is enabled.</td>
</tr>
</tbody>
</table>
| **Build Request**   | Create the request manually, or import an OpenAPI Specification.  
• **Manually:** Create action inputs and complete the REST step form manually.  
• **From OpenAPI specification:** Import an OpenAPI Specification to generate action inputs and complete the REST step form. For more information, see OpenAPI support in the REST step. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| API Source       | Select an OpenAPI Specification used to construct the request, or select Import OpenAPI to import a new OpenAPI Specification. You can import specifications by providing a URL to the YAML or JSON, or copying and pasting content.  
  **Note:** This field is only visible when Build Request is set to From OpenAPI specification.                                                                 |
| API Operation    | Select an operation from the list. Available operations are provided by the OpenAPI Specification in the API Source field.  
  **Note:** This field is only visible when Build Request is set to From OpenAPI specification.                                                                                                           |
| Resource Path    | Specify the path for the resource.                                                                                                                                                                           |
| HTTP Method      | Specify the HTTP method to process the request.  
  - GET  
  - POST  
  - PUT  
  - PATCH  
  - DELETE                                                                                                                                                                                 |
| Query Parameters | Specify the name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag input variables into the parameter fields, and then assign a value.  
  **Note:** When importing an OpenAPI Specification, the system adds all parameters and headers present in the specification to the REST step. Review the final REST step values and remove parameters you do not want to send in the request. For example, if the API accepts content type headers for both JSON and XML, the system adds both headers to the REST step. You must remove one depending on the content type you want to receive in the response. |
| Headers          | Specify the headers to send with the request. You can create headers manually, or drag input variables into the parameter fields, and then assign a value.  
  **Note:** When importing an OpenAPI Specification, the system adds all parameters and headers present in the specification to the REST step. Review the final REST step values and remove parameters you do not want to send in the request. For example, if the API accepts content type headers for both JSON and XML, the system adds both headers to the REST step. You must remove one depending on the content type you want to receive in the response. |

<tr>
<td>Attachment File Record</td>
<td>Specify the target record to which the attachment is associated. Must be a data pill of type Record. For example, a specific incident record. You can look up this record in a prior step or define it as an input variable. The flow execution details display the Sys ID of the associated record.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when Save Response As Attachment is enabled.</td>
</tr>
</tbody>
</table>

REST response size limits

By default, the system limits the size of REST responses that are not saved as attachments to 5 MB. Direct REST responses that exceed this limit generate an error. To support larger response sizes, either save the response as an attachment or increase the response size limit with the glide.pt.rest.response_payload_max_size system property. This system property supports a maximum value of 10 MB.

OpenAPI support in the REST step

Populate REST step fields and action inputs with information imported from an OpenAPI Specification. Import specifications by providing a URL to the YAML or JSON, or copying and pasting content.

Benefits

OpenAPI support in the REST step offers these benefits.

- Use information imported from an OpenAPI Specification to configure REST step operations, HTTP methods, parameters, request body, path, and headers.
- Review available API operations without leaving the Flow Designer interface.
- Generate inputs required for the REST step to send valid requests to an OpenAPI service and add them to the REST step in the correct location.

**Note:** Always review REST step values imported from an OpenAPI Specification before sending a request. Remove parameters, headers, and inputs that the API does not require.

Generated inputs

When you import an OpenAPI Specification, the system creates any required inputs and adds them to the REST step form where appropriate. At runtime, the system sends a REST request that contains input values provided to the action. For example, if an API requires a name parameter
passed in the request, the system creates a name input and adds it to the REST step. When you add the action to the flow, name becomes an input to the action.

The system maps OpenAPI data types to Flow Designer data types. For example, if the OpenAPI Specification requires a user object, then the system creates a complex data object as input. For more information, see Complex data.

**Specification size limit**

By default, the system can import OpenAPI Specifications up to 10 MB. To increase the import size, update the glide.rest.openapi.max_request_size system property. The maximum value is 100 MB.

**Specification management**

Import an OpenAPI Specification by selecting options in the REST step. For more information, see REST step. Importing an OpenAPI Specification creates a record in the OpenAPIs (sys_openapi) table. You can view or delete specification records directly from this table. To update a specification, delete it and import it again.

**Design considerations**

Create a REST step from an OpenAPI Specification with these considerations in mind.

**Remove unnecessary REST step parameters**

When importing an OpenAPI Specification, the system adds all parameters and headers present in the specification to the REST step. Review the final REST step values and remove parameters you do not want to send in the request. For example, if the API accepts content type headers for both JSON and XML, the system adds both headers to the REST step. You must remove one depending on the content type you want to receive in the response.

**Make input labels user-friendly**

Ensure that input labels required for the REST step are clear and understandable. Clear labels enable flow designers to easily understand the required inputs when using the action in a flow.

**Remove inputs that do not require flow designer configuration**

When importing an OpenAPI Specification, the system adds all inputs present in the specification to the action input section. Remove any inputs that do not require a flow designer to configure. For example, if a REST step variable receives a value from another step in the action, an action input is not required.

**Avoid changing the API operation**

Changing the value of the API Operation field removes all values dependent on that operation. If you configure the OpenAPI Specification values in the REST step form, then change the operation, the system does not save your configuration. Values that are entered manually by a user are not affected.

**Limitations**

Create a REST step from an OpenAPI Specification with these limitations.

**Request body media types**
The request body only supports JSON and XML-based media types. If the selected operation from the imported OpenAPI Specification contains a request body with a different media type, the system adds a data pill of type String to the **Request body** field.

**OpenAPI 3.0 components**

OpenAPI 3.0 adds new components to Swagger 2.0 to describe an API in further detail. OpenAPI support in the REST step supports some, but not all of these components. The REST step does not currently support these components.

- Schema Object: oneOf, anyOf properties
- Discriminator Object
- Info object: termsOfService, contact, license fields
- Example Object
- Link Object
- Callback Object
- Security Scheme Object
- Security Requirements Object
- Tag Object
- External Documentation Object
- Server Object
- Specification extensions
- Recursive references

More information on these components is available in the OpenAPI documentation. See [OpenAPI Specification](#).

**SOAP step**

Enable action designers to send outbound SOAP web service requests to external systems.

**Note:** SOAP step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
- Action designers need the web_service_admin role to perform these web services tasks.
  - Select WSDL
  - Load new WSDL
  - Select a WS-Security policy

- The MID Server does not support WS-Security policies

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Details</td>
<td></td>
</tr>
</tbody>
</table>
### Field | Description
---|---
**Connection**<br>The type of connection to use.<br>- **Define Connection Inline**: Define connection information within the action step.<br>- **Use Connection Alias**: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action.<br>To learn more about connections and credentials, see [credentials, connections, and aliases](#).

**Connection Alias**<br>Connection & Credential alias record the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see [credentials, connections, and aliases](#). The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.<br>Note: This field is only visible when the Connection is **Use Connection Alias**.

**Credential Alias**<br>Credential alias the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see [credentials, connections, and aliases](#). The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.<br>Note: This field is only visible when the Connection is **Define Connection Inline**.

**Use MID**<br>The option to use a MID Server to run the SOAP step. Select this option to display the MID Application and Capabilities fields.

**Endpoint**<br>The URL endpoint for the SOAP request. If **Use Connection Alias** is selected, this field is read-only and displays the endpoint URL associated with alias. If **Define Connection Inline** is selected, enter a endpoint URL for the connection.

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Omit if empty</td>
<td>The option to exclude a name-value pair if the value is empty or null.</td>
</tr>
</tbody>
</table>

**Note:** This field is only visible after clicking the down arrow to display advanced options.

### SOAP response size limit

The system limits the size of SOAP responses to 5 MB. Direct SOAP responses that exceed this limit generate an error. To support larger response sizes, increase the response size limit with the `glide.pf.soap.response_payload_max_size` system property. This system property supports a maximum value of 10 MB.

### SSH step

The SSH step executes SSH commands on an external *nix system through a ServiceNow® MID Server. The step also stores scripts and commands for the *nix systems.

**Note:**
- The SSH step is not available in the base system. The step requires the subscription to ServiceNow® IntegrationHub and activation of IntegrationHub Professional Pack Installer (com.glide.hub.integrations.professional) or later. For more information about the IntegrationHub subscription packages, see *IntegrationHub usage and subscription*. After you activate the required plugin, the step is visible under Integrations.
- IntegrationHub supports ServiceNow SSH only.

### Roles and availability

The SSH step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

### Sanitizing arguments using the escape class and function

Escape all user inputs to eliminate the possibility of a malicious user executing arbitrary commands on your target server. Escape and validate data pills before the command field uses them by sanitizing arguments using a preprocessing Script step. Precede the SSH step with a Script step, which takes the arguments that are used to construct a command in the SSH step.

In the Script step, use the escape class, `GlideShellEscapeUtils` and escape function, `escapeBashShellArg`. The escaped arguments are the output of the Script step. Use this escaped output as the arguments of the commands used in the SSH step. The escaped values should contain arguments of a command.
### Escape APIs

<table>
<thead>
<tr>
<th>Escape class/function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideShellEscapeUtils</td>
<td>Provides scripted APIs to escape the shell arguments. For example, var escapedArgument = SNC.GlideShellEscapeUtils.escapeBashShellArg('/etc &amp;&amp; cat myfile.txt'); The escaped argument is, '/etc &amp;&amp; cat myfile.txt'.</td>
</tr>
</tbody>
</table>
| escapeBashShellArg    | • Adds single quotes around a string.  
• Escapes any existing single quotes within a string enabling you to pass the string directly to a shell function and treat the string as a single safe argument. |

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<td>Command that runs on the target directory. The command can also include MID Serverscripts. See Advanced SSH script options for more information.</td>
</tr>
<tr>
<td>Note: escape and validate data pills before the command field uses them by sanitizing arguments using a preprocessing Script step. For more information, see Sanitizing arguments using the escape class and function.</td>
<td></td>
</tr>
<tr>
<td>Long Running</td>
<td>Option to disable the SSH connection timeout for commands that might take longer than the default time of 120 seconds to run. When selected, the engine detaches from the execution thread until completion.</td>
</tr>
<tr>
<td>Sudo Mode</td>
<td>Option to elevate privileges to execute the script.</td>
</tr>
</tbody>
</table>

For more information, see [SSH credentials](#).

**Advanced SSH script options**

To run a MID Server script on the target host, specify the script type and pass the name of the script into the `${syncFile()}` parameter. The system uses this parameter to locate the named
script in the MID Server Script File (ecc_agent_script_file) table and run it on the target host. For example, a bash script can be expressed as:

```bash
bash ${syncFile("<MID script name>")} argument1 argument2 argument3
```

A base script (main_script.bash) can reference another script (my_include.bash) as well as a separate file (.my_profile) located on the target host. Both scripts and the file referenced must be synced to the MID Server, using the ${syncFile()} parameter, to execute properly.

```bash
source ${syncFile(".my_profile")}
cp ${syncFile("my_include.bash")} /usr/ssmith/my_include.bash
bash ${syncFile("main_script.bash")} one two three four five six
rm /usr/ssmith/my_include.bash
```

A Python example with inline comments might look like this:

```python
set $LIB_DIR=/usr/bin;
# Sync a file that is referenced inside myF5CreateLBPool.py
cp ${syncFile("specialFunctions.py")} ~/specialFunctions.py
# set up environment variables
source ${syncFile(".python_profile")}
# call script that sets up dependencies on the box from remote package repos
python ${syncFile("setupPythonDependencies.py")} pycontrol
# call a script that requires functions from the package as well as a function from myIncludedFile
python ${syncFile("myF5CreateLBPool.py")} snow_pool myActualValue
# user is responsible for their own cleanup
rm ~/specialFunctions.py
```

To see the list of available MID Server scripts, navigate to MID Server > Script Files.

**XML parser step**

Identify structured data from an XML payload without having to write script. Map incoming XML elements to a complex object output that you can use in other steps or actions. At runtime, values from an XML payload populate the complex object output.

To learn more about complex objects, see [Complex data](#).

---

**Note:** XML parser step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

---

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

**Payload size limit**

At runtime, XML parser step supports payloads up to 10 MB. For larger payloads, create a Data Stream action. For more information, see [Data Stream actions and pagination](#).

At design time, XML parser step supports sample payloads up to 64,000 characters.
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source data</td>
<td>Select or drag a data pill that contains the source XML data. For example, a REST step <strong>Response Body</strong> data pill. At runtime, values from the data source populate the complex object output.</td>
</tr>
<tr>
<td>Payload view</td>
<td>Select a view for the example payload.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Raw (edit mode)</strong>: Displays editable XML.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Structured</strong>: Displays XML in a tree view. Click an element in the tree to copy the element XPath. If creating complex data in the <strong>Target</strong> field manually, you can paste the XPath into the target XPath field.</td>
</tr>
<tr>
<td>Example payload</td>
<td>Enter an example payload to generate a complex object. For example, if parsing the response from a REST API step that returns a list of users, enter the expected XML for a single user. This field accepts XML with the following limitations.</td>
</tr>
<tr>
<td></td>
<td>- XML namespaces are not applied to the complex object. More than one namespace in an XML file is not supported and generates an error message.</td>
</tr>
<tr>
<td></td>
<td>- Multidimensional arrays are not supported.</td>
</tr>
<tr>
<td></td>
<td>- Some special characters are not supported, such as hyphen and period. Double colons (::) are not supported in attribute values.</td>
</tr>
<tr>
<td></td>
<td>- Payloads larger than 64,000 characters cannot be saved and generate an error message. However, if working with a large example, you can generate the complex object and delete the example payload before saving the step.</td>
</tr>
<tr>
<td>Generate Target</td>
<td>Click to generate a complex object from the example payload. Review and edit the <strong>Target</strong> field as necessary. Child elements are generated as type String. Alternatively, manually create the target by adding items in the <strong>Target</strong> field.</td>
</tr>
<tr>
<td>Target</td>
<td>View the XML payload as a complex object. Generate structured data by clicking <strong>Generate Target</strong>, or manually add items. For more information, see <a href="#">Complex data</a>. Each complex data variable contains this information.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Label</strong>: Data pill label. By default, the system uses the name of the XML element.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Preview</strong>: Sample value from the example payload.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: Data type, which must be String, Object, Array.String, or Array.Object. The top-level item must be an Object.</td>
</tr>
<tr>
<td></td>
<td>- <strong>XPath</strong>: Path to the element. Modify the XPath to change how source data elements map to complex data variables. If manually adding complex data variables, you can copy the XPath from the <strong>Payload view</strong> field and paste it in a complex data variable XPath field to ensure the correct hierarchy. Conditional XPath expressions are not supported.</td>
</tr>
<tr>
<td></td>
<td>Click <strong>Edit Object</strong> to:</td>
</tr>
<tr>
<td></td>
<td>- Change the label, internal name, or data type</td>
</tr>
<tr>
<td></td>
<td>- Add or remove complex data variables</td>
</tr>
<tr>
<td></td>
<td>- Mark a variable mandatory</td>
</tr>
</tbody>
</table>
Password reset using IntegrationHub

Create subflows in IntegrationHub to automate and customize the password reset process for users managed by third-party applications such as Okta or Microsoft Azure AD.

Create subflows in IntegrationHub to automate password reset processes. Use the Password Reset application to enable an end user to use a self-service process to reset or change the password. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users. See Customize password reset processes and integrate third-party credential services for more information.

Interaction Management

Interactions are a centralized location for all communication channels in the platform. Each interaction represents a request for assistance through a given channel, for example, a call or a chat.

The Now Platform offers several forms of queueing and communication management, but each system is tightly coupled to the specific area. Interactions offer an alternative, flexible, and more extensible option so that each product area can use the same framework.

Activate the interaction management system

An administrator can activate the Interaction Logging, Routing, and Queueing plugin (com.glide.interaction) to access the functionality.

Role required: admin

1. Navigate to System Definition > Plugins.
   A banner notifies you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:**
   To redirect to the legacy list view for plugins, click the link.

   ![You have been redirected to All Applications. To see the Plugins list click here](#)

   2. Find the plugin using the filter criteria and search bar.
      You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.
   3. Activate the plugin.
      You can activate the plugin directly from the All Applications page or you can view more details about the plugin before you activate it.
      - If you are certain that you have the correct plugin, click **Install**, and when you see the dialog box, click **Activate**.
To view plugin details before activation:

1. Click the plugin name.
2. On the form, click the **Activate/Update** related link.
3. In the dialog box, review the dependent plugins.

   If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.

4. If demo data is available and you want to install it, click **Load demo data**.

   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.

5. Click **Activate**.

Components installed with Interaction Management

Several types of components are installed with activation of the Interaction Logging, Routing, and Queueing plugin, including tables and user roles.

**Note:** To view all other components that install with this application, see the Application Files table. For instructions on how to access this table, see Find components installed with an application.

Roles installed

<table>
<thead>
<tr>
<th>Role title (name)</th>
<th>Description</th>

</tr>
</thead>
<tbody>
<tr>
<td>Interaction Administrator (interaction_admin)</td>
<td>Configure interactions for users.</td>
<td>interaction_agent</td>
</tr>
</tbody>
</table>
### Interaction configuration overview

Configure the behavior of an interaction by determining the routine behavior for each state that the interaction goes through during the life cycle.

### Interaction framework

Configure each of the following interaction components to determine the behavior and life cycle.

- Lists: Configure the interaction list view. You can also extend the interaction table.
- Forms: Configure the form view to tailor interactions for each application.

### Interaction states

States determine the behavior for interactions. For each state of the interaction life cycle, you determine which routine actions to perform. For example, the **On Created** state would have a script that creates an interaction and then adds the end user as the 'opened for'. The script then sends a message to the end user to let them know that the interaction has been opened.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New</td>
<td>An interaction is inserted into the interaction table</td>
</tr>
<tr>
<td>On Hold</td>
<td>The interaction is waiting for assignment</td>

<tr>
<td>Work In Progress</td>
<td>An agent accepts an unassigned interaction</td>
</tr>
<tr>
<td>Closed Complete</td>
<td>The agent or consumer intentionally closes the interaction</td>
</tr>
<tr>
<td>State</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Closed Abandoned</td>
<td>The interaction is closed because the consumer disconnects or is unresponsive</td>
</tr>
</tbody>
</table>

### Interaction context and channel metadata

Context and channel metadata are document ID fields included as part of interactions. Both types of records store information about the interaction.

**Context**

Context for an interaction tracks the information for an interaction, such as the initial question, asset tagging, or device location. Context records are stored on the interaction_json_blob table by default, however you can use any table to store a context record.

**Channel metadata**

Channel metadata contains the information needed to interact with the channel on which communication is happening on, for example, the chat or phone channels. Channel metadata can be free-form JSON or a reference to another record.

### Create an interaction

Most interaction creation takes place in other applications, interactions are merely a method of controlling channels. However, if needed you can create an interaction from the Interaction application.

Role required: interaction_agent

1. Navigate to Interaction > All.
2. Click New.
3. In the Type field, enter the way the interaction began. For example, chat, phone, or walk-up.
4. In the Opened for field, type the name of the user starting the interaction.
5. Include any additional information in the short description and the work notes fields.

View any incidents opened by the same user by clicking the Use the Incidents by Same Caller related list.

### Associate a record with an interaction

As an agent, you might need to create a record on another table to work on an interaction. You can associate the record with the interaction.

Role required: interaction_agent

1. Navigate to Interaction > Assigned to me.
2. Open the interaction you want to associate with another record.
3. In the form header, click Associate Record.
4. In the ID of related record field, click the search icon.
5. From the Document Table list, select the table you want to associate a record from.
6. From the Document field, click the search icon.
7. Select an existing record from the list, or click **New** to create a record.
8. Click **OK**.
9. Click **Submit**.

The associated record appears in the Related Tasks related list for the interaction.

**Knowledge Management**

The ServiceNow® Knowledge Management (KM) application enables the sharing of information in knowledge bases. These knowledge bases contain articles that provide users with information such as self-help, troubleshooting, and task resolution.

Knowledge Management has significantly changed with Knowledge v3, which is enabled by default for all instances starting with the Fuji release.

The Knowledge Management Service Portal enables users to access a portal view of knowledge bases and articles. It is available by default for new customers on the Madrid and later releases. If required, existing and upgrade customers can activate the Knowledge Management Service Portal plugin.

Knowledge Management supports processes for creating, categorizing, reviewing, and approving articles. Users can search and browse articles as well as provide feedback.

To support multiple groups, knowledge bases can be assigned to individual managers. Separate workflows can be used for publishing and retiring articles, and separate access controls can be used to control reading and contributing.
## Additional plugins for Knowledge Management

After Knowledge Management is activated, you can activate additional plugins that provide access to various additional Knowledge Management features.

You must have the admin role to activate these additional plugins. For details, see [Activate a plugin](#).

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
</table>
| Knowledge Management Core  
com.glideapp.knowledge | Installs the core Knowledge Management items used to allow other Knowledge-related plugins to work, such as Knowledge V3, Knowledge Advanced, and Knowledge Service Portal. This plugin is activated by default. |
| Knowledge Management Advanced Installer  
com.snc.knowledge_advanced.installer | Installs the Knowledge Management Advanced plugin. Activating/upgrading to this plugin validates the knowledge articles and knowledge bases to make sure that the Knowledge Advanced plugin can be successfully installed. If validation fails, check the Plugin Activation logs and follow instructions given to fix any errors. Once you fix all the issues, re-run this plugin. |
| Knowledge Management Advanced  
com.snc.knowledge_advanced | Adds advanced features to Knowledge Management such as version control and subscriptions. This plugin requires that all knowledge bases are version Knowledge V3. Use the Knowledge Management Advanced Installer plugin to activate this plugin. |
| Predictive Intelligence for Knowledge Management  
(com.snc.knowledge_ml) | Enables you to leverage machine-learning algorithms for searching related articles in Knowledge Management. Activation of this plugin on production instances might require a separate license. Contact ServiceNow for details. **Note:** Before activating this plugin, you must activate the Predictive Intelligence plugin (com.glide.platform_ml). |
| Performance Analytics - Content Pack - Knowledge Management  
com.snc.pa.knowledge_v2 | Enables the Performance Analytics content pack for Knowledge Management out-of-the-box KPIs. Activation of this plugin on production instances might require a separate Performance Analytics license. Contact ServiceNow for details. |
| Knowledge Management V3  
com.snc.knowledge3 | Enables support for Knowledge Management V3. Activate this plugin when you upgrade from Eureka or earlier versions. |
| 118N: Knowledge Management Internationalization Plugin v2  
com.glideapp.knowledge.i18n2 | Helps create and maintain translations of an article in various languages in a way that is easy to manage translations while authoring as well as viewing articles. Activating internationalization plugins for any of the available languages automatically activates this plugin. |
| Knowledge Document  
com.snc.knowledge_document | Adds knowledge-based functionalities to the Managed Documents plugin. You can create a knowledge article from a document or update a knowledge document to a newer revision. |
<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Management - External Content Integration com.snc.knowledge.external_integration</td>
<td>Adds external content search capabilities to the Knowledge Management application. Once configured, this feature creates a copy of the external content on ServiceNow as knowledge articles, and then indexes the articles through Zing Search. You must have appropriate reuse and copy privileges before you configure an external source to be searchable using this feature.</td>
</tr>
<tr>
<td>Knowledge Management Wiki Support com.glideapp.knowledge2.wiki</td>
<td>Enables support for wiki type Knowledge articles.</td>
</tr>
</tbody>
</table>

**Knowledge Management roles**

Certain roles are required to use Knowledge Management functionality.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>knowledge</td>
<td>Users with the knowledge role can contribute to the default knowledge base and access the Knowledge application menu.</td>
</tr>
<tr>
<td>knowledge_manager</td>
<td>Knowledge managers perform administrative functions for knowledge bases they manage such as defining categories, pinning important articles, and approving changes to articles. Users selected as managers of a knowledge base receive this role automatically.</td>
</tr>
<tr>
<td>knowledge_admin</td>
<td>Knowledge administrators can create new knowledge bases and manage all knowledge bases.</td>
</tr>
<tr>
<td>knowledge_coach</td>
<td>Knowledge coaches perform AQI surveys on articles and can write, edit and review knowledge management articles. A knowledge coach does AQI on articles and coaches the team on best practices.</td>
</tr>
<tr>
<td>knowledge_domain_expert</td>
<td>Knowledge domain experts perform AQI surveys on articles and can write, edit and review knowledge management articles. A knowledge domain expert keeps track on the health of knowledge base.</td>
</tr>
<tr>
<td>admin</td>
<td>Administrators can configure knowledge workflows, set knowledge properties, and manage knowledge forms and homepages.</td>
</tr>
<tr>
<td>Role</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>knowledge_group_manager</td>
<td>Knowledge group managers can add or remove members in ownership groups managed by them. They cannot change the manager assigned in their groups. The manager can only be reassigned by the knowledge administrator. Knowledge group managers are assigned feedback tasks by default. They can reassign tasks to another group member, or group members can assign a feedback task to themselves.</td>
</tr>
<tr>
<td>knowledge_group_member</td>
<td>Knowledge group members are part of an ownership group that can be associated to knowledge articles. They can approve knowledge articles, assign feedback tasks to themselves and work on them as well as edit any knowledge articles that their ownership group is assigned to.</td>
</tr>
</tbody>
</table>

**Knowledge properties**

As an administrator, you can configure the look and functionality of many knowledge base features with knowledge properties.

You can access knowledge properties by navigating to **Knowledge > Administration > Properties**.

**Knowledge portal properties**

Knowledge portal properties control the look and functionality of the legacy portal page. This portal page lists recent knowledge articles and their publishing dates, organized by topic.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>

| Omit empty Knowledge topics and categories. *(glide.knowman.show_only_populated)* | Select the Yes check box to display topic sections only if there are articles for the topic. Clear the check box to show all topic sections, even those with no assigned articles.  

**Note:** This property does not apply to the News category.  

**Note:** This property applies only to the default knowledge base and the legacy knowledge portal. Knowledge v3 articles do not specify a topic. Therefore, this property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages. |
| Show Knowledge section descriptions. *(glide.knowman.show_descriptions)* | Select the Yes check box to display topic descriptions in the knowledge portal. To enter these descriptions:  
1. Edit an existing knowledge article.  
2. Right-click the Topic field label and choose Show Choice List.  
3. Open the record for the topic name and enter the description into the Hint field.  

Clear the check box to omit section descriptions from the knowledge portal.  

**Note:** This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages. |
| Number of Knowledge Base items to preview in a section. *(glide.knowman.section_limit)* | Set the maximum number of articles per topic for the knowledge portal. The specific articles shown depends on the Knowledge section sort field property setting.  

**Note:** This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages. |
| Knowledge section sort field. *(glide.knowman.section_sort)* | Select the default order for articles within each topic section on the knowledge portal.  
- **Published:** uses the date published.  
- **View count:** uses the number of times articles have been viewed during the period specified in the Number of days used when summing article views property.  
- **Alphabetically:** uses the first letter of the article title *(Short description field)*.  

**Note:** This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages. |

</table>
**Property**

Number of days (integer, default 30) used when summing article views. Views older than this are not considered when sorting articles based on view count. 0 means consider all views. (glide.knowman.view_age.days)

**Description**
Enter a number of days to consider when calculating view count. This is used only when the Knowledge section sort field property is set to View count. The view_count field in the knowledge record will be updated periodically to reflect the view count based on this property. For example, if you enter 60, the view count is the total number of views in the past 60 days. Enter 0 to have ServiceNow consider all views, regardless of date.

Automatically place cursor in Knowledge portal search box. (glide.knowman.portal_search_focus)

**Description**
Select the Yes check box to have ServiceNow place the cursor in the search field when a user opens the knowledge portal. Clear the check box to have users click in the search field before entering a search term.

**Note:** This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.

---

**Knowledge search properties**

Knowledge search properties give you control over the search options available to users and the presentation of search results.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Knowledge search result order. (glide.knowman.order.search) | Select the order for displaying search results:  
- **Number of Views**: orders search results based on the Number of days used when summing article views property.  
- **Relevancy**: orders search results based on content that is similar to the search term.  
- **Last Modified**: orders search results based on modification date.  

This property is applicable for search within the Knowledge Management application and not the Now Platform global search. |
| Search method used when searching Knowledge from a task or directly in the Knowledge Base. (glide.knowman.search.operator) | Select the search approach to use when the search term includes multiple words:  
- **OR query**: returns articles that contain at least one word from the search term.  
- **AND then OR query**: first searches for articles that include all words in the search term (an AND query). If no matches are found, an OR query is performed. |
<table>

<td>Select this check box to include the number of times each article was viewed in knowledge search results.</td>
</tr>
</tbody>
</table>
| How to display attachments in Knowledge Search Results. (glide.knowman.search.attachment) | Select the behavior of how the attachments are shown in the search results:  
- **Do not show attachment**  
- **Show only link for attachment**  
- **Show attachment with text snippet** (default)  
For best performance, select **Do not show attachment** or **Show only link for attachment**. |
<p>| Show relevancy in knowledge search results. (glide.knowman.search.show_relevancy) | Select this check box to show how relevant each search result is based on the search string. <strong>Relevancy</strong> value is only shown when knowledge search result order property is set to <strong>Relevancy</strong>. |
| Enable instant search results for knowledge. (glide.knowman.search.instant_results) | Select this check box to enable instant search for search results. The default is <strong>No</strong>. |
| Show Knowledge Base name in Knowledge search results. (glide.knowman.search.show_knowledgebase) | Select this check box to display the knowledge base to which the knowledge base article belongs. For example, <strong>IT</strong>. |
| Show average rating from knowledge search results. (glide.knowman.search.show_rating) | Select this check box to display the average star ratings for knowledge base articles. |
| Show article number in knowledge search results. (glide.knowman.search.show_article_number) | Select this check box to display the article number for each article in the search result. If the article versioning feature is enabled, the article number and the version number are displayed for each article in the search result. <strong>Note:</strong> This property does not apply to contextual search results. |</p>
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Specify default language for searching articles. (glide.knowman.search.default_language) | Set the property to the desired default language for searching articles.  
- **String**  
- **Default value**: user-specified  
- **Location**: System Properties  

**Note**: If the glide.knowman.enable_multi_language_search property is set to **True**, then the multi-language search capability overrides the default language search capability.

| Enable multi-language search. (glide.knowman.enable_multi_language_search) | Set the property to **True** to enable search for multiple languages simultaneously.  
- **Type**: true | false  
- **Default value**: false  
- **Location**: System Properties  

**Note**: If this property is set to **True**, it overrides the setting for the glide.knowman.search.default_language property.

| Maximum character limit for meta description used for SEO. (glide.knowman.seo.pages.meta_description.length) | Set the maximum number of characters used as meta description for SEO.  
- **Type**: integer  
- **Default value**: 100  
- **Location**: System Properties  

When you change the character limit, the meta description with the updated limit is only applied to articles published after the change was made. To apply the change to all existing published articles, run the Populate Meta Description on KB Articles fix script.

**Knowledge article view properties**

Article view properties give you control over the meta data and rating options that appear with articles. They also enable you to grant access to individual feedback options based on user role.

| (glide.knowman.versioning.enable_minor_edits)                | - Type: true | false  
- Default value: false  
- Location: Knowledge > Administration > Properties                                                                                                         |

**Note:** This feature is available for the following users: the knowledge administrator, the knowledge base manager, and the knowledge base owner.

<table>
<thead>
<tr>
<th>A comma-separated list of fields that can be edited on published articles without creating a new version.</th>
<th>Enter the fields in a comma-separated list that can be edited on published articles without creating a new version.</th>
</tr>
</thead>
</table>
| (glide.knowman.versioning.minor_edit_fields)                                                                   | - Type: string  
- Default value: valid_to  
- Location: Knowledge > Administration > Properties                                                                                                         |

### Knowledge subscription properties

The knowledge administrator can set configuration properties that enable users to subscribe to knowledge bases and knowledge articles.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable subscribe feature for KM</td>
<td>Select the Yes check box to enable the knowledge subscription feature.</td>
</tr>
</tbody>
</table>
| (glide.knowman.enable_km_subscription)                        | - Type: true | false  
- Default value: true  
- Location: Knowledge > Administration > Properties                                                                                                         |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List of roles (comma-separated) who can have subscription feature</td>
<td>Enter the roles in a comma-separated list that can use the Knowledge subscription feature.</td>
</tr>
<tr>
<td>glide.knowman.enable_km_subscription.roles</td>
<td>· <strong>Type</strong>: string</td>
</tr>
<tr>
<td></td>
<td>· <strong>Default value</strong>: knowledge</td>
</tr>
<tr>
<td></td>
<td>· <strong>Location</strong>: Knowledge &gt; Administration &gt; Properties</td>
</tr>
<tr>
<td></td>
<td>List of workflow states (comma-separated) that can have subscription feature</td>
</tr>
<tr>
<td>glide.knowman.enable_km_subscription.workflow_state</td>
<td>· <strong>Type</strong>: string</td>
</tr>
<tr>
<td></td>
<td>· <strong>Default value</strong>: draft, review, published</td>
</tr>
<tr>
<td></td>
<td>· <strong>Location</strong>: Knowledge &gt; Administration &gt; Properties</td>
</tr>
</tbody>
</table>

**Article quality index properties**

The knowledge administrator can set the pass score for AQI reviews using the knowledge properties page.

**Properties for Article Quality Index**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pass score for AQI reviews. glide.knowman.aqi_pass_score</td>
<td>Set the pass score for AQI reviews.</td>
</tr>
<tr>
<td></td>
<td>· <strong>Type</strong>: integer</td>
</tr>
<tr>
<td></td>
<td>· <strong>Default value</strong>: 70</td>
</tr>
<tr>
<td></td>
<td>· <strong>Range of values possible</strong>: 1-100</td>
</tr>
<tr>
<td>List of article workflow states to perform AQI reviews. glide.knowman.aqi_article_workflow_states</td>
<td>Enter the article workflow states, in a comma-separated list, where users can perform AQI reviews.</td>
</tr>
<tr>
<td></td>
<td>· <strong>Type</strong>: string</td>
</tr>
<tr>
<td></td>
<td>· <strong>Default value</strong>: draft, review, published</td>
</tr>
</tbody>
</table>

**External Content Integration Properties**

Administrators can configure the properties to add allowed content types and change the UI label for the external content integration feature.

**Properties for External Content Integration**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum limit for total size of external content in Knowledge Management (in GB). sn_km_intg.glide.knowman.external.max_content_size</td>
<td>· <strong>Type</strong>: integer</td>
</tr>
<tr>
<td></td>
<td>· <strong>Default value</strong>: 2</td>
</tr>
<tr>
<td><strong>Note</strong>: This is a read-only field.</td>
<td></td>
</tr>
</tbody>
</table>
### Property

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
</table>
| Maximum size of an external article including its attachments (in MB) | • Type: integer  
• Default value: 8  

\[\text{sn\_km\_intg.glide.knowman.external.max\_article\_size}\] |

An editable, comma-separated list of allowed content types to be processed from the source system.  

\[\text{sn\_km\_intg.glide.knowman.external.allow\_content\_types}\] |

List of content types not allowed to be processed from the source system.  

\[\text{sn\_km\_intg.glide.knowman.external.reject\_content\_types}\] |

UI Label for indicating external articles in Search Results and Article View Pages.  

\[\text{sn\_km\_intg.glide.knowman.external.ui\_label\_for\_external\_content}\] |

### Actionable Knowledge Feedback Properties

The Knowledge administrator can set configuration properties that would create actionable feedback tasks.

**Properties for Actionable Knowledge Feedback**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Create actionable feedback task when an article is marked as not helpful.  
(glide.knowman.feedback.enable_actionable_feedback_for_helpful) | Select the Yes check box to enable actionable feedback task generation when an article is marked as not helpful.  
• Type: true|false  
• Default value: false  
• Location: Knowledge > Administration > Properties |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Create actionable feedback task when an article is rated at or lower    | An actionable feedback task is created when an article is rated at or lower than this value. The article is rated on a scale of 1-5.  
| than this value. 0 or no value indicates that actionable feedback tasks are not enabled for Rating type feedback | - Type: integer  
|                                                                         | - Default value: none  
|                                                                         | - Location: Knowledge > Administration > Properties |

**Knowledge Management setup guide for admins**

Before users in your organization can start creating knowledge bases and knowledge articles, you must set up Knowledge Management. Work with stakeholders to define requirements for setting up Knowledge Management effectively to meet the needs of users.

**Requirements**

Role required: admin

**Before you begin**

**Meet with the stakeholders**

<table>
<thead>
<tr>
<th>Stakeholder</th>
<th>Responsibilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge manager</td>
<td>Defines and oversees the knowledge management processes for day-to-day operations related to content publishing and usage.</td>
</tr>
<tr>
<td>Knowledge admin</td>
<td>Configures advanced settings for specific Knowledge Management features</td>
</tr>
<tr>
<td>Knowledge coach</td>
<td>Enables users to adhere to content standards.</td>
</tr>
<tr>
<td>Knowledge domain expert</td>
<td>Provides domain knowledge expertise.</td>
</tr>
<tr>
<td>Version author</td>
<td>Contributor to a particular version of an article.</td>
</tr>
<tr>
<td>Content creators and reviewers</td>
<td>Create, review, and update articles in the knowledge bases.</td>
</tr>
<tr>
<td>Community managers</td>
<td>Focus on the creation and curating of social content.</td>
</tr>
<tr>
<td>Line managers</td>
<td>Manage teams that create and use knowledge articles</td>
</tr>
</tbody>
</table>

**With stakeholders, determine the following requirements**

- Who are the consumers of the content in the knowledge bases?
- Who are the writers, editors, and managers for the knowledge base articles?
- What are the required workflows to publish and retire articles?
- What are the unique behaviors required for your knowledge management implementation? For example, should attachments appear in search results?
• Do you want to translate knowledge articles into other languages?

What to do

Assign knowledge roles to users and groups
Determine which Knowledge Management roles are appropriate for each user, and then assign those roles.

Create custom Knowledge workflows
If the default knowledge workflows for publishing and retiring knowledge articles are not appropriate for your knowledge bases, create custom workflows for those knowledge bases.

Configure Knowledge properties
If the default knowledge properties do not fulfill the requirements of users, reconfigure the properties as necessary.

Activate support for other languages besides English
If languages other than English must be supported, activate the Knowledge Management Internationalization plugins.

Coordinate with knowledge managers for knowledge base setup
Let knowledge managers and administrators know that they can start configuring their knowledge bases. For details, refer them to the Knowledge base setup guide for knowledge admins and managers.

Next steps
Depending on any other requirements for the knowledge bases, you may be asked to help with additional tasks, such as configuring knowledge homepages.

Using guided setup to implement Knowledge Management
Knowledge Management guided setup provides a sequence of tasks that help you configure Knowledge Management on your instance. To open Knowledge Management guided setup, navigate to Knowledge Management > Administration > Guided Setup.
For more information about using the guided setup interface, see Using guided setup.

Domain separation and Knowledge Management
This is an overview of domain separation and Knowledge Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview
Support: Level 2
Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

Domain separation works differently at different access levels of an application. In Knowledge Management, data, requester, and fulfiller access to knowledge bases are domain separated.

**How domain separation works in Knowledge Management**

In Knowledge Management, the following rules apply:

Data: At the data level of domain separation, data visibility is separated from one domain to another. Knowledge bases, user criteria, articles, categories, article feedback, article versions, article templates, and external sources are domain separated in the base system.

Requester: Requester activities are supported within tenant domains. Users can search; view; comment; and rate articles of their domain, any child domain, and global domains, if feedback is enabled and the knowledge base settings grant them read access to articles.

- Users in the global domain can access articles in all the domains if read access is granted at knowledge base and/or article level.
- Users in the parent domain can access articles in that domain, global, and all its child domains if read access is granted at knowledge base and/or article level.
- Users in the child domain can access articles in that domain and the global domain if read access is granted at knowledge base and/or article level.

Fulfiller: The application can be used by the Fulfiller within the tenant domains as a tenant domain-owned application. Users are allowed to author articles in knowledge bases of their domain, any child domain, and the global domain if the knowledge base has user criteria set up to grant contribute access.

- Articles are automatically saved to the user’s current domain when the article is created.
- If the glide.knowman.allow_edit_global_articles system property is enabled, users from a domain other than the global domain can check out and edit global articles. Otherwise, system administrators and users from a domain other than the global domain cannot check out global articles and are shown a warning message to that effect. Depending on their access, users can change their domain to the global domain to check out and edit the global articles.
- Domains of versioned articles will be maintained as per the latest article version's domain. This includes updating the domain for kb_version, kb_knowledge, kb_feedback, and sys_attachment tables.

See Select user criteria for a knowledge base to learn how to control which users create, read, write, and retire knowledge articles within a knowledge base.

See Select user criteria for an article to learn how to control read access to users at the article level.

**Use cases**

This image demonstrates a basic domain hierarchy that is available in the base system.
### Requester use cases

<table>
<thead>
<tr>

### Known Issues
- The following AQI tables are not domain separated:
  - AQI Checklist (kb_quality_checklist)
  - Checklist Question (kb_checklist_question)
  - Article Checklist Answer (kb_article_checklist_answer)

**Note:** The Article Checklist Answer table does not contain the Order field. The application shows the list in a random order.

- Comment provided by a user on an article is stored in article's domain instead of user domain.
Knowledge base setup guide for knowledge admins and managers

After basic Knowledge Management setup is completed, you can set up a knowledge base for users to create and publish knowledge articles.

Multiple knowledge bases can be created for different groups within your organization to share information within and between those groups.

Administrators create knowledge bases, and assign them to individual managers responsible for controlling the behavior and organization scheme of each knowledge base.

Each knowledge base contains knowledge articles that provide information for users, such as policy, release notes, or instructions for a task. Each knowledge base can also use a separate workflow for publishing and retiring articles.

Requirements

Role required: knowledge_administrator, knowledge_manager, or admin

Before you begin

Determine the following requirements for each knowledge base that you want to set up:

- Who are the knowledge base managers that are responsible for approving articles?
- Who are the users and contributors for that knowledge base? Access for these users is defined through user criteria.
- What are the categories to be used to classify articles? Will users be able to create categories?
- Will users of the knowledge base be able to create new content?
- Will Social Q&A be leveraged for this knowledge base?

What to do

Set up the knowledge base

1. Create the knowledge base.
2. Set up which users can read, create, or edit knowledge articles by selecting user criteria for the knowledge base.
3. Define the approval process for articles using workflows.
4. Define the knowledge categories that are needed for organizing articles in the knowledge base.
5. If you want to enable users to ask and answer questions in the knowledge base, activate Social Q&A.
6. If you want a custom knowledge homepage, ask your ServiceNow administrator to create it.

© 2019 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Next steps

Let users in your organization know that they can start creating and searching articles in the knowledge base. For details, refer users to the Knowledge Management guide for users.

If you have the knowledge_manager role, there are many other tasks that you can perform to maintain the knowledge base. You can pin articles so they are featured prominently in the search results and on homepages. You can also assign other users as managers of a knowledge base. For details, see Knowledge manager.

Quick start tests for Knowledge Management

Validate that Knowledge Management still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Knowledge Management quick start tests require activating the Knowledge Management Core plugin (com.glideapp.knowledge), the Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer), and the Customer Service Management Demo Data plugin (com.snc.customerservice.demo).

</table>

**Configure Knowledge Management**

Configure various aspects of Knowledge Management based on the specific requirements of your organization.

The following podcast offers additional information on using Knowledge Management.

**Create a knowledge base**

Create a knowledge base to provide a self-service platform for users to store, share, and manage content. Configure knowledge bases into product or service categories and manage user access based on permissions. Customize workflows for publishing and retiring articles in the knowledge base.
Understand the **requirements** for setting up a knowledge base.

Role required: knowledge_admin or admin

1. **Navigate to Knowledge > Administration > Knowledge bases.**
2. In the Knowledge Bases list, click **New**.
3. On the form, fill in the following fields as appropriate:

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Unique name for the knowledge base.</td>
</tr>
<tr>
<td>Article Validity</td>
<td>Number of default days articles will be valid for after their created date.</td>
</tr>
<tr>
<td>Icon</td>
<td>An image that provides a visual reference to describe the knowledge base. This image is displayed next to all articles from this knowledge base in the article search results page.</td>
</tr>
<tr>
<td>Disable commenting</td>
<td>Check box to disable commenting. If selected, users cannot comment on articles in the knowledge base.</td>
</tr>
<tr>
<td>Disable suggesting</td>
<td>Check box to disable edit suggestions. If selected, users cannot suggest edits to articles in the knowledge base.</td>
</tr>
<tr>
<td>Disable category editing</td>
<td>Check box to disable editing of knowledge categories. If selected, only knowledge managers can add or edit knowledge categories for the knowledge base.</td>
</tr>
<tr>
<td>Checklist</td>
<td>Checklist to evaluate the quality of articles in the knowledge base.</td>
</tr>
<tr>
<td>Owner</td>
<td>The user responsible for the knowledge base. A knowledge base owner can assign other roles to the knowledge base.</td>
</tr>
<tr>
<td>Manager</td>
<td>Users who perform administrative functions on the knowledge base.</td>
</tr>
</tbody>
</table>

Note: The **Article Validity** field is configured to set the **Valid to** date for an article. The **Valid to** date is the date this knowledge article expires. When you create an article within a knowledge base, the date value in the **Valid to** field of the article is calculated as follows: Created (sys CREATED ON) + Article Validity (in days). An article author or editor can select whether to keep or change the **Valid to** date (see Create a knowledge article). If the **Article Validity** field is blank, the date in the **Valid to** field date is set to January 1, 2100.
<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can Contribute</td>
<td>The Can Contribute user criteria list for this knowledge base. <strong>Note:</strong> It is recommended to assign appropriate user criteria to secure contribute access. See, Select user criteria for a knowledge base.</td>
</tr>
<tr>
<td>Article Templates</td>
<td>If you have activated the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin, the Article Templates related list is displayed. If there are article templates in the related list, articles in that knowledge base can only be created using one of the article templates listed. If the Article Templates related list is empty, articles can be created using any article template. Click Edit to map article templates to the knowledge base. <strong>Note:</strong> Admins, knowledge admins, and knowledge managers can edit the article templates for the knowledge base.</td>
</tr>
<tr>
<td>Featured Content</td>
<td>List of knowledge articles that appear in the homepage Featured Content section based on the corresponding keyword search set for each article.</td>
</tr>
<tr>
<td>Knowledge Categories</td>
<td>List of knowledge categories associated with this knowledge base.</td>
</tr>
</tbody>
</table>

6. Click Submit.

**Create a custom knowledge homepage**

As a system administrator, you can create a module allowing users to open a knowledge homepage for a specific knowledge base or category.

Role required: admin

1. Right-click the application label in the application navigator and select Edit Application.
2. In the Modules related list click New.
3. Enter a Title for the module.
4. In the Link type field, select URL (from Arguments).
5. In the Arguments field, append one or more of the following values to $knowledge.do#/search?.

<tr>
<td>sysparm_kb=&lt;knowledge base sys_id&gt;</td>
<td>Enter the sys_id of a knowledge base to show knowledge articles from that knowledge base by default. If the specified knowledge base does not exist, the default knowledge homepage appears when accessing the custom homepage module.</td>
</tr>
<tr>
<td>sysparm_category=&lt;knowledge category sys_id&gt;</td>
<td>Enter the sys_id of a knowledge category to show knowledge articles from that category by default. If the specified category does not exist, the default category for the selected knowledge base appears when accessing the custom homepage module. Note: The category passed in this parameter must belong to the knowledge base passed in the <code>sysparm_kb</code> parameter.</td>
</tr>
<tr>
<td>sysparm_order=&lt;view_count, last_modified, or relevancy&gt;</td>
<td>Enter the default sort order for articles to appear in.</td>
</tr>
</tbody>
</table>

To create a homepage for a *Facilities* knowledge base with a `sys_id` of d582764047022100158b949b6c9a7145 and sorting by last modified date, enter `$knowledge.do#/search?sysparm_kb=d582764047022100158b949b6c9a7145&sysparm_order=last_modified` in the **Arguments** field on the Module form.

**Knowledge workflows**

The publishing and retirement processes for a knowledge article are controlled by workflows defined for the knowledge base that the article belongs to.

You can assign different workflows to each knowledge base.

You can use one of the default workflows, or create your own workflows to define custom publishing and retirement processes for different types of knowledge.

For the workflows that require approval, you can configure which users can approve or reject by editing the `getApprovers()` function in the `KBWorkflow` script include.
### Default knowledge workflows

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
</table>
| Knowledge - Approval Publish | Requests approval from a manager of the knowledge base. Articles in approval are in **Review** state before moving to **Published** state once approved. If the manager rejects the request, the workflow is canceled and the article remains in **Draft** state.  
If ownership groups is enabled, email notifications with a link to the article are sent to the ownership group members for approval.  
If ownership groups is not enabled, email notifications with a link to the article are sent to knowledge base managers for approval.  
A notification is also sent to authors or revisers of articles to inform them that their article has been approved or rejected.  
To turn on approval email notifications, set the `glide.knowman.enable_approval_notification` property to `true`. |
| Knowledge - Approval Retire | Requests approval from a manager of the knowledge base before moving the article to the retired state. The workflow is canceled and the article remains in the published state if any manager rejects the request. |
| Knowledge - Instant Publish | Immediately publishes a draft article without requiring an approval.                                                                                                                                          |
| Knowledge - Instant Retire | Immediately retires a published article without requiring an approval.                                                                                                                                        |
| Knowledge - Publish Knowledge | A subflow that moves the knowledge article to the published state. You can use this subflow when defining your own workflow.                                                                               |
| Knowledge - Retire Knowledge | A subflow that moves the knowledge article to the retired state. You can use this subflow when defining your own workflow.                                                                                  |

**Note:** Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.

### Activate the Knowledge Management Advanced plugin

Activate the Knowledge Management Advanced plugin (`com.snc.knowledge_advanced`) to enable advanced features for Knowledge Management.

Role required: admin

The Knowledge Management Advanced plugin includes feature code and demo data.

The Knowledge Management Advanced Installer plugin (`com.snc.knowledge_advanced.installer`) is used to activate the Knowledge Management Advanced plugin.
Note: The Knowledge Management Advanced plugin is not automatically activated with the Knowledge Management v3 application.

The Knowledge Management Advanced Installer plugin performs two validation steps prior to activation.

- Determines if there are any active Knowledge Management v2 knowledge bases.
- Determines if there is a unique database index on the Number field. If a unique constraint has been added to the Number field, the plugin activation fails. Follow the instructions listed in KB0634959 to perform corrective steps to resolve the issue.

You need access to \textit{HI} to be able to view KB articles.

The Knowledge Management Advanced plugin activates the following features:

- **Article Versioning**
  Customers must migrate to Knowledge Management v3 completely to use article versioning.
- **Article Subscriptions**
  The Knowledge Management Advanced plugin activates the Subscriptions and Activity Feed Framework plugin (com.snc.activity_subscriptions).
- **Article Quality Index**
- **Article Templates**
- **In-Context Article Creation**
- **External Content Integration**
  Activating the Knowledge Management - External Content Integration plugin automatically activates the Knowledge Management Advanced Installer plugin.
- **Knowledge User Criteria Diagnostics**
- **Actionable Knowledge Feedback**

Demo data is included as part of the Knowledge Management Advanced plugin. If the validation step performed by the Knowledge Management Advanced Installer plugin completes successfully, the Knowledge Management Advanced plugin is activated automatically. However, the demo data is not included in this activation. To load the demo data, go to the Knowledge Management Advanced plugin page, click the \textbf{Load Demo Data Only} related link, and then click \textbf{OK}.

1. Navigate to \textit{System Definition} > \textit{Plugins}.
   A banner notifies you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

   \textbf{Note:}
   To redirect to the legacy list view for plugins, click the link.

   ![You have been redirected to All Applications. To see the Plugins list click here](image)

2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in \textit{Request a plugin}.

3. Activate the plugin.
You can activate the plugin directly from the All Applications page or you can view more details about the plugin before you activate it.

- If you are certain that you have the correct plugin, click **Install**, and when you see the dialog box, click **Activate**.

- To view plugin details before activation:
  1. Click the plugin name.
  2. On the form, click the **Activate/Update** related link.
  3. In the dialog box, review the dependent plugins.
     - If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.
  4. If demo data is available and you want to install it, click **Load demo data**.
     - Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.
  5. Click **Activate**.

**Knowledge article templates**

Article templates have pre-defined fields structured in a specific order. These templates help create a consistent structure for knowledge articles.

Using the Knowledge Article Templates feature, as a knowledge administrator (a user with knowledge_admin role), you can create article templates, add or customize fields in a template, and activate or deactivate a template.

As a security administrator (a user with security_admin role), you can configure field-level security in any template to make it visible to specific users.

As an author, you can create articles using pre-defined article templates or any newly created article templates.
Pre-defined knowledge article templates

Use either the standard template or one of the pre-defined How To, What Is, FAQ or KCS article templates.

**Note:**

When you upgrade Knowledge Management to Kingston or later releases, all existing articles from the earlier version automatically use the standard template of the upgraded version. For example, if you upgrade Knowledge Management from Jakarta to Kingston, all existing articles use the standard template available in the Kingston version.

All pre-defined templates are inactive by default. If you do not activate a template, the articles automatically use the standard template. As a knowledge admin, you can activate a template by navigating to **Knowledge > Administration > Article Templates**. Then in the article template list, set the **Active** field to true for one or more templates you would like to activate.

The table below lists the fields available in each template and the name of the template table.

### Pre-defined knowledge article templates

<table>
<thead>
<tr>
<th>Template name</th>
<th>Template fields</th>
<th>Maps to table</th>
<th>SEO Description Tag</th>
</tr>
</thead>
<tbody>
<tr>
<td>FAQ</td>
<td>• Question</td>
<td>FAQ (kb_template_faq)</td>
<td>Question</td>
</tr>
<tr>
<td></td>
<td>• Answer</td>
<td></td>
<td></td>
</tr>
<tr>
<td>How To</td>
<td>• Introduction</td>
<td>How To (kb_template_how_to)</td>
<td>Introduction</td>
</tr>
<tr>
<td></td>
<td>• Instructions</td>
<td></td>
<td></td>
</tr>
<tr>
<td>What Is</td>
<td>• Introduction</td>
<td>What Is (kb_template_what_is)</td>
<td>Introduction</td>
</tr>
<tr>
<td></td>

</tr>
<tr>
<td>Standard</td>
<td>Text</td>
<td>kb_knowledge</td>
<td>Text</td>
</tr>
</tbody>
</table>

**Activating knowledge article templates**

The Knowledge Article Templates feature is activated with the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin. For details, see [Activate the Knowledge Management Advanced plugin](#).

**Deactivating knowledge article templates**

You cannot delete an article template because article templates have an associated child table. Deleting a template would also require deleting the child table. Due to the limitations on dropping tables, article templates and template columns are explicitly made non-deletable. Instead you
can disable the Knowledge Article Templates feature by clearing the **Active** check box on the Article Template form.

## Create an article template

Create new article templates in addition to the pre-defined templates. Add new fields based on how you want to customize and display your content.

**Role required:** knowledge_admin or admin

For each new article template, a child table of the Knowledge (kb_knowledge) table is created. When you add a new field to the template, a new column is added to that table created for the template.

1. Navigate to **Knowledge > Administration > Article Templates**, and click **New**.
2. Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the article template.</td>
</tr>
<tr>
<td>Description</td>
<td>Description for the article template.</td>
</tr>
<tr>
<td>SEO Description Tag</td>
<td>Article template field name. The content in this field is used as meta description tags to search for articles created using this article template.</td>
</tr>
</tbody>
</table>

3. Right-click the form header and click **Save**.
4. In the **Article Templates Field** related list, add fields to the template.

To add a field:

a) Click **New**.

b) Fill in the following fields as required:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Name</td>
<td>Title to display on the template form.</td>
</tr>
<tr>
<td>Field Type</td>
<td>Available field types:</td>
</tr>
<tr>
<td></td>
<td>• HTML</td>
</tr>
<tr>
<td></td>
<td>• String</td>
</tr>
<tr>
<td></td>
<td>• Integer</td>
</tr>
<tr>
<td></td>
<td>• Date</td>
</tr>
<tr>
<td></td>
<td>• Date and time</td>
</tr>
<tr>
<td>Order</td>
<td>Position of the field in the article page view and the article edit view.</td>
</tr>
<tr>
<td>Article Template</td>
<td>(Read-only) Name of the article template associated with this field.</td>
</tr>
<tr>
<td>Template Table</td>
<td>(Read-only) Name of the table for this template.</td>
</tr>
<tr>
<td>Template Field</td>
<td>(Read-only) Name of the template column associated with this field.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>If checked, this field is mandatory.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Expand/Collapse</td>
<td>Defines whether the template field displays as collapsed or expanded by default.</td>
</tr>
<tr>
<td>Active</td>
<td>If checked, this field displays in the template.</td>
</tr>
<tr>
<td>Heading style</td>
<td>CSS formats applied to the template header. For example, to display the background of the template header in red, with a 24-px font size, Arial font family, and white text color, enter the following code: background-color:red; font-size:24px; font-family:Arial; color:white;</td>
</tr>
<tr>
<td>Field style</td>
<td>CSS formats applied to the template fields. Any CSS format applied at the field level is automatically applied to the header if not already specified in the Heading style field. For example, to display the 300px page width, 25px solid green border, 25px padding, and 25px page margin, enter the following code: width:300px; border:25px solid green; padding:25px; margin:25px;</td>
</tr>
</tbody>
</table>

5. Configure the article template form to display the fields that you added to the template.

   **Note:** You must have the admin role to configure the form layout. If the field is not available in the form layout, use the form designer to configure the fields.

   a) Navigate to Knowledge > Articles > Create New.
   b) Select the template in which you want to display the fields.
   c) Right-click the header and select Configure > Form Layout
   d) Select and move the required fields from the Available to the Selected list.
   e) Click Save.

   **Note:** Authors who started a session before a template was created or activated will see the newly added template upon their next login.

If you want to search for duplicate articles when creating an article from a new template, you must configure the article template table for contextual search. On the Table Configuration form, the Search context field must be set to Knowledge ML Search. For more information, see Configure table for a contextual search.
Restrict access to fields in an article template

Use encryption context to set field-level security in article templates and display the fields based on user permissions.

Activate the Encryption Support plugin to enable field-level security using encryption context.

Role required: security_admin

2. In the Name field, enter a name for the encryption context and click Submit.
3. Set the Type field for a table to Encrypted Text.
   To set the Type field for a table to Encrypted text:
   a) Navigate to System Definition > Dictionary.
   b) Select the table to set the Type field to Encrypted Text.
   c) In the Type field, select Encrypted Text.
   d) Click Update.

The field is configured for encryption context.

4. Configure roles that can view the fields configured for encryption context.
   To configure the roles that can view the fields:
   a) Navigate to User Administration > Roles and select the role you want to assign permissions to view this field.
   b) In the Encrypted context field, select the name of the encryption context to apply for this role.

   Note: If the Encrypted context field is not on the form, configure the form to add the field.

5. Click Update.
   The field is displayed if the user has permissions to view the configured encrypted text field.

Generate SEO information for articles using article templates

Improve the searchability of knowledge articles by using the content in an article template field to generate SEO tags for articles created using that template.

Role required: knowledge_admin or admin

   Note: If you are using the Standard article template, the content of the Text field is used to generate the tags.

You can define the number of characters to be used as tags in the glide.knowman.seo.pages.meta_description.length system property.

1. Navigate to Knowledge > Article Templates.
2. Select an article template.
3. In the SEO Description Tag field, select an article template field.
4. Click Update.

   Note: You can change which article template field is used for generating SEO. Changes are applied only to knowledge articles created or updated after the change.
was made. To apply the update to all existing published articles created using this template, run the **Populate Meta Description on KB Articles** fix script.

---

### Article versioning

Use the Knowledge Management article versioning feature to create and maintain multiple versions of a knowledge article.

Knowledge contributors can create a new version of a knowledge article from an existing published version. This existing version can be either the latest published version or an older outdated version. All changes are stored in the new version of the article and the information in the existing article remains the same.

Activate the **Knowledge Management Advanced plugin** (com.snc.knowledge_advanced) to use the knowledge subscription feature.

If you import published knowledge articles from a ServiceNow instance that does not support article versioning, you must run the **Initialize Versions on Articles** fix script to enable article checkout and editing.

With the article versioning feature, knowledge users can:

- Check out the latest version of a published article and create a new version.
- Select a previously published (outdated) version of an article and make it current.
- Recall an article that is being reviewed.
- Retire the latest published version of an article.

There are two types of article revisions: major and minor. Minor revisions include updates to an article that has not yet been published. Major revisions include updates to an article that has been published and is available to customers. To track the different revisions, the article versioning feature introduces version numbering.

With the article versioning feature, the knowledge article number also includes the version number. All references to knowledge articles use this number format. For example, KB0010003 v2.0.

### Manually update customized files

If you have customized any of the files that are updated as part of the Knowledge Management Advanced Installer plugin, these files are skipped during plugin activation and must be updated manually.

Manually update your customization to include the article versioning-related changes.

- Add the **Version** field to the Knowledge form layout and the Knowledge list view, if it is not already present.
- Add the **outdated** choice to the **Workflow** choice list field on the Knowledge form, if it is not already present. Keep the value as **outdated** because of dependencies that article versioning functionalities have on this choice.
- Update the **Knowledge > My Flagged** and **Self-Service > My Knowledge Articles** modules to include the following condition in the **Filter** field, if these modules do not already reflect this change: **Revised by is (dynamic) me**.

If you have customized any of the Knowledge Management Overview dashboard reports, these files are also skipped during plugin activation and must be updated manually.
Article versioning changes

Article versioning introduces new actions that allow knowledge users to create and revise versions of existing articles. It also introduces new fields and related lists to the Knowledge form, new columns to the Knowledge list, and updates to Knowledge dashboard reports.

New user actions

As part of creating article versions, users can:

- Check out a published article and create a new version by clicking **Checkout** on the Knowledge form.
  
  **Note:** Only the author, knowledge base owner, and users with the knowledge_admin role can edit an article in the draft state.

- Recall an article that is being reviewed by clicking **Recall** on the Knowledge form.

- Select a previously published article in the Outdated state and make it the current published version by clicking **Make this current** in the Knowledge form header.

  **Note:** To edit a published article without having to create a new version, make sure the `glide.knowman.versioning.enable_minor_edits` property is enabled.

Changes to the Knowledge list

The article versioning feature adds the following to the Knowledge list:

- The **Version** column displays the article version number. The Knowledge list displays multiple versions of an article.
- The **Workflow** column includes the new **Outdated** state.

Changes to the Knowledge form

The article versioning feature adds the following to the Knowledge form:

- The **Version** field displays the article version number.
- The **Display number** field displays a combination of the article number and the version number. For example, KB0010004 v1.02. All references to a knowledge article use this display number.

- The **Base Version** field displays the knowledge article number and version on which the current article is based.
- The **Revised By** field displays the name of the user who checked out a published article and created a new version.

- The **Article Versions** related list displays a list of all versions for an article. From this list, you can:

  - Click the **Version** to view a specific version of an article.
  - Click the **View Article** related link to see the article page view.

  **Note:** If necessary, configure the form to display the fields and the related list.
Changes to Knowledge modules

The article versioning feature introduces the following Knowledge module changes:

- **My Knowledge Articles**
  - For a knowledge user, this module includes records for the articles authored by the user as well as records for each article revised by the user.
  - For a knowledge reviser, this module includes records for the articles published by the user as well as records for each article revised by the user.

- **My Flagged**
  - For a knowledge user, this module includes records for each revision made to articles authored by the user.
  - For a knowledge reviser, this module includes records for each article revised by the user.

**Note:** Users that have customized these modules do not see these changes.

Changes to Knowledge Management dashboard reports

The Knowledge Management Overview dashboard reports have been updated to include article versioning-related changes when the Knowledge Management Advanced plugin is activated.

- Articles Flagged in the Last 30 Days
- Articles Marked Not Useful in the Last 30 Days
- Articles Used per Month
- Knowledge use
- Knowledge view
- Knowledge updated in past 30 days
- Knowledge flagged in past 30 days
- Knowledge by Workflow state
- Knowledge created by Author
- Knowledge created in past 30 days
- New Knowledge Articles Created in the Last 30 Days
- Knowledge Ratings for past 30 days

Versioning information available in the Knowledge Management Service Portal

Knowledge search results show the article number and the version number for each article.

**Note:**

To display the article version number next to the article number in the search results, enable the glide.knowman.search.show_article_number property in the Knowledge Search Properties section of the Knowledge Management Properties page.

If you are accessing an article from the base system or knowledge service portals using the URL to a KB article, you must also include the article version number in the URL. For example, to access the KB0000005 knowledge article, instead of using the https://<instance name>/sp?id=kb_article&sys_id=KB0000005 as the URL, you must use...
https://<instance name>/sp?id=kb_article&sys_id=KB0000005%20V1.0 to view the
article.

The article view page shows a version history section for articles that have been updated. This
section includes the version numbers, date updated, and the name of the author or reviser.

- Click Latest version or the version number and current state to expand the version history
section.
- Click the version number to open that particular version of the article.
- When viewing an outdated article, a message informs the user that a newer updated version is
available. The message includes a link to the latest version.

Feedback on article versions

With the article versioning feature, users can view and contribute to feedback on the current
versions of knowledge articles.

For more information about feedback options, see Knowledge feedback.

<table>
<thead>
<tr>
<th>Feedback option</th>
<th>How this option works with article versioning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rating an article</td>
<td>The average rating for an article is carried over to the checked out version. The average rating calculation updates and displays on the current version of the article.</td>
</tr>
<tr>
<td>Marking an article as helpful</td>
<td>The helpfulness percentage of a previous version of an article is also considered for a new version when displayed in the helpfulness column on the homepage.</td>
</tr>
<tr>
<td>Comments</td>
<td>The Comments section at the bottom of an article displays comments from previous versions unless Live Feed is enabled. Live Feed only shows comments for the current version.</td>
</tr>
<tr>
<td>Flagging an article</td>
<td>Checking out an article or setting a previous version to the current version resets the flagged value to false.</td>
</tr>
<tr>
<td>View count</td>
<td>The view count is carried over to the checked out article. Any view of a version of an article increments the view count of all subsequent versions. Views to a newer version of an article do not affect the view count of previous versions.</td>
</tr>
<tr>
<td>Use count</td>
<td>The use count is carried over to the checked out article. Any use of a version of an article increments the use count of all subsequent versions. Any use of a newer version of an article does not affect the use count of previous versions.</td>
</tr>
</tbody>
</table>

Knowledge article version numbers

Knowledge article version numbers follow a specific pattern. Increments to the version number
depend on the revision type.

Article version numbers follow this pattern: <major release number.minor release number>

The type of revision being made to an article determines the increment. A minor revision
increments the version number by 0.01. A major revision, such as publishing an article, increments
the version to the next whole number, for example, from version 2.02 to 3.0.
The following example illustrates the life cycle of a versioned article and the changes to the version number.

<table>
<thead>
<tr>
<th>User action</th>
<th>Article state</th>
<th>Version number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge author creates a new article</td>
<td>Draft</td>
<td>0.01</td>
</tr>
<tr>
<td>Knowledge author makes a change and updates the article.</td>
<td>Draft</td>
<td>0.01</td>
</tr>
<tr>
<td>Knowledge author submits the article for review.</td>
<td>Review</td>
<td>0.02</td>
</tr>
<tr>
<td>Knowledge author recalls the article to make another change.</td>
<td>Draft</td>
<td>0.03</td>
</tr>
<tr>
<td>Knowledge article submits the article for review</td>
<td>Review</td>
<td>0.04</td>
</tr>
<tr>
<td>Approver rejects the article and requests a change.</td>
<td>Draft</td>
<td>0.05</td>
</tr>
<tr>
<td>Knowledge author makes the change and submits the article for review.</td>
<td>Review</td>
<td>0.06</td>
</tr>
<tr>
<td>Approver approves the article</td>
<td>Published</td>
<td>1.0</td>
</tr>
<tr>
<td>Knowledge author checks out the published article.</td>
<td>Draft</td>
<td>1.01</td>
</tr>
<tr>
<td>Knowledge author submits the article for review.</td>
<td>Review</td>
<td>1.02</td>
</tr>
<tr>
<td>Approver approves the article</td>
<td>Published</td>
<td>2.0</td>
</tr>
</tbody>
</table>

When the version 2.0 article is published, the state of the version 1.0 article changes to **Outdated**.

Any change to the state of an article results in a version increment, except to and from the **Pending retirement**, **Retired**, and **Outdated** states.

**Knowledge article version information**

Users can view version information for a knowledge article from the Knowledge view page.

The knowledge article number and the version number appear at the top of the article, just below the title. Clicking the version number expands the version history section, which includes a list of the available article versions. User roles determine what is included in this list:

- Users with read access to a knowledge base can see the latest published version and previous major versions.
- Users with read and contribute access to a knowledge base can see the latest published version, previous major versions, and any draft or review versions.

You can view any of the previous versions of an article by clicking the version number in the list. When you view a previous version, a message at the top of the article indicates that an updated version is available.
At the bottom of a knowledge article, you can see additional information about an article, including the name of the author or revisor and the date that the article was last modified.

**Knowledge article states**

A versioned knowledge article can be in one of several states as it progresses through the creation cycle.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draft</td>
<td>The article is in the process of being created.</td>
</tr>
<tr>
<td>Review</td>
<td>The draft version of the article is sent to reviewers to approve or reject.</td>
</tr>
<tr>
<td>Published</td>
<td>The article is approved and published. When the state of an article changes to Published, the state of any previous published versions of that article changes to Outdated.</td>
</tr>
<tr>
<td>Pending retirement</td>
<td>The published article is selected for retirement, pending approval.</td>
</tr>
<tr>
<td>Retired</td>
<td>The published article is retired.</td>
</tr>
<tr>
<td></td>
<td>Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.</td>
</tr>
<tr>
<td>Outdated</td>
<td>A more recent version of the article has been published. End users can read published articles as well as the outdated versions.</td>
</tr>
</tbody>
</table>

**Article versioning properties**

The knowledge administrator can set configuration properties that enable users to edit specific fields on published articles without creating new versions.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable article versioning feature.</td>
<td>Select the Yes check box to enable the article versioning feature.</td>
</tr>
<tr>
<td>(glide.knowman.versioning.enabled)</td>
<td>Type: true</td>
</tr>
<tr>
<td></td>
<td>Default value: true</td>
</tr>
<tr>
<td></td>
<td>Location: Knowledge &gt; Administration &gt; Properties</td>
</tr>
<tr>
<td>Enable minor edits to a published article without creating a new version.</td>
<td>Select the Yes check box to enable minor edits to published articles without creating a new version.</td>
</tr>
<tr>
<td>(glide.knowman.versioning.enable_minor_edits)</td>
<td>Type: true</td>
</tr>
<tr>
<td></td>
<td>Default value: false</td>
</tr>
<tr>
<td></td>
<td>Location: Knowledge &gt; Administration &gt; Properties</td>
</tr>
</tbody>
</table>

**Note:** This feature is available for the following users: the knowledge administrator, the knowledge base manager, and the knowledge base owner.
Check out a published article and create a new version

Create a new version of a knowledge article by checking out the latest published version.

Users with canContribute permissions, including the knowledge owner, knowledge manager, and knowledge administrator, can check out a published article unless there is already a checked out version. If a version has been checked out, the Checkout button does not appear on the Knowledge form header.

When you check out an article, the default value of Valid to field of the article is derived from the Article Validity field configured for the knowledge base (see Create a knowledge base). If the Article Validity field is blank, the date in the Valid to field date is set to January 1, 2100. An article author or editor can select whether to keep or change the default Valid to date.

**Note:** For article versions that were created in the previous releases, the relative paths to the attachments may not be updated. To update them, activate and run the Fix attachment links on article versions fix script.

1. Navigate to Knowledge > Articles > Published.
2. Select the desired article from the list.
3. Click Checkout in the Knowledge form header.
   The system creates a new version of the knowledge article and displays a message to the user. The article number for the new version remains the same, the version number is increased by 0.01, and the state changes to Draft. The new version of the article is added to the Knowledge list and to the Article Versions related list on the Knowledge form.

Approve an article that is being reviewed

Approve an article that is being reviewed and create a new published version.

When an article is in the Review state, only those users who are included in the Approvals related list can modify the article.

1. Navigate to Knowledge > Articles > Unpublished.
2. Open an article in the Review state and review the text.
3. In the Approvals related list, click Requested in the State column to display the Approval form for the article.
4. Click Approve.
   The system displays the Knowledge form. The version number of the article increments to the next whole number (for example, from 2.02 to 3.0) and the state changes to Published. The new published version of the article is added to the Knowledge list and to the Article Versions related list on the Knowledge form.

Revert an outdated article to the current state

Use an outdated version of an article to create a new version.

---

**Property** | **Description**
--- | ---
A comma-separated list of fields that can be edited on published articles without creating a new version. | Enter the fields in a comma-separated list that can be edited on published articles without creating a new version. Type: string  Default value: valid_to  Location: Knowledge > Administration > Properties
Roles required: knowledge base owner, knowledge_manager, knowledge_admin

This action is available for earlier published version that have a state of Outdated and only when there is no checked out version. If a version has been checked out, the Make this current button does not appear on the Knowledge form header.

1. Navigate to Knowledge > Articles > All.
2. Open an article in the Outdated state.
3. Click Make this current in the Knowledge form header.
   The system displays the Knowledge form. The version number increments to the latest version number plus 0.01 and the state changes to Draft. For example, if the latest published version of an article is 3.0 and you select the outdated 1.0 version to become the current version, the version number increments to 3.01.

Recall an article that is being reviewed

Recall an article that is being reviewed to make additional changes.

If ownership groups is not enabled, only the author of the article, knowledge administrators, or system administrators can recall the article.

If ownership groups is enabled, the author of the article, the ownership group manager, ownership group members, knowledge administrators, or system administrators can recall an article.

Recalling an article in the Review state results in a minor version increment.

When a revised article is in Review state, only the corresponding versions reviser can recall the article to make additional changes.

1. Navigate to Knowledge > Articles > All.
2. Open an article in the Review state.
3. Click Recall in the Knowledge form header.
   The system returns the state of the article to Draft, increments the version number by 0.01, and displays a message to the user.

View all versions of an article

View a list of all available versions for a selected knowledge article and then view the selected version in a new tab.

The list of all available versions for a selected knowledge article is displayed in the Article Versions related list on the Knowledge form. Users with read access can see major versions. Users with contribute access can see major and minor versions.

1. Navigate to Knowledge > Articles > All.
2. Open the desired article.
3. Click the Article Versions tab to display the related list.
4. Click Version to display the desired article version in a new tab.
5. If desired, click the View Version related link to see the article view page.

Compare two versions of an article

Select and compare two versions of a knowledge article.

Role required: knowledge_manager, knowledge_admin

1. Navigate to a knowledge article with multiple versions.
2. In the Article Versions related list, select two versions of the article to compare.
3. In the Actions choice list below the list, select Compare.
The Compare Versions page opens in a new tab and lists the fields for the selected articles in a side-by-side format. Differences between the two articles are highlighted.

4. When you are finished comparing the two versions, click Done to return to the Knowledge form.

Retire a versioned article

You can retire the latest published version of a knowledge article. Retiring a knowledge article does not create a new version. It simply marks the article as Retired.

This action is available only when there is no checked out version. If a version has been checked out, the Retire button does not appear on the Knowledge form header.

**Note:** For the Knowledge - Approval Retire workflow, this happens only when the retire request is approved.

In addition to the knowledge administrator and the knowledge manager, the following users can retire a versioned article:

- knowledge owner
- latest publisher of the versioned knowledge article

Users can still access outdated articles that have been attached to incidents by navigating to the article view page with the sys_id of the article. Outdated articles include a message that an updated article is available.

If versioning is disabled, only the latest version of the article is shown in search results and list views.

Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.

1. Navigate to Knowledge > Articles > Published.
2. Open the desired article.
3. Click Retire in the Knowledge form header.
   
   The system returns to the Knowledge list. The state of the article changes to Pending retirement and the state of previously published versions change to Outdated.

   **Note:** You cannot check out or edit a retired article.

Disable the article versioning feature

Users with the system administrator role can disable the article versioning feature by setting a property.

Role required: admin

The Enable article versioning feature property controls the article versioning feature. Setting this property to false disables the article versioning feature. Once disabled:

- The Version field is removed from the Knowledge form. The Version column remains on the Knowledge list and can be removed manually.
- The Article Versions related list is removed from the Knowledge form.
- The Recall, Checkout, and Make this current buttons are removed from the Knowledge form.
- Outdated articles are removed from Knowledge list views.
- The version history does not appear on the article view page.

Articles continue to be versioned in the background. Minor versions are incremented until an article is published and then the version number is increased to the next major version.
Users can still access outdated articles that have been attached to incidents. Outdated articles include a message that an updated article is available.

1. Navigate to Knowledge > Administration > Properties.
2. Locate the Enable article versioning feature property in the Article Versioning Properties section.
3. Click the check box to disable the property.
4. Click Save.

Knowledge manager

Having multiple knowledge bases allows an organization to spread management responsibilities across multiple users, known as knowledge managers.

As a knowledge manager, you can assign other managers, define category structures, configure which users can read and contribute articles, move and pin articles, and modify most fields on the Knowledge Base form. You can also approve the publishing or retiring of knowledge articles in those knowledge bases. You can enable Social Q&A for your knowledge bases if the Social Q&A application is active.

The primary manager of a knowledge base is the owner of that knowledge base. Each knowledge base must have one owner. There may be any number of additional managers for each knowledge base. All managers of a knowledge base, including the owner, automatically receive the knowledge_manager role.

Add a knowledge article to featured content

Add a knowledge article to appear in the Featured content section of the knowledge homepage and at the top of knowledge search results page.

Role required: knowledge_manager, knowledge_admin, or admin

Adding an article to featured content requires associating an article to specific keywords. You can search a keyword in the knowledge service portal or search results page to display articles in the Featured content section or at the top of the knowledge search results list.

Note: The articles added to the Featured content section do not appear in the global search results and Virtual Agent conversations.

- To display articles in the Featured content section, add a default keyword in the glide.knowman.default_keyword property Value field and add the same keyword to all articles you want to display in that section.
- To display articles at the top of the knowledge search results list, add a list of keywords to each article you want to display at the top of the list.

1. Navigate to Knowledge > Knowledge Bases.
2. Select a knowledge base.
3. In the Featured content related list, click New.
4. In the Knowledge field, search for and select the desired article.
5. In the Keywords field, click the lock/unlock toggle icon.
6. Click the lookup icon to open the Knowledge keywords list.

Note: Each keyword must be a single word and cannot contain spaces.

7. Select the keyword to add for this article.
   - Add the default keyword to display this article in the Featured content section during search.
• Add all related keywords for the article to display it at the top of the knowledge search results page during search.

**Note:** You can create knowledge keywords, if it does not already exist in the list, and then add it to the article.

8. Click the lock/unlock toggle icon to add the keywords to the article.
9. Click Submit.

### Create a user criteria record in Knowledge Management

You can create or modify a user criteria record in Knowledge Management. User criteria is used to control which users, groups, roles, companies, locations, and/or departments can access knowledge bases and articles.

Role required: user_criteria_admin

1. Navigate to Knowledge > Administration > User Criteria.
2. Click New or open a record.
3. Fill out the fields on the form as required.
   For field descriptions, refer to [Create a user criteria record in Service Catalog](#).

**Note:** Including scripts in user criteria records can impact performance, because scripts are evaluated dynamically.

If scripted user criteria is defined for a knowledge base, user access to knowledge bases is evaluated once per session. If the script results in changes after a session cache is built, the result takes effect in the next session.

Changes to a user role, group, company, location, or department take immediate effect.

4. Click Submit.

### Select user criteria for a knowledge base

You can specify user criteria to control which users can create, read, write, and retire knowledge articles within a knowledge base.

Role required: knowledge_manager, knowledge_admin, or admin

User criteria refers to knowledge base records that determine the users who can read or contribute to a knowledge base. User criteria definitions:

- **canRead**
  users who can read all knowledge base articles

- **cantRead**
  users who cannot read, create, or modify articles in the knowledge base

- **canContribute**
  users who can read, create, and modify articles in the knowledge base

- **cantContribute**
  users who cannot create or modify articles in the knowledge base

### Set user criteria for a knowledge base without explicit roles
If a knowledge base has no user criteria defined, all users (including unauthenticated users) can read its articles. Any user having at least one role can create and edit articles, unless they are members of the cantContribute user criteria. If a knowledge base has canRead user criteria, but no canContribute user criteria, all users with at least one role can access and modify the knowledge base.

**Set user criteria for a knowledge base with explicit roles**

If you create a new knowledge base with the Explicit Roles plugin active, only users with snc_internal role can access the knowledge base. To make all existing knowledge bases that do not have the canRead or canContribute user criteria accessible only to users with the snc_internal role, activate and run the Fix unsecured knowledge bases fix script.

If the Any User user criteria is associated with a knowledge base, only users with at least one role can view the article within the knowledge base.

This video demonstrates how to control Knowledge Management access through user criteria.

1. Navigate to **Knowledge > Knowledge Bases**.
2. Select a knowledge base you manage.
3. Access one of these related lists, and then select or create user criteria records. For information about user criteria fields, see **User criteria fields**.

<table>

| User D         | User C           | empty  | User A | 1. User D -> Denied Create, Read    |
|                |                  |        |        | 2. User C -> Create, Read           |
|                |                  |        |        | 3. User A -> Read                   |

| User D         | User C           | User B | empty  | 1. User D -> Denied Create           |
|                |                  |        |        | 2. User C -> Create, Read            |
|                |                  |        |        | 3. User B -> Denied Read             |
|                |                  |        |        | 4. All Other Users -> Read           |

| User D         | User C           | User B | User A | 1. User D -> Denied Create, Read    |
|                |                  |        |        | 2. User C -> Create, Read           |
|                |                  |        |        | 3. User B -> Denied Read             |
|                |                  |        |        | 4. User A -> Read                    |

**Note:** In the tables of rules, an implicit last rule is: All Users -> Denied Create, Read.

**Enable user criteria system property to override role read access**

Add the glide.knowman.search.apply_role_based_security system property to enable user criteria to control read access of knowledge bases or articles over roles.
Role required: admin

1. Follow the steps to Add a system property.
2. Add the `glide.knowman.search.apply_role_based_security` property, and set the property value to `false`. This enables specified user criteria to override canRead access specified for roles.

Select user criteria for an article

You can specify user criteria for an article to control which users can read the article.

If an article has no user criteria selected, the article is available to all users, including unauthenticated users, who have access to that knowledge base (based on the user criteria for the knowledge base). Knowledge base user criteria restrictions override article-level user criteria. For example, a knowledge base that is configured to restrict user access overrides any access granted at the article level.

If a user has contribute access to the knowledge base, article-level user criteria are not evaluated and the user can read all articles in the knowledge base. If a user has read access to the knowledge base, article-level user criteria are evaluated to determine if the user has read access to the article.

On the article level, if Can read user criteria is defined, only those users specified can read the article. If an article has Cannot read user criteria defined, those users specified are denied reading the article. Cannot read user criteria overrides Can read user criteria for articles.

If the Any User user criteria is associated with an article, only users with at least one role can view the article.

1. Navigate to Self-Service > My Knowledge Articles.
2. Select an article.
3. Select the desired user criteria for the Can Read and Cannot Read fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can Read</td>
<td>Users who meet one of these criteria can read the article.</td>
</tr>
<tr>
<td>Cannot Read</td>
<td>Users who meet one of these criteria are denied reading the article (regardless of the Can Read setting for the user).</td>
</tr>
</tbody>
</table>

**Note:** If the Can Read and Cannot Read fields are not visible, add the fields to the form by configuring the form layout (click the form context menu icon and select Configure > Form Layout).
<table>
<thead>
<tr>
<th>Knowledge base level</th>
<th>Article level</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Access</td>
<td>Read</td>
</tr>
<tr>
<td></td>
<td>Contribute</td>
<td>canRead</td>
</tr>
<tr>
<td>Yes</td>
<td>N/A</td>
<td>N/A</td>
</tr>
<tr>
<td></td>
<td>User -&gt; Read</td>
<td></td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>N/A</td>
</tr>
<tr>
<td></td>
<td>User -&gt; Denied Read</td>
<td></td>
</tr>
<tr>
<td>Yes</td>
<td>empty</td>
<td>empty</td>
</tr>
<tr>
<td></td>
<td>empty</td>
<td>User</td>
</tr>
<tr>
<td></td>
<td>User</td>
<td>empty</td>
</tr>
<tr>
<td></td>
<td>User</td>
<td>User</td>
</tr>
</tbody>
</table>

Note:
- When article-level read access is assigned to an article, only the user who belongs to that particular user criteria can read the article. Other users are restricted.
- Users with contribute access to a knowledge base can also read articles even if they are not in the defined Can Read user criteria.
- Ownership group users who are either members or managers of groups assigned to an article will have access to contribute to articles even if they don’t have contribute access to the knowledge base.

Define a knowledge article category

Each knowledge base has a hierarchy of categories that organizes the articles.

You must have CanContribute access to the knowledge base or have a knowledge_admin or admin role.

You can define a hierarchy for categories by creating parent-child relationships. The category hierarchy is saved in the Full category field in the Knowledge Category (kb_category) table.

You can create and edit categories separately for each knowledge base.

1. Navigate to Knowledge > Knowledge Bases.
2. Select a knowledge base you manage.
3. Choose an option.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a top-level category.</td>
<td>Navigate to the Knowledge Categories related list and click New.</td>
</tr>
<tr>
<td>Create a child category.</td>
<td>Expand an existing category and click New within the expanded section.</td>
</tr>
</tbody>
</table>

4. Enter a Label for the category. The label appears as the name of the category.
5. Optional: Enter a Value you can use when referencing the category in scripts.
6. Click Submit.

In addition to using categories defined by a knowledge manager, knowledge contributors can add and edit categories when editing an article.
Assign a knowledge base manager

You can assign users as managers of a knowledge base.

Role required: knowledge_admin, or admin

1. Navigate to Knowledge > Knowledge Bases.
2. Select a knowledge base you manage.
3. In the Managers field, click the unlock icon.
4. Add one or more users.
5. Click Update.

After you save the knowledge base record, users selected as managers automatically receive the knowledge_manager role if they do not have it already.

You can remove a knowledge base manager by removing that user from the Managers field. If the user is not a manager of any other knowledge base, the knowledge_manager role is removed from that user.

User criteria diagnosis for Knowledge Management

Manage user access to a knowledge base or an article using user criteria diagnostics. Understand what access users have to a knowledge base or an article and determine which user criteria define those permissions.

User access to a knowledge base or an article can be restricted based on:

- Domain separation
- Access control list (ACL) rules
- Knowledge work flows
- User criteria set for a knowledge base or an article

This feature considers domain separation and user criteria to determine the user access to knowledge bases and articles.

Activating user criteria diagnostics

The user criteria diagnostics feature is activated with Knowledge Management v3 (com.snc.knowledge3) plugin.

Diagnose user access to a knowledge base

Identify which users have access to a knowledge base and what enables that access.

Role required: knowledge_manager, knowledge_admin, or admin

1. Access the User Criteria Diagnostics landing page using one of these options:

<table>
<thead>
<tr>
<th>To access</th>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using the application navigator</td>
<td>Knowledge &gt; Administration &gt; User Criteria Diagnostics</td>
</tr>
</tbody>
</table>
### To access
From a knowledge base

<table>
<thead>
<tr>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. <a href="#">Knowledge &gt; Administration &gt; Knowledge Bases</a></td>
</tr>
<tr>
<td>2. Select the knowledge base to diagnose user access.</td>
</tr>
<tr>
<td>3. In the Related Links section, click <a href="#">Run User Criteria Diagnostics</a>.</td>
</tr>
</tbody>
</table>

The [User Criteria Diagnostics](#) landing page appears with the Select knowledge base field pre-populated.

---

2. To diagnose user access:
   a) In the **Select user** field, select a user.
   b) From the **Select record type** choice list, select **Knowledge base**.
   c) In the **Select knowledge base** field, select a knowledge base.

   Every time you select a different user, record type, or knowledge base, the page refreshes and displays data for the selected user.
   d) Click **Diagnose**.

   The page displays these details:

   - Whether the user has access to the knowledge base based on their domain. Only system administrators can view domain information and change the domain to give access to a user.
   - Which user criteria provides read or read and contribute access for this user to the knowledge base and what type of user criteria definition enables this access.
   - Whether a role that the user has (knowledge_manager, knowledge_admin, or owner of the knowledge base) enables this access.
   - For a user with no access to this knowledge base, which user criteria may be modified to grant the access.

The following image shows an example of a diagnosis where the user Alene Reback does not have access to the IT knowledge base.

Alena can get access to the knowledge base if:

- Alena is added to one of the existing user criteria defined in the knowledge base.
- Alena is added to a new user criteria that is defined and added to the knowledge base.

Click the IT knowledge base link and provide the access by adding Alena to a user criteria for this knowledge base.
**User Criteria Diagnostics**

- **Select user**: Alene Rabeck
- **Select record type**: IT
- **Select knowledge base**: Knowledge Base

**No Access**

Alene Rabeck does not have access to knowledge base (IT).

⚠️ If ACLs were applied to this Knowledge Base, the ACLs will override the permissions defined by user criteria.

**How to Provide Access**

To provide access to knowledge base (IT), add Alene Rabeck to one or more of the following user criteria.

<table>
<thead>
<tr>
<th>User Criteria</th>
<th>Access Type</th>
<th>Set on</th>
</tr>
</thead>
<tbody>
<tr>
<td>The ACME North America IT Department</td>
<td>Can Contribute</td>
<td>Knowledge Base</td>
</tr>
<tr>
<td>All ACME North America employees</td>
<td>Can Read</td>
<td>Knowledge Base</td>
</tr>
<tr>
<td>All ACME Corporation employees</td>
<td>Can Read</td>
<td>Knowledge Base</td>
</tr>
</tbody>
</table>

Diagnose user access to an article

Identify which users have access to an article and what enables that access.

Role required: knowledge_manager, knowledge_admin, or admin

1. Access the User Criteria Diagnostics landing page using one of these options:

<table>
<thead>
<tr>
<th>To access</th>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using the application navigator</td>
<td>Knowledge &gt; Administration &gt; User Criteria Diagnostics.</td>
</tr>
<tr>
<td>From an article</td>
<td>1. Knowledge &gt; Administration &gt; Knowledge Bases.</td>
</tr>
<tr>
<td></td>
<td>2. Select the knowledge base that has the article to diagnose for user access.</td>
</tr>
<tr>
<td></td>
<td>3. In the Knowledge related list, select the article.</td>
</tr>
<tr>
<td></td>
<td>4. In the Related Links section, click Run User Criteria Diagnostics.</td>
</tr>
</tbody>
</table>

The User Criteria Diagnostics landing page appears with the Select article field pre-populated.

2. To diagnose user access:
   a) In the Select user field, select a user.
   b) From the Select record type choice list, select Article.
   c) In the Select article field, select an article.
      Every time you select a different user, record type, or knowledge base, the page refreshes and displays data for the selected user.
   d) Click Diagnose.
      The page displays these details:
      - Whether or not the user has access to the knowledge article based on their domain. Only system administrators can view domain information and change the domain to give access to a user.
      - Which user criteria provides read or read and contribute access for this user to the article and what type of user criteria definition enables this access.
      - Whether a role of the user has (knowledge_manager, knowledge_admin, or owner of the knowledge base) enables this access.
      - For a user with no access to this article, which user criteria may be modified to grant the access.

Note: Members of an ownership group are automatically given Can Contribute access to knowledge articles that their ownership group is associated with.

The following image shows an example of a diagnosis where the user Adela Cervantsz has read access to the KB article, KB0000001 v5.0, in the IT knowledge base because Adela belongs to one of the Can Read user criteria defined in the knowledge base.
## User Criteria Diagnostics

<table>
<thead>
<tr>
<th>Select user</th>
<th>Adela Cervantz</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select record type</td>
<td>Article</td>
</tr>
<tr>
<td>Knowledge Base</td>
<td></td>
</tr>
<tr>
<td>Select article</td>
<td>KB0000001 v1.0</td>
</tr>
</tbody>
</table>

- Diagnose

## Read Access

No user criteria is configured at article level. Adela Cervantz has Read access to article KB0000001 in knowledge base IT, because the user has Read access to the knowledge base.

- If ACLs were applied to this Article, the ACLs will override the permissions defined by user criteria.
- The article's publication status may also impact the user's access to it. If diagnostic results conflict with the user's access, please check the publication status of the article.

## User Criteria Assigned

<table>
<thead>
<tr>
<th>User Criteria</th>
<th>Access Type</th>
<th>Set on</th>
</tr>
</thead>
<tbody>
<tr>
<td>All ACME North America employees</td>
<td>Can Read</td>
<td>Knowledge Base</td>
</tr>
<tr>
<td>All ACME Corporation employees</td>
<td>Can Read</td>
<td>Knowledge Base</td>
</tr>
</tbody>
</table>

I18N - Knowledge internationalization

Organizations with knowledge users who speak multiple languages can activate the optional knowledge internationalization features.

Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2).

When active, knowledge internationalization enables the knowledge management team to create language-specific knowledge articles and keep translations of the same article related to each other so they are easy to manage. Users can view and search within their own language while still being able to view articles in other languages when necessary.

Note:
To set the default language for searching articles to a language different from the logged in language of the user, specify the desired language in the glide.knowman.search.default_language system property. For example, if you are logged in using the French language and would like the default language for searched articles to be English, specify English in the system property. You can then switch to French from within the UI to see French articles. If no language is specified in the system property, articles default to the logged in language of the user.

To enable search for different languages simultaneously, navigate to Knowledge Administration > Knowledge Search > Properties > Enable multi language search. Select the Yes check box to enable the feature.

Note: If you do not enable this property, you can search in one language at a time. If the property is enabled, you can search for multiple languages simultaneously.

Social Q&A does not use language-specific questions and answers. All questions and answers appear in the language they were created in. For example, a question in English is not translated when the current user’s selected language is French.

Activate the knowledge management internationalization plugin

To enable translation of knowledge articles, you must activate multiple plugins.

- I18N: Knowledge Management Internationalization v2 plugin
- Internationalization plugins for each appropriate language

Activate a plugin

Installed Components

Activating the Knowledge Management Internationalization plugin installs these components:

- A relationship named Translated Versions that creates a related list on the Knowledge form showing other articles that have the same parent article.
- A business rule named knowledge query that automatically filters the knowledge portal and search results based on the user’s selected language.
- A UI macro named kb languages.
- Two fields, named Language and Parent, in the Knowledge [kb_knowledge] table and the Knowledge form.

**Knowledge Form Changes**

Activating knowledge management internationalization adds these fields to the Knowledge form.

- **Language**: select the language for the article.
- **Parent**: enter the number of the article that represents the base language. This setting keeps translations of the same article related to each other. Consider choosing the same language consistently for the parent article.

Additionally, the Translated Versions related list is automatically added to the Knowledge form after you save an article.

**Enable ownership groups**

Configure ownership groups and associate them with knowledge articles to maintain article quality, manage approvals, and for timely resolution of feedback.

Knowledge administrators perform the following tasks to configure ownership groups.

- Activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced).
- Set the `glide.knowman.ownership_group.enabled` property to `true`.

**Note**: Once you have set this property to `true`, it is not recommended to set it back to `false`. Before setting this property back to false, manually reassign all knowledge articles associated with any ownership group, close all article approvals sent to ownership groups, and resolve all open feedback tasks assigned to ownership groups.

**Manage ownership groups**

Create ownership groups and associate them to knowledge articles. Knowledge group managers or knowledge administrators can edit ownership groups.

The Knowledge Management Advanced plugin (com.snc.knowledge_advanced) must be activated.

Role required: Users with the knowledge_domain_expert or knowledge_admin roles can create ownership groups.

Users with the knowledge_group_manager or knowledge_admin roles can edit ownership groups.

Create an ownership group by adding members and a manager. Knowledge administrators approve ownership groups.

When knowledge articles are created, ownership groups can be associated to them. Ownership groups manage article approvals and feedback and can edit and retire knowledge articles that they are associated with.

Knowledge group managers can edit ownership groups managed by them by adding or removing members without the need for approval. They cannot change the manager assigned in their groups. Only knowledge administrators can reassign managers.

1. Navigate to **Knowledge > Ownership Groups > Manage Group**.
2. To create an ownership group, select **Create Ownership Group** from the **Request** field.
Note: To edit an existing ownership group, select Edit Ownership Group from the Request field.

3. Fill in the fields on the form, as required.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the ownership group.</td>
</tr>
</tbody>
</table>
| Group email      | An email address for the ownership group. Emails are sent to group members in these cases.  
|                  | - Activity on articles they are associated with, for example, comments.      
|                  | - Article quality checks (AQI) performed on articles they are associated with.  
|                  | If no group email is defined, emails are sent to individual group member emails. |
| Description      | Description that defines the ownership group.                               |
| Manager          | Manager for the ownership group.                                            |
| Group members    | Members of the ownership group.                                             |

4. Click Order Now.
The ownership group is sent to the knowledge administrator for approval. Once approved, the ownership group is ready to use and associate to a knowledge article.

Note: You can also create an ownership group from an existing group.

2. Click a group.
3. In the Type field, enter Knowledge.

Note: If the Type field does not appear on the form, configure the form layout to add it.

4. In the Manager field, enter a manager and add the role knowledge_group_manager.
5. In the Roles related list, click Edit and add the role knowledge_group_member to the group.

Configure the Knowledge Management Service Portal

The Knowledge Management Service Portal enables users to perform the same operations that are available with the Knowledge Management V3 plugin. From the portal, users can view knowledge bases and articles, search for information, sort and filter search results, and provide feedback.

- For new customers on the Madrid and later releases, the Knowledge Management Service Portal plugin (com.snc.knowledge_serviceportal) is active by default.
For existing customers on release versions prior to Madrid, activate the plugin, if required. Configure the Knowledge Management Service Portal properties, including the property that directs users to the Knowledge Management Service Portal homepage.

Navigate to Service Portal > Portals and click Knowledge Portal. See Service Portal for more information about creating a custom interface.

System administrators can configure portal pages and configure widgets for searching, sorting, and filtering knowledge base information. To configure widget instance options and configure search, sort, and filter features, see Knowledge Management Service Portal widgets.

To add knowledge bases to the Knowledge Service Portal, complete the following steps.

1. Navigate to Service Portal > Portals and click Knowledge Portal.
2. Click the Knowledge Bases related list.
3. Click Edit to map one or more knowledge bases to the portal.

**Note:** If no knowledge bases are added, all knowledge bases are available in the portal.

If knowledge bases are mapped, only those knowledge bases are available in the portal. All search results and all widgets display results from the mapped knowledge bases only.

---

### Section 508 compliance features

Users can view and interact with the Knowledge Management Service Portal article view page using Section 508 compliance features. See Set up Section 508 compliance features for more information.

---

**Enable external or public users to view knowledge articles from the Knowledge Management Service Portal**

Enable knowledge articles on the Knowledge Management Service Portal to be visible to external or public users.

The Knowledge Management Service Portal plugin (com.snc.knowledge_serviceportal) must be enabled.

**Role required:** admin

If you are using Knowledge Management within the Customer Service application, you can automatically make knowledge public by activating and running the Make KM Service Portal Pages Public fix script after you install the Customer Service Management plugin (com.sn_customerservice).

If you are using Knowledge Management as a standalone application, perform the steps in this procedure.

1. Navigate to Service Portal > Pages.
2. Search for kb_home and open it.
3. You have to be in the Global application to edit. If a message appears, click here to edit.
4. Perform one of the following actions.
### To Do this

| Make knowledge service portal pages visible to public users | 1. Select the **Public** check box.  
2. Click **Update**. |
|------------------------------------------------------------|--------------------------------------------------|
| Make knowledge service portal pages visible to external users | 1. Click the edit user roles icon.  
2. Select snc_external and click **Done**.  
3. Click **Update**. |

5. Repeat these steps for **kb_article_view** and **kb_search**.

6. Perform one of the following actions.

<table>
<thead>
<tr>
<th>To Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable access to the knowledge base for public users</td>
</tr>
<tr>
<td>Enable access to the knowledge base for external users</td>
</tr>
</tbody>
</table>

**Enable access to the knowledge base for public users**  
Ensure that no **Can Read** user criteria is defined in the knowledge bases you want to give access to.

**Enable access to the knowledge base for external users**  
Add **Can Read** access to the knowledge base.

### Knowledge Management Service Portal properties

Knowledge Management Service Portal properties determine how information is displayed on the Knowledge portal. You must have the admin role to set configuration properties.

The following system properties are set to direct users to the Knowledge Management Service Portal homepage, and to specify the URL suffix for the homepage.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| `sn_km_portal.glide.knowman.serviceportal.enable_redirect` | Directs users to the desired Knowledge homepage.  
- Type: true | false  
- Default value: false  
Set to **true** to redirect users navigating to v2 or v3 pages to the Knowledge Management Service Portal homepage.  
This property is not honored for the following use cases:  
- Contextual search in the Incident form  
- Connect |
| `sn_km_portal.glide.knowman.serviceportal.portal_url` | The URL suffix for the Knowledge Management Service Portal. The default is **kb**. |

The Knowledge Management Service Portal supports the [Knowledge Management V3 properties](#). Configuring widget instance options on the portal pages can override these properties.
Knowledge Management Service Portal widgets

The Knowledge Management Service Portal uses a number of widgets to enable searches, display search results, and display articles, related articles, related items, and social Q&A.

The Knowledge Management Service Portal homepage, search results page, and article view page honor the Knowledge Management V3 system properties. If configured, widget instance options can override the system properties.

Users with the knowledge_admin or admin role can configure the widget instance options used on the Knowledge Management Service Portal pages. Use the control + right-click menu to access the widget instance options and configure a widget instance.

Note: Before configuring widget instance options, switch to the Knowledge Management - Service Portal scope.

Homepage widgets:

- **Knowledge Homepage Search**
  Customize search features for the homepage.
- **Knowledge Bases Browse**
  Displays knowledge base tiles in the homepage.
- **Knowledge Featured Articles**
  Displays a list of featured articles in the homepage.
- **Knowledge Most Useful Articles**
  Displays a list of most useful articles in the homepage.
- **Knowledge Most Viewed Articles**
  Displays a list of most viewed articles in the homepage.

Search results page widgets:

- Knowledge Breadcrumbs
  Displays navigation path to the current page.
- **Knowledge Search**
- Knowledge Facet Header
  Displays the title for the filter facets.
- **Knowledge Field Facet**
  Display search results filtered by knowledge base, knowledge category, and author.
- **Knowledge Tags Facet**
  Display search results filtered by article tags.
- **Knowledge Resource Facet**
  Display search results filtered by article resource.
- **Knowledge Query Facet**
  Display search results filtered by article rating, number of article views, and last modified.
- **Knowledge Result Sort**
  Displays search results filtered by sort options for returned results.
- Knowledge Selected Filter
  Displays the selected facet filters and allows you to clear the selections.
- **Knowledge Result**
Displays search results filtered by returned results.

Article view page widgets:

- **Knowledge Breadcrumbs**
  Displays navigation path to the current page.
- **Knowledge Article Content**
  Customizes what information users can view and what actions they can perform in the article view page.
- **Knowledge Article Helpful**
  Enables users to mark the article as helpful.
- **Knowledge Article Comments**
  Enables users to add comments for the article.
- **Knowledge Attachments**
  Displays article attachments if the **Display Attachment** field for the article is enabled.
- **Related Catalog Item**
  Displays a list of catalog items mapped to the article. The widget appears only when the related catalog items are available for the selected article.
- **Knowledge Related Articles**
  Displays a list of related articles with information similar to the selected article. The related articles are manually mapped, automatically predicted, or both. The manually mapped articles appear first in the widget. The widget appears only when the related articles are available for the selected article.
- **Affected Products**
  Displays the products related to the knowledge articles available in the **Affected Products** related list for the article. The widget appears only when the affected products are available for the selected article.
- **Most Recent Tasks**
  Displays the tasks attached to the articles available in the **Attached Tasks** related list for that article. The widget appears only when the related tasks are available for the selected article.
- **Most Useful**
  Displays a list of knowledge articles that users found most useful.

Activate the Knowledge Management Service Portal plugin
The Knowledge Management - Service Portal plugin (com.snc.knowledge_serviceportal) is active by default for customers on Madrid and later releases. Existing customers on release versions prior to Madrid can activate the plugin, if required.

Role required: admin

This plugin requires the following plugins:

- **Knowledge Management V3** (com.snc.knowledge3)
- **Service Portal for Enterprise Service Management** (com.glide.service-portal.esm)

1. Navigate to **System Definition > Plugins**.

A banner notifies you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

---

**Note:**
To redirect to the legacy list view for plugins, click the link.

2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.
   You can activate the plugin directly from the All Applications page or you can view more details about the plugin before you activate it.
   - If you are certain that you have the correct plugin, click Install, and when you see the dialog box, click Activate.

   ![Activate Plugin](image)

   - To view plugin details before activation:
     1. Click the plugin name.
     2. On the form, click the Activate/Update related link.
     3. In the dialog box, review the dependent plugins.
        - If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.
     4. If demo data is available and you want to install it, click Load demo data.
        - Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.
     5. Click Activate.
Configure search widget instance options
Configure widget instance options for the search widgets on the Knowledge Management Service Portal homepage and search results page.

Role required: knowledge_admin or admin

The homepage uses the Knowledge Homepage Search widget and the search results page uses the Knowledge Search widget. Use the widget instance options to customize the search feature for these pages.

1. Navigate to the Knowledge Management Service Portal homepage or search results page.
2. Control + right-click the search bar.
3. Click Instance Options.
4. Configure the desired settings for the search widgets.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the search widget. The default for the homepage is <strong>Welcome to Knowledge</strong>.</td>
</tr>
<tr>
<td>Glyph</td>
<td>An icon that appears in the search bar.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>The color of the search widget.</td>
</tr>
<tr>
<td>Bootstrap size</td>
<td>The size of the search widget.</td>
</tr>
<tr>
<td>CSS</td>
<td>See widget CSS for details.</td>
</tr>
<tr>
<td>Search Placeholder</td>
<td>Default text that appears in the search bar.</td>
</tr>
<tr>
<td>Allow Empty Search</td>
<td>Allow empty knowledge base searches. The default for the homepage uses the system property. The default for the search results page is <strong>Yes</strong>. For an empty search, the search results page returns all results.</td>
</tr>
<tr>
<td>Allow Instant Search On Keypress</td>
<td>Enables instant search results as you type a search term. The default for the search results page uses the system property.</td>
</tr>
<tr>
<td>Minimum Number of Characters for Search</td>
<td>The minimum number of characters required to generate a search.</td>
</tr>
<tr>
<td>Wait time (ms) between searches, if instant search is enabled</td>
<td>The time, in milliseconds, to wait between searches if the instant search feature is enabled. The default wait time is <strong>500</strong> ms.</td>
</tr>
<tr>
<td>Alternate URL Parameters for Search</td>
<td>Alternate parameters that appear in the search results URL. By default these parameters include keyword and query.</td>
</tr>
<tr>
<td>Alternate URL Parameters for Language</td>
<td>Alternate parameters that appear in the URL denoting the selected language.</td>
</tr>
</tbody>
</table>

5. Click **Save**.

Configure knowledge base tile widget instance options
Configure widget instance options for the knowledge base tile widgets on the Knowledge Management Service Portal homepage.

Role required: knowledge_admin or admin
The homepage uses the Knowledge Bases Browse widget to display knowledge base tiles.

1. Navigate to the Knowledge Management Service Portal homepage.
2. Control + right-click a knowledge base tile.
3. Click **Instance Options**.
4. Configure the desired settings for the knowledge base tile widgets.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title that appears above the knowledge base tiles. The default is <strong>Explore our Knowledge Bases</strong>.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>The color of the widget.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <strong>widget CSS</strong> for details.</td>
</tr>
<tr>
<td>Order By</td>
<td>The order in which the knowledge base tiles appear on the homepage. Use any field on the Knowledge table. If this field is empty, tiles are displayed in alphabetical order. Other available options include <strong>article_count</strong>.</td>
</tr>
<tr>
<td>Reverse Order</td>
<td>Enable this check box to display knowledge base tiles in the reverse order.</td>
</tr>
<tr>
<td>Post Question Label</td>
<td>The label on the button used to post a question. The default is <strong>Ask a Question</strong>.</td>
</tr>
<tr>
<td>Create Article Label</td>
<td>The label on the button used to create an article. The default is <strong>Create Article</strong>.</td>
</tr>
<tr>
<td>Post Question URL</td>
<td>The parameters that appear in the URL when posting a question.</td>
</tr>
<tr>
<td>Create Article URL</td>
<td>The parameters that appear in the URL when creating an article.</td>
</tr>
</tbody>
</table>

5. Click **Save**.

**Configure the home page widget instance options**

Configure widget instance options for the widgets used to display popular articles on the Knowledge Management Service Portal homepage.

Role required: knowledge_admin or admin

The homepage displays links to the featured, most viewed, and most useful articles using several widgets. The featured articles are displayed based on the keywords associated with the articles. For information on displaying articles in the Featured content section, see **Pin a knowledge article**. Most viewed and most useful articles are displayed based on the highest view and use count of the articles.

1. Navigate to the Knowledge Management Service Portal homepage.
2. Control + right-click one of the widgets.
3. Click **Instance Options**.
4. Configure the desired settings for the widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the widget.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>The color of the widget.</td>
</tr>
<tr>
<td>Glyph</td>
<td>An icon that appears in the widget.</td>
</tr>
<tr>
<td>Instance option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------</td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that contains the Source Field used to provide the featured, most viewed, and most useful articles widget options. The default table is Knowledge (kb_knowledge).</td>
</tr>
<tr>
<td>Display Field</td>
<td>The title displayed for each article in the list. By default, this is the article short description.</td>
</tr>
<tr>
<td>Secondary Fields</td>
<td>Additional information displayed for each article in the list below the title. By default, this information includes the author, view count, the date that the article was last modified, and the article rating.</td>
</tr>
<tr>
<td>Max number of records to show</td>
<td>The maximum number of articles to include in the list.</td>
</tr>
<tr>
<td>Show even when empty</td>
<td>Enable this check box to display the widget even if there are no articles in the list.</td>
</tr>
<tr>
<td>Show Secondary Fields Label</td>
<td>Enable this check box to display the field labels for the additional information displayed for each article.</td>
</tr>
<tr>
<td>Knowledge Base</td>
<td>To restrict the articles that appear in this list to a specific knowledge base, select the knowledge base from the knowledge base list.</td>
</tr>
</tbody>
</table>

5. Click **Save**.

Configure sort widget instance options

Configure widget instance options for the knowledge sort widget on the Knowledge Management Service Portal search results page.

Role required: knowledge_admin or admin

The search results page uses the Knowledge Result Sort widget to provide sort options for the returned list of results. Use the widget instance options to customize the sort options.

1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click the sort options at the top of the results list.
3. Click **Instance Options**.
4. Configure the desired settings for the sort widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>The color of the search widget.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
<tr>
<td>Hide Relevancy</td>
<td>Removes the relevancy sort option.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that contains the fields used to sort the list of knowledge items. The default table is Knowledge.</td>
</tr>
<tr>
<td>Sort Fields</td>
<td>The fields used for sorting the list of knowledge items.</td>
</tr>
</tbody>
</table>
5. Click **Save**.

**Configure article list widget instance options**

Configure widget instance options for the article lists on the Knowledge Management Service Portal homepage.

Role required: knowledge_admin or admin

The homepage uses the Article List widget to display different lists of articles, including Featured, Most Useful, and Most Viewed.

1. Navigate to the Knowledge Management Service Portal homepage.
2. Control + right-click one of the article list headers.
3. Click **Instance Options**.
4. Configure the desired settings for the article list widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the article list.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>The color of the widget.</td>
</tr>
<tr>
<td>Glyph</td>
<td>An icon that appears in the widget.</td>
</tr>
<tr>
<td>CSS</td>
<td>See widget CSS for details.</td>

5. Click **Save**.

**Configure filter facet widget instance options**

Configure widget instance options for the filter facet widgets on the Knowledge Management Service Portal search results page.

Role required: knowledge_admin or admin

The homepage uses several widgets to filter the items in the search results list. There are two types of facet widgets:

- Simple field facets based on the Knowledge table fields
- Advanced query facets based on custom queries of the Knowledge table

Use the widget instance options to customize these facet widgets:

- Knowledge Field Facet (for filtering by knowledge base, knowledge category, and author)
- Knowledge Tags Facet (for filtering by tag)
- Knowledge Resource Facet (for filtering by resource, such as articles and social Q&A)
- Knowledge Query Facet (for filtering by rating, last modified, and number of views)

1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click a filter facet widget.
3. Click **Instance Options**.
4. Configure the desired settings for the selected type of facet widget.

<table>

<tr>
<td>Maximum length for string field</td>
</tr>
</tbody>
</table>
### Instance option | Description
--- | ---
Alternate URL Parameters | Names of the URL parameters used to initialize this filter facet, if used in the URL as a search parameter.
Fetch Maximum Values | If enabled, fetches all facet values instead of only those facets applicable for the initial load of results. Disabling this instance option can reduce the load time for the filter facet. Based on the glide.knowman.search.facet_depth property.
Show Empty Value | If enabled, shows an empty filter facet option that users can select to filter for articles that do not have this field set.
For example, if an article does not have an assigned category, clicking the empty option lists all articles with no assigned category.
Show Only Facet Values Matching Results | Creates a dynamic filter facet widget that displays only those filter values that match the search results rather than showing all values. If you disable this instance option, the time needed to load the filter facet data is reduced.
Show category hierarchy (valid for kb_category only) | If enabled, shows categories with their hierarchy list up to the fourth-level. When you enable this option, you can select only one category at a time. Any articles that are included in the subcategories beyond the fourth-level also appear in the fourth-level of category. The search results filtered on a selected parent category include articles within that category and all the associated child categories.

5. Click **Save**.

**Configure a user action for the article view page**
Configure a user action for the Knowledge Management Service Portal article view page.

Role required: admin

The article view page uses the Knowledge Article Content widget to provide user actions. Use the widget instance options to customize these actions.

Ensure that the application scope on the Now Platform is set to Knowledge Management Service Portal.

User actions available for the article view page appear in a menu after clicking the overflow icon (*** ) in the article header. These actions enable users to flag an article, edit an article, or create an incident for an article.

1. Navigate to the Knowledge Management Service Portal article view page.
2. Control + right-click the article header.
3. Click **Instance Options**.
4. Configure the desired settings for the Knowledge Article Content widget.
### Instance option | Description
--- | ---
Bootstrap color | The color of the widget header.
CSS | See [widget CSS](#) for details.
Hide All Actions | Hides the user actions in the article header including the **Subscribe/Unsubscribe** button and the overflow icon.
Show Version Information | Displays version information for the selected article. Requires the Knowledge Management Advanced plugin (com.snc.knowledge_advanced).
Show Create Incident Action | Displays the **Create Incident** user action when a user clicks the overflow icon in the article header.
Create Incident Action Label | The label for the user action that appears in the overflow icon menu. The default is **Create Incident**.
Create Incident Action URL | The target URL for the **Create Incident** user action.
If no URL is specified, the system uses the URL in the **glide.knowman.create_incident_link** system property.

5. Click **Save**.

**Configure article helpful widget instance options**

Configure the Knowledge Article Helpful widget instance options for the Knowledge Management Service Portal article view page.

Role required: knowledge_admin or admin

The article view page uses the Knowledge Article Helpful widget to allow users to provide feedback on the helpfulness of the article, display a confirmation message after a feedback is provided, and display the percentage of users who found the article to be useful. Use the widget instance options to customize these actions.

1. Navigate to the Knowledge Management Service Portal article view page.
2. Control + right-click **Helpful?**
3. Click **Instance Options**.
4. Configure the desired settings for the Knowledge Article Helpful widget.

### Instance option | Description
--- | ---
Bootstrap color | The color of the widget header.
CSS | See [widget CSS](#) for details.
Show helpful percentage information | Check box to enable the display of percentage of users who found this article to be helpful.
Helpful Action Label | Label for marking this article as helpful or not.
Feedback Message | Text that displays when the user marks the article as helpful or not.

5. Click **Save**.
Configure article helpful comments instance options
Configure the Knowledge Article Comments widget instance options for the Knowledge Management Service Portal article view page.

Role required: knowledge_admin or admin

The article view page uses the Knowledge Article Comments widget to allow users to rate an article, add a comment, or view existing comments for the article. Use the widget instance options to customize these actions.

1. Navigate to the Knowledge Management Service Portal article view page.
2. Control + right-click the comments section.
3. Click Instance Options.
4. Configure the desired settings for the Knowledge Article Comments widget.

<table>
<thead>
<tr>
<th>Instance option</th>

</table>

5. Click Save.

Configure related catalog item widget instance options
Configure the Related Catalog Item widget instance options for the Knowledge Management Service Portal article view page. These options relate to the list of catalog items mapped to an article.

Role required: admin
The article view page displays a list of catalog items mapped to an article. Use the widget instance options to customize the Related Items section on the article view page.

1. Navigate to the Knowledge Management Service Portal homepage by adding /kb to the end of your instance URL.

   **Note:** Your administrator might have changed this default navigation.

2. Search for and click the article for which you want to modify the instance options for the Related Catalog Item widget.
3. Press Control and right-click the Related Items section.
4. Click **Instance Options**.
5. Configure settings for the Related Catalog Item widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Table</td>
<td>Source table containing related catalog items. The source table specified in the base system is Related Catalog Items (kb_2_sc).</td>

<tr>
<td>Source Column</td>
<td>Field in the source table referring to the source record. The source column specified in the base system is knowledge article (kb_knowledge).</td>
</tr>
<tr>
<td>Title</td>
<td>Title that appears on the widget header. The default title is Related Items.</td>
</tr>
<tr>
<td>Max Number</td>
<td>Maximum number of catalog items to include in the Related Items section on the article view page. The maximum number specified in the base system is 5.</td>
</tr>
<tr>
<td>Use Full Width</td>
<td>Option for displaying the widget in a 12-column grid at 100% of the available width. If you clear the check box, the widget displays at 75% of the available width.</td>
</tr>
<tr>
<td>Target Column</td>
<td>Field in the source table referring to the target record. The target column specified in the base system is Catalog item (sc_cat_item).</td>
</tr>
<tr>
<td>Source Id</td>
<td>URL parameter containing the unique record identifier (sys_id) of the source record. For the article view page, the URL parameter containing the source ID is sys_kb_id.</td>
</tr>
</tbody>
</table>

6. Click **Save**.

Configure knowledge related articles widget instance options

Configure the Knowledge Related Articles widget instance options for the Knowledge Management Service Portal article view page. These options relate to the list of related articles mapped to an article.

Role required: admin

The article view page displays a list of related articles mapped to an article. Use the widget instance options to customize the Related Articles section on the article view page.

1. Navigate to the Knowledge Management Service Portal homepage by adding /kb to the end of the URL for your instance.
2. Search for and click the article for which you want to modify the instance options for the Knowledge Related Articles widget.

3. Press Control and right-click the Related Items section.

4. Click **Instance Options**.

5. Configure settings for the Knowledge Related Articles widget.

<td>URL parameter containing the unique record identifier (sys_id) of the source record. For the article view page, the URL parameter containing the source ID is sys_kb_id.</td>
</tr>
</tbody>
</table>

6. Click Save.

**Search using the Knowledge Management Service Portal**

Enter one or more words in the search bar on the Knowledge Management Service Portal homepage to view all search results.

Search results include items in which the short description, content, or attached files include the search term. By default, knowledge search results include articles, pinned articles, and social Q&A.

You can also filter the search results.

**Enable multi-language search**

The multi-language search facet is available when more than one supported language is enabled. All available languages are displayed in the facet and you can select which languages you want your search results to appear in. Your selection is maintained per session, but not across logins.

1. To enable different languages, activate the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) or activate one of the internationalization plugins for the language you require.

   **Note:** Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.

2. Navigate to **Knowledge > Administration > Knowledge Search Properties > Enable multi language search**.
3. Select the Yes check box to enable the feature.

   **Note:** If this property is not enabled, you can only search for one language at a time.
Search auto-correct feature

The Knowledge Management Service Portal homepage search tool also includes an auto-correct feature. When enabled, users can auto-correct a typing error in a search term by clicking one of the suggestions.

When a search term contains a misspelling, the search tool displays the search results page and includes one or more suggested terms at the top of the page under the heading Did you mean. Clicking one of these suggestions shows all the search results that match the selected term.

Users with the system administrator role can enable this feature.

1. Navigate to System Properties > Text Search.
2. Set the following properties to true:
   - Suggest alternate search spellings for knowledge or global search (glide.ts.dym.enable_spell_correct).
   - Suggest related searches for knowledge or global search (glide.ts.dym.enable_chain_suggest).
3. Click Save.

Features not yet supported on Knowledge Management Service Portal

The following features are not yet supported on the Knowledge Management Service Portal:

- Article import on the Search results page
- Hierarchical categories on the Article view page
- Live Feed support for Social Q&A on the Article view page
- Tags added in Social Q&A are not honored in search results

The `glide.knowman.portal.enable_redirect` property is not honored for the following use cases:

- Contextual search in the Incident form
- Connect

Configure knowledge bases for a portal

Select which knowledge bases are displayed in a portal to view the associated knowledge articles. If no knowledge bases are configured, users can view articles from all knowledge bases in the portal.

Role required: admin

1. Navigate to **Service Portal > Portals**.
2. Select the portal for which you want to enable search for the desired knowledge bases.
3. In the Knowledge Bases related list, click **Edit**.
4. On the Edit Members form, move the desired knowledge bases from the available items in the **Collection** column to the **Knowledge Bases List** column.
5. Click **Save**.

Configure knowledge subscriptions

Configure knowledge subscriptions by activating the Knowledge Management Advanced plugin and setting the subscription properties.

Ensure that the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated.

**Note:** The Knowledge Management Advanced plugin activates the Subscriptions and Activity Feed Framework plugin (com.snc.activity_subscriptions).

Role required: knowledge_admin or admin

1. Navigate to **Knowledge > Administration > Properties**.
2. In the **KM Subscription Properties** section, configure the following properties.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable subscribe feature for KM (glide.knowman.enable_km_subscription)</td>
<td>Enables or disabled the Knowledge Management knowledge subscriptions feature.</td>
</tr>
<tr>
<td>List of roles (comma-separated) who can have subscription feature</td>
<td>A comma-separated list of the roles that can use the knowledge subscriptions feature and subscribe to knowledge bases and articles.</td>
</tr>
<tr>
<td>(glide.knowman.enable_km_subscription.roles)</td>
<td></td>
</tr>
<tr>
<td>List of workflow states (comma-separated) that can have subscription feature</td>
<td>A comma-separated list of the article states for which the knowledge subscription feature is available. The default states include Draft, Review, and Published.</td>
</tr>
<tr>
<td>(glide.knowman.enable_km_subscription.workflow_state)</td>
<td></td>
</tr>
</tbody>
</table>

3. Click **Save**.

Knowledge subscription email notification templates

The knowledge subscription feature uses email notification templates to send subscription notifications to knowledge users.

<table>
<thead>
<tr>
<th>Email template</th>
<th>Subscription type</th>
</tr>
</thead>
<tbody>
<tr>
<td>KM Subscription: Article created</td>
<td>Knowledge base</td>
</tr>
<tr>
<td>KM Subscription: Article revised in KB</td>
<td>Knowledge base</td>
</tr>
<tr>
<td>KM Subscription: Article checked out</td>
<td>Knowledge article</td>
</tr>
<tr>
<td>KM Subscription: Article revised</td>
<td>Knowledge article</td>
</tr>
<tr>
<td>KM Subscription: Article commented</td>
<td>Knowledge article</td>
</tr>
</tbody>
</table>

Users with the admin or knowledge_admin role can customize these email notification templates. To locate the template, navigate to **System Notifications > Email > Notifications**. For more information about customizing a template, see **Create an email notification**.

Subscription notifications include a link at the bottom of the email to the user’s Notification Preferences page.

Out-of-the-box Knowledge Management Performance Analytics Solutions

Performance Analytics Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Performance Analytics Solutions

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With solutions, you can get value from Performance Analytics for your application with minimal setup.

**Note:**

- Solutions include some dashboards that are inactive by default. You can activate these dashboards to make them visible to end users according to your business needs.
- Out-of-the-box solutions and in-form analytics provide all the configuration records required to analyze default applications. Customize these records for use in your production environment.
To enable the solution for Knowledge Management, an admin can navigate to **Performance Analytics > Guided Setup**. Click **Get Started** then scroll to the section for Knowledge Management. The guided setup takes you through the entire setup and configuration process.

**Domain separation and 'Run As' user**

By default, System Administrator is the Run As user for data collection jobs in the OOTB Performance Analytics Solutions. Verify that this user exists on the instance, and whether this user has the appropriate level of access. An inappropriate Run As user can cause errors or limit the data that is collected. If you have Domain Separation enabled, ensure you set an appropriate Run As user in each domain.

**New and deprecated versions of this solution**

In London, this Solution was replaced with a new version, `com.snc.pa.knowledge_v2`. If you activated an earlier version of the Solution and then upgraded your instance, you still have and can still use the earlier Solution. You can also activate the newer version without losing data from existing indicators and breakdowns. If you activate the newer version, run a historical data collection job to populate any new indicators and breakdowns.

**Knowledge Management dashboard**

The Knowledge Management dashboard helps knowledge content owners and managers to determine the usage and quality of their knowledge content and ensure the proper processes and procedures are being followed for content creation.

### CSM Knowledge Management dashboard indicators

The CSM Knowledge Management dashboard provides three views, into content usage, content governance, and content quality.

The Knowledge Management dashboard presents the following key performance indicators:

**% of Knowledge Articles Published**
A daily calculation using the formula \[
\frac{\text{Number of knowledge articles published}}{\text{Number of knowledge articles active}}\]

**% of Knowledge Articles Flagged**
A daily calculation using the formula \[
\frac{\text{Number of knowledge articles flagged}}{\text{Number of knowledge articles active}}\]

**Monthly Average Article Rating**
A monthly calculation of the sum of all article ratings for the month divided by the number of knowledge articles rated for the month.

**Average Click Rank**
A monthly calculation using the formula \[
\frac{\text{Sum of knowledge search ranks}}{\text{Number of knowledge searches with rank}}\]

**Click Through Rate**
A monthly calculation using the formula \[
\frac{\text{Number of knowledge searches with rank}}{\text{Number of knowledge searches}}\]

**Article Quality Index**
A monthly calculation using the formula \[
\frac{\text{Sum of AQI scores}}{\text{Number of AQI records}}\]

**Average Time to Publish**
The average time to publish is recalculated daily, as a number of days. The goal of the indicator is for scores to minimize.

**Sum of AQI Scores - Monthly**
The sum of all Article Quality Index scores created in a month, calculated monthly. The goal is for scores to maximize.
Number of AQI Records - Monthly
The number of Article Quality Index records created in a month, calculated monthly. The goal is for the number to maximize.

Number of Active Users Who Performed Searches - Monthly
The number of knowledge searches made in a month, calculated monthly. The goal is for the number to maximize.

Sum of Knowledge Search Ranks - Monthly
The sum of feedback rankings of knowledge searches made in a month, excluding empty Highest Click Rank values. The goal is for the number to maximize.

Number of Knowledge Searches with Rank - Monthly
The number of knowledge searches in a month where the Highest Click Rank has a value higher than zero. The goal is for the number to maximize.

Number of Knowledge Searches - Monthly
The number of knowledge searches in a month. The goal is for the number to maximize.

Number of Knowledge Articles Rated - Monthly
The number of knowledge feedback records created in a month, excluding records where the Rating field is empty. The goal is for the number to maximize.

Number of Knowledge Articles Published
A daily count of the total number of knowledge articles that have entered the Published state. The goal is for the number to maximize.

Number of Knowledge Articles Flagged
A daily count of the number of active knowledge articles, with up-to-date workflows, that were flagged. The goal is for the number to maximize.

Number of Knowledge Articles Active
A daily count of the number of active knowledge articles with up-to-date workflows. The goal is for the number to maximize.

Breakdowns
The following breakdowns apply to the indicators on the dashboard:

- Time to Publish Groups
- Knowledge Base
- Knowledge Category

Reports
The dashboards include the following reports:
## Integration with external knowledge sources

Use the external content integration feature to integrate content from various external sources and enable unified knowledge search results.

Users store and manage knowledge using various external sources and search each source separately for relevant results. External content integration enables acquiring and searching all WebDAV-compliant source content from a single location. This provides users with a seamless search experience across multiple knowledge sources and drives more usage to the platform.

Using this feature, knowledge administrators can define the external content to be imported into a knowledge base and periodically run a job to import the content. Knowledge users have a seamless user experience searching for relevant content across multiple knowledge sources.

### Activate the External Content Integration plugin

The External Content Integration feature is activated with the Knowledge Management - External Content Integration plugin (com.snc.knowledge.external_integration).

Role required: admin

The Knowledge Management - External Content Integration plugin is not active by default.

The following plugins are automatically activated when the Knowledge Management - External Content Integration plugin is activated:

- Centralized Connection and Credentials plugin (com.snc.core.automation.connection_credential)
- Knowledge Management V3 plugin (com.snc.knowledge3)
- Knowledge Management Advanced Installer plugin (com.snc.knowledge_advancedinstaller)
The Knowledge > Administration module displays the External Knowledge Sources and External Knowledge Jobs sub-modules when the Knowledge Management - External Content Integration plugin is activated.

1. Navigate to System Definition > Plugins.

A banner notifies you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

Note:
To redirect to the legacy list view for plugins, click the link.

2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.

You can activate the plugin directly from the All Applications page or you can view more details about the plugin before you activate it.

- If you are certain that you have the correct plugin, click Install, and when you see the dialog box, click Activate.

- To view plugin details before activation:
  1. Click the plugin name.
  2. On the form, click the Activate/Update related link.
  3. In the dialog box, review the dependent plugins.
  4. If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.
  5. If demo data is available and you want to install it, click Load demo data.
Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.

5. Click **Activate**.

**Define an external knowledge source**

Before you import content, create and configure the connection between the a Web Distributed Authoring and Versioning (WebDAV) - compliant external knowledge source and the ServiceNow knowledge base into which you want to import content. Define import parameters for the external knowledge source.

Define **basic authentication credentials** and **create an HTTP connection** to the external source.

**Caution:** This feature expects that the external source endpoint is a publicly accessible endpoint. Mid-server configuration is not supported.

Role required: admin

1. Define the connection from the external source and the target knowledge base.
   a) Navigate to **Knowledge > Administration > External Knowledge Sources**.
   b) Click **New**.
   c) Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Instruction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter unique name for the external source.</td>
</tr>
<tr>
<td>Target Knowledge Base</td>
<td>Select the knowledge base in which you want to create articles for the external content.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Select the connection alias to connect to the external source.</td>
</tr>
</tbody>
</table>

   d) Right-click the form header and click **Save**.

2. Set import parameters for the external content.
   a) In the **Parameter** related list, click **New**.
   b) In the **Name** field, select the name of the parameter from the drop-down list.
   c) In the **Value** field, enter the desired value for the parameter.

The table below lists the parameters and the corresponding values that can be set for the external source.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum size limit (in MB) for this source</td>
<td>Set maximum allowed content size for this source. Once this limit is reached, no further content is processed. Default value is 400 MB.</td>
</tr>
<tr>
<td>Parameter Name</td>
<td>Instructions</td>
</tr>
<tr>
<td>----------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Maximum size limit (in KB) per file/content in this source</td>
<td>Set maximum allowed size limit for each file from this external source. If a file exceeds this limit, that file is not processed. Default value is 4000 KB.</td>
</tr>
<tr>
<td>Open search results in the original source system</td>
<td>Set value to <strong>true</strong> to open search results in the external source system. Set value to <strong>false</strong> to open search results in the target knowledge base. Default value is set to <strong>false</strong>.</td>
</tr>
<tr>
<td>Include folders with names that match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for folder names that need to be included from this external source.</td>
</tr>
<tr>
<td>Exclude folders with names that match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for folder names that need to be excluded from this external source.</td>
</tr>
<tr>
<td>Create articles when file names match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for file names that need to be included to create articles.</td>
</tr>
<tr>
<td>Do not create articles when file names match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for file names that need to be excluded to create articles.</td>
</tr>
<tr>
<td>Maximum retry limit</td>
<td>Maximum number of retries to send request to the external source.</td>
</tr>
</tbody>
</table>

---

d) Click **Submit**.

### Import content from an external knowledge source

Run an import job manually or set up a schedule to process the integrated external content.

**Role required:** admin or knowledge_admin

Each external source is associated with two handlers: the **Acquire handler** and the **Process handler**, for running the import job. The acquire handler uses a WebDAV client to acquire external content to create articles. You can customize the process handler to assign categories to articles or populate additional metadata for the knowledge articles.

1. Navigate to **Knowledge > Administration > External Knowledge Sources**.
2. Select the external knowledge source from which you would like to import content.
3. In the **Handler** tab, set a schedule to run the acquire and process handlers.
4. In the Related Links section, click **Run Scheduled Job**.
5. To view all jobs scheduled to run to import content for the external source, click the **Jobs**. You can open the most recent job to monitor the status.

**Note:** If the externally imported content is infected, a notification about each infected file is sent to the users with the knowledge_admin role and Knowledge Base owners. The notified users can then take required actions on the infected files.

### Open knowledge search results in source system

Configure the URL to the external source system to open articles from search results directly in the source system.
Make sure the **Open search results in the original source system** import parameter for the **external knowledge source** is set to **true**.

Role required: admin

1. Navigate to **System Definition > Script Includes**.
2. Open **KBWebDAVContentHandler**.
3. In the **Script** window, override the function **getFileURL** using script shown below.
   
   The **getFileURL** function is shown below.

   ```javascript
   getFileURL: function(fileObj) {
     //write your logic here
   },
   ```

4. Click **Update**.

**Sample configuration for integrating external knowledge content**

You can integrate content from multiple external sources so your users can acquire and search knowledge from a single location. Use this sample configuration to create a connection to your external account, configure external knowledge sources, and import content to enable search results for unified content.

**Requirements for integrating external content**

Make sure the Knowledge Management -- External Content Integration plugin (com.snc.knowledge.external_integration) is enabled and your external source is WebDAV-compliant.

**Integrate external knowledge sources into the Knowledge Management application**

Create authentication credentials and a connection alias to connect your external knowledge source to the ServiceNow Knowledge Management application. Define import parameters for your external source to import integrated content.

Role required: admin

1. Enable basic authentication on your external account.

   **Note:** Your external account password is not affected when you enable basic authentication.

2. Create the connection to your external account using the basic authentication credentials.
   a) Navigate to **Connections and Credentials > Credentials**.
   b) Click **New**.
   c) Click **Basic Auth Credentials**.
Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the credential. For example, Demo_Auth.</td>
</tr>
<tr>
<td>User name</td>
<td>The external account user name created for basic authentication.</td>
</tr>
<tr>
<td>Password</td>
<td>The external account password for the user name.</td>
</tr>
</tbody>
</table>

d) Click **Submit**.

3. Create an HTTP connection to your external account.
   a) Navigate to **Connections & Credentials > Connection & Credential Aliases**.
   b) Select **New**.
   c) In the **Name** field, enter the name of the connection alias. For example, Demo_Account.
   d) Right-click the form header and click **Save**.
   e) In the **Connections** related list, click **New**.
      Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the HTTP connection. For example, Demo_Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential created to connect to the external account. For example, Demo_Auth.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>WebDAV URL to your external account. This is the WebDAV endpoint of your external account.</td>
</tr>
<tr>
<td>Note: You can also import contents from a specific folder by appending the folder path to the URL. For example, https://&lt;web link to your external_account&gt;/KnowledgeIT.</td>
<td></td>
</tr>
</tbody>
</table>

f) Click **Submit**.

4. Configure the external knowledge source for importing content.
   a) Navigate to **Knowledge > Administration > External Knowledge Sources**.
   b) Click **New** and fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the external source. For example, Demo_knowledge.</td>
</tr>
<tr>
<td>Target Knowledge Base</td>
<td>Knowledge base in which you want to create articles for the external content. For example, IT.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Connection alias to connect to the external source. For example, Demo_Account.</td>
</tr>
</tbody>
</table>

c) Right-click the form header and select **Save**.

d) In the Parameter related list, click **New**.
e) On the Parameter form, select the name of the import parameter that you want to configure for your external source and then set the value for the parameter.

The table below lists the parameters and the corresponding values that can be set for the external source.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum size limit (in MB) for this source</td>
<td>Maximum allowable content size to import from your external source. For example, 250 MB.</td>
</tr>
<tr>
<td>Maximum size limit (in KB) per file/content in this source</td>
<td>Maximum allowable size for each article, including attachments, that you can import from this external source. For example, 2000 KB.</td>
</tr>
<tr>
<td>Open search results in the original source system</td>
<td>Opens search results in the external source system if this value is set to true.</td>
</tr>
<tr>
<td>Include folders with names that match these regex patterns</td>
<td>Comma-separated list of regular expressions for folder names to include from this external source. For example, to include all folders names that start with the letters a and b, enter a.<em>,b.</em>.</td>
</tr>
<tr>
<td>Exclude folders with names that match these regex patterns</td>
<td>Comma-separated list of regular expressions for folder names to exclude from this external source. For example, to exclude all folders names that start with the letters a and b, enter a.<em>,b.</em>.</td>
</tr>
<tr>
<td>Create articles when file names match these regex patterns</td>
<td>Comma-separated list of regular expressions for file names that to include when creating articles. For example, to include all file names have .docx and .pdf extensions, enter .<em>/.docx,.</em> .pdf.</td>
</tr>
<tr>
<td>Do not create articles when file names match these regex patterns</td>
<td>Comma-separated list of regular expressions for file names to exclude when creating articles. For example, to exclude file names have .docx and .pdf extensions, enter .<em>/.docx,.</em> .pdf.</td>
</tr>
<tr>
<td>Maximum retry limit</td>
<td>Maximum limit for the number of times a connection request can be sent to the external source. For example, 5.</td>
</tr>
</tbody>
</table>

**Import content from an external knowledge source.**

**Use extension points for Knowledge Management**

Use UI extension points to add knowledge article headers and footers to knowledge articles and to customize the email template for notifications when a knowledge article is commented on. Use scripted extension points to customize the feedback object used in the email template for notifications when a knowledge article is commented on.

The Knowledge Management Advanced plugin (com.snc.knowledge_advanced) must be activated to view the KMFeedbackNotification UI extension point and the KMFeedbackObject.
scripted extension point. These notifications are part of the Subscriptions feature, which is activated with this plugin.

Role required: admin

Using extension points makes it easier to integrate customizations without actually altering the base code. You can extend standard base functionality using customized scripts.

To use UI extension points in Knowledge Management, create an implementation and change the data as required. You can create multiple implementations per extension point, but for these scenarios, the use is limited to one implementation only. Example code is provided in the extension point, which can be edited, as required.

An implementation is delivered in the base system for scripted extension points. You can change the data and add additional fields, as required.

1. To use UI extension points to customize headers and footers in knowledge articles, and the email notification that is sent when a knowledge article is commented on:
   a) Navigate to **System Extension Points > UI Extension Points**.
   b) Click the UI extension point you want to use.

   **Note:**
   - Use the KMArticleViewFooter and KMArticleViewHeader UI extension points to add knowledge article headers and footers to knowledge articles.
   - Use the KMFeedbackNotification UI extension point to customize the email template for notifications when a knowledge article is commented on.
   c) Click **Create Implementation**.
   d) Change the data as required.
   e) Click **Update**.

2. To use scripted extension points to update the feedback object used in the email template for notifications when a knowledge article is commented on:
   a) Navigate to **System Extension Points > Scripted Extension Points**.

   **Note:** Use the KMFeedbackObject scripted extension point to customize the feedback object used in the email template for notifications when a knowledge article is commented on.
   b) In the **API Name** column, click `global.KMFeedbackObject`.
   c) In the **Implementations** related list, click the `KMFeedbackObjectBaseImpl` class.
   d) Change the data and add additional fields, as required.
   e) Click **Update**.

**Duplicate knowledge article numbers**

Importing knowledge articles into an instance can create articles with duplicate numbers.

The Knowledge **Number** field is auto-generated and is incremented every time you create a new article in an instance. The initial value for the **Number** field is 10,000. To customize this number:

1. Navigate to **System Definition > Number Maintenance**.
2. Search for Knowledge in the Table column.
3. Click the Controls related list tab.
4. Enter a new Number and click Update.

Importing knowledge articles from another instance or as part of the demo data for another application may introduce an article with a number that is already in use. Because the Knowledge Number field is not uniquely indexed, the import completes without error.

With duplicate knowledge article numbers present, links to article view pages that use the knowledge number can behave inconsistently. For example, if there are two articles with the same Knowledge number KB0000033, the following link may open either of these two articles randomly: kb_view.do?sysparm_article=KB0000033. This can happen in Knowledge search results where clicking on a result opens a different article instead of the article displayed in the search results.

**Avoiding duplicate Knowledge article numbers**

To avoid inserting Knowledge articles with duplicate numbers into a production environment:
- Do not import demo data articles in production environment.
- Verify the numbers of the articles to be inserted to make sure they are not already in use.
- Create a before insert business rule on the Knowledge table (kb_knowledge) to ensure the new number is not already in use.

You can also update the initial value for the Knowledge Number field so that newly created articles do not conflict with existing articles.

1. Navigate to System Definition > Number Maintenance.
2. Search for Knowledge in the Table column.
3. Click the Knowledge link to open the Knowledge table form.
4. Click the Controls related list tab.
5. In the Number field, update the count to a number greater than the largest value already in the system.
6. Click Update.

**Train the similarity solution for Knowledge Management to find related articles**

Train the Knowledge Similar Articles solution definition included within the Predictive Intelligence feature to find related knowledge articles when creating an article or viewing an article.

Ensure that the Predictive Intelligence plugin (com.glide.platform_ml) and Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml) are activated. For the solution definition to work, the knowledge base must include at least 1000 articles.

Role required: admin

1. Navigate to Predictive Intelligence > Similarity > Solution Definitions.
2. On the ML Solution Definitions list, search for and select the Knowledge Similar Articles solution definition (ml_sn_global_knowledge_similar_articles).
3. On the ML Solution Definition form, click Update & Retrain.
Note: If the application scope is set to an application other than Knowledge Management - Machine Learning, a message appears on the ML Solution Definition form. In the message, click here to edit the record. You can then click Update & Retrain.

4. Open the ML Solution Definition form for the Knowledge Similar Articles solution definition (ml_sn_global_knowledge_similar_articles).
5. In the ML Solutions related list, view the training solution progress in the **Progress** column.

Note: Alternatively, you can click the link for the solution in the **Created** column. On the ML Solution Definitions list, click the **Show training progress** related link.

When the solution is complete, the related knowledge articles appear in the Knowledge results section on the Knowledge form and in the Related Articles section. The Knowledge form appears when you create an article. The Related Articles section appears on the article view page in the Knowledge Management Service Portal and Now Mobile applications.

- To review similarity examples, when **Progress** is 100%, in the **Created** column, click the link for the solution. Click the **Similarity Examples** related link.
- To update the similarity score threshold, type the required value in the **Similarity Score Threshold** field. Right-click the ML Solution page and click **Save**.

**Knowledge-Centered Service configuration**

Knowledge-Centred Service configuration (KCS) is a method for the creation and continuous improvement of knowledge based on the experience of agents and the patterns observed by knowledge reuse.

As a KCS (V6) verified product, ServiceNow Knowledge Management provides features to improve knowledge, such as article quality reviews, in-context knowledge capture, and feedback management.

**Article quality index for knowledge management**

Assess the quality of knowledge articles with the article quality index (AQI). The AQI helps maintain consistent quality of knowledge articles attached to a knowledge base where articles are written by various authors.

Using AQI feature, a knowledge administrator (a user with knowledge_admin role) creates a checklist and adds a set of true or false questions to the checklist to assess the quality of knowledge articles. For each question, the knowledge_administrator assigns a weight based on its importance to the quality measurement and then attaches the checklist to a knowledge base.

A knowledge reviewer (a user with knowledge_coach and knowledge_domain_expert role) performs AQI review on knowledge articles attached to the knowledge base by answering the true or false questions in the checklist. The article quality is then scored based on the cumulative weight of all answers set to true in the checklist.

**Activating article quality index**

The article quality index feature is activated with the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin. For details see, [Activate the Knowledge Management Advanced plugin](#).
Create an AQI checklist

Create a checklist of questions that reviewers can use to evaluate the quality of knowledge articles.

Role required: knowledge_admin or admin

1. Navigate to Knowledge > Article Quality Index > AQI checklists, and click New.
2. Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Checklist</td>
<td>Name for the checklist.</td>
</tr>
<tr>
<td>Description</td>
<td>Description for the checklist.</td>
</tr>
</tbody>
</table>

3. Right-click the form header and click Save.
4. In the Checklist Questions related list, add questions to the checklist.

Add questions and adjust the weight of the questions until the combined weight of all questions is equal to 100. The weight defines the score that is added to the total AQI review score of the article when the answer for that question is set to true. The maximum score that can be applied to an article in an AQI review is 100.

**Note:** The default AQI pass score is 70. You can change the pass score in the Article Quality Index properties.

To add a question:

a) Click New.

b) Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Question</td>
<td>Text for the question to evaluate articles.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description for the question.</td>
</tr>
<tr>
<td>Order</td>
<td>Value for the display order of questions in the checklist.</td>
</tr>
</tbody>
</table>

The lower the value in the Order field, the higher the question displays in the checklist.

**Note:** Before you assign a value for the display order, think about how many questions you would create for the checklist. For example, if you have five questions in a checklist, you can assign the value in increments of 20. This ensures that you have enough values to assign if you add questions to the checklist later.
### Field | Description
--- | ---
Weight | A value for the question to score the article quality. This value is added to the AQI score when the answer for the question is set to **true**.

**Note:**
- The combined weight of all questions cannot exceed 100.
- The sum of weights of all questions in a checklist must be equal to 100 to be assigned to a knowledge base.

---

c) Click **Submit**.

5. After you finish adding questions to the checklist, click **Update** on the AQI Checklist form.

After you create a checklist, assign it to a knowledge base.

**Assign an AQI checklist to a knowledge base**

Before a knowledge reviewer can start performing the AQI review, you must assign an AQI checklist to a knowledge base.

You can only assign a checklist to a knowledge base when the weight of all questions in the checklist is equal to 100. Each knowledge base can have one assigned checklist. However, a checklist can be assigned to more than one knowledge base.

Role required: knowledge_admin or admin

1. Navigate to **Knowledge > Administration > Knowledge Bases**.
2. Click a knowledge base to which you want to assign a checklist.
3. On the Knowledge Base form, click the search icon in the **Checklist** field and select the AQI checklist to apply.
4. Click **Update**.

After you assign an AQI checklist to a knowledge base, you can start performing AQI reviews.

**Remove an AQI checklist from a knowledge base**

Before you can edit a checklist that is assigned to a knowledge base, you must remove it from the knowledge base.

A checklist with pending AQI reviews cannot be removed from the knowledge base until all AQI reviews associated with the checklist are complete.

Role required: knowledge_admin or admin

1. Navigate to **Knowledge > Administration > Knowledge Bases**.
2. Click a knowledge base from which you want to remove a checklist.
3. On the Knowledge Base form, delete the name of the AQI checklist from the **Checklist** field.
4. Click **Update**.
Delete questions from an AQI checklist

Deleting a question in a checklist deletes the text in the question of previously performed AQI reviews that use the checklist. Deleting an AQI question from a checklist will not affect the score of the previously performed AQI reviews. However, the text of the question will not be displayed in the checklist.

You can delete questions from a checklist if the following conditions are met:

- The checklist is not attached to a knowledge base. For more information, see Remove an AQI checklist from a knowledge base.
- There are no AQI reviews using the checklist in progress.

Role required: admin

1. Navigate to Knowledge > Article Quality Index > AQI checklists.
2. Click the AQI checklist from which you want to delete one or more questions.
3. In the Checklist Questions related list, select the check box next to the questions that you want to delete.
4. From the Actions on Selected Rows choice list, select Delete.
5. In the Confirmation window, click Delete.

Perform an AQI review

Perform the AQI review to evaluate the quality of the article.

The knowledge base must have an assigned AQI checklist.

Role required: knowledge_domain_expert, knowledge_coach, knowledge_admin, or admin

Configure the glide.knowman.aqi.article_workflow_states property to set the article workflow states where you could perform AQI reviews. You can perform several AQI reviews for an article. If you perform several AQI reviews for the same version of the article, the latest AQI score appears in the Latest AQI field in the article.

1. Navigate to Knowledge > Articles > Published, and click on an article to perform the AQI review.
2. Perform one of the following actions:

<table>
<thead>
<tr>
<th>Option</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>The AQI review is not yet started.</td>
<td>Click Perform AQI in the form header.</td>
</tr>
<tr>
<td>The AQI review was started and is pending.</td>
<td>Click Continue AQI in the form header.</td>
</tr>
</tbody>
</table>

An Article Checklist Summary form appears.

3. In the Article Checklist Answers related list, read the questions and evaluate which ones are true. Double-click the Answer cell for each question that is true, select true, and click the green check mark.

**Note:** The associated Weighted Score is applied to the AQI score when the answer is set to true.
4. Perform one of the following actions:

<table>
<thead>
<tr>
<th>To</th>
<th>Do This</th>
</tr>
</thead>
<tbody>
<tr>
<td>Submit the completed AQI review.</td>
<td>Click Submit.</td>
</tr>
</tbody>
</table>

The form refreshes and the total score of the AQI review is displayed in the AQI score field.

The system sends an email notification as follows:

- If the AQI review was performed on the first version of the article, the system sends an email notification to the author of the article.
- If the AQI review was performed on subsequent versions of the article, the system sends an email notification to the author and creator of the article versions.

**Note:** The notification includes the AQI review score and AQI review result. You can customize the content and design of the notification emails.
To view all the AQI reviews you completed, navigate to Knowledge > My Completed AQI Checklists.

View all pending and completed AQI reviews

View checklists of all users to monitor the pending and completed reviews.

Role required: knowledge_admin or admin

1. Navigate to Knowledge > Article Quality Index
2. Do one of the following:
   - To view all completed AQI checklists, select All Completed AQI Checklists.
   - To view all pending AQI checklists, select All Pending AQI Checklists.

Delete AQI reviews

Roles required:
- To delete an AQI in a submitted state: admin or knowledge admin
- To delete an AQI not in a submitted state: knowledge admin or the reviewer who initiated the AQI

1. Navigate to Knowledge > Articles > My Pending AQI Checklists.
2. Select all checklist reviews you would like to delete.
3. Click Delete.

Automating feedback management to improve content

Manage high volumes of article feedback by enabling task generation for negative feedback. When an article is rated poorly or marked as unhelpful, a feedback task is generated.

If an ownership group is assigned to the article, the feedback task is assigned to the manager of the ownership group. Ownership group managers can reassign tasks to another group member, or group members can assign a feedback task to themselves.

If no ownership group is assigned to the article, the feedback task is assigned to the author or reviser of the article.

The task assignee can update the article, create a new article, request additional feedback, or reassign the task and receives notification after the feedback is updated or resolved.

Note: Feedback tasks are only generated if feedback is given on the Knowledge Service Portal.
Enable actionable knowledge feedback

The actionable knowledge feedback feature is available when the Knowledge Management Service Portal (com.snc.knowledge_serviceportal) plugin is activated and the actionable knowledge feedback properties are enabled.

Role required: admin

The feedback tasks are created only from the Knowledge Management Service Portal.

By default, negative article feedback does not automate the triggering of feedback tasks. You must configure these properties to generate feedback tasks when an article is marked as not helpful or rated below a set value.

1. Navigate to **Knowledge > Administration > Properties**.
2. In the **Actionable Feedback Properties** section, configure the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create actionable feedback task when an article is marked as not helpful.</td>
<td>Select Yes.</td>
</tr>
<tr>
<td>Create actionable feedback task when an article is rated at or lower than this value. 0 or no value indicates that actionable feedback tasks are not enabled for Rating type feedback.</td>
<td>Enter a value from 1 to 5 to specify the rating threshold for generating a feedback task. For example, if you set this value to 3, a feedback task is generated when a user selects three or less stars to rate an article.</td>
</tr>
</tbody>
</table>

   **Note:** If you enter ‘0’, a negative article feedback does not generate a feedback task.

3. Click **Save**.

Work on a feedback task

You can change the state of a task and resolve or reassign tasks generated by article feedback.

Role required: none

- If no ownership group is assigned to the article, the feedback task is available to you as the author or reviser of the article.
- If an ownership group is assigned to the article, a feedback task is assigned to you as an ownership group manager. As a manager, you can reassign the task to another group member. All group members see the feedback task in **All Open Tasks**. As a group member, you can reassign the task to yourself to appear in **My Assigned Tasks**.

1. Navigate to **Knowledge > Feedback Management > My Assigned Tasks**.
2. Select a feedback task.
3. Review the feedback given by the submitter.

When a feedback task is generated, the information in the article feedback form is copied to the feedback task form as follows:

<table>
<thead>
<tr>
<th>Feedback task form field</th>
<th>Information from article feedback form</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason</td>
<td>The selected reason for the feedback.</td>
</tr>
</tbody>
</table>
Feedback task form field | Information from article feedback form
--- | ---
**Description**

| **Note:** If feedback is negative and the Details field is left blank, this field indicates whether the article was not helpful or rated poorly. |

| Text in the Details field. |

4. **To work on the feedback task:**

<table>
<thead>
<tr>
<th>Change the feedback task state to</th>
<th>If you want to</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Work in progress</strong></td>
<td>Start working on the feedback task.</td>
</tr>
<tr>
<td></td>
<td>You can save the feedback task and edit the article or create a new article if the information in the existing article is irrelevant or obsolete.</td>
</tr>
<tr>
<td><strong>Awaiting information</strong></td>
<td>Request clarification from the feedback submitter.</td>
</tr>
<tr>
<td></td>
<td>In the Additional Comments field, enter information you need from the submitter and click Update. This triggers an email notification for the feedback task submitter.</td>
</tr>
<tr>
<td><strong>Resolved</strong></td>
<td>Resolve the feedback task.</td>
</tr>
<tr>
<td></td>
<td>In the Resolution Code field, select the code for resolving the article. In the Resolution notes field, enter the reason for the resolution and click Update. An email notification is sent to the feedback submitter to accept or reject the feedback.</td>
</tr>
<tr>
<td><strong>Closed</strong></td>
<td>Close the feedback task without the submitter having to accept the feedback resolution.</td>
</tr>
</tbody>
</table>

**Note:** If the submitter accepts the feedback resolution, the state for the feedback task is automatically set to Closed. You can view all closed feedback tasks in your queue by navigating to Knowledge > Feedback Management > My Closed Tasks.

---

**Track the progress on a feedback task**

Monitor open and closed feedback tasks and track the duration of time a feedback task remains in each state.

Role required: Owner of the knowledge base, knowledge_manager, knowledge_admin, or admin

1. Navigate to the open or closed tasks you want to track.

<table>
<thead>
<tr>
<th>To</th>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>View open feedback tasks</strong></td>
<td>Knowledge &gt; Feedback Management &gt; All Open Tasks and select a feedback task.</td>
</tr>
<tr>
<td><strong>View closed feedback tasks</strong></td>
<td>Knowledge &gt; Feedback Management &gt; All Closed Tasks and select a feedback task.</td>
</tr>
</tbody>
</table>

2. In the Knowledge Feedback Task Metrics related list section, select a feedback task metric to view the start and end time and the duration of the feedback task.

**Note:** If you are a knowledge administrator, you can view the feedback tasks and task metrics of articles in the knowledge bases. If you are a knowledge owner or
knowledge manager, you can view feedback tasks and task metrics of all articles in the knowledge bases you own or manage.

Enable creating an article from a customer service case

You can enable authors to reuse information in a case by copying case details into an article template. Use the pre-defined customer service source case table to article template target table configuration or create custom configurations between the two tables to copy information from a case to an article.

- The Knowledge Management Advanced plugin must be active.
- The KCS for Customer Services Management property must be enabled
- The pre-defined KCS article template or a newly created article template must be active.

Note: You can do one of the following to create an article from a case:

- Use the pre-defined Case KCS Article mapping as is or modify the field mappings between the case source table and article template target table.
- Create a new article template target table and map it to the case source table and customize the field mappings between them. For information on creating article templates, refer to Create an article template.
- Knowledge users use the Create Knowledge button in a case form to create an article from a case and must have "can contribute" permission for at least one active knowledge base to create an article from a case. For information on user permissions, see Knowledge Management roles.

Role required: sn_customerservice.customer_admin or admin

The pre-defined Case KCS Article mapping is stored in the CSM Table Map (csm_table_map) table. This configuration has the sn_customerservice_case source case table configured to the kb_template_kcs_article target article template table with the four field mappings pre-configured between the tables. You can customize the existing field mappings or map additional fields between the tables.

1. In the application filter navigator, type csm_table_map.list.
2. Click Case KCS Article.
3. From the Target Table list, use the pre-defined KCS article template table or select the newly created article template table.
4. Map each customer service case field that must be used to create knowledge articles.
   a) In the Basic Field Mapping related list, click New.
      To map fields, fill in the following fields:

      | Field                      | Instructions                                      |
      |----------------------------|---------------------------------------------------|
      | Source Field               | Select the field in the source case table that contains the information to be copied to the field in the article template target table. |
      | Target Field               | Select the field in the article template target table to which you need information copied to from the field in the source case table. |

© 2019 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
b) Click Submit.

c) To map fields using advanced scripts, select the **Advanced Field Mapping** check box and then map the fields between the source and the target table using advanced scripts in the **Advanced Field Mapping** tab.

**Note:**
If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.
If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

d) To customize when and how the **Create Knowledge** button is displayed, use the condition builder in the **Condition** tab or select **Use Advanced Condition** check box and configure using advanced scripts.

**Note:** If you change the target table in the **Case KCS Article** mapping, also update the scripts with the configuration changes for display of this button.

5. Click Update.

**Enable creating a knowledge article from an incident**

Enable users to quickly and easily reuse information from an incident in a knowledge article.
Role required: admin

Perform the following steps to enable creating a knowledge article from an incident.

**Note:** Once you have performed the configuration steps, knowledge users can select the Knowledge check box on the Incident form to create an article from an incident. They must have **Can Contribute** access to at least one active knowledge base to create an article.

**Create field mapping from an incident to a knowledge article**

Copy information from an incident into a knowledge article by creating custom mapping between the Incident table and the KCS article table.
Role required: admin

- Ensure that the Knowledge Advanced plugin (com.snc.knowledge_advanced) is active.
- Ensure that the KCS Article template is active.

1. Navigate to **Knowledge > Administration > Article Templates**.
2. Set the **Active** field to true for the KCS Article template.

1. In the filter navigator, type **csm_table_map.list**.
2. Click New.
3. In the **Mapping Name** field, enter **Incident KCS Article**.
4. In the **Source Table** field, enter **Incident**.
5. In the **Target Table** field, enter KCS Article.
6. Right-click the form header and Save.
7. In the Basic Field Mapping related list, click New.
8. Create mappings for the following fields.

<table>
<thead>
<tr>
<th>Source Field</th>
<th>Target Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sys ID</td>
<td>Source Task</td>
</tr>
<tr>
<td>Short description</td>
<td>Short description</td>
</tr>
<tr>
<td>Resolution notes</td>
<td>Resolution</td>
</tr>
</tbody>
</table>

**Note:** You can create field mappings for more fields, as required.

- In the Source field, select the field in the source Incident table that contains the information to be copied to the field in the article template target table.
- In the Target field, select the field in the article template target table to which you need information copied to from the field in the source Incident table.

9. To customize when and how the Knowledge check box is displayed, click the Condition tab.
10. Select the Use Advanced Condition check box.
11. Copy and paste the following code.

```
(function (source) {
    //Only if selected article type is active
    var tem = new GlideRecord("kb_article_template");
    tem.addQuery("child_table","kb_template_kcs_article");
    tem.addActiveQuery();
    tem.query();
    if(!tem.hasNext())
        return false;
    //Do not allow to create the knowledge again
    var gr = new GlideRecord("kb_knowledge");
    gr.addQuery("source",source.sys_id);
    gr.query();
    if(gr.next())
        return false;
    return true;
})(source);
```

12. To map fields using advanced scripts, select the Advanced Field Mapping check box.
13. On the Advanced field Mapping tab, paste in the following code.

```
(function (source,target) {
    // Get the first comments from incident and use it as Issue
description for article
    var notes = source.comments.getJournalEntry(-1);
    var entries = notes.split("\n\n");
    var comment = "";
    if(entries[entries.length-2]){
        comment = entries[entries.length-2];
        var part = comment.toString().indexOf("\)");
        if(part != -1){
            comment = comment.toString().substring(part+2).replaceAll("\r\n","<br/>");
        }
    }
    if(comment)
```

© 2019 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The first comment on an incident is mapped to the **Issue Description** field in the knowledge article.

**Note:** If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping. If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

---

**Add a property to enable creating knowledge article from incidents**

Add a property, which is required to allow users to create a knowledge article from an incident.

Role required: admin

1. In the Filter navigator, enter `sys_properties.list`.
2. Click **New**.
3. Fill in the following fields.
   **System Property form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>enable_kcs_incident</td>
</tr>
<tr>
<td>Description</td>
<td>Enable Knowledge Centered Services (KCS) for Incident Management.</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Create a UI action to enable creating knowledge articles from incidents**

Create a UI action to add the Knowledge check box to the Incident form.

Role required: admin

1. Navigate to **System UI > UI Actions**.
2. Click **New**.
3. Fill in the following fields.
   **UI Action form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Knowledge</td>
</tr>
<tr>
<td>Table</td>
<td>Incident</td>
</tr>
<tr>
<td>Action name</td>
<td>create_knowledge</td>
</tr>
</tbody>
</table>

4. Select the **Client** check box.
5. Select the **List v3 Compatible** check box.
6. Select the **Form button** check box.
7. In the **Onclick** field, enter `createKnowledgeClient()`.

8. In the **Condition** field, enter
   
   ```
   gs.getProperty("enable_kcs_incident") == 'true' &&
   new global.CSMTTableMapUtil (current).findMapByName("incident_kcs_article")
   && new global.KBKnowledge().canCreate();
   ```

9. In the **Script** field, enter the following code.

   ```
   function createKnowledgeClient() {
   if (g_form.modified) {
       alert(new GwtMessage().getMessage('You have unsaved changes.
Please save them to continue.'));
   }else{
       //Call the UI Action again but skip the 'onclick' function
       gsftSubmit(null, g_form.getFormElement(), 'create_knowledge');
       //MUST call the 'Action name' set in this UI Action
   }
   }
   //Code that runs without 'onclick'
   //Ensure call to server-side function with no browser errors
   if (typeof window == 'undefined')
       CreateKnowledgeServer();
   function CreateKnowledgeServer(){
       current.update();
       var map = new global.CSMTTableMapUtil (current);
       map.findMapByName("incident_kcs_article");
       var targetURL = map.getTargetURL();
       var referenceLink = 
       "&sysparm_collection=incident&sysparm_collectionID=\"+current.sys_id+"&sysparm_collection_key=task&sysparm_link_collection=m2m_kb_task&sysparm_collection_related_field=kb_knowledge&sysparm_referring_url=incident.do%3fsys_id%3d\"+current.sys_id;
       if(targetURL)
           action.setRedirectURL(targetURL[0]+referenceLink);
   }
   ```

---

Enable creating a knowledge article from an HR case

Enable users to quickly and easily reuse information from an HR case in a knowledge article.

**Role required:** admin

- Ensure that the Human Resources Scoped App: Core (com.sn_hr_core) plugin is active.
- Ensure that the Developer Application is set to Human Resources: Core.

**Note:** To check, navigate to the Settings icon and then **Developer > Application**.

Perform the following steps to enable creating a knowledge article from an HR case.

**Note:** Once you have performed the configuration steps, knowledge users can select the Knowledge check box on the HR Case form to create an article from an HR case. They must have Can Contribute access to at least one active knowledge base to create an article.

Create field mapping from an HR case to a knowledge article

Copy information from an HR case into a knowledge article by creating custom mapping between the HR case table and the KCS article table.
Role required: admin

- Ensure that the Knowledge Advanced plugin (com.snc.knowledge_advanced) is active.
- Ensure that the Developer Application is set to Human Resources: Core.
- Ensure that the KCS Article template is active.

1. Navigate to Knowledge > Administration > Article Templates.
2. Set the Active field to true for the KCS Article template.

1. In the filter navigator, type csm_table_map.list.
2. Click New.
3. In the Mapping Name field, enter HR Case KCS Article.
4. In the Source Table field, enter HR Case.
5. In the Target Table field, enter KCS Article.
6. Right-click the form header and Save.
7. In the Basic Field Mapping related list, click New.
8. Create mappings for the following fields.

<table>
<thead>
<tr>
<th>Source Field</th>
<th>Target Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sys ID</td>
<td>Source Task</td>
</tr>
<tr>
<td>Short description</td>
<td>Short description</td>
</tr>
<tr>
<td>Close notes</td>
<td>Resolution</td>
</tr>
<tr>
<td>Description</td>
<td>Cause</td>
</tr>
</tbody>
</table>

**Note:** You can create field mappings for more fields, as required.

- In the Source field, select the field in the source HR Case table that contains the information to be copied to the field in the article template target table.
- In the Target field, select the field in the article template target table to which you need information copied to from the field in the source Incident table.

9. To customize when and how the Knowledge check box is displayed, click the Condition tab.
10. Select the Use Advanced Condition check box.
11. Copy and paste the following code.

```
(function (source) {
  // Get the first comments from HR case and use it as Issue
description for article
  target.short_description=source.short_description;"
  target.kb_resolution=source.close_notes;"
  target.kb_cause=source.description;"
  var notes = source.comments.getJournalEntry(-1);
  var entries = notes.split("\n\n");
  var comment = ";
  if(entries[entries.length-2]){
    comment = entries[entries.length-2];
    var part = comment.toString().indexOf("\n")
    if(part !== -1){
      comment = comment.toString().substring(part+2).replaceAll("\r\n","<br/">
    }
  }
}
```
12. To map fields using advanced scripts, select the **Advanced Field Mapping** check box.

13. On the **Advanced field Mapping** tab, paste in the following code.

```javascript
(function (source) {
  // Get the first comments from HR case and use it as Issue description for article
  target.short_description = source.short_description + ""
  target.kb_resolution = source.close_notes + ""
  target.kb_cause = source.description + ""
  var notes = source.comments.getJournalEntry(-1);
  var entries = notes.split("\n\n");
  var comment = ""
  if(entries[entries.length-2]) {
    comment = entries[entries.length-2];
    var part = comment.toString().indexOf(""");
    if(part != -1) {
      comment = comment.toString().substring(part + 2).replaceAll("\r\n", "<br/>");
    }
  }
  if(comment) {
    target.kb_issue = comment;
  }

  // Only if selected article type is active
  var tem = new GlideRecord("kb_article_template");
  tem.addQuery("child_table", "kb_template_kcs_article");
  tem.addActiveQuery();
  tem.query();
  if(!tem.hasNext()) {
    return false;
  }

  // Do not allow to create the knowledge again
  var gr = new GlideRecord("kb_knowledge");
  gr.addQuery("source", source.sys_id);
  gr.query();
  if(gr.next()) {
    return false;
  }

  return true;
})(source);
```

The first comment on an HR case is mapped to the **Issue Description** field in the knowledge article.
**Note:** If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.

If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

### Add a property to enable creating knowledge articles from HR cases

Add a property, which is required to allow users to create a knowledge article from an HR case.

**Role required:** admin

Ensure that the Developer Application is set to **Human Resources: Core**.

1. In the Filter navigator, enter `sys_properties.list`.
2. Click **New**.
3. Fill in the following fields.

<table>
<thead>
<tr>
<th><strong>Field</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td><code>enable_kcs_hr</code></td>
</tr>
<tr>
<td>Description</td>
<td>Enable Knowledge Centered Services (KCS) for HR Service Delivery.</td>
</tr>
<tr>
<td>Type</td>
<td><code>true</code> \ <code>false</code></td>
</tr>
<tr>
<td>Value</td>
<td><code>true</code></td>
</tr>
</tbody>
</table>

4. Click **Submit**.

### Create a UI action to enable creating knowledge articles from HR cases

Create a UI action to add the Knowledge check box to the HR case form.

**Role required:** admin

Ensure that the Developer Application is set to **Human Resources: Core**.

1. Navigate to **System UI > UI Actions**.
2. Click **New**.
3. Fill in the following fields.

<table>
<thead>
<tr>
<th><strong>Field</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Knowledge</td>
</tr>
<tr>
<td>Table</td>
<td>HR Case</td>
</tr>
<tr>
<td>Action name</td>
<td><code>create_knowledge</code></td>
</tr>
</tbody>
</table>

4. Select the **Client** check box.
5. Select the **List v3 Compatible** check box.
6. Select the **Form button** check box.
7. In the **Onclick** field, enter `createKnowledgeClient()`.

© 2019 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
8. In the **Condition** field, enter `gs.getProperty("sn_hr_core.enable_kcs_hr") == 'true' && new global.CSMTableMapUtil (current).findMapByName("sn_hr_core.hr_case_kcs_article") && new global.KBKnowledge().canCreate()

9. In the **Script** field, enter the following code:

```javascript
function createKnowledgeClient() {
    if (g_form.modified) {
        alert(new GwtMessage().getMessage('You have unsaved changes. Please save them to continue.'));
    } else {
        // Call the UI Action again but skip the 'onclick' function
        gsftSubmit(null, g_form.getFormElement(), 'create_knowledge');
        // MUST call the 'Action name' set in this UI Action
    }
}

// Code that runs without 'onclick'
// Ensure call to server-side function with no browser errors
if (typeof window == 'undefined')
    CreateKnowledgeServer();

function CreateKnowledgeServer() {
    current.update();

    var map = new global.CSMTableMapUtil(current);
    map.findMapByName("sn_hr_core.hr_case_kcs_article");
    var targetURL = map.getTargetURL();
    var referenceLink = 
        
        "&sysparm_collection=sn_hr_core_case&sysparm_collectionID="+current.sys_id + 
        "&sysparm_collection_key=task&sysparm_link_collection=m2m_kb_task 
        &sysparm_collection_related_field=kb_knowledge&sysparm_referring_url=sn_hr_core_case.do 
        %3fsys_id%3d"+current.sys_id;
    if(targetURL)
        action.setRedirectURL(targetURL[0]+referenceLink);
}

10. Click **Submit**.

**Use Knowledge Management**

Share your ideas and experience by creating a knowledge article. Search and find information such as self-help, troubleshooting, and task resolution in knowledge bases. Review, provide feedback on knowledge articles, and resolve issues yourselves rather than contacting customer service or an internal helpdesk.

Role required: none

Use Knowledge Management in one or more of the following ways.

**Knowledge Management guide for users**

After knowledge bases are set up, you can start searching and creating articles. If Social Q&A was activated for the knowledge base, you can also submit answers or answer questions for other users.
Requirements

Role required
All users can read knowledge articles. Users with at least one ServiceNow role can create and edit knowledge articles in a knowledge base, unless the knowledge manager has restricted access to the knowledge base or knowledge articles.

If you need these permissions, contact the knowledge manager or knowledge administrator for the knowledge base.

What to do

Create knowledge articles
If you have the required permissions for a knowledge base, you can create articles for it. You can create articles from the Self-Service application menu or by importing Word documents.

You can also create knowledge articles from incidents and problems.

Search for knowledge articles
From the Knowledge homepage, you can select a knowledge base to search for articles and answers. You can view only the knowledge bases to which you have access.

Access to knowledge using your mobile device is supported.

Ask and answer questions
If Social Q&A was activated for a knowledge base, you can ask and answer questions. You can also browse and vote on answers.

Next steps

After articles are created, you can perform the following tasks to make sure that articles are organized in the right knowledge bases and retired when appropriate. If existing knowledge bases do not fit your needs, you can request a new knowledge base.

- Move a knowledge article
- Retire a knowledge article
- Request a knowledge base

Knowledge Management homepage features

The Knowledge Management Service Portal homepage displays knowledge articles and social Q&A items organized by knowledge base and category, as well as featured content and popular articles. Learn how to navigate the homepage to search for and find useful and relevant information quickly.

To use the Knowledge Management Service Portal, the Knowledge Management — Service Portal plugin (com.snc.knowledge_serviceportal) must be activated.

Note: It is active by default for customers on the Madrid and later releases. Existing or upgrade customers must activate the plugin and enable the glide.knowman.serviceportal.enable_redirect property.
Your organization can customize the homepage, so it may look different to the following image. You must be logged in to view the knowledge homepage.

**Knowledge Management homepage features**

## UI component

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
</table>
| Use filter facets to refine your search results. The selections you make filter the items displayed in the search results list. The search results list updates to display only those items that match your selections. Deleting a selection from the filter facet or breadcrumb reverses the filtering in the list. Clear selected filter options by:  
  - Deleting a single option from the search results list header.  
  - Clicking **Clear all** in the search results list header.  
  - Clicking **Clear** in the filter facet widget header.  
  - Author: lists the names of the authors for the knowledge articles included in the search results list  
  - Tags: lists the available knowledge tags  
  - Resource: lists the types of items available, such as knowledge articles and social Q&A  
  - Rating: lists article ratings from 0-5 stars (clicking a rating displays articles that have the selected rating and higher)  
  - Last Modified: lists selections based on the timing of knowledge item modifications such as Past Month or Past Week  
  - View Count: lists the knowledge item view counts such as More Than 50 or Less Than 10. Set the number of days to consider when calculating view count using the glide.knowman.view_age.days property. |

### View additional search results

Depending on the system setup, view additional search results using one of these options:

- **Standard Pagination**: displays the search results in multiple pages.
- **Infinite Scroll**: displays the search results while scrolling.

---

**Note:** If a custom widget on the knowledge search results page uses the KnowledgeSearchService angular service, you must add the sn.knowledgeApplication dependency to enable the functionality of the custom widget.

1. Navigate to **Service Portal > Dependencies**.
2. In the **Name** field, search for the sn.knowledgeApplication dependency.
3. If a message appears, click **here** to edit. You have to be in the Knowledge Management - Service Portal application to edit.
4. Click **Update**.
Knowledge Management article view page features

View the knowledge article you selected, including the article number, short description, and article content. Give feedback or comment on an article.

**Note:** If you select a question, the article view page displays the question, any answers to the question, and a text box for providing an answer.

**Knowledge article URL parameters**

You can add parameters to an article URL to view the latest version and an existing translation.

**Knowledge article URL structure**

The knowledge article URL appears in the following structures:

- **Accessed from Service Portal:** https://<instance-name>.service-now.com/kb?id=kb_article_view&sysparm_article=<article number>&sysparm_language=<language code>

  For example, the URL https://yourbusiness.service-now.com/kb?id=kb_article_view&sysparm_article=KB0010053&sysparm_language=EN returns the article with the most recent version in the selected language, if the translation for the selected language exists.

- **Accessed from Knowledge Base View (kb_view) UI page:** kb_view.do?sysparm_article=<article number>&sysparm_language=<language code>

  For example, the URL https://yourbusiness.service-now.com/kb_view.do?sysparm_article=KB0010044&sysparm_language=en returns the article with the most recent version in the selected language, if the translation for the selected language exists.

**Note:** The listed parameters can include the sys_id in the url parameter.

**Parameters**

The following parameters are available for knowledge article URLs.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Possible values</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_article</td>
<td>Returns the most recent article version. For example, <a href="https://yourbusiness.service-now.com/kb?id=kb_article_view&amp;sysparm_article=KB0010053">https://yourbusiness.service-now.com/kb?id=kb_article_view&amp;sysparm_article=KB0010053</a>.</td>
</tr>
<tr>
<td>sysparm_language</td>
<td>Returns the most recent article version in the input language if a translation exists. For example, <a href="https://yourbusiness.service-now.com/kb?id=kb_article_view&amp;sysparm_id=3b07857187032100d6db">https://yourbusiness.service-now.com/kb?id=kb_article_view&amp;sysparm_id=3b07857187032100d6db</a>.</td>
</tr>
</tbody>
</table>
Create a knowledge article

Knowledge contributors can create and edit knowledge articles within a knowledge base to share information across your organization.

You must have Can Contribute access to at least one active knowledge base.

To view an article template, you must activate the article templates feature and enable the desired templates.

Users with at least one role can create and edit knowledge articles. These users are known as knowledge contributors. Users without any role can read articles and submit feedback, but cannot create or edit articles.

If you try to create an article with more than 2 MB of data, the article might fail to create because of the Now Platform limitation.

Some knowledge bases may allow only certain users to contribute. For example, a member of the IT department can create knowledge articles in the IT knowledge base, such as desktop support information or articles describing company IT processes.

1. There are three ways of creating knowledge articles.
   - Navigate to Self-Service > Knowledge and click the Create an Article icon.
   - Navigate to Knowledge > Articles > Create New.
   - From the Knowledge Management homepage, click the Overflow icon and then Create Article.

2. On the Create new article page, select a knowledge base.
   The list of article templates to select in the next step is filtered according to the article templates available for the selected knowledge base.

   Note:
   On the Create new article page, you can select to Switch to older version of this page or Switch to updated version of this page (recommended).

3. Select an article template.
4. Click Next.
   The Knowledge form is displayed based on the article template selected.
5. Fill in the fields on the form, as appropriate.

   Knowledge form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Base</td>
<td>The knowledge base selected for this article.</td>
</tr>
</tbody>
</table>

   Note: An article can only be associated with one knowledge base.

   You can change the knowledge base, but only if the selected article template is available in the knowledge base.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>The category for this article. Select a Knowledge Base before you can select a category. Articles without a category appear on the knowledge homepage in the (empty) category.</td>
</tr>
<tr>
<td>Ownership Group</td>
<td>The ownership group for this knowledge article. An ownership group consists of a group of members and a manager who are responsible for approvals, ensuring article quality, and feedback tasks. Ownership groups can publish, edit, and retire knowledge articles that they are associated with.</td>
</tr>
<tr>
<td>Note:</td>
<td>If no ownership group is assigned, the article automatically goes to the knowledge administrator and knowledge manager for approval.</td>
</tr>
<tr>
<td>Published</td>
<td>The date this knowledge article was published. This value is set when the article is published.</td>
</tr>
<tr>
<td>Valid to</td>
<td>The date this knowledge article expires. Articles do not appear in search results after the Valid to date or if the Valid to date is blank. The default value of the Valid to field is derived from the Article Validity field configured for the knowledge base (see Create a knowledge base). The Valid to date starts from the date the article was created until the number of days specified in the Article Validity field. If the Article Validity field is blank, the default date in the Valid to field for the knowledge article is set to January 1, 2100. An article author or editor can select whether to keep or change the default Valid to date.</td>
</tr>
<tr>
<td>Note:</td>
<td>If the system date format or user preferences is set to use yy year format, you might face issues when the Valid to date is set to the default date. Contact your system administrator or modify the user preferences to use a date format with the yyyy year format. For more information, see Global date and time field format and Personalize the system date format topics.</td>
</tr>
<tr>
<td>Article type</td>
<td>The type of article, either HTML or wiki.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is only visible in the standard template.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Workflow</td>
<td>(Read-Only) The publication state of the article, such as Draft, In Review, or Published. When inserting a new article from an existing article, the state of the new article is reset to Draft.</td>
</tr>
<tr>
<td>Source</td>
<td>The task this knowledge article was created in response to, if any. This field is set automatically when you create the knowledge article from a task record.</td>
</tr>
<tr>
<td>Attachment link</td>
<td>Check box for downloading an attached file automatically when a user accesses the article, instead of opening the article view. Add one or more attachments to the article to use this option.</td>
</tr>
<tr>
<td>Display attachments</td>
<td>Check box for displaying attachments to users viewing this knowledge article. Attachments appear below the article text. Add one or more attachments to the article to use this option.</td>
</tr>
<tr>
<td>Short description</td>
<td>The title of the article. This title appears when browsing and searching knowledge, and at the top of the article.</td>
</tr>
<tr>
<td>Article body</td>
<td>Content for the article. Use the HTML editor to create content. A preview of the content appears when browsing and searching knowledge.</td>
</tr>
</tbody>
</table>

6. Optional: To search for similar articles, type in the **Related Search** field or continue with the default text in the Knowledge Results section. If the Knowledge results section is not displayed on the Knowledge form, a system administrator can configure the form layout to add the **Contextual Search Results** field to the form.
   - **Search Articles**: Finds similar articles based on the text included in the **Related Search** field.
   - **Similar Articles (ML)**: Finds similar articles based on the Predictive Intelligence feature.
7. Optional: To view the entire article in a pop-up window, click the link to the article title.
8. Click Submit to create the article.

After saving the article record, you can add tags to further organize the article.

Any additional steps required to publish the article, such as approvals, depend on the publishing workflow for the knowledge base.

- If there is no approval workflow set up, the article is immediately published.
- If an approval workflow is set up and Ownership Group is configured, an email notification with a link to the article is sent to the ownership group members assigned to the article for approval.
- If an approval workflow is set up and Ownership Group is not configured, an email notification with a link to the article is sent to the knowledge base manager for approval.
- If the article is approved, it is published and an email notification is sent to the author or reviser of the article.
- If the article is rejected, an email notification is sent to the author or reviser of the article to revise and resubmit it for publishing.

Edit a knowledge article

Knowledge contributors can edit/update knowledge articles within a knowledge base to update information shared across your organization.

Role required: knowledge

Users with at least one role can edit knowledge. These users are known as knowledge contributors. Users without any role can read articles and submit feedback, but cannot edit articles.

However, Knowledge managers can configure User Criteria to restrict access to certain Knowledge bases. For example, only members of the IT department can create or edit knowledge articles in the IT knowledge base, such as desktop support information or articles describing company IT processes.

- If you have user criteria “Can contribute” permission for the specified knowledge base, but are not the article author, and do not have a knowledge base admin or manager role: The installed Knowledge Management Advanced Installer plugin requires the glide.knowman.versioning.enabled property (from the System Property [sys_properties] table) to be set to false to enable you to be able to make changes to unpublished articles within the knowledge base.

Edit an article using one of these options.

- Edit published/unpublished articles with Versioning enabled:
  1. Navigate to Knowledge > Articles.
  2. Select an article from the Published or Unpublished category.
  3. From the article, click Checkout and edit the article.
  4. To save changes to:
     - an unpublished article, and to publish it at the same time, click Publish.
• a published article, or to save changes to an unpublished article without publishing it, click Update.

• Edit published articles from the Knowledge homepage or Service Portal:
  1. Navigate to one of the following modules:
     • Self-Service > Knowledge
     • Knowledge > Homepage
     • Knowledge Service Portal homepage
  2. From the Knowledge homepage, search for and select the article to edit.
  3. From the article, click Edit, then from the Knowledge form record, edit the desired editable fields.
  4. Click Update to save changes.

If you edited an unpublished article, any additional steps required to publish an article, such as approvals, depend on the publishing workflow for the knowledge base.

Map related articles
Discover similar information across articles on a topic while viewing an article. You can manually map related articles or have the application automatically present related articles using machine learning (ML) algorithms.

Role required: knowledge
To edit the article, you must have knowledge contributor access for the associated Knowledge Base.

You can manually map related articles when editing an article. These manually mapped articles appear in the Related Articles section on the article view page.

Note: An administrator can train the solution definition for Knowledge Management within the Predictive Intelligence feature to predict related articles. These automatically
predicted related articles appear in the Knowledge results section on the create article form and in the Related articles section on the article view page.

1. On the Now Platform, open the knowledge article for which you want to map related articles.
2. On the Knowledge form, click the Related Articles related list.
3. Click Edit.
4. On the Edit Members form, move the desired articles from the available articles in the Collection column to the Related Articles List column.
5. Click the up or down icon to arrange the articles in the order in which you want them to appear in the Related Articles section on the article view page, and then click Save.

Note: Knowledge administrators can configure the number of articles shown in the Related Articles section using the instance options.

Map catalog items related to an article

Manually map catalog items related to a knowledge article to enable employees to request the related product or service.

Role required: knowledge

To edit the article, you must have knowledge contributor access for the associated Knowledge Base.

1. On the Now Platform, open the knowledge article for which you want to map related catalog items.
2. On the Knowledge form, click the Related Catalog Items related list.
3. Click Edit.
4. On the Edit Members form, move the desired catalog items from the available catalog items in the Collection column to the Related Catalog Items List column.
5. Click the up or down icon to arrange the articles in the order in which you want them to appear in the Related Items section on the article view page, and then click Save.

Note: Knowledge administrators can configure the number of catalog items shown in the Related Items section using the instance options.

Comment on a knowledge article

Comment on a knowledge article or reply to a comment.

Role required: Admin

1. Navigate to the Knowledge Management Service Portal.
2. Click the article you want to comment or reply to a comment on.
3. Click Click here to comment on this article or Reply.
4. Enter your comment or reply and add links, images, and attachments as required.

Note: Attachments to comments posted in the Knowledge Management Service Portal are not displayed in the Live Feed. If attachments to comments are posted in Live Feed, they are displayed in the Knowledge Management Service Portal.

If antivirus protection is enabled, all attachments are automatically scanned for viruses once the comment is posted. Attachments are only displayed once the scan is finished and successful.
If you are the author of the comment, you can delete it. All comments and replies underneath are automatically deleted.

5. Click **Submit**.

**Note:** You can only view comments in the Live Feed if the Use Live Feed for Knowledge feedback property is active. It is inactive by default.

Comments posted in Live Feed before upgrading to release version New York are not shown hierarchically in the Knowledge Management Service Portal. Comments posted in Live Feed after upgrading to release version New York are shown hierarchically in the Knowledge Service Portal.

The following table illustrates how comments and replies to comments are displayed depending on where you are viewing them.

**Create knowledge from an incident, problem, or case**

Create a knowledge article, so the next time the issue comes up the resolution is easy to find.

Depending on the value of the `glide.knowman.submission.workflow` property, knowledge created from an incident, problem, or case may require additional approval. When this property is true, a submission record is created instead of a knowledge article. A user with the knowledge role must approve the submission to create a knowledge article.

1. Open a resolved incident, problem, or case.
2. Select the **Knowledge** check box on the form.
3. Close the incident, problem, or case.
   A new draft knowledge article is created.
4. If additional approval is required, navigate to **Knowledge > Open Submissions**.
5. Select a submission record.
6. Review the submission to ensure the content and settings are correct.
7. Click **Create Article**.
   A new draft knowledge article is created. Articles created this way are added to the knowledge base specified in the property `glide.knowman.task_kb`.

**Knowledge feedback**

You can view and contribute to feedback on knowledge articles.
Feedback options

You can submit feedback for knowledge articles in these ways:

- Flag an article as incorrect or inappropriate.
- Provide a rating value for the article.
- Mark an article as helpful or not helpful.
- View comments, add a new comment, or reply to existing comments.

Users can view comments directly on the article. Knowledge managers can view the other types of feedback by navigating to Knowledge > Feedback.

Administrators and knowledge managers can disable some feedback options using fields on the Knowledge Base form. Administrators can configure feedback options using properties.

Flagging articles

You can flag an article for incorrect or inappropriate content. Click Flag Article in the article header to open a new window, allowing you to enter suggested changes.

The glide.knowman.use_live_feed property controls the display of knowledge article comments.

- If enabled, the system uses live feed to manage and display feedback on knowledge articles. Flagged comments do not appear on the Article View page. Users with the admin, knowledge_admin, and knowledge_manager roles can access flagged articles by navigating to Knowledge > Articles > All Flagged. Users with the knowledge role can access their flagged articles by navigating to Knowledge > Articles > My Flagged.
- If disabled, the author of the article and users with the admin, knowledge_admin, and knowledge_manager roles can see all flagged comments. Other users can see only their own flagged comments.

**Note:** You cannot disable flagging for an article until you have disabled the flagging for all feedback comments for that article.

Flagged comments are stored in the Knowledge Feedback (kb_feedback) table but not the Live Feed Messages (live_message) table.

Rating articles

The five stars below the article title allow you to indicate the article's effectiveness on a scale of 1 to 5.

Marking articles

The question Helpful? at the bottom of the article allows you to indicate the usefulness of the article with a simple Yes or No answer.

Comments

Knowledge comments at the bottom of the article use live feed to enable a conversation around a knowledge article. For example, you can post replies to comments, add attachments, or Like comments.
Import a Word document to a knowledge base

Import a Word document to create a knowledge article.

- You must have Can Contribute access to at least one active knowledge base.
- You must show the Publish check box on the Import Articles form.

To show the Publish check box, navigate to Knowledge > Administration > Properties and activate the Show publish checkbox on the knowledge import pop-up property.

Role required: none

This feature is active by default for customers on Madrid and later releases.

Existing customers on release versions prior to Madrid use the Word import functionality on the Knowledge V3 homepage.

Upgrade customers use the Word import functionality on the Knowledge V3 homepage by default. If required, add the Import Articles module to the Application Navigator.

These styles and elements are preserved when importing a .doc or .docx file into a knowledge base. Styles and elements not included in this list may not be preserved when importing a document.

- Titles
- Headings
- Images

**Note:** Images may not be aligned exactly as in the Word document you import.

- Links
- Bold text
- Italic text
- Underlined text
- Ordered and unordered lists

**Note:** After import, the bullets in an unordered list are replaced with dots.

- Tables

**Note:** Only default heading settings are supported. Custom heading styles are imported using the default settings for those styles. Table styling and borders are not supported.

1. Navigate to Knowledge > Articles > Import Articles.
2. Enter the knowledge base to add the article to.
3. Optional: Select a Category from within the knowledge base.

**Note:** Use the category picker to add a category. The picker does not differentiate between the different category levels. You can select a category or sub category and add it to the Category field.

4. Optional: Select the Publish check box to start the publishing workflow for each imported article immediately after the import finishes.

**Note:** The Publish check box only appears if the Show publish checkbox on the knowledge import pop-up property is activated.

5. Select one or more Word files to import.
6. Click **Import**.
   An article is created in the selected knowledge base and category using the content from the uploaded document.
   - If you uploaded multiple documents, one article is created for each.
   - If you use knowledge internationalization, the language of the article is set to the system language selected.
   - When the upload completes, a pop-up window displays the number and short description of the articles. Click an article to view the full record.
   - If any errors occur during the upload, a pop-up window displays the error.
   - If the **Publish** check box is activated, knowledge articles go into **Review** or **Published** state, depending on the workflow attached to the knowledge base.
   - If the **Publish** check box is not activated, the knowledge articles go into **Draft** state and are then reviewed before publishing.

Create an article version by importing a Word document

Import a Word document to a knowledge article to create a new version.

- Ensure that the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is installed.
- You can only upload new versions to articles that are in **Draft** or **Published** state.
- You cannot upload new versions to articles that are created using an article template or if the article type is **Wiki**.

Role required: admin

1. Navigate to **Knowledge > Articles**.
2. Click an article.
3. Click the **Upload New Version** related link.

   **Note:** Any text written in TinyMCE is overwritten once the file is imported.

4. Add the file you want to import.
5. Optional: Select the **Copy Attachments** check box to copy all attachments to the knowledge article.

   **Note:** If the article is published, the attachments are added to a new article version. If the article is in draft, the attachments are added to the existing knowledge article. The draft article does not appear in the knowledge base (KB) for users until it is reviewed and published.

6. Click **Import**.
   A draft version is created and sent to approvers to approve or reject. Once the article is approved, it is displayed in the **Article Versions** related list.

Social Q&A question view page

View the question you selected as well as any answers. Answer a question or give feedback to a question.
How long does it usually take to set up my router?

Let's face it: Each router is different, and getting the right combination of settings, while setting up the router can be confounding. For example, even some reasonably experienced PC hands do not understand the differences between security settings or know that WPA-2 offers better protection than WEP and ordinary WPA.

With these considerations in mind how long does it usually take to setup my routers?

Various vendors have tried to make things simpler with easy-setup CDs or one-click connection buttons, but they can not cover every possible circumstance. Router setup instructions go extra mile by explicitly detailing the order in which you need to you plug everything in before you run the CD. (Cable modems in particular should be powered on before you connect your router to them.) That is a nice touch -- but it assumes you have read the printed instructions that came with the router. This helps in setting up the router relatively quickly.

</table>

Knowledge subscriptions

Subscribe to knowledge bases and knowledge articles and receive email notifications about new articles and article revisions or comments.

- **Subscribed to a knowledge base:**
  - Knowledge base owners are auto-subscribed to all articles in the knowledge bases they own. They receive email notifications when new articles are created or revised (published) in the knowledge base.
  - Users who subscribe to a knowledge base receive email notifications when new articles are created in the knowledge base or if the existing articles are revised (published).

- **Subscribed to a knowledge article:**
  - Knowledge authors are auto-subscribed to the articles they create. They receive email notifications when the articles they created are checked out or revised (published) by other authors, and if the articles receive user comments.
  - Users who subscribe to an article receive email notifications when the article is revised (published).

Users can set their Knowledge notification preferences using System Settings.
The knowledge subscription feature is available for both the Knowledge Management v3 user interface and the Knowledge Management Service Portal.

If the article versioning feature is enabled, the following notifications are also sent:

- An article is checked out
- An article is revised
- A new version of an article is published

**Subscribe to a knowledge base**

Subscribe to a knowledge base and receive notifications when articles are added to that knowledge base.

Role required: knowledge

Users can subscribe to a knowledge base from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

1. Navigate to **Knowledge > Homepage**.
2. Click the **Subscribe** link on the knowledge base tile.
   
   The link changes to **Subscribed** and includes a check mark.

**Unsubscribe from a knowledge base**

Unsubscribe from a knowledge base.

Role required: knowledge

Users can unsubscribe from a knowledge base from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

Note: If you subscribe to an article and then subscribe to the knowledge base, unsubscribing from the knowledge base also unsubscribes you from the article.

1. Navigate to **Knowledge > Homepage**.
2. Point to and click the **Subscribed** link on the knowledge base tile, which toggles to **Unsubscribe**.
   After unsubscribing you from the knowledge base, the link toggles to **Subscribe**.

**Subscribe to a knowledge article**

Subscribe to a knowledge article within a knowledge base.

Role required: knowledge

Users can subscribe to a knowledge article from either the Knowledge Management V3 user interface or the Knowledge Management Service Portal.

Note:

Users who are already subscribed to a knowledge base are also subscribed to the articles within that knowledge base.

To subscribe to articles from the base service portal (https://<instance name>/sp?), you must navigate to the **Knowledge Management Service Portal** pages (for example: https://<instance name>/sp?id=kb_home) from the base service portal.

1. Navigate to **Knowledge > Homepage**.
2. Click **Subscribe** at the top of the knowledge article.
The system shows an information message about the article subscription and the button toggles to Subscribed. If the email notification contains an article link, the link points to the Knowledge Management Service Portal.

Unsubscribe from a knowledge article

Unsubscribe from a knowledge article.
Role required: knowledge

Users can unsubscribe from a knowledge article from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

**Note:** If you are subscribed to a knowledge base and you unsubscribe from an article in that knowledge base, you must also unsubscribe from the parent knowledge base.

1. Navigate to Knowledge > Homepage.
2. Point to and click Subscribed, which toggles to Unsubscribe.
   If you are subscribed to the knowledge article, this action results in an information message that the article subscription has been removed. If you are also subscribed to the parent knowledge base, proceed to the next step.
3. If you are subscribed to the parent knowledge base, click Yes on the Unsubscribe pop-up window.
   This action results in an information message that the knowledge base subscription has been removed.

Set knowledge notification preferences

Set notification preferences for knowledge bases and knowledge articles.
Role required: knowledge

Users can set notification preferences from the Knowledge menu or from the Knowledge Management Service Portal.

1. Navigate to the Notification Settings page.

<table>
<thead>
<tr>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From the Knowledge application</td>
<td>Click the Notification Settings module.</td>
</tr>
<tr>
<td>From the Knowledge Management Service Portal</td>
<td>Click the user name in the portal header and then click Notification Settings.</td>
</tr>
</tbody>
</table>

2. Click the Notification Preferences tab.
3. Click Knowledge Base and enable or disable the knowledge base notification options.
4. Click Knowledge Articles and enable or disable the knowledge article notification options.

Manage knowledge subscriptions

Manage knowledge base and knowledge article subscriptions from the Notification Settings page.
Role required: knowledge

Users can manage knowledge subscriptions from the Knowledge application or from the Knowledge Management Service Portal.

1. Navigate to the Notification Settings page.

<table>
<thead>
<tr>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From the Knowledge application</td>
<td>Click the Notification Settings module.</td>
</tr>
<tr>
<td>Location</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>From the Knowledge Management Service Portal</td>
<td>Click the user name in the portal header and then click Notification Settings.</td>
</tr>
</tbody>
</table>

2. Click the Subscriptions tab.
3. Click Knowledge Base or Knowledge Articles to see a list of current subscriptions.
4. To unsubscribe from a knowledge base or knowledge article, click Subscribed. The link toggles to Unsubscribed.

Knowledge blocks

Simplify knowledge authoring for writers and knowledge consumption for readers with knowledge blocks. Knowledge blocks are reusable pieces of content secured by user criteria that you can add to knowledge articles in a knowledge base. The user criteria controls which users can read or not read the block content in an article or search, enabling users to more easily view content that is relevant to them.

How to use knowledge blocks

To use knowledge blocks, a knowledge administrator or manager must enable the knowledge blocks feature for each knowledge base in which the blocks will be used.

- Enable knowledge blocks for each knowledge base

Knowledge contributors can create knowledge blocks and insert them into articles in a knowledge base:

Note: Knowledge blocks are not supported in article templates and articles of type wiki.

- Create a knowledge block
- Add knowledge blocks to a knowledge article
- Preview a knowledge article with knowledge blocks

Knowledge block content can be read or not read in an article or search based on user criteria set at the knowledge base and knowledge block level. See Select user criteria for a knowledge block for more information.

Holiday calendar with location-specific knowledge block content

You are part of an enterprise HR organization that maintains a company knowledge base. You want to create a holiday calendar so that employees know which days of the year are company holidays. Since the company has multiple locations and holiday dates vary based on where the employee is located, there are several ways that you could create the knowledge article.

One way is that you could create a knowledge article for each location, with an article for Location A, Location B, and so on.

- Pros: simplified consumption. Employees have a single article to search for and read.
- Cons: more work for HR. HR has multiple articles to manage and update for each location where the company has employees.
Another way is that you could create a single knowledge article that includes sections for each location.

- Pros: simplified authoring. HR has a single article to manage and update.
- Cons: more work for employees. Employee must scroll through and disregard extraneous content to find the section in the article that pertains to them.

With knowledge blocks, you can create a single knowledge article with location-specific block content secured by user criteria. This approach helps to reduce the workload for both HR and employees. As an HR agent, you have a single article to manage and update. Employees have a single article to search for and read, with the user criteria ensuring that they only view content that is relevant to them.

If you are using a custom search or knowledge article viewer

If you are using a custom search or knowledge article viewer with your application, you should integrate it with the appropriate knowledge or knowledge blocks API. (Integration is only necessary if you are using a custom search or knowledge article viewer.)

- Integrating a custom search or knowledge article viewer with knowledge blocks

Activation information

To use knowledge blocks in your application, you must activate knowledge blocks. For information on what components are installed with the feature, see Components installed with knowledge blocks.

**Note:** Activating knowledge blocks automatically activates Knowledge Management Advanced, which enables advanced features such as article versioning. Knowledge blocks can be used with or without the article versioning feature. To disable the feature, see Disable the article versioning feature.

Activate knowledge blocks

You can activate knowledge blocks (com.snc.knowledge_blocks) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

Knowledge blocks activates these related plugins if they are not already active.
Plugins for knowledge blocks

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Management Advanced (com.snc.knowledge_advanced)</td>
<td>Enables advanced features for Knowledge Management, such as article versioning. For a full list of features, see <a href="#">activate the Knowledge Management Advanced plugin</a>.</td>
</tr>
</tbody>
</table>

**Note:** Knowledge blocks can be used with or without the article versioning feature. To disable the feature, see [Disable the article versioning feature](#).

1. **Navigate to System Definition > Plugins.**
   A banner notifies you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:**
   To redirect to the legacy list view for plugins, click the link.

2. **Find the plugin using the filter criteria and search bar.**
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in [Request a plugin](#).

3. **Activate the plugin.**
   You can activate the plugin directly from the All Applications page or you can view more details about the plugin before you activate it.
   - If you are certain that you have the correct plugin, click **Install**, and when you see the dialog box, click **Activate**.
To view plugin details before activation:

1. Click the plugin name.
2. On the form, click the **Activate/Update** related link.
3. In the dialog box, review the dependent plugins.
   
   If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.

4. If demo data is available and you want to install it, click **Load demo data**.

   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.

5. Click **Activate**.

**Components installed with knowledge blocks**

Several types of components are installed with activation of the knowledge blocks plugin, including tables.

**Note:** To view all other components that install with this application, see the Application Files table. For instructions on how to access this table, see [Find components installed with an application](#).

Demo data is available for this feature.
Tables installed

<table>
<thead>
<tr>

For further information on table administration and how to manage data, see Table administration.

Enable knowledge blocks for each knowledge base

Enable the knowledge blocks feature for each knowledge base where you plan to use the blocks. Once enabled, you can create knowledge blocks to add to knowledge articles within a knowledge base.

Role required: knowledge_admin or knowledge_manager

1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Open the knowledge base record.
3. In the Knowledge Base form, select the Enable blocks check box.

Note: If the Enable blocks check box is not visible, you can add the field to the form by right-clicking the form header and navigating to Configure > Form Layout.
4. Click **Update**.

**Note:** If you decide to later disable the knowledge blocks feature, all knowledge blocks within the knowledge base must be deleted before you can clear the box.

Create knowledge blocks to use within the enabled knowledge base.

**Create a knowledge block**

Create or modify a knowledge block to define a reusable piece of content that can be inserted into knowledge articles in a knowledge base. The knowledge block is secured by user criteria, which controls what users, groups, roles, companies, locations, or departments can read or not read the content in an article or search, enabling users to more easily view content that is relevant to them.

Role required: user must have contributor access to the knowledge base.

1. Navigate to **Knowledge > Knowledge Blocks > Create New**.
2. Click **New** or open a record.
3. Fill in the fields on the form.
# Knowledge Block form

<table>

</tr>
</tbody>
</table>
| Version       | This field is automatically set to a version number when the article versioning feature is enabled.  
  **Note:** Knowledge blocks can be used with or without the article versioning feature. To learn more about article versioning, including how to disable the feature, see Article versioning. |
| Article type  | This field is automatically set to HTML.  
  **Note:** Knowledge blocks are only supported with HTML knowledge articles. |
| Workflow      | This field is automatically set to the publication state of the block, such as Draft, Published, or Retired. |
| Source task   | Not applicable.                                                             |

4. Click **Save** or **Update** to create or update the block.
5. Click **Publish** to publish the block.

**Note:** Any additional steps required to publish the knowledge block, such as approvals, depend on the publishing workflow for the knowledge base. See Knowledge workflows for more information.

After the knowledge block is published, you can add the block to an article within the knowledge base.

**Select user criteria for a knowledge block**

Control which users can read or not read knowledge block content within an article in a knowledge base by setting user criteria at the knowledge base and knowledge block level. As a knowledge contributor, you can apply user criteria at the knowledge block level.

Role required: user must have contributor access to the knowledge base.

1. Navigate to **Knowledge > Knowledge Blocks > All.**
2. Open a knowledge block.
3. Apply the desired user criteria for the **Can Read** and **Cannot Read** fields.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can Read</td>
<td>User criteria to apply for read access at the knowledge block level.</td>
</tr>
<tr>
<td>Cannot Read</td>
<td>User criteria to apply for cannot read access at the knowledge block level.</td>
</tr>
</tbody>
</table>

**Note:**
- You can use existing or create new user criteria records. To create a new record, see Create a user criteria record in Knowledge Management.
- If a user meets any **Can Contribute** criteria at the knowledge base level, they can read all knowledge block content, regardless of the **Can read** and **Cannot read** criteria set at the knowledge block level.
- If a user meets any **Cannot read** criteria at the knowledge block level, they cannot read the block content, regardless of the **Can read** criteria set at the knowledge block level.
4. Right-click the form header and click **Save**.

- To finish and publish the block, see *Create a knowledge block*.
- To add the block to an article, as well as preview the article by impersonating different users, see *Add knowledge blocks to a knowledge article*.

*Retire a knowledge block*

You can retire a published knowledge block so that it is no longer available for users to view or search. A knowledge block can only be retired if it is not being used in any knowledge articles.

**Role required:** user must have contributor access to the knowledge base.

1. Navigate to **Knowledge > Knowledge Blocks > Published**.
2. Open the applicable record.
3. In the **Articles** related list, verify that the knowledge block is not being used in any knowledge articles.

   **Note:** A knowledge block can only be retired or deleted if it is not being used in any knowledge article, including any retired article or previous version of an article.

4. Click **Retire** to retire the knowledge block.

   **Note:** Any additional steps required to retire the knowledge block, such as approvals, depend on the workflow for the knowledge base. See *Knowledge workflows* for more information.

*Add knowledge blocks to a knowledge article*

You can insert one or more knowledge blocks into a knowledge article within a knowledge base. Each knowledge block is secured by user criteria, which controls who can read or not read the content in an article.

**Role required:** user must have contributor access to the knowledge base.

1. Navigate to **Knowledge > Articles > All**.
2. Click **New** or open a record.
3. Fill in the fields on the form, as appropriate.

   For further details on creating a knowledge article, see *Create a knowledge article*.

   **Note:** Knowledge blocks are only supported with HTML knowledge articles. Make sure that the **Article type** field is set to **HTML**.

4. Click **Add Blocks** to open the **Add Blocks** side panel.

   **Note:** If the **Add Blocks** button is not visible, make sure that the knowledge blocks feature is enabled for the knowledge base that the article is in. See *Enable knowledge blocks for each knowledge base* for more information.
5. In the **Add Blocks** side panel, you can search for, do an advanced search, view, and insert knowledge blocks into the article. You can also create blocks directly from the side panel.

**Note:** If there are knowledge blocks you cannot find, make sure that the blocks are published, in the same language, and in the same knowledge base as the article.
6. In the **Article body**, you can rearrange knowledge blocks within an article.

<table>
<thead>
<tr>
<th>Option</th>
<th>Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you are using a mouse</td>
<td>1. Click the block to select it.</td>
</tr>
<tr>
<td></td>
<td>2. Drag and drop the block within the article.</td>
</tr>
<tr>
<td>If you are using a keyboard</td>
<td>1. Place your cursor to the left of the block.</td>
</tr>
<tr>
<td></td>
<td>2. Press the right arrow key to select the block.</td>
</tr>
<tr>
<td></td>
<td>3. Use Ctrl+x and Ctrl+v to cut and paste the block within the article.</td>
</tr>
</tbody>
</table>

The following GIF shows an example of a user moving a knowledge block within an article using a keyboard.
Get ready for your next day off! Here's a list of company holidays:

KBB0010002
Company Holiday Calendar - Location A

Holiday

KBB0010003
Company Holiday Calendar - Location B
7. Click **Save** or **Update** to create or update the article.

   **Note:** You can preview the article with the blocks by user or, if published, by date. See Preview a knowledge article with knowledge blocks for more information.

8. Click **Publish** to publish the article.

   **Note:** Any additional steps required to publish the knowledge article, such as approvals, depend on the publishing workflow for the knowledge base. See Knowledge workflows for more information.

---

**Preview a knowledge article with knowledge blocks**

Preview a knowledge article with knowledge blocks by user or, if published, by date. For an unpublished article, you can preview the article by user by impersonating different users to see how the article displays or hides block content (based on the user criteria set at the knowledge base and knowledge block level). For published articles, you can preview the article by both user and date to see how the article appears in past versions for different users.

Role required: user must have contributor access to the knowledge base.

1. Navigate to **Knowledge > Articles**, and open one of the modules, such as **Unpublished** or **Published**.
2. Open the knowledge article with knowledge blocks.
3. In the **Related Links** section, click **Preview Article with Blocks**.
4. Preview the article as one of the following.

<table>
<thead>
<tr>
<th>Option</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unpublished article</td>
<td>Preview the article by user. In the View As field, you can search for and impersonate different users to see how the article appears based on the can and cannot read access of the user.</td>
</tr>
<tr>

</tr>
<tr>
<td>Published article</td>
<td>Preview the article by user and date:</td>
</tr>
<tr>
<td></td>
<td>• In the View As field, you can search for and impersonate different users to see how the article appears based on the can and cannot read access of the user.</td>
</tr>
<tr>
<td></td>
<td>• In the View on date field, you can select different dates to see how the article appears in past versions.</td>
</tr>
</tbody>
</table>

**Preview a knowledge article with blocks by different users**

The author is previewing the article as different users in different locations. Ashley Aoto sees the block content for Location A, Beth Berry sees the block content for Location B, and Claire Chaganti sees the block content for Location C.
Company Holiday Calendar

KB0010004

Employees in Location A have the following company holidays.

- Mon, January 1 - New Year's Day
- Mon, February 19 - Presidents' Day
- Mon, May 28 - Memorial Day
- Wed, July 4 - Independence Day
- Mon, September 3 - Labor Day
- Thurs, November 22 - Thanksgiving
- Tues, December 25 - Christmas Day
- Mon, December 31 - New Year's Eve

Employees in Location B have the following company holidays.

- Mon, January 26 - Republic Day
- Tues, May 1 - May Day
- Fri, June 15 - Idul Fitr
- Wed, August 15 - Independence Day
- Thurs, September 13 - Ganesh Chaturthi
- Tues, October 2 - Ghandi Jayanthi
- Wed, November 7 - Diwali
- Tues, December 25 - Christmas Day

Employees in Location C have the following company holidays.

- Mon, January 1 - New Year's Day
- Fri, March 30 - Good Friday
- Mon, April 2 - Easter Monday
Integrating a custom search or knowledge article viewer with knowledge blocks

If you are using a custom search or knowledge article viewer with your application, you can integrate that custom search or viewer with the appropriate knowledge or knowledge blocks API.

**Note:** Integration is only necessary if you are using a custom search or knowledge article viewer.

KBPortalServiceImpl - Global

The KBPortalServiceImpl API is included with Knowledge Management V3 (com.snc.knowledge3) as a script include. It provides methods to use with knowledge, such as integration with a custom search.

KBPortalServiceImpl - KBPortalServiceImpl()

Instantiates a KBPortalServiceImpl object in a global application.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

KBPortalServiceImpl - getResultData(Object request)

Returns search results based on keywords from the knowledge article and from relevant knowledge block content that the user has access to read.

If you have activated the knowledge blocks feature and are using a custom search for knowledge with your application, your search may not return relevant articles when keywords are contained in the blocks. To return search results based on keywords from the article and from relevant block content that the user has access to read, you must call the `getResultData()` method inside your custom search.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request</td>
<td>Object</td>
<td>JSON object to refine the search.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Array of search results in JSON format based on keywords from the knowledge article and from relevant knowledge block content that the user has access to read.</td>
</tr>
</tbody>
</table>

Integrating a custom search with knowledge blocks

```javascript
function doKeywordSearch(queryText, count, queryLocation) {
  var results = [];
  // To set up the request.
  var request = {
    keyword: queryText,
    language: "",
  }
  // Call the API.
  KBPortalServiceImpl.getResultData(request);
  // Process the results.
  // ...
}
```
// To pass data to filter on different metadata.
variables: {
    kb_knowledge_base: ['Knowledge'],
    kb_category: '',
    author: ['',]
},

// Provide the following.
context: gs.getProperty('glide.knowman.sp.search_context', 'Knowledge Search'),
resource: 'Knowledge',
order: "relevancy,true",

// Provide the pagination variables.
start: queryLocation,
end: queryLocation+count,
attachment: false,

// Provide any additional metadata you want to include in your results.
knowledge_fields: [
    "number",
    "sys_id",
    "published"
]

// To execute the search.
var response = new KBPortalServiceImpl();
response.getResultData(request);

// To send the search results back to the UI or to store results in your object.
for (var i = 0; i < response.results.length; i++) {
    var result = response.results[i];
    var article = {};
    article.sys_id = result.meta.sys_id.display_value;
    article.number = result.meta.number.display_value;
    article.short_description = article.short_description;
    article.title = result.title;
    article.published = result.meta.published.display_value;
    article.publishedUTC = result.meta.published.display_value;
    article.text = article.text;
    article.score = result.meta.score;
    article.label = article.short_description;
    article.shortDescription = article.short_description;
    results.push(article);
}

return results;

---

**KBBloack - Global**

The **KBBloack** API is included with knowledge blocks (com.snc.knowledge_blocks) as a script include. It provides methods to use with the knowledge blocks feature, such as integration with a custom knowledge article viewer.

**KBBloack - KBBloack()**

Instantiates a KBBloack object in a global application.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**KBBlock - getArticleContent(GlideRecord knowledgeRecord)**

Gets knowledge articles with relevant knowledge block content that a user has access to read.

If you have activated the knowledge blocks feature and are using a custom knowledge article viewer with your application, your viewer may not display articles that expand the relevant block content. To expand block content that a user has access to read, you must call the `getArticleContent()` method inside your custom viewer.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>knowledgeRecord</td>
<td>GlideRecord</td>
<td>GlideRecord of the knowledge article to display.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Knowledge article with relevant knowledge block content that a user has access to read.</td>
</tr>
</tbody>
</table>

### Integrating a custom knowledge article viewer with knowledge blocks

```javascript
// This function returns the article text with expanded block content.
function getArticleText(kbSysId) {
  var knowledgeRecord = new GlideRecord('kb_knowledge');
  var kbText='';
  if(knowledgeRecord.get(kbSysId)) {
    if(new GlidePluginManager().isActive('com.snc.knowledge_blocks')) {
      kbText = new KBBlock();
      kbText.getArticleContent(knowledgeRecord);
    } else {
      kbText = knowledgeRecord.getValue('text');
    }
  }
  return kbText;
}

// This is an example of how to call the function defined above.
var kbText = getArticleText('01a1ca5b671030038876c3b5685efd3');
```

### Knowledge Management V3 homepage

The Knowledge Management V3 homepage displays knowledge articles and social Q&A questions organized by knowledge base and category, as well as featured content and popular articles.
To view the default knowledge homepage, navigate to **Self-Service > Knowledge**.

**Note:**
The knowledge homepage is not compatible with Internet Explorer 9 or earlier. Using one of these browsers will cause you to be redirected to the legacy knowledge portal.
The Knowledge V3 home page is not customizable. Use the **Knowledge Management Service Portal** for an easily configurable user experience.

If you access knowledge from a service management application, the knowledge homepage for the associate application opens.

From the homepage, you can import a Word document to a knowledge base using the **Import Articles** button.

**Note:** From Madrid, you can import a word document from the Import Articles module available in the Application Navigator. This feature is active by default for customers on Madrid and later releases. Existing customers on release versions prior to Madrid use the Word import functionality on the Knowledge V3 homepage. Upgrade customers use the Word import functionality on the Knowledge V3 homepage by default. If required, add the Import Articles module to the Application Navigator. If you add the module, the **Import Articles** button does not appear on the Knowledge V3 homepage.

You can also create a new article using the **Create An Article** button, or ask a question using the **Post a Question** button.

- **Import a Word document**
- **Create an article**
- **Ask a question**

**Note:** You must have user criteria "Can contribute" permission for at least one active knowledge base, otherwise these buttons do not appear. See **Migrate to Knowledge Management v3** and **Knowledge manager**.

You can select a knowledge base to browse articles and questions within that knowledge base. You can view only knowledge bases you can access.

Articles and questions are organized by category or by tag. Categories are listed alphabetically. While browsing, you can filter content by type to view only knowledge articles, only social Q&A questions, or only unanswered questions. You can sort content by most recent update or by number of views.

You can comment on an article. There is no HTML formatting available for comments on the Knowledge V3 homepage.

Existing customers on release versions prior to New York can view knowledge article feedback comments in the following ways.

- **On the Knowledge V3 homepage.**
- **If the Knowledge Management — Service Portal plugin (com.snc.knowledge_serviceportal) is installed, on the Knowledge Service Portal.**
- **If the Use Live Feed for knowledge feedback property is active, in the Live Feed.**

For new customers on New York and later releases, comments can only be viewed in the Knowledge Service Portal.
An administrator can configure the knowledge homepage to display the number of articles and questions within each category. This count includes articles and questions from subcategories. To display the article and question count, set the knowledge homepage property `Display or hide the count of articles and questions in the category and child categories (glide.knowman.show_number_on_categories)` to true.

### Search using Knowledge Management v3

Search for knowledge articles and social Q&A questions from the knowledge homepage using the search bar on the Knowledge Management v3 homepage.

Search results include only articles and questions you are authorized to read. The search results count do not take into consideration any security rules set for the articles. The number of articles you can access may be lower than the count displayed in the search results page. Documents that are attached to articles are also listed in the search results.

**Note:** To change how the attachments are displayed in the search results, set the `How to display attachments in Knowledge Search Results glide.knowman.search.attachment` property. Attachments can be displayed with a snippet, link only, or not at all.

To use wildcards in your search, navigate to **Contextual Search > Search Contexts > Knowledge Base Search** and select **Enable wildcard searches**.

Sort knowledge content by relevancy, most recent update, or number of views.

Filter results using the check boxes that appear. Filtering options appear depending on the search text.

**Filtering options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select if you want to view knowledge articles, social Q&amp;A questions, or both. This option is only available if Social Q&amp;A is enabled.</td>
</tr>
<tr>
<td>Knowledge Bases</td>
<td>Select a knowledge base to search. You can select only knowledge bases you can access. If you do not select a specific knowledge base, search results include articles and questions from all knowledge bases that you can access. You can also select a knowledge base from the choice list in the search bar. For pinned articles, only those in the selected knowledge base in the corresponding language appear.</td>
</tr>
<tr>
<td>Categories</td>
<td>Select one or more knowledge categories. Categories are listed alphabetically.</td>
</tr>
<tr>
<td>Authors</td>
<td>Select one or more authors.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>Language</td>
<td>The multi-language search feature is available when more than one supported language is enabled.</td>
</tr>
</tbody>
</table>

1. To enable multi-languages, activate the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) or activate one of the internationalization plugins for the language you require.

   **Note:** Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.

2. To display search results in all available languages simultaneously, enable the glide.knowman.enable_multi_language_search property.
   a. Navigate to Knowledge > Administration > Properties > Knowledge Search Properties > Enable multi language search and select the Yes check box.
   b. Enter sys_properties.list in the filter navigator, search for the property to configure, and in the Value field, enter true.

   **Note:** By default, the glide.knowman.enable_multi_language_search property is not enabled. Search results are displayed based on the language you select in the language filter on the Search page.

---

**Import a Word document to a knowledge base using Knowledge Management V3**

Import a Microsoft Word document using Knowledge Management v3 homepage to create a knowledge article.

You must have user criteria "Can contribute" permission for at least one active knowledge base.

The import articles button does not appear in the following conditions:

- The Import Articles module is available on the Application Navigator. This feature is active by default for customers on Madrid and later releases.
- You cannot contribute to any knowledge base.

**Note:** An administrator can control the visibility of the Import Articles button by setting the other knowledge property Hide the 'Import' functionality (button and drag-n-drop) for all users (glide.knowman.import.hide_import_functionality) to true.
Role required: None

You can import Microsoft Word .doc and .docx files.

**Note:** The file extension must be lowercase.

When you import a document, text content from the document is used to create the knowledge article. The articles support all editing functions supported by the TinyMCE editor. All HTML supported by TinyMCE such as tables, lists, and links, as well as styling such as bold and italics, are preserved. Images from the document are added as attachments to the knowledge article and embedded in the article body.

**Note:**
You can import multiple files at a time. Closing the browser or navigating away cancels any in-progress uploads but does not delete articles created from completed imports.

You cannot import documents to knowledge from mobile devices.

The following styles and elements are preserved when importing a .doc or .docx file into a knowledge base. Styles and elements not included in this list may not be preserved when importing a document.

- Titles
- Headings
- Images

**Note:** Images may not be aligned exactly as in the Word document you import.

- Links
- Bold text
- Italic text
- Underlined text
- Ordered and unordered lists

**Note:** After import, the bullets in an unordered list are replaced with dots.

- Tables

**Note:** Only default heading settings are supported. Custom heading styles are imported using the default settings for those styles. Table styling and borders are not supported.

1. Navigate to **Self-Service > Knowledge**.
2. Perform one of the following actions.
   - Click **Import Articles** and select one or more document files.
   - Drag one or more document files onto the knowledge homepage.
3. Select the **Knowledge base** to add the new article to.
   You can select only knowledge bases you can contribute to.
4. Optional: Select a **Category** from within that knowledge base.

**Note:** Use the category picker to add a category. The picker does not differentiate between the different category levels. You can select a category or sub category and add it to the **Category** field.
5. Optional: Select the **Publish** check box to start the publishing workflow for each imported article immediately after the import finishes.

   This check box applies only when importing to v3 knowledge bases and only if the **Show publish checkbox on the knowledge import pop-up** property is set to **Yes** on the Knowledge Management properties form. You cannot automatically publish articles imported to v2 knowledge bases.

   Knowledge v2 articles go into **Draft** state. Knowledge v3 articles go into **Review** or **Published** state, depending on the workflow attached to the knowledge base (Approval Publish or Instant Publish).

6. Click **Import**.

   A new article is created in the selected knowledge base and category using the content from the uploaded document. If you uploaded multiple documents, one article is created for each. If you use knowledge internationalization, the language of the new article is set to the currently selected system language.

   After the upload completes, a popup window appears displaying the number and short description of the newly-created articles. Click an article to view the full record.

   If any errors occur during the upload, a popup window appears to display the error.

### Select a knowledge article category

Knowledge articles within a knowledge base are grouped by category. These groups can help you define the knowledge base taxonomy, and can help users find articles within that knowledge base.

As a knowledge contributor, when editing a knowledge article you can select categories using the Category picker, and add or edit categories if enabled for the knowledge base.

1. Click the reference lookup icon beside the **Category** field.
2. Select an existing category, or click the add category icon (+) to add a new category.
   After you select a category, you can click the pen icon to rename that category. Press the enter key or click outside the selected category to save the change.

   **Note:** Clicking **Cancel** while selecting a category cancels selecting a new category, but does not revert any changes you make to the categories such as renaming or adding new categories.

3. Fill in the fields on the form, as appropriate.
4. Optional: Select or add a subcategory.
5. Click **OK**.

### Move a knowledge article

You can move articles between knowledge bases.

1. Edit a knowledge article.
2. Change the **Knowledge Base** field value.
   After moving an article, the **Apply Default Values** dialog box prompts you to populate certain fields in the article with default values from the new knowledge base. If the new knowledge base has no default values, the dialog box does not appear.
3. Click **OK** to overwrite fields with the default values, or **Cancel** to leave all fields unchanged.

   A knowledge manager can define default values for articles in knowledge bases you manage using the **Set default knowledge field values** field on the Knowledge Base form.
4. Click **Update**.

**Retire a knowledge article**

Retired knowledge articles are not available to users except for administrators and knowledge administrators who can view them.

A knowledge article has an associated retirement workflow, similar to the publishing workflow. This allows administrators to configure these workflows, defining an approval and review process for retiring knowledge if appropriate.

When editing an article, click **Retire** to launch the retirement workflow associated with that article. If the article requires approval prior to retirement, the article goes to a pending approval state, and the workflow either finishes upon approval or cancels if rejected by a required approver. The article number associated with the retired article is not available for reuse.

**Note:** Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.
Instant retire and Approval retire workflows

**Republish a retired article**

Instantly republish a retired article.

Role required: admin or knowledge admin
There may be cases where you’ll need to republish a retired article. For example, an admin may want to temporarily retire an article when its information doesn’t currently apply, but will at a later date. An administrator or knowledge administrator who can view retired articles can instantly republish these without having to go through an approval workflow.

1. Navigate to **Knowledge > Articles > Retired**.
2. Select a retired article and click **Republish**.

The article is instantly published as the previous last published version.

### Create a knowledge article from a customer service case

Reuse information from a customer service case by creating knowledge articles from cases.

Your administrator must [enable creation of articles from customer service cases](#).

Role required: sn_customerservice_agent or knowledge

1. Navigate to **Customer Service > Cases > All**.
2. Select a case from which you want to create a knowledge article.
3. Click **Create Knowledge**.
   - The relevant fields are automatically copied from the case to the record that opens.
4. In the **Knowledge base** field, enter the name of the knowledge base in which you want this article to display.
5. Click **Submit**.

### Request a knowledge base

If existing knowledge bases do not fit your needs, you can request a new knowledge base through the service catalog. If the request is approved, you are added as the owner of the new knowledge base.

Role required: none

If no knowledge base exists that fit your needs, all users can request a new knowledge base.

1. Navigate to **Self-Service > Service Catalog**.
2. Select **Can We Help You?**.
3. Select the **Request Knowledge Base** catalog item.
4. Enter the reason you want the knowledge base, and a name for the knowledge base.
5. Click **Submit**.

You are notified when the request is approved or rejected. If the request is approved, you are added as the owner of the new knowledge base. You can then assign managers and manage articles in the new knowledge base.

Knowledge bases created through this request process are inactive by default, so you must activate the knowledge base to make it available for users.

### Use knowledge on mobile devices

All users can access knowledge from mobile devices to search for and view knowledge articles and social Q&A questions.

### Browse knowledge on mobile devices

You can browse knowledge bases using a mobile device.
Navigate to **SELF-SERVICE > Knowledge Base**.

**Mobile Knowledge View**

Browse Knowledge by tapping on a category and browsing articles or subcategories.
Mobile Knowledge Categories

**Note:** Select the desired category and click the close icon (×) for the selected category to reflect in the search results.

**View knowledge articles and questions on mobile devices**

You can read knowledge content using a mobile device.
Tap a title to view the article or question.
Note: You cannot edit or add comments to knowledge articles on the mobile interface. If using Social Q&A, you can perform all functions such as adding and editing questions, answers, and comments through the mobile interface.

Search knowledge on mobile devices

Find a specific article or question by searching on a particular term.
Translation management

Manage multi-language knowledge bases by using automated translation tasks and translation APIs. Translate published knowledge articles in languages configured for the knowledge base containing the articles.

When you log in to an instance, after entering your credentials, you can choose a default language. The list of languages are listed based on the internationalization language plugins you have installed.

Knowledge articles are authored and published in various languages. As an administrator you can configure the required languages for a knowledge base and ensure that users can create articles only in the configured languages.

The translation management feature allows you to translate published knowledge articles that are missing translations manually or by using the machine translation option to automatically translate the knowledge article. This feature creates translation tasks automatically for the languages you have specified. You can configure assignment rules and auto-assign tasks for a language, knowledge base, or category to a translator or a group of translators.

The translation management feature is available only if you have installed required plugins and set a system property.
The required plugins are:
- Knowledge Management Advanced plugin
- I18N:Knowledge Management Internationalization Plugin v2 or Internationalization language plugins

Enable the glide.knowman.translation.enable_translation_task property to display the following Translation Management menu items:
- All Open Tasks
- My Assigned Tasks
- Translator Mapping

Enable languages for a knowledge base
You can select the languages you want enabled at a knowledge base level. Users can then create articles only for selected languages.
Role required: knowledge_admin or admin
1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Click New or select an existing knowledge base.
3. Click the lock icon to unlock the Languages field.
4. Select the languages from the list.

Note:
You can also remove languages from the list if you decide that you do not want to create a translation task in that language.

5. Click Submit or Update.

Create translation assignments
To ensure accurate translations, you can assign knowledge articles to language experts. Identify the language experts and create assignment rules to automatically assign translation tasks to language experts and groups.
Role required: knowledge_admin or admin
1. Navigate to Knowledge > Translation Management > Translator Mapping.
2. Click New to create a new assignment rule or select an existing rule to modify.
3. Enter a name for the assignment rule in the Name field.
4. In the Applies To tab, select a table, and specify the conditions that must be met before the task is assigned to the user or group.
5. Click Submit.

Note: Assignment rules are applied only if the task is not already assigned to another user or group.

6. In the Assign To tab, and select the user or group you want to assign the task to and click Submit.
An email notification is sent to the translator with a link to the translation task and source article.
7. Click the Script tab to enter a script to further customize the assignment rule and click Submit.
Auto-create translation tasks

Manage multi-language knowledge bases by using automated translation tasks and translation APIs. Translate published knowledge articles in languages configured for the knowledge base containing the articles.

Role required: knowledge_admin or admin

The available languages are determined by the language plugins you have installed.

1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Click New or open an existing knowledge base.
   Tasks are created for languages you have configured. If Auto-create translation tasks is unchecked, you must create the tasks manually after the article is published.
4. Click Submit or Update.

   **Note:** Open a knowledge article and click Knowledge Translation Tasks related list to view the associated translation tasks.

Translate a knowledge article

You can start translating articles once they are published and assigned to you for translation.

Role required: admin, knowledge_admin, or knowledge

1. Navigate to Knowledge > Translation Management > My Assigned Tasks.
2. In the Knowledge Translation Tasks page, select one of the listed translation tasks assigned to you.
3. Click Translate.

   **Note:** If you want to do a translation directly from an article, use the Translate related link on the article page.

The Translate from and Translate to panes are side-by-side for easy viewing, as shown in the following figure.
4. Click **Machine translate**, which automatically translates to the targeted languages. For configuring the translation API, see **Dynamic Translation**.

5. Click **Create draft article** to create a draft version of the translated article. If a translated article is already present for that language, a new draft version is created.

6. Click **Publish**.

---

**Note:**
- The **Translated Versions** tab lists all the translated versions for that article.
- To cancel a task, add an appropriate reason for cancellation in the **Cancellation notes** field and click **Cancel**.

---

**Translate knowledge blocks within an article**

Knowledge blocks added to an article must be translated first before translating an article.

Role required: translator
If a selected article indicates that a knowledge block is missing a translation, you must translate the knowledge block before you can translate the article.

1. Navigate to Knowledge > Translation Management > My Assigned Tasks.
2. In the Knowledge Translation Task page, select a translation task and click Translate.

   **Note:**
   A message stating that the knowledge article contains one or more knowledge blocks that have missing translations is displayed.

3. Click on the link in the message to view the list of blocks that require translation.
4. Click the translation task again and click Translate.

   **Note:** The newly translated blocks appears in the Translated Block Versions related list.

**Request missing translations for available languages**

Create translation tasks manually for missing languages through the Request Translations option. The option is available even if the auto-create translation task option is enabled.

Role required: admin

Verify that the glide.knowman.translation.enable_translation_task property is set to true.

1. Navigate to Knowledge > Articles > Published.
2. Select an article from the list of published articles.
3. From the article, click Request translations.
4. Select the missing languages and click Submit.

   **Note:** If a task is already open for a particular language, you cannot select the same language again.

The translation tasks for the article are created and listed in the Knowledge Translation Tasks tab.

**Now Mobile for Knowledge Management**

Access knowledge articles from anywhere using the Information applet on the Now Mobile app. You can view recently viewed and most popular articles, search for articles, browse articles by category, and provide feedback for articles.

To access articles from the Information applet on the Now Mobile app, you must first download the ServiceNow mobile application on an iOS platform from the Apple App Store or on an Android platform from the Google Play Store.
Make sure your administrator has activated the Now Mobile app. For more information, see [Activate the Now Mobile app](#).

After you access an article, you can view the author, published date, number of views, and the overall rating details of the article. In addition, you can respond to and evaluate articles and view related items and related articles.

**Activation information**

The Information applet is available on the Now Mobile app. The ServiceNow Mobile Request - Knowledge Management Screens and Applet Launcher plugin (com.glideapp.knowledge.mobile_requestor) activates the Information applet. The Information applet is activated by default for both new and upgrade customers.
View the most popular or recently viewed articles in the Now Mobile Information applet

The Information applet on the Now Mobile app enables you to access knowledge articles from a mobile device.

You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

1. Access your instance using the mobile application.
2. On the Now Mobile app, tap Information.
3. Access your recently viewed or the most popular knowledge articles

<table>
<thead>
<tr>
<th>Information applet article views</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Section</strong></td>
</tr>
<tr>
<td>Recently Viewed</td>
</tr>
<tr>
<td>Popular</td>
</tr>
</tbody>
</table>

**Note:** Tap See All to view the complete list of articles within the selected section.

Browse articles in the Now Mobile Information applet

You can browse articles within a category in the Now Mobile Information applet to see articles related to a particular subject or grouping.

You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

1. Access your instance using the mobile application.
2. On the Now Mobile app, tap Information.
3. In the Browse section, tap a category from the categories list to view articles and child categories associated with the selected category.

**Note:** Tap See All to view the complete categories list.

4. Tap further categories until you view the articles list associated with the desired category.

The articles associated with a parent category are grouped under a dummy child category labeled as Other.
5. To view an article, tap the article in the articles list.

Search for an article in the Now Mobile Information applet

You can search for an article in the Now Mobile Information applet.

You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

1. On the Now Mobile app, tap Information.
2. Tap Search for Services, Articles or People, and enter a search term related to the article.
3. Tap the search icon on your app keyboard.
   The app displays search results.
4. Tap Articles to view only articles in the search results.
5. Tap an article in the search results to view the article content.

View an article in the Now Mobile Information applet

You can view the author, published date, number of views, and the overall rating details of the article in the Now Mobile Information applet. In addition, you can respond to and evaluate articles and view related items and related articles.

You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

1. On the Now Mobile app, tap Information.
2. Search for or select the desired article from the sections available in the Information applet.
   The article page displays the content and associated information for the selected article such as author, published date, number of views, and the overall rating. The page also displays the following sections:

<table>
<thead>
<tr>
<th>UI component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Related Articles</td>
<td>Up to five related articles that are manually mapped, automatically predicted, or both. The manually mapped articles appear first in the Related Articles section. This section appears only when related articles are available for the selected article.</td>
</tr>
<tr>
<td>UI component</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Related Items</td>
<td>Up to five related items that are manually mapped. This section appears only when related items are available for the selected article.</td>
</tr>
</tbody>
</table>

**Note:** Tap See All to view the complete list of articles within the selected section.

3. Optional: Respond to and evaluate the article.

**Respond to and evaluate articles in the Now Mobile Information applet**

You can contribute to feedback on knowledge articles by rating an article, marking an article as helpful or not helpful, and posting and replying to comments for an article in the Now Mobile Information applet.

You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

1. On the Now Mobile app, tap Information.
2. Select the desired article.
3. Contribute to the article feedback by rating it, marking it as helpful or not helpful, or leaving a comment.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rate the article</td>
<td>Tap the star icons displayed on the article. You can also rate an article that appears within the Related Articles section by tapping the star icons next to the number of times the article was viewed.</td>
</tr>
<tr>
<td>Mark an article as helpful or unhelpful</td>
<td>Tap the helpful icon (👍) or the not helpful icon (👎).</td>
</tr>
<tr>
<td>Post a comment</td>
<td>Enter a comment in the Comments section and click Submit.</td>
</tr>
<tr>
<td>View all comments and replies posted for the article</td>
<td>Scroll down to the Comments section.</td>
</tr>
<tr>
<td>Like a comment on the article</td>
<td>Underneath a comment, tap the like icon (👍).</td>
</tr>
<tr>
<td>Reply to a comment on the article</td>
<td>Underneath a comment, tap the reply icon (💬), enter your comment in the text box that appears, and then tap Submit.</td>
</tr>
<tr>
<td>Delete any previous comments or replies you posted earlier</td>
<td>Go to a comment or reply, and then tap the delete icon (🗑). If a message appears, tap OK. Only users who have posted the comment, knowledge administrators, and knowledge owners can delete a comment.</td>
</tr>
</tbody>
</table>
Migrate to Knowledge Management v3

Knowledge Management has significantly changed with the introduction of knowledge v3 starting with the Fuji release.

Knowledge Management v3 has several key differences from Knowledge Management v2, the version of Knowledge Management that was available until Eureka release. The knowledge v3 plugin is activated by default starting with the Fuji release.

The following podcast provides more information on what is new in Knowledge Management v3.

When upgrading from Eureka or earlier versions, if you intend to use the new features available in knowledge v3, you have to migrate legacy knowledge content and any customizations you have made to the Knowledge Base applications.

The following video provides more information on how to migrate from Knowledge Management v2 to v3.

Key differences

<table>
<thead>
<tr>
<th>Legacy Knowledge</th>
<th>Knowledge v3</th>
</tr>
</thead>
<tbody>
<tr>
<td>One knowledge base.</td>
<td>Multiple knowledge bases.</td>
</tr>
<tr>
<td>A single lifecycle workflow shared by all articles.</td>
<td>Separate, customizable workflows available for each knowledge base.</td>
</tr>
<tr>
<td>Two-level organizational structure with Topic and Category. A single organizational taxonomy shared by all articles.</td>
<td>Category structure with any number of levels. Each knowledge base has a unique category taxonomy.</td>
</tr>
<tr>
<td>Permissions defined per article using roles and ACLs.</td>
<td>Permissions defined per knowledge base or article using user criteria.</td>
</tr>
</tbody>
</table>

Knowledge Management v3 migration process

When you upgrade from Eureka or earlier, consider a multi-step migration process. This process ensures you can access existing knowledge content and allows you to fully migrate at your own pace.

Review automatic changes before upgrading. These changes are applied immediately when upgrading and may impact existing functionality.

1. Migrate knowledge functionality to use your customized functionality with the Knowledge Management v3 enhancements.

2. Migrate knowledge content to use the Knowledge Management v3 enhancements with your existing knowledge articles.

After migration to Knowledge Management v3

These items are relevant to getting the full range of new functionality after you migrate.

- You must configure knowledge access controls based on user criteria to ensure that users can access existing knowledge content. Since access control in knowledge v3 is intended to be based on user criteria alone, users may be unable to access v2 or v3 knowledge articles, or have restricted access, with preexisting ACLs.
• If the home page was customized in knowledge v2, custom layout and links are not saved in knowledge v3.
• Images added using the Image field in a knowledge article form do not display in the Knowledge v3 or Knowledge Service Portal pages. The article search results page displays the knowledge base icon next to all articles from the knowledge base.

Automatic changes after Knowledge Management v3 migration

Upgrading to Knowledge Management v3 automatically changes knowledge functionality including the knowledge user interface and security model.

Default knowledge base

When you upgrade from Eureka or earlier, a default knowledge base is created, titled Knowledge, that contains all knowledge articles from the previous version.

After the upgrade, you can add and edit articles in this knowledge base.

Articles in the default knowledge base continue to use legacy functionality, such as role-based access controls. Any customizations you made to knowledge functionality before the upgrade are preserved in the default knowledge base.

Knowledge search changes

By default, the legacy knowledge portal uses knowledge v3 search with limited filtering options. You can filter results only by knowledge base. Search results include only those articles the current user can view based on user criteria. ACLs do not restrict search results.

Knowledge security changes

Knowledge v3 manages access to articles with user criteria rather than roles and ACLs.

Existing ACLs on the Knowledge (kb_knowledge) table are preserved, but with the following changes.
• A version of 3 indicates that a knowledge base uses the knowledge v3 functionality.
• A version of 2 indicates that a knowledge base uses legacy functionality.

New ACLs introduced by knowledge v3, such as field-level controls, apply to all knowledge bases.

When you upgrade from Eureka or earlier, any custom ACLs you implemented for the Knowledge table still apply to any knowledge records in the default knowledge base. Knowledge v3 updates ACLs that exist before upgrade so they only apply to Knowledge (kb_knowledge) records where this field value is 2.

Note: These changes affect the default knowledge base. Even if you are not using the new knowledge functionality, the legacy knowledge behavior may change if you have made customizations to ACLs on the Knowledge (kb_knowledge) table. Ensure you configure knowledge access controls after upgrading to prevent unexpected behavior.

Because Knowledge v3 introduces ACLs for the Knowledge (kb_knowledge) table, if you do not have high security enabled, you may notice differences in default behavior. See KB0549970 for information about configuring Knowledge v3 without high security.

Knowledge article view changes

The Knowledge application uses the kb_view UI page to display knowledge articles.
UI page

The following changes apply automatically when you upgrade from Eureka or earlier:

- The existing `kb_view` page is renamed to `kb_view_customer`. The `kb_view_customer` page is used to display articles in the default knowledge base, preserving the legacy user experience.

  **Note:** By default, the `kb_view_customer` page is publicly accessible. As an administrator, you can change this behavior by modifying the `sys_public` table record for this page and clearing the **Active** field in the record.

- A new `kb_view` page is used. This is becomes the primary page used to display articles that are not in the default knowledge base.

You should review all customizations introduced around the legacy `kb_view` UI page.

- URLs should not be updated as the new `kb_view` page redirects to the correct page depending on the article.
- Customizations made to the `kb_view` UI page are automatically copied to the `kb_view_customer` page on upgrade.
- Other customizations that affect `kb_view` may need to be copied or modified to apply to `kb_view_customer`. For example, an ACL defined for `kb_view` may need to be duplicated to provide security coverage for `kb_view_customer`.

Feedback

Legacy feedback functionality is retained for knowledge articles displayed in the legacy article view. Users can continue to use the feedback options to view, add, and reply to comments on these legacy articles. Legacy comments are retained in the Knowledge Feedback (`kb_feedback`) table.

To retain the legacy comment functionality with new knowledge articles, set the Use Live Feed for Knowledge feedback property (`glide.knowman.use_live_feed`) to false. This property is set to false by default.

Knowledge portal changes

While the legacy knowledge portal, `kb_home`, has not changed in Knowledge v3, we strongly recommend that you consider moving to the new Knowledge v3 home page, `$knowledge.do`.

UI page

You can search articles from the knowledge portal and filter search results by knowledge base, and by language if the instance uses knowledge management internationalization. This portal also appears for users on older browsers, such as Internet Explorer 9, instead of the knowledge homepage.

Navigation add-ons are available in the legacy knowledge portal. Navigation add-ons of the **Link** type appear in the top-right of the portal. To add navigation add-ons of the **Search** type, you must customize the `kb_home` UI page.
Search

By default, the legacy knowledge portal uses knowledge v3 search with limited filtering options. You can filter results only by knowledge base. Search results include only those articles the current user can view.

Knowledge submissions

Knowledge submissions created from tasks continue to work in knowledge v3 with minor changes. By default, the Topic and Category fields no longer appear on the Submission form due to the knowledge v3 category changes. The property glide.knowman.submission.workflow no longer appears on the knowledge properties UI page. To enable knowledge submissions, set this property to true on the System Properties (sys_properties) table.

See creating knowledge from incidents and problems for instructions on using knowledge submission in knowledge v3.

Migrating Knowledge access controls

Access to knowledge articles is controlled based on the user criteria for the knowledge base.

**Important:** If you do not migrate existing knowledge ACLs to user criteria, users may be unable to access knowledge articles, or may be able to access restricted articles.

User criteria records, rather than ACLs, control basic create, read, update, and delete operations for knowledge articles as well as which search results appear. This may lead to unexpected behavior if your configuration depends on ACLs to control access.

To ensure users are able to access the correct knowledge articles, migrate any ACL-based security settings to user criteria. This process may include creating additional knowledge bases and moving existing content to these knowledge bases, depending on your security model. For a detailed explanation and migration examples, refer to KB0550924 Understanding User Criteria and ACLs in Knowledge v3.

This video demonstrates how to manage article-level access controls during migration from Knowledge Management v2 to v3.

Knowledge functionality migration

You can migrate knowledge functionality to use your customized functionality with the knowledge v3 enhancements.

Replaced knowledge modules

When you are ready to migrate to knowledge v3, you can activate the v3 modules and deactivate the legacy modules.

Use the tables below to identify which knowledge v3 modules to activate and which legacy modules to deactivate. When activating a knowledge v3 module, deactivate the knowledge v2 module with the same name to ensure users access the correct module.

You can use the enablev3anddisablev2menus.txt backup script to enable knowledge v3 menus and disable knowledge v2 menus.
### Knowledge v3 modules

Knowledge article publish and retire workflows

With knowledge v3, article state is controlled by workflows.

In the legacy knowledge base, article state was controlled by UI actions. UI actions from previous versions are available only in the default knowledge base.

To preserve your article publishing and retirement process in new knowledge bases, create workflows that follow these processes. To create these workflows, copy the default workflow that best matches your process and modify that copy. After creating workflows that use your article publishing and retirement processes, use these workflows as the Publish workflow and Retire workflow for the new knowledge bases.

Knowledge article category structure

With knowledge v3, all knowledge articles are organized by category and subcategory within knowledge bases.

The default knowledge base uses the legacy category structure; knowledge articles are organized by topics and categories.

Before you migrate articles, create a category structure for these articles in the destination knowledge bases. This structure can reproduce your legacy topic and category structure or can be extended to take advantage of the knowledge v3 category functionality.

Knowledge content migration

To use the new functionality available in knowledge v3 with legacy articles, you must migrate these articles out of the default knowledge base.

To migrate knowledge content, move articles out of the default knowledge base by changing the Knowledge Base value for each article. The state of the article remains unchanged when moving articles. After selecting a new knowledge base, assign a category to each article using the category structure defined in the new knowledge base.

After you migrate a knowledge article, the legacy feedback functionality is automatically replaced with the new knowledge feedback mechanisms. Legacy feedback is copied to the Live Feed Message (live_message) table to ensure previously submitted feedback is available for knowledge v3 articles.

Social Q&A

If Social Q&A is activated for a knowledge base, you can ask questions and respond to questions from other users. You can also vote on helpful questions and answers.

Social Q&A extends the Knowledge application. All questions and answers are associated with a knowledge base. Social Q&A uses Knowledge access controls, search, and the knowledge homepage.

Social Q&A is available on mobile devices using the mobile knowledge interface. You can perform all Social Q&A functions on mobile, such as asking and answering questions.
Enable social Q&A for a knowledge base

As a knowledge manager, you can enable social Q&A for a knowledge base you manage.

Role required: knowledge_manager

You can set the limit for the number of times users can post questions, answers, and comments, or subscribe to the questions using the Knowledge Social Q&A properties section.

All Social Q&A questions and answers are associated with a knowledge base. The Enable social questions and answers check box on the Knowledge Base form controls if users can view and ask questions.

Social Q&A uses user criteria from the knowledge base to determine which users have access to questions.

1. Navigate to Knowledge > Knowledge Bases.
2. Select a knowledge base you manage.
3. Select the Enable social questions and answers check box.
   This check box only appears if the Social Q&A plugin has been activated.
4. Click Update.

You can disable Q&A for a knowledge base by clearing the Enable social questions and answers check box. Disabling Q&A does not delete existing questions and answers associated with this knowledge base, but prevents users from browsing or searching for those questions and answers.

Social Q&A questions

Social Q&A organizes information by question.

You can browse and search for questions from the Knowledge homepage (Self-Service > Knowledge). Questions appear along with knowledge articles organized by knowledge base, category, and tags.

Click on a question to view the question details, as well as responses and comments. You can add responses and comments, vote on existing responses, share questions, and edit your own questions and answers from the question details. Click on a picture profile to view the user’s profile.

Ask a social Q&A question

As a Social Q&A user, you can ask questions that other users can respond to.

Roles required: None

1. Navigate to Self-Service > Knowledge.
2. Click Post a Question.
3. Enter a value for the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Enter the question you have.</td>
</tr>
<tr>
<td>Question details</td>
<td>Enter additional details about the question that may help other users provide an answer.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Knowledge base</td>
<td>Select the knowledge base this question relates to. You can select only knowledge bases configured to allow Q&amp;A.</td>
</tr>
<tr>
<td>Category</td>
<td>Select the knowledge category this question relates to. You can select only categories within the selected knowledge base. Questions without a category appear on the knowledge homepage in the (empty) category.</td>
</tr>
<tr>
<td>Tags</td>
<td>Enter one or more tags that describe the question.</td>
</tr>
</tbody>
</table>

4. Click **Post Question**.

To accept the answer, click the **Accept** link from within the answer. The accepted answer moves to the top of the list of answers. You can unaccept an answer by clicking **Unaccept**.

**Note:** You must be the owner of the question or the knowledge manager to accept an answer.

**Answer a question**

As a user, you can answer a question another used has asked. The owner of the question or the knowledge manager can then accept the answer.

Roles required: None

As a knowledge manager or the owner of a question, you can accept an answer as the correct answer. That answer then appears above other answers for the question.

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Enter an answer in the **Your answer** field.
4. Click **Submit**.

**Comment on a question or answer**

You can comment on a question or an answer to provide additional information relevant to that question or answer.

Roles required: None

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Within the question or answer you want to comment on, click the **Comment** link.
4. Enter the comment text.
   - Comments have a maximum length of 140 characters.
5. Click **Post comment** or press the Enter key.

**Edit a question, answer, or comment**

You can edit questions, answers and comments you submit, or in knowledge bases you manage.

Role required: None

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Within the question, answer, or comment you want to edit, click **Edit**.
4. Edit the details as needed.
5. Optional: When editing a question, click **Advanced** to make changes to the question record.
6. Click **Update**.
   Click **Undo** to discard the changes and close the editor.

**Vote on a question or answer**

As a Social Q&A user you can vote on a question or answer to promote it.

Role required: None

Vote up questions that you want users to answer, and answers that you believe accurately resolve questions. Alternatively, vote down questions that you do not find useful, or answers that you believe are incorrect. You can vote for each question or answer only once, but you can change your vote.

Answers with a higher score appear above answers with a lower score when viewing a question. A pinned answer appears above other answers regardless of votes.

---

**Note:** You cannot vote for your own questions or answers.

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Click the up or down arrow next to the question or answer you want to vote on.
   The score for that question or answer changes depending on your vote.

You can change your vote by clicking the other arrow.

**Subscribe to a question**

You are automatically subscribed to any question you ask, so you receive notifications when another user votes on, comments on, or answers the question. If you want to receive notifications for a question asked by another use, you can manually subscribe to the question.

Role required: None

You automatically subscribe to any question you ask.

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Click the subscribe icon ( ).

If you want later to stop receiving notifications about this question, click the unsubscribe icon ( ).

**Delete a question, answer, or comment**

You can delete questions, answers, or comments that you submitted.

You can delete only questions, answers, and comments you submitted. Knowledge managers can delete any question, answer, or comment within knowledge bases they manage.

Role required: none

1. Navigate to **Self-Service > Knowledge**.
2. Select a question or answer.
3. Within the question, answer, or comment you want to delete, click the Delete link.

Deleting a question also deletes all answers and comments associated with that question. Deleting an answer also deletes all comments associated with that answer.

Share a question

You can generate a URL directly to a question and related answers.

Role required: None

1. Navigate to Self-Service > Knowledge.
2. Select the question that you want to share.
3. Click Share.

Some browsers do not allow adding content directly to the clipboard. You may need to manually copy the URL from the popup that appears.

Distribute the URL to share the question.

Social Q&A internationalization support

The Social Q&A questions and answers are automatically associated with the language that is set for the interface.

You can only browse and search for questions in the language currently set for the interface. For example, if a Social Q&A user has set French as the interface language, any questions that the user asks is associated with the French language. All Social Q&A users who want to view those questions must have their interface language set to French.

Note: For Social Q&A internationalization to take effect, you must clear the platform cache and browser cache after selecting the desired language.

Social Q&A search

Users can search for specific questions from the knowledge homepage.

Social Q&A uses knowledge search to provide search results. Searching knowledge returns questions that contain the search terms in the question title or the question details, or in the accepted answer.

By default, knowledge search results include both knowledge articles and questions. You can filter results using knowledge search controls, such as filtering by knowledge base or author.

Social Q&A results also appear with knowledge articles when using global search.

Social Q&A uses the Contextual Search feature to generate search results. Questions appear in Contextual Search results, such as when creating an incident. The Social QA Question Search Context and Social QA Question Searcher records define the Social Q&A search. To ensure Social Q&A search functions as intended, do not modify these records.

Social Q&A tags

Tags organize questions and provide information about the question subject matter.

Social Q&A shares available tags with other applications allowing you to organize records consistently across the instance. Tags are stored on the Tags (label) table.

You can view a list of tags and filter by tag from the knowledge homepage. Clicking on a tag displays a list of knowledge articles and questions with that tag.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Only users who can edit a question can edit the associated tags. By default, only the question owner and knowledge managers can add or remove tags on questions.

**Legacy: Chat**

Chat is deprecated in the Istanbul release.

**Note:** The Connect feature provides an updated instant messaging platform, which is activated by default for new instances. The legacy chat and Connect features should not be used concurrently. There is no migration path from legacy chat to Connect.

Chat provides real-time communication via instant messaging between users in a ServiceNow instance. Features include:

- One-to-one chats (instant messaging) between users.
- Chat rooms for conversations with multiple users. Chat rooms may be public (any user can join) or private (only invited users can join).
- Chat rooms linked to task records. Users can work together to solve issues, and conversation history can be shared by everyone who needs to reference it.
- Help desk chat. End users can access live support via instant messaging. Service desk staff can resolve basic issues in real-time or create incidents directly from chat requests for more extensive issues.
Legacy: Get started with Chat

Get started with legacy chat.

Role required: admin

1. Establish use guidelines. Social media can improve communication and aid productivity. To get the most out of these tools, establish clear and simple social media guidelines that foster information sharing and a comfortable work environment.

2. Activate the Chat plugin to enable the legacy chat and legacy Help Desk Chat features.

3. Configure security settings. Users must log in to use the legacy chat features in the base system. The standard system security settings and Social IT-specific security settings are available. To learn more about setting up these features, refer to the plugin activation pages.
   - Chat rooms may be Public (any user can join) or Private (only invited users can join).
• Administrators can limit who can read chat messages on tasks and who can create chat rooms.

Legacy: Installed with Chat

What components are installed with legacy chat.

Demo data is available for legacy chat. The demo data creates a chat queue called Help Desk Chat that is supported by the assignment group Chat Support. Additionally, the Help Desk Chat link is added to the header of the Employee Self-Service portal. To learn more, see Set Up Chat Queues for Help Desk Chat.

Other:
• Event: A new event called chat.invite is registered to trigger an email notification when users are invited into a chat room.
• Email Notification: An email notification called Chat Room Invite is added to send when users are invited to a chat room.

Legacy: Fields installed with legacy chat

Legacy chat adds fields.

<tr>
<td>SNC - Chat Queue Average Wait Time</td>
<td>Chat Queue Entry (chat_queue_entry)</td>
<td>When a chat queue entry is accepted, calculates the average wait time for the queue by averaging the last 20 chat queue entries.</td>
</tr>
</tbody>
</table>

**Legacy: Chat use**

Legacy chat allows you to interact and collaborate through real-time instant messages with other users in an instance.

Use legacy chat to:
- Initiate or participate in chat conversations with one or multiple users.
- Initiate or participate in chat conversations that are attached to task records (such as an incident).
- See when other users are available to chat.

To open the chat desktop, navigate to **Social IT > Chat**.

**Note:** Service desk staff may also provide live support to other users via help desk chat.
Legacy: Update your profile

Your profile identifies your contributions to legacy chat conversations.
Your profile identifies your contributions to conversations. It is created automatically the first time you use chat and consists of:

<table>
<thead>
<tr>
<th>Profile</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>From your user account in ServiceNow. Your name appears on your messages and in the member list of any chat room you join.</td>
</tr>
</tbody>
</table>
To update your profile picture:

1. Click your picture in the top of the favorites list.
2. Browse to the desired picture file and click Open.

**Note:** Changes to your profile picture affect legacy chat and live feed if the Live Feed plugin is activated.

---

### Chat profile picture

**Legacy: Update your status**

In legacy chat, your status lets other users know whether you are available to chat.

Your status lets other users know whether you are available to chat. Your current status is indicated by the color of the icon in the upper right of your favorites list, beside your name. View the status of other users in your favorites list.

To change your status:

1. Click the status icon beside your name.
2. Select a status (see table).
## Change status

<table>

| Chat offline |

**Legacy: Use your favorites list**

In legacy chat, your favorites list appears on your chat desktop and provides certain functions.
Favorites list

- Users:
  - Add another user in the system to your favorites list.
  - See if your favorite users are available to chat. Users are organized alphabetically and in sections by status.
  - Start a conversation by double-clicking a name.
  - Expand or collapse a section by clicking Online or Offline.

- Rooms:
  - See the list of your favorite chat rooms.
  - Join a chat room by double-clicking its name.

- Favorites list toolbar:
  - Options (): access a menu with options to add a favorite user, view online users, create a chat room, and view chat rooms.
  - Add User (): add a favorite user.
  - Create Room (): create a chat room.
  - Invitations (): respond to invitations to join chat rooms.

To expand or collapse a section in the favorites list, click the section header or click the arrows on the section header.
Legacy: Add a favorite user
How to add a user to your favorite users list in legacy chat.
1. Click the **Add User** button.

2. Begin typing a user name and select a user from the list, or click the reference lookup and select a user from the table.

3. Click OK.

Legacy: Remove a favorite user
How to remove a favorite user in legacy chat.
To remove a user from your favorite users list, right-click the user's name and select **Remove From List**.

Legacy: View an online user
How to view a list of all users who are available to chat (status of Online) in legacy chat.
1. Right-click the Users section header or click **Options** on the toolbar.

2. Select **Show Online Users**.
   - Start a one-to-one chat with a user on the list by double-clicking a name.
   - **Send Message** or **Add To Friend List** by right-clicking a name.
Legacy: View a room

How to view a list of all public chat rooms in legacy chat.

1. Right-click the **Rooms** section header or click **Options** on the toolbar.

   ![Chat window menu]

2. Select **Public Rooms**.
   - To join a room, double-click a name or right-click and select **Join Room**. See *Joining Chat Rooms*.

Legacy: Start a one-to-one chat

How to start a one-to-one chat in legacy chat:

- To start a chat with one user in your favorites list, double-click the user’s name or right-click and select Send Message.
- To start a chat with one available user, double-click the user’s name on the online users list. See Viewing Online Users.

  Send a message to start a conversation.

Legacy: Create a chat room

How to start a chat with multiple users from the legacy chat desktop.

To start a chat with multiple users from the chat desktop (requires access rights):

1. Click Create Room on the favorites list toolbar.

2. Enter the room details (see table).
3. Click Create Room. An invitation appears in the favorites list of all invited users and a new chat window opens on your chat desktop.

Legacy: Create a chat room for a task

How to start a legacy chat with multiple users from a task record.

**Note:** This procedure is not possible if the Connect feature is enabled.

1. Open the record (example, an incident on which you are working).
2. Click the **Create or Join Chat Room** related link.
3. If a chat room already exists, click a name to join the existing chat room. If no chat room exists, continue to the next step to create a new room.

4. Click the **create** link at the bottom of the window.
5. Enter the room details as you would for a **chat room**.
6. Click **Create Room**. An email notification is sent and appears in the favorites list for all invited users (the assignment group and the watch list, if selected, and additional invited users).
7. In the New Room Created message, click **Join Room**.
   - A new chat window opens on your chat desktop.
- All invited users are listed in the chat member list. Invited users that are not currently participating in the chat are listed in gray.

**Legacy: Join one-to-one chats**

In legacy chat, when another user starts a chat by sending a message to you, a chat window opens on your chat desktop. To join the chat, click the window.

**Legacy: Join a chat room**

How to join a chat room in legacy chat.

1. If another user invites you to join a chat room, an invitation appears in your favorites list.

   ![Chat invitation](image)

2. To respond, click the invitation.

   A window opens that displays the room name, room description, and the name of the user who invited you.
   - To join the chat, click **Join**. When the chat window opens on your chat desktop, click the window.
   - To ignore the invitation, click **Decline**.

![Chat Room for INC0000003 - Wireless access not available on floor 3](image)

**View invitations**

To rejoin a favorite chat room that you have left, click the chat room name in the Rooms section of the favorites list.

To join a public chat room without an invitation, right-click the Rooms section header and select **Public Rooms**. Double-click a room name on the list.

**Legacy: Join a chat room for a task**

In legacy chat, if another user invites you to join a chat room from a task record, you receive an email notification.

1. Click the link in the email notification.
2. If a prompt for a password appears, enter the password listed in the email notification.
3. When the chat window opens on your chat desktop, click the window.

Legacy: Join a chat room from a task record without an invitation

How to join a chat room in legacy chat without an invitation.

Note: This procedure is not possible if the Connect feature is enabled.

1. Open the task record.
2. Click the Create or Join Chat Room related link.
3. Click a chat room name.
4. If a prompt for a password appears, contact the person who created the chat room for the password.
   If a chat room has a password, only users with the password can join the chat.
5. When the chat window opens on your chat desktop, click the window.

Legacy: Chat windows

In legacy chat, a chat window appears on your chat desktop for each chat conversation that you start or join.
Legacy: Send messages in legacy chat

How to send messages in legacy chat.

To chat with other users that have joined the conversation, enter your message in the text field at the bottom of the window and press Enter. The message appears in the other users' chat windows.

To send a link, type the full URL (example, http://www.service-now.com). When the message is sent, the text appears blue and any user in the conversation can click it to follow the link.

To send a smiley face, type a colon followed by a close parentheses (;)). When the message is sent, a smiley face

(😊)

appears in place of the text. For more emoticons, see Sending Emoticons in Messages (Smileys).

Chat activity is indicated with the following alerts:

- When a new message is posted to an inactive browser tab, the tab name blinks.
- When a new message is posted to an inactive chat window, the window header appears in yellow and blinks.
• When a user joins or leaves a room, a message appears in the other room members’ chat windows.

Legacy: Send emoticons in legacy chat messages (smileys)

How to send emoticons (smileys) in legacy chat.

To send an emoticon (smiley), type text from the following table. When your message is sent, the emoticon appears in place of the text. For example, enter colon followed by a close parentheses (;) and a smiley face (😊) appears in your message.

<table>
<thead>
<tr>
<th>Emoticons</th>
<th>Image</th>
</tr>
</thead>
<tbody>
<tr>
<td>:) :-</td>

**Legacy: Change the display**

How to change the display of legacy chat.

To view the chat window menu, click the gear button ( ⚙️ ) in the bottom left.

- To show or hide timestamps, select **Show Timestamps** from the chat window menu or press **F2**.
- To show or hide the chat member list, select **Show Members** from the chat window menu or press **F4**.
To resize the window, point to the lower corner (left or right). When the pointer changes shape, drag the window to the desired size.

To move the window, point to the header. When the pointer changes shape, drag the window anywhere on your chat desktop.

To close a chat window, click the X in the upper right corner.

**Legacy: Invite a user into a chat**

How to invite another user into a chat in legacy chat.

1. Select **Invite User** from the chat window menu.

2. Begin typing a user name and select a user from the list, or click the reference lookup and select a user from the table.

3. Click **OK**.

   An invitation is sent to the selected user. One-to-one chats are automatically converted into temporary chat rooms.

**Legacy: Add a favorite room**

How to add a favorite room in legacy chat.

To add a room to your favorites, click the chat window and select **Add To Favorites** from the chat window menu.

**Legacy: Remove a favorite room**

How to remove a favorite room in legacy chat.

To remove a room from your favorites, right-click the room name and select **Remove From List**.

**Legacy: Set your chat preferences**

Use the Chat Window Preferences to set audio notifications and default chat window display options in legacy chat.

Use the Chat Window Preferences to set audio notifications and default chat window display options. The default display options control how a chat window looks when you first open it. You can still control the display options for an individual window as described in [Changing the Display](#).

To view your chat preferences, click your name in the upper left corner of the chat desktop and select **Chat Preferences**.
Chat preferences

To set your preferences, select or clear the check boxes next to the options, then click Update.

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

Legacy: Delete a chat room

You can delete chat rooms in legacy chat.

Role required: chat_admin

Note that when you delete a chat room, the system also deletes the records for any chat members and messages.

1. In the application navigator filter, enter chat_room.list.
2. Delete multiple chat rooms from the list or open a chat room record and click Delete.

Legacy chat administration

Users with the chat_admin role can administer various aspects of legacy chat.

Define chat room access rights

Control the access rights for creating a chat room so that not all users can create a chat room.

Role required: chat_admin
To define the access rights for creating chat rooms:

1. Navigate to Social IT > Chat Administration > Properties.
2. Locate the property **Comma-separated list of roles that are allowed to create chat rooms**.
3. Enter user roles. A user must have one of the specified roles to create a chat room.

### Change chat room message read access

In legacy chat, you can associate a chat room with a record, such as an incident, and add the chat messages to a **Chat Activity** journal field on the form.

Role required: admin

By default, a user can read the chat messages for a room if either of the following is true:

- The room is public
- The user is a member of the room

To change chat room message read access:

- Modify the Chat message access control rule or create a new rule.
- Read access to the messages displayed is handled by the access control list security operation `chat_messages_read` on the Chat room (chat_room) table.

### View a legacy chat message as a journal field

You can view all chat messages in one place by viewing them as a journal field.

Chat rooms can be linked to any task record in the following ways:

- Create a room from the record.
- Create a record from a chat room, such as creating an incident from a Help Desk Chat.

To view the chat messages as a journal field:

- Configure the task record form to select the **Chat Activity** field.
- The maximum number of chat messages that are displayed by this field is 1000.
Chat Activity

Chat actions

Chat actions are additional items that appear in the chat window menu (requires the Chat plugin). Administrators and users with the chat_admin role can define chat actions.
Add actions to the legacy chat window menu

You can create new actions and add them to the chat window menu.

1. Navigate to Social IT > Chat Administration > Actions.
2. Select an action to edit or click New.
3. Enter the chat action details and click Update or Submit.

The following example demonstrates how to add a chat action that appears only on windows where the user is a Help Desk Agent. The action appears on the menu as Show User Type and opens a popup window that indicates a current user of queue_agent.

- **Action Name:** Show User Type
- **Active:** Select the check box.
- **Order:** 100
- **Client Show Condition:**

  ```javascript
  answer = g_chat.getChatType() == 'queue_agent';
  ```

- **OnClick Action Script:**

  ```javascript
  alert('The current user is: ' + g_chat.getChatType());
  ```
Chat action details
You can define a chat action name and the script that runs when the action is selected.

Chat action details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Name</td>
<td>Enter a label for the action as it appears in the menu.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate or clear the check box to deactivate the action. Only active actions may appear in the menu.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order in which the action appears in the menu. Standard menu items (such as Show Timestamps) always appear at the top of the chat menu, followed by chat actions in order.</td>
</tr>
<tr>
<td>Client Show Condition</td>
<td>Define the conditions under which this menu option appears. The show condition must set the pre-defined answer variable to a boolean value.</td>
</tr>
<tr>
<td>OnClick Action Script</td>
<td>Enter the JavaScript code that runs when the menu item is selected.</td>
</tr>
</tbody>
</table>

Available methods associated with the g_chat variable
The g_chat variable is a legacy chat window object that is available in the Client Show Condition and OnClick Action Script of a chat action definition.

Method Summary
The following table defines the available methods associated with this object.

<table>
<thead>
<tr>
<th>Return Object</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>getActiveUsers()</td>
</tr>
<tr>
<td></td>
<td>Returns the active users.</td>

<tr>
<td></td>
<td>Returns:</td>
</tr>
<tr>
<td></td>
<td>Array - Returns the active users.</td>
</tr>
<tr>
<td>String</td>
<td>getChannelJID()</td>
</tr>
<tr>
<td></td>
<td>Returns the channel JID, which is a sys_id for a record chat_channel table.</td>
</tr>
<tr>
<td></td>
<td>Returns:</td>
</tr>
<tr>
<td></td>
<td>String - Returns the channel JID.</td>
</tr>
<tr>
<td>Return Object</td>
<td>Details</td>
</tr>
<tr>
<td>---------------</td>
<td>---------</td>
</tr>
<tr>
<td>String</td>
<td><strong>getChatType()</strong>&lt;br&gt;Determines the chat window type.&lt;br&gt;Returns:&lt;br&gt;String - Returns one of the following values that specifies the type of user:&lt;br&gt;· queue_agent: Help Desk Chat support agent&lt;br&gt;· queue_user: Help Desk Chat end user&lt;br&gt;· group_chat: The individual is a member of a chat room (multiple users)&lt;br&gt;· conversation: The individual is a member in a private chat with another user</td>
</tr>
<tr>
<td>String</td>
<td><strong>getChatQueueAgent()</strong>&lt;br&gt;Returns the <code>sys_id</code> for agent that is administering this thread.&lt;br&gt;Returns:&lt;br&gt;String - Returns the <code>sys_id</code> of the chat queue agent.</td>
</tr>
<tr>
<td>String</td>
<td><strong>getChatQueueUser()</strong>&lt;br&gt;Returns the <code>sys_id</code> for end user of the chat queue.&lt;br&gt;Returns:&lt;br&gt;String - Returns the <code>sys_id</code> of the chat queue user.</td>
</tr>
<tr>
<td>String</td>
<td><strong>getThreadID()</strong>&lt;br&gt;Returns the thread ID. This returns the same value as <code>g_chat.getChannelJID().getID()</code>. &lt;br&gt;Returns:&lt;br&gt;String - Returns the thread ID.</td>
</tr>
</tbody>
</table>

**Legacy: Help desk chat**

Communicate with service desk staff using instant messaging.

*Note:* The [Connect Support](https://<instance web address>/support) feature provides an updated messaging platform similar to help desk chat. The help desk chat and Connect Support features should not be used concurrently. There is no migration path from help desk chat to Connect Support.

Users can communicate directly with service desk staff using instant messaging in a ServiceNow instance (requires the Chat plugin.):

- Users access live support from the Employee Self-Service portal.
- Service desk staff provide support from the chat desktop.

**Legacy: Use help desk chat to get support**

You can contact service desk staff.

2. Log in to your ServiceNow account. Only logged in users can use chat.
3. In the upper right, click the **Service Desk Chat** button. A chat window opens.
4. Enter your question in the text field at the bottom of the window and press **Enter**.
   1. A message confirms that you have entered the chat queue and indicates your position and estimated wait time.
   2. When a service desk staff member accepts your chat and begins working on your question, another message appears.
5. Chat with your service desk agent via instant messaging.
   service desk staff may lead you through troubleshooting, ask clarifying questions, or create an incident record to address your question.

**Note:** Administrators can configure Service Desk Chat to be accessible on content management (CMS) pages.

---

**Legacy: Use help desk chat to provide support**

Staff who are assigned to chat support can provide live support via instant messaging. Administrators and users with the chat_admin role can assign chat support staff (see Set Up Chat Queues for Help Desk Chat).

To provide users with live support using chat:

1. Navigate to **Social IT > Chat** to open your chat desktop.
   * A chat queue agent window appears on your chat desktop for each chat queue you are assigned to. If no agent windows appear, ask an administrator to add you as a member of the assignment group for a chat queue.
• The chat queue agent window displays the number of users in the queue and how long they have been waiting.
• Every member of the assignment group sees the associated chat queue agent window.

2. Click **Answer Next User** to answer the next user or click **Answer** beside a specific user in the queue. A chat window opens.
• Only the agent and the user can see the chat window.

Provide support via instant messaging. Chat queue agents can access additional support functions in the chat window menu:

• **Invite User**: invite another expert to assist with a support chat. An invitation appears in the favorites list of an invited user.
• **Create Incident from Chat**: create a new incident record with the initial question as the short description and the support chat as a linked chat room (accessible from the **Create or Join Chat Room** related link on the Incident form).

**Note:** Administrators can edit this action or add additional actions to the chat window menu.
Legacy: Set up chat queues for help desk chat

Help desk chat allows users to communicate directly with Service Desk staff via instant messaging in an instance.

Chat queues define the schedules, staff, and system messages for help desk chat. Administrators and users with the chat_admin role can set up chat queues.

Define a chat queue for legacy chat

How to define a chat queue for legacy chat.

**Note:** The Chat Queue (chat_queue) table is also used by Connect Support. Legacy chat and Connect Support should not be used concurrently.

1. Navigate to Social IT > Chat Administration > Queues.
2. Select a chat queue to edit or click New.
3. Enter the chat queue details and click Update or Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name that end users see as a title for the queue.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate or clear the check box to deactivate the chat queue.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>Select the group that contains the support staff for the chat queue. Every agent sees the chat queue on their chat desktop and can answer any user that is waiting in the queue. To assign staff members to the group, see Assign Service Desk Staff to a Chat Queue.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Select a schedule that defines when a queue is available (see Use Schedules). If the queue is always available, clear the field.</td>
</tr>
<tr>
<td>Question</td>
<td>Enter the initial question that end users see when they open a new Help Desk Chat. For example, How can I help you?</td>
</tr>
<tr>
<td>Confirm problem</td>
<td>(Optional) Enter the confirmation message that end users see when they enter an initial question. For example, Thank you for contacting support. Your problem has been submitted and an agent will be with you shortly.</td>
</tr>
<tr>
<td>Initial agent response</td>
<td>(Optional) Enter the message that end users see when an agent accepts their chat. For example, Thank you for waiting. I am looking into your question now and will be with you shortly.</td>
</tr>
<tr>
<td>Not available</td>
<td>Enter the message that end users see when a Help Desk Chat request is not accepted because the queue is outside its scheduled availability (defined by the Schedule field).</td>
</tr>
</tbody>
</table>
Assign service desk staff to a chat queue
Chat queue agents are Service Desk staff that are members of a chat queue’s assignment group.

To assign agents to a chat queue:

1. Navigate to User Administration > Groups.
2. Select an existing assignment group or click New.
3. Enter or modify the group details (see Create a Group).
4. Right-click the header and select Save.
5. In the Group members related list, click Edit.
6. Using the slushbucket, add support staff to the group.
7. Navigate to Social IT > Chat Administration > Queues.
8. Select the chat queue for which the group provides support.
9. In the Assignment Group field, select the group.

Make help desk chat accessible to an end user
Users access live support from the Employee Self-Service Portal (ESS Portal).

Users access live support from the Employee Self-Service Portal (ESS Portal). To make a Help Desk Chat queue accessible to end users, add a link to the ESS Portal (requires the Content Management Plugin).

To change the default link in the ESS header:

1. Navigate to Content Management > Headers.
2. Open **Portal - Header**.
3. In the Chat queue field, enter the chat queue that users access by clicking the link in the ESS header. Clear the field to remove the chat queue link.
4. Click **Update**.

![Chat queue link](image1)

Add a custom link elsewhere on the ESS portal
How to add a custom help desk chat link on the ESS portal.

1. Navigate to **Content Management > Static HTML**.
2. Click **New**.
3. Enter a Name.
4. In the Static content field, click **Toggle HTML Source** to edit the field in HTML source mode.

![HTML editor button](image2)

5. Create a link to the desired Help Desk Chat queue (see [Link Syntax](#)).
6. Click **Submit**.
7. Add the new content block to the desired location on the portal (see [Adding Content to the Page](#)).

**Link syntax**

To open a Help Desk Chat queue from a custom link on the ESS Portal, you must call the `CustomEvent.fire` method using appropriate arguments.

To open a Help Desk Chat queue from a custom link on the ESS Portal, you must call the `CustomEvent.fire` method using appropriate arguments. Details of the API call and an example that generates an anchor link are provided below.
API Call:

```javascript
CustomEvent.fire(LiveEvents.LIVE_EVENT,
    LiveEvents.LIVE_WINDOW_JOIN_QUEUE_QUERY, CHAT_QUEUE_SYS_ID,
    CHAT_QUEUE_SYS_NAME);
```

where the variables are:
- CHAT_QUEUE_SYS_ID: Specifies the sys_id for the chat queue.
- CHAT_QUEUE_SYS_NAME: Specifies the name of the chat queue (must match the value the Name field of the chat queue record).

Example: This example creates an anchor link that opens the Help Desk Chat queue.

```html
<a href="#" onclick="CustomEvent.fire(LiveEvents.LIVE_EVENT,
    LiveEvents.LIVE_WINDOW_JOIN_QUEUE_QUERY,
    'c54f0abf0a0b452db84664f409c79c',
    'Help Desk Chat'); return false;">Help Desk Chat
</a>
```

Monitor chat queues
Chat queues can yield useful Key Performance Indicators (KPI) for evaluating support effectiveness.

- Queue Wait Time: amount of time a user waits in the queue before a help desk agent accepts the request.
- Percentage of Chats Abandoned: users that exit the queue before an agent responds (user stopped waiting).
- Percentage of Chats Accepted: requests that are answered by an agent.

**Note:** This information is not calculated automatically. Administrators may calculate these values based on data collected by chat queues.

Monitor help desk chat tasks
Help Desk Chat requests are tracked in the Chat queue entries table, which appears as a related list on the associated chat queue record.

Help Desk Chat requests are tracked in the Chat queue entries table, which appears as a related list on the associated chat queue record. Because this table extends the Task table, administrators can take advantage of core task functionality. For example, administrators can attach Service Level Agreements (SLAs) to chat queue entries to evaluate the response time of Help Desk Chat support.

Legacy Notify
Legacy Notify enables organizations with a Twilio account to send notifications using text and voice messages.

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

Legacy Notify also allows conference calls between ServiceNow users to enable quick communications.
When Legacy Notify is active, you can configure ServiceNow to automatically generate and send notifications to selected contacts, for instance when a new incident communication plan is raised in the incident communications management process.

Users with the notifynow_admin role can set properties and monitor message and conference call activities.

Legacy Notify has been implemented for use within Incident Communications Management. Refer to the Notify API documentation for details on how to implement Legacy Notify for use within other ServiceNow applications.

### Working with Legacy Notify

Follow this process to enable and use Notify.

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Set up a Twilio account to provide phone connectivity for Notify.
2. Activate Notify.
3. Configure Notify to use Twilio.
4. Begin using Notify immediately within Incident Communications Management.
5. Use the Notify API with other ServiceNow applications to provide SMS, voicemail, email, and conference calls for those applications.

### View a Legacy Notify question

Questions contain a response action and a set of response choices. Use these questions to simplify communications. Then, you can monitor the resulting communication thread.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

For example, the process can be used to ask members of a specific on-call group to acknowledge or reject an incident. Depending on the answer from the first team member, the incident is assigned to that person or an SMS question is sent to the next on-call member. In this example, the questions are used as part of a workflow.

To see a list of predefined questions both Notify and On-Call Scheduling need to be active.

1. Navigate to Notify > Questions.
2. Click the question On-Call responsibility Accept/Reject to see the question details.
3. Click the Notify Response Choices related list to view or edit the choices. The person who receives the SMS question can either choose to accept or reject the assignment. If the assignment is accepted, the Response action can be that the incident is actually assigned to that person. The response action is a script that you can modify or replace. If the assignment is rejected, an SMS question may be sent to the next person in the escalation chain, and so on. You can combine questions with a workflow to automate a process like on-call scheduling escalation.

Create a question in Legacy Notify

Define a question that can be sent to users.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Questions.
2. Click New.
3. Fill in the fields, as appropriate.
## Notify New Question form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a description of the question.</td>
</tr>
<tr>
<td>Question</td>
<td>Enter the question you want to send. You can enter variables in the question with the { } tags, for example, {0}. When using more than one variable, use consecutive numbering. When using multiple variables, reference them by specifying their position in the parameter list, starting from {0}. The variable is picked up by the script and translated into, for example, an incident or a problem number.</td>
</tr>
<tr>
<td>Params</td>
<td>Enter parameters which map to the fields on the record that the workflow was triggered for. This enables the message to show dynamic data. Multiple parameters should be separated by a comma. For example, number, shows the incident number in case the workflow was triggered from an incident. A second parameter could be, for example short_description.</td>
</tr>
<tr>
<td>Response Action</td>
<td>Select the action that must be taken. This is a script that can be modified, or you can create a new script by clicking the search button and selecting New. Several examples of scripts are shown. Write your own script and click Submit.</td>
</tr>
</tbody>
</table>

4. Click Submit.

## Create a new response choice in Legacy Notify

Create a new response choice to allow users to select that response for a Notify question.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Questions.
2. Open the notify question you have just created.
3. Click New to create a new notify response choice.
4. Fill in the fields, as appropriate.

## Notify New Response Choice form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>The abbreviation for the response choice in the text message. For example, ACC for accept or REJ for reject.</td>
</tr>
<tr>
<td>Text</td>
<td>The text displayed for this response choice.</td>
</tr>
</tbody>
</table>
5. Click Submit.

### View Legacy Notify messages

Applications implementing Notify, such as Incident Communications Management, can send Short Message Service (SMS) text messages to relevant contacts under predefined conditions, such as when a new incident communication plan has been created.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Messages.
2. Click a message to see the message details.

### SMS Outbox Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>A number indicating the order in the list of response choices. Choices with lower order numbers are listed before choices with higher order numbers.</td>
</tr>
</tbody>
</table>
automatically deactivated after the thread release time runs out. The default thread release time is 10 days. To change this value, add the `nn.thread.release.age` property.

1. Navigate to **Notify** > **Conversations**.
2. Click a conversation record to see the conversation details.

![Notify Conversation Details]

The State of the conversation can have one of the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ended</td>
<td>The conversation has been completed.</td>
</tr>
<tr>
<td>Failed</td>
<td>The conversation has failed.</td>
</tr>
<tr>
<td>Pending</td>
<td>The SMS or email is waiting to be sent.</td>
</tr>
<tr>
<td>Sent</td>
<td>The SMS or email has been sent.</td>
</tr>
<tr>
<td>Unanswered</td>
<td>The SMS or email has not been answered.</td>
</tr>
</tbody>
</table>

**Note:** The mode of conversation cannot be changed during one conversation thread. For example, you cannot switch between SMS and email during one conversation.

### View Legacy Notify conference calls

Applications that use Notify, such as Incident Communications Management, can launch and maintain conference calls between involved parties.

**Role required:** notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see [Notify](#).

1. Navigate to **Notify** > **Conference Calls**.
2. You can also access conference call information from the relevant record, such as the **Conference Calls** related list in an incident communication plan record.
3. Click a conference call in the list to view details.
3. Click the arrow beside the check box to expand a Participant entry. This shows participant session information, including details of the conference calls that the participant has been involved in.

4. Click a Participant name to see more detailed information about that participant.
A Notify conference call can be public. 

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

The Private field on the conference call record indicates if a call is private (selected) or public (not selected). By default, all calls created automatically, such as those created through Incident Communications Management, are public. You can create private calls using the Notify API initiateConferenceCall method.

When created, public conference calls generate an associated Code which is sent via SMS to all invited participants. These participants can distribute the code to allow other users to join the public call. An administrator can control the format of the code using the property glide.notifynow.conference_call.code.pattern. Anyone with the code can connect to a public conference call using one of these methods:

- By calling the Twilio phone number and entering the code for that conference call.
- By sending the code in an SMS message to the Twilio phone number. Participants that join a public call this way are considered ad-hoc participants, indicated on the participant record.

**Administering Legacy Notify**

An administrator can set up Notify, manage Notify properties and conference call participants.
Configuring legacy Notify to use the Twilio service

Each ServiceNow instance using Notify requires a valid Twilio account and telephone number. Refer to the Twilio documentation for detailed instructions.

After the Twilio account is set up, perform the following to use that account with Notify:

- Associate the account with Notify
- Configure Twilio with ServiceNow endpoints

Associate a Twilio account with Legacy Notify

Associate a Twilio account with your instance to use that account for legacy Notify.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Administration > Properties.
2. Enter the **AccountSID**, **AuthToken** and **phone number** values. These values can be obtained from the Twilio dashboard:
When the Twilio account details are entered in the Notify Properties page, the account status is updated.

3. (Optional) To use Notify on multiple ServiceNow instances, activate Notify on each instance and create a separate Twilio account and telephone number for each instance.

**Note:** Some telephone numbers are voice capable, but not SMS capable. This is shown in the Notify properties with relevant messages. Two methods are available to check this: `isSMSCapable` and `isVoiceCapable`.

### Configuring the Twilio service with endpoints in legacy Notify

In order for the Twilio service to receive Notify commands, the `Request URL` field value for every Twilio telephone number must point to the ServiceNow instance that uses Notify with that Twilio telephone number.

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see [Notify](#).

To set these values, do one of the following:

- Define them manually in the Twilio service dashboard.
- Ensure the fields are blank in the Twilio service dashboard, then open the Notify Properties page. Notify automatically configures the correct endpoints if the `Request URL` fields are blank.

Set these values from within the Twilio service dashboard.
The `notifyusa` values underlined in the image should be replaced with your ServiceNow instance name, for:

- Voice Request URL: `https://notifyusa.service-now.com/NotifyNowCallProcessor.do`
View and edit legacy Notify properties

You can view and edit Notify properties.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Administration > Properties.
**Notify Properties form**

2. Fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Status</td>
<td>Information showing the status of the associated Twilio account.</td>
</tr>
<tr>
<td>Twilio AccountSID</td>
<td>The Twilio account AccountSID, acting as the user name for that account.</td>
</tr>
<tr>
<td>Twilio AuthToken</td>
<td>The Twilio account AuthToken, acting as the password for that account.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Twilio SMS and voice enabled phone number</td>
<td>The Twilio number that Notify will use. Telephone numbers must be entered in the E.164 format and need to exist under the Twilio account. See Associating a Twilio Account.</td>
</tr>
<tr>
<td>Number of frequent conference call participants to be displayed</td>
<td>The number of people to display in the frequently called list.</td>
</tr>
<tr>
<td>Voice</td>
<td>The voice used for Notify communications. Select <strong>woman</strong> or <strong>man</strong> to provide female or male voice support for English, Spanish, French, German, and Italian. Select <strong>alice</strong> to provide female voice support for a wider range of languages.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

**Legacy Notify account status messages**

Account status messages are visible on the Notify Properties page.

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Your account is ready for use</td>
<td>Notify is correctly configured and ready for use.</td>
</tr>
<tr>
<td>Your Twilio AccountSID or AuthToken are not valid</td>
<td>An incorrect value has been entered in the AccountSID or AuthToken fields in the Notify properties.</td>
</tr>
<tr>
<td>Your Twilio phone number is not valid</td>
<td>Incorrect telephone number information is defined in the Notify properties.</td>
</tr>
<tr>
<td>Your Twilio phone number does not have properly configured endpoints</td>
<td>The Request URL endpoint settings have not been properly configured.</td>
</tr>
<tr>
<td>Your Twilio account is not configured properly</td>
<td>One or more of your Twilio account settings is incorrect. Open the Twilio dashboard and check the settings.</td>
</tr>
</tbody>
</table>

**Manage Legacy Notify conference call participants**

As a Notify administrator, you can mute, unmute, and kick participants on a conference call.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see **Notify**.

Muting a participant prevents that person from speaking on the conference call but does not notify any participants, including the muted participant. Kicking a participant removes that person from the conference call and sets the **Response** field for the participant session to kicked.

1. Navigate to **Notify > Conference Calls**.
2. Select an active conference call.
3. In the **Notify Conference Call Participants** related list, select a participant.
4. Click the button for the action you want to perform, such as **Mute** to mute the participant.
You can perform these actions for multiple participants as a single operation using the **Actions on selected rows** choice list on the **Notify Conference Call Participants** related list.

### Installed with Legacy Notify

Activating the Notify plugin adds or modifies tables, user roles, script includes, and other components.

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see [Notify](#).

### Tables

Notify adds or modifies the following tables.

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Answer [notifynow_answer]</td>
<td>Information for possible answers to the SMS question sent.</td>
</tr>
<tr>
<td>Conversation [notifynow_conversation]</td>
<td>Information for the conversation thread.</td>
</tr>
<tr>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Information for conference call records.</td>
</tr>
<tr>
<td>NotifyNow Participant Session [notifynow_participant_session]</td>
<td>Information regarding conference call sessions for individual conference call participants.</td>
</tr>
<tr>
<td>Participant [notifynow_participant]</td>
<td>Information regarding individual conference call participants.</td>
</tr>
<tr>
<td>Question [notifynow_question]</td>
<td>Information for the possible questions in the SMS.</td>
</tr>
<tr>
<td>Response_action [notifynow_response_action]</td>
<td>Information for the notify response action associated with the question.</td>
</tr>
<tr>
<td>Response_choice [notifynow_response_choice]</td>
<td>Information for the notify response choice associated with the question.</td>
</tr>
<tr>
<td>SMS Messages [notifynow_message]</td>
<td>Information for the actual SMS messages sent.</td>
</tr>
</tbody>
</table>

### Properties

Notify adds the following system properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.notifynow.frequent_participant_count</td>
<td>The number of frequent conference call participants to be displayed.</td>
</tr>
<tr>
<td>glide.notifynow.voice</td>
<td>The voice used for Notify communications.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.accountsid</td>
<td>The Twilio account AccountSID.</td>
</tr>
</tbody>
</table>
### Property & Description

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.notifynow.twilio.token</td>
<td>The Twilio account AuthToken.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.phonenumber</td>
<td>The Twilio number that Notify will use.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.answering_machine_detection</td>
<td>A boolean flag to enable or disable answering machine detection. Set to true to use answering machine detection. Set to false to continue the call.</td>
</tr>
<tr>
<td>nn.thread.release.age</td>
<td>The number of days after which the conversation thread release time runs out. Defaults to 10 days.</td>
</tr>
<tr>
<td>glide.notifynow.conference_call.code.pattern</td>
<td>The pattern used to generate a conference call code for public conference calls. Number signs (#) in the pattern are replaced with random numbers when a code is generated.</td>
</tr>
<tr>
<td>glide.notifynow.fix_invalid_phone_number</td>
<td>A boolean flag to enable or disable automatic correction of invalid phone numbers. Twilio might incorrectly prefix non-US phone numbers with 1. When this property is true, the instance automatically removes the 1 for non-US calls. When this property is false, you might be incorrectly identified when reconnecting to a call using SMS.</td>
</tr>
</tbody>
</table>

### User Roles

Notify adds the following user roles.

**User Roles**

<table>
<thead>
<tr>
<th>Role</th>
<th>Contains Roles</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifynow_admin</td>
<td>None</td>
<td>Administrator with privileges for Notify functionality.</td>
</tr>
</tbody>
</table>

### UI Actions

Notify adds the following UI actions.

**UI Actions**

<table>
<thead>
<tr>
<th>UI Action</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initiate Conference Call</td>
<td>Incident Communication Plan [incident_alert]</td>
<td>Adds a link to the Incident Communication Plan form, if that plugin is activated, which displays a dialog box for starting a conference call with selected participants.</td>
</tr>
<tr>
<td>UI Action</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>--------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Invite to Conference Call</td>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Adds a link to the Notify Conference Call form which displays a dialog box for adding more users to an active conference call.</td>
</tr>
</tbody>
</table>

**Script Includes**

Notify adds the following script includes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IncidentAlertConferenceCall</td>
<td>A utility JavaScript Prototype class allowing users to initiate the conference call and add other users to the conference call. Should be used in conjunction with the slushbucket UI page (notifynow_participant).</td>
</tr>
</tbody>
</table>

**Business Rules**

Notify adds the following business rules.

<table>
<thead>
<tr>
<th>Business Rule Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMS on new Incident Communication Plan</td>
<td>Incident Communication Plan [incident_alert]</td>
<td>Sends an SMS to any default contacts added when an incident communication plan record is created.</td>
</tr>
<tr>
<td>Conference Call Allowed</td>
<td>Incident Communication Plan [incident_alert]</td>
<td>Displays or hides the initiate conference call UI action by storing true or false in g_scratchpad.conferenceCallAllowed.</td>
</tr>
<tr>
<td>Update Conference Call Started IA Activity</td>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Logs when a conference call started by writing to an incident communication plan's comment field if the source record is from the incident_alert table.</td>
</tr>
<tr>
<td>Update Conference Call Finished IA Activity</td>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Logs when a conference call ended and what actions the conference call participants took by writing to an incident communication plan's comment field if the source record is from the incident_alert table.</td>
</tr>
</tbody>
</table>

Workflow Activities

Notify adds the following workflow activities.

### Workflow Activities

<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Activity Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send Notify SMS</td>
<td>Notify</td>
<td>Sends an SMS message (maximum 1600 Characters) to an E.164 compliant mobile phone number of the selected recipients and/or groups.</td>
</tr>
<tr>
<td>Send Notify SMS Question</td>
<td>Notify</td>
<td>Sends predefined SMS Question message (maximum 1600 Characters) to an E.164 compliant mobile phone number of the selected recipients and/or groups. This is one of two main activities for workflow On-Call Assign by Acknowledgement. In a predefined message, the recipient is asked to assign himself to a newly created incident. The same message also contains predefined answers.</td>
</tr>
<tr>
<td>Send Email Question</td>
<td>Notify</td>
<td>Sends email generated from email template containing notification that recipient is the current On-call resource for a newly created task. This is one of two main activities for the workflow On-Call Assign by Acknowledgement. In a predefined message, the recipient is asked to assign himself to a newly created incident. The email contains two links that enable the user to accept or reject assignment.</td>
</tr>
</tbody>
</table>

Legacy Notify API

The legacy Notify API provides functionality for sending emails, sending SMS messages, and setting up conference calls.

Use this when you want to use Notify functionality with applications on your system.

**Note:** This API is included with the legacy Notify functionality. For APIs included in the current Notify feature, see the Notify, NotifyAction, NotifyPhoneNumber, and NotifyClient APIs.
NotifyNow - getReadyState()

Indicates whether Notify is set up correctly or not.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message False when trying to run the function in a script.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if Notify is set up correctly, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
gs.log((nn.getReadyState()) ? "OK" : "NOT OK");
```

NotifyNow - getStatus()

Returns the current status of Notify configuration.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message Unauthorized when trying to run the function in a script.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>One of the possible status messages.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_NUMBER_MESSAGE</td>
<td>The account does not have a telephone number set up. Ensure that you set up the telephone number for the account.</td>
</tr>
<tr>
<td>NO_ENDPOINTS_MESSAGE</td>
<td>The account does not have its endpoints set up correctly. Ensure that you set up the endpoints for the account.</td>
</tr>
<tr>
<td>ACCOUNT_OK_MESSAGE</td>
<td>The account is active and ready for use.</td>
</tr>
<tr>
<td>ACCOUNT_NO_AUTH</td>
<td>The Twilio AuthToken is not valid.</td>
</tr>
<tr>
<td>ACCOUNT_NOT_CONFIGURED</td>
<td>The Twilio AccountSID or AuthToken is not valid.</td>
</tr>
</tbody>
</table>

```java
var nn = new SNC.NotifyNow();
gs.log(nn.getStatus());
```

### NotifyNow - initiateConferenceCall(String[] conferenceCallParticipants, String conferenceCallTitle)

Initiate a new conference call.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallParticipants</td>
<td>String</td>
<td>One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.</td>
</tr>
<tr>
<td>conferenceCallTitle</td>
<td>String</td>
<td>Title of the conference call. This parameter has a maximum length of 40 characters.</td>
</tr>
</tbody>
</table>
This initiates a conference call with E.164-compliant phone numbers for participants, without the optional source record parameter and and does not send any conference call details via SMS or email.

```javascript
var participants = ['+31205655548', '+31205655552', '+31652825393'];
// set up conference call
var nn = new SNC.NotifyNow();
var conferenceCall = nn.initiateConferenceCall(participants, "testing12");
gs.log('started conference call: ' + conferenceCall.getUniqueValue());
```

**NotifyNow - initiateConferenceCall(String[] conferenceCallParticipants, String conferenceCallTitle, GlideRecord sourceRecord, Boolean private)**

Initiate a new conference call.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallParticipants</td>
<td>String</td>
<td>One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.</td>
</tr>
<tr>
<td>conferenceCallTitle</td>
<td>String</td>
<td>Title of the conference call. This parameter has a maximum length of 40 characters.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>Source record to associate to the conference call such as an incident or problem number.</td>
</tr>
<tr>
<td>private</td>
<td>Boolean</td>
<td>Value to control if a conference call is private. This value defaults to false.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The conference call record, or null if there was an error.</td>
</tr>
</tbody>
</table>
This initiates a conference call with participants that have a E.164-compliant phone number and participants from the sys_user table and sends conference call details via SMS and email to all participants.

```javascript
// define phone number participants
var participants = ['+31205655548', '+31205655552', '+31652825393'];

// we also want to add two Dutch sys_user participants
var user = new GlideRecord('sys_user');
user.addNotNullQuery('mobile_phone');
user.addQuery('mobile_phone', 'STARTSWITH', '+316');
user.setLimit(2);
user.query();

// add users to the participant array
while (user.hasNext() && user.next()) {
  gs.log('adding user ' + user.getValue('name') + ' with phone number ' + user.getValue('mobile_phone') + ' to the participant array');
  participants.push(user.getUniqueValue());
}

// define a source record to associate with the conference call
var source = new GlideRecord("cmdb_ci");
source.query("asset_tag", "P1000167");
if (source.hasNext() && source.next()) {
  // set up conference call
  var nn = new SNC.NotifyNow();
  var conferenceCall = nn.initiateConferenceCall(participants, "testing 1 2", source);

  // check if the conference call was successfully created
  if (conferenceCall != null) {
    gs.log('started conference call: ' + conferenceCall.getUniqueValue());
  } else {
    gs.log('could not start the conference call :(');
  }
}
```

**NotifyNow - isCallable(String participant)**

Determines whether a user is callable or not.

A user must have a valid phone number to be callable. A user who is already in an active session is not callable.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>String or GlideRecord</td>
<td>A sys_user or notifynow_participant record, or an E.164-compliant phone number.</td>
</tr>
</tbody>
</table>
### NotifyNow - isCallable()

Checks whether a participant can be called or not.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>boolean</td>
<td>Whether this participant can be called or not.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Whether this participant can be called or not.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
gs.log('by number: ' + nn.isCallable('+31612345678'));

var user = GlideRecord('sys_user');
user.query('sys_id', '13d39544eb5201003cf587b9d106fea9');
if (user.hasNext() && user.next())
gs.log('by user: ' + nn.isCallable(user));

var participant = GlideRecord('notifynow_participant');
participant.query('sys_id', '33b11430eb1201003cf587b9d106feb9');
if (participant.hasNext() && participant.next())
gs.log('by participant: ' + nn.isCallable(participant));
```

### NotifyNow - isSMSCapable()

Checks if the telephone number associated with the Twilio account is capable of sending SMS messages.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the telephone number associated with the Twilio account is capable of sending SMS messages.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('The twilio number is SMS capable: ' + ((new SNC.NotifyNow().isSMSCapable()) ? 'yes' : 'no'));
```

### NotifyNow - isSMSCapable(String userID)

Checks if a user is able to send SMS messages.

```javascript
gs.log('The twilio number is SMS capable: ' + ((new SNC.NotifyNow().isSMSCapable()) ? 'yes' : 'no'));
```
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of the user you want to check for an SMS-capable phone number.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>If the user can send SMS messages.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('the user is able to send SMS messages (e.g. has a SMS device): ' + ((new SNC.NotifyNow().isSMSCapable(<user sys_id>)) ? 'yes' : 'no'));
```

**NotifyNow - isVoiceCapable()**

Checks if the telephone number associated with the Twilio account is capable of setting up phone calls.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the telephone number associated with the Twilio account is capable of setting up phone calls.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('the Twilio number is Voice capable: ' + ((new SNC.NotifyNow().isVoiceCapable()) ? 'yes' : 'no'));
```

**NotifyNow - isVoiceCapable(String userID)**

Checks if a user is able to make voice calls.
### NotifyNow - kick(GlideRecord participant)

Removes a participant from a conference call.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The conference call participant to remove from the call.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was removed, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // kick participant
    result = new SNC.NotifyNow().kick(participant);
    gs.log('participant kicked: ' + result);
}
```

### NotifyNow - mute(GlideRecord participant)

Mutes a participant on a conference call.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The conference call participant to mute.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was muted, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // mute participant
    result = new SNC.NotifyNow().mute(participant);
    gs.log('participant muted: ' + result);
}
```

---

**NotifyNow - umute(GlideRecord participant)**

Unmutes a participant on a conference call.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The muted conference call participant to unmute.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was unmuted, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // unmute participant
    result = new SNC.NotifyNow().unmute(participant);
    gs.log('participant unmuted: ' + result);
}
```
NotifyNow - sendEmailQuestion(String emailAddress, String question, GlideRecord sourceRecord, String emailSubject)

Send an email question to an email address.

The sendEmailQuestion method produces a question body and requires users to click a link to indicate their choice.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>emailAddress</td>
<td>String</td>
<td>Email address to send the question to.</td>
</tr>
<tr>
<td>question</td>
<td>String or GlideRecord</td>
<td>The question record to send or the sys_id of a question record.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>An optional source record to associate to the SMS question, such as an incident.</td>
</tr>
<tr>
<td>emailSubject</td>
<td>String</td>
<td>Optional text to override the default email subject.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The conversation sys_id.</td>
</tr>
</tbody>
</table>

This example demonstrates using the default email subject.

```java
var user = GlideRecord("sys_user");
user.get("email", "someone@somedomain.com");
new SNC.NotifyNow().sendEmailQuestion(user.getValue('email'),
  "b6b34500bf3111003cf585ce2c0739ce", user);
```

This example uses dot-walking and specifies a source record and email subject.

```java
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com",
  "b6071733bf1111003cf585ce2c07390f", current,
  "Please answer this question");
```

This example uses dot-walking and specifies an email subject but no source record.

```java
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com",
  "b6071733bf1111003cf585ce2c07390f",
  "Please answer this question");
```
**NotifyNow - sendSMS(String phoneNumber, String smsBody)**

Sends an SMS message to an E.164-compliant mobile phone number.

Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>smsBody</td>
<td>String</td>
<td>The message to send, maximum 1600 characters.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
new SNC.NotifyNow().sendSMS("+31612345678", "This is a message without source record");
```

**NotifyNow - sendSMS(String phoneNumber, String smsBody, GlideRecord source)**

Sends an SMS message to an E.164-compliant mobile phone number.

Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>smsBody</td>
<td>String</td>
<td>The message to send, maximum 1600 characters.</td>
</tr>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>The source record to associate with this SMS message.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var source = new GlideRecord("my_table");
```
source.query("my_field", "my_value");

if (source.hasNext() && source.next()) {
    // send a text message
    var nn = new SNC.NotifyNow();
    var message = "this is just a test";
    var number = "+31612345678";
    nn.sendSMS(number, message, source);
}

This example uses dot-walking and the current record as the source record.

new SNC.NotifyNow().sendSMS("+31612345678", "this is a test", current);

**NotifyNow - sendSMSQuestion(String phoneNumber, String question, GlideRecord sourceRecord)**

Sends an SMS question.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>An E.164-compliant phone number to send the message to.</td>
<td></td>
</tr>
<tr>
<td>question</td>
<td>String or GlideRecord</td>
<td>The question record to send or the sys_id of a question record.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>An optional source record to associate to the SMS question, such as an incident.</td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The conversation sys_id, or null if the SMS was not sent successfully.</td>
</tr>
</tbody>
</table>

```javascript
var question = new GlideRecord("notifynow_question");
question.query();

// get the first question
if (question.hasNext() && question.next()) {
    // send the sms question
    var number = "+31612345678";
    var nn = new SNC.NotifyNow();
    nn.sendSMSQuestion(number, question.getUniqueValue(), current);
}"
```
NotifyNow - addConferenceCallParticipant(String conferenceCall, String participant)

Adds ad-hoc users to an ongoing conference call.

When the method is called with a phone number for the participant parameter and there is exactly one sys_user record that matches the phone number, that sys_user record will be related to the participant. The participant's phone number field will be left blank because the phone number is in the sys_user record. If there are several sys_user records that match the phone number, or if there are no results, the participant's phone number field will be filled in, and there will be no stored reference to sys_user because the user is not known.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCall</td>
<td>String or GlideRecord</td>
<td>The sys_id or GlideRecord of an active conference call.</td>
</tr>
<tr>
<td>participant</td>
<td>String or GlideRecord</td>
<td>The sys_id or GlideRecord of a user with an E.164-compliant phone number, or an E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The participant record of the new participant that was added to the conference call.</td>
</tr>
</tbody>
</table>

```java
// add a new participant by conference call sys_id (string) and phone number (string)
var nn = new SNC.NotifyNow();
gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', '+31612345678'));

// add a new participant by conference call sys_id (string) and user record (GlideRecord)
var user = new GlideRecord('sys_user');
user.query('user_name', 'myUserName');
if (user.hasNext() && user.next()) {  
    var nn = new SNC.NotifyNow();
    gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', user));
    // you could have added the user by sys_id as well:
    //
    // nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', user.getValue('sys_id'));
} else {
    gs.log('no such user');
```
// add a new participant by conference call record (GlideRecord) and phone number (string)
var conferenceCall = new GlideRecord('notifynow_conference_call');
conferenceCall.query('title', 'IA0001001');
if (conferenceCall.hasNext() && conferenceCall.next()) {
    var nn = new SNC.NotifyNow();
gs.log(nn.addConferenceCallParticipant(conferenceCall,
        '+31612345678'));
} else {
    gs.log('no such conference call');
}

NotifyNow - convertLocalPhoneNumberToE164(String userID, String phoneNumber)

Converts a local phone number to an E.164-compliant phone number based on a user's location.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of a sys_user record to get location information from.</td>
</tr>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The phone number.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

var localPhoneNumber = '01784 221600';
var userName = 'Heath Vanalphen';

var user = new GlideRecord('sys_user');
user.get('name',userName);
var E164Number = new SNC.NotifyNow().convertLocalPhoneNumberToE164(user.getUniqueValue(),
    localPhoneNumber);
gs.log('converted: ' + localPhoneNumber + ' to ' + E164Number + ' based on ' + user.getValue('name') + 's location (' + user.getValue('location') + ')');
NotifyNow - getConferenceCallParticipants(String conferenceCallId, Boolean isCallable)

Returns all participants for a conference call.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallId</td>
<td>String</td>
<td>The ID of the conference call.</td>
</tr>
<tr>
<td>isCallable</td>
<td>Boolean</td>
<td>An optional flag to return either only the users you can call (true) or those you cannot call (false).</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The participants</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106fe37');

while (user.hasNext() && user.next()) {
    if (user.getValue('participant')) {
        gs.log('user: ' + user.getValue('sys_id'));
    } else {
        gs.log('phone number: ' + user.getValue('phone_number'));
    }
}
```

```javascript
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106fe37', true);

while (user.hasNext() && user.next()) {
    if (user.getValue('participant')) {
        gs.log('user: ' + user.getValue('sys_id'));
    } else {
        gs.log('phone number: ' + user.getValue('phone_number'));
    }
}
```

```javascript
var conferenceCallId = '32b11430eb1201003cf587b9d106feb8';

// get all participants
```
```javascript
gs.log('all conference call participants:');
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants(conferenceCallId);
gs.log(user);

// get all callable participants
gs.log('all conference call participants we can call:');
user = nn.getConferenceCallParticipants(conferenceCallId, true);
gs.log(user);

// get all un callable participants
gs.log('all conference call participants that are already in an active session and whom we cannot call:');
user = nn.getConferenceCallParticipants(conferenceCallId, false);
gs.log(user);
```

### NotifyNow - getFrequentlyCalledUsers(Number limit)
Returns a number of frequently-called users, up to the limit parameter, in alphabetical order.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>limit</td>
<td>Number</td>
<td>The maximum number of results.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The frequently called users in alphabetical order.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
var fc = nn.getFrequentlyCalledUsers(10);

while (fc.hasNext() && fc.next()) {
    gs.log("got user " + fc.getValue('name') + ' - ' + fc.getValue('sys_id'));
}
```

### NotifyNow - getPreferredE164VoiceNumber(GlideRecord user)
Returns a user's preferred E.164-compliant phone number for voice calls.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number or null.</td>
</tr>
</tbody>
</table>

```
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164RecognitionNumber(userID);
gs.log('the preferred phone number for setting up voice calls is ' + E164Number + ' for user with id: ' + userID);
```

NotifyNow - getPreferredE164SMSNumber(GlideRecord user)

Returns a user's preferred E.164-compliant phone number for SMS messages.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number or null.</td>
</tr>
</tbody>
</table>

```
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164SMSNumber(userID);
gs.log('the preferred phone number for sending SMS notifications is ' + E164Number + ' for user with id: ' + userID);
```

NotifyNow - getPreferredEmailAddress(GlideRecord user)

Returns a user's preferred email address

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the email address from.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The user record or the sys_id of a user to get the email address from.</td>
</tr>
</tbody>
</table>

```
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164SMSNumber(userID);
gs.log('the preferred phone number for sending SMS notifications is ' + E164Number + ' for user with id: ' + userID);
```
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The email address or null.</td>
</tr>
</tbody>
</table>

```javascript
var userID = "some user sys id";
var email = new SNC.NotifyNow().getPreferredEmailAddress(userID);
gs.log('the preferred email address for sending email notifications is ' + email + ' for user with id: ' + userID);
```

Live Feed

Live Feed is a social IT application that provides a place to post and share content in a ServiceNow instance.

Live Feed content forms a searchable knowledge source for sharing information within an organization. Main features include the following:

- Users can post, reply to, and rate messages, including links and images.
- Administrators can set up automatic messages that are generated when specific records are updated throughout the system.
- Users can subscribe to receive email notifications when new messages are posted.
- Users who take advantage of the accessibility options in the platform can tab through a live feed to navigate.

Live feed includes different types of feeds.
<table>
<thead>
<tr>
<th>My Live Feeds</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>System Administrator</strong></td>
</tr>
<tr>
<td>Share your thoughts</td>
</tr>
<tr>
<td><strong>System Administrator</strong></td>
</tr>
<tr>
<td>16 minutes ago • From Feed W0010007</td>
</tr>
<tr>
<td>WM Admin added as an approver</td>
</tr>
<tr>
<td>Like • Copy Link • Comment</td>
</tr>
<tr>
<td><strong>System Administrator</strong></td>
</tr>
<tr>

</tr>
<tr>
<td>WM Approver added as an approver</td>
</tr>
<tr>
<td>Like • Copy Link • Comment</td>
</tr>
</tbody>
</table>
**Note:** Live Feed v2 is active for all new instances by default. If you are upgrading from an earlier version of ServiceNow, you need to activate live feed v2 to use these features.

Live feed can be domain separated at the data level only. For more information on live feed and domain separation, see [Domain separation in Live Feed](#).

**Live Feed browser support**

The Live Feed v2 plugin does not support Internet Explorer 7 through 9.

Users who access the instance from those browser versions can use Live Feed v1 functionality. Users who access the instance from browsers that are compatible with HTML5 can use Live Feed v2 functionality.

**Activate Live Feed**

Live Feed is active for all instances. An administrator can activate the Live Feed plugin if it is not already active.

1. **Navigate to System Definition > Plugins.**

   A banner notifies you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:**

   To redirect to the legacy list view for plugins, click the link.

2. **Find the plugin using the filter criteria and search bar.**

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in [Request a plugin](#).

3. **Activate the plugin.**

   You can activate the plugin directly from the All Applications page or you can view more details about the plugin before you activate it.

   - If you are certain that you have the correct plugin, click **Install**, and when you see the dialog box, click **Activate**.
To view plugin details before activation:
1. Click the plugin name.
2. On the form, click the **Activate/Update** related link.
3. In the dialog box, review the dependent plugins.
   - If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.
4. If demo data is available and you want to install it, click **Load demo data**.
   - Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.
5. Click **Activate**.

**Administer live feed**

Administrators and users with the live_feed_admin role can configure live feed security and provide access to live feed from content management pages. Administrators can also set up live feed table notifications.

**Document feeds**

A document feed is a live feed group that is associated with a record, such as an incident or change.

Document feeds allow users to work on tasks and other records through the live feed interface. Users can post messages in live feed that are automatically maintained as comments or work notes on the record, if the record has these journal fields.

The benefits of using document feeds include the following:
- Improving communication between users working on the same record.
• Improving visibility into progress for end users.
• Providing a single place to see updates on multiple records.
• Saving conversation history in the record so that knowledge is not lost in an email chain.

To use document feeds, activate the Live Feed Document plugin, which is active by default in new instances. See Use live feed to work on records to learn how to use this feature.

The system automatically creates a document group for the feed when a user follows or shows a record on live feed. The system also creates a document group when a user creates a new record on a table that has live feed enabled.

The following list describes features of the document feed group.

• Is unlisted; it does not appear when users view all groups on live feed.
• Automatically approves membership for every user who can access the record.
• Uses the record number as the group name.
• Uses the record short description as a group description.
• Maintains all messages posted to live feed on the record, if the record has a journal field for comments. If the record has a standard text field for comments, each live post overwrites the field value.
• Maintains all messages posted on the record in live feed if the record has a journal field for comments. When the group is created, existing messages are added to the document feed.

A user who participates in live feed becomes a member of the group.

Add a live feed UI action on a table

You can add UI actions on a table to allow users to follow records in live feed.

Role required: ui_action_admin or admin

1. Navigate to System Definition > UI Actions.
2. Open one of the live feed UI actions, for example, the Follow on Live Feed list UI action.
3. In the Table field, select the table name.
4. Right-click the header and select Insert to create a copy of the UI action for the desired table.
5. Repeat steps 1 – 4 for all live feed UI actions.

Configure document feeds

You can configure a table to support document feeds.

Role required: personalize_dictionary or admin

Configuring a table to support document feeds includes the following steps:

1. Add live feed to a form header.
2. Add Follow on Live Feed and Show Live Feed as list and form UI actions.

Security configuration for document feeds

Document feeds honor the access control rules (ACLs) for the associated record. Users can only view messages on the document feed if they have access to the same information on the record.

Consider the following examples.

• If an ACL allows a user to read and create comments on an incident, then the user can view and add messages posted as comments on the incident feed.
• If an ACL restricts a user from reading work notes, then the user cannot view messages posted as work notes on the incident feed.

**Note:** Access control rules are only checked when a user first accesses the document feed. After users view the feed, an administrator must remove them manually to change their access.

**Enable a record feed**

You can enable live feed functionality from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to System Definition > Dictionary.
2. Open the dictionary entry for the table.
3. Add `live_feed=true` in the Attributes field.
4. Click Update.

**Note:** If the Collaboration feature is activated, you can remove the show live feed icon from all form headers. Set the `glide.live_feed.task_header_button` property to `collaboration`.

**Enable a document feed**

You can enable a document feed from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to System Definition > Tables.
2. Open the table record.
3. Clear the Live feed check box.
4. Click Update.

**Business rule installed with Live Feed Document**

This business rule is installed with Live Feed Document. There are no tables, roles, or notifications installed with it.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Feed integration</td>
<td>Writes journal comments to the live feed if there is a group for this record.</td>
</tr>
</tbody>
</table>

**Record feeds**

A record feed is a live feed group that is associated with a record, such as an incident or change.

Record feeds allow users to work on tasks and other records through the live feed interface. Users can post messages in live feed that are automatically maintained as comments or work notes on the record if the record has these journal fields.

You can use record feeds to:

• Improve communication between users working on the same record.
• Improve visibility into progress for end users.
- Provide a single place to see updates on multiple records.
- Save feed history in the record so that knowledge is not lost in an email chain.

![Live Feed Document](image)

**Live feed document**

**Note:** Many of these features are part of live feed v2.

**Activate live feed document**

The Live Feed Document plugin is active by default.

Administrators can enable record feeds in an instance by activating the Live Feed Document plugin, which activates the Live Feed plugin, if it is not active. For upgrades, administrators must activate the plugin.

1. Navigate to **System Definition > Plugins**.
   
   A banner notifies you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:**

   To redirect to the legacy list view for plugins, click the link.
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.

   You can activate the plugin directly from the All Applications page or you can view more details about the plugin before you activate it.

   - If you are certain that you have the correct plugin, click Install, and when you see the dialog box, click Activate.

   ![Activate Plugin](image)

   - To view plugin details before activation:
     1. Click the plugin name.
     2. On the form, click the Activate/Update related link.
     3. In the dialog box, review the dependent plugins.

        If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.

     4. If demo data is available and you want to install it, click Load demo data.

        Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.

     5. Click Activate.

Configure record feeds

Configure a table to support record feeds. You can add the Show Live Feed button in the form header and add the UI actions Follow on Live Feed and Show Live Feed as List and Form.

By default, the Show Live Feed icon appears on the form header for all tables that extend task, including the Incident, Change Request, and Problem tables, and in the list and form context menus for all task tables.
Add live feed to a form header
Add the Live Feed button in the form header for a table.

1. Type sys_properties.list in the Application Navigator.
2. Open the record for glide.live_feed.task_header_button.
3. In the Value field, change the value to both.

Note: By default, the value is collaboration so that the property is supported in the Collaboration (com.glide.collaboration) plugin. Changing the value to both allows the system property to be supported in Collaboration and Live Feed.

4. Click Update.
5. Navigate to System Definition > Tables.
6. Open the table record.
7. If the Live feed check box does not appear on the form, configure the form layout to add the Live feed field.
8. On the form, select the Live feed check box.
9. Click Update.

Alternatively, you can add live_feed=true to the Attributes field in the dictionary entry for the table.

The Live Feed button appears on the overflow menu of the form header.

---

Add live feed to a context menu
Add live feed UI actions on a table.

1. Navigate to System Definition > UI Actions.
2. Open one of the live feed UI action, for example, Follow on Live Feed.
3. In the **Table** field, select the table name.
4. Right-click the header and select **Insert** to create a copy of the UI action for the desired table.
5. Repeat steps 1 – 4 for all live feed UI actions.

**Disable a record feed**

You can disable live feed functionality from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to **System Definition** > **Dictionary**.
2. Open the dictionary entry for the table.
3. Add `live_feed=false` in the **Attributes** field.
4. Click **Update**.

**Note:** If the Collaboration feature is activated, you can remove the show live feed icon ( ) from all form headers. Set the `glide.live_feed.task_header_button` property to `collaboration`.

**Configure security**

Record feeds honor the access control rules (ACLs) for the associated record.

Users can only view messages on the record feed if they have access to the same information on the record. For example:

- If an ACL allows a user to read and create comments on an incident, then the user can view and add messages posted as comments on the incident feed.
- If an ACL restricts a user from reading work notes, then the user cannot view messages posted as work notes on the incident feed.

**Note:** Access control rules are only checked when a user first accesses the record feed. After users view the feed, an administrator must remove them manually to change their access.

**Live feed table notifications**

Live feed table notifications generate automatic live feed messages. The Live Feed plugin must be activated to use table notifications.

When a record is inserted or updated on a specific task table and the notification conditions are met, a message is generated and posted to the specified group or to the company feed. Table notifications are supported for all task tables and all task types by default.

Administrators and users with the `live_feed_admin` or `chat_admin` roles can set up table notifications for any table in an instance.

**Set up table notifications for task tables**

You can set up a table notification for a task table to enable automatic live feed messages.

Role required: `live_feed_admin` or `chat_admin`

1. Navigate to **Collaborate** > **Feed Administration** > **Table Notifications**.
2. Click **New** or select a notification to open it.
3. Complete the form.

**Live Table Notification fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the table for which notifications are generated.</td>
</tr>
<tr>
<td>Post to chat rooms</td>
<td>Select the check box to generate the notification in chat rooms that are associated with the record. This applies to task records only and requires that the Chat plugin is active.</td>
</tr>
<tr>
<td>Post to live feed</td>
<td>Select the check box to generate the notification on live feed. If record feeds are not set up and the <strong>Feed group</strong> field is blank, the notification is posted to the company feed.</td>
</tr>
<tr>
<td>Record Feeds</td>
<td>Select the fields to post for record feeds. This field is available only if <strong>Post to live feed</strong> is selected.</td>
</tr>
<tr>
<td>Application</td>
<td>Select the application that contains this record.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to enable the notification.</td>
</tr>
<tr>
<td>Insert</td>
<td>Select the check box to generate the notification when a record is inserted into the database.</td>
</tr>
<tr>
<td>Update</td>
<td>Select the check box to generate the notification when a record is updated.</td>
</tr>
<tr>
<td>Feed</td>
<td>Select the live feed team to which you want to post messages. This field is available only if <strong>Post to live feed</strong> is selected. Clear the field to post notifications on the company feed.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Create the condition that must be met to generate the notification. If you add a condition statement, the system evaluates the condition first and parses the <strong>Before script</strong> field only if the condition is met. You may choose to leave this field blank and include conditions in the script.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description of the table notification.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Message      | Construct the automatic message you want to generate. You can include field values as variables and a link to the record. To add a variable, position the cursor in the text and then click the field name in the **Select variables** field. To add a link to the record, enter \$\{URI\} in the message text as shown in the following example. **Example:**

```
High priority incident opened:
\$\{URI\}
Short description:
\$\{short_description\}
```

**Note:** For security reasons, any HTML code is automatically stripped out of a message before it is posted.

| Before script | Create a script that runs before a notification is generated. The script runs only if the condition evaluates to true or is empty. The following variables are available in the script.

- **current**: the GlideRecord object that triggered the notification.
- **changedFields**: an ArrayList of fields changed on submit. Use `changedFields.contains('fieldname')` to check for change.
- **answer**: set answer to false to cancel the notification.
- **profileSource**: set to a valid GlideRecord object to define the profile that is posting the message.
- **profileID**: set to a live_profile sys_id to define the profile that is posting the message; by default it is the current record. Overrides profileSource if both are specified.

Any custom variable created in the script is also exposed to the message in the form of \$\{myVariableName\}.

4. Click **Submit** or **Update**.

**Set up table notifications for non-task tables**

Table notifications are supported for all task tables by default, and you can set up a table notification for any other table.

**Role required:** live_feed_admin or chat_admin

1. Navigate to **System Definition > Business Rules**.
2. Open the **live feed events** business rule.
3. In the Advanced section, select and copy the text in the **Script** field.
4. Click the back arrow on the top, left to exit the record and return to the Business Rules list.
5. Click **New**.
6. Enter the following values at the top of the form.
   - **Name**: Enter a name, such as `live feed events for my table`.
   - **Table**: Select the table for which you are setting up a notification.
   - **Active** and **Advanced**: Select these check boxes.

7. In the **When to run** section, enter the following values.
   - **When**: Select **before**.
   - **Insert**, **Update**, and **Delete**: Select the check boxes.

8. In the **Advanced** section, paste the script from the `live feed events` business rule into the script box.
9. Click **Submit**.

The `live feed events` business rule runs on the non-task table. It fires the `live_feed.update` event, which is associated with the **Live Feed Update** script action. The script action sets up variables and processes the table notifications.

After saving the business rule, create a **live feed table notification record** for the new table as you would for a task table.

**Live feed table notification examples**

The following examples demonstrate how to set up different types of table notifications that are useful for live feed.

**Workaround posted**

This example demonstrates a table notification that generates an automatic message on live feed whenever a workaround is added to an open problem.

- **Table**: Problem (`problem`)
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions**: (State) (is) (Open)
- **Description**: Workaround Posted
- **Message**:
  ```
  ${sys_updated_by} posted a workaround for ${URI}.
  Short description: ${short_description}
  ```
- **Before script**:
  ```
  // only post to live feed when the Workaround field changes
  answer = changedFields. contains ( "work_around" ) ;
  ```
Example workaround message

*Problem resolved (advanced)*
This advanced example demonstrates a table notification that generates an automatic message on live feed whenever a problem is closed.

It also adds a message about the assigned user and posts the message from the assignment group profile instead of the problem record.

- **Table**: Problem (problem)
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions**: (Problem State) (is) (Closed/Resolved)
- **Description**: Problem Resolved
- **Message**:

  Problem `${number} - ${short_description} has been resolved. ${fixedByMsg}

- **Before script**:

  //cancel if we didn't just change the problem state if ( !changedFields.
contains ( "problem_state" ) )
answer  = false ;
//if we have an assigned_to value add a comment about who it was //create a new variable fixedByMsg that we can access from the message fixedByMsg = "" ; if (!current. assigned_to. nil () ) fixedByMsg = " Thank you " + current. assigned_to. getDisplayValue () ; //make the message appear to come from the assignment group if we have one if (!current. assignment_group. nil () ) profileSource = current. assignment_group. getRefRecord () ; //need GlideRecord object

Example problem resolved message

Opportunity won (non-task)
This example demonstrates a table notification on a non-task table. It generates an automatic message on live feed whenever a sales opportunity is won, if you have activated the Sales Force Automation plugin.
Create a **business rule** on the Opportunity (sales_opportunity) table that matches the **live feed events** business rule on the task table.

Create a table notification with the following values:

- **Table**: Opportunity (sales_opportunity)
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions**: (State) (is) (Closed Won)
- **Description**: Opportunity won
- **Message**: ${owner} closed a sale with ${account}!

**Before script:**

```java
// make the message appear to come from the assigned salesperson if there is one if ( !current. owner. nil ( ) )
profileSource = current. owner. getRefRecord ( ) ; // need GlideRecord object
```

Example opportunity won message

**Related feeds table notification**

This example demonstrates table notifications to be sent out to related feeds.
For this example, whenever the status of a story changes to **Complete**, a table notification message is sent to the related sprint, release, or epic. Messages are posted only if the related feed already exists; this notification does not create a new feed.

- **Table**: Story (rm_story)
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Record feeds**: Move **Sprint**, **Release**, and **Epic** to the **Selected** column.
- **Conditions**: (State) (changes to) (Complete)
- **Description**: Story is done; message to Epic, Release, and Sprint
- **Message**:

  ```
  ${URI} status changed to ${state}
  ```

**Live feed security and table access**

By default, administrators and users with the live_feed_admin role can configure live feed security and view all live feed tables.

You can also modify the following live feed tables.

- **Live Table Notification** (live_table_notification): set up automatic messages that are generated when specific records are updated throughout the system.
- **Live Feed Message** (live_message): modify only if necessary, such as to delete an inappropriate message or restore a message that a user accidentally deleted. This table is typically managed by system functionality.

Extending or modifying data in any live feed chat table is not recommended.

**Domain separation in Live Feed**

This is an overview of domain separation and Live Feed. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Overview**

**Support: Level 2**

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see [Application support for domain separation](#).

Parent and child domains define the live feed content that can be viewed and shared with other users.

- A user in a parent domain can see users and content within their domain and within all child domains that are lower in the domain hierarchy.
- A user in a child domain can see users and content within their domain but cannot see the parent domain or other child domains at the same level in the domain hierarchy.
Enable domain separation for live feed

Domain separation for the Live Feed application is available starting with the Eureka release. For users upgrading to Eureka, a sys_domain column is added to existing live feed-related database tables. For existing database records, the value of the sys_domain field is set to empty (global). This allows the domain separation feature to work with existing live feed records.

Show or hide the live feed application for a domain

The administrator can live feed visibility for a domain. This includes:

- Displaying live feed in the application navigator.
- Following a document feed for a record.
- Viewing live feed from a record.

Use live feed with domain separation

All of the live feed features are available to users within a domain and work the same way, with some exceptions to visibility.

- Posting and sharing content
  - Users in a child domain can interact with other users in the same domain. This includes posting and replying to messages, deleting messages, attaching files and links, and rating content.
  - Users in a parent domain can interact with other users in the same domain and with users in any child domains. Messages that are added to child threads by parent users are given the visibility of the child domain, not the parent domain.

- Viewing content
  - Users in a child domain can view content that resides within their domain. This includes filtering by feed, sorting, searching, and viewing older messages.
  - Users in a parent domain can view content that resides within their domain and within any child domains.
  - My Feed shows messages, teams, and hashtags based on the user’s domain. Showing another user’s feed only shows posts visible in the current user’s domain.

- Using hashtags
  - Hashtags are separated by domain. Users in a child domain can use all of the hashtag functions within their domain. This includes tagging messages, viewing available hashtags, changing hashtag names, and searching and filtering by hashtag.
  - Users in a parent domain can use all of the hashtag functions within their domain and can see hashtags in any child domains.

- Using teams
  - Teams are separated across domains. Users in a child domain can join and follow teams within their domain, and can invite other users within their domain to join teams.
  - Users in a parent domain can join and follow teams that belong to their domain or to any child domains.

- Exceptions to teams
• New teams are created in the user's domain. However, if the team has a record associated with it, the team is created in record's domain.
• New threads in an existing team are created in the domain of the existing team.
• When a user is creating a new team from a document, if the document domain is not empty or global, the team domain needs to be changed to be the document's domain.
• For a document-generated team, when the domain of the document changes, the domain of all related live feed records changes as well.

• Subscribing to email notifications
  • Users can subscribe to email notifications from users and teams within their domain only.

Limit live feed access by role
All active users in the instance have access to live feed by default.

Access control for live_feed_admin and admin
1. Complete the following steps to define the roles that allow users to see the Live Feed module.
   a) Perform the appropriate action for your version of the UI:
      - UI16: Navigate to System Definition > Application Menus > Collaborate and select Live Feed.
      - UI15: Right-click the icon beside the Live Feed module and select Edit Module.
   b) Enter the roles that have access in the Roles field.
   c) Click Update.

2. Complete the following steps to define the roles that allow users to see live feed from a mobile device.
   a) Navigate to System Definition > Applications (Mobile).
   b) Click Live Feed.
   c) Enter the roles that have access in the Roles field.
   d) Click Update.

3. Use the following settings in the Access Control form to create access control rules to limit who can view the live_feed pages.
   • Type: ui page
   • Operation: read
   • Name: create one access control rule record for each of the following pages
     - live_feed
     - live_feed_small
     - $live_feed
     - $live_feed_small
   • Requires role: in this related list, add roles to define who can access the live feed pages.
     Users who do not have these roles cannot access live feed.

Manage live feed message content
Users can remove their own messages from feeds. If necessary, administrators can remove inappropriate messages that are posted by any user.
live_feed_admin and admin
For security reasons, any HTML code is automatically stripped out of a message before it is posted. This measure ensures that users cannot modify any page settings by posting a message.

1. Navigate to Collaborate > Feed Administration > Messages.
2. Open the message to be removed.
3. In the State field, select deleted. You may need to configure the form to add this field.
4. Click Update.

Live feed team security
You can restrict who can create teams by modifying an access control rule.

Modify the following access control rule.
- **Table**: Live Group Profile (live_group_profile)
- **Operation**: create

Restrict hashtag renaming
You can restrict who can rename hashtags.

You restrict hashtag rename by modifying the following access control rule:
- **Table**: Live Tag (live_tag)
- **Operation**: write

Provide access to live feed from CMS pages
You can provide access to live feed from pages built in the Content Management System (CMS).
For example, allow an end user to access your company feed via the ESS portal.

Role required: content_admin or admin

The ESS Portal template includes the Portal - Live page and Live Feed dynamic blocks. To provide access to live feed from CMS pages, add the Live Feed dynamic block to a CMS page or include Portal - Live page in a site.

1. Navigate to Content Management > iFrames.
2. Click New.
3. Enter the iFrame block details.

**iFrame block fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name such as Live Frame.</td>
</tr>
<tr>
<td>Frame Name</td>
<td>Enter a frame name, such as live_frame.</td>
</tr>
<tr>
<td>URL</td>
<td><a href="https://INSTANCE/live_feed.do?sysparm_doctype=true">https://INSTANCE/live_feed.do?sysparm_doctype=true</a></td>
</tr>
<tr>
<td></td>
<td>where INSTANCE is your instance URL (example, [instance name].service-now.com)</td>
</tr>
<tr>
<td>Application</td>
<td>Displays scoping information.</td>
</tr>
</tbody>
</table>
4. Click Submit.
5. Add the block to a page.

Components installed with live feed

Several types of components are installed with Live Feed. Demo data is available with Live Feed.

Tables installed with live feed

Live Feed plugin installs the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link attachments</td>
<td>Stores links and attachments that are added to messages.</td>
</tr>
<tr>
<td>(live_link)</td>
<td></td>
</tr>
<tr>
<td>Live Favorite</td>
<td>Stores the favorite conversations, user groups, and messages.</td>
</tr>
<tr>
<td>(live_favorite)</td>
<td></td>
</tr>
<tr>
<td>Live Feed Searches</td>
<td>Stores live feed text searches. Access at Collaborate &gt; Feed Administration &gt; Search Log.</td>
</tr>
<tr>
<td>(live_feed_search)</td>
<td></td>
</tr>
<tr>
<td>Live Follows</td>
<td>Maintains users’ follow preferences for user feeds.</td>
</tr>
<tr>
<td>(live_follow)</td>
<td></td>
</tr>
<tr>
<td>Live Group Profile</td>
<td>Stores conversation properties, including name, description, and public status. Also stored are user group properties, such as name, description, and public status.</td>
</tr>
<tr>
<td>(live_group_profile)</td>
<td></td>
</tr>
<tr>
<td>Live Group Member</td>
<td>Maintains the member lists for conversation and user group.</td>
</tr>
<tr>
<td>(live_group_member)</td>
<td></td>
</tr>
<tr>
<td>Live Mention</td>
<td>Stores the profiles mentioned in a message. References sys_user table.</td>
</tr>
<tr>
<td>(live_mention)</td>
<td></td>
</tr>
<tr>
<td>Live Message Tag</td>
<td>Stores messages associated with user-created tags. Appears as a related list on Live Tag records.</td>
</tr>
<tr>
<td>(live_message_tag)</td>
<td></td>
</tr>
<tr>
<td>Live Messages</td>
<td>Stores messages. References sys_user table. Access at Collaborate &gt; Feed Administration &gt; Messages.</td>
</tr>
<tr>
<td>(live_message)</td>
<td></td>
</tr>
<tr>
<td>Live Poll</td>
<td>Stores a poll question.</td>
</tr>
<tr>
<td>(live_poll)</td>
<td></td>
</tr>
<tr>
<td>Live Poll Cast</td>
<td>Stores profiles of users who voted for a particular option in a poll.</td>
</tr>
<tr>
<td>(live_poll_cast)</td>
<td></td>
</tr>
</tbody>
</table>
### Table

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Poll Options</td>
<td>Stores poll options.</td>
</tr>
<tr>
<td>(live_poll_option)</td>
<td></td>
</tr>
<tr>
<td>(live_profile)</td>
<td></td>
</tr>
<tr>
<td>Live Table Notification</td>
<td>Generates automatic table notifications, such as when a user reads live feed for the first time and when a high priority incident is opened. Access at Collaborate &gt; Feed Administration &gt; Table Notifications.</td>
</tr>
<tr>
<td>(live_table_notification)</td>
<td></td>
</tr>
<tr>
<td>Live Tag</td>
<td>Maintains user-created tags. Access at Collaborate &gt; Feed Administration &gt; Tags.</td>
</tr>
<tr>
<td>(live_tag)</td>
<td></td>
</tr>
<tr>
<td>Live Tag Follows</td>
<td>Maintains users’ follow preferences for tags.</td>
</tr>
<tr>
<td>(live_tag_follow)</td>
<td></td>
</tr>
<tr>
<td>Messages Liked by</td>
<td>Maintains like ratings for posts. Access at Collaborate &gt; Feed Administration &gt; Likes.</td>
</tr>
<tr>
<td>(live_message_like)</td>
<td></td>
</tr>
</tbody>
</table>

### User roles installed with Live Feed

Live Feed plugin installs the following user roles.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>live_feed_admin</td>
<td>Can manage live feed functions. For example, users with the live_feed_admin role can:</td>
</tr>
<tr>
<td></td>
<td>• Set up table notifications for task tables.</td>
</tr>
<tr>
<td></td>
<td>• Set up table notifications for non-task tables.</td>
</tr>
<tr>
<td></td>
<td>• Limit live feed access by role.</td>
</tr>
<tr>
<td></td>
<td>• Manage live feed message content.</td>
</tr>
<tr>
<td>chat_admin</td>
<td>Can manage chat functions (if the Chat plugin is activated). For example, users with the chat_admin role can:</td>
</tr>
<tr>
<td></td>
<td>• Change chat room message read access.</td>
</tr>
<tr>
<td></td>
<td>• Define chat room access rights.</td>
</tr>
</tbody>
</table>

### Script includes installed with Live Feed

Live Feed plugin installs the following script includes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LiveMsgUtil</td>
<td>Provides helper functions for working with live_message records.</td>
</tr>
<tr>
<td>LiveFeedFilter</td>
<td>Queries filters for working with live_feed records.</td>
</tr>
<tr>
<td>LiveFeedUtil</td>
<td>Provides helper functions for working with live_feed records.</td>
</tr>
</tbody>
</table>
### Business rules installed with Live Feed

Live Feed plugin installs the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feed Group Creator Becomes Admin</td>
<td>Live Group Profile (live_group_profile)</td>
<td>Designates the group creator as the group administrator.</td>
</tr>
<tr>
<td>live feed events</td>
<td>Task (task)</td>
<td>Runs on task insert, update, and delete. Triggers event associated with the Live Feed Update Script action that processes Live Table Notifications to auto-generate live feed messages.</td>
</tr>
<tr>
<td>Live feed member update events</td>
<td>Live Group Member (live_group_member)</td>
<td>Generates a notification event when member state changes (invited, accepted, declined, left, rejected, request, request_accepted).</td>
</tr>
<tr>
<td>Live feed integration</td>
<td>Journal Entry (sys_journal_field)</td>
<td>Writes journal comments to the live feed if there is a group for this record.</td>
</tr>
<tr>
<td>Live feed new member events</td>
<td>Live Group Member (live_group_member)</td>
<td>Generates a notification event when new members are added.</td>
</tr>
<tr>
<td>live feed profile events</td>
<td>Live Profile (live_profile)</td>
<td>Runs on live_profile insert/ update/delete, triggers event associated with the Live Feed Update script action that processes Live Table Notifications to auto-generate live feed messages.</td>
</tr>
<tr>
<td>Live Feed message events</td>
<td>Live Feed Message (live_message)</td>
<td>Runs on live_message, notification event trigger for new live messages.</td>
</tr>
<tr>
<td>Live message like events</td>
<td>Message Liked by (live_message_like)</td>
<td>Runs on live_message_like, notification event trigger for new like records.</td>
</tr>
<tr>
<td>LiveFeed Group Member Visibility 2.0</td>
<td>Live Group Member (live_group_member)</td>
<td>Ensures users can only see the members list for public groups and groups they belong to.</td>
</tr>
<tr>
<td>LiveFeed Group Profile Validation</td>
<td>Live Group Profile (live_group_profile)</td>
<td>Ensures that a public group is visible.</td>
</tr>
<tr>
<td>LiveFeed Group Profile Visibility 2.0</td>
<td>Live Group Profile (live_group_profile)</td>
<td>Ensures that the list of all groups only displays public groups, private groups that are visible, and groups the user belongs to.</td>
</tr>
<tr>
<td>LiveFeed Membership Changes</td>
<td>Live Group Member (live_group_member)</td>
<td>Ensures that only the group administrator and users with live_feed_admin role can manage membership for a group.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>--------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>LiveFeed Single Group Membership</td>
<td>Live Group Member</td>
<td>Ensures that a user is not added multiple times to the same group.</td>
</tr>
<tr>
<td></td>
<td>(live_group_member)</td>
<td></td>
</tr>
<tr>
<td>Live Message Likes</td>
<td>Live Message Like</td>
<td>Updates the number of likes for a message.</td>
</tr>
<tr>
<td></td>
<td>(live_message_like)</td>
<td></td>
</tr>
<tr>
<td>LiveFeed Join Group Check</td>
<td>Live Group Member</td>
<td>Ensures that users can not automatically join private visible groups.</td>
</tr>
<tr>
<td></td>
<td>(live_group_member)</td>
<td></td>
</tr>
<tr>
<td>Update Follow/Follower Counts</td>
<td>Live Follow</td>
<td>Updates the following/followers counts.</td>
</tr>

**Email notifications installed with Live Feed**

Live Feed plugin installs the following email notifications:

<table>
<thead>
<tr>
<th>Email notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Feed Feed Member Accepted</td>
<td>Sends an email to the administrator when a user has accepted to join the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Declined</td>
<td>Sends an email to the administrator when a user has declined to join the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Invited</td>
<td>Sends an email to a user when they have been invited to join a feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Left</td>
<td>Sends an email to the administrators when a user has left the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Removed</td>
<td>Sends an email to user when they have been removed from the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Request</td>
<td>Sends an email to administrators when an user requests to join a feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Request Accepted</td>
<td>Sends an email to the user when their request to join a feed is accepted.</td>
</tr>
<tr>
<td>Live Feed Feed Request Rejected</td>
<td>Sends an email to the user when their request to join a feed has been rejected by an administrator.</td>
</tr>
<tr>
<td>Live Feed MsgReply Subscription</td>
<td>Sends an email when a reply or reply_to_reply message is inserted into the thread of a message in a feed.</td>
</tr>
<tr>
<td>Live Feed Team Member Accepted</td>
<td>Sends an email to administrators when a user accepts an invitation to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Declined</td>
<td>Sends an email to administrators when a user declines an invitation to join a team.</td>
</tr>
<tr>
<td>Email notification</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Live Feed Team Member Invited</td>
<td>Sends an email when a user is invited to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Left</td>
<td>Sends an email when a user leaves a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Removed</td>
<td>Sends an email when an administrator has removed a user from a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Request</td>
<td>Sends an email when a user requests to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Request Accepted</td>
<td>Sends an email when a user’s request to join a team is accepted.</td>
</tr>
<tr>
<td>Live Team Member Request Rejected</td>
<td>Sends an email when a user’s request to join a team is rejected.</td>
</tr>
<tr>
<td>Live Message All Subscription</td>
<td>Sends an email to subscribed users when any message (new or reply) is posted.</td>
</tr>
<tr>
<td>Live Message Feed Subscription</td>
<td>Sends an email when a new message is inserted into a feed.</td>
</tr>
<tr>
<td>Live Message Liked</td>
<td>Sends an email to the creator of a message when another user likes the message.</td>
</tr>
<tr>
<td>Live Message Mention</td>
<td>Sends an email to a user when that user is mentioned in a message.</td>
</tr>
<tr>
<td>Live Message New Posts Subscription</td>
<td>Sends an email to subscribed users when a new (not reply) message is posted.</td>
</tr>
<tr>
<td>Live Message Reply</td>
<td>Sends an email to all users in a feed thread when a user posts a reply (live_message.replied event).</td>
</tr>
</tbody>
</table>

**Use Live Feed**

Live Feed provides many methods you can use to share content with others in your organization. Depending on your role, there are several different types of feeds you can access, teams you can join and share information with, and hashtags you can use for categorizing messages.
Note: Live Feed v2 is active for all new instances by default. If you are upgrading from an earlier version of ServiceNow, you need to activate Live Feed v2 to use these features.
Use hashtags in Live Feed

Hashtags are words marked with a hash symbol (#) in messages. Hashtags are a way to categorize messages by keyword or topic for improved search results.

For example, to identify messages associated with VPN questions, add the hashtag #VPN in the message text.

**Note:** Many of these features are part of live feed v2. If you are using live feed v1, or have not activated live feed v2, see Legacy Live Feed.

Tag messages

To tag a keyword or topic in a message, enter a # symbol before the word. A link to the hashtag is added beneath the message and all feed users can search and filter by the hashtag to find the message.

Tips for using hashtags effectively include:

- Limit the number of hashtags per message (no more than 3 is a good guideline).
- Use hashtags only in messages that are relevant to the tagged topic.
- Write a message first, and then add hashtags only if they add value. Answer the question, "What are you working on?", rather than "What hashtags apply to what you are working on?"
- Use camel case to create a hashtag that is more than one word long. For camel case, remove the space and use an uppercase letter to start each word. For example, to create a topic about the service desk, use #ServiceDesk.
Tag

View an available hashtag

View a hashtag from any feed.

1. Navigate to Collaborate > Live Feed.
2. Click Hashtags in the sidebar.
   Any hashtags already defined are displayed. Up to 36 hashtags can be displayed, and options are available for searching and sorting the hashtags. When searching, you do not need to include the hash symbol (#).
3. Click a hashtag to view all messages containing that hashtag.

### Change a hashtag name and merge a hashtag

Over time, users may create many hashtags with similar names, such as competitive, competitor, and competition. To combine hashtags for better searching and filtering, change the names of similar hashtags to a standard name.

Administrators can restrict who can rename hashtags.

1. Navigate to **Collaborate > Live Feed.**
2. Click Hashtags in the sidebar to reveal the currently defined hashtags.
3. Turn off the filter to show all hashtags.
4. Point to the hashtag you want to change. If you have the rights to edit hashtags, an edit tag (✏️) appears.
5. Click the edit tag icon.

### Hashtags

<table>
<thead>
<tr>
<th>1</th>
<th>Competitive</th>
<th>1</th>
<th>Competitor</th>
<th>3</th>
<th>joined</th>
<th>4</th>
<th>Email</th>
<th>1</th>
<th>WiFi</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Lync</td>
<td>1</td>
<td>VPN</td>
<td>1</td>
<td>SAP</td>
<td>edit tag</td>
<td>SSO</td>
<td>1</td>
<td>MacBook</td>
</tr>
</tbody>
</table>

#### Edit tag

6. Enter a new hashtag name.
7. Press Enter.
   - If the new name is different than the other hashtags, the new hashtag name replaces the old hashtag name on the list and in the text of any messages that include the hashtag.
   - If the name is the same as one of the existing hashtags, the hashtags will be merged. For example, if you have two hashtags called Competitive and Competitors, and you change the name of Competitors to Competitive, all of the messages previously tagged Competitors are changed to Competitive and the Competitors hashtag is removed.

---

**Note:** If a hashtag is removed from the message, renaming that hashtag does not change the message text.

### Add an image to a hashtag

You can add an image at the domain level of already defined hashtags if you have the admin role.

1. Click Hashtags in the sidebar.
2. Select the appropriate hashtag.

```
#VPN Feed
```

#### Tag with image icon

3. Do one of the following:
   - Locate the image in your file system, and then drag-and-drop the image onto the add an image icon (📷).
Click the add an image icon ( ), select the image file, and click Open.

4. To change the image, simply drag-and-drop a new image onto the old one, or click on the existing one and select a new image.

When you view a message that contains a hashtag with an image, that image appears in the hashtag heading bar.

Follow and unfollow a hashtag

You can view all postings assigned a specific hashtag by following the hashtag. You can also unfollow the hashtag if you no longer want to view those postings.

1. Navigate to Collaborate > Live Feed.
2. Click Hashtags in the sidebar.
3. Select the hashtag you want to follow.
4. Click Follow.
Follow tag

A confirmation message appears.
5. Click X to dismiss the message.
   To unfollow a hashtag, repeat the same steps and click Unfollow.

Bookmark hashtags

The live feed interface uses the standard bookmarking functionality for hashtags.

In UI15, the live feed interface uses the standard bookmarking functionality for hashtags. You can drag-and-drop group feeds and hashtags from the Feed Summary section to the Edge for quick access.
Remove a hashtag from a posted message

As a participant in a conversation, you can remove hashtags from messages that have already been posted.

1. Navigate to the posted message.
2. Click Hashtags in the message posting.

The hashtags associated with the message are displayed, along with the removal icon.
3. Click the removal icon.

Use teams in Live Feed

Users can be combined into teams for the purpose of subscribing to specifically-focused feeds. Teams can be created based on any criteria that makes sense for your organization. For example, you can create a team called IT Developers and subscribe the team to feeds such as Coding Standards, AngularJS Development, and ServiceNow Customization Best Practices. When a new developer is added to the IT Developers team, that user automatically has rights to participate in all of the feeds followed by the team.

Create a live feed team

When you create a team, you become the team administrator.

As team administrator, you can:

- Modify team properties
- Accept or reject membership requests
- Remove members from the team
- Delete the team

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. Click **Create Team**.

4. Enter a **Name** to appear at the top of the feed and in messages posted to the team. This name links to the team feed.
5. Enter a **Description** to appear at the top of the feed and under the team name in the list of all teams.

6. Select the access level for the team:
   - **Public Team**: In the list of all teams, any user can see the name of this team. Any user can also see the feed and join the team. Messages in a public team appear in the Company Feed with a link to the team feed.
   - **Private Team**: In the list of all teams, any user can see the name of this team, but not the feed. Messages in private teams do not appear on the Company Feed.

   When **Private Team** is selected, the **Show this team for anyone to find and request to join** check box is displayed. Select this check box to allow any user to search for this team and request to join it. Clear the check box to allow only invited users to see the feed and join the team.

7. Click **Create**.
   The team is created with you as the team administrator.

---

**Note**: A team administrator can create one or more group feeds specifically for the members of this team by clicking the **Group Feeds** tab and **Create Group Feed**. Additionally, the team can be invited to join a feed. Having multiple feeds for the team facilitates focused discussions on topics of interest to the team and allows the team to selectively invite other teams and members to collaborate on specific feeds.
Automatic team creation

If you create a record on a table that has live feed enabled, such as the Incident table, and click Follow/Show Live Feed for the record, a record feed is created for the record.

The record feed name is based on the table name.

Join a team

You can join a public team, accept an invitation, or request access to a team.

As a team member, you can:

- **View messages** posted to the team (team feed). Non-members can also view the feed for a public team.
- **View a list of team members**.
- **Invite another team** to join the team.
- **Subscribe to team email notifications**.
- **Leave** the team.

1. Navigate to **Collaborate > Live Feed**.
2. Click **Teams** and click **All Teams**.

   - If you received an invitation, click **Accept**. You can **Decline** the invitation if you do not want to join the team.
   - If the team is public, click **Join**.
   - If the team is private, click **Request**. The team administrator receives an email notification and must accept your request before you can join the team.

View a team feed

View a team feed to see messages belonging to that team.

1. Navigate to **Collaborate > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.

   - To view a team you belong to, select the team name.
   - To view a public team you do not belong to, select **All Teams** and then click the team name.

   You must be a member to view the feed for a private team.

View a team member

View a list of members belonging to a live feed team.

1. Navigate to **Collaborate > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.

   You must be a member of the team to view the members.

4. Click **Members**.

   The list of team members appears, organized by team administrators and team members.

Invite a new member

You can invite another user to join a team.

1. Navigate to **Collaborate > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the **Pending members** tab.
5. In the **Add User** field, enter the name of the user you want to invite. The invited member's picture appears.

---

**Remove a member**

If you are team administrator, you can remove any member from the team.

1. Navigate to **Collaborate > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the **Members** tab.
5. Click **Remove** below the member name.
6. Click **Remove** again in the confirmation box that opens.

**Note:** You can remove members regardless of their current state. That is, you can remove members who have already joined the team or whose membership is pending.

---

**Subscribe to team and email notification**

Users can subscribe and unsubscribe to receive email notifications generated by feeds the team participates in.

Email notifications are generated whenever actions such as posting messages, replies, likes, polls, and @mentions are performed.

All notifications related to a top-level message, such as replies, mentions, and likes, are sent out with the same subject. The subject line defaults to **Live Feed** followed by the beginning of the subject line from the top-level message. For example, if the subject of the feed is **IT Support**, the email notification’s subject will be **Live Feed IT Support**.

1. Navigate to **Collaborate > Live Feed**.
2. Click **Teams** and select the team name.
3. Click the subscribe icon ( ).
You can click the unsubscribe icon ( 

) to stop receiving email notifications.

**Subscribe a team to feed notification**

A team administrator can subscribe a team to specific feeds so the members of the team receive email notifications.

1. Navigate to **Collaborate > Live Feed**.
2. Click **Teams** and select the team name. You can use the advanced search to locate team of which you are the administrator.
3. Click **Feeds**.
4. Click the subscribe icon ( 

) beside the feed name.

You can click the unsubscribe icon ( 

) to stop receiving email notifications.

**Reply to email notifications using email**

After receiving an email about a posted message or a reply, you can reply to live feed with your email client.

The body of the reply email becomes a reply to the live feed message. Any attachments included in your reply email are included in the live feed reply.

**Leave a team**

You can give up membership to a team by leaving that team.

1. Navigate to **Collaborate > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. Click **Leave** beside the team name.

**Modify a team**

If you are team administrator, you can modify an existing team.

1. Navigate to **Collaborate > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the edit icon ( 

).
5. Modify the team properties as needed.
6. Click **Save**.

**Manage a membership request**

When a user requests membership to a private team, the team administrator receives an email. If you are the team administrator, you can manage membership requests.

1. Navigate to **Collaborate > Live Feed**.
2. Click **Teams** and select the team name.
   If one or more users have been invited to the team, the **Pending members** tab shows the number of invitations sent.

© 2019 ServiceNow, Inc. All rights reserved.
Pending members

3. **Click Pending members.**

This shows the users who have received invitations, but who have not yet accepted.
4. You can cancel a user's invitation by clicking Remove.
5. You can invite another user to the team by entering their name in the Add user field and clicking the Invite member ( ) button.

Delete a team
If you are the team administrator, you can delete a team.
1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
4. Click the edit icon ( ).
5. Click Delete.
6. Click Yes to confirm deletion. The team is deleted from live feed. Messages posted to a private team are deleted; messages posted to a public team remain on the company feed without a team link.

If you delete a team that is associated with an active record, such as an incident that has not yet been closed, the team becomes active again when any user modifies that record or follows the record on live feed. The first user who modifies the record becomes the team administrator. The previous messages that existed as part of the record feed are not deleted.

Use live feed to work on records

A record feed is associated with a record, such as an incident or change.

Record feeds help users collaborate on records by providing a place for anyone who can access the record to share messages and post attachments specific to that record.

With record feeds, users can:

- Follow record feeds and post messages in live feed. These messages can also be automatically maintained in the comments or work notes journal fields on records.
- View live feed from records.
- Work on multiple records from My Feed.
- Access live feed team functions, such as sending invitations and subscribing to email notifications.

Any users with access to the record can also use the record feed. By default, record feeds are available on the incident, change, and problem tables. Administrators can configure record feeds for additional tables.
How Document Feeds Work

The Live Feed application creates a document group for each document feed. The document group:

- Automatically approves membership for every user who can access the record.
- Uses the record number as the group name.
- Uses the record short description as a group description.
• Maintains all messages posted on the record in live feed (if the record has a journal field for comments). When the group is created, existing messages are added to the document feed.
• Lists the group when users select View all groups on their live feed interface, unless the record associated with the document feed has been closed. When the state of the record is closed, the live feed group becomes inactive and unlisted.
• Automatically adds users to the document group when they view the record.

Document Group Creation

When a user follows or shows a record on live feed, a live feed group is automatically created and associated to the record (if one does not already exist). The user becomes a member of the group and can use live feed to work on the record. If the user can access work notes on the record, the user also becomes a group administrator.

A live feed group is also automatically created when a user creates a record on a table that uses document feeds, such as the Incident table. The user who creates the record becomes the administrator of the group, and any other user who modifies the same record automatically joins the group.

Add Live Feed to a homepage

Add live feed to a homepage so it is the first thing you see when you log in.

1. Click Add content at the top of the homepage.
2. Select Live Feed in the left panel.
3. On the bottom of the window, click Add here in the appropriate layout position, then close the window.

Note: Administrators can add live feed to a global homepage to make it available for all homepage users by default. By default, users with any role can add live feed to their homepage. Administrators can restrict this ability.
Modifying and deleting document feeds

The user who creates a record feed becomes the group administrator, which allows the user to modify the following record feed properties.

- **Name**: default value is the record number.
- **Description**: default value is the record short description.
- **Picture**: default value is a thumbnail image of the record.

Feed administrators can also delete the feed. When deleted, the feed is removed from live feed but messages remain in the journal field of the associated record.

Viewing Live Feed from records

Interact with the record feed in any form that has live feed enabled.
The record feed appears in a pop-up window. The record feed also appears on the record form's activity formatter if the administrator enables the record feed system property (glide.ui.show_live_feed_activity).

To access a record feed from the form, do one of the following:

- Click the Show Live Feed button in the form header. This displays the live feed pop-up.
- Right-click the form header and select Show Live Feed. This also displays the live feed pop-up.
- Scroll down to the activity formatter area on the form. Click one of the following tabs:
  - Live Feed: click to show a text box to type in the feed.
  - Activity: click to show the activity summary. The activity filter determines the content in the activity summary.
If the activity formatter or the **Live Feed** and **Activity** tabs are not visible, administrators can do the following:

- Configure the form layout and add **Activities (filtered)** to the form. This adds the activity formatter.
- Personalize the form layout and add **Activities (filtered)** to the form. This adds the activity formatter.
Go to **System Definition > Tables**, access the table associated with the record, and verify that the `live_feed` dictionary attribute is set to true on the form. This adds live feed to the activity formatter.

Go to **Collaborate > Feed Administration > Properties** and enable the following property: **Toggle the display of the live feed tab in the activity formatter**

**Working with record feeds**

When a user follows a record, the user becomes a member of a private group for the record.

Team members can:
- View the record feed from live feed.
- View a list of group members (other users who are following the record).
- Invite another user to join the group. Only users who have access to the record have access to the record feed.
- Subscribe to email notifications.
- Leave the team to stop following the record.

**Follow a record feed from a form**

You can follow records that have a record feed associated with them from within the record form.

1. Navigate to the record in a list or form.
2. Click the **Show on Live Feed** icon in the header.
Follow Task

Follow a record feed from a list
You can follow records that have a record feed associated with them when viewing a list of records. This method allows you to select multiple records to follow.

1. Navigate to a list of records (for example, Assigned to me).
2. Select the Action check box beside each record to follow.
3. In the Actions choice list, select Follow on Live Feed.
Follow My Tasks

Post a message to a record feed
Use live feed to post a message to a record feed.

1. Open the record feed in one of the following ways:
   - From your homepage (must already be following the record)
   - As a team in live feed (must already be following the record)
   - From My Live Feed (must already be following the record)
   - From the Live Feed pop-up window
   - From the Live Feed tab on the activity formatter
   - Click the Show Live Feed button (聊) in the form header.

2. Compose the message and add images and links.
3. (My Live Feed only) In the To list, select the record where you want to post the message.
4. (Optional) Select the Work Notes check box to post the message as a work note. Only users with access to work notes on the record can post and see work notes. This option is only available for records that have a journal field.
5. Click Post.

Note: If the record has journal fields for comments or work notes, your message is automatically added to the appropriate field on the record. If the record has a standard text field for comments on the activity formatter, each live post overwrites...
the field value. Comments added through live feed start with #LiveFeed on the activity formatter.

**Use feeds in Live Feed**

Feeds allow users to create focused discussions in Live Feed.

Live feed includes different types of feeds. The user who creates a group or record feed becomes the feed administrator. This user configures the access level for the feed:

- **Public**: any user can see the name on the list of all feeds, view the feed, and join it. Messages appear on the company feed with a link to the public feed.
- **Private**: any user can see the name on the list of all feeds, but only invited members can view the feed and join. Messages do not appear on the company feed.

**Note**: The concept of groups has changed in live feed v2 (starting with the Fuji release).

**Create a group feed**

Group feeds are created by users so that members with similar interests can find that information in one place. Individual users or teams can join group feeds.

1. Navigate to **Collaborate > Live Feed**.
2. Click **Group Feeds** and click **All Feeds**.
3. Click **Create Group Feed**.

![Create group feed interface](image)

4. Enter the feed name and description. These will appear in the list of group feeds.
5. Indicate how members can join the feed:
   - **Public Feed**: Select this to allow anyone to view and join the group feed.
   - **Private Feed**: Select this to restrict membership to only members invited by the administrator.
When Private Feed is selected, the Show this feed for anyone to find and request to join check box is displayed. If it is selected, any user can search for this group feed and join it. If the check box is not selected, only users who are invited can see the feed and join the group feed.

6. Click Create.

Create record feeds

When a user views a record on a table that has live feed enabled, such as the Incident [incident] table, the user can click the Show live feed button at the top of the form to automatically create a record feed.

When a user who has write access to a record's work_notes journal field clicks the Show live feed button, that user becomes the record feed administrator. If, for example, a customer calls technical support to report an incident and the customer clicks Show live feed on a record, a record feed is created, but the customer is not the record feed administrator. When a support representative later opens the incident and participates in the record feed, the user becomes the feed administrator.

Record feeds are, by default, private unlisted. That is, only invited members can see the name of the record feed in the list of feeds, and join it. Record feed administrators, however, have the ability to change the access level at any time. This can be helpful if, for example, a user is working on a sales opportunity and wants customers to be able to participate in a record feed without granting them access to the records.

Control how live feed is enabled for records

A property called glide.ui.show_live-feed_activity controls whether live feed is automatically enabled for all records.

This glide record is disabled by default. If the property is enabled, a record feed is automatically created whenever a record is viewed, and you become a member of that feed.

A second property, glide.live-feed.auto_join_document_group, enables automatic membership to a record feed whenever the associated document is visited and the user clicks Show Live Feed.

View the activity stream in record feeds

When you view record feeds, live feed displays the activity stream for the document.

For example, for an incident feed, the screen displays recent activity for the incident. The activity stream is updated whenever anything is changed in the associated record.
Live feed activity stream

Note: The information in the activity stream is subject to the same ACL rules as those for viewing the underlying document.
Participate in a feed

When you join a feed, you become a feed member.

Feed members can:

- View messages posted to the feed. Non-members can also view the messages for a public feed.
- View a list of feed members.
- Invite another user to join the feed.
- Subscribe to feed email notifications.
- Leave the feed.

1. Navigate to Collaborate > Live Feed.
2. Click either Group Feeds or Record Feeds, and then click All Feeds.
All feeds

- If you received an invitation, click **Accept**. You can **Decline** the invitation if you do not want to join the feed.
- If the feed is public, click **Join**.
- If the feed is private, click **Request**. The feed administrator receives an email notification and must accept your request before you can join the feed.

**Mark a feed as a favorite**

Top-level messages in feeds can be marked as favorites on a per user basis only.
You can also search for messages marked as favorites, and remove the favorite designation as needed.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then click **All Feeds**.
3. In the list of feeds, click the star icon (🌟) adjacent to the feed name you want to mark as a favorite.

To unfavorite a message, click the star icon (🌟) of a message that is already a favorite.

**View a feed**

You have several options for viewing a feed.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**.
   This displays a list of feeds you belong to and an option to view all feeds.
   - To view a feed you belong to, select the feed name.
   - To view a public feed you do not belong to, select **Show All** and then click the feed name.
     You must be a member to view the feed for a private feed.

---

**Note:** If you navigate away from the live feed application and then back again, the system displays the feed you last visited if you are a member of it.

---

**View a feed member**

View a specific member of a group feed.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**.
   This displays a list of feeds you belong to and an option to view all feeds.
3. Click the feed name.
   The list of feed members appears, organized by feed administrators and members.

**Invite a new member to a group feed**

The feed administrator can invite another user or a group to join a feed.

When a team is added to a feed, all members of the team also indirectly become members of the feed. Only users, and not teams, can be the feed administrators. A team member who is following a feed can become administrator by directly inviting another user to the feed.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click the **Pending members** tab.
4. In the **Add user or team** field, begin entering a user or team name and select a user or team from the suggestion list.
   The invited user or team members receive an email notification.

**Invite a new member to a record feed**

The feed administrator can invite another user or a team to join a record feed.

© 2019 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
When a team is added, each of the individual members of the team become members of the feed. That is, if Team ABC is added to a feed, the feed does not show that Team ABC is a member. Instead, the feed shows each of the individual members of Team ABC as members of the feed.

When users are invited, their membership state is initially Invited. When they accept the invitation, the system checks their access to the work_notes journal field. If they have write access, they become administrator members; otherwise, they become active members.

1. Navigate to Collaborate > Live Feed.
2. Click Record Feeds and select the record feed name.
3. Click the Pending members tab.
4. In the Add user or team field, begin entering a user or team name and select a user or team from the suggestion list.
   
   If you invite a team, the individual members of the team are invited.
   
   The invited users receive an email notification.

Remove a member from a feed

The feed administrator can remove any member from the feed.

1. Navigate to Collaborate > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click the Members tab.
4. Locate the member you want to remove and click Remove.
Remove member

**Note:** You can remove members regardless of their current state. That is, you can remove members who have already joined the feed or whose membership is pending.

**Subscribe to a feed**

Direct members of a feed can subscribe and unsubscribe to the feed in order to receive email notifications whenever any activity in the feed occurs, such as new messages being posted, replies, likes, polls, and @mentions.

Individual indirect members—that is, members of a team that is participating in a feed—cannot subscribe or unsubscribe from a feed directly. If the team administrator subscribes the team to a feed, the individual members receive an email notification for activities in the feed such as new messages being posted, replies, likes, polls and @mentions.

All notifications related to a top-level message, such as replies, mentions, and likes, are sent out with the same subject. The subject line defaults to **Live Feed** followed by the beginning of the subject line from the top-level message. For example, if the subject of the feed is **IT Support**, the email notification’s subject will be **Live Feed IT Support**.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click the subscribe icon (_emails).
You can click the unsubscribe icon ( ) to stop receiving email notifications.

**Note:** If a team is subscribed to receive email notifications for a feed, but a member of the team did not subscribe to the team, that member does not receive the email notifications.

### Navigate between live feed and other modules

If you are participating in a feed and navigate to another module, when you return to live feed it displays the feed you were previously viewing if it is public or if it is a private feed that you are a member of.

For example, assume you are viewing a public feed and then navigate to a particular incident record. Upon returning to live feed, the feed you were previously viewing opens. If you were last viewing a private feed that you are not a member of, returning to live feed opens the Company Feed.

### Leave a feed

Members can choose to leave a group feed.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click **Leave**.

**Note:** If you leave a feed associated with a record, such as an incident, you automatically rejoin that feed if you modify the associated record again.

### Delete a feed

If you are a feed administrator, you can delete the feed.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click **Delete**.
4. Click **Yes** to confirm deletion.

The feed is deleted from live feed. Messages posted to a private feed are deleted. Messages posted to a public feed remain on the Company Feed without a feed link.

### Live Feed UI overview

The Live Feed user interface provides many methods you can use to share content with others in your organization.

### Update your Live Feed profile

Your profile information includes a photo or image, and tabs for different types of information including messages, feeds, teams, followers, and those who are following you. You can update your profile information and picture at any time.

**Note:** The functionality described here applies to HTML5-compliant browsers, such as Chrome, Firefox, Safari and IE10 and above.

1. Navigate to **Collaborate > Live Feed**.
2. Click your name or title displayed below your picture.

![Profile Image]

The profile record opens.

![Profile Record]

3. Click the pencil icon next to **About Me** and type a short description about yourself that you want to share with others who view your profile. This is text that you might not necessarily want to change on a regular basis.
4. You can change your profile photo using either of the following two methods:
   - Locate the photo file you want to use, and drag-and-drop it over the existing photo.
   - Hover over the existing picture (or tap the photo in the case of the smartphone or tablet interface) to display the **Upload a picture** link. Click the link, navigate to the location of the photo you want to use, and click **Open**.

   ![Upload a picture](image.png)

   **Note:** Your profile picture is used by the Connect and legacy chat features as well if they are activated.

---

**Work with Live Feed messages**

This portion of the UI gives the user access to various types of messages and tools for grouping and categorizing messages. Also included are methods for identifying which user feeds you are following and which users are following you.
## Tools for working with live feed messages

<table>
<thead>
<tr>
<th>Menu section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>My Live Feeds</td>
<td>These are custom feeds that allow you to customize live feed to view the content that is most important to you.</td>
</tr>
<tr>
<td>Company Feed</td>
<td>This feed displays all posts, except those posted to private or unlisted groups.</td>
</tr>
<tr>
<td>Group Feeds</td>
<td>These feeds are created by users. Record Feeds: These feeds are associated with a record, such as an incident or change.</td>
</tr>
<tr>
<td>Record Feeds</td>
<td>These feeds help users collaborate on records by providing a place for anyone who can access the record to share messages and post attachments specific to that record.</td>
</tr>
<tr>
<td>People</td>
<td>This option displays people who are following the current user and people the current user is following.</td>
</tr>
<tr>
<td>Teams</td>
<td>This option is used to combine users into groups for the purpose of subscribing to specifically-focused conversations.</td>
</tr>
<tr>
<td>Hashtags</td>
<td>Hashtags are words marked with a hash (#) symbol in messages. Hashtags are used to categorize messages by keyword or topic for improved search results messages filtered from all conversations that include specific hashtags.</td>
</tr>
</tbody>
</table>

### View another Live Feed user

When a requester user, one that has no ServiceNow role, is viewing a feed and points to another user's picture, information for the user appears from the Business Card view of the User (sys_user) table.

You can customize ACLs to increase the amount of information you want displayed for users with different roles.
If you click a user's name or title, the user's profile appears. Click the tabs to view different types of information for the user.
As you use Live Feed, you can follow the message threads of other users.

1. Navigate to a thread that the user you want to follow is engaged in.
2. Click that user's name or point to the user's picture.

A Follow link appears in the user's profile.
3. Click **Follow**.
4. To stop following the user, navigate to **People > Following**.
Unfollow

5. Click Unfollow.
6. To view people who are following you, navigate to People > Followers.

Select feeds

A feed is a stream of related messages. You can use the feed selector to switch between feed types and to view specific group feeds and record feeds.

1. Use the Search field to locate any type of feed. As you type in the Search field, the results are dynamically displayed. For example, if you type INC, records that are incidents are forced to the top of the results list.
2. You can also select the following types of feed information.

**Feeds types**

<table>
<thead>
<tr>
<th>Feed</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>My Live Feeds</td>
<td>Displays the following posts:</td>
</tr>
<tr>
<td></td>
<td>- messages from users you follow</td>
</tr>
<tr>
<td></td>
<td>- messages with hashtags you follow</td>
</tr>
<tr>
<td>Company Feed</td>
<td>Displays all posts, except those posted to private or unlisted groups.</td>
</tr>
<tr>
<td>Add Group Feed</td>
<td>Allows you to add a group feed.</td>
</tr>
</tbody>
</table>
Follow feeds

You can view users who are following you or other users you are following.
To view users who are following you or other users you are following, click **People** in the sidebar.
The system shows 10 most recent followers or users you are following.

![People](image)

**People**

If either list contains more than 10 users, a Show More link appears.

**Note:** If you are following a particular user whose profile changes, that user moves to the front of the Following list. This alerts you to changes in the profile of a user you are following.

Bookmark feeds and hashtags

The live feed interface uses the standard bookmarking functionality for feeds and hashtags.
In UI15, you can drag-and-drop group feeds and hashtags from the Feed Summary section to the Edge for quick access.
Bookmark a hashtag

Add Live Feed to your homepage

You can add Live Feed to your own homepage or to a global homepage.

1. Navigate to a homepage.
2. Click the add content icon (∧) in top left corner of the homepage.
3. Select Live Feed in the left panel.
4. On the bottom of the window, click Add here in the appropriate layout position, then close the window.
Post content in Live Feed

In Live Feed, you can post new messages and replies to existing messages for all users in the feed. You can also send a reply message to a team or record.

Post a live feed message

You can post a message to open a new feed.

1. Navigate to Collaborate > Live Feed.
2. Click the feed to which you want to post your message, for example My Live Feed, Company Feed, and so on.
3. Enter a message in the Share your thoughts field. Use hashtags, if you want.
4. As needed, click , , or to add a poll, attachment, or screenshot image, respectively.
5. Click Post.

Reply to a live feed message

To participate in an existing thread of a feed, you can compose and submit a reply message. By default, the message is visible to all members of the feed.

1. Navigate to Collaborate > Live Feed.
2. Locate the message you want to reply to.
3. Type your reply in the message box and click Reply.
   As needed, you can add hashtags, attachments, links, or knowledge base articles.
4. To limit who can view the reply to a single individual, select a user from the To choice list.
5. Click Reply.
6. By default, 7 replies are visible for each message. To view additional replies, click Show all replies. Any reply to a reply includes a Threads link.
7. Click Threads to view all of the replies within the selected reply in reverse chronological order within the Message Thread pop-up window, similar to an email thread.
Message Thread

Navakanth Reddy #suggestion(s) A common black vertical line just before the bars would help with this. Also, line spacing between two options should be more than single-spaced.

Also, the bar says 5 people voted and it shows up 5 people and 1 more. Is this a #bug?

Siva Dirisala We have some UI issues to improve. We need to ensure that contains a poll, or perform.

Lawrence I guess we need some visual distinction between the poll question and the options. After voting, I got confused for some moments why there are four options in result. See screenshot.

Shouvik Goswami We have enabled polls in Live Feed. Please review and provide #suggestions and #feedbacks

How do you like the poll in Live Feed?

- Exactly what I was looking for
- Wanted something more
- Did not visualize it this way

Vote

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Attach files, links, images, and knowledge articles to messages

In addition to entering text, you can attach files, such as images, documents, and spreadsheet files in any ServiceNow supported file type to live feed messages.

Administrators can manage attachment file settings, such as supported file types and maximum attachment file size, by **editing system properties**.

You can also include links to user-defined URLs and knowledge articles contained in your instance’s knowledge base.

**Note:** The functionality described here applies to HTML5-compliant browsers, such as Chrome, Firefox, Safari and Internet Explorer 10 and above. Significant differences while using different browsers are highlighted.

### Attach a file to a post or reply

You can attach files to a post by dragging a file into a post or pasting an image from the clipboard.

Use the paperclip icon ( ![paperclip](image)) to drag files into a post. Additionally, you can **paste images into a post or reply from the clipboard**.

1. Do one of the following:
   - While composing a post or reply (see [Reply to a Message](#)), locate one or more images or other supported types of files, and drag them into the message box.
   - ![paperclip](image)
     
     Click the paperclip icon ( ![paperclip](image)) in the message box, navigate to the location of the files you want to attach, select them, and click **Open**.

2. To add more files, drag-and-drop additional files into the text box below the displayed files or images, or click the plus sign.
Attaching files

3. If you want to delete an attachment before posting the message, click the trashcan icon adjacent to the attachment.
4. Enter a comment to share your thoughts about the image.

Note: The Post button is enabled only after you add the comment.

5. Click Post or Reply.
6. If you added files that do not contain previews and then posted the message, they will be listed in the message box with a Download link.
7. Click the link to download the files.

Copy an image from the clipboard

In addition to adding files to a message, you can also copy images to the clipboard and paste them into a message or reply.

1. Click into the Comment box and add a comment.

2. Click the Add an image button. The Screenshots dialog box opens.

3. Right-click the Paste an image here box and select Paste to paste the image from the clipboard.
4. To add another image, repeat the previous steps.
5. When you finish pasting images into the message, click **Done**.
6. To change the link text, click **Pasted Image** and enter a new label.
7. When you finish, click **Post** or **Reply**.
8. To remove an image, click the trash can icon adjacent to the link.
9. To make changes to an existing image, click the edit icon (📝).
Add a link to a post or reply

Add or modify a link to a live feed post.

1. Click into the Comment box. The Add a link button appears.
2. Click the Add a link button. The URL and Link text fields appear.

Add a URL

3. Enter the URL and the text you want to appear as the link.
4. To add another link, click the link icon under the URL field.
5. When you have finished entering your message, click Post or Reply.
To remove a link, click the trash can icon adjacent to the link. To make changes to an existing link, click the edit (📝) icon.

Add a knowledge article link to a post or reply

Use the ID of a knowledge article to post it as a reply to a live feed conversation.

1. While composing a post or reply, type the ID of the knowledge article you want to link to. You do not need to identify the knowledge article ID as a hyperlink; live feed recognizes it as such and automatically converts it into a link when the message is posted.
2. When you are finished entering your message, click Post or Reply.

Add a poll to a message

When you are posting a message, you have the option of creating a poll in order to record your viewers' opinions. As users take the poll, their feedback statistics are displayed within the feed.

1. Open the feed where you want to create a message with a poll.
2. Enter the message with an invitation to take the poll in the Share your thoughts box.
3. Click the poll (📊) icon.
In the **Question** field, enter the question on which you are soliciting opinions.

5. In the **Option** fields, enter possible responses to the query.

6. To add more response options, click **Add more options**.

7. Click **Post**.

   After the poll is posted, users who view the message can vote. After they vote, their pictures appear next to their response, with others who have voted for the same option.

---

**Note:** Only the poll creator can view results without casting a vote. Other members can see results only after casting a vote or if the poll is closed.
Close poll

An email notification with the poll result is sent to all participants of the poll informing them that the poll is closed.

Add mentions to a message

An @mention is any posted update that contains @username anywhere in the body of the message.

The user’s name, with a link to that user’s feed, is inserted into the message. Additionally, the mentioned user receives an email notification about the mention. This is a great way of bringing attention to other members in a conversation. All @mentions are included in the logged-in user’s My Feed.

**Note:** If an @mention is used by a member of a team, only members of that team appear in the auto-suggest list.

1. While entering a message or reply in a conversation, type @username anywhere in the message. As you type, an auto-suggest list appears with names and pictures of users that
match your entries. For example, if you type @t, the auto-suggest list shows the pictures and names of all users with names that start with T.

2. Click the user you want to add.
That user's name is inserted into the @mention in the body of the message.

Note: My Feed displays @mentions of you and the teams you are a member of. Profile feeds for another user display only @mentions of that user.

Like a message
Like a message to provide feedback to the author.

1. Navigate to Collaborate > Live Feed.
2. Click Feeds.
3. Locate the feed that contains the message you want to like.
4. Under the message title, click Like.
   If the message has previously been liked, the number of likes for a message displays next to the Like link.
   For a top-level message, the profile pictures of the first 5 users who liked a message are displayed. Any additional users who liked the message can be viewed by hovering over the # more link. If the logged-in user has liked the message, that user's image will appear first, followed by the image of the user who last liked the message.
   For a reply, you must hover your mouse pointer over the count link to view the users who liked the message.

Note: After a message has been liked, it cannot be unliked.
Delete a message

Users can delete any of their own posts or replies. A conversation administrator can also delete messages.

1. Hover over the message you want to delete.
2. Click the trash can icon in the upper-right-hand corner of the message box.
3. Click Delete in the confirmation box.
   The message disappears from the feed.

Managed Documents

Use the ServiceNow® Managed Documents application to control electronic documents within your instance.

After parameters have been set by the administrator and the Knowledge Document plugin installed, documents can move through the managed document cycle.

**Note:** Step through the process below on your test (or any non-production) instance.

Managed Document features

Managed Documents is a lightweight, ITIL-based solution for creating and managing electronic documents within your instance.

This application adds a layer of control around any document by providing workflow, storage, security, and categorization options. It can be used for a variety of internal documents, such as policies and procedures, compliance documentation, and knowledge articles. Because it is integrated within the instance, Managed Documents offers a seamless alternative to 3rd-party systems.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check-in/Check-out</td>
<td>Track revisions, approval history, and automated notifications for approvers and reviewers. Useful for compliance and risk authors, policy and procedure writers, and contract administrators.</td>
</tr>
<tr>
<td>Categorization</td>
<td>Classify documents for organization and search.</td>
</tr>
<tr>
<td>Access control</td>
<td>Share documents with selected users.</td>
</tr>
<tr>
<td>Revision control</td>
<td>Track changes to documents.</td>
</tr>
<tr>
<td>Digital signature for approval</td>
<td>Integration with the Approval with E-Signature plugin.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Support consistent content review and approval.</td>
</tr>
<tr>
<td>Security</td>
<td>Use high security setting.</td>
</tr>
</tbody>
</table>

Managed Document concepts

The following concepts explain Managed Documents: Managed Document, Document Collection, Document Revisions, and Document Parameters.
## Concepts

<table>
<thead>
<tr>
<th>Concept</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Managed Document</td>
<td>The Document (dms_document) table contains the documents controlled through the managed documents process.</td>
</tr>
<tr>
<td>Document Collection</td>
<td>The Document Collection (dms_collection) table allows related documents to be grouped together.</td>
</tr>
<tr>
<td>Document Revisions</td>
<td>Because managed documents must have clear records of individual versions of a document, revisions (including the file) are attached to the master document record through a related list. Document revisions are controlled to keep a standard naming scheme and consistent version numbers. Once a document revision is ready, it can be submitted for review.</td>
</tr>
</tbody>
</table>
| Document Parameters   | **Attention:** Parameters do not control application or document security. Parameters only organize documents, they do not affect who can access documents. To grant access to the Managed Documents application, you can assign a role. To grant access to a specific document, set user and group permissions. Each document can be associated with predefined parameters. The parameters can help with grouping documents.  
  - Type: Defines the type of document being controlled. Documents of the same type use the same controls.
  - Classification: Defines document restriction level, such as public, restricted, or confidential.
  - Audience: Defines the groups with access to the document, such as internal or external.
  - Name Formats: Defines the format of document names, ensuring that documents of the same type have the same name scheme assembled from name components.
  - Name Components: Defines the document values used in the name formats.
  - Approval Rules: Defines the approvals the document must have before it can be published. |

---

### Install the Managed Documents plugin

The Managed Documents plugin is available for activation by users with the admin role.

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.

If the plugin depends on other plugins, these plugins and their activation status are listed.
3. (Optional) Select the **Load demo data** check box.
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when first activating the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.

4. Click **Activate**.

**Managed Documents plugin**

This page describes the applications and modules, database table structure, scripts, and roles.

**Database table structure**

The following tables are added:

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revision (dms_revision)</td>
<td>The document revisions.</td>
</tr>
<tr>
<td>Audience (dms_audience)</td>
<td>The intended document readers.</td>
</tr>
<tr>
<td>Classifications (classification)</td>
<td>The document restriction level, such as public or confidential. (Does not define access to the document. Document security is set in user and group permissions.)</td>
</tr>
<tr>
<td>Type (dms_type)</td>
<td>The document purpose.</td>
</tr>
<tr>
<td>Component (dms_component)</td>
<td>The components of name formats. The value field is a dot-walking expression that is evaluated. An exception is made for the revision because it does not exist when the revision name is generated.</td>
</tr>
<tr>
<td>Name format (dms_name_format)</td>
<td>The composition of components to generate revision names.</td>
</tr>
<tr>
<td>Approval sequence (approval_sequence)</td>
<td>The approval sequences that users need to follow.</td>
</tr>
<tr>
<td>Approval Rule (dms_approval_rule)</td>
<td>The criteria that records of the dms_document table must match. Used to automatically add approvers to a document.</td>
</tr>
<tr>
<td>Collection (dms_collection)</td>
<td>The document groups created by the user.</td>
</tr>
</tbody>
</table>

**Scripts**

**Business rules that are added to sys_script**

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update Document</td>
<td>Changes the state of a document depending on its revisions.</td>
</tr>
<tr>
<td>Rule</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>------------------------------------------------------------------</td>
</tr>
<tr>
<td>Add Approvers</td>
<td>Populates the list of approvers in the document.</td>
</tr>
</tbody>
</table>

**Script includes that will be added to sys_script_include**

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DocumentManagement</td>
<td>Contains the main logics for the Managed Documents plugin.</td>
</tr>
<tr>
<td>DocumentManagementDB</td>
<td>Contains methods to perform CRUD operations on the database.</td>
</tr>
<tr>
<td>DocumentManagementSecurity</td>
<td>Helps manage the security of the Managed Documents system.</td>
</tr>
<tr>
<td>DocumentManagementAjax</td>
<td>Updates the details of the temporary revision that is created when opening the upload/check in revision form.</td>
</tr>
<tr>
<td>DocumentAttachmentAjax</td>
<td>Renames an attachment file.</td>
</tr>
<tr>
<td>DocumentRevisionWorkflowHelper</td>
<td>Helps perform basic workflow operations on a revision.</td>
</tr>
<tr>
<td>DocumentManagementApprovalMatcher</td>
<td>Helps obtain the user and group approvers for a document that matches approval rules.</td>
</tr>
<tr>
<td>DocumentApproverHelper</td>
<td>Contains logics to handle document approvers.</td>
</tr>
<tr>
<td>DocumentManagementUtils</td>
<td>Useful methods.</td>
</tr>
<tr>
<td>DocumentReferenceQualifiers</td>
<td>Static methods that return reference qualifiers.</td>
</tr>
</tbody>
</table>

**Client script that is added to sys_script_client**

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document type change</td>
<td>Updates the name format field in the revision settings section of the document. Each type has a default name format.</td>
</tr>
</tbody>
</table>

**Roles**

This plugin introduces two new roles:

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>document_management_user</td>
<td>This role enables a user to access the Managed Documents plugin, create documents, and search for documents. Document reviewers and approvers need the document_management_user role to access the Managed Document plugin. (Please note that reviewers and approvers can also access a document revision from an approval record.)</td>
</tr>
<tr>
<td>Role</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>document_management_admin</td>
<td>This role enables a user to change administrative settings for the Managed Documents plugin.</td>
</tr>
</tbody>
</table>

**Note:** Each document has individual permissions, so even if a user is given the document_management_user role and has permissions to the application, the user can only view documents to which they have been given access.

### Create a new managed document record

Configure the properties and policies for a managed document.

1. Navigate to **Managed Documents > Create New**.
2. In the **Name** field, type **Policy**.
3. In the **Requested by** field, add your name.
4. In the **Owner** field, add your name.
5. In the **Reviewer** field, add your name.
6. In the **Type** field, select **Policy**.
7. In the **Classification** field, select **Confidential**.
8. In the **Audience** field, select **Internal**.
9. Under **Revision Settings**, select the **Auto increment revision** option.

![Revision Settings](image)

10. Click **Submit**.

### Check in a document after making changes

After making changes to a document, check the revised document into Managed Documents.

1. Open the document record.
2. Click the **Upload/Check in Revision** related link.
3. Click **Choose File**, select the revised file, and click **Open**.
4. Check that the **Name** and **Revision Number** contain the updated number.
5. Ensure that the **Check in** option is selected.
6. Click **OK**.
   The Document Revisions list updates to contain the most recent revision.
Check out a document to make changes

After a document is added to a managed document record, check the file out to make changes. Checking documents in and out keeps a record of document changes and ensures that only one person at a time is editing the document.

1. Open the document record.
2. Select the Check Out Document related link.
4. Click Check Out.
5. Open the file and make a small change.
6. Save the document with the same name, but a new revision number. For example, Policy_POL_02.txt.

Publish a document in Managed Documents

After the document is reviewed and approved, publish the document within Managed Documents.

1. Open the document record.
2. In the Document Revisions list, click the name of the revision that was approved and is listed in the Ready for Publishing stage.
3. In the header bar, click Publish Revision.
4. In the Publish revision dialog box, check that the name and revision number are correct and click Publish.
   In the Document Revisions list, the revision you just published is now in the Published stage.

Send a document out for review and approval

When a document is ready, send it out for review and approval. If a reviewer or approver is not identified in the document record, the document is moved directly to the publishing stage.

1. In the Document Revisions list, right-click the revised document and select Submit Revision.

Because you identified yourself as the reviewer, you receive an approve request email message.

2. In the email message, click the link next to Click here to view Approval Request.
3. (Optional) View the document by clicking the attachment name under Document Revision.
4. Click Approve.
   The Approvals page displays and lists the document you just approved.
5. Open the document record.
6. In the Document Revisions list, the revision you approved is now in the Ready for Publishing stage.

Upload a document as an attachment

After creating a document record, add the document to the record as an attachment.

1. Open the document record.
2. Select the Upload/Check in Revision related link.
Defining Document Parameters

Before using the Managed Documents application, the user with the document_management_admin role needs to set the parameters that define the kinds of documents to be managed through the application. Managed Documents provides both base and custom parameter options.

Defining Document Parameters

The following document parameters should be defined:

- **Type**: identifies the purpose of the document. The type also determines the default document format and name format.
- **Classification**: indicates the security level assigned to the document and determines who can view or edit the document.
- **Audience**: specifies the intended readers of the document.
- **Name format**: specifies the name format to use when a document revision is added.
- **Name components**: are individual identifiers used inside a name format. Name components define a reference path (often by dot-walking) that holds the value specific to the document.
- **Approval rules**: determine which approvers are added to documents (in addition to the Reviewers specified on the document record).

Defining Types

To define a new type, navigate to Managed Documents > Administration > Type and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the type.</td>
</tr>
<tr>
<td>Code</td>
<td>A short code for the type. Referenced as a name component for the name format.</td>
</tr>
<tr>
<td>Label</td>
<td>A label to display in the Type choice list.</td>
</tr>
<tr>
<td>Name Format</td>
<td>The name format that documents of this type will use.</td>
</tr>
</tbody>
</table>
The following types are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Code</th>
<th>Label</th>
<th>Name format</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>-- None --</td>
<td>null</td>
<td>-- None --</td>
<td>null</td>
<td>1</td>
</tr>
<tr>
<td>policy</td>
<td>POL</td>
<td>Policy</td>
<td>Default Policy</td>
<td>2</td>
</tr>
<tr>
<td>guideline</td>
<td>GUI</td>
<td>Guideline</td>
<td>Default</td>
<td>3</td>
</tr>
<tr>
<td>procedure</td>
<td>PROC</td>
<td>Procedure</td>
<td>Default</td>
<td>4</td>
</tr>
<tr>
<td>contract</td>
<td>CON</td>
<td>Contract</td>
<td>Default</td>
<td>5</td>
</tr>
</tbody>
</table>

**Note:** For documents with a **Type** of **Contract**, a **Contracts** related list appears on the document record, listing any contracts the document is associated with.

**Defining Approval Rules**

To define a new approval rule, navigate to **Managed Documents > Administration > Approval Rules** and click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique identifier for the approval rule.</td>
</tr>
<tr>
<td>Active</td>
<td>A check box indicating whether this approval rule is used.</td>
</tr>
<tr>
<td>Condition</td>
<td>A condition builder that determines which documents use this approval rule.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the approval rule.</td>
</tr>
</tbody>
</table>

Once the approval rule is saved, the **Approvers** related list defines which approvers are added if the conditions in the **Condition** field are met.

The following approval rules are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internal policy</td>
<td>type=Policy ^ audience=Internal</td>
</tr>
<tr>
<td>Development policy</td>
<td>type=Policy ^ department=Development</td>
</tr>
</tbody>
</table>

**Defining Audiences**

To define a new audience, navigate to **Managed Documents > Administration > Audience** and click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audience Name</td>
<td>A unique name for the audience.</td>
</tr>
</tbody>
</table>
### Defining Classifications

Define a new classification on the Classification form.

Navigate to **Managed Documents > Administration > Classification** and click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the classification.</td>
</tr>
<tr>
<td>Code</td>
<td>A short code for the classification. Referenced as a name component.</td>
</tr>
<tr>
<td>Label</td>
<td>A label to display in the Classification choice list.</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating this classification’s sequence in the choice list.</td>
</tr>
</tbody>
</table>

The following classifications are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Code</th>
<th>Label</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>P</td>
<td>Public</td>
<td>1</td>
</tr>
<tr>
<td>restricted</td>
<td>R</td>
<td>Restricted</td>
<td>2</td>
</tr>
<tr>
<td>confidential</td>
<td>C</td>
<td>Confidential</td>
<td>3</td>
</tr>
</tbody>
</table>

### Defining Name Components

Name components define the document values used in the name format.

For example, the name component `document.audience.code` dot-walks from the document record to the audience **Code**.

To define a new name component, navigate to **Managed Documents > Administration > Components** and click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique identifier for the name component.</td>
</tr>
<tr>
<td>Short Description</td>
<td>A short description of the name component value.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Value   | The path to the field holding the value used for the name format. Defined relative to a current revision record. For example:  
  - Enter `revision` to use the revision `Number` field on the revision record.  
  - Enter `document.name` to use the `Name` field on the revision’s referenced document.  
  - Enter `document.audience.code` to use the `Code` field for the audience referenced by the document.  
  This dot-walking approach makes it possible to get any value related to the revision into the name format. |

### Note:
The `revision` component is a special component replaced by the appropriate revision number (rather than querying a value related to the current record). The revision is either automatically incremented or uses the latest revision number, depending on the setting on the document form.

The following components are defined in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Short description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audience code</td>
<td>Displays the code assigned to the document audience.</td>
<td><code>document.audience.code</code></td>
</tr>
<tr>
<td>Classification code</td>
<td>Displays the classification code.</td>
<td><code>document.classification.code</code></td>
</tr>
<tr>
<td>Document name</td>
<td>Displays the document name.</td>
<td><code>document.name</code></td>
</tr>
<tr>
<td>Revision</td>
<td>Displays the document revision.</td>
<td><code>revision</code></td>
</tr>
<tr>
<td>Type code</td>
<td>Displays the code assigned to the document type.</td>
<td><code>document.type.code</code></td>
</tr>
</tbody>
</table>

### Defining Name Formats

The name format automatically generates a name for a document revision by arranging name components in a standard code to match naming conventions.

For example, a name format with the name components `Type Code`, `Document Name`, and `Revision Number` and the separator `-`, would be formatted as:

```
TYPECODE-Name-RevNumber.fileformat
```

In this example, a policy (code POL) named `IT Off-Boarding Policy`, with revision number `1.0`, and uploaded as a `.docx` file would have the name:

`POL-IT Off-Boarding Policy-1.0.docx`

To define a new name format, navigate to `Managed Documents > Administration > Name Formats` and click **New**.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Separator</td>
<td>A separator to put between each of the components. Hyphens (-) and underscores (_) are commonly used. Using alphanumeric characters can create a confusing name format.</td>
</tr>
<tr>
<td>Description</td>
<td>A description of the name format.</td>
</tr>
</tbody>
</table>

Use the related list to add name components. Use the **Order** field to set the sequence in which name components are used.

The following name formats are defined in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Separator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>_</td>
<td>The default format. Document name and revision separated by an underscore.</td>
</tr>
<tr>
<td>Default Policy</td>
<td>_</td>
<td>The format for the policy document type.</td>
</tr>
<tr>
<td>Development documentation</td>
<td>(no separator)</td>
<td>The format for the software documentation type.</td>
</tr>
<tr>
<td>Development Sources</td>
<td>(no separator)</td>
<td>The format for the development and code sources type.</td>
</tr>
<tr>
<td>Intranet Improvement</td>
<td>(no separator)</td>
<td>The format for documents that describe intranet use.</td>
</tr>
</tbody>
</table>

**Defining Document Workflow**

In the base system, all managed documents use the **Managed Documents** workflow after the **Active** check box is selected.
Document workflow

The document parameters defined in the workflow are often used as conditions to trigger more specific workflows, such as type-specific workflows or classification-specific workflows. If different
kinds of documents should follow different workflows, use the Graphical Workflow Editor to create new workflows.

**Knowledge document**

The Knowledge Document plugin extends the Managed Documents plugin by providing the functionality for managed documents to be published to the knowledge base.

**Installed with knowledge document**

These elements are installed with the knowledge document plugin.

**Dependencies**

The Knowledge Document plugin depends on the Managed Documents plugin. Activating Knowledge Document activates Managed Documents.

**Tables**

<table>
<thead>
<tr>
<th>Display Name (table_name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Records (m2m_document_knowledge)</td>
<td>A many-to-many table storing the relationship between a document and a knowledge article.</td>
</tr>
</tbody>
</table>

**UI Actions**

<table>
<thead>
<tr>
<th>UI action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link to Knowledge</td>
<td>Creates or updates a knowledge article related to the current document, depending on whether a knowledge article already exists.</td>
</tr>
</tbody>
</table>

**Scripts**

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KnowledgeDocument</td>
<td>Holds the main logic for the Knowledge Document plugin.</td>
</tr>
<tr>
<td>KnowledgeDocumentDB</td>
<td>Class that gets, inserts, and updates data for the Knowledge Document plugin.</td>
</tr>
</tbody>
</table>
**Knowledge settings fields**

These fields appear on the Managed Document form Knowledge Settings section.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Behavior</td>
<td>Defines the process performed when the Link to Knowledge related link is clicked. Select <strong>Always create record</strong> to create a new knowledge article with the latest published revision attached. The knowledge article is then linked to the document. Select <strong>Update existing record</strong> to update the existing knowledge article to the latest published revision. If no knowledge articles exist for the document, a new knowledge article is created. The <strong>Update existing record</strong> option is not available when many knowledge articles are linked to a document.</td>
</tr>
<tr>
<td>Type</td>
<td>Specifies the type of knowledge article. Use Knowledge or any option that extends the <em>kb_knowledge</em> table. For example, if you have the IT GRC plugin installed to create GRC policies, select the type Policies. Note that when a knowledge article is created, the <strong>Type</strong> field becomes read-only.</td>
</tr>
<tr>
<td>Topic</td>
<td>Defines the subject of the document. Adds the topic information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Published</td>
<td>Date that the article should be published. Adds publishing date information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Valid to</td>
<td>Date that the article expires. Adds valid to date information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Short description</td>
<td>A few words or short phrase describing the knowledge article. Adds the short description to the same field in the knowledge article.</td>
</tr>
</tbody>
</table>

**Create a version of a knowledge article from a managed document**

You can create a new version of a knowledge article from the managed document record.

- The Knowledge document plugin (com.snc.knowledge_document) must be enabled.
- The Knowledge Management Advanced plugin (com.snc.knowledge_advanced) must be enabled.

1. Navigate to **Managed Documents** > **Documents** > **All**.
2. Click a document.
3. Click **Upload/Check In Revision**.
4. Enter a **Name** and a **Note** for the revised document.
5. Choose a file.
6. Click **OK**.
7. Click the **Link to Knowledge** related link.
The uploaded document is updated to the latest published version of the knowledge article. If the knowledge article is in **Draft**, **Review**, or **Retired** state, it is not updated unless the reviser and author of the managed document are the same.

If the author of the managed document and the reviser is not the same and the knowledge article is checked out, the article has to be published before any changes can be made.

8. Select the knowledge article to view.

**Create a document**

After Managed Documents parameters have been set by the administrator, documents can be created, requested, checked out, edited, checked in, copied, and, if necessary, rolled back to an earlier version.

Once documents have been added to the Managed Documents application, they can be grouped into document collections.

**Approval process**

During the approval process, the approver approves or rejects the document. A document goes through the approval process after the review process.

**Approval workflow**

After the document has been reviewed, submit the document for approval. If the document does not have an approver, the approval process is omitted.

When the document is Active, the workflow Document Management Default is used to manage approvals:
Document Management Default workflow
If the approver rejects the document, the author and owner are notified and the document review is cancelled. The author, owner, and approver should discuss what changes need to be made to the document. When the document is ready, a new review can be initiated.

If the final approver approves the document, the author and the owner are notified. Once final approval is successful, the document stage changes to Ready for Publishing in the Document Revisions list:

---

If there are multiple approvers, the approval process works in sequence and multiple approvers can be assigned to a single sequence. For example:

Sequence 1: approvers A and B
Sequence 2: approvers C and D
Sequence 3: approver E

Because the sequences take place in ascending chronological order, approvers A and B receive the approval request first (approvers C, D, and E are not part of the process yet). Similar to the review process, the first approver to act within a sequence dictates what happens to the document. If approver A acts first and rejects the document, the approval process stops and the state is set to Cancelled. Approver B’s status is changed to No Longer Required. If approver A acts first and approves the document, the process stops and approver B’s status is changed
to No Longer Required. Then, the document moves to approval sequence 2. After at least one approver in each sequence approves the document, the author and the owner are notified that the document has been approved.

**Review process**

During the review process, the reviewer approves or rejects the document. Sometimes a document will have multiple reviewers.

If the reviewer rejects the document, the author and owner are notified and the review is cancelled. The author, owner, and reviewer should discuss what changes need to be made to the document. If the reviewer approves the document, the author and owner are notified that the review was successful and the document can move to the approval stage.

If multiple reviewers are assigned to a document, the first reviewer to act dictates what happens to the document. For example, there are two reviewers, A and B. If reviewer A acts first and rejects the document, the review process stops and the revision state is set to Cancelled. Reviewer B receives a notification email stating that the review was rejected and their status is changed to No Longer Required. If reviewer A acts first and approves the document, the review process stops and the document can move to the approval stage. Reviewer B’s status is changed to No Longer Required.

**Enable electronic signature for approval**

This topic explains how to enabling electronic signatures for approval. Electronic signatures are helpful if you must obtain a digital signature for compliance or auditing purposes.

You can activate the Approval with E-Signature plugin to require that users type in a user name and password when reviewing and approving documents.

The digital signature is not tracked or stored in the document record. Users must simply type in a user name and password after clicking the Approve or Reject button.

![Approver Authentication](image)

Digital signature

After activating the Approval with E-Signature plugin, ensure that a row in the e-signature registry table is created for the dms_document_revision table.

1. Navigate to System Definition > e-Signature Registry.
2. Check if dms_document_revision is already listed and Enabled is set to true.
3. If not listed, click New.
4. In Table name, select Document Revision.
5. Select Enabled.
6. Click Submit.

Publish an approved revision

This topic explains how to publish a document revision that has been approved. Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

Publish the approved revision from the Document Revisions list.

**Note:** Publishing documents to the Knowledge Base requires the Knowledge Document Plugin.

1. Navigate to the document record.
2. In the Document Revisions List, click the revision marked Ready for Publishing.
3. Click Publish Revision to display the Publish dialog box.

The revision number matches the latest revision number. If your standard is to change the revision number when the document is published, such as incrementing the version number to 1.1 or 1.0.1, the change can be made on this dialog box manually.

4. Click Publish.

The published revision is highlighted in green and the stage of previous revisions is automatically changed to Retired:
Submit a revision for draft review

This topic explains how to submit a document draft for review.

Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

When a draft of the document is ready, submit the draft for review. If the document does not have reviewers identified in the Reviewers field of the document record, the review process is omitted.

1. Navigate to the document record.
2. Right-click the appropriate revision.
3. Select Submit Revision.

The revision stage is set to Awaiting Review.
Once an administrator has set parameters for the Managed Documents application, you can create or request new documents.

1. Navigate to **Managed Documents > Create New**.
2. Complete the following fields:

**New document fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>An identifying number for the document. Automatically generated using number maintenance.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Name</td>
<td>A name for the document. Note that the name for the document is combined with other naming components (as defined by the name format) to create the names for each document revision.</td>
</tr>
<tr>
<td>Requested by</td>
<td>The person asking that the document be created or updated.</td>
</tr>
<tr>
<td>Owner</td>
<td>The approver of the document request. Also responsible for setting completion date with requesters and authors.</td>
</tr>
<tr>
<td>Reviewers</td>
<td>The user or users who review the document and provide feedback to owners and authors.</td>
</tr>
<tr>
<td>Department</td>
<td>The department responsible for the document.</td>
</tr>
<tr>
<td>Type</td>
<td>The document purpose. This is a choice list derived from the type parameters.</td>
</tr>
<tr>
<td>Classification</td>
<td>The document classification, based on security, audience, and confidentiality. This is a choice list derived from the classification parameters.</td>
</tr>
<tr>
<td>Audience</td>
<td>The document readers, such as external or internal. This is a choice list derived from the audience parameters.</td>
</tr>
<tr>
<td>State</td>
<td>The current status of the document in the editing and publication process.</td>
</tr>
<tr>
<td>Checked out by</td>
<td>The user who currently has the document checked out.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the document.</td>
</tr>
<tr>
<td>Revision Settings</td>
<td></td>
</tr>
<tr>
<td>Name format</td>
<td>The format for the name of each individual revision of the document. For more information, see Defining Name Formats.</td>
</tr>
<tr>
<td>Revision format</td>
<td>A choice between the two digit (0.x) or the three digit (0.0.x) revision format.</td>
</tr>
<tr>
<td>Auto increment revision</td>
<td>If selected, the revision number automatically increments each time the document is revised.</td>
</tr>
</tbody>
</table>

The User Permissions related list determines which users have rights to view and contribute to the document:

**User permissions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>A reference to a user who is entitled to read and contribute to the document.</td>
</tr>
</tbody>
</table>
The Group Permissions related list determines which groups have rights to view and contribute to the document:

### Group permissions

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group</td>
<td>A reference to a group of users who are entitled to read and contribute to the document.</td>
</tr>
</tbody>
</table>
| Type  | A choice list describing how group members can interact with the document. Options are:  
- Reader - Group members can read the document versions.  
- Editor - Group members can upload new versions.  
- Owner - Group members can edit the document. |

### Specify an approver

You can specify approvers for a document record after you save it.

You can have one approver or multiple approvers. For example, set multiple approvers to have one person do a quality check of the document and a different individual to serve as a final approver. Approvers are assigned a number. The lowest number (usually number one) approver always goes first, then any other approvers in ascending chronological order. Multiple approvers can have the same sequence number. For example, two approvers can do a quality check and be assigned sequence number 1. Then, two individuals can be final approvers and be assigned sequence number 2.

1. Navigate to the document record.  
2. Right-click in the document header bar and select Add Approver.  
3. Add a user name.  
4. Select a sequence number from the drop-down list. (Lower numbers approve before higher numbers. For example, approver number one approves before number two.)  
5. Click Add User.  
6. Repeat steps 2-5 to add more approvers.

### Check in a document

Check in the document after you revise it so other users can check out the document.

1. Navigate to the document record.
2. Select the **Upload/Check In Revision** related link.
3. Click **Browse** and navigate to the revised file.
4. Click **Open**.
5. Check the Name and Revision Number.
6. Click **OK**.

The Document Revisions related list updates to contain the most recent revision:

![Document Revisions](image)

**Copy a document**

A document can be duplicated at any time. This is useful if you have an existing document that you want to use as a base for a new document.

1. Navigate to the document record.
2. Right-click the header bar and select **Copy Document**.
   
   An information message with a link to the new document displays:
3. Click **OK**.
   
   The new document is renamed and includes the word "Copy."

   **Note:** Only the latest revision is copied.

**Deactivate a document**

To change the document state to Inactive, deactivate the document. This is useful when changes to a document have been put on hold. An inactive document can be reopened at any time.

1. Navigate to the document record.
2. Right-click the header bar and select **Deactivate Document**.

   **Note:** To activate a document, right-click on the header and click **Reopen Document**.

**Reopen a deactivated document**

A document that has been deactivated can be reopened.

1. Navigate to the document record.
2. Right-click the header bar and select **Reopen Document**.

**Roll back a document**

A document can be rolled back to an earlier revision at any time. Before rolling back to an earlier revision, ensure that the document is not checked out and that you have Editor or Owner permissions for the document.

1. Navigate to the document record.
2. In the Document Revisions list, click the revision to which you want to roll back.
3. Right-click the header bar and select **Rollback**. The Rollback to Revision dialog box displays. The name and revision number are new. The note specifies the revision to which you are rolling back.

4. Change any information on the Rollback to Revision dialog box as necessary.
5. Click **OK**. The latest revision is now the revision you selected for rollback.

**Cancel a document**

Change the document state to Cancelled when no more changes will be made to the document.

When canceling a document, there is no confirmation message, so ensure that you want to cancel the document.

1. Navigate to the document record.
2. Right-click the header bar and select **Cancel Document**.

An info message confirms the cancellation:

The **State** is set to **Cancelled**.
Check out a document

Documents in the Managed Documents application can only be revised by one user at a time. Check out the document to revise it.

1. Navigate to the document record.
2. Select the Check Out Document related link.
3. Select Download file to download the current version of the document when it is checked out.

4. Click Check Out.

After checking out a document, you can edit the document and make any necessary changes.

Create a document collection

A document collection is a set of individual documents. After documents have been uploaded into Managed Documents, organize the documents by grouping them into collections.

1. Navigate to Managed Documents > Document > My Collections.
2. Select New.
3. Type in a Name.
4. (Optional) Type in a Description.
5. Click Submit.
6. Click the name of the collection you created.
7. Click Edit.
8. On the left, double-click an available document or select a document and click Add.
9. Click Save. The Document Collection page displays and the individual documents in the collection are listed:

![Document Collection](image)

### Upload a document

Upload a document into a saved record. You can upload text files, spreadsheets, presentations, PDF files, and more.

1. Navigate to the document record.
2. Click the Upload/Check In Revision related link.
3. Click Choose File and navigate to the file.
4. Click Open.
5. Check the Name and Revision Number.
6. Click OK.

After the initial document is uploaded, subsequent revisions can be created by checking out the document.
Domain separation and Managed Documents

This is an overview of domain separation in Managed Documents. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Data only

Domain separation in this application is supported at the Data only level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see Application support for domain separation.

MetricBase

The MetricBase application stores time-series data, which is data that is sampled at regular intervals. You can graph the stored data or use it with triggers to execute Flow Designer flows. MetricBase helps developers working with IoT-based applications that monitor or act on large amounts of machine-generated data.

How MetricBase works

You use MetricBase to deal with large amounts of data by using a smaller summary of that data that is stored in the MetricBase database. For example, an instance might store CPU usage. With MetricBase, you might summarize that data by storing the average CPU usage for every five-minute interval. You can graph the data or you can use it with Flow Designer to trigger flows.

MetricBase works with:

- An instance that stores machine-generated data
- A server that has the MetricBase application and database

On a very high level, when using MetricBase, you can:

1. Define the sampling rate for the data (float) on an instance. For example, you can sample the machine-generated data that is stored on an instance once every five minutes. This sampling rate is called the time-series definition.

2. Use a MetricBase API to send data from the instance to the MetricBase database at the rate that is prescribed by the time-series definition. If you send the data to MetricBase at a different rate, you get an error.

3. Use the Reporting application to graph the time-series data that is stored in MetricBase, or create triggers that execute Flow Designer flows. The time-series data remains in the MetricBase database for a prescribed amount of time, after which MetricBase deletes the data.
This figure shows that machine-generated data is sampled every 4 seconds. You send the average of the values in each sampling period to the MetricBase database, which stores the data until its expiration date.

**Benefits**

- MetricBase integrates seamlessly with ServiceNow IoT-based applications that monitor or act on large amounts of machine-generated data.
- MetricBase collects, retains, analyzes, graphs, and acts on time-series data.
- MetricBase works with Flow Designer to trigger flows and with Reporting to generate reports.

**Use cases**

- Create graphs about metrics, such as about CPU usage over time.
- Generate an email if the average CPU usage is more than 85% in the last 5 minutes.
- Train a machine language model to detect anomalies and execute a Flow Designer trigger when an anomaly is detected.
- If MetricBase detects a gap in data submitted for 10 minutes or more, generate an email.
- If the average of the collected data is less than 10 or greater than 500 in the last 5 minutes, generate an alert.
- If memory usage is likely to exceed 90% in the next 10 minutes, generate an alert.

**MetricBase demo**

Use the [MetricBase Demo](#) plugin to familiarize yourself with MetricBase. The demo contains sample metrics, triggers, and a scheduled job that collects and stores data. Use the demo to explore MetricBase before you set it up. The [Data Explorer](#), which comes with the demo plugin,
provides a place to experiment with MetricBase JavaScript APIs. The demo plugin is separate from the MetricBase plugin. Make sure to request both.

**Domain separation**

MetricBase supports *level-3 domain separation*.

**Next**

*Request the installation* of the MetricBase and MetricBase Demo plugins.

**Purchase the MetricBase product**

The MetricBase application requires a separate subscription and must be activated by ServiceNow personnel. Be sure to request the MetricBase Demo plugin, which includes sample tables, metrics, triggers, and data.

Role required: none

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and sub-production instances, generally within a few days.

When ServiceNow personnel install the MetricBase Demo plugin, they also connect your instance to the server that contains the MetricBase database. A MetricBase database can connect with only one other instance. For example, a clone of the original instance can’t talk to the same database as the original instance.

- *Play with MetricBase* to get familiar with it.
- *Define and collect MetricBase data*.

**Getting familiar with MetricBase**

After ServiceNow personnel install the MetricBase and MetricBase Demo plugins, you can use the demo to get familiar with MetricBase.

**Prerequisites**

- MetricBase and the MetricBase demo plugins must be installed by ServiceNow personnel.
- Role required: admin

**MetricBase Demo**

With the MetricBase Demo plugin, you can experiment with MetricBase without configuring it or knowing much about it. The plugin includes sample time-series data and triggers in your MetricBase database to help you visualize the data and see how triggers operate. The demo also includes scheduled time-series data updates, as if they had been received from an instance, so you can test the functionality of the included triggers.

In the demo, a fictional fleet of drones has been outfitted with sensors that broadcast their metrics, including their speed, altitude, and battery life over time.
1. Navigate to **MetricBase Demo > Drones**
   to see the name, model, length, width, altitude, and speed for all drones in the fleet.

   ![Drones Table]

2. Click **MetricBase Demo > Metrics** to see how the metrics are defined.
   In the Time Series Metrics list, the column values specify the table where the drone's time-series metrics are stored, the names of all the metrics that are stored for each drone, and the retention policy for each metric. The retention policy specifies how frequently measurements are taken, and how long MetricBase retains that data.

   ![Metrics Table]

Now that you've seen the drone data and learned how to find it, let's see how the data was collected using a retention policy.

3. Click a retention policy.
   The Retention Policy form shows the definition for the policy. In the following example, this metric is measured once a minute for the first 8 days, then once every 10 minutes for the following 94 days, and then once an hour for the following 397 days. After that, the system discards the data.

   ![Retention Policy Form]
For more information on retention policies, see Define and collect time-series data.

4. To see how the data is aggregated during the Retention Durations, click the left arrow (<) at the top of the Retention Policy Schedules window to return to the Time Series Metrics list.

5. Click a table name.

The Time Series Metric definition shows the Retention policy aggregator. This aggregator summarizes the data as, for example, the average, maximum, or minimum value in the aggregation period. In the following example, the admin clicked the table for the speed metric. The result is that MetricBase stores the speed averages during each sampling period in the MetricBase database.

Now that you understand how the data was collected using retention policies, let's see how to display the data in lists and graphs.

6. Notice the parameter fields that start with Display. In this example, they mean that the speed values that are displayed in the list view of drones are the last speeds recorded in every hour interval for each drone.

These Display fields control what appears in the list view of the drones only. They have nothing to do with the retention policy.
7. Display the list view of a table by entering `<table-name>.list` in the **Field navigator** field. For example, `mb_demo_drone.list`. All drone data appears. In the example from the previous step, the speed column would contain the **Last** value of the sampling period.

8. Click **MetricBase Demo > Drones** and look at the speed (kph) column. From the previous step, you know that these values are the last speeds recorded for each drone up to an hour ago. The values are the same as you would get by using the `.list` command.

9. Click the speed value of the first drone. The following graph shows the speed of the drone that was measured hourly.

Note: You might need to select a different **Time Span** field value to get a clearer graph. For example, try **1 Day**. The speed is a sine wave because it's artificially generated. Hover over the sine wave to see the actual measurements.

10. Click the left arrow (<) to return to the list of drone metrics, right click on one drone type (**Model** column), and select **Show Matching**. Only the drones of the selected type appear.

11. Click the menu icon (≡) next to the Altitude column heading and select **Time Series Chart**. You see a graph that shows the altitude measurements of the Warbler-T7-type drones.

You might like to change the **Time Span** value for a clearer graph.

12. In the **Transform** field, select **Envelope**. You see a graph that shows the minimum and maximum (envelope) altitudes for the fleet of Warbler T7 drones over time.
13. Click the left arrow (<) to return to the list of drone metrics.

14. Click the menu icon (≡) next to the Altitude column heading and select Time Series Chart Designer to see another way of visualizing the data.

15. In the Create a Report page that displays in the Reporting application, vary with the graph parameters.

   **Note:** In the following steps, to stay on the same page, click Run. To advance to the next page when designing the graph, click Next.

   a. Change the Last value to one day and click Next.
b. In the Style pane, change the **Chart color** value and click **Run**.

c. Click **Type**, select the kind of graph to display, and click **Run**.
d. Click Configure, select a transform to run on the data from the Transform list, and click Run.

e. Edit the report title, which is above the graph, and click Run.

f. Click Configure. In Time range, select the time line to display on the graph.

**Note:** Relative uses the Last timespan relative to the present time. For example, if Last is 1 hour, the time line in the graph always spans the previous hour. You can add this report to your dashboard to show the metrics in the previous hour.
You've displayed drone data in lists and graphs. Now, let's define a trigger that executes when data that you monitor reaches a threshold value.

16. Click MetricBase Demo > Trigger Definitions.

The MetricBase Trigger Definitions list, shows the name (Name) of the trigger, the metric (Metric) the trigger monitors, the table (Table name) the metric that it is in, the trigger description, and whether the trigger is active. Triggers kick off flows when metrics meet trigger thresholds. An example is when a drone flies too low. For more information about triggers, see Trigger Workflows.

17. Click Low-Battery Drone.

The MetricBase Linear Predictor trigger form displays the definition of the Low-Battery Drone trigger.
In this example, the trigger monitors the **Remaining Battery (%)** metric (**Metric**) in the Drone table (**Table name**) every 10 minutes (**Window**). If the battery life is trending downward (**Trend**) and is 80% likely (**Confidence Level**) to reach 20% (**Threshold**) within 20 minutes (under **Window** for **Level** 1), the trigger executes. Although it fires, nothing happens until you associate this trigger with a flow. The flow defines the actions to take.

18. **Click MetricBase > Triggers.**
   - Flow Designer opens.
19. Click **New > New flow** to associate a trigger that is defined in the system to a flow.

20. In the **Name** field, name the flow and click **Submit**.
21. Click **Click to add a Trigger** and select **MetricBase** in the list.

22. In **MetricBase Trigger**, select a trigger that already exists and click **Done**. Alternately, you could click the plus sign to the right of **MetricBase Trigger** to create a new trigger.

23. Click **Click to add an Action, Flow Logic, or Subflow**.

24. Click **Action** to specify the actions to take when the trigger fires. The Action modal appears.
25. Select a domain of actions from the left column and the specific action to take in the right column.

26. Click **Save** and **Activate**.

The flow doesn't execute unless it is activated. For more information about Flow Designer, see [Flow Designer](#).

The following table summarizes the modules in the MetricBase demo.

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drones</td>
<td>Table that keeps metrics on drones, such as speed and altitude. Each record is a different drone. You can add records.</td>
</tr>
<tr>
<td>Fleets</td>
<td>Table that maintains metrics about groups of drones. Each record is a different fleet. You can add records.</td>
</tr>
<tr>
<td>Data Generators</td>
<td>Table that defines how data is created for the drone records. This field is provided for informational purposes. You cannot change or add records.</td>
</tr>
<tr>
<td>Metrics</td>
<td>List of metrics that are defined in the system. This list is the same table as MetricBase &gt; Time Series Metrics. You can add metric fields.</td>
</tr>
<tr>
<td>Scheduled Jobs</td>
<td>Scheduled job that is created for the demonstration application. The job runs every five minutes to add data to the demo tables in the MetricBase database. You can change the schedule.</td>
</tr>
<tr>
<td>Trigger Definitions</td>
<td>List of triggers that are defined in the demo. This list is the same table as MetricBase &gt; MetricBase Triggers &gt; Trigger Definitions. You can create additional triggers.</td>
</tr>
</tbody>
</table>
### Next topics

- [Set up MetricBase](#).
- Explore the MetricBase JavaScript APIs.

### Define and collect MetricBase data

MetricBase stores time-series summaries of much larger data collections. In MetricBase, you specify the metric that you want to store, how often to collect it, and how long to store it in the MetricBase database. Then, you send the data from an instance to the MetricBase server at the rate that you define using MetricBase REST or JavaScript APIs. In this way, you can monitor a much large data collection with MetricBase summaries of it.

- [Install MetricBase](#)
- Role required: clotho_admin

You use MetricBase to work with large amounts of machine-generated data by storing a smaller summary of that data in MetricBase.

You use MetricBase to define how often you will send data to MetricBase and what the aggregation of that data is, for example, maximum, minimum, average, or last. This data is called **time-series data**. For example, if you collect drone speeds on an instance, you might send the average the drone speed for every two minutes to the MetricBase database. This data might be one of many time-series metrics that you collect. You might also collect altitude and battery life. MetricBase stores each metric as a column in its database.

<td>Anomaly Logs</td>
<td>List of logs that result from triggers firing. The <strong>Low-Flying Drone</strong> trigger creates the anomaly logs.</td>
</tr>
<tr>
<td>Data Explorer</td>
<td>Widget that enables you to experiment with MetricBase JavaScript APIs using the demonstration application data. See <a href="#">Get Familiar with MetricBase APIs</a> for more information.</td>
</tr>
</tbody>
</table>
Retention schedules specify how long MetricBase stores the time-series data in the MetricBase database. The syntax is <retention duration> @ <time-series-definition>. For example, 30 Days @ 5 Minutes, means that the specified metric is sampled every 5 minutes and that data remains in the MetricBase database for 30 days.

Retention policies include multiple retention schedules with coarser granularity the longer that the data is kept. For example, the Coarse retention policy stores sampled data every:

- Hour for one week (7 Days @ 1 Hour interval)
- Two hours for one month (31 Days @ 2 Hour interval)
- Day for 13 months (397 Days @ 1 Day interval)

In this policy, the specified metric is measured every hour for the first 7 days, every other hour for the next 31 days, and once a day for next 397 days. MetricBase deletes data that is older than 435 days.

To see the list of all supported retention policies, navigate to MetricBase > Retention Policies.

1. Navigate to MetricBase > Time Series Metrics and click New to create a time-series definition.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Intuitive name for the Metric field name. For example, attitude could be the label for the metric field name, mb-altitude.</td>
</tr>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table name</td>
<td>Name of the table to add the metric to in the MetricBase database. For example, in the MetricBase Demo, the mb_drone table stores all of the drone data. Each column in the table is a different metric, for example, altitude, length, and speed.</td>
</tr>
<tr>
<td>Metric field name</td>
<td>Name of the time-series metric being recorded. For example, mb-altitude. You can think of it as the name of a column in the MetricBase database table.</td>
</tr>
<tr>
<td>Retention policy</td>
<td>Sampling frequency and how long MetricBase keeps the values in the database. You cannot customize the value. For a definition of the values, click the magnifying glass and then a policy. The coarser the sampling rate, the less data is stored. Use the coarsest sampling rate that works for your dataset. For example, do not collect data every minute if collecting it once an hour suffices.</td>
</tr>
<tr>
<td>Retention policy aggregator</td>
<td>Operator that is used to aggregate all of the data in a sampling period. For example, last, minimum, maximum, and average.</td>
</tr>
<tr>
<td>Display value aggregator</td>
<td>Aggregation method that is used only when using <code>&lt;table-name&gt;.list</code> where <code>&lt;table-name&gt;</code> is a table in the MetricBase database. This value is unrelated to the retention policy. For a definition of the options, see MetricBase transforms.</td>
</tr>
<tr>
<td>Display value aggregate duration</td>
<td>Duration that is used to calculate the aggregation only when using the list view. For example, <code>&lt;table-name&gt;.list</code> where <code>&lt;table-name&gt;</code> is a table in the MetricBase database. This value is unrelated to the retention policy.</td>
</tr>
</tbody>
</table>

You’ve created a time-series specification for a metric that you want to track.

3. **Click Submit.**

4. **Sample the data according to the time-series specification and send it from an instance to the MetricBase database server.**

There are many ways to send the data to the MetricBase database. The following example shows how to use REST and JavaScript APIs. For information about the MetricBase REST APIs, see the [Clotho Time Series API](https://servicenow.com/). For information on the MetricBase JavaScript APIs, see [Client, Data, DataBuilder, Transformer, TransformPart, TransformResult](https://servicenow.com/).

**Note:** You must send the data at the rate that is prescribed by the time-series definition. If you send the data at a different rate or for a different duration, you receive an error. Make sure to aggregate the data according to the time-series metric definition. Also, the MetricBase database only stores values of data type float.

You can gain experience with the APIs by using the Data Explorer. For more information, see [Get familiar with MetricBase APIs](https://servicenow.com/).
Store time-series data using REST and JavaScript APIs

The following examples store time-series data in the MetricBase database using REST and JavaScript APIs. The following example uses REST.

```bash
curl -X POST -H "Content-Type: application/json" -H "Accepts: application/json"
  "https://<your_instance.servicenow.com>/api/now/v1/clotho/put?align_time"
  -d [
    {"seriesRef": {"subject": "<sys_id-of-data-source>",
      "table": "<metricbase-table>",
      "metric": "<metric-name>",
      "start": "<start-time-of-data>",
      "values": [0.0, 1.4, 1.1, 1.0, 0.9]}]
  -u username:passwd
```

- **sys_id-of-data-source**—Sys ID of the object that generates the metric. For example, in the MetricBase Demo, this would be the sys_id of a drone.
- **metricbase-table**—Name of the table in the MB database that stores the time-series data.
- **metric-name**—Metric field name of the metric that is recorded in the database.
- **start-time-of-data**—Time that the data was sampled from the instance, for example, 2019-04-02T03:00:00Z.

**Note:** Line returns were introduced into the curl statement to make it fit on the page. To use the code, remove the line returns.

If you prefer to use a JavaScript API to store the time-series data in the MetricBase database, here’s a similar example:

```javascript
var count = 60 * 48; // 2 days of data
var values = [];
for (var i = 0; i < count; i++) {
  values.push(Math.random());
}
var gr = new GlideRecord('<metricbase-table>');
gr.get('<sys_id-of-data-source>');
var start = new GlideDateTime();
start.addSeconds(-1 * 60 * count);
var dataBuilder = new sn_clotho.DataBuilder(gr, '<metric-name>').add(start, values);
new sn_clotho.Client().put(dataBuilder);
```

- **sys_id-of-data-source**—Sys ID of the object generating the metric. For example, in the MetricBase Demo, this would be the sys_id of a drone.
- **metricbase-table**—Name of the table in the MB database that stores the time-series data.
- **metric-name**—Metric field name of the metric that is recorded in the database.

If you use a predictive model to detect anomalies, create a predictive model. To see how, refer to the [Detect anomalies using predictive models](#).

View the metrics that are stored in the MetricBase database. To see how, refer to the [View the metrics](#).
Set up triggers that execute Flow Designer flows. To see how, refer to Set up triggers.

**Detect anomalies using predictive models**

Submit MetricBase data to train a model, which you can use with a model trigger. Use models to detect data that varies from normal values.

Role required: admin

MetricBase supports the probabilistic exponentially weighted moving average (PEWMA) model. You need to run data through the model to train it. Training is the process of entering a lot of normal data into the model so it can determine the model parameters that best fit the normal data. In this way, the model can distinguish anomalous data. When you choose the data to train your model, make sure to eliminate all anomalous data.

1. Navigate to MetricBase > MetricBase Models and click New.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model name</td>
<td>Name of the model. The name can be any combination of alphanumeric characters. This model name is not the same as the PEWMA model type. In general, the name relates to the value in Group by.</td>
</tr>
<tr>
<td>Table name</td>
<td>Name of the table that contains the training data.</td>
</tr>
<tr>
<td>Metric</td>
<td>Name of the metric that you use to train the model. The metric must be in the table.</td>
</tr>
<tr>
<td>Created</td>
<td>Date that you trained the model.</td>
</tr>
<tr>
<td>Filter</td>
<td>Filters that you use to exclude some of the data in the dataset.</td>
</tr>
<tr>
<td>Group by</td>
<td>Field that is the basis of the predictive model. For example, if you select altitude, you generate a model based on the altitude metric, which establishes what is normal for altitude. To create multiple models, select a field, and click Submit and Train. To create a different model, select a different field in Group by, and click Submit and Train.</td>
</tr>
<tr>
<td>Training Dataset Start Date</td>
<td>First date in the dataset to start with. The data in the table starting with this date is used to train the model.</td>
</tr>
<tr>
<td>Training Dataset End Date</td>
<td>Last date in the dataset that you want to use. The data in the table from the start date up to this date is used to train the model.</td>
</tr>
<tr>
<td>Valid until</td>
<td>Date that serves as a reminder to consider retraining the model. If the model is performing well, there's no need to retrain it. The model can continue working past this date.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to use the trained model.</td>
</tr>
</tbody>
</table>

3. Click Submit and Train. MetricBase trains the model. When complete, the model appears on the MetricBase Model Instances tab.
4. Click the model name.
The modeling data appears as does the model string with the parameters optimized by the training.

5. Optional: Change the model parameters and click **Update**.
6. Optional: Change the model parameters and click **Update**.

The graph does not update. By clicking **Update**, you only save the revised model string.

The PEWMA parameters are:

- **Alpha**—A greater value means that more data is used to calculate the weighted average. Also, the weighted average line is smoother.
- **Beta**—A greater number means that the model is more sensitive to variations from the mean. The following images show differing beta values. The second image has a lower beta and a higher tolerance for variations from the predicted value.
Values

High beta
7. Optional: Click **Delete** to delete the model.

8. Click the **MetricBase model triggers** tab to create a Flow Designer trigger for this model. For more information, see **Create a model trigger**.

**Access MetricBase data**

Access the time-series data that you sent to the MetricBase database in the way that is convenient to you.

Role required: admin

You can access and visualize time-series data in the MetricBase database by using:

- **Reporting application**
  
  You can generate reports and graphs from the time-series data that is stored in the MetricBase database. For more information, see **Create reports from MetricBase time-series data**.

- **Table lists using the .list command**
  
  For more information, see **View MetricBase data using the list command**.

- **REST or JavaScript APIs**
  
  For more information, see **Retrieving MetricBase data using REST and JavaScript**.
Access MetricBase data using the list command

Use the list command on a table in the MetricBase database to view time-series data. The data reveals the behavior of the entity that supplies the data.

Role required: admin

1. On the MetricBase instance, in the application navigator, type `<table-name>.list`, and press the Enter key.
2. Click the menu icon (☰) above the metric column, and select Time Series Chart.
3. Change the Time Span and Transform fields to evaluate the data.
4. Optional: Adjust the data:
   a) Select one of the transforms: Add, Multiply, or Divide.
   b) In the Value field, enter the number to add, multiply, or divide the metric data by and click Submit.

Note: The adjusted data is not saved in the MetricBase database.

Retrieving MetricBase data using REST and JavaScript

Use JavaScript or REST APIs to retrieve time-series data from the MetricBase database and to run transforms on the data. The transformations enable you to visualize time-series data in a variety of ways.

For more information about MetricBase time-series data transformations, see MetricBase transforms.

Using REST

For information about the MetricBase REST APIs that return time-series data from the MetricBase database, see:

- Clotho Time Series API, which inserts, retrieves, and transforms data in the MetricBase database.
- MetricBase Data Explorer that comes with the MetricBase Demo, and enables you to experiment with the APIs.

Using JavaScript

For information about the MetricBase JavaScript APIs that return time-series data from the MetricBase database, see:

- Client — Execute transforms on the MetricBase database and receive the results.
- Data — Return the object that contains the result of a transform.
- DataBuilder — Create a series of data points for a metric.
- Transformer — Manipulate time-series data to prepare the data for evaluation and analysis.
- TransformPart — Specify details of the transform to be done.
- TransformResult — Return the object that contains the result of the transformation.
Analyze time series data with JavaScript APIs

This example returns the average CPU usage over the specified time for each XYZ computer.

```javascript
// Query the cmdb_ci_computer table for the records for
var gr = new GlideRecord('cmdb_ci_computer');
gr.addEncodedQuery('manufacturer=xyz');
gr.query();

// Create a DataSelector object and specify the metric (cpu_percentage),
// the transform (avg), and label (avg cpu)
var transform = new
    sn_clotho.Transformer(gr).addMetric('cpu_percentage').avg()
    .label('avg-cpu-percentage');

// Run the transform between startTime and endTime.
// startTime and endTime are GlideDateTime
var data = transform.execute(startTime, endTime);
var values = data['avg-cpu-percentage'].getValues();
```

Filter data

Developers can use SQL WHERE clauses in transformation scripts to filter data in report visualizations. Transformations in clotho aggregations apply mathematical functions on metric records. Use SQL WHERE clauses in transformation scripts to filter data. In the following example, the WHERE clause filters out all results except those results where mb_demo_mt_speed equals 100.

```javascript
var eqCon = new sn_clotho.Condition().eq(100);
var builder = new sn_clotho.Transformer(drones);
var fit = builder.metric("mb_demo_mt_speed").where(eqCon);
```

MetricBase triggers

Time-series data that is stored in the MetricBase database can trigger Flow Designer flows. These triggers can log incidents, send emails, and create other alerts.

You use MetricBase to define a trigger on an instance. When you associate the trigger with a Flow Designer flow, the trigger definition transfers from your instance to the MetricBase server. When you make the trigger and flow active, the trigger monitors the time-series data that is stored in the MetricBase database. When data meets the triggering conditions, MetricBase adds the trigger alert to the Trigger queue. The instance regularly polls that queue. When the polling finds a trigger waiting in the queue, the Flow Designer flow executes on the instance.
For more information about time-series policies, see Define and collect MetricBase data.

High-level overview of implementing triggers

1. Define one or more of the following triggers on an instance:
   - **Band trigger** — Triggers when a metric value falls within a range of values.
   - **Linear Predictor trigger** — Triggers when a series of values trend toward and are expected to reach a specified value.
   - **Gap trigger** — Triggers when values are not received for a period of time.
   - **Model trigger** — Triggers when a trained model detects anomalous behavior.

2. Create a **trigger condition** to add additional requirements for a trigger to execute a flow. For example, data often fluctuates over time. Small fluctuations can cause unwanted, duplicate triggering events. A Condition Script can prevent that erroneous duplication.

3. **Associate the trigger with the flow it executes** using Flow Designer.

4. Test the trigger and workflow.

5. Activate the trigger.

Deleting triggers

You can’t delete a trigger in MetricBase if it is associated with a flow in Flow Designer. To delete a trigger, you must first delete the flow in Flow Designer and then you can delete the trigger in MetricBase.
Legacy triggers

Legacy triggers are deprecated. You can’t create new ones; you can only carry forward ones that already exist. To see them, navigate to Legacy triggers.

Create a MetricBase band trigger

Create a MetricBase band trigger that detects when a metric value falls within a range of values.
Role required: admin

Band triggers execute when metrics fall outside of or within a range of values.

1. Navigate to MetricBase > MetricBase Triggers > Trigger Definitions and click New.
2. On the MetricBase Trigger Creation form, click Band Trigger - Detects and takes action when metric value meet certain threshold or is within a range.
   On the MetricBase Band Trigger form, you can see the table and tracked metric but not the band trigger parameters.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>MetricBase Band Trigger form</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Name</td>
</tr>
</tbody>
</table>
### ServiceNow, New York, Now Platform Capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table name</td>
<td>Table in the MetricBase database that contains the metric that you want to monitor. The only tables that appear when you click the search icon are the tables that you specified in the time-series metrics. If you select a metric before you select a table, only tables that have that metric appear in the Table name modal.</td>
</tr>
<tr>
<td>Metric</td>
<td>Table metric that you want to monitor that is specified by the Table name. The only metrics that appear when you click the search icon are the metrics in that table. If you select a metric before you specify a Table name, the metrics in all your time-series metrics appear. After you select a metric, only the tables that contain that metric appear when you click the search icon that is next to the Table name.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the trigger.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the trigger.</td>
</tr>
<tr>
<td>Aggregator</td>
<td>Aggregation value that you select: None, Max, Min, or Average. None means that you use the last value in the collection interval.</td>
</tr>
</tbody>
</table>

4. **Click Save.**

5. In the MetricBase Band Trigger Levels area, double-click each cell to add values that specify trigger parameters.

### MetricBase Band Trigger Levels

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>Numbers that indicate increasing severity. For example, you might define the CPU usage for level 1 to be above 85% and the CPU usage for level 2 above 90%. Each level should trigger a different flow. <strong>Level</strong> is often used in Conditional Scripts.</td>
</tr>
<tr>
<td>Function</td>
<td>Function that makes the Value the maximum or minimum value of the lower end of the band and defines whether trigger values are inside or outside of the band. For example, if the Function is Less than, the trigger executes when the metric goes below band.</td>
</tr>
<tr>
<td>Value</td>
<td>Lower end of the band. See the following image.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Band Function</td>
<td>Function that makes the <strong>Band Value</strong> the maximum or minimum value of the upper end of the band and defines whether trigger values are inside or outside of the band. For example, if the <strong>Band Function</strong> is <strong>Greater than</strong>, the trigger executes when the metric goes above the band. See the following image.</td>
</tr>
<tr>
<td>Band Value</td>
<td>Upper end of the band. See the following image.</td>
</tr>
<tr>
<td>Tolerance</td>
<td>Tolerance range, plus or minus the <strong>Value</strong> and <strong>Band Value</strong>. Select a tolerance to prevent repeatedly executing a trigger for small fluctuations in the data. Once a trigger executes, the data must exceed the tolerance to execute the trigger again. See the following image.</td>
</tr>
</tbody>
</table>

For example, if the **Function** is **Less than**, the **Value** is 100, the **Band Function** is **Greater than**, the **Band Value** is 200, and the **Tolerance** is 0, the trigger executes for all values that are less than 100 and greater than 200.

6. Optional: Add additional rows in the table to create multi-layered triggering behavior. Typically, each additional row indicates a more severe condition and the Flow Designer flow that is associated with the level warns with increasing severity. For example, level 1 might define the band from 100 through 200. Level 2 might define the level from 50 through 250.

7. Click **Update**.

8. Optional: Add a triggering condition that determines whether or not a trigger executes a Flow Designer flow. For more information, see [Create a triggering condition](#).

Associate this trigger with a Flow Designer flow. For more information, see [Assign a trigger to a flow](#).
Create a MetricBase linear predictor trigger

Create a MetricBase linear predictor trigger to detect when a metric is likely to cross a specified threshold within a specified period of time.

Role required: admin

The linear predictor trigger uses past data to generate a line that predicts future values. When MetricBase predicts that the linear value will reach a threshold, the trigger executes.

If the most recent data point reaches the threshold, the trigger executes regardless of the linear prediction.

Trigger parameters include how much past data to use in the calculation of the prediction, how far ahead to look, and the level of confidence that you accept.

1. Navigate to MetricBase > MetricBase Triggers > Trigger Definitions > New.
2. Click Linear Predictor Trigger - Predicts and takes action when a metric follows an upward or downward trend and is expected to reach a given threshold in the future.
3. On the form, fill in the fields.

MetricBase Linear Predictor Trigger form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name that you give the trigger.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table in the MetricBase database that contains the metric that you want to monitor. The only tables that appear when you click the search icon are the tables that you specified in the time-series metrics. If you select a metric before you select a table, only tables that have that metric appear in the Table name modal.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metric</td>
<td>Table metric that you want to monitor that is specified by the <strong>Table name</strong>. The only metrics that appear when you click the search icon (🔍) are the metrics in that table. If you select a metric before you specify a <strong>Table name</strong>, the metrics in all your time-series metrics appear. After you select a metric, only the tables that contain that metric appear when you click the search icon that is next to the <strong>Table name</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the trigger.</td>
</tr>
<tr>
<td>Window</td>
<td>Length of time that you want to use to calculate the line that predicts the future course of the value. For example, you might want to use the last 10 minutes of data to calculate the linear predictor. If the value is too long, the line does not reflect current trends. If the value is too short, the line might follow the raw values too closely and not accurately reflect the overall trend of the values. The value must be at least 10 times the sampling period that is defined by the sampling rate of your <strong>Metric</strong>. The format is hours:minutes:seconds. Do not confuse this value with the value of <strong>Window</strong> in the trigger level. That value specifies how far into the future that you want the linear predictor to look to see if the <strong>Metric</strong> is likely to cross the <strong>Threshold</strong>.</td>
</tr>
<tr>
<td>Confidence Level (%)</td>
<td>Percentage that specifies how tolerant you are of the real data fitting the linear prediction of the data. For example, a confidence level of 95% means that the real value must be within 5% of the predicted value in order to execute a trigger. If you only want to trigger when the real values are close to the predicted values, choose a high confidence percentage. If you are willing to accept real data that varies more significantly from the predicted values as being valid, select a lower confidence level, for example, 80%.</td>
</tr>
<tr>
<td>Trend</td>
<td>Direction of the trend: increasing or decreasing. For example, the value is increasing or decreasing toward the <strong>Threshold</strong>.</td>
</tr>
<tr>
<td>Threshold</td>
<td>Target value that the metric is expected to reach before the trigger executes.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the trigger.</td>
</tr>
</tbody>
</table>

4. **Click Save.**

In the MetricBase Linear Predictor Trigger Levels form, you can create multiple trigger levels of increasing severity. For example, you can configure the battery level to be 80% for level one and at 90% for level two.

5. In the MetricBase Linear Predictor Trigger Levels area, double-click each cell to add values that specify trigger parameters.

**MetricBase Linear Predictor Trigger Levels**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>Numbers that indicate increasing severity. For example, you might define level 1 to be CPU use is predicted to reach 85%. Level 2 might be CPU use is predicted to reach 90%. Each level can trigger a different Flow Designer flow.</td>
</tr>
<tr>
<td>Function</td>
<td>Function to use on the value. For example, <strong>Less than or is</strong>.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Window</td>
<td>How far into the future that you want the linear predictor to look to see if the metric is predicted to cross the threshold. Do not confuse this value with the <strong>Window</strong> value in the trigger definition form. That value specifies how much data to use (measured in time) to calculate the slope of the predictor line.</td>
</tr>
</tbody>
</table>

6. Click **Update**.

7. Optional: Add a triggering condition that determines whether or not a trigger executes a Flow Designer flow. For more information, see **Create a triggering condition**.

Associate this trigger with a Flow Designer flow. For more information, see **Assign a trigger to a flow**.

### Create a MetricBase gap trigger

Create a MetricBase gap trigger to alert you when MetricBase stops receiving data.

Role required: admin

Gap triggers execute when MetricBase stops receiving data for a specified period.

You can define multiple trigger levels to indicate different severities. For example, you can set a gap of 15 minutes as level 1, a gap of 30 minutes as level 2, and so on. Each level should trigger a different Flow Designer flow. The difference between gap durations on different levels must be at least 10 minutes. For example, if you set level 1 to a gap of 15 minutes, you must set level 2 to a gap of 25 minutes or more.

**Note:** If you make the gap durations between levels less than 10 minutes, MetricBase displays an error message and deletes the level that you added.

MetricBase calculates how often to poll data by taking the difference between gap durations on different levels and dividing them by 2. For example, if level 1 triggers after 20 minutes of missing data and level 2 triggers after 40 minutes of missing data, the polling frequency is $(40-20)/2 = 10$ minutes. The maximum polling frequency is every 5 minutes, and the minimum frequency is every 30 minutes. If a trigger has only one level, the polling frequency is 30 minutes.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
MetricBase searches through the data that is stored in the MetricBase database, not through incoming data. For that reason, a gap trigger might execute after the gap when data is missing. For example, if MetricBase polls the database every 10 minutes and the gap is 30 minutes of missing data, the trigger might execute as late as 40 minutes after the data was last received.

1. Navigate to **MetricBase > MetricBase Triggers > Trigger Definitions > New**.
2. In the MetricBase Trigger Creation form, click **Gap Trigger - Detects and takes action when no data is received for a metric**.
3. On the form, fill in the fields.

   **MetricBase gap trigger form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the trigger.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table in the MetricBase database that contains the metric that you want to monitor. The only tables that appear when you click the search icon are the tables that you specified in the time-series metrics. If you select a metric before you select a table, only tables that have that metric appear in the <strong>Table name</strong> modal.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the trigger.</td>
</tr>
<tr>
<td>Metric</td>
<td>Value the trigger monitors in the MetricBase database.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the trigger.</td>
</tr>
</tbody>
</table>

4. Click **Save**.
5. In the MetricBase Gap Trigger Levels area, double-click each cell to add values that specify trigger parameters.

   **MetricBase gap trigger form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>Numbers that indicate increasing severity. For example, you might define level 1 to be no data for 1 minute. Level 2 might be no data for 5 minutes. Each level should trigger a different flow.</td>
</tr>
<tr>
<td>Function</td>
<td>Function, <strong>Greater than or is</strong>, which means that this trigger executes when the gap in received data is greater than the value that you specify in the <strong>Window</strong> field.</td>
</tr>
<tr>
<td>Window</td>
<td>Length of time that no data has been received that executes the trigger. The format is hours:minutes:seconds. For example, 00:20:00 means that this trigger executes after 20 minutes of missing data.</td>
</tr>
</tbody>
</table>

6. Click **Update**.
7. Optional: Add a triggering condition that determines whether or not a trigger executes a Flow Designer flow.
   For more information, see **Create a triggering condition**.

Associate this trigger with a Flow Designer flow. For more information, see **Assign a trigger to a flow**.

**Create a MetricBase model trigger**

Model triggers execute when the time-series data deviates from expected values.

Role required: admin
Probabilistic exponentially-weighted moving average (PEWMA) is the only model type supported. MetricBase uses this model to create a definition of expected, normal values.

1. Click MetricBase > MetricBase Triggers > Trigger Definitions and click New.
2. Click Model Trigger - Detects and takes action when a metric value deviates from the trained model.
   The MetricBase Model Trigger form specifies the table and metric used to train the model.

3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name the model trigger.</td>
</tr>
<tr>
<td>Model</td>
<td>Trained model this trigger uses.</td>
</tr>
<tr>
<td>Metric</td>
<td>Automatically filled in based on the model.</td>
</tr>
<tr>
<td>Table name</td>
<td>Automatically filled in based on the model.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the trigger.</td>
</tr>
<tr>
<td>Description</td>
<td>Explanation of the trigger.</td>
</tr>
<tr>
<td>Spike Direction</td>
<td>Trigger execution criteria. Specify whether you want to trigger only on anomalies that occur above predicted values, only on anomalies that occur below predicted values, or both.</td>
</tr>
<tr>
<td>Window</td>
<td>Amount of data to use when calculating the moving, weighted average; the longer the window, the more data. The recommendation is 30 times the sampling interval. For example, if the time-series data is sampled every minute, make this value 30 minutes. Values must be multiples of the sampling interval.</td>
</tr>
</tbody>
</table>
### ServiceNow New York Now Platform Capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Turns on the trigger.</td>
</tr>
</tbody>
</table>

**Note:** For the **Window** value, very short durations make the weighted average move with the data itself and fail to detect anomalies. Very long durations make the weighted average unresponsive to current trends in the data and may cause false triggers.

4. Click **Save**.

5. In the MetricBase Model Trigger Levels area, double-click each cell to add values that specify trigger parameters.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>Numbers that indicate increasing severity. For example, you might define level 1 to be 3 standard deviations from the mean. Level 2 might be 5 standard deviations. Each level should trigger a different Flow Designer flow. <strong>Level</strong> is often used in <strong>Conditional Scripts</strong>.</td>
</tr>
<tr>
<td>Function</td>
<td><strong>Always Greater than or is</strong>, meaning that in order to trigger, the time-series metric must be greater than or equal to the number of standard deviations from the mean specified in <strong>Number of Standard Deviations</strong>.</td>
</tr>
<tr>
<td>Number of Standard Deviation</td>
<td>Float value specifying the number of standard deviations the time-series metric must be away from the mean to trigger an alert at this level.</td>
</tr>
</tbody>
</table>

6. Optional: Add additional rows in the table to create multi-layered triggering behavior. Each successive row should indicate a more severe condition.

7. Click **Update**.

The MetricBase Trigger Definitions page displays the list of defined triggers.

8. Test your model and trigger on real data before deploying to production.

9. Optional: Add a triggering condition that determines whether or not a trigger executes a Flow Designer flow.

   For more information, see [Create a triggering condition](#).

   Associate this trigger with a Flow Designer flow. For more information, see [Assign a trigger to a flow](#).

### Execute triggers conditionally

MetricBase triggers execute based on a single metric. **Condition Scripts** impose additional requirements that determine whether a trigger kicks off a flow.

**Role required:** admin

Condition Scripts execute when conditions for a trigger are met but before the trigger executes a Flow Designer flow. In that way, Condition Scripts can prevent triggers from executing flows even when trigger conditions are met. For example, data often fluctuates over time. Small fluctuations can cause unwanted, duplicate triggering events. A Condition Script can prevent that erroneous duplication.

Condition Scripts always return True (trigger) or False (do not trigger). To learn how to write these scripts, see [Scripting in ServiceNow Fundamentals](#). To experiment with scripts, see [Get familiar with MetricBase APIs](#).
You can create and save Condition Scripts in MetricBase but you associate them with triggers using Flow Designer.

1. Click **MetricBase > MetricBase Triggers > Trigger Condition Script > New**.
2. On the Additional MetricBase Trigger Filtering Condition New Record form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the Condition Script.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of the Condition Script. The value, Global, means that the action applies to all applications.</td>
</tr>
<tr>
<td>Description</td>
<td>Explanation of what the Condition Script does.</td>
</tr>
<tr>
<td>Script</td>
<td>Field to enter the JavaScript. Make it returns True to execute a flow. See the next step.</td>
</tr>
</tbody>
</table>

3. Write the Condition Script.
   The key part of these scripts is the conditional statements. If all evaluate true, the script returns True and the flow executes, otherwise it does not. The following example script triggers a flow when a drone is traveling too fast at a low altitude (defined by level 1). The example shows a typical approach to writing a Condition Script.
   a) Get the trigger definition.
   b) Get the record (current) that is causing the triggering event.
   c) Get the time from the record that the trigger conditions were satisfied.
   d) Get the trigger level, which defines the trigger parameters.
   e) Use these parameters to return True if the level 1 trigger conditions are met and travel_state equals traveling or speeding.

   ```javascript
   function filter(/*GlideRecord*/ triggerDefinition, /*GlideRecord*/ current, /*GlideDateTime*/ start, /*int*/ level) {
     // retrieve current travel state of drone
     var travel_state = String(current.travel_state);

     // the drone is traveling at a significant speed, and the altitude just went below the threshold
     if ((travel_state === 'traveling') || (travel_state === 'speeding')) {
       return true; //process this trigger
     }

     return false; // don't process this trigger
   }
   ```

   **Note:** Condition Scripts must execute quickly.

4. Click **Submit**.

Use Flow Designer to **associate a flow with a trigger**. When configuring a flow, you can select a Condition Script you created.
Assign a trigger to a flow

Now that you created a trigger, use Flow Designer to specify the flow a trigger executes. The flows provide alerts for unexpected behavior.

Role required: admin

Triggers, by themselves, execute nothing. After defining a trigger in MetricBase, you use Flow Designer to associate the trigger with a flow.

1. Navigate to MetricBase > Triggers.
   Flow Designer displays a list of triggers associated with Flow Designer flows.
2. Click New > New Flow.

   **Note:** If the list contains triggers, click +New and then New Flow in the list.
3. Enter values for the modal fields and click **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Name of the flow to execute. The system computes the internal name of the flow from the name.</td>
</tr>
<tr>
<td><strong>Application</strong></td>
<td>Application scope to create your flow in. Global is the default.</td>
</tr>
<tr>
<td><strong>Protection</strong></td>
<td>Option to make the flow read-only. Selecting read-only prevents users who do not own the application scope from making changes to the flow. You can only select a value when you create the flow in an application scope you own.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Explanation of why you are associating this flow with the trigger.</td>
</tr>
<tr>
<td><strong>Run As</strong></td>
<td>Choose whether the flow runs as System User or the user who initiates the session. Use the user who initiates the session option when the update should come from the user who triggered the flow. For example, comments to incident records that should come from the current user, or approval emails that should originate from the approver. Settings on a flow do not apply to child subflows. When run as the user who initiates the session, flow actions are limited by the user's ACL restrictions. Flows run by the initiating user respect user-specific settings like date/time format.</td>
</tr>
</tbody>
</table>

**Note:** When choosing the option to run as the user who initiates the session, ensure that security restrictions do not prevent users who will trigger the flow from performing the flow actions.

A tab opens and the tab name is the value for **Name**.

4. Click **Click to add a trigger** to specify the trigger that kicks off this flow.
   A modal displays that enables you to find and select a trigger type.

5. Scroll and select MetricBase for the trigger type.
   The Flow Designer form displays.
6. Under **TRIGGER**, fill in the form to define the trigger to associate with this flow.
   a) Beside **MetricBase Trigger**, click the magnifying glass to select an existing trigger or click the plus sign (+) to define a new trigger.
   b) Optionally, add requirements for the flow to execute by clicking **Add Filter** and adding filter conditions, for example, **flight-status is not landed**.
   c) Optionally, beside **Condition Script**, click the magnifying glass to select a [condition script](#) or click the plus (+) to [create a script](#).
      Condition scripts add additional requirements for a trigger to execute a flow.

7. Under **ACTIONS**, click **Click to add an Action, Flow Logic, or Subflow** and select a category in the first column and a flow action in the second column.
8. Click Done.

9. Test the flow.
   a) Navigate to Flow Designer > Designer, and double-click the flow.
   b) Click Test.
      The Test flow dialog box displays. The contents of the Test flow dialog depend on the type of trigger: Data or Schedule. If the trigger is a Data trigger, the dialog asks for a record to use for the test.
   c) Select a record in the dialog box and click Submit.

   **Note:** When you test a flow, the system does not execute the trigger, and therefore does not create a new record. By selecting a record in the Test flow dialog box, the system acts as if that record was just created. For more information, see Test a flow.

10. Click Activate to activate the trigger.
The flow will not execute unless you activate it.

**Maintain MetricBase**

View the status of MetricBase and debug its triggers.

**View MetricBase status and statistics**

You can view the status of the MetricBase database.

Role required: admin

1. View the status of the MetricBase instance.
   a) Navigate to System Diagnostics > Stats > Stats
   b) Scroll down to find MetricBase Statistics

   ![MetricBase Statistics](attachment:image)
   
   **MetricBase Statistics**
   
   Status: ONLINE
   Name: clotho
   Connection Pool stats: [leased: 0; pending: 0; available: 1; max: 42]

2. View the metrics monitored by MetricBase and statistics about them.
   a) Click MetricBase > MetricBase Status

   The MetricBase Status page displays all of the metrics tracked in MB.
b) Click the gear icon. The Personalize List Columns modal displays.
c) Select and move metrics from the **Available** column to the **Selected** column to display the metric and click **OK**.
The metrics display on the MetricBase Status page.
View trigger logs

Trigger logs show different levels of trigger malfunctions.
Role required: admin
1. Navigate to MetricBase > MetricBase Triggers > Trigger logs.
2. Click one of the trigger logs.
4. Optional: Change the default values in the Enter parameters for log file entries to browse form to select the log entries to view and click Submit.

Debug MetricBase

You can display the results of debugging scripts in MetricBase.
Role required: admin
1. Navigate to System Diagnostics > Session Debug > Debug MetricBase.
When the page you are on submits queries to MetricBase, you see the transforms and how long they took on the bottom of the page. Submitting a lot of MetricBase queries may slow down the page load time significantly.

2. To view a history of the debug script’s execution, click available here.

3. Click Update. Session debug tracking for MetricBase activities starts and the MetricBase Status page displays.

Get familiar with MetricBase APIs

Experiment with MetricBase APIs using Data Explorer that is part of the MetricBase Demo application. Data Explorer uses the data installed with the MetricBase Demo application.

Role required: clotho_admin

Data Explorer is a playground where you can see and edit example scripts that visualize data included with the MetricBase Demo application. The example scripts use the MetricBase JavaScript APIs. For information on the MetricBase JavaScript APIs, see Client, Data, DataBuilder, Transformer, TransformPart, TransformResult.

Example scripts use either:

- Transforms, which use the Transformer method.
- Machine Language, trained models that predict expected behavior. All the scripts without "Transform" in their title use Machine Language.

1. Navigate to MetricBase Demo > Data Explorer. The Data Explorer displays.
When you run a script, the data visualization appears under **Data Explorer Script Result Display**.

2. Select one of the sample scripts to run in the **Example Script** menu.
3. Click **Load Example**.
4. Click **Run**.
   The script displays the data visualization under **Data Explorer Script Result Display**.
5. Optional: Change the values or statements in the script or write an entirely new script and click **Run**.
   
   **Note:** If you want to save the changes you made in the script, click **Save**.

6. Under **Server Output**, look at the server's response that might include error information.
### Example scripts

<table>
<thead>
<tr>
<th>Example script</th>
<th>Definition and visualization</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simple Transform</td>
<td>Uses the transformer API to display a single time-series metric, the average speed of the drones: transformer.metric('mb_demo_mt_speed').avg()</td>
</tr>
</tbody>
</table>

![Graph of average speed of drones over time]
<table>
<thead>
<tr>
<th>Example script</th>
<th>Definition and visualization</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simple Transform with Grouping</td>
<td>Uses the transformer API to display a group of time-series metrics, the average altitude of the fleet of the drones:</td>
</tr>
<tr>
<td></td>
<td>transformer.groupBy(&quot;fleet&quot;).metric(&quot;mb_demo_mt_altitude&quot;).avg().label('avg - %g:fleet:')</td>
</tr>
<tr>
<td>Normal Model</td>
<td>Models normal data, which approximates a bell-shaped or Gaussian curve for distributed values.</td>
</tr>
</tbody>
</table>
**Example script**

```
var builder = new sn_clotho.Transformer(drones);
var fit =
    builder.metric("mb_demo_nt_rem_battery").resample(100).
    fit({model:"linear"}).label("Fitted");
builder.metric("nb_demp_mt_rem_battery").avg().label("Original");
```

**Definition and visualization**

Linear Model

Create a line to summarize the current data and predict future values. This example, about the remaining charge in drone batteries, graphs both the trained model values and the average of the values.
<table>
<thead>
<tr>
<th>Example script</th>
<th>Definition and visualization</th>
</tr>
</thead>
</table>
| Seasonal Trend Decomposition Model | Uses a seasonal trend model so that data can be subtracted to reveal non-seasonal trends. This model is similar in purpose to the Holt Winters model but arrives at the result using different algorithms.  
```
var builder = new sn_clotho.Transformer(drones);
var metric = "nb_demo_mt_rem_battery";
var fit = builder.metric(metric).fit({model:"STL",periodicity:"PT2H", innerCycles:1, outerCycles:10})
``` |
| Holt Winters Model | Uses the Holt Winters, seasonal trend model so that data can be subtracted to reveal non-seasonal trends. This model is similar in purpose to the Seasonal Trend Decomposition model but arrives at the result using different algorithms. |
| ARIMA Model | The most general class of models for predicting time-series data that has no trend, meaning all the data has the same value or the values fluctuate sinusoidally around the mean. |
### MID Server

The Management, Instrumentation, and Discovery (MID) Server is a Java application that runs as a Windows service or UNIX daemon on a server in your local network. The MID Server facilitates communication and the movement of data between a ServiceNow instance and external applications, data sources, and services.

The MID Server initiates all communications with the ServiceNow® instance. This communication is recorded as records in the **ECC Queue**, which acts as the communication log between the instance and the MID Server. The MID Server picks up any work it has to do from the ECC Queue and returns the results of that work to the queue.

This video gives you an overview of the MID Server:
Setting up the MID server

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

This documentation provides detailed instructions for setting up a functioning MID Server for use with ITOM applications. Click the icons to go to each task’s portal page. These procedures help you prepare your system, download and run the installer, and configure MID Servers to run in your environment. After you get a valid MID Server up and running, you can add security and encryption to protect your data.

At the bottom of each page is a link to the reference materials you need, such as system requirements, configuration parameters, and instructions for monitoring your MID Server. Use the additional link at the bottom to move through the content within a specific category or return to the MID Server setup to access a different portal.

If you are new to the MID Server or an experienced user who wants to set up a MID Server quickly, you can use the MID Server Guided Setup. This wizard walks you through the process of installing and configuring a MID Server with default settings in just a few steps.

Upgrading the MID Server

The MID Server checks with the instance periodically to see if an upgrade is necessary. If the MID Server detects that a new version is available for upgrade, it downloads the installer from install.service-now.com and runs the package automatically. You can also elect to upgrade the MID Server manually. See MID Server upgrades for details.
Resolving MID Server issues

You can search the Hi Knowledge Base for troubleshooting articles or monitor the MID Server status and track active issues from within the instance. See Resolving MID Server issues for details.

ServiceNow applications that use the MID Server

- Discovery
- Orchestration
- Service Mapping
- Event Management
- Operational Intelligence
- Cloud Management

External applications that use the MID Server

- Import Sets
- Microsoft SMS/SCCM
- LANDesk Maintenance Suite
- Microsoft System Center Operations Manager (SCOM)
- Microsoft MIIS

MID Server version compatibility

The version of the MID Server must be compatible with the version of the instance. Otherwise, the MID Server cannot process commands or communicate with the instance.

The instance determines which version of the MID Server is allowed. The MID Server version must at minimum belong to the same major release, such as Madrid. If the MID Server version belongs to the same major release, it can, but does not have to, belong to the same minor version, such as Madrid Patch 1. In this case, communication with the instance might still be possible, but it is always suggested that you upgrade to the latest version.

Caution: You can pin the MID Server to a specific version, but you should be aware that the version might become out of date.

Configure MID Server network connectivity

Prepare the network for MID Servers to connect with the instance and access the download site. The network must be prepared before installing or configuring the MID Server. If computers or devices have additional security measures, that security may interfere with MID Servers on those systems.

Role required: admin
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Ensure that the MID Server can connect to elements inside and outside your network
3. Configure MID Server security
4. Configure your MID Server
5. Download and install the MID Server on a Linux or Windows host
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The MID Server host computer must have access to the ServiceNow download site at install.service-now.com to upgrade automatically. If you have a self-hosted ServiceNow environment that blocks access to the download site, you must import the MID Server installer package into your MID Server hosts manually. For instructions, see KB0760123 in the Self-Hosted knowledge base.

The host machine must have these network privileges:

- Firewall access: Configure any firewalls between the MID Server and the target devices to allow a connection. If your network uses a DMZ, and if your network security protocols limit port access from within the network to the DMZ, you might have to deploy a MID Server to a machine within the DMZ to probe the devices there.
- Network access: Configure target devices to allow the MID Server probe to connect. If network security prevents you from configuring new machines that can connect to the targets, install the MID Server on an existing machine with connection privileges.
- Network account: Install the MID Server with the proper account, either local or domain administrator.

Additionally, for the MID Server to access your ServiceNow instance, satisfy these prerequisites:

- Network access to the ServiceNow instance: Configure the network that the MID Server uses to allow traffic over TCP port 443.
- A MID user: Create a ServiceNow user record for the MID Server to use. This user record must have the mid_server and import_admin roles.

**Note:** Verify that the baseline public page InstanceInfo is active for the MID Server to connect to the instance.

1. Configure the network to allow MID Server network connectivity to the ServiceNow instance over TCP port 443.
2. Configure basic authentication for SOAP communications with the ServiceNow instance.
3. Navigate to System Web Services > Scripted Web Services > Scripted SOAP Services.
4. Confirm that the following web services are active:
   - GetMIDInfo
   - InstanceInfo
   - MIDAssignedPackages
   - MIDFieldForFileProvider
   - MIDFileSyncSnapshot
   - MIDServerCheck
   - MIDServerFileProvider

5. Type `sys_public.list` in the navigation search field and press Enter.
   The Public Pages record list appears.

6. Verify that the `InstanceInfo` public page is active, to allow the MID Server to validate its version.

7. Ensure that the MID Server host computer can access the download site at `install.service-now.com`.

After the network is prepared, proceed to Installing the MID Server.

Prepare network connections for MID Servers

Before you install the MID Server, perform the necessary prerequisites that it needs to connect to elements inside and outside your network. This includes network privileges and security considerations.

Security considerations

Sometimes computers or devices have additional security measures configured, and these measures may interfere with the MID Server's ability to run commands or queries on those systems.

For example, a Linux server might be configured to allow only certain IP address to connect to it via SSH. Similarly, a network router might be configured to allow only certain IP address to query SNMP on it. To allow access in such cases, use one of the following methods:

- Update the configuration of those computers or devices to allow the desired MID Server to run commands or query them. For example, a network router may be configured to only allow the network management systems to query SNMP on it. In that case, add the MID Server as though it were another network management system.
- Install a MID Server on a computer that already has access to the computers or network devices with such restrictions. For example, to use Discovery within a DMZ (where communication from outside the DMZ will be severely restricted), install a MID Server on a computer that is already in the DMZ.

External connectivity requirements

These requirements are specifically for the use of MID Servers with the ServiceNow® Discovery and Orchestration products.

The MID Server communicates securely on port 443 to the instance and requires no inbound connections. In some cases, it might be necessary to allow this communication through the firewall if the MID Server fails to register on the instance. To determine if the application or a network security restriction is to blame for connection failure, attempt to telnet to the instance on port 443 from the server that is hosting the MID Server application. If this connection fails, then the problem could be a web proxy (since 443 is an https connection) or a Firewall rule.
preventing external TCP connections from that host. Contact network security personnel for the proxy information to add to the config.xml file, or request that the firewall be configured to allow access using one of the following syntaxes:

- `<source IP> to <any>`
- `<source IP> to <ServiceNow> any established`
- `<source IP> to <instance_name.service-now.com> 443`

**Important:** The MID Server host computer must have access to the ServiceNow download site at `install.service-now.com` to upgrade automatically. If you have a self-hosted ServiceNow environment that blocks access to the download site, you must import the MID Server installer package into your MID Server hosts manually. For instructions, see KB0760123 in the Self-Hosted knowledge base.

### Internal connectivity requirements

These methods are used for discovering various devices on a network and are specifically for the use of MID Servers with the Discovery and Orchestration products.

- **SSH:** For UNIX-like machines, Discovery and Orchestration use SSH protocol, version 2 to access target machines. SSH is a network protocol that allows data to be exchanged using a secure channel between two networked devices. SSH communicates on port 22 within an encrypted data stream and requires a login to access the targets using two available methods of authentication: a user name and password combination and a user name and shared private key. Specify SSH authentication information and type in the Credentials module. If multiple credentials are entered, the platform tries one after the other until a successful connection is established or all are ultimately denied. To provide for application relationships a limited number of SUDO commands must be available to be run. Additional details to these requirements can be found in UNIX/Linux commands requiring root privileges for Discovery and Orchestration.

- **WMI:** For Windows machines, Discovery uses the Windows Management Instrumentation (WMI) interface to query devices. Due to security restrictions for WMI, the MID Server application executing the WMI queries must run as a domain user with local (target) administrator privileges. When Discovery detects activity on port 135, it launches a WMI query. The response from the Windows device is sent over a Distributed Component Object Model (DCOM) port configured for WMI on Windows machines. This can be any port. Ensure that the MID Server application host machine has access to the targets on all ports due to the unique nature of the WMI requirements.

- **Windows PowerShell:** PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. Orchestration uses PowerShell to run Workflow activities on Windows machines. PowerShell must be installed on any MID Server that executes these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 2.0 and 3.0. Orchestration activities for PowerShell require a credentials Type of Windows.

- **SNMP - Network:** For network devices, Discovery uses an SNMP scan to get device specific MIBs and OIDs. SNMP is a common protocol used on most routers, switches, printers, load balancers and various other network enabled devices. Use a community string (password) for authentication when scanning a device via SNMP. Many devices have a default community string of public which Discovery uses by default when querying a target. Define additional community strings in the SNMP credentials form which are tried in succession, along with public, until a successful query returns. In addition to the credentials, the platform also requires the ability to make SNMP requests on port 161 from the MID Server to the target. If Access Control Lists (ACLs) are in place to control the IP addresses that can make these queries,
ServiceNow New York Now Platform Capabilities

ensure that the IP address of the MID Server is in the ACL. Discovery supports SNMP versions 1, 2c, and 3.

- **WBEM**: Web-Based Enterprise Management (WBEM) defines a particular implementation of the Common Information Model (CIM), including protocols for discovering and accessing each CIM implementation. WBEM requires either of two ports, 5989 or 5988 and uses the HTTP transport protocol. WBEM supports SSL encryption and uses CIM user name/password credentials. Discovery launches a WBEM port probe to detect activity on the target ports and to append gathered data to a classification probe that explores CIM Servers.

**Installing the MID Server**

Download and install the MID Server on the host machine, test the connection, and then validate the MID Server. Use the manual procedures or the guided setup. Set up multiple MID Servers for load balancing and domain separation. These procedures prepare it for use with any application.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Ensure the **MID Server connection prerequisites** are met, then install the MID Server manually or use the guided setup utility.

**MID Server manual installation**

The manual process requires these setup tasks, performed in the order shown here:

1. Create the MID Server user account and grant the appropriate role to this user.
2. Download the installer file for the host machine.
3. Install the MID Server on a Linux or Windows host.
4. Validate the MID Server to ensure that it is trusted to access credentials used by the instance for automations.
5. Test connectivity between the MID Server and the instance for automatic upgrades.

© 2019 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
6. Optionally, deploy multiple MID Servers in your network for load balancing or when domain separation is enabled.

**MID Server guided setup**

Alternatively, the MID Server Guided Setup streamlines the process and allows you to set up a basic MID Server quickly.

**Create the MID Server user and grant the role**

To communicate with the instance, MID Servers need a user ID and the appropriate role. Create the user ID for a MID Server and grant the ID the mid_server role. To prevent MID Server validation failure, the system runs business rules to monitor the settings selected for MID Server users.

Role required: admin

---

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The MID Server connects to an instance by using the SOAP web service. To allow authentication with the instance, create a separate user account for each MID Server or share the same account across multiple MID Servers. Grant each MID Server user the mid_server role, which is required for the MID Server user on any instance on which basic authentication is enabled. The mid_server role allows the MID Server to access protected tables when strict SOAP security is in place. The system adds the necessary SOAP roles automatically with this role.

**Note:** The strict SOAP security feature, enabled by default for any instance that uses basic authentication, protects all tables with Access Control Lists (ACL).

1. From the instance, navigate to **User Administration > Users**.
2. Click **New**.
3. Complete the fields in the form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>User name for the MID Server user. This name is specified in the <code>mid.instance.username</code> parameter of the configuration file that the MID Server installer creates. For details, see MID Server parameters.</td>
</tr>
<tr>
<td>First name</td>
<td>The user's first name.</td>
</tr>
<tr>
<td>Last name</td>
<td>The user's last name.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for the MID Server user. This password is specified in the <code>mid.instance.password</code> parameter of the configuration file that the MID Server installer creates.</td>
</tr>
</tbody>
</table>

4. Right-click the header and select Save.
5. Under the Roles related list, click Edit.
6. Select the mid_server role for this user.
   Each MID Server account must have this role to access protected tables.
7. Click Save.
8. Confirm that the MID Server account was created successfully and the account has connectivity to the instance.
   a) On the host machine where you intend to install the MID Server, open a browser and navigate to the instance.
   b) Use your new MID Server user credentials to log in.
      If the login is successful, then any MID Servers you install on that host will be able to connect to the instance.

**MID Server role validation**

Real-time system validation of MID Server role assignments prevents incompatible settings.

To prevent MID Server validation failure and ensure that your MID Server is configured correctly, the system runs several business rules that monitor the roles and settings you select for your MID Server user. The instance displays a warning and blocks the change when you attempt to save an incompatible configuration.

**Elevated privileges not permitted**

The mid_server role cannot be configured for elevated privileges. The Invalid MID Server settings business rule runs on the Role (sys_user_role) table and prevents the elevated_privileges field from being set to true for the mid_server role.
Warning for elevated privileges on the mid_server role

Relationship table protection

The User Role (sys_user_has_role) table creates the relationship between the User (sys_user) and the Role (sys_user_role) tables.

- **Incompatible role**
  
The mid_server and security_admin roles are incompatible and cannot be assigned to the same user. The system determines the user's current role and runs the **Security Admin incompatible with MID** business rule on the User Role (sys_user_has_role) table. This rule prevents an administrator from adding the security_admin role for a user who currently has the mid_server role.
Warnings for incompatible security_admin role assignment

- **Incompatible user role and user record settings**
  
The Incompatible MID Server user role business rule runs on the User Role (sys_user_has_role) table to protect its data from incompatible configurations. Validation for this related table ensures that an administrator cannot assign the mid_server role to a user who already holds the security_admin role.

**What to do next**

*Download* the MID Server files for your operating system.

**Download the MID Server files**

Download the MID Server installer package through the instance and make it available for installation on the host. Allow the local network to access the authorized IP addresses to ensure that you can download the installation package and receive automatic upgrades.

Role required: admin
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The IP address of the MID Server download site (install.service-now.com) can change without notice. To ensure that you can download the MID Server installation package and receive automatic MID Server upgrades, allow local network access to these IP addresses:

- 149.96.5.98
- 149.96.6.98

**Note:** Download the MID Server first and then enable Discovery, Orchestration, or any integration that requires the use of the MID Server.

1. On the ServiceNow instance, navigate to **Mid Server > Downloads**.
2. Select and download the MID Server for the appropriate operating system.
   For the best performance, install the 64-bit MID Server for your operating system.

**Note:** ServiceNow will discontinue support for 32-bit MID Servers in a future release.
MID Server downloads

3. Save the download file to a temporary file on the local drive.
4. Move the file into the designated MID Server folder you create for your operating system and run the installer from that location.

Install the MID Server on the host computer.
- **Linux**
- **Windows**

**Install a MID Server on Linux**

Install MID Servers with the MID Server installation package and verify it is active. The package includes an installer that automatically configures OpenJDK to run in the environment. The MID Server can use an existing JRE rather than the provided OpenJDK. Uninstall the MID Server to redeploy it.

Verify that the host computer satisfies the [MID Server system requirements](#).

Role required: admin, mid_server
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

OpenJDK version 1.8.0_181 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures OpenJDK to run in your environment. No additional configuration is required. This version supports both 32-bit and 64-bit MID Servers. For the best performance, install the 64-bit MID Server for your operating system. The MID Server requires a minimum JRE version 1.8.0_161, and recommended version 1.8.0_181. If you are using a lower version than 1.8.0_161, you may see encryption related issues.

Note: ServiceNow will discontinue support for 32-bit MID Servers in a future release.

Upgraded MID Servers might use different Java versions depending on their release level.

- MID Servers upgraded from Kingston and earlier use the OpenJDK provided with the MID Server installer. This version of the OpenJDK was tested and certified for use with these MID Servers.
- MID Servers upgraded from London continue to use the same JRE you configured for London. The MID Server supports JRE 1.8.

Click this link to view the installation video:

1. From the Linux command line, type `mkdir -p /servicenow/mid server name` to create the installation directory. You need to have read/write/execute permissions on this folder.
2. Extract the downloaded MID Server archive file, *mid.os.zip* into the *servicenow/mid server name* directory. Use the MID Server name created in the instance or create a new name that you will use for this MID Server moving forward. The resulting directory structure is *servicenow/<mid server name>*/agent.
3. Change to the *servicenow/mid server name* /agent directory, and enter the following command to start the MID Server installer: `./installer.sh`.
   If you prefer to manually configure the MID Server instead, skip to step 13.
4. Use the installer to enter the following information.
**Configure Instance Connectivity**

- **ServiceNow instance URL**: `https://[inst.name].service-now.com/`
- **ServiceNow MID Server username**: `midserver`
- **ServiceNow MID Server password**: `************`
- **Use proxy**: checked
- **Proxy host**: `proxyserver.domain.com`
- **Proxy port**: `3238`
- **Proxy username**: `proxyuser`
- **Proxy password**: `************`

**Test your connection**

**View Installer Logs**

<td>Modify this field if necessary. It is populated automatically by prefixing <code>ServiceNow MID Server_</code> to the MID Server name. In most cases, you do not need to modify this.</td>
</tr>
</tbody>
</table>

8. Click **Next** to view the summary.
Your MID Server has been successfully configured!

To begin using the MID Server:

1. Click **Start MID Server**.
2. Click **MID Servers List Page**. It may take a few seconds for your MID Server to appear.
3. Click on the record for "My_Linux_mid_server" then click **Validate** under Related Links.

For installation details, you may check the log files at: /agent
9. **Click Start MID Server.**
The local host starts the MID Server.

When the MID Server service starts, it verifies that it is the only active (not down) MID Server with that name. If the MID Server discovers another active MID Server with the same name, the starting MID Server waits 5 minutes and sends another query. The MID Server repeats this query three times and logs each attempt in the agent log. If the MID Server still detects a duplicate after this cycle, it creates a record in the **MID Server Issue (ecc_agent_issue) table** and shuts down.

**Note:** The record in the MID Server Issue (ecc_agent_issue) table cannot be resolved automatically by the instance. Close this record manually for accounting purposes. Either mark the issue **Resolved** or delete it.

10. **Click Mid Servers List Page.**
The installer opens the MID Server list from your instance.

11. **Select the MID Server name from the list.**

**Note:** It may take a few seconds for the MID Server time to establish a connection with your instance.

The system displays the MID Server record.

12. From **Related Links**, click **Validate.**
The MID Server **Validated** changes to **Yes.**

13. To configure the MID Server manually, change to the **servicenow/mid server name** / **agent** directory, and then edit the **config.xml** file as follows:

   a) Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` and change the value to the URL of your instance.

   b) Enter the MID user credentials in the **mid.instance.username** and **mid.instance.password** parameters.

   By default, the MID Server uses basic authentication for SOAP messages. The password value is also encrypted authentication.

   c) Find the `<parameter name="name" value="YOUR_MIDSERVER_NAME_Goes_HERE" />` element and change the value for the MID Server name.

   d) Optional: Enter connection information for the proxy server. Remove the appropriate comment tags from the proxy configuration information. For example, you can configure these parameters:

   - **mid.proxy.use_proxy**
   - **mid.proxy.host**
   - **mid.proxy.port**
   - **mid.proxy.username**
   - **mid.proxy.password**

14. **Start the MID Server and verify that it is active.**

   a) In the MID Server home directory (**agent**), execute the shell script **start.sh** to start the new MID Server.

   b) Log into the instance and navigate to **MID Servers > Servers** to verify that your new MID Server has a **Status or Up**.

   Additional log information appears here:

   - The MID Server log on the instance.

© 2019 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
15. To configure the MID Server to restart automatically when the host is restarted, run
${base_install_dir}/agent/bin/mid.sh install as root.
This command installs the MID Server as a daemon service and adds the auto start scripts to the init.d directory.

Note: You cannot install more than one MID Server service as a daemon on a Linux host. This is a limitation of the Tanuki wrapper service.

16. To stop the MID Server, navigate to the MID Server home (agent) directory and execute the stop.sh shell script.

17. To restart a stopped MID Server, navigate to the MID Server home (agent) directory and execute the restart-service.sh script, using one of these commands:
   - ./restart-service.sh
   - sh restart-service.sh
   - bash restart-service.sh

Configure a Linux MID Server to use an existing JRE

You can choose to use an existing JRE for your MID Server rather than the OpenJDK provided with the MID Server installer.

Ensure that your JRE version is supported. See MID Server system requirements for details.

Role required: admin

By electing to use your own JRE, you are responsible for upgrading it as necessary. For a detailed procedure and cautions regarding changing the JRE, see KB0778272.

1. Navigate to this file in the MID Server installation directory:
   agent/conf/wrapper-override.conf
2. To specify the existing Java executable that you want to use, add this line to the file:
   wrapper.java.command={your_java_executable}
   For more information, see the Java service wrapper property documentation.
3. Save the file.

Uninstall a Linux MID Server

The MID Server runs as a stand-alone service. You can remove a stand-alone MID Server service to accommodate such tasks as redeploying the MID Server to another host machine or changing the unique name of a MID Server when deploying multiple MID Servers.

Role required: admin

1. To stop the running MID Server service, navigate to the MID Server home (agent) directory and run stop.sh.
2. From a command prompt, go to the \agent\bin directory in the MID Server installation directory.
3. Confirm that the MID Server is stopped by executing the bin/mid.sh status shell script.
4. After the MID Server stops, delete the files in the agent directory.

Validate the MID Server to prepare it for use.
Install a MID Server on Windows

Install MID Servers with the MID Server installation package and verify it is active. The package includes an installer that automatically configures OpenJDK to run in the environment. The MID Server can use an existing JRE rather than the provided OpenJDK. Uninstall the MID Server to redeploy it.

- Verify that the host computer satisfies the **MID Server system requirements**.
- Ensure that the Microsoft Application Experience Lookup Service is enabled on the MID Server host. If this service is disabled, the MID Server auto-upgrade might fail, causing the MID Server to go down. For information on managing issues with the Application Experience service, see KB0597552.

Role required: admin or mid_server

![Diagram: Connect, Install, Configure, Encrypt]

OpenJDK version 1.8.0_181 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures OpenJDK to run in your environment. No additional configuration is required. This version supports both 32-bit and 64-bit MID Servers. For the best performance, install the 64-bit MID Server for your operating system. The MID Server requires a minimum JRE version 1.8.0_161, and recommended version 1.8.0_181. If you are using a lower version than 1.8.0_161, you may see encryption related issues.

**Note:** ServiceNow will discontinue support for 32-bit MID Servers in a future release.

Upgraded MID Servers might use different Java versions depending on their release level.

- MID Servers upgraded from Kingston and earlier use the OpenJDK provided with the MID Server installer. This version of the OpenJDK was tested and certified for use with these MID Servers.
- MID Servers upgraded from London continue to use the same JRE you configured for London. The MID Server supports JRE 1.8.
Click this link to view the installation video:

1. Log in to the Windows host machine where you want to install the MID Server.
2. Create a folder for the MID Server on the top level of the drive such as ServiceNow\MID Server1.
3. Download the MID archive file into the new folder.
4. Right-click the archive and select **Extract All**.
5. Navigate to the `service-now\<mid server name>\agent` folder that was created when the file was extracted.
6. Run `installer.bat` to start the MID Server installer.
   To configure the MID Server manually, skip to step 16.
7. Use the installer to enter the following information.
Configure Instance Connectivity

- ServiceNow instance URL: https://[inst.name].service-now.com/
- ServiceNow MID Server username: midserver
- ServiceNow MID Server password: ************
- Use proxy: 
- Proxy host: proxyserver.domain.com
- Proxy port: 3238
- Proxy username: proxyuser
- Proxy password: ************

11. Click **Next** to view the summary.
12. Click **Start MID Server**.
   The local host starts the MID Server.

   **Note:** If the MID Server fails to start, the cause might be a duplicate name or multiple services that point to the same executable path. See [MID Server fails to start](#) for details.

13. Click **Mid Servers List Page**.
14. Select the MID Server name from the list.

**Note:** It may take a few seconds for the MID Server time to establish a connection with your instance.

The system displays the MID Server record.

15. From Related Links, click Validate. The MID Server Validated changes to Yes.

16. To configure the MID Server manually, edit the `config.xml` file with a text editor such as WordPad:
   a) Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` element and change the value to the URL of your instance.
   b) Enter the MID user credentials in the `mid.instance.username` and `mid.instance.password` parameters. By default, the MID Server uses basic authentication for SOAP messages. The password value is also encrypted authentication.
   c) Optional: Find the `<parameter name="name" value="YOUR_MIDSERVER_NAME_GOES_HERE" />` element and change the value for the MID Server name.
   d) Optional: Enter connection information for the proxy server. Remove the appropriate comment tags from the proxy configuration information. For example, you can configure these parameters:
      - `mid.proxy.use_proxy`
      - `mid.proxy.host`
      - `mid.proxy.port`
      - `mid.proxy.username`
      - `mid.proxy.password`

17. Start the MID Server and verify that it is active.
   a) In the MID Server home directory (`agent`), execute the batch file `start.bat` to start the new MID Server.
   b) Log into the instance and navigate to MID Server > Servers to verify that the Status of your new MID Server is Up.

      Additional log information appears here:
      - The MID Server log on the instance.
      - The corresponding `agent0.log.0` and wrapper logs (`wrapper.log`) in the MID Server `agent\logs` folder.

18. To stop the MID Server, use either of these procedures:
    - **Windows command line**: From the MID Server home directory (agent) run `stop.bat`.
    - **Windows Services console**: Right click `ServiceNow <MID Server name>`, and then select Stop.

19. To restart a stopped MID Server, use either of these procedures:
    - **Windows command line**: In the MID Server home directory (agent).
• **Windows Services console**: Right click **ServiceNow <MID Server name>**, and then select **Start**.

**Configure Windows MID Server service credentials**

MID Server service credentials are required to manage the MID Server service on the host machine, including its ability to successfully auto-upgrade.

By default, the MID Server service runs as a **Local System** account. This account has privileges to create and run the MID Server service and to download, create, and move files for the MID Server auto-upgrade process.

Windows service credentials are not the same as the MID Server user credentials, which allow communication between the MID Server and the instance. You must configure both of these credentials separately. See [Create the MID Server user and grant the role](#) for instructions on MID Server user credentials.

**Attention:** This procedure is optional. Allowing the MID Server service to run as a Local System account is sufficient for a majority of users.

1. Open the Windows Services console.
2. Double-click the **ServiceNow <MID Server name>** service for each MID Server.
3. Select the **Log On** tab.
4. Set **Log on as** privileges with the user account (local or on a domain) that has local admin access to the MID Server host.
   The MID Server upgrade process deploys a temporary Windows service which requires local administrator privileges.
5. In the **General** tab, set the **Startup type**.
   The field is set to **Automatic** by default.
6. Click **OK**.
7. Restart the **ServiceNow <MID Server name>** service, and make sure that **ServiceNow\<MID Server name>\agent\logs\agent0.log** does not have error messages. If the MID Server does not start, see the ServiceNow knowledge article [Review the agent log for MID Server errors](article KB0535148).
8. On the instance to which this MID Server is connected, navigate to **MID Server > Servers**. If Discovery is installed, alternately navigate to **Discovery > MID Servers**.
   All MID Servers connected to this instance are listed.
9. Make sure that the Status of the MID Server you just installed is **Up**.

**Manually install a MID Server as a Windows Service**

If you did not start the MID server at the end of the installation procedure, you can manually install the MID Server to run as a Windows service.

Role required: admin

You can install a MID Server as a Windows service in these operating systems:

- Windows Server 2008
- Windows Server 2012
- Windows Server 2016

1. Open the agent directory in the directory you created for the MID Server installation files. For example, the path might be **C:\ServiceNow\MID Server1\agent**.
2. Right-click the **start.bat** file, and select **Properties**.
3. Select the option to **Run as administrator**.
4. Double-click the `start.bat` file to install the Windows service.

**Configure a MID Server on Windows to use an existing JRE**

You can choose to use an existing JRE for your MID Server rather than the OpenJDK provided with the MID Server installer.

Ensure that your JRE version is supported. See [MID Server system requirements](#) for details.

Role required: **admin**

By electing to use your own JRE, you are responsible for upgrading it as necessary. For a detailed procedure and cautions regarding changing the JRE, see [KB0778272](#).

1. Navigate to this file in the MID Server installation directory:
   `agent/conf/wrapper-override.conf`

2. To specify the existing Java executable that you want to use, add this line to the file:
   `wrapper.java.command={your_java_executable}`

   For more information, see the Java service wrapper property [documentation](#).

3. Save the file.

**Uninstall a Windows MID Server**

The MID Server runs as a stand-alone service. You can remove a stand-alone MID Server service to accommodate such tasks as redeploying the MID Server to another host machine or changing the unique name of a MID Server when deploying multiple MID Servers.

Role required: **admin**

1. Stop the running MID Server service, using either of these procedures:
   - **Windows command line**: From the MID Server home (`agent`) directory, run `stop.bat`.
   - **Windows Services console**: From the Windows Services console, right-click the **ServiceNow MID Server name** and then select **stop**.

2. From a command prompt, go to the `\agent\bin` directory in the MID Server installation directory and double-click the `UninstallMID-NT.bat` file.

3. Check the Windows Services console for a service named **ServiceNow WMI Collector**. If the service is running, open a command prompt, navigate to `agent\bin\sw_wmi\tools`, and double-click `uninstall_wmi.bat`

   **Validate** the MID Server to prepare it for use.

**Validate the MID Server**

You must manually validate the MID Server after it is installed to enable it to execute automation tasks. You can invalidate a MID Server you suspect has been compromised to prevent it from accessing automation credentials in the instance or executing outbound ECC probes.

Role required: **agent_admin, admin**
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Make sure that the MID Server version is compatible with the instance.

Validation restricts access to automation credentials to trusted MID servers only.

You can specify that the MID should be used for all capabilities, applications, and IP ranges when you validate a MID Server. You will be prompted to set the initial selection criteria when you validate MID Servers that do not already have capabilities, applications, or IP ranges already configured. You do not have to set the initial selection criteria to actually validate the MID Server. See MID Server selection for more information on capabilities, applications, and IP ranges.

Note: When you upgrade, MID Servers that are already configured in your instance are automatically validated. This prevents the interruption of automation tasks that MID Servers might be performing. See MID Server upgrades for more information.

1. Navigate to MID Server > Servers.
2. Open the new MID Server you created from the list of MID Servers.
3. Under Related Links click Validate.

   The Set Initial Selection Criteria window appears if there are no records in the Supported Applications, IP Ranges, or Capabilities related lists.

4. On the Set Initial Selection Criteria window, use the switches to enable or disable selection criteria for this MID Server:

   - Allow ALL capabilities: Allow all capabilities for Orchestration and Event Management to use this MID Server.

   Note: Service Mapping and Event Management alert aggregation and RCA, which used capabilities in previous releases, rely on the application for MID Server selection.

   - Allow ALL applications: Allow all applications that use MID Servers to use this MID Server.

   - Allow ALL IP ranges: Make all IP ranges valid for this MID Server, meaning that it can target any IP address.
Setting initial selection criteria

If you click **Cancel**, the validation continues but none of the capabilities, applications, or IP ranges are added.

5. **Click OK.**

   The **Validated** field on the dashboard is set to **Validating**, and then set to **Yes** after the validation completes.

6. **To invalidate a MID Server, open the record for the MID Server you suspect has a security issue.**

7. **Under **Related Links**, click **Invalidate.**

   Invalidating a MID Server forces it to clear its memory and restart. The MID Server generates a new keypair on restart.

**Test network connectivity** to ensure that the MID Server can upgrade automatically.

**Test MID Server connectivity**

Confirm that the MID Server host is able to communicate with the instance. Resolve any issues with the network connectivity such as conflicts with firewalls, access control lists, and routing errors. Successful communication is necessary for automatic upgrades.

Role required: admin
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The computer that hosts the MID Server must be able to access one of these URLs to upgrade automatically:

- HTTPS: https://install.service-now.com on the default HTTPS port (443)
- HTTP: http://install.service-now.com on the default HTTPS port (80)

1. Use PING to test connectivity with the host on the network (ping<host IP>).
2. If no ping response is returned, use TRACEROUTE to see where traffic might be stopped (traceroute<host>).
3. Use TELNET to connect to any of the TCP ports (telnet<host> <port>).
4. Use an SNMP scanning tool to determine if a potential network device is responsive.
5. Resolve the most likely issues around network connectivity:
   - Routing: Confirm that the MID Server host has network access to the IP ranges you are attempting to discover.
   - Firewalls: Confirm access to the physical firewalls that protect a large environment such as the Data Center. Confirm access to any logical firewalls that protect an individual computer. MID Server communications are initiated inside the firewall and therefore do not require any special firewall rules or VPNs.
   - Access Control Lists (ACL): Confirm that ACLs contain the IP addresses based list on SNMP network devices that allows communication to a particular target.
   - Resolve all issues with your network teams to better understand your topology. Deploy additional MID Servers if necessary to help keep your network secure. Configure access from your existing MID Server host to networking components.

6. Verify that the MID Server service is running on the host:
   - Windows: In the Windows Services console, locate the ServiceNow (MID Server name) and confirm that each MID Server has the Started Status value.
   - Linux: Ensure that the agent0.log.0.lck appears in the /servicenow/ MID Server name]/agent folder.
7. After each MID Server restart, open the `agent0.log.0` and address all error messages.
8. From the ServiceNow instance, navigate to **MID Server > Servers**.
9. Review and verify that all MID Servers that are connected to the instance are listed.
10. Verify that the **Status** is **Up** for the MID Servers.

This concludes the installation of a single MID Server. If necessary, continue to **deploy multiple MID Servers from a single host** in your network. Otherwise, begin **configuring your MID Server**.

### Install multiple MID Servers on a single system

Install multiple MID Servers on the same host computer. Multiple MID Servers can support each other with load balancing, as well as use domain separation. The number of MID Servers required is determined by factors like network policies, security restraints, and the reliability of the host computer.

Role required: admin, mid_server

1. **Ensure that the MID Server can connect to elements inside and outside your network**
2. **Download and install the MID Server on a Linux or Windows host**
3. **Configure your MID Server**
4. **Configure MID Server security**
5. **Ensure that the MID Server can connect to elements inside and outside your network**
6. **Download and install the MID Server on a Linux or Windows host**
7. **Configure your MID Server**
8. **Configure MID Server security**

You can install multiple MID Servers on a Linux or Windows host or on a virtual machine. Installing multiple MID Servers may involve other setup steps depending on your network configuration.

**Important:** Only one MID Server service can be a daemon on a Linux host. This is a limitation of the Tanuki wrapper service.

1. Log in to the host system or virtual machine where you want to install multiple MID Servers.
2. Create a directory for each MID Server on the top level of the drive.
   Make sure you create a unique and descriptive name for each MID Server, such as `MIDServer_SMS_Int` or `MIDServer_Disc1`.
3. Extract the downloaded MID Server archive file into each MID Server directory.
   When the extract completes, there should be a directory path similar to the following for each MID Server: `ServiceNow\<MID Server name>\agent`.
4. For each MID Server, run the installer appropriate to the host's operating system.
MID Server installers

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Installer path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>/agent/installer.bat</td>
</tr>
<tr>
<td>Linux</td>
<td>/agent/installer.sh</td>
</tr>
</tbody>
</table>

5. Use the installer to enter the following information.
   - URL to your instance
   - User credentials to run the MID Server
   - Proxy server connection details
   - MID server name
   - MID server service wrapper name and display name (Windows systems only)

**Note:** The MID Server user must have the mid_server role.

6. From the installer, click **Start MID Server**.
The local host starts the MID Server.

7. Click Mid Servers List Page.
   The installer opens the MID Server list from your instance.

8. Select the MID Server name from the list.
Note: It may take a few seconds for the MID Server time to establish a connection with your instance.

The system displays the MID Server record.

   The MID Server Validated changes to Yes.

All MID Server installation procedures are complete. Proceed to configure your MID Server.

Multiple MID Server deployments

Depending upon how you use the MID Server (for an external integration, Discovery, Service Mapping, or Orchestration) and the load placed on it, you might find it necessary to deploy multiple MID Servers in your network.

Factors determining the number of MID Servers your network will require to support external applications that integrate with ServiceNow include the following:

- The security constraints in your network.
- Your network policies.
- The amount of traffic between ServiceNow and the integrations.
- The reliability of the MID Server machines.

Network policies and security

Security policies in your network (firewalls between network segments, for example) might make direct communication impossible between your instance and an integration’s data source (JDBC, LDAP, etc.). To retrieve data for the instance, you can install a MID Server that has access to both the data source and the instance.

These network policies can determine if you need to install multiple MID Servers in your environment:

- Access control lists (ACL): If your security policy controls access to network devices (e.g. switches and routers) with an ACL, it might be necessary to install one or more MID Servers on a machine in the network that is already on the ACL.
- DMZ: Your network policy might require you to install one or more MID Servers in your DMZ to probe the devices there. This is common in networks that tightly regulate the ports that are opened on the inside firewall.
- Probe types: If you are conducting probes of different operating systems, your network policy might require a separate MID Server for each type of probe (e.g., one MID server for Windows WMI probes and another for SSH probes on UNIX).

Load balancing

Deploy multiple MID Servers where capacity is an issue, as when Discovery has to gather information about thousands of configuration items quickly. In a high volume environment, it might be necessary to deploy multiple MID Servers as load balancers for certain transactions. For example, JDBC data transfers can tie up the resources of a MID Server, making it unable to respond to other requests. The following operations between an integration might require separate MID Servers in a busy network:

- File exports
- Running scripts
- JDBC data sources
- Reading files

**High availability model**

Avoid installing MID Servers for critical integrations on a machine that might experience any type of planned outage or an outage caused by overloaded processes. If necessary for reliability, consider deploying these types of MID Servers to dedicated machines for high reliability.

---

**Note:** Do not integrate with an external application on a MID Server provisioned for ServiceNow Discovery or Orchestration.

---

**Wide area network (WAN)**

When determining where to deploy MID Servers in a WAN, consider the bandwidth available between your local area networks. In most cases, install a MID Server on each LAN to probe devices locally, rather than deploying MID Servers that must probe devices across slow WAN connections. An alternative to this type of deployment is to install MID Servers that probe other LANs via VPN connections that take advantage of fast Internet connections. If the bandwidth of your WAN connections is comparable to that of your Internet connection, then there is no performance impact in running MID Server probes across WAN connections.

**Domain separation**

In deployments where domain separation is enabled and domains are configured to form a hierarchy, place the MID Servers at the lowest domain level.
Deploying MID Servers with domain separation

Use MID Server guided setup

MID Server guided setup provides a sequence of tasks that help you install a MID Server with the proper user account and validate the MID Server. If you are setting up a MID Server for the first time, this is a good way to get one up and running in your environment quickly.

Role required: admin
You are guided through a series of configuration activities that create a fully qualified MID Server. A progress indicator on each screen allows you to monitor your progress on each task.

Each configuration activity provides the following resources to help you:

- Contextual embedded help.
- Links to comprehensive documentation on the ServiceNow product documentation site.

**Important:** You must complete MID Server configuration before you can launch any other IT Operations Management guided setup.

1. Navigate to **Guided Setup > ITOM Guided Setup**.
   The IT Operations Management Guided Setup welcome screen appears.

2. Take one of the following actions:
   - If none of the MID Server installation and configuration tasks are complete, click **Get Started**.
   - If you have completed any of the MID Server installation and configuration tasks, click **Continue** to return to the task list.
   - Select the MID Server icon in the progress bar on the left side of the category screen to display the MID Server category pane at any time.
3. **Click Continue.**

   The IT Operations Management Guided Setup category screen appears. The controls for starting the MID Server tasks are at the top of the list. These tasks must be completed before you can set up the other applications that rely on the MID Server.

4. **In the MID Server pane, click Get Started.**

   The MID Server task list appears with a description of each task.
The MID Server runs as a Windows service or a UNIX daemon to facilitate communication and the movement of data between a ServiceNow instance and external applications, data sources, and services. Complete the activities in this category to create a user for the MID Server, download the installation package, and validate the MID Server after installation.

Create MID User

Create the user account that the MID Server needs to authenticate on the ServiceNow instance.

Download & Install MID

Select and download the appropriate MID Server installer archive for the operating system.

Validate MID

You must validate the network connection between the MID server and your instance before the MID server is permitted to access automation credentials or execute any outbound JDBC probes.
5. Click **Configure** to create the MID Server user and follow the instructions in the help pane that appears on the right side of the screen.

**Attention:** If you configured MID Servers manually prior to starting Guided Setup, select from that information to complete each specific task.

6. When you have provided the requested information for the MID Server user, click **Submit**, and then click **Mark as Complete** at the bottom of the help pane. The view returns to the task list. Notice that the circular progress indicator for the category shows 33% of the MID Server configuration complete. The progress indicator on the left side of the screen shows the completion percentage for all the IT Operations Management tasks.

7. Click **Configure** for the next task, **Download & Install MID**.

OpenJDK version 1.8.0_181 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures OpenJDK to run in your environment. No additional configuration is required. This version supports both 32-bit and 64-bit MID Servers. For the best performance, install the 64-bit MID Server for your operating system. The MID Server requires a minimum JRE version 1.8.0_161, and recommended version 1.8.0_181. If you are using a lower version than 1.8.0_161, you may see encryption related issues.
8. Validate your new MID Server.

If necessary, **deploy multiple MID Servers from a single host** in your network. Otherwise, proceed to **configure your MID Server**.

### Configuring MID Servers

After installing and validating your MID Servers, ensure that they have access to sufficient system resources, probe the proper targets, and communicate with the instance as expected. Configure MID Server selection criteria, create clusters for failover protection, and set up MID Servers in different domains to protect data.

1. **Ensure that the MID Server can connect to elements inside and outside your network**
2. **Download and install the MID Server on a Linux or Windows host**
3. **Configure your MID Server**
4. **Configure MID Server security**
5. **Ensure that the MID Server can connect to elements inside and outside your network**
6. **Download and install the MID Server on a Linux or Windows host**
7. **Configure your MID Server**
8. **Configure MID Server security**

Some of these configuration procedures rely on data found in the MID Server **references home page**. See that page for links to the parameters, properties, and privileged commands you need to fine tune the behavior of your MID Servers. You can apply controls to individual MID Servers or to all the MID Servers in your environment. Remember to restart the MID Server after any configuration change for those changes to take effect.

### MID Server selection

MID Servers are selected for use based on three criteria: applications, IP address or range, and capabilities. You can designate specific applications for a given MID Server, such as Discovery or Orchestration. You can specify an IP address or a range that a MID Server is allowed to work within. Some applications require specific capabilities, and so are restricted to MID Servers with those capabilities.

**MID Server selection**
Configure the way your instance selects a MID Server, either by application, IP address ranges, network capability, or behavior.

**MID Server capabilities**
Create capabilities that define the specific functions of a MID Server within an IP address range.

**MID Server IP range auto-assignment**
Configure the system to automatically assign a qualified MID Server to a subnet by that subnet’s IP address range.

**Map an IP address to a DNS name**
Map host server DNS names to IP addresses if your MID Server manages resources within defined IP ranges.

**Configure MID Server as WinRM trusted host**
Add servers, which are part of WinRM, as trusted hosts on all MID Servers that Discovery or Service Mapping use for discovery.

**MID Server clusters**

MID Server clusters are groups of MID Servers which provide support to each other in the forms of load balancing and fail-over protection. Work sent to a MID Server that is part of a cluster is automatically balanced between all the MID Servers in that cluster. MID Servers in a fail-over cluster each have a configured order that the platform uses to determine which MID Server to use next in case of failure.

**Create a MID Server cluster**
Create a MID Server cluster for load balancing and fail-over protection.

**Set thread use**
Set the number of threads your MID Server uses for the desired MID Server speed, based on hardware capabilities and competing applications running on the host.

**Domain separation**

Domain separation segregates MID Servers based on the records they can access. The credentials configured in a MID Server’s `config.xml` file determine which records that MID Server can read, update, or create. You can specify MID Server policy records that only MID Servers from the same domain can use.

**MID Server domain separation**
Set up your MID Servers in different domains to restrict the records and credentials that a MID Server can access.

**Synchronize a JAR file to MID Servers**
Upload a JAR file to an instance and synchronize it to all MID Servers connected to that instance. Use JAR file synchronization to create policies that only a MID Server from the same domain can use.
**MID Servers used for credential-less Discovery**

MID Servers that are used for [credential-less Discovery](#) require special configuration to run Network Mapper (Nmap) commands on target computers.

*Install and uninstall Nmap on a MID Server*

You must install Nmap on each MID Server running on a Windows host. When given the proper capability, those MID Servers can discover some basic information about CIs in your network if normal authentication fails.

**MID Server extensions**

*vCenter event collector*

The vCenter event collector listens for vCenter-related events and updates the CMDB accordingly. The event collector allows the CMDB to be updated with changes to virtual machines (VMs), in addition to the updates detected by Discovery. A change to a VM is sent as an event from the vCenter server to the vCenter event collector. When an event is received, the CMDB is updated accordingly. Full vCenter Discovery does not need to rerun. For some events, such as powered on and powered off events, Discovery does not need to run again at all. For most events, Discovery runs only on the necessary vCenter resource.

*SNMP trap collector extension*

The SNMP trap collector is a MID Server extension that listens for SNMP traps from the devices on your network. Upon receiving a trap, the MID Server sends the trap to the instance for further processing by Event Management. If Event Management is not active, traps are not processed and are discarded by the instance.

**MID Server selection**

You can configure MID Server selection by application, IP address ranges, network capability, or behavior. Specific MID Servers can be assigned to particular tasks, or the MID Server can be selected automatically. MID Servers can use domain separation to limit the scope of discoveries and event management.
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

MID Server criteria

MID Servers offer these types of criteria that help an application determine which MID Server to use:

- **Application**: The application that you specify on the MID Server. You can designate these applications for a specific MID Server:
  - Discovery
  - Orchestration
  - Service Mapping
  - Event Management
  - Operational Intelligence
  - Cloud Management
  
  An **ALL** application option is also available. By default, this option includes all applications except Event Management alert aggregation and RCA, which requires an exclusive MID Server. You can **configure which applications** are included in the **ALL** designation.

- **IP address or range**: The IP address or the IP ranges that the MID Server is allowed to work within. You can specify an IP address or IP range in the application, such as on a Discovery schedule or an Orchestration activity, and for the MID Server. If the IP configured in the application matches the IP address or falls within the allowable IP range configured on the MID Server, a match is possible, and that MID Server passes this criteria. To have the instance automatically assign IP ranges (subnets) to available MID Servers, see **Using MID Server IP range auto-assignment**.

- **Capabilities**: The **network capability** an application needs to use, such as the **PowerShell Orchestration activity** or the Flow Designer **PowerShell step**. Some applications, like Cloud Management and alert aggregation and RCA, require a specific capability.
**Note:** Discovery and Service Mapping can also use behaviors, which determine the type of port probes used during the port scan phase of Discovery. Both Discovery and Service Mapping use a behavior to discover load balancers running on Linux. Other applications do not use behaviors. Behaviors are not used for auto-selection, default MID Servers, or specific MID Servers as described below. See [Discovery behaviors](#) for more information.

### How an application selects a MID Server

If you do not specify a specific MID Server for an application to use, the application tries to select one. Each application relies on different criteria to select an appropriate MID Server.

<table>
<thead>
<tr>
<th>Application</th>
<th>Supported Application on the MID Server</th>
<th>IP address range</th>
<th>Capability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery</td>
<td>The Discovery or ALL application must be specified on the MID Server.</td>
<td>Discovery uses IP ranges that you configure on the Discovery Schedule form to see if they fall within the IP ranges that you configure on the MID Server, or the ALL IP ranges option must be selected on the MID Server.</td>
<td>N/A</td>
</tr>
<tr>
<td>Orchestration</td>
<td>The Orchestration or ALL application must be specified on the MID Server.</td>
<td>The target IP address that you configure in an Orchestration activity must fall within the IP ranges that you configure on the MID Server, or the ALL option must be selected on the MID Server.</td>
<td>The capability that is required for an Orchestration activity must match the capabilities you configure on the MID Server, or the MID Server capability must be set to ALL.</td>
</tr>
<tr>
<td>Alert aggregation and RCA (as part of Event management)</td>
<td>The Service Analytics application must be specified on the MID Server.</td>
<td>N/A</td>
<td>One of these capabilities must be present on the MID Server: the RCA capability for alert aggregation and RCA and the Metrics capability for Operational Intelligence.</td>
</tr>
<tr>
<td>Service Mapping</td>
<td>The Service Mapping or ALL application must be specified on the MID Server.</td>
<td>The endpoint IP address must fall within the IP range that you configure on the MID Server, or the ALL option must be selected on the MID Server.</td>
<td>One of the supported Service Mapping capabilities (for new installs) must be configured on the MID Server, or the MID Server capability must be set to ALL.</td>
</tr>
</tbody>
</table>
### Using a specific MID Server

Discovery and Event Management can use a MID Server that you specifically call out.

**Note:** Selecting a specific MID Server is not the same as specifying the default MID Server for an application. A specific MID Server is always used. If it is Down or not validated, the application does not execute commands against the MID Server. A default MID Server is fallback that is used when the auto-selection of MID Servers does not find any eligible MID Server.

<table>
<thead>
<tr>
<th>Application</th>
<th>How you specify a specific MID Server</th>
<th>Criteria that the default MID Server must meet</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery</td>
<td>Choose the MID Server on the Discovery schedule.</td>
<td>You can use any MID Server as long as it does not have the RCA capability. If you select a MID Server with the Discovery or ALL application, it automatically adds the Discovery application.</td>
</tr>
<tr>
<td>Orchestration</td>
<td>N/A</td>
<td>N/A</td>
</tr>
<tr>
<td>Alert aggregation and RCA</td>
<td>N/A</td>
<td>N/A</td>
</tr>
<tr>
<td>Service Mapping</td>
<td>N/A</td>
<td>N/A</td>
</tr>
<tr>
<td>Event Management</td>
<td>Choose one or more MID Servers on the connector instance event collection, such as HPOM.</td>
<td>N/A</td>
</tr>
<tr>
<td>Cloud Management</td>
<td>N/A</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Note:** If a MID Server manages resources within defined IP ranges for Orchestration, you must map the fully-qualified domain name (FQDN) of a server with its IP address to run certain activities, such as Exchange activities.

### Domain separation

If you are using domain separation, you can configure MID Servers to be in separate domains. The domain that the MID Server is in affects how the application selects the domain:

- **Discovery and Service Mapping:** On the Discovery schedule, the MID Servers and clusters that available for selection are limited to the same domain of the user who is configuring the
schedule. This also applies to the auto-selection option: only MID Servers in the same domain as the user can be automatically selected.

- **Alert aggregation and RCA (Event Management):** The metrics for a business service is done on the MID Server that is in the same domain as the business service. Otherwise, a MID Server from the global domain is used.

**MID Server selection test**

If Service Mapping is active, you can preview which MID Server that Service Mapping uses for a specific target device or computer. To do this, navigate to Service Mapping > MID Servers and click MID Selection Test. Enter the IP address and an optional application and capability, and then click OK. The name of the MID Server that Service Mapping will use appears in the window.

**Configure a default MID Server for each application**

You can configure a default MID Server that an application can use if all other possible MID Servers are unavailable. You can narrow down the list of applications that are included in the definition of ALL.

Role required: agent_admin or admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Applications are only available when their respective plugins are activated.

The default MID Server is used when applications fail to find a suitable MID Server that matches configured criteria during auto-select. The default MID Server for the ALL application is used if the default MID Server for the specific application is not available. Some applications also offer a property to set the default MID Server.

**Important:** If you configure a MID Server for ALL IP ranges (type Include) and also create an IP range of type: Exlude for the same MID Server, the system ignores the excluded IP range for that MID Server.
The default MID Server does not need to meet any criteria (application, IP range, behavior, or capability) to be used. Specifying a default MID Server is optional, and you can use a MID Server as the default for more than one application.

<table>
<thead>
<tr>
<th>Application</th>
<th>Additional notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery</td>
<td>Discovery attempts to use the default MID Server when the Discovery schedule specifies Auto-Select MID Server and Discovery cannot find any MID Servers with the correct application and IP range.</td>
</tr>
<tr>
<td>Orchestration</td>
<td>Orchestration attempts to use the default MID Server when it cannot find any MID Servers with the capabilities that you define in the Orchestration activity. You can also specify a default MID Server. The value in that property automatically synchronizes with the default MID Server you select in the Orchestration application.</td>
</tr>
<tr>
<td>Alert aggregation and RCA</td>
<td>Not applicable. The MID Server is selected if it has the RCA capability. Route to right MID by domain.</td>
</tr>
<tr>
<td>Service Mapping</td>
<td>If there are no MID Servers with matching application, capability, or IP range, Service Mapping uses the default MID Server.</td>
</tr>
<tr>
<td>Event Management</td>
<td>You can specify a default MID Server for Event Management using the mid.server.connector_default system property. Event Management does not use the default MID Server in the application record.</td>
</tr>
<tr>
<td>Cloud Management</td>
<td>N/A</td>
</tr>
</tbody>
</table>

1. Navigate to **MID Server > Applications**.
   The list of installed applications that can use MID Servers appears.
2. Click the name of an installed application.
3. Select a MID Server from the list in the Default MID Server field.
4. To select additional MID Servers for this application, click Edit in the MID Servers related list and select alternate MID Servers that this application is allowed to use.
5. Click Update.

**Select applications to include in the definition of ALL for a MID Server**
You can narrow down the list of applications that are included in the definition of ALL.

Role required: agent_admin or admin

You can specify the ALL application for a MID Server, which means that the MID Server is allowed to work with any of the applications that require MID Servers, such as Discovery, Event Management, Service Mapping, and so on. But you might not want all applications to be included in the definition of ALL. For example, you might want to exclude Service Mapping from the ALL definition if you already have a dedicated MID Server to work with Service Mapping.

1. Navigate to **MID Server > Applications**.
   The list of installed applications that can use MID Servers appear.
2. If you do not see the Included in application ALL column, you can personalize the list and add it.
3. For each application, double-click the value in the **Included in application ALL** column.
4. Change the value to **true** (to include) or **false** (to exclude).

**Configure an IP address range for the MID Server**

You can manually configure an IP address range for the MID Server to explore.

Role required: agent_admin or admin

1. **Ensure that the MID Server can connect to elements inside and outside your network**
2. **Download and install the MID Server on a Linux or Windows host**
3. **Configure your MID Server**
4. **Configure MID Server security**
5. **Ensure that the MID Server can connect to elements inside and outside your network**
6. **Download and install the MID Server on a Linux or Windows host**
7. **Configure your MID Server**
8. **Configure MID Server security**

Applications, such as Discovery and Orchestration, can specify an IP range or the specific IP address of a target. When the application looks for a MID Server to use during auto-selection, it chooses a MID Server whose IP range includes the application's range or specific IP address. Applications also use other criteria, such as the MID Server's supported application or capability. See **MID Server selection** for more information.
Note: This is a manual configuration procedure. To learn how the system can assign IP address ranges to selected MID Servers automatically, see Using MID Server IP range auto-assignment.

These applications use IP ranges as follows:

- **Orchestration**: Use the IP address of the target machine (together with the capability) to select the correct MID Server for Orchestration activities. See the procedure in this topic to configure the IP address.
- **Service Mapping**: Select the MID Server whose IP address range matches the IP in the discovery request. See MID Server configuration for Service Mapping for more information.
- **Discovery**: Can select an IP address range using the same criteria as Service Mapping. Discovery can also use a quick IP range that you specify in the Discovery schedule.

Tip: You can also use the ALL IP range, which allows the MID Server to be used with any range of IP addresses that an application specifies. This only allows the MID Server to access IP ranges, it does not mean that the MID Server can actually reach all of the IP ranges. To function with an application, the MID server must have access to the IP ranges that the application needs.

Valid IP address ranges can be as follows:

- An IP address in dotted decimal or hexadecimal format. The hexadecimal format can be explicitly prefixed with 0x, this is not mandatory. Here are examples:
  - 10.11.144.155
  - 0xA0B909B
  - A0B909B

- An IP address range in dotted decimal or hexadecimal format. Here are examples:
  - 10.11.144.150-10.11.144.160
  - 0xA0B9096-0xA0B90A0
  - 10.11.144.150-0xA0B90A0

- An IP network address with the net mask specified after a slash (/) in regular notation (0-32 inclusive) or in IP address notation. Here are examples:
  - 10.11.144.0/24 10.11.144.0/255.255.255.0
  - 10.11.144.0/0xFFFFFFFF
  - 0xA0B9000/24
  - 0xA0B9000/0xFFFFFFFF

1. Navigate to MID Server > IP Ranges.
2. Click New.
3. Complete the form, using the fields in the table.
IP address ranges

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for this IP range. The default is <strong>Global</strong>.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Type  | Select the type of range:  
  - **Include**: Include the specified IP range.  
  - **Exclude**: Exclude the IP address range.  
  **Note**: If a MID Server is configured for **ALL** applications, any IP addresses configured for exclusion are ignored by the system. If your goal is to configure default MID Servers for separate applications in your system, see Configure a default MID Server for each application. |
| Range | Enter the range in a valid format. |
| Related list |  
  **MID Servers**: The MID Servers that can use this IP address range. |

4. **Click Save.**

**Important**: IP ranges assigned manually prior to using auto-assignment in the **Discovery Quick Start** are affected as follows:

- Individual IP ranges are retained and appended to the ranges assigned automatically by the system for the designated MID Server.
- If the MID Server was configured with the **ALL** ranges selection, the auto-assignment feature overwrites that designation with the ranges it finds.

Open the **ALL** IP range record and configure the MID Servers that you want to use with any set of IP addresses.

### Override the MID Server selection filter

You can use the override feature to write your own filter condition that overrides the normal MID Server selection criteria for an application. An override has precedent over the default filter and can be defined for a specific selection condition.

Before attempting to create an override filter, be sure you understand the criteria the platform uses to select MID Servers. See **MID Server selection** for details.

**Role required**: admin
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

**Note:** The override feature is intended for Cloud Management and Cloud Discovery only. The Override by capability filter is provided by default.

There are four MID Server selection filters included in the base ServiceNow system. These filters are applied to all MID Servers in order until the system finds a matching condition:

- Status Filter
- App Filter
- Capability Filter
- IP Filter

**Important:** The override feature allows multiple filter types but only one override filter for each filter type. The Override selector filter type overrides all other filters and takes complete control of the MID Server selection. If this type is active, it is the only filter applied.

1. Navigate to MID Server > Mid Selector Override.
The list of MID Server overrides appears.
2. Click New to create a new filter.
3. Complete these fields:
   - **Name:** Unique name for this override. Ensure that you can identify the override type by the name.
   - **Script:** Condition for this filter. Create the MID Server selection logic for your override in this field, using the directions provided in the function template. Look at the Override by capability filter as an example before starting to create your filter.
   - **Type:** Type of override being configured. Select one of the four default filters to override with your condition, or select Override selector to create a filter that overrides all the others.
4. Click Submit.
```javascript
(function filter(/* MIDServerJS Array */ candidateMIDList, /* MIDServerJS Array */ defaultSelectedMIDList, /* Native JS object */ #idSelectorContext, /* MIDSelectorParamJS */ requestedParameters) {
    // If anything matching no need to do anything
    if (defaultSelectedMIDList.length > 0) {
        return defaultSelectedMIDList;
    }
    // Check if this is cloud capability - if not nothing to do
    if (!hasCloudCapability(requestedParameters.capabilities)) {
        return defaultSelectedMIDList;
    }
    // get first non cloud capability (e.g AWS) - there should be only one non
    var capability = getNonCloudCapability(requestedParameters.capabilities);
    if (!capability) {
        gs.warn("MID Selection filterOnCapability could not find a capability for provider!");
        return defaultSelectedMIDList;
    }
    // Get rid with AWS capability
    var ids = getMidsWithCapability(capability);
    if (ids.length > 0) {
        return ids;
    }
    ids = getMidsWithCapability('Cloud Management');
    getMidsWithoutCapability(ids, capability);
})
```
Using MID Server IP range auto-assignment

Discovery Quick Start can automatically assign ranges of IP addresses, called subnets, to qualified MID Servers. This subnet auto-assignment requires SNMP credentials for read-only access to routers Discovery uses. The Automation Status Set form shows summary details of subnet Discoveries and the IP range assignments for associated MID Servers.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

To be automatically assigned to a subnet, a MID Server must be:

- In a running (Up) state.
- Successfully validated.
- Able to access one or more subnets in your network.

The subnet assignments that the instance makes for your MID Servers are stored in the Automation Status Set (automation_status_set) table. For details about MID Server auto-assignment, see Discovery Quick Start.

**Important:** You must auto-assign at least one MID Server to create a schedule automatically.

Required SNMP OIDs for MID Server IP range auto-assignment

Customers who use network service providers must request specific SNMP access to use MID Server IP range auto-assignment.

IP range auto-assignment requires SNMP credentials for read-only access to all routers that Discovery uses to identify subnets. In addition, your service provider must grant the following SNMPWALK access:

- `iso.org.dod.internet.mgmt.mib-2.ip.ipRouteTable (1.3.6.1.2.1.4.21)`
- `ipRouteDest (1.3.6.1.2.1.4.21.1.1)`
- `ipRouteNextHop (1.3.6.1.2.1.4.21.1.7)`
- ipRouteType (1.3.6.1.2.1.4.21.1.8)
- ipRouteMask (1.3.6.1.2.1.4.21.1.11)
- iso.org.dod.internet.mgmt.mib-2.ip.ipForward.ipCidrRouteTable (1.3.6.1.2.1.4.24.4)
  - ipCidrRouteDest (1.3.6.1.2.1.4.24.4.1.1)
  - ipCidrRouteMask (1.3.6.1.2.1.4.24.4.1.2)
  - ipCidrRouteNextHop (1.3.6.1.2.1.4.24.4.1.4)
  - ipCidrRouteType (1.3.6.1.2.1.4.24.4.1.6)

**View automation status sets and IP range assignments**

The Automation Status Set form shows summary details of a subnet Discovery and the subsequent IP range assignments for MID Servers selected for automatic subnet assignment.

Role required: admin

1. Navigate to **MID Server > Automation Status Sets**.
2. Select a status record for a subnet Discovery you want to view.

   The form contains read-only status information about the selected Discovery, the subnets found, and the range assignment process for the MID Servers you selected for auto-assignment.

   **Important:** IP ranges assigned manually prior to using auto-assignment in the Discovery Quick Start are affected as follows:
   
   - Individual IP ranges are retained and appended to the ranges assigned automatically by the system for the designated MID Server.
   - If the MID Server was configured with the **ALL** ranges selection, the auto-assignment feature overwrites that designation with the ranges it finds.
The Automation Status Set shows the IP range assignments for the MID Servers selected for discovery. This form includes summary details of the Discovery that identified the available subnets and the IP range assignments.

</tr>
</tbody>
</table>
3. Select the **Subnets Discovered** related list to view the list of subnets available for assignment.

4. Select the **IP Range Assignments** related list to view the IP ranges that were assigned to a MID Server.

**Caution:** IP ranges identified by Discovery are stored in the IP collection (ip_address_collection) table, which is only used for MID Server IP range auto-assignment in the Jakarta release. This table is intended for future development and should not be used in any customizations, including column additions, business rules, or scripting actions.
Map an IP address to a DNS name

Associate the IP address to a DNS name to ensure the appropriate MID Server is selected. The IP Address range configuration determines which MID Server is selected. If the MID Server manages resources within defined IP ranges, all host servers must have their DNS names mapped to an IP address.

Role required: admin
The association of an IP address to a DNS name ensures that the appropriate MID Server is selected based on the IP Address range configuration. If this is not done, Orchestration reverts to the default MID Server.

If Discovery cannot discover the server and resolve the DNS name to an IP address, you must create the mapping manually.

| Important: | The platform does not map localhost to 127.0.0.1 automatically. You must create that mapping using this procedure. |

1. Enter cmdb_ci_dns_name.list in the navigation filter.
   
   A list of DNS names appears.
2. Check the list for your host server.
   
   If the server does not appear in the list, continue with this procedure.
3. Click New.
4. Enter the fully-qualified domain name (FQDN) of the host server in the Name field.
5. Right-click in the form header and select Save from the context menu.
6. In the IP Address related list, click New.
7. In the IP Address field, enter the IP address of your host server.
8. In the Nic field, select eth0 or your preferred network interface controller.
9. Leave the Netmask field blank.
10. Click Submit.

Configure MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range, allowing an application to select the most appropriate MID Server. Configure capabilities on MID Servers for applications like Orchestration, Cloud Management, and Service Mapping.
Role required: admin or sm_admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Several applications use capabilities, IP ranges, and MID Server selection to narrow the pool of MID Servers the applications need.

**Note:** At least one capability is required for each MID Server used by Orchestration. See MID Servers for Orchestration for more information.

The following capabilities are available by default with Discovery:

<table>
<thead>
<tr>
<th>All</th>
<th>IBM</th>
<th>Resolve DNS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ansible</td>
<td>JDBC</td>
<td>REST</td>
</tr>
<tr>
<td>AWS</td>
<td>NetApp</td>
<td>SNMP</td>
</tr>
<tr>
<td>Azure</td>
<td>Nmap</td>
<td>SOAP</td>
</tr>
<tr>
<td>Chef</td>
<td>OpenStack</td>
<td>SSH</td>
</tr>
<tr>
<td>Cloud Management</td>
<td>PowerShell</td>
<td>VMware</td>
</tr>
<tr>
<td>Google</td>
<td>RCA</td>
<td>WMI</td>
</tr>
</tbody>
</table>

1. Navigate to MID Server > Capabilities.
2. Select an existing capability. You can also select ALL to include all capabilities.
   **Note:** Ensure that each IP address range has MID Servers with the necessary capabilities to complete the Orchestration activities on that network segment.

3. Create a new capability:
   a) Click **New**.
   b) Configure the value for a custom capability.
      An example is a capability for **DOMAIN**, with a value of **service-now**.
c) Click **Submit**.

4. Click **Edit** in the MID Servers related list to add MID Servers to the capability.
5. Select one or more MID Servers for this capability from the **Available** list.
6. Click **Save**.

   The capability defined here also appears in the primary record for this MID Server.

**MID Server capabilities**

MID Server capabilities define the specific functions of a MID Server within an IP address range.

**Nmap capability**

The **Nmap** capability is only assigned to MID Servers for which the Network Mapper (Nmap) scanner has been installed for **credential-less Discovery**. This capability cannot be added to or removed from any MID Server manually. For instructions on installing or uninstalling Nmap, see **Install and uninstall Nmap on a MID Server**.

**MID Server capability values**

Capabilities provided in the base system do not have a defined value string. A MID Server configured to use a capability that has no value can locate any device using that capability’s protocol. If a capability has a defined value, the MID Server using that capability finds only those devices using that protocol that match the value string exactly. The exception to this is the Resolve DNS capability, which is configured to resolve any DNS name into an IP address using a partial string match.

Starting with the madrid release, the **(capability name):(value)** combination appears in the slushbucket when you add a capability to a MID Server. This combination allows you to see all the capabilities that have different values, even if the capability name is the same. For example, if you are using the Cloud Management capability, and you use the value field to specify the us-west logical datacenter on one of the capability records, you can see the combination in the **Collection** list.
Scripted MID Server capability value matching

You can use value tests to create capabilities that find devices using values without requiring exact string matching. Action on these values is controlled by a user-defined script.

The Resolve DNS capability is provided in the base system and is configured to resolve DNS names into IP addresses for devices whose names end with a specified domain name. The capability Value entered is automatically prefaced with a dot during processing to match domain syntax. This value can contain one or more sub-domains, but must include the end of the domain string. Matching devices must end with the identical syntax. The script for the Resolve DNS capability determines if a device name matches the criteria defined by Value. If a match exists, the platform performs the address resolution automatically. For example, if the value for the Resolve DNS capability is service-now.com, the MID Server with this capability finds lnxlab01.sandiego.service-now.com and dbsrv101.sanjose.service-now.com. If the value is changed to sandiego.service-now.com, then the MID Server finds only lnxlab01.

**Note:** If Value in the Resolve DNS capability is blank, then all domains match.

To view the script for evaluating this capability, navigate to MID Server > Capability Value Tests and select Resolve DNS from the list.
Configure a MID Server cluster

Group multiple MID Servers to form clusters, then configure clusters for fail-over protection or load balancing. Load-balancing clusters automatically balance work between each MID Server to improve stability and performance. Fail-over clusters have a configured order used to determine which MID Server to use next if a failure occurs.
Ensure that each MID Server in the cluster has the appropriate capabilities for the job. A MID Server in a fail-over cluster must have the same capabilities (or expanded capabilities) as the MID Server it is expected to replace.

Role required: admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

You can select a MID Server cluster from the Discovery Schedule form.

1. Navigate to MID Server > Clusters.
2. Click New.
3. Name the cluster and select the cluster type: Failover or Load Balance.
4. Right click in the header bar and select Save from the context menu.
5. Click Edit in the Includes MID Servers Related List.
6. Select appropriate MID Servers for this cluster from the slushbucket.

MID Server clusters

MID Server clusters enable multiple MID Servers with the appropriate capabilities to be grouped together for load balancing and fail-over protection.

External data sources

For performance and reliability reasons, these data sources should not be used with MID Server clusters. These external data sources should only be used with dedicated MID Servers.

- LDAP
- Export sets
- JDBC data sources

Note: If a MID Server in a cluster fails, the fail-over MID Server starts over at the beginning of the ECC queue task even if much of the information from the JDBC data source
was already returned. This can result in duplicate data. For more details, see the Using MID Server clusters for JDBC data sources can cause duplicate and out-of-date data (KB0727739) article in the HI Knowledge Base.

How clusters work

MID Servers in clusters must be able to connect to the instance and to all the devices with which they are expected to communicate. If all MID Servers in a cluster are down, the discovery is canceled. Make sure all the MID Servers are added to any Access Control List (ACL) in use. MID Server clusters are managed by a business rule called MID Server Cluster Management, which checks to see if the MID Server assigned to a job in the ECC Queue belongs to a cluster.

Load balancing

If the cluster business rule determines that a MID Server is part of a load balancing cluster, the application using the MID Server automatically balances the work between the MID Servers in that cluster. It is good practice to put MID Servers with the same capabilities in a load balancing cluster.

Fail-over protection

MID Servers in a fail-over cluster each have a configured order that the platform uses to determine which MID Server to use next in case of failure. MID Servers in a fail-over cluster work independently and do not load balance with other MID Servers in that cluster (although they might also be members of load balancing clusters). When a MID Server fails, the MID Server Cluster Management business rule selects the highest available MID Server in the order to take over the work. The selected MID Server checks the ECC Queue and starts with jobs that are either Processing or Ready.

Note: MID Server clustering does not support the ECC queue topics Command or SystemCommand. If these commands are received, the clustered MID Servers do not redirect the ECC queue to another MID Server. The ECC queue records stay on the ECC queue without being processed.

Configure a fail-over MID Server with at least the same capabilities as the MID Server it is intended to relieve.

Note: If a MID Server fails while the Shazzam probe is running and auto-selection is configured, failover is not available. The Shazzam discovery stops. Discovery does not automatically choose another MID Server.

MID Server cluster event

The following event is triggered when the platform cannot find a MID Server with the appropriate capabilities to replace a MID Server in a fail-over cluster. Use this event to create an email to notify appropriate users that the cluster has failed.

MID Server cluster event

<table>
<thead>
<tr>
<th>Event</th>
<th>Table</th>
<th>Description</th>
<th>Business Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid_server.cluster.down</td>
<td>[ecc_agent_cluster]</td>
<td>A MID Server cluster has failed</td>

Combining clusters

A MID Server can be added to both types of clusters at the same time. This diagram shows a scenario in which a MID Server from a load balancing cluster (MID Server D) is also present in a fail-over cluster. If MID Server D fails, MID Server E in the failover cluster is available to the load balancing cluster to perform the tasks previously assigned to MID Server D.

![Diagram showing load balance and failover clusters](image)

Specifying a specific MID Server cluster

You can specify a specific MID Server cluster for a Discovery schedule. The discovery process uses that cluster only. You cannot chain clusters or specify a single MID Server that belongs to multiple clusters.

Distributed MID Server clusters for Operational Intelligence

The distributed MID Server cluster type is used exclusively in Operational Intelligence, which analyzes Event Management events and generates anomaly alerts. These MID Servers communicate with one another to distribute and balance the workload. For details, see [MID Server distributed clusters for Operational Intelligence](#).

Set MID Server thread use

Change the number of threads used by the MID Server according to performance requirements. MID Servers which compete with other programs for CPU time can use fewer threads than the default. MID Servers which need more speed, and have a host computer powerful enough, can use more threads.

Role required: admin
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

You can set the MID Server to use as few as 5 threads without issues. If the MID Server needs more speed, and the host is powerful enough or lightly loaded with other programs, raise the thread setting. The thread limit depends on the hardware and the operating system of the host. You might have to experiment to find the optimal value for your situation. The following general observations may be useful:

- Most MID Server tasks require file handles to do their job.
  - Windows: On the Windows operating system, file handles are available in a fixed quantity. If you configure too many MID Server threads on a Windows host, the MID Server can consume all the file handles before approaching maximum CPU usage. This situation appears as an Out of file handles error in the MID Server log and indicates that the MID Server is trying to use too many threads.
  - UNIX and Linux: UNIX and Linux hosts have a much different scheme for allocating file handles. Generally, you can increase MID Server thread use on these operating systems until the CPU of the host is overloaded. See your OS documentation for monitoring CPU usage.

- Each thread on the MID Server requires some memory. Exactly how much memory varies considerably from task to task and depends on the equipment being discovered. To increase the number of threads, you might have to increase the amount of memory that Java uses. If you configure insufficient memory, an Out of memory error appears in the MID Server log.

- You can set threads.max as high as 200, however, this setting may need to be changed depending on the OS. For example, Windows-based MID Servers running Discovery uses Powershell which is resource intensive. In this case, you may exhaust the CPU power of the host machine with just 50 threads count.

Follow the steps below to change the config.xml file. Alternatively, use the threads.max connection parameter. See MID Server Connection parameters for more details.

1. Open the \agent\config.xml file using any text editor.
2. Locate the following lines:

   <!-- MID Server Threads --><parameter name="threads.max" value="25"/>

3. Edit the value. Keep in mind the cautions described above.

4. Save the record.

5. Restart the MID Server service.

Install and uninstall Nmap on a MID Server

If you decide to use credential-less Discovery in your network, you must install Nmap on each Windows MID Server that you want to use for this purpose. Self-hosted customers whose network security does not permit downloads from install.service-now.com must use a specific manual process to install and configure Nmap.

Role required: mid_admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

- Assign MID Server IP ranges to all deployed MID Servers. The quickest and most reliable way to do this is with the Using MID Server IP range auto-assignment feature available in the Discovery Quick Start wizard. This method ensures that the set of MID Servers configured to access an IP address range is comprehensive.
- Identify the IP ranges you want to explore with credential-less Discovery. Ensure that these ranges can only be accessed by MID Servers with Nmap installed, running on supported Windows hosts.
- Use the All option for selecting IP ranges and observe these requirements:
  - Restrict the use of this feature to Windows MID Servers only.
  - Ensure that Nmap is installed on each of these MID Servers.
  - Ensure that the MID Servers can access the entire customer network.
- When you create a Discovery schedule with Nmap enabled, observe these requirements for the MID Server selection options:
- **Specific MID Cluster**: Verify that Nmap is installed on all MID Servers in the cluster, where each MID Server in the cluster is configured to access the same set of IP ranges.
- **Auto-Select Mid Server**: When running horizontal Discovery, verify that Nmap is installed on at least one of the MID Servers that can access the Discovery schedule’s configured MID Server IP ranges.
- **Specific MID Server**: Verify that Nmap is installed on each MID Server that can access the schedule’s configured MID Server IP Ranges.

**Note**: To use credential-less Discovery for Service Mapping, install Nmap on all MID Servers that can access the Discovery schedule’s configured MID Server IP ranges.

Role required: agent_admin

The Discovery - IP Based (com.snc.discovery.ip_based) plugin provides connection to the installer for Nmap and the programming elements that allow a Windows MID Server to run approved scripts on target CIs for credential-less Discovery. MID Servers on which Nmap is installed can execute an Nmap command configured to perform reverse DNS name resolution, discover MAC addresses, or gather OS information on target CIs without using credentials. The Discovery - IP Based plugin is activated automatically when the Discovery (com.snc.discovery) or Event Management and Service Mapping Core (com.snc.service-watch) plugins are activated.

**Service Mapping and Nmap**

Service Mapping does not check for the presence of the Nmap capability and selects the MID Server based on the IP address only. To ensure that Service Mapping does not select a MID Server without the Nmap capability, install Nmap on all MID Servers assigned to the IP address ranges for which you want credential-less Discovery to be available. If Service Mapping selects a MID Server for credential-less Discovery that does not have Nmap capabilities, this error message appears in the map at the site of the CI being discovered: Nmap is not installed on MID Server. Verify all MIDs configured to handle selected IP Address have Nmap Capability. Nmap root directory path does not exist: <path>

**Amazon Web Service AWS**

Running Nmap scans to or from any resource within the Amazon Web Service AWS environment is tightly regulated and requires the permission of AWS through the [AWS Vulnerability/Penetration Testing Request](https://aws.amazon.com/security/ssm) form. AWS only permits testing of EC2 and RDS instances that you own. Tests against any other AWS services or AWS-owned resources are prohibited. In addition, any Nmap scan of a permitted instance must be performed within an approved time window. For these reasons, credential-less Discovery within an AWS environment is not appropriate, and if a violation of their policy occurs, could result in expulsion from the service.

**Supported operating systems**

Nmap is supported on all editions of these operating systems, including virtual machines and 64 bit systems:

- Windows 2008
- Windows 2012
- Windows 2016

**MID Server requirements**

Nmap can be installed on MID Servers that meet these requirements:

- Status is Up.
- MID Server is validated.
- MID Server does not already have the Nmap capability.

Warning: The MID Server installation path must not contain the following characters:
- ( )
- { }
- [ ]

The Nmap installer replaces these characters with spaces. This prevents the installer from finding the correct path, and the installation fails. An example of a path that will fail is C:\MIDServers\MID(1)\agent.

1. Navigate to MID Server > Servers.
2. Open the desired MID Server record.
3. Under Related Links, select Enable Credential-less Discovery.
   A confirmation dialog box appears.

4. Click Yes to continue with the installation.
   The instance runs the Nmap installer from https://install.service-now.com, a site within a ServiceNow datacenter that contains installers for the platform. This progress notice appears during installation:

   The Logs tab in the MID Server record shows the message: Running system command: installNmap.

5. Click OK if you want to hide the dialog box while the installer continues to run in the background.
Installing Nmap also installs Npcap on the host, if it is not already installed. Npcap is Nmap’s packet capture library for Windows that allows Nmap to perform port scans quickly and to identify the family of the operating system running on the target. Npcap is installed once on the host and can be used by any other application that requires it, such as Wireshark.

**Note:** If a more recent version of Npcap is already installed on the Windows MID Server host, Nmap is installed without Npcap. If an older version of Npcap is installed on the host, the Nmap installer upgrades it to the newer version.

The installation process has either of these outcomes:

- **Success:** These conditions indicate a successful installation:
  
  - The version of Nmap that is installed appears in the **Nmap version** field in the MID Server record
  - The **Related Link** changes to Disable Credential-less Discovery.
  - The **Nmap** capability is assigned to the MID Server and appears in the **Capabilities** tab of the MID Server record.

- **Failure:** If the installation fails, an error message is logged to the **MID Server Issue (ecc_agent_issue)** table. If you run the installer again with success, the issue is marked as **Resolved**.

6. To uninstall Nmap for a selected MID Server, select **Disable Credential-less Discovery** under **Related Links** in the MID Server record.

   This dialog appears during the uninstallation process:

   ![Disable Credential-less Discovery](image)

   The **Logs** tab in the MID Server record shows the message: Running system command: uninstallNmap.

   **Important:** Because Npcap can be used by other applications, uninstalling Nmap does not automatically uninstall Npcap. You must uninstall Npcap manually, after determining that no other dependencies exist.

---

**Install Nmap on a self-hosted system**

Use this procedure to install Nmap on MID Server host machines in a self-hosted environment that does not allow network access to the ServiceNow® install.service-now.com download site.

**Role required:** admin, maint

You must install Nmap manually on each MID Server host, and then configure the instance to execute credential-less Discovery.
**Note:** This procedure does not apply to self-hosted customers whose MID Server hosts can access install.service-now.com from within their network.

1. Navigate to **MID Server > Properties** (MID Server Property (ecc_agent_property) table) and open the record for the **mid.nmap.version** property.
   This property contains the version of Nmap that you must install. Record the version number.

2. Download the correct installer executable from one of these URLs:
   - [https://nmap.org/dist/](https://nmap.org/dist/): If the Nmap version in the property is 7.50, the executable you need is [https://nmap.org/dist/nmap-7.50-setup.exe](https://nmap.org/dist/nmap-7.50-setup.exe).

3. Create a folder called **nmap** in the MID Server **agent** folder of every MID Server you want to use for credential-less Discovery.

4. Copy the Nmap installer file that you downloaded to the **nmap** folder and rename it to **nmapInstaller.exe**.

5. Run the **agent\scripts\PowerShell\NmapInstallation.ps1** script and pass it the following parameters in the order in which they appear.
   This script runs the **nmapInstaller.exe** file.
1. `$operation`: Task that `NmapInstallations.ps1` will process. To install Nmap, the task is `install`.

2. `$nmap_root_path`: Complete path for the `nmap` folder that you create in step 4.

3. `$nmap_self_installer`: Complete path for `nmapInstaller.exe` file that you copied in step 5.

4. `$nmap_command`: Complete path for the Nmap install command. The `NmapInstallations.ps1` script installs Nmap in the `nmap` folder created in step 4. This parameter is `$nmap_root_path\nmap.exe`.

5. `$nmap_uninstall_command`: Complete path for the Nmap uninstall command. This command is `$nmap_root_path\Uninstall.exe`.

6. `$nmap_npcap_version`: The Npcap version installed with Nmap. This value must be the same as the value of the `mid.nmap.npcap.version` property in the MID Server Property `[ecc_agent_property]` table.

7. `$nmap_safe_scripts`: List of safe scripts that Nmap uses. You can retrieve this list from the `mid.nmap.safe.scripts` property in the MID Server Property `[ecc_agent_property]` table.

6. Set up the parameters in the `NmapInstallation.ps1` script in this order:

   ```powershell
   .\NmapInstallations.ps1 $operation $nmap_root_path $nmap_self_installer $nmap_command $nmap_uninstall_command $nmap_npcap_version $nmap_safe_scripts
   ```

   For example, the script might look like this:

   ```powershell
   C:\MidServers\mid1\agent\scripts\PowerShell> .\NmapInstallations.ps1 install
   "C:\MidServers\mid1\agent\nmap" "C:\MidServers\mid1\agent\nmap\nmapInstaller.exe"
   "C:\MidServers\mid1\agent\nmap\nmap.exe"
   "C:\MidServers\mid1\agent\nmap\Uninstall.exe" "0.91"
   "allseeingeye-info.nse,amqp-info.nse,db2-das-info.nse,drda-info.nse,freelancer-info.nse,
   ike-version.nse,mcafee-evo-agent.nse,mqtt-subscribe.nse,openlookup-info.nse,oracle-tns-version.nse,
   quakel-info.nse,quake3-info.nse/rfc868-time.nse,rpcinfo.nse,snmp-info.nse,ventrilo-info.nse,
   weblogic-t3-info.nse,xmpp-info.nse"
   ```

7. After installation is complete, add the **Nmap** capability to each MID Server you want to use for credential-less Discovery.
Attention: Only a maint user can add the Nmap capability to a MID Server. Contact ServiceNow Technical Support to request temporary maint access to your instance.

a) On the instance, open the MID Server record.
b) Select the Capabilities related list.
c) Click Edit.
d) Select Nmap from the list of available capabilities and click Save.

Uninstall Nmap on a self-hosted system

Use this procedure to uninstall Nmap in a self-hosted environment that does not allow network access to the ServiceNow install.service-now.com download site.

Role required: admin, maint

Nmap must be manually uninstalled from each MID Server host machine and then disabled on the ServiceNow instance.

1. Run Uninstall.exe in the nmap folder on each MID Server host configured for credential-less Discovery.
2. After uninstallation is complete, delete the nmap folder from the agent folder.
3. Remove the Nmap capability from each MID Server record.

Attention: Only a maint user can remove the Nmap capability from a MID Server. Contact ServiceNow Technical Support to request temporary maint access to your instance.

a) On the instance, open the MID Server record.
b) Select the Capabilities related list.
c) Click Edit.
d) Remove Nmap from the active capabilities list and click Save.
Configure MID Server as WinRM trusted host

In environments using Windows Remote Management (WinRM), Discovery or Service Mapping can discover servers using the WinRM protocol. Add servers, which are part of WinRM, as trusted hosts on all MID Servers that Discovery or Service Mapping use for discovery.

Role required: mid_admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

MID Server cannot access servers using the WinRM protocol unless these servers are configured as trusted hosts for this MID Server.

Perform this procedure on each MID Server used by Service Mapping or Discovery.

1. On the MID Server, open the command-line shell.
2. To add all servers to the TrustedHosts lists, run the following command:
   winrm s winrm/config/client @{TrustedHosts="*"}
3. To add specific servers to the TrustedHosts list, run the command with the comma-separated hosts instead of the asterisk (*), for example:
   winrm s winrm/config/client @{TrustedHosts="serverA,serverB,serverC"}

MID Server domain separation

Use the MID Server user role to configure MID Servers to access separate domains. The credentials in the config.xml file of a MID Server determine which domains it can access. Specific MID Server policy records can be restricted for use only by MID Server from the same domain.
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The records that can be read, updated, or created by a MID Server are determined by the credentials configured for that MID Server in the config.xml file. These are the user credentials that a MID Server uses to access the instance and specify which domain's records that MID Server can access.

You can create versions of these specific MID Server policy records that only a MID Server from the same domain can use. This process separation is supported for records in tables that extend MID Server Synchronized Files (ecc_agent_sync_file):

- MID Server MIB File (ecc_agent_mib)
- MID Server JAR File (ecc_agent_jar)
- MID Server Script File (ecc_agent_script_files)

**Note:** Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. The attachments do not appear because the Attachments (sys_attachment) table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

**Set up domain separation for MID servers**

Set up domain separation through the MID server user role and the MID Server configuration file.

Role required: admin, agent_admin

1. **Configure a MID Server user** within a specified domain with the proper mid_server role.
2. Specify this user within the MID Server config.xml file. When you set the MID Server user credentials in the config.xml file, make sure they are in the proper domain.

If you must change the MID Server domain:

1. Stop the MID Server and delete the ecc_agent record.
2. Update the MID Server `config.xml` with the new user in the new domain and restart the MID Server service.

If you need to create versions of specific MID Server files that only MID Servers in your domain can use:

1. Open or create a record in one of these MID Server modules:
   - SNMP MIBs
   - JAR Files
   - Script Files
2. Update an existing domain policy or submit a new record.

   **Note:** Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. The attachments do not appear because the `Attachments` (sys_attachment) table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

### Configure a multi-domain MID Server

You can create a MID Server in the global domain that can explore targets in other domains.

Before configuring a multi-domain MID Server:

- Activate the Domain Support - Domain Extensions Installer (com.glide.domain.msp_extensions.installer) plugin.
- Ensure that your instance is **domain separated**.

**Role required:** admin

1. Type `sys_properties.list` in the navigation filter and press Enter.
2. Locate the `glide.ecc.enable_multidomain_mid` property.
3. Set the value of the property to `true`.

   **Note:** Enabling this property has no effect on existing MID Servers. MID Servers in a domain prior to setting this property, remain in that domain.

4. Create a MID Server in the global domain.
   
   A MID Server created in the global domain after this property is set to `true` can explore any domain for which it has the credentials. However, this MID Server is restricted to trying only the credentials for the target domains requested by ECC Queue inputs.

   **Caution:** If you reset the `glide.ecc.enable_multidomain_mid` property to `false` after creating a multi-domain MID Server in the global domain, that MID Server writes all the data it receives to the global domain and not to the correct domains.

### Synchronize a JAR file to MID Servers

You can upload a JAR file to an instance and synchronize it to all MID Servers, or write custom probes that use the synchronized JAR file.

**Role required:** admin, agent_admin
1. **Ensure that the MID Server can connect to elements inside and outside your network**
2. **Download and install the MID Server on a Linux or Windows host**
3. **Configure your MID Server**
4. **Configure MID Server security**
5. **Ensure that the MID Server can connect to elements inside and outside your network**
6. **Download and install the MID Server on a Linux or Windows host**
7. **Configure your MID Server**
8. **Configure MID Server security**

The MID Server JAR File (ecc_agent_jar) table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see [Set up domain separation for MID servers](#).

**Caution:** Synchronizing a JAR file with this procedure causes all MID Servers connected to the instance to restart automatically.

1. Navigate to **MID Server > JAR Files**.
2. Click **New**.
3. Complete the following fields:
   - **Name**: A unique and descriptive name for identifying the file in the instance.
   - **Version**: A version number for the file, if one is available.
   - **Source**: Location of the JAR file for reference purposes. Source information is not used by the system.
   - **Description**: Short description of the JAR file and its purpose in the instance.
4. Click the paper clip icon in the banner.
5. In the Attachments dialog box, click Browse and select the file you want to attach.

The platform attaches the JAR file to the record and restarts the MID Servers to synchronize the file. It is not necessary to update the record to attach the file.

vCenter event collector

The vCenter event collector is a MID Server extension that listens for vCenter-related events and updates the CMDB accordingly.

The event collector allows the CMDB to be updated with changes to virtual machines (VMs), in addition to the updates detected by Discovery. A change to a VM is sent as an event from the vCenter server to the vCenter event collector. When an event is received, the CMDB is updated accordingly. Full vCenter Discovery does not need to rerun. For some events, such as powered on and powered off events, Discovery does not need to run again at all. For most events, Discovery runs only on the necessary vCenter resource.

For example, if a VM is turned off, the vCenter server sends the event VmPoweredOffEvent. The vCenter event collector receives and processes the event and the CMDB is updated to reflect that the state of the corresponding VM is set to off.

**Important:** With this extension, Discovery can only modify the state of a VM which exists in the CMDB. When an event with "CreatedEvent" occurs in its name, such as VmCreatedEvent, Discovery scans that VM and then creates the CI using the data it collects. When a new event occurs involving that CI, Discovery can update the existing record without launching another scan.

**Note:**

vCenter event collector supports domain separation by inheriting the domain of the specified Mid Server in the event collector context. However, it does not support multi-domain Mid Server configuration.

See Discovery for VMware vCenter for supported versions of vCenter.

How vCenter events are processed

The MID Server listens for the vCenter events configured in the vCenter Event Collector form. When one of these events is returned from vCenter, the instance parses the payload with a
business rule that converts the vCenter event into a system event (sysevent). The instance then uses that sysevent to perform tasks, such as email notification.

**Note:** If the MID server is paused when a vCenter event occurs, the MID server still processes the event. In this case, it is possible for the event collector to display a status of **Started**.

The resulting sysevents contain these values:

- **Name**: Name of the system event created from the vCenter event. This value is always `automation.vcenter`.
- **Parm1**: vCenter event that was returned. This event must be associated with an event collector record.
- **Parm2**: Event data provided by vCenter, in JSON format.

Log entries for vCenter events
**Supported vCenter events**

The following events are the only vCenter events handled by the base system when Discovery is activated. If you have upgraded your instance from an earlier version, you might not have the default events added with later releases. To use the missing events, manually add them.

**vCenter events**

<table>
<thead>
<tr>
<th>Event name</th>
<th>Description</th>
<th>Launches probe</th>
</tr>
</thead>
<tbody>
<tr>
<td>VmPoweredOnEvent</td>
<td>The VM has been powered on from the powered off state or resumed from the suspended state. This event is sent when the VM is powered on. It does not account for the time it may take to boot the host operating system.</td>
<td>None</td>
</tr>
<tr>
<td>DrsVmPoweredOnEvent</td>
<td>The VM has been powered on by a distributed resource schedule (DRS), which balances workload between available resources.</td>
<td>None</td>
</tr>
<tr>
<td>VmRestartedOnAlternateHostEvent</td>

<td>DatacenterRenamedEvent</td>
<td>A datacenter was renamed.</td>
<td>None</td>
</tr>
</tbody>
</table>

**Configure and run the vCenter event collector extension**

Configure the vCenter event collector extension in the MID Server module, and then add or remove supported events.

Before configuring event collectors, perform these tasks:

- Deploy and start a MID Server.
- Ensure that the MID Server has access to the vCenter.
- Run discovery on the vCenter.

Role required: agent_admin, admin

Multiple MID Servers can listen to the same vCenter instance, but each MID Server and each vCenter can have only one event collector record associated with it. Make sure you configure the events on the event collector record that specify the correct MID Server.
Note: You can add events to the vCenter event collector. However, not every event is supported by the base system event handlers. If you want to handle events other than those supported in the base Discovery system, you must create a script action to process the events. For instructions, see *Script actions*. As a reference, the instance processes the vCenter events in the base system with a script action called *Discovery: Process vCenter events*. Do not edit or delete this script action.

To configure the vCenter event processor extension:

1. Navigate to **MID Server > Extensions > vCenter Event Collectors**.
2. Click **New** or open an existing extension.
3. Fill in the fields, as appropriate from the table.
4. Right-click in the header bar and click **Save** in the context menu.
   
   The **vCenter Event** related list appears, containing the default events that the system is configured to handle.
5. To select a different vCenter event, click **Edit** in the **vCenter Event** related list and browse for the event.
   
   The slushbucket does not display all the available events in the opening list. Use the filter to browse for events not displayed.
6. Under **Related Links** click **Start** to save the events in this collection and start the collector.

The Related Links in this form work as follows:

<table>
<thead>
<tr>
<th>Related Link</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Start</strong></td>
<td>Starts the collector if it is not running. The extension connects to the specified vCenter server by enumerating the VMware credentials in the credential set until a connection can be made. Next, the extension tells the vCenter server to supply the events specified in the Collector Context.</td>
</tr>
<tr>
<td><strong>Stop</strong></td>
<td>Stops the running collector on the configured MID Server. No action is taken if the extension is not running.</td>
</tr>
<tr>
<td><strong>Restart</strong></td>
<td>Stops, then starts the collector on the configured MID Server.</td>
</tr>
<tr>
<td><strong>Test</strong></td>
<td>Tests the parameters for validity. If the IP address, hostname, and the set of events is valid then the test returns a successful status. If any of the parameters are incorrect, an error is shown. Running a test does not affect any extensions that are currently running.</td>
</tr>
<tr>
<td>Related Link</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Update parameters</td>
<td>Sends updated parameters to the collector. Any changes you make to the collector while the MID Server is running do not take effect immediately when they are saved. If you click this control when the collector is not running, no update is made. In the case of the vCenter extension, the collector first tests the parameters for validity. If the parameters are valid, the extension disconnects from the vCenter server and reconnects with the new parameters.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Name</td>
<td>A unique name for this vCenter event collector extension for easy identification.</td>
</tr>
<tr>
<td>Short description</td>
<td>A description of this collector.</td>
</tr>
<tr>
<td>Extension</td>
<td>(Read-Only) The collector type is automatically set to vCenterExtension.</td>
</tr>
</tbody>
</table>
| Status           | This field auto-populates with the status of the collector. This field is blank until the collector is started. After issuing a command to the collector, you see one of these values:  
  • Started: The collector is running.  
  • Stopped: The collector is not running.  
  • Offline: The MID Server is down.  
  • Error: The collector failed with an error.  
  
  **Note:** The MID Server continues to process vCenter events, even if it is paused. The status of the event collector may show as Started. |
| Error Message    | Message describing any error that causes a command, such as Start or Stop, to fail. This field only appears when the value in the Status field is Error. |
| Execute on       | Location for running this collection. The possible options are Specific MID Server or Specific MID Server Cluster.                          |
| MID Server       | The name of the designated MID Server if you selected Specific MID Server in the Execute on field. The name of the designated MID Server cluster if you selected Specific MID Server Cluster. If you selected the MID Server cluster option, an algorithm determines which server in the cluster runs the collector. |
| vCenter          | The IP address or hostname of the vCenter server.                                                                                              |
| Executing on     | (Read-Only) The name of the MID Server on which the collector is running. This field shows the name of the MID Server even if the MID Server is down. If the collector is stopped by the user, this field is empty. |

### SNMP trap collector extension

The SNMP trap collector is a MID Server extension that listens for SNMP traps from the devices on your network.

Upon receiving a trap, the MID Server sends the trap to the instance for further processing by Event Management. If Event Management is not active, traps are not processed and are discarded by the instance.
For the SNMP trap collector extension to receive traps from network devices, each device must designate the MID Server that runs the SNMP trap collector extension as a recipient of the trap. See the documentation for the network device to configure your hardware to do this. Generally, the SNMP trap collector extension should run on only one MID Server per VLAN. Multiple MID Server recipients on the same VLAN causes duplicate data in the CMDB. If network devices are separated by VLANs, multiple MID Servers may have trap collectors installed.

To configure multiple SNMP trap collector extensions, configure each in a separate record, with a unique name, and a designated MID Server.

**Configure the SNMP Trap Collector Extension**

For the SNMP trap collector extension to receive traps from network devices, each device must designate the MID Server that runs the SNMP trap collector extension as a recipient of the trap.

Role required: admin

1. Navigate to **MID Server > Extensions. > MID SNMP Trap Listener**
2. Click **New** or open an existing extension.
3. Fill in the fields from the table, as appropriate.
4. Click **Submit** or **Update**.

<table>
<thead>
<tr>
<th>Field name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for this SNMP trap collector extension for easy identification.</td>
</tr>
<tr>
<td>Short description</td>
<td>A description of the MID Server extension, if more description than the Name is necessary.</td>
</tr>
<tr>
<td>Extension</td>
<td>(Read-Only) The extension type is automatically set to <strong>TrapExtension</strong>.</td>
</tr>
<tr>
<td>Field name</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>UDP port</td>
<td>The port number that your network hardware uses when sending a trap to the designated MID Server. Port numbers 1024 and above are recommended. Port numbers 1023 and lower may be system reserved and can result in access violations for MID Servers that are not running with administrative credentials.</td>
</tr>
</tbody>
</table>

**Status**

(Read-Only) The status of the trap collector extension. This field is blank until the extension is run. After it is run, the value may be:

- **Started**: The extension is running.
- **Stopped**: The extension is not running.
- **Offline**: The MID Server is down.
- **Error**: The extension failed with an error.

**Execute on**

The location for running this extension: a Specific MID Server or a Specific MID Server Cluster. The recommended setting is Specific MID Server. Network hardware typically has to be configured to send to a specific IP address. If the listener moved to a different MID Server in the cluster, the trap would not be received.

**MID Server**

The name of the designated MID Server if you selected Specific MID Server in the Execute on field. The name of the designated MID Server cluster if you selected Specific MID Server Cluster in the Execute on field. If you selected Specific MID Server Cluster, a ServiceNow algorithm determines which server in the cluster runs the extension.

**Executing on**

(Read-Only) The name of the MID Server on which the extension is running. This field shows the name of the MID Server even if the MID Server is down. If the extension is stopped by the user, this field is empty.

5. **In Related Links**, run any of the following actions against the SNMP trap collector extension:

<table>
<thead>
<tr>
<th>Related Link</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start</td>
<td>Starts the extension if it is currently not running. The extension is started on the configured MID Server and port number.</td>
</tr>
<tr>
<td>Stop</td>
<td>Stops the running extension on the configured MID Server. No action is taken if the extension is not running.</td>
</tr>
<tr>
<td>Restart</td>
<td>Stops, then starts the extension on the configured MID Server and port number.</td>
</tr>
<tr>
<td>Test</td>
<td>Verifies that the configured MID Server can run the SNMP trap collector extension on the specified port. Running a test does not affect any extensions that are currently running.</td>
</tr>
</tbody>
</table>
Securing and encrypting MID Server data

After configuring your MID Server, you can add security by encrypting MID Server parameter values in the `config.xml` file. Encryption protects data that the MID Server returns to the ECC Queue. Other available security options include the authorization of SOAP requests, restricting access to the MID Server configuration file, and establishing secure socket layer (SSL) connections.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

How MID Server password encryption works

The `username` and `password` are initially set in the `config.xml` file on the MID server. When the MID server retrieves the credentials, it replaces the clear-text password with an encrypted password automatically, using an AES128 encryption algorithm. The MID server also maintains an encryption key that is generated each time it starts and remains in memory and not on the hard disk. When credentials need to be sent from the instance to the MID server, the following process takes place:

1. The instance retrieves the encrypted `password` and the unencrypted `username` from the instance database table.
2. The instance decrypts the encrypted password, and then re-encrypts it using the MID server encryption key.

3. The username and re-encrypted password are sent to the MID Server through the encrypted TLS session that was already established between the MID server and the instance.

4. The MID server receives the credentials and decrypts the password in memory before using the credentials for remote operations. At no point is the credential password stored on the disk in an unencrypted format.

Security options

The MID Server provides built-in security options for other content in the configuration file, such as the default encryptor, Windows Data Protection API, and options for custom encryption.

Encrypt or decrypt MID Server configuration file values
You can encrypt and decrypt any value in the MID Server config.xml file.

ECC queue data encryption with the automation API
Use the automation API to encrypt sensitive probe data that is sent from an instance to the MID Server through the ECC Queue.

MID Server configuration file security
Protect sensitive MID Server configuration data in the config.xml file using internal and external data encryption and external data storage.

Rekey a MID Server
Rekey a MID Server to force it to restart and generate a new private key. Typically, this process is only necessary if the MID Server keystore is compromised.

Add SSL certificates for the MID Server
Add certificates to the MID Server to communicate over SSL.

MID Server authentication credentials and SOAP requests
For added security, enforce basic authentication on each incoming SOAP request to the MID Server.

Attach a script file to a file synchronized MID Server
Attach a script file and synchronize it to a MID Server to prevent Windows enhanced security from blocking MID Server download files if determined are dangerous.

Encrypt or decrypt MID Server configuration file values
The value of any MID Server parameter in the config.xml file can be encrypted. The attributes for all encrypted values are managed from within the configuration file, including the security attribute of the login password.

Role required: admin
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

1. Navigate to the agent directory that was created when the MID Server was installed and open the config.xml file using a text editor such as WordPad.
2. Locate or add the parameter you want to encrypt. For example, you might want to protect your proxy server passwords by configuring this parameter:

   `<parameter name="mid.proxy.password" value="securepasswd"/>`

3. Add the encryption attribute `secure="true"`.

   `<parameter name="mid.proxy.password" secure="true" value="securepasswd"/>`

4. Restart the MID Server.
5. Open the config.xml file

   The encrypted password appears as follows:

   `<parameter name="mid.proxy.password" secure="true" value="encrypted:rhfrUNYRzZAI8/BkTtZmNA=="/>`

6. To decrypt this or any other value in the config.xml file and display the value in clear text:
   a) Stop the MID Server.
   b) Set the `secure="true"` attribute to `false`.
   c) Replace the encrypted value with the clear text value.
   d) Restart the MID Server.
ECC queue data encryption with the automation API

The automation API encrypts sensitive probe data that is sent from an instance to the MID Server through the ECC Queue.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

You can use the automation API to encrypt data that you send from a custom application to the ECC queue and prevent that data from appearing in clear text. For example, you can encrypt a password used by a MID Server to authenticate on a REST endpoint.

Methods

The API provides these methods:

- encrypt()
- isEncrypted()

The following example shows how you might call these methods:

```javascript
var automation_api = new sn_automation.AutomationAPI();
var password = 'xyz';
var encrypted_password;
if (automation_api.isEncrypted(password))
    encrypted_password = password;
else
    encrypted_password = automation_api.encrypt(password);
```

The encrypted_password value can then be passed safely to the ECC Queue and on to the desired MID Server.
Center Server configuration file security

Sensitive MID Server configuration data can be protected using several different schemes, including internal and external data encryption and external data storage.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The MID Server provides the following built-in security options for content in the config.xml file:

- **Default security provider**: Secures the data in the config.xml file by encryption. When the MID Server is restarted, any unencrypted data is encrypted and written to the config.xml file. The default security provider offers these encryption options:
  
  - **Default encryptor**: Default process for encrypting data in the MID Server config.xml file. See Encrypt or decrypt MID Server configuration file values for details.
  
  - **Windows Data Protection API (DPAPI)**: The operating system performs the data encryption, rather than the MID Server. DPAPI encryption is based on the logged in user's account. When this scheme is used, the data can only be decrypted by the same user account. If the account changes, the data must be re-encrypted.
  
  - **Custom encryption**: Implement the IMidServerEncrypter interface to create your own custom encryption scheme to manage sensitive config.xml data.

- **CyberArk**: Data security is provided by CyberArk's Privileged Account Security system, which moves sensitive data from the config.xml file to a secure CyberArk vault. This solution does not encrypt the data.

- **Custom external storage**: Implement the ISecuredConfigProvider interface to create your own custom external storage system to manage sensitive config.xml data.
Secured content and encryption schemes

Encrypt MID Server configuration data with DPAPI

Windows Data Protection API (DPAPI) encrypts sensitive data from the config.xml file, based on the MID Server user account.

Role required: admin

DPAPI encryption provides another level of security for data such as credentials, IP addresses, and URLs in the MID Server config.xml file. The operating system performs the data encryption, rather than the MID Server. DPAPI encryption is based on the logged in user's account. When this scheme is used, the data can only be decrypted by the same user account. If the account changes, the data must be re-encrypted.

1. Open the config.xml file in a text editor.
   This file is located in the /agent folder in your MID Server installation path.
2. Enable this parameter and value:
   <parameter name="mid.secure_encrypter"
     value="com.service_now.mid.services.config.WindowsDPAPIEncrypter"/>
3. Save the configuration file.
4. Restart the MID Server.
   Any values in clear text in the config.xml file are encrypted by the operating system.
5. Follow this procedure if you need to change the MID Server user account that is used for encryption.
   a) Stop the MID Server service.
   b) Open the config.xml file in a text editor.
      This file is located in the /agent folder in your MID Server installation path.
   c) Re-enter all the encrypted values in clear text.
   d) Make the changes to the MID Server user account in the ServiceNow® instance.
   e) Restart the MID Server service.
      The data is re-encrypted by the operating system, based the new MID Server user account.

Use CyberArk as a secure configuration provider

You can use a CyberArk vault to secure any sensitive data from the MID Server config.xml file.
Role required: admin

CyberArk is commonly used to secure credentials in its external vault. However, a MID Server parameter in the config.xml file enables you to store other types of data in CyberArk.

1. Open the config.xml file in a text editor.
   This file is located in the /agent folder in your MID Server installation path.
2. Enable this parameter and value:
   <parameter name="mid.secure_config.provider" value="com.service_now.mid.services.config.CyberArkSecuredConfigProvider"/>
3. Configure specific data to secure in the CyberArk vault, as shown in these examples.
   a) Secure the MID Server credentials by setting this parameter to match the ID and Type for that data in your CyberArk configuration.

   <parameter name="mid.instance.username" secure="true" value="cyberark: id=<CyberArk ID>, type=<CyberArk type>"/>
   <parameter name="mid.instance.password" secure="true" value="cyberark: id=<CyberArk ID>, type=<CyberArk type>"/>

   b) Secure the URL of the instance by setting this parameter to match the ID and Type for that data in your CyberArk configuration.

   <parameter name="url" secure="true" value="cyberark: id=<CyberArk ID>, type=<CyberArk type>"/>

4. Save the configuration file.
5. Restart the MID Server.

Change MID Server configuration file security schemes

The MID Server provides several schemes for securing sensitive data in the config.xml file and allows you to switch between these options to suit your security requirements.
Role required: admin

1. Stop the MID Server service.
2. Open the config.xml file in a text editor.
   This file is located in the /agent folder in your MID Server installation path.
3. Re-enter all the encrypted values in clear text.
4. Disable the previous security scheme and configure the MID Server to use the new provider.
5. Restart the MID Server service.
   The data is re-secured or encrypted, based on the security scheme you have selected.

MID Server ISecuredConfigProvider interface

Use the methods in this interface to create custom providers that manage secured parameter values in the MID Server config.xml file.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>initialize</td>
<td>This method initializes the provider with additional configuration parameters and does not return a value.</td>
</tr>
<tr>
<td>isParameterValueSecured</td>
<td>This method checks to see if the parameter value has been secured or not. This method returns a boolean type value.</td>
</tr>
</tbody>
</table>

initialize

Example

```java
void initialize(java.util.Properties properties, 
IMidServerEncrypter encrypter) 
throws java.lang.Exception
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>Initialization properties.</td>
</tr>
<tr>
<td>encrypter</td>
<td>Encrypter to use if the provider is encryption based.</td>
</tr>
</tbody>
</table>

Exception

`java.lang.Exception`

isParameterValueSecured

Example

```java
boolean isParameterValueSecured(java.lang.String paramValue)
```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>paramValue</td>
<td>The parameter value.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>The parameter returns <strong>true</strong> if the parameter value is secured.</td>
</tr>
</tbody>
</table>

**secureParameterValue**

This method secures the parameter value if it has not been secured. This method returns a `string` type value.

**Example**

```java
java.lang.String secureParameterValue(java.lang.String unsecuredParameterValue) throws java.lang.Exception
```

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>unsecuredParameterValue</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>This method returns the unsecured parameter value.</td>
</tr>
</tbody>
</table>

**Exception**

```java
java.lang.Exception
```

**unsecuredParameterValue**

This method returns the unsecured value of the parameter. This method returns a `string` type value.

**Example**

```java
java.lang.String unsecuredParameterValue(java.lang.String parameterName) throws java.lang.Exception
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameterName</td>
<td>The parameter name.</td>
</tr>
</tbody>
</table>

Returns

This parameter returns the unsecured value.

Exception

java.lang.Exception

**MID Server IMidServerEncrypter interface**

Use the methods in this interface to create a custom external encrypter for the MID Server config.xml file.

*Note:* These methods are contained in the snc-automation-api.jar file, located in the MID Server installation folder.

**initialize**

This method initializes the encrypter with additional configuration parameters and does not return a value.

**Example**

```java
void initialize(java.util.Properties properties)
throws java.lang.Exception
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>Initialization properties.</td>
</tr>
</tbody>
</table>

Exception

java.lang.Exception

**encrypt**

This method encrypts the unencrypted data and returns a `byte()` type value.
Example

```java
byte[] encrypt(byte[] unencryptedData)
    throws java.lang.Exception
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unencryptedData</td>
<td>The data unencrypted.</td>
</tr>
</tbody>
</table>

**Returns**

- Encrypted data

**Exception**

- java.lang.Exception

---

**decrypt**

This method decrypts encrypted data and returns a `byte[]` type value.

Example

```java
byte[] decrypt(byte[] encryptedData)
    throws java.lang.Exception
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>encryptedData</td>
<td>The data decrypted.</td>
</tr>
</tbody>
</table>

**Returns**

- Decrypted data.

**Exception**

- java.lang.Exception

---

**Rekey a MID Server**

Rekey a MID Server to generate a new private key. Private keys are used to decrypt automation credentials, so that MID Servers can transmit information securely. Key pairs are initially generated
when a MID Server is validated, and MID Servers should be rekeyed periodically to meet security requirements.

Role required: admin

1. **Ensure that the MID Server can connect to elements inside and outside your network**
2. **Download and install the MID Server on a Linux or Windows host**
3. **Configure your MID Server**
4. **Configure MID Server security**
5. **Ensure that the MID Server can connect to elements inside and outside your network**
6. **Download and install the MID Server on a Linux or Windows host**
7. **Configure your MID Server**
8. **Configure MID Server security**

When the MID Server comes back online, the system automatically validates the new key, and the MID Server resumes processing automation tasks.

Automation credentials are secured by encrypting them in the instance with the MID Server’s trusted public key prior to transmission. When the MID Server is created, it generates a keypair, consisting of a public and private key. After the MID Server is validated, it can use the private key to decrypt automation credentials. You should occasionally rekey the MID Server to meet your organization’s security requirements.

1. Navigate to **MID Server > Servers**.
2. Open the MID Server whose keypairs you want to rotate.
3. Under **Related Links**, click **Rekey**.

**Add SSL certificates for the MID Server**

Configure the MID Server to connect to a source over SSL.

Role required: admin
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

You can add certificates to the MID Server if you want communication to occur over SSL. You can add these certificates to the cacerts keystore file:

- Signing Certificate Authority (CA) certificate
- MID Server certificate

**Note:** The MID Server does not support SSL when importing data from an integration, such as an LDAP server.

1. Open a command prompt and navigate to the folder containing the JRE `keytool`. This is the location of the JRE you installed. An example path might be: `C:\Program Files\Java\jre1.8.0_161\bin`
2. Import a certificate into the MID Server’s cacerts keystore, using this command:
   ```
   keytool -import -alias <certificate alias> -file "<path to certificate>" -keystore "<path to the JRE>\lib\security\cacerts"
   ```
   For example, you might enter:
   ```
   keytool -import -alias MyCA -file "C:\myca.cer" -keystore "C:\Program Files\Java\jre1.8.0_161\lib\security\cacerts"
   ```
   **Note:** The keytool prompts you for a certificate password. If the certificate is for a CA, the keytool also asks whether to trust the certificate authority. To add a certificate to an instance, see [Upload a certificate to an instance](#).

**MID Server authentication credentials and SOAP requests**

Set basic authentication credentials to update the web service invocation data. For added security, you can enforce basic authentication on each incoming SOAP request to the MID Server.
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Basic authentication credentials and SOAP requests

You can enforce basic authentication on each request. The MID Server is not able to communicate through a proxy server if the proxy server supports only NTLM authentication. You can use basic authentication with a proxy server or create an exception for the MID server host. Supplying basic authentication information, regardless of whether it is required, has an added advantage. The web service invocation creates or updates data using the supplied credentials. For example, when you create an incident record, the journal fields have the user id of the basic authenticated user instead of the default Guest user. This behavior allows you to identify data added by a specific MID Server.

You can set basic authentication credentials for SOAP requests. Each SOAP request contains an Authorization header as specified in the Basic Authentication protocol.

**Note:** The setting for enforcing strict security controls how the instance uses the credentials you provide for the MID Server. When the setting is enabled, you must provide a user ID with access to the tables the MID Server is trying to access. When the setting is disabled, any valid user ID allows the MID Server to access to all tables.

Require basic authorization for incoming SOAP requests

Enforce basic authentication on each incoming SOAP request to the MID Server.

Role required: admin

1. Navigate to **System Properties > Web Services.**
2. Select the check box for **Require basic authorization for incoming SOAP requests.**
3. Click **Save.**
4. To provide basic authentication credentials for a MID Server, navigate to C:\Program Files \ServiceNow\<MID Server name>\agent and edit the config.xml file, as follows:
a) Find the element `<parameter name="mid.instance.username" value=""/>` and enter the instance administrator user name as the value. For example, you might enter `<parameter name="mid.instance.username" value="admin"/>`.

b) Find the element `<parameter name="mid.instance.password" value=""/>` and enter the configured password for this instance as the value. For example, you might enter `<parameter name="mid.instance.password" value="abc123"/>`.

### Attach a script file to a file synchronized MID Server

You can attach a script file to synchronize to a connected MID Server. Windows Internet Explorer enhanced security blocks downloaded files that it determines are potentially dangerous. However, synchronizing the files avoids this security problem.

Role required: admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Enhanced security in Windows browsers, such as Internet Explorer, blocks downloaded files that it determines are potentially dangerous. This would block files downloaded for use by the MID Server. You would need to unblock each file manually through the browser.

To get around this issue, use file synchronization. File synchronization requires you to proactively take script files from your instance and save them on the MID Server. The files on the instance and the MID server stay synchronized, but there is no longer any need for the MID Server to download the whole file. File synchronization also protects any updates you make in those script files from being overwritten during the upgrade of an instance.

You can attach multiple files, but the last attached file gets synchronized to the MID Server. If you delete the attachment, the script file becomes inactive, and the synchronized file is deleted from the MID Server.

1. Navigate to MID Server > Script Files.
2. Open the file to which you would like to attach the script file, or click New to create a new file.

3. Select Use attachment, and then click the paperclip icon to add the attachment.
   When Use attachment is checked, an attached script file overrides the script contained in the Script field. If this check box is cleared, the script in the Script field is used instead of the attachment.

   The script file attachment name must match the MID Server script file name, since the record can contain other attachments.

4. Click Update to initiate the synchronization process.
   Ensure that the file name matches the script name. If you receive the error message: File type not permitted or mime type does not match the file content, request that your administrator turn off mime type validation on attachments. The system property glide.security.file.mime_type.validation controls this setting.

Enable script file synchronization for Windows enhanced security

Windows Internet Explorer enhanced security blocks downloaded files that it determines are potentially dangerous.

Script files synchronized with the MID Server are stored on the instance in the MID Server Script File [ecc_agent_script_file] table, which you can access in the MID Server > Script Files module.

When the MID Server first connects to the instance, the instance creates a directory called \scripts in the MID Server root. The instance then creates a parent directory in the path \scripts\<parent name> using definitions from the ecc_agent_script_file table. Finally, the instance creates the script files themselves inside the parent directory using the records from the ecc_agent_script_file table.

The record for the parent directory looks like this:
The instance creates each script file in the parent directory on the MID Server using the record Name from the ecc_agent_script_file table as the file name and the Script field payload as the file contents. A script file record looks like this:
The synchronization of the script file continues to work as if the script was manually added to the form.

See Attach a script file to a file synchronized MID Server for instructions on how to attach a script file.

**Note:** The MID Server Script File (ecc_agent_script_file) table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see Set up domain separation for MID servers.

### MID Server upgrades

Upgrade MID Servers manually, or automatically through their host computers. The instance automatically tests to identify issues before MID Servers upgrade. Pin MID Servers to specific versions using system properties.

**Warning:** The MID Server cannot auto-upgrade on a Windows host if the Windows Application Experience service is disabled. For information on the error that is displayed and instructions for re-enabling this service, see KB0597552.
Access to the MID Server download site

The MID Server host computer must have access to the ServiceNow download site at install.service-now.com to upgrade automatically. If you have a self-hosted ServiceNow environment that blocks access to the download site, you must import the MID Server installer package into your MID Server hosts manually. For instructions, see KB0760123 in the Self-Hosted knowledge base.

Upgrade methods

- **Automatic**: Allow the instance to automatically upgrade the MID Server. This functionality is available by default. Automatic upgrade occurs:
  - Every hour, when the MID Server checks with the instance to see if there is a different version available for upgrade. You cannot modify this time period.
  - When the instance is upgraded and the MID Server for that version is different than the version currently on the MID Server.
  - When the MID Server pre-upgrade test passes without an error. Any errors encountered during this automatic test prevent the upgrade from occurring until the issues are resolved. The pre-upgrade test is enabled by default, but can be disabled by adding and setting a system property.

- **Manual**: Manually start the upgrade by clicking a related link on the MID Server record. Use this method when you do not want to wait until the next hourly automatic update or if your upgrade failed and you want to force an upgrade. See Upgrade the MID Server manually for instructions.

The Upgrade state

The instance initiates the upgrade by sending the autoUpgrade system command to the MID Server. Starting with MID Servers upgrading from an Istanbul version MID Server, the MID Server Status is changed to Upgrading while the upgrade is running. The Upgrading state is similar to the Paused state. This is done to avoid potential miscommunication between the new version of the instance and the previous version of the MID Server during upgrade. For the upgrade to run, MID servers must be in the Up state and must be validated.

While in the Upgrading state, you cannot resume or restart the MID Server. However, you can perform the same actions that you can when the MID Server is in the Paused state. After a successful upgrade, the queued output is sent to the instance and the MID Server starts retrieving new commands to process. The status also changes to Up.

When the instance sends the autoUpgrade system command to the MID Server, if it is Down or Paused, or if it has not been validated, the command remains in the ECC Queue until the MID Server status changes to Up. Then the command is processed.

---

**Note**: If you are using an Istanbul instance but you are upgrading a pre-Istanbul MID Server to Istanbul, these upgrade states are not available. They are only available for MID Servers that are already on Istanbul.

Failed upgrades

Failed upgrades are handled differently based on the version you are upgrading to:
- Upgrade to another major release (such as Istanbul to the next full release): the status changes to **Upgrade Failed**.
- Upgrade from a minor version within a release (such as Jakarta patch 1 to patch 2): the MID Server continues using the version it is currently running. It does not perform the upgrade and the status eventually changes to **Up**, assuming the MID Server was already functioning properly.

### Upgrading MID Servers in the Down state

If a MID Server is in the **Down** state, it cannot process the upgrade command. When the MID Server changes to **Up**, it immediately checks to see if an upgrade is necessary. If it does need to upgrade, the upgrade process starts before the MID Server processes any other commands.

### Upgrade error messages

The MID Server can display the following upgrade error messages.

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unable to refresh packages</td>
<td>Generic error when the error is not handled by a defined error message.</td>
</tr>
<tr>
<td>Failed to query instance for MID Server buildstamp</td>
<td>Instance is unavailable or there is a major version mismatch between the MID Server and the instance.</td>
</tr>
<tr>
<td>Not a valid package buildstamp</td>
<td>InstanceInfo returned an assigned buildstamp that was not in the correct format, such as a version mismatch.</td>
</tr>
<tr>
<td>Method failed (&lt;instance URL&gt;) HTTP/1.1 409 Conflict with code: 409</td>
<td>MID Server auto-upgrade request rejected when number of concurrent upgrades exceeds 2. The configured number of available semaphores for MID Server upgrades on the instance is set at 2 to prevent performance degradation.</td>
</tr>
</tbody>
</table>

**Note:** The MID Server re-sends the request every 20 seconds until it can get the semaphore.

### MID Server Upgrade History

Use the MID Server Upgrade History module for troubleshooting problems with MID Server upgrades. The module contains a record of each instance upgrade. Those records provide step-by-step status details for each MID Server’s upgrade process. If an error occurs, it is noted in the step and a message is dynamically generated with further details. For further information, see **MID Server Upgrade History**.

### MID Server pre-upgrade check

The instance automatically tests the MID Server’s ability to upgrade on your system prior to the actual upgrade, to identify issues that could cause a MID Server outage or require re-installation.
Each MID Server contains an AutoUpgrade monitor that compares the MID Server version with that of the instance to determine if the MID Server needs to upgrade. If the AutoUpgrade monitor discovers that the MID Server version is out of date, the monitor runs pre-upgrade validation tests for that MID Server. If an issue is detected, a message is logged to the MID Server Issue (ecc_agent_issue) table, and the upgrade is blocked. The AutoUpgrade monitor continues to run every hour, until all the tests pass. If there are no blocking issues, the MID Server downloads the appropriate upgrade package and begins the upgrade process.

Failed tests leave the MID Server in one of these states:

- **Upgrade Failed**: For upgrades to a different release family, such as from London to Madrid.
- **Up**: For upgrades within the same release family, such as an upgrade to a patch.

Errors, such as insufficient disk space for the installer or lack of connectivity to the download server, are written to both the MID Server agent log and to the MID Server Issue (ecc_agent_issue) table. These errors are published before the actual MID Server upgrade occurs and must be resolved before the upgrade can continue. You can view issues from the MID Server Issue (ecc_agent_issue) table in any of these locations:

- MID Server Issues related list in a MID Server record.
- MID Server > Server Issues navigation module.
- MID Server Issues gauge on the MID Server dashboard.

### Pre-upgrade tests

The pre-upgrade validation tests check these requirements:

- At least 1 GB of free disk space
- Access to the download site at install.service-now.com
- Permission to execute these file operations:
  - Extract a ZIP archive to a temp folder.
  - Copy files from the temp folder to the agent folder.
  - Read a text file.
  - Delete the pre-upgrade contents.

- For Windows, ensure that the Log On As user for the Windows service is either LocalSystem or a user that is part of the local Administrator group. By default, domain administrators are added to the local Administrator group when joining a computer to a domain. If the PowerShell script that performs this test does not return the expected output, the system logs a warning to the MID Server Issue (ecc_agent_issue) table, but the test passes.

### Data provided

When the instance encounters issues during the pre-upgrade check, it populates these fields in the MID Server Issue (ecc_agent_issue) table:

**MID Server issue fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last detected</td>
<td>Date and time the issue was last detected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Short description</td>
<td>Contents of the generated message that specifies a possible issue with available disk space, download server access, or file permissions.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Name of the MID Server affected by a pre-upgrade test failure.</td>
</tr>
<tr>
<td>Issue source</td>
<td>The process that identified the issue. For all issues with MID Server pre-upgrade testing, the source is UpgradeCheck.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the issue. Possible states are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>New</strong>: Starting state when the instance creates the issue.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Acknowledged</strong>: State set by the administrator when they first examine the issue.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Resolved</strong>: Ending state, set by the instance, indicating that the issue has been resolved. If the scheduled job does not encounter the issue when it runs again, the instance automatically sets the state to this value.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain for the MID Server. For all issues derived from MID Server pre-upgrade testing, the domain value is inherited from the domain of the MID Server user.</td>
</tr>
<tr>
<td>Count</td>
<td>Number of times an issue has been detected. Each time the pre-upgrade tests run and encounter the same issue, the AutoUpgrade monitor increments this field.</td>
</tr>
</tbody>
</table>

Errors that block the upgrade

These messages describe issues detected by the pre-upgrade test and published to the MID Server Issue (ecc_agent_issue) table. Failure of any of these tests blocks the upgrade.

- **Not enough free disk space. The system reports <n> bytes free**: This message is displayed when less than 1 GB of free disk space is detected on the MID Server host. This error is also written to the MID Server agent log.

- **Unable to download updates from the install server**: This message indicates that either the MID Server host does not have permission to download the installation package from install.service-now.com, or network problems prevent connection. This error is also written to the MID Server agent log.

- **Unable to extract contents of pre upgrade check zip**: This message indicates that the service account on the MID Server host does not have permission to extract the pre-upgrade ZIP archive to the temporary folder specified by the system property, java.io.tmpdir. On a UNIX host, the value for this property is typically /tmp or /var/tmp. On Microsoft Windows hosts, the path is c:\WINNT\TEMP.

- **Unable to create folder <upgrade check file path>**: This message indicates that the MID Server service account does not have permission to create the upgradeCheck folder for the pre-upgrade checking files in the agent/package path.

- **Unable to verify file permissions: <message>**: This message indicates an exception has occurred when checking file permissions, such as a file that does not exist or access failure.
**MID Server Windows Service is not running as LocalSystem or a local Administrator.** This message warns that the Windows service is not running with the desired permissions.

**Non-blocking warnings**

These warnings are displayed in the MID Server Issue (ecc_agent_issue) table and do not prevent a Windows MID Server from upgrading:

- **WARN: Unable to parse $logOnAsUser**: This message warns that the Log On As User value for the Windows service is not in either of these expected formats:
  - user@domain.company.com
  - domain\user

- **WARN: Unable to look up Log On As user’s groups**: When the instance attempts to look up the logged on user's group memberships, it executes the `net user <username>` command. The instance expects a certain output structure by the Windows service from this command and issues this warning if the expected output does not match the actual output.

These PowerShell warnings are written only to the MID Server agent log. Because PowerShell is not required to use a MID Server, these configuration issues do not prevent a Windows MID Server from upgrading. However, these warnings might indicate issues in your environment that require attention.

- **Skipping PowerShell upgrade checks since PowerShell is not usable**: PowerShell 2.0 (at a minimum) is not installed or `powershell.exe` is not available to the MID Server service user.

- **Continuing with upgrade, but the following issue was encountered during upgradeCheck: <exception message>**: This message indicates that there was an issue running the PowerShell portion of the pre-upgrade tests.

**Disabling the pre-upgrade check**

A MID Server configuration parameter called `mid.upgrade.run_precheck` is set to true by default, which allows the automatic pre-upgrade test to run. To disable these tests for a single MID Server, add this parameter to that MID Server's `config.xml` file and set it to false. To disable these tests for all MID Servers, add a new record to the MID Server Property (ecc_agent_property) table called `mid.upgrade.run_precheck`. Set the value of this property to false and leave the MID Server field blank.

**Pinning a MID Server to a specific version**

You can pin all the MID Servers in your environment to a specific version by setting a system property, or you can configure specific versions for individual MID Servers.

**Note:** Do not pin the MID Server to a specific version for a significant amount of time, especially if you upgrade the instance. Under most circumstances, let the instance determine which MID Server version to use.

**Version control properties**

These system properties control the version for all MID Servers:
• **mid.buildstamp**: Identifies the MID Server version with an identifier based on the date of the build. This property uses the format of `mm-dd-yyyy-hhmm`. The MID Server checks for version information hourly. If no override version is configured, the MID Server looks at the mid.buildstamp property for the version to use. This property resets itself to the default version (the version that matches your instance version) when the instance is restarted or upgraded, so any user changes are lost at that time. The system appends the release name and patch information to the date and time format.

  **Caution:** This property is not visible by default and should not be configured.

• **mid.version.override**: Sets an override condition for the current version for all MID Servers in your environment. This action pins the MID Servers to a single version and disables the automatic upgrade feature. This property is not visible in the base system and must be added to the System Property (sys_properties) table when it is set. For details, see [Add a system property](#).

  When the MID Servers check the version each hour, they look at the mid.version.override property first. If this property is empty, the MID Servers get their version information from the mid.buildstamp property. If an override version is configured, the MID Servers use this value and ignore the version information in the mid.buildstamp property. This override value remains when the instance is restarted and is passed to the MID Servers.

  **Attention:** The value in the **mid.version.override** property is cleared during an upgrade, which forces the MID Server to reset itself to the version in the mid.buildstamp property.

**Version control configuration parameter**

To pin specific MID Servers on a desired version, set the **mid.pinned.version** parameter with the name of that version in the `config.xml` file of each MID Server. Use the format `<version>-mm-dd-yyyy`. This setting overrides the property setting for the pinned MID Server version. For instructions, see [Add a MID Server parameter](#).

  **Note:** The value set in this parameter is not affected by an upgrade.

**Upgrade the MID Server manually**

You can manually upgrade MID Servers at any time if you do not want to wait for the automatic upgrade.

Role required: mid_server or admin

For the upgrade to run, MID servers must be in the **Up** state and must be **validated**.

The MID Server is upgraded to the version specified by build stamp on the instance, or by the `upgrade property` that you specify.

1. Navigate to **Discovery > MID Servers** or **Orchestration > MID Server Configuration > MID Servers**.
2. Open the record of the MID Server that you want to upgrade.
3. Click **Upgrade MID** under **Related Links**.
4. Confirm that you want to perform the upgrade.
Resolving MID Server issues

Troubleshoot problems with the MID Server to find solutions. Monitor the MID Server to receive alerts about issues as they occur. Troubleshooting procedures exist to resolve specific problems with the MID Server. The Knowledge Base on Hi contains several articles to help you troubleshoot MID Server issues.

Monitor the MID Server

Monitoring a MID Server involves verifying entries in log files, confirming network connectivity, and checking MID server status.

- If the MID Server is on a Windows host, navigate to the Windows Services console, locate the service name that matches the name that appears from the wrapper-override.conf file. If the MID Server process is the only Java process running on the host, monitor the memory used by java.exe and alert on less than the maximum configured memory defined in the \agent\conf\wrapper-override.conf folder.
- Ensure that the agent0.log.0.lck file appears in the \agent\logs folder to confirm that the MID Server running and logging system activity in the agent0.log.0 file.
- Review the following logs for warning, critical, and severe errors: \agent\logs\agent0.log.0\agent\logs\wrapper.txt. See Manage ECC Queue content for a MID Server to see how to open log entries from the instance.
- Test MID Server connectivity to confirm that the MID Server host is able to communicate with the instance. Resolve any issues with the network connectivity such as conflicts with firewalls, access control lists, and routing errors.
- From the MID Server instance, navigate to the MID Servers page, and review the status of the MID Server. For additional information, click a Name.
- Set up email, SMS, and push notifications to alert you when issues occur with MID servers. The MID Server Down notification is enabled by default. See Notifications for details.

Troubleshooting procedures

The following procedures provide information on resolving specific problems with the MID Server. Knowledge Base articles also cover a wide range of issues. If you are encountering problems which are not covered in these procedures, search the Knowledge Base for related articles. For instance, if you are experiencing symptoms such as the MID Server going down or not responding, or CIs being duplicated during discovery, see KB0597571 for information and recommended solutions.

MID Server active issues

The ServiceNow® instance has a dedicated table that publishes active issues with MID Servers and alerts administrators when a MID Server is in danger of exceeding its resources.

MID Server fails to start

The MID Server cannot run if another MID Server on the host has the same name or if multiple Windows services have the same executable path.

Active MID Server post-cloning credential issues

The system provides automatic processes to detect and notify you of possible MID Server credential issues after instance cloning.

MID Server resource threshold alerts
The instance displays warnings when a MID Server breaches its resource thresholds for CPU and JVM memory usage, enabling users to create email notifications or custom scripts when a breach occurs.

**MID Server user connectivity issues**

The instance writes issues involving MID Server user logins and network connectivity to the MID Server Issue (ecc_agent_issue) table and creates events you can use in custom scripts or to send email notifications.

**Interpreting MID Server user debugging output**

Debugging output from the system log is available in either a summary or detailed view for MID Server user issues, but must be enabled manually.

**MID Server Upgrade History**

Use this module to troubleshoot errors that occur during the MID Server upgrade process. The MID Server Upgrade Histories table contains a record of each instance upgrade. The MID Server Upgrade Stages table shows the status of each MID Server and its upgrade progress, including any errors encountered.

**MID Server active issues**

The ServiceNow® instance has a dedicated table that publishes active issues with MID Servers and alerts administrators when a MID Server is in danger of exceeding its resources.

The MID Server Issue (ecc_agent_issue) table displays a number of common issues that a MID Server can experience, as they occur. Error checking processes attempt to pinpoint the most likely cause of the issue. Informative error messages name the affected MID Server and explain the possible cause of the issue. The ecc_agent_issue table retains its records for 30 days.

To access records in this table, navigate to MID Server > Server Issues.

Supported MID Server active issues:

- Bad user credentials after instance cloning.
- Unsupported Java Runtime Environment (JRE) on the MID Server host.
- Approaching resource thresholds for CPU usage and JVM memory.
- Errors detected during pre-upgrade testing.
- User authentication and authorization failures.
- Network connectivity interruptions and role configuration errors.
Example MID Server Issue record

**MID Server fails to start**

When a newly installed MID Server fails to start or shuts down prematurely, improper configuration could be to blame.

**Duplicate MID Server names**

When the MID Server service starts, it verifies that it is the only active (not down) MID Server with that name. If the MID Server discovers another active MID Server with the same name, the starting MID Server waits 5 minutes and sends another query. The MID Server repeats this query three times and logs each attempt in the agent log. If the MID Server still detects a duplicate after this cycle, it creates a record in the MID Server Issue (ecc_agent_issue) table and shuts down.
Upgraded MID Servers running multiple services

Beginning with the New York release, a batch file in the MID Server installer package ensures that only one Windows MID Server service is configured for an executable path (MID Server installation folder). Previous versions have not checked for this configuration. MID Servers upgraded to New York or later that run multiple services with the same executable path are prevented from starting. If you experience this issue, follow this procedure to reconfigure the MID Server to use only one service:

1. Delete the unwanted Windows service by running `sc.exe delete <service name>` from the command line.
2. Open the `wrapper-override.conf` file in the MID Server installation folder.
3. Change the `wrapper.name` and `wrapper.displayname` parameters to the service name that you want to keep.
4. Restart the MID Server.

Active MID Server post-cloning credential issues

The system provides automatic processes to detect and notify you of possible MID Server credential issues after instance cloning.

During an instance clone, the MID Server (ecc_agent) table is not copied from the source instance, but the User (sys_user) table is copied. As a result, the source MID Server user credentials copied into the target instance might not match those used by the existing set of MID Servers used by the target. Bad credentials can cause those MID Servers to be down for the target instance. Processes on the instance notify you if a MID Server is down from suspected bad credentials following an instance clone.

Table for post-cloning credential issues

The MID Server Issue (ecc_agent_issue) table stores active MID Server issues after an instance clone. Records in this table show a MID Server's current state, evaluation times, and the Issue source. For cases in which a MID Server for a cloned instance is down because of possible bad credentials, the Issue source is InstanceClone. Data from the MID Server Issue (ecc_agent_issue) table are displayed in a related list on a MID Server record. Records in this table are removed after 10 days, regardless of their state. Ongoing issues reappear as they occur.

Post-cloning cleanup script and scheduled jobs

A cleanup script called Bad MID Server credentials after clone runs on the target instance after cloning and calls a script include called BadMIDCredentialAfterClone. This script include schedules the execution of the following jobs on the Schedule Item (sys_trigger) table:

- **BadMIDCredentialAfterClone-1**: Runs 15 minutes after clone execution.
- **BadMIDCredentialAfterClone-2**: Runs 75 minutes after clone execution.

These jobs log to the MID Server Issue (ecc_agent_issue) table any MID Servers that existed on the target instance prior to the clone that are in the Down state. These MID Servers are not ready for normal processing and might be down due to invalid credentials resulting from the cloning process. The state of MID Servers added to the target instance after the clone is not evaluated.
Note: The **MID Server log** shows that the MID Server user associated with the target instance could not be authenticated or was missing the proper role.

### Business rule that checks for bad credentials

The **Check for bad MID credential after clone** business rule monitors the MID Server (ecc_agent) table for MID Servers that are transitioning from **Down** to **Up**. If the business rule finds a MID Server making that transition, the rule attempts to find a matching MID Server in the MID Server Issue (ecc_agent_issue) table that has an issue source of **InstanceClone** and a state other than **Resolved**. If a match is found, the business rule updates the state of the MID Server in the (ecc_agent_issue) table to **Resolved**.

### Resolving MID Server issues

The error message in the MID Server Issue (ecc_agent_issue) table names the affected MID Server user. This message appears each time the business rule runs and finds a MID Server that is down from suspected bad credentials:

```
MID Server not operational (status: Down), possibly due to recent clone. Verify credentials for logged in User 'local-midserver'.
```

Attempt to resolve the issue first by comparing the user’s credentials with the credentials that the affected MID Server is expecting. If the credentials are incorrect, fix the problem and check the MID Server status again. If the credentials are correct, but the MID Server remains down, check the [Knowledge Base](#) for other possible causes.

### MID Server resource threshold alerts

The instance displays warnings when a MID Server breaches its resource thresholds for CPU and JVM memory usage, enabling users to create email notifications or custom scripts when a breach occurs.

The MID Server Issue (ecc_agent_issue) table warns users when a MID Server exceeds configured thresholds of its allocated CPU and memory resources. These warnings are published before the MID Server experiences performance degradation or an out-of-memory error, enabling the administrator to increase resources and avoid downtime. Administrators can use a registered event to send email notification to selected recipients, advising them of any threshold breaches, or to create a custom script to do some other type of work. The instance continues to update the MID Server Issue (ecc_agent_issue) table to keep unresolved issues current.

By default, CPU and memory threshold alerts are disabled and no alerts are published to the MID Server Issue (ecc_agent_issue) table. To enable both types of alerting, add these properties to the System Property (sys_properties) table, and then set their values to **true**:

- `mid.threshold.resource.breach.enable.cpu.alerts`
- `mid.threshold.resource.breach.enable.memory.alerts`

For details on adding system properties to the platform, see [Add a property using sys_properties.list](#).

### Evaluation process

This processing occurs whether or not alerting is enabled:

1. Every 10 minutes, each MID Server transmits its CPU and memory consumption metrics to the instance. The instance inserts CPU metrics into the **Mean CPU used %** field of the ECC Agent
Scalar Metrics (ecc_agent_scalar_metric) table and memory metrics into the Max memory used % field of the ECC Agent Memory Metrics (ecc_agent_memory_metric) table.

2. After a successful insert, the following business rules run on each table, invoking a script include that calls an appropriate function. Each function takes an average of the metric sets inserted into the tables, based on the configured sampling intervals.

- **Update cpu mean on MID Server Status:** Calls the MIDResourceThresholdBreach.checkCpuUsage() script include.
- **Update max memory on MID Server Status:** Calls the MIDResourceThresholdBreach.checkMemoryUsage() script include.

Each function takes an average of the metric sets inserted into the tables, based on the configured thresholds and sampling intervals. The instance first looks at each MID Server for configuration parameters that set custom threshold values or sampling intervals for that MID Server. If no configuration parameters for these attributes are found, the instance looks in the System Properties (sys_properties) table for custom values to use. If no properties are found, the instance uses the default threshold and interval values from the code.

**Note:** Both the threshold percentages and the sampling intervals are configurable. See Configuring thresholds and sampling intervals for details.

**Alerting process**

When alerting for CPU or memory thresholds is enabled, this processing occurs:

1. If the aggregated average metric value equals or exceeds the configured percent threshold, the instance triggers the mid.threshold.resource.breach event. Administrators can use this event to create email notifications for threshold breach alerts or to create a custom script.

2. The instance inserts a record of the breach into the MID Server Issue (ecc_agent_issue) table with a State value of New and a Count of 1, and then publishes a message containing all the pertinent details of the breach. An example of this message is

   Mean CPU used % has exceeded threshold (96>=91) for a 40 minute interval span, occurring after start date 2017-01-11 14:25:19. This message appears in the Short description field of the MID Server Issue form and in the event. You can copy any part of the message into your email notifications.

**MID Server issue states**

When the administrator first examines an issue in the MID Server Issue (ecc_agent_issue) table, the administrator can change the State of the issue to Acknowledged to indicate that the issue is being addressed. Each time the instance detects a breach, it attempts to match the breach with an existing issue. If a MID Server already has an issue record for that breach in a State of New or Acknowledged, the instance updates the Last Detected field with the current date/time and increments the Count field in the existing record. This prevents the creation of duplicate records in the MID Server Issue (ecc_agent_issue) table and records the number of times after the initial incident that the breach reoccurred. The administrator can increase MID Server resources gradually and watch the effect on the Count field. When the counter stops incrementing, the administrator knows that the MID Server has adequate resources. When the MID Server resource have been adjusted appropriately, the administrator sets the State to Resolved. If a new threshold breach is logged that matches a MID Server issue with a State of Resolved, the instance creates a new issue record.
Note: Any record in the MID Server Issue (ecc_agent_issue) table that has not been updated in 30 days is deleted, regardless of its state.

Recommendations for resolving resource issues

Administrators have the opportunity to resolve any resource issues with a MID Server when they receive notification of the event. Follow these recommendations for reducing the strain on MID Server resources:

- **JVM memory:**
  - Allocate more max memory to the MID Server. For more information, see [Set the MID Server JVM memory size](#).
  - Add additional MID Servers to share the workload. For more information, see [MID Server clusters](#).
  - Reduce the amount of concurrent processing for the MID Server. This includes segmenting IP Address ranges into smaller segments for a Discovery schedule or loading smaller segments of data within an import job.

- **CPU:** Reduce the activity on the host or migrate the MID Server to a new host with more available resources.

Tables used for resource threshold evaluation

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
</table>
| MID Server Issue (ecc_agent_issue) | Stores data on various types of MID Server issues, including breaches of configured CPU and memory thresholds. Fields used for resource threshold breaches are:  
  - **count:** Number of times a previously reported threshold breach occurs, if the event is not marked **Resolved**.  
  - **last_detected:** Current date and time a threshold breach is detected. This field is updated each time a previously detected breach is found, if it is not marked **Resolved**.  
  - **message:** Descriptive message summarizing the conditions that triggered the threshold breach event. This message includes the actual percentage of CPU and memory calculated and the configured thresholds that were breached.  
  - **mid_server:** Name of the MID Server experiencing the resource threshold breach.  
  - **source:** The issue source for the breach. These are the possible sources:  
    - **CpuMIDResourceThresholdBreach:** CPU threshold issue sources.  
    - **MemoryMIDResourceThresholdBreach:** Memory threshold issue sources. |
## Table

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server Status (ecc_agent_status)</td>
<td>Stores the percentages used for the CPU and memory resources, averaged over configurable intervals for each resource. The fields used are:</td>
</tr>
<tr>
<td></td>
<td>• Mean CPU used %</td>
</tr>
<tr>
<td></td>
<td>• Max Memory used %</td>
</tr>
<tr>
<td>ECC Agent Scalar Metric (ecc_agent_scalar_metric)</td>
<td>Stores the CPU usage data inserted by each MID Server every 10 minutes. The table field used by resource threshold alerting is mean.</td>
</tr>
<tr>
<td>ECC Agent Memory Metric (ecc_agent_memory_metric)</td>
<td>Stores the memory usage data inserted by each MID Server every 10 minutes. The table field used by resource threshold alerting is max_used_pct.</td>
</tr>
</tbody>
</table>

### Business rules that check for threshold breaches

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update cpu mean on MID Server Status</td>
<td>Runs after the MID Server inserts a record into the ECC Agent Scalar Metric (ecc_agent_scalar_metric) table. This business rule triggers the MIDResourceThresholdBreach script include function that evaluates threshold settings to determine if the MID Server has breached its configured CPU resource thresholds.</td>
</tr>
<tr>
<td>Update max memory on MID Server Status</td>
<td>Runs after the MID Server inserts a record into the ECC Agent Memory Metric (ecc_agent_memory_metric) table. This business rule triggers the MIDResourceThresholdBreach script include function that evaluates threshold settings to determine if the MID Server has breached its configured memory resource thresholds.</td>
</tr>
</tbody>
</table>

### Configuring thresholds and sampling intervals

You can use the default threshold percentages and sampling intervals or configure custom values using either of these methods:

- **Add system properties** to the instance and change the default values for all MID Servers.
- **Add configuration parameters** to change the default resource values for individual MID Servers.

The system properties and the configuration parameters use the same names.

<table>
<thead>
<tr>
<th>Property/configuration parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid.threshold.mean_cpu.aggregate_interval_span</td>
<td>Number of 10 minute units in the interval for sampling CPU usage data. The default interval is 30 minutes (3 x 10 min.)</td>
</tr>
<tr>
<td><strong>Default:</strong> 3</td>
<td></td>
</tr>
</tbody>
</table>
## Property/configuration parameter | Description
---|---
mid.threshold.mean_cpu.percent | Usage percentage of the total CPU resources that initiates a threshold breach alert. Default: 95
mid.threshold.mean_max_memory.aggregate_interval_span | Number of 10 minute units in the interval for sampling memory usage data. The default interval is 30 minutes (3 x 10 min.) Default: 3
mid.threshold.mean_max_memory.percent | Usage percentage of the total memory resources that initiates a threshold breach alert. Default: 95

### MID Server resource reporting

The **MID Server dashboard** contains two reports that give you views into the consumption of CPU and JVM memory resources. These reports show usage over the previous 30 days.

- **Avg Percentage of CPU Used:** Trending the daily average on CPU usage helps illustrate the amount of CPU processing that the MID Server host consumes. MID Servers deployed on the same host will report the same CPU usage.
- **Avg Percentage of Max Memory Used:** The maximum used percentage (max_used_pct) is a useful metric for determining if the MID Server has enough memory resources. This metric is a percentage of the max used memory over the total available memory. Trending this over time provides a visualization of how much memory is needed by the MID Server.

### MID Server user connectivity issues

The instance writes issues involving MID Server user logins and network connectivity to the MID Server Issue (ecc_agent_issue) table and creates events you can use in custom scripts or to send email notifications.

Records in the MID Server Issue (ecc_agent_issue) table can provide insight into why your MID Server user cannot log in or why a MID Server cannot connect to the instance. The system displays records for connectivity problems in this table that include informative error messages suggesting possible causes. By default, a scheduled job called MIDUserConnectivity runs every four hours and launches the MIDUserConnectivity script include to evaluate MID Server connection activity. Records in the MID Server Issue (ecc_agent_issue) table reflect the status of MID Server login attempts and connectivity at the time the scheduled job runs.

From the perspective of the instance, the MID Server is Down when:

- User authentication fails
- User authorization fails.
- Network issues prevent MID Server from establishing a TCP/IP connection.

**Note:** To associate a user with a MID Server, navigate to the servicenow/<mid_server name>/agent/config.xml file and enter the user credentials in the mid.instance.username and mid.instance.password parameters. Make sure to restart the MID Server to activate your changes.
How issues are logged

User authentication failures and authorization issues are logged automatically to the MID Server agent log file. The message for both is the same: **User cannot be authenticated or is missing the proper roles.** If the issue is related to authorization, the agent.log file shows the list of missing roles.

When debugging is enabled, MID Server issues are logged to the system log (syslog) and are available for display in either a summary or a detailed format. You can also change the sampling interval from the default 4 hours to something shorter for tracking your remediation efforts. For instructions on enabling and configuring debugging for MID Server user issues, see [Test remediation efforts for MID Server user connectivity issues](#).

Data provided

When the instance encounters user connectivity issues, it opens a record in the MID Server Issue (ecc_agent_issue) table.
## Example user authentication error message

The MID Server Issue table contains these fields:

**MID Server issue fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last detected</td>
<td>Date and time the issue was last detected.</td>
</tr>
<tr>
<td>Short description</td>
<td>Contents of the generated message that specifies a possible issue with the named user or the MID Server.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Empty in the Jakarta release.</td>
</tr>
<tr>
<td>Issue source</td>
<td>The process that identified the issue. For all issues with MID Server user connectivity, the source is MIDUserConnectivity.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| State | The current state of the issue. Possible states are:  
  - **New**: Starting state when the instance creates the issue.  
  - **Acknowledged**: State set when the administrator first examines the issue.  
  - **Resolved**: Ending state, set by the instance, indicating that the issue has been resolved. If the scheduled job does not encounter the issue when it runs again, the instance automatically sets this value. |
| Domain | Domain associated with the MID Server user account. |
| Count | Number of times an issue has been detected. Each time the scheduled job runs and encounters the same issue, it increments this field. |

### User authentication failure

The credentials that the instance uses to authenticate a MID Server user are configured in the MID Server Configuration Parameters (ecc_agent_config) table. If the MID Server user attempts to log into the instance with invalid credentials, the instance rejects the connection, and writes the **login.failed** event to the Events (sysevents) table for the user. Administrators can use this event in a custom script or in email notifications for authentication failure.

**Note:** If user authentication fails, user authorization is not attempted.

### User accounts associated with a MID Server

Either of the following messages in the MID Server Issue (ecc_agent_issue) table indicate authentication failure for user accounts that are associated with a MID Server:

- Login authentication failure for User `<user name>` associated with 1 down MID Server. Check password on MID server.
- Login authentication failure for User `<user name>` associated with `<n>` down MID Servers. Check password on MID servers.

The necessary conditions for these messages to appear are:

- The **Status** field in the MID Servers (ecc_agent) table that is associated with the MID Server indicates that the MID Server is **Down**.
- The user identified in the MID Server Configuration Parameters (ecc_agent_config) table is the user that one or more MID Servers is configured to use for authentication and authorization when connecting to the instance. The record in the (ecc_agent_config) table must have these values:
  - Parameter name (param_name) field set to **mid.instance.username**.
  - Value (value) field set to the user's name, corresponding to the User ID (user_name) field in Users (sys_user) table.
- The Events (sysevent) table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The record created in the (sysevent) table contains these field values:
- Event Name (name) field is set to login.failed.
- Parm1 (parm1) field is set to the user’s name.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

**User accounts with the mid-server role not associated with a MID Server**

The following message appears when a user with the mid_server role who is not associated with a MID Server fails to authenticate: **Login authentication failure for User <user_name> with mid_server role not associated with a MID Server.**

The necessary conditions for this message to appear are:

- The User Roles (sys_user_has_role) table contains a record linking the sys_id associated with the user record stored in the (sys_user) table, with the sys_id associated with the mid_server role record stored in the (sys_user_role) table.
- The user is not identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events (sysevent) table contains posts showing that the last login attempt associated with the user failed during the scheduled time period.
- The (sysevent) table contains a record with the Event Name (name) field set to login.failed.
- The Parm1 (parm1) field is set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

**User authorization failure**

The user authorization check occurs after the MID Server has successfully authenticated on the instance. In this step, the system ensures that the user account associated with a MID Server is granted the minimum roles required. A SOAP web service called MIDServerCheck performs the role checking on the instance. If the MID Server user has the proper roles, the connection is allowed and a **login** event is written to the Events (sysevent) table. If the user does not have the proper roles, the instance writes a **login.authorization.failed** event to the Events (sysevent) table. This event provides a comma separated list of the user’s missing roles. Administrators can use this event in custom scripts or in email notifications for authorization failure.

Authorization can fail if a user is missing the mid_server role or any of the important SOAP roles, as in these cases:

- If the user has the soap_script role, the MIDServerCheck SOAP web service runs to check for the appropriate MID Server roles. If the user lacks the mid_server role or any of the other SOAP roles, authorization fails, and the **login.authorization.failed** event is created.
- If the user is missing the soap_script role, that user is not authorized to launch the MIDServerCheck SOAP web service, which checks for all required MID Server roles. Authorization fails, but the **login.authorization.failed** event is not created. When this occurs, the instance displays this message: **Connectivity of MID Server user <user name> cannot be detected by the instance.**

**Users associated with one or more down MID Servers**
Either of the following messages in the MID Server Issue (ecc_agent_issue) table indicate authorization failure for user accounts that are associated with a MID Server that is Down:

- Login authorization failure for User `<user name>` associated with 1 down MID Server. Re-assign mid_server role to grant all required roles.
- Login authorization failure for User `<user name>` associated with `<n>` down MID Servers. Re-assign mid_server role to grant all required roles.

The MIDUserConnectivity script includes identifies active users associated with one or more down MID Servers whose last login attempt within the reporting period failed user authorization. This message is generated when user authorization failures are detected and reported by the MIDServerCheck scripted web service. However, user authorization failures are not reported for users who are not assigned the soap_script role. Should this occur, problems with the user are reported by the network connectivity message.

This message appears in the MID Server Issue (ecc_agent_issue) table when:

- The user may or may not have the mid_server role.
- The user is identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events (sysevent) table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The (sysevent) table contains a record with these settings:
  - Event Name (name) field set to login.authorization.failed.
  - Parm1 (parm1) field set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

### Users with the proper role not associated with a MID Server

The following message appears when a user with the mid_server role who is not associated with a MID Server fails authorization: **Login authorization failure for User `<user name>` with mid_server role not associated with a MID Server.**

This message is generated when user authorization failures are detected in which the user account, with the mid_server role, is not identified as a configured MID Server user in the (ecc_agent_config) table. It is possible that the user account was associated with a MID Server at the time of the failure.

This message appears in the MID Server Issue (ecc_agent_issue) table when:

- The user has the mid_server role. The User Roles (sys_user_has_role) table has a record linking the sys_id associated with the user record stored in the (sys_user) table, with the sys_id associated with the mid_server role record stored in the (sys_user_role) table.
- The user is not identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events (sysevent) table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The (sysevent) table contains a record with these settings:
  - Event Name (name) field set to login.authorization.failed.
• Parm1 (parm1) field set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.

Note: The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

Network issues

A network issue can prevent the MID Server from connecting to the instance’s TCP/IP server to begin a session. In this case, the instance marks the MID Server as Down, because the instance failed to receive the MID Server heartbeat within the prescribed 5 minute interval.

Users associated with down MID Servers who have not attempted to log in

Either of the following messages in the MID Server Issue (ecc_agent_issue) table name users associated with MID Servers who have not attempted to log in during the reporting period:

• User <user name> is associated with 1 down MID Server. No login attempts within reporting period.
• User <user name> is associated with <n> down MID Servers. No login attempts within reporting period.

The MIDUserConnectivity script include reports active users associated with down MID Servers where network connectivity cannot be detected by the instance.

This message appears in the MID Server Issue (ecc_agent_issue) table when:

• The user may or may not have the mid_server role.
• The user is identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user which one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
• There are no login attempts, either failed or successful, recorded in the Events (sysevent) table for the user during the scheduled reporting period.

Note: The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

Users not associated with MID Servers who have not attempted to log in

The following message appears when a user with the mid_server role who is not associated with a MID Server has not attempted to login during the configured reporting interval: User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.

The MIDUserConnectivity script include reports active users with the mid_server role not associated with a MID Server, where connectivity cannot be detected by the instance.

This message appears in the MID Server Issue (ecc_agent_issue) table when:

• The user has the mid_server role. The User Roles (sys_user_has_role) table has a record linking the sys_id associated with the user record stored in the (sys_user) table, with the sys_id associated with the mid_server role record stored in the (sys_user_role) table.
• The user is not identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
• There are no login attempts, either failed or successful, recorded in the Events (sysevent) table for the user during the scheduled reporting period.
Configuration issues

Any of the following messages, discussed above, can indicate a configuration issue:

- **Login authentication failure for User <user name> with mid_server role not associated with a MID Server.**
- **Login authorization failure for User <user name> with mid_server role not associated with a MID Server.**
- **User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.**

These are some common configuration errors:

- An administrator neglected to associate the user record with the MID Server record as shown in the MID Server Configuration Parameters (ecc_agent_config) table. This table is read-only and cannot be updated directly. To associate a user with a MID Server, configure the user name and password in the MID Server's config.xml file and restart the MID Server.
- During the process of reconfiguring a MID Server to use a different account for TCP/IP connection, the administrator has not yet removed the mid_server role from the account or deleted the account.
- A multipurpose user account was created and granted a large number of roles, including the mid_server role, although this account was never intended to be used as a MID Server account.

**User who successfully authenticates and authorizes but might not need mid_server role**

The following message appears when a user with the mid_server role who is not associated with a MID Server successfully logs in: **User <user name> with mid_server role successfully connected but not associated with a MID Server. The mid_server role should be reserved for MID Server use only.**

The MIDUserConnectivity script include reports active users with the mid_server role who are not identified as a configured MID Server user, and whose last login attempt was successful during the scheduled time period. This message suggests that the user’s credentials are being used by a system administrator or a process that is not running on a MID Server. The assumption here is that the mid_server role should only be used for applications deployed to a MID Server. The presence of this message reminds the system administrator to remove extraneous mid_server roles from user accounts that do not require them.

This message appears in the MID Server Issue (ecc_agent_issue) table when:

- The user has the mid_server role.
- The user is not identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events (sysevent) table contains posts showing that the last login attempt associated with the user succeeded during the scheduled time period. The (sysevent) table contains a record with these settings:
  - Event Name (name) field set to **login**.
  - Parm1 (parm1) field set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.
Note: The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

Test remediation efforts for MID Server user connectivity issues

After attempting to resolve a user connectivity issue that appears in the MID Server Issue (ecc_agent_issue) table, you can test your remediation efforts without having to wait until the next scheduled reporting period by shortening the sampling interval.

Role required: admin

Reconfigure the sampling interval using this procedure and then examine the results in the MID Server Issue (ecc_agent_issue) table. You can set any time span for the sample, but you should define a window of not less than 5 minutes, since this is the default interval of the MID Server heartbeat that reports its status. The recommended method for configuring a shorter sampling interval is to copy and modify the code from the MIDUserConnectivity scheduled job, and then run it manually in the background script utility.

Caution: Avoid editing the script in the MIDUserConnectivity schedule record. If you make any change to this record, it will not be updated when you upgrade the instance.

1. Navigate to System Definition > Scheduled Jobs.
2. Open the MIDUserConnectivity scheduled job.
3. Copy this line from the Run this script field:
   MIDUserConnectivity(0).checkConnectivity(4 * (60 * 60 * 1000));
   This code sets the 4 hour sampling interval in milliseconds and turns debugging off with the MIDUserConnectivity(0) value.
4. Navigate to System Definition > Scripts - Background.
5. Paste the code from the scheduled job into the Run script field.
6. Set the sampling interval to 5 minutes by changing the time calculation to (5 * 60 *1000).
   The modified command looks like this: MIDUserConnectivity(0).checkConnectivity (5 * 60 *1000);
7. Click Run script.
8. Open the record of the MID Server that had the issue and select the MID Server Issues related list.
   The issue is updated as follows:
   • If the issue persists, the Count column is incremented, and the Last detected column shows the current date and time.
   • If the issue no longer exists, the system changes the State to Resolved.
9. Optionally, you can enable debugging by selecting a level, and then run the script again to see the breakdown for each condition evaluated.
   Use these settings to select a debugging level:
   • For a summary view, enter MIDUserConnectivity(1).
   • For a detailed view, enter MIDUserConnectivity(2).

For details about the type of debugging information provided, see Interpreting MID Server user debugging output.
Interpreting MID Server user debugging output

Debugging output from the system log is available in either a summary or detailed view for MID Server user issues, but must be enabled manually.

To enable debugging and display all connectivity issues in either of the available formats, you must run a method manually on your instance. For instructions on enabling debugging, see Test remediation efforts for MID Server user connectivity issues. For information about each error condition and how records are created in the MID Server Issue (ecc_agent_issue) table, see MID Server user connectivity issues.

Available formats

You can configure the instance to generate a simple summary of the issue or a detailed output that identifies users and MID Servers. Summaries provide a quick look at the issue conditions, by count, while the detailed view allows you to examine roles, MID Server associations, and login activity by named users.

In this summary example of an authorization issue, the instance evaluates each condition and indicates how many users met that condition. You can see that a MID Server is down and that one of two users configured for a MID Server failed authorization. Because this is a summary, neither the MID Server nor the users are named.

Sample summary debug output

Authentication failure

When a MID Server user cannot authenticate on the instance, the system displays these error messages in the detailed output:

- Login authentication failure for User <user name> associated with 1 down MID Server. Check password on MID server.
- Login authentication failure for User <user name> associated with <n> down MID Servers. Check password on MID servers.
- Login authentication failure for User <user name> with mid_server role not associated with a MID Server.

In this example, three users with the mid_server role, midserver2, local-midserver, and ardis.maison, failed to authenticate. Two of these users were configured for MID Servers that were Down, and the other user was not configured for any MID Servers. Each of these users has an authentication failure and is named in the appropriate error message.

MID Server ID map

The debugging output lists all MID Servers that are marked as Down and maps them to their user accounts by the MID Server sys_id. This map includes all user accounts that have the mid_server role, whether or not they are associated with a MID Server. If there are no Down MID Servers, the map is not displayed in the debugging output.

The map is presented in three sections:

- User accounts not associated with any MID Servers.
- User accounts associated with Down MID Servers, identified by their sys_id.
- The sys_id of each Down MID Server, identified by name.

Authorization failure

If a user is missing any of the required roles, the instance generates these authorization failure messages:

- Login authorization failure for User <user name> associated with 1 down MID Server. Re-assign mid_server role to grant all required roles.
- Login authorization failure for User <user name> associated with <n> down MID Servers. Re-assign mid_server role to grant all required roles.
- Login authorization failure for User <user name> with mid_server role not associated with a MID Server.

In this example, three users with the mid_server role, midserver2, local-midserver, and ardis.maison have failed authorization. One user is not associated with any MID Server, but the other two users are. The system has logged an authorization failure, indicating that the user is missing at least one critical role. To see what roles are missing, look at the comma separated list in...
the `Parm2` field in the `login.authorization.failed` event record. This record is the most recent login attempt in the Event (sysevent) table for the user account within the reporting period.

Network issues

Network issues may exist for these users who are associated with MID Servers, but who have not attempted to log in during the reporting period:

- **User `<user name>` is associated with 1 down MID Server. No login attempts within reporting period.**
- **User `<user name>` is associated with `<n>` down MID Servers. No login attempts within reporting period.**

Network issues may also exist for these users who are NOT associated with MID Servers, and who have not attempted to log in during the reporting period: **User `<user name>` with mid_server role is not associated with a MID Server. No login attempts within reporting period.**

In this example, no login attempts have been detected for midserver2, local-midserver, and ardis.maison, all of whom have the mid_server role. Two of those users are associated with MID Servers that are marked **Down**. The other user is not associated with any MID Server. None of these users has attempted to log in to the system within the configured reporting interval. The system assumes that these users would make an attempt to log in unless network issues prevented them from doing so.

**Note:** By default, the sampling period is 4 hours. However, during debugging or remediation, the sampling period can be reset to a value that matches the MID Server heartbeat interval of 5 minutes, or greater.
Configuration issues

Any of the following messages can indicate a user configuration issue:

- Login authentication failure for User `<user name>` with mid_server role not associated with a MID Server.
- Login authorization failure for User `<user name>` with mid_server role not associated with a MID Server.
- User `<user name>` with mid_server role successfully connected but not associated with a MID Server. The mid-server role should be reserved for MID Server use only.
- User `<user name>` with mid_server role is not associated with a MID Server. No login attempts within reporting period.

In this example, a user with the mid_server role has logged in successfully within the configured sampling interval. However, this user is not configured for a MID Server and might have the role in error.

Detailed debugging log for MID Server user account login
**MID Server Upgrade History**

Use this module to troubleshoot errors that occur during the MID Server upgrade process. The MID Server Upgrade Histories table contains a record of each instance upgrade. The MID Server Upgrade Stages table shows the status of each MID Server and its upgrade progress, including any errors encountered.

**MID Server Upgrade Histories**

Users with admin or agent-admin roles can find detailed information for any MID Server upgrade in the Upgrade History module for MID Server. Whenever an instance is upgraded, all MID Servers in the Up state are upgraded automatically. The Upgrade History module uses the MID Server Upgrade Histories table (ecc_agent_upgrade_history). This table shows the following information:

- The old instance version.
- The new version.
- The number of successfully upgraded MID Servers.
- The number of MID Servers with pending upgrades. MID Servers have pending upgrades if the upgrade has failed or is in progress.

**MID Server Upgrade Stages**

Select an instance record to see more details about the MID Servers upgraded with that instance. The Pending Upgrades and Complete Upgrade Details related lists use the MID Server Upgrade Stages table (ecc_agent_upgrade_history_stage). MID Servers pinned to a specific version generate an entry with a blank MID Upgrade History on the MID Server Upgrade Stages table (ecc_agent_upgrade_history_stage).

<table>
<thead>
<tr>
<th>MID Upgrade History</th>
<th>Refers to a corresponding record in the (ecc_agent_upgrade_history) table.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stage</td>
<td>Shows the progress of the MID Server through each stage of the upgrade process.</td>
</tr>
<tr>
<td>State</td>
<td>Shows the status of each stage.</td>
</tr>
<tr>
<td>Message</td>
<td>Displays dynamically generated messages about the upgrade stages, such as the file path to download directories or extract folders. It also displays information about any errors encountered, even if those errors do not block the upgrade.</td>
</tr>
</tbody>
</table>

**MID Server reference information**

MID Server reference information includes system requirements and other information you need to configure a MID Server for your specific needs.
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

System clones and the MID server

See KB0547597 for information on what to do with MID Servers when you are cloning your instance.

Reference topics

System requirements
Use the minimum system requirements to allocate resources for computers hosting MID Servers.

ECC Queue
Learn about the External Communication Channel (ECC) Queue, which is the connection point between the MID Server and the instance. Jobs that the MID Server needs to perform are saved in this queue until the MID Server is ready to handle them.

MID Server Dashboard
Use the reports and gauges in the MID Server dashboard to monitor ongoing operations.

MID Server properties
Use MID Server properties to control the behavior of all MID Servers or a particular MID Server.

MID Server parameters
Use MID Server parameters to control the behavior of a particular MID Server.

MID Server protected records and reserved characters
Some MID Server records cannot be altered. Certain special characters are pre-defined in XML and cannot be used in passwords.

MID Server privileged commands
To discover certain information on a host server, the MID Server must run SSH commands with higher privileges. The platform provides default privileged commands for the MID Server to use and the ability to add additional commands to the system.

**MIDSystem methods**

MIDSystem variables (referred to by the variable name ms.) provide a variety of methods to get information about the MID Server.

**MID Server heartbeat**

Configure the interval that the instance uses when it checks the “heartbeat” of MID Server. By default, the instance checks the MID Server for a response every 5 minutes.

**Set JVM memory size**

Modify the JVM setting for your MID Server from the default size to suit the amount of work your MID Server does in your network.

**Pause the MID Server**

Pause the MID Server to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

**MID Server system requirements**

Use these minimum system requirements to allocate resources for computers hosting MID Servers.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

**MID Server supported systems**

**Windows server**

To discover Windows-based servers, run Service Mapping patterns, or execute Orchestration commands on Windows devices, the MID Server must be installed on a Windows server. The MID Server supports these Windows operating systems, including virtual machines and 64-bit systems:
- Windows Server 2008
- Windows Server 2012
- Windows Server 2016

**Note:** .NET Framework version 3.5, 4.0, 4.5, 4.6, or 4.7 is required for Service Mapping support and for Windows pattern-based discovery.

**Linux**

The MID Server is supported on these Linux versions for virtual machines and 64-bit systems:

- Linux Red Hat 6 and above
- Ubuntu 1404 (Ubuntu 14) and above
- CentOS 6 and above

**Note:** On 64-bit Linux systems, you must install the 32-bit GNU C library (glibc). The installation command for CentOS is: `yum install glibc.i686`.

**Java version support**

OpenJDK version 1.8.0_181 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures OpenJDK to run in your environment. No additional configuration is required. This version supports both 32-bit and 64-bit MID Servers. For the best performance, install the 64-bit MID Server for your operating system. The MID Server requires a minimum JRE version 1.8.0_161, and recommended version 1.8.0_181. If you are using a lower version than 1.8.0_161, you may see encryption related issues.

**Note:** ServiceNow will discontinue support for 32-bit MID Servers in a future release.

Upgraded MID Servers might use different Java versions depending on their release level.

- MID Servers upgraded from Kingston and earlier use the OpenJDK provided with the MID Server installer. This version of the OpenJDK was tested and certified for use with these MID Servers.
- MID Servers upgraded from London continue to use the same JRE you configured for London. The MID Server supports JRE 1.8.

MID Server supports Java 8 and Java 11 on any supported operating system. However, CPU monitoring is disabled by default on Windows with Java 11 because an outdated SIGAR library causes the MID Server to crash. If you decide to patch the SIGAR library, you can re-enable CPU monitoring. See [CPU and maximum memory usage](#) for more information on how to enable CPU monitoring.

**Java Service Wrapper**

The MID Server installer includes the Tanuki Java Service Wrapper, version 3.5.36.
Setting the JVM Memory size

The MID Server installs with 1 GB of JVM memory. If the suggested memory size for your product is greater than 1 GB, see Set the MID Server JVM memory size for the procedure to override the default setting.

Deployment types

System requirements for your instance are determined by the needs of the individual products you use that require a MID Server.

Standard deployments

The following products are considered ‘standard’ because their MID Servers share the same minimum disk space and memory requirements:

- Discovery
- Event Management
- Integrations
- Orchestration
- Service Mapping

The minimum standard requirements pertain to both a single product and a combined product deployment. You can deploy a single MID Server for multiple standard products without significantly increasing the disk or memory requirements.

High resource deployments

Cloud Management Platform (CMP), alert aggregation and RCA, and Operational Intelligence are processing intensive and require more resources for each MID Server than the standard products. Install MID Servers for these products on dedicated hosts that do not support MID Servers for other products.

Recommended MID Server minimum requirements

All configurations listed here require a quad core processor with a speed of 2 GHz or greater and were calculated for a Windows Server 2012 R2 host.

**Note:** The MID Server minimum system requirements for 25 concurrent threads includes resource overhead that is independent of the number of threads. As a result, the system requirements for 200 threads do not require a linear increase in resources. You can set the MID Server to use as few as 5 threads without issue. To increase the speed of the MID Server if the host is powerful enough or lightly loaded with other programs, you can increase the threads setting. The threads setting depends on the limitation of the CPU speed, memory, and operating system of the host machine. You might have to experiment to find the optimal threads count that works best when the MID Server is busy so it does not exhaust the host machine’s hardware limitations. This means you may have to refine the thread count to best meet your situation. Important: You can set threads.max as high as 200, however, this setting may need to be changed depending on the OS. For example, Windows-based MID Servers running Discovery uses Powershell which is resource intensive. In this case, you may exhaust the CPU power of the host machine with just 50 threads count.
### MID Server minimum system requirements for 25 concurrent threads (base system)

<td>4 GB</td>
<td>8 GB</td>
</tr>
</tbody>
</table>

**Use case 1: Single MID Server deployed for multiple standard products**

In this example, Service Mapping, Discovery, and Orchestration share a MID Server with 25 threads that is installed on a dedicated host. The disk space and memory requirements specified here satisfy the minimum recommended requirements for the combined product deployment.
One MID Server for multiple standard products

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>
</tr>
<tr>
<td>Service Mapping + Discovery + Orchestration</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
</tbody>
</table>

Use case 2: Multiple MID Servers deployed to a single host

In this example, three MID Servers (not clustered) are assigned to different standard products. All three MID Servers are deployed to a single host, where each MID Server has 25 threads. The required resources are calculated as follows:

- **Total disk space required**: Add the recommended disk space for the operating system from the OS column to the sum of the values in the MID Server + product column for all products mapped.
- **Total memory required**: Add the recommended memory for the operating system from the OS memory column to the sum of the values in the JVM memory column for all products mapped.

Monitoring performance

To ensure that the MID Server resource allocations are sufficient for your environment, monitor performance during peak periods of product execution from the MID Server dashboard.

MID Server supports Java 8 and Java 11 on any supported operating system. However, CPU monitoring is disabled by default on Windows with Java 11 because an outdated SIGAR library causes the MID Server to crash. If you decide to patch the SIGAR library, you can re-enable CPU monitoring.
monitoring. See [CPU and maximum memory usage](#) for more information on how to enable CPU monitoring.

**MID Server ECC Queue**

The External Communication Channel (ECC) Queue is a connection point between an instance and the MID Server. Jobs that the MID Server needs to perform are saved in this queue until the MID Server is ready to handle them.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>

<td>Configure your MID Server</td>
</tr>
<tr>
<td>8.</td>
<td>Configure MID Server security</td>
</tr>
</tbody>
</table>

**Asynchronous Message Bus**

The MID Server subscribes to messages published by the Asynchronous Message Bus (AMB), which notifies the MID Server that it has pending tasks in the ECC Queue. If a job exists in the ECC Queue for that MID Server, the MID Server sets the status to “I'm working on it.” When finished working on a requested job, the MID Server reports back to the ECC queue with the results.

The MID Server opens a persistent connection to the instance through the AMB)Client and listens on the `/mid/server/<mid_sys_id>` AMB channel. When an output record is inserted into the Queue (ecc_queue) table, an AMB message is sent to the MID Server's channel. The MID Server receives this message and immediately polls the ecc_queue table for work.

The MID Server polls the ECC queue on the regular interval defined in the `mid.poll.time` configuration parameter, regardless of AMB message activity. The default polling interval is set to 40 seconds, but can be reconfigured. This polling of the ECC queue at a regular interval is done in case the AMB connection is dropped.
Note: The AMB client on the MID Server does not work in all environments and might need to be disabled to avoid performance issues. To disable AMB in your environment, set the `mid.disable_amb` parameter to `true`. When you disable AMB, the MID Server reverts to a default polling interval of 5 seconds, unless the `mid.poll.time` parameter is set to a different value.
ECC Queue information

You can access the ECC Queue by navigating any of these paths:

- Discovery > Output and Artifacts > ECC Queue
- Discovery > Discovery Schedules > {schedule name} > {Discovery status record}
- ECC > Queue
- {Discovery Status record} > ECC Queue

An ECC Queue provides the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent</td>
<td>The name of the external system that this messages is either from or to. If the message is from or to a MID Server, the agent name is in the form mid.server.xxx, where xxx is the name of a particular MID Server.</td>
</tr>
<tr>
<td>Topic</td>
<td>The name of the probe the MID server ran. If you are using a pattern for discovery, the Horizontal Pattern probe appears.</td>
</tr>
<tr>
<td>Name</td>
<td>The actual command the probe ran. For example, if Topic is SSHCommand, then the Name field contains the actual shell command to run. If you are using a pattern for discovery, the following appears: Pattern Launcher: followed by the name of the pattern and the multipage number.</td>
</tr>
<tr>
<td>Source</td>
<td>The IP address that the discovery is to run against. A few probes run against multiple IP addresses; in those cases, this field contains a human-readable description.</td>
</tr>
<tr>
<td>Response to</td>
<td>This optional field contains a reference (sys_id) to the ECC Queue message that this message is in response to. Discovery makes extensive use of this field to track the hierarchy of messages that result from a given scheduled Discovery. Click the record icon for the value in this field to open the ECC Queue record for the activity that spawned the current probe or sensor record.</td>
</tr>
<tr>
<td>Queue</td>
<td>An indicator of whether this message was is an input message or an output message.</td>
</tr>
<tr>
<td>State</td>
<td>The state of the current ECC queue record. States update automatically.</td>
</tr>
<tr>
<td>Processed</td>
<td>The time when this message was processed.</td>
</tr>
<tr>
<td>Created</td>
<td>The time when this message was created.</td>
</tr>
<tr>
<td>Sequence</td>
<td>The unique sequence number for this message. This value is automatically generated when an ECC Queue record is inserted. Its use is deprecated.</td>
</tr>
<tr>
<td>Error string</td>
<td>An error message, if an error occurred during processing. This field is hidden on the standard form unless there was an error.</td>
</tr>
</tbody>
</table>
Field | Input value
--- | ---
Payload | The body of the message in XML format. The returned XML has a root tag of `<results>` containing one or more `<result>` tags and a single `<parameters>` tag. The parameters are simply an echo of those sent to the MID server in the probe; they vary from probe to probe, but in general they tell the probe the details of what it is to do and how it should behave. The result tags are the most interesting ones: they contain the actual data generated by the probe.

ECC queue controls

The ECC Queue form contains these related links:

<table>
<thead>
<tr>
<th>Related link</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run again</td>
<td>Runs the probe again. You can re-run probes when you encounter a failed discovery or other unexpected results.</td>
</tr>
<tr>
<td>Go to CMDB item</td>
<td>Open the CI record for the CI that was updated during the discovery.</td>
</tr>
<tr>
<td>Go to Sensor</td>
<td>Open the record for the associated sensor.</td>
</tr>
</tbody>
</table>

Manage ECC Queue content for a MID Server

The ECC Queue allows you to create ECC Queue messages, access MID Server log entries, and retrieve statistics from an individual MID Server record.

Role required: admin, mid_server

1. Send remote commands through a MID Server to a hosting device directly from the ECC Queue without running Discovery.
   a) Navigate to the ECC Queue and click **New**.
   b) Create a message with these settings:
      - **Agent**: The name of the MID Server that executes the command.
      - **Topic**: Command
      - **Name**: The actual command that you want to process. For Windows, this is expressed in a DOS command line structure. For Linux, the structure could be a bash command line entry.
      - **Queue**: Output
      - **Payload**: With proper XML tags, you can specify the command here instead of in the **Name** field. The advantage to this is that the command is not restricted by the **Name** field length of 120 characters. Use the following XML format for the command:

        ```xml
        <parameters>
          <parameter name="name" value="ACTUAL_COMMAND_LINE"/>
        </parameters>
        ```

2. Access entries in the ECC Queue that show **agent0.log.0** logs and **wrapper.log** logs for an individual MID Server.
a) Open a MID Server record.
b) Under Related Links, click Grab MID Logs.
ECC queue records appear in the list using the following filter:

- (Topic) (is) (SystemCommand)
- (Source) (is) (grabLog)
- (Agent) (is) (your MID Server)

Only agent0.log.0 and wrapper.log entries appear. These logs are also accessible in the ~\agent\logs\ file path.
c) To open a log entry, click the link under the Created column.

3. Access the queue.stats topic for useful information about individual MID Servers, such as memory and CPU usage data.
a) Open a MID Server record.
b) Under Related Links, click MID Statistics.
ECC queue records appear in the list using the following filter:

- (Topic) (is) (queue.stats)
- (Agent) (is) (your MID Server)

MID Server dashboard

The MID Server dashboard is a central place for MID Server users to monitor ongoing operations. The dashboard consists of reports and gauges that display information from the MID Server Status table.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The MID Server Dashboard is available from the MID Server > Dashboard module.
MID Server status gauge

The MID Server Status gauge on the dashboard displays basic information about each MID Server. This information comes from the MID Server Status (ecc_agent_status) table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Host name</th>
<th>Status</th>
<th>Validated</th>
<th>Version</th>
<th>Logged in user</th>
<th>Max memory used %</th>
</tr>
</thead>
<tbody>
<tr>
<td>linux2</td>
<td>Mid</td>
<td>Paused</td>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

MID Server Dashboard gauge

If the version is not compatible, the MID Server status is not changed to Down in the MID Server dashboard. So it might still appear to be processing commands when it actually is not doing so. You must check the MID Server Version on the dashboard.

See KB0535181 for additional MID Server troubleshooting information.

The icons in the Version column indicates the following:

- **Red:** Incompatible. The MID Server and instance do not belong to the same release. You must upgrade the MID Server and verify that it is not pinned to an older version with the mid.version.override property. The MID Server will not be upgraded until the parameter is cleared.
- **Yellow:** Compatible, but an upgrade is recommended. This indicates that the MID Server version belongs to the same family as the instance, but not the same version.
- **Green:** Compatible. No upgrade necessary.
- **Gray:** Incompatible. The instance cannot detect the version.

<table>

</tr>
</tbody>
</table>

**CPU and maximum memory usage**

MID Server supports Java 8 and Java 11 on any supported operating system. However, CPU monitoring is disabled by default on Windows with Java 11 because an outdated SIGAR library causes the MID Server to crash. If you decide to patch the SIGAR library, you can re-enable CPU monitoring. To re-enable CPU monitoring, set the MID Server parameter `mid.monitoring.force_sigar_cpu_monitoring` to True. See [Add a MID Server parameter](#) for instructions on how to set MID Server parameters.
This graph shows the average percentage of CPU usage on all the systems that host MID Servers in the last 30 days.

This graph shows the average percentage of maximum memory used by all the systems that host MID Servers in the last 30 days.
MID Server properties

Properties control the behavior of all MID Servers or a particular MID Server.
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The MID Server properties are in the MID Server Property (ecc_agent_property) table and can be accessed by navigating to MID Server > Properties. To set these properties, you must add them, if they are not already present.

**MID Server properties**

**alias_filtering_behavior**

Sets the behavior of Discovery aliases. Behaviors define how strictly the system enforces the use of credential aliases in Discovery schedules.

The choices for behaviors are:

- **strict**: Aliases defined for the credential must match the aliases configured for the probe.
- **loose**: The probe’s credential is used if it contains all the aliases specified in the schedule.

- Type: string
- Default value: loose

**com.glide.closure_max_rows_per_table**

Sets the maximum number of rows allowed in a table. This property is not visible by default and must be added.

- Type: integer
- Default value: 200000

**concurrent.dist.download**

Sets the number of concurrent MID Server auto-upgrades permitted by the instance. The default value of this property is 2, which allows the MID Server to use 2 of the 4 semaphores available on the instance for upgrading. If your instance has more than 4 INT semaphores, you can increase the value in this property to allow more concurrent upgrades.
**glide.stored_proc.data_type.validation**

Stops validation of data types in stored procedure parameters. Use this property if you use Orchestration to run a stored procedure on MySQL, Oracle DB, and MS-SQL databases and you want to avoid performing data type validation. Restart the MID Server service after you change the value of this property.

- Type: true | false
- Default value: false

**mid.aws.sts.assume_role.disable_credential_caching**

Set this property to true to prevent the caching of temporary AWS credentials for Cloud Discovery.

- Type: true | false
- Default: false

**mid.aws.sts.assume_role.credential_ttl_minutes**

Set the number of minutes you want to cache temporary AWS credentials for Cloud Discovery.

- Type: integer
- Default: 60

**mid.discovery.max_pattern_payload_size**

Defines the maximum overall payload size for the payload of results that come from patterns.

- Type: integer (bytes)
- Default value: 300000

You can also configure this as a configuration parameter on a individual MID Server.

**mid.discovery.max_payload_size**

Specifies the maximum string length of Discovery results that the MID Server sends to the instance. If the Discovery probe results exceed the limit, the MID Server discards them and returns a warning message.

For probes, this applies only to those probes where the Used by Discovery field is true. For patterns, this applies to the Horizontal Pattern probe.

Set the value to any negative number to disable the payload limit and allow payloads of any size to be sent to the instance. For example, -1.

- Type: integer (bytes)
- Default value: 5000000

You can also configure this as a configuration parameter on a individual MID Server.

**mid.discovery.multiprobe.skip_others_on_error**

Prevents probes in a multi-probe from iterating through available credentials when another member probe has already failed or timed out. If this property is set to false, each probe in the multi-probe attempts to connect to the target with the same invalid credentials. This condition results in longer probe execution times on the MID Server.
This property is not visible by default and must be added to the sys_properties table to change the value.

- Type: true | false
- Default value: true

**mid.eccq.max_payload_size**

Specifies the maximum string length of a payload that the MID Server sends to the instance. The MID Server verifies the size of the payload before sending it to the instance. If the payload size exceeds the limit, the MID Server discards it and returns an error message in the payload.

- Type: integer (bytes)
- Default value: 20000000

You can also configure this as a *configuration parameter on a individual MID Server.*

**mid.max_ci_count_per_page**

Defines the size of each chunk in a payload of results that come from patterns. The chunk can be greater than this value, depending on the relationships of the CIs.

- Type: integer (bytes)
- Default value: 300000

You can also configure this as a *configuration parameter on a individual MID Server.*

**mid.powershell.target_base_dir**

Specifies the location of the target base folder used for Discovery using WMI. If another network share is mounted on each Windows target, the folder may be changed by updating this property.

- Type: string
- Default value: $admin share

**mid.probe.use_legacy_forward_dns**

Enables the legacy DNSNameResolver probe and disables the default DNSNameResolver probe. See [Probes used by Orchestration](#) for more information.

- Type: true | false
- Default value: false

**mid.probe.use_legacy_reverse_dns**

Enables the legacy DNS probe and disables the default DNS probe. If you experience problems with the features of the default DNS probe, use this property to disable those features. The default DNS probe’s features include being lightweight and faster due to executing in parallel, while the legacy probe is throttled by the MID Server because it executes in serial. The default probe utilizes DNS lookup by the MID Server host OS to make use of the OS maintained DNS cache, while the legacy probe does not. Consequently, after a DNS lookup by the default probe fails in Windows systems, the OS also tries looking up by NETBIOS name.

- Type: true | false
- Default value: false

**mid.process_flow.log_listener.max_size**
Sets the maximum size in bytes of memory available to save log messages for Flow Designer actions running on a MID Server. The MID Server stores up to the limit in memory and discards additional log messages, then sends the messages back to the instance along with the execution plan.

- Type: integer (bytes)
- Default value: 10485760

**mid.property.jdbc_operations**

Tells the JDBCOrchestrationProbe what JDBC operations it is allowed to execute. Edit this property value to allow JDBC Orchestration activities to perform more operations. All operations are comma separated. Select a MID Server in the MID server field to define specific operations for that MID Server, or leave the field empty to apply the list of operations to all MID Servers. This property requires the Orchestration plugin.

- Type: string
- Default value: select,update,insert,delete,show,create,describe,begin,if,end,not,exists

**mid.property.jms.command.allowed_factory_names**

Comma delimited list of Java Messaging Service (JMS) connection factories that the MID Server requires for a custom JMS activity or action. This property requires the Orchestration plugin.

- Type: string
- Default value: connectionFactory, queueConnectionFactory, topicConnectionFactory

**mid.property.ssh.use_snc**

Enables the use of the SNCSSH client for Discovery and Orchestration. Change this property to false to use J2SSH. This property applies to all MID Servers connected to the instance.

- Type: true | false
- Default value: true

**mid.servicewatch.max_concurrent_connections**

Defines the maximum number of concurrent tasks sent to an individual host by a single MID Server.

- Type: integer
- Default value: 7

**mid.sa.prefer_powershell**

Enables MID Server to use PowerShell Remoting.

- Type: True | False
- Default value: false

**mid.shazzam.regulator.interval_ms**

Sets the interval, in milliseconds, in which Shazzam can launch packets.

- Type: integer
- Default value: 1

**mid.shazzam.regulator.packets_per_interval**

© 2019 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Sets the number of packets that Shazzam can launch in the time interval specified by the
mid.shazzam.regulator.interval_ms property:

- Type: integer
- Default value: 1

**mid.sm.discolog.max_log_size**

Limits the length of the log statements in the Horizontal Discovery Log. If the results are truncated,
the **Command results** reports, "Result is larger than (value) characters and was truncated by the
logger."

- Type: integer (characters)
- Default value: 1000

**mid.sm.discolog.max_object_size**

Limits the length of the object in the Horizontal Discovery Log. Objects in the log statement are
truncated to the number of characters set by this property's value. This property only affects
the object character size in the Horizontal Discovery Log. The following message appears if an
object is limited by this property "The max object size reached the maximum limit of (value). To
adjust this use the mid property mid.sm.discolog.max_object_size."

- Type: integer (characters)
- Default value: 1000

**mid.snmp.use_getbulk**

Specifies whether to use GETBULK to receive a large amount of data in batches. This can be
used to globally configure all MID servers.

- Type: true | false
- Default value: true

GETBULK can also be set at the probe level or for an individual MID Server. Settings are listed in
the order of precedence:

- **SNMP probe parameter**
- **MID Server configuration parameter**
- MID Server properties

**shazzam.chunk_size**

Maximum number of IP addresses Shazzam will scan in parallel. This property primarily controls
outbound port consumption.

- Type: integer
- Default value: 100

**Create a MID Server property**

Use a MID Server property to control either the behavior of all MID Servers or a particular MID
Server.

Role required: admin

You set MID Server properties to override MID Server parameters. Configure MID Server properties
in the MID Server plugin. Do not configure MID Server properties in the **glide.properties** file that is
located in the properties folder of the agent. The **glide.properties** file gets overwritten during the upgrade process.

1. Navigate to **MID Server > Properties**.
2. Click **New**.
3. Fill in the fields, as appropriate (see table).

### MID Server properties fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the property name.</td>
</tr>
<tr>
<td>Value</td>
<td>You can enter the value you want the property to have.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>If you are amending JDBC operations through the mid.property.jdbc_operations properties, you can enter verbs like BEGIN, END, IF, or common PL/SQL block statements. This will assist in being able to run CREATE or ALTER statements. You might have to restart the MID server before running some of the statements.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Leave this field blank to set a MID Server property that affects all MID Servers. To set a MID Server property for a particular MID Server, select the MID Server.</td>
</tr>
</tbody>
</table>

4. After setting any MID Server properties, restart the MID Server to ensure the properties sync with the instance.

### MID Server parameters

Parameters control the behavior of a particular MID Server and have lower precedence than MID Server properties.
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

To add a parameter to a MID Server, see Add a MID Server parameter

**Important:** Changes to parameters only take effect when the MID Server is started (or restarted).

### Required parameters

**Note:** Using special characters in an XML configuration file requires you to encode them.

**url**

Specifies the URL to the associated instance. Normally the URL is similar to https://instance.service-now.com, where you replace instance with the instance name. If you host your own instance, use the URL set by your organization.

- **Type:** string
- **Default value:** none

**mid_sys_id**

Records the MID Server record’s unique identifier. This parameter should be empty when you initially configure a MID Server. Do not change the value.

- **Type:** string
- **Default value:** automatically set (GUID)

**name**

Use this parameter to supply a name that is meaningful for you. If you do not supply this parameter, the MID Server uses the default value. A set of business rules synchronizes the name in the configuration file with the name in the MID Server record. The business rules ensure that changing the name in one location also changes the name in the other location.

© 2019 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
· Type: string
· Default value: YOUR_MIDSERVER_NAME.GOES_HERE

mid.instance.username or glide.glidesoap.username
If the ServiceNow instance has authentication enabled, as it is by default, set this parameter to define the user name the MID Server should use to log in to the instance. This user should have the mid_server role on the ServiceNow instance in order to access necessary tables and fields. You can use this parameter to define user names with special characters.

· Type: string
· Default value: none

mid.instance.password or glide.glidesoap.password
If your ServiceNow instance has authentication enabled, as it is by default, set this parameter to define the password the MID Server should use to log in to the instance. You can use this parameter to define passwords with special characters.

· Type: string
· Default value: none

CIM parameters

mid.cim.batch.size
Specifies the maximum number of messages sent at once to a CIM server.

· Type: integer
· Default value: 1

mid.cim.request.interval
Specifies the number of milliseconds to wait between requests to the same Common Information Model Object Manager (CIMOM).

· Type: integer
· Default value: 0

mid.cim.host.connection.limit
Specifies the maximum number of simultaneous connections to each CIMOM. A value of zero disables simultaneous connections.

· Type: integer
· Default value: 0

Connection parameters

glide.mid.fast.responses
Instructs the MID Server to try sending messages to the instance as soon as they are ready. Normally the MID Servers end messages to the ServiceNow instance serially (that is, one message at a time). Since many probes can be run in parallel, there can be multiple messages transmitted simultaneously to the instance. Setting this parameter to true may decrease the time
between a probe's completion and its response arriving at the instance. However, the multiple simultaneous messages consume resources, decreasing the overall instance responsiveness. If there are communications problems, this parameter's value can also cause a logjam on the MID Server, as threads normally used for running probes may become consumed for sending messages. Generally, leave this parameter out of your configuration. Setting it to true is meaningful only under very special circumstances.

- **Type**: true | false
- **Default value**: false

**glide.mid.max.sender.queue.size**

Places an upper limit on how large the queue is allowed to get. The MID Server starts deleting queued messages if this limit is exceeded. When the MID Server generates messages to the ServiceNow instance faster than it can send them, it queues them temporarily on the file system of the MID Server's host. This queue is normally quite small, and is completely emptied as soon as the MID Server processing slows for a short period. However, this queue can grow in size when there are communication problems between the MID Server and the instance, and especially if there is an integration running on the MID Server.

The parameter is of the form `{number}{multiplier}`, where `{number}` is any positive decimal number including non-integers, and the optional multiplier is any spelling of bytes, kilobytes, megabytes, gigabytes, or terabytes (only the first character is tested, and the test is case-insensitive). The default multiplier is bytes. White space is liberally tolerated. The following strings all represent valid parameters: "1000000000", "0.5m", "5 GB", "7.67gigas", "145.69392 meg", and "1.1 terra".

- **Type**: string
- **Default value**: 0.5 GB

**instance.date.format**

Specifies the format the instance uses for dates and times. The primary impact of setting this parameter is to allow the MID Server to correctly refresh its start and stop times on the MID Server record in ServiceNow. The format of this date/time string is identical to that used by the Java SimpleDateFormat class.

- **Type**: string (Date format)
- **Default value**: yyyy-MM-dd HH:mm:ss

**mid.disable_amb**

Disables the Asynchronous Message Bus (AMB) Client. When AMB is enabled, the MID Server uses a default polling interval of 40 seconds. When the AMB client is disabled, the default polling interval switches to 5 seconds. If you set a polling interval with the **mid.poll.time** parameter, the MID Server uses that value whether or not the AMB client is enabled.

- **Type**: true | false
- **Default value**: false

**mid.https.truststore.password**

Sets the trustStore password that is required for HTTPS connections with the Asynchronous Message Bus (AMB) Client.

- **Type**: string
- **Default value**: none
mid.https.truststore.path
Path to the trustStore to be used by the MID Server for TLS transactions (Asynchronous Message Bus (AMB) Client). Add this parameter only if you want to change the default path.

- Type: string
- Default: Path to the JRE trustStore bundled with the MID Server

mid.jmx.enabled
Enables a JMX server on the MID Server, which exposes some management information to JMX consoles. Implementing JMX requires additional configuration of the Java runtime environment. Setting this parameter to true is only recommended for those with detailed knowledge of the Java security architecture and a specific need for JMX.

- Type: true | false
- Default value: false

mid.poll.time
Sets the default MID Server polling interval (in seconds). The polling interval is the amount of time the MID Server waits before checking the ECC queue for work when the ECC queue is not busy. The MID Server polls the ECC queue using this interval if the AMB client connection is dropped.

**Note:** The default polling interval resets to 5 seconds when the AMB client is disabled. If you configure the mid.poll.time parameter, the MID Server uses this polling interval whether or not the AMB client is connected.

- Type: integer (seconds)
- Default value: 40

threads.expedited.max
Sets the maximum amount of expedited messages to queue in memory for processing. These requests are higher priority than background tasks, but do not receive an immediate response. This value is calculated based on the (threads.max) value; Do not change.

- Type: integer (threads)
- Default value: 4 (threads)

threads.interactive.max
Sets the maximum amount of interactive messages to queue in memory for processing. These requests require an immediate response. This value is calculated based on the (threads.max) value; Do not change.

- Type: integer (threads)
- Default value: 4

threads.max
Controls the number of execution threads (simultaneous work) that probes may use. This parameter provides direct control over what CPU resources the MID Server consumes on the computer that hosts it. You can set the MID Server to use as few as 5 threads without issue. To increase the speed of the MID Server if the host is powerful enough or lightly loaded with other programs, you can increase the threads setting. The threads setting depends on the limitation of the CPU speed, memory, and operating system of the host machine. You might have to experiment to find the optimal threads count that works best when the MID Server
is busy so it does not exhaust the host machine’s hardware limitations. This means you may have to refine the thread count to best meet your situation. This value directly affects both the (threads.expedited.max) and (threads.interactive.max) values. See Set MID Server Thread Use.

- Type: integer (threads)
- Default value: 25

**Important:** You can set threads.max as high as 200, however, this setting may need to be changed depending on the OS. For example, Windows-based MID Servers running Discovery uses Powershell which is resource intensive. In this case, you may exhaust the CPU power of the host machine with just 50 threads count.

### Credentials parameters

**mid.aws.instance_profile_name**

Name of the AWS IAM role configured on the EC2 instance. When configured, the MID Server uses the temporary credentials granted to this role by the AWS instance profile to Discover cloud resources.

- Type: string
- Default value: None (User must provide a non-blank value)

**mid.credentials.provider**

Specifies the Java class name of the credentials provider.

- Type: string
- Default value: com.service_now.mid.creds.standard.StandardCredentialsProvider

**mid.secure_credentials.key_pairs.provider**

Class that the MID Server uses to generate secure key pairs.

- Type: String
- Default value: com.service_now.mid.keypairs.provider.standard.StandardKeyPairsProvider

### Debug parameters

**debug.logging**

(Deprecated) Specifies whether to enable logging of MID Server events and messages (both sent and received). Normally this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.

- Type: True | False
- Default value: false

This parameter has been replaced by the mid.log.level parameter.

**debug**
(Deprecated) Specifies whether to enable debug logging on the MID Server. Normally this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.

- Type: True | False
- Default value: false

This parameter has been replaced by the mid.log.level parameter.

**file.probe.template.debug**

Specifies whether to debug file probe templates.

- Type: True | False
- Default: false

**mid.cim.debug**

Specifies whether to enable debug logging for CIM, WBEM, SLP, or SMI-S.

- Type: True | False
- Default value: false

**mid.ssh.debug**

Enables SSH debug information in the log file. The parameter usage depends on whether the ServiceNow SSH client is enabled.

When the ServiceNow SSH client is enabled, the parameter functions as follows:

- Type: String
- Default value: false

The following string values are valid for the ServiceNow SSH client:

- true: Enables SSH debug information in the log file.
- false: Disables SSH debug information in the log file.
- <IP Addresses>: Specify which IP ranges to enable SSH debug information in the log file.
  
  You can enter IP addresses in the following formats:

  - An IP range defined by a slash and the number of bits in the subnetwork. For example, the string 10.10.10.0/24 scans 24 bits of IP addresses from 10.10.10.0 to 10.10.10.254.
  - An IP range defined by a dash. For example, the string 10.10.11.0-10.10.11.165 scans the IP addresses from 10.10.11.0 to 10.10.11.165.
  - A comma-separated list of specific IP addresses. For example the string 10.10.11.200,10.10.11.235 scans the IP addresses 10.10.11.200 and 10.10.11.235.

- deferred: Logs SSH debug information in memory unless an error or warning occurs. If an error or warning occurs, the platform publishes the debug information to the log file. This ensures that only the part of the log file pertaining to the error or warning is recorded. If no error or warning is detected, the platform deletes the unused log data from memory when the session closes. Each session stores up to 1000 log messages. If the session exceeds 1000 log messages, the deferred log discards the oldest log message to make room for the newest log message.

When the ServiceNow SSH client is disabled, the parameter enables or disables SSH debug information in the log file:
mid.log.level
Specifies the logging level for the MID Server. Possible values are:
• debug
• info
• warn
• error

Note: Values are case insensitive.

mid.http.idle_connection_monitor.debug
Enables debug logging for the Idle Connection Monitor.
• Type: True | False
• Default value: false

DNS parameters

mid.dns_scan.regulator.interval_ms
Specifies the interval between DNS scans in milliseconds.
• Type: Integer
• Default value: 10

mid.dns_scan.regulator.packets_per_interval
Specifies the number of regulator packets per DNS scan.
• Type: Integer
• Default value: 1

mid.dns_scan.default_name_servers
Specifies the host names or IP addresses of the default name servers.
• Type: String
• Default value: none

mid.dns_scan.default_name_servers
Specifies the host names or IP addresses of the default name servers.
• Type: String
• Default value: none

mid.dns_scan.additional_name_servers

Specifies the host names or IP addresses of any additional name servers.

- Type: String
- Default value: none

mid.dns_scan.load_balancing_enable
Specifies whether to enable load balancing of name servers.

- Type: True | False
- Default value: false

mid.probe.use_legacy_forward_dns
Enables the legacy DNSNameResolver probe and disables the default DNSNameResolver probe. See Probes used by Orchestration for more information.

- Type: True | False
- Default value: false

mid.probe.use_legacy_reverse_dns
Enables the legacy DNS probe and disables the default DNS probe. If you experience problems with the features of the default DNS probe, use this parameter to disable those features. The default DNS probe's features include being lightweight and faster due to executing in parallel, while the legacy probe is throttled by the MID Server because it executes in serial. The default probe utilizes DNS lookup by the MID Server host OS to make use of the OS maintained DNS cache, while the legacy probe does not. Consequently, after a DNS lookup by the default probe fails in Windows systems, the OS also tries looking up by NETBIOS name.

- Type: True | False
- Default value: false

Event Management parameters

mid.probe.event.bulk_size
Specifies the maximum size of an event payload, in MB.

- Type: Integer
- Default value: 120

mid.probe.event.wait_time
Waiting period on an empty queue for sending events.

- Type: Integer
- Default value: 1000

mid.probe.event.send.enabled
Enables or disables the sending of events.

- Type: True | False
- Default value: true

mid.probe.event.queue.max_size
Specifies the maximum size permitted for the event queue before incoming events are rejected.

- Type: Integer
- Default value: 100,000

`mid.probe.event.queue.use_bulk`

Specifies whether events are sent to the server singly or in bulk. If this parameter evaluates to true then events are sent to the server in bulk.

- Type: True | False
- Default value: true

`mid.probe.event.suppress.whitespaces`

Allows line breaks in description fields for multi-line events. Apply this parameter to each MID Server used with event connector instances. Choices are:

- all
- leave_as_is
- keep_newline

- Type: String
- Default: all

`mid.em.metric.metric_to_ci_map_limit`

Specifies the maximum number of active metrics allowed per CI map.

- Type:
- Default value: 200,000

`mid.em.metric_binding_timeout_seconds`

Specifies the number of seconds to wait before resending unhandled events

- Type: Integer
- Default value: 300

`mid.em.metric_binding_timeout_max_seconds`

Specifies the maximum number of seconds to wait before resending unhandled events.

- Type: Integer
- Default value: 10800

`mid.em.metric_max_elapsed_time_before_refresh`

Specifies the maximum number of seconds before the metric source type cache is refreshed in memory.

- Type: Integer
- Default value: 60

`mid.em.metric_max_sql_string_length_for_types`

Specifies the maximum length of the string (composed of types) used for an SQL command

- Type: Integer
- Default value: 30000

**mid.em.statistics_report_period_seconds**
Specifies the period, in seconds, between statistics reports to the instance. Use 0 to disable reporting. This parameter requires a restart.
- Type: Integer
- Default value: 60

**mid.em.metric_connector_max_run_time_seconds**
Specifies the maximum number of seconds to collect metrics in every cycle.
- Type: Integer
- Default value: 300

**mid.em.metric_connector_history_min**
Specifies the number of minutes to go back in history to retrieve metrics.
- Type: Integer
- Default value: 180

**mid.em.metric_event_logging**
Specifies the level of metric and event logging. Choices are:
- none
- all
- events
- metrics
- metrics:<filter>
- events:<filter>
- Type: String
- Default value: none

**mid.em.metric_connector_late_arrivals_delay**
Specifies the number of seconds to delay when collecting metrics.
- Type: Integer
- Default value: 30

**FTP connection parameters**

**mid.ftp.max_pool_size**
Specifies the maximum size of the FTP Connection Pool, in megabytes.
- Type: Integer
- Default value: 25

**mid.ftp.max_per_target**
Specifies the maximum number of the FTP connections per target.

- Type: Integer
- Default value: 5

`mid.ftp.max_conn_idle_time`

Specifies the maximum amount of time, in milliseconds, that an FTP connection can sit idle in the pool.

- Type: Integer
- Default value: 300000

`mid.filesystem.max.ls`

Specifies the maximum number of files that can be returned in the filesystem list directory command.

- Type: Integer
- Default value: 10000

**Logging parameters**

`disable_monitors`

Specifies whether to disable the MID Server from actively checking for monitors on the instance.

- Type: True | False
- Default value: true

`mid.show.queries`

Instructs the MID Server whether to log details about every query it makes to the ServiceNow instance. Typically this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.

- Type: True | False
- Default value: false

`disable.remote.logging`

Prevents the MID Server from logging any information to the MID Server log on the instance. Relatively little information is logged on the instance in any case, but setting this parameter to true eliminates all logging to the instance.

- Type: True | False
- Default value: false

`disable.status`

Prevents the MID Server from sending a status report to the instance every 10 minutes.

- Type: True | False
- Default value: false
Pattern parameters

**mid.parsing.max_field_size**

Sets the maximum character length of strings stored as temporary variables while patterns are run. Strings longer than this parameter's value are truncated to equal the value. Use the parameter to increase the limit when parsing longer strings.

*Warning:* Exceeding the max field size limits of the SQL database implementation cause errors.

- Type: Integer
- Default value: 1024

Proxy server parameters

**mid.instance.use_proxy or mid.proxy.use_proxy**

If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to true to instruct the MID Server to use the proxy. You must also set the proxy server's host and port, and perhaps the user name and password as well.

- Type: True | False
- Default value: false

**mid.proxy.host**

If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to define the proxy's host.

- Type: String
- Default value: none

**mid.proxy.password**

If your MID Server must go through a web proxy to access the ServiceNow instance, and your proxy requires a password, set this parameter to define that password.

- Type: String
- Default value: none

**mid.proxy.port**

If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to define the proxy's port.

- Type: Integer (0-65535)
- Default value: 80

**mid.proxy.username**

If the MID Server must go through a web proxy to access the ServiceNow instance, and the proxy requires a user name, set this parameter to define that user name.

- Type: String
- Default value: none

Request timeout override parameters

mid.sa.cloud.request_timeout
Sets the timeout in milliseconds for cloud requests. This parameter overrides the glide.http.timeout system property, which specifies the maximum number of milliseconds to wait before an outbound REST transaction times out.
- Type: integer
- Default value: 30000

mid.http_classy.request_timeout
Sets the timeout in milliseconds for HTTP classification requests with the HTTP - Classify probe. This parameter overrides the glide.http.timeout system property, which specifies the maximum number of milliseconds to wait before an outbound transaction times out.
- Type: integer
- Default value: 30000

Shazzam parameters

mid.shazzam.regulator.interval_ms
Sets the interval, in milliseconds, in which Shazzam can launch packets. This parameter works with the mid.shazzam.regulator.packets_per_interval parameter to set the number of packets allowed in this interval. By default, Shazzam launches one packet each millisecond.
- Type: Integer
- Default value: 1

mid.shazzam.regulator.packets_per_interval
Sets the number of packets that Shazzam can launch in the configured time interval. This parameter works with the mid.shazzam.regulator.interval_ms parameter, which sets that interval. By default, Shazzam launches one packet each millisecond.
- Type: Integer
- Default value: 1

mid.shazzam.chunk_size
Specifies the maximum number of IP addresses that Shazzam scans in parallel. This parameter primarily controls outbound port consumption.
- Type: Integer
- Default value: 100
SNMP configuration parameters

**mid.snmp.enable_auto_public**
Specifies whether to use the SNMP public community string automatically if no other SNMP credentials were successful.
- Type: True | False
- Default value: true

**mid.snmp.request.timeout**
Specifies the timeout value for the first OID request, in milliseconds. For subsequent requests (for example, table OIDs), the **mid.snmp.session.timeout** configuration parameter (see below) takes effect.

*Note:* You can override this parameter with the **timeout** SNMP probe parameter.
- Type: Integer
- Default value: 1500

**mid.snmp.session.timeout**
Specifies the timeout value for subsequent OID request, in milliseconds. SNMP communication is stateless and does not have a session or connection in the normal sense. The system regards a positive response from the first OID request as a sign that it should expect prompt responses to subsequent requests. While the default is short, it may be useful to increase this parameter value to the same value as that used for **mid.snmp.request.timeout**.

*Note:* You can override this parameter with the **establish_session_timeout** SNMP probe parameter.
- Type: Integer
- Default value: 500

**mid.snmp.use_getbulk**
Specifies whether to use GETBULK to receive a large amount of data in batches. This can be used to configure an individual MID Server.
- Type: True | False
- Default value: True

GETBULK can also be set at the probe level or globally for all MID servers. Settings are listed in the order of precedence:
- **SNMP probe parameter**
- MID Server configuration parameter
- **MID Server properties**

**mid.snmp.use_snmp4j**
Use the Snmp4j library for SNMP communication. This is a strict requirement for SNMPv3. This parameter should only be set to **false** based on advice from ServiceNow Technical Support.
- Type: True | False
mid.snmp.use_snmp_v1_v2c
Use the Snmp4j library for SNMP communication. This is a strict requirement for SNMPv3. This parameter should only be set to false based on advice from ServiceNow Technical Support.
- Type: True | False
- Default value: true

mid.snmp.use_snmp_v3
Attempt communication using the SNMPv3 protocol version. Requires configuration of SNMPv3 credentials.
- Type: True | False
- Default value: true

SSH Discovery parameters
By default, the MID Server is configured to search for SSH commands in the following paths and the logged-on user's default paths:
- /usr/sbin
- /usr/bin
- /bin
- /sbin

mid.connection_cache
Specifies whether to cache connections. Set to false to disable connection caching. This parameter applies to SSH connections only.
- Type: true | false
- Default value: true

mid.ssh.set_path
Specifies whether to set the PATH environment variable for SSH commands.
- Type: true | false
- Default value: true

mid.ssh.local
Specifies whether to execute commands for the MID Server host machine (localhost) via SSH rather than from a console. This allows long-running commands to execute properly. This parameter applies to the legacy SSH client only.
- Type: true | false
- Default value: false

mid.ssh_connections_per_host
Controls the number of concurrent probes the MID Server can run against a given host. Lowering the number of concurrent connections can slow Discovery.
mid.ssh.sudo_preserve_environment
Specifies whether to use sudo to preserve the environment for SSH.

- Type: true | false
- Default value: false

mid.ssh.path_override
Overrides the default paths set before executing a command. Enter one or more override paths delimited by a colon (:). The default path is /usr/sbin: /usr/bin: /bin: /sbin.

The ServiceNow SSH client accepts the following prefixes in front of the path_override value.

- **append**: Appends the override path to the end of the host’s path. This is the default behavior.
- **replace**: Replaces the host path with the path_override value.
- **prepend**: Appends the override path to the front of the host path.

- Type: string (a colon-separated list of directories)
- Default value: None

mid.ssh.use_snc
Enables the ServiceNow SSH client (SNCSSH) on individual MID Servers. SNCSSH is a ServiceNow implementation of an SSH client and is active by default for all MID Servers on new instances, via a MID Server property. Enabling the ServiceNow SSH client disables the legacy J2SSH client.

**Important**: Mixing SSH client types for MID Servers connected to the same instance is not a good practice.

- Type: true | false
- Default value: false

mid.ssh.max_retries
Specifies the maximum amount of times to retry an SSH operation after a time-out. The system sleeps two seconds between each connection attempt. By default, the MID Server retries once only. Set the parameter to 0 to disable retries.

- Type: integer
- Default value: 1

mid.ssh.alt_rm
Sets a different SSH remove file command.

- Type: string
- Default value: none

mid.ssh.initial_delay_ms
Delays sending any SSH probe commands to a server after connecting to the target for the time specified, in milliseconds. This parameter applies to the legacy SSH client only.

- Type: integer (milliseconds)
- Default value: 0

**mid.ssh.suppress_history**

Suppresses the generation of the SSH history file. This parameter applies to the legacy SSH client only.

- Type: true | false
- Default value: false

**mid.ssh.socket_timeout**

Specifies the timeout value for the SSH socket to prevent issues created by a socket timeout. Some devices, such as systems with embedded controllers like UPSs and PDUs, that have SSH enabled require more time to respond to an authentication request. The default value of 2 minutes ensures such requests do not timeout prematurely.

- Type: integer (milliseconds)
- Default value: 120000 (2 minutes)

**mid.ssh.channel_timeout**

Specifies the amount of time that the MID Server waits for activity on the SSH socket before closing the connection. If there has been no activity on the SSH socket for the specified timeout value, the MID Server closes the connection. Some devices, such as systems with embedded controllers like UPSs and PDUs, that have SSH enabled may require more time to respond to an authentication request.

- Type: integer (milliseconds)
- Default value: 120000 (2 minutes)

**mid.ssh.session_timeout**

Specifies the amount of time that a cached session remains in memory after last use. Excessively small values tend to decrease performance. This parameter applies to the ServiceNow SSH client only.

- Type: integer (milliseconds)
- Default value: 300000 (5 minutes)

**mid.ssh.command_timeout_ms**

The timeout duration, in milliseconds, for the execution of an SSH command.

- Type: integer (milliseconds)
- Default value: 300000 (5 minutes)

**mid.ssh.use_keyboard_interactive**

Uses the keyboard interactive authentication mode in SSH daemons on which it is activated.

- Type: true | false
- Default value: false
Caution: An issue exists in Mac OS X Sierra and later with the authentication order of the password and keyboard-interactive modes that can cause Discovery to fail. For details about this issue and the configuration required for proper SSH authentication, see KB0623600.

mid.ssh.dh_group_length_min
Specifies the minimum group length in bits used for generating a "shared secret" key in Diffie-Hillman key exchange. The larger the key the more secure the SSH connection is but at the cost of performance.
- Type: integer (bits)
- Default value: 1024

mid.ssh.dh_group_length_max
Specifies the maximum group length in bits used for generating a "shared secret" key in Diffie-Hillman key exchange. The larger the key the more secure the SSH connection is but at the cost of performance.
- Type: integer (bits)
- Default value: 2048

mid.ssh.shells_supported
Defines the bourne-compatible shells supported by the MID Server. This value is a comma-separated list of supported shells, such as ksh, dsh, bash and sh.
- Type: string
- Default value: ksh,bash,sh

mid.ssh.discard_lrc_error
Discard long running command error output, emulating legacy behavior.
- Type: String
- Default value: j2ssh - true, sncssh - false

mid.ssh.pool_thread_ratio
Ratio of the SSH session pool capacity to the configured MID Server thread number (threads.max), expressed as a percentage. The number of permitted pool capacity sessions is set in this parameter. Regardless of the value set in this parameter, the system never permits the pool capacity to fall below 25 sessions.
- Type: Integer
- Default value: 150

mid.ssh.disable_privilege_check
This parameter has no effect if the target is using a privileged command other than "sudo." For more information, see MID Server privileged commands.

The remainder of this section only applies to targets which run sudo. When this parameter is set to true, the MID Server assumes that the user configured in the credential has the privilege to run the given command using sudo. The MID Server assumes the target user can run any command string following sudo on the target. When this parameter is set to false, the MID Server runs "sudo -l" on the target to verify the command which follows sudo has permission to run on the target.
Regardless of this parameter’s value, the MID Server always validates that ‘sudo’ by itself can be run on the target.

Some releases do not show this parameter in the MID Configuration Parameters pull down list. In this case, you may optionally add this parameter in MID Properties.

- Type: true | false
- Default value: false

Upgrade parameters

**mid.pinned.version**

Name of the version to which this MID Server is pinned.

- Type: string
- Default value: MID buildstamp

**Note:** To see the MID buildstamp for your instance, type `stats.do` in the navigation filter. An example of the buildstamp format is `london-06-27-2018__patch3-10-24-2018_11-11-2018_0542`.

**mid.upgrade.use_proxy**

If your MID Server must go through a web proxy to access the upgrade URL, set this parameter to true to instruct the MID Server to use the proxy. You must also set the proxy server’s host and port. If the instance proxy user name and password are set, they are used for the upgrade proxy as well.

- Type: true | false
- Default value: false

**glide.mid.autoupgrade.proxy_host or glide.glidesoap.proxy_host**

If your MID Server must go through a web proxy to access the upgrade URL, define the proxy’s host here.

- Type: string (URL)
- Default value: none

**glide.mid.autoupgrade.proxy_port or glide.glidesoap.proxy_port**

If your MID Server must go through a web proxy to access the upgrade URL, define the proxy’s port here.

- Type: integer (0-65535)
- Default value: 80

**glide.mid.autoupgrade.proxy_user**

If your MID Server must go through a web proxy to access the upgrade URL, define the proxy’s user name here.

- Type: string (URL)
- Default value: none
**glide.mid.autoupgrade.proxy_password**

If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's password here.

- Type: string
- Default value: none

---

**Windows Discovery parameters**

**mid.monitoring.force_sigar_cpu_monitoring**

Enables CPU monitoring on Windows MID Server hosts using Java 11. An outdated SIGAR library causes the MID Server to crash. If you patch the SIGAR library, set this value to True to enable CPU Monitoring for Windows with Java 11.

- Type: True | False
- Default value: false

**mid.powershell_api.session_pool.max_size**

Specifies the maximum number of sessions allowed in the session pool.

**Note:** Setting or changing this parameter requires restarting the MID Server.

- Type: Integer
- Default value: 25

**mid.powershell_api.session_pool.target.max_size**

Specifies the maximum number of sessions allowed in the pool per target host.

**Note:** Setting or changing this parameter requires restarting the MID Server.

- Type: Integer
- Default value: 2

**mid.sa.prefer_powershell**

Enables MID Server to use PowerShell Remoting.

- Type: True | False
- Default value: false

**mid.powershell_api_winrm.use_ssl**

Requires the use of SSL certificates for HTTPS connections using WinRM.

- Type: True | False
- Default value: false

**mid.powershell_api_winrm.additional_pssesion_options**

**mid.powershell_api_winrm.remote_https_port**

Configures the port for connecting to Windows servers using PowerShell over HTTPS.

- **Type:** Integer
- **Default value:** 5986

**mid.powershell_api_winrm.remote_port**

Configures the port for connecting to Windows servers using PowerShell over HTTP.

- **Type:** Integer
- **Default value:** 5985

**mid.powershell_api_winrm.skip_ssl_cert_check**

Skips the SSL certificate check when using WinRM for HTTPS connections.

- **Type:** True | False
- **Default value:** false

**mid.powershell_api_winrm.skip_ssl_cert_check_options**

Skips specific SSL certificate checks when using WinRM for HTTPS connections. Configure the MID Server to skip checks for certificates from a Certification Authority (CA), from the Common Name (CN) that identifies the host associated with the certificate, and for revoked certificates.

- **Type:** String
- **Default value:** -SkipCACheck -SkipCNCheck -SkipRevocationCheck

**mid.powershell.use_credentials**

Determines the credentials to use for Discovery with PowerShell. A setting of true directs the MID Server to run probes with the Windows credentials from the credentials table. To run probes with the credentials of the user for the MID Server service, set this parameter to false.

- **Type:** true | false
- **Default value:** true

**mid.use_powershell**

Enables or disables PowerShell for Discovery. Restart the MID Server after changing the value. If PowerShell is not installed or the version installed is less than version 2.0, Discovery reverts to using WMIRunner.

- **Type:** true | false
- **Default value:** true, in the Fuji release.
- **Default value:** false, in releases prior to Fuji.

**mid.powershell.path**

Enables an administrator to point to a specific PowerShell on a MID Server in cases where more than one PowerShell is installed. Supply the path to the folder containing the PowerShell executable, for example, C:\mypowershell or C:\mypowershell\. ServiceNow automatically appends the string powershell.exe to the path. Configure this parameter when both a 32-bit and 64-bit PowerShells are active on the same MID Server, and it becomes necessary to launch
the correct PowerShell for the context. 64-bit Windows employs file system redirection and
the MID Server runs as a 32-bit application. If trying to specify a path in %WinDir%\System32,
Windows automatically redirects to %WinDir%\SysWOW64. To avoid redirection, specify the path
as %WinDir%\Sysnative. For example, instead of C:\WINDOWS\system32\WindowsPowerShell
\v1.0\, specify C:\WINDOWS\sysnative\WindowsPowerShell\v1.0\.

**Note:** On a 64-bit version of Windows XP, a Microsoft hotfix may be required to enable
this.

To discover applications running on a 64-bit Windows machine, the MID Server must be running
on a 64-bit Windows host machine.

- Type: string (path)
- Default value: none

**mid.powershell.enforce_utf8**

Enable this parameter to force commands on a target Windows system to return UTF-8 encoded
output. Disabling it allows the target system to use its default encoding. This parameter is only
valid when PowerShell is enabled.

Setting this value to false may result in incorrect values in the CMDB when non-ASCII characters
are returned by a probe.

- Type: true | false
- Default value: true

**mid.powershell.local_mid_service_credential_fallback**

Enables automatically falling back to MID Server service credentials if all other credentials fail.

- Type: True | False
- Default value: true

**mid.powershell_api.idle_session_timeout**

Specifies the timeout value of idle PowerShell sessions in seconds.

**Note:** Setting or changing this parameter requires restarting the MID Server.

- Type: Integer
- Default value: 60

**mid.powershell.command.parameter_passing**

Enable this parameter to allow passing PowerShell parameters from the command line.

- Type: True | False
- Default value: false

**mid.powershell.command.script.parameter_passing**

Enable this parameter to allow passing PowerShell scripts from the command line.

- Type: True | False
- Default value: true

**mid.windows.management_protocol**
Enables administrators to select the Windows management protocol used for device and process classification. Options include:

- WMI
- WinRM

- Type: String
- Default value: WMI

**mid.windows.probe_timeout**

Sets the timeout interval for all Windows probes on a specific MID Server. This value is overridden by the values configured for individual probes with the wmi_timeout probe parameter.

- Type: Integer
- Default value: 300

**Add a MID Server parameter**

Use a MID Server parameter to control the behavior of a particular MID Server.

Role required: admin

1. Navigate to **MID Server > Servers**.
2. From the list of MID Servers, select a MID Server to configure.
3. Select the **Configuration Parameters** related list.
   
   This shows all the parameters currently in the MID Server's configuration file. If there are any passwords, they are displayed in asterisks for security reasons. See **MID Server parameters** for a list of available parameters.
Defining MID Server configuration parameters

4. To add parameters, click **New**, and then complete the form. After the form is submitted, the configuration file for that MID Server is modified to include the new parameter. Changes to existing parameters are reflected in the MID Server configuration file as well. Changes made to the MID Server configuration file do not take place immediately, but rather the next time the MID Server is restarted. The MID Server form has a related link for restarting the MID Server.
Note: ServiceNow prevents you from saving changes, such as modifying or deleting parameters, that would cause the MID Server to lose communications with the instance. For example, you cannot change the url parameter. Any changes to these protected parameters must be made directly in the config.xml file for that MID Server.

5. (Optional) Set parameters in the config.xml file.

MID Server configuration is controlled by an XML file called config.xml. This file is located in the /agent directory, in the MID Server installation directory. You can edit this file directly to make any configuration changes to protected parameters. Many configuration changes, such as those that do not disrupt communication between the MID Server and the ServiceNow instance, may also be made from the instance.

The structure of the config.xml file is simply an outer parameters tag and a series of inner parameter tags. Each parameter tag has name and value attributes.

- To change the value of a parameter, edit the value attribute.
- To add a parameter, add another parameter tag with its name and value.
- To delete a parameter, delete the entire parameter tag.

The order of the parameters within the file is not important. Notice the green comment sections in the sample. Use these elements to add useful comments to the configuration file.

Note: When configuring the MID Server for use with a proxy server, be sure to remove the comment tags around the proxy sections that you configure.
MID Server config.xml file

---

**Note:** The sample file here is from a Firefox browser. Conventional text editors, such as Notepad, WordPad, or TextEdit, do not display colors and variable fonts.

**MID Server protected records and reserved characters**

Some MID Server records cannot be altered. Certain special characters are pre-defined in XML and cannot be used in passwords.
1. **Ensure that the MID Server can connect to elements inside and outside your network**
2. **Download and install the MID Server on a Linux or Windows host**
3. **Configure your MID Server**
4. **Configure MID Server security**
5. **Ensure that the MID Server can connect to elements inside and outside your network**
6. **Download and install the MID Server on a Linux or Windows host**
7. **Configure your MID Server**
8. **Configure MID Server security**

---

### MID Server Records that cannot be altered

These records cannot be modified or deleted.

---

### Using special characters in an XML file

The XML specification defines five predefined entities that represent special characters, and requires that all XML processors honor them. If these characters are used in a password, you will experience unexpected results.

The following characters represent the five pre-defined entities:

- "
- &
- '
- 
- <
- >
If you use the pre-defined entity characters in an XML file, such as the MID Server configuration file, you need to encode them. To encode pre-defined entities into an XML document:

- replace " with &quot;
- replace & with &amp;
- replace ' with &apos;
- replace < with &lt;
- replace > with &gt;

For example, to specify the password as test& in the MID Server config.xml file:

```xml
<parameter encrypt="true" name="mid.instance.password" value="test&amp;"/>
```

**MID Server privileged commands**

To discover certain information on a host server, the MID Server must run SSH commands with higher privileges. The platform provides default privileged commands for the MID Server to use and the ability to add additional commands to the system.

1. **Ensure that the MID Server can connect to elements inside and outside your network**
2. **Download and install the MID Server on a Linux or Windows host**
3. **Configure your MID Server**
4. **Configure MID Server security**
5. **Ensure that the MID Server can connect to elements inside and outside your network**
6. **Download and install the MID Server on a Linux or Windows host**
7. **Configure your MID Server**
8. **Configure MID Server security**

An example of information that requires elevated privileges is information about storage disks on a host server, retrieved with the `fdisk -l` command. If your system cannot use sudo commands, you must configure the hosts in your network to use one of the other privileged commands. You can configure different privileged commands for different hosts. However, Discovery supports only one privileged command per host.

**Important:** You can edit supported privileged commands, but do not delete them.

For a list of possible SSH commands requiring root privileges, see [SSH credentials](#).
## SSH privileged escalation command requirements

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **sudo** | · Host must support the `sudo -S -p <password>` command and return the correct list of allowed SSH commands.  
· Credentials provided for Discovery must be able to run the command `sudo -S -p <password> <commands>`.
| **pbrun** | · Host must support the `pbrun -v` command and return the correct version of PowerBroker.  
· Credentials provided for Discovery must be able to run `pbrun <commands>`.  
· Discovery does not support any other `pbrun`-options, such as a password prompt.  
· The instance must be able to reach the target host via SSH.
| **pfexec** | · Host must support the `pfexec id -a` command and return the correct ID.  
· Credentials provided for Discovery must be able to run `pfexec <commands>`.  
· Discovery does not support any other `pfexec`-options, such as a password prompt.
| **dzdo** | · Host must support the command `-v dzdo` command and return the path to `dzdo` in standard output.  
· Credentials provided for Discovery must be able to run `dzdo <commands>`.  
· Discovery does not support any other `dzdo`-options, but Discovery supports password authentication for `dzdo`.

### Long-running commands with sudo

Configure J2SSH and ServiceNow SSH to prevent long running commands using sudo from failing when the MID Server disconnects.

ServiceNow SSH allows probes to run sudo against individual commands or an entire, long-running script. This is also supported for the `pbrun` and `pfexec` privileged commands.

### Sudo for individual commands

You can run sudo against individual commands within a probe, but only if all the following sudoer configurations are performed on the target:

- The `!requiretty` option is required.
- Allow individual commands to be run by the user in the provided credential with `NOPASSWD` configured.
The target specifies an individual sudo call in the command or referenced scripts. For example, set sudo as "sudo fdisk -I" or "${sudo:fdisk -I}" rather than "must_sudo" for the entire script.

**Note:** Running sudo against individual commands with ServiceNow SSH produces detailed and useful entries in the sudo logs on the target computer.

**Running sudo on an entire script**

If any of the required sudoer configuration requirements for individual commands is not in place, Discovery applies sudo to the initial and complete probes, and does not execute sudo remotely inside the command. This condition can be forced by setting `must_sudo` on the probe and eliminating any sudo commands within the probe.

This approach prevents long running commands from failing when the probe disconnects, but cannot specify individual commands in the sudoers configuration.

**Logging**

The logs from ServiceNow SSH sudo activity run against an entire script show cryptic entries, such as `/tmp/.run.aef13123fe124123`, which prevent administrators from controlling permissible commands and knowing the exact command that was run. Sudo run against individual commands produces more detailed log entries, such as `/sbin/fdisk -l`.

**Add a new privileged command for use by the MID Server**

Add a new privileged command to the Privileged Command (privileged_command) table that is available to your MID Servers.

Role required: admin

**Important:** Do not delete any of the supported commands.

1. Navigate to **MID Server > Privileged Command** and click **New**.
2. Complete these fields:
   - **Command**: The name of the privileged command.
   - **Password Prompt**: The password prompt displayed to the user for this privileged command, or a regular expression that matches this password prompt. If this field is empty, no password is required for this privileged command, and no prompt is displayed. SUDO commands do not require a password prompt.
3. Click **Submit**.

**Configure the MID Server to use specific privileged commands**

You can configure the MID Server to use specific commands in a defined order.

Role required: admin

1. Navigate to the list of MID Servers using one of the following paths:
   - **MID Server > Servers**
   - **Discovery > MID Servers**
   - **Orchestration > MID Servers**
2. Select the MID Server you want to configure.
3. Click the menu icon in the header bar and select View > Advanced from the context menu.

4. In the Privileged Command related list, click Edit.
5. Select the command you want this MID Server to use and click Save.
   The default order of privileged commands is 100, but you can change the order as necessary. The privileged command with the smallest order number is tried first.
Create a pbrun profile privileged command

You can create a special configuration for the pbrun privileged command that allows it to run as a profile.

Role required: discovery_admin, admin

Of all the privileged commands, only the pbrun command can be configured to run as a profile, and only one of these special pbrun configurations can function on a MID Server.

**Important:** Edit the existing pbrun record for this purpose. The system ignores any additional commands you create for pbrun.

1. Navigate to MID Server > Privileged Command.
2. Select pbrun from the list.
3. In the Privileged Command record, edit the value in the Command field to use the format `pbrun -u <profile>`.
   For example, you can set `pbrun -u admin` as a command to run with an admin profile.
4. Click Update.

Return to Configuring MID Servers.

**MIDSystem methods**

MIDSystem variables (referred to by the variable name ms.) provide a variety of methods to get information about the MID Server.
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

### Method summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log(String message)</td>
<td>Logs the given message with a standard prefix to indicate that the message was generated by JavaScript.</td>
</tr>
<tr>
<td>getConfigParameter(String parameter name)</td>
<td>Returns the value of the named configuration parameter.</td>
</tr>
<tr>
<td>include(String script include)</td>
<td>Include the MID Server script include with the given name into the current context.</td>
</tr>
<tr>
<td>getName()</td>
<td>Returns the name of the MID Server.</td>
</tr>
<tr>
<td>getSysID()</td>
<td>Returns the sys_id of the MID Server.</td>
</tr>
<tr>
<td>toJavaScript(Object)</td>
<td>Converts the given Java object into the equivalent JavaScript object.</td>
</tr>
</tbody>
</table>

This example writes a message to the log:

```javascript
ms.log('Attempting to log in with user: ' + this.getParameter('user'));
```

### MID Server heartbeat

The instance checks the MID Server for a response every 5 minutes, using a synthetic transaction monitoring system.
Checking for a heartbeat

ServiceNow instances send a synthetic transaction via the Heartbeat probe to every MID Server every 5 minutes. The Heartbeat probe functions exactly as a normal probe does and is sent by writing an output record to the ECC queue. A MID Server retrieves the record when it queries the ECC queue for work. The MID Server processes the probe just as it would any other probe and responds back to the instance. If the instance does not detect a response from a MID Server, the instance marks that MID Server as Down. If the MID Server responds, the instance considers the MID Server to be functioning and communicating properly with the instance.

Note: Make sure that your MID Server can communicate on port 443. See Configure MID Server network connectivity and MID Server system requirements for more information.

System events

When a MID Server transitions from one state to another, one of these events is triggered:

- **mid_server.up**: The MID Server goes from a status of **Down**, **Paused**, or **Upgrading** to a status of **Up**.
- **mid_server.down**: The MID Server goes from a status of Up to a status of Down.
- **mid_server.paused**: The MID Server is paused.
- **mid_server.upgrading**: The MID Server is being automatically upgraded because the instance is being upgraded.

You can use these events to send notifications or trigger actions that you specify in scripts.
Scheduled job

To change the trigger interval for the Heartbeat probe, navigate to System Scheduler > Scheduled Jobs > Scheduled Jobs. Open the MID Server Monitor record and edit the interval.

MID Server heartbeat trigger interval
Set the MID Server JVM memory size

The MID Server starts with a default JVM memory allocation, but you can modify this setting in the configuration file.

Role required: admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

In the base ServiceNow system, the MID Server JVM memory is set to 1024 MB, which is configured in the \agent\conf\wrapper-override.conf file in the MID Server installation directory. This setting might not be appropriate for the way your organization uses the MID Server. If you want the MID Server to work harder, allocate more resources to it. If the MID Server is located in a small branch office and runs in an environment where memory allocation is shared between a print server, mail server, or web proxy server, the allocation might have to be reduced.

**Note:** For a complete list of minimum MID Server requirements, see [MID Server system requirements](#).

1. Open the \ServiceNow\<MID Server name>\agent\conf\wrapper-override.conf file in a text editor.
   For more information about this file, see [Installing Multiple MID Servers on a Single System](#).
2. Locate the following lines in the file:

   ```
   # OPTIONAL: Maximum Java Heap Size (in MB)
   wrapper.java.maxmemory=1024
   ```

3. Edit the memory allocation.
4. Remove the comment tag (#) from the memory allocation parameter.
5. Save the file.
6. Restart the MID Server service.
Pause the MID Server

Pause the MID Server to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

Role required: agent_admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

You can only pause validated MID Servers. You might want to pause the MID Server when your network infrastructure is undergoing changes. This prevents applications like Discovery from throwing errors during a particular maintenance window.

A paused MID Server continues processing commands that it had already retrieved before it was paused. When you resume the MID Server, the MID Server starts retrieving new commands to process.

**Note:** Discovery continues to assign jobs to MID Servers that are Paused. MID Servers that are Down are not assigned jobs.

1. Open the MID Server record.
2. Select a running MID Server that has been validated.
3. On the MID Server form, select Pause MID under Related Links.

The state of the MID Server changes to Paused.
4. To resume MID Server processing, select **Resume MID** under **Related Links**.

**MID Server pause**

The MID server can be put into a **Paused** state to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

Unlike stopping the MID Server from the **Windows** or **Linux** server command line on the MID Server machine, pausing the MID server is something that you can do from the instance. The MID Server pause feature is available starting with the Istanbul release.

**Note:** You can only pause **validated MID Servers**.

You can still perform these actions when the MID Server is paused:

- **Access the MID Server logs** and delete log entries.
- View MID server statistics. While the MID Server is in the **Paused** state it stops generating statistics. But you can still view the statistics generated before you paused the MID Server.
- Retrieve the MID Server thread dump.
- Make and save **configuration changes** and property changes to the server. The changes take effect after the MID Server is resumed.
- Clear the ECC queue.

The **MID server heartbeat** continues to function while the MID Server is in the **Paused** state. If the MID Server is upgraded while it is in the **Paused** state, the MID Server state automatically changes to **Up** after successful upgrade. It does not return to the **Paused** state.

During **MID Server selection**, paused MID Servers can still be selected but are prioritized below MID Servers that are not paused.

**Events that occur during MID Server pause**

The **vCenter** and **SNMP** event collectors, continue to run and process events when you pause the MID Server. These events are not part of the normal synchronous communication that the MID Server has with the instance that you see in the ECC queue. Events are still relayed to the instance and can even trigger actions on records in the instance, such as a CI update. For example, if vCenter detects that a virtual machine goes down or is deleted, a vCenter event makes a change to the status of the corresponding CI record for that virtual machine.

To prevent these events from being processed, stop the extensions from running. For more information, see:

- **Configure and run the vCenter event collector extension**
- **Configure the SNMP Trap Collector Extension**

**Notifications**

Notifications keep users informed of events that concern them. The system can notify users by email, SMS text message, or push notification.

Email and SMS notifications

Use email notifications to send selected users email or SMS notifications about specific activities in the system, such as updates to incidents or change requests.

Email notifications allow administrators to specify:

- When to send the notification
- Who receives the notification
- What content is in the notification
- Whether the notification can be delivered in an email digest and if so, the digest content

Additional email notification options are available. Users can subscribe to notifications, and administrators can make some notifications mandatory.

Administrators also have the option of converting existing email notifications to a rich HTML format. This format provides several advantages, including:

- Raw HTML content is converted into a WYSIWYG format.
- The content can be edited in a feature-rich HTML editor.
- Mail scripts are condensed into a single, easy-to-read line that can be reused in multiple email notifications.
- To prevent broken links, items like images and incidents, that are linked with URLs relative to an instance are converted to absolute links. For example, if an incident is linked using a relative URL, the link is converted to an absolute link.

**Note:** The rich HTML format is the default for all new email notifications.

**Note:** Instances cannot send or receive encrypted email messages. The system strips out the body of the encrypted email because it cannot process the encrypted content in plain text or HTML.

An email notification can also send as an SMS notification if the recipient has subscribed to the notification on an SMS channel. The system uses the subject line of the email notification and converts it to an SMS message. If the administrator doesn’t want to use the email notification subject for the SMS notification, they can define an alternate SMS message in the email template form or email notification form. For more information, see Create an email notification.
For more information on creating an SMS channel, see Create notification channels.

If you want to change how the instance processes incoming email, see Inbound email actions. See System email log and mailboxes for examples of messages the system displays when notifications or inbound email actions are not processed.

**Email setup**

All email notifications use the email properties that you define for your instance and the email accounts that you set up. Your email service can also affect the successful transmission of incoming and outgoing email.

**Email accounts**

Email administrators set up email accounts to allow the system to connect to external mail services such as POP3, SMTP, or IMAP servers. You can use the ServiceNow-provided email accounts or create your own accounts for your own email services.

**Email properties**

Use Email Properties to configure settings for inbound and outbound email. Email properties apply to all email accounts.

**Email service size restrictions**

Your email service, whether you are using a standard ServiceNow email configuration or an alternate email configuration, determines the successful transmission of incoming or outgoing emails based on a maximum email size. An email configuration consists of your instance, email server, and email client.

- **Standard email configurations** – For instances that use the standard email configuration, the ServiceNow mail servers cannot send or receive emails larger than approximately 50 MB (before encoding), including the email header, body text, and attachments. Email messages are encoded by an email client, which increases total email message size. The maximum ServiceNow mail server size restriction is 75 MB (after encoding). The maximum email size limit is enforced regardless of any configured attachment size limits.

- **Alternate email configurations** – If your email service uses a company-owned or third-party server, the approximate size restriction of 50 MB (including the email header, body text, and attachments) may still apply. However, your service might support different maximum total file sizes for inbound and outbound emails. Check with the email administrator of your email service to verify email size limits.

For details on how encoding can affect email message size and email transmission, see KB0521772.

**Email service availability**

Email service is intentionally shut down on instance clones to prevent resending already delivered email. Upgrades no longer require an extended interruption of email service. Instances continue to process email during an upgrade. For a possible explanation for undelivered emails, see the blog post Whitelisting emails sent from the ServiceNow infrastructure by a ServiceNow Technical Support Engineer in the Now Community.
For instructions on creating and sending custom emails when events on the instance occur, see the tasks in Email and SMS notifications.

**Instance-to-instance communication via email**

Use Web services to communicate between two instances.

**Designate untrusted and trusted email domains**

Using Instance Security Center, you can monitor the blocked and allowed incoming email metrics for your instance. For more information, see Designate untrusted and trusted email domains.

**Basic email setup**

All production instances can send and receive email using ServiceNow-provided resources. The instance has an email address of instance@service-now.com.
Network layout for standard email configuration
Basic email services and features

- Mail servers maintained by ServiceNow.
  - Encrypt mail with opportunistic TLS (Transport Layer Security) if supported by your mail servers.
    If your internal mail servers send and receive messages via a TLS-encrypted channel, ServiceNow mail servers support that communication.
  - Provide a dedicated mailbox for your instance.
- Pre-configured email accounts to connect to ServiceNow mail servers.
  - An SMTP account sends email to your primary Mail Exchange (MX) server from your instance email address of instance@service-now.com.
  - A POP3 account receives email sent to your instance email address of instance@service-now.com.
- High availability features from ServiceNow datacenters.
- Spam detection for incoming email.

Administrators who want to use basic email services can do so by enabling the email properties for sending and receiving email.

Enable basic email
Enable basic email to use ServiceNow-provided email servers and accounts.

Role required: admin

1. Navigate to **System Properties > Email**.
2. Configure these email properties and click **Save**.

Advanced email setup

With an advanced email setup, you can use your own SMTP server, POP3 server, or both.

Setting up your own email environment can be useful if you want to use existing filtering, retention, or compliance aspects of your internal email architecture. You can set up email in several ways:

- Use your own SMTP server to forward email to ServiceNow servers.
- Use your own SMTP server to send email.
- Use your own POP3 server to receive email.
- Use your own SMTP and POP3 servers to send and receive email.
- Use an OAuth 2.0-enabled SMTP server to send email from a third-party service.
- Use an OAuth 2.0-enabled IMAP server to receive email from a third-party service.

The following procedures assume that you enabled basic email properties.
Enable using your own SMTP server
Enable using your own SMTP server so that you can leverage the existing filtering, retention, or compliance aspects of your own SMTP server while also using the ServiceNow POP3 server.

- Role required: admin
- Email server required: SMTP
- Basic email properties: enabled

You can combine your own internal email architecture with the ServiceNow email architecture to handle email. The following diagram demonstrates how you would use your own SMTP server alongside the ServiceNow POP3 server.
1. Navigate to System Mailboxes > Administration > Email Accounts.
The system displays the list of available email accounts.

2. Locate the record for **ServiceNow SMTP** and change **Active** to **false**.

3. Click **New**.
4. Create an email account record for your SMTP server where the **Type** is **SMTP**.
5. From **Related Links**, click **Test Connection**.
   If the email account is valid, the system returns a success message.
Configure the SMTP server in your internal email architecture to forward email from the custom email address to the instance email address. Implement a spam filter on the custom email address.

Enable using your own POP3 server
You can use your own POP3 server to store and receive email for the instance.

- Role required: admin
- Email server required: POP3
- Basic email properties: enabled

1. On your POP3 server, create a mailbox for your instance that has a custom email address. For example, create a mailbox for service-desk@company.com.
2. Navigate to System Mailboxes > Administration > Email Accounts. The system displays the list of available email accounts.
3. Optional: If you do not want to receive email sent to the instance@service-now.com mailbox, locate the record for ServiceNow POP3 and change Active to false. An instance can receive email from multiple POP3 accounts at the same time. Leaving the ServiceNow POP3 account active allows the instance to receive email sent to the instance default email address.

4. Click New. The system displays a blank Email Account form.
5. Create an email account record for your POP3 server where the Type is POP3.
6. From Related Links, click Test Connection. If the email account is valid, the system returns a success message.
Connection Test

Connection Successful

Close
Enable using your own SMTP and POP3 servers
You can use your own SMTP and POP3 servers to send email from the instance and to store and receive email for the instance.

- Role required: admin
- Email servers required:
  - SMTP
  - POP3

- **Basic email properties:** enabled

1. On your POP3 server, create a mailbox for your instance. For example, create a mailbox for service-desk@company.com.
2. Navigate to **System Mailboxes > Administration > Email Accounts.** The system displays the list of available email accounts.
3. Locate the record for **ServiceNow SMTP** and change **Active** to **false.**

4. Optional: If you do not want to receive email sent to the instance@service-now.com mailbox, locate the record for **ServiceNow POP3** and change **Active** to **false.**
   
   An instance can receive email from multiple POP3 accounts at the same time. Leaving the **ServiceNow POP3** account active means that the instance receives email sent to its default email address.
5. Click **New**.
   The system displays a blank Email Account form.

6. Create an email account record for your SMTP server where the **Type** is **SMTP**.

7. From **Related Links**, click **Test Connection**.
   If the email account is valid, the system returns a success message.

![Connection Test](image)

8. Click **New**.
   The system displays a blank Email Account form.

9. Create an email account record for your POP3 server where the **Type** is **POP3**.

10. From **Related Links**, click **Test Connection**.
If the email account is valid, the system returns a success message.

Connection Successful
**OAuth email authentication**

OAuth enables your instance to receive and send email through a third-party email account.

Open Authentication (OAuth) is an open standard for authorization that provides administrators with an authorization method when connecting to incoming IMAP and outgoing SMTP servers. OAuth enables an instance to receive and send email from a third-party account, such as Gmail, without having to enter the credentials for that account.

The OAuth 2.0 implementation requires you to obtain an access and refresh token from your third-party email provider for each third-party email account. The tokens are automatically saved to the instance database. They provide authorization for all email communication between the instance and the authorized third-party account. A scheduled job regularly checks to see if email access tokens are valid. If the access token is not valid, but the refresh token is, the instance automatically regenerates a new access token.

OAuth 2.0 support is available starting with the Geneva release. The OAuth implementation supports IMAP and SMTP accounts only. POP3 is not supported. OAuth 1.0 is no longer supported.

---

**Note:** Customer email accounts configured to use OAuth 1.0 authentication with Gmail cease to function as of April 20, 2015. See [KB0546976](#) for more information.

Activating the Email - OAuth support for IMAP and SMTP plugin allows you to use OAuth with email. If you upgrade to Geneva or later instances and are already using OAuth 1.0, activate the plugin again.

See [Outbound REST with OAuth 2.0 profile tutorial - integrating with Google Contacts API](#) for an example of using an OAuth 2.0 profile to authenticate an outbound REST message with Google to retrieve contact information. Also see [OAuth 2.0](#) for more information on OAuth 2.0 support in the instance.

Activate the OAuth email authentication plugin

OAuth email authentication requires the Email - OAuth support for IMAP and SMTP plugin.

**Role required:** admin

1. **Navigate to System Definition > Plugins.**

   A banner notifies you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:**

   To redirect to the legacy list view for plugins, click the link.

2. **Find the plugin using the filter criteria and search bar.**

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in [Request a plugin](#).

3. **Activate the plugin.**

   You can activate the plugin directly from the All Applications page or you can view more details about the plugin before you activate it.

   - If you are certain that you have the correct plugin, click **Install**, and when you see the dialog box, click **Activate**.
To view plugin details before activation:
1. Click the plugin name.
2. On the form, click the **Activate/Update** related link.
3. In the dialog box, review the dependent plugins.
   If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.
4. If demo data is available and you want to install it, click **Load demo data**.
   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.
5. Click **Activate**.

Enable OAuth 2.0 for email
Setting up OAuth 2.0 for email requires you to obtain access and refresh tokens from your email provider.
- Role required: admin
- Plugin required: Email - OAUTH support for IMAP and SMTP

1. Log in to your third-party email account, such as Gmail, and enable OAuth 2.0.
2. Obtain the following from your third-party email account:
   - client ID
   - client secret
   - authorization URL
   - token URL
   - redirect URL
   - token revocation URL
3. Navigate to **System OAuth > Application Registry**.
4. Click **New**.
5. Click **Connect to a third party OAuth Provider** to create an application registry record that email uses.
6. Use the information you obtained from your third-party email account to fill in the fields on the form. See **Use a third-party OAuth provider** for instructions. Create the OAuth application registry record and its associated OAuth Entity Profile and OAuth Entity Scope records.
7. Click **Submit**.
8. Navigate to **System Mailboxes > Administration > Email Accounts**. The system displays the list of available email accounts.
9. Optional: If you do not want to receive email sent to the default instance email address, locate the record for **ServiceNow POP3** and change `Active` to `false`. The system can receive email from multiple POP3 email accounts.
10. Locate the records for **ServiceNow SMTP** and change `Active` to `false`.

![Email Accounts](Image)

### Email Accounts

<table>
<thead>

</tr>
</tbody>
</table>

11. Click **New**.
   The system displays a blank Email Account form.
12. Create an email account record for your OAuth 2.0 SMTP server where the **Type** is **SMTP**.
13. For **Authentication**, select **OAuth 2.0**.
14. For **OAuth Profile**, select the application registry record you created.
15. Click **Authorize Email Account Access** to obtain the access and refresh tokens.
   Another browser window opens asking you to authorize the account access on the third-party email account.
16. Authorize the access.
   After the authorization is successful and the tokens are saved to the instance, the **Authorize Email Account Access** button no longer appears on the Email Account form.
17. Click **New**.
   The system displays a blank Email Account form.
18. Create an email account record for your OAuth 2.0 IMAP server where the **Type** is **IMAP**.
Use the same **Authentication** and **OAuth profile** settings as the OAuth SMTP email account.

**Email accounts**

Email accounts store the connection details and credentials the system uses to access external email servers and services.

By default, instances come with email accounts for ServiceNow-managed SMTP and POP3 servers to send and receive email. These accounts cannot be modified, but can be deactivated if you do not want to use them. To connect to other email servers and services you must create email accounts for them. You can create email accounts for servers and services that use these protocols:

- SMTP
- POP3
- IMAP

**Note:** The system only allows one SMTP email account to be active at a time and sends all email through this account. You can however receive email from multiple POP3 or IMAP accounts.

The system stores individual email accounts in the `sys_email_account` table. Create separate email accounts to send and receive email. Use **email properties** to define how the system processes email for all email accounts.

By default, the ServiceNow POP3 server provides each instance with its own mailbox at the address `instance@service-now.com`. Likewise, the ServiceNow SMTP server sends email from the address `instance@service-now.com`. To create another mailbox, provision your own POP3 or IMAP server and create an email account to the server on the instance. To change the sent from email address, update the address in the email account you use for sending email.

Emails received via a POP3 or IMAP server account are stored in the Email (sys_email) table and then deleted from the account.
Configure an email account
You can create email accounts in addition to the accounts provisioned for you.

- Role required: admin
- Email server: a compatible email server
  - SMTP
  - POP3
  - IMAP

**Warning:** An SMTP server that uses a localhost or loopback (127.0.0.1) IP address is not accepted as a compatible email server. For more information, see [KB0724199](#).

1. Navigate to **System Mailboxes > Administration > Email Accounts**.
2. Click **New**.
3. Fill in the fields on the form (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>

<td>- STARTTLS: Upgrades an insecure connection to a secure connection using the SSL/TLS encryption protocol, if your email server supports TLS.</td>
</tr>
<tr>
<td></td>
<td>- SSL/TLS: Connect to an SSL/TLS encrypted port to secure the connection. Email is encrypted between the ServiceNow instance and your mail server.</td>
</tr>
<tr>
<td><strong>Port</strong></td>
<td>Connection TCP port.</td>
</tr>
</tbody>
</table>
4. Click **Submit**.

5. Click the test connection link at the bottom to test the SMTP, POP3, or IMAP account.

The system displays a pop-up window with the results of the connection test.

---

![Connection Test](image)

**Connection Successful**

If the test succeeds, click **Close** to return to the email account record. If the test fails, click **View Logs** to display more information about the test results.
The system uses the email account to send or receive email.

Enable the system to send or receive email.

**Multiple email readers**

Organize POP3/IMAP email accounts into email account groups (subsets of email accounts) that can be processed by multiple email reader jobs. To improve the performance of inbound email account processing, you can incrementally add email account groups and if needed, email reader jobs to process email account groups concurrently.

---

**How email account group processing works**

By default, the email reader job processes POP3/IMAP email accounts serially, which can result in longer processing times when you have many email accounts. It can also be difficult to identify any problematic email accounts that might contribute to slower processing times.

To reduce email account processing time, you can create one or more email account groups that contain subsets of your email accounts. Organizing your email accounts into groups enables the default email reader job to process each email account group separately. After creating one or more email account groups, you can then add another email reader job to process account groups concurrently.

Use the `glide.email.inbound.account_group_processing` system property to activate email account group processing.

During email account group processing:

- The system stores the email accounts in the Email Account Groups (sys_email_account_group) table.
- The default email reader job runs every two minutes. The email reader chooses the account group to be processed based on the account group processing state and the date and time that the group was last processed.
  - Claimed state: If an account group has a claimed state, the email reader is processing the account group. If you defined other email reader jobs, no other email reader job can claim the group for processing.
  - Unclaimed state: If an account group is unclaimed, the account group is available for processing by the email reader.
- The email reader job processes the email accounts contained in the selected account group.
- The email reader job chooses the next available account group for processing and continues processing that account group.

You can monitor the processing of each email account group by using the Email Account Groups (sys_email_account_group) table. Each account group record includes the processing duration (how long it takes for the email reader to process all the accounts in the group).

After you review the processing times for your email account groups, determine whether to make further adjustments in email account group processing. For example, you can create another email account group or create another email reader job to process your email account groups in parallel. You define additional email reader jobs using the Schedule (sys_trigger) table.

---

**Set up email account group processing**

To set up email account group processing, you must have the email_account_admin or admin role.

1. **Create email account groups**.
Define one or more email account groups that contain a subset of your POP3/IMAP email accounts. Your base system includes a default email account group. Any POP3/IMAP accounts not contained in an email account group are processed as part of the default email account group.

2. **Enable email account group processing.**

Navigate to sys_properties.list and locate the `glide.email.inbound.account_group_processing` system property. Set the **Value** to **true**. The email reader job starts processing the email account groups that you created.

3. **Monitor email account group processing.**

Check the status of your email account groups to see if processing time has been reduced. Determine whether the additional groups sufficiently reduce account processing time or consider adding another email reader job to further reduce processing time.

4. **Create an email reader job.**

As part of fine-tuning email account group processing, create an email reader job to process email account groups concurrently, in addition to the default email reader job.

### Create email account groups

Define an email account group that contains a subset of your POP3/IMAP email accounts. The email reader job automatically processes each email account group as scheduled.

**Role required:** admin or email_account_admin

1. **Navigate to** System Mailboxes > Administration > Email Account Groups and click **New**.
2. **Fill in the form.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the account group.</td>
</tr>
<tr>
<td>Email Accounts</td>
<td>A subset of POP3/IMAP email accounts. Select the email accounts that make up the group.</td>
</tr>
<tr>
<td>Note: When you add an email account to a group, it cannot be reused in other account groups.</td>
<td></td>
</tr>
<tr>
<td>Active</td>
<td>Check box that enables the email account group for processing. New account groups are active by default.</td>
</tr>
<tr>
<td>Default</td>
<td>Read only. Check box that indicates the account is the default email account.</td>
</tr>
<tr>
<td>Status</td>
<td>Read only. Processing state of the email account group: Unclaimed or Claimed.</td>
</tr>
<tr>
<td>Claimed by</td>
<td>Read only. ID of the email reader job currently in progress.</td>
</tr>
<tr>
<td>Last Processed</td>
<td>Read only. The last time that the email reader job processed this group.</td>
</tr>
<tr>
<td>Processing Duration</td>
<td>Read only. The length of time taken by an email reader job to process the account group.</td>
</tr>
</tbody>
</table>

3. **Click Create.**
The system updates the Email Account Group (sys_email_account_group) table with the new account group. Use the this table to monitor email account group processing.

- Review email account group processing.
- Determine if you want to continue fine-tuning email account processing. You could add another email account group or another email reader job to process email account groups concurrently.

Enable email account group processing
Enable the email reader job to start processing your email account groups so that you can reduce the time it takes to process inbound email accounts.

Create email account groups.
Role required: admin
1. In the Navigation filter, enter sys_properties.list. The entire list of properties in the System Properties (sys_properties) table appears.
2. On the list, find and open the glide.email.inbound.account_group_processing system property.
3. On the form, set the Value to true.
4. Click Update.

Check the status of your email account groups to see if processing time has been reduced. For more information, see Monitor email account groups.

To further reduce processing time, consider creating another email reader job to process inbound email accounts. For more information, see Create an email reader job.

Monitor email account groups
Use the Email Account Groups (sys_email_account) table to check the status of email account groups processed by email reader jobs.
1. Create email account groups.
2. Enable email account group processing.

Role required: email_account_admin or admin
1. Navigate to System Mailboxes > Administration > Email Account Groups.
2. Review the processing details for each account group:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the email account group.</td>
</tr>
<tr>
<td>Active</td>
<td>The operational state of the email account group. The value true indicates</td>
</tr>
<tr>
<td></td>
<td>that the account is enabled for email account processing.</td>
</tr>
<tr>
<td>Claimed by</td>
<td>The ID of the email reader job if the job is running on the account group.</td>
</tr>
<tr>
<td>Default</td>
<td>The default indicator. The value true indicates that the email account</td>
</tr>
<tr>
<td></td>
<td>group is the default.</td>
</tr>
<tr>
<td>Email Accounts</td>
<td>The names of the email accounts contained in the email account group.</td>
</tr>
<tr>
<td>Last Processed</td>
<td>The day and time that the email reader job last processed this account group.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Processing Duration</td>
<td>The length of time (in hours, minutes, seconds) to process the account group.</td>
</tr>
<tr>
<td>Status</td>
<td>Processing state of the email account group:</td>
</tr>
<tr>
<td></td>
<td>• Unclaimed: The account group is available for processing by the next email reader job.</td>
</tr>
<tr>
<td></td>
<td>• Claimed: An email reader job is processing the current account group.</td>
</tr>
</tbody>
</table>

**Email account group — unclaimed processing state**

**Email account group — claimed processing state**

If fine-tuning email accounts, consider doing one of the following:
• Create another email account group.
• Create another email reader job to process email account groups concurrently.

Create an email reader job
If you created email account groups to fine-tune inbound email account processing, you can create an email reader job to process those account groups concurrently, in addition to the default email reader job.

1. Create email account groups.
2. Enable email account group processing

Role required: email_account_admin or admin

1. In the Navigation filter, type sys_trigger.list.
2. In the sys_trigger table, select the Email Reader job record.
3. In the Email Reader job form:
   1. Enter a unique name for the email reader job to be added so that you can differentiate it from the default email reader job.
   2. If needed, change the time interval for this email reader job.
4. Click Update.
   Another email reader job is created. This job runs concurrently with the default email reader job to process email account groups.

Monitor email account group processing, and determine if the additional reader job reduces processing time. If needed, you can continue fine-tuning email account processing. For example, you might consider adding another email account group.

Email properties
The Email Properties page is where you can configure settings for inbound and outbound email.

Email properties are available from either of these modules:

• System Mailboxes > Email Properties
• System Properties > Email Properties
### Email Properties

Email accounts can be created or modified in the **Email Accounts** table. Email account connection status and diagnostics information can be found on the **Email Diagnostics** page.

#### Outbound Email Configuration

<table>
<thead>

<td>service-now.com</td>
</tr>
</tbody>
</table>
Email accounts are configured in the System Mailboxes > Administration > Email Accounts module. For more information and instructions, see Configure an email account.

Email diagnostics are available from the System Mailboxes > Email Diagnostics module.

Outbound mail configuration
The Outbound Mail Configuration section of the Email Properties page contains properties for sending email.
Outbound Email Configuration

Email sending enabled

☑ Yes | No

Send all email to this test email address (non-production testing)

Append timezone to dates and times in sent email

☑ Yes | No

Create visible watermark in sent email. If false, create invisible watermark via hidden div tag.

☑ Yes | No

Resend email if server returns these SMTP error codes

421,450,451,452

Do not resend email if server returns these SMTP error codes

500,501,502,503,504,550,551,552,553,554

Resend email when server returns unknown SMTP error codes.

☑ Yes | No

Roles that can view email in the Activity formatter when including "Sent/Received Emails"

itil

Number of journal entries (Additional comments, Work notes, etc.) included in email notifications (-1 means all).

### Inbound email properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.read.active</td>
<td>Email receiving enabled</td>
<td>Specifies whether to enable or disable the inbound mail server.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Type: true</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Default value: true</td>
</tr>
<tr>
<td>glide.email.reply_subject_prefix</td>
<td>Identify email as a reply by these subject prefixes</td>
<td>Specifies the comma-separated list of prefixes in the subject line that identify an email reply.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Type: string</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Default value: re:,aw:,r:,Accepted:,Tentative:,Declined:</td>
</tr>
</tbody>
</table>

**Note:** The case of the reply prefix in the email, for example RE:, must exactly match the case of the prefixes defined in this property. If, for example, an email contains the Re: prefix and only RE: is defined in the property, the email will not be recognized as a reply. Therefore, it is a best practice to define multiple versions of the prefix, including mixed-case versions, such as RE:, Re:, and so on.
<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>glide.email.forward_subject_prefix</td>
<td>Identify email as a forward by these subject prefixes</td>
<td>Specifies the comma-separated list of prefixes in the subject line that identify a forwarded email.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Type: string</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Default value: fw:, fwd:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> The case of the forward prefix in the email, for example fw:, must exactly match the case of the prefixes defined in this property.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If, for example, an email contains the Fwd: prefix and only fwd: is defined in the property, the email will not be recognized as a forward. Therefore, it is a best practice to define multiple versions of the prefix, including mixed-case versions, such as FWD:, Fwd:, and so on.</td>
</tr>
<tr>
<td>glide.pop3.reply_separators</td>
<td>Discard everything below this text if found in a reply body (comma separated, case sensitive)</td>
<td>Specifies the comma-separated list of separators that cause the instance to disregard everything below the text string in the message body. This list is case sensitive.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Type: string</td>
</tr>
</tbody>
</table>
|                                  |                                                                       | - Default value: 

-----

From:                                                                 |

**Note:** Some email service providers don’t support this default format. If your reply emails aren’t formatting as expected, edit this property manually. |
<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.pop3readerjob.create_caller</td>
<td>Automatically create users for incoming emails from trusted domains</td>
<td>Controls the behavior when an instance receives an email from an email address not associated with a user record. If this property is set to true, the instance creates a new user record for the email address and places that new user in the Caller field of any tickets created. If the property is set to false, the instance places Guest in the Caller field of any tickets created.</td>
</tr>
</tbody>
</table>
|                                      |                                                                       | - Type: true | false  
|                                      |                                                                       | - Default value: false

| glide.user.default_password          | Default password for users created from email sent from trusted domains, (must reset upon login) | Specifies the password for new users created from incoming email. Users must reset the password at first login.                                                                                               |
|                                      |                                                                       | - Type: string  
|                                      |                                                                       | - Default value: password  
|                                      |                                                                       | - Learn More: Enabling Automatic User Creation                                                                                                       |
| glide.user.trusted_domain            | Trusted domains when creating users from incoming email.              | Comma-separated list of trusted domains for which the instance automatically creates a user based on incoming emails. Use an asterisk (*) to trust all domains. If an email is not from a trusted domain, the instance processes the inbound email as a ‘guest user’ but it does not create a guest user in the instance. |
|                                      |                                                                       | - Type: string  
|                                      |                                                                       | - Default value: asterisk (*)  
|                                      |                                                                       | - Learn More: Enabling Automatic User Creation                                                                                                       |

**Email image filtering properties**

Use email image filtering properties to control how inbound email images attach to a target record.

When a user sends an email to the system, email images (such as logos or email signatures) attach to the target record by default. These images are also visible in the activity stream of the target record. The system then replicates these images, which can cause duplicate image attachments to the target record and also duplicate images in the activity stream.

To filter images from emails and reduce duplicate image attachments to target records, configure the following properties in the System Properties (sys_properties) table. Use these properties to:
• Specify the email image sizes eligible for filtering.
• Choose an action that controls image attachment behavior and image visibility in the activity stream.

**Note:** These properties do not delete attachments. You can verify attachment records in the Attachments (sys_attachment) table.

### Email image filtering properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.email.inbound.image_sys_attachment.filter.minimum_bytes | Sets the minimum image size in bytes of inbound email images that can be filtered. Any image that is below this size limit does not attach to the target record.  
- **Type:** Integer  
- **Default value:** 0 (no filtering) |
| glide.email.inbound.image_sys_attachment.filter.action | Specifies the image filtering behavior.  
- **Type:** Choice list  
  - AttachTarget - Associate the image to the target record. The image is visible in the activity formatter and in the attachment to the target record.  
  - AttachEmail - Attach the image to the email record. The image is not visible in the activity formatter of the target record nor in the attachment to the target record.  
  - AttachNone - Do not attach the image to a record. You can select this option to attach the image manually at a later time.  
- **Default value:** AttachEmail |

### Email digest properties

Several properties are available to manage digest intervals for email digests.

The following properties are available for the email digest feature.

**Note:** To open the System Properties (sys_properties) table, enter `sys_properties.list` in the navigation filter.
Properties for email digest intervals

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.digest.default_interval</td>
<td>The sys_id of the default email digest interval available to users.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: string</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value</strong>: 28d157e07f1332007f005212bdfa9116</td>
</tr>
<tr>
<td></td>
<td>• <strong>Location</strong>: System Property (sys_properties) table</td>
</tr>
<tr>
<td>glide.email.digest.max_intervals</td>
<td>The maximum number of email digest intervals that can be defined.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value</strong>: 100</td>
</tr>
<tr>
<td></td>
<td>• <strong>Location</strong>: System Property (sys_properties) table</td>
</tr>
<tr>
<td></td>
<td>• <strong>Learn more</strong>: For details on digest intervals, see</td>
</tr>
<tr>
<td></td>
<td><a href="#">Create or modify email digest intervals</a>.</td>
</tr>
</tbody>
</table>

Additional email properties
There are several advanced email properties that you can use to fine tune the way your instance sends or receives email.

You must add these properties to the System Property (sys_properties) table before they can be used to overwrite the defaults.

**com.glide.email.max_body_bytes**
Sets the maximum body size in bytes allowed per inbound email.

- **Type**: integer
- **Default value**: 1048576

**com.glide.email.max_read**
Specifies the maximum number of emails a POP3 reader should process concurrently.

- **Type**: integer
- **Default value**: 20

**com.snc.on_call_rotation.reminders.showtz**
Specifies whether to show a user's timezone.

- **Type**: true | false
- **Default value**: false

**glide.email.allow_duplicate_message_ids**
Allows storing of emails with duplicate message IDs and adds error message "Duplicate message-id encountered, prevented loop."

- **Type**: true | false
- **Default value**: false
**glide.email.email_with_no_target_visible_to_all**

Email that is missing a target record or whose target record is the email will allow any user to view the email regardless of their roles. By turning this property to false, the user is restricted unless they sent in the record or have an admin role.

- **Type:** true | false
- **Value:** false

**glide.email.inbound.calendar_behavior**

Specifies how the system stores calendar data, such as an invitation or an invitation response. Enter one of these options (not case sensitive):

- **Attach:** Store the calendar data as an attachment on the associated record, such as the incident or change that triggers an invitation.
- **Ignore:** Discard the calendar data.
- **Inline:** Store the calendar data as text in the email Body field.
- **Type:** string
- **Default value:** Attach

**glide.email.inbound.convert_html_inline_attachment_references**

Specifies whether to convert inbound email HTML so email images appear in the email HTML body preview. The system displays broken cid (content ID) links in place of images received when this property is disabled. The format in which the system displays an email image depends on the property setting at the time the email is received, not the current property setting.

- **Type:** true | false
- **Default value:** true

**glide.email.inbound.generate.missing.html.part**

Enables the system to generate HTML text for inbound emails that contain only a plain text message.

- **Type:** true | false
- **Default value:** true

**glide.email.inbound.generate.missing.text.part**

- **Type:** true | false
- **Default value:** true

**glide.email.inbound.max_attachment_count**

Sets the maximum number of attachments allowed per inbound email. This property is available starting with the Eureka Patch 4 release.

- **Type:** integer
- **Default value:** 30
- **Location:** System Property (sys_properties) table

**glide.email.inbound.max_total_attachment_size_bytes**

Sets the maximum total attachment size in bytes allowed per inbound email. This property is available starting with the Eureka Patch 4 release.

- **Type:** integer
- Default value: 18874368
- Location: System Property (sys_properties) table

`glide.email.mail_to`
Specifies the email address for sending notifications that use the ${mailto:} variable.
- Type: string
- Default value: SMTP email address that is active by default

`glide.email.name_split`
Specifies the delimiter used between first and last names in an email address. For example, a delimiter of "," (period) in the email address john.smith@company.com tells the system to look for a user record for John Smith.
- Type: string
- Default value: period (.)

`glide.email.notification.save_when_no_recipients`
Controls whether a notification-generated `sys_mail` record is saved even if there are no recipients. Used in conjunction with other notification recipient logging properties, this property enables troubleshooting problems with notifications.
- Type: true | false
- Default value: true

`glide.email.outbound.header.auto_submitted`
Stores the value used in the "Auto-submitted" outbound email header. Clear the property value to remove the "Auto-submitted" header from all outbound emails. Some spam filters flag auto-generated email as spam.
- Type: string
- Default value: auto-generated

`glide.email.outbound.max_attachment_count`
Sets the maximum number of attachments allowed per outbound email. This property is available starting with the Eureka Patch 4 release.
- Type: integer
- Default value: 30
- Location: System Property (sys_properties) table

`glide.email.outbound.max_body_bytes`
Sets the maximum body size in bytes allowed per outbound email.
- Type: integer
- Default value: 1048576

`glide.email.outbound.max_total_attachment_size_bytes`
Sets the maximum total attachment size in bytes allowed per outbound email. This property is available starting with the Eureka Patch 4 release.
- Type: integer
• Default value: 18874368
• Location: System Property (sys_properties) table

glide.email.override.url
Sets the URL to use in emailed links in place of the instance URL. The URL should end with nav_to.do. An example value is: https://servicenow.customerdomain.com/production/nav_to.do. This property is suitable for customers who use custom redirect URLs for their instances.

- Type: string
- Default value: instance URL

glide.cms.use_email_override_url
Forces the system to use the glide.email.override.url property, rather than the glide.servlet.uri property, when a notification has a link to a CMS page in an instance.

- Type: true | false
- Default value: false
- Location: System Property (sys_properties) table

glide.email.append.timezone
Appends the user time zone to all date and time values in outbound email messages (for example, 2018-07-02 04:01:14 PST). The time zone does not show if the system property glide.sys.time_format does not have a 'z' value. For more information on configuring the time zone in email notifications, see Time zone for email notifications.

- Type: true | false
- Default: false

glide.email.removeIllegalAddressQuotes
Removes invalid quotation marks from an inbound email address, thus allowing the inbound email address to be accepted as valid. For example, when you set the property to true, the address "john.doe@example.com" is changed to john.doe@example.com. However, addresses that are formatted as John Doe <©john.doe@example.com©> are removed entirely.

- Type: true | false
- Default: false

glide.email.smtp.maxRecipients
Specifies the maximum number of recipients the instance can list in the To: line for a single email notification. Notifications that would exceed this limit instead create duplicate email notifications addressed to a subset of the recipient list. Each email notification has the same maximum number of recipients.

- Type: integer
- Default value: 100

glide.email.smtp.maxSend
Specifies how many emails to send through each new SMTP connection. The instance establishes a new SMTP connection if there are more emails to send than the specified value.

- Type: integer
- Default value: 100
**glide.email.text_plain.strip_xhtml**
Indicates whether both outbound and inbound emails that are shown in comments convert the XML to plain text (true) or preserve the XML (false).
- Type: true | false
- Default value: true

**glide.imap.secure**
Specifies whether to enable SSL encryption for connections to the IMAP server.
- Type: true | false
- Default value: false

**glide.imap.secure.port**
Specifies the communications port for IMAP secure connections.
- Type: string
- Default value: 995

**glide.imap.tls**
Specifies whether to start the IMAP server in Transport Layer Security (TLS) mode.
- Type: true | false
- Default value: false

**glide.notification.recipient.excludeLogging**
Master switch to enable or disable logging all reasons a recipient was excluded. If set to true, the subsequent properties dealing with the exclusion of logging are enabled. If it is set to false, none of the subsequent properties relating to the exclusion of logging are enabled. This property cannot suppress log messages generated by the glide.email.test.user property.
- Type: true | false
- Default value: true

**glide.notification.recipient.excludeLogging.device_inactive**
Logs recipients who are excluded because their chosen notification device record is marked as inactive.
- Type: true | false
- Default value: true

**glide.notification.recipient.excludeLogging.device_schedule**
Logs recipients who are excluded based on the Schedule field on the New Device for System Administrator form for their chosen notification device.
- Type: true | false
- Default value: true

**glide.notification.recipient.excludeLogging.event_creator**
Logs recipients who are excluded because they initiated the notification event, such as updating an incident record, and the Send to Event Creator check box is cleared on the notification record.
• Type: true  |  false
• Default value: true

**glide.notification.recipient.exclude_logging.invalid_email**
Logs recipients who are excluded because the email address for that user is invalid, for example the @ is missing, or empty.

• Type: true  |  false
• Default value: true

**glide.notification.recipient.exclude_logging.user_calendar_integration_disabled**
Logs recipients of calendar invitations who are excluded because the Calendar Integration field is set to **None** on the user record.

• Type: true  |  false
• Default value: true

**glide.notification.recipient.exclude_logging.user_inactive**
Logs recipients who are excluded because the the Active check box is cleared on the user record.

• Type: true  |  false
• Default value: true

**glide.notification.recipient.exclude_logging.user_notification_disabled**
Logs recipients who are excluded because the Notification field is set to **Disabled** on the user record.

• Type: true  |  false
• Default value: true

**glide.notification.recipient.include_logging**
Master switch to enable or disable logging all reasons a recipient was included. If set to true, the subsequent properties dealing with the inclusion of logging are enabled. If it is set to false, none of the subsequent properties relating to the inclusion of logging are enabled.

• Type: true  |  false
• Default value: true

**glide.notification.recipient.include_logging.delegate**
Logs recipients who are included because they are delegates of another user.

• Type: true  |  false
• Default value: true

**glide.notification.recipient.include_logging.event_parm**
Logs recipients who are included because they are in the parm1 or parm2 fields of the event record.

• Type: true  |  false
• Default value: true
**glide.notification.recipient.include_logging.recipient_fields**

Logs recipients who are included via a notification target record, such as an incident record, specified in the **Users/Groups in Field** field for the notification record. The recipient_fields are fields in the target record that contain a recipient to add. For example, if the record that triggered the notification is an incident, and the **assigned_to** field for the incident is listed in recipient_fields, that user is included as a recipient.

- **Type:** true | false
- **Default value:** true

**glide.notification.recipient.include_logging.recipient_groups.group_email**

Logs recipients who are included in a group email for any group provided in the notification record’s recipient_groups or the event **parm1** or **parm2** field.

- **Type:** true | false
- **Default value:** true

**glide.notification.recipient.include_logging.recipient_groups.manager**

Logs recipients who are included because they manage any group provided in the notification record’s recipient_groups or the event **parm1** or **parm2** field.

- **Type:** true | false
- **Default value:** true

**glide.notification.recipient.include_logging.recipient_groups.membership**

Logs recipients who are included via membership in any group provided in the notification record recipient_groups or the event **parm1** or **parm2** field.

- **Type:** true | false
- **Default value:** true

**glide.notification.recipient.include_logging.recipient_users**

Logs recipients who are included via notification record’s **Users** field (recipient_users).

- **Type:** true | false
- **Default value:** true

**glide.notification.recipient.include_logging.subscription**

Logs recipients because they are subscribed via User Notification Preferences.

- **Type:** true | false
- **Default value:** true

**glide.pop3.parse_start**

Specifies the text that indicates the beginning of the email body section. The instance parses name:value pairs within this section to set or update field values when processing inbound email actions.

- **Type:** string
- **Default value:** none

**glide.pop3.parse_end**
Text indicating the end of the email body section where the instance should parse name:value pairs to update field values when processing inbound email actions.

- **glide.smtp.dateformat**
  Specify the date format to use for outgoing email notifications.
  - Type: string
  - Default value: date format listed in email sender's user record `sys_user.date_format`

- **glide.smtp.precedence_bulk**
  Specifies whether outbound email includes the header "Precedence: bulk". Some spam filters flag bulk email as spam. Set the value to **false** to remove this header from outbound email.
  - Type: true | false
  - Default value: true

- **glide.smtp.send_partial**
  Splits outgoing email between valid and invalid recipients. The email is sent only to the valid recipients. A new email containing the invalid recipients is created in the **send-ready** state and attempts to send again.
  - Type: true | false
  - Default value: false

- **glide.smtp.timeformat**
  Specify the time format to use for outgoing email notifications.
  - Type: string
  - Default value: time format listed in email sender's user record `sys_user.time_format`

- **glide.ui.activity.email.use_display**
  Specifies whether to display email addresses or user IDs (display value from the User table) in email headers. If true, the instance searches for a user record with a matching email address. If it cannot find a matching user record, it displays the email address.
  - Type: true | false
  - Default value: false

- **glide.ui.email_client.email_address.disambiguator**
  Sets the columns from the User `sys_user` table that the autocomplete list displays. Separate each column name with a semicolon character (;).
  - Type: string
  - Default value: name
  - Learn more: Displaying Additional Information in the Email Client Autocomplete

- **glide.ui.incident_activity.max_addresses**
Specifies the maximum number of addresses to list in an email audit record. If the number of addresses exceeds this limit, the instance truncates the list after the maximum value and displays an ellipsis character (...).

- Type: string
- Default value: 5

**NotifyAffectedCI.max_rel_level**

Sets a value used by the Affected ci notifications business rule, which notifies subscribers when configuration items (CIs) are affected by tasks. The business rule generates notifications for parent CIs up to the level defined by this property. You might need to adjust the property value according to the complexity and depth of your CI relationships.

- Type: integer
- Default value: 5

**Email size limits**

To prevent issues with large email messages, the system enforces configured limits on the maximum allowed email body size, total attachment file size, and number of attachments per email.

An email or attachment that exceeds the system capacity may not be processed as expected. To ensure that your emails and attachments are processed as expected, you can configure properties that limit the size of emails and attachments.

**Message body size limit properties**

Several properties enforce the maximum email body size allowed for inbound and outbound email messages.

**Properties**

By default, the system processes up to 1MB worth of information in the email body and body_text fields (524KB each).

You can add and configure system properties com.glide.email.max_body_bytes and glide.email.outbound.max_body_bytes to increase or decrease the email body size limits, but note that the system truncates the body text for emails that exceed the configured limit. For example, if you configure the body size limit of com.glide.email.max_body_bytes to 2MB but receive an inbound email that is 3MB, then the system cuts 1MB worth of information from the email body.

Also note that the system cannot process emails larger than 16MB. Even if you configure the email body size limits to a value larger than 16MB, emails larger than 16MB are truncated.

**Message body size limit properties**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.glide.email.max_body_bytes</td>
<td>Sets the maximum body size in bytes allowed per inbound email. Ensure that the sum of this property and the glide.email.inbound.max_total_attachment_size_bytes property is well below the maximum total email size (16MB).</td>
</tr>
<tr>
<td></td>
<td>- Type: integer</td>
</tr>
<tr>
<td></td>
<td>- Default value: 1048576</td>
</tr>
</tbody>
</table>
## Glide Email Outbound Max Body Bytes

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.outbound.max_body_bytes</td>
<td>Sets the maximum body size in bytes allowed per outbound email. Ensure that the sum of this property and the glide.email.outbound.max_total_attachment_size_bytes property is well below the maximum total email size (16MB).</td>
</tr>
<tr>
<td></td>
<td>- Type: integer</td>
</tr>
<tr>
<td></td>
<td>- Default value: 1048576</td>
</tr>
</tbody>
</table>

### Note:
A different property, **com.glide.attachment.max_size**, sets the maximum file size allowed for any attachment in the system and overrides any larger values of glide.email.inbound.max_total_attachment_size_bytes and glide.email.outbound.max_total_attachment_size_bytes.

---

### Inbound Email Body Processing

For inbound emails, the system enforces the maximum body size as set by the **com.glide.email.max_body_bytes** property. When the body size exceeds the configured value:

- The system does not run inbound email actions that would otherwise be triggered by the email.
- The system truncates the Body text on the Email form.
- The system logs a warning and sets the Error string field on the Email form. The log message for such an email might look like this: Email set to receive-ignored because its size exceeds the value set in **com.glide.email.max_body_bytes**. 1995 character(s) were truncated from the body field.

### Outbound Email Body Processing

For outbound emails, the system enforces the maximum body size as set by the **glide.email.outbound.max_body_bytes** property. When the body size exceeds the configured value:

- The system does not send the email.
- The system truncates the Body text on the Email form.
- The system logs a warning and sets the Error string field on the Email form. The log message for such an email might look like this: Email set to send-ignored because its size exceeds the value set in **glide.email.outbound.max_body_bytes**. 1337 character(s) were truncated from the body field.

### Attachment Limit Properties

Several properties control email attachment limits.

To see the status of all email attachments, go to the Email Attachments (sys_email_attachment) table.

### Properties

All the properties are located in the System Property (sys_properties) table. Setting any of the following properties to an excessively large value may cause performance issues.
### Attachment limit properties

</tr>
</tbody>
</table>

**Note:** A different property, `com.glide.attachment.max_size`, sets the maximum file size allowed for any attachment in the system and overrides any larger values of `glide.email.inbound.max_total_attachment_size_bytes` and `glide.email.outbound.max_total_attachment_size_bytes`.

### Inbound email attachment processing

For inbound emails, the system enforces the maximum number and size of attachments as set by the `glide.email.inbound.max_attachment_count` and `glide.email.inbound.max_total_attachment_size_bytes` properties. When an attachment for an inbound email exceeds either value, the attachment is discarded. A record is created in the Email Attachments (sys_email_attachment) table containing the discarded file name and the reason it was discarded. The discarded file remains in the Email (sys_email) record. The order in which the system processes the attachments determines which attachments are discarded. This order may not be consistent from email to email.
When an inbound email attachment is discarded, the system also fires the `inbound.email_attachments.discarded` event. You can use the event to trigger a notification that alerts the email sender. For an example of a notification that can be triggered by the event, see the inactive "Demo Email Attachment(s) Discarded" notification.

Inbound email attachments are prevented from attaching to the target record if an identical attachment exists.

**Outbound email attachment processing**

For outbound emails, the system enforces the maximum number and size of attachments as set by the `glide.email.outbound.max_attachment_count` and `glide.email.outbound.max_total_attachment_size_bytes` properties. Email records are created from various sources and may exceed the configured attachment limits.

Emails that are ready to be sent from the Email (sys_email) table are subject to the outbound attachment limits. Emails that exceed either limit trigger a warning in the email system log and are sent with attachments up to the maximum number or total file size.

The log message for such an email might look like this: Maximum combined attachment size exceeded. (max:15728640 bytes). One or more attachment records ignored.

**Emails for notifications, scheduled reports, and exported tables**

Notifications can be set to include all the attachments from the record that triggers the notification. If the attachments exceed either of the outbound email attachment limits, the system excludes the excess attachments from the email and logs a warning message.

Reports can be scheduled for email distribution as attachments. Large reports may exceed the outbound attachment size limit. In this case, the system sends the scheduled report email without the report attached and logs a warning message. To avoid the issue, send links to large reports instead of sending the reports as attachments.

If a user attempts to export numerous records from a list that exceeds a configured warning threshold, a dialog box offers the option to email the exported records as an attachment. If the attachment exceeds the outbound attachment size limit, the system sends the email without the exported record list attached and logs a warning message.

**Domain separation and Notifications**

This is an overview of domain separation and the Notifications application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Overview**

**Support: Level 2**

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation Application support for domain separation.
Domain separation is specifically supported in Notifications but not in email accounts. Notifications are not data-separated but they are process-separated. Notifications are also triggered by specific actions.

How domain separation works in Notifications

There are two basic components of domain separation and Notifications.

- Notifications are process-separated (not data-separated).
- Notifications are triggered in two main ways:
  1. When a record is Inserted or Updated
     a. Notifications with matching conditions AND in the same domain as the inserted/updated record are processed.
  2. When an event defined in the notification is triggered
     a. Events typically have a target record. For example, (incident.inserted) event references the incident record being inserted.
     b. When an event is fired, notifications configured for that event in the same domain as the event’s target record are processed.

Domains and email accounts

Domain separation is not supported in email accounts for these reasons:

1. Sending mail: There is only one SMTP sender per account. This prohibits providing domains for each account, and they are not configurable.
2. For receiving Inbound mail: You can set up multiple email accounts but cannot meaningfully set the domain of an inbound email action. Inbound Actions are processed in the domain of the user who sent the email. For example: User_A in Domain A sends an email to a ServiceNow email account which executes the “Create an incident” inbound email action. The resulting new incident created by the inbound action is in Domain A.

To learn more see Inbound email actions.

Note: If the number of email accounts exceeds 20, reception of email slows down.

Use case

- If an instance is using the Domain separation plugin and a new email notification is defined for a domain that has the same event as the notification on the global domain, the user receives two emails for the same event.

Solution: Set the [sys_overrides] field on the notification that belongs to the domain so it overrides the setting on global. For more information, see Delegated administration.

Next steps after enabling email

After enabling email on your instance, consider performing several of these important tasks.
- Test the email configuration by routing all email to a single user (set the `glide.email.test.user` property).
- Review the baseline notification categories, email notifications, and templates to determine if they meet your business needs.
- Review the baseline inbound email actions to determine if they meet your business needs.
- Determine if you want to use email layouts to add consistent content elements.
- Determine if you want to use email filters to restrict the email the instance receives.
- Determine if you want to implement a retention policy to archive and destroy email at certain intervals.
- Determine what kind of watermarks outbound email uses to associate records with email messages.
- Determine if you want to create users when the instance receives an email from an unrecognized user.
- Set the precedence of outgoing mail. By default, the instance sends email with a precedence of bulk (set the `glide.smtp.precedence_bulk` property).
- Consider preventing untrusted users from triggering inbound actions to prevent unwanted email from affecting your instance.
- Implement a spam filter to restrict unwanted messages sent to your custom email addresses.

### Create notification categories

You can create notification categories to identify and group related notifications that are listed in the notification settings for your users.

Role required: admin

Before adding new categories, review the base system notification categories in the Notification Categories (sys_notification_category) table to determine if you need a new category.

1. Navigate to **System Notification** > **Email** > **Notification Categories**.
2. Click **New**.
3. Enter the **Name** of the category to identify the family of notifications. Provide a category name that is meaningful to your users, so that they can easily find their notifications under the appropriate category in their notification settings.
4. Enter a **Short description** to identify the category.
5. Click **Submit**.

The system adds the new category to the Notification Categories (sys_notification_category) table. After you create at least one, active notification that uses the new category, the category and notification are listed in the notification settings for users (**Notifications** tab in the System Settings window).

### Create an email notification

Creating an email notification involves specifying when to send it, who receives it, what it contains, and if it can be delivered in an email digest.

Role required: admin

Consider the following items when you create or update a notification:

- Your notification recipients must be active users and have a valid email address defined.
  
  ServiceNow users or members of groups must be defined as active users in the User (sys_user) table. They must also have a valid email address defined for their primary channel (device) in the Notification Device (cmn_notif_device) table. If users do not have an active profile and a valid email address, they will not receive notifications.
  
- Your notification recipients must have the appropriate notification preferences enabled.
If the notification is subscribable, each ServiceNow user or group member must have the notification and channels (devices) for the notification enabled in their notification preferences. Admins can impersonate users to review and configure their notification preferences.

- To have your email notification also send as an SMS notification, recipients must subscribe to the notification on an SMS channel. For more information on creating an SMS channel, see Create notification channels.
- After you create or update the notification, use the Preview Notification option to examine it. For example, you can test links that you may have added and verify the notification recipients. For details, see Preview email notifications.

Use the following tabs in the Notification form to configure an email notification:

- **When to send** — Conditions required to send the notification.
- **Who will receive** — Recipients of the notification.
- **What it will contain** — Contents of the notification.
- **What Digest will contain** — Contents of the email digest if the notification can be delivered in a digest.

**Note:** If you do not see all the fields on the form, switch to the Advanced view.

Watch this six-minute video to learn about the actions that the instance can take in response to messages from users and shows how to create or modify email notifications to users. In the video, skip to 3:29 for details on configuring email notifications.

1. Navigate to **System Notification > Email > Notifications**.
2. Click **New**.
3. Fill in the fields at the top of the Notification form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the email notification. Descriptive names help identify the purpose of the email notification. For example, Incident Opened &amp; Unassigned.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Table</td>
<td>Select the database table to link the notification to, for example Incident</td>
</tr>
<tr>
<td></td>
<td>(incident).</td>
</tr>
<tr>
<td></td>
<td><strong>Attention:</strong> Do not select the Task (task) table. This table is for extending</td>
</tr>
<tr>
<td></td>
<td>other tables. Notifications that run on the Task table directly are not</td>
</tr>
<tr>
<td></td>
<td>supported.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Only tables and database views that are in the same application</td>
</tr>
<tr>
<td></td>
<td>scope appear in the list.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of notification you are creating: EMAIL or Meeting Invitation.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to enable the email notification.</td>
</tr>
<tr>
<td>Category</td>
<td>Select the category to which this notification belongs. A category identifies</td>
</tr>
<tr>
<td></td>
<td>and groups related notifications. This notification, if active and subscribable,</td>
</tr>
<tr>
<td></td>
<td>is listed in the selected <strong>Category</strong> in the notification preferences for</td>
</tr>
<tr>
<td></td>
<td>each user (Notifications tab in the System Settings window).</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Do not leave the category as <strong>Uncategorized</strong>, as users may not be</td>
</tr>
<tr>
<td></td>
<td>able to find the notification in their list of notifications.</td>
</tr>
<tr>
<td>Allow Digest</td>
<td>Select the check box if an email digest is to be created for the notification.</td>
</tr>
<tr>
<td>Description</td>
<td>Type a description for this notification.</td>
</tr>
</tbody>
</table>

4. Fill in the fields on the **When to send** tab.
Note: If the same trigger generates multiple notifications, the system only sends one notification. The system considers all other notifications, even if they have a different subject and body, as duplicates. The Ignore Duplicates business rule controls this functionality.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send when</td>
<td>Select under what condition the notification is sent:</td>
</tr>
<tr>
<td></td>

</tr>
<tr>
<td></td>
<td>• When a particular event is fired</td>
</tr>
<tr>
<td></td>
<td>• When triggered as an action step in Flow Designer</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Weight</td>
<td>(Required) Set a numerical value for the notification priority relative to duplicate notifications. Notifications that have the same target table and recipients, or the same subject and body, are considered duplicates. When there are duplicate notifications, the system only sends the notification with the highest weight. All other notifications are moved from the Outbox to the Skipped mailbox. The default value 0 causes the system to always send the notification (assuming the conditions are met). For example, suppose that a service desk agent adds a comment to an incident and shortly thereafter closes it. By default, these actions trigger both the Incident commented and Incident Closed notifications. However, both notifications are from the Incident table and also notify the incident caller. The system only sends the notification with the highest weight, which in this case is the Incident Closed notification. Note: The SMTP Sender scheduled job determines how often to send email. By default, this job runs every minute.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Use the condition builder to select the conditions under which this notification is sent. For example, select Priority &gt; greater than &gt; 3 - Moderate to send the notification only for High and Critical priority incidents.</td>
</tr>
<tr>
<td>Inserted</td>
<td>Select the check box to enable email notification when a record is inserted. This field appears when you set the Send when field to Record inserted or updated.</td>
</tr>
<tr>
<td>Updated</td>
<td>Select the check box to enable email notification when a record is updated. This field appears when you set the Send when field to Record inserted or updated.</td>
</tr>
<tr>
<td>Event name</td>
<td>Select the event that triggers this notification. This field appears when you set the Send when field to Event is fired.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Advanced condition  | Create a script to perform certain actions, like sending a notification based on the current email record, changing field values, or changing system properties. The advanced condition script must return true or set a global answer variable to true to send the notification. The advanced condition script uses the following global variables:  
  - current: Contains the current record from the table to which the notification is linked.  
  - event: Contains the event that triggered the notification.  

**Note:** The Advanced condition field is evaluated in addition to other conditions you set on the notification. Both the condition and advanced condition must evaluate to true to send the notification. |

5. Fill in the fields on the **Who will receive** tab.  
The following example shows the default view of the tab. The advanced view contains additional fields (see table).  

**Tip:** Consider limiting the recipient list of any notification to 1000 users. By default, if a notification has more than 100 intended recipients, the system creates multiple notification messages with up to 100 recipients each. If you want to change the recipient limit, set the system property `glide.email.smtp.max_recipients`.  

<table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users</td>
<td>Select the users you want to receive the email notification. You can search for users with the reference lookup icon or manually add their email addresses. This list of users is static.</td>
</tr>
<tr>
<td>Users/groups in fields</td>
<td>Select users or groups from reference fields. For example, if a notification uses the Incident (incident) table, you can select users or groups from incident fields like <strong>Opened by</strong> and <strong>Assignment group</strong>. This list of users or groups is variable and depends upon the values of the associated task record.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can dot-walk to values in reference fields by clicking the plus sign in the field selector and then selecting the related field.</td>
</tr>
<tr>
<td></td>
<td>If you address the notification to a user with an inactive record in the User (sys_user) table, the system does not send the notification to that user.</td>
</tr>
<tr>
<td>Groups</td>
<td>Select the groups you want to receive the email notification. You can search for groups with the reference lookup icon or by manually entering the group name. This list of groups is static.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Group members receive individual notifications only if <strong>Include members</strong> is selected in the group record.</td>
</tr>
<tr>
<td>Exclude delegates</td>
<td>Select this option to prevent the instance from sending email notifications to delegates of the users and members of the groups you selected.</td>
</tr>
<tr>
<td>Send to event creator</td>
<td>Select this check box to send the notification to the person who performed the action that started the notification process if the person is also a recipient. If the event creator is not specified in one of the recipient fields, the event creator does not receive a notification regardless of the setting in this field. For new notifications, this option is selected by default.</td>
</tr>
<tr>
<td></td>
<td>If you want to know why you may not be receiving certain email notifications, see the blog post <strong>Troubleshooting email notifications - Send to the Event Creator</strong> by a ServiceNow Technical Support Engineer in the ServiceNow Now Community.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Event parm 1 contains recipient</td>
<td>Select this check box if the event parameter 1 contains one or more notification recipients (in a comma separated-list). This field is visible only when the Send when field is set to Event is fired.</td>
</tr>
<tr>
<td>Event parm 2 contains recipient</td>
<td>Select this check box if the event parameter 2 contains one or more notification recipients (in a comma-separated list). This field is visible only when the Send when field is set to Event is fired.</td>
</tr>
<tr>
<td>Subscribable</td>
<td>Select this check box to allow all users to subscribe to this notification. See Subscription-based notifications for more information.</td>
</tr>
</tbody>
</table>

Note: If the record contains sensitive or protected data, consider restricting the recipient list only to those users and groups who normally have access to it, and do not enable the Subscribable option. You can also configure your notification content so that private or sensitive data is not exposed. For example, you could insert a link back to the associated record, so that details are not revealed in the notification.

The system does not exclude recipients based on access controls. Recipients can receive email about records that they cannot normally access from the user interface. For example, requesters can receive email about incidents and catalog requests opened on their behalf even though they normally do not have access to these records. If a notification includes record details, verify that all recipients need these details.

Note: By default, the system does not send email notifications to itself. For example, an email notification from instanceABC@service-now.com does not send to instanceABC@service-now.com. The system prevents this behavior to avoid looping.

6. Fill in the fields on the What it will contain tab.

The following example shows the default view of the tab. The advanced view contains additional fields (see table).
Field | Description
--- | ---
Email template | If you want to reuse existing content, select an email template to add content to the email notification. You can only select an email template that meets one of the following conditions:
- shares the same scope and table as the notification
- shares the same scope but has no specified table
- shares the same table and is in the global scope
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subject</td>
<td>Enter the subject line for the email message. The subject can include variables from the <code>Select variables</code> column. If empty, the system uses the <code>Subject</code> value from the <code>Email template</code>. If you enter a value in this field, it overrides the template value. If your recipients subscribe to the email notification on an SMS channel, then the system sends the email notification subject as an SMS message. To send a different SMS message, fill in the <code>SMS alternate</code> field on the email template form or the email notification form.</td>
</tr>
<tr>
<td>Message HTML</td>
<td>Enter the content of the email notification message. The message can include variables from the <code>Select variables</code> column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. The <code>Message HTML</code> field is visible only if you set the content type to <code>HTML and plain text</code> or <code>HTML only</code>. If empty, the system uses the <code>Message HTML</code> value from the <code>Email template</code>. If you enter a value in this field, it overrides the template value. To prevent adding extra <code>&lt;p&gt;</code> and <code>&lt;div&gt;</code> elements to your email notifications, see the blog post <a href="https://community.service-now.com/blog/extra-line-spacing-with-paragraph-tags-in-email-client">Extra line spacing with paragraph tags in email client</a> by a ServiceNow employee in the ServiceNow Now Community.</td>
</tr>
<tr>
<td>SMS alternate</td>
<td>Enter the notification message to send to an SMS device. The SMS alternate message is limited to 140 characters. If empty, the system uses the <code>SMS alternate</code> value from the <code>Email template</code>. If you enter a value in this field, it overrides the template value. If you don't fill in the <code>SMS alternate</code> field on this form or the email template, then the system uses the email notification subject as the SMS message.</td>
</tr>
<tr>
<td>Importance</td>
<td>Set the importance of the email message to low or high.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Content type        | Select the content type for the email notification:  
  - HTML and plain text  
  - HTML only  
  - Plain text only  
  By default, **HTML only** is enabled.                                                                                                                                                                                                                                                                                                                                                                      |
| Include attachments | Select this check box to send all attachments from the triggering record as email attachments.                                                                                                                                                                                                                                                                                                                                                                               |
| Omit watermark      | Use this check box to apply or remove the watermark attached to each email. If the email does not contain a watermark, the system reviews the conditions of the inbound actions to create or update task records. For more information, and an alternative way to hide watermarks, see [Watermarks on notification emails](#).                                                                                                                                                                                                 |
| Message Text        | Enter the notification message to send in plain text. This field appears when you set the content type to **HTML and plain text** or **Plain text only**.  
  If empty, the system uses the **Message Text** value from the **Email template**. If you enter a value in this field, it overrides the template value.                                                                                                                                                                                                                  |
| From                | Enter the email address that you want the email notification to use in the From field. For example, helpdesk@yourcompany.com. The email must be in a valid format, otherwise a notification message appears near the field. Changing this address may require an advanced email setup such as enabling email forwarding, for example when using Sender Policy Framework (SPF) records for spam detection. |
| Reply to            | Enter the email address you want people to use when replying to the email notification. For example, helpdesk@yourcompany.com. The email must be in a valid format, otherwise a notification message appears near the field. You can add no more than one email address in this field. Changing this address requires an advanced email setup such as enabling email forwarding. |
| Push message only   | Select this option to send this notification only as a push notification to a mobile device. The **Push Notification** feature must be active.                                                                                                                                                                                                                                                                                            |
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Push messages</td>
<td>Associate one or more push messages with this notification. The <strong>Push Notification</strong> feature must be active.</td>
</tr>
</tbody>
</table>

**Note:** The push message and notification must be for the same table.

7. If you selected the **Allow Digest** check box, fill in the fields on the **What Digest will contain** tab to create the email digest content for the notification. The following example shows the default view of the tab. The advanced view contains additional fields (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digest Template</td>
<td>If you want to reuse existing content, such as headers or footers, select an email template to add content to the email digest.</td>
</tr>
</tbody>
</table>
| Digest Subject      | Enter the subject line for the email digest. The subject can include variables from the Select variables column.  
If empty, the system uses the Subject value from the Email template. If you enter a value in this field, it overrides the template value.                                                                                                                |
| Digest HTML         | Enter the recurring content for the email digest. The digest content can include variables from the Select variables column.  
Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes.  
To prevent adding extra `<p>` and `<div>` elements to your email digest, see the blog post [Extra line spacing with paragraph tags in email client](https://community.servicenow.com/articles/Extra-line-spacing-with-paragraph-tags-in-email-client) by a ServiceNow employee in the ServiceNow Now Community. |
| Digest Separator (HTML) | Use the line to separate each item summarized in the digest.                                                                                                                                                                                                                     |
| Digest From         | Enter the email address to be used in the From field of the email digest. For example, helpdesk@yourcompany.com. The email address must be in a valid format, otherwise a notification message appears near the field.                                                                                                         
Changing this address requires an advanced email setup such as [enabling email forwarding](https://community.servicenow.com/articles/how-to-enable-forwarding). |
| Digest Reply To     | Enter the email address that you want people to use when replying to the email digest. For example, helpdesk@yourcompany.com. The email must be in a valid format, otherwise a notification message appears near the field.                                                                                                     
Changing this address requires an advanced email setup such as [enabling email forwarding](https://community.servicenow.com/articles/how-to-enable-forwarding). |
<p>| Digest Text         | Enter the recurring content of the email digest to send in plain text. This field appears when you set the content type to HTML and plain text or Plain text only.                                                                                                     |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digest Separator (text)</td>
<td>(Optional) Use the dash character as a line to separate each item summarized in the digest. This field appears when you set the content type to HTML and plain text or Plain text only.</td>
</tr>
</tbody>
</table>

When you save or update the notification, the email Digest option is available for the notification in the notification settings of your users.

8. When you finish creating the notification, click Submit. Or, if you are done modifying the notification, click Update.

Use the Preview Notification option to check your notification. For example, you can see:

- How the Subject and Message fields are displayed.
- Which users will or will not receive the notification, including the reasons why users will not receive it.

Convert legacy email notifications to rich HTML

By default, new email notifications are created in the rich HTML format. But you can also convert legacy notifications to rich HTML.

Role required: admin

1. Navigate to System Notification > Email > Notifications.
2. On the Email Notifications list screen, click the name of the email notification you want to convert.
3. Click the What it will contain tab.
4. **Click Switch to Rich HTML Editor.**

The system copies any raw HTML from the **Message** field and converts it to rich HTML in the **Message HTML** field. Additionally, any mail scripts in the body are automatically saved to the **Email Script** [sys_script_email] table and are replaced in the notification body with an embedded script tag. This makes the notification body easier to read.
<table>
<thead>
<tr>
<th>When to send</th>
<th>Who will receive</th>
<th>What it will contain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content type</td>
<td>HTML and plain text</td>
<td>Importance: None</td>
</tr>
<tr>
<td>Include attachments</td>
<td></td>
<td>From:</td>
</tr>
<tr>
<td>Omit watermark</td>
<td></td>
<td>Reply to:</td>
</tr>
<tr>
<td>Email template</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Subject</td>
<td>Test notification: New test assigned to you on $(metric_type) - due by $(due_date)</td>
<td></td>
</tr>
<tr>
<td>Message HTML</td>
<td>Displays the message content with options for formatting and variable selection</td>
<td></td>
</tr>
</tbody>
</table>

You have been assigned to complete tests on $(metric_type). Please follow the link below and complete the tests by $(due_date). You can save your results until you are ready to submit them. When you have completed the test, and filled in all final results, submit the test.

Click here to begin the test:

$(':mail_script:Notify test case user_script_1')

To view your test queue at any time, sign in and navigate to Self-Service > My Tests.
Note: The string "div" at the bottom of the screen shows the location of your cursor within the Message HTML field. In this case, the cursor is in a line containing an HTML <div> tag.

When you convert an email notification that was created in a version prior to Eureka to rich HTML, mail scripts are automatically moved to the Email Script (sys_script_email) table and an embedded script tag with the name of the script is automatically inserted into the body of the notification.

When creating new email notifications, write mail scripts using System Notification > Email > Notification Email Scripts. When the scripts are completed, add a ${mail_script:script name} embedded script tag to the email notification body. This makes it easy to use the same scripts in multiple email notifications. All you need to copy and paste from one notification to the next is the embedded script tag.

If you manually enter a mail script, any text bounded by <mail_script> </mail_script> in the body of a new or converted email notification or template which is saved to the record, a message asks whether the mail script should be converted.

In many cases, an unconverted mail script fails to run from inside the HTML editor. If you select Yes, the script is added to the Email Script (sys_script_email) table and is automatically replaced in the body with an embedded script tag. You can view the mail scripts in their original form by opening the email notification and clicking the Show Notification Scripts related link.

Control visibility to email records generated by notifications
Define conditions that restrict read access to target email records containing sensitive information.

Role required: admin

Use the Email Access Restriction (email_access_restriction) table to define conditions that control read access to an email record generated by a notification containing sensitive information. These conditions are processed by the base system ACL for the Email (sys_email) table.

When you specify conditions to restrict access for a notification, the email records are visible only to users that match the conditions specified for the notification.

1. Navigate to System Notification > Email Access Restriction.
2. Click New.
3. Complete the form.
### Field | Description
--- | ---
Notification | Choose the notification that generates the email record that should be restricted.
Application | Displays the application scope.
Table | Displays the target table for the notification that you selected.
Condition | Use the condition builder to determine who can access the email record. The conditions must evaluate to true to enable read access to the email record.
Description | Enter a short description of the read access restriction.

4. Click **Submit**.

**Advanced conditions for email notifications**

Use an advanced condition to send a notification based on the current email record, changing field values, or system properties.

To send a notification using an advanced condition, you can:

- Call a function that returns a value, or
- Set the global variable `answer` using a script

For example, in the following code, you call a function to prevent the system from sending an email notification if the sender of a self-service request is a member of the XYZ group:

```javascript
(function() {  
    var groupMember = gs.getUser();  
    return !groupMember.isMemberOf('XYZ'); 
})();
```

Alternatively, you can script the same advanced condition by using the `answer` variable:

```javascript
var groupMember = gs.getUser();
if(groupMember.isMemberOf('XYZ')){
    answer = false;
} else {
    answer = true;
};
```

Note that the script must set the `answer` variable to `true` to send the notification. If you script no conditionals, the value of `answer` is equal to the last value that you set for the variable.

You can add a script-based condition in the **Advanced condition** field by configuring the Email Notification form and adding the field. You can access the field in the **Advanced** view without configuring the form.

The advanced condition script uses the following business rule global variables:

- `current`: contains the current record from the table to which the notification is linked.
- `event`: contains the event that triggered the notification.

**Note:** The **Advanced condition** field is evaluated in addition to other conditions you set on the notification. Both the **Condition** and **Advanced condition** must evaluate to true in order to send the notification.
Edit HTML content in an email notification
For added control over the content of an email notification, you can edit the underlying HTML.

Role required: admin

1. Navigate to System Notification > Email > Notifications.
2. Open an email notification record.
3. On the form, open the What it will contain tab.
4. In the Message HTML field, click the source code icon (« ») to open the HTML source code editor.

5. Make the needed changes to the HTML.
6. On the window, click Ok.
7. On the form, click Update.
Document attachments on an email notification

You can attach documents and reports to email notifications by scripting or linking to the sys ID of the record.

You can include all attachments from the source record with the notification. For example, if an incident update generates a notification, you can include all attachments from the incident record with the notification. To include all attachments from the source record, select the check box for the **Include attachments** field. Note that email messages, including attachments, cannot exceed the maximum email size. This size includes MIME encoding. For details on MIME encoding, see [Email service size restrictions](#).

Attaching documents with scripting

Using scripting, you can attach documents by linking to them, or you can attach various types of reports by specifying their IDs in the system.

Linking to an attachment

You can add attachments to a notification by linking to the attachment record in the message of the notification. Linking to attachment records in this fashion requires using email notification scripting. For example:

```javascript
 template.print ( 'Attachment: <a href="/sys_attachment.do?sys_id=' + gr. sys_id + '"></a> ' + gr. file_name + '</a>
 ' );
```

Attaching reports using the Sys ID

You can also attach various types of reports, including gauges, dashboards, and charts, to a notification. The scripts to attach these reports take the following syntax:

```javascript
${report:X:Y}
```

where:

- **X** is the type of report you want to attach (reportID, gaugeID, dashboardID, or chartID).
- **Y** is the sys ID of the report, gauge, dashboard, or chart to be attached.

For example:

- `$(report:reportID:<abc123>)`
- `$(report:gaugeID:<abc123>)`
- `$(report:dashboardID:<abc123>)`
- `$(report:chartID:<abc123>)`

Line breaks in email notifications and rich HTML

Rich HTML provides additional control over line breaks in your email notifications and templates. To provide control over line breaks, a **Newlines to HTML** check box is available in the Email Script form.
Newlines to HTML option

Selecting the **Newlines to HTML** check box indicates that the method for handling line breaks in earlier versions carries forward for email notifications and templates. When an email notification or template is converted to rich HTML, the **Newlines to HTML** check box is automatically selected.

For new mail scripts, add correct HTML line breaks to template.print() statements.

If an email notification or template is not converted to rich HTML, newlines are automatically wrapped with `<div>` tags, the same as previous versions. The old mail scripts still work. However, the administrator does not enjoy the benefits of working in the rich HTML format, and does not have as much control over exact HTML formatting.

**HTML line breaks in new scripts**

When writing new scripts, insert explicit HTML line breaks and clear the **Newlines to HTML** check box so that no HTML tags are injected when email notifications are generated. For existing notifications and templates, replace template.print("\n") JavaScript function calls with
template.print("<br />"). This replacement gives you better control over the HTML formatting of your email notifications.

**Preview email notifications**

You can preview what notifications look like before you actually enable the instance to send them.

Role required: admin

You can preview both types of notifications as specified by the **Send when** field on the Notification form:

- **Record inserted or updated**: A change to record in the instance triggers the notification.
- **Event is fired**: An event, such as expiration of a certificate or an inbound email action, triggers the notification.

1. Navigate to **System Notification > Email > Notifications**.
2. Open the notification or create one.
   
   You must save the record before you can view the preview accurately.
3. Click **Preview Notification** on the form header.
4. On the Notification Preview window, verify that the notification works as expected.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preview records for this breakdown source</td>
<td>The type of event that triggers the notification. This choice list appears if you preview an event-triggered notification. Select one of the following:</td>
</tr>
<tr>
<td>Event Record</td>
<td>An existing event to preview an event-created notification. This option appears if you select <strong>Existing Event</strong> as the event type (for event-triggered notifications only).</td>
</tr>
</tbody>
</table>
| Event Creator                      | The user triggering the notification for the purpose of the preview. The event creator defaults to the user who clicked **Preview Notification**.  
You can change the creator as needed. You can change the preview record as needed to see the changes in the notification content. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preview Record</td>
<td>The record triggering the notification for the purpose of the preview. The preview record defaults to one of the records in the table specified in the Table field on the Email Notification form. You can change the preview record as needed to see the changes in the notification content.</td>
</tr>
</tbody>
</table>
| Users         | The users who will receive the notification, as specified in the Who will receive section of the Email Notification form:  
- All users that you specify on the form appear, but only the users that will actually receive the notification with the current preview settings appear in black text.  
- Users that are specified but for whatever reason will not receive the notification appear in red, strikethrough text. Place the cursor over any of these names to see the reason the user will not receive the notification. For example, one reason could be that the user’s notification settings are disabled. |
| Subject and Body | The content of the notification as defined by the template. The Subject and Body sections on the preview display the content in the corresponding Subject and Message fields on the template.  
If the template includes a link to the record that triggered the notification, the Preview Record link is used. Click the link to go to that record. |

5. After you have reviewed the notification, exit the preview window.
6. Make the necessary changes to the notification or template, if necessary.

**Time zone for email notifications**
A system property controls the time zone that the instance uses for the date and time stamp of a message.

The date and time stamp of a notification uses the system time zone, not the time zone of any recipient. The email property `glide.email.append.timezone` controls whether to append the time zone. If true, the system time zone of the instance is appended to any Date/Time fields in outbound email messages (for example, 2018-07-02 04:01:14 PST).

**Specify alternative outbound email addresses for notifications**
By default, the system sends all outbound email notifications from the default email address of the instance, but you can specify an alternative address.

Role required: admin
For organizations that need to send email messages from specific email addresses, such as from multiple service desks, or they want to send notifications in different languages, the platform supports configuring multiple outbound addresses.

1. Navigate to **System Notification** > **Email** > **Notifications**.
2. Select an existing notification record for the desired event, such as **Incident Closed**.
3. Create a copy of this notification for each outbound email address.
4. Open one of the notification copies, and click the **Advanced view** related link.
5. In the **What it will contain** section, add an email address to the From field that is different from the default instance address.

For more information on how to construct the From address, refer to section 3.6.2 of the [RFC 2822](https://tools.ietf.org/html/rfc2822).

6. Add a different email address than the From address to the **Reply to** field if you want replies to this notification to go to a different address.

The system checks the From field for an address. If this field is empty, then the system uses the default address for the instance. If the Reply to field is empty, then all replies are sent to the address from which the notification was sent. If the Reply to field contains an email address, then the system sends all replies to the notification to this address.

7. Create mutually-exclusive conditions for notifications of the same type, so only the desired notification is sent when the event is fired.

For example, if the **Company** is a certain value, then the notification comes from a unique email address entered in the From field.

8. Click **Update**.

Specify an outbound email address for a particular language
You can specify a different email address for each language your instance supports.

**Role required:** admin

1. Create or copy a notification record for the desired event.
2. In the **What will it contain** section, enter a new email address in the From field.
3. Create the Subject and Message content in the desired language.
4. In the **When to send** section, create a condition as follows:
   1. In the list of **Condition** fields, select **Show Related Fields** from the bottom of the choice list.
   2. From the choice list of **Related Fields**, select the field that identifies the recipient.
      
      For example, select **Caller > User** fields to send the notification to the user who called in an incident, or **Assigned to > User** fields to send the notification to the user to whom an incident is assigned.
   3. From the choice list of user fields, select **Language**.
   4. Select the **is** operator.
   5. Complete the condition by selecting the language of the desired user.

5. Click **Update**.

All notifications for that event originate from the specified email address and go out in the language of the recipient.

**Notification variables**
Use notification variables to display dynamic information in the body of a notification such as a field value, a link to a record, or a link to system preferences.
Syntax

Specify a notification variable using this syntax:

${variable-name+variable-parameters}

The **variable-name** portion is always required. Not all notification variables support the **variable-parameters** portion. When available, most variable parameters are optional. See the list of available notification variables for variable names and available parameters.

Available variables

The system provides these notification variables.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>${field-name}</td>
<td>Display the value of the specified field.</td>
<td>None</td>
</tr>
<tr>
<td>${image-field-name}</td>
<td>Display an image associated with a record. This variable is typically used with HTML to specify the source of an image element.</td>
<td>None</td>
</tr>
</tbody>
</table>
| • ${URI} | Display a link to the current record. | Any valid sysparm URL parameter. For example:  
• sysparm_scriptlet  
• sysparm_view |
| • ${URL_REF} | | |
| • ${reference-field.URI} | Display a link to the record listed in a reference field. | Any valid sysparm URL parameter. For example:  
• sysparm_scriptlet  
• sysparm_view |
<p>| • ${reference-field.URI_REF} | | |
| ${CMS_URI} | Display a link to the specified record within a CMS page. | &lt;CMS-site&gt;/&lt;CMS-page&gt;: The required relative path to the CMS page. |
| ${notification:body} | Display the body contents of an email template or email notification. Use this notification variable to specify where to display body content in an email layout. | None |
| ${mail_script:script-name} | Run the specified mail script. | None |
| ${NOTIF_UNSUB} | Display a link unsubscribe from this notification. | link_text: specify the text to display as a link within quotation marks. |
| ${NOTIF_PREFS} | Display a link to set notification preferences. | link_text: specify the text to display as a link within quotation marks. |</p>
<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
</table>
| ${comments:n}           | Display the most recent comments that were made on the target record. The number of comments to display is $n$. For example, ${comments:3}$ displays the last three comments that were made to the record. To display all comments, use the variable ${comments}.
|                          | Any number greater than 0.                                                                                                                                         |                                       |
| ${comments_and_work_notes:n} | Display the most recent comments and work notes that were made on the target record. The number of comments and work notes to display is $n$. For example, ${comments_and_work_notes:3}$ displays the last three comments and work notes that were made to the record. To display all comments and work notes, use the variable ${comments_and_work_notes}.
|                          | Any number greater than 0.                                                                                                                                         |                                       |

### Examples

Refer to the following examples to see how each notification variable is rendered in the output:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Example</th>
</tr>
</thead>
</table>
| ${field-name} | Source: Incident ${number} - comments added  
Output: Incident INC1000001 - comments added                                                                                                        |
<table>

</tbody>
</table>

![Diagram showing variable usage in a context]
Links to records in email notifications
Adding the ${URI} parameter to an outbound email body or template creates a link to a specific record.

When a user clicks the word LINK, the instance prompts the user to log in if not already logged in, and then redirects the user to the record specified in the URI.

![Short description: SAP Sales app is not accessible](image)
Click here to view incident: **LINK**

Comments:

Link displayed by ${URI} parameter

The ${URI} parameter has an extension called the ${URI+} format to specify additional arguments in the email link, such as sysparm terms, in addition to the automatically created URI. For example (whitespace added for improved readability):

```
${URI+&sysparm_scriptlet=current.assigned_to=gs.getUserID()
  &sysparm_scriptlet_condition=current.assigned_to.nil()
  &sysparm_view=incident_active}
```

This example executes the JavaScript:

```
current.assigned_to=gs.getUserID()
```

when the condition of

```
current.assigned_to.nil()
```

is satisfied. Additionally, the script sets the view to incident_active.

Enable links to records
Adding the special ${URI} parameter to an outbound email body or template creates a link to a specific record.

When a user clicks the word LINK, the instance prompts the user to log in if not already logged in, and then redirects the user to the record specified in the URI.

![Short description: SAP Sales app is not accessible](image)
Click here to view incident: **LINK**

Comments:

URI email notification

The ${URI} parameter has an extension called the ${URI+} format to specify additional arguments in the email link, such as sysparm terms, in addition to the automatically created URI. For example (whitespace added for improved readability):

```
${URI+&sysparm_scriptlet=current.assigned_to=gs.getUserID()
  &sysparm_scriptlet_condition=current.assigned_to.nil()}
```
This example executes the JavaScript:

```javascript
current.assigned_to=gs.getUserID()
```

when the condition of

```javascript
current.assigned_to.nil()
```

is satisfied. Additionally, the script sets the view to `incident_active`.

Change the link text

To show the display value of the record as the link text instead of the word LINK, use the `${URI_REF}` parameter instead of the `${URI}` parameter.

**URI_REF email notification**

For example, if the URL displays an incident record, the link text is the incident number, which is the display value for incidents. If the URL displays a user record, then the link text is the user name.

**Link to related records**

A notification can link to a related record by specifying a reference field in front of the `${URI}` or `${URI_REF}` parameters.

Format the related record link as follows:

- `${<reference field that contains the related record you want to display>.URI}`
- `${<reference field that contains the related record you want to display>.URI_REF}`

For example:

**Related records**

<table>
<thead>
<tr>
<th>Related record to provide link to</th>
<th>Notification record table</th>
<th>Reference field</th>
<th>Samples</th>
</tr>
</thead>
</table>
| Related task record to be approved from an approval notification | Approval (sysapproval_approver) | Approval for (sysapproval) | • `${sysapproval.URI}`  
|                                   |                           |                  | • `${sysapproval.URI_REF}` |
| Related problem record in an incident notification | Incident | Problem (problem_id) | • `${problem_id.URI}`  
|                                   |                           |                  | • `${problem_id.URI_REF}` |

For example, the following notification template produces the email links in the picture below:

**Click here to view Incident: `${URI_REF}`**
Content page links in email notifications

Links to CMS pages can be put in notifications to make it easy for the reader to access the pages. The link takes the following format: \( \text{${CMS\_URI+<site>/<page>}} \).

For example, to link the email recipient to a page called Incident in the content site ESS, with the current incident as the target document, use the following format: \( \text{${CMS\_URI+ess/incident\_detail}} \)

The resulting email URL has this format: https://<instance name>.service-now.com/ess/incident_detail.do?sysparm_document_key=incident,46e18c0fa9fe19810066a0083f76bd56

Email unsubscribe

Administrators can add unsubscribe links to notifications so that users can stop receiving particular email messages.

Note: The base system notifications include unsubscribe and notification preferences links.

The system offers two types of macros to create unsubscribe links.

- An unsubscribe link that creates an email message to the instance.
- An unsubscribe link that opens the notification preferences for the user on the instance.

Available unsubscribe macros

<table>
<thead>
<tr>
<th>Unsubscribe type</th>
<th>Macro used</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unsubscribe by email</td>
<td>${NOTIF_UNSUB}</td>
<td>The system generates an HTML mailto hyperlink. When users click the link, their browser or email client creates a pre-formatted unsubscribe email message to the instance.</td>
<td>link_text: specify the text to display as a link within quotation marks.</td>
</tr>
<tr>
<td>Unsubscribe by notification preferences</td>
<td>${NOTIF_PREFS}</td>
<td>The system generates an instance link directly to the notification preferences for this notification type.</td>
<td>link_text: specify the text to display as a link within quotation marks.</td>
</tr>
</tbody>
</table>

Administrators can add unsubscribe macros to any notification record type such as:

- Email layouts
- Email templates
- Email notifications
Unsubscribe by email

Unsubscribe by email requires the user email client or browser to create a pre-formatted email message containing these elements:

- The **To** field has the email address of the instance.
- The **Subject** starts with the string `Unsubscribe from`.
- The **Body** has a JSON string with a name-value pair of `Unsubscribe` and an array value that contains two more name-value pairs.
  
  - The **notification_id** parameter specifies the Sys ID of the notification the user wants to unsubscribe from.
  - The **unsub_token** parameter specifies an instance ID the system uses to verify that the email came from a ServiceNow instance.

**Note:** Some email clients and web browsers, such as GMail on Chrome, require extra client configuration to support mailto hyperlinks. Administrators can provide an alternative unsubscribe method for users whose email client or browser does not support mailto links. See [RFC6068](https://tools.ietf.org/html/rfc6068) for information about the mailto URI scheme.

The **Unsubscribe from Notification** inbound action processes the email and unsubscribes the sender from the listed notification.

**Note:** Unsubscribing by email message does not require users to authenticate with the instance first.

Unsubscribe by notification preferences

Unsubscribe by notification preferences requires the user’s browser to navigate to the notification preferences page on the instance. After logging in, the system displays the notification preferences for this particular notification.

Users can set preferences for this notification such as disabling notifications for a particular device. Users must save their notification preferences for changes to take effect.

**Unsubscribe links**

This email layout adds several unsubscribe links to the bottom of each email notification.

```html
${NOTIF_UNSUB} from this notification by email or ${NOTIF_UNSUB}+link_text="click here"
Manage your ${NOTIF_PREFS} or ${NOTIF_PREFS}+link_text="click here"
```

When rendered in an email notification, the unsubscribe links only display the link text.
Notification Preview

Preview records for this breakdown source

<table>

Body

servicenow

You can view all the details of the incident by following the link below:

Go to Instance

Unsubscribe | Manage Preferences
If a user clicks the **Unsubscribe** link, the email client creates a message such as this:

![Sample unsubscribe by email message](image)

**Sample unsubscribe by email message**

**Scripting for email notifications**

Email scripts allow for business rule-like scripting within an outbound email message.

With mail scripts, you can dynamically change the email output of your system based on different criteria. Mail scripts allow you to perform simple tasks, such as displaying incident data, and complex ones, such as making advanced database queries.

You can add a `${mail_script:script name}` embedded script tag to the body of the email notification or template, replacing `script name` with the name of the script you created. This makes it easy to use the same scripts in multiple email notifications or templates.

If you manually enter a mail script bounded by `<mail_script>` and `</mail_script>` in the body of a new or converted email notification or template, and then attempt to save the record, a message asks whether the mail script should be converted. In many cases, an unconverted mail script fails to run from inside the HTML editor. If you select **Yes**, the script is added to the Email Script (sys_script_email) table and is automatically replaced in the body with an embedded script tag `${mail_script:script_name}`.

**JavaScript in emails**

Create mail scripts in **System Notifications > Email > Notification Email Script**, and refer to them by using `${mail_script:script name}` in the script field.

To print text into the body of the message, use the `template.print("a string")` function.
JavaScript in templates

The `event.parm1` and `event.parm2` parameters that come from the originating event can also be used.

Mail script API

Certain variables are available when processing mail_script scripts.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Object Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template</td>
<td>Handles printing from the mail script to the email message.</td>
</tr>
<tr>
<td></td>
<td>template.print(&quot;message&quot;); //outputs message to the email body.</td>
</tr>
<tr>
<td></td>
<td>template.space(&quot;number of spaces&quot;); //outputs spaces to the email body.</td>
</tr>
<tr>
<td>email_action</td>
<td>GlideRecord object for the email notification (sysevent_email_action).</td>
</tr>
<tr>
<td>event</td>
<td>GlideRecord object for the event that fired the notification (sysevent).</td>
</tr>
<tr>
<td>Variable</td>
<td>Object Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------------</td>
</tr>
<tr>
<td>email</td>
<td>EmailOutbound object</td>
</tr>
</tbody>
</table>

Available methods:

- `addAddress(String type, String address, String displayname):` type can be cc or bcc.
- `setFrom(String address):` override the sender address.
- `setReplyTo(String address):` override the reply to address.
- `setSubject(String subject):` override the subject of the message.
- `setBody(String message):` override the body of the message.

The email address that is passed by setFrom and setReplyTo needs to be in a valid form such as helpdesk@sn.com or Display Name <helpdesk@sn.com>. If the email address includes a 'Display Name', then that value overrides the instance's display name.

Example scripting for email notifications

Examples of scripting for email notifications.

**Scripting examples for email notifications**

A simple text string is the most basic example of the way a mail script works. This script prints out "Incident number - INC00001".

```java
template.print("Incident number - "+ current.number);
```

More advanced scripts, like this one, can be found by browsing through the base system email templates.

```java
template.print("Summary of Requested items:<br />
var gr = new GlideRecord("sc_req_item");
gr.addQuery("request", current.sysapproval);
gr.query();
while(gr.next()) {
        template.print(gr.number + ": " + gr.quantity + " X " +
               gr.cat_item.getDisplayValue()
               + " at " + gr.cat_item.price.getDisplayValue() + " each
<br />
}
```

To dynamically change field values within an email, use the following functions within `<mail_script>` syntax:

```java...
email.setFrom(current.caller_id.email);
email.setReplyTo("joe.employee@yourcompany.com");
email.setSubject("This is the new subject line");
email.setBody("This is the new body");
```
Using the instance_name property ensures that the notification still works when migrated between instances.

dothis();

function dothis()
{
    var gr = new GlideRecord('sys_attachment');
    gr.addQuery('table_sys_id', current.sys_id);
    gr.query();
    while (gr.next()){
        template.print('Attachment: <a href="https://' +
        gs.getProperty('instance_name')+'.'+ service-now.com/sys_attachment.do?sys_id='+
        gr.sys_id+'">'+
        gr.file_name+'</a>');}
}

You can specify copied and blind copied recipients by using the email object within a mail script.

//email.addAddress(type, address, displayname);
email.addAddress("cc","john.copy@example.com","John Roberts");
email.addAddress("bcc","john.secret@example.com","John Roberts");

The following is an example script to add users from watch_list as copied recipients.

if(!current.watch_list.nil()){
    //get watch list addresses and add to cc
    var watcherIds = current.watch_list.split(",");

    //get user records
    var user = new GlideRecord("sys_user");
    user.addQuery("sys_id", watcherIds);
    user.addQuery("notification",2);
    //email
    user.addQuery("email","!="","");
    user.query();
    while (user.next()){
        //add to cc list
        email.addAddress("cc", user.email, user.getDisplayValue());}
}

Useful attachment scripts

This is a searchable version of the Useful Attachment Scripts.

Caution: The customization described here was developed for use in specific instances, and is not supported by ServiceNow Technical Support. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.

Copy attachments from record to record

Use the following script to copy an attachment from one record to another record:

GlideSysAttachment.copy('sourcetable','sys_id','destinationtable','sys_id');

Note: GlideSysAttachment.copy copies all attachments; it cannot select specific attachments.
Delete duplicate attachments

Use the following script in a business rule, scheduled job, or background script to delete duplicate attachments located in the Attachments (sys_attachment) table:

```javascript
function fixDuplicateImages(){
    var gr = new GlideRecord('sys_attachment');
    gr.addQuery('table_name','LIKE','ZZ_YY%');
    gr.orderBy('table_sys_id');
    gr.orderByDesc('sys_created_on');
    gr.query();
    var lastID = 'not_a_match';
    var lastFile = 'not_a_match';
    while (gr.next()) {
        var isDuplicate = (lastID == gr.table_sys_id) && (lastFile == gr.file_name);
        lastID = gr.table_sys_id;
        lastFile = gr.file_name;
        gs.print(gr.table_sys_id + ' ' + gr.table_name + ' ' + gr.file_name + ' ' + gr.sys_created_on + ' ' + isDuplicate);
        if (isDuplicate)
            gr.deleteRecord();
    }
}
```

Display whether tasks have attachments in list view

Use the following script in a business rule to display whether tasks have attachments when viewed in the record list view. Note that the script needs a custom field on the Has Attachments (u_has_attachments) table.

```javascript
function checkAttachment(){
    // if inserting then the task has an attachment
    if (current.operation()=='insert') {
        hasAttachment('true');
    } else {
        // if deleting attachment check for other attachments
        if (current.operation()=='delete') {
            var timeNow3 = new GlideDateTime();
            gs.log('has_attachment br: gliderecord query start date time is: ' + timeNow3.getNumericValue(), 'jwtest');
            var attachCount = new GlideAggregate('sys_attachment');
            attachCount.addQuery('table_sys_id', current.sys_id);
            attachCount.addAggregate('COUNT');
            attachCount.query();
            var numAttachments = '0';
            if (attachCount.next()) {
                numAttachments = attachCount.getAggregate('COUNT');
                if (numAttachments > 0) {
                    hasAttachment = 'true';
                } else {
                    hasAttachment = 'false';
                }
            }
            var timeNow4 = new GlideDateTime();
            gs.log('has_attachment br: gliderecord query start date time is: ' + timeNow4.getNumericValue(), 'jwtest');
            function hasAttachment(answer) {
                var task = new GlideRecord('task');
                task.addQuery('sys_id', current.table_sys_id);
                task.query();
                if (task.next()) {
                    task.u_has_attachment = answer;
                    task.autoSysFields(false); // Don't set the lastUpdatedTime or the Simultaneous Update Alert will likely get triggered
                    task.setWorkflow(false); // Don't allow other business rules to run, otherwise multiple notifications will likely be sent
                }
            }
        }
    }
}
```
Link to attachments in an email notification

Use the following script in an email notification or template to include links to attachments:

```javascript
printattachments();

function printattachments(){var gr =new GlideRecord('sys_attachment');
gr.addQuery('table_sys_id',current.sys_id);
gr.query();while(gr.next()){template.print('Attachment: <a href="http://'+gs.getProperty("instance_name")+'.service-now.com/sys_attachment.do?sys_id='+ gr.sys_id+'">'+ gr.file_name+'</a>');}}
```

**Note:** Replace “instance_name” with your instance name.

Attachment Logging

Whenever a user downloads an attachment, the action writes an attachment.read event record to the event log. If desired, you can process these events with a Script Action or an Email Notification. This can be useful if you want to do something when an attachment is read. For example, you can record when and by whom certain attachments are downloaded. For this functionality, the current variable must point to a sys_attachment record, and the event record must use the following parameters:

- **parm1:** File name
- **parm2:** Table name

**Baseline email notifications**

The baseline system provides several email notifications.

Some events listed in this table do not appear in a business rule and are fired by other conditions in the platform. Some events are hardcoded and are not user configurable.

**Baseline email notification descriptions**

**Notification example:** notify an assignment group of updates to Priority 1 Incidents  
Notify users by email when there are updates to high priority incidents.  
Role required: admin  
Send emails to an assignment group whenever there are updates to an incident in which the **Priority** is **1 - Critical**. Include information that is of interest to the recipients, such as the incident number, category, assignees, and any comments that were added to the incident.

1. Navigate to **System Notification > Email > Notifications**, and then click **New**.  
2. On the email notification form, enter the following values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Priority 1 Incident Updated</td>
</tr>
</tbody>
</table>
3. In the **Message HTML** field, enter the following message and script:

```html
Short Description: ${short_description}
Click here to view incident: ${URI}
Incident number: ${number}
Category: ${category}
Assigned to: ${assigned_to}
Assignment group: ${assignment_group}
<hr/>
Comments: ${comments}
```

4. From the form context menu, click **Save**.

5. Preview the email notification to ensure it includes all the needed information.
   a) On the notifications form, click **Preview Notification**.
   b) Note that the email includes the following information:

   - Short description
   - A link to the incident record
   - Incident number
   - Category
   - The name of the user to whom the incident is assigned
   - The group assigned to the incident
   - Comments from the incident record

6. Test that the email notification sends to an assignment group when its Priority 1 Incident is updated.
   a) **Create a user** who has an email address that you can monitor, and then **create a group** that includes the user that you created.
   b) Navigate to **Incident > Open**, and then open an incident in which the **Priority** is 1 - **Critical**.
c) In the **Assignment group** field, enter the group that you created.

d) From the form context menu, click **Save**.

e) Add comments to the form to update the incident, and then click **Update**.

f) Check the email account of the user member in the assignment group.

*Notification example: notify task assignees*

Notify users who are assigned a Task (task) record.

**Role required:** admin

Set up your email as a test email address. Navigate to **System Properties > Email Properties**, and then enter your email address under **Send all email to this test email address**.

1. Navigate to **System Notification > Email > Notifications**, and then click **New**.

2. On the form, enter the following values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Task Assigned</td>
</tr>
<tr>
<td>Table</td>
<td>Task (task)</td>
</tr>
<tr>
<td>Active</td>
<td>Selected</td>
</tr>
<tr>
<td>Category</td>
<td>Uncategorized</td>
</tr>
<tr>
<td>Send when</td>
<td>Record inserted or updated</td>
</tr>
<tr>
<td>Inserted</td>
<td>Selected</td>
</tr>
<tr>
<td>Updated</td>
<td>Selected</td>
</tr>
<tr>
<td>Conditions</td>
<td>(Assigned to)(changes)</td>
</tr>
<tr>
<td>Users/Groups in fields</td>
<td>Assigned to</td>
</tr>
<tr>
<td>Subject</td>
<td>Task Assigned</td>
</tr>
</tbody>
</table>

3. In the **Message HTML** field, add a message to send to whomever the task is assigned to.

4. From the form context menu, click **Save**.

5. To see a mock version of the system email that you created, click **Preview Notification** on the notification form.

6. Test the notification sends to a task assignee.
   a) Assign some task records.
   b) Check your email for assignment notifications.

**Email templates**

Email templates enable administrators to create reusable content for the subject line and message body of email notifications.

Templates deliver consistent information on specific system activities and improve the efficiency of creating multiple email notifications for similar actions. If necessary, you can make minor changes on the fly to an email that uses a template by overriding the subject line and message body content in the notification form. A common practice is to define the message body in a template and create new subject lines for different types of recipients. There is no limit to the number of templates that you can create.
Email templates are created in rich HTML format, and administrators have the option of converting existing email templates to rich HTML (starting with the Eureka release). This format provides several advantages, including:

- Raw HTML content is converted into a WYSIWYG format.
- The content can be edited in a feature-rich HTML editor.
- Mail scripts are condensed into a single, easy-to-read line that can be reused in multiple email notifications.
- To prevent broken links, images linked using URLs relative to a particular instance are converted to absolute links.

Create an email template
You can create an email template with rich HTML formatting, rather than plain text.

Role required: admin

1. Navigate to System Policy > Email > Templates.
2. Click New.
3. Fill in the form fields (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the template. For example, <code>change.update.risk</code>.</td>
</tr>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
<tr>
<td>Email layout</td>
<td>If the message body for the template is to be formatted using a predefined email layout, select the layout.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the name of the table involved. For example, <code>Change Request [change_request]</code>.</td>
</tr>
</tbody>
</table>
| Subject      | Enter a subject line that explains the purpose of the email. Select the appropriate variables for the subject line from the fields available on the selected table. Place the cursor where you want the variable to appear, and click the field name in the **Select variables** column. For example:  

```
${sys_class_name} ${number}  
with ${risk} risk has been assigned to you.
```

| Message HTML | Enter the content of the email template message. You can use the HTML editor toolbar to format the HTML, and you can include variables from the **Select variables** column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes.  

**Notes:**  
- When a template is applied to a notification, the contents of this field are used when you select **HTML and plain text** or **HTML** in the **Content Type** field in the Email Notification form.  
- You cannot use HTML code to control the appearance of the contents in the `${comments}` variable.  
- If you want to include a link to the record that triggered the notification, see Enable links to records. |
| Message Text | Enter the notification message to send in plain text.  

**Note:** When a template is applied to a notification, the contents of this field are used when you select **HTML and plain text** or **Text** in the **Content Type** field in the Email Notification form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| SMS alternate | Create a different message to be delivered to an SMS device. Enter a brief message, showing the most important information only. If this message field is blank, the contents of the **Message Text** field are used for the SMS message.  
*Note:* The message in this field is used when the message is sent to a device configured as SMS. |

**Apply a template to an email notification**

After you create an email template, you can apply it to a notification.

Role required: admin

1. Navigate to **System Notification > Email > Notifications**.
2. Open the email notification record that should use the template.
3. Navigate to the **What it will contain** section.
4. From the **Email template** field, select the appropriate template.
5. Click **Update**.

**Convert an email template to rich HTML**

If you have an email template created prior to the Eureka release, you can convert it to rich HTML.

Role required: admin

1. Navigate to **System Policy > Email > Templates**.
2. Open the email template you want to convert.
3. **Click Switch to Rich HTML Editor.**

When content is converted, these changes are made to the content:

- **HTML Editor:** Any raw HTML in the **Message** field is rendered as WYSIWYG text in the **Message HTML** field. The content can be edited in a feature-rich HTML editor.
- **Simplified Mail Scripts:** Any mail scripts in the body are automatically saved to the **Email Script (sys_script_email)** table and are replaced in the notification body with an embedded script tag. This makes the template body easier to read and makes it easier to reuse scripts in multiple email templates.
<table>
<thead>
<tr>
<th><strong>Name</strong></th>
<th>notify.change</th>
<th><strong>Table</strong></th>
<th>Incident [incident]</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Email layout</strong></td>
<td>Unsubscribe and Preferences</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Subject</strong></td>
<td>${TABLE_NAME} ${DISPLAY_VALUE} Change Notification</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Message HTML</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Click here to view ${TABLE_NAME}: ${URL}
4. Modify the message text, as needed, using the WYSIWYG editor or by editing the underlying HTML.

**Note:** The letter "P" at the bottom of the screen shows the location of your cursor within the **Message** field. In this case, the cursor is in a line containing an `<HTML>` tag.

**Note:** Email templates that are already formatted with rich HTML do not show the **Switch to Rich HTML Editor** button.

---

Whether you are working with templates converted from earlier versions or creating new templates in the rich HTML format, it is a good practice to write mail scripts in **System Notification > Email > Notification Email Scripts**. When the scripts are completed, a `${mail_script:script name}` embedded script tag should be added to the email template body. This makes it easy to use the same scripts in multiple email templates. All that needs to be copied and pasted from one template to the next is the embedded script tag.

If you manually enter a mail script in the body of a new or converted email notification or template, and then attempt to save the record, a message asks whether the mail script should be converted. Unconverted mail scripts often fail to run from inside the HTML editor. If you select **Yes**, the script is added to the Email Script (sys_script_email) table and is automatically replaced in the body with an embedded script tag.

You can view the mail scripts in their original form by opening the email template and clicking the **Show Notification Scripts** related link.

---

**Construct an email message with a template**

Email templates provide a list of the fields from database tables that are available for constructing an email message.

An email template can include a **mailto** automatic response link, which enables the email recipient to simply choose a link that sends a preformatted response back to the instance. An example is the email template used for notification that an approval is required. The following example shows the base email:
| ServiceNow    New York    Now Platform Capabilities |
|---------------|--------------------------|

### Notification - Approval Request [Advanced view*]

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>

The selection list on the right shows the available fields from the `sysapproval_approver` table. All email templates used are based on an event that was created. Generally events are created based on business rules that execute when a database record is modified in some way. The database record being modified when the event is created is the record that is available for generating an email request.

In this case, a change request approval was requested, which results in an update to the `sysapproval_approval` table. The "approval events" business rule was executed, which created the "approval.inserted" event. The "Approval Request" email event is defined to process the approval.inserted event, and this email event is defined to use the following `change.itil.approve.role` email template. Notice that this template has two mailto: items specified. One for "mailto.approval" and one for "mailto.rejection." This email template builds an automatic response that lets the email receiver simply click a link in the email to either approve or reject the change request.

Here is what the `change.itil.approve.role` template looks like using the rich HTML editor:
Notice the `change.itil.approve.role` template also uses a predefined email layout (Unsubscribe and Preferences), which provides links for the recipient to unsubscribe from approval notifications and set notification preferences.

And here is the `mailto.approval` template:

![Email Template](image)

**Note:** If you put text on the lines following the `Click here to approve ${sysapproval}` line, this text forms the actual body of the email.

The combination of templates used would generate an email similar to the following example:
Template generated email message

Notice that the email recipient can use the following links in the mail:

- A link to view all the details of the change request
- A link to view the approval record
- A link that generates an automatic email response to approve the change
- A link that generates an automatic email response to reject the change
- A link to unsubscribe from approval notifications and another link to set notification preferences

Add blank lines in an email template

You can easily add blank lines in an email template using HTML tags. Judicious use of these HTML tags can make your email easier to read.

- You can use `<br/>` to insert a line break
- You can wrap paragraphs in `<p> ... </p>` tags to format your email nicely.

Calendar integration

With email notifications, you can use import export maps to leverage information about records and integrate with Outlook or another calendar.

For example, an email notification can create a calendar event based on the planned start and end dates of a change request. To enable integration with a calendar, the following iCalendar variables are available to be added to an email template message and reference the email template from the notification. The variables must be added to the *Message Text* field.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$dtstart</td>
<td>Start Date</td>
</tr>
<tr>
<td>$dtend</td>
<td>End Date</td>
</tr>
<tr>
<td>$location</td>
<td>Location</td>
</tr>
</tbody>
</table>
By default, the instance computes the value of iCalendar variables using import and export maps for the Appointment (iti_appointment) and Change Request (change_request) tables. The instance also uses import and export maps for other tables, depending on which plugins you activate. For example, if you activate the Incident (com.snc.incident) plugin, the instance uses the import and export maps of the Incident (incident) table.

### Import export maps

Each import export map can specify a different set of iCalendar fields. For example, the icalendar.change_request import export map only maps two iCalendar fields.
iCalendar change request mappings

The instance uses the **External Name** value as the variable name in the email template. For example, the icalendar.change_request import export map defines the `dtstart` and `dtend` variables.

<table>
<thead>
<tr>
<th>External name</th>
<th>Associated variable name</th>
<th>Table</th>
<th>Field mapped</th>
<th>Field label</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtstart</td>
<td>${dtstart}</td>
<td>change_request</td>
<td>start_date</td>
<td>Planned start date</td>
</tr>
<tr>
<td>dtend</td>
<td>${dtend}</td>
<td>change_request</td>
<td>end_date</td>
<td>Planned end date</td>
</tr>
</tbody>
</table>

Map date fields to iCalendar variables

You can specify what fields provide the date information in calendar invitation notifications by changing the field mappings of the `dtstart` and `dtend` variables in the import export map for the iCalendar invitation.

Role required: admin

1. In the navigation filter, enter `sys_impex_map.list`.
2. Open a map to edit.
3. In the Field Maps related list, click either the end_date or start_date mapped field to change the mapping for dtstart or dtend, as needed.
4. Change the Database field to the field you want to use to set the start date or end date.
5. Click Update.

Create iCalendar invitations for custom tables

To generate iCalendar invitations that use field values from custom tables, create an import export map that computes the values of the iCalendar fields.

Role required: admin

1. Create the custom table and fields using the Date/Time field type for the fields that map to the $dtstart and $dtend variables.
2. In the navigation filter, enter sys_impex_map.list.
3. Click New.
4. Set the following fields:
   - Name: Use the following naming convention: icalendar.<table name>. For example, icalendar.u_my_custom_table.
   - Table: Select the custom table you created.
   - Type: Select icalendar.
5. Right-click the form header and select Save.
6. In the Field Maps related list, click New.
7. In the Mapping Entry Wizard, select Mapping to a Database Field.
8. Create field mappings for dtstart and dtend. These variables are required.
   - For example, map the External Name dtstart to the u_meeting_start_time field in u_my_custom_table.
9. Click Submit.
10. Create field mappings for any other iCalendar fields as necessary.
11. Click Update.

Here are sample field mappings between iCalendar variables and custom fields in a custom table, u_my_custom_table:
Sample field mappings

<table>
<thead>
<tr>
<th>External name</th>
<th>Database field</th>
<th>Type</th>
<th>Map</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtstart</td>
<td>u_meeting_start_time</td>
<td>field</td>
<td>icalendar.u_my_custom_table</td>
</tr>
<tr>
<td>dtend</td>
<td>u_meeting_end_time</td>
<td>field</td>
<td>icalendar.u_my_custom_table</td>
</tr>
<tr>
<td>description</td>
<td>u_meeting_description</td>
<td>field</td>
<td>icalendar.u_my_custom_table</td>
</tr>
</tbody>
</table>

12. Create an email template that defines what to include in the iCalendar invitation.
   a) Set the **Table** field to the custom table you created.
   b) In the **Message** text field, use the following format to define the iCalendar invitation.

```plaintext
BEGIN:VCALENDAR
PRODID:-//Service-now.com//Outlook 11.0 MIMEDIR//EN
VERSION:2.0
METHOD:REQUEST
BEGIN:VEVENT
ATTENDEE;ROLE=REQ-PARTICIPANT;RSVP=TRUE:MAILTO:${to}
DTSTART:${dtstart}
DTEND:${dtend}
UID:${sys_id}
DTSTAMP:${dtstamp}
DESCRIPTION:${description}
SUMMARY:${u_meeting_summary}
END:VEVENT
END:VCALENDAR
```

**Note:** Mail script is not allowed or processed in meeting invitation email templates.

**iCalendar invitation template details**

<table>
<thead>
<tr>
<th>iCalendar template line</th>
<th>Required?</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEGIN:VCALENDAR</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>PRODID:-//Service-now.com//Outlook 11.0 MIMEDIR//EN</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>VERSION:2.0</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>METHOD:REQUEST</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>BEGIN:VEVENT</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>ATTENDEE;ROLE=REQ-PARTICIPANT;RSVP=TRUE:MAILTO:${to}</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>DTSTART:${dtstart}</td>
<td>Yes</td>
<td>You must use the import export map to map dtstart to a start time field on the custom table.</td>
</tr>
<tr>
<td>DTEND:${dtend}</td>
<td>Yes</td>
<td>You must use the import export map to map dtend to an end time field on the custom table.</td>
</tr>
<tr>
<td>iCalendar template line</td>
<td>Required?</td>
<td>Notes</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>-----------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>UID:${sys_id}</td>
<td>Yes</td>
<td>You must provide the name of a field that uniquely identifies the record, such as the sys_id or the record number field.</td>
</tr>
<tr>
<td>DTSTAMP:${dtstamp}</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>DESCRIPTION:${description}</td>
<td>No</td>
<td>To include a multiple line description, you must use the import export map to map description to a text field on the custom table. The field mapping ensures that the system encodes line breaks correctly for the iCalendar file format.</td>
</tr>
<tr>
<td>SUMMARY: ${u_meeting_summary}</td>
<td>No</td>
<td>To include a summary from a text field on the custom table, provide the name of the field, such as u_meeting_summary. The summary field value must not contain line breaks. You do not need to create a field mapping.</td>
</tr>
<tr>
<td>END:VEVENT</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>END:VCALENDAR</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

13. Create an email notification to trigger the iCalendar invitation and ensure the following fields are set accordingly:

- **Table**: Select the custom table.
- **Type**: Select **Meeting Invitation**.
- **Content type**: Select **Plain text** only.
- **Email template**: Select the template you created.

**Email layouts**

Create reusable content for the message body of email templates.
Administrators can use email layouts to:

- Ensure all email notifications have a consistent layout such as always displaying a header, body, and footer.
- Display static content on all email notifications such as a company logo or a background.
- Declare inline styles available for use in the message body of an email template such as setting a text font, size, and color.
- Provide users with links to common response actions such as unsubscribe from a notification or manage notification preferences.

**Note:** To display dynamic content such as mail scripts, use email templates. For more information, see [Create an email template](#).

Email layouts insert HTML elements into the message body of email templates. Any style elements you define in the email layout are available to the email template. Email layouts support style sheets in these formats.

- Internal style sheets defined within a `<style>` element.
- Inline styles within a `style` attribute.

By default, the system includes several sample layouts administrators can use to create their own layouts. Administrators can create email layouts using an inline HTML editor or manually entering HTML code. The system stores email layout records in the Email Layout (sys_email_layout) table.

**Create an email layout**
Create an email layout to specify the HTML content you want to appear in the body of one or more email templates.

- **Role required:** admin
- **Record required:** email template record

1. Navigate to **System Policy > Email > Layouts**.
   The system displays the list of existing email layouts.
2. Click **New**.
   The system displays a blank email layout form.
3. Fill in the form.

### Email layout fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specify a unique name for the record.</td>
</tr>
<tr>
<td>Application</td>
<td>Lists the parent application to which this record belongs.</td>
</tr>
<tr>
<td>Description</td>
<td>Specify an optional description of the layout.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select whether to display the Advanced Layout field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Layout</td>
<td>Use the inline editor to add HTML elements. The system displays HTML from this field in the body of any email template that uses the layout. Include notification variables to show content from the related record. For more information notification variables see Notification variables.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The editor automatically formats any HTML code you enter from the Source code view.</td>
</tr>
<tr>
<td>Advanced Layout</td>
<td>Use this field to manually enter HTML code. The system displays HTML from this field in the body of any email template that uses the layout.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> To enter text in this field, select Click here to disable syntax highlighting and script formatting.</td>
</tr>
</tbody>
</table>

4. Click Submit. The system creates the email layout record.
5. Navigate to System Policy > Email > Templates. The system displays the list of existing email templates.
6. Select the email template which you want to use an email layout. The system displays the email template record.
7. In Email layout, select the email layout you want to use to format the body of email messages.
8. Click Update. The email template uses the selected email layout to format the body of email messages.

**Email filters**

Email filters enable administrators to specify when to move email to particular mailboxes or to ignore it using a condition builder or a condition script. The Email Filters (com.glide.email_filter) plugin is active by default.

When an email is ignored, the email is saved to your instance but is not processed. You can access an ignored email by viewing its Email (sys_email) record.

**Default email filters**

By default, the following filters are available from the System Mailboxes > Filters module:
Default email filters

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore VCAL</td>
<td>Ignores all email containing vCalendar requests. This filter prevents inbound email actions from creating unnecessary incident records when the instance receives a response to sent email. vCalendar requests in email responses are identified by the EmailUtils script include.</td>
</tr>
<tr>
<td>Ignore header</td>
<td>Ignores email that contains specific headers. This filter overrides the glide.pop3.ignore_headers property.</td>
</tr>
<tr>
<td>Ignore sender</td>
<td>Ignores email from specific senders. This filter overrides the glide.pop3.ignore_senders property.</td>
</tr>
<tr>
<td>Ignore subject</td>
<td>Ignores email with specific terms or phrases in the subject line. This filter overrides the glide.pop3.ignore_subjects property. This filter might not apply to emails arriving from unknown users. Unknown users can be locked out.</td>
</tr>
<tr>
<td>Move spam to junk folder</td>
<td>Moves email identified as spam to the Junk folder. This filter checks for the value of the ServiceNow spam header. If the header is X-ServiceNow-Spam-Status:Yes, the filter moves the email to the Junk folder</td>
</tr>
</tbody>
</table>

Email filter script include

Email filters use a script include called EmailUtils that contains a simple utility function to determine if vCalendar is in the body of the response email. The results of this query are used in a condition script in the Ignore VCAL email filter.

Spam scoring and filtering

Every message sent through email servers is assessed for the likelihood of being spam. Based on this assessment, the instance adds headers to each message that can be used for filtering within the customer instance using the Email Filters plugin. This is only available for instances that use the ServiceNow email infrastructure. See KB0549426 for an explanation of email scoring and filtering.

Activate email filters

Administrators can activate the Email Filters plugin (com.glide.email_filter).

Role required: admin

1. Navigate to System Definition > Plugins.

A banner notifies you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

Note:

To redirect to the legacy list view for plugins, click the link.
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.
   You can activate the plugin directly from the All Applications page or you can view more details about the plugin before you activate it.
   - If you are certain that you have the correct plugin, click Install, and when you see the dialog box, click Activate.
   - To view plugin details before activation:
     1. Click the plugin name.
     2. On the form, click the Activate/Update related link.
     3. In the dialog box, review the dependent plugins.
        - If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.
     4. If demo data is available and you want to install it, click Load demo data.
        Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.
     5. Click Activate.
Create an email filter
You can create email filters to apply a custom action script or filter actions when email matches your filter's conditions.

Role required: admin

1. Navigate to **System Mailboxes > Administration > Filters.**
2. Click **New.**
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the email filter.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the email filter.</td>
</tr>
<tr>
<td>Order</td>
<td>Priority that the email filter takes over other filters for the same table.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the email filter.</td>
</tr>
<tr>
<td>Short description</td>
<td>Description of what the filter does.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions to define which emails to filter. Note that conditions are case sensitive.</td>
</tr>
<tr>
<td>Condition script</td>
<td>Script to define which emails to filter. Use this script to access other tables, variables, or methods. For example, the condition script for the Ignore VCAL filter looks for the results of the EmailUtils script include, which detects vCalendar attachments.</td>
</tr>
<tr>
<td>Action script</td>
<td>Script to define additional behavior to be performed when the filter condition evaluates to true. This might include an email action not included in the default filter actions. In the base system, the action script is used to produce the error string that is published to the email log (<strong>System Logs &gt; Email</strong>).</td>
</tr>
</tbody>
</table>

4. Right-click in the header bar and select **Save** from the context menu.
   The Filter Actions related list appears.
5. Click **New** in the related list.
6. Select how the system should react when the conditions of this filter evaluate to true.
   The two choices in the base system are: Mark as Ignored and Move to Junk. You can use the Action script to perform additional email tasks.

**Note:** Before creating additional email actions with a script, see **Inbound Email Actions.** Like business rules, inbound email actions use both conditions and scripts and can provide a number of useful actions on emails the instance receives.

**Email retention**
You can archive and eventually destroy email messages that you no longer need or if your Email table is excessively large.

Email retention is available starting with the Helsinki release.

**Email archive and destruction plugins**
The email archiving and destruction feature uses the **Data Archiving** and **Email Retention** plugins. The Data Archiving plugin must be active to archive and destroy email records. The Email...
Retention plugin provides a set of rules that specify when the system archives and destroys email records.

**Note:** The Email Retention plugin also prevents the system from deleting watermarks, which are required for inbound email actions to continue to function.

The Email Retention plugin and associated archive and destroy rules are active by default on new instances. On upgraded instances, you must manually activate both the plugin and the archive and destroy rules. ServiceNow recommends that you review and approve these rules before activating them.

If your instance already has a process to manage email records, you do not need to activate the Email Retention plugin. If you want to replace your current process with Email Retention, be sure to deactivate the current process before activating the archive and destroy rules.

### Archiving and destroying email records

*Archiving* means moving records from the Email (sys_email) table to the Archive Email (ar_sys_email) table when they exceed the archive rule time limit. *Destroying* means deleting records in the Archive Email table when they exceed the destroy rule time limit.

**Note:** When a destroy rule deletes email records, associated watermarks are not deleted. They are preserved to ensure that your inbound email actions continue to function.

### Default archive and destroy rules

Email Retention provides these email archive rules:

- **Emails - Ignored and over 90 days old:** archives email message records that were created more than 90 days prior to the current date and are of type `received-ignored` or `sent-ignored`.
- **Emails - Over a year old:** archives email message records that were created more than 365 days prior to the current date.

Email Retention also provides this email destroy rule:

- **Email Archive - Over a year old:** destroys email records that have been archived for more than 365 days prior to the current date.

With these default settings, your email messages are kept on the instance for a total of two years: one year in the Email table, and one year in the Email archive table. At the end of this period, the system deletes the expired email records from the Email archive table.

**Note:** By default these rules are active on new instances and inactive on upgrades. The system runs archive and destroy rules when you activate them.

### Compatibility with other record management implementations

If you are already using another method to manage email records, such as table cleaners, you do not have to use the Email Retention feature. To prevent unexpected record deletion, ServiceNow recommends that you avoid using multiple email management processes on the same instance at the same time.
**Note:** For assistance replacing your existing record management implementation with Email Retention, contact your professional services or sales representative.

---

### Effects of archiving and deleting email records

Inbound email actions copy the body of an email to the work notes of the related record. If the inbound email record is later deleted, the work notes still contain a text copy of the email.

When the system sends an email message about a record, the activity formatter displays a Sent Email section with a link to the email message. If the system archives the email message, the activity formatter removes Sent Email section. When the system deletes the email message, it is no longer visible in the activity formatter nor the work notes.

**Note:** Set the archive time length long enough so your users can access sent emails through the activity formatter.

---

Archiving email records changes the methods available to the system to identify inbound email as a reply. After archiving an email record, the system can no longer use the In-Reply-To field to match an incoming email to an email record. However, the system can still match incoming email to an existing record from a record number or watermark.

**Activate the Email Retention plugin**

The Email Retention plugin provides archive and destruction rules for email messages. It is active by default for new instances, but must be activated for upgrades.

**Required role:** admin

The Email Retention plugin requires these plugins:

- Data Archiving
- System Mailboxes

1. **Navigate to System Definition > Plugins.**

   A banner notifies you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:**

   To redirect to the legacy list view for plugins, click the link.

2. **Find the plugin using the filter criteria and search bar.**

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. **Activate the plugin.**

   You can activate the plugin directly from the All Applications page or you can view more details about the plugin before you activate it.

   - If you are certain that you have the correct plugin, click **Install**, and when you see the dialog box, click **Activate**.
To view plugin details before activation:

1. Click the plugin name.
2. On the form, click the Activate/Update related link.
3. In the dialog box, review the dependent plugins.
   
   If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.

4. If demo data is available and you want to install it, click Load demo data.
   
   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.

5. Click Activate.

Archive email manually

You can archive email messages manually on demand instead of waiting for the instance to archive them based on a scheduled job.

Role required: admin

Email Retention provides these email archive rules:

- **Emails - Ignored and over 90 days old**: archives email message records that were created more than 90 days prior to the current date and are of type received-ignored or sent-ignored.
- **Emails - Over a year old**: archives email message records that were created more than 365 days prior to the current date.

You can manually archive email messages that meet these archive rules or any additional archive rules that you create.
1. Navigate to **System Archiving > Archive Rules**.
2. Open the email archiving rule that you want to modify.
3. Click **Recalculate Estimate** to see how many records in the Email (sys_email) table are going to be archived. The estimate appears in the **Record estimate** field.
4. Click **Run Archive Now**.

**Note:** You can also **archive related records**.

---

**Watermarks on notification emails**

By default, the system generates a watermark label at the bottom of each notification email to allow matching incoming email to existing records. Each watermark includes a random 20-character string that makes it unique.

Starting with the Jakarta release, the system automatically generates randomized watermarks for notification emails in base systems. The random 20-character string reduces the possibility of a watermark being guessed or coincidentally matching the watermark of an email from another instance.

**Note:** If you are upgrading from a release before Jakarta, random watermark support is optional and requires the Random Watermark Support plugin to be activated.

---

**Watermark format**

The email watermark always begins with "**Ref:**" to identify the label as a watermark. After this identifier, the default label is 31 characters in length and consists of:

- Customizable prefix — The default prefix is **MSG**.
- Auto-numbered identifier — The numeric string identifying the source record, such as incident, problem, or change request.
- An underscore character followed by a random 20-character string
Randomized watermark example

When inbound emails are processed, the system matches random watermarks to the appropriate source records.

**Watermark configuration**

Watermarks are always generated, but you can configure them to:

- Create a custom watermark prefix for each instance to prevent accidentally triggering events in the wrong instance.
- Have custom prefix characters after MSG
- Be hidden globally
- Be omitted from individual email messages

If watermarks are omitted from email notifications, inbound email actions might not work properly. Without a watermark, the system processes inbound email messages as described in [Criteria for matching email to inbound actions](#).

**Note:** Email clients that use the plain text version of the email still show the watermark.

Create a custom watermark prefix for email notifications

By default, email notifications use the watermark prefix **MSG**, but you can create a custom watermark prefix.

Role required: admin

Any email notifications that are forwarded from one instance to another might be more easily distinguished with different prefixes for each instance. To avoid unintentionally triggering events in the wrong instance, create a unique watermark prefix for each instance.
**Note:** Do not use colons (:) in custom watermark prefixes. Colons are a reserved character and may cause the watermark to be ignored.

1. **Navigate to System Definition > Number Maintenance.**
2. **Open the MSG record in the Email Watermark (sys_watermark) table.**
3. **Enter the unique **Prefix** for this instance.

4. **Click Update.**

Your custom watermark applies to all new email notifications. Email notifications that existed before you created a custom watermark keep the same watermarks as before.

**Omit an email notification watermark**

You can omit watermarks on email notifications if you do not want the instance to match the notification to an existing record.

**Role required:** admin

1. **Navigate to System Notification > Email > Notifications.**
2. **Select the email notification to update.**
3. **Click the Advanced View related link.**
4. **In the What it will contain section, select the Omit watermark check box.**

When incoming email does not contain a watermark, the system searches the subject line and message body for a record number. The system attempts to match any record number that it finds to an existing record. If there is a matching record number, the system updates the record with the values in the incoming email. To ensure that response email messages don’t update records, remove the record number variable \${number} from the Subject and Message HTML fields.
Hide email watermarks globally
Rather than omitting watermarks, it is possible to hide watermarks on a global basis using HTML markup.

Role required: admin

Watermarks can only be hidden in the HTML message. The text version of the message, because it does not have markup allowing show/hide semantics, will always have the watermark.

1. Navigate to sys_properties.list in the Application Navigator.
2. Create a new property named glide.email.watermark.visible and set it to false.

This ensures that all watermarks are hidden on all email messages. This cannot be done on a per-email basis.

System mailboxes
Email messages can be seen in the System Mailboxes menu, which gives you access to the system Inbox, Outbox, and Sent mail box.

Each provides a filtered view of emails to let you see only what you need to at any given time, including list fields applicable to each. The system mailboxes menu shows your current POP and SMTP status.

The System Mailbox is hosted by ServiceNow, who have sole access to the mailboxes. By default, once the instance pulls an email message, it is deleted from the mail server and stored in the application on the Email [sys_email] table.

For information about the fields that are shown in the System Mailbox, see System email log and mailboxes. You can configure the layout of a system mailbox to show any of the email log fields, not only the ones that are shown by default.

- **Inbound emails**: All inbound mail is placed into the Inbox until it is processed. After it is cleared, the email moves to the Received state. If the email message matches the criteria in an inbound email action, the email is changed to Processed. If not, it is changed to Ready. If the system is restarted for any reason (such as during a system upgrade), all inbound mail waits on the external mail server until the system can request delivery.
