**Dependency Views** ..................................................................................................................................... 455

- Supported browsers for Dependency Views ............................................................................................... 456
- Domain separation and Dependency Views ................................................................................................. 456
- Dependency Views map .................................................................................................................................. 457
- Dependency Views map menus and controls ............................................................................................... 458
| Cluster nodes in a Dependency Views map                          | 462 |
| Virtual grouping of nodes in a Dependency Views map             | 465 |
| Use Dependency Views                                           | 467 |
| Administer Dependency Views                                    | 472 |
| Properties for Dependency Views                                | 481 |
| Components installed with Dependency Views                     | 484 |

**Connect**

| Supported browsers for Connect                                   | 485 |
| Activate Connect                                                 | 486 |
| Activate Connect Support                                         | 486 |
| Connect interface                                                | 489 |
| Enable or disable Connect notifications globally                  | 501 |
| Edit which notifications you receive for a conversation          | 502 |
| Upload a profile picture                                         | 504 |
| Drag a file into a Connect conversation                          | 505 |
| Share a Visual Task Board in a Connect conversation              | 505 |
| Mention a user in a Connect conversation                         | 505 |
| Connect administration                                           | 506 |
| Connect Chat                                                     | 516 |
| Connect Support                                                  | 522 |

**Content Management System**

| Content Management design                                       | 539 |
| Domain separation in the Content Management System              | 547 |
| Configure Content Management sites                              | 547 |
| Content Management integration points                           | 598 |
| Content Management testing                                      | 605 |
| Global search in Content Management                             | 606 |
| CMS translation                                                 | 606 |

**Credentials and connection information**

| Introduction to credentials, connections, and aliases           | 607 |
| Domain separation for Credentials and Connections              | 608 |
| Create connection attributes for IntegrationHub                 | 609 |
| Setting up connections to target hosts                         | 610 |
| Getting started with credentials                                | 611 |
| Credential alias for Orchestration activities                   | 617 |
| Check IP service affinity for Discovery and Orchestration       | 678 |

**Data Certification**

| Activate Data Certification                                     | 681 |
| Certification schedules                                         | 681 |
| Certification tasks                                             | 687 |
| Certification elements                                           | 689 |
| Certification instances                                         | 691 |
| Certification audit instances                                   | 692 |
| Certification audit definition                                  | 693 |
| Data Certification Overview module                              | 694 |
| Data Certification planning                                     | 696 |
| Data certification performance                                  | 699 |
| Reassign a certification task                                   | 710 |
| Send certification task reminders                               | 717 |
| Mark a certification task as closed incomplete                  | 717 |
| Certification tasks cancellation                                 | 718 |
| Domain separation and Data Certification                        | 719 |

**Decision Tables**

| Create a decision table to resolve complex decisions             | 720 |
| Decision table properties                                       | 721 |

**E-signature**

Now Platform capabilities

Digitize your workflows and run them at scale by using the core capabilities of the Now Platform®. When you activate and configure these features, you can create custom business logic, manage and secure data, and build alternate user interfaces.
Digitize your workflows with the Now Platform

Use native platform intelligence to predict, prioritize, and proactively manage the work that matters most for your own organization.

View and download the full infocard for a highlight of Now Platform capabilities features.

Automate work with Flow Designer

Turn business processes into digital workflows to deliver more intuitive experiences by extending ServiceNow solutions or building new workflow apps with no-code development tools.
Connect your enterprise with IntegrationHub

Connect your systems and apps using Now Platform APIs and tools. Use the ServiceNow Store to get access to an entire ecosystem of innovation for enterprise software.
Create engaging app experiences with Service Portal
With Service Portal, you can deliver your apps to employees through a portal that they can access from any device, at any time.

**Improve agent efficiency with Agent Workspace**

Solve issues faster with a workspace that is built to facilitate resolutions. From a single view, agents get full context and AI-assisted recommendations to resolve issues quickly. Agents can communicate with customers from the same interface while reviewing issues.

**Get started**

- Learn how to build your first flow. See [Getting started with flows](#)
- Review the list of available IntegrationHub spokes. See [IntegrationHub available spokes](#)

Advanced Work Assignment

Use the ServiceNow® Advanced Work Assignment (AWA) feature to automatically assign work items to your agents, based on their availability, capacity, and optionally, skills. AWA pushes work to qualified agents using work item queues, routing conditions, and assignment criteria that you define. Agents see their assignments in their Agent Workspace inbox.
Customers use different channels to request service, for example, chats, cases, or incidents. Requests from customers create task or interaction records that store information about these objects, called work items.

AWA automatically routes work items to queues that focus on certain types of support, using criteria (such as priority or customer status) that you provide. Queues can be defined based on need or type, for example product or critical cases. You also identify the agent groups responsible for work in the queue. AWA then applies assignment rules that you set and uses agent availability, capacity, and skills (if defined) to assign work to the most qualified agent.

Advanced Work Assignment components

Service channels
A means of providing customer service. AWA offers base system channels for chats, cases, incidents, and walk-up centers. For each channel, you can set attributes such as agent capacity and utilization conditions to control the work handled in the channel.
Work items
A single piece of work to be handled by an agent from start to completion. For example, one chat or one case are objects that are routed and assigned to agents.

Work item queues
A queue stores a specific type of work item for a service channel. AWA admins can create queues that focus on certain types of support within the channel, such as VIP customers or critical cases. AWA routes work items to queues based on specific conditions or requirements that you define, such as customer status, or region. Groups assigned to each queue handle the incoming work items. Once work items are placed in a queue, AWA can then assign items to available agents based on assignment rules and agent availability and capacity.

Assignment groups
Agents belong to specific groups that are organized by the type of work assigned to them. You provide details about an assignment group including the name and description, manager, and group email. You can also set up roles, groups and group members, queues, and agent capacity overrides for agents in an assignment group.

Assignment rule
Criteria that determines how work items are pushed to the appropriate agent within a qualified assignment group.

Agent capacity
The maximum number of work items on a particular service channel that an agent may actively work on at one time.

Agent availability
States that indicate agent presence and whether the agent is available for work or is busy or offline. AWA uses the agent availability state to determine if an agent is able to receive work.

Inbox layout
A configuration tied to a service channel that defines which fields of a record representing a work item are shown in agent inboxes. A layout defines what the agent sees in Agent Workspace.

Advanced Work Assignment roles
AWA adds the following roles for users who configure, manage, and receive work assignments.

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWA administrator [awa_admin]</td>
<td>Admin role for the AWA feature. Configures and administers across all channels.</td>
</tr>
<tr>
<td>AWA agent [awa_agent]</td>
<td>Agent role for the AWA feature. Handles customer interactions and manages workload across multiple service channels.</td>
</tr>
<tr>
<td>AWA developer [awa_integration]</td>
<td>Developer role for using the AWA API.</td>
</tr>
</tbody>
</table>
Basic process for configuring AWA

Users with the awa_admin role determine:

- What to route – Configure the base service channels to be used.
- Where to route – Define the work item queues and the routing rules, execution order, work item sort order, and strategy
- How to assign work items – Define the assignment rules that determine the work items pushed to agents
- What the agent sees – Set the inbox card layouts and presence (availability) states that agents use in their Agent Workspace inbox.

For details on the AWA components and related configuration, see these sections.

Get started with Advanced Work Assignment

To implement Advanced Work Assignment, complete these initial configuration and setup steps.

Role required: awa_admin and admin

1. Activate the Advanced Work Assignment plugin for your instance.
2. Activate related AWA plugins to enable base system service channels and the Performance Analytics Solution for AWA. For example, activate the Agent Chat plugin to enable the Chat service channel and Agent Chat in Agent Workspace.
3. Configure the service channels that you activated.
   - Create or modify an inbox layout.
   - Override agent capacity as needed.
4. Create agent groups to which work items are assigned.
5. Create work item queues for your service channels.
   - Define the pools of agents eligible for assignment (eligibility assignment).
   - Set the sort order for work items in the queue.
6. Configure the work assignment rules used to push work to the appropriate agents.
7. Set the controls that agents use to manage their availability states and assignments in Agent Workspace.
   - Create or update the presence states that agents use to indicate their availability.
   - Create or update the reasons that agents use to decline work assignments.

Activate Advanced Work Assignment

You can activate the Advanced Work Assignment plugin (com.glide.awa) if you have the admin role.

Role required: admin

Advanced Work Assignment activates the Skills Management [com.snc.skills_management] plugin to implement user and group skills.
Plugins for

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skills Management</td>
<td>Implements user and user group skills. Based on the same principles of roles management, which uses inheritance between user groups.</td>
</tr>
</tbody>
</table>

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.
   - You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, they will receive the following error: *Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.*

Activate the related AWA plugins to enable the appropriate service channels and the Out-of-the-box Performance Analytics Solutions for Advanced Work Assignment.

**Activate related plugins for Advanced Work Assignment**

After activating the Advanced Work Assignment plugin, activate related AWA plugins to enable other base system service channels and the Performance Analytics Solutions dashboard for AWA.

You must have the admin role to activate these additional plugins for AWA. For details, see [Activate a plugin](#).

<table>
<thead>

Migrate from Connect Support to Advanced Work Assignment and Agent Chat

Agent Chat (live chat) is the real-time messaging system that agents use in Agent Workspace to interact with customers. To migrate from Connect Support, use AWA to create the chat queues used for routing chat work items to agents and the Chat Setup form to configure Agent Chat.

Role required: admin

1. Activate the Advanced Work Assignment and Agent Chat plugins if they are not currently active.
2. If needed, review your existing Connect Support chat queues and determine whether you want to create a similar set of queues for the Chat service channel in AWA.

   **Note:** You cannot use your Connect Support chat queues in AWA. Chat queues for Connect Support are stored in the Chat Queue [chat_queue] table, while chat queues for AWA are stored in the AWA Queue [awa_queue] table.

3. In AWA, configure the Chat service channel and create the associated chat queues.
4. In the Chat Setup form, specify Agent Workspace as the fulfiller interface for live chat.
   a) Navigate to **Collaboration > Chat Setup**.
   b) In the **Global Fulfiller UI** choice list or the **Fulfiller UI** choice list for CSM or ITSM, select Agent Workspace.
   c) Click **Update**.

Components installed with Advanced Work Assignment

Several types of components are installed with activation of the Advanced Work Assignment plugin, including tables, user roles, and scheduled jobs.

**Note:** The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

Roles installed

### Domain separation in Advanced Work Assignment

This overview describes domain separation in the Advanced Work Assignment feature. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

### Overview

#### Support: Level 2

Advanced Work Assignment enables the automatic assignment of work items to qualified agents using work item queues defined for specific service channels. Managed Service Providers can create domain-specific queues by specifying a particular domain as a queue routing condition.
How domain separation works in Advanced Work Assignment

When an instance has a domain hierarchy where users and groups belong to different domains, you may need to restrict the visibility of work items to certain agents in a domain. You may also need to ensure that work items are routed to agents in the proper domain. AWA admins can configure service channels and associated work item queues to:

Route work by domains

To push work items to agents in domains where only certain tasks or interactions are visible to them, use a routing condition that routes those items to the appropriate queues. For example:

- To restrict a queue to only items that match exactly to a particular domain X, specify this condition: `[Domain] [is] [X]`
- To route all work items in domain X and its child domains to a queue, use the Domain Path field and specify a condition such as: `[Domain Path] [starts with] [!!!/!!#/]`

Assign work to agents in the appropriate domain

To assign work items to agents in the appropriate domain, ensure that the assignment groups specified in the queue Eligibility Assignment pools have agents that belong to the domains where they can see the work items routed to the queue.

If a mismatch occurs, and agents in an eligible assignment group cannot see a work item in a queue, AWA may temporarily assign an item to an agent. However, before the item is moved to the agent's inbox, AWA automatically rejects the assignment with the reason No access. AWA reassigns the work item to a different agent who might have access. If none of the available agents can see the work item, the item could be rejected multiple times. The item can get stuck in the queue until the AWA admin can correct the eligible assignment configuration.

Service channels

Provide customer support for your full range of incoming work by automatically routing work to agents through service channels.

A service channel is a means of assigning a specific type and scope work to agents. You can configure base system service channels to set the context and service channel attributes that define the work handled in the channel, or you can create your own custom service channel.

Advanced Work Assignment provides several service channels from which work items originate. These channels are:

<table>
<thead>
<tr>
<th>Service channel</th>
<th>Description</th>
<th>Plugin</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chat</td>
<td>Used to route and assign chat interactions</td>
<td>Included with the Agent Chat (com.glide.interaction.awa) plugin</td>
</tr>
<tr>
<td>Case</td>
<td>Used to route and assign customer service cases</td>
<td>Included with the Advanced Work Assignment for CSM (com.sn_csm_awa) plugin</td>
</tr>
<tr>
<td>Incident</td>
<td>Used to route and assign incidents</td>
<td>Included with the Advanced Work Assignment for Incidents (com.snc.incident.awa) plugin</td>
</tr>
<tr>
<td>Walk-up</td>
<td>Used to route requests from a walk-up contact channel</td>
<td>Included with the Walk-up Experience (com.snc.walkup) plugin</td>
</tr>
</tbody>
</table>
You can also set up a custom service channel to address work that is not supported in the base system channels. For more information, see Set up a custom service channel.

For each service channel, you set attributes such as:

- Agent capacity: the amount of work that can be handled by the agents supporting the channel.
- Filters: conditions that filter the type of work handled in the channel.
- Utilization: conditions that determine when work items are generated.

For each service channel, you also:

- Create the agent inbox card layout used in Agent Workspace.
- Set capacity overrides for specific agents.
- Review and modify associated work item queues. For the Chat service channel, you can create queues using the Queues related list.

Service channel capacity and utilization

In Advanced Work Assignment, capacity is the number of work items automatically assigned to agents supporting a service channel. Utilization is the condition that identifies the work item states supported in the channel.

Agents have an assigned capacity for each service channel. This capacity is based on the default capacity set for the channel. The agent capacity for one service channel (for example, chat) does not interfere with the capacity on other service channels (for example, case or incident). Admins can set the Default capacity for a channel on the Service Channel form. This setting applies to all agents supporting the channel.

Managers can override the default capacity for:

- Individual agents, by using the Agent Capacity Override related list on the Service Channel form.
- Groups of agents, by using the Agent Capacity Override related list on the Group form.

If an agent already has a capacity override, setting the override again updates the existing capacity for that agent. Override capacity is stored in the Agent Capacity (awa_agent_capacity) table.

Inbox layout

The inbox layout determines the information shown on work item cards displayed in an agent's inbox.

The AWA admin (awa_admin) can configure layouts that represent items in an agent inbox. The configuration allows agents to see the most important attributes by service channel work items. The fields specified on the inbox layout determine the information displayed for a work item.

Each base system service channel provides preconfigured inbox layouts for work items. The AWA admin can view and edit these layouts and also create new layouts.

Up to five fields can be shown in the card layout.

- Fields can be added from the table that the service channel points to.
- The first field added to the layout becomes the title field on the card.

Layout example

For chats that do not have either a contact or consumer, the layout includes only the chat subject. You control the display of the Time to accept count (timer) and the Reject button through the agent assignment rules.
Configure a service channel

Modify or create a service channel used in Advanced Work Assignment. You can specify additional conditions to filter the work items handled in the channel, change agent capacity (workload) for the channel, set the inbox layouts that your agents use in Agent Workspace, and view associated work item queues.

Role required: awa_admin or admin

AWA provides base system channels for the following services, if you activated the corresponding plugins:

- Chats (com.glide.interaction.awa)
- Cases (com.snc_csm.awa)
- Incidents (com.snc.incident.awa)
- Walk-up interactions (com.snc.walkup)

For each channel, you can change certain default settings, such as the default capacity (workload) for agents. You can also use the related lists to review associated queues, define the associated inbox layouts (work item cards) displayed in Agent Workspace, and override the agent capacity value.

You can also create a service channel record from the Service Channel module, but you need to create a queue, assignment rule, and eligible assignment pool in order to route work through the service channel. For more information, see Set up a custom service channel.

1. Navigate to **Advanced Work Assignment > Service Channels**.
   - To create a service channel, click **New**.
   - To modify a service channel, select the service channel record to be updated.
2. Fill in or update fields on the Service Channel form.

<table>

### Field | Definition
--- | ---
**Default capacity** | The number of items automatically assigned to agents (pending overrides).
  * Chat: the default is 4.
  * Case and Incident: the default is 2.
  * Walk-up: 1

**Utilization condition** | Condition that determines what constitutes an active item that counts toward agent workload/capacity (for example, the record state is New, Open, or Awaiting Info).
  * For chat: State is not one of On Hold, New, Work in Progress, Closed Complete
  * For case: State is one of New, Open
  * For incident: State is one of New, In Progress, On Hold
  * For walk-up: State is not one of On Hold, Closed Complete, or Closed Abandoned

3. Click **Update**.
   The channel is added to or updated in the Service Channels [awa_service_channel] table.

As needed:
- Override the agent capacity for selected agents or groups.
- Create or modify an inbox layout for the service channel.
- Configure agent assignment rules for the channel.
- Define agent pools eligible for assignment.
- Create or modify a work item queue for the channel.

### Set up a custom service channel

Set up a custom service channel to expand the type and scope of work that is routed automatically to your agents.

- Select the table that you want to use to route work to agents automatically. Only Task [task] and Interaction [interaction] tables are supported.
- Ensure that the form layout for the selected table is configured for the workspace view. Record types without a workspace view appear as read-only in Agent Workspace. For more information, see Configure the form layout for Agent Workspace.
- Assign the awa_agent and workspace_agent roles to whichever agents are receiving work items in Agent Workspace from your custom service channel.

**Role required:** awa_admin or admin

You can create a service channel record from the Service Channel module, but you need to create a work item queue, assignment rule, and eligible assignment pool to route work through the service channel. You also need to configure the custom service channel to make it available in an agent's inbox in Agent Workspace.

1. Navigate to **Advanced Work Assignment > Service Channels**, and then click **New**.
2. Complete the service channel fields, and then click **Submit**.
   For more information, see Configure a service channel.
3. Create an assignment rule.
   For more information, see Configure agent assignment rules.

4. Create a work item queue for your service channel.
   For more information, see Create a work item queue.

5. On the form for the work item queue that you created, go to the Assignment Eligibility related link
   and create an eligible assignment pool.
   Make sure to associate your assignment rule to the eligible assignment pool.
   For more information, see Define agent pools eligible for assignment.

6. Make your service channel available in Agent Workspace.
   a) Navigate to Advanced Work Assignment > Presence States, and then open Available.
   b) On the form, move your custom service channel to the Selected list.
   c) Select Active option (if not already selected).
   d) Click Update.

7. Optional: Create or modify the inbox card layout to show the most important information from a work item.
   For more information, see Create or modify an inbox layout.

Your custom service channel routes work to agents. In Agent Workspace, the service channel appears as an available service channel in the agent inbox.

**Tutorial: Set up a custom service channel for change requests**

Learn how to configure Advanced Work Assignment to automatically assign change requests to agents. Use this tutorial as a guideline to help you understand how service channel records, queues, and assignment rules work together to create a custom service channel.

In this tutorial, you learn how to set up a custom channel that:

- Assigns new change requests to whichever Change Management agent has the most capacity
- Populates the assignee's agent inbox in Agent Workspace with change requests from the queue
- Displays the change request number, short description, and type on the inbox card
- Enables the agent to accept or reject change requests

For information on setting up custom service channels, see Set up a custom service channel.

Before you begin:

- Ensure that the form layout for the Change Request table is configured for the workspace view; otherwise, work items from the Change Request service channel appear as read-only in Agent Workspace. For more information, see Configure the form layout for Agent Workspace.
- Assign the awa_agent and workspace_agent roles to the Change Management group so that members can open work items in Agent Workspace.

**Create a service channel to route requests**

Create a service channel in Advanced Work Assignment so that you can route change requests to agents.

Role required: awa_admin or admin

1. Navigate to Advanced Work Assignment > Service Channels, and then click New.
2. On the form, fill in the fields.
   - Name: Change Request
   - Inbox Order: 100
   - Table: Change Request [change_request]
- Active: Selected
- Utilization condition: [Active] [is] [true]

3. Click Submit.

Create an assignment rule for change requests
Create an assignment rule in Advanced Work Assignment that assigns change requests to agents who are available to do the tasks.

Role required: awa_admin or admin

1. Navigate to Advanced Work Assignment > Assignment Rules, and then click New.
2. On the form, fill in the fields.
   - Name: Change Request Assignment Rule
   - Assign by: Most Capacity
   - Allow agents to reject: Selected

3. Click Submit.

Create a queue to route new change requests
Create a work item queue in Advanced Work Assignment that routes new change requests through the service channel that handles change requests.

Role required: awa_admin or admin

1. Navigate to Advanced Work Assignment > Queues, and then click New.
2. On the form, fill in the fields.
   - Name: Change Management
   - Service channel: Change Request
   - Condition mode: Simple
   - Work item routing condition: [State] [is] [New]

3. From the form context menu, click Save.

Create an assignment pool of agents
Create an eligible assignment pool in Advanced Work Assignment that receives overflow work items, just in case you need more help from other agents to handle change requests.

Role required: awa_admin or admin

1. Navigate to Advanced Work Assignment > Queues, and then open the Change Management queue.
2. On the form, go to the Assignment Eligibility related list and click New.
3. On the form, fill in the fields.
   - Agent assignment rule: Change Request Assignment Rule
   - Groups: Change Management

4. Click Submit.

Make your service channel available in Agent Workspace
Make your service channel available in Agent Workspace so that agents can receive change requests in their inbox.

Role required: awa_admin or admin

1. Navigate to Advanced Work Assignment > Presence States, and then open Available.
2. On the form, move Change Request to the Selected list.
3. Select **Active** (if not already selected).
4. Click **Update**.

*Customize how change requests appear in an agent inbox*

Customize how change requests appear in an agent inbox so that agents receive enough information to decide whether to accept or reject the work item.

**Role required:** awa_admin or admin

1. Navigate to **Advanced Work Assignment > Service Channels** and open the **Change Request** service channel record.
2. On the Change Request service channel form, go to the **Inbox Layouts** related list and open **Default Change Request layout**.
3. On the form, fill in the fields.
   - Field 1: Number
   - Field 2: Short description
   - Field 3: Type
4. Click **Update**.

When you create a new change request, the item is routed through the Change Request service channel and assigned to the agent in the Change Management assignment group who is available to receive the change request. When the assignee checks their agent inbox, the change request appears with the option for the agent to either reject or accept the work item.

---

**Create or modify an inbox layout**

Create or modify the card layout for inbox items for a given service channel. Card layouts are displayed in the agent inbox view of Agent Workspace.
Role required: awa_admin or admin. Users with the awa_manager or agent role can review inbox layouts.

Cards represent work items in an agent's inbox in Agent Workspace. Each channel has a default layout for these cards, which can display up to five fields from the related table record. Use the Inbox Layout form to change a default layout, such as the name, short description, and the specific fields displayed on the card, for example channel and contact or consumer name. You can also specify certain conditions that determine when the card layout is used.

1. Navigate to Advanced Work Assignment > Service Channels and select the service channel to be updated.
2. In the Service Channel form, click the Inbox Layouts related link.
   - To create a layout, click New.
   - To modify a layout, select the layout to be updated.
3. Fill in or modify the Inbox Layout form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the inbox layout.</td>
</tr>
<tr>
<td>Service channel</td>
<td>The name of the selected service channel.</td>
</tr>
<tr>
<td>Short description</td>
<td>The description of the inbox layout.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which the layouts appear in the agent inbox.</td>
</tr>
<tr>
<td>Condition</td>
<td>A condition that determines when this layout is used. Use the condition builder to specify a condition that must evaluate to true to apply the layout.</td>
</tr>
<tr>
<td>Card layout</td>
<td>Example card layout.</td>
</tr>
<tr>
<td>Field 1</td>
<td>The field from the table for the channel, for example the Interaction [interaction] table for the chat service channel. Select the field or select None to remove an existing field.</td>
</tr>
<tr>
<td>Field 2</td>
<td>The field from the table for the channel, for example the Interaction [interaction] table for the chat service channel. Select the field or select None to remove an existing field.</td>
</tr>
<tr>
<td>Field 3</td>
<td>The field from the table for the channel, for example the Interaction [interaction] table for the chat service channel. Select the field or select None to remove it.</td>
</tr>
<tr>
<td>Field 4</td>
<td>The field from the table for the channel, for example the Interaction [interaction] table for the chat service channel. Select the field or select None to remove it.</td>
</tr>
<tr>
<td>Field 5</td>
<td>The field from the table for the channel. For example, the Interaction [interaction] table for the Chat service channel. Select the field or select None to remove it.</td>
</tr>
</tbody>
</table>

4. Click Submit for a new layout or Update to modify a layout.
   The layout is added to or updated in the Inbox Layout [awa_inbox_layout] table.

As needed:
Override the agent capacity value for selected agents or groups.
Create or modify a work item queue for the channel.

Override agent capacity for selected agents

Change the default number of work items that an agent can handle for a service channel.

Role required: awa_manager, awa_admin, or admin

To change the capacity for selected agents, use the Agent Capacity Override related list for the service channel. To change the capacity for one or more members of a selected group, use the Agent Capacity Override related list for the group (Advanced Work Assignment > Groups).

1. Navigate to Advanced Work Assignment > Service Channels and select the desired service channel.
2. In the Agent Capacity Override related list, click New.
3. Fill in the fields on the Change Agent Capacity (Service Channel) form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Channel</td>
<td>The name of the selected channel.</td>
</tr>
<tr>
<td>Override Capacity</td>
<td>The number of work items that the selected agents can handle.</td>
</tr>
<tr>
<td>Users</td>
<td>The agents to which this override applies. Move the agent names from the Available list to the Selected list. You can use the filter to identify conditions that restrict the list of agents.</td>
</tr>
</tbody>
</table>

Note: The filter shows only users or groups that have AWA roles (awa_agent, awa_manager, awa_admin, admin).

4. Click Submit.

The selected agents and their associated capacity values are listed in the Agent Capacities table.

If you are configuring a service channel, you can create or change an inbox layout for the channel.

Work item queues

In Advanced Work Assignment, queues store a specific type of work item for a service channel.

AWA administrators can create or modify queues based on customer need. As part of creating or modifying a queue, the awa_admin identifies some information about the queue, including the service channel to which the queue belongs and which agent groups handle the incoming work items.

In addition, the awa_admin can select a schedule that defines when the queue is available and identify a time limit within which an agent should accept a work item in the queue. If the selected service channel is Chat, the awa_admin creates the chat messages that are displayed to users.

Routing conditions identify the work items that are routed to a queue. Create routing conditions in one of two ways:

- Simple: use a condition builder to select routing conditions. The fields available for selection are based on the selected service channel.
• Advanced: use a JavaScript script to identify routing conditions.

The awa_admin can also create a queue without routing conditions so that work items are not automatically routed to that queue. Customers can manually assign work items to the queue or assign work items using assignment tools such as matching rules or flow designer.

When a case in a queue is manually assigned, the case is removed from the queue. The state of the work item is set to Canceled and the cancellation reason is set to Manually assigned.

Note: New work items may not be assigned if they are routed to queues containing more than 10,000 work items in the queued state.

Assign pools of agents eligible to work on a queue

Assign one or more agent groups to a queue using the Eligibility Assignment related list. These groups are eligible to receive work items from the queue, which allows work to get prioritized to eligible agents.

For each group, select an agent assignment rule and any eligibility time constraints, which are used to determine when the next pool of agents is eligible for assignment. For example, you can assign one group to handle work items immediately and assign a second group to handle the overflow from the first group after work items sit in the queue for a specified amount of time.

Note: If no groups are assigned to a queue, work items can be routed to the queue but are not assigned by Advanced Work Assignment.

Create a sort order for a queue

Use the Work Item Sort Order related list to create one or more sort conditions for work items in a queue. For each sort condition, specify a field from the selected service channel table and the direction to sort, either ascending or descending. Items in the queue are sorted and assigned to agents based on these conditions.

Create a work item queue

Define or modify a queue so that you can determine which specific work items are routed automatically to agents through a given service channel.

Role required: awa_admin or admin

Depending on the service channel, additional configuration options are available. For example, in the chat channel you define the standard messages displayed during a chat session with a user.

1. Navigate to Advanced Work Assignment > Queues.
   • To create a queue, click New.
   • To modify a queue, select the queue record to be updated.

2. Fill in or update the fields on the Queues form.

<table>
<thead>

</tbody>
</table>
### Field | Definition
--- | ---
**Question** | Initial phrase that users see when they start a new chat in the queue. For example: How can we help you?  
**Confirm problem** | Message to users acknowledging the chat request. For example: Thank you for contacting support. Someone will be with you shortly to assist you.  
**Initial agent response** | Message that users see when an agent accepts a chat. For example: Thank you for contacting support. I am looking into your question now and will be with you shortly.

3. **Click Submit** for a new queue or **Update** to modify the queue. The queue is added to or updated in the Queues [awa_queue_list] table.

As needed:
- Define the **Assignment Eligibility**.
- Optionally define the **Work Item Sort Order**.

### Define agent pools eligible for assignment

Specify pools of agents eligible to receive overflow work assignments for a queue. An eligible assignment pool can consist of one or more groups of agents available to work on items in the queue. This feature enables AWA to find a qualified agent from a wider pool of agents.

**Role required:** admin

Use the **Assignment Eligibility** related link to expand the pool of agents eligible to work on items in the queue when other agents are busy or unavailable. For each agent pool, select the assignment rule that determines the assignment eligibility. If you do not define an eligible assignment pool for a queue, work items are routed to the queue but AWA does not assign them.

1. **Navigate to** Advanced Work Assignment > Queues and in the Queues [awa_queues] table, click the queue to update.
2. **To create an assignment pool,** go to the Assignment Eligibility related link.
   - To create a new eligible assignment pool, click **New**.
   - To modify the assignment eligibility for a pool of agents, select the pool to be updated.
3. **Fill in or update the Assignment Eligibility form.**

### Field | Definition
--- | ---
**Agent assignment rule** | The name of the rule that determines how work items are to be assigned. Select an assignment rule from the list.
**Eligible at** | The length of time in seconds before AWA considers the next set of agents for assignment.
### Set work item sort order

Specify the order in which work items in a queue are sorted.

Role required: awa_admin or admin

1. Navigate to **Advanced Work Assignment > Queues > Module** and select the queue.
2. Click the **Work Item Sort Order** related list and click **New**.
3. In the Work Item Sort Order form, select:
   a) **Field**: The field to be used for the sort. The fields are from the table for the associated channel. For example, the fields available for the chat service channel are from the Interaction table.
   b) **Sort Direction**: The order in which work items are sorted. Select either Ascending (smallest to largest or oldest to newest) or Descending (largest to smallest or newest to oldest).
   c) **Order**: The value of the **Order** value relative to other items in the queue.
4. Click **Submit**.

### Tutorial: Route interactions by context

Learn how you can configure Advanced Work Assignment to route conversations to agents according to the context of the conversation.

Activate the Customer Service Management Demo Data (com.snc.customerservice.demo) plugin.

A basic understanding of context variables is required. For more information on context variables, see Virtual Agent scripts.

Role required: awa_admin or admin

The **What can we help you with?** record producer is available by default with the Customer Service Management Demo Data (com.snc.customerservice.demo) plugin. In the record producer, chat requesters can specify one of three issue categories that they need help with:

- Product
- Billing
- Order

Whichever category they select passes a value through the **liveagent_csp_category** context variable. Learn how to create queues that route conversations to agents according to the values passed through this context variable.

### Create a queue for product issues

Create a queue for the Chat service channel that routes product issues.

1. Navigate to **Advanced Work Assignment > Queues**, and then click **New**.
2. Enter the following information in the fields listed:
   • Name: Product Support
   • Service channel: Chat
   • Condition mode: Advanced

3. In the **Script** field, enter this script:

   ```javascript
   (function executeCondition(/* glide record */ current) {
     var contextTable = current.getValue('context_table');
     var interactionBlobRecord = new GlideRecord(contextTable);
     interactionBlobRecord.addQuery('sys_id', current.getValue('context_document'));
     interactionBlobRecord.query();
     if (interactionBlobRecord.next()){ 
       var jsonBlob = JSON.parse(interactionBlobRecord.getValue('value'));
       if (jsonBlob.liveagent_csp_category == 'product')
         return true;
     }
     return false;
   })(current);
   ```

4. Click **Submit**.

**Create a queue for billing issues**

Create a queue for the Chat service channel that routes billing issues.

1. From the Queues list view, click **New**.
2. Enter the following information in the fields listed:
   • Name: Billing Support
   • Service channel: Chat
   • Condition mode: Advanced

3. In the **Script** field, enter this script:

   ```javascript
   (function executeCondition(/* glide record */ current) {
     var contextTable = current.getValue('context_table');
     var interactionBlobRecord = new GlideRecord(contextTable);
     interactionBlobRecord.addQuery('sys_id', current.getValue('context_document'));
     interactionBlobRecord.query();
     if (interactionBlobRecord.next()){ 
       var jsonBlob = JSON.parse(interactionBlobRecord.getValue('value'));
       if (jsonBlob.liveagent_csp_category == 'billing')
         return true;
     }
     return false;
   })(current);
   ```

4. Click **Submit**.

**Create a queue for order issues**

Create a queue for the Chat service channel that routes order issues.

1. From the Queues list view, click **New**.
2. Enter the following information in the fields listed:
   • Name: Order Support
   • Service channel: Chat
• Condition mode: Advanced

3. In the Script field, enter this script:

```javascript
(function executeCondition(/* glide record */ current) {
    var contextTable = current.getValue('context_table');
    var interactionBlobRecord = new GlideRecord(contextTable);
    interactionBlobRecord.addQuery('sys_id', current.getValue('context_document'));
    interactionBlobRecord.query();

    if(interactionBlobRecord.next()){
        var jsonBlob = JSON.parse(interactionBlobRecord.getValue('value'));
        if(jsonBlob.liveagent_csp_category == 'order')
            return true;
    }
    return false;
})(current);
```

4. Click Submit.

Work assignments

After routing work items to the appropriate queues and corresponding agent groups, Advanced Work Assignment pushes work to the most qualified agent using the assignment criteria that you specify.

Administrators can choose to push work items to agents based on one of these assignment rules:

• Most capacity: This option pushes work to agents that have the most capacity (availability for work) for a given channel. For example, suppose that two available agents, John and Beth have different capacities. John has capacity for three chats, but Beth has capacity for two chats and is currently working on one chat. AWA assigns the next work item to John since he has the most capacity.
• Last assigned: This option pushes work to the agent who has gone the longest without a work assignment in the service channel. If more than one agent has the same spare capacity in a service channel, AWA creates and assigns the next work item to the agent who has gone the longest without work in the service channel.

In addition to selecting the assignment rule, AWA admins can also determine whether:

• Agents can reject work items
• A timer is used to set a timeout period (the length of a time that an agent has to reject or accept a work item)
• Agent skills are to be considered in assignment

Assignment process

When an agent is available, AWA:

• Checks the queue priority and gets an item from the queue with the highest priority. AWA also reviews items that have timed out or have been rejected by agents.
• Identifies the eligible assignment pool. The eligibility assignment pool widens the group of agents who are eligible to work on an item.
• Determines the available agents based on their presence state, the assignment rule selected (most capacity or last assigned), and also skills, if defined. Agents have spare capacity when they decline, transfer, or complete a work item. For example, after an agent transfers a chat, the agent has additional capacity.
• Pushes the item to the inbox of most qualified agent (the timer begins).
Skill-based work assignment

In AWA, you can enable skill-based assignment and if needed, make skill assignment mandatory. The basic process for setting up skills involves the following steps:

1. Identify agents that have specific skills (for example, a foreign language or expertise in a certain area such as network routers) and assign the skills to those agents using the Skills Management feature.
2. Make the agents members of the assignment groups for the work item queues involving those skills.
3. Create an assignment rule in AWA that enables mandatory skill handling for the specific skills.
4. Create the work item queue with a routing condition that includes the specific skill, and include the appropriate group in the eligible assignment pool.
5. Create a scripted business rule that includes the skill in the table associated with the relevant service channel (for example, the Case table).

During work assignment, AWA routes and assigns work items that require the mandatory skills to the Agent Workspace inbox of the most qualified agent.

Configure agent assignment rules

Set the criteria for assigning work items to agents. Choose the assignment rule that considers the agent with the most capacity or the agent who has gone the longest without work. Select the timeout period for rejecting work items and indicate whether agent skills are to be considered during assignment.

- A basic understanding of the Skills Management feature is recommended.
- If you want agent skills to be considered when work is routed to the appropriate agents, define the skills for your agents or groups. When you enable the skill handling options in the Assignment Rules form, AWA assigns the users in groups with the appropriate skills to corresponding work items.
- You can use rules to identify skills and assign it to work items. For more information on defining and assigning skills for work items, refer to Using rules to identify skills for work items

Role required: admin or awa_admin

1. Navigate to Advanced Work Assignment > Assignment Rules.
   - To create a new rule, click New.
   - To modify a rule, select the layout to be updated.

2. Fill in or update the fields on the Assignment Rule form.

<table>
<thead>

</tbody>
</table>

3. Click **Submit** for a new rule or **Update** if modifying the rule. The assignment rule is added to or updated in the Assignment Rules [awa_assignment_rule] table.

**Tutorial: Assign work to agents by skill**

Learn how you can configure Advanced Work Assignment to route cases to agents who speak German. Use this tutorial as a guideline to help you understand how you can route work items to agents according to their designated skills.

Before you begin:

- Activate the Skills Management (com.snc.skills_management) plugin.
- A basic understanding of the Skills Management feature is required.
- To have skills automatically assigned to cases, consider activating the Skill Determination (com.snc.skill_determination) plugin.
- Create a group of users who work in customer support.
- Assign the awa_agent and workspace_agent roles to the customer support group.
Create a skill

Create a "German" skill.
Role required: skill_admin or admin
1. Navigate to Skills > All Skills, and then click New.
2. Enter the following information in the fields listed:
   • Name: German
   • Active: Selected
3. Click Submit.

Create an assignment rule

Create an assignment rule that routes cases according to skills.
Role required: awa_admin or admin
1. Navigate to Advanced Work Assignment > Assignment Rules, and then click New.
2. Enter the following information in the fields listed:
   • Name: Case Assignment Rule with Skills
   • Assign by: Most Capacity
   • Enable skills: Selected
   • Enforce mandatory skills: Selected
3. Click Submit.

Create a queue

Create a queue where you can route work to agents who have the German skill.
Role required: awa_admin or admin
1. Navigate to Advanced Work Assignment > Queues, and then click New.
2. Enter the following information in the fields listed:
   • Name: German Cases
   • Service channel: Case
3. Click Submit.

Define assignment eligibility

Define who is eligible to receive cases from the German Cases queue.
Role required: awa_admin or admin
1. Navigate to Advanced Work Assignment > Queues, and then open the German Cases queue.
2. On the form, go to the Assignment Eligibility related link and click New.
3. In the Agent assignment rule field, select Case Assignment Rule with Skills.
4. In the Groups field, select your customer support group.
5. Click Submit.

Cases that require German speakers are routed to users in your customer support group who have the German skill.
Agent Inbox controls

Control certain elements of the agent experience in Agent Workspace. Define the agent presence (availability) states and the work item rejection reasons used by agents to decline work assignments in their Agent Workspace inbox.

Agent presence states

Agent availability in Agent Workspace Inbox

AWA admins can define the presence states that agents choose in their inbox to indicate their availability. The default states are

- Available: Solid green bubble indicates that the agent is available to receive work.
- Away: Solid yellow bubble indicates that the agent is not available to receive work.
- Offline: Solid grey bubble indicates that the agent is not available to receive work.

AWA developers with the awa_integration_user role can also use JavaScript or REST APIs to get or set agent presence and agent channel availability. For more information, see

- Agent Presence API (REST APIs)
- Agent - Global (JavaScript APIs)

Agent rejection controls

AWA admins can give agents the option to reject work assignments and specify the reason for rejecting it. The Reject button displays on work assignment cards. When an agent rejects an assignment, a pop-up window enables the agent to select a reason for declining the work item.
Configure agent presence states

Create or modify the availability states that agents use to indicate whether they can receive work or are offline or away. Agents set these states in their Agent Workspace Inbox.

Role required: awa_admin or admin. Users with the awa_manager and awa_agent roles can review the presence states.

The default presence states are Available, Away, and Offline. For the Available state, be sure to enable it (using the Active check box) so that AWA can route work to agents.

1. Navigate to **Advanced Work Assignment > Presence States**.
   - To create a new presence state, click **New**.
   - To update an existing presence state, click the presence record.

2. Fill in or update the fields on the Presence State form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the presence state, for example: Out of office. The default presence states are Available, Away, or Offline.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box for enabling this presence state for agents.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For the default Available state, be sure to enable this Active check box so that work items are routed to available agents. If the Active state is not enabled, AWA does not route work items to agents.</td>
</tr>
<tr>
<td>Available to receive work items</td>
<td>Check box for indicating that agents can handle work items in this presence state. If the presence state is Away or Offline, this box is not selected.</td>
</tr>
<tr>
<td>Service channels</td>
<td>The service channels that can use this presence state. To select a service channel, move the channel name from the Available list to the Selected list.</td>
</tr>
<tr>
<td>Description</td>
<td>A brief description of the state.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which this state is displayed in the agent inbox.</td>
</tr>
<tr>
<td>Show channels</td>
<td>Check box that enables you to restrict the service channels in which agents can update their presence using this state. When you select this field, the Restrict agent update field is displayed.</td>
</tr>
<tr>
<td>Restrict agent updates</td>
<td>The service channels in which agents cannot use this state to update their presence. Click the lock icon and select the appropriate channels. When you complete your selections, click the lock icon to lock the field.</td>
</tr>
<tr>
<td>Apply to all groups</td>
<td>Check box that indicates all groups can use this presence state. To specify only certain groups that can use this presence state, unselect this check box to display the Apply to groups list.</td>
</tr>
</tbody>
</table>
### Configure reasons for rejecting work items

Define the reasons that agents can use to decline work assignments that they receive in their Agent Workspace inbox. A reject reason can apply to all service channels or a single channel that you specify.

**Role required:** awa_admin or admin

1. **Navigate to** Advanced Work Assignment > Reject Reasons.
   - To create a new rejection reason, click **New**.
   - To update an existing rejection reason, click the reason record.
2. **Fill in or update the fields on the Reject Reason form.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the reason for rejecting work items.</td>
</tr>
<tr>
<td>Agent selectable</td>
<td>A check box that indicates the reject reason is selectable by agents in their Agent Workspace Inbox.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which the reject reasons are listed in the agent inbox.</td>
</tr>
<tr>
<td>Apply to all service channels</td>
<td>A check box that indicates the reject reason applies to all service channels. To make the reason available to a single channel, unselect this check box and in the Service channel field, select the appropriate channel.</td>
</tr>
<tr>
<td>Service channel</td>
<td>A list for selecting the service channel to which the reject reason applies. This field is displayed when Apply to all service channels is not enabled.</td>
</tr>
</tbody>
</table>

3. **Click** Submit for a new reason, or if changing an existing reason, click **Update**.
   The rejection reason is added to or updated in the Reject Reasons [awa_reject_reason] table.

### Enable logging for Advanced Work Assignment

Enable logging to monitor AWA routing and assignment.

**Role required:** awa_admin or admin

1. **In the Navigation filter,** enter sys_properties.list.
2. In the System Property [sys_properties] table, click **New** and add the `com.snc.awa.syslog.enabled` property:
   • **Name**: `com.snc.awa.syslog.enabled`
   • **Description**: Log AWA work item routing and assignments in the system log.
   • **Type**: true | false

3. Set the **Value** to true.
4. Click **Submit**.
   Logging for the AWA assignment engine is enabled in the syslog table.

### Out-of-the-box Performance Analytics Solutions for Advanced Work Assignment

Out-of-the-box Performance Analytics Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

### Enabling Performance Analytics Solutions

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With solutions, you can get value from Performance Analytics for your application with minimal setup.

**Note**: Solutions include some dashboards that are inactive by default. You can activate these dashboards to make them visible to end users according to your business needs.

To enable a solution for Advanced Work Assignment, an admin navigates to **System Definitions > Plugins** and activates the Performance Analytics - Content Pack - Advanced Work Assignment plugin.

### Advanced Work Assignment dashboard for interactions

Enable managers to monitor Interaction [interaction] work items so that their agents can better support customer needs.

This dashboard is available in the Advanced Work Assignment content pack. For information on activating the content pack, see Out-of-the-box Performance Analytics Solutions for Advanced Work Assignment.
Advanced Work Assignment dashboard for Interactions
End users and roles

<table>
<thead>
<tr>
<th>End user and goal</th>
<th>Required role</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWA administrator: Configures Advanced Work Assignment to best fit the business needs of customer service.</td>
<td>awa_admin</td>
</tr>
<tr>
<td>AWA manager: Identifies the areas of concern for routing and assignment of work items across service channels.</td>
<td>awa_manager</td>
</tr>
<tr>
<td>Agent manager: Manages agents or agent groups. The agent manager needs to know what agents are working on to make sure customer needs are being met.</td>
<td>sn_customerservice_manager</td>
</tr>
<tr>
<td>Performance Analytics administrator: Ensures that business managers are making the best use of Performance Analytics solutions.</td>
<td>pa_admin or pa_viewer</td>
</tr>
</tbody>
</table>

Use case

This dashboard provides support managers with an overview of incoming work items and the availability of agents to handle them. Managers can monitor these daily trends to determine if adjustments should be made to the routing criteria, agent capacity values, and other settings that determine how work is pushed to agents.

Indicators

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Work Items</td>
<td>Total number of Interaction work items that were created today. The goal for this indicator is to minimize the number of Interaction work items that agents receive.</td>
</tr>
<tr>
<td>Accepted Work Items</td>
<td>Percentage of all Interaction work items that agents have accepted.</td>
</tr>
<tr>
<td>Exceeding Target Work Items</td>
<td>Percentage of all Interaction work items that have exceeded the target wait time.</td>
</tr>
<tr>
<td>Rejected Work Items</td>
<td>Percentage of all Interaction work items that agents have rejected.</td>
</tr>
<tr>
<td>Timed Out Work Items</td>
<td>Percentage of all Interaction work items that timed out.</td>
</tr>
</tbody>
</table>
### Indicator | Description
--- | ---
Weekly Trends | Number of work items in each of the following states for the past week:  
• New  
• Exceeding Target  
• Abandoned  
• Rejected  
• Timed Out

---

#### Breakdowns
To analyze data according to different categories, select a breakdown from the dashboard menu:

- Service Channel
- Queue
- Assignment Group

For more information on analyzing data with breakdowns, see Using breakdowns on dashboards.

Agent Workspace

Agent Workspace ™ is a configurable service desk application that provides agents with an integrated and graphically intuitive user experience.

Agent Workspace features include:

- A multi-tab interface to help agents efficiently manage multiple cases or incidents on one screen
- Real-time handling of calls and chats via Interaction Management System
- Task resolution assistance via Agent Assist
- Intuitive search capabilities enabling agents to quickly find relevant content
- Heads up display of contextual information helping agents quickly get oriented to the task at hand

By default, Agent Workspace is active for all instances.

Agent Workspace in ITSM

The following video shows a sample use of Agent Workspace in ITSM.

Navigating Agent Workspace

Use Agent Workspace to integrate Now Platform functionality that is specific to tier 1 agents into an easy-to-navigate interface.
Agent Workspace features

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Lists</td>
<td>List categories that you can configure to organize lists in the list panel. You can then create filtered lists and assign them to agents or teams. Agents can create their own filtered lists under My Lists.</td>
</tr>
<tr>
<td>(2) Tabs</td>
<td>Tabs that allow agents to manage many records at once. You can enable agents to create records and complete tasks in separate tabs by configuring tables in the New Record Menu.</td>
</tr>
<tr>
<td>Forms</td>
<td>Agent Workspace form that contains a header, ribbon, and layout, including the activity stream. Configure the fields that appear on the form depending on the record type and user roles.</td>
</tr>
<tr>
<td>Feature</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>

<td>A fixed tab facilitates navigation between the modules which are selectable from the left navigation bar (except CTI, if configured).</td>
</tr>
</tbody>
</table>

### Agent Workspace administrator configuration

Configure Agent Workspace for agents, so that they can access cases, incidents, or communications all from one location.

### Requirements

Your Agent Workspace configuration can vary depending on which plugins that you have enabled and who you are configuring it for. Currently, Agent Workspace is available for Customer Service Management and ITSM.

**Role required**: workspace_admin

### Using Guided Setup to configure Agent Workspace

Agent Workspace guided setup provides a sequence of tasks that help you configure Agent Workspace on your instance. To open Agent Workspace Guided Setup, navigate to Agent Workspace > Agent Workspace Guided Setup. For more information about using the guided setup interface, see Using guided setup.

### What to configure

#### Tab Settings

You can configure:

**Service Catalog**

Use the Workspace Settings to choose which Service Catalog that agents use in Agent Workspace.

**New Record Menu**

Add tables that agents can select to create records in Agent Workspace. Make sure that agents have permissions for each table in the New Record menu so that they can create a record from the menu.
Lists
You can configure the list menu by elevating your role to the workspace_list_admin role from the profile settings menu:

Create list categories
Create specific categories for lists, group lists, or records to make them easier for agents to discover.
Create filtered lists
Create filtered lists and assign them to user roles or groups.

Forms
You can configure the way forms appear for agents in Agent Workspace. You can also configure the fields that appear on the form depending on the record type and user roles.

You can configure **Lookup and Verify** to populate a list of contacts, which supports caller validation.

Form headers
Define what agents see in the form header and preview data. You can define primary field and secondary fields that contain additional information.

Ribbon settings
Add a ribbon to each record type to help agents see relevant information about the record, such as a timeline, user or customer summary, and SLAs.

Configure lookup and verify in Agent Workspace
Select a **Consumer lookup** or **Contact lookup** configuration to guide agents to find customer information.

Form layout
Configure which fields display on a form. You can hide and rearrange fields that agents do not often use to make the form more streamlined and usable.

UI Actions
Define Agent Workspace-specific UI actions. UI actions include the buttons, links, and context menu items on forms and lists. Configure UI actions to make the UI more interactive, customized, and specific for agents.

Form templates
You can find any templates that have been configured for forms in the platform to appear under the **Templates** tab in the **Contextual Sidebar**.

Search
You can define search sources for agents to query in Agent Workspace. Agents can use these keywords to search for specific records or knowledge articles in Agent Workspace.

Search Sources
Configure search sources to specify the data that agents can access in Agent Workspace.

Agent Assist
Configure contextual search for Agent Assist in Agent Workspace. Contextual search displays related articles or information in a side panel to help agents find the information they are looking for from directly within a record.

Configure similar records
Enable the contextual sidebar to show similar records to provide agents with information about similar resolutions or so they can notice trends with other similar records.

**Configure Predictive Intelligence with Agent Workspace**

Enable Predictive Intelligence Similarity Solutions in Agent Assist to improve results when searching for similar records. You can set and change an associated similarity threshold to ensure the quality of the solution results presented to the agent.

**Configure the similarity analyzer with Agent Workspace**

The Similarity Analyzer enables administrators to define patterns and trends that can assist in the resolution of a record. Utilizing Predictive Intelligence Similarity Solutions, the Similarity Analyzer can reference trends such as common resolutions, linked problems, linked changes, attached articles, major incident detection, and linked major incidents. If you enable Agent Assist Recommendations, you can provide helpful recommendations to agents when trends are detected.

**Configure Agent Assist recommendations in Agent Workspace**

You can configure Agent Assist Recommendations to display recommended actions when specified trends are found in similar incidents. After you enable and configure Predictive Intelligence and the Similarity Analyzer, you can define the recommendation messaging, display, and actions for the specified trends. Administrators can also prioritize recommendations, ensuring the best recommendation is shown when multiple trends are returned.

**Workspace Notifications**

Determine the conditions when notifications display in Agent Workspace, such as when a record updates or a record is assigned to a user.

**Advanced Work Assignment**

Configure Advanced Work Assignment (AWA) to initiate routing and assigning of new work items to appropriate agents. Agents can set their availability and accept or reject work items from their Agent Workspace inbox.

**Chat in Agent Workspace**

Configure chat for Agent Workspace so that agents can interact with customers. From a chat, agents can respond to questions, create a record, or escalate the chat to another agent.

**Agent Chat**

Enable Agent Chat to use chat functionality within Agent Workspace.

**Quick actions in Agent Workspace chat**

Set up shortcuts in Agent Workspace chat so agents can work more efficiently with their customers.

**Landing page for Agent Workspace**

Your instance should have at least one landing page, depending on the features and products that you have. All landing pages are configurable and consist of a layout with containers and widgets that appear on the page. You can use any landing page without modifications or you can clone a landing page and make updates for your installation.

**OpenFrame**

You can use OpenFrame to provide a communication frame that agents use to place and receive customer calls. Set up the CTI partner integration application for communication channels. With CTI enabled, agents can make and receive phone calls from within the workspace. The records that are created from a call can have auto-populated fields.

**Agent Workspace phone integration with OpenFrame and computer telephony integration (CTI)**
Set up a phone integration so that agents can answer calls from within the workspace.

**Components installed with Agent Workspace**

Several types of components are installed with activation of the Agent Workspace [com.agent_workspace] plugin, including tables and user roles.

*Note:* The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

**Roles installed**

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
</table>
| Workspace administrator [workspace_admin] | Provides access to the Agent Workspace application and modules to configure Agent Workspace. | • form_admin  
• chat_admin  
• template_editor  
• ui_action_admin  
• personalize_form  
• interaction_admin  
• workspace_list_admin |
| Workspace list administrator [workspace_list_admin] | Provides the ability to create list categories and to create and assign filtered lists in Agent Workspace. This is an elevated role. For more information on elevated roles, see Elevated privilege. | • agent_workspace_user |
| Workspace agent [agent_workspace_user] | Provides access to Agent Workspace. The itil and sn_esm_agent for CSM roles also contain this role. | • None |
| Workspace user [workspace_user] | Provides access to workspace_core. This role is for internal use only. | • None |

**Tables installed**

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workspace Global Search Configuration [sys_aw_global_search_config]</td>
<td>Provides the default search settings for global search in Agent Workspace</td>
</tr>
<tr>
<td>Workspace Form Header [sys_aw_form_header]</td>
<td>Defines the fields that appear in the header for a form</td>
</tr>
<tr>
<td>My Workspace List [sys_aw_my_list]</td>
<td>Enables agents to create their own filtered list in Agent Workspace</td>
</tr>
</tbody>
</table>
### Agent Workspace tab settings

Configure tab settings in Agent Workspace to help agents find and order items in catalogs, select tables to create records, and create records only from specific lists.

#### Assign a Service Catalog for Agent Workspace

Assign a specific Service Catalog with Agent Workspace to let agents find and order catalog items within the workspace.

Role required: workspace_admin

1. Navigate to **Service Catalogs > Portal Catalogs** and select **Service Catalog - Service Workspace**.
2. In the **Catalog** field, search for a catalog to associate with Agent Workspace, or click the search icon to see a list of available catalogs.
3. Click **Update**.

#### Configure the New Record Menu Items for Agent Workspace

Add tables that agents can select to create records in Agent Workspace.

Role required: workspace_admin

Agents use records to log information in the system, such as incident details, cases, or user information. Agents must have **Create** permissions for each table in the New Record menu to be able to create a record from the menu.

1. Navigate to **Agent Workspace > Settings**.
2. In the New Record Menu Items related list, click **New**.
3. In the New Record Menu Item form, select the table that you want agents to be able to create records for in the workspace.
4. In the **Order** field, enter the order that the menu item should appear from the list. The lowest number shows the menu item at the top, following in ascending order.
5. Select the **Active** option.
6. Click **Submit**.
If the order field for the Incident table is 100, and the order field for the Interaction table is 200, the graphic shows the order.

**Declarative Actions in Agent Workspace**

Add custom functionality to your Agent Workspace forms, fields, lists, and related lists without writing custom scripts or learning APIs.

**Declarative Actions**

Actions & Components appear as icons or labels in Agent Workspace. Clicking them makes them take action. Those actions can be, for example, dialing a phone number, adding a component to the Contextual Side Panel, deleting a related list, or adding a record to the database. The goal of Actions & Components is to enable your agents to take actions on one screen rather than performing the actions on multiple screens. For example, to pull up a caller's address to verify their identity, you can create an Action that pops up a caller's personal information in a modal as opposed to making the agent switch to another screen for the same information. You can create all of these actions using little or no scripting.

**Action types**

There are three Action types:

- **UI component**—Places a component in Agent Workspace, for example, an Agent Assist component in the Form Side panel.
- **Client action**—Clicking a Client Action icon dispatches an action that the browser carries out. Agent Workspace supplies a limited number of Client Actions, including dialing a phone number, opening a record, opening a form to modify record content, and opening a URL.
- Server script—Executes a script on the server to change the database, for example, to assign a record to someone, to delete a record, or to add a record.

**Action locations**

Actions can only appear in a limited number of areas in Agent Workspace. List View has only one Action, List Action and it can only appear in one place: as a button.

Record View can have the following Actions. Their names specify the locations of those Actions in Agent Workspace.

- Field decorator—Displays an icon in one or more fields in an open record. Clicking these icons can, for example, call a phone number or display additional information.
- Related List Action—Displays a button in the Related Items Menu Bar. Examples include adding or removing a related list.
- Form Side Panel Items—Displays as an icon in the Form Side Panel. Click the panel makes a component appear in the Form Side Panel. For example, you display additional Agent Assists in the Form Side Panel.
- Form Related Items—Displays as an entry in the Related Items Menu Bar. The entry works like a tab and sits, be default, between Details and Related Lists. Related Lists act like tabs that display information from tables related to the open record. Related items makes any component appear in the Form pane.

Record View Actions can only appear in the following locations.
Declarative Actions supplied with your instance

<table>
<thead>
<tr>
<th>Action</th>
<th>Action Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent Assist</td>
<td>Form</td>
<td>Adds an action to the contextual side panel.</td>

<td>Field</td>
<td>Opens a modal to enable users to search a reference table.</td>
</tr>
</tbody>
</table>

Declarative Actions tables

<table>
<thead>
<tr>
<th>Name</th>
<th>Permissions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Declarative Action Model Definition [sys_declarative_action_model_definition]</td>
<td>Read-only for Admin</td>
<td>Defines the section in the workspace that a declarative action can exist and displays available data. Models include List, Related List, Form, and Field.</td>
</tr>
<tr>
<td>Declarative Action Model Field [sys_declarative_action_model_field]</td>
<td>Read-only for Admin</td>
<td>Represents a field in a specific model. A model can have multiple fields.</td>
</tr>
<tr>
<td>Declarative Action Definition [sys_declarative_action_definition]</td>
<td>Read-only for Admin</td>
<td>Accumulates all the declarative actions.</td>
</tr>
<tr>
<td>Declarative Action Assignment [sys_declarative_action_assignment]</td>
<td>Admin only</td>
<td>Defines where and when a declarative action runs.</td>
</tr>
<tr>
<td>Declarative Action Group [sys_declarative_action_group]</td>
<td>Admin only</td>
<td>Allows associating multiple declarative actions into a group. This action is only supported for the List model.</td>
</tr>
</tbody>
</table>

New Button List Exclusion tab functionality changes to a declarative action

Prevent users from creating a record from specific lists by using a declarative action in Agent Workspace.

In Madrid, to mask the **New** button from tables, you would add the table to the Exclusion table under Workspace Settings. In New York, the functionality to create or suppress the **New** button resides within the declarative action framework. A migration script runs on an instance upgrade to migrate these tables from the Exclusion table to a declarative action. The migration script creates declarative action assignments. To change this functionality for your table exclusion customizations, you can go to Declarative Action...
Assignments, identify the action and table affected, and confirm that the Enabled option is not selected. If you want to exclude additional tables, you can create a declarative action assignment.

**Assign a Declarative Action in Agent Workspace**

Associate a defined Declarative Action to a form, list, or field in Agent Workspace to add custom functionality to your workspace.

Role required: admin

1. Navigate to **Declarative Action > Action Assignment**.
2. Click **New**.
3. On the form, fill in the fields.

### Assign a Declarative Action form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Name</td>
<td>Unique name for your action.</td>
</tr>
<tr>
<td>Action Label</td>
<td>Action label that displays on the form when a user hovers over the field. For field decorators, the label serves as the tooltip. For list and form buttons, the label serves as the text for the button.</td>
</tr>
<tr>
<td>Action Model</td>
<td>Option that you can select for an available action from the action definition table.</td>
</tr>
<tr>
<td>Model Fields required</td>
<td>Fields that are required to display.</td>
</tr>
<tr>
<td>Description</td>
<td>Summary of the action assignment.</td>
</tr>
<tr>
<td>Tooltip</td>
<td>Text that displays when a user hovers over the field name. If a user leaves this blank, the Action Label text appears.</td>
</tr>
<tr>
<td>Form position</td>
<td>For the form action model, select either Contextual Side Bar or Related List.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that you can select with the form action model.</td>
</tr>
</tbody>
</table>

**Note:** You can add syntax `{{ }}` for an unknown value to evaluate at runtime. Example: `{{count}}`.
### ServiceNow Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>UI view that you want to associate with the action assignment.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that the action runs in.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace that the action runs in.</td>
</tr>
<tr>
<td>Active</td>
<td>Option that you can select. You can use this assignment if you also use Enabled.</td>
</tr>
<tr>
<td>Enabled</td>
<td>Option that you can select. If you do not select the Enabled option, the assignment is not available and does not render.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that applies if multiple actions are selected per model.</td>
</tr>
<tr>
<td>Icon</td>
<td>Icon that is used on the field action.</td>
</tr>
</tbody>
</table>

**Note:**
- If the Active option is not available, the system falls back to the parent's table declarative action, if applicable.
- Selecting the Active option does not override this setting to make the assignment available.

4. Depending on the action assignment, you need to fill in the fields for a related list:
   - Action Attributes
   - Server Conditions
   - Server Script
   - Client Conditions

On the form, fill in the fields.

#### Action Assignment Related Lists form

<table>
<thead>
<tr>
<th>Related List</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Action Attributes | Action Payload         | Payload that you define to dispatch to an internal event when an action triggers. For example: 
{"table":"{{table}}","row":{"sys_id": 
{"value":"-1"},"parent_table":"{{parentTable}}", 
"query":"{{query}}"}} |
| Server Conditions | Record Conditions      | Condition builder that you use to add conditions that must be met before the action displays. |
|                   |                        | **Note:** You can add syntax {{}} for an unknown value to evaluate at runtime. Example: {{count}}. |
| Server Conditions | Script Condition       | Script that you add conditions that must be met before the action displays. |

<td>Server Conditions</td>
<td>Required Roles</td>
</tr>
<tr>
<td>Server Script</td>
<td>Server Script</td>
</tr>
<tr>
<td>Client Conditions</td>
<td>Client Conditions on Fields</td>
</tr>
</tbody>
</table>

### Configure a field action as a decorator

Configure a field action in Agent Workspace to display an icon next to a reference field and then open a user record in a tab.

Role required: admin

The field action, Open Record, must exist as a Declarative Action action definition before you create a new action assignment. The icon, icon-user, must be an icon available in your instance.

1. Navigate to **Declarative Action > Action Assignment**.
2. Click **New**.
3. On the form, fill in the fields.

#### Assign the Open Record action form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Name</td>
<td>Example: user_icon_open_record</td>
</tr>
<tr>
<td>Action Label</td>
<td>Example: Open user record</td>
</tr>
<tr>
<td>Action</td>
<td>Open Record</td>
</tr>
<tr>
<td>Action Model</td>
<td>Field</td>
</tr>
<tr>
<td>Order</td>
<td>Example: 1</td>
</tr>
<tr>
<td>Table</td>
<td>Global</td>
</tr>
<tr>
<td>Icon</td>
<td>icon-user</td>
</tr>
<tr>
<td>Action Type</td>
<td>Type</td>
</tr>
<tr>
<td>Field Type</td>
<td>Reference</td>
</tr>
</tbody>
</table>

**Note**: The example descriptions can change depending on your preference. The other field descriptions must be as noted.

4. Click **Submit**.
5. Fill in the field for the Action Attributes related list:

**Open record action attribute related list**

<table>
<thead>
<tr>
<th>Related List</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Attributes</td>
<td>Action Payload</td>
<td>This script is the payload to dispatch when the open record action triggers.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;referenceInfoClick&quot;: {</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;name&quot;: &quot;{{name}}&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;sys_id&quot;: &quot;{{value}}&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;referencetable&quot;: &quot;{{referenceTable}}&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;{{referenceTable}}&quot;,&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;table&quot;: &quot;{{tableName}}&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;field&quot;: &quot;{{fieldName}}&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

| Client Conditions    | Client Conditions on Fields | If you want the user icon to only appear after a user inputs value, check Requires Value. |

6. Click **Update**.

When the user icon is next to a reference field, clicking the icon opens the user record in a separate tab. The icon appears regardless of whether a user inputs a value.
Configuring Agent Workspace lists

Configure list categories and create agent-specific lists to show items by user role for Agent Workspace.

To configure lists, you need the privileged `workspace_list_admin` role. If you have the `workspace_list_admin` role, you can elevate your privileges by using the profile settings menu. For more information on privileged roles, see Elevated privilege.

The List menu in Agent Workspace has the following sections.

- Lists: Categorized set of lists that you can assign to a user by role or assignment group. If no lists are configured for a list category, the list category does not appear in the list panel.
- My Lists: Created by agents. The lists in this section are not visible to other agents.

Create list categories for Agent Workspace

Create list categories in Agent Workspace to help agents sort and find specific information that they can use for their tasks.

To create list categories, you need the privileged workspace_list_admin role. If you have the workspace_list_admin role, you can elevate your privileges by using the profile settings menu. For more information on how to get a privilege role, see Elevated privilege.

Role required: workspace_list_admin

1. Navigate to Lists > List Categories.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Enter a category name. For example, Open, Incidents, or Cases.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order that you want the category to appear in. The lowest number appears first. For example, a category with an order of 100 appears before a category with an order of 300.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this option to show the list.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description for the category</td>
</tr>
</tbody>
</table>

4. Click Submit.
Configure filtered lists for Agent Workspace

Create a filtered list to give agents focused list results in Agent Workspace.

To create a filtered list, you need the privileged workspace_list_admin role. If you have the workspace_list_admin role, you can elevate your privileges by using the profile settings menu. For more information about how to get a privileged role, see Elevated privilege.

Role required: workspace_list_admin

1. Navigate to Agent Workspace > Lists > List Filters.
2. Click New.
3. On the form, fill in the fields.
### List filter form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List name</td>
<td>Name for the list. Choose something that agents can easily identify. For example, Open incidents.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that you want to show records from.</td>
</tr>
<tr>
<td>Category</td>
<td>Category that a list is filed under. Select a category that you previously configured.</td>
</tr>
<tr>
<td>Columns</td>
<td>The columns to be shown in the list.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Filters that apply to the list. Use the condition builder to show or hide relevant items in the list. For example, Active is true. For more information on creating a filter, see Create a filter.</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the list appears in Agent Workspace. Select Active to ensure that it appears.</td>
</tr>
<tr>
<td>Group</td>
<td>List of users who can view the list. Add any group to limit the list access to just that group. For example, you might add Customer Service Support. You can add more than one group to the list. If you do not add a group, any user who can access Agent Workspace can access the list.</td>
</tr>
<tr>
<td>Roles</td>
<td>Specific roles that can view the list. Limit the list access by role. If you do not add a role, any user who can access Agent Workspace can access the list.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which the list appears by levels of 100. The lower numbers appear first. For example, 100 appears before 200.</td>
</tr>
</tbody>
</table>

4. Click Submit.

### Configure field styles for Agent Workspace

Configure field styles to make specific fields visually distinguishable for agents.

Role required: admin

Field styles are only supported in the list view for Agent Workspace, not the form view. Only the background color field style is supported.

**Note:** For additional information on field styles, see Define field styles.

Any field that you define for a field in a parent table also appears in the child table. For example, if you apply a field style to the Priority field in the task table, the Priority field in the Incident table also shows the field style.

1. Navigate to System UI > Field Styles, and locate the field to apply a style to.

   **Note:** You can make changes to field styles through the platform, not the Agent Workspace UI.

2. Click New, or click the style that you want to modify.

3. On the form, fill in the fields.
### Style form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table that contains the field.</td>
</tr>
</tbody>
</table>

**Note:** The list shows only tables and database views that meet the scope protections for field styles.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field name</td>
<td>Field to which the style applies.</td>
</tr>
<tr>
<td>Value</td>
<td>Value or script-based-condition required to apply the style.</td>
</tr>
</tbody>
</table>

**Note:** The value only affects list field styles. To apply field styles on both lists and forms, leave this field blank.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Style</td>
<td>CSS style to apply. Only the background color field style is supported for workspace.</td>
</tr>
</tbody>
</table>

For example, you can make the background of the **Incident Category** fields red in the record lists, by entering the following code:

```css
background-color:red;
```

4. Click **Submit** or **Update**.

Configuring Agent Workspace forms

Configure the way that forms appear for agents in Agent Workspace so that they can easily find the information they need to complete their tasks. You can also configure the fields that appear on the form depending on the record type and user role.

You can configure templates with pre-populated fields and UI actions to make the workspace more interactive. You can also configure **Lookup and Verify** to help agents look up and verify contact or consumer information.

The fields in the Agent Workspace form are limited to the ones that agents use the most. For a list of available fields, see [Agent Workspace supported field types](#).

<td>Tab that identifies the open record. Agents can have an unlimited number of</td>
</tr>
<tr>
<td></td>
<td>tabs open and can work between tabs without leaving their working session.</td>
</tr>
</tbody>
</table>
## Feature Description

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(2) Sub tabs</td>
<td>Tabs that enable agents to open related information from a form in a sub tab. Any related information that agents open from a form opens in a subtab. That way, agents do not lose any context from where they started.</td>
</tr>
<tr>
<td>(3) Reference icon</td>
<td>Reference icon that opens a subtab where the agent can see more information about the record. For example, a reference icon on a caller gives user information on that person.</td>
</tr>
<tr>
<td>(4) Activity stream</td>
<td>Stream that enables agents to view all the activity for a record. Agents use the activity stream filter to focus on more specific information in the stream.</td>
</tr>
<tr>
<td>(5) Related lists</td>
<td>Lists that agents can reference to give accessible related context. For example, Child Incidents show related incidents to the record.</td>
</tr>
<tr>
<td>(6) Contextual sidebar</td>
<td>Displays icons corresponding with these options:</td>
</tr>
<tr>
<td></td>
<td>• Agent Assist - displays/hides the Agent Assist panel from which you can attach articles, order catalog items, or find community discussions.</td>
</tr>
<tr>
<td></td>
<td>• Attachments - displays/hides the Attachments panel from which you can add an attachment to the record. Attachments are automatically scanned for viruses when added.</td>
</tr>
<tr>
<td></td>
<td>• Templates - displays/hides the Templates panel from which you can apply a template. Templates created for platform records also apply to workspace records. For more information on creating a template, see form templates. Templates in workspace follow any ACL rules that have been configured.</td>
</tr>
<tr>
<td>(7) UI actions</td>
<td>Actions that agents can perform on the form. UI actions in workspace can either be buttons or menu items.</td>
</tr>
<tr>
<td>(8) Record tags</td>
<td>You can add tags to records in Agent Workspace. Tag visibility can be set to all users, visible only to specific groups or users, or visible to a single user.</td>
</tr>
<tr>
<td>(9) Highlighted Values</td>
<td>You can add highlighted values to the secondary values in the form header in Agent Workspace.</td>
</tr>
</tbody>
</table>

### Configure the form header for Agent Workspace

Configure the form header and subheaders in Agent Workspace so that agents can quickly see information about each record.

Role required: workspace_admin

Form headers are made up of one primary header and several secondary headers, or subheaders.

1. Navigate to Agent Workspace > Forms > Form Headers.
2. Click New.
3. Select a table from the list.
   - **Note:** Configuration tables are not included as an option for form headers in Agent Workspace.
4. From the Primary field list, select the field that you want as the form header.
   - Choose a field that is descriptive and unique. For example, you could choose short_description.
5. Right-click the form header and select Save.
6. To add secondary fields to the form subheader, select the fields that add important details to the form, such as priority, state, and category.

**Note:** You can select as many secondary fields for the header as you want; however, only the first five non-empty fields show in the header.

7. Click Submit.

Forms can inherit the header configuration from the parent tables. For example, if the Incident [incident] table does not have a table configuration, any incident records inherit the configuration from the Task [task] table.

### Configure Agent Workspace ribbon settings

Configure components that appear on a form ribbon in Agent Workspace. The form ribbon helps agents quickly scan relevant information about the record, such as a timeline, a user or customer summary, and SLAs.

Role required: workspace_admin

1. Navigate to Agent Workspace > Forms > Ribbon Settings.
2. Click New.
3. In the Name field, enter a name for the ribbon setting.
4. In the Ribbon Component field, select a ribbon component.
   
   Component options vary depending on which plugins are enabled for your instance.

   Depending on the component that you select, additional information appears on the form.
5. From the Table list, select the table that you want the ribbon component to appear in on the workspace form.
6. From the Width list, select a width for the component.
   
   The width is based on the 12-column flexbox layout.
7. In the Order field, enter a number between 100-199 to determine the order that the component appears.
   
   The smallest number means that the component appears first in the ribbon.

---

For the timeline configurations, you also must configure the Resolution Shaper for a selected table. See Configure ribbon component attributes.
Configure lookup and verify in Agent Workspace

Configure a Consumer lookup or Contact lookup so that agents can easily identify the consumer information or contact information.

Role required: workspace_admin, admin

Two lookup and verify configurations are provided: one for contacts and one for consumers. You can configure settings in these configurations to control the type-ahead search and the information that is displayed in the search results list and the verification card.

1. Navigate to Agent Workspace > Lookup and Verify > Configuration.
2. Select a configuration from the list.
3. Select the Active option.

   A configuration must be active for the related UI action to appear on the interaction record.
4. Optional: In the Minimum characters to start typeahead search field, enter the minimum number of characters that you want for your search.
5. In the Max result count list, set the maximum number of search results up to a maximum of 10.
6. Configure the Search results tab:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary field</td>
<td>Select the name of the field that you want a contact or consumer to see in the search results list.</td>
</tr>
<tr>
<td>Secondary fields</td>
<td>Unlock to access the Secondary fields and move a secondary field from the Available list to the Selected list. Lock when done.</td>
</tr>
</tbody>
</table>

7. Configure the Verification card tab.

   Unlock to access the Display fields and move a field from the Available list to the Selected list. Lock when done.
8. Click Update to save the configuration.

Configure highlighted values in Agent Workspace

Add highlighted values to the secondary values in the form header in Agent Workspace.

Role required: admin

1. Navigate to Agent Workspace > Highlighted Values.
2. Click New.
3. On the form, fill in the fields.

   **Highlighted Value form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table that you want the highlighted value to display.</td>
</tr>
<tr>
<td>Field</td>
<td>Field that you want the highlighted value to display.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains the record.</td>
</tr>
</tbody>
</table>

4. Click Update.
5. Select the record, go to the Highlighted Value Conditions related list, and click New.
6. On the form, fill in the fields.

### Highlighted Value Condition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td>Condition builder where you can set the conditions for your highlighted value to display.</td>
</tr>
<tr>
<td>Status</td>
<td>Status to display for your highlighted value:</td>
</tr>
<tr>
<td></td>
<td>• Critical</td>
</tr>
<tr>
<td></td>
<td>• High</td>
</tr>
<tr>
<td></td>
<td>• Info</td>
</tr>
<tr>
<td></td>
<td>• Low</td>
</tr>
<tr>
<td></td>
<td>• Moderate</td>
</tr>
<tr>
<td></td>
<td>• Positive</td>
</tr>
<tr>
<td></td>
<td>• Warning</td>
</tr>
<tr>
<td></td>
<td>• None</td>
</tr>
<tr>
<td>Show icon</td>
<td>Option that you can select to display an icon with the status.</td>
</tr>
<tr>
<td>Value Override</td>
<td>Text that you can specify to render in the highlighted value. You can reference a value using <code>{{value}}</code>.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains the record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the highlighted values are evaluated.</td>
</tr>
</tbody>
</table>

### Configure a highlighted value

Configure a highlighted value for the **Priority** field in problem records when the priority is **1 - Critical**. Select the Incident table and the **Priority** field when creating this highlighted value.

In the Highlighted Value Conditions, set the conditions to be **Priority** is **1 - Critical** and **Status** **Critical** and check **Show icon**.

The highlighted value renders for this configuration:

![Employee payroll application server is down.](image)

### Record tagging in Agent Workspace

Add tags to records in Agent Workspace. You can set the tag visibility to all users, visible only to specific groups or users, or visible to a single user.
Record tags

Tags are text labels that you associate to records to organize records. On any given record, click the Record Tag icon to add a tag or tags to your record.

Record tagging viewing levels

Three viewing levels of tagging are available:

**Me**

This setting is for a private tag which is visible only to the owner of the record.

**Groups and Users**

This setting is for a shared tag which is visible to specific groups or users.

**Everyone**

This setting is for a global tag which is visible to everyone. This sharing level is only available to an admin or tags_admin role.
Disable record tagging for your instance

You can disable tags for an entire instance. Create the following system property and parameters:

<table>
<thead>
<tr>
<th>Disable record tagging</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Property</td>
</tr>
<tr>
<td>glide.ui.show.form_tags_bar</td>
</tr>
</tbody>
</table>

Configure the form layout for Agent Workspace

Configure the form layout for the workspace form view so agents can create or edit a form.

Only one form view is available per table in Agent Workspace. The form view that agents see vary depending on the views that you configure for each agent role. Agents only see the form that is specific to them.

- **Note:** Not all field types are supported in Agent Workspace.
- **Note:** Record types without a workspace view appear as read-only in Agent Workspace.

Role required: personalize_form

1. Navigate to a form that you want to configure for Agent Workspace.
For example, you might want to configure a case [sn_customerservice_case] or an incident [incident].

2. Click the context menu icon ( ) and select **Configure > Form Layout**.

3. From the view name list, select the workspace that you want to configure a form view. For example, you might select **Workspace_itil**.
4. Select the fields and the order in which you want them to appear.
   Available items that appear in green followed by a plus (+) sign represent related tables. To access the fields on these tables, use dot-walking.

5. Click Save.
Do not add the same field to more than one section of a form unless the field displays read-only data. Having two or more instances of an editable field can cause data loss and prevent the proper functioning of UI and data policies.

Add new fields to the form. For more information on how to add a customized field, see #unique_84.

**Agent Workspace supported field types**
Check which field types are supported for Agent Workspace so that you can properly configure the form layout.

<table>
<thead>
<tr>
<th>Field type</th>

<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------------------------------------</td>
</tr>
<tr>
<td>String</td>
<td>For 255 characters or less, the string field is a single-line text field. Anything 256 characters or over appears as a multi-line text box. Note: The database may translate the value that you provide in the Max length field to the closest matching database field type. For example, a max string length of 80 maps to the nearest database field type of VARCHAR(100). For Oracle instances, users are not able to increase the max length of a string field to a value greater than 4000 through the application UI. Changes greater than 4000 require the CLOB data type in Oracle. If you require a field to be larger than 4000 characters, log an incident to request the change.</td>
<td>glide.ui.textarea.character_counter</td>
</tr>
<tr>
<td>Suggestion</td>
<td>String field that provides suggested values but accepts free-form text. Available when you add a field by configuring a form or list. Otherwise, you must modify the dictionary entry of an existing string or journal field.</td>
<td></td>
</tr>
<tr>
<td>Time</td>
<td>Specific time. Stored in the database as a date/time field. Only the time part of this field is used. Note: This field always stores the date as 1970-01-01, which does not fall within the dates for Daylight Savings Time (DST). As a result, the time is not automatically adjusted for DST. If a custom feature uses time as a start time, it is the responsibility of the feature to adjust for DST, if necessary.</td>
<td></td>
</tr>
<tr>
<td>Translated HTML</td>
<td>HTML field that displays different translations that are based on the user's language.</td>
<td></td>
</tr>
<tr>
<td>Field type</td>
<td>Description</td>

<tr>
<td>True/False</td>
<td>Boolean field that appears as a one-digit integer, typically 1 (true) or 0 (false).</td>
<td></td>
</tr>
<tr>
<td>URL</td>
<td>String field that is a clickable URL field when locked.</td>
<td></td>
</tr>
</tbody>
</table>

**Note**: In the mobile UI, this field appears as a multi-line text field. The field saves as a single line, with the line breaks removed.

---

**Configure Workspace View Rules by role for Agent Workspace**

Administrators can use Workspace View Rules to control which form view renders for their users by role.

Role required: admin

1. Navigate to **Agent Workspace > Forms > Workspace View Rules**.
2. Click **New**.
3. Fill out the following fields:

<table>
<thead>
<tr>
<th>Workspace View Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Table</td>
</tr>
<tr>
<td>View</td>
</tr>
<tr>
<td>Application</td>
</tr>
<tr>
<td>Workspace</td>
</tr>
<tr>
<td>Active</td>
</tr>
</tbody>
</table>
4. Under Conditions, select the roles that the rule applies.

Use the role selection picker:

<table>
<thead>
<tr>
<th>Available</th>
<th>Selected</th>
</tr>
</thead>
<tbody>
<tr>
<td>action_designer</td>
<td></td>
</tr>
<tr>
<td>activity_admin</td>
<td></td>
</tr>
<tr>
<td>activity_creator</td>
<td></td>
</tr>
<tr>
<td>acts_sub_admin</td>
<td></td>
</tr>
<tr>
<td>acts_sub_user</td>
<td></td>
</tr>
<tr>
<td>admin</td>
<td></td>
</tr>
<tr>
<td>agent_admin</td>
<td></td>
</tr>
<tr>
<td>agent_schedule_admin</td>
<td></td>
</tr>
<tr>
<td>agent_schedule_manager</td>
<td></td>
</tr>
</tbody>
</table>

5. Click **Submit**.

Users with the role selected view the form view configured for this rule.

If there are multiple Workspace View Rules in place, the rule with the lower execution order applies. If the execution order is the same for multiple rules, the first rule created applies.

**Configure a form view by role for Agent Workspace**

Set different form view for agents by configuring a form that is based on their role.

Agents can be specific to CSM (for cases) or ITSM (for incidents), or an agent can have combined responsibilities. A workspace view is configured for each type of agent. Views use the following role-based hierarchy to determine which form the agent sees in Agent Workspace.

Any view/role combination that results in the **Default** form view is read-only.

<table>
<thead>
<tr>
<th>Role</th>
<th>Form view</th>
</tr>
</thead>
</table>
| itil     | 1. workspace_itil  
           2. workspace

</tr>
<tr>
<td></td>
<td>2. Default</td>
</tr>
</tbody>
</table>

Configure Workspace View Rules by field values for Agent Workspace

Administrators can use Workspace View Rules to control which form view renders for their users. Set conditions on field values.

Role required: admin

1. Navigate to Agent Workspace > Forms > Workspace View Rules.
2. Click New.
3. Fill out the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the view rule.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the table to apply the rule.</td>
</tr>
<tr>
<td>View</td>
<td>Select the form view to render for the conditions set.</td>
</tr>
<tr>
<td>Application</td>
<td>Select the application scope that contains this record.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Select a workspace available.</td>
</tr>
<tr>
<td>Active</td>
<td>Check to make this rule active.</td>
</tr>
</tbody>
</table>
4. Under Conditions, and configure filter conditions. For example, you can set conditions on the watch list field.

![Conditions](image)

5. Click **Submit**.

Records that meet the conditions set render in the form view.

**Create custom UI actions for Agent Workspace**

Create UI actions to customize Agent Workspace for your organization. With UI actions, you can create custom buttons or menu items and you can also limit agent access to certain forms by user role.

**Role required: workspace_admin**

Agent Workspace only supports UI actions for menu items or form buttons. Buttons appear in the top right of the form and menu items appear in the workspace menu in the form.

1. Navigate to **System Definition > UI Actions**.
2. Open the UI action that you want to enable for the workspace or create a UI action. The following fields work in both workspace and the platform:
   - Name
   - Table
   - Order
   - Action name
   - Active
   - Show insert
   - Show update
   - Client
   - Hint
   - Condition
   - Script (server scripts only)

   For more information on each field on the UI actions form, see **UI actions**.

3. To create a client script for the UI action, select the **Client** option.

   The system does not check the workspace client script field unless this check box is selected.

4. To create a server script for the UI action, in the **Script** field, enter the server script.

   For example, if you want to include the caller name and the short description in an incident that is created from an interaction record, you could use the following script:

   ```javascript
   if(current.update()){
   var inc = new GlideRecord("incident");
   inc.newRecord();
   inc.caller_id = current.opened_for;
   inc.short_description = current.short_description;
   action.openGlideRecord(inc);
   }
   ```
The system ignores any client scripts that are included in this field. You can only use the workspace client script field for client scripts.

5. In the **Workspace** tab, select the **Workspace Form Button** option or the **Workspace Form Menu** option.

The **Workspace Client Script** field appears.

6. Optional: In the **Workspace Client Script** field, create a workspace-specific client script.

Workspace has similar client scripting limitations as Service Portal. For example, to open a form by clicking it, you could add the following client script:

```javascript
function onClick(g_form) {
}
```

For more information on available client scripts for workspace, see [Supported client script types and APIs](#).

7. In the **Requires role** tab of the workspace section, add any roles that you want to limit access to the UI action to.

8. Click **Submit** or **Update**.

Using the condition builder to customize UI actions for Agent Workspace

Configure UI actions by adding conditions to a UI Action form.

**Using the UI action condition builder**

The following condition is configured for the **Close Incident** button:
For this action to appear on a form, these conditions must evaluate to true:

- `current.incident_state` must equal 6: The incident must already be in a Resolved state.
- `gs.hasRole("itil_admin")`: The current user must have the itil_admin role.

OR this condition must evaluate to true:

- `gs.getUserID() == current.caller_id`: The current user is the user who requested the change.

**Note:**

- The current object is not available for conditions on a list context menu or list choice. The List context menu option or List Choice option is selected. Any use of `current` on these actions is ignored.
- You can reference the parent record for the UI action conditions on a related list button. For example, to disable the New and Edit buttons on the Affected CIs related list for
Configure templates for Agent Workspace

Configure templates for Agent Workspace. Templates display content for defined fields on a specified table that are relevant to your agent.

Any templates that you create for a form in the platform also work in Agent Workspace.

Role required: admin

1. Navigate to System Definition > Templates.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of this template.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that this template applies to. Select Global to make the template available for use with all tables.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The table list shows only the tables and database views that are in the same scope as the template.</td>
</tr>
<tr>
<td>Active</td>
<td>Option for making the template available for use. A template must be active to be used.</td>
</tr>
<tr>
<td>User</td>
<td>User who can configure and apply the template. If you define a user, no other users can see the template unless you select the Global option.</td>
</tr>
<tr>
<td>Group</td>
<td>Group whose members can configure and apply the template. If you define a group, no other groups can see the template unless you select the Global option.</td>
</tr>
<tr>
<td>Global</td>
<td>Option for allowing any user who can access the templates to view and apply this template.</td>
</tr>
<tr>
<td>Short description</td>
<td>Description of the template.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Template</td>
<td>Content that automatically populates records that are based on this template. Select a field from the specified table in the left column and then enter the data to automatically populate in the right column.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Even though you can select dot-walked fields in the template, they do not apply to fields that are on the form.</td>
</tr>
<tr>
<td>Link element</td>
<td>Template that links a child table with the template for the parent table. In the template for the child table, set the value to the field that references the parent table. After you set the value, the child template is explicitly linked to the parent table.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field does not appear by default. Configure the template form to add the field.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

You can also create a template by saving a form. For more information, see #unique_90.

**Add special handling notes to records in Agent Workspace**

Add special handling notes to highlight important information on a record for agents to quickly see and act upon.

**Viewing a special handling note**

Special handling notes appear in a pop-up window when the agent opens the record in Agent Workspace.
Priorities for special handling notes

The Special Handling Notes pop-up window displays up to three notes. Notes are also available in the Special Handling Notes related list. Agents can see a priority, short description, and message for each note. Notes are ordered by priority and use different styles that are based on the priority and type:

- Priority 1 — red
- Priority 2 — yellow
- Priority 3 — green
- Priority 4 — blue

Agent actions for special handling notes

Agents can:

- Dismiss individual notes. When all notes are dismissed, the pop-up window closes.
- Close the window. After the pop-up window closes, the agent cannot reopen it during the current session.
Roles

In the Special Handling Notes module on the platform:

- Users with the sn_shn.admin role can configure special handling notes and specify properties.
- Users with the sn_shn.admin or sn_customerservice_manager roles can create special handling notes.

Journal fields in Agent Workspace

Enter information on a form using Agent Workspace journal fields. The information in these fields helps you collaborate and communicate about the record. In New York, only journal_input fields are supported. Journal_input fields are multi-line text boxes which add comments into the activity field. By default, the Additional comments and Work notes journal fields are available.

Attachment management

When you download a file, the system automatically scans it for viruses. If the file has a virus, the message "File unavailable" appears under the file name in the Activity Stream and an error message displays at the top of the screen. You will not able to view or download the file.
After a user attaches a file, you can preview the file before you download it. Click the file's icon in the Activity stream or the Attachments panel to preview the attachment.
Click the download icon (△) to save file locally.
Rich text editing

Rich text editing is available if TinyMCE is enabled by setting the glide.ui.journal.use_html system property to true. If TinyMCE is enabled, you can customize field text in journal fields using the buttons at the top of the field.

Activity

Respond via Additional comments (Customer visible) ▼

<table>
<thead>
<tr>
<th>B</th>
<th>I</th>
<th>U</th>
<th>Verdana -</th>

Configuring search options for Agent Workspace

Configure search sources, Agent Assist settings, global search settings, similar records, and Predictive Intelligence as search options for agents.

You can configure five distinct search options within Agent Workspace. These configuration options include:

Prioritizing search sources

You can prioritize the order that search sources report search results within Agent Assist. You can also use a condition builder to add conditions to your search results.
Distinguishing search results for agents by view
You can distinguish a UI view for Agent Workspace that is separate from a UI view for the Now Platform. You can use conditions and custom scripts to restrict results that are returned for Agent Assist searches.

Global search settings
You can change the default settings for Agent Workspace global search regarding the number of search results that display for agents.

Showing similar records
You can expose similar records for agents to note trends and to suggest information by viewing similar resolutions.

Enabling Predictive Intelligence
You can enable machine learning for agents to apply predictive capabilities regarding trending issues.

Configure a search source for Agent Workspace
Configure a search source in Agent Workspace to define where search data is retrieved from.

Role required: workspace_admin

1. Navigate to Agent Workspace > Search Configuration.
2. In Application Search Sources, click New or open an existing record to edit a record.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the search source. This name appears as a search category in the workspace search.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that the search pulls information from. For example, the search might pull in information from Knowledge [kb_knowledge] or Users [sys_user].</td>
</tr>
<tr>
<td>Conditions</td>
<td>Search filter that limits the records that are returned in the search. For example, you could limit the search to return only the published and valid knowledge articles.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope that this search source should run in.</td>
</tr>
<tr>
<td>Active</td>
<td>Option that you select to enable the Search Source for your workspace.</td>
</tr>
</tbody>
</table>

4. Click Save or Update.

Configure contextual search for Agent Assist in Agent Workspace
Configure contextual search for Agent Assist so agents can access pertinent information in the Agent Assist side panel to respond to user requests.

Contextual search helps users deflect or quickly resolve their issues without involving the service desk operators. Contextual search displays search results including Knowledge, Service Catalog, Communities, and Additional resources on forms when users enter text in a field. Agent Assist uses a contextual search in a similar way as the Now Platform. For additional information on using and configuring contextual search, see Contextual search.
Configure contextual search form settings for Agent Workspace
Define which search results for Agent Assist appear for a particular form, the information the results contain, and what the agent can do with the results.

Role required: admin

1. Navigate to **Contextual Search > Table Configuration**.
2. Click a record and then click **New**.
3. On the form, fill in the fields.

### Table Configurations form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Name of the table that is associated with the form. An example is Incident [incident] or case [sn_customerservice_case].</td>
</tr>
<tr>
<td>Note: The list shows only tables and database views that are in the same scope as the contextual search.</td>
<td></td>
</tr>
<tr>
<td>UI type</td>
<td>UI that the configuration applies to. Select <strong>Workspace</strong>.</td>
</tr>
<tr>
<td>Search context</td>
<td>Name of the search context that this table configuration applies to.</td>
</tr>
<tr>
<td>Results header text</td>
<td>Text that displays above the search results.</td>
</tr>
<tr>
<td>Enable related search box</td>
<td>Option that is automatically enabled for Agent Workspace</td>
</tr>
<tr>
<td>Enable source selector</td>
<td>Option that you can enable to select the search source.</td>
</tr>
<tr>
<td>Active</td>
<td>Option that you select to activate this configuration.</td>
</tr>
<tr>
<td>Limit</td>
<td>Maximum number of search results returned.</td>
</tr>
<tr>
<td>Results per page</td>
<td>Number of results to appear per page.</td>
</tr>
<tr>
<td>Allow expand/collapse</td>
<td>Option that you can enable to expand or collapse for search results.</td>
</tr>
<tr>
<td>Enable preview buttons</td>
<td>Preview buttons that you can enable for search results.</td>
</tr>
<tr>
<td>When to display</td>
<td>Conditions under which this search is enabled. For example, set [Active] [is] [true] to only enable the search on active knowledge articles.</td>
</tr>
<tr>
<td>Enable search as</td>
<td>Option that you select to define the results to show for a different user. Click the <strong>Search as</strong> tab for the check box. For more information, see #unique_96.</td>
</tr>
</tbody>
</table>

4. In the Search fields related list, select the field that the system uses to query contextual search.
5. Click **Update** to save the configuration.
6. In the Search Action Configurations related list, add or remove the following UI actions that an agent can perform on each contextual search result:
   • Helpful
   • Order
   • Attach
   • Flag article
   • View full article

**Define search UI action labels for Agent Assist**

Define the search UI action labels for Agent Assist so that agents know what to do with the search results.

Search results for the default field appear automatically in the Agent Assist section when an agent opens a record. Search results in other associated fields only appear when an agent types content in those fields.

1. Navigate to **Contextual Search > Table Configuration** and open a record.
2. In the Search UI Action Configurations related list, edit any of the following label fields in the list.

<table>
<thead>
<tr>
<th>UI action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action label</td>
<td>Label to indicate what to do with the search result. For example, use <strong>Attach</strong> to attach a knowledge article search result to the activity stream.</td>
</tr>
<tr>
<td>Action undo label</td>
<td>Label that appears to undo an action. For example, <strong>Unattach</strong> appears as an option after you attach an article to an activity stream.</td>
</tr>
<tr>
<td>Badge label</td>
<td>Label that appears on the search result after you have completed an action. For example, after you attach an article to the activity stream, <strong>Attached</strong> appears as a badge on the knowledge article search result.</td>
</tr>
</tbody>
</table>

**Associating a knowledge article in Agent Workspace with Agent Assist**

Determine whether to deliver a knowledge article to the activity stream as a full article attachment or as a link to the article.

Role required: admin

1. Navigate to **Contextual Search > Table Configuration**.
2. Open an existing table configuration. If you are configuring a knowledge article specifically for workspace, make sure that you open a table configuration with the UI type **Workspace**.
3. In the Search Action Configurations related list, open a UI action with a search resource of **KnowledgeSearchResource**.
   The **KnowledgeSearchResource** is not configurable.
4. In the **Attachment type** field, you can choose to embed a link or embed an article:
   • **Embed link to article**: Includes a link to the article in the activity stream for the record.
   • **Embed article**: Attaches the entire article in the activity stream for the record.
5. Click **Update** to save the configuration.
Configure global search settings for Agent Workspace

Change the default settings on the Workspace Global Search Configuration page to amend the number of search results that display for agents.

Role required: workspace_admin

1. Navigate to Agent Workspace > Settings.
2. Click the Global Search preview icon and then click Open Record.
3. In the Name field, change the name from the default name.
4. On the form, fill in the fields.

Global Search Configuration Settings

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recent Items count</td>
<td>Number of recently selected search results that appear in the global search field. The default number is 5.</td>
</tr>
<tr>
<td>Recent terms count</td>
<td>Number of recently searched terms that appear in the global search field. The default number is 5.</td>
</tr>
<tr>
<td>Recent TTL (days)</td>
<td>Time To Live, which is the length of time in days that recently searched terms and recently selected search results remain in the search history. The default number is 30.</td>
</tr>
<tr>
<td>Tab drilldown items per page</td>
<td>Number of search results that appear at one time when you view search results for a specific search category. The default number is 25.</td>
</tr>
<tr>
<td>Tab overview items per section</td>
<td>Number of items that appear in the search results by section. The default number is 10.</td>
</tr>
</tbody>
</table>

5. Click Update.

Note:
If any access control lists (ACLs) are configured to prevent users from accessing certain information, the search results show a message to the agent about security constraints. For more information on limiting access using ACL rules, see #unique_100.

Configure similar records for the contextual sidebar in Agent Workspace

Configure the contextual sidebar to show similar records to agents. With this information, agents can see similar resolutions or notice trends with other similar records.

By integrating Predictive Intelligence, the Agent Workspace contextual sidebar enables agents to see similar incidents and problems using a combination of contextual search configurations and the Machine Learning feature. Predictive Intelligence with Agent Workspace is on by default for any customer who is upgrading to the Madrid release.

Note:
The Machine Learning feature in the contextual sidebar is only available to customers who have a Machine Learning subscription. Additional features, such as Major Incident detection and similar incidents, are also only available through subscription.

Configure additional resources for similarity in the contextual sidebar in Agent Workspace
Configure similarity thresholds for records to display in the contextual sidebar.
Role required: admin
1. Navigate to Contextual Search > Additional Resources.
2. Choose a pre-defined search resource from Search Resources and edit the Title field and Additional fields.

Configure additional resource fields in Agent Workspace
Configure the layout of similar record fields in the contextual sidebar so agents see relevant information in a predictable order.
Role required: Admin
2. Open an Incident, Problem, or Case and edit the Title field and Additional fields.

Agent Assist recommendations in Agent Workspace
You can use Agent Assist recommendations in Agent Workspace to show agents actions taken on similar incidents or cases.

Agents typically work incidents or cases that are similar to many other incidents or cases across their team. Agent Assist recommendations derive from the common actions made by other agents and use trending data to make helpful resolutions. The Agent Assist recommendations rely on configuring a Predictive Intelligence solution and configuring a similarity analyzer for detecting trends.

Once the configuration of a similarity solution, similar trend, and recommendation exist, agents using Agent Workspace can receive recommendations based on work:

- Problem resolutions
- Change requests
- Attachments of relevant articles
- Major incident resolutions

Configure Predictive Intelligence with Agent Workspace
Enable Predictive Intelligence similarity solutions in Agent Assist to improve results when agents search for similar records. You can set and change an associated similarity threshold to ensure the quality of the solution results that are shown to the agent.

See Implement the initial setup and configuration for Predictive Intelligence on your instance.
Role required: admin
1. Navigate to Predictive Intelligence > Classifications > Solution Definitions.
   You can also use the Agent Workspace Guided Setup Search > Predictive Intelligence (Machine Learning Solutions) > Configure
2. Click New to create a new solution definition or open an existing solution definition that returns similar incidents.
3. Click Save or Submit & Train.

Configure the similarity analyzer with Agent Workspace
Use the similarity analyzer to define patterns and trends that can help your users resolve a record.
Role required: admin

Use Predictive Intelligence similarity solutions for the similarity analyzer to reference trends. Trends include common resolutions, linked problems, linked changes, attached articles, major incident detection, and linked major incidents. If you enable Agent Assist recommendations, you can provide helpful recommendations to agents when a trend arises.

1. Navigate to **Similarity Analyzer > Trend Definitions**.
   You can also use the Agent Workspace Guided Setup **Search > Similarity Analyzer > Configure**.

2. Click **New** to create a new trend definition or open an existing trend definition.

3. On the form, fill in the fields.

### Trend Definition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the trend definition.</td>
</tr>
<tr>
<td>Table</td>
<td>Table where you want to identify a trend.</td>
</tr>
</tbody>
</table>
| Trend type      | Type of trend configuration:  
|                 | • Common value - Identifies common values across a group of incidents. For example, say that the same value is for a resolution code.  
|                 | • Common reference - Identifies common related records in a group of incidents. For example, say that there are multiple incidents with the same problem record.  
<p>|                 | • Common condition - Identifies a condition that applies to a group of similar records. For example, say that multiple incidents apply to the same location and are all high impact. |
| Common field    | If the trend type is common value, select that field to check for duplicate values across similar records. |
| Reference type  | If the trend type is common reference, select the type of reference relationship. Choices include simple reference or M2M reference. A simple reference refers to 1-to-many or 1-to-1 relationships. For example, an incident relates to a problem, but a problem might have multiple incidents that are related to it. An M2M reference refers to a more complex relationship, such as the relationship between incidents to knowledge articles. An incident might reference many knowledge articles and a knowledge article might have many references from incidents. |
| Trend field     | If you select a simple reference, select the field to check for trend reference across similar records. |
| M2M table       | Table that you would like to identify trends in. For example, select the m2m_kb_task to look for knowledge articles that are applied to a task. |
| M2M from field  | Field that is related to the current table. For example, if you are looking for common articles that are related to an incident, this field is task. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>M2M to field</td>
<td>Field that is related to the reference table. For example, if you are looking for common articles that are related to an incident, this field is kb_knowledge.</td>
</tr>
<tr>
<td>Condition</td>
<td>If the trend type is common condition, use the condition builder to create a condition to apply to a group of similar records. For example, set conditions for multiple incidents in this group that apply to the same location, are high impact and are in the same category.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope that this trend definition should run in.</td>
</tr>
<tr>
<td>Trend ID</td>
<td>ID for this trend.</td>
</tr>
<tr>
<td>Order</td>
<td>Integer value that determines the priority of this trend versus all other trends. A lower value means that there is a greater priority for the trend. If no value exists, the priority goes by alphabetic order of the trend names.</td>
</tr>
<tr>
<td>Threshold</td>
<td>Number of duplicate values to indicate a trend.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

*Configure Agent Assist recommendations in Agent Workspace*

Configure Agent Assist to display recommended actions for agents for specified trends.

Role required: admin

After you enable and configure Predictive Intelligence and the similarity analyzer, you can define the recommended messaging, display, and actions for the specified trends. You can also prioritize that the best recommendations display when multiple trends return.

1. Navigate to **Agent Assist Recommendation > Agent Assist Recommendations**.
2. Click **New** to create a new Agent Assist recommendation or open an existing recommendation to edit the recommendation.
3. On the form, fill in the fields.

*Agent Assist Recommendation form*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the recommendation.</td>
</tr>
<tr>
<td>Table Configuration</td>
<td>Pointer to the table configuration record.</td>
</tr>
<tr>
<td>Source type</td>
<td>Source to use for the recommendation:</td>
</tr>
<tr>
<td></td>
<td>• Script</td>
</tr>
<tr>
<td></td>
<td>• Predictive Intelligence</td>
</tr>
<tr>
<td>Solution Definition</td>
<td>Pointer to the solution definition record.</td>
</tr>
<tr>
<td>Script</td>
<td>Script that you can add to define a query that returns records for analysis.</td>
</tr>
<tr>
<td>Active</td>
<td>Option that you can select to use this recommendation.</td>
</tr>
</tbody>
</table>
**Order**

Integer value that determines the priority of this recommendation versus all other recommendations. A lower value means that there is a greater priority for the recommendation.

---

4. Click **Submit**.

**Agent Workspace notifications**

Create the conditions when notifications appear for your agents in Agent Workspace, such as when a record updates or a record is assigned to an agent. These notifications help agents identify urgent issues.

You can alert agents about new or updated records through on-screen notifications. Workspace notifications add context to new or revised records and enable agents to link directly to the record. When a record changes, an indicator appears on any open record so that it is visible to an agent.

You can configure notification triggers that are most relevant for your team.

**Configure notification triggers in Agent Workspace**

Determine the conditions when a notification appears for your agents in Agent Workspaces such as when a record updates or is assigned to a user.

**Role required:** admin

1. Navigate to **Agent Workspace > Notification Triggers**.
2. Click **New** to create a new record or open an existing record to edit.
3. On the form, fill in the fields.

**Trigger Notifications**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Notification trigger setup configuration.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that you can select except for the system tables.</td>
</tr>
<tr>
<td>Content</td>
<td>Field that defaults to <strong>Agent Workspace UI Notifications</strong>.</td>
</tr>
<tr>
<td>When to Send</td>
<td>Notification that is sent when a record is created or updated. You can add filter conditions.</td>
</tr>
<tr>
<td>Who will receive</td>
<td>Assigned agent (if specified). You can add or remove additional agents by unlocking the users and selecting the field.</td>
</tr>
</tbody>
</table>

4. Click **Update**.

**Agent Workspace Advanced Work Assignment (AWA)**

AWA automatically routes work items to agents when you set the criteria for the agent's availability, capacity, and skills. With AWA, agents can access their work item assignments from their Agent Workspace inboxes.

AWA uses service channels to organize incoming work items, such as chats, cases, and incidents. AWA routes these work items to specific work item queues, such as the product chat, billing chat, VIP chat,
critical cases, and IT support queues. You can set the capacity for an agent, which is the number of work items on a particular service channel that an agent may actively work on. You can set assignment rules to determine how AWA routes work items to a group of agents. If an agent rejects a work item, the item is rerouted to another agent.

**Note:**
The Advanced Work Assignment plugin is required for Agent Workspace.

### Service Channels

- **Chats**
- **Cases**
- **Incidents**

### Work Item Queues

- Product Chat
- Billing Chat
- VIP Chat
- Critical Cases
- IT Support

### Groups

- Assignment Rules

### Agent Options

- Agent Presence
- Reject Reasons

**AWA work flow**

**AWA Configuration Components**

**Service channels**

Agents receive work items through service channels, which are preconfigured work channels. You can customize the channel conditions, define the inbox layout for agents, create additional queues, and set the capacity for specific agents. Agent Workspace includes two preconfigured service channels, Chat and Case.
Work items

Each work item is a single piece of work that is handled by an agent, such as an incoming chat or case. Work items come through a work item queue, which has definable schedules, target wait times, and routing conditions.

Assign Groups

You can use assignment groups to group agents and provide details regarding the name and description, manager, and group email. You can use the related lists to set up roles, groups and group members, queues, and agent capacity overrides for the agent pool.

Assignment Rules

Assignment rules determine how work items, such as cases, chats, or incidents, are routed to an assignment group. You can set the criteria to assign work items to agents and create custom assignment rules to determine work item assignment and handling. You can define agent skills by using the Skills Management feature.

Agent Presence States

An agent presence state indicates if an agent is online and available to receive incoming work items or whether the agent is away or offline. You can create or modify these availability states for agents.

Reject Reasons

You can define the reasons that agents use to reject a work item, such as out to lunch or on a break.

Workspace Agent Chat

Configure Workspace Agent Chat to enable customers to ask questions and receive information through a live agent. Through Agent Chat, agents communicate with customers, create incident or case records, or transfer chats to another agent or queue.

Agent Chat uses a persistent widget for chat conversations on any portal page of the portal you're using. You can establish assignment rules to enable chat conversations to reach the best agent available who has the capacity and skills to handle the job. The agent can transfer the chat to another agent if necessary. Response templates can be used by agents to enable reusable, consistent messages to requesters.

Configure Workspace Agent Chat

Configure Workspace Agent Chat to enable live agent chat with customers. Through agent chat, agents interact with customers, create incident or case records, and transfer chats to another agent or queue.

The following should be configured before accomplishing this task:

- Install the Agent Chat plugin, com.glide.interaction.awa.
- In Advanced Work Assignment:
  - Configure service channels.
  - Define work item queues.
  - Set up work assignments.

Watch this video to get started with Workspace Agent Chat:

Role required: workspace_admin

Set up Agent Chat for agents to use chat functionality in Agent Workspace.

1. Navigate to Collaboration > Chat Setup.
2. On the form, fill in the fields.

**Chat Setup form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Live Agent setup configuration.</td>
</tr>
<tr>
<td>Live Chat Enabled</td>
<td>Option to activate live chat. If you don't want to use live agent chat, clear this check box.</td>
</tr>
<tr>
<td>CSM Fulfiller UI</td>
<td>Chat support interface: Connect Support or Agent Workspace.</td>
</tr>
<tr>
<td>CSM Queue</td>
<td>Live Agent chat queue used for Customer Service Management (CSM) if not specified in the chat interface or changed by a Virtual Agent topic. If you're using Agent Workspace, you don't need to specify a CSM queue.</td>
</tr>
<tr>
<td>HR Fulfiller UI</td>
<td>Chat support interface: Connect Support.</td>
</tr>
<tr>
<td>HR Queue</td>
<td>Live Agent chat queue used for HR if not specified through the chat interface or changed by a Virtual Agent topic.</td>
</tr>
<tr>
<td>ITSM Fulfiller UI</td>
<td>Chat support interface: Connect Support or Agent Workspace.</td>
</tr>
<tr>
<td>ITSM Queue</td>
<td>Live Agent chat support queue is used for IT Service Management if not specified through the chat interface or specified by a topic.</td>
</tr>
<tr>
<td>Global Fulfiller UI</td>
<td>Chat support interface for the platform: Connect Support or Agent Workspace</td>
</tr>
<tr>
<td>Global Queue</td>
<td>Queue used if Virtual Agent doesn't have information about the queue from the chat interface or a Virtual Agent topic. If you're using Agent Workspace, you don't need to specify a Global Queue.</td>
</tr>
<tr>
<td>Transfer Message</td>
<td>Message users see when they are transferred to a live agent or another queue. For example: &quot;Please stand by while I connect you to a live agent.&quot;</td>
</tr>
</tbody>
</table>

**Note:** Collaboration module is unrelated to the Collaboration plugin.
### No Agents Available Message

Message that users see when a live agent is not available. For example: "No agents are available at the moment. Try again later."

**Note:** You can define only one agent availability message, which is displayed for all the queues in your instance.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No Agents Available Message</td>
<td>Message that users see when a live agent is not available. For example: &quot;No agents are available at the moment. Try again later.&quot;</td>
</tr>
</tbody>
</table>

### 3. Click Update.

You're almost done with Agent Chat configuration. Your final step is to enable the chat client on your end user portal, which is commonly called the Service Portal. After completing that step, you're done configuring Agent Chat.

Two options are available for setting the Service Portal chat client for Virtual Agent and Live Agent:

- **Configure the Service Portal chat client for Virtual Agent:** Define a configuration that enables the chat client to persist across all portal pages for selected portals. End users can engage in chat on any portal page in specified portals.
- **Configure the Legacy Virtual Agent Service Portal widget:** bundle/newyork-performance-analytics-and-reporting/page/administer/live-agent/task/configure-virtual-agent-for-sp.html#configure-legacySP-widget: Configure the Legacy Virtual Agent Service Portal widget: Add the Legacy Virtual Agent Service Portal widget to a single, selected portal page, from which your end users run the chat client. Use this widget if you're using pre-chat routing before users can engage in chat.

### Anonymous user chat sessions

Anonymous users (unauthenticated guests) can chat with support agents in the web chat client, without logging in to a service portal. Admins can control certain aspects of the conversational experience for guest users, such as enabling resumable chat sessions after a browser refresh.

When guest users refresh the browser window while chatting with an agent, the refresh automatically starts a new conversation and chat session. By default, the ongoing conversation and chat session history are not retained.

You can change the default guest session behavior to let your guest users resume an ongoing conversation and see the chat session history after a browser refresh.

### Enable resumable guest sessions

Use the `com.glide.cs.guest_session_resumable` system property to the change the default chat guest session behavior for guest users.

1. In the navigation filter, enter `sys_properties.list`.
2. Open the `com.glide.cs.guest_session_resumable` property.
3. In the **Value** field, enter `true` to enable resumable guest chat sessions and retain the chat session history.
4. Click Update.

After a browser refresh, your guest users can continue their conversations with agents and see the chat session history in the chat panel.
Quick actions in Agent Workspace chat

Set up shortcuts in Agent Workspace chat so agents can work more efficiently with their customers.

Using quick actions

In Agent Workspace chat, an agent can insert a quick action in any of the following ways:

- Enter a command after the forward slash (/).
- Click the lightning bolt icon
  
  and select a quick action from the menu.
- If available, click the quick action button on the toolbar.

For example, an agent can transfer a conversation to another queue by entering `/t.q` in the message input field.
Initiating a queue transfer by typing

An agent can also initiate a queue transfer by clicking the lightning bolt icon and then selecting `/tq` from the menu.
Initiating a queue transfer from the quick action menu

Alternatively, an agent can transfer to another queue by clicking the arrow button on the toolbar.
Initiating a queue transfer from the toolbar

**Note:** Agents must have the quickactions_user role to use quick actions.

**Parameters**

Some quick actions require a secondary menu so that agents can further control the quick action. For example, after an agent initiates a queue transfer, the agent needs to select which queue to transfer to. The items that appear on the secondary menu are called **parameters**.

The following figure shows that, after an agent inserts a quick action to transfer to another queue, the agent sees a list of available queues. The default parameters for the quick action are queues that are available to agents.
To create a quick action that requires a secondary menu, you must define parameters for the quick action. For more information, see Define a quick action parameter for Agent Workspace chat.

**Default quick actions**

The following quick actions are available by default with Agent Workspace chat:

<table>
<thead>
<tr>
<th>Command name</th>
<th>Toolbar button</th>
<th>Action</th>
<th>Default parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>tq</td>
<td><img src="image" alt="Transfers" /></td>
<td>Transfers the conversation to another queue.</td>
<td>Available queues</td>
</tr>
<tr>
<td>ta</td>
<td><img src="image" alt="Transfers" /></td>
<td>Transfers the conversation to another agent.</td>
<td>Available agents</td>
</tr>
<tr>
<td>r</td>
<td><img src="image" alt="Uses" /></td>
<td>Uses response templates to insert as text in a conversation.</td>
<td>Available response templates</td>
</tr>
</tbody>
</table>

**Activation information**

To enable your agents to use quick actions, you must activate the Agent Chat [com.glide.interaction.awa] plugin, which is required for chat in Agent Workspace.

© 2021 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
As of the New York release, quick actions replace Connect actions in Agent Workspace chat. If you activated the Agent Chat [com.glide.interaction.awa] plugin prior to New York, your Connect actions are no longer available in Agent Workspace chat; you may need to create new quick actions.

Create a quick action for Agent Workspace chat

Create a quick action so that agents can use shortcuts for performing actions in Agent Workspace chat.

Role required: admin

1. Navigate to Quick Actions > Actions, and then click New.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the quick action.</td>
</tr>
<tr>
<td>Active</td>
<td>Option for activating the quick action.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the quick action.</td>
</tr>
<tr>
<td>Command Name</td>
<td>Text that triggers the quick action when entered after the forward slash (/) in a conversation.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Work item that the quick action is available for. Filter the table that you select in the Table field to qualify a certain kind of work item. For example, to make the quick action available only for conversations that are assigned to Beth Anglin, you would first select the Interaction [interaction] table in the Table. Then, in the Applies to field, you would create the following filter: [Assigned to] [is] [Beth Anglin].</td>
</tr>
<tr>
<td>Table</td>
<td>Work item table that the quick action is available for.</td>
</tr>
<tr>
<td>Note: Quick actions are supported only in the Interaction [interaction] table.</td>
<td></td>
</tr>
<tr>
<td>Apply to all groups</td>
<td>Option for making the quick action available to all user groups.</td>
</tr>
<tr>
<td>Apply to groups</td>
<td>List of which groups can use the quick action. This field appears only if you clear the Apply to all groups option.</td>
</tr>
<tr>
<td>Script</td>
<td>JavaScript code to control what the quick action does. In this script, you have access to: • The record variable, which for Agent Workspace chat is the Interaction [interaction] record • The params array, if you defined quick action parameters If provided, all free-form text entered after all the other parameters are captured as the last item in the params array. Set the value of answer as follows:</td>
</tr>
</tbody>
</table>

```javascript
answer = {
  success: <Boolean>,
  message: <success_or_error_message>
};
```

Note: If you do not script a message, the agent receives a default message instead.
3. **Click Submit.**

If your quick action requires a secondary menu, define a quick action parameter so that agents can further control the quick action. For more information, see *Define a quick action parameter for Agent Workspace chat.*

Optionally, you can make the quick action available in Agent Workspace chat as a button. For more information, see *Configure a quick action button for Agent Workspace chat.*

*Define a quick action parameter for Agent Workspace chat*
Define a quick action parameter to allow agents to further control a quick action in Agent Workspace chat.

Role required: admin

1. Navigate to *Quick Actions > Parameters*, and then click **New**.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the parameter.</td>
</tr>
<tr>
<td>Action</td>
<td>Quick action that uses the parameter.</td>
</tr>
<tr>
<td>No Matching Results Message</td>
<td>Message to agents if no records match the record query. If you do not create a <em>No Matching Results Message</em>, a default message is provided.</td>
</tr>
<tr>
<td>Display value field</td>
<td>Field from the parameter record that appears in Agent Workspace chat.</td>
</tr>
<tr>
<td>Query mode</td>
<td>Type of query. You can select <em>Scripted</em> or <em>Basic</em>. To query records with a script, select <em>Scripted</em>. To query records by whichever table that you specify in the <em>Table name</em> field, select <em>Basic</em>.</td>

</tbody>
</table>

**3. Click Submit.**

*Configure a quick action button for Agent Workspace chat*

Configure a quick action button so that agents can perform actions in Agent Workspace chat with a single click.

Role required: admin

The toolbar of the Agent Workspace chat window contains three buttons. By default, clicking the left button

(_attach a file in a conversation, clicking the center button

(initiates a queue transfer, and clicking the right button

(initiates an agent transfer. You can't configure the left button, but you can assign different quick actions to the center and right buttons. However, you can't change the button icons.
1. Navigate to **Collaboration > Chat Setup**.
2. Go to the Quick Actions for Workspace Actions related list and select a button to configure.
   - To configure the arrow button
     open `arrow-right-outline`.
   - To configure the add user button
     open `user-plus-outline`. 
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quick Action</td>
<td>Quick action that is inserted when you click the button.</td>
</tr>
<tr>
<td>Icon</td>
<td>Button icon that appears on the toolbar of the Agent Workspace chat window.</td>
</tr>
<tr>
<td></td>
<td>You can't change the button icon.</td>
</tr>
<tr>
<td>Order</td>
<td>Position of the button on the toolbar. If the value is 100, the button</td>
</tr>
<tr>
<td></td>
<td>appears at the center of the toolbar. If the value is 101, the button</td>
</tr>
<tr>
<td></td>
<td>appears at the right side of the toolbar. You can't change the button order.</td>
</tr>
</tbody>
</table>

4. Click **Update**.

**Configuring Agent Workspace landing pages**

The Agent Workspace landing page is the initial view of your agent's workspace. It displays a set of preconfigured reports and grouped data that are specific to your agent's work responsibilities.

Your instance should have at least one landing page, depending on the features and products that you have. All landing pages are configurable and consist of a layout with containers and widgets that appear on the page. You can use any landing page without modifications or you can clone a landing page and make updates for your installation.

**Note:** Widgets that display in Agent Workspace must be pre-configured. If you need to configure a widget, see **Performance Analytics and Reporting for Agent Workspace**.

Components and behavior include:

- **Lists:** Displays a list with any selected record that opens in a new tab. Clicking **Show All** displays the full list in the home module.
- **Single Score:** Displays a full list in the home module.

**Note:** A database view, such as Spotlight, will not have other interactions.

- **Time Series/Trend By:** Displays a graph of records over time or a trend but does not contain other interactions.

Show all
Modify the landing page layout for Agent Workspace

Modify or create a new landing page for Agent Workspace. If you modify an existing landing page, the clone of the landing page copies the layout and all associated containers and widgets.

Role required: Uxframework_designer

You must be in the Agent Workspace application.

1. Navigate to Agent Workspace > Landing Pages.
2. Create a landing page or modify an existing landing page:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modify an existing landing page</td>
<td>Go to step 3. You should have a default landing page and other customized landing pages for specific features or products.</td>
</tr>
<tr>
<td>Create a landing page</td>
<td>Click New and go to step 5.</td>
</tr>
</tbody>
</table>

3. Select a landing page.
4. Click Clone Page.
5. On the form, fill in the fields.

Landing page attributes and layout form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of your landing page.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the page shows. If you set up multiple landing pages, the page with a lower value takes precedence over the pages with higher values.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If there are permissions on any active page, a user sees the page with their group or role set. The permissions takes precedence over a user who sees a page without permissions that is the lowest order.</td>
</tr>
<tr>
<td>Applicability</td>
<td>If applicability is for any page or a specific page.</td>
</tr>
<tr>
<td>Applicable Page Registry</td>
<td>If applicability is for a specific page, identify the page from the UX page registry.</td>
</tr>
<tr>
<td>Active</td>
<td>Option that you select to determine whether the landing page appears. A page that is not active does not appear.</td>
</tr>
<tr>
<td>Optional Page Title</td>
<td>Title to display on the page.</td>
</tr>
<tr>
<td>Available Child Slots</td>
<td>Pre-defined named location for child elements.</td>
</tr>
<tr>
<td>Layout</td>
<td>Pre-defined list of containers to define the number of slots (columns) that display on a layout.</td>
</tr>
</tbody>
</table>

6. Click Update.
7. Configure permissions for users to access the landing page:
   a) Click the UX Page Element Permissions related list.
   b) Click **New**.
   c) Select the role or group for the landing page to be visible.
   d) Click **Submit**.

Any page element (including sub-elements) can have a restriction to a given set of roles or groups. If no element permissions are set on roles or groups, all users see the element. If some element permissions are set, a user needs just one role or group assignment to see the element.

8. Configure a container:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Add a container</strong></td>
<td>Click <strong>New Container</strong>.</td>
</tr>
<tr>

</table>
Agent Workspace phone integration with OpenFrame and computer telephony integration (CTI)

OpenFrame and CTI enable third-party phone integrations for phone use for agents in Agent Workspace.
- OpenFrame enables CTI with third-party telephony service providers (TSPs) such as Twilio.
- CTI integrates with the Now Platform and the TSPs to support incoming and outgoing calls.

When you integrate OpenFrame and CTI with a TSP, agents in Agent Workspace can use:
- An embedded softphone to place and receive customer calls.
- Click-to-call capability from phone number fields on forms and the Customer 360 ribbon component.
- Contextual identification for incoming calls.
- An additional window that contains contextual links in the softphone window and open related records.

OpenFrame and CTI can also integrate with the Interaction Management System (IMS), which enables you to manage the life cycle of the phone interaction. With this integration, incoming and outgoing calls create phone interaction records.

Use embedded softphones with Agent Workspace

Configure Agent Workspace to support embedded softphones so that agents can receive incoming calls and place outgoing calls.

Incoming calls

Agents receive incoming calls in the OpenFrame window. Contextual information, such as the account, contact, consumer, and case number, is displayed in the window.

Agents click links from the contextual information in the OpenFrame window to open the corresponding records in Agent Workspace. Agents can open the forms in primary or child tabs depending on the workspace tab configuration.

- With Interaction Management System (IMS) integration, these records open as sub-tabs to the interaction record.
- Without IMS integration, these records open as primary tabs.

For more information, see the OpenFrame overview overview.

Outgoing calls

Agents can place outgoing calls from phone number fields on a form or from the ribbon on the Case form.

By clicking these phone fields, agents see the OpenFrame window, where they can place a call to the number which shows on-screen.

Integration with Interaction Management System (IMS)

With OpenFrame, computer telephony integration (CTI), and IMS integration, incoming and outgoing calls create interaction records.

Receive incoming calls through Agent Workspace

When an agent answers an incoming call from the OpenFrame window, an interaction record opens in a parent tab in the New state with the Channel field set to Phone.
If available for your installation, the account information, the contact information, or the consumer information, is added to the interaction record. The case number is also added to the record if the caller provides it to the agent. If an agent clicks a link in the OpenFrame window, such as the account, contact, consumer, or case number, the corresponding record opens in a sub-tab under the interaction record.

The call forwards to an agent. The interaction record is assigned to the agent and the state is set to Pending Acceptance. The interaction record is displayed in the agent's workspace and includes any details that are provided by the customer.

The agent can accept or reject the call:

- If accepted, the interaction record state is set to Work in Progress.
- If rejected, the interaction record state is set to Closed Complete.
- If the call is not picked up or the caller hangs up before the agent can pick up, the interaction state is set to Closed Complete.

When a call is ended, a phone log record is created for the interaction and the interaction record state is set to Closed Complete.

Make outgoing calls through Agent Workspace

For outgoing calls, the `sn_openframe.create_interaction` property determines whether or not an interaction record is created.

When an agent places an outgoing call using a click-to-call enabled phone field, the system gathers contextual information about the call, including the account, contact, or consumer details.

If the `sn_openframe.create_interaction` property is set to true:

- An interaction record is created in the Work in Progress state. The record is populated with the contextual information and is assigned to the agent.
- The interaction record and relevant information is passed to OpenFrame.
- CTI receives the interaction, initiates the call, and manages the interaction life cycle.
- If the outgoing call is unanswered, the interaction record is set to Closed Complete.

If the `sn_openframe.create_interaction` property is set to false:

- The contextual information is passed to OpenFrame.
- CTI receives the contextual information and initiates the call.

Transferring calls to other agents

If an agent transfers a call to another agent, the interaction record is also transferred and a transfer record is created. The call is shown in the OpenFrame window in the new agent's workspace. The interaction record is assigned to the new agent in the Pending Acceptance state and is displayed in the agent's workspace. The state changes to Work in Progress when the agent accepts the call.

Integration with Interactive Voice Response (IVR)

With IVR integration, an interaction record is created as soon as the caller connects and receives an IVR message. The selections made by the caller are captured and added to the interaction record. If the caller enters a case number, the case is added as a related record on the interaction.
Completing your tasks with Agent Workspace

With Agent Workspace, you can respond to users, maintain context while opening several tabs, and find the answers to questions without leaving the form that you are working on.

You can customize Agent Workspace to fit the way you work best.

Agent Workspace customization

Customize Agent Workspace to match your workflow needs.

Customize your Agent Workspace

Make Agent Workspace work for your workflow by customizing preferences, create tags, and creating filters to find your records.

- Set your user preferences in Agent Workspace to customize the ribbon, sidebar, and banners. You can also wrap list text and show a notifications badge count.
- Set record tags in Agent Workspace to organize and group records.
- Create a filtered list in Agent Workspace to monitor your issues, tasks, or problems. Filters appear under My Lists.

Set your user preferences in Agent Workspace

Configure Agent Workspace to display settings that are important to your workspace.

Role required: agent_workspace_user

1. Navigate to Agent Workspace > Agent Workspace Home.
   Agent Workspace opens in a new tab.
2. Navigate to User Menu > Settings.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Ribbon</td>
<td>Enables the workspace to show the Ribbon widget by default when the form loads.</td>
</tr>
<tr>
<td>Show Sidebar</td>
<td>Enables the workspace to show the contextual sidebar by default when the form loads.</td>
</tr>
<tr>
<td>Wrap List Text</td>
<td>Enables the workspace to automatically wrap the List text lines to save space on the workspace screen.</td>
</tr>
<tr>
<td>Show Banners</td>
<td>Enables agents to opt into or out of notification pop-up displays.</td>
</tr>
<tr>
<td>Show Badge Count</td>
<td>Enables agents to opt into or out of a count of incoming notifications.</td>
</tr>
</tbody>
</table>

Set record tags in Agent Workspace

Customize your workspace by adding record tags, which are text labels to group and organize records, in Agent Workspace.

Role required: admin

1. Navigate to any open record in Agent Workspace.
2. Click the Tag icon

next to the primary value in the form header.

3. In **Add Tag**, enter a tag name.

4. Click **Enter** to save the tag with the record.

You can continue to add more tags, if desired.

The tag visibility setting defaults to private, which is only visible to the owner of the record.

5. To change the visibility setting of the tag, select a tag and change the **Viewable by** setting:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Me</td>
<td>This setting is for a private tag and is visible only to the owner of the record. This setting is the default.</td>
</tr>
<tr>
<td>Groups and Users</td>
<td>This setting is for a shared tag which is visible to specific groups or users. You can specify the groups and users who can view this tag.</td>
</tr>
<tr>
<td>Everyone</td>
<td>This setting is for a global tag which is visible to everyone.</td>
</tr>
</tbody>
</table>

**Note:** This visibility setting is only available to an admin or tags_admin role.

6. To remove a created tag, click a filled Tag icon and click the X on the tag.
Create a filtered list in Agent Workspace

Create your own filtered lists in Agent Workspace to monitor your issues, tasks, or problems, under **My Lists**.

Role required: agent_workspace_user

1. Navigate to **Agent Workspace > Agent Workspace Home**. Agent Workspace opens in a new tab.
2. In **Lists**, select a pre-defined list, and then click the Edit Menu icon.
3. Click **Save as** and rename the list. The new list appears in the **My Lists** section of the List menu.
4. Optional: To edit an existing list under **My Lists**, click the **Edit Menu** icon to enter edit mode, and then click the list that you want to edit.
5. Optional: To copy a list from either **Lists** or **My Lists**, click the **Edit Menu** icon to enter edit mode and then the Copy List item icon next to the list you want to copy.
6. Optional: To change the order of your lists, enter edit mode, then drag each list into the order that you want.

List menu in Agent Workspace

Use the list menu in Agent Workspace to see which cases are assigned to you and to make lists that only you can see. Lists are organized into two categories: Lists and My Lists.
Lists

Categorized set of lists are created by the workspace list administrator. You only see the categories and lists that are assigned to you. If no lists are configured for a list category, the list category does not appear in the list panel.

Configure your own versions of the lists in this section by entering edit mode ( ), copying a configured list, and making your own adjustments.

Expand and collapse categories to make it easier to find the lists that you want.

My Lists

Any lists that you create appear in this section. Lists in this section are not visible to anyone but you. Use the edit menu for the following:

Rename
Enables you to rename a list.

Personalize Columns
Allows you to alter the columns that are displayed in the list.

Save
Saves the current list and underlying filters.

Save as
Saves and renames the current list and underlying filters under My List.

Delete
Removes a user-created list from My List.

Starting work with Agent Workspace

An agent begins work in a list queue, chat queue, or phone call.

Agent Workspace channels

Typically, there are three avenues to start work in Agent Workspace:

• Starting from the List queue
• Starting from the Agent Inbox
• Starting from a phone call
## Starting from the List queue

<table>
<thead>
<tr>
<th>Agent Responsibilities</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select a queue in the List queue</td>

</tr>
<tr>
<td>Open or review the customer and issue information</td>
<td>The Form header and ribbon give a quick look at customer information and a short description view of an issue.</td>
</tr>
<tr>
<td>Review the activity stream</td>
<td>The activity stream shows work done for a customer through the life cycle of the issue.</td>
</tr>
</tbody>
</table>

Global search capabilities in Agent Workspace

The global search feature enables searches for case, incidents, problems, knowledge articles, community questions and change requests.

Global search feature

Users can search on a term and view the search results in a separate tab. The search results include items in which the short description, content, or attached files include the search term. By default, global search results can include:

- Cases
- Customers or Users
- Community Questions
- Incidents
- Change Requests
- Problems
- Knowledge Articles

Searching for a customer or user

You can search for a customer or user by name, for example, search for a user or customer with the first name of Fred:

![Search bar with text 'fred']

Global search results show the number search results by designated categories:
By clicking Users, the results show for users with the name of Fred:

Users (2 of 2) ①

Fred Luddy
fred.luddy@example.com
ACME North America

Fred Kunde
fred.kunde@example.com
ACME France

Searching for a case or incident

You can search for specific cases or incidents by the case or incident number. If you do not know the specific case or incident number, you can also search by user or customer. A search for incidents involving Fred:
Interaction records in Agent Workspace

Using an interaction record, agents can create or reference basic information from a customer contact. Agents can then decide if the conversation is an incident, a case, or a request.

An interaction represents a request for assistance made through a given channel (chat, phone, walk-up). Interactions can be routed to queues for assignment or assigned to agents directly. Support agents can create cases, requests, or incidents from the interaction. Interactions can also be used to capture one-and-done type requests where an agent might not want to create associated tasks.
### Features

<table>
<thead>
<tr>
<th>Features</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Details, Related Tasks, User's Interactions forms</td>
<td>Every interaction record defaults to the Details form, showing initial interaction record information. Related Tasks are tasks opened from the interaction, for example, a new incident. The User's Interactions form logs all interactions tied to each specific user.</td>
</tr>
<tr>
<td>Number</td>
<td>A number is associated to each customer interaction.</td>
</tr>
<tr>
<td>Features</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Logs the type of channel communication, such as chat, phone, or walk-up.</td>
</tr>
<tr>
<td></td>
<td>Note: Phone is an available type of channel communication when the OpenFrame plugin (com.sn_openframe) is activated.</td>
</tr>
<tr>
<td><strong>State</strong></td>
<td>The state of the interaction record. Choices include:</td>
</tr>
<tr>
<td></td>
<td>• Queued</td>
</tr>
<tr>
<td></td>
<td>• Pending Accept</td>

<td>The time it takes to initially respond to the customer.</td>
</tr>
<tr>
<td><strong>Short Description</strong></td>
<td>A short description of the interaction.</td>
</tr>
<tr>
<td></td>
<td>Note: The short description field is empty by default, but it cannot be empty when the record is closed, saved, or associated to a related task. Populate the short description and then close, save, or associate the record, or you cannot archive the record.</td>
</tr>
</tbody>
</table>

**Agent Workspace notifications**

Agents can receive Agent Workspace notifications so they are aware of updates to their records without leaving their workspace.

Agents can view on-screen notifications from administrator configured triggers, such as a notification for the “assigned to” agent of a newly assigned or updated record. These notifications give context to the change and enable agents to link directly to the record. Also, more noticeable tab indicators on record change for off-focus open records. Benefits include:

- On-screen notification pop-up, for newly assigned or updated records
- A notification icon and badge
- Notification tray which retains notifications for the last seven days (unless manually cleared by the user)
- New settings to opt into or out of notification toasts and notification badge count
Working from the List queue

Open a list from the List menu to view a list of items in the workspace.

Working from the List enables you to see high-level information for all of your records.
You can perform numerous tasks from the List in the workspace to quickly find the information you are seeking, such as sorting and filtering columns, and grouping items.

**Sorting columns**

Click the column headings to determine the sort order of a column. The arrow next to the column name indicates the current sort order. A downward pointing arrow indicates that the column sorts in a descending order. The system remembers the most recent sort order that you choose for a specific column.

Click the **More UI Actions** icon

![More UI Actions icon](image)

... to **Show Matching** records or **Filter Out** matching records from the list.

By default, a column sorts in an ascending order unless the column data type is a date. Dates sort in a descending order.
Changing the number of rows per page

In the list footer, click the number of rows per page

20 rows per page

and select the number of rows that you want to display.

List quick edit

You can make updates to a record directly from a list, without leaving the list. Click the Open Preview icon to open the record for edits.

Note: This feature is available only on a full list view, not a related list.

List multi-edit

You can apply the same changes to multiple records at the same time directly from the list. Select the records for your global edits. The Edit button shows an aggregate total of the records selected. Make changes and click Update to save. The number of records you can update cannot extend past the page.

Note: This feature is available only on a full list view, not a related list.

List grouping

You can group your list by a single column. Click the More UI Actions icon to apply a filter for grouping. You can also save this view to My Lists by grouping the list, and clicking Save. When you access this list from My Lists, the grouping filter applies.
After a list group filter applies, the pagination also updates. The display shows a count of rows per group. The maximum number of groups that display per page is 20. You can adjust this count to change the number of records displayed in each group.

**List column filtering**

You can filter a list from a column header without having to open the Advanced Filter panel. Click the More UI Actions icon

- to the right of the column and set filter your conditions. Click Apply to see your filter in the list.
List export

You can export records from a list into CSV, XLSX, JSON, or PDF files. Click the List Actions icon and select Export.

List updates

Last refreshed indicates the time period since the last data refresh on screen. View the changes by refreshing the list. Related list counters do not get updated automatically, so you must refresh the browser to see an accurate count.

List filter badges

The list filter icon displays badges that show the number of conditions that apply to the current list. You can restore the defaults to a list to remove additional filters on the original filter list. The advanced view launches the condition builder.

List URLs

Each list has an associated URL, similar to records. You can bookmark a list to allow quick access and deep-linking from the platform UI directly to a workspace list.
Create a record in Agent Workspace
Create a record in Agent Workspace from the New Record menu or from a list.

Depending on your workspace configuration, you might not see the options.

Role required: agent_workspace_user

1. Create a record using one of the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Record menu</td>
<td>Click the New Record menu icon tab to create a record. If more than one record option is available, select the type of record that you want to create. If you do not select a record type, a new interaction record opens automatically.</td>
</tr>
<tr>
<td>List Panel</td>
<td>From the List menu, select a queue under the list category that you want to create a record for, and then click New. Depending on your configuration, the New button might not be available.</td>
</tr>
</tbody>
</table>

2. On the form, fill in the fields.

If another user makes changes to the same record, you see a visual indicator next to the changed fields.

Apply a template to a record in Agent Workspace
Select a template for a form that you use frequently from the contextual sidebar to automatically populate fields on the form.

Role required: agent_workspace_user

1. In Agent Workspace, open an existing record from a list, or create a record.
2. From the contextual sidebar, click the template icon.
3. From the list of templates, select a template to apply to the form. Any fields that are included in the template automatically populate in the form.
4. Optional: To undo the changes that were made when you added the template, navigate away from the form without saving.

Using Agent Assist in Agent Workspace
Agent Assist is a contextual search option that agents use to search for additional information.

Search results automatically appear when you use the search bar in Agent Assist to search for information. Depending on your installation, Agent Assist enables the following options:

- Predictive Intelligence
- Knowledge articles
- Attachments
- Templates
Agent Assist

ServiceNow Predictive Intelligence can help you to find similar incidents and problems by using a combination of contextual search, Azul Systems, Inc Zing, and machine learning.

**Note:** Machine learning and Major Incident Management require separate subscriptions.

Depending on your configuration, Agent Assist search results can include knowledge articles, social Q&A entries, and catalog items. The default number of search results is 10. If you see more than 10 results, the number appears as 10+. Use the filter to narrow down your search results.

If **Search as** is enabled for Agent Assist for your instance, you can also filter search results by caller name. That way, you know that the caller can also see the articles that you are attaching.

You can place a catalog order directly from the form by clicking the catalog item in Agent Assist. You can also add a knowledge article to the Additional comments (customer facing) activity stream for a record by clicking **Attach** in Agent Assist.

For Agent Assist to work, the ITSM plugin, com.snc.agent_workspace.itsm, must be activated on your instance.

**Order a catalog item using Agent Assist**

Use Agent Assist to order catalog items from within the form.

**Role required:** agent_workspace_user

1. Navigate to **Agent Workspace > Agent Workspace Home.**
2. Open an incident record from the list of open incidents.
3. In the Agent Assist panel, select an item from the default search or search for something specific in the search bar.
4. Click the catalog item, and then click **Order**.

Catalog item

The form for the catalog item opens in a new sub-tab.
5. Complete the catalog item form.

<table>
<thead>
<tr>
<th>INC0000057</th>
<th>INC0000055</th>
<th>+</th>
</tr>
</thead>
<tbody>
<tr>
<td>Details</td>
<td>DevelopmentLa...</td>
<td>x</td>
</tr>
</tbody>
</table>

- Service Catalog > Hardware > Development Laptop (PC)

Catalog item form

Ordering the catalog item creates a service catalog request.

*Add a knowledge article to a form using Agent Assist*

Use Agent Assist to search for and add articles to a form.

Role required: agent_workspace_user

1. Navigate to **Agent Workspace > Agent Workspace Home**.
2. Open an incident record from the list of open incidents or cases.
3. In the Agent Assist panel, select an item from the default search or search for something specific by using the search bar.

4. Click **Attach**.

Depending on your configuration, when you click **Attach**, you add a link or embed an article directly into the Additional comments (customer visible) portion of the activity stream.
Working from the agent inbox

Use the agent inbox to manage your incoming work items, such as chats, cases, and incidents.

To open the agent inbox, click **Inbox** in the navigation bar.

### Inbox responsibilities

<table>
<thead>
<tr>
<th>Agent responsibilities</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Monitor your inbox</td>
<td>Use designated service channels to route work items to available agents, such as incoming chat requests, case assignments, and incidents.</td>
</tr>
</tbody>
</table>
| Start a chat session                       | Accept a chat from your inbox. You have a time limit to accept a chat before it reroutes to another agent. The chat associates to an interaction record that captures the conversation and work done during the session. During a chat session, you can:  
  - Add attachments using the Action toolbar.  
  - Transfer the chat to another agent.  
  - Add another agent to the chat.  
  - Perform other support tasks, such as create an incident or case.  
  - Use workspace tools, such as the ribbon to glance at information or the activity stream to review related work. |

### Agent inbox navigation

![Agent inbox navigation](image-url)
<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(A) Agent inbox</td>
<td>Display the queues that are assigned to you, the number of active chats in each queue, and the average wait time for chats in the queue.</td>
</tr>
<tr>
<td>(B) Active chat panel</td>
<td>Display your active chat session. Chat actions appear beneath the chat and allow your agents to attach a file, add an agent, transfer the chat, and more.</td>
</tr>
<tr>
<td>(C) Interaction record</td>
<td>Display the interaction record (IMS). The IMS initiates from a chat or phone call and lists the initial information about the customer and the communication. You can archive this interaction as a log of communication, or you can create an incident or a case that is based on the customer needs.</td>
</tr>
<tr>
<td>Attachments panel</td>
<td>Add attachments to the interaction. For example, you can add supporting information to a customer issue. If templates are available, they appear in the template section of this panel.</td>
</tr>
</tbody>
</table>

**Accept a chat session**

Begin a conversation with a customer by selecting a chat queue in the chat session. You can work on multiple chats in different queues simultaneously.

Role required: agent_workspace_user

1. Navigate to **Agent Workspace Home > Inbox**.
2. From your inbox, accept or reject a chat.

You are automatically connected to the first customer in the chat queue, which is the oldest request in the queue. The Active Chat panel displays a pre-chat message acknowledging the customer chat request. You can review the customer information before you enter a response in the Active Chat panel.

In the chat workspace, an interaction parent tab with a details child tab open for the session. The details child tab offers more information on the chat request and provides contextual options for performing related operations during the chat session.

3. Use chat tools for managing the chat and contextual options to perform related tasks.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manage your chat</td>
<td>Do the following actions from the Actions toolbar:</td>
</tr>
<tr>
<td></td>
<td>• Add an attachment.</td>
</tr>
<tr>
<td></td>
<td>• Transfer a chat to another queue.</td>
</tr>
<tr>
<td></td>
<td>• Transfer a chat to another agent.</td>
</tr>
</tbody>
</table>
### Option | Description
--- | ---
Perform additional support tasks | Engage in other support work during the chat session by using the contextual options in the **Details** tab. For example, you can:  
- Update chat information.  
- Create a new case or incident.  
  From the sub-tab, you can select other contextual options to work on a resolution for the case or incident. For example, you might need to escalate the issue.  
- Choose a related task in the More options (….), such as send email.  
- Search for relevant information in the knowledge base using Agent Assist.  
  
4. In the **Details** tab of the interaction, end the chat session by clicking **Close**.  
Ending the chat saves the conversation history and closes out the interaction. You can also end a chat by closing the tab. If you end the chat this way, you lose all of the conversation history and you cannot save the information in the interaction record.  

**Add an attachment to a chat**  
Chat agents can add attachments, such as documents and image files, to the conversation.  
Role required: `agent_workspace_user`  
- From the Action toolbar, click the Attachment icon ( ![Attachment](attachment_icon.png)) to upload an attachment to the case.  

**Transfer a chat to another queue**  
Route a chat to another queue. Any agent who belongs to the associated queue can accept the chat.  
Role required: `agent_workspace_user`  
1. From the Action toolbar, click the Transfer to Queue icon ( ![Transfer to Queue](queue_icon.png)).  
2. In the Transfer to Queue panel, select the queue to transfer the chat to.  
   When you transfer a chat, the current work item associated with the interaction is marked as closed complete. A new work item is associated with the new queue and the chat is added to the selected queue. When a receiving agent accepts the transfer, that agent sees the conversation and the chat history in the Active Chat panel.  

**Transfer a chat to another agent**  
Route a chat to another agent in the same service channel.  
Role required: `agent_workspace_user`  
1. From the Action toolbar in the Active chat panel, click the Transfer Agent icon ( ![Transfer Agent](agent_icon.png)).
2. In the Transfer to Agent window, select the agent to receive the chat.

![Transfer to Agent window](image)

The transferred chat is listed in the Queues panel for the receiving agent. The receiving agent can accept or decline the transfer request.

**Change your status in the chat panel**

Change your status while you are on a break or offline so no new chats are assigned to you. When you return, you can update your status to let everyone know you are back.

Role required: agent_workspace_user

1. Navigate to **Agent Workspace Home > Chat**.
2. In the chat panel, from the status list, select your current status.
   - **Available**: You are available to receive new chats.
   - **Away**: You are not available to receive new chats.
   - **Offline**: You are not available to receive new chats.

Adjust your status depending on your availability.

**Using a phone in Agent Workspace**

Use Agent Workspace to make inbound and outbound telephone calls if your instance is integrated with your telephony system.

Role required: agent_workspace_user

You can do the following with the Agent Workspace phone:

- Make an outgoing call
- Receive an incoming call
- Transfer a call to another user within the system
- Place a call on hold or on mute
- Set your availability status

1. Do one of the following:
2. Click **End** to end the call.

### Domain separation and Agent Workspace

This is an overview of domain separation and Agent Workspace. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Overview**

Domain separation is not supported in this application. For more information, see [Application support for domain separation](#).

### Configuration Management Database

With the ServiceNow® Configuration Management Database (CMDB) application, build logical representations of assets, services, and the relationships between them that comprise the infrastructure of your organization. Details about these components are stored in the CMDB which you can use to monitor the infrastructure, helping ensure integrity, stability, and continuous service operation.

Use core features such as CMDB Health, CMDB Identification and Reconciliation, and CMDB CI Lifecycle Management to monitor and detect health issues, reconcile data integrity issues, and manage data life cycle.

**Note:** CMDB modules, features, and wizards are not supported on mobile devices. You cannot use a mobile device to access the CI Class Manager, Query Builder, or Duplicate CI Remediator. Or to access or configure CMDB features such as Identification and Reconciliation, CMDB Health, CI Lifecycle Management, baseline CMDB, and proposed changes.
### Configuration Management and the CMDB

The Configuration Management database (CMDB) creates and maintains the logical configurations your network infrastructure needs to support a ServiceNow service.

These logical service configurations are mapped to the physical layout data of the supporting network and application infrastructure in each of your respective domains. They track the physical and logical state of IT service elements and associate incidents to the state of service elements, which helps in analyzing trends and reducing problems and incidents.

The configurations are stored in a configuration management database (ServiceNow CMDB) which consists of entities, called Configuration Items (CI), that are part of your environment. A CI may be:

- A physical entity, such as a computer or router
- A logical entity, such as an instance of a database
- Conceptual, such as a Requisition Service

In each case, there are attributes about the CI that you want to maintain, and there is control you want to have over the CI. There are changes that may need to be made and tracked against the CI. Also, a CI does not exist on its own. CIs have dependencies and relationship with other CIs. For example, the loss of disk drives may take a database instance down, which affects the requisition service that the HR department uses to order equipment for new employees.

It is this relationship data that makes the CMDB a powerful decision support tool. Understanding the dependencies and other relationships among your CIs can tell you, for example, exactly who and what is affected by the loss of that bank of disk drives. When you find out that a router has failed, you will be able to assess the effect of that outage. When you decide to upgrade the processor in a server, you can tell who or what will be affected during the outage.

Configuration items differ from environment to environment because each customer has unique needs. Details about the exact physical attributes of a computer may be needed by one customer, but may represent meaningless data to another. The NOW Platform provides a mechanism to easily define new classes of configuration items and new relationships that may exist between CIs. New classes can be defined that extend other classes. For example, a laptop class exists that extends the computer class. The
computer class itself extends the base CI class. Customer class extensions are automatically part of the ServiceNow environment and blend seamlessly into the integration points for other ITIL processes.

You can for example, set the **Used for** attribute in the cmdb_ci_server table to a value such as ‘development’, ‘test’, or ‘production’. These values indicate the environment that the CI is supporting, and serve as a way of tracking a CI through its lifecycle in a changing environment.

**Architecture**

![Architecture Diagram]

**Roles required**

Reading CMDB tables directly requires the cmdb_read role, however accessing the **Configuration** module requires the asset, itil, or itil_admin roles. For viewing CMDB-related records in the user interface, the itil role is usually sufficient. For updating records and for other manipulation of records, roles with higher credentials are usually required, as noted in each procedure throughout the documentation set.
Domain separation in Configuration Management Database (CMDB)

This is an overview of domain separation and the Configuration Management Database (CMDB). Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Level 2

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

The following topics provide details about domain separation in Configuration Management (CMDB) modules:

- Domain separation in CMDB Health
- Domain separation in CMDB Query Builder
- Domain separation in CMDB Identification and Reconciliation
- Domain separation in the relations formatter and the CI relationship editor
- CMDB APIs (CMDB SDK)

ITIL Configuration Management integration

The CMDB has relationships with IT service management processes in the following areas: ITIL incident management, ITIL problem management, ITIL change management, ITIL service catalog management, and financial management.

ITIL Incident Management

Configuration management assists Incident Management by providing the Service Desk with immediate information on the CIs affected, and more timely resolution of faults by understanding what CIs have been affected and changed.

ITIL Problem Management

Configuration Management assists Problem Management by linking the CIs affected by problems to the Incident / Problem / Change Management processes, and ensuring the CI status is properly maintained.

ITIL Change Management

Configuration Management assists Change Management by recording which CIs have been changed and controlling the status of CIs throughout the entire CI lifecycle. Configuration Management ensures that any changes made to CIs are recorded and kept accurate. Configuration Management is also used in the integration of Change Management with the DiscoverNow Discovery feature.
ITIL Service Catalog Management

With Service Portfolio Management, business services in the CMDB can also be managed by the Service Catalog team, and exposed to end users who can then request items from them.

Financial Management

With Cost Management, costs can be associated with configuration items, so that the cost associated with Configuration Management can be tracked and bundled into expense lines, budgets, or cost centers.

IT4IT

IT4IT provides reference architecture about the implementation of ITIL strategy. For more information, see the ServiceNow Community blog Running IT as a Business using IT4IT and ServiceNow.

ITIL

The IT Infrastructure Library (ITIL) is an integrated, process-based framework for managing IT services. It provides guidance for creating and operating a Service Desk that provides efficient communication between the user community and the IT provider. Originally initiated to improve IT service management for the UK central government, it has become a standard for many organizations; public or private sector, large or small, centralized, or distributed.

ITIL provides processes for three service concepts: design, transition, and operation.

<table>
<thead>
<tr>
<th>Service concept</th>
<th>Processes</th>

                  • facilities service automation |

Watch this 11-minute video for an overview of the ITIL role including the ITSM process, capabilities of ITIL users, working on incidents and problems, change requests, and the Incident Overview dashboard.

Service design

This guide provides a general overview of ITIL service design concepts.
Service level management

The service level management process is designed to ensure customer satisfaction within IT service processes. Service level agreements are made between the IT staff and the customers, and the IT desk must monitor their performance as compared to the agreements. In addition, underpinning contracts with external vendors and operational level agreements with internal vendors ensures that these service level agreements are feasible.

Availability management

The availability management process ensures that availability within a system is kept as close to 100% as possible. By both reacting to past service failures, and planning to avoid future service failures, availability management can greatly increase end-user satisfaction with services.

Capacity management

The capacity management process is designed to ensure that business services are not made unavailable by over-capacity. By analyzing past failures and planning for growth of demand of services, capacity management can increase end-user satisfaction with services.

Supplier management

Supplier management is a process that defines and monitors agreements between an IT department and an external supplier.

Service catalog management

The service catalog provides a front end for customers to request items and services. Service catalog management ensures that this service catalog provides accurate and useful information on the items and services.

Service transition

This guide provides a general overview of ITIL service transition concepts and how the Now Platform can enable these processes.

Change management

The change management process ensures that standardized methods and procedures are used for efficient and prompt handling of all changes to minimize the impact of change related incidents on service quality. Consequently, change management aims to improve the day-to-day operation of the organization. IT-related changes that may affect one or many customers are tracked with change management. Adding memory to one machine, getting a new server, and installing the latest Windows OS on all PCs are all examples. To find out how the ServiceNow platform implements change management, see Change Management.
Knowledge management

The knowledge management process ensures that important information flows freely throughout the IT organization. Knowledge management keeps the CMDB and knowledge base of an organization up-to-date, and uses a knowledge-centered support approach to reduce repeat incidents and problems. For more information on how the ServiceNow platform implements knowledge management, see Knowledge Management.

Asset management

Asset management enables a process of monitoring processes, organizations, people, information, applications, infrastructure, and financial capital within an organization. This allows the organization to collect accurate records of these business components, making them available for both internal and external auditing processes. To find out how the Now Platform implements asset management, see Asset Management.

Configuration management

Configuration management provides a logical model of the infrastructure or a service by identifying, controlling, maintaining and verifying the Configuration Items in existence. To find out how the Now Platform implements configuration management, see Configuration Management Database.

Release management

This discipline of IT service management is the management of all software configuration items within the organization. It is responsible for the management of software development, installation and support of an organization’s software products. Software Control & Distribution procedures include the management of the software Configuration Items and their distribution and implementation into a production environment. This involves the definition of a release program suitable for the organization, the definition of how version control is implemented, and the procedures surrounding how software is built, released and audited. To find out how the Now Platform implements release management, visit Release Management.

Populate the CMDB

You can populate the CMDB by using Discovery, by importing information from another source, by integrating with an existing external CMDB, or by manually creating CIs.

When you populate the CMDB with information, you create a record for each configuration item in the cmdb_ci table or on one of the tables that extend that table.

ITIL configuration management auto-discovery

The key to any configuration management business practice is the initial and on-going inventory or discovery of what you own. The ServiceNow platform provides three options for auto-discovery:

- The separate and highly robust Discovery product.
- A lightweight native discovery tool, called Help the Help Desk, as part of the overall CMDB. Help the Help Desk enables organizations to proactively scan their network to discover all Windows-based PCs and the software packages installed on those PCs. This WMI-based discovery is included in the core ServiceNow functionality, in the Self Service application, at no additional cost.
• For organizations that want to leverage the discovery technologies they already have deployed (SMS, Tally NetCensus, LanDesk, and so on), the ServiceNow platform supports integrations to those technologies via web services. Scanned data can be mapped directly into the CMDB.

For further information on designing, constructing, and maintaining the CMDB, see white papers CMDB Design & Configuration and CMDB Design.

Discovery

The Discovery product automatically populates the CMDB. Discovery uses probes, sensors, and patterns, to collect and process data about computers, servers, printers, a variety of IP-enabled devices, the applications that run on them, and the relationships between all the items found. This information is sent back to the instance and is used to populate the CMDB.

For more information about Discovery see:
• ITOM Visibility
• Discovery basics

Import information from another source

Information can be imported to the CMDB using import sets. Import sets find files of information (in formats such as XML, Excel, or CSV), import them, and transform them onto the required table. This process can be scheduled or performed on demand.

To import relationships between CIs, use import sets to populate the table [cmdb_rel_ci] with information on the parent, the child, and the nature of the relationship. The [cmdb_rel_ci] table displays a list of all CI relationships and is useful when importing CI data.
Integrate with an existing external CMDB

If the data required for the CMDB is already being collected by another CMDB, it is possible to collect the information from that CMDB in an automated process.
CMDB import integration overview

CMDB instance API

Use the CMDB instance API to populate the CMDB by creating or updating CMDB tables.

Manually create a CI

Create a single CI for a specific class. The role required is based on the selected table settings.

1. Use the CI Class Manager:
   a. Navigate to Configuration > CI Class Manager.
   b. Click Hierarchy to display the list of CI Classes. Select the class to use for the CI.
   c. In the class navigation bar, select CI List and then on the CI list view, click New.
   d. Fill out the CI form and then click Submit.

162
2. Or, directly use a table:
   a. Navigate to and expand Configuration and then elect the class to use for the CI, such as Business Services.
   b. In the navigation filter of the application navigator, enter the table label (such as 'Linux'), or the table name in the format of <table name>.list (such as 'cmdb_ci_linux_server.list'). Then, press Enter.
   c. In the list view of the table, click New and fill out the form fields for the table.
   d. Click Submit.

CMDB schema model

The Configuration Management Database (CMDB) schema model is a series of connected tables that contain all the assets and business services controlled by a company and its configurations.

CMDB tables contain information about computers and devices on the network, software contracts and licenses, business services, and so on. The IT desk can use the CMDB to better understand their network users' equipment, and the relationships between them. The CMDB can also be referenced by other processes within the system.

The CMDB can be populated using the Discovery product. Discovery searches the network for all attached computers and devices, then populates the CMDB with information on each computer/device's configuration, provisioning, and current status. Discovery also reports on any software which is running, and the TCP connections between computer systems, thereby establishing their relationships.

Applications such as Asset Management and Contract Management, operate in conjunction with the CMDB. Asset Management and Software Asset Management link to CMDB all assets, hardware, software, assets in stock, as well as records for manufacturers and vendors. The Contract Management application contains information about contracts, including leases, service contracts, purchase orders, warranties, and software licenses. The Configuration Management Database (CMDB) application has a focus on operation.

For more background information about the CMDB, see the ServiceNow® Community post) at CMDB 101 - What is a configuration management database and why do you need one?

CMDB tables

Key tables in the configuration management database (CMDB):

- The Base Configuration Item [cmdb] table, which is the core CMDB table for non IT CIs (descending classes are non IT CIs).
- The core Configuration Item [cmdb_ci] table, which stores the basic attributes of all the CIs. The admin, itil, or asset user role is required to access this table (ascending classes are IT CIs).
- The CI Relationship [cmdb_rel_ci] table, which defines all relationships between CIs.

The Configuration Item table is extended to other tables, such as Database [cmdb_ci_database] and Computer [cmdb_ci_computer]. The Computer table is extended to the Server [cmdb_ci_server] table, which is extended to the UNIX Server [cmdb_ci_unix_server] table, and so on.

Note: The Base Configuration Item [cmdb] table uses the table per partition extension model, which has different behaviors for replicating and deriving information than other extended tables. See Table extension and classes.

You can use the schema map to view more details of tables and their relationships:
1. Navigate to **System Definition > Tables & Columns**.

2. Select a table and click **Schema Map**.

   **Note:** CIs not extended from the Configuration Item [cmdb_ci] table, are not displayed in Dependency Views maps and in CI relation formatters.
CI attributes

Attributes apply to all the CIs in a classification. To change attribute values for a CI, edit the appropriate CI. To add a unique attribute to a class, extend the class table and create a new classification for that CI.

The position of a CI in a classification hierarchy is determined by the attributes it shares with the CIs below it. Each time a CI has a single different attribute from its parent, the classification hierarchy branches.

For example, servers have different attributes from computers, which include workstations and laptops. Linux servers and UNIX servers have different attributes from the parent server classification and from each other, so they occupy separate branches in the hierarchy.

CMDB tables descriptions

List of all the tables in the CMDB, and for each table, its name, label, and a description of the type of information that is stored in the table.

<table>
<thead>
<tr>

<td>Database</td>
<td>Organized collection of data such as the set of files where data is stored, the reason for a database, and the metadata about the data.</td>
</tr>
<tr>
<td>cmdb_ci_datacenter</td>
<td>Data Center</td>
<td>Facility used to house computer systems and associated components, such as telecommunications and storage systems. It generally includes redundant or backup power supplies, redundant data communications connections, environmental controls (such as air conditioning and fire suppression), and various security devices.</td>
</tr>
<tr>
<td>cmdb_ci_datapower_server</td>
<td>Data Power Hosting Server</td>
<td>Server running IBM DataPower Gateway software.</td>
</tr>
<tr>
<td>cmdb_ci_db_catalog</td>
<td>Database Catalog</td>
<td>Metadata which defines database objects such as base tables, views (virtual tables), synonyms, value ranges, indexes, users, and user groups, for a specific database instance.</td>
</tr>
<tr>
<td>cmdb_ci_db_db2_catalog</td>
<td>DB2 Catalog</td>
<td>Database catalog for DB2 database.</td>
</tr>
<tr>
<td>cmdb_ci_db_db2_instance</td>
<td>DB2 Instance</td>
<td>Instance of a DB2 database.</td>
</tr>
<tr>
<td>cmdb_ci_db_hbase_instance</td>
<td>HBase Instance</td>
<td>Instance of an HBase database.</td>
</tr>
<tr>
<td>cmdb_ci_db_instance</td>
<td>Database Instance</td>
<td>Software and memory used to manipulate data in a database.</td>
</tr>
<tr>
<td>cmdb_ci_db_mongodb_instance</td>
<td>MongoDB Instance</td>
<td>Instance of a MongoDB database.</td>
</tr>
<tr>
<td>cmdb_ci_db_mssql_analysis</td>
<td>SQL Server Analysis Services</td>
<td>MSFT SQL Catalog</td>
</tr>
<tr>
<td>cmdb_ci_db_mssql_catalog</td>
<td>MSFT SQL Catalog</td>
<td>Database catalog for a specific instance of a Microsoft SQL database.</td>
</tr>
<tr>
<td>cmdb_ci_db_mssql_int_job</td>
<td>SQL Server Integration Services Job</td>
<td>Scheduled job to run a SQL Server Integration Service package.</td>
</tr>
<tr>
<td>cmdb_ci_db_mssql_integration</td>
<td>SQL Server Integration Services</td>
<td>MSQl Server Integration Services software.</td>
</tr>
<tr>
<td>cmdb_ci_db_mssql_reporting</td>
<td>SQL Server Reporting Services</td>
<td>SQL Server software used for server-based reporting generation.</td>
</tr>
<tr>
<td>cmdb_ci_db_mssql_server</td>
<td>MS SQL Server</td>
<td>Microsoft SQL Server.</td>
</tr>
<tr>
<td>cmdb_ci_db_mysql_catalog</td>
<td>MySQL Catalog</td>
<td>Database catalog for a specific instance of a MySQL database.</td>
</tr>
<tr>
<td>cmdb_ci_db_mysql_clustermgnode</td>
<td>MySQLClusterMGMNode</td>
<td>MySQL primary administrative interface to a running cluster.</td>
</tr>
<tr>

<td>cmdb_ci_db_mysql_clusternode</td>
<td>MySQLClusterDataNode</td>
<td>Summary table used in the [ndbd] or [ndbd default] sections of a config.ini file for configuring MySQL Cluster data nodes.</td>
</tr>
<tr>
<td>cmdb_ci_db_mysql_instance</td>
<td>MySQL Instance</td>
<td>Instance of a MySQL database.</td>
</tr>
<tr>
<td>cmdb_ci_db_ora_catalog</td>
<td>Oracle Catalog</td>
<td>Database catalog for a specific instance of an Oracle database.</td>
</tr>
<tr>
<td>cmdb_ci_db_ora_instance</td>
<td>Oracle Instance</td>
<td>Instance of an Oracle database.</td>
</tr>
<tr>
<td>cmdb_ci_db_ora_listener</td>
<td>Oracle Database Listener</td>
<td>Process that runs on an Oracle Database Server.</td>
</tr>
<tr>
<td>cmdb_ci_db_postgresql_instance</td>
<td>PostgreSQL Instance</td>
<td>Instance of a PostgreSQL database.</td>
</tr>
<tr>
<td>cmdb_ci_db_syb_catalog</td>
<td>Sybase Catalog</td>
<td>Database catalog for a specific instance of a Sybase database.</td>
</tr>
<tr>
<td>cmdb_ci_db_syb_instance</td>
<td>Sybase Instance</td>
<td>Instance of a Sybase database.</td>
</tr>
<tr>
<td>cmdb_ci_desktop_software</td>
<td>Desktop Software</td>
<td>Software used on desktops and laptops.</td>
</tr>
<tr>
<td>cmdb_ci_dir_policy_server</td>
<td>Policy Server</td>
<td>Policy server, which provides a security component of a policy-based network that provides authorization services and facilitates tracking and control of files.</td>
</tr>
<tr>
<td>cmdb_ci_dir_site_minder_server</td>
<td>Site Minder</td>
<td>Server running SiteMinder software.</td>
</tr>
<tr>
<td>cmdb_ci_directory_ad_forest</td>
<td>AD Forest</td>
<td>Active Directory forest.</td>
</tr>
<tr>
<td>cmdb_ci_directory_ha</td>
<td>HA Proxy</td>
<td>HAProxy software.</td>
</tr>
<tr>
<td>cmdb_ci_directory_iifp</td>
<td>IIFP</td>
<td>Identity Identification Feature Pack (Active Directory) software.</td>
</tr>
<tr>
<td>cmdb_ci_directory_server</td>
<td>Directory Server</td>
<td>Server running LDAP software.</td>
</tr>
<tr>
<td>cmdb_ci_disk</td>
<td>Disk</td>
<td>General category of data storage mechanisms.</td>
</tr>
<tr>
<td>cmdb_ci_disk_partition</td>
<td>Disk Partition</td>
<td>Sections of a disk separated so that information in each section can be managed separately.</td>
</tr>
<tr>
<td>cmdb_ci_display_hardware</td>
<td>Display Hardware</td>
<td>Hardware used to display information in visual form.</td>
</tr>
<tr>
<td>cmdb_ci_dns_alias</td>
<td>DNS Alias</td>
<td>Synonym for the host used to resolve DNS addresses.</td>
</tr>
<tr>
<td>cmdb_ci_dns_name</td>
<td>DNS Name</td>
<td>Primary DNS names.</td>
</tr>
<tr>
<td>cmdb_ci_docker</td>
<td>Docker Container</td>
<td>Docker containers (a runtime instance of a docker image).</td>
</tr>
<tr>
<td>cmdb_ci_docker_engine</td>
<td>Docker Engine</td>
<td>Docker software for running and managing Docker containers.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_docker_image</td>
<td>Docker Image</td>
<td>Docker images. Ordered collection of root filesystem changes and the corresponding execution parameters for use within a container runtime.</td>
</tr>
<tr>
<td>cmdb_ci_docker_image_tag</td>
<td>Docker Image Tag</td>
<td>Docker tag, which is a label applied to a Docker image in a repository.</td>
</tr>
<tr>
<td>cmdb_ci_docker_local_image</td>
<td>Docker Local Image</td>
<td>Locally managed Docker image.</td>
</tr>
<tr>
<td>cmdb_ci_drs_vm_config</td>
<td>DRS VM Config</td>
<td>Distributed Resource Scheduler (DRS) behavior for the VMs in the vCenter that override the cluster behavior.</td>
</tr>
<tr>
<td>cmdb_ci_ec2_instance</td>
<td>EC2 Virtual Machine Instance</td>
<td>Virtual machine running in the Amazon Elastic Compute Cloud (EC2) platform.</td>
</tr>
<tr>
<td>cmdb_ci_email_server</td>
<td>Email Server</td>
<td>Server running email software.</td>
</tr>
<tr>
<td>cmdb_ci_email_server_jes</td>
<td>JES</td>
<td>Server running JES software (multi-featured hybrid MTA/MDA server).</td>
</tr>
<tr>
<td>cmdb_ci_endpoint</td>
<td>Endpoint</td>
<td>Endpoint, which represents the entry point to a service, a process, or a queue or topic destination in service-oriented architecture.</td>
</tr>
<tr>
<td>cmdb_ci_environment</td>
<td>Environment</td>
<td>Logical grouping of hardware and software used to develop, test, and deliver computing services. For example: development, test, quality assurance, and production.</td>
</tr>
<tr>
<td>cmdb_ci_esx_resource_pool</td>
<td>ESX Resource Pool</td>
<td>VMware set of physical resources.</td>
</tr>
<tr>
<td>cmdb_ci_esx_server</td>
<td>ESX Server</td>
<td>Physical ESX server running the VMware ESXi operating system.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_cas</td>
<td>Exchange Client Access Server</td>
<td>Server running Exchange software providing client access services.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_edge_transport</td>
<td>Exchange Edge Transport Server</td>
<td>Server running Exchange Edge Transport software.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_hub</td>
<td>ExchangeHub</td>
<td>Server running Exchange Hub software.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_hub_transport</td>
<td>Exchange Hub Transport Server</td>
<td>Server running Exchange Hub software providing transport services.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_mailbox</td>
<td>Exchange MailBox</td>
<td>Exchange email account.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_mailbox_server</td>
<td>Exchange Mailbox Server</td>
<td>Server running Exchange software providing client access services.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_service_component</td>
<td>Exchange Service Component</td>
<td>Server running Exchange software.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_facility_hardware</td>
<td>Facility Hardware</td>
<td>Base class for hardware used to facilities services such as electric, water, sewer, air, and security.</td>
</tr>
<tr>
<td>cmdb_ci_fc_disk</td>
<td>Fibre Channel Disk</td>
<td>Base table for fibre channel disk.</td>
</tr>
<tr>
<td>cmdb_ci_fc_export</td>
<td>Fibre Channel Export</td>
<td>Storage volume exported by a storage server via Fibre Channel protocol.</td>
</tr>
<tr>
<td>cmdb_ci_fc_port</td>
<td>Fibre Channel Port</td>
<td>Fibre Channel port on a storage server, FC switch, or on a host's HBA.</td>
</tr>
<tr>
<td>cmdb_ci_fddi_network</td>
<td>FDDI Cards</td>
<td>Fiber Distributed Data Interface cards.</td>
</tr>
<tr>
<td>cmdb_ci_file_system</td>
<td>File System</td>
<td>File system information for a server, capturing details such as mount point, capacity, and type of file system.</td>
</tr>
<tr>
<td>cmdb_ci_file_system_nfs</td>
<td>NFS File system</td>
<td>Extension of File System, which provides NFS file system information.</td>
</tr>
<tr>
<td>cmdb_ci_file_system_smb</td>
<td>SMB File system</td>
<td>Extension of File System, which provides SMB file system information.</td>
</tr>
<tr>
<td>cmdb_ci_firewall_network</td>
<td>Firewall Hardware</td>
<td>Firewall hardware.</td>
</tr>
<tr>
<td>cmdb_ci_ftp_server</td>
<td>FTP Server</td>
<td>Server providing FTP services.</td>
</tr>
<tr>
<td>cmdb_ci_fuel_tank</td>
<td>Fuel Tank</td>
<td>Fuel tank.</td>
</tr>
<tr>
<td>cmdb_ci_generator_power_eq</td>
<td>Power Generator</td>
<td>Power generator.</td>
</tr>
<tr>
<td>cmdb_ci_group</td>
<td>Group</td>
<td>Logical group of CIs.</td>
</tr>
<tr>
<td>cmdb_ci_hardware</td>
<td>Hardware</td>
<td>Base class for hardware.</td>
</tr>
<tr>
<td>cmdb_ci_hpux_server</td>
<td>HPUX Server</td>
<td>Server running HPUX software.</td>
</tr>
<tr>
<td>cmdb_ci_hub_network</td>
<td>Hub Hardware</td>
<td>Physical network hub.</td>
</tr>
<tr>
<td>cmdb_ci_hvac</td>
<td>HVAC Equipment</td>
<td>Heating, ventilation, and air conditioning equipment.</td>
</tr>
<tr>
<td>cmdb_ci_hyper_v_cluster</td>
<td>Hyper-V Cluster</td>
<td>Cluster of the Hyper-V servers.</td>
</tr>
<tr>
<td>cmdb_ci_hyper_v_instance</td>
<td>Hyper-V Virtual Machine Instance</td>
<td>Hyper-V virtual machine instance. This table extends the generic Virtual Machine Instance [cmdb_ci_vm_instance] table.</td>
</tr>
<tr>
<td>cmdb_ci_hyper_v_network</td>
<td>Hyper-V Virtual Network</td>
<td>Hyper-V virtual network.</td>
</tr>
<tr>
<td>cmdb_ci_hyper_v_object</td>
<td>Hyper-V Object</td>
<td>Base class for all Hyper-V objects.</td>
</tr>
<tr>
<td>cmdb_ci_hyper_v_resource_pool</td>
<td>Hyper-V Resource Pool</td>
<td>Hyper-V resource pool.</td>
</tr>
<tr>
<td>cmdb_ci_hyper_v_rpool_comp</td>
<td>Hyper-V Resource Pool Component</td>
<td>Resource pool component belonging to resource pool.</td>
</tr>
<tr>
<td>cmdb_ci_hyper_v_server</td>
<td>Hyper-V Server</td>
<td>Server running Hyper-V software.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>---------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_ids_network</td>
<td>Intrusion Detection System</td>
<td>Security intrusion detection systems.</td>
</tr>
<tr>
<td>cmdb_ci_iisdirectory</td>
<td>IIS Virtual Directory</td>
<td>Virtual Directory in IIS Manager.</td>
</tr>
<tr>
<td>cmdb_ci_imaging_hardware</td>
<td>Imaging Hardware</td>
<td>Hardware used to create electronic/physical images.</td>
</tr>
<tr>
<td>cmdb_ci_inetinfo</td>
<td>Inetinfo service</td>
<td>Inetinfo service of IIS application.</td>
</tr>
<tr>
<td>cmdb_ci_inf_software</td>
<td>Infrastructure Software</td>
<td>Base class for enterprise software or programs specifically designed to help business organizations perform basic tasks such as workforce support, business transactions and internal services, and processes.</td>
</tr>
<tr>
<td>cmdb_ci_information_object</td>
<td>Information Object</td>
<td>Types of information that a business application or any other entity handles. For example: 'Employee Salary Data', 'Employee Personal Data', and 'Sales Data'.</td>
</tr>
<tr>
<td>cmdb_ci_infra_service</td>
<td>Infrastructure Service</td>
<td>IT services which support providing computing infrastructure.</td>
</tr>
<tr>
<td>cmdb_ci_infra_service_ldap</td>
<td>LDAP Service</td>
<td>Running LDAP service.</td>
</tr>
<tr>
<td>cmdb_ci_ip_address</td>
<td>IP Address</td>
<td>IP address.</td>
</tr>
<tr>
<td>cmdb_ci_ip_device</td>
<td>IP Device</td>
<td>Base class for devices with an IP address.</td>
</tr>
<tr>
<td>cmdb_ci_ip_firewall</td>
<td>IP Firewall</td>
<td>Firewall hardware.</td>
</tr>
<tr>
<td>cmdb_ci_ip_network</td>
<td>IP Network</td>
<td>IP network information capturing details such as subnet, router, and router_interface_type.</td>
</tr>
<tr>
<td>cmdb_ci_ip_phone</td>
<td>IP Phone</td>
<td>IP-enabled (VOIP) phone.</td>
</tr>
<tr>
<td>cmdb_ci_ip_router</td>
<td>IP Router</td>
<td>Specialization of the Network Gear [cmdb_ci_netgear] table.</td>
</tr>
<tr>
<td>cmdb_ci_ip_server</td>
<td>IP Server</td>
<td>Server hardware.</td>
</tr>
<tr>
<td>cmdb_ci_ip_service</td>
<td>IP Service Instance</td>
<td>Base table for IP services running on a server such Unix daemon or Windows service.</td>
</tr>
<tr>
<td>cmdb_ci_ip_switch</td>
<td>IP Switch</td>
<td>Specialization of the Network Gear [cmdb_ci_netgear] table.</td>
</tr>
<tr>
<td>cmdb_ci_iplanet_web_server</td>
<td>Iplanet Web Server</td>
<td>Server running Oracle iPlanet Web Server (OiWS) software.</td>
</tr>
<tr>
<td>cmdb_ci_isam_server</td>
<td>ISAM Server</td>
<td>Server running ISAM software.</td>
</tr>
<tr>
<td>cmdb_ci_iscsi_disk</td>
<td>iSCSI Disk</td>
<td>Host mount of an iSCSI disk.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_iscsi_export</td>
<td>iSCSI Export</td>
<td>Storage volume exported by a storage server via iSCSI.</td>
</tr>
<tr>
<td>cmdb_ci_kvm</td>
<td>KVM</td>
<td>Hypervisor that manages kernel-based virtual machines (KVMs).</td>
</tr>
<tr>
<td>cmdb_ci_kvm_network</td>
<td>Network</td>
<td>KVM Virtual network.</td>
</tr>
<tr>
<td>cmdb_ci_kvm_object</td>
<td>KVM Object</td>
<td>Base object for all KVM objects.</td>
</tr>
<tr>
<td>cmdb_ci_kvm_storage_pool</td>
<td>Storage Pool</td>
<td>KVM storage pool.</td>
</tr>
<tr>
<td>cmdb_ci_kvm_storage_volume</td>
<td>Storage Volume</td>
<td>KVM storage volume.</td>
</tr>
<tr>
<td>cmdb_ci_kvm_vm_instance</td>
<td>KVM Virtual Machine Instance</td>
<td>Virtual machine instance running on a KVM hypervisor.</td>
</tr>
<tr>
<td>cmdb_ci_lb</td>
<td>Load Balancer</td>
<td>Server functioning as a load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_a10</td>
<td>A10 Load Balancer</td>
<td>Server functioning as an A10 load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_ace</td>
<td>ACE</td>
<td>Server functioning as an ACE load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_alteon</td>
<td>Alteon</td>
<td>Server functioning as an Alteon load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_appl</td>
<td>Load Balancer Application</td>
<td>Application that provides load balancing functionality.</td>
</tr>
<tr>
<td>cmdb_ci_lb_backend_server</td>
<td>LB Backend Server</td>
<td>Server functioning as a backend load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_bigip</td>
<td>F5 BIG-IP</td>
<td>Server functioning as an F5 BIG-IP load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_cisco_csm</td>
<td>Cisco CSM</td>
<td>Server functioning as a Cisco CSM load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_cisco_css</td>
<td>Cisco CSS</td>
<td>Server functioning as a Cisco CSS load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_f5_gtm</td>
<td>F5 BigIP GTM</td>
<td>Server functioning as an F5 BigIP GTM load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_f5_ltm</td>
<td>F5 BigIP LTM</td>
<td>A server functioning as an F5 BigIP LTM load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_haproxy</td>
<td>HAProxy Load Balancer</td>
<td>Server functioning as an HA Proxy load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_isa</td>
<td>ISA Server</td>
<td>Server functioning as an ISA load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_modjk</td>
<td>Modjk Load Balancer</td>
<td>Server functioning as a Cisco CSM load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_modproxy</td>
<td>ModProxy Load Balancer</td>
<td>Server functioning as a ModProxy load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_netscaler</td>
<td>Citrix Netscaler</td>
<td>Server functioning as a Citrix Netscaler load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_network</td>
<td>Network Load Balancer</td>
<td>Server performing network load balancing.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_lb_nginx</td>
<td>Nginx Load Balancer</td>
<td>Server functioning as an Nginx load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_pool</td>
<td>Load Balancer Pool</td>
<td>Collection of host-to-port mappings to be balanced.</td>
</tr>
<tr>
<td>cmdb_ci_lb_pool_member</td>
<td>Load Balancer Pool Member</td>
<td>Host-to-port mapping of a request to be balanced.</td>
</tr>
<tr>
<td>cmdb_ci_lb_radware</td>
<td>Radware Load Balancer</td>
<td>Server functioning as a Radware load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_service</td>
<td>Load Balancer Service</td>
<td>Virtual service that the device balances by forwarding requests to members within a pool.</td>
</tr>
<tr>
<td>cmdb_ci_lb_template</td>
<td>Load Balancer Template</td>
<td>Load balancer template which contains load balancer-related configuration settings for a specific type of network traffic.</td>
</tr>
<tr>
<td>cmdb_ci_lif</td>
<td>LIF</td>
<td>Logical interface.</td>
</tr>
<tr>
<td>cmdb_ci_lb_vlan</td>
<td>Load Balancer VLAN</td>
<td>Virtual LAN segment.</td>
</tr>
<tr>
<td>cmdb_ci_linux_server</td>
<td>Linux Server</td>
<td>Server running Linux software.</td>
</tr>
<tr>
<td>cmdb_ci_logical_datacenter</td>
<td>Logical Datacenter</td>
<td>VMware vCenter logical datacenter.</td>
</tr>
<tr>
<td>cmdb_ci_lpar</td>
<td>Logical Partition</td>
<td>Logical partition, commonly called an LPAR, is a subset of a computer’s hardware resources, virtualized as a separate computer.</td>
</tr>
<tr>
<td>cmdb_ci_lvm_pool</td>
<td>LVM Pool</td>
<td>Linux Volume Manager storage pool.</td>
</tr>
<tr>
<td>cmdb_ci_lvm_pool_member</td>
<td>LVM Pool Member</td>
<td>Linux Volume Manager storage pool member.</td>
</tr>
<tr>
<td>cmdb_ci_mainframe</td>
<td>IBM Mainframe</td>
<td>IBM large-scale computer system.</td>
</tr>
<tr>
<td>cmdb_ci_mainframe.hardware</td>
<td>Mainframe Hardware</td>
<td>The hardware components of a large-scale computer system.</td>
</tr>
<tr>
<td>cmdb_ci_mainframe_lpar</td>
<td>IBM Mainframe LPAR</td>
<td>Logical partition, which is commonly called an LPAR, and is a subset of a mainframes computer’s hardware resources, virtualized as a separate computer.</td>
</tr>
<tr>
<td>cmdb_ci_memory_module</td>
<td>Memory Module</td>
<td>Circuit board that provides for memory storage.</td>
</tr>
<tr>
<td>cmdb_ci_mfp_printer</td>
<td>Multi-function Printer</td>
<td>Physical device with scan, copy, and fax capabilities.</td>
</tr>
<tr>
<td>cmdb_ci_microsoft_iis_web_server</td>
<td>Microsoft iis Web Server</td>
<td>Server running Internet Information Services (IIS) for Windows software.</td>
</tr>
<tr>
<td>cmdb_ci_modem_network</td>
<td>Modem Hardware</td>
<td>Physical modem hardware.</td>
</tr>
<tr>
<td>cmdb_ci_mpio_pool</td>
<td>Multipath IO Pool</td>
<td>Multipath IO pool, representing multiple redundant paths to storage.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_mpio_pool_group</td>
<td>Multipath IO Pool Group</td>
<td>Group of multipath IO pools.</td>
</tr>
<tr>
<td>cmdb_ci_mpio_pool_path</td>
<td>Multipath IO Pool Path</td>
<td>Single path in an MPIO pool.</td>
</tr>
<tr>
<td>cmdb_ci_msd</td>
<td>Mass Storage Device</td>
<td>Physical storage device.</td>
</tr>
<tr>
<td>cmdb_ci_nat_gateway</td>
<td>NAT Gateway</td>
<td>Functionality for NAT gateway.</td>
</tr>
<tr>
<td>cmdb_ci_netapp_cdot</td>
<td>NetApp CDOT</td>
<td>Functionality of NetApp Clustered Data OnTap operating system.</td>
</tr>
<tr>
<td>cmdb_ci_netapp_datacenter</td>
<td>NetApp Datacenter</td>
<td>NetApp logical datacenter.</td>
</tr>
<tr>
<td>cmdb_ci_net_app_server</td>
<td>Network Appliance Hardware</td>
<td>Server configured to perform as a networking appliance.</td>
</tr>
<tr>
<td>cmdb_ci_netgear</td>
<td>Network Gear</td>
<td>Extension of the Hardware table, that captures network equipment such as router, switch, hub, gateway, and bridge.</td>
</tr>
<tr>
<td>cmdb_ci_netware_server</td>
<td>Netware Server</td>
<td>Server running NetWare software.</td>
</tr>
<tr>
<td>cmdb_ci_network</td>
<td>Cloud Network</td>
<td>VMware vCenter cloud network.</td>
</tr>
<tr>
<td>cmdb_ci_network_acl</td>
<td>Network ACL</td>
<td>Network access control list (ACL).</td>
</tr>
<tr>
<td>cmdb_ci_network_acl_rule</td>
<td>Network ACL Rule</td>
<td>Rule used to control networking access rights.</td>
</tr>
<tr>
<td>cmdb_ci_network_adapter</td>
<td>Network Adapter</td>
<td>Network adapter hardware.</td>
</tr>
<tr>
<td>cmdb_ci_network_policy_group</td>
<td>Network Policy Group</td>
<td>Group policy consumed by Active Directory services.</td>
</tr>
<tr>
<td>cmdb_ci_network_template</td>
<td>Network Template</td>
<td>OpenStack file used to configure a network.</td>
</tr>
<tr>
<td>cmdb_ci_nic</td>
<td>Cloud Mgmt Network Interface</td>
<td>Virtual network adapter.</td>
</tr>
<tr>
<td>cmdb_ci_nginx_web_server</td>
<td>Nginx Web Server</td>
<td>Server running Nginx software.</td>
</tr>
<tr>
<td>cmdb_ci_openstack_datacenter</td>
<td>OpenStack Datacenter</td>
<td>OpenStack logical datacenter.</td>
</tr>
<tr>
<td>cmdb_ci_oslv_container</td>
<td>Operating-system-level Virtualization Container</td>
<td>Containers (a runtime instance of a docker image).</td>
</tr>
<tr>
<td>cmdb_ci_oslv_engine</td>
<td>Operating-system-level Virtualization Engine</td>
<td>Software for running and managing containers.</td>
</tr>
<tr>
<td>cmdb_ci_oslv_image</td>
<td>Operating-system-level Virtualization Image</td>
<td>Container images. Ordered collection of root filesystem changes and the corresponding execution parameters for use within a container runtime.</td>
</tr>
<tr>
<td>cmdb_ci_oslv_image_tag</td>
<td>Operating-system-level Virtualization Image Tag</td>
<td>Container tag, which is a label applied to a container image in a repository.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>------------------------------------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_oslv_local_image</td>
<td>Operating-system-level Virtualization Local Image</td>
<td>Locally managed container image.</td>
</tr>
<tr>
<td>cmdb_ci_osx_server</td>
<td>OS/X Server</td>
<td>Server running OS/X operating system.</td>
</tr>
<tr>
<td>cmdb_ci_os_template</td>
<td>Image</td>
<td>Software files used to create a new instance of a compute resource such as server, desktop, virtual machine, and virtual router.</td>
</tr>
<tr>
<td>cmdb_ci_outofband_device</td>
<td>Out-of-Band Device</td>
<td>Hardware used to perform out-of-band management.</td>
</tr>
<tr>
<td>cmdb_ci_patches</td>
<td>Patch</td>
<td>Patch software to fix or improve a computer program or its supporting data.</td>
</tr>
<tr>
<td>cmdb_ci_pc_hardware</td>
<td>Personal Computer</td>
<td>Multi-purpose electronic computer whose size, capabilities, and price make it feasible for individual use.</td>
</tr>
<tr>
<td>cmdb_ci_pdu</td>
<td>PDU</td>
<td>Power distribution unit (PDU).</td>
</tr>
<tr>
<td>cmdb_ci_pdu_outlet</td>
<td>Outlet</td>
<td>Single outlet of a PDU.</td>
</tr>
<tr>
<td>cmdb_ci_peripheral</td>
<td>Computer Peripheral</td>
<td>Various computer peripherals such as monitor, docking station, KVM switch, projector, scanner, keyboard, mouse, and UPS.</td>
</tr>
<tr>
<td>cmdb_ci_personal_printer</td>
<td>Personal Printer</td>
<td>Printer whose size, capabilities and price make it feasible for individual use.</td>
</tr>
<tr>
<td>cmdb_ci_plotter</td>
<td>Plotter</td>
<td>Printer with capabilities to print large vector graphic images.</td>
</tr>
<tr>
<td>cmdb_ci_power_eq</td>
<td>Power Equipment</td>
<td>Hardware used to manage electrical power.</td>
</tr>
<tr>
<td>cmdb_ci_port</td>
<td>Port</td>
<td>Interface between a computer and other electronic devices.</td>
</tr>
<tr>
<td>cmdb_ci_port_group</td>
<td>Port Group</td>
<td>Group of ports on a virtual switch.</td>
</tr>
<tr>
<td>cmdb_ci_print_queue</td>
<td>Print Queue</td>
<td>Print queue, which is a list of printer output jobs held in a reserved memory area, including the most current status of all active and pending print jobs.</td>
</tr>
<tr>
<td>cmdb_ci_printer</td>
<td>Printer</td>
<td>Physical device which makes a persistent human-readable representation of graphics or text on paper or similar physical media.</td>
</tr>
<tr>
<td>cmdb_ci_printing_hardware</td>
<td>Printing Hardware</td>
<td>Physical device which makes a persistent human-readable representation of graphics or text on paper or similar physical media.</td>
</tr>
<tr>
<td>cmdb_ci_puppet_master</td>
<td>Puppet Master</td>
<td>Server running PuppetMaster application.</td>
</tr>
<tr>
<td>cmdb_ci_qtree</td>
<td>Qtree</td>
<td>Qtree file system.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------</td>
<td>------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_rack</td>
<td>Rack</td>
<td>Datacenter racks containing details such as rack units, rack units in use, and power consumption.</td>
</tr>
<tr>
<td>cmdb_ci_raid</td>
<td>RAID</td>
<td>Storage pool using RAID mechanisms to ensure data integrity.</td>
</tr>
<tr>
<td>cmdb_ci_raid_member</td>
<td>RAID Member</td>
<td>Member of storage pool using RAID mechanisms.</td>
</tr>
<tr>
<td>cmdb_ci_resource_group</td>
<td>Resource Group</td>
<td>Resource pool is a logical abstraction for flexible management of resources.</td>
</tr>
<tr>
<td>cmdb_ci_san</td>
<td>Storage Area Network</td>
<td>Network which provides access to block level storage.</td>
</tr>
<tr>
<td>cmdb_ci_san_connection</td>
<td>SAN Connection</td>
<td>Connection in a SAN network.</td>
</tr>
<tr>
<td>cmdb_ci_san_endpoint</td>
<td>SAN Endpoint</td>
<td>One end of a SAN connection.</td>
</tr>
<tr>
<td>cmdb_ci_san_fabric</td>
<td>SAN Fabric</td>
<td>Hardware that connects workstations and servers to storage devices in a SAN. Referred to as a &quot;fabric.&quot;</td>
</tr>
<tr>
<td>cmdb_ci_san_zone</td>
<td>SAN Zone</td>
<td>Subset of SAN storage that certain users are restricted to.</td>
</tr>
<tr>
<td>cmdb_ci_san_zone_alias</td>
<td>SAN Zone Alias</td>
<td>Collection of SAN zone members.</td>
</tr>
<tr>
<td>cmdb_ci_san_zone_alias_member</td>
<td>SAN Zone Alias Member</td>
<td>M2m relationship between SAN zone aliases and SAN zone members.</td>
</tr>
<tr>
<td>cmdb_ci_san_zone_member</td>
<td>SAN Zone Member</td>
<td>Ports and devices in a SAN zone.</td>
</tr>
<tr>
<td>cmdb_ci_san_zone_set</td>
<td>SAN Zone Set</td>
<td>Collection of SAN zones.</td>
</tr>
<tr>
<td>cmdb_ci_scanner</td>
<td>Scanner</td>
<td>Hardware used to create digital imagine of paper documents.</td>
</tr>
<tr>
<td>cmdb_ci_server</td>
<td>Server</td>
<td>Base class for all types of servers.</td>
</tr>
<tr>
<td>cmdb_ci_server_snapshot</td>
<td>Server Snapshot</td>
<td>Server snapshot, which is the state of a system at a particular point in time.</td>
</tr>
<tr>
<td>cmdb_ci_service</td>
<td>Business Service</td>
<td>IT Service that directly supports a Business Process (ITIL).</td>
</tr>
<tr>
<td>cmdb_ci_solaris_instance</td>
<td>Solaris Virtual Machine Instance</td>
<td>Virtual machine instance running Solaris software.</td>
</tr>
<tr>
<td>cmdb_ci_solaris_server</td>
<td>Solaris Server</td>
<td>Physical server running Solaris software.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_spkg</td>
<td>Software</td>
<td>Software package information containing details such as version, install count, license count, package name, and key (when SAM enabled).</td>
</tr>
<tr>
<td>cmdb_ci_storage_controller</td>
<td>Storage Controller</td>
<td>Logical device that controls a storage volume or Fibre Channel port.</td>
</tr>
<tr>
<td>cmdb_ci_storage_device</td>
<td>Storage Device</td>
<td>Base table for block storage devices such as DAS, SAN, and NAS.</td>
</tr>

<tr>
<td>cmdb_ci_win_cluster</td>
<td>Windows Cluster</td>
<td>A single (virtual) server composed of one ore more physical Windows Servers.</td>
</tr>
<tr>
<td>cmdb_ci_win_cluster_node</td>
<td>Windows Cluster Node</td>
<td>A physical member of the Windows Cluster application.</td>
</tr>
<tr>
<td>cmdb_ci_win_cluster_resource</td>
<td>Windows Cluster Resource</td>
<td>A logical or physical entity managed by the Windows Cluster application.</td>
</tr>
<tr>
<td>cmdb_ci_win_domain_controller</td>
<td>Windows Domain Controller</td>
<td>A server that responds to security authentication requests within a Windows Server domain.</td>
</tr>
<tr>
<td>cmdb_ci_win_server</td>
<td>Windows Server</td>
<td>A server running Microsoft Windows Server operating system.</td>
</tr>
<tr>
<td>cmdb_ci_windows_service</td>
<td>Windows Service</td>
<td>A Windows computer program that operates in the background.</td>
</tr>
<tr>
<td>cmdb_ci_zone</td>
<td>Data Center Zone</td>
<td>A specified portion of a data center facility.</td>
</tr>
</tbody>
</table>

**Configuration Item [cmdb_ci] class**

Attributes in the Configuration Item [cmdb_ci] class, which extends the Configuration Item [cmdb] class.
**Attention:** Do not modify any of these attributes in the dictionary. For example, do not modify the type of the `location` attribute from reference to list. Such modifications may prevent features that use the CMDB, from functioning properly.

**Common, core, user tables**
CMDB CI schema related to common core and non-core tables

**Hardware [cmdb_ci_hardware] class**

Attributes, identification rule, and other important schema structures for the CMDB Hardware [cmdb_ci_hardware] class.
Attributes

The Hardware class adds the following unique attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hardware_status</td>
<td>Status of hardware such as In Maintenance or Retired. Used to sync status to the Asset class.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>hardware_substatus</td>
<td>Secondary hardware status. Each setting in <code>hardware_status</code> results in a different set of choices available for this field.</td>
</tr>
<tr>
<td>default_gateway</td>
<td>Default gateway that the computer is connected through.</td>
</tr>
</tbody>
</table>

**Key relationship structures**

Use the following key relationships as important guidelines when creating Hardware, Computer, or Server CIs:

- **Serial number**: During CI identification, Identification and Reconciliation Engine (IRE) processes search for a serial number in two locations. One is the CI serial number attribute, and the second one is the Serial Number [cmdb_serial_number] table, with reference back to the Hardware [cmdb_ci_hardware] table.
  - Store any serial number of any type other than System, only in the Serial Number table (and not in the server CI attribute).
  - If the system serial number is available, store it in both the `Serial Number` attribute of the CI and in the Serial Number table.

The Serial Number table is a many to one relationship linking back to the server CI. This table has a type field for specifying the type of the serial number (system, uuid, chassis, bios, or baseboard) and storing the actual value itself. Use the following Windows standards for serial number types in the Serial Number [cmdb_serial_number] table:

- **system**: Product identification such as a serial number for software, a die number on a hardware chip, or a project number (for noncommercial products).
- **uuid**: Universally unique identifier (UUID) for the product. A UUID is a 128-bit identifier that is guaranteed to be different from other generated UUIDs.
- **chassis**: Manufacturer-allocated number that is used to identify a physical element. Value is the Serial Number member of the System Enclosure or Chassis structure in the SMBIOS information. This type represents the properties associated with a physical system enclosure.
- **bios**: The assigned serial number of the BIOS. This type represents the attributes of the computer system basic input/output services (BIOS) that are installed on the computer.
- **baseboard**: Manufacturer-allocated number that is used to identify the physical element. This property is inherited from CIM_PhysicalElement, and is sometimes referred to as the ‘Motherboard Serial Number’.

- **Network adapter**:
  - Use the Network Adapter [cmdb_ci_network_adapter] class to store network adapters.
  - Set the `Name` attribute in the Network Adapter class to be the name of the Network Adapter device (such as eth0, eth1).
  - Set the `MAC Address` attribute to be the MAC address value. Format the string with colon separators between octets and lower case hexadecimal characters with padded zeros.
    
    For example: `f8:f2:1e:00:d4:66`
  - In the CI Relationship [cmdb_rel_ci] table, create an **Owned By::Owns** relationship to the associated Hardware CI. Specify a reference from the Network Adapter [cmdb_ci_network_adapter] table using the CI with a reference to the associated Hardware CI.
• IP address:
  • Use the IP Address [cmdb_ci_ip_address] class to store IP addresses.
  • Store an IP address value in the IP Address attribute, and in the Name attribute (to avoid empty Name attributes).
  • Store an IPv4 IP address value using the format ‘NNN.NNN.NNN.NNN’, with decimal-based octets and period separators. Non-conforming values should be considered invalid and cleansed to null values.
  • Store an IPv6 IP address value using lower case hexadecimal with colon separators. Non-confirming values should be considered invalid and cleansed to null values.
  • Set the Netmask attribute to the IP address.
  • In the CI Relationship [cmdb_rel_ci] table, create an Owned By::Owns relationship to the associated Hardware hierarchy CI.
  • Specify for the IP address a reference to the Network Adapter [cmdb_ci_network_adapter] table using the Configuration Item with a reference to the associated Hardware CI.
  • To ensure that base system identification rules work properly, also store the IP address in the associated Network Adapter class.

• Network adapter and IP address:
  • Store the MAC address of the network adapter installed on a server, in the Network Adapter [cmdb_ci_network_adapter] class.
  • Store the IP address in the IP Address [cmdb_ci_ip_address] class.
  • Do not store the MAC address or the IP address in the Server [cmdb_ci_server] class.

Key reference structures

Use the following key references as important guidelines when creating Hardware, Computer, or Server CIs:

• Software and processes running on a server: The Software [cmdb_ci_spkg] class contains the generic software package that is related to the server CI. The cmdb_sw_instance table instantiates each instance of the software package with:
  • One to one reference back to the Server [cmdb_ci_server] class
  • Many to one reference back to the Software class

These references are stored in the Installed on and the Product Name reference attributes respectively.

If either the Software Asset Management Foundation [com.snc.sams] or the Software Asset Management [com.snc.software_asset_management] plugin is installed, then store software details in the Software Installation [cmdb_sam_sw_install] table instead of the cmdb_sw_instance table.

• The Manufacturer and Model ID are reference attributes to the Company [core_company] and Product Model [cmdb_model] tables respectively.

• The Owned By, Assigned To, Managed By, and Supported By are reference attributes to the User [sys_user] table. The Assignment Group and Support Group are reference attributes to the Group [sys_user_group] table.

Identification rule

The base system contains pre-defined identification rules for the Hardware, Computer, and Server classes, which are identical. That identification rule has the following key identifier entries, listed in priority order:
1. Identifier entry which uses lookup-based identification specified with Serial Number [cmdb_serial_number] as the lookup table. The Serial Number table is a many to one reference from Serial Number back to the server CI.

2. Identifier entry specified with the Serial Number attribute in the CI.

3. Identifier entry for the Name attribute. If Serial Number is not available, then the Name (which is the hostname) attribute is used. If both the Serial Number and the Name attributes are provided, then Identification and Reconciliation Engine (IRE) looks first for the Serial Number. Then, if a Serial Number is not found, IRE falls back to using Name.

4. Identifier entry specified for the MAC Address/IP Address attributes in the Network Adapter table. However, do not rely only on the MAC Address/IP Address.

   If both Serial Number and Name are not available, and only MAC Address/IP Address are available, use MAC Address as the name of the CI. Using the MAC Address as the name of the CI ensures that you don't create an empty CI.

For more information, see CMDB Identification and Reconciliation.

**Computer [cmdb_ci_computer] class**

Attributes, identification rule, and other important schema structures for the CMDB Computer [cmdb_ci_computer] class.
Attributes

The Computer class adds the following unique attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CD_ROM</td>
<td>Denotes whether a CD ROM exists.</td>
</tr>
<tr>
<td>CD Speed</td>
<td>Speed of CD_ROM.</td>

</tbody>
</table>

<table>
<thead>
<tr>
<th>Reference attribute</th>
<th>Reference to</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU manufacturer</td>
<td>Company [core_company] table</td>
</tr>
</tbody>
</table>

**Schema description**

The CMDB schema model does not separate between servers and computers that are physical and servers and computer that are virtual. Instead, the Computer and the Server classes have a field named **IsVirtual**. If a computer or server is a virtual instance, set this **IsVirtual** attribute to **true**.

As described in the Virtual Machine schema section, to fully model a virtual machine, set the **IsVirtual** attribute in the Computer or Server CI to **true**. Create a Virtual Machine Instance [cmdb_ci_vm_instance] record using the **BIOS UUID** attribute as the key identifier. Then create a Hosted_On relationship between the Virtual Machine Instance record and the Computer or Server instance and set **IsVirtual** to **true**.

**Key relationship structures**

Use the following key relationships as important guidelines when creating Hardware, Computer, or Server CIs:
• Serial number: During CI identification, Identification and Reconciliation Engine (IRE) processes search for a serial number in two locations. One is the CI serial number attribute, and the second one is the Serial Number [cmdb_serial_number] table, with reference back to the Hardware [cmdb_ci_hardware] table.
  
  • Store any serial number of any type other than System, only in the Serial Number table (and not in the server CI attribute).
  
  • If the system serial number is available, store it in both the Serial Number attribute of the CI and in the Serial Number table.

The Serial Number table is a many to one relationship linking back to the server CI. This table has a type field for specifying the type of the serial number (system, uuid, chassis, bios, or baseboard) and storing the actual value itself. Use the following Windows standards for serial number types in the Serial Number [cmdb_serial_number] table:

  • system: Product identification such as a serial number for software, a die number on a hardware chip, or a project number (for noncommercial products).
  
  • uuid: Universally unique identifier (UUID) for the product. A UUID is a 128-bit identifier that is guaranteed to be different from other generated UUIDs.
  
  • chassis: Manufacturer-allocated number that is used to identify a physical element. Value is the Serial Number member of the System Enclosure or Chassis structure in the SMBIOS information. This type represents the properties associated with a physical system enclosure.
  
  • bios: The assigned serial number of the BIOS. This type represents the attributes of the computer system basic input/output services (BIOS) that are installed on the computer.
  
  • baseboard: Manufacturer-allocated number that is used to identify the physical element. This property is inherited from CIM_PhysicalElement, and is sometimes referred to as the ‘Motherboard Serial Number’.

• Network adapter:
  
  • Use the Network Adapter [cmdb_ci_network_adapter] class to store network adapters.
  
  • Set the Name attribute in the Network Adapter class to be the name of the Network Adapter device (such as eth0, eth1).
  
  • Set the MAC Address attribute to be the MAC address value. Format the string with colon separators between octets and lower case hexadecimal characters with padded zeros.

  For example: ‘f8:f2:1e:00:d4:66’
  
  • In the CI Relationship [cmdb_rel_ci] table, create an Owned By::Owns relationship to the associated Hardware CI. Specify a reference from the Network Adapter [cmdb_ci_network_adapter] table using the CI with a reference to the associated Hardware CI.
• IP address:
  • Use the IP Address [cmdb_ci_ip_address] class to store IP addresses.
  • Store an IP address value in the **IP Address** attribute, and in the **Name** attribute (to avoid empty **Name** attributes).
  • Store an IPv4 IP address value using the format 'NNN.NNN.NNN.NNN', with decimal-based octets and period separators. Non-conforming values should be considered invalid and cleansed to null values.
  • Store an IPv6 IP address value using lower case hexadecimal with colon separators. Non-confirming values should be considered invalid and cleansed to null values.
  • Set the **Netmask** attribute to the IP address.
  • In the CI Relationship [cmdb_rel_ci] table, create an **Owned By::Owns** relationship to the associated Hardware hierarchy CI.
  • Specify for the IP address a reference to the Network Adapter [cmdb_ci_network_adapter] table using the Configuration Item with a reference to the associated Hardware CI.
  • To ensure that base system identification rules work properly, also store the IP address in the associated Network Adapter class.

• Network adapter and IP address:
  • Store the MAC address of the network adapter installed on a server, in the Network Adapter [cmdb_ci_network_adapter] class.
  • Store the IP address in the IP Address [cmdb_ci_ip_address] class.
  • Do not store the MAC address or the IP address in the Server [cmdb_ci_server] class.

### Key reference structures

Use the following key references as important guidelines when creating Hardware, Computer, or Server CIs:

• Software and processes running on a server: The Software [cmdb_ci_spkg] class contains the generic software package that is related to the server CI. The cmdb_sw_instance table instantiates each instance of the software package with:
  • One to one reference back to the Server [cmdb_ci_server] class.
  • Many to one reference back to the Software class.

These references are stored in the **Installed on** and the **Product Name** reference attributes respectively.

If either the Software Asset Management Foundation [com.snc.sams] or the Software Asset Management [com.snc.software_asset_management] plugin is installed, then store software details in the Software Installation [cmdb_sam_sw_install] table instead of the cmdb_sw_instance table.

• The **Manufacturer** and **Model ID** are reference attributes to the Company [core_company] and Product Model [cmdb_model] tables respectively.

• The **Owned By**, **Assigned To**, **Managed By**, and **Supported By** are reference attributes to the User [sys_user] table. The **Assignment Group** and **Support Group** are reference attributes to the Group [sys_user_group] table.

### Identification rule

The base system contains pre-defined identification rules for the Hardware, Computer, and Server classes, which are identical. That identification rule has the following key identifier entries, listed in priority order:
1. Identifier entry which uses lookup-based identification specified with Serial Number [cmdb_serial_number] as the lookup table. The Serial Number table is a many to one reference from Serial Number back to the server CI.

2. Identifier entry specified with the Serial Number attribute in the CI.

3. Identifier entry for the Name attribute. If Serial Number is not available, then the Name (which is the hostname) attribute is used. If both the Serial Number and the Name attributes are provided, then Identification and Reconciliation Engine (IRE) looks first for the Serial Number. Then, if a Serial Number is not found, IRE falls back to using Name.

4. Identifier entry specified for the MAC Address/IP Address attributes in the Network Adapter table. However, do not rely only on the MAC Address/IP Address. If both Serial Number and Name are not available, and only MAC Address/IP Address are available, use MAC Address as the name of the CI. Using the MAC Address as the name of the CI ensures that you don't create an empty CI.

For more information, see CMDB Identification and Reconciliation.

**Server [cmdb_ci_server] class**

Attributes, identification rule, and other important schema structures for the CMDB Server [cmdb_ci_server] class.
Attributes

The Server class adds the following unique attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Classification</td>
<td>Type of server, such as production, development, disaster recovery, or user acceptance testing (UAT).</td>
</tr>
</tbody>
</table>
### ServiceNow DocVersion Now Platform capabilities

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firewall status</td>
<td>Internet or intranet facing server.</td>
</tr>
<tr>
<td>Host name</td>
<td>Use the Name attribute to store the host name of the server instead of the Host name attribute.</td>
</tr>
<tr>
<td>Used for</td>
<td>Business service supported by the server, such as production, staging, or quality assurance (QA). This attribute uses the Used for choice list field from the Service [cmdb_ci_service] table.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Reference attribute</th>
<th>Reference to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disaster backup</td>
<td>Server [cmdb_ci_server] table. Reference to another server that is the backup server for this server.</td>
</tr>
</tbody>
</table>

### Reference classes

The following reference classes extend the Server class. They do not add any new attributes.

<table>
<thead>
<tr>
<th>Reference class</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmdb_ci_solaris_server</td>
<td>Solaris Server</td>
<td>Server running Oracle Solaris operating system.</td>
</tr>
<tr>
<td>cmdb_ci_lb_cisco_csm</td>
<td>Cisco CSM</td>
<td>Cisco Security Manager (CSM) load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_win_server</td>
<td>Windows Server</td>
<td>Server running Microsoft Windows Server operating system.</td>
</tr>
<tr>
<td>cmdb_ci_lb_ace</td>
<td>ACE</td>
<td>Cisco Application Control Engine load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_netscaler</td>
<td>Citrix Netcaler</td>
<td>Citrix Netcaler load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_alteon</td>
<td>Alteon</td>
<td>Alteon load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_a10</td>
<td>A10 Load Balancer</td>
<td>A10 load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_cisco_css</td>
<td>Cisco CSS</td>
<td>Cisco Content Services Switch (CSS) load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_cisco_gss</td>
<td>Cisco GSS</td>
<td>Cisco Global Site Selector (GSS) load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_osx_Server</td>
<td>OS/X Server</td>
<td>Server running OS/X operating system.</td>
</tr>
<tr>
<td>cmdb_ci_HPUX_Server</td>
<td>HPUX Server</td>
<td>Server running HP-UX operating system.</td>
</tr>
<tr>
<td>cmdb_ci_tape_server</td>
<td>Server Tape Unit</td>
<td>Server using a tape drive.</td>
</tr>
<tr>
<td>cmdb_ci_Server_Hardware</td>
<td>Server Hardware</td>
<td>Server hardware.</td>
</tr>
<tr>
<td>cmdb_ci_datapower_server</td>
<td>Data Power Hosting Server</td>
<td>IBM DataPower hosting server.</td>
</tr>
</tbody>
</table>
### Schema description

The CMDB schema model does not separate between servers and computers that are physical and servers and computer that are virtual. Instead, the Computer and the Server classes have a field named `IsVirtual`. If a computer or server is a virtual instance, set this `IsVirtual` attribute to `true`.

As described in the Virtual Machine schema section, to fully model a virtual machine, set the `IsVirtual` attribute in the Computer or Server CI to `true`. Create a Virtual Machine Instance [cmdb_ci_vm_instance] record using the `BIOS UUID` attribute as the key identifier. Then create a Hosted_On relationship between the Virtual Machine Instance record and the Computer or Server instance and set `IsVirtual` to `true`.

### Key relationship structures

Use the following key relationships as important guidelines when creating Hardware, Computer, or Server CIs:

- **Serial number**: During CI identification, Identification and Reconciliation Engine (IRE) processes search for a serial number in two locations. One is the CI serial number attribute, and the second one is the Serial Number [cmdb_serial_number] table, with reference back to the Hardware [cmdb_ci_hardware] table.
  - Store any serial number of any type other than System, only in the Serial Number table (and not in the server CI attribute).
  - If the system serial number is available, store it in both the **Serial Number** attribute of the CI and in the Serial Number table.

The Serial Number table is a many to one relationship linking back to the server CI. This table has a type field for specifying the type of the serial number (system, uuid, chassis, bios, or baseboard) and...
storing the actual value itself. Use the following Windows standards for serial number types in the Serial Number [cmdb_serial_number] table:

- **system**: Product identification such as a serial number for software, a die number on a hardware chip, or a project number (for noncommercial products).
- **uuid**: Universally unique identifier (UUID) for the product. A UUID is a 128-bit identifier that is guaranteed to be different from other generated UUIDs.
- **chassis**: Manufacturer-allocated number that is used to identify a physical element. Value is the Serial Number member of the System Enclosure or Chassis structure in the SMBIOS information. This type represents the properties associated with a physical system enclosure.
- **bios**: The assigned serial number of the BIOS. This type represents the attributes of the computer system basic input/output services (BIOS) that are installed on the computer.
- **baseboard**: Manufacturer-allocated number that is used to identify the physical element. This property is inherited from CIM_PhysicalElement, and is sometimes referred to as the ‘Motherboard Serial Number’.

**Network adapter:**

- Use the Network Adapter [cmdb_ci_network_adapter] class to store network adapters.
- Set the **Name** attribute in the Network Adapter class to be the name of the Network Adapter device (such as eth0, eth1).
- Set the **MAC Address** attribute to be the MAC address value. Format the string with colon separators between octets and lower case hexadecimal characters with padded zeros.
  
  For example: ‘f8:f2:1e:00:d4:66’
- In the CI Relationship [cmdb_rel_ci] table, create an **Owned By::Owns** relationship to the associated Hardware CI. Specify a reference from the Network Adapter [cmdb_ci_network_adapter] table using the CI with a reference to the associated Hardware CI.

**IP address:**

- Use the IP Address [cmdb_ci_ip_address] class to store IP addresses.
- Store an IP address value in the **IP Address** attribute, and in the **Name** attribute (to avoid empty **Name** attributes).
- Store an IPv4 IP address value using the format 'NNN.NNN.NNN.NNN', with decimal-based octets and period separators. Non-conforming values should be considered invalid and cleansed to null values.
- Store an IPv6 IP address value using lower case hexadecimal with colon separators. Non-confirming values should be considered invalid and cleansed to null values.
- Set the **Netmask** attribute to the IP address.
- In the CI Relationship [cmdb_rel_ci] table, create an **Owned By::Owns** relationship to the associated Hardware hierarchy CI.
- Specify for the IP address a reference to the Network Adapter [cmdb_ci_network_adapter] table using the Configuration Item with a reference to the associated Hardware CI.
- To ensure that base system identification rules work properly, also store the IP address in the associated Network Adapter class.

**Network adapter and IP address:**

- Store the MAC address of the network adapter installed on a server, in the Network Adapter [cmdb_ci_network_adapter] class.
- Store the IP address in the IP Address [cmdb_ci_ip_address] class.
- Do not store the MAC address or the IP address in the Server [cmdb_ci_server] class.
Key reference structures

Use the following key references as important guidelines when creating Hardware, Computer, or Server CIs:

- Software and processes running on a server: The Software [cmdb_ci_spkg] class contains the generic software package that is related to the server CI. The cmdb_sw_instance table instantiates each instance of the software package with:
  - One to one reference back to the Server [cmdb_ci_server] class
  - Many to one reference back to the Software class

These references are stored in the Installed on and the Product Name reference attributes respectively.

If either the Software Asset Management Foundation [com.snc.sams] or the Software Asset Management [com.snc.software_asset_management] plugin is installed, then store software details in the Software Installation [cmdb_sam_sw_install] table instead of the cmdb_sw_instance table.

- The Manufacturer and Model ID are reference attributes to the Company [core_company] and Product Model [cmdb_model] tables respectively.
- The Owned By, Assigned To, Managed By, and Supported By are reference attributes to the User [sys_user] table. The Assignment Group and Support Group are reference attributes to the Group [sys_user_group] table.

Identification rule

The base system contains pre-defined identification rules for the Hardware, Computer, and Server classes, which are identical. That identification rule has the following key identifier entries, listed in priority order:

1. Identifier entry which uses lookup-based identification specified with Serial Number [cmdb_serial_number] as the lookup table. The Serial Number table is a many to one reference from Serial Number back to the server CI.
2. Identifier entry specified with the Serial Number attribute in the CI.
3. Identifier entry for the Name attribute. If Serial Number is not available, then the Name (which is the hostname) attribute is used. If both the Serial Number and the Name attributes are provided, then Identification and Reconciliation Engine (IRE) looks first for the Serial Number. Then, if a Serial Number is not found, IRE falls back to using Name.
4. Identifier entry specified for the MAC Address/IP Address attributes in the Network Adapter table. However, do not rely only on the MAC Address/IP Address.

If both Serial Number and Name are not available, and only MAC Address/IP Address are available, use MAC Address as the name of the CI. Using the MAC Address as the name of the CI ensures that you don't create an empty CI.

For more information, see CMDB Identification and Reconciliation.

VMware vCenter Object [cmdb_ci_vcenter_object] class

Attributes, identification rule, and other important schema structures for Virtual Machine related classes.
Schema description

ServiceNow® has an extensive modeling of virtual machines (VMs) environment, with classes such as:

- VMware vCenter Cluster [cmdb_ci_vcenter_cluster]
- VMware vCenter datacenter [cmdb_ci_vcenter_datacenter]
- VMware Virtual Machine Instance [cmdb_ci_vmware_instance]

Virtual machines are modeled just like any other server, but with the `IsVirtual` attribute set to `true`. 
VMWare vCenter Instance schema structure

In the diagram above, the ‘Discovered’ virtual server is referred to as the ‘Guest’ (VM object). Follow the preceding diagram for any further modeling of VMWare components.

**Key reference structures**

The Guest has the following important key reference structures:
• An Instantiates::InstantiatedBy relationship with the cmdb_ci_vmware_instance (which is the VM instance reported by Center).
• A Virtualizes::Virtualized by relationship with ESXi Server (the hardware with the ESXi virtualization software installed).
• Guest (Discovered, VMOBJECT) also has a HasRegistered::RegisteredOn relationship to ESXi Server.

Identification rules

• Guest operating system: Guest operating system is modeled as Server (with IsVirtual set to true) and therefore identification rules follow the rules for the Server class. In most operating systems, BIOS UUID is reported as serial number. It is essential that you follow proper VMware guidelines to ensure that BIOS UUID is not being reused. Having a cloned BIOS UUID causes issues with identification rules.
• VM Instances: IRE uses instance MosRef ID as key identifier.
• ESX Server: Server is modeled as bare metal Server (with IsVirtual set to false) and therefore applies the Server class identification rules.

CMDB CI Class Models store app

Adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs.

CMDB CI Class Models Release 1.12.0

The CMDB CI Class Models store apps adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships (if applicable). Use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs and discover various technologies and software.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

What’s new in this release

CMDB CI Class Models: Release 1.12.0 adds classes to the following:

• Kubernetes pattern
• Firewalls

Kubernetes pattern

The Kubernetes pattern main flow helps with discovering Kubernetes core elements. The classes in this release, extend the support to discover kubernetes workload controller components like deployments,
daemonsets, and statefulsets. The Workload Share library captures information about deployments, daemonsets, and statefulsets and stores them in the respective tables. Other extensions include YAML and service mesh extension that generates a YAML file to track configuration files and creating service to service relations by discovering service mesh information.

Kubernetes extension class integrated with the CMDB hierarchy

Firewalls

A firewall is a network security system that monitors and controls incoming and outgoing network traffic, based on security policies. Firewalls typically form a barrier between an internal network and an untrusted external network, such as the internet. It usually consists of security policies that help secure an organization from external threats and cyber attacks. Firewall vendors may provide a centralized firewall manager to manage many firewall devices and the security policies residing on them. For example, Panorama™ is the centralized management system for Palo Alto Networks firewalls.

The ServiceNow Discovery application uses the following patterns for the discovery of firewall devices:

- #unique_176
- #unique_177
- #unique_178
- #unique_179
Firewall extension classes integrated with the CMDB class hierarchy.

Classes

This section lists the classes that the CMDB CI Class Models store app adds or updates.

CMDB CI Class Models: Release 1.12.0 adds the following classes for Kubernetes pattern:

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Fields</th>
<th>Relation</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmdb_ci_kubernetes_work</td>
<td>cmdb_ci_kubernetes_component</td>
<td>'Provides' from cmdb_ci_kubernetes_service</td>
<td></td>
</tr>
<tr>
<td>cmdb_ci_kubernetes_deployment</td>
<td>cmdb_ci_kubernetes_workload</td>
<td>Replicas Desired • Replicas Updated • Replicas Total • Replicas Available • Replicas Unavailable</td>
<td>Hosted on Cluster</td>
</tr>
<tr>
<td>cmdb_ci_kubernetes_daemonset</td>
<td>cmdb_ci_kubernetes_workload</td>
<td>Pods running • Pods Waiting • Pods Succeeded • Pods Failed • Pods Available</td>
<td>Hosted on Cluster</td>
</tr>
<tr>
<td>cmdb_ci_kubernetes_statefulset</td>
<td>cmdb_ci_kubernetes_workload</td>
<td>Replicas Desired • Replicas Updated • Replicas Total • Replicas Available • Replicas Unavailable</td>
<td>Hosted on Cluster</td>
</tr>
</tbody>
</table>

The CMDB CI Class Models store app adds the following class for the discovery of firewall devices.

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Firewall Device</td>
<td>[cmdb_ci_firewall_device_cisco]</td>
<td>All Cisco Firewall devices.</td>
</tr>
<tr>
<td>[cmdb_ci_firewall_device]</td>
<td>[cmdb_ci_firewall_device]</td>
<td></td>
</tr>
</tbody>
</table>

Class columns

The CMDB CI Class Models store app adds no columns to the existing classes.

CMDB CI Class Models: Release 1.10.0

The CMDB CI Class Models store app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships (if applicable). Use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs and discover various technologies and software.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

What's new in this release

CMDB CI Class Models: Release 1.10.0 adds classes for the following:

- Firewalls
- VMware NSX load balancers

Firewalls

A firewall is a network security system that monitors and controls incoming and outgoing network traffic, based on security policies. Firewalls typically form a barrier between an internal network and an untrusted external network, such as the internet. It usually consists of security policies that help secure an organization from external threats and cyber attacks. Firewall vendors may provide a centralized firewall manager to manage many firewall devices and the security policies residing on them. For example, Panorama™ is the centralized management system for Palo Alto Networks firewalls.
Firewall extension classes integrated with the CMDB class hierarchy.
VMware NSX load balancers

NSX is a network virtualization solution offered by VMware. Among the virtual resources included in the NSX solution are virtual LANs (VLANs), virtual load balancers, virtual routers, switches, and firewalls.

ServiceNow Discovery uses the #unique_181 pattern to find VMware NSX load balancers and their components: Listeners, pools, pool members, and health services.

VMware NSX load balancer classes integrated with the CMDB class hierarchy

Classes

This section lists the classes that the CMDB CI Class Models store app adds or updates.

CMDB CI Class Models: Release 1.10.0 adds the following classes for the discovery of network firewall devices.

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>--------------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Firewall Device [cmdb_ci_firewall_device]</td>
<td>IP Firewall [cmdb_ci_ip_firewall]</td>
<td>Network security system that monitors and controls incoming and outgoing network traffic, based on security policies.</td>
</tr>
<tr>
<td>cmdb_ci_firewall_device_fortinet</td>
<td>cmdb_ci_firewall_device</td>
<td>Fortinet firewall device.</td>
</tr>
<tr>
<td>cmdb_ci_firewall_device_juniper</td>
<td>cmdb_ci_firewall_device</td>
<td>Juniper firewall device.</td>
</tr>
<tr>
<td>Firewall Device Group [cmdb_ci_firewall_device_group]</td>
<td>CMDB CI [cmdb_ci]</td>
<td>Group of firewall devices.</td>
</tr>
<tr>
<td>Panorama Firewall Device Group [cmdb_ci_firewall_device_group_panorama]</td>
<td>Firewall Device Group [cmdb_ci_firewall_device_group]</td>
<td>Group of Panorama firewall devices.</td>
</tr>
<tr>
<td>Palo Alto Firewall Device [cmdb_ci_firewall_device_palo_alto]</td>
<td>Firewall Device [cmdb_ci_firewall_device]</td>
<td>Palo Alto firewall device.</td>
</tr>
<tr>
<td>Firewall Cluster [cmdb_ci_firewall_cluster]</td>
<td>cmdb_ci_cluster</td>
<td>Group of firewall nodes that work as a single logical entity.</td>
</tr>
<tr>
<td>Fortinet Firewall Cluster [cmdb_ci_firewall_cluster_fortinet]</td>
<td>cmdb_ci_firewall_cluster</td>
<td>Fortinet firewall cluster.</td>
</tr>
<tr>
<td>Juniper Firewall Cluster [cmdb_ci_firewall_cluster_juniper]</td>
<td>cmdb_ci_firewall_cluster</td>
<td>Juniper firewall cluster.</td>
</tr>
<tr>
<td>Firewall Manager [cmdb_ci_firewall_manager]</td>
<td>CMDB CI [cmdb_ci]</td>
<td>System that provides centralized management for many firewall devices and the security policies residing on them.</td>
</tr>
<tr>
<td>Panorama Firewall Manager [cmdb_ci_firewall_manager_panorama]</td>
<td>Firewall Manager [cmdb_ci_firewall_manager]</td>
<td>The centralized network security management tool for Palo Alto Networks firewalls.</td>
</tr>
<tr>
<td>Firewall Security Policy [cmdb_ci_firewall_sec_policy]</td>
<td>CMDB CI [cmdb_ci]</td>
<td>The security policy that the firewall device enforces.</td>
</tr>
<tr>
<td>Panorama Firewall Security Policy [cmdb_ci_firewall_sec_policy_panorama]</td>
<td>Firewall Security Policy [cmdb_ci_firewall_sec_policy]</td>
<td>The security policy that the Panorama firewall device enforces.</td>
</tr>
</tbody>
</table>

CMDB CI Class Models: Release 1.10.0 adds the following classes for the VMware NSX load balancer.

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NSX Load Balancer [cmdb_ci_nsx_lb]</td>
<td>Load Balancer [cmdb_ci_lb]</td>
<td>The table containing the NSX Load Balancer resources.</td>
</tr>
</tbody>
</table>

Class columns

CMDB CI Class Models: Release 1.10.0 adds the following columns to the respective classes for the discovery of network firewall devices.
IP Firewall [cmdb_ci_ip_firewall] class

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hardware Operating System</td>
<td>OS running on the hardware.</td>
</tr>
<tr>
<td>Hardware OS Version</td>
<td>OS version running on the hardware.</td>
</tr>
</tbody>
</table>

Firewall Cluster [cmdb_ci_firewall_cluster]

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hardware Operating System</td>
<td>OS running on the hardware.</td>
</tr>
<tr>
<td>Hardware OS Version</td>
<td>OS version running on the hardware.</td>
</tr>
</tbody>
</table>

The #unique_181 pattern introduces one new table with one identification rule and entry. The table uses only the columns inherited from its parent.

CMDB CI Class Models: Release 1.8.0

The CMDB CI Class Models store app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs and discover various technologies and software.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

What's new in this release

CMDB CI Class Models: Release 1.8.0 adds classes for the following:

- OpenStack

OpenStack

OpenStack is a cloud operating system that controls large pools of compute, storage, and networking resources throughout a datacenter. All of these resources are managed and provisioned through APIs with common authentication mechanisms. Other components provide services such as orchestration, fault management, and service management to ensure high availability of user applications. OpenStack is broken up into services to enable you to plug and play components depending on your needs. These components are designed for horizontal scalability, so you can easily add new resources to grow your cloud over time.
### Classes

The CMDB CI Class Models store app adds or updates the following classes.

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpenStack Services</td>
<td>[cmdb_ci_cloud_openstack_service]</td>
<td>Virtual Machine Object [cmdb_ci_vm_object] An OpenStack web service that can be accessed via a URL.</td>
</tr>
</tbody>
</table>

### Class Columns

The CMDB CI Class Models store app adds the following columns to the relevant classes.

**OpenStack Services** [cmdb_ci_cloud_openstack_service] class

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>The Service type, which describes the API implemented by the Service. Possible values: Compute, ec2, identity, image, network, or volume.</td>
</tr>
<tr>
<td>enabled</td>
<td>Defines if the service and its endpoints appear in the Service catalog (true/false).</td>
</tr>
</tbody>
</table>

**OpenStack Endpoint** [cmdb_ci_cloud_openstack_endpoint] class

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface</td>
<td>The interface type, which describes the visibility of the endpoint. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• public - Visible by end users on a publicly available network interface.</td>
</tr>
<tr>
<td></td>
<td>• internal - Visible by end users on an unmetered internal network interface.</td>
</tr>
<tr>
<td></td>
<td>• admin - Visible by administrative users on a secure network interface.</td>
</tr>
<tr>
<td>enabled</td>
<td>Defines if the Service and its endpoints appear in the Service catalog (true/false).</td>
</tr>
</tbody>
</table>

**OpenStack Domain** [cmdb_ci_cloud_openstack_domain] class

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>Defines if the domain is enabled (true/false).</td>
</tr>
</tbody>
</table>
CMDB CI Class Models: Release 1.6.0

Add class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any other CMDB class. Applications such as Service Mapping patterns and Discovery can use these class extensions to populate CIs.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

Use extension classes

The CMDB CI Class Models app adds classes, columns, and the associated metadata, as related records in the following tables:

- **CMDB Class Information [cmdb_class_info]**: Class descriptions
- **Identifier [cmdb_identifier]**: Identification rules
- **Identifier Entry [cmdb_identifier_entry]**: Identification entries
- **CMDB Metadata Hosting Rules [cmdb_metadata_hosting]**: Dependent relationships

After installation, navigate to **Configuration** and then click **CI Class Manager**. Then click **Hierarchy** in CI Class Manager to display the CI Classes list. This list contains the added classes, such as the Nutanix classes. Select a class to see the corresponding class details, identification rules, identifier entries, and dependent relationships if applicable.

Use extension classes as any other CMDB class. Applications such as Service Mapping and Discovery can use these class extensions to discover various technologies and software such as the Nutanix Enterprise Cloud software.

**Note:** Uninstalling the CMDB CI Class Models application might compromise the integrity of the CMDB and result in unexpected behavior.

Internet of Things (IoT)

IoT is a system of interrelated computing devices, mechanical and digital machines, objects, animals or people that are provided with unique identifiers and the ability to transfer data over a network without requiring human-to-human or human-to-computer interaction. The classes added in this release, extend the Data Model to provide a foundation for the representation of IoT CI classes. This foundation underpins workflows for Enterprise Asset Management (EAM), Governance Risk Compliance (GRC), Component Supply Management (CSM), and Field Service Management (FSM) surrounding the management of IoT devices and the transport vehicles that some reside in.
IoT extension classes integrated with the CMDB class hierarchy.

AVI Load Balancer

The Avi Vantage platform is built on software-defined principles, enabling a next generation architecture to deliver the flexibility and simplicity expected by IT and lines of business. The Avi Vantage platform...
architecture separates the data and control planes to deliver application services beyond load balancing, such as application analytics, predictive autoscaling, and self-service, for app owners in on-premises or cloud environments. The platform provides a centrally managed, dynamic pool of load balancing resources on commodity x86 servers, virtual machines, or containers, to deliver granular services close to individual applications. Providing these services allows network services to scale near infinitely without the added complexity of managing hundreds of disparate appliances.
Avi load balancer classes integrated with the CMDB class hierarchy
## Classes

The CMDB CI Class Models store app adds or updates the following classes. See the respective class section for further details.

<table>
<thead>
<tr>
<th>Class</th>

</tbody>
</table>
Class columns

The CMDB CI Class Models store app adds the following columns to the relevant classes.

<table>
<thead>
<tr>
<th>Added column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>The version of the Avi Service Engine resource.</td>
</tr>
</tbody>
</table>

CMDB CI Class Models: Release 1.5.0

Add class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any other CMDB class. Applications such as Service Mapping patterns and Discovery can use these class extensions to populate CIs.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

Use extension classes

The CMDB CI Class Models app adds classes, columns, and the associated metadata, as related records in the following tables:

- CMDB Class Information [cmdb_class_info]: Class descriptions
- Identifier [cmdb_identifier]: Identification rules
- Identifier Entry [cmdb_identifier_entry]: Identification entries
- CMDB Metadata Hosting Rules [cmdb_metadata_hosting]: Dependent relationships

After installation, navigate to Configuration and then click CI Class Manager. Then click Hierarchy in CI Class Manager to display the CI Classes list. This list contains the added classes, such as the Nutanix classes. Select a class to see the corresponding class details, identification rules, identifier entries, and dependent relationships if applicable.

Use extension classes as any other CMDB class. Applications such as Service Mapping and Discovery can use these class extensions to discover various technologies and software such as the Nutanix Enterprise Cloud software.

Note: Uninstalling the CMDB CI Class Models application might compromise the integrity of the CMDB and result in unexpected behavior.

Red Hat Virtualization (RHV)

Red Hat Virtualization (RHV) is a virtualization product which is based on the Kernel-based Virtual Machine (KVM) hypervisor. RHV uses the SPICE protocol and Virtual Desktop Server Manager (VDSM) with a RHEL-based centralized management server. RHV solution is based on two primary software components:
Red Hat Virtualization Manager (RHV-M) and Red Hat Virtualization Hypervisors or hosts: Red Hat Enterprise Linux or RHV Host (RHV-H).

### Classes

The CMDB CI Class Models store app adds or updates the following classes. See the respective class section for further details.

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RHV Server</td>
<td>Virtualization Server</td>
<td>The RHV virtualization host.</td>
</tr>
<tr>
<td>[cmdb_ci_rhv_server]</td>
<td>[cmdb_ci_virtualization_server]</td>
<td></td>
</tr>
</tbody>
</table>
### RHV Server

The CMDB CI Class Models store app adds the following columns to the RHV Server [cmdb_ci_rhv_server] class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>URL used to access the object.</td>
</tr>
</tbody>
</table>

### RHV Object

The CMDB CI Class Models store app adds the following columns to the RHV Object [cmdb_ci_rhv_object] class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>href_id</td>
<td>Href ID.</td>
</tr>
<tr>
<td>manager_id</td>
<td>Manager ID.</td>
</tr>
<tr>
<td>url</td>
<td>URL to access the object (used in child classes).</td>
</tr>
</tbody>
</table>

### RHV Manager

The CMDB CI Class Models store app adds the following columns to the RHV Manager [cmdb_ci_rhv_manager] class.
<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>URL of the manager.</td>
</tr>
<tr>
<td>product_name</td>
<td>Product name.</td>
</tr>
</tbody>
</table>

**RHV Cluster**

The CMDB CI Class Models store app adds the following columns to the RHV Cluster [cmdb_ci_rhv_cluster] class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cpu_type</td>
<td>CPU type.</td>
</tr>
<tr>
<td>cpu_architecture</td>
<td>CPU architecture.</td>
</tr>
<tr>
<td>ksm</td>
<td>Enabled state of kernel same-page merging (KSM) memory policy.</td>
</tr>
<tr>
<td>fencing_policy</td>
<td>Fencing policy.</td>
</tr>
<tr>
<td>memory_overcommitment</td>
<td>Amount of over-commitment memory allowed on the cluster.</td>
</tr>
<tr>
<td>transparenthuge_pages</td>
<td>Transparent huge memory pages policy.</td>
</tr>
<tr>
<td>ballooning</td>
<td>Memory ballooning for guests.</td>
</tr>
<tr>
<td>compatibility_version</td>
<td>Compatibility version.</td>
</tr>
</tbody>
</table>

**RHV Datacenter**

The CMDB CI Class Models store app adds the following columns to the RHV Datacenter [cmdb_ci_rhv_datacenter] class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>quota_mode</td>
<td>Quota mode policy.</td>
</tr>
</tbody>
</table>

**RHV Virtual Machine Instance**

The CMDB CI Class Models store app adds the following columns to the RHV Virtual Machine Instance [cmdb_ci_rhv_vm_instance] class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mgmt_url</td>
<td>Management URL.</td>
</tr>
<tr>
<td>cpu_architecture</td>
<td>CPU architecture.</td>
</tr>
<tr>
<td>delete_protected</td>
<td>Delete protected (true/false).</td>
</tr>
<tr>
<td>ha_priority</td>
<td>HA priority.</td>
</tr>
<tr>
<td>high_availability</td>
<td>High availability (true/false).</td>
</tr>
<tr>
<td>Columns (added)</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>memory_policy_guaranteed</td>
<td>Amount of memory guaranteed (MB).</td>
</tr>
<tr>
<td>memory_policy_max_mb</td>
<td>Maximum memory in the dynamic memory allocation policy.</td>
</tr>
<tr>
<td>multi_queues</td>
<td>Multi queues.</td>
</tr>
<tr>
<td>placement_policy</td>
<td>Placement policy.</td>
</tr>
<tr>
<td>cpu.Sockets</td>
<td>Number of CPU sockets.</td>
</tr>
<tr>
<td>stateless</td>
<td>Stateless (true/false).</td>
</tr>
<tr>
<td>storage_error_resume_behaviour</td>
<td>Behavior of a virtual machine that is paused due to storage I/O error. For examples, AUTO_RESUME, LEAVE_PAUSED, and KILL.</td>
</tr>
<tr>
<td>start_time</td>
<td>Start time.</td>
</tr>
<tr>
<td>stop_time</td>
<td>Stop time.</td>
</tr>
<tr>
<td>threads</td>
<td>Number of threads.</td>
</tr>
<tr>
<td>time_zone</td>
<td>Time zone.</td>
</tr>
<tr>
<td>usb</td>
<td>USB enabled state.</td>
</tr>
<tr>
<td>run_once</td>
<td>Run once.</td>
</tr>
<tr>
<td>type</td>
<td>RHV type.</td>
</tr>
</tbody>
</table>

**Nutanix Prism Central**

The Nutanix Prism Central [cmdb_ci_nutanix_prism_central] class has no added columns.

**CMDB CI Class Models: Release 1.4.0**

Add class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

**Use extension classes**

The CMDB CI Class Models app adds classes, columns, and the associated metadata, as related records in the following tables:

- CMDB Class Information [cmdb_class_info]: Class descriptions
- Identifier [cmdb_identifier]: Identification rules
After installation, navigate to Configuration and then click CI Class Manager. Then click Hierarchy in CI Class Manager to display the CI Classes list. This list contains the added classes, such as the Nutanix classes. Select a class to see the corresponding class details, identification rules, identifier entries, and dependent relationships if applicable.

Use extension classes as any other CMDB class. Applications such as Service Mapping and Discovery can use these class extensions to discover various technologies and software such as the Nutanix Enterprise Cloud software.

**Note:** Uninstalling the CMDB CI Class Models application might compromise the integrity of the CMDB and result in unexpected behavior.

### Classes

The CMDB CI Class Models store app updates the following class. See the class section for further details about the updates.

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique Certificate</td>
<td>Configuration Item</td>
<td>A public key certificate in X.509 standard format.</td>
</tr>
<tr>
<td>[cmdb_ci_certificate]</td>
<td>[cmdb_ci]</td>
<td></td>
</tr>
</tbody>
</table>

### Unique Certificate

The CMDB CI Class Models store app changes the Unique Certificate [cmdb_ci_certificate] class as follows:

- The assigned_to attribute now depends on the assignment_group attribute so that users in the assigned_to attribute are filtered based on the specified assignment_group.
- You can no longer add new records to the Unique Certificate [cmdb_ci_certificate] class. The list view for that class does not have a New button.
- You can no longer add or delete attachments in the Certificate file attribute.

### CMDB CI Class Models: Release 1.3.0

Add class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs.

### Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.
Use extension classes

The CMDB CI Class Models app adds the classes and columns and the metadata associated with each class as related records in the following tables:

- CMDB Class Information [cmdb_class_info]: Class descriptions
- Identifier [cmdb_identifier]: Identification rules
- Identifier Entry [cmdb_identifier_entry]: Identification entries
- CMDB Metadata Hosting Rules [cmdb_metadata_hosting]: Dependent relationships

After installation, navigate to Configuration and then click CI Class Manager. When you click Hierarchy in CI Class Manager, the CI Classes list contains the added classes such as the Nutanix classes. Select a class to see its corresponding class details, identification rules, identifier entries, and dependent relationships if applicable.

Use extension classes as any other CMDB class. Applications such as Service Mapping and Discovery can use these class extensions to discover various technologies and software such as the Nutanix Enterprise Cloud software.

Note: Uninstalling the CMDB CI class models application might compromise the integrity of the CMDB and result in unexpected behavior.

Scoped apps certification classes

The scoped apps certification classes support certification of scoped apps. With these classes you can proactively manage certificates by keeping stakeholders informed about any impending expiries. Use these extension classes to ensure that certificates are monitored and renewed before they expire, to prevent severe outage of production systems.

Classes

The CMDB CI Class Models store app adds or updates (by adding new columns) the following classes. See each respective class section for further details about the columns added for each class.

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique Certificate</td>
<td>Configuration Item</td>
<td>N/A</td>
</tr>
<tr>
<td>[cmdb_ci_certificate]</td>
<td>[cmdb_ci]</td>
<td></td>
</tr>
<tr>
<td>Certificate Domain</td>
<td>N/A</td>
<td>Fully qualified domain name.</td>
</tr>
<tr>
<td>[certificate_domain]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>IBM Frame</td>
<td>Server</td>
<td>IBM physical machine with considerable resources which can be virtualized.</td>
</tr>
<tr>
<td>[cmdb_ci_ibm_frame]</td>
<td>[cmdb_ci_server]</td>
<td></td>
</tr>
<tr>
<td>IBM HMC Processor pool</td>
<td>Virtual Machine Object</td>
<td>IBM shared pool used to allocate processors to a group of LPARs.</td>
</tr>
<tr>
<td>[cmdb_ci_processor_pool]</td>
<td>[cmdb_ci_vm_object]</td>
<td></td>
</tr>
</tbody>
</table>
Unique Certificate

The CMDB CI Class Models store app adds the following columns to the Unique Certificate [cmdb_ci_certificate] class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certificate file</td>
<td>Certificate in an encoded form.</td>
</tr>
<tr>
<td>Fingerprint</td>
<td>Hash value of the certificate.</td>
</tr>
<tr>
<td>Fingerprint algorithm</td>
<td>Algorithm used to hash the certificate.</td>
</tr>
<tr>
<td>Is certificate authority</td>
<td>Indicates whether a certificate is a Certificate Authority (CA) or not.</td>
</tr>
<tr>
<td>Is selfsigned</td>
<td>Indicates whether the certificate is self-signed or not.</td>
</tr>
<tr>
<td>Issuer</td>
<td>Entity that has signed and issued the certificate.</td>
</tr>
<tr>
<td>Reference: Unique Certificate [cmdb_ci_certificate]</td>
<td></td>
</tr>
<tr>
<td>Issuer common name</td>
<td>Common name of the issuer.</td>
</tr>
<tr>
<td>Issuer distinguished name</td>
<td>Distinguished name of the issuer.</td>
</tr>
<tr>
<td>Key size</td>
<td>Size of the key used by the signing algorithm.</td>
</tr>
<tr>
<td>Choices:</td>
<td></td>
</tr>
<tr>
<td>• Create priority 1 tasks</td>
<td></td>
</tr>
<tr>
<td>• Create priority 3 tasks</td>
<td></td>
</tr>
<tr>
<td>• Do not create renewal tasks</td>
<td></td>
</tr>
<tr>
<td>Renewal tracking</td>
<td>Indicates whether to create any priority 1 or priority 3 tasks for the expiring certificates.</td>
</tr>
<tr>
<td>Root issuer</td>
<td>Root entity that has signed and issued the intermediate certificate.</td>
</tr>
<tr>
<td>Choices:</td>
<td></td>
</tr>
<tr>
<td>• External</td>
<td></td>
</tr>
<tr>
<td>• Internal</td>
<td></td>
</tr>
<tr>
<td>Reference: Unique Certificate [cmdb_ci_certificate]</td>
<td></td>
</tr>
<tr>
<td>Service type</td>
<td>Indicates whether the certificate is used for external or internal services.</td>
</tr>
<tr>
<td>Signature algorithm</td>
<td>The cryptographic algorithm used to sign the certificate.</td>
</tr>
<tr>
<td>Choices:</td>
<td></td>
</tr>
<tr>
<td>• Issued</td>
<td></td>
</tr>
<tr>
<td>• Installed</td>
<td></td>
</tr>
<tr>
<td>• Revoked</td>
<td></td>
</tr>
<tr>
<td>• Retired</td>
<td></td>
</tr>
<tr>
<td>State</td>
<td>Lifecycle states of the certificate.</td>
</tr>
</tbody>
</table>
### Certificate Domain

The CMDB CI Class Models store app adds the following column to the Certificate Domain [certificate_domain] class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain</td>
<td>Fully qualified domain name.</td>
</tr>
</tbody>
</table>

### IBM Frame

The CMDB CI Class Models store app adds the following columns to the IBM Frame [cmdb_ci_ibm_frame] class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current available processor units</td>
<td>Current available processor units.</td>
</tr>
<tr>
<td>Configurable processor units</td>
<td>Configurable processor units.</td>
</tr>
<tr>
<td>Configurable memory units</td>
<td>Configurable memory units.</td>
</tr>
<tr>
<td>Installed processor units</td>
<td>Installed processor units.</td>
</tr>
<tr>
<td>Current available memory units</td>
<td>Current available memory units.</td>
</tr>
<tr>
<td>Installed memory units</td>
<td>Installed memory units.</td>
</tr>
</tbody>
</table>
IBM HMC Processor pool

The CMDB CI Class Models store app adds the following columns to the IBM HMC Processor pool [cmdb_ci_processor_pool] class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LPAR IDs</td>
<td>LPAR IDs.</td>
</tr>
<tr>
<td>LPAR names</td>
<td>LPAR names.</td>
</tr>
<tr>
<td>Frame name</td>
<td>Frame name.</td>
</tr>
</tbody>
</table>

CMDB CI Class Models: IBM HMC (Release 1.2.0)

Add class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

Use extension classes

The CMDB CI Class Models app adds the classes and columns and the metadata associated with each class as related records in the following tables:

- [cmdb_class_info]: Class descriptions
- [cmdb_identifier]: Identification rules
- [cmdb_identifier_entry]: Identification entries
- [cmdb_metadata_hosting]: Dependent relationships

After installation, navigate to Configuration and then click CI Class Manager. When you click Hierarchy in CI Class Manager, the CI Classes list contains the added classes such as the Nutanix classes. Select a class to see its corresponding class details, identification rules, identifier entries, and dependent relationships if applicable.

Use extension classes as any other CMDB class. Applications such as Service Mapping and Discovery can use these class extensions to discover various technologies and software such as the Nutanix Enterprise Cloud software.

Note: Uninstalling the CMDB CI class models application might compromise the integrity of the CMDB and result in unexpected behavior.

IBM Hardware Management Console (HMC)

The IBM HMC extension classes support discovery of IBM virtualization technology by providing:
• Discovery of LPARs/FRAMEs which SAM use cases need.
• Topology data of IBM HMC which event correlation requires.
• Topology data for ITSM use cases such as in frame migration.
IBM HMC extension classes integrated with the CMDB class hierarchy
Nutanix Enterprise Cloud platform

The Nutanix Enterprise Cloud platform is a converged, scale-out compute and storage system that hosts and stores virtual machines. All nodes in a Nutanix cluster share the management of cluster resources. The foundational unit for the cluster is a Nutanix node which runs a standard hypervisor and contains processors, memory, and local storage (SSDs and hard disks). A Nutanix Controller virtual machine runs on each node, enabling the pooling of local storage from all nodes in the cluster.

Classes

The CMDB CI Class Models store app adds the following classes. See each respective class section for further details about the columns added for each class.

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>Object ID</td>
<td>ID of the controller virtual machine.</td>
</tr>
</tbody>
</table>

### Nutanix Storage Container

The CMDB CI Class Models store app adds the following columns to the Nutanix Storage Container [cmdb_ci_nutanix_storage_container] class.
### ServiceNow DocVersion Now Platform capabilities

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compression</td>
<td>Indicates whether compression is enabled.</td>
</tr>
<tr>
<td>Container ID</td>
<td>UUID of the container.</td>
</tr>
<tr>
<td>Deduplication</td>
<td>Indicates whether on disk deduplication is enabled, that is dedup compression applied to data on hard disks (HDD). Performance tier deduplication is a prerequisite for on disk deduplication.</td>
</tr>
<tr>
<td>Erasure Code</td>
<td>Indicates whether erasure coding is enabled.</td>
</tr>
<tr>
<td>Replication Factor</td>
<td>Number of maintained data copies. The replication factor is specified (2 or 3) when the container is created.</td>
</tr>
</tbody>
</table>

**Nutanix Storage Pool**

The Nutanix Storage Pool [cmdb_ci_nutanix_storage_pool] class has no added columns.

**Nutanix Host**

The Nutanix Host [cmdb_ci_nutanix_host] class has no added columns.

**Nutanix Virtual Machine Instance**

The Nutanix Virtual Machine Instance [cmdb_ci_nutanix_vm_instance] class has no added columns.

**CMDB CI Class Models: Nutanix (Release 1.1.5)**

Add class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

**Nutanix Enterprise Cloud platform**

Use the Nutanix CI class models as any other CMDB class. Applications such as Service Mapping and Discovery can use these class extensions to discover the Nutanix Enterprise Cloud software.

The Nutanix Enterprise Cloud platform is a converged, scale-out compute and storage system that hosts and stores virtual machines. All nodes in a Nutanix cluster share the management of cluster resources. The foundational unit for the cluster is a Nutanix node which runs a standard hypervisor and contains...
processors, memory, and local storage (SSDs and hard disks). A Nutanix Controller virtual machine runs on each node, enabling the pooling of local storage from all nodes in the cluster.

CMDB CI class models adds the classes and columns and the metadata associated with each class as related records in the following tables:

- CMDB Class Information [cmdb_class_info]: Class descriptions
- Identifier [cmdb_identifier]: Identification rules
- Identifier Entry [cmdb_identifier_entry]: Identification entries
- CMDB Metadata Hosting Rules [cmdb_metadata_hosting]: Dependent relationships

### View Nutanix Enterprise Cloud extension classes

After installation, navigate to **Configuration** and then click **CI Class Manager**. When you click **Hierarchy** in CI Class Manager, the CI Classes list contains the added Nutanix classes. Select a class to see its corresponding class details, identification rules, identifier entries, and dependent relationships if applicable.

**Note:** Uninstalling the CMDB CI class models application might compromise the integrity of the CMDB and result in unexpected behavior.

### Classes

The following classes are added:

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nutanix Cluster</td>
<td>Virtual Machine Object</td>
<td>Cluster comprising of the physical nodes running Nutanix software.</td>
</tr>
<tr>
<td>[cmdb_ci_nutanix_cluster]</td>
<td>[cmdb_ci_vm_object]</td>
<td></td>
</tr>
<tr>
<td>Nutanix Controller VM</td>
<td>Application</td>
<td>Nutanix controller virtual machine that is present in each node and that provides the storage clustering and management capabilities.</td>
</tr>
<tr>
<td>[cmdb_ci_nutanix_controller_vm]</td>
<td>[cmdb_ci_appl]</td>

<tr>
<td>NTP Servers</td>
<td>NTP servers that are related to this cluster.</td>
</tr>
<tr>
<td>Number of Nodes</td>
<td>Number of nodes that are connected to the cluster.</td>
</tr>
<tr>
<td>Timezone</td>
<td>Timezone of the cluster.</td>
</tr>
<tr>
<td>Version</td>
<td>Version of the cluster. For example: 5.10.3.1</td>
</tr>
</tbody>
</table>

### Nutanix Controller VM

The following columns are added in the Nutanix Controller VM [cmdb_ci_nutanix_controller_vm] class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hypervisor Type</td>
<td>Type of hypervisor.</td>
</tr>
<tr>
<td>Memory</td>
<td>Amount of memory (in MB) available to the virtual machine.</td>
</tr>
<tr>
<td>State</td>
<td>On/off state of power.</td>
</tr>
<tr>
<td>VM ID</td>
<td>UUID of the controller virtual machine.</td>
</tr>
<tr>
<td>Object ID</td>
<td>ID of the controller virtual machine.</td>
</tr>
</tbody>
</table>

### Nutanix Storage Container

The following columns are added in the Nutanix Storage Container [cmdb_ci_nutanix_storage_container] class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compression</td>
<td>Indicates whether compression is enabled.</td>
</tr>
<tr>
<td>Columns (added)</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Container ID</td>
<td>UUID of the container.</td>
</tr>
<tr>
<td>Deduplication</td>
<td>Indicates whether on disk deduplication is enabled, that is dedup compression applied to data on hard disks (HDD). Performance tier deduplication is a prerequisite for on disk deduplication.</td>
</tr>
<tr>
<td>Erasure Code</td>
<td>Indicates whether erasure coding is enabled.</td>
</tr>
<tr>
<td>Replication Factor</td>
<td>Number of maintained data copies. The replication factor is specified (2 or 3) when the container is created.</td>
</tr>
</tbody>
</table>

**Nutanix Storage Pool**

The Nutanix Storage Pool [cmdb_ci_nutanix_storage_pool] class has no added columns.

**Nutanix Host**

The Nutanix Host [cmdb_ci_nutanix_host] class has no added columns.

**Nutanix Virtual Machine Instance**

The Nutanix Virtual Machine Instance [cmdb_ci_nutanix_vm_instance] class has no added columns.

**CMDB CI Class Models: Nutanix (Release 1.1.4)**

Add class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

**Nutanix Enterprise Cloud platform**

Use the Nutanix CI class models as any other CMDB class. Applications such as Service Mapping and Discovery can use these class extensions to discover the Nutanix Enterprise Cloud software.

The Nutanix Enterprise Cloud platform is a converged, scale-out compute and storage system that hosts and stores virtual machines. All nodes in a Nutanix cluster share the management of cluster resources. The foundational unit for the cluster is a Nutanix node which runs a standard hypervisor and contains processors, memory, and local storage (SSDs and hard disks). A Nutanix Controller virtual machine runs on each node, enabling the pooling of local storage from all nodes in the cluster.
CMDB CI class models adds the classes and columns and the metadata associated with each class as related records in the following tables:

- CMDB Class Information [cmdb_class_info]: Class descriptions

</tbody>
</table>

**Nutanix Storage Pool**

The Nutanix Storage Pool [cmdb_ci_nutanix_storage_pool] class has no added columns.

**Nutanix Host**

The Nutanix Host [cmdb_ci_nutanix_host] class has no added columns.

**Nutanix Virtual Machine Instance**

The Nutanix Virtual Machine Instance [cmdb_ci_nutanix_vm_instance] class has no added columns.

**Application services**

An application service is a set of interconnected applications and hosts which are configured to offer a service to the organization. Application services can be internal, like an organization email system or customer-facing, like an organization website.

ServiceNow applications refer to devices and applications that comprise an application service as configuration items (CIs). The various CIs and the relationships between them, that comprise an application service, are stored in the CMDB.

In the base system, you can manually create an application service and then populate it by adding CIs and their relationships from the CMDB. The system generates a map which shows the CIs and relationships in the application service. The system also tracks changes to application service and shows the history of those changes in the application service map.

All application services that you create manually or by using an API, or that are discovered by Service Mapping, are stored in the Application Service [cmdb_ci_service_discovered] table.

Activating Service Mapping or Event Management provides additional functionality for creating, updating, and using application services.

**Domain separation**

Domain separation, if deployed, impacts application services as follows:

- When creating an application service, the application service is assigned to the user's domain.
• When manually adding a CI to an application service, you can choose only CIs that belong to the service domain.
• When using the createOrUpdateService - POST REST API for creating or updating an application service, the process stops if one of the CIs referenced in the API belongs to a different domain than the application service itself.
• When converting business services into application services, the newly created application service belongs to the same domain as the original business service. The application service comprises only CIs belonging to the same domain as the application service itself.

**Application services APIs**

Application services provide several APIs that you can use to perform tasks such as creating an application service or adding a CI or a connection to an application service. See [Use application services APIs](#) for details about all application service APIs.

**Service Mapping**

If activated, Service Mapping discovers application services and automatically populates application services with discovered application and host CIs. If Service Mapping is activated, then an application service can comprise of manually added CIs and Service Mapping discovered CIs. Service Mapping creates and updates application services by communicating with individual CIs in the CMDB and identifying connections between the CIs. Service Mapping stores information about discovered CIs and relationships in the CMDB.

**Event Management**

Application services are associated with a criticality level which determines the prominence of an application service on the Event Management dashboard. You can also use a criticality value to define recovery strategies. For more information, see [Define criticality for application services](#).

**Manually create an application service**

Create an application service that does not contain any CIs.

Role required: app_service_admin

An application service is a set of interconnected applications and hosts which are configured to offer a service to the organization. Application services can be internal, like an organization email system or customer-facing, like an organization website. Use application services to organize, maintain, and monitor services in your organization.

You can specify an owner for the application service. The application service owner is a user who is familiar with the infrastructure and applications making up the service. This user is the application service SME who provides information necessary for a successful creation of an application service.

An application service has an entry point, which lets users access the application service. If you are at the planning stage and do not know what the entry points are for an application service, you can create the application service without entry points. Such application service is referred to as an empty application service, to which you can add entry points at any later time.

Service Mapping, if activated, can automatically discover and map application services as described in [Application service mapping](#). A discovered application service contains the CIs and the connections between them that Service Mapping discovered and mapped.
All application services, both manually created and discovered by Service Mapping, are stored in the Application Service [cmdb_ci_service_discovered] table.

You can also create an application service by using the createOrUpdateService - POST REST API.

1. Navigate to Configuration > Application Services > Application Services.
2. Click New.
3. Specify the basic application service attributes.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the application service name. This name must be unique. Use self-explanatory names such as mailing service or printing service.</td>
</tr>
<tr>
<td>Owner</td>
<td>Select an owner who is responsible for this application service in the organization.</td>
</tr>
</tbody>
</table>

4. Optional: Add entry points:
   a) In the Add Entry Point section, fill out the form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Type</td>
<td>Select the CI type (CI class) for the CI you are adding. Every CI belongs to a CI type which contains a set of attributes configured for this kind of CI, for example, cmdb_ci_appl for applications.</td>
</tr>
<tr>
<td>CI Name</td>
<td>Select the CI from the list of CIs of the selected CI type.</td>
</tr>
</tbody>
</table>

   The CI type list includes only allowed CI types. For example, you cannot add an application cluster.
   b) Click Add.
   c) To add additional entry points, click Add Entry Point and fill out the necessary details.

5. Click Save.
   This application service is added to the Application Service [cmdb_ci_service_discovered] table.

Manually add CIs to an application service

Convert a business service to an application service

Unify the way you manage services in your organization by converting manually created records in the Service [cmdb_ci_service] table into application services. Using application services lets you view maps and change history for services. If Event Management is deployed, you can monitor service performance and identify health issues for application services.

Role required: app_service_admin

During conversion:

- The service record is moved from the Service [cmdb_ci_service] table into the Application Service [cmdb_ci_service_discovered] table by changing the record class.
- The application service is set with all the original business service attributes such as name, owner, and operational status.
The system adds related items from the business service to the converted application service, up to the specified level.

All connections created between CIs in an application service are of the **Depends on::Used by** relationship type. You can modify this default relationship type by changing the value of the `sa.it_service.manual_ci_rel_type` property.

The system queries the CMDB for the latest CI changes.

Event Management, if activated, applies CI impact rules to CIs that are associated with alerts and that are part of the application service. Event Management deploys CI impact rules for alert monitoring.

A conversion might involve adding CIs of the following CI types, which cannot be added to an application service:

- `cmdb_ci_endpoint`
- `cmdb_ci_translation_rule`
- `cmdb_ci_config_file`
- `cmdb_ci_qualifier`
- `cmdb_ci_application_cluster`

If the original business service contains related items belonging to these CI types, then the system does not add such CIs or connections coming from them. If necessary, you can prevent CIs of other CI types from being added to application services by modifying the `sa.mapping.user.manual.citype.blacklist` property.

In environments with domain separation, only CIs belonging to the same domain as the application service are added to the application service. If there is a domain hierarchy, CIs must belong to the same child domain as the application service.

1. Navigate to **Configuration > Business Services**.
2. Select the business service that you want to convert to an application service.
3. Click **Convert to Application Service**.
4. In the Converting to Application Service dialog box, select a number from the **Up to** list, as the number of levels of related CIs to include in the conversion.
   - The maximal number of levels is eight.
5. Click **OK**.

The system adds the CIs from the business service to the converted application service.

**Manually update an application service with changes from the CMDB**

Ensure that an application service is up-to-date and reflects all the latest changes to its configuration items (CIs). Regularly update application services to reflect any changes to CIs and their relationships in the CMDB.

Role required: app_service_admin

An example of a change is deleting CIs from the CMDB or connecting two CIs one of which is part of an application service. In the first case, your application service may show a CI that no longer exists. In the second case, on the contrary, the application service omits a CI.

There is no mechanism or an API that automatically updates application services that were created manually. Also, you may need to manually update application services discovered by Service Mapping, if they contain manually added CIs. You can only update application services which contain manually created entry points and which are not discovered by Service Mapping.

An update might involve adding CIs of the following CI types, which cannot be added to an application service:

- `cmdb_ci_endpoint`
ServiceNow    DocVersion    Now Platform capabilities

- cmdb_ci_translation_rule
- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

If necessary, you can prevent CIs of other CI types from being added to application services by modifying the sa.mapping.user.manual.citype.blacklist property.

All connections created between CIs in an application service are of the **Depends on::Used** by relationship type. You can modify this default relationship type by changing the value of the sa.it_service.manual_ci_rel_type property.

Also, the system can connect a CI from the application service only to actual CIs that exist in the CMDB, not a visualization of other items on the map like clusters or boundaries.

In environments with domain separation, only CIs belonging to the same domain as the application service are added into the application service. If there is a domain hierarchy, CIs must belong to the same child domain.

You can also update application services by using APIs.

1. Navigate to **Configuration > Application Services > Application Services**.
2. Alternatively, if Service Mapping is deployed, navigate to **Service Mapping > Services > Application Services**.
3. Select the application service that you want to update.
4. Click **Update with changes from CMDB** under Related Links.
5. Select a number in the **Up to** list to limit the number of levels of related items to be updated.
   
   If the specified number is higher than the number of levels of related items that already exist in the application service, then the system adds the missing CIs and their connections.

   **Warning:** Specifying a lower number than the number of levels that already exist in the application service, does not result in the removal of CIs from the application service.

6. Click **OK**.

   - The system updates the application service with the changes from the CMDB and shows them on the map.
   - After the update process is complete, the application service form opens.

**Manually add CIs to an application service**

Add configuration items (CIs) to manually created application services or to services discovered by Service Mapping.

- Verify that the CI type for the CI that you are planning to add, exists. If necessary, create the CI type as described in Create CI types for Service Mapping and Discovery.
- Add CIs to the CMDB for the device or application that you want to add, if necessary. See Populate the CMDB for more information.

Role required: app_service_admin or sm_admin

You can populate an application service that was created manually, by manually adding the CIs comprising it. Adding a CI to an application service requires creating a relationship between the new CI and a CI in the application service.

Information about the CI in application service, to which you are connecting a new CI, is updated in the CMDB. This information includes the type of the relationship between the CIs. If other application services
use the same applicative flow, the CMDB recognizes it and adds the CI you added manually to these application services by analogy. For example, you manually added an IBM WebSphere Message Broker to an IBM WebSphere HTTP Listener in the Bank Customer Portal service. The system also adds this IBM WebSphere Message Broker to the same HTTP Listener in the Bank Internal Portal, because it uses this HTTP Listener. The same logic applies when you remove a CI you added manually: The system removes it from all application services where you either manually added it or the system added it by analogy.

All connections created between CIs in an application service are of the Depends on::Used by relationship type. You can modify this default relationship type by changing the value of the sa.it_service.manual_ci_rel_type property.

You can manually connect a CI only to actual CIs existing in the CMDB, not to a visualization of other items on the map such as clusters or boundaries. Also, it is prohibited to add CIs of these CI types to an application service:

- cmdb_ci_endpoint
- cmdb_ci_translation_rule
- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

If necessary, you can prevent CIs of other CI types from being added to application services by modifying the sa.mapping.user.manual.citype.blacklist property.

In environments with domain separation, only CIs belonging to the same domain as the application service are added to the application service. If there is a domain hierarchy, CIs must belong to the same child domain as the application service.

If working with an application service discovered by Service Mapping, manually add a CI:

- To indicate that an application service contains a device or application, which Service Mapping cannot discover. For example, add an A/C unit to the Production Floor service.
- To add a temporary placeholder for a CI, which Service Mapping did not discover. In this case you are planning to perform necessary troubleshooting to ensure that Service Mapping discovers this CI in the future. For example, add an IBM WebSphere Message Broker to the Bank Customer Portal service.
- To create an application service that combines entry points and CIs automatically discovered by Service Mapping with entry points and CIs from the CMDB. After you manually add an entry point, you can update the application service with CIs from the CMDB based on the relationships defined there.

For additional information related to Service Mapping, see Pattern customization and Enable traffic-based discovery for CI types or specific CIs.

1. Navigate to Configuration > Application Services > Application Services.
2. Alternatively, if Service Mapping is deployed, navigate to Service Mapping > Services > Application Services.
3. Open the relevant application service map:
   a) Click View map next to the relevant application service.
   b) If needed, click Edit to ensure that the map is in Edit mode.

   If Service Mapping is deployed, then in Edit mode, the Discovery Messages section appears below the map.

4. To connect a CI to another CI on the map, right-click the CI to which you want to connect the new CI, and then select Add a CI.
5. In the Add A CI dialog box, specify the CI to add:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Type</td>
<td>Select the CI type (CI class) for the CI you are adding. Every CI belongs to a CI type which contains a set of attributes configured for this kind of CI, for example, <code>cmdb_ci_appl</code> for applications.</td>
</tr>
<tr>
<td>CI Name</td>
<td>Select the CI from the list of CIs of the selected CI type.</td>
</tr>
</tbody>
</table>

The CI type list includes only allowed CI types. For example, you cannot add an application cluster.

6. Click **Submit**.

The manually added CI appears on the map.

**Note:** When you manually add a CI, which is an application, as a child to a service that already includes its parent application CI, the newly added child application CI is hidden inside the inclusion. Click the plus (+) symbol next to the parent application CI to see the child application CI.

7. Optional: (If Service Mapping is activated) To add a discoverable outgoing connection for the manually added CI:
   a) Right-click the manually added CI.
   b) Select **Manually add a connection**.
   **Note:** If you do not see the **Manually add a connection** option in the right-click menu, check that you are logged in with the user that belongs to the same domain as the application service.
   c) Configure attributes for the entry point as described in **Entry points attributes**.
   d) Click **Submit**.

Discovery and Service Mapping attempt to discover this CI. If successful, the CI appears on the map. Otherwise, a warning icon appears.
8. Optional: (If Service Mapping is activated) If you want Service Mapping to automatically discover a CI, which you previously added manually:
   a) Customize the relevant pattern or fine-tune traffic-based discovery to enable Service Mapping to discover the CI.
   b) Navigate to the relevant application service map.
   c) Click **Run discovery**.
   d) After the discovery process finishes, verify that Service Mapping discovered the CI by checking the connector leading to the CI. If Service Mapping discovered the CI, then two connectors, a manual and automatically discovered, appear for the CI.
   
   ![Image of a service map with connectors]

   e) Right-click the CI you added manually.
      In the example, it is IBM WebSphere Message Broker.
   
   f) Select **Remove manually added CI**.
      The map shows the CI with only one connector leading to it. If this CI had any manually added connections, they are removed together with the manually added CI.
**Link application services**

You can manually add to one application service a reference to another application service. Ensure that you know the name of the application service that you want to add a reference to.

Role required: app_service_admin or sm_admin

An application service can be part of another application service, in which case you can link one to the other. To link, edit an application service, and add a reference to another application service as an outgoing connection of the relevant CI inside the other application service.

When you link an application service to another application service, the information about the CI, to which you linked the service, is updated in the CMDB. The CMDB recognizes other application services that use the same applicative flow, and adds the application service you linked to these application services by analogy. The same logic applies when you remove a linked application service: The system removes it from all application services where you either manually linked this service or the system linked this service by analogy.

When using Service Mapping, you may want to link application services to create:

- A link between two discovered services.
- A placeholder for a map branch that Service Mapping failed to discover. If you modify or add a pattern that can discover the configuration item (CI) serving as an entry point for the linked application service, Service Mapping can discover this linked service.
- An indication that an application service contains a branch, which Service Mapping cannot discover.
You can link application services to one another to create dependencies for impact monitoring in Event Management.

1. Navigate to Configuration > Application Services > Application Services.
2. Alternatively, if Service Mapping is deployed, navigate to Service Mapping > Services > Application Services.
3. Click View map next to the application service which you want to link to another application service.
4. Right-click the CI to which you want to link an application service as a reference.
5. Select Add A CI.
6. In the Add a CI dialog box, select the application service you want to add as a reference:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Type</td>
<td>Select Application service from the list.</td>
</tr>
<tr>
<td>CI Name</td>
<td>Select the name of the application service that you want to link as a reference.</td>
</tr>
</tbody>
</table>

7. Click Submit.
   The icon for the linked service appears on the map.

Navigate to the linked application service, and double-click its icon on the map. The map window shows the linked application service.

Service maps contain no indication of transferred services being linked to their original services. You may need to know if a service is a part of another, larger service when dealing with changes or incidents. Use the updateset to add the ability to view the list of all application services that contain a certain service as a link, as described in KB0748865:Viewing list of application services that contain a certain service as a link.

**Group application services**

Organize application services by groups to perform actions simultaneously on multiple services, and to control user access to services. You can use Event Management to track service health by service groups.

Role required: sm_admin or app_service_admin

Typically, enterprises have hundreds of services which makes it impractical to manage them individually. Service groups can make service lists much shorter and easier to manage, especially in large organizations or service providers.

How you group application services depends on the user and on service provisioning policies in your enterprise. The relation between application services in groups is purely logical and the same application service can belong to multiple groups. For example, the Mobile service can be part of the following service groups: sales, Beijing, and telephony.
Example of an application service belonging to different groups

You can embed a service group within another service group to create a hierarchy of service groups. If users have access to a parent service group, they automatically have access to all its child groups. By default, all new services are assigned to the All service group that lets all users view and manage application services. When you assign a role to a service group, the users with this role can access application services in this service group and in the All service group. To enable users with this role to access other services, assign this role to the respective service group. Do not assign user roles directly to the All service group.

If Service Mapping is activated, service groups can contain a mixture of manually created application services and application services discovered by Service Mapping.

You can use Now Platform Notifications to alert users if the service group severity changes to critical. The overall severity of the group is determined by the highest alert severity within the group.

1. Navigate to Configuration > Application Services > Service Groups. Or, if Service Mapping is activated, navigate to Service Mapping > Services > Service Groups.
2. Click New.
3. Enter the name of the new application service group in the Name field.
4. To embed this group in another group, enter the name of the other group in the Parent Group field.
5. Right-click the form header and click Save.
6. Add an application service to the newly created service group.
   a) In the Service Group Members section, click **New**.
   b) In the **Name** field, enter the name of the application service. If you are using Event Management, you can also enter an alert group name.
   c) Click **Submit**.

7. Alternatively, add an application service to a group from the application service form.
   a) Navigate to **Configuration > Application Services > Application Services**.
   b) Select the application service you want to add to a service group.
   c) In the **Service Group Members** section, double-click **Insert a new row**.
   d) Enter the name of the service group to which you want to add the selected application service.
   e) Click the **OK** icon (✔).
   f) Click **Update**.

Control user access to application services

Assign user roles to service groups to grant users access to application services in your organization. Your organization may restrict access to some services for security or secrecy reasons.

Make sure that you have performed the user provisioning tasks for the users you want to grant access:

1. Add users to user groups.
2. Create new roles.
3. Assign roles to users or user groups.

Also, make sure that you have created service groups as described in **Group application services**.

Role required: app_service_admin or sm_admin

In the base system, the following roles provide access to application services:

**app_service_admin**

Creates and modifies application services, creates service groups, views, and edits application service maps.

**app_service_user**

Views application service maps. The itil role that serves as the basic helpdesk technician role contains the app_service_user role.

Service Mapping provides these preconfigured roles:

**sm_admin**

Sets up the Service Mapping application. Maps, fixes, and maintains application services. Also performs advanced configuration and customization of the product. Assign this role to application administrators.

**sm_user**
Views maps for operational application services to plan change or migration, as well as analyze the continuity and availability of services. Assign this role to application users.

**sm_app_owner**

Provides information necessary for successful mapping of an application service. Once a service is mapped, this user reviews the results and either approves it or suggests changes. Assign the sm_app_owner role to users who own application services and are familiar with the infrastructure and applications that make up the services.

Event Management provides these preconfigured roles:

**evt_mgmt_admin**

Has read and write access to all Event Management features to configure Event Management.

**evt_mgmt_operator**

In addition to the evt_mgmt_user permissions, can also activate operations on alerts such as acknowledge, close, open incident, and run remediations.

**evt_mgmt_user**

Has read access to all Event Management features. Has write access to alerts to manage the alert life. Has the itil role to be able to manage incidents that are created from alerts.

**evt_mgmt_integration**

Has create access to the Event [em_event] and Registered Nodes [em_registered_nodes] tables to integrate with external event sources.

Typically, enterprises have hundreds of services which makes it impractical to manage them individually. Service groups can make service lists much shorter and easier to manage, especially in large organizations or service providers. In a hierarchy of service groups, access to a parent service group automatically grants access to all the child service groups.

Users inherit permissions from roles that are assigned to them. You can assign some roles directly to service groups to allow all users with this role to access all application services belonging to this group. However, most enterprises choose to organize their roles as a hierarchy. It helps to manage roles across multiple ServiceNow applications. For example, the Service Mapping administrator [sm_admin] can be part of a broader administrator role like administrator [admin]. You can add users to user groups and then assign roles to the user groups to give permissions of this role simultaneously to all the group users.
Assigning a role to an application service group

By default, all new services are assigned to the All service group that lets all users view and manage application services. When you assign a role to a service group, the users with this role can access application services in this service group and in the All service group. To enable users with this role to access other services, assign this role to the respective service group. Do not assign user roles directly to the All service group.

**Note:** Some references in the user interface to business services are actually references to application services.

1. Navigate to either of the following:
   - Configuration > Application Services > Service Group Responsibilities.
   - If Service Mapping is activated: Service Mapping > Services > Service Group Responsibilities.
   - If Event Management is activated: Event Management > Services > Service Group Responsibilities.

2. Click **New** and fill out the Business Service Group Responsibilities form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business Service Group</td>
<td>Service group to which you want to assign a role.</td>
</tr>
<tr>
<td>Role</td>
<td>Role you want to assign to the selected service group. For example, financial_services_admin.</td>
</tr>
</tbody>
</table>
3. Click **Submit**.

To manage access to services that contain sensitive financial information in your organization:

1. Organize the services into the Financial Services group.
2. Create a new user role, financial services administrator \( \text{[financial\_services\_admin]} \) role, that contains the \( \text{[app\_service\_admin]} \) role.
3. Assign the Financial Services administrator role to the Financial Services group.

As a result, only users with the Financial Services administrator role can access application services belonging to the Financial Services group.

**View an application service map in base system**

An application service map provides a visualization of data for the CIs comprising an application service, and the relationships and connections between these CIs.

Role required: \( \text{app\_service\_user} \) to view the map in View mode, and \( \text{app\_service\_admin} \) to modify services in Edit mode.

When you create an application service, the system generates an associated application service map. The system then updates the map to reflect any changes to the application service. This map consists of icons representing CIs and arrows that represent the connections between them.

If Service Mapping is deployed, see Application service maps and View CI connection attributes in an application service map for more details.

To open an application service map, navigate to Configuration > Application Services > Application Services and then click the View map link. You can then perform any of the following operations.

- Click on the windows bar to navigate to a different application service.
- Use the navigation tools to increase or decrease the view of the map and to move the map on the page. You can also click anywhere on the map area and drag a segment of the map into the visible area.
• View changes: You can view changes and change records associated with the application service as a whole or with any of its CIs, within a time range. For more information, see View the change history of application services.

Records under the Change tab underneath the map, which are associated with a selected CI or connection, are highlighted. If you select a change record under the Change tab, then the associated CI icon appears yellow on the map.

• View attributes: When you select a device, application, or connector on the map, it appears in blue and its attributes appear in the Properties pane on the right of the map. When nothing is selected on the map, the details of the application service itself appear on the Properties pane.

• Open the CI's form for further details by clicking Detailed Properties at the bottom of the Properties pane.

• Click Edit or View to switch the map mode. Edit mode lets you add or remove CIs from the map.

• Click for Additional actions:

  • Set Group CIs on map: Simplify maps by grouping 10 or more CIs belonging to the same type and hosted on servers sharing prefix and domain name.
  
  • Set Spanning tree view: Simplify the map by organizing CIs into a tree structure and hiding some connection lines. This option is especially useful for very large maps.
  
  • Map Indicators: Show additional information for a CI or for the application service itself by displaying related records such as alerts, outages, incidents, and problems. For each indicator that is enabled, the corresponding indicator icon appears next to CIs with associated records, and the corresponding tab appears underneath the map. If a record is associated with the application service itself, the indicator appears next to the application service name.

  For information about managing map indicators, see Create or modify map indicators. For more general information, see Event Management Map Indicators (Video).

• Export to PDF: Export the map to a .PDF file which you can then share as needed. After the PDF file is ready, click to download the PDF file to your local drive.
• View the details of a connection.

By default, connection lines for the same CI on an application service map, are merged. This merge reduces clutter on the map and helps to make the map more readable. For a merged connection line, you can view details for all the underlying connection lines.

• To view the source and target CIs of a connection, right-click a connection line.

If spanning tree view is enabled:
  1. Click the CI whose connections you want to view to show all the concealed connections for the CI.
  2. Right-click one of the connection lines.

• To view properties of a connection, click a connection line. For manually added connections, Endpoint Type is Manual Endpoint.

• To view properties of a connection within a merged connection:
  1. Right-click the merged connection line.
  2. Select one of the connections.
3. Select Select edge.

You can change the details that appear in the Properties pane by updating the form view 'Form view and section', as described in Configuring the form layout.

**View CI attributes in an application service map**

An application service map displays attributes for each configuration item (CI) that is part of the application service, as well as for the application service itself. The attributes come from the CMDB.

Role required: sm_admin or sm_user

You can view the following information for each CI:

**Name label**

The CI name. This attribute is either preconfigured on the CI or configured during CI installation.

**Basic attributes**

A summary of the most important CI attributes.

**Detailed attributes**

A complete list of all attributes collected for the CI.

Each CI type (CI class) has different attributes. For example, the Linux Server type has different attributes than the SQL Instance type.

If Service Mapping is deployed, the way CIs appear on the map depends on the view you select for the map. Attributes available for viewing also depend on the Service Mapping setup. For more information see description of components installed with Service Mapping.

The following user interface screens refer to application services as business services: Business Service Group Responsibilities, Approve, Service Mapping Properties, and Service Map Planner.

1. Navigate to Configuration > Application Services > Application Services.
2. Alternatively, if Service Mapping is deployed, navigate to Service Mapping > Services > Application Services.
3. Click View Map next to the relevant application service.
4. To see the full name of a CI whose name has been shortened on the map, point to the CI. A tooltip displays the full CI name.
5. Click a CI to see its details in the **Properties** pane. The attributes of applications and the servers that host them appear separately.

![Diagram of CI properties view](image)

6. To view more detailed attributes for the CI, click **Detailed properties** at the bottom of the Properties pane.

7. Optional: (If Service Mapping or Discovery are enabled, and if tracking changes to configuration files is enabled for a CI) To view configuration files associated with a CI:
   - Review the list of files under **Tracked Files** in the **Properties** pane. Click the file name to open the actual file.
   - Click the **Affected CIs** tab and view the list of configuration files. Click the file name to open the actual file.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
View the change history of application services

You can view changes made to an application service as a whole and to the individual configuration items (CIs) comprising the service. Change history is useful for maintenance, planning, or troubleshooting procedures.

Role required: admin, sm_admin, sm_user, app_service_admin, or app_service_user

Details about changes to an application service and to its CIs is stored in the CMDB. Typically, these changes reflect adding or removing CIs from an application service, upgrading or updating CIs, or modifying CI configuration files. The system gathers this data by querying CMDB tables and then creating the change history view. In deployments where Service Mapping is activated, the type of change information Service Mapping queries depends on discovery patterns that Service Mapping uses to discover CIs.

Changes to configuration files are associated with CIs to which these files belong. Maps show configuration file changes as changes to related CIs.

While you can see change records for a specific CI in the context of application services, you can also see detailed history of a specific CI separate from its application service as described in History Timeline.

If the is configured to validate changes, all changes are evaluated and rendered as valid or not. If a change is valid, its change record on the application service map is marked as approved. For more information about configuring the platform for change validation, see Managing proposed changes.

Changes to the application service appear on the history timeline.

The type of change mark depends on the nature of changes that it represents:

Light gray balloon

Unapproved change that does not influence the application service behavior. For example, a change in a network path or adding a node to a cluster.

Dark gray balloon

Unapproved change that changes the application service behavior.

Green balloon

An approved change in deployments where the is configured to validate changes.
Double balloon

Multiple separate changes that happened a short time from each other.

You can mark times on the history scale by creating baselines to quickly return to the marked view.

The following user interface screens refer to application services as business services: Business Service Group Responsibilities, Approve, Service Mapping Properties, and Service Map Planner.

1. Navigate to Configuration > Application Services > Application Services.
2. Alternatively, if Service Mapping is deployed, navigate to Service Mapping > Services > Application Services.
3. Click View map for the application service for which you want to see change history.

Actions or map elements which are relevant only for application services discovered by Service Mapping, do not appear on maps for manually created application services.

The Changes tab at the bottom of the page shows all change records created for this application service.

4. On the history timeline, set the time range of changes that you want to view.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>To set the time range of the history timeline</td>
<td>Click the hour, day, week, or month icons.</td>
</tr>
<tr>
<td>To increase or decrease the time range</td>
<td>Click the zoom in and zoom out icons.</td>
</tr>
<tr>
<td>Option</td>
<td>Action</td>
</tr>
<tr>
<td>----------------------------------------------------------------------</td>
<td>--------</td>
</tr>
<tr>
<td>To change the upper limit on your history range</td>
<td>Click the history scale.</td>
</tr>
</tbody>
</table>

The time that serves as the upper limit appears above the history timeline.

**Note:**
You cannot set the lower limit on your history range to a time before this application service was created. This time is marked with the **IT Service Created** event on the history timeline.

The map shows the history view of the application service for the time you selected.

**Note:** The **Change** tab shows all change records, even the ones which are filtered out of the history view.
5. To mark a time on the time scale, set a baseline:
   a) Click the **Compare** icon.
   b) Navigate to the time you want to mark as a baseline on the history scale.
   c) Click **Set baseline**.
   d) Enter the name of the baseline and click **OK**.
      The new baseline appears as a button above the history scale and as a blue flag on the history scale.
6. **View the change history:**

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>To see the CI responsible for a change record</strong></td>
<td>Select a change record on the <strong>Changes</strong> tab. &lt;br&gt;The related CI is marked yellow in the map.</td>
</tr>
</tbody>
</table>

---

![Change History](image-url)
<table>
<thead>

</table>
| To see the configuration file at the selected moment in the past | a. Set the time on the history scale.  
b. In the Properties pane, scroll to Tracked Configuration Files, and click the file name. The new tab opens displaying the content of the tracked configuration file at the selected time. |
7. To exit the history view and see the current status of the application service, click the current icon.

Compare two versions of an application service

You can see a summary of application service changes at a glance by comparing two versions of an application service. This feature is useful for checking the application service status before and after a certain change or problem.

Role required: admin, app_service_admin, app_service_user, sm_admin, or sm_user

Specify two points in time for which to compare the two versions of an application service. You can use the change indicators on the timeline to specify one point in time that is before and another that is after a change for which to see the details. For example, if you know that the application service started to fail at a certain time, you can compare two versions of the application service, one before and one after the problem started. This comparison lets you see the summary of changes that possibly led to the problems.

Service Mapping, if deployed, tracks and shows all changes to a CI including configuration files associated with a CI. When you compare two versions of an application service, you can see changes made to configuration files as changes to CIs. You can also compare two versions of a configuration file to see the actual changes in the files, during the time range specified for the comparison.

The following user interface screens refer to application services as business services: Business Service Group Responsibilities, Approve, Service Mapping Properties, and Service Map Planner.

1. Navigate to Configuration > Application Services > Application Services.
2. Alternatively, if Service Mapping is deployed, navigate to Service Mapping > Services > Application Services.
3. Click View Map next to an application service.
4. On the history timeline, set the time range of changes that you want to view.

Option | Action
--- | ---
To see network at the selected moment in the past | a. Set the time on the history scale.
b. Right-click the connection and select Show network path.
The new tab opens displaying the network or storage path map for the time you selected.

Note: You cannot view the network path for connections marked as boundaries to this application service.
<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>To increase or decrease the time range</td>
<td>Click the zoom in and zoom out icons.</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Zoom Icons" /></td>
</tr>
<tr>
<td>To change the upper limit on your history range</td>
<td>Click the history scale.</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="History Scale" /></td>
</tr>
</tbody>
</table>

The time that serves as the upper limit appears above the history timeline.

**Note:**
You cannot set the lower limit on your history range to a time before this application service was created. This time is marked with the **IT Service Created** event on the history timeline.

The map shows the history view of the application service for the time you selected.

**Note:** The **Change** tab shows all change records, even the ones which are filtered out of the history view.

5. Click the **Compare** icon.
6. Set **Compare point 1** and **Compare point 2** as the two points in time for the comparison.
   You can drag the pointers on the history scale to set corresponding time points.

   ![Comparison Interface](image)

   If the history scale does not include the time set for comparison, then its corresponding pointer appears next to the compare point in yellow:

   ![Comparison Interface](image)

   **Note:** If there are no changes to the service during the time interval specified by **Compare point 1** and **Compare point 2**, then no change details are displayed.

7. Click **Compare**.
   The comparison view opens in a separate tab.
8. Select a marked CI to see the relevant change record on the Changes tab.
9. Optional: If Service Mapping is deployed, you can compare two versions of a configuration file that appears on the map as Updated:
   a) Select the CI that is associated with the updated configuration file.
   b) In the Properties pane, click the link to the updated file.

   ![Image showing Service Mapping and Tracked Configuration Files]

   The **Tracked Configuration Files Version Compare** tab opens showing two versions of the configuration file side by side.

   c) Review actual changes.
      
      Highlight colors indicate the type of change:
      
      - Purple — Updated line
      - Pink — New line
      - Gray — Deleted line

   d) Navigate between the changes using the arrows in the upper right corner.

   e) Close the **Tracked Configuration Files Version Compare** tab when finished.
10. Close the comparison view when finished.

**Use application services APIs**

Application services provide APIs that let you perform operations such as creating and updating an application service, populating it with CIs from the CMDB, and retrieving details from an existing application service.

Role required: app_service_admin

An application service is a set of interconnected applications and hosts which are configured to offer a service to the organization. Application services can be internal, like an organization email system or customer-facing, like an organization website.

**Create an application service**

Using the `createOrUpdateService` - POST REST API to create an application services suits your organization if the ServiceNow CMDB already contains the CIs making up the service. Typically, it is the case when you have manually added CIs directly into the CMDB, or used the Discovery application to discover CIs and store information about them in the CMDB. You can also use this API to create application services containing CIs discovered using non-ServiceNow applications.

By default, when an application service is created, all CI connections are of the **Depends on:**-**Used by** relationship type. You can modify this default type by changing the value of the `sa.it_service.manual_ci_rel_type` property.

Before creating an application service, ensure that:

- The CMDB contains all the CIs comprising the application service.
- You have the `sys_id` of each CI comprised in the application service you want to create.
- You understand the hierarchy that the CIs form.

The Application Service `[cmdrb_ci_service_discovered]` table contains all application services including services you create using APIs.

You can also manually create application services using the user interface as described in Manually create an application service.

**Retrieve content from an application service**

Use the `getContent` - GET REST API to retrieve a list of CIs and the relationships between them, for an application service that was created manually.

**Additional APIs**

The following JavaScript APIs are also available:

- `addCI()`: Add a CI to a manually created an application service.
  
  For restrictions on the CIs being added and other details about adding CIs to application services, see Manually add CIs to an application service.
- `addManualConnection()`: Add a manually created connection to an application service.
- `migrateManualToApplicationService()`: Convert a manual service to an application service.
- `populateApplicationService()`: Populate an application service with CIs and relationships from the designated entry point.
• `removeCI()`: Remove a manually created CI from an application service.
• `removeManualConnection()`: Remove a manually created connection and the connected CI from an application service.

**Components installed with application services**

Several types of components are installed with activation of the Application Service [com.snc.cmdb.it_service] plugin, including tables, user roles, and scheduled jobs.

**Note:** The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

**Baseline CMDB**

CMDB baseline provides capabilities that help you understand and control the changes that have been made to your configuration items (CIs) in the CMDB.
• You can create a baseline, which is a snapshot of your configuration items in the CMDB. You can review the changes that have been made to that configuration item since a previous baseline. Multiple baselines may be created and the system tracks the changes that have been made per baseline.

Creating a baseline captures the attributes of the CI as well as all first-level relationships for the CI. Any changes to the base CI or to any related CIs are captured and displayed. Newly created CIs are not automatically added to a baseline.

• Associate a configuration item with a task, a change or change task, and to propose changes to the CI after the change is complete. You can record changes, and these changes are not applied to the CI immediately but are delayed until the change is complete.

When the change is complete, you can choose to apply the proposed changes which makes all changes previously proposed and associates the changes with the task.

Create a CMDB baseline

You can create a baseline for a CI to track updates to the CI over time.

Role required: ecmdb_admin and itil

1. Navigate to Configuration > Baselines > Baselines.
   If the Baselines module is not visible in the Configuration application, the module is inactive. In that case append /sys_app_module.do?sys_id=f4463879a9fe3dba01b30bc100cbf404 to the instance URL, and in the Module - Baselines form, ensure that the module is Active.
2. Click New.
3. Enter a Name for the baseline.
   By default, the cmdb_ci table is selected so that the record creates the baseline for all configuration items in the system.
4. Optional: To limit the baseline to specific CIs, select a different Table or choose Conditions that a CI must meet for it to have a baseline entry.
   For example, you might create a baseline for the Database table with the condition [Location] [is] [configured location].
5. Click Submit.
   The creation of a baseline is time consuming and occurs in the background. A message at the top of the record list notifies you that your baseline has been scheduled and you will receive an email when the process is complete.

Display baseline differences

You can see the changes that have been made to a CI or any first level related CIs by configuring the CI form layout to display the CMDB Baseline diff field. This field is labeled Baseline differences on the form.

Role required: itil

Changes are displayed only for the cmdb_ci table and child tables. You can change the com.cmdb.baseline.max_changes system property to limit the number of relationships and changes that appear in a baseline diff section on a CI form (set to 100 by default).

1. Open a CI record.
2. Select the baseline you want to see for this CI from the choice list. The field displays the details of any changes that were made to the current record for the selected baseline, or indicates that no changes were made.

<table>
<thead>
<tr>
<th>Details of baseline differences</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Baseline differences</strong></td>
</tr>
<tr>
<td><strong>Basic attribute changes</strong></td>
</tr>
<tr>
<td><strong>2009-09-14 14:46:49</strong></td>
</tr>
<tr>
<td>System Administrator</td>
</tr>
<tr>

</tr>
<tr>
<td>RAM (MB): 4 was: -1</td>
</tr>
<tr>
<td>Disk space (GB): 500 was: 100</td>
</tr>
</tbody>
</table>

3. To add a relationship to the CI, click the green plus icon in the Related Items toolbar. The new relationship appears below the toolbar. For more information about the Related Items toolbar and how to control the display, see CI relations formatter.

4. Update a related CI and see the changes displayed as Basic attribute changes in the current CI record.

<table>
<thead>
<tr>
<th>Details of baseline differences</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>RAM (MB): 4 was: -1</td>
</tr>
<tr>
<td>Disk space (GB): 500 was: 100</td>
</tr>
</tbody>
</table>

### Properties for baseline CMDB

Use the baseline CMDB properties to configure how many changes and relationships for a CI can appear in the baseline diff for the CI.

These properties are available for baseline CMDB. To view and edit these properties, the admin role is required.

**Properties for Baseline CMDB**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum number of changes and relationships for a CI that can appear in the baseline diff for the CI. | - Type: integer  
- Default value: 100  
- Location: Configuration > CMDB Properties > Baseline Properties |
Managing proposed changes

The proposed changes feature allows you to pre-configure changes to configuration items and their associated relationships. These pre-configured changes are prepared to be implemented, but do not actually happen until they are applied at a later time.

When you view a CI, the proposed changes can be displayed so that you can see what is planned.

This feature is useful when you want to make modifications while a change process is in the approval stage, and only implement the changes after the approvals are complete. If the change is never approved, no changes to records have to be reversed. If the change is approved, a quick command applies all the proposed changes.

You can make the following proposed changes to a CI:

- Modify any field on the CI form.
- Add or delete a relationship to that CI.

To modify a relationship, you must delete the current relationship and add a new relationship. You cannot delete a proposed change.

View CI history

You can view the history of changes to a CI in a list, calendar, or timeline format.

View the proposed changes of a CI

You can view the proposed changes so that you can see what is planned for the CI.

Role required: personalize_form

To view any proposed changes, configure the CI form layout to display the CMDB Scheduled Changes field. Proposed changes are not displayed in a CI form by default.

1. Navigate to Change > Open and open a change request.
2. In the Affected CIs related list, open the Configuration Item.
   You may also navigate directly to the CI form.
3. Right-click the form header bar.
4. Select Configure > Form Layout.
5. Move the CMDB Scheduled Changes field to the Selected pane.
6. Click Save.
   The CI form shows the details of any proposed changes in the Scheduled changes area.

Add a proposed change to a CI

Proposed changes to a CI can be made while viewing a change request or any task-related record.

Role required: itil

1. In the Change Request form, go to the Affected CIs related list.
   If there are no CIs in the Affected CIs list, click Edit to add CIs that are affected by this change request.
2. Right-click the CI that you want to configure for a proposed change, and select Proposed Change.
3. Complete the form to make the proposed changes, and click Save Proposed Change.
   Click Update to apply the changes immediately. Click Delete to delete the CI.
4. To propose an addition or a removal of a CI relationship:
   a) Click the plus icon in the Related Items section.
   b) In the Relationships section, add or delete a relationship. For information about using the
      relationship editor, see Create or edit a CI relationship.
   c) Click Save Propose Change.
   d) Confirm saving the proposed change.

   Click Update or Delete to commit the changes immediately.

   **Note:** Use only with CI relationships. Proposing additions or removal of relationships is not
   valid for user relationships and group relationships.

After the proposed changes are saved, the Apply Proposed Changes button appears on the Change Request form. This button lets the user commit the proposed changes to the CI. Your business processes determine the appropriate time to commit the changes. The CI retains the existing data until the proposed changes are committed. However, users can see that changes have been proposed.

**Apply a proposed change to a CI**

When you apply the proposed changes, all the proposed changes for that change request are applied to the configuration item. You can apply proposed changes without verification, or if verification tests of the proposed changes have failed.

Role required: itil

After you apply the proposed changes, the Scheduled changes part of the form displays No scheduled changes found. You can configure proposed change verification rules which you can use to verify proposed changes before applying the changes.

1. Navigate to the Change Request form.
2. Click the Apply Proposed Changes button.

   You may have to right-click the form header and select the Reload Form option to see the changes.

**Create or edit a proposed change verification rule**

Ensure that proposed changes meet business requirements and do not introduce invalid data to the CMDB, create a rule that includes a script to verify the proposed changes.

Role required: asset or itil

When you configure proposed change verification rules for a CI, you have an option to verify that the proposed changes pass the verification test script in the rule. The verification test results are logged as passed or failed, and you can view the results. Running the verification test is not mandatory, and a failed verification test does not prevent you from applying proposed changes.

1. Navigate to Configuration > Change Verification > Proposed Change Verification Rules.
2. Click New or select an existing rule to edit.
3. Fill in the fields, as appropriate.

**Proposed Change Verification Rules form**

<table>
<thead>
<tr>

</tbody>
</table>
|                 | ```java
|                 | validateRule()
|                 | {                     
|                 |   var os =
|                 |   current.getValue("os");
|                 |   var cpu =
|                 |   current.getValue("cpu_count");
|                 |     //Use
|                 |     current.getValue(fieldName)
|                 |     to get the proposed
|                 |     change value, eg. var os =
|                 |     current.getValue("os");
|                 |     //Your verification code
|                 |     if (os != "SunOS" || cpu < 2)
|                 |     return false;             
|                 |     //Return true to pass the
|                 |     verification and false if the
|                 |     verification failed
|                 |     return true;             
|                 | }                           |

4. Click **Submit** or **Update**.

On the **Change Request** form, you can click **Verify Proposed Changes** to verify proposed changes for the affected CIs.

**Verify proposed changes**

Before applying proposed changes to affected CIs, use proposed change verification rules to verify that the changes meet business requirements and do not add invalid data to the CMDB.

Create or edit the rules used to verify proposed changes. For details, see [Create or edit a proposed change verification rule](#).

Role required: none

You can apply proposed changes even if they are unverified or fail a verification test.

1. Open the **Change Request** form that affects the CI.
2. Click **Verify Proposed Changes**.
   - The proposed changes are verified against any proposed change verification rules in which the CI meets the **Filter condition** criteria.
3. Review the message that appears at the top of the form after the verification process is finished.
   - The message states whether the verification tests passed or failed.

To view the details of any verification tests that were performed for the change request in the past two days, click the **Proposed Change Verification Log** related link.
Create or edit a planned change validation script

Create a custom script that checks if a change to a class was valid according to business requirements, and whether the change was planned or not. A planned change validation script is used whenever a CI change is viewed in the CI timeline or change history.

Role required: admin or itil

The system attempts to validate each CI change as follows:

• If a custom script exists for the CI or one of the CI parents, then the script is executed and the results are used to flag the change as valid or invalid. Parent CIs are examined in the hierarchical order.
• If a custom script does not exist for the CI or any of its parents, then a predefined validation script is used. The change is determined as a planned change if the change occurred between the Work start and Work end dates of the change request associated with the changed CI.

However, this check is not always reliable because a user might have manually modified the CI within the work dates, which flags the change as valid even if it is invalid.

The script needs to return a boolean, true or false, which depends on meeting the test criteria in the script. You can define a separate script for each CI class, and you can define multiple planned change validation scripts for a single class. For example, to maintain different versions of the script. Only one script can be active for a CI class at any given time.

These are the parameters that uniquely characterize a change:

• The fields that were changed
• The data source that performed the change
• The time stamp of the change

To correctly determine the validity of a change, examine the parameters and apply business logic to evaluate if the validation tests are met. A planned change validation script can test any of these characteristics and determine when a change meets pre-established criteria. For example, the custom script can check if the mode of the CI is operational or maintenance, or who initiated the change.

1. Navigate to Configuration > Change Verification > Planned Change Validation Script.
2. Click New or select a validation script to edit.
3. Complete the form.

Planned change validation script form

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box to activate this script for validating changes.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Class that this script applies to.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to run to validate a change. If the script does not return a boolean value, then it is configured to false.</td>
</tr>
</tbody>
</table>

The script has a template which displays the input variables of the script.

Template script input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>current</td>
<td>GlideRecord</td>
<td>Current record that is being processed.</td>
</tr>
<tr>
<td>Variable</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------</td>
<td>-----------------------------------------------------</td>
</tr>
<tr>
<td>updatedOn</td>
<td>GlideDateTime</td>
<td>Time stamp of the change.</td>
</tr>
<tr>
<td>updatedBy</td>
<td>String</td>
<td>Entity responsible for the change.</td>
</tr>
<tr>
<td>fieldsChanged</td>
<td>String</td>
<td>Comma-separated list of the names of all fields that were changed.</td>
</tr>
</tbody>
</table>

This sample script checks who initiated the record update. It returns true if admin initiated the record update. Otherwise, the script returns false.

```javascript
isValidChange();

function isValidChange(/*GlideRecord current, GlideDateTime updatedOn, String updatedBy, String changedFields*/) {
    // Return true if the user that updated the record has an admin role
    return isUserAdmin(updatedBy);
}

function isUserAdmin(userName) {
    var grUser = new GlideRecord("sys_user");
    grUser.addQuery('name', userName);
    grUser.query();
    if(grUser.next()) {
        var roles = new GlideRecord("sys_user_has_role");
        roles.addActiveQuery();
        roles.addQuery('user', grUser.sys_id);
        roles.query();
        while(roles.next()) {
            if(roles.role.name == 'admin')
                return true;
        }
    }
    return false;
}
```

4. Click Submit.

### CI relationships in the CMDB

The CMDB, in contrast to a static asset list, helps you track not only the configuration items (CIs) within your system, but also the relationships between those items.

A relationship in the CMDB consists of two CIs and a relationship type:

- Parent CI
- Child CI
- Type of the relationship that links both CIs

For example, in the [Server1] [Managed by] [Server2] relationship:

- Server1 is the child CI
- Server2 is the parent CI
• [Managed by] is the relationship type

For example, a web application might read data from an instance of Oracle, which in turn might depend on a piece of underlying hardware. Most CIs in a CMDB have multiple relationships to other CIs, users, and groups.

The relationships between CIs can be automatically discovered. If you use Discovery, many relationships can be automatically loaded into the system through the discovery process. If you import your data from another system, you get some form of relationships.

You can add to automatically discovered relationships, create relationships, or edit relationships for a CI by launching the CI relationship editor from the CI form.

Dependent and non-dependent relationships

Dependent relationships, such as tomcat RunsOn Hardware, are used by the Identification and Reconciliation Engine (IRE) to identify dependent CIs. Dependent relationships should not be directly deleted because they are used for CI identification.

Non-dependent relationships are not used for CI identification, and therefore can be deleted if no longer needed.

Suggested class relationships

The system keeps a table (Suggested Relationship [cmdb_rel_type_suggest]) of relationship types that are appropriate for a CI type, based on its class. You can manage suggested relationships by navigating to Configuration > Suggested Relationships, or in the CI Class Manager.

Suggestion model

The relationship editor has a base CI. The base CI designates the CI that a user was on before launching the editor, as the base CI in the new relationship. If you launched the relationship editor from the Inx100 CI, then Inx100 becomes the base CI. Also, every CI in the system has a type (class). For example, bond Inx100 is of the Linux server type.

Many CI types are children of other types in the hierarchy. For example, the class hierarchy for a Linux server is:

```
cmdb_ci -> cmdb_ci_computer -> cmdb_ci_server -> cmdb_ci_linux_server
```

The suggestion model works by analyzing the suggested relationship table for all relationships whose base class is the current base class of the user or any one of its parent classes. For example, looking at a Linux server, the suggestion model would retrieve any relationships whose base class was:

```
cmdb_ci_linux_server, cmdb_ci_server, cmdb_ci_computer, or cmdb_ci
```

The system automatically adds relationships that are used in Service Mapping and Discovery (if activated), to the Suggested Relationship table.

Suggested CI relationships in the relationship editor

The CI relationship editor uses the suggestion model to help users select reasonable relationships for configuration items.

For example, consider these relationship types in the system:

• Provides Power for :: Receives Power From
• Runs on :: Hosts

Typically, a user uses these relationships to define the following reasonable relationships between two items as follows:
• a database runs on a server
• a rack provides power for a server

Typically, neither of the following definitions would be appropriate:
• a rack runs on a server
• a server runs on a database

**Add a suggested relationship**

Add a suggested relationship for a class. The list of suggested relationships for a class is available when you create a new relationship for a CI of that class.

Role required: To view — itil. To create, update, or delete suggested relationships — itil_admin.

1. Use the CI Class Manager (Role required: itil_admin):
   a) Navigate to **Configuration > CI Class Manager**.
   b) Click **Hierarchy** to expand the CI Classes list. Then select the class to add a suggested relationship to.
   c) In the class navigation bar, click **Suggested Relationships**.
   d) Click **New**.
   e) In the Add Suggested Relationship dialog box, select a **Relationship** and a **Target Class** for the relationship. **This Class** and the **Target Class** become parent or child in the suggested relationship, based on your selection of the **Relationship**.
   f) Click **Save**.

2. Or, navigate to **Configuration > Relationships > Suggested Relationships** (Role required: admin):
   a) Click **New**.
   b) Complete the form.

**Suggested Relationship fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base class</td>
<td>The base class in the relationship, which depending on the relationship type, is either the parent or the child in the relationship.</td>
</tr>
<tr>
<td>Relationship</td>
<td>Relationship type.</td>
</tr>
<tr>
<td>Dependent class</td>
<td>The dependent class in the relationship, which depending on the relationship type, is either the parent or the child in the relationship.</td>
</tr>
</tbody>
</table>
Suggested relationship you can add

<table>
<thead>
<tr>
<th>Base Class</th>
<th>Relationship</th>
<th>Dependent/Target Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle</td>
<td>Is Hosted On</td>
<td>Linux Server</td>
</tr>
<tr>
<td>Oracle</td>
<td>Is Hosted On</td>
<td>Solaris Server</td>
</tr>
</tbody>
</table>

Note: The same parent class and relationship can appear more than once.

You may need to delete a suggested relationship, for example, to limit the choice of available relationships in the CI relationship editor. Removing a suggested relationship does not affect relationships that are created or updated by Discovery.

Relationship governance rules

Relationship governance rules is a set of relationship rules used to ensure consistency and validity in modeling relationships between configuration items (CIs) in the CMDB. Use relationship governance rules to prevent the selection of relationship types or directions that are not allowed between specific CI types.

Different applications such as Discovery and Service Mapping, create relationships between CIs. Each application might use inconsistent relationship type or direction to represent the same entity, resulting in multiple views of the same CIs. Relationship governance rules define what are valid relationship types and valid directions between pairs of CI types resulting in valid and consistent relationships in the CMDB.

Relationship governance rules consist of:

- **CMDB dependent relationship rules**: Rules (hosting and containment rules) that are used for CI identification. You can view and modify dependent relationship rules in the CI Class Manager, after selecting a class from the class hierarchy and clicking **Dependent Relationship**.
- **Suggested relationships**: Rules that are based on existing suggested relationships in the Suggested Relationship [cmdb_rel_type_suggest] table. Suggested relationships are used in the CI relationship editor. You can view and modify suggested relationships in the CI Class Manager, after selecting a class from the class hierarchy and clicking **Suggested Relationships**.
- **Reference rules**: Rules that are used mostly by Cloud Management to represent all the possible valid combinations of pairs of referencing and referenced CIs in the service definition.
- **Built-in valid relationships**: The following relationships are pre-defined in the base system as valid relationships:
  - `cmdb_ci_endpoint -> Applicative Flow To::Applicative Flow From -> cmdb_ci_endpoint`
  - `cmdb_ci_endpoint -> Implement End Point To::Implement End Point From -> cmdb_ci`
  - `cmdb_ci -> Use End Point To::Use End Point From -> cmdb_ci_endpoint`

General behavior

- Relationship governance rules support inheritance.
  
  For example, suppose that the suggested relationship `cmdb_ci_appl Runs On::Runs cmdb_ci_hardware` exists. Then a `Runs On::Runs` relationship between a `cmdb_ci_appl_dot_net CI` and a `cmdb_ci_windows_server CI` is valid. That is because .Net Application class inherits from the Application class and the Windows Server class inherits from the Hardware class.
- Duplicate relationship governance rules are not allowed.
- Relationship governance rules are not domain separated.
• It is allowed to have more than one relationship type between the same two CI types.
   For example, the following relationships are valid:
   • `cmdb_ci_appl Depends On::Used by cmdb_ci_service`
   • `cmdb_ci_appl Receives data from::Sends data to cmdb_ci_service`

**Reports**

A relationship between CIs is considered valid if it conforms to any of the relationship governance rules. Use the CMDB dashboard to view reports about overall relationships health including relationships compliance with relationship governance rules. The 'Relationships not compliant with all relationship rules' report shows CI relationships that are not compliant with any of the relationship governance rules.

**CI relations formatter**

The default CI form includes a CI relations formatter from which you can examine a CI and its relationships in various views. From the CI relations formatter, you can also launch the CI relationship editor for the CI.

If the domain separation plugin is activated, then only relationships in which the logged on user is authorized to view both CIs, are displayed.

The CI relations formatter contains a list of related CIs and a toolbar with controls for viewing the relationships between the current CI and related CIs. You can configure the controls in this formatter to modify varying aspects of the view. For more information about formatters, see Create a formatter and add it to the form.

**Note:**

• If an endpoint is a child in one relationship and the same endpoint is a parent in another relationship, then that endpoint is hidden and does not appear in the relations formatter view. Similarly, relationship qualifier chains are also hidden and do not appear in the relationship formatter view.
  
  • Example: CI1 > endpoint > CI2
    In this example, CI1 is related to CI2 through relationships with endpoint. A single relationship appears in the relations formatter:
    CI1 > CI2 (These relationships appear as a direct relationship without endpoint, because endpoint is a parent in one relationship and a child in another relationship)
  • Example: CI1 > endpoint1 > CI2 > endpoint2
    Two relationships appear in the relations formatter:
    CI1 > CI2 (endpoint1 is hidden because it is a parent in one relationship and a child in another relationship)
    CI1 > CI2 > endpoint2 (appears as level 2 relationship – endpoint1 is hidden and endpoint2 appears as it a child and not a parent in any other relationship)

• On instances that do not meet the internet browser requirements for the CI relations formatter, the default CI form includes the legacy CI relations formatter instead. For more information, see Legacy CI relations formatter.
• CIs not extended from the Configuration Item [cmdb_ci] table, are not displayed in Dependency Views maps and in CI relation formatters.
• The **Applicative Flow To::Application Flow From** relationship is a special relationship type used only between Service Mapping endpoints. This relationship type is not intended for use
in the CMDB as a relationship between CIs and therefore it is not displayed in the relations formatter.

Controls for viewing related CIs

<table>
<thead>
<tr>
<th>Control</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add CI relationship</td>
<td>Starts the relationship editor to manually create CI relationships. For more information, see Create or edit a CI relationship.</td>
</tr>
<tr>
<td>Show dependency views</td>
<td>Launches a Dependency Views map in another window or tab. The CI is the central node in the map, with a configurable number of levels above and below that node in the hierarchy. Map indicators next to the nodes indicate the number of tasks, incidents, problems, changes, or outages related to that node. Right-click to expand collapsed nodes or display a list of related tasks or problems. For more information, see Dependency Views map.</td>
</tr>
<tr>
<td>Search for CI</td>
<td>Filters the CIs included in the display.</td>
</tr>
</tbody>
</table>

Click the **Settings** icon to configure additional view settings that filter the data displayed. Settings are preserved through logging out and logging back in.

**Related items settings**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Relations in Flat/Tree Layout</td>
<td>To view a flat list of related CIs that are grouped by relationship type in alphabetical order, click <strong>Flat</strong>. To view groups of related CIs in a hierarchical tree, click <strong>Tree</strong>. If you select the tree view, you cannot configure any other settings for viewing related CIs. A single list of upstream and downstream relationships is displayed.</td>
</tr>
<tr>
<td>Show Relations in Split/Merge Layout</td>
<td>To view separate lists for upstream and downstream relationships, click <strong>Split</strong>. To view a single list that includes both upstream and downstream relationships, click <strong>Merge</strong>. Relationships are grouped by relationship type.</td>
</tr>
<tr>
<td>Filter Relations by Max Level</td>
<td>Select the number of levels in the hierarchy to include when displaying CIs in a flat view.</td>
</tr>
<tr>
<td>Filter Relations by Relationship Type</td>
<td>Select the types of relationships to view.</td>
</tr>
<tr>
<td>Filter Relations by CMDB View</td>
<td>Filter by tables specified in CMDB views, if any relationship filters exist.</td>
</tr>
</tbody>
</table>
The relations formatter uses the following icons to provide additional information about changes, problems, and outages related to CIs in the relationship:

**Icons related to CIs**

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt=" recently closed changes icon " /></td>
<td>Recently closed changes</td>
</tr>
<tr>
<td><img src="image" alt=" planned changes icon " /></td>
<td>Planned changes</td>
</tr>
<tr>
<td><img src="image" alt=" currently open changes icon " /></td>
<td>Currently open changes</td>
</tr>
<tr>
<td><img src="image" alt=" recently closed outages icon " /></td>
<td>Recently closed outages</td>
</tr>
<tr>
<td><img src="image" alt=" problems icon " /></td>
<td>Problems</td>
</tr>
<tr>
<td><img src="image" alt=" incidents icon " /></td>
<td>Incidents</td>
</tr>
<tr>
<td><img src="image" alt=" planned outages icon " /></td>
<td>Planned outages</td>
</tr>
<tr>
<td><img src="image" alt=" currently open outages icon " /></td>
<td>Currently open outages</td>
</tr>
</tbody>
</table>

In large networks, a list of related CIs might be excessively long, which can slow performance when a CI form is rendered. You can configure these properties to control the amount of data that is displayed. To find a property, enter `sys_properties.list` in the left navigation filter and search for the property.

**Properties related to performance**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>glide.ecmdb.find_relationship_issues</code></td>
<td>Hides or displays an icon in the CI relations formatter that links to open issues for the CI. This property defaults to true (displays the icon).</td>
</tr>
<tr>
<td><code>glide.ui.max_relation_levels</code></td>
<td>Specifies the maximum level for displaying CIs in flat view before reaching the maximum relations limit. The default value is 5.</td>
</tr>
<tr>
<td><code>glide.ui.max_relations</code></td>
<td>Specifies the maximum number of related CIs to display. When exceeded, a notification is displayed indicating that the limit has been reached, and that not all relations are displayed. The default value is 1000.</td>
</tr>
</tbody>
</table>

**Domain separation in the relations formatter and the CI relationship editor**

This is an overview of domain separation as it pertains to the relations formatter and the CI relationship editor. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Overview

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

How domain separation works in the relations formatter and relationship editor

• Relations formatter
  The relations formatter is domain-separation supported. The relations formatter is used to display CMDB relationships in the UI in different views. Since the CI Relationship (cmdb_rel_ci) table is not domain separated, relationships are visible in the relations formatter only if both parent and child CIs (cmdb) are visible in the domain.
  
The CI Relationship Type (cmdb_rel_type) table is not domain separated. Therefore, in the relations formatter, all the relationship types are available to be selected as a filter.
  
  By default domain separation is supported in the relations formatter.

• Relationship editor
  The relationship editor is domain-separation supported. You can use the relationship editor to add new relationships or delete existing relationships for the current CI.
    • The CI relationship editor displays a list of CIs to add or remove from relationships. Since they are domain separated, the CI list view in the relationship editor displays the CIs that are visible to the current domain.
    • The CI relationship editor displays a list of relationships to add or remove. Since the CI Relationship [cmdb_rel_ci] table is not domain separated, the relationships list view displays all the relationships of the current CI.

  The Suggested Relationship (cmdb_rel_type_suggest) table is not domain separated, which means that all the suggested relationship types in the relationship editor are visible for all domains.
  
  By default domain separation is supported in the relationship editor.

Create or edit a relationship filter

Create a custom relationship filter to display CI relationships from selected tables in the CI relations formatter.

Role required: ecmdb_admin

The CI relations formatter displays related CIs for the base CI, and the relationships between the CIs. You can use relationship filters on the CI relations formatter to customize CI relationship views.

1. Navigate to Configuration > Relationships > Relationship Filters.
2. Click New or select a filter to edit.
3. Enter or edit the relationship filter name.
4. Right-click the form header and click Save.
5. In the Configuration Types section, click Edit.
6. On the Edit Members form, select the tables of the CIs that you want to show with the filter and then move the tables to the Configuration Types list.
7. Click Save.

On a CI form, in the relations formatter settings, you can select the newly defined relationship filter from the Filter Relations by CMDB View list.
In the legacy CI relations formatter, you can click View and select the newly defined relationship filter. After you select a filter, the relations formatter displays only CIs from the tables specified in the filter or from descending tables.

Exclude relationships from the relations formatter view
Create a list of relationships that should not appear in the relations formatter view on CI forms.

Role required:
- To view the relationship type exclusion list — itil
- To create, update, or delete the relationship type exclusion list — itil_admin

1. Navigate to Configuration > Relationships > Relationship Type Exclusion List.
2. In the CI Relation Filters list view, click New.
3. Fill out the CI Relation Filter form to specify the relationship that you want to exclude from view.
4. Click Submit.
   Excluded relationships do not appear in Related Items on CI forms.

Legacy CI relations formatter
On instances that do not meet the internet browser requirements for the latest CI relations formatter, the default CI form includes the legacy CI relations formatter instead.

This element contains the list of related CIs and a toolbar with controls for viewing the relationships between the current CI and related CIs.

Related items field

Note: The legacy BSM map provides a more complete view of CI relationships.

Configure the controls in this formatter with two properties that restrict varying aspects of the view.

Flat layout
Click the flat layout icon ( ) to group the related CIs by relationship.
Flat layout view

Tree layout

Click the tree layout icon ( ) to group the related CIs in a hierarchical tree.

Tree Layout View

**CI relationship editor**

Use the CI relationship editor to create CI relationships.

When you use the relationship editor, the CI from which the editor was launched is designated as the base CI. You can then select one or more CIs as a second CI for the relationship. Depending on the selected relationship type, the base CI can become the parent CI or the child CI in the new relationship.

The relationship editor operates differently, depending on whether you select the **Use suggested relationship** check box.
• With suggested relationships, the relationship editor lists all available relationship types for the base CI. To define a new relationship, select a relationship type, and then select a second CI for the relationship.

Suggested relationships are highlighted for you. These relationships are displayed in blue with a prefix of [Suggested].

• Without suggested relationships, you define a new relationship by first selecting a second CI for the relationship and then selecting a parent or a child relationship type.

**Note:** The following relationship types are used only for Service Mapping endpoints, and you cannot use them as a relationship type between two CIs:
- Implement End Point To: Implement End Point From
- Use End Point To: Use End Point From
- Applicative Flow To: Applicative Flow From

**Suggested relationships**

If you select the **Use suggested relationship** check box in the editor, the **Suggested relationship** list appears. It displays all available CI, user and group relationship types for the base CI. Relationship types have a suffix of (Parent) or (Child) to note the relationship descriptor, and suggested relationship types are displayed in blue and have a "*" prefix.

When you select a relationship, you are also designating the base CI as being the parent or the child CI in the new relationship. For example, if you select the 'Feeds' relationship type, the base CI becomes the designated parent CI, and the second CI that you select becomes the child CI in this relationship.

**Downstream relationships**

If you do not select the **Use suggested relationship** check box in the editor, the **Downstream relationships** list appears. It displays all relationships in which the base CI is the parent CI. The child CI of the relationship is displayed in the **Child** column.

**Upstream relationships**

If you do not select the **Use suggested relationship** check box in the editor, the **Upstream relationships** list appears. It displays all relationships in which the base CI is the child CI. The parent CI in each relationship is displayed in the **Parent** column.

**Supported browsers for the relationship editor**

You must use supported browser versions in order to use the latest CI relationship editor. If you do not use a supported browser version, the instance provides the legacy CI relationship builder.

• Firefox version 20 and up
• Chrome version 25 and up
• Safari version 6 and up
• Internet Explorer version 9 and up

**Create or edit a CI relationship**

Use the relationship editor to view, create or modify CI relationships. You can open the relationship editor from the CI Relations formatter.
Role required:

- To create relationships: ITIL or asset
- To view relationships, depending on the state of the Table API ACL:
  - If inactive (default): ITIL or asset
  - If active: ITIL or asset, and snc_platform_rest_api_access

For more information, see REST API and Table API.

The relationship editor operates differently, depending on whether you check the **Use suggested relationship** option or not.

1. Launch the relationship editor:
   a) Open a CI form.
   b) Locate the **Related Items** section near the center of the form.
   c) Click the plus (+) icon on the **Related items** section.
2. To use suggested relationships, first select a relationship type, and then select one or more CIs to be the child CIs in the relationship:
a) Select **Use suggested relationship**.

b) From the **Suggested relationship type** list, select a relationship type.

You can filter the list of suggested relationships by using the filter check boxes.

<table>
<thead>
<tr>
<th>Filter option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hide CI relationship</td>
<td>Hides any relationships between the base CI and another CI (such as &quot;Receives data from&quot;). Default filter is stored in the ci_manage_relationships_filter_hint.cmdb_ci user preference.</td>
</tr>
<tr>
<td>Hide user relationship</td>
<td>Hides any relationships between the base CI and a user (such as &quot;Logs reviewed by&quot;). The default filter is stored in the ci_manage_relationships_filter_hint.sys_user preference.</td>
</tr>
<tr>
<td>Hide group relationship</td>
<td>Hides any relationships between the base CI and a group (such as &quot;Backups done by&quot;). Default filter is stored in the ci_manage_relationships_filter_hint.sys_user_group user preference.</td>
</tr>
</tbody>
</table>

The **Configurations Items** list displays all the CIs that are appropriate for the base CI and the selected relationship type. The **Relationships** list at the bottom of the editor, displays all existing relationships of the selected relationship type, in which the base CI is a parent CI or a child CI.

c) From the **Configuration Items** list, select one or more CIs as a second CI for the relationship.

You can filter the list of **Configurations Items** by adding conditions in the **Filter** section and clicking **Run filter**.

If you selected a parent relationship type, these CIs becomes the child CI in the relationship, and if you selected a child relationship type, then the selected CIs become the parent CI in the relationship.

d) In the **Relationships** section, click the plus icon (+) to add the new relationships.

Alternatively, you can drag the selected CIs to the **Relationships** list. Each new relationship will consist of the base CI, the selected relationship type, and a selected second CI.
3. To not use suggested relationships, first select one or more CIs to be the child CIs in the relationship, and then select the relationship type:

a) Clear **Use suggested relationship**.

b) In the **Configuration Items** list, select one or more CIs as a second CI for the relationship. You can filter the list of **Configurations Items** by adding conditions in the **Filter** area and clicking **Run filter**.

   Depending on the relationship type that you will select, the selected CIs might become a parent or a child CI in the relationship.

c) With at least one CI selected in the **Configuration Items** list, click the ‘+’ sign in the **Downstream Relationships** section or the **Upstream Relationships** section to create the relationship.
• Add the relationship to **Downstream Relationships** to create a relationship in which the base CI is the parent CI and the selected CI is the child CI.
• Add the relationship to **Upstream Relationships** to create a relationship in which the base CI is the child CI and the selected CI is the parent CI.

d) For each newly created relationship in either the **Downstream Relationships** or the **Upstream Relationships** lists, click **Please select a relationship** and select a relationship type.

• The list of available relationship types in the **Downstream Relationships** list contains parent relationships only, in which the base CI is the parent CI.
• The list of available relationship types in the **Upstream Relationships** list contains child relationships only, in which the base CI is the child CI.

e) Click **Save** or **Save and Exit**.

Only after you enter all the information that is necessary for creating the relationship, these buttons light up indicating that there are pending updates that require saving.

### Legacy CI relationship builder

Used to define CI relationships manually, this page is a sophisticated version of the standard slushbucket.

In the legacy CI relations formatter, click the CI relationship builder icon (➕) to display the legacy Define Relationships page.

**Select a CI relationship type**

The top half of the legacy relationship editor contains a large option box that allows you to select which type of relationship you want to manipulate. Click the particular type of relationship you are interested in working with.

**Filter the list of CI relationships**

In the legacy relationship editor, the checkboxes along the right hand edge of the select box provide a quick way to filter down the list of available relationships.

By default, the system displays a list of all suggested relationships for the type of CI you selected. For example, if you selected a Database instance, a relationship of “Runs on” makes sense, but a relationship of “Provides HVAC for” does not. The default filter is stored in the user preferences `ci_manage_relationships_filter_hint.cmdb_cici_manage_relationships_filter_hint.sys_user`, and `ci_manage_relationships_filter_hint.sys_user_group`.

- **Hide CI relationship** -- Hides any relationships between this CI and another CI (e.g. "Receives data from").
- **Hide user relationships** -- Hides any relationships between this CI and a user (e.g. "Logs reviewed by").
- **Hide group relationships** -- Hides any relationships between this CI and a group (e.g. "Backups done by").
- **Show all relationships** -- If you have the appropriate role (out of the box this is `itil_admin`) you will have an additional checkbox labeled "Show all relationships." If you click that checkbox, the system will let you choose any relationship defined in the system, regardless of where it is on the "suggested" list for this type of CI.
Select CI relationship targets

In the legacy relationship editor, users can link or unlink CIs for a relationship type.

As soon as you pick a relationship type, the system will fill in the two select boxes at the bottom of the screen with CIs's that are appropriate for the relationship you suggested. The left hand select box will contain a list of CI's that might reasonably be linked via this relationship, while the right hand box contains a list of those CI's which are already linked.

1. Link or unlink items.

<table>
<thead>
<tr>
<th>Link new items</th>
<th>Move that CI from the left hand box to the right hand box.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unlink existing items</td>
<td>Move them from the right hand box to the left.</td>
</tr>
</tbody>
</table>

**Result:** When you make either type of change, a message appears indicating that you have pending changes.

2. Apply or cancel your changes.

<table>
<thead>
<tr>
<th>Click the Save button.</th>
<th>This will save your set of changes, and go back to the previous screen (either a CI or the BSM map depending on how you got here).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click the Cancel button.</td>
<td>This causes you to exit without saving your changes.</td>
</tr>
</tbody>
</table>

Relation qualifier

A relation qualifier, which is a CI of the Qualifier [cmdb_ci_qualifier] type, stores important information about the CI relationships.

In a relation qualifier, you can annotate arbitrary unique information about the relationship between two CIs. You can define multiple qualifiers for a single relationship, resulting in a qualifier chain. But, there can be only a single qualifier chain for a specific relationship type between two CIs.

For example, for a relationship between a parent CI and a child CI, you can add a relation qualifier to note that the relationship was discovered based on traffic (such as cmdb_ci_qualifier_trafficbased). This results in having two records in the CI Relationship [cmdb_rel_ci] table for the relationship.

- A record that links the parent CI and the new qualifier
- A record that links the new qualifier and the child CI

For this relationship, there is a parent CI and a child CI, and a relation qualifier of type cmdb_ci_qualifier_trafficbased.

For information about usage of relation qualifiers in the identification process, see CMDB identification rules.

CI relationship security

When applying security to CI relationships, it is important to apply the access controls both to the CI Relationship (cmdb_rel_ci) table and to create an operation editCIRelations to the * table as well.

If the current instance has defined security for editCIRelations, it will be applied to edit_ci_relations automatically in the process of upgrading, and the out-of-date security will be removed.
Create a CI relation rollup

A CI relation rollup allows you to sum, count, max, min, or mean a relationship type. You can create CI relation rollups.

Role required: ecmdb_admin

CI relation rollup can be useful for tracking and for receiving notifications. For example:

- In a sum roll up, add up fields from multiple CIs and display the result on another CI to which they are related. So, if you have four configuration items in a rack that are all consuming power, create a CI relation rollup to add all the power usage together and display the result in one field on the rack CI form.
- If a certain level of power consumption in a rack is exceeded, send a notification.
- With a rack that has 10 slots, send a notification when 9 slots are filled.

CI relation rollups use the `cmdb synch event` business rule on the `[cmdb_ci]` table. Although this business rule is active by default, you must modify the rule slightly before it will run.

1. Navigate to Configuration > Relationships > CI Relation Rollups.
2. Click New.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Relationship Type</td>
<td>Select a relationship type from the list to use with the rollup. For example, Members::Member of contains the parent descriptor Members and the child descriptor Member of.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of rollup from the drop-down list: COUNT, MAX, MEAN, MIN, or SUM.</td>
</tr>
<tr>
<td>Parent field</td>
<td>The target field on which the operation will be done.</td>
</tr>
<tr>
<td>Child field</td>
<td>The input to the equation type. The Parent field is affected by the selections in the child field.</td>
</tr>
<tr>
<td>Rollup class</td>
<td>The classes that can use the relationship. For example, you can specify that the relationship only applies to racks.</td>
</tr>
</tbody>
</table>

4. To run the `cmdb synch event` business rule, navigate to Business Rules.
5. Use the search box to find the `[cmdb synch event]` table.
6. Click the `cmdb synch event` business rule to go to the Business Rule page.
7. Select the Update, Delete, and Query check boxes.
   Additionally, if you wish CI relation rollups to recalculate when there is a change to a relationship, use a similar procedure to select the Active check box on the `cmdb_rel_ci synch event` business rule.

CMDB classifications

CMDB classifications are groups of configuration items (CIs) that share attributes and are stored in their own table. Classifications allow administrators to define the hierarchy of CIs within the CMDB. A CI class refers to the actual table name in the instance database. In that context, CI Type is a friendly name that a CI is known by, such as computer, router, or printer.

As good practice, keep CI classifications as simple as possible.
### CMDB record types

The CMDB contains the following major record types.

<table>
<thead>
<tr>
<th>Record types</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item (CI)</td>
<td>Any computer, device, or service in the CMDB. A CI's record includes all of the relevant data, such as manufacturer, vendor, location, etc. Configuration items can be created or maintained either using tables, lists, and forms within the platform, or using the Discovery application.</td>
</tr>
<tr>
<td>Relation Type</td>
<td>A defined relationship between a CI and either another CI, a user, or a group. Relation types are defined twice, once from the perspective of the child CI and once from the parent CI's perspective. For example, a parent CI that powers a child CI uses relation type <strong>Powers::Is Powered By</strong>. Example relation types include <strong>In Rack::Rack contains</strong>, <strong>Log Reviewed by::Reviews logs</strong> for, or <strong>Backup done by::Does backups</strong> for. CMDB relationships can be established using Discovery or using the tables, lists, and forms within the platform. The CMDB form has a specific Related Items toolbar optimized for modifying relationships.</td>
</tr>
</tbody>
</table>

### Related Lists of CI components

Related lists in CI records display additional components contained by that CI, such as disk drives on a server and the rules that control the behavior of a network router.

When Discovery runs, the Related List is populated with the components that Discovery finds running on the CI. The CI record might show different lists from scan to scan, depending on whether or not Discovery found the component.

By default, the Related Lists only display those components that are associated with that CI in the CMDB that have been discovered by the last scan. Components that are recorded in the CMDB but are not discovered in a scan, are deemed absent and do not appear in the list.

There are two types of components that appear in the Related List: those that are CIs themselves (such as hard disks), and those that are not (serial numbers and rules). The default filter condition in the breadcrumbs for components that are CIs is `[Status] [!=] [Absent]`. The filter condition for components that are not CIs is `[Absent] [=] [false]`.

In the following example, the `snc-tc01` router has several Related Lists affected by these filter conditions, including routing rules, disk drives, interfaces, and network adapters. Only those components found during the last Discovery appear in these Related Lists.
Create a CI class

Create a CI class (table) that is an extension of an existing CI class. Then create identification and reconciliation rules for the new class.

The class that is being extended must have its **Is_Extendable** field checked, indicating that the class is extendable.

Roles:

- Itil_admin and personalize_dictionary: Required for editing the dictionary table
- admin: Full access

The CI Class Manager is a centralized location for managing CMDB tables and for creating a class that is derived from another CMDB class. Creating a class requires basic details such as a label and a name. Identification and reconciliation rules are also required to ensure that the class can be successfully identified by the identification engine.

For more information about extending a class and how attributes are derived from a parent class in that process, see **Table extension and classes**.

1. Navigate to **Configuration > CI Class Manager**.
2. Click **Hierarchy** to expand the CI Classes list. Then select the class that the new class is extended from.
3. Click **Add Child Class**.  
   The **Add Child Class** option appears only if the selected class is extendable.
4. On the **Provide Basic Info** tab, fill out the information and then click **Next**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display name</td>
<td>A unique label for the class (such as Laptops or Thin Clients). The label appears on list and form views for the class. Updating the <strong>Label</strong> field also updates the label record in the language file for the current language. See Field Labels in Data dictionary tables. Maximum string length is 80 characters.</td>
</tr>
</tbody>
</table>
| Table name     | Automatically populated based on the table label and a prefix as follows:  
|                | • For a table in a scoped application, the name is prefixed with a namespace identifier to indicate that it is part of an application.  
|                | • For a table in the global application, the name is prefixed with the string ‘u_cmdb_ci’. This prefix denotes that the table is created by a user in the CMDB.  
|                | You cannot modify the prefix; however, you can modify the rest of the table name. The name can contain only lowercase, alphanumeric ASCII characters and underscores (_). Maximum string length is 80 characters. |
| Description    | Explanation of the use purpose of the class. |
| Icon           | The icon associated with the class. |
| Extensible     | Indicator of whether this class can be extended. |

5. On the **Add Attributes** tab, click the + sign and enter details for each new class column. Then click **Next**. For description of the different columns in the list view, see Dictionary entry form. Set **Identification** to true to designate the column as a CI identifier for class identification.

6. On the **Set Identification Rule** tab, examine the **Derived** identification rule and its **Identifier Entries**. You can click **Replace** to replace the derived rule with a new identification rule and new identifier entries specific to the new class. See Identification rules for details about identification rules and identifier entries.

7. On the **Dependencies** tab, click **Add dependency** to add dependent rules. The **Dependencies** tab appears only if there are dependent identification rules for the selected class.

8. On the **Add Reconciliation Rules** tab, click **Add** to create the following rules:
   a) **Reconciliation Rules**
   b) **Data Precedence Rules**
   c) **Data Refresh Rules**
9. On the Add Suggested Relationships tab, review the diagram of the class derived suggested relationships. Use the filter to display only inbound, outbound, or specific relationship types. To add a suggested relationship for the class:
   a) Click New.
   b) In the Add Suggested Relationship dialog box, select a Relationship and a Target Class for the relationship. This Class and the Target Class become parent or child in the suggested relationship, based on your selection of the Relationship.
   c) Click Save.

When building relationships for the class in the Query Builder, the list of suggested relationships is updated.

10. Click Done.

Reclassify a CI
You can upgrade, downgrade, or switch the class of a CI by modifying its Class attribute.

Role required: itil or asset (In general, the roles required to update a CI)

Each class is defined with a unique set of attributes. This set consists of attributes that were derived from the parent class, and additional attributes defined for the class.

When you reclassify a class, the following occurs.

1. The set of attributes is adjusted to match the set of attributes of the newly assigned class. Attributes are added or removed as needed.
2. If any attributes are unique to the current class and are not defined in the newly reclassified class, they are lost.
3. A new record with the CI's current sys_id is inserted to the table of the new class, with the appropriate set of attributes for the class (the sys_id of the CI is retained).

Depending on the reclassification, the following occurs.

Downgrade
The CI class is updated to a class that is higher in the class hierarchy, and the newly assigned class is a parent of the current class. For example, reclassifying a CI from the cmdb_ci_server class to the cmdb_ci_computer class.

For example, the cmdb_ci_server class has attributes that the cmdb_ci_computer class does not have. During the downgrade, these attributes and their respective values are not included in the new CI record that is inserted into the cmdb_ci_computer class.

Upgrade
The CI class is updated to a class that is lower in the class hierarchy, and the newly assigned class is a derived child of the current class and has additional attributes. For example, reclassifying a CI from the cmdb_ci_computer class to the cmdb_ci_server class.

Switch
The newly assigned class is in a different branch in the class hierarchy and has a different set of attributes than the current class. For example, reclassifying a CI from the cmdb_ci_linux_server class to the cmdb_ci_win_server class.
A switch is a combination of a downgrade and an upgrade. For example, if the CI is downgraded to the `cmdb_ci_server`, and then upgraded to the `cmdb_ci_win_server` class. Therefore, attributes are lost in the same manner as in a downgrade operation.

**Note:** Avoid the CI class downgrade and CI class switch operations as those can lead to data loss. When automatic CI reclassification is enabled (which is by default), the identification process can result in some automatic reclassifications which lead to data loss.

For information about CI reclassification by the Identification and Reconciliation Engine (IRE) and related system properties that control the behavior of automatic CI reclassification, see [CI reclassification](#).

1. Locate the CI that you want to reclassify and display it in a list view. You can use the application navigator. Or for example, if the CI is a server, then in the navigation search box, type `cmdb_ci_server.list` to display the CI in the Server view.
2. Ensure that the **Class** field is displayed in the list. If you do not see this attribute, personalize the list to add the **Class** field.
3. Double-click the **Class** value for the CI, and select a new class.
4. Click the green check box to confirm your selection.

### Delete CIs for a CMDB class

You can use the CI Class Manager to delete CIs that are no longer needed.

**Role required:** itil_admin

1. Navigate to **Configuration > CI Class Manager**.
2. Click **Hierarchy** to expand the CI Classes list and then select the class from which you want to delete CI records.
3. In the class navigation bar on the left, click **CI List**.
4. On the CI List form view, select the CIs that you want to delete. Select the check box in the header to select all the CIs that are visible.
5. Click **Actions on selected rows** and then click **Delete**.
6. Click **Delete** in the **Confirmation** dialog box.

### View and edit class definitions and metadata

Use the CI Class Manager as a central location to explore the CMDB class hierarchy, CI table definitions, and class CIs. View the details of each table such as its label and fields, relationships, and all related metadata definitions.

The CI Class Manager displays the entire CMDB class hierarchy in a tree-view format, consolidating class definitions into a central location. It lets you display metadata information for a class, such as reconciliation rules, mandatory and recommended fields, and audit templates. You can also select a specific class to view, to modify, or to extend its definition to create a derived class. For each table, you can directly access CMDB Health settings and rules such as datasource precedence rules, orphan scorecard, and certificate template defined for the table class.

For more information about extending a class and how attributes are derived from a parent class in that process, see **Table extension and classes**.

1. Navigate to **Configuration > CI Class Manager**.
2. Click **Hierarchy** to expand the CI Classes list and then select a class to display details for.
3. On the class navigation bar, expand the following items to display further details for the class.

- **Class Info:**
  - **Basic Info:** Displays details for the selected class, such as the display and table name, description, and class icon. Lets you edit some of the class definitions, and prevents editing of some details such as the table name.
    Role required: itil for reading, and itil_admin and personalize_dictionary for writing.
  - **Attributes:** Displays table attributes (columns). Lets you edit those attributes and add new ones. For description of the different attributes in the list view, see Dictionary entry form.
    Role required: personalize_dictionary and itil for editing, and personalize_dictionary for reading
  
  To add an attribute:
  a. Click the Added tab and scroll to the bottom of the list.
  b. Double-click Insert new column, and enter details for each new class attribute. Set Identification to true to designate an attribute as a CI identifier for class identification.
  c. Click Save, and fix any errors that appear.

- **Identification and Reconciliation:** Displays and lets you edit, create, and delete identification and inclusion rules, reconciliation, data precedence, and data refresh rules for the class.
  See CMDB Identification and Reconciliation for more information.
  Role required: itil for reading, and itil_admin (on top of itil) for writing.

- **Dependent Relationships:** Displays and lets you edit, create, and delete hosting and containment relationships for the class. See CMDB dependent relationship rules for more information.
  Role required: itil for reading and itil_admin (on top of itil) for writing.

- **Suggested Relationships:** Displays a diagram of all suggested relationships for the class, and lets you delete or add suggested relationships for the class. Use the navigation tools to increase or decrease the diagram, and to move the diagram on the page. Use the filter to display specific relationship types. See Suggested class relationships for more information.
  Role required: itil

- **All Relationship Rules:** Displays a combined diagram of all suggested relationships and all dependent relationships for the class. Use the navigation tools to zoom in or out, and to move or center the diagram on the page. Use the filter to display specific relationship categories.

- **Health:** Lets you review and configure CMDB Health-related system properties, scorecards, and rules and settings for all CMDB health KPI and metrics, at the class level. See CMDB Health for information about enabling and configuring CMDB Health, and displaying health reports.
  Role required: Itil for reading and itil_admin (on top of itil) for writing.

- **CI List:** Displays the CIs of the selected class. Lets you create CIs of the selected class and perform other operations such as delete.
  Role required: Itil for reading. Writing requirements follow the selected table settings.

**Querying the CMDB**

The CMDB Query Builder allows you to easily build complex infrastructure and service queries, that span multiple CMDB classes, non-CMDB tables, and that involve many CIs that are connected by different relationships.
The CMDB Query Builder provides a canvas into which you drag the CI classes that you want to include in a query. Then you add relationships, AND/OR operators between the CI classes, and define the relationship properties to query for. You can use saved queries to populate a CMDB group with CIs, and then use scriptable APIs to retrieve the CI list and apply actions collectively to all the CIs in the group.

There are two query types: CMDB Query and a Service Mapping query, which you can use separately or in combination to create queries such as:

- All CIs of a certain type in a business service. For example, all Apaches/Web Servers/Linux servers per service.
- All virtual servers and the physical servers that host them.
- All servers that are not mapped to any business service.
- All Servers with a database.
- All database servers that are included in any business service or in a particular business service.
- All business services and their associated servers and the cost of each server. This query helps evaluate the cost of technology for each business service.

A start node in the Query Builder is the starting point of the query and is noted by gray background in its query node. The first class that you drag to the canvas becomes automatically the start node of the query and you cannot select a different start node. In a complex query, the start node must always be the only node connected to an AND/OR operator. If you try to connect a second node to an operator that the start node is connected to, the query fails to run and a prompt to select a different start node appears.

**CMDB Query**

A query type that queries the infrastructure for CI classes and optionally a non-CMDB table, and the relationships and references that connect them.

When you create a CMDB query, you can add tables from a list of non-CMDB tables. The list of non-CMDB tables includes a subset of tables within the system (such as Asset, Task, and Problem), which have a reference to the Configuration Item [cmdb_ci] class or its children. You can use the system property glide.cmdb.query.non_cmdb.blacklisted_tables to narrow down the list of non-CMDB tables to choose from.

**Service Mapping Query**

A query type that queries business services and technical services, and thus requires that Service Mapping is activated. The query is framed within a business service map. You define a pattern, and query for business service maps that have that pattern in their definition. The relationships in Service Mapping queries are matched by single-level direct relationships which is similar to the CMDB queries, and in addition, they are also matched by multi-level indirect relationships if they exist. A query for a relationship between two CI classes is satisfied even if the two CI classes are connected by intermediate CI classes that are not specified in the query.

**Combination Query**

You can combine the two query types by incorporating a saved Service Mapping query into a CMDB query. For example, create a CMDB query for Windows Servers that are connected to Tomcat WAR. Then connect the Tomcat WAR CI class to a Service Mapping query. The query changes to find Windows Servers that are connected to Tomcat WAR which is included in the services that returned by the Service Mapping query. You can inverse that query by choosing Does Not Belong To Service. This changes the query to find Windows Servers that are connected to Tomcat WAR that is not included in services returned by the Service Mapping query.
Relationship properties

When you connect CI classes on the canvas, the CMDB Query Builder displays the Connection Properties in the right-side bar, where you can configure the properties of the relationship, such as the relationship direction. For Service Mapping queries, you can configure whether to query for related or unrelated CIs.

Connection properties include:

- Relationship type: Query for CIs and descending classes with specific relationship types.
- Relationship direction: Which CI class is the parent and which CI class is the child in the relationship.
- Relationship level: Query only on first-level relationship or also on second-level relationships.
- No relationships: Query for CIs which have no relationship to the set class.
- References fields: A field that the parent and ancestor parent CI classes use to reference the child CI class.

Newly added relationships between CI classes may take up to 30 minutes to appear in the relationship list.

Domain separation in CMDB Query Builder

This is an overview of domain separation as it pertains to the CMDB Query Builder. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

How domain separation works in the CMDB Query Builder

With the CMDB Query Builder you can easily build complex infrastructure and service queries that span multiple CMDB classes, and that involve many CIs that are connected by different relationships. Domain separation is set to be on by default.

- Saved Query
  The user creates a query by dragging a class node from the class hierarchy and dropping it to the canvas and connecting the nodes with the relationships type.
  The user can save the created query as an XML file to the database [qb_saved_query] table in the CMDB for future use. The saved query is domain separated.

- Query results
  With a saved query, the user clicks Run and the query result is saved and displays in the platform list view.
  In the query results, the domain separation behaves in the same way as the platform list view for the CI relationship [cmdb_rel_ci] table and CMDB CI [cmdb] table. Consequently, since the CI relationship is not domain separated, all relationships of the query result display, regardless of the domains. Conversely, if the query result is CI only, since the CMDB CI is domain separated, the results display only if visible in the current domain.
Build a CMDB query using the CMDB Query Builder

A CMDB query type queries the infrastructure for CI classes and optionally a non-CMDB table, and the relationships and references that connect them.

The UI16 plugin (com.glide.ui.ui16) must be activated.

Role required: cmdb_query_builder_read to only view and run saved queries, and cmdb_query_builder (contained for itil, itil_admin, and asset) to create and save queries, modify saved queries, and run queries. Authorized users can update and delete a query created by another user.

Build the query by dragging the CI classes and a non-CMDB table that you want to include in the query. Then dropping them as nodes on the canvas, and defining relationship properties between them. You can filter on the attributes of any node to narrow down the results to a specific set of CIs of that class or to a single specific CI. You can also select which property columns appear in the query results.

As you step through building a query, list options and other user interface elements of the CMDB Query Builder, are dynamically filtered as appropriate to your selections.

1. Navigate to Configuration and click CMDB Query Builder.
2. On the CMDB Query Builder page do either of the following steps:
   - Click Create new. Type in a Name, choose CMDB Query as the Query type, and then click Create.
   - Click a widget of a saved query to continue building an existing query. Search saved queries first if needed.
   - Point to the upper right corner of a saved query widget, and click the Duplicate Query icon to edit a copy of a saved query. The default name of the new query contains the string ‘copy’.
3. On the canvas, you can do any of the following operations:
   
   • Add CI classes to the query: Select classes from the **CMDB Classes** hierarchy list and drag them to the canvas.
   
   • Add a non-CMDB table to the query: Select a table from the **Non-CMDB Tables** list and drag it to the canvas.
   
   **Note:** A non-CMDB table cannot be the start node in the query, and you cannot connect a CMDB class to two non-CMDB tables of the same type.

   • Add connections (relationships) between two nodes on the canvas:
     
     a. On the first node in the relationship, click the small square at the center of the right side.
     
     b. On the second node in the relationship, click the small square at the center of the left side to create the connection.
     
     c. In Connection Properties on the right-side bar, configure the following settings (click the connection line if necessary):
        
        • In the Relationship Direction section, select the **Parent** node (the **Child** node automatically adjusts).
        
        • In the Relationship Levels section, set **Level** to **First level relationships** if the CIs are directly connected. Or, **Up to 2nd level relationships** if the CIs are connected either directly or indirectly through another CI.
        
        • In the Relationship Types and Related Items section, select either option:
   
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No Relationships</td>
<td>To query for CIs with no connecting relationships, such as All Tomcat WAR CIs which are not connected to a Windows Server.</td>
</tr>
<tr>
<td>Add Relationship Types</td>
<td>To select specific or any relationship type.</td>
</tr>
<tr>
<td>Add a Related Item</td>
<td>To query for related CIs between the nodes.</td>
</tr>
</tbody>
</table>

   • (Applies only to a non-CMDB table). In the CI Reference Column section, select the column with a reference to a class from the **Reference column to a CI to query on** list. If there is only one option, it is automatically selected.

   **Relationship UI Notations**

<table>
<thead>
<tr>
<th>Notation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Full line</td>
<td>A relationship in a CMDB query.</td>
</tr>
<tr>
<td>Red asterisk at the center of the connection line</td>
<td>Information such as relationship type is missing, invalidating the query.</td>
</tr>
</tbody>
</table>
### Notation

<table>
<thead>
<tr>
<th>Levels:&lt;n&gt; Types:&lt;n&gt; or a &lt;Reference type&gt; notation on the connection line</th>
</tr>
</thead>
<tbody>
<tr>
<td>As applicable: The number of relationship levels and the number of relationship types included for the connection. Or, a reference type for a relationship that is a reference.</td>
</tr>
</tbody>
</table>

- Add filters to a class node: Apply filters to narrow down a class query to a specific set of CIs or to a single specific CI.
  - Point to the node to add a filter to, and then click the **Apply filters** icon that pops up above the node.
  - In the **Filters** section, add attribute and related list conditions.
  - Close the **Filters** section.

  For example: Add a filter for database location to query for databases located in Seattle.

  Click **Applied Filters** in the right-side bar to view all filters for each node on the canvas.

- Add And/Or operators to the query:
  - Connect one node to two other nodes.
  - Click the **And** box that appears on the connection line, to toggle between the **And/Or** operators.

  For example: C1 is Tomcat WAR, C2 is Linux Server, and C3 is Windows Server. Query for all Tomcat WAR CIs which are connected either to Linux Server or to a Windows Server.

- Add property columns for a node, to appear in the query results:

  **Note:** For a relationship, the query results include the parent, child, and type columns. You cannot add any other columns from the [cmdb_rel_ci] table.

  - Click **Properties** in the right-side pane.
  - Click a node once or twice, so that the Report Columns section appears in the right-side bar, and then click **Add Columns**.
  - Select properties and then click outside the properties list to close it.

- Create a combination query by integrating a Service Mapping query into a CMDB query:
  - When building a CMDB query, click **Saved Service Queries** in the left-side bar.
  - Select and then drag a Service Mapping query to the canvas.

  This query returns all CIs that satisfy the CMDB query, and that are included in the services returned by the embedded Service Mapping query.

- Add a search tag that can then be used as a search criteria for saved queries:
  - Click the **Add Tags** icon at the top of the canvas.
  - Click **Add Tag** and in the **Query Tags** dialog box enter one or more tag strings.
  - Click the **Add Tags** icon again to close the **Query Tags** dialog box.
4. Click **Save**.

   On the **Saved Queries** tab, point to a saved query widget and click **Query Information**. Query details such as the query type, last update date, CMDB groups associated with the query, and the query schedules appear.

   • Click **Run**.

   Only the first 100 results of the query appear in the results pane.

   • Click **Load More Results** to view the next set of 100 results.

   • Click **Load All Results** to view the rest of the query results, up to the number specified by the glide.cmdb.query.max_results_limit system property (10,000 by default).

   Click a CI to open its CI form, and on the CI form click **Dashboard** to view CI health in the CI dashboard.

   **Note:**

   • Ensure that the glide.security.use_csrf_token property is set to true, allowing all results to appear.

   • When **Level** is set to **Up to 2nd level relationships**, the relationship type does not appear in the query results.

   • When a query is running, wait for it to complete or to time out before opening or running another query.

   • **Modify Query Builder settings**: Click the **(Settings)** icon to open the **Query Builder Settings** dialog box.

   • Copy and share the URL of a saved query with users that have access to the CMDB Query Builder. Pasting the shared URL in a new internet browser window, directly opens the saved query in the CMDB Query Builder.

   • **Create a report from CMDB query results**.

   • **Create a schedule** to run the query at a future time, and to email the results to interested parties.

   • **Export query results**:

     Click the Query Results context menu and select **Export**. Even if the **Load More Results** button is visible, indicating that there are additional query results, only the results that are visible are exported.

     • **Export and import a CMDB query** to port a query definition between instances.

     • **Populate a CMDB group** using a saved query.

**Build a Service Mapping query using the CMDB Query Builder**

The Service Mapping query type is a pattern consisting of classes and relationships between those classes. After you build the pattern and run the query, the query returns all the Service Mapping services that contain that pattern.

The **UI16 plugin** (com.glide.ui.ui16) must be activated.

Role required: cmdb_query_builder_read to only view and run saved queries, and cmdb_query_builder (contained for itil, itil_admin, and asset) to create and save queries, modify saved queries, and run queries.

Authorized users can update and delete a query created by another user.
Build the query by dragging the CI classes that you want to include in the query, dropping them as nodes on the canvas, and then defining relationship properties between them. For every class node in the query, you can filter on its attributes to narrow down the results to a specific set of CIs of that class or to a single specific CI. You can also select which property columns appear in the query results.

As you step through building a query, list options and other user interface elements of the CMDB Query Builder, are dynamically filtered as appropriate to your selections.

1. Navigate to Configuration and click CMDB Query Builder.
2. On the CMDB Query Builder page do either of the following:
   a) Click Create new. Type in a Name, choose Service Mapping Query as the Query type, and then click Create.
   b) Click on a widget of a saved query to continue building an existing query. Search saved queries first if needed.
   c) Point to the upper right corner of a saved query widget, and click the Duplicate Query icon to edit a copy of a saved query. The new query’s default name contains the string ‘copy’.
3. On the canvas, you can do any of the following:

- Add CI classes to the query: Select classes from the **CMDB Classes** hierarchy list and drag them to the canvas.
- Add connections (relationships) between two nodes on the canvas:
  a. On the first node in the relationship, click the small square at the center of the right side.
  b. On the second node in the relationship, click the small square at the center of the left side to create the connection.
  c. In **Connection Properties** on the right-side bar, configure the following (click the connection line if necessary):
     - In the Relationship Direction section, select the **Parent** node (the **Child** node automatically adjusts).
     - In the Service Query Properties section, select **Find Related CIs** or **Find Unrelated CIs** to query for a pattern in which the two classes have or do not have relationships with each other, respectively.

  For example, **All Tomcat WAR CIs which are not connected to a Windows Server**.

<table>
<thead>
<tr>
<th>Notation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dashed line</td>
<td>A relationship in a Service Mapping query.</td>
</tr>
</tbody>
</table>

- Add filters to a class node: Apply filters to narrow down a class to a specific set of CIs or to a single specific CI.
  a. Point to the node to add a filter to, and then click the **Apply filters** icon that pops up above the node.
  b. In the Filters section, add attribute and related list conditions.
  c. Close the **Filters** section.

  For example: Add a filter for business criticality to query for businesses that are 'most critical'.

  Click **Applied Filters** in the right-side bar to view all filters for each node on the canvas.
- Add And/Or operators to the query:
  a. Connect one node to two other nodes.
  b. Click the **And** box that appears on the connection line, to toggle between the **And** and the **Or** operators.

  For example C1 is Tomcat WAR, C2 is Linux Server, and C3 is Windows Server. Query for all Tomcat WAR CIs which are connected either to Linux Server Or to a Windows Server.
- Add property columns for a node, to display in the query results:

  **Note:** For a relationship, the query results display the **parent**, **child**, and **type** columns. You cannot add any other columns from the [cmdb_rel_ci] table.

  a. Click **Properties** in the right-side pane.
  b. Click a node once or twice, so that the node’s Report Columns section appears in the right-side bar, and then click **Add Columns**.
c. Select properties and then click outside the properties list to close it.

- Select columns and add filters that will be applied to the resulting set of services:
  a. Select Properties in the right-side bar, and then click an empty space on the canvas to ensure that nothing is selected.
  b. Click Add Columns at the bottom of the right-side bar and select columns to add. Click outside the columns list to close it.
  c. Click the Apply Service Mapping Query Filters icon at the top of the canvas and add filters.

- Inverse the entire query and search for all Service Mapping services that do not include the query pattern:
  - Click a node once or twice so that Query Properties appear in the right-side bar. In the Metadata section, toggle Services Including This Pattern to enable or disable the option.

- Add a search tag that can then be used as a search criteria for saved queries:
  a. Click the Add Tags icon at the top of the canvas.
  b. Click Add Tag and in the Query Tags dialog box enter one or more tag strings.
  c. Click the Add Tags icon again to close the Query Tags dialog box.

4. Click Save.

   On the Saved Queries tab, point to a saved query widget and click Query Information to view query details such as the query type, last update date, and the query schedules.

- Click Run.

   The query results pane displays only the first 100 results of the query.

   - Click Load More Results to display the next set of 100 results.
   - Click Load All Results to display the rest of the query results, up to the number specified by the glide.cmdb.query.max_results_limit system property (10,000 by default).

Click a CI to open its CI form, and on the CI form click Dashboard to view CI health in the CI dashboard.

**Note:** When a query is running, wait for it to complete or to time out before opening or running another query.

- Modify Query Builder settings: Click the (Settings) icon to open the Query Builder Settings dialog box.

- Copy and share the URL of a saved query with users that have access to the CMDB Query Builder. Pasting the shared URL in a new internet browser window, directly opens the saved query in the CMDB Query Builder.
- Create a report from CMDB query results.
- Create a schedule to run the query at a future time, and to email the results to interested parties.
• Export query results:
  Export query results that are visible: Click the Query Results context menu and select Export. Even if the Load More Results button is visible, indicating that there are additional query results, only the results that are visible are exported.
• Export and import a CMDB query to port a query definition between instances.
• Populate a CMDB group using the saved query.

Sample CMDB queries

Use the following sample queries to build your own CMDB queries.

Using the CMDB Query Builder requires that the UI16 plugin (com.glide.ui.ui16) is activated.

CMDB query sample

Use this example to build a CMDB query.

All servers with a connection to a database

1. Navigate to Configuration and click CMDB Query Builder
2. Click Create new. Enter a Name - All servers with a connection to a DB. Choose CMDB Query, and click Create.
3. In the CMDB Classes list, locate the Server class, and drag it to the canvas.
4. Locate the Database class, and place it to the right of the Server class node on the canvas.
5. Click at the center of the right side of Server, and then at the center of the left side of Database to create a connection.
6. Select the Server 1 node on the canvas. In the Relationship Types and Related Items section in the right-side bar, click Add Relationship Types and add all the relationships from the list.
   Note that the added relationships appear in the right-side bar, in the Relationship Types and Related Items section.
7. Click Save, and then click Saved Queries on the left to see the widget for the saved query.
8. Click the query widget to return to the canvas in edit mode.
9. Click Run to execute the query.
   Review the query results. Each row displays the name of a server CI, the name of a database CI, and the relationship type between them.
10. Add columns to the query results:
    a. Click the Server 1 node on the canvas once or twice so that the Server 1 Report Columns section appears in the right-side pane. Click Add Columns.
    b. Select Manufacturer and then click outside the columns list to close it.
    c. Click Run.
       Review the query results which now include the Manufacturer column.
    d. Click Save again to save all your customization for this query.

Service Mapping query sample

Use this example to build a Service Mapping query.
Linux server in services

**Note:** To build and run a Service Mapping query, Service Mapping must be activated.

1. Navigate to **Configuration** and click **CMDB Query Builder**
2. Click **Create new**. Enter a **Name** - *Linux server in services*. Choose **Service Mapping Query**, and click **Create**.
3. In the **CMDB Classes** hierarchy list, locate **Linux Server** and drag it to the canvas.
4. Click **Run**.
   Review the query results. Each row displays the name of a Service Mapping Service and the name of a Linux Server that is a member of that service.
5. On the right-side pane, click **Disable Service Including This Pattern** and then click **Run** again.
   Review the query results. Now, each row displays the name a Service Mapping Service that does not include the specified Linux Server.

Run a partial CMDB query

You can run a partial query in the CMDB Query Builder by defining a section of a query, and then running it.

The **UI16 plugin** (com.glide.ui.ui16) must be activated.

Role required: **cmdb_query_builder** (contained for itil, itil_admin, and asset)

While building a query or reviewing a saved query, you can run only a section of the query. On the canvas in the CMDB Query Builder, highlight a section of the query which contains the nodes and relationships of the partial query that you want to run. You can then examine the results of the partial query, and update the query if needed.

1. Navigate to **Configuration** and click **CMDB Query Builder**.
2. On the CMDB Query Builder page, click a tile to open an existing query.
3. Click the selection tool under the navigation tool to switch to a section selection mode.
4. Border a section of the query:
   a) Click the mouse device on the upper left corner of the section that you want to create.
   b) Drag the mouse device to the bottom right corner of the section that you want to create. As you drag the mouse device, the selected section is highlight in light blue.
   c) Release the mouse device. The query nodes that are included in the partial query, appear with a blue border.
5. Click **Run**.
6. In the **Pick Starting Node** dialog box, select the starting node for the partial query, and click **Confirm**.

The results of the partial query appear in the Results pane.

Navigation in CMDB Query Builder

Use the navigation tools to enlarge or shrink the query, to move the query, or to border a section of the query to run.

Using the Query Builder requires that the **UI16 plugin** (com.glide.ui.ui16) is activated.
Use the buttons in the navigation tool as follows:

- Use the plus sign (+) to increase magnification of the query.
- Use the minus sign (-) to decrease magnification of the query.
- Click the center dot to center the query on the canvas.
- Use the direction arrows to move the query in that direction.
- Use the selection tool under the navigation tool to toggle between two states:
  - Moving the entire query on the canvas.
  - Bordering a section of the query, which you can then run as a partial query.

Create a report from CMDB query results

After running a query in the CMDB Query Builder, you can generate static reports that are scoped to the query results.

The UI16 plugin (com.glide.ui.ui16) must be activated.

Role required:
- View report: cmdb_query_builder or cmdb_query_builder_read
- Create report: cmdb_query_builder or cmdb_query_builder_read, and report_user

In a base system, the cmdb_query_builder role is contained in the itil and asset roles.

1. Navigate to Configuration and click CMDB Query Builder.
2. Build a query.
3. In the query results pane, click the list context menu and select Bar Chart or Pie Chart.

The Reports application creates a report that is scoped to the query results.

Search saved queries

The CMDB Query Builder allows you to search for a specific saved query using any combination of search criteria based on the query's title, type, custom tags, and who created or updated the query.

To locate a saved query using a Query Tags search criteria, the query must have a query tag associated with it. For more information see Build a CMDB query using the CMDB Query Builder, or Build a Service Mapping query using the CMDB Query Builder.

The UI16 plugin (com.glide.ui.ui16) must be activated.

Role required: cmdb_query_builder (contained for itil, itil_admin, and asset)

1. Navigate to Configuration > CMDB Query Builder.
2. In the **Search Saved Queries** box on the **Saved Queries** tab, enter a string to search for.

   The resulting list displays all search categories that can be applied using the search string.

3. Select an item from the list to add it as a search criteria.

4. Refine the search string or select additional search criteria as needed.

### Create a schedule for a CMDB query

Schedule a saved CMDB query to run once at a scheduled time or on a recurring schedule, and to email the query results to specified users.

The **Ui16 plugin** (com.glide.ui.ui16) must be activated and a saved CMDB query that was built in the CMDB Query Builder must exist.

Role required: cmdb_query_builder (contained for itil and asset)

The query results are attached to the email as a file in the specified format. By default, the maximum result rows that can be attached is 10,000. This is controlled by a system property.

1. If need to, navigate to **Configuration**, click **CMDB Query Builder**, and then click a saved query.

2. Click **Create Schedule** and fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Query</td>
<td>The query to run.</td>
</tr>
<tr>
<td>Users</td>
<td>Users who should receive query results email. To receive emails, users must have an Email address defined and have Notifications set to Enable in their user records.</td>
</tr>
<tr>
<td>Groups</td>
<td>Groups to email the query results to.</td>
</tr>
<tr>
<td>Zip output</td>
<td>Indicates whether the report should be sent as a zip file.</td>
</tr>
<tr>
<td>Active</td>
<td>Indicates whether to run the query according to the specified schedule.</td>
</tr>
<tr>
<td>Run</td>
<td>Frequency for running the query.</td>
</tr>
<tr>
<td>Time</td>
<td>Time of day to run the query.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Indicates whether to display the <strong>Condition</strong> field, which allows you to specify conditions under which the query runs.</td>
</tr>
<tr>
<td>Omit if not records</td>
<td>Indicate whether to distribute email if the query returns zero results.</td>
</tr>
<tr>
<td>Email addresses</td>
<td>Email addresses of users who should receive the email but who are not in the system.</td>
</tr>
<tr>
<td>Subject</td>
<td>Text that appears in the subject line of the distribution email.</td>
</tr>
<tr>
<td>Introductory message</td>
<td>Additional message that is delivered with the query results.</td>
</tr>
</tbody>
</table>
Export and import a CMDB query

Export a saved CMDB or Service Mapping query definition to an XML file which you can later import and run in the CMDB Query Builder. This process lets you port a saved query between instances, such as from a development environment to a production environment.

- You must save a query before you can export it.
- Domain in an exported query must be visible in both, source and destination instances.

Role required: cmdb_query_builder (contained in itil, itil_admin, and asset).

When exporting a combination query, the integrated Service Mapping query definition is included in the exported query.

For backward compatibility, you can alternatively Export and import a query as an update set.

1. Navigate to Configuration > CMDB Query Builder.
2. Export a saved query:
   a) In the Saved Queries tab, in either list view or card view, select a saved query.
   b) Click the Export query icon at the top of the Query Builder canvas.
   c) Wait for the Query Export Complete message to appear and then click Download.
      You can now access the query XML file.

3. Import a saved query:
   a) In the Saved Queries tab, click the Import query icon at the top of the CMDB Query Builder window.
   b) In Finder, select the saved query XML file and click Open.

      The imported query is available in the Saved Queries tab of the CMDB Query Builder on the instance.

Export and import a query as an update set

Export a saved query definition to an XML file as an update set, which you can later import.

Role required: To export — cmdb_query_builder (contained in itil and asset). To import — user with permission to import an update set.

Domain in the exported query must be visible in both, source and destination instances.

Export a query definition as an update set which you can later import and commit. This process lets you port a query between instances, such as from a development environment to a production environment.
For more information about exporting and then committing update sets using XML files, see Save an update set as a local XML file.

When exporting a combination query, the integrated Service Mapping query definition is included in the exported update set.

1. Export a saved query:
   a) In the Filter navigator, enter qb_saved_query.list and hit Enter to navigate to the Saved Queries table.
   b) In the Saved Queries list view, select the query that you want to export.
   c) Click Actions on selected rows and then select Export query.
   d) Wait for the Query Exporter to complete the export.

2. Import the exported saved query:
   a) Navigate to System Update Sets > Retrieved Update Sets.
   b) On the Retrieved Update Sets form, click Import Update Sets from XML.
   c) On the Import XML page, click Choose file and select the exported XML file. Then click Upload.
   d) Open the new record that was added to the Retrieved Update Sets list view.
   e) On the Retrieved Update Set form, click Preview Update Set Batch and then close the Batch Update Set Preview dialog box.
   f) Click Commit Update Set Batch and then close the Commit Update Set Batch dialog box.

The imported query is added to the Query Builder saved queries on the instance.

Settings for CMDB Query Builder

Use settings to control some aspects of the CMDB Query Builder behavior.

Using the Query Builder requires that the Ui16 plugin (com.glide.ui.ui16) is activated.

Open the Query Builder Settings dialog box:

1. Navigate to Configuration and click CMDB Query Builder.
2. On the CMDB Query Builder page, click the (Settings) icon.
3. Click the Settings icon again to close the dialog box.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Relationships in Results</td>
<td>Display the relationship between CIs in the query results.</td>
</tr>
</tbody>
</table>
Display Suggested Connections
Filter the CMDB classes and the non-CMDB tables lists in the left pane to display only classes and tables that the selected node on the canvas has a relationship with. You can then drag any item from the filtered list to the canvas, and connect it to the selected node on the canvas.
This setting applies only to CMDB queries.

Display Results in New Tab
Display query results in a separate browser tab titled Query Results.

Properties for CMDB Query Builder
Use the CMDB Query Builder properties to configure query processing.
These properties are available for CMDB Query Builder. To view and edit these properties, the admin role is required.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.cmdb.query.max_results_limit</td>
<td>Limits the number of results for a scheduled query and in the results section in the Query Builder when you click Load All Results.</td>
</tr>
<tr>
<td>glide.cmdb.query.batch_time_limit_in_sec</td>
<td>Time limit (in seconds) for running one batch to get one batch of query results (100 results).</td>
</tr>
<tr>
<td>glide.cmdb.query.query_time_limit_in_sec</td>
<td>Time limit (in seconds) for running an entire query to get all results.</td>
</tr>
<tr>
<td>glide.cmdb.query.non_cmdb.black_listed_tables</td>
<td>Blacklist of non-CMDB tables that appear in the CMDB Query Builder when creating a CMDB query.</td>
</tr>
</tbody>
</table>

CMDB Search

Query on CMDB CIs and relationships by entering a search text with configurable synonyms and stop words, which CMDB Search converts into a properly formulated query.

CMDB Search is integrated into the global text search, providing enhanced capabilities for searching the CMDB. CMDB Search is designed to search within CMDB tables and relationships, allowing for queries that are more complex than basic text search. For example, you can query for all Tomcats that are running on Linux, or for all applications of a specific version that are running on Linux.

CMDB Search parses the search text that you enter, to formulate a properly formatted query that runs on the CMDB. Your search text can include plain words which are then parsed to identify any CMDB table, column, or relationship names. CMDB Search also uses synonyms and stop words to replace any plain text strings within your search text.

Localization is not supported for CMDB Search. In a localized instance, query words such as CI, relationship, or server, must be in English.

Stop Words

A collection of words that are ignored when CMDB Search parses your search text. When CMDB Search finds a stop word in your search text, that word is ignored. CMDB Search provides default stop words such as ‘if’, ‘me’, and ‘have’. You can delete or add stop words.

To view stop words, navigate to Configuration > CMDB Search > Stop Words.

Relation Synonyms

A collection of synonyms for relationships. CMDB Search searches your search text for strings that match any relationship synonym. For any such string that is found, CMDB Search replaces that string with the relationship type specified in the relation synonym. CMDB Search provides relationship synonyms for common words that stand for any relationship between two tables. For example, the strings “connect”, “in”, and “on” in your search text, are all treated as a general reference to a relationship, without specifying any relationship in particular. You can modify, delete, or add relationship synonyms.

To view relationship synonyms, navigate to Configuration > CMDB Search > Relation Synonyms.

CI Class Synonyms

A collection of synonyms for CI classes. CMDB Search searches your search text for strings that match any CI class synonym. For any such string that is found, CMDB Search replaces that string with the CI class name specified in the CI class synonym. CMDB Search provides at least one default CI class synonym for each CMDB table. Most default CI class synonyms are the class label. You can modify, delete, or add CI class synonyms.

To view CI class synonyms, navigate to Configuration > CMDB Search > CI Class Synonyms.

Column Synonyms

A collection of synonyms for table columns. CMDB Search searches your search text for strings that match any column synonym. For any such string that is found, CMDB Search replaces that string with the column name specified in the column synonym. CMDB Search provides at least one default column synonym for each table column in the CMDB. Most default column synonyms are similar to the column name itself. You can modify, delete, or add column synonyms.

To view column synonyms, navigate to Configuration > CMDB Search > Column Synonyms.

CMDB Search supports domain separation, searching CIs according to the user domain.
Plugin

To use CMDB Search, activate the CMDB Search (com.snc.cmdb_search) plugin. Activating CMDB Search, triggers an indexing of all CMDB tables to enable using Zing, which is required for some CMDB Searches.

Search text format and examples

The format of the search text is:

\[(<CI \text{ class name}> (<attribute> "value")* (<relationship>)* )*\]

Consisting of a table name, followed by pairs of \(<column> "<value>"\), without any separating commas, and with values surrounded by quotation marks. For column, table, and relationship names, you can search by actual names, labels, or synonyms, and column names can be omitted.

Examples:

- application runs on ci name "ciname"
- application name "JBoss Server13" version "1.0.0.0" on tomcat name "Tomcat10" version "2.1"
- tomcat on linux
- tomcat name "My Tomcat" version "2.0" running on linux server name "Linux8"
- tomcat "My Tomcat"
- tomcat name "My Tomcat"
- tomcat name related to Linux server "my server"
- tomcat name related to Linux server ip 1.1.1.1
- services related to tomcat "my tomcat"
- CI impacted by service "EmailService"

Sometimes the search text contains a name, such as Port, which is both a class and a column name. In this situation, the CMDB Search strategy is to first search for a class with the specified name, and then search for a column with the specified name. If this strategy does not yield the expected results, then use the actual class or column name to prevent ambiguity.

Results

Up to 10 query results appear after running the query. To view any additional results, click View all <record> matches. The total number of results that you can view depends on the value of the cmdb.search.rows.limit system property, which is set to 100 by default. You can increase this property value, or you can change the query to return a smaller number of results. Increasing the number of query results might impact performance.

Add synonyms and stop words to CMDB Search

Create, delete, or modify CI class synonyms, column synonyms, relationship types synonyms, and stop words for CMDB Search.

The CMDB Search (com.snc.cmdb_search) plugin must be activated.

Role required: cmdb_read

You can add any number of synonyms or stop words. There can be multiple synonyms for the same CI class, column, or relationship type.
• Add a CI class synonym:
  a) Navigate to Configuration > CMDB Search > CI Class Synonyms.
  b) Click New and fill out the CMDB Search CI class synonym form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Designates that the synonym is in effect.</td>
</tr>
<tr>
<td>Synonym</td>
<td>String to replace with CI type when parsing the search text.</td>
</tr>
<tr>
<td>CI class</td>
<td>The CMDB class for which the synonym applies.</td>
</tr>
<tr>
<td>Is attribute value</td>
<td>Designates that the synonym is applied only for CIs with an attribute whose value equals the synonym. When checked, the synonym is searched through the columns of the CI class. For example, 'Ubuntu' is specified as a synonym for the cmdb_ci_linux_server CI class, but only if one of the CI's attributes (such as operating system) is 'Ubuntu'.</td>
</tr>
</tbody>
</table>

c) Click Submit.

• Add a column synonym:
  a) Navigate to Configuration > CMDB Search > Column Synonyms.
  b) Click New and fill out the CMDB Search column synonyms form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Designates that the synonym is in effect.</td>
</tr>
<tr>
<td>Column</td>
<td>The CMDB column for which the synonym applies.</td>
</tr>
<tr>
<td>Synonym</td>
<td>String to replace with Column when parsing the search text.</td>
</tr>
</tbody>
</table>

c) Click Submit.

• Add a relationship type synonym:
  a) Navigate to Configuration > CMDB Search > Relation Synonyms.
  b) Click New and fill out the CMDB Search relation synonym form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Designates that the synonym is in effect.</td>
</tr>
<tr>
<td>Synonym</td>
<td>String that represents any relationship type.</td>
</tr>
</tbody>
</table>
• Add a stop word:
  a) Navigate to Configuration > CMDB Search > Stop Words.
  b) Click New and fill out the Stop Words form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Designates that the synonym is in effect.</td>
</tr>
<tr>
<td>Stop word</td>
<td>String to ignore when parsing the search text.</td>
</tr>
</tbody>
</table>

c) Click Submit.

When parsing a search text in the global text search box, CMDB Search uses all synonyms and stop words.

Components installed with CMDB search

Several types of components are installed with activation of the CMDB Search (com.snc.cmdb_search) plugin, including tables and properties.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Scheduled jobs installed

<table>
<thead>
<tr>
<th>Scheduled job</th>
<th>Description</th>

</table>

**CMDB CI Lifecycle Management**

From the time of its creation to the time that it is no longer needed, a CMDB CI would typically transition through several operational states while undergoing various operations. CI Lifecycle Management provides the mechanism to define states and actions for a CI and lets you apply appropriate actions based on a CI’s state to tailor the management of CI lifecycle to business needs.

Terms associated with CI Lifecycle Management:

**Operational states**

A set of states that a CI can be at such as 'Operational' or 'Repair in Progress'. A CI can be associated with only a single operational state at any given time. The choices for operational states are based on the **operational_status** field in the [cmdb_ci] table. There are several operational states that are defined in the base system such as 'Retired' and 'Repair in Progress'. You can modify this list to reflect operational states that are relevant in your business.

**Note:** By default, Service Mapping is configured to ignore all host CIs for which the value of Operational status [operational_status] is not 1 (Operational) or the value of status [install_status] is 100 (absent). For additional information about this behavior, see Preparing customized ServiceNow deployments to work with Service Mapping [KB0647574] in the HI Knowledge Base.

CI Lifecycle Management allows multiple operators and automations to simultaneously set different operational states of a CI. Since a CI cannot be associated with multiple operational states, it is important to configure each operational state with a priority. These priorities are then used in such situation to determine which of the operational states is the cumulative operational state.

**CI actions**

A set of actions that can be applied to a CI during its lifetime. You can define CI actions that are relevant in your business.

**Compatible CI Actions**

CI Lifecycle Management allows a CI to have multiple active CI actions simultaneously, however they must be specifically defined as compatible. By default, there are no two actions for a CI that are compatible with each other. You can change this behavior by specifying pairs of actions that are compatible and thus allowed to be applied simultaneously to a CI. For example, you can specify...
that the ‘Patching’ and the ‘Provisioning’ CI actions are compatible making it possible to apply both simultaneously to a CI.

**Not Allowed CI Actions**

By default, any CI action can be applied to any CI. You can restrict this behavior by defining a rule that an action is not allowed for a CI when it is in a specific operational state. For example, you can define a Not Allowed CI Action in which it is not allowed to apply the ‘Provisioning’ action to a Linux Server that is in a ‘Non-Operational’ state.

**Not Allowed Operational Transitions**

By default, transitions are allowed from any operational state to another. You can restrict this behavior by defining a rule that for a specified CI, a transition from a certain operational state to another operational state is not allowed. For example, you can define that for a Linux Server it is not allowed to transition from 'Repair in progress' to 'Non-Operational'.

**Requestor**

A requestor can be a workflow or a non-workflow operator that is trying to set operational states and apply CI actions. Each requestor has an associated requestor ID that is a GUID and that can be an active workflow context or a non-workflow registered operator ID.

**Lease time**

A time period that each requestor (especially non-workflow operators) can provide, during which a specified CI action is allowed to be active for a specified CI.

CMDB CI Lifecycle Management provides a set of APIs to manage CI operational states and CI actions. And the UI where you define a set of rules to restrict certain operational state transitions and to restrict actions based on operational states. It also provides a mechanism to audit CI operational state and CI actions during the entire CI lifecycle.

Providers such as automation, workflows, or Change Management can use CI Lifecycle Management as a mechanism to manage CI operational states and apply CI actions. By default, the behavior of CI Lifecycle Management has no restrictions on some operations, and full restrictions on other operations. The CI Lifecycle Management UI lets you modify this default behavior by specifying Not Allowed CI Actions, Compatible CI Actions, and Not Allowed Operational Transitions that restricts some operations and enables for others.

With CI Lifecycle Management you can:

- Manage CI operational states and CI actions throughout the entire CI lifecycle.
- Manage CI operational state transitions.
- Restrict certain operational state transitions.
- Associate certain actions for certain CI types that are in specific operational state.
- Restrict IT Service Management applications based on CI operational state.
- Audit CI operational states and CI actions during the entire CI lifecycle.

**Lifecycle management APIs**

CI Lifecycle Management provides a set of APIs to manage CI operational state and CI actions during the entire CI lifecycle. All restrictions and allowances specified by rules in the UI are enforced when state management APIs run, and if an API attempts to perform a restricted operation, the operation is blocked and an error is logged.
Registering requestors

When using the lifecycle management APIs to apply CI actions, requestors are required to be registered and to obtain a requestor ID which is unique within the lifecycle management tables. To register and to obtain a requestor ID, non-workflow users should call the registerOperator API. Workflow users can use the active Workflow context as the requestor ID, and they do not need to explicitly call registerOperator.

After completing the CI lifecycle operations, the requestor should call the unregisterOperator API to unregister. All the state management records associated with that specific requestor ID are then marked as inactive or they are removed by the CI Lifecycle Management — Restore Internal State Management Tables scheduled job.

Integration with Incident Management and Problem Management

A base instance includes the pre-defined CI action CreateTask used for creating a task for a CI. New instances have a pre-defined Not Allowed CI Action, specifying that the CreateTask action is not allowed for any CI with a Retired operational state. This restriction is integrated with Incident Management and with Problem Management to prevent the creation of incident or problem tasks for retired CIs. The CreateTask CI action is used as a reference qualifier to the Configuration Item field of the Incident/Problem tables. In a new incident or problem, CIs in which Operational Status is Retired — are filtered out from the Configuration Item list on the form. For more information about reference qualifiers, see Reference qualifiers.

Integration with Asset Management

In a base system, a CI’s Operational Status field and the Status/Hardware Status (if its hardware) fields are kept synchronized if one of the two fields’ values is Retired. When Operational Status of a CI is set to Retired, then the Status/Hardware Status field is automatically set to Retired. In the opposite direction, when the Status/Hardware Status field of a CI is set to Retired, Operational Status is then automatically set to Retired too. When an Operational Status field changes from Retired to another status, the CI’s Status/Hardware Status field is set to Installed. And when a CI’s Status/Hardware Status field changes from Retired to another status, the Operational Status field is automatically set to Non-Operational.

Whenever CI’s Status/Hardware Status changes, it is synchronized to the CI’s corresponding Asset State field, and vice versa — keeping the CI’s Operational Status and the CI’s corresponding Asset State synchronized.

For more information about mapping Asset State and Substate fields to a CI’s Status/Hardware Status (if its hardware) field, see Map asset state and CI hardware status. And for more information about retiring assets, see Retire assets.

Get started with CI Lifecycle Management

Follow these high level steps to get started and to track activities of the CI Lifecycle Management module of the CMDB application.

1. Activate the base system CI Lifecycle Management - Restore Internal State Management Tables scheduled job that continuously checks and maintains data integrity of all internal CI Lifecycle Management tables.
2. Define CI actions.
3. Define compatible CI actions rules.
   Navigate to Configuration > CI Lifecycle Management > CMDB CI Actions to display currently active/inactive CI actions in the CMDB.
4. Define not-allowed CI actions rules.
5. Define not-allowed operational state transitions rules.
6. Define new operational states by modifying the operational_status field in the [cmdb_ci] table in the system dictionary.
   Navigate to Configuration > CI Lifecycle Management > View Internal Operational States to display available operational states set by each requestor.
7. Set priority for operational states.
8. Call APIs to apply CI actions.
   Navigate to Configuration > CI Lifecycle Management > CMDB CI Actions to display which actions were submitted and their active/inactive state in the CMDB.
9. Navigate to Configuration > CI Lifecycle Management > View CI State Registered Users to display currently registered operators that were registered via the registerOperator API.
10. Review Renew Lease tasks and extend leases as needed: Navigate to Configuration > CI Lifecycle Management > Renew Lease Tasks. These tasks are created automatically by the CI Lifecycle Management - Restore Internal State Management Tables scheduled job for CI action records in which the lease for a valid requester has expired. The Requestor should use the lifecycle management API ExtendCIActionLease to extend the lease. Otherwise, if the lease remains expired for a specified grace period, the CI Lifecycle Management - Restore Internal State ManagementTables scheduled job marks the respective CI action record as 'inactive'.
    The grace period for expired lease time is configurable by the system property glide.cmdb.statemgmt.max_lease_expired_days.
11. Navigate to Configuration > CI Lifecycle Management > State Management Logs to display logs of CI Lifecycle Management operations.

Lifecycle management APIs

CI Lifecycle Management provides a set of state management APIs for manipulating CI operational states, and applying CI actions. State management APIs adhere to restrictions and allowances specified by Not Allowed CI Actions, Compatible CI Actions, and Not Allowed Operational Transitions. If an API attempts to perform a restricted operation, the operation is blocked, an error is logged, and a task is automatically created if appropriate.

Lifecycle management APIs can set operational states and CI actions to CMDB groups by utilizing lifecycle management bulk APIs.

Registration APIs

- registerOperator() - Method to register operator with state management for non-workflow user.
- unregisterOperator(String requestorId) - Method to unregister operator for non-workflow users.
- isValidRequestor(String requestorId) - Method to determine if the specified requestor is a valid active workflow user or a registered user.
- isLeaseExpired(String requestorId, String ciSysId, String ciActionName) - Method to check if registered user lease expired.
- extendCIActionLease(String requestorId, String ciSysId, String ciActionName, String leaseTime) - Method to extend CI Action Lease time, for registered users. If previous lease already expired, extend lease from now.

Operational State APIs

- setBulkCIOperationalState(String requestorId, String sysIdList, String opsLabel, String opsStateListOld) - Method to set Operational State for an array of CIs.
• `getOperationalState(String ciSysId)` - Method to get CI Operational State.

**CI Actions APIs**

• `addBulkCIAction(String requestorId, String sysIdList, String ciActionName, String ciActionListOld, String leaseTime)` - Method to add CI Action for an array of CIs.
• `removeBulkCIAction(String requestorId, String sysIdList, String ciActionName)` - Method to remove a CI Action for a list of CIs.
• `getCIActions(String ciSysId)` - Method to get CI Actions.

**Not Allowed Action Based on Operational State API**

• `isNotAllowedAction(String ciType, String opsLabel, String actionName)` - Method to check if a specific CI action is not allowed for specific Operational State on a CI Type.

**Not Allowed Operational State Transition API**

• `isNotAllowedOpsTransition(String ciType, String opsLabel, String transitionOpsLabel)` - Method to check if specific operational state transition is not allowed on a CI Type.

**Compatible Action API**

• `isCompatibleCIAction(String actionName, String otherActionName)` - Method to check if two specific actions are compatible with each other.

**Using state management APIs**

```javascript
// 1. Register Operator with State Mgmt
var output = SNC.StateManagementScriptableApi.registerOperator();
var jsonUntil = new JSON();
var result = jsonUntil.decode(output);
var requestorId = result.requestorId;

// Get list of sys_ids to update
var sys_ids;

// 2. Set list of sys_ids's Operational State to 'Repair in Progress'
output = SNC.StateManagementScriptableApi.setBulkCIOperationalState(requestorId, sys_ids, 'Repair in Progress');
gs.print(output);

// 3. Set list of sys_ids's CI Action State to 'Patching'
output = SNC.StateManagementScriptableApi.addBulkCIAction(requestorId, sys_ids, 'Patching');
gs.print(output);
```
Components installed by CI Lifecycle Management

Several types of components are installed by CI Lifecycle Management (included in the com.snc.cmdb plugin), including tables, scheduled jobs, and properties.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Scheduled jobs installed

<table>
<thead>
<tr>
<th>Scheduled job</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Lifecycle Management - Restore Internal State Management Tables</td>
<td>Continuously checks and maintains the data integrity of all internal CI Lifecycle Management tables.</td>
</tr>
</tbody>
</table>

Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI State Registered Users [statemgmt_register_users]</td>
<td>All currently active registered users that were created via the registerOperator API. You cannot manually add new records to this table.</td>
</tr>
<tr>
<td>CI Actions [statemgmt_ci_actions]</td>
<td>A set of CI actions that can be applied to a CI during its lifetime.</td>
</tr>
<tr>
<td>CMDB CI Actions [statemgmt_cmdb_actions]</td>
<td>Active/inactive CI actions set by a specific requestor for a specific CI. You cannot manually add new records to this table.</td>
</tr>
<tr>
<td>Compatible CI Actions [statemgmt_compat_actions]</td>

<td>Maximum number of CIs that CI Lifecycle Management can process in a bulk update operation.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 1000</td>
</tr>
<tr>
<td></td>
<td>• Location: System Property [sys_properties] table.</td>
</tr>
</tbody>
</table>

Activate the CI Lifecycle Management scheduled job

When starting to use the CI Lifecycle Management module, ensure to activate the **CI Lifecycle Management - Restore Internal State Management Tables** scheduled job which is disabled by default. This scheduled job continuously checks and maintains the data integrity of all internal CI Lifecycle Management tables.

When CI Lifecycle Management operations do not complete properly, for example due to a failure of the requestor or a requestor whose lease has expired, the integrity of tables related to CI Lifecycle Management might be compromised. The **CI Lifecycle Management - Restore Internal State Management Tables** scheduled job scans tables related to CI Lifecycle Management, and does the following:

- De-activates or removes all internal lifecycle management records with invalid requestors, and closes any corresponding Renew Lease Tasks if present.
- Detects records associated with a valid requestor whose lease has expired, and automatically creates a Renew Lease Task to notify the user and to provide details for extending the lease. If the requestor takes no action and the lease remains expired for a specified grace period (default 15 days), automatically de-activates the corresponding CI action record, and closes any corresponding Renew Lease Task if present.

1. Navigate to **System Definition**, and click **Scheduled Jobs**.
2. Search for the **CI Lifecycle Management - Restore Internal State Management Tables** job.
3. In the respective **Active** column, double-click the value **false**, and select **true**.
4. Click the **Save** icon.

Define a CI action

Define a CI Lifecycle Management CI action that can be later applied to CIs.

You can view a list of all the actions that are currently applied to CIs by navigating to **Configuration** and clicking **CMDB CI Actions**.

1. Navigate to **Configuration > CI Lifecycle Management > CI Actions**.
2. On the **CI Actions** page, click **New**. Fill in **Name** and **Description**, and then click **Submit**.
Define compatible CI actions

Allow a CMDB CI Lifecycle Management operation in which two specified CI actions can be applied simultaneously to a CI.

By default, it is not allowed to apply more than a single action to a CI. You can change that behavior by defining pairs of CI actions as compatible and therefore these actions can be applied simultaneously to a CI. For example you can specify that Provisioning and Patching are compatible CI actions, which lets you apply both to a CI at the same time.

1. Navigate to Configuration, and click Compatible CI Actions.
2. On the Compatible CI Actions page click New and fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>First action in the compatibility actions pair.</td>
</tr>
<tr>
<td>Compatible Action</td>
<td>Second action in the compatibility actions pair.</td>
</tr>
</tbody>
</table>

An API can successfully apply the two specified actions simultaneously to a CI.

Define a not-allowed CI action

Define a restriction for CI Lifecycle Management in which a specified action is not allowed for a CI that is in a specified operational state.

By default, there are no restrictions in the CMDB CI Lifecycle Management on applying CI actions. You can restrict this behavior by not allowing a specified action to be applied to a CI when it is in a specified operational state. For example, you can define a restriction in which the provisioning action cannot be applied to a Linux Server that is in a non-operational state.

1. Navigate to Configuration > CI Lifecycle Management > Not Allowed CI Actions.
2. Click New on the Not Allowed CI Actions page, and fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not Allowed Action</td>
<td>The action that is being restricted.</td>
</tr>
<tr>
<td>CI Type</td>
<td>The CI type for which the restriction applies to.</td>
</tr>
<tr>
<td></td>
<td>To apply a rule to all CIs, select Configuration Item.</td>
</tr>
<tr>
<td>Operational State</td>
<td>The operational state that the CI must be at in order to apply the restriction.</td>
</tr>
</tbody>
</table>

3. Click Submit.

If an API attempts to apply the specified action to the specified CIs, while it is in the specified operational state, the operation fails and an error is logged.

Set priority for an operational state

CI Lifecycle Management allows multiple operators or automations to simultaneously set different operational states for a CI. A CI can have only a single operational state, so in this case, the cumulative operational state of the CI is set to the one with the highest priority. It is recommended that you specify a priority for each operational state that you define so that a cumulative state can be correctly calculated.
1. Navigate to **Configuration > CI Lifecycle Management > Operational State Priority**.

2. On the **Operational State Priority** page, click the operational state for which you want to set or update priority.

3. Enter a **Priority** and click **Update**.
   
   Smaller numbers represent higher priority.

**Define a non-allowed operational transition**

Define a restriction for CI Lifecycle Management in which a specified CI cannot transition from one operational state to another.

By default, CI Lifecycle Management has no restrictions for transitioning CIs from one operational state to another. You can restrict this behavior by defining transitions that are not allowed for a specified CI. For example, you can define a restriction on transitioning a Linux server from non-operational state to repair in progress state.

1. Navigate to **Configuration > CI Lifecycle Management > Not Allowed Operational Transitions**.

2. On the **Not Allowed Operational Transitions** page, click **New** and fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Type</td>
<td>The CI type for which the restriction applies.</td>
</tr>
<tr>
<td>Not Allowed Transition</td>
<td>The CI state into which transitioning is restricted.</td>
</tr>
<tr>
<td>Operational State</td>
<td>The operational state that the CI must be in for the restriction to apply.</td>
</tr>
</tbody>
</table>

If an API attempts to transition a CI that is in the specified operational state to a state that is not allowed, the operation fails and an error is logged.

**CMDB groups**

A CMDB group is a collection of CIs that lets you apply CI actions collectively to all the CIs that are members in the group. For example, a CMDB CI Lifecycle Management API can use a CMDB group scriptable API to retrieve the group's list of CIs, and then apply a CI Lifecycle Management action collectively to all the CIs.

**Group type**

A CMDB group is configured with a group type. If a CMDB group is set with the Health group type, then the CIs in the group can be monitored by CMDB Health, and the aggregated health is reported for the group as a whole in the CMDB group view dashboard. For example, you can monitor health only for CIs in a specific location.

**Populate a CMDB group**

Depending on the group type, you can populate a CMDB group by manually adding individual CIs, selecting saved CMDB queries, or building encoded queries in the CMDB group itself. The resulting CIs from each query are added as members to the group.

Roles required:

- To view CMDB groups - itil
- To use a CMDB queries - cmdb_query_builder on top of itil

© 2021 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
• To manually add CIs - itil or asset

Also, to populate a CMDB group using a CMDB query, a saved CMDB query must exist.

1. Navigate to Configuration > CMDB Group.
2. In the CMDB Groups pane click New.
3. Fill out the form, right-click the title bar and select Save.

<table>
<thead>
<tr>
<th>CMDB Group form</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Group Name</td>
</tr>
</tbody>
</table>
| Group type    | • Default: Basic group type which can be populated by manually adding CIs, saved queries, and encoded queries.  
• Health: Sets CMDB Health to monitor the health of the group CIs and aggregate health results for the group as a whole. Can be populated only by encoded queries. |

Note: Dynamic filters are not supported when populating this type of CMDB groups.

4. To use saved CMDB queries:
   a) Click CMDB Group Contains Saved Queries and then click Add Query.
   b) Select a query from the Query Builder Saved Query list.
   c) Click Submit.

   The query that is used returns a list of CIs of the class in the start node of the query.

5. To manually add CIs:
   a) Click CMDB Group Contains Configuration Items and then click Edit Manual CI.
   b) Optionally add filters.
   c) Select CIs in the Configuration Item list and click the '+' icon at the bottom.
   d) In the Group members list, select the CIs to add to the group.
   e) Click Save or Save and Exit.
   f) In the Save Confirmation dialog box, click OK.
   g) Click Submit.
To use encoded queries:

a) Click **CMDB Group Contains Encoded Queries** and then click **New**.

b) Select a class for which the encoded query applies to and add conditions to build a query. The resulting CIs are included in the group.

![Note: Dynamic filters are not supported for CMDB health-type groups, even though it is possible to add them in a condition clause.]

c) Click **Submit**.

Click **Show All CI** to display all CI members of the group.

### Show CI Lifecycle Management details for CMDB group CIs

Display CI Lifecycle Management operational state and CI actions that apply to the CIs that are members of a CMDB group.

If the CMDB group is based on a CMDB query, then the query runs in real-time and displays the resulting CIs. If the query does not complete successfully due to timing out or for other reasons, then appropriate error messages are displayed.

1. Navigate to **Configuration > CMDB Groups**.
2. On the **CMDB Groups** page, click on a CMDB group.
3. Click **Show All CI**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item</td>
<td>CI group member.</td>
</tr>
<tr>
<td>Class</td>
<td>Class of CI group member.</td>
</tr>
<tr>
<td>Operational Status</td>
<td>CI Lifecycle Management operational state of the CI such as 'Repair in Progress' or 'Operational'. Possible operational states are defined in the choice list of the <strong>Operational status</strong> field in the <em>cmdb_ci</em> table.</td>
</tr>
<tr>
<td>Actions</td>
<td>CI Lifecycle Management actions that apply to the CI such as 'Cloning' and 'Provision'. Possible actions are defined in the CMDB CI Actions [statemgmt_cmdb_actions] table.</td>
</tr>
</tbody>
</table>

### CMDB Identification and Reconciliation

The Identification and Reconciliation module provides a centralized framework for identifying and reconciling data from different data sources. It helps maintain the integrity of the CMDB when multiple data sources such as EventManagement, Discovery, ImportSets, and ManualEntry are used to create and update CI records.

The use of multiple sources increases the risk of introducing inconsistencies through duplicate records. To maintain the integrity of the database, it is important to correctly identify CIs and services so that new records are created only for CIs that are truly new to the CMDB. Identification and Reconciliation helps you prevent duplication of CI records, reconcile CI attributes, reclassify CIs, and allow only authoritative data sources to update the CMDB.
Domain separation in CMDB Identification and Reconciliation

This is an overview of domain separation and the CMDB Identification and Reconciliation feature. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

This topic explains how domain separation is enforced during the CMDB Identification and Reconciliation process. In addition this topic addresses how domain separation is applied to the Identification and Reconciliation rules.

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

How domain separation works in Identification and Reconciliation

The identification process is domain aware. If the domain separation plugin has been activated, then identification processes only those CIs in which the domain ID is identical to the domain of the currently logged on user. If duplicate CIs exist across domains (including parent and child domains), then those CIs are not considered duplicate CIs because their domain IDs do not match. Domain separation in the identification engine is enforced as soon as users activate the domain separation plugin.

Domain separation during the Identification and Reconciliation Process

- Domain separation during the Identification/Reconciliation process is enforced through the domain ID.
  - Domain IDs do not need to be explicitly sent in the input payload of the identification engine APIs. Internally, the identification engine causes the current domain ID of the user to call the identification engine APIs.
  - Only CIs that have the same domain ID as the currently logged-in user's domain display during matching.
  - During matching, if no records are found and a CI needs to be inserted, the CI's domain ID is the same as the domain ID of the currently logged-in user’s domain.
  - During matching, if duplicates are found, De-Duplication tasks created in the [reconcile_duplicate_task] table, have the same domain ID as those of the duplicate CIs.
  - Duplicate CIs that exist across domains (including parent and child domains) are not considered as duplicate CIs by the identification engine.
  - During matching, if reclassification of the CI is not allowed, reclassification tasks are created in the [reclassification_task] table, with the same domain ID as the CI for which reclassification is needed.

Domain separation and Identification Rules

- The identification rules and identification inclusion rules used during the identification process are always defined at the global level. For example, the tables below do not have a sys_domain field:
  - Identifier (cmdb_identifier), Identifier Entries (cmdb_identifier_entry), Related Entries (cmdb_related_entry), and Identification Inclusion Rules (cmdb_ie_active_config).
Domain separation and Reconciliation Rules

- The reconciliation definition rules and data source precedence rules that are used during the reconciliation process can be defined for different domains. For example, the tables below do have sys_domain, sys_overrides, sys_domain_path fields:
  - Reconciliation Definition (cmdb_reconciliation_definition), Datasource Precedence (cmdb_datasource_precedence), and Data Source Staleness Definitions (cmdb_datasource_staleness).

Identification and reconciliation components and process

The CMDB identification and reconciliation functionality is supported by identification rules, reconciliation rules, de-duplication tasks, and reclassification tasks.

Components of Identification and Reconciliation

Identification

Identification is the process of uniquely identifying CIs, to determine if the CI already exists in the CMDB or if it is a newly discovered CI that must be added to the CMDB. The identification engine performs identification processes, relying on identification rules.

Reconciliation

Reconciliation is the process of reconciling CIs and CI attributes by allowing only designated authoritative data sources to write to the CMDB at the CI table and attribute level. The CMDB is updated in real time as records are being processed. There is no staging area to verify the reconciliation activities before they are committed. The process relies on reconciliation rules.

De-duplication tasks

If the instance encounters duplicate CIs during the identification and reconciliation process, it groups each set of duplicate CIs into a de-duplication task. Review the information in these tasks to see how it was determined that these CIs are duplicates.

Reclassification tasks

During the CI identification process, a matched CI might need to be upgraded, downgraded, or switched to another CI class. If automatic reclassification is disabled, then the system generates a reclassification task. Review the information in these tasks, and decide whether a manual reclassification of the CI is appropriate.

APIs

The Identification and Reconciliation APIs are a centralized set of APIs that can be used with different sources of data such as Discovery, Monitoring, or Import Sets. You can use it to enforce identification and reconciliation before data is stored in the CMDB. Data sources do not directly write to the CMDB. Instead, they call the APIs first to ensure that the data being written does not introduce inconsistencies.

Identification engine APIs are accessible in scoped apps. See Activate Configuration Management For Scoped Apps (CMDB) for information about how to activate the plugin, and how to script a scoped app to access those APIs.

- createOrUpdateCI(): A scriptable API that creates or updates a CI based on identification and reconciliation rules.
- **identifyCI()**: Similar to the **createOrUpdateCI** API, but does not commit the result to the database. Use this API with a given payload to find out if the identification engine will perform insert or update operations, without committing the operation.
- **CMDBTransformUtil**: An API to be used exclusively with Import Sets to **apply identification and reconciliation processes to data imported by Import Sets**.

Predefined identification and reconciliation rules are included for tables that are in the base instance. You can customize these rules for your organization. When a new table is created in the CMDB, it derives identification and reconciliation rules from its parent table if these rules exist. To apply identification and reconciliation rules to a new table, create the rules either at the child level or at its parent level.

**Process flow of Identification and Reconciliation**

![Flowchart of Identification and Reconciliation](chart.png)

**Identification and Reconciliation Engine (IRE)**

IRE is an underlying key component in Identification and Reconciliation, providing a centralized framework to perform identification and reconciliation processes across different data sources. IRE uses identification
rules and reconciliation rules when processing incoming data before inserting that data to the CMDB. IRE processes help maintain data integrity in the CMDB.

- IRE prevents duplicate CIs by uniquely identifying CIs.
- IRE reconciles CI attributes by allowing only authoritative data sources to write to CMDB.

**Activate Configuration Management For Scoped Apps (CMDB)**

You can activate the Configuration Management For Scoped Apps (CMDB) plugin (com.snc.cmdb.scoped) to allow a scoped app in scripts to use the prefix 'sn_cmdb.IdentificationEngine.<method>' to access identification engine APIs. This plugin does not include demo data and activates related plugins if they are not already active.

Role required: admin

For plugin activation steps, see Activate a plugin.

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   - You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise they will receive the following error: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

**Apply CI Identification and Reconciliation to Import Sets**

You can apply CMDB Identification and Reconciliation processes when Import Sets are used to import CIs into the CMDB. CI identification can prevent duplicate CIs in the CMDB, which Import Sets might otherwise cause.

Populating CMDB tables using Import Sets can inadvertently result in duplicate CIs when multiple imported records are identical to an existing CI. To minimize this duplication, you can apply CMDB Identification and Reconciliation processes to Import Sets when importing new records into CMDB tables.

**Transform map script**

In the onBefore transform map script for an import set, add a call to the CMDBTransformUtil API, similar to the following code sample:

```javascript
(function runTransformScript(source, map, log, target) {
    // Call CMDB API to do Identification and Reconciliation of current row
    var cmdbUtil = new CMDBTransformUtil();
    cmdbUtil.identifyAndReconcile(source, map, log);
    ignore = true;

    if (cmdbUtil.hasError()) {
        var errorMessage = cmdbUtil.getError();
        log.error(errorMessage);
    } else {
        log.info('IE Output Payload: ' + cmdbUtil.getOutputPayload());
        log.info('Imported CI: ' + cmdbUtil.getOutputRecordSysId());
```
The `ignore = true` code phrase prevents Import Sets from creating the same record again after it is processed by the identification engine.

**Process**

The identification engine performs identification of each source record before it is inserted into the CMDB. The identification engine determines if the record is a duplicate of an existing CI, and then:

- If not duplicate: Inserts the record to the target table.
- If duplicate: Updates the existing CI in the CMDB, with data from the source record.

The CMDBTransformUtil API pre-processes the source data, then passes the input values to the identification engine with import set being the data source by default. The CMDBTransformUtil API supports a target field that is a reference field in the same manner that Import Sets supports it. The CMDBTransformUtil API also supports a source script, evaluating source scripts to determine the target value which is then passed to the identification engine. For more information, see [Creating a field map](#).

**Specify multiple target tables for an import set**

You can configure each record in an import set with its own target table. Then, instead of inserting all the transformed records into a single target table, the records are inserted into the different target tables that are specified per record. For example, you might need to insert some records from the import set to the Computer class and other records to the Server class.

When importing data using Import Sets, incorporate the following steps:

- In the data source file, add a target table column. Use a string such as "MyTable" to label the column header. In each record row, enter the target table for the record, as a valid CMDB class name such as "cmdb_ci_computer".
- After you Auto Map Matching Fields on the Table Transform Map form, add a field map for the added target table column to establish a relationship between classes and the target tables in the CMDB.

1. In the Field Map related list on the Table Transform Map form, click **New**.
2. Set **Source field** to the header of the target table column that you added in the data source file, such as **MyTable**.
3. Set **Target field** to **Class**.
4. Click **Submit**.

When you configure an import set with multiple target tables as described in the steps above, the **Target table** that is specified on the Table Transform Map form is not used.

**Restrictions**

The following restrictions apply:

- An import set should be associated with a single transform map. While adding a call to the CMDBTransformUtil API, ensure that still a single transform map exists for the import set.
• The CMDBTransformUtil API does not check if mandatory fields have values when used with Import Sets. Regardless of how enforce mandatory fields is set in the transform map, data import fails if a mandatory field does not have a value.
• CI Identification and Reconciliation cannot be applied to Import Sets for dependent CIs (CIs with dependent identification rules).

**CMDB identification rules**

The CMDB identification process relies on identification rules to uniquely identify CIs.

An identification rule applies to a CI class and consists of a single CI identifier and one or more identifier entries and related entries, each with a different priority. Each identifier entry defines a unique attribute set with a specific priority and each related entry defines rules for identifying related items. Create strong identification rules that are set with the highest priority for the strongest identifier entries and related entries.

The identification process and identification rules use the CIs attributes for identification:

**Unique attributes**

Designated sets of criterion attribute values of a CI, that can be used to uniquely identify the CI. Unique attributes can be from the same table or from derived tables.

**Required attributes**

Designated attributes of a CI that cannot be empty.

**Identification rule types**

The steps for identifying dependent CIs can be different from the steps for identifying independent CIs. This difference is reflected in the differences between dependent identification rules and independent identification rules.

**Independent identification rule**

A rule that identifies a CI based on the CI's own attributes, independently of other CIs or relationship.

**Dependent identification rule**

A rule in which identifying a CI requires identifying a dependent CI first. A CI can have dependency on one or more CIs, and a dependent CI can have only a single parent CI with dependency. The relationship types between the CI and its dependent CIs are also included in the identification process. To help with the identification process of dependent CIs, create dependent relationships that define the dependency chain within CI types.

The payload used for identification of a dependent CI, can include a relationship with a qualifier chain. For such relationship, if there is a matching parent/child pair, the system compares the qualifier chain in the payload, with the qualifier chain of the CIs in the database. If there is a difference, the qualifier chain in the database is updated to match the qualifier chain in the payload for that relationship.

**Identifier entries**

You can configure an identifier entry to match a CI not only based on the CI’s own attributes (field-based identification) but also based on the CI’s related list (lookup-based identification) such as Serial Numbers or Network Adapters. The lookup table that is used for identification, needs to have a reference field that points to cmdb_ci.
There are three types of identifier entries:

**Regular identifier entry**

Based on CI's attributes that uniquely identify the CI.

**Lookup identifier entry**

Uses a lookup table (related table) which can be any table that has a reference to the CI that is being identified. After you select a related lookup table, you select identifier attributes from the related table that reference either the cmdb_ci table itself, or one of its descendants.

If the lookup records do not already exist, then they are inserted in the lookup table referenced in the identifier entry.

**Hybrid identifier entry**

A combination of both, a regular identifier entry and a lookup identifier entry.

Example: When discovering virtual machines in a cloud environment which contains two virtual machines with identical serial numbers. A regular identifier entry for the Hardware table such as 

```
[Table: Serial Number, Criterion Attributes: Serial Number, Serial Number Type]
```

cannot uniquely identify these two virtual machines. However, a hybrid identifier entry such as 

```
[Table: Serial Number, Criterion Attributes: Serial Number, Serial Number Type + (Name field from main Hardware table)]
```

can uniquely identify the two virtual machines.

**Guidelines for lookup tables**

Follow these guidelines when specifying a lookup table in an identifier entry.

1. Ensure that lookup tables reference the cmdb_ci table.
2. It is preferable to enforce exact count match (check box Enforce exact count match (Lookup)) for a stronger identification rule. During lookup identification, this option enforces matching only on exact lookup records count match. See Create or edit a CI identification rule for more details.
3. Do not create conflicting identification rules especially for lookup-based rule.

Example: In a CI Identifier for the Hardware class, you specify a lookup-based rule for the Network Adapter class and you also define a CI Identifier for the Network Adapter class. Duplicates might potentially be created in the Network Adapter table, because there are contradicting rules to identify a unique CI in that table:

- One rule that looks only at criterion attributes (CI identifier rule)
- Another rule that looks at criterion attributes and referenced sys_id (lookup rule).

Example: CI with related items that needs to be inserted - sysId is available.

```javascript
const payload = {
  items: [{
    className: 'cmdb_ci_linux_server',
    related: [{
      className: 'cmdb_ci_spkg',
      values: {
        name: 'package1',
        version: 'version1'
      }
    }],
    values: {
      sys_id: '194876usyrr65378098'
    }
  }]
};
```
Related entries

You can define related entries which are rules that are based on related CIs. A related entry is based on a related table which can be any table (CMDB or non-CMDB) that has a reference to the CI that is being identified. Related entries let you create or update records on other tables in which the data is associated with the CI being identified by the identifier entries. Related entries are not used to directly identify CIs.

After you select a related table for the rule, the list in Referenced field is populated with fields from the related table that reference either the [cmdb_ci] table itself, or one of its descendants.

Create or edit a CI identification rule

Identification rules are used to uniquely identify CIs in the CMDB, as part of the identification and reconciliation process. Each CMDB class can be associated with a single identification rule.

Role required: itil has read access, itil_admin (on top of itil) has full access.

In a CI identification rule, specify a CI identifier, and identifier entries and related entries that uniquely identify the CI. You cannot use the CI Class Manager to create related entries for an identification rule, instead, add related entries directly to the cmdb_identifier table.

Review the following before creating identification rules:

- CMDB identification rules
- Effective usage of CMDB Identification

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create an identification rule.
3. In the class navigation bar, expand Class Info and then click Identification Rule.
4. Click Edit to edit an existing rule, or click Add in the Identification Rule section to create one. Fill out the form, and then click Save.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Independent/Dependent</td>
<td>Designation of whether the CI identifier can identify the CI independently of other CIs, or not.</td>
</tr>
<tr>
<td><strong>Note:</strong> To set the rule as Dependent, you must specify dependent relationship rules for the selected class.</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Name of CI identifier.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the CI identifier.</td>
</tr>
</tbody>
</table>

5. In the Identifier Entries section, click an existing identifier entry to edit, or click Add to create one.
6. In the Identifier Entry dialog box, choose an option and then click Next. Continue with one of the following three steps according to the option you selected.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use attributes from main table &lt;table&gt;</td>
<td>Lets you select attributes from the currently selected table (regular identifier entry).</td>
</tr>
<tr>
<td>Use attributes from another table (Lookup table)</td>
<td>Lets you select attributes from any related table, other than the currently selected table (lookup identifier entry).</td>
</tr>
</tbody>
</table>
7. **Use attributes from main table <table>** option: Set the options on the form and then click **Save**. **Search On Table** is preset to the currently selected table in the CI Classes list.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box that specifies the identifier entry is active. At least one identifier entry in an identification rule must be active for the rule to apply.</td>
</tr>
</tbody>
</table>
| Priority               | Priority of the identifier entry. Identifier entries are applied based on priority. Rules with lower priority numbers are given higher priority. Identifier entries of identical priorities are applied randomly.  
                          | You can keep gaps between the priority numbers, so you can assign the unused priority numbers to new entries without modifying the existing priority order.                                                       |
| Criterion Attributes   | Set of attributes that uniquely identify the CI. Attributes can belong to the current class, or to a parent class.                                                                                     |
|                        | It is not possible to add reference fields as a criterion attribute. Reference fields store sys_ids that point to a record in another table, and thus is considered a weak criterion attribute (in terms of uniqueness) for the current table. |
| Allow null attribute   | When selected, then if at least one criterion attribute is not null, allow to attempt matching with an identifier entry even if there are criterion attributes which are null.                                |
|                        | Otherwise, all criterion attributes must have values to attempt matching with an identifier entry.                                                                                                       |
| Allow fallback to parent's rules | Allows the identification rules of the CI's parent to be used if a match is not found for this identification rule. Applies only for dependent identification rules.                                                                 |

**Note:**
- If criterion attributes have only two attributes and **sys_class_name** is one of them (for example [name, sys_class_name], [ip_address, sys_class_name]), then the other attribute cannot be NULL, even if **Allow null attribute** is enabled. This restriction is due to **sys_class_name** being considered a special system matching attribute.
- Optional condition is applicable only for lookup or hybrid identifier entries (and not applicable when using attributes from the main table).
- The Optional condition does not apply, although you are able to customize the default Identifier Entry form by adding the **Optional condition** field. Then navigating to...
8. Use attributes from another table (Lookup table) option:
   a) Set Search On Table to a table other than the currently selected table in the CI Classes list. The Search On Table must have a reference field to cmdb_ci, otherwise the identifier entry is considered invalid.
   b) Set the rest of the fields as described in the previous step.
   c) Optionally, click Advanced options and enter the information for a lookup identifier (scroll down if necessary).

<table>
<thead>
<tr>
<th>Advanced Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All of these conditions must be met</td>
<td>A filter to narrow the set of records that will be searched for a matching CI.</td>
</tr>
<tr>
<td>Enforce exact count match</td>
<td>For lookup identification, match a CI only on exact lookup records count match.</td>
</tr>
<tr>
<td></td>
<td>When enforced, all lookup items for a CI in the payload must have matching records in the lookup table, that reference the same CI:</td>
</tr>
<tr>
<td></td>
<td>1. Only matches CIs that have all the lookup items from the input payload referencing the CI in CMDB.</td>
</tr>
<tr>
<td></td>
<td>2. If there are multiple matches, selects the oldest created CI as the final match.</td>
</tr>
<tr>
<td></td>
<td>When not enforced, one lookup item for a CI in the payload matching a record in the lookup table, is sufficient to consider a match:</td>
</tr>
<tr>
<td></td>
<td>1. Matches any CI that has at least one of the lookup items from the input payload referencing the CI in CMDB.</td>
</tr>
<tr>
<td></td>
<td>2. If there are multiple matches, selects the CIs with the max number of lookup items from the input payload referencing the CI in CMDB.</td>
</tr>
<tr>
<td></td>
<td>3. If there are still multiple matches, selects the oldest created CI as the final match.</td>
</tr>
</tbody>
</table>

d) Click Save.
9. **Use attributes from main and another table (Hybrid) option:**
   a) Set the options on the **General Settings** tab as described in previous steps, and then click **Next**.
   b) On the **Main Table Settings** tab, select the attributes to use from the currently selected table, and then click **Next**.
      - **Search On Table** is preset to the currently selected table in the CI Classes list.
   c) On the **Lookup Table Settings** tab, select a **Search On Table** and then in **Criterion Attributes** select attributes from the specified table. **Search On Table** must have a reference field to **cmdb_ci**, otherwise the identifier entry is considered invalid.
      - You can click **Advanced options** and enter the information for a lookup identifier as described in the previous step (scroll down if necessary).
   d) Click **Save**.

**Note:** The **Allow null attribute** option in the hybrid option, is set to ‘false’. Therefore, all of the selected criterion attributes from both the currently selected table and the lookup table, must have a value.

10. **Optional:** Add related entries to the **cmdb_identifier** table.
   a) In the main platform navigation bar, navigate to **Configuration > Identification/Reconciliation**, and click **CI Identifiers**.
   b) In the **Identifiers** view, locate and click the identification rule that you have been editing or creating.
   c) Click the **Related Entries** tab.
   d) In the **Related Entries** related list, click **New** or open an existing entry to specify a related entry for matching the related item. Fill out the form, and then click **Submit**.

**Related Entry form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identifier</td>
<td>The CI identifier for which this related entry belongs to. By default it is set to the identifier you previously selected.</td>
</tr>
<tr>
<td>Related table</td>
<td>A related table that references the CI that is being matched.</td>
</tr>
<tr>
<td>Referenced field</td>
<td>A referenced field in <strong>Related table</strong> that should store the referenced CI. This field always references the cmdb_ci table, or a descendent of the cmdb_ci table.</td>
</tr>
<tr>
<td>Criterion attributes</td>
<td>The set of attributes to uniquely identify the related item. Attributes can belong to the current class, or to a parent class. Click the lock icon to view, add, or remove attributes from the identification rule.</td>
</tr>
<tr>
<td>Optional condition</td>
<td>Use the <strong>Add Filter Condition</strong> and the <strong>Add “OR” Clause</strong> buttons to construct a filter to narrow the set of records that will be searched for a matching related item.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that specifies that the related entry is active.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Allow null attribute</td>
<td>If at least one criterion attribute in the related table is not null, allow to attempt matching with an identifier entry even if there are criterion attributes which are null.</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority of the related entry for the specified <strong>Related table</strong>. Rules with lower priority numbers are given higher priority while matching a related item for specific related table. Related entries for the specified related table with identical priorities are applied randomly. You can keep gaps between the priority numbers, so you can assign the unused priority numbers to new entries without modifying the existing priority order.</td>
</tr>
</tbody>
</table>

**Note:** If criterion attributes have only two attributes and **sys_class_name** is one of them (for example [name, sys_class_name], [ip_address, sys_class_name]), then the other attribute cannot be NULL, even if **Allow null attribute** is enabled. This restriction is due to **sys_class_name** being considered a special system matching attribute.

For example, the pre-defined **Hardware Rule** applies to the Hardware [cmdb_ci_hardware] table. It has an identifier entry with the criterion attribute **Serial Number, Serial Number Type** and its **Search on table** field is set to **Serial Number**.

The following payload snippet adds a CI to the cmdb_ci_linux_server class, that is a child of the Hardware class. It also shows how you can add related items in the payload for which you should create **Related Entries** on the CI Identifier page for the Hardware [cmdb_ci_hardware] table:

```json
{
  "items": [

    {
      "className": "cmdb_ci_linux_server",
      "lookup": [

        {
          "className": "cmdb_serial_number",
          "values": {
            "serial_number": "VMware-42 21 e3 da 44 14 5а a6-56 48 2b 0а 28 53 42 4c",
            "serial_number_type": "system",
            "valid": "true"
          }
        },

        {
          "className": "cmdb_serial_number",
          "values": {
            "serial_number": "4221E3DA-4414-5AA6-5648-2B0A2853424C",
            "serial_number_type": "uuid",
            "valid": "true"
          }
        }
      ]
    }
  ]
}
```
When the **Hardware Rule** is applied, the Serial Number [cmdb_serial_number] table is searched for a match with the values specified within the lookup key. Unless **Enforce exact count match (Lookup)** is checked, it is not necessary for every lookup key to return a match, as long as there is at least one match. If all matches reference the same CI, then that CI is considered to be the existing CI record. If no match is found, then the identification search continues to the next rule entry. If after all the rules are exhausted without finding a match, a new CI record is created in the database.

You can optionally **create an inclusion rule** to narrow the scope of CIs that are included in identification.

**Create an identification inclusion rule**

Narrow the scope of CIs that are included in the identification process by creating an identification inclusion rule.

Role required: itil has read access, itil_admin (on top of itil) has full access.

During duplication detection of independent CIs, the identification and reconciliation engine (IRE) processes only the CIs that satisfy the identification inclusion rules. For example, you can set a filter to include only CIs whose state is operational. When no identification inclusion rules exist, all CIs are included in the identification process and in the CMDB Health duplicate metric calculations. In the base system, there are no predefined identification inclusion rules. Identification inclusion rules are defined at the class level.

Identification inclusion rules also indirectly impact what appears in CMDB health dashboards for duplicate CIs, in addition to any health inclusion rules.
Identification inclusion rules can prevent the identification of certain types of CIs, affecting some features of Discovery and Service Mapping.

1. Navigate to **Configuration > CI Class Manager**.
2. Click **Hierarchy** to display the CI Classes list. Select the class for which to create an identification inclusion rule.
3. In the class navigation bar, expand **Class Info** and then click **Identification**.
4. In the Inclusion Rule (Advanced) section, click **Add** to create a rule or click **Edit** to edit an existing rule. In the Create Inclusion Rules dialog box, specify a criteria in the **Active record condition** field. CIs must meet this criteria to be included in the identification process and in the duplicate CMDB Health metric.
5. Click **Save**.

Navigate to **Configuration > Identification/Reconciliation > Identification Inclusion Rules** to see the list of all identification inclusion rules.

**Reconciliation rules**

Reconciliation rules specify which data sources can update a table or a set of table attributes, and they can be defined at the parent and the child table level. Ensure that there is a reconciliation rule for each data source that is authorized to update an attribute - multiple reconciliation rules can exist for the same set of attributes.

Data sources are used with the **createOrUpdateCI()** API to simulate manual updates to CIs. EventManagement, ImportSet, ManualEntry, and Tivoli are examples of data sources.

As you create reconciliation rules, keep the following principles and guidelines in mind. These principles are designed for flexibility and the refinement of rules at the attributes level.

**Example reconciliation rules**

For example, you might have the following reconciliation rules. The rules are created for the cmdb_ci_computer table and one of its child tables, the cmdb_ci_linux_server table. The rules specify the following:

1. Discovery is exclusively authorized to update the **name** attribute in the cmdb_ci_computer table.

   Because reconciliation rules are derived by child tables from parent tables, this rule also authorizes Discovery to update the **name** attribute in any child tables for the cmdb_ci_computer table.

2. ServiceWatch is exclusively authorized to update the **name** attribute in the cmdb_ci_linux_server table.

3. ServiceWatch is exclusively authorized to update all attributes in the cmdb_ci_linux_server table, as configured by leaving the **Attributes** field empty in the rule.

**Authorization for all attributes in a table**

If you want to authorize a data source to update all attributes in a table, leave the attribute list empty in the reconciliation rule for the data source. However, this authorization can be overridden for some of the attributes by rules for child tables in which specific attributes are listed.
For example, if only example rules #1 and #3 are created, then Discovery is authorized to update the **name** attribute in the cmdb_ci_linux_server table. ServiceWatch is authorized to update all other attributes in the table except for the **name** attribute.

To override the authorization of Discovery to update the **name** attribute, example rule #2 is added to specifically authorize ServiceWatch to update the attribute.

**Authorization to only specific attributes in a table**

If you want to authorize a data source to update specific attributes in a table, list these attributes in the reconciliation rule for the data source. A rule that grants access to specific attributes in a table overrides other rules with an empty attribute list that grants access to the entire table.

Example rule #1 grants Discovery with exclusive authority to update the **name** attribute of the cmdb_ci_computer table. All other data sources are prevented from updating the **name** attribute of any CI in the cmdb_ci_computer table.

**Child table rules overrides parent table rules**

Any reconciliation rules defined for a child table override the rules defined for its parent table.

For example, rule #1 lets Discovery update the **name** attribute in the cmdb_ci_computer table and all of its child tables. However, rule #2 for the cmdb_ci_linux_server child table, which overrides rule #1 for the parent table, explicitly authorizes ServiceWatch to update this attribute in the child table.

As a result:

- Discovery cannot update the **name** attribute of the child cmdb_ci_linux_server table. Only ServiceWatch is authorized to update this attribute.
- Discovery is authorized to update the **name** attribute of CI records in all other child tables of the cmdb_ci_computer table.

**Overlapping rules**

Rules that authorize different data sources for the same attributes of the same table can coexist and do not exclude each other.

For example, assume the following rule is added. It is similar to example rule #1 but authorizes a different data source:

- ServiceWatch is authorized to update the **name** attribute in the cmdb_ci_computer table.

Like example rule #1, this new rule applies to the **name** attribute in the cmdb_ci_computer table so both Discovery and ServiceWatch can update the attribute. Any applicable data source precedence rules are enforced to prevent the data sources from overwriting each other's updates.

**Domain separation**

If Domain Separation is enabled, then you can scope reconciliation rules to specific domains. Rules of the parent domain, if not overridden, apply to CIs of child domain. All rules that are visible to a domain are applied, and a rule overriding the parent domain displays the child domain version.
Create or edit a CI reconciliation rule

A reconciliation rule specifies the attributes that a data source is authorized to update for a given table and prevents unauthorized data sources from overwriting the attributes' values. If an attribute does not have any reconciliation rules created for it, data sources are allowed to overwrite each other's updates to the attribute's value.

Role required: itil has read access, itil_admin (on top of itil) has full access.

Reconciliation rules are used in conjunction with data refresh rules and data source precedence rules to determine reconciliation steps for a CI. These rules determine if, when, and by which data source a CI can be updated.

Precedence order of reconciliation rules:

• Rule configured for a specific attribute, has precedence over rule set with Apply to all attributes (regardless of priority value).
• Between 2 rules for same attribute or between 2 rules set with Apply to all attributes, the rule that is specific directly for the class has precedence over the derived rule.
• Between 2 rules for same attribute or between 2 rules set with Apply to all attributes at same class level, precedence is determined by rule priorities.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to open the CI Classes list. Then select a class for which to create a reconciliation rule.
3. In the class navigation bar, expand Class Info and then click Reconciliation Rules.
4. In the Reconciliation Rules section, click Add to create a rule or select an existing rule to edit.
5. In the Create Reconciliation dialog box, fill out the fields on the Rule Info tab, and then click Next.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>The data source that you are configuring this rule for.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate this reconciliation rule.</td>
</tr>
</tbody>
</table>

6. In the Create Reconciliation dialog box, fill out the fields on the Attributes tab, and then click Next.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply to All Attributes</td>
<td>Authorizes the specified source to update all table attributes.</td>
</tr>
<tr>
<td>Attributes</td>
<td>Attributes that the data source is authorized to update. You can select attributes from the current class, or a parent class. Available only if Apply To All Attributes is false.</td>
</tr>
</tbody>
</table>

Note: This rule will be overridden by any rule that applies to a specific attribute. In which case, instead of using this option, you can directly include all attributes for Attributes.
Field | Description
--- | ---
Update with Null | Attributes that the data source can update with a null value. By default, authorized data sources cannot overwrite a non-null value with a null value. Attributes in this list, which are not in the Attributes list, are not included with the attributes that the data source can update with a null value.

7. In the Create Reconciliation dialog box, fill out the fields on the Filter Condition tab if applicable.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Filter Condition | Conditions that a CI must meet, in order for the rule to apply to that specific CI. For example, to apply this rule only to CIs that are associated with the Finance department, select this condition: `[Department] [is] [Finance]`

8. Click Save.

Additional rules that affect reconciliation:
1. Define or edit data source precedence rules
2. Create data refresh rules

**Define or edit data source precedence rules**

If multiple data sources are authorized to update the same table or the same table attributes in the CMDB, assign a priority to each of these data sources to prevent them from overwriting each other’s updates. Without data source precedence rules, data sources can overwrite each other’s modifications.

Role required: itil has read access, itil_admin (on top of itil) has full access.

Data source precedence rules are used along with data refresh rules and reconciliation rules to determine reconciliation steps for a CI. These rules determine if, when, and by which data source a CI can be updated.

After an authorized data source updates an attribute, subsequent updates are accepted only from the same data source or from a data source with a higher priority. Updates from a data source with a lower priority are rejected, unless these two conditions are met:

- The lower propriety source is the first source updating the CI.
- The CI became stale based on data refresh rules for the CI class.

Information about the last data source that updates each attribute is stored in the Data Source History [cmdb_datasource_last_update] table.

Data source precedence rules affect reconciliation of stale CI attributes. During reconciliation, the information in the Data Source History table is considered along with the data refresh rules for the CI’s class, to determine if a CI attribute is stale. A CI attribute is determined to be stale if it was not updated by the latest data source to update the CI, within a time period. The time period is specified by the Effective Duration time in the data refresh rule for the class for the data source. In this case, if another authorized data source, with a lower priority attempts to update the stale CI attribute, the update is allowed.
1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create a data source precedence rule.
3. In the class navigation bar, expand Class Info and then click Reconciliation Rules.
4. In the Data Precedence Rules section, click Add to create a rule or select an existing rule to edit. Fill out the details in the Create Precedence Rules dialog box.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data source</td>
<td>The data source that this precedence rule applies to. EventManagement, ImportSet, ManualEntry, or an application such as Tivoli are examples of a data source.</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority of this precedence rule within the set of precedence rules for the specified table. Smaller numbers designate higher priority. Data sources without a precedence rule are assigned the lowest priority.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate this precedence rule.</td>
</tr>
</tbody>
</table>

5. Click Save.

Create data refresh rules

Specify data refresh rules to determine if a CI is stale for a specific data source. Such CIs can then be updated by a lower-priority authorized data source.

Role required: itil has read access, itil_admin (on top of itil) has full access.

Data refresh rules are used in conjunction with data source precedence rules and reconciliation rules to determine reconciliation steps for a CI. These rules determine if, when, and by which data source a CI can be updated.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create a data refresh rule.
3. In the class navigation bar, expand Class Info and then click Reconciliation Rules.
4. In the Data Refresh Rules section, click Add to create a rule or select an existing rule to edit. Fill out the details in the Create Data Refresh Rules dialog box.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data source</td>
<td>Data source of the class.</td>
</tr>
<tr>
<td>Effective Duration</td>
<td>The time period that is used for the staleness test.</td>
</tr>
<tr>
<td></td>
<td>If the fields specified in the reconciliation rule for the CI's class were not updated by the specified data source within the specified time period — the CI is determined to be stale for that data source.</td>
</tr>
<tr>
<td></td>
<td>If you enter a value with a prefix that is valid and a suffix that is not, such as 15 x — the valid portion of the value is used (&quot;15&quot;). If the entire value is invalid — the default value of 0 is used.</td>
</tr>
</tbody>
</table>
5. Click Save.

Detecting duplicate CIs

When the identification process encounters duplicate CIs, it groups each set of duplicate CIs into a de-duplication task for review and remediation. A large number of duplicate CIs might be due to weak identification rules. You can configure the identification engine to reconcile duplicate CIs.

During CMDB Identification, processing of duplicate CIs is determined by the properties `glide.identification_engine.skip_duplicates` (set to true by default) and `glide.identification_engine.skip_duplicates.threshold` (set to 5 by default), and on the number of duplicate CIs that are detected. You can configure these properties so duplicate CIs are automatically reconciled, skipping duplication.

- If `glide.identification_engine.skip_duplicates` is true, and the number of duplicate CIs is less than the threshold specified by `glide.identification_engine.skip_duplicates.threshold`, then the oldest of the duplicate CIs is picked as a match and gets updated. That oldest duplicate CI also becomes the master CI for that set of duplicate CIs. The rest of the duplicate CIs are tagged as duplicates by setting the `cmdb_ci's duplicate_of` to the appropriate master CI. During matching, the identification engine filters out any CI that is tagged as duplicate of any CI.
- If `glide.identification_engine.skip_duplicates` is false, then matching of duplicate CIs fails with an error, and none of the duplicate CIs are updated.

Note: In either case, de-duplication tasks are always created.

For more information about these properties, see Properties for Identification and Reconciliation.

Review de-duplication tasks

For information about reviewing and remediating de-duplicate tasks, and how the master CI is used, see Duplicate CIs.

Generate and simulate payload execution using identification simulation

Identification simulation is a central location for automatically constructing a payload that is guaranteed to be complete and valid. You can then simulate the processing of the payload by the identification and reconciliation engine (IRE) and examine the results before actually submitting it for execution by IRE.

Use identification simulation to construct an input payload, and simulate processing of the payload by IRE. You can then examine the results, adjust identification rules if needed, and re-run the simulation of the updated payload.

Use the identification simulation to:

- Automatically construct input payload that is based on existing identification rules, hosting and containment rules.
- Simulate execution of a payload (automatically constructed by identification simulation, or manually created).
- Browse payload output and execution log messages for a simulated run.
Note: Identification simulation does not commit any updates to the CMDB.

Automatically generate payload using identification simulation

Use identification simulation to automatically construct an input payload for a specified class. The constructed payload is complete with any required dependent CIs, correctly structured, and syntactically valid for processing by the identification and reconciliation engine (IRE).

Role required: admin

The payload that is constructed during identification simulation is for the specified class. For a dependent CI class, you will be prompted for information about all dependencies. After you provide the required details, identification simulation constructs the payload based on your input.

1. Navigate to Configuration > Identification/Reconciliation, and click Identification Simulation.
2. In the Start with CI Class box click Start.
3. On the Payload Information form, in the Data source field, select the data source that is associated with this class update.
   For the ServiceNow Discovery data source, select ServiceNow.
4. Select the Class in the payload.
   a) In the Criterion Attributes area select the CI identifier attributes and then specify the values that uniquely identify a CI.
   b) In the Additional Attributes area specify attributes and values that matching CIs will be updated with.
5. For dependent CIs associated with dependent identification rules, fill out the Criterion Attributes and Additional Attributes sections in all Container level sections that display.
6. Click Generate Script. If any errors indicate that there are missing fields, fill in the missing fields and then click Generate Script again.

   • Click Run Simulation to simulate processing of the payload by IRE.
   • Examine the results of the simulation, fine-tune the payload as needed, and combine with other payloads for other classes as desired. After finalizing the payload, use the createOrUpdateCI() API to execute the payload by IRE which will result in actual updates to the CMDB.
   • Click Copy Script to copy the JSON script into the clipboard. You can then paste that script into a third party software or to another screen of the identification simulation.

Simulate payload processing using identification simulation

Use identification simulation to simulate the identification and reconciliation engine (IRE) process of CI identification for an input payload. Provide a valid payload, which was constructed using identification simulation or that was created manually.

Role required: admin

1. Navigate to Configuration > Identification/Reconciliation, and click Identification Simulation.
2. Optional: To run a simulation of an existing payload:
   a) Click Start in the Start with Existing Payload tile.
   b) In the Data source field, select the data source that is associated with this class update.
   c) Paste the JSON payload into the empty canvas.
3. Optional: To construct a new payload click Start in the Start with CI Class tile. See Automatically generate payload using identification simulation for more information.
4. Click Run Simulation to simulate processing of the payload by IRE.
1. Examine the results of the simulation in the results pane, and fine-tune the payload as needed:
   a. Click Run #1 to display the Context ID and the Run ID of the simulated run.
   b. Click the drop down arrow next to Run #1 to display additional details.
      - **Input**: Displays the payload for the simulation.
      - **Logs**: Displays all the logged messages that IRE generated while simulating processing of the payload, according to the specified logging level.
      - **Output**: Displays the output payload returned by IRE.

2. After finalizing the payload, use the createOrUpdateCI() API to execute the payload by IRE which will result in actual updates to the CMDB.

**Set logging level for identification simulation**

Identification simulation logs each step of a simulated payload processing. You can then examine these run logs to determine if a payload was processed as expected, and if identification rules are effective. You can adjust the level of logging so it is helpful, and so that the amount of messages is not excessive or insufficient.

Role required: admin

1. Navigate to Configuration > Identification/Reconciliation, and click Identification Simulation.
2. Click the Settings icon.
3. Select logging level for the identification and reconciliation engine (IRE) under IE Log Level and for the service cache under Service Cache Log Level.
   - The logging levels are displayed in ascending order, from the minimum level to the maximum level of logging.
4. Click on the Settings icon again to close the Settings dialog box.

**Examine run logs**

Identification simulation provides run logs which are generated by Identification and Reconciliation Engine (IRE). You can access these run logs for payload runs, to examine results and for debugging purposes. IRE payload output logs appear in a user friendly format on a central page.

Role required: admin

Also, internal applications that use IRE (such as Discovery) can call an internal API to provide a URL to viewing IRE run logs.

Logging is in the context of a specific run of the identification engine, and you can filter the log list by a specific data source and time range. Up to 1000 run logs that are up to 2 months old are listed, grouped by Context IDs, and run times. You can use the glide.identification_logs.max_run_ids property to modify the 1000 limit.

You can control the logging level by using the glide.discovery.identification.log_level Discovery system property and setting the value to one of the following:

- Info
- Warn
- Error
- Debug
- DebugVerbose
- DebugObnoxious
Note: IRE performs an initial verification of a payload before processing identification rules. If IRE detects any duplicate CIs based on any class identifiers, the payload is rejected and processing stops.

1. Navigate to Configuration > Identification/Reconciliation > Identification Logs.
2. Filter the runs list as follows:
   a) Source: Select the data source for which to display run logs.
   b) Time Range: Specify a time range for which to display run logs.

The Runs list displays all runs for the specified data source, during the specified time range.

3. In the Runs list, click a Run # to display its Context ID and Run ID.
   A unique Context ID is associated with each specific payload that is run. Each run of that payload, is associated with a unique Run ID. A single Context ID for a payload that is run multiple times is associated with multiple Run IDs.

4. Click the drop down arrow for a Run # to display additional details.
   • Input: Displays the payload for the run.
   • Logs: Displays all the logged messages that the identification engine generated while running the payload, according to the specified logging level.
   • Output: Displays the output payload returned by the identification engine.

IRE error messages
The Identification and Reconciliation Engine (IRE) generates the following errors, which are displayed in the Identification Logging pane and in the system logs.

For information about lookup-based CI identification and qualifier chains, see Create or edit a CI identification rule.

Note: IRE performs an initial verification of a payload before processing identification rules. If IRE detects any duplicate CIs based on any class identifiers, the payload is rejected and processing stops.

Error: IDENTIFICATION_RULE_MISSING

<table>
<thead>

**CI reclassification**

During the CI identification process, a CI might need to be reclassified to a different `sys_class_name` type. By default, CIs are reclassified automatically. If automatic reclassification is disabled, then the CI is not reclassified and the system generates a reclassification task for your review.

A CI can be upgraded to a higher class, downgraded to a lower class, or switched to a different branch in the class hierarchy. For more details about reclassification operations, see Reclassify a CI. You can configure CI reclassification behavior at a system-wide level or individually per CI.

**Note:** CI reclassification is possible only between two classes that have identical identification rules.

**Enabling and disabling automatic CI reclassification**

You can use the following properties to configure system-wide behavior for CI reclassification, enabling or disabling automatic reclassification updates specified in a payload. These properties are set to `true` in the base system, enabling processing of CI updates including CI reclassification updates. To disable any automatic reclassification update, set the respective property to `false`. In that case, IRE rejects a payload with the respective reclassification updates, and creates a reclassification task.

- `glide.class.upgrade.enabled`
- `glide.class.downgrade.enabled`
- `glide.class.switch.enabled`

For more information about CI reclassification related properties, see Properties for Identification and Reconciliation.

Alternatively, you can control the reclassification behavior for individual CIs in the input payload of the `createOrUpdateCI()` API. In the payload, you can set these properties to `true` or `false` to temporarily override the respective property setting.

- `classUpgrade`
- `classDowngrade`
- `classSwitch`

The following sample JSON payload enables automatic reclassification for the specified CI:

```json
{ items: [{className: 'cmdb_ci_server', classUpgrade: true, classDowngrade: true, classSwitch: true, values: {name: 'linux123', serial_number: '12srt567', ip_address: '10.2.3.4'}}, ]}
```
View a reclassification task

When automatic CI reclassification is disabled, reclassification tasks are created for CIs that could not be automatically reclassified during the identification process. Review these tasks to locate the CIs and decide if to reclassify them.

Role required: admin or itil

1. Navigate to Configuration > Identification/Reconciliation > Reclassification Tasks.
2. Select a reclassification task.
3. Examine the details on the Reclassification Task form.

Reclassification Task form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration item</td>
<td>The CI that must be reclassified.</td>
</tr>
<tr>
<td>Short description</td>
<td>Short description noting that CI reclassification was not allowed.</td>
</tr>
<tr>
<td>Description</td>
<td>Description noting the current class of the CI and the class that the CI must be changed to.</td>
</tr>
<tr>
<td>Internal payload</td>
<td>Payload used in the identification process.</td>
</tr>
</tbody>
</table>

After examining the task details, you can locate the CI that is noted in the task Description and manually reclassify it. For details, see Reclassify a CI.

CMDB dependent relationship rules

Service definitions consist of CI types and relationship types. Dependent relationship rules define the dependency structure of the CI types and the relationship types in these service definitions, helping in CI identification and in the construction of business service maps.

The dependencies that are defined by these rules are used when identifying dependent CIs to prioritize the order of CI identification, and to match CIs and respective dependent CIs in a payload. Dependent relationship rules are also used by Service Mapping and can be defined for custom CI types. After defining a new CI type, you can define dependent relationship rules that specify how the new CI type is related to existing types in the CMDB.

Dependent relationship rules consist of hosting and containment rules (dependent relationship rules), each type modeling the data from a different perspective of the CI. Containment rules represent CIs’ configuration hierarchy, describing which CI contains which other CIs. Hosting rules represent CIs’ placement in a business definition, describing what CIs run on.

Both hosting and containment rules describe a relationship type between two CI types and the same relationship type can be used in a hosting rule and in a containment rule. It is the context in which the relationship is used that distinguishes between a containment and hosting rule.

Manage dependent relationship rules:

- To access rules at the class level, use the CI Class Manager. Navigate to Configuration > CI Class Manager.
- To access grouped rules, use the Metadata Editor. Navigate to Configuration > Identification/Reconciliation > Metadata Editor.

The plugins that have been activated on an instance determine which hosting and containment rules exist in a base system.
Hosting rules

Hosting rules represent all the possible valid combinations of pairs of hosting and hosted CIs in the service definition. Hosting rules are a flat set of rules that can be only one level deep, and which always involve resources, typically physical or virtual hardware. Each hosting rule is a stand-alone rule between two CI types, describing either a valid CI type that another CI type can host, or by which another CI type can be hosted. A hosting rule consists of a parent CI type, a relationship type (such as Hosted On::Hosts) and a child CI type. For example, you can have a hosting rule that specifies that the CI type ‘Application’ ‘Runs On::Runs’, the CI type ‘Hardware’.

A CI can be hosted on multiple resources (such as Windows and Linux). This CI is represented by a hosting rule for the CI with each resource that the CI can be hosted on. During CI identification, the pair of CIs that are being examined, should satisfy at least one hosting rule.

Hosting rules are stored in the CMDB Metadata Hosting Rules [cmdb_metadata_hosting] table.

Containment rules

Containment rules represent the containment hierarchy for a CI type, describing valid objects that a CI type can contain in the service definition, and valid objects that can be contained by the CI type. Containment rules are chained to each other in a containment rules group, with a CI type that is the top-level (root) parent of the group. The collection of containment rules construct a hierarchy-like map of containment relationships. Containment rules are logical concepts used to represent logical CIs, for example to describe software that runs on a server. A containment rule consists of a parent CI type, a relationship type (such as ‘Contained By::Contains’), and a child CI type. For example, you might have a containment rule specifying that the CI type ‘Tomcat’ ‘Contains::Contained By’ CI type ‘WAR File’.

Endpoints are special containment rules that specify incoming or outgoing connections in the model, designating the CI types that data of some specified type flows in to or out from the service definition. After adding an endpoint to a containment rule, you cannot add any child rules to the endpoint rule.

Containment rules are stored in the CMDB Metadata Containment Rules [cmdb_metadata_containment] table.

Reference rules

Reference rules are used mostly by Cloud Management to represent all of the possible valid combinations of pairs of referencing and referenced CIs in the service definition.

- Reference rules are a flat set of rules that can be only one level deep.
- Reference rules always involve resources, typically virtual entities. Each reference rule is a stand-alone rule between two CI types, describing either a valid CI type that another CI type can reference, or by which another CI type can be referenced. Both the CI classes should be able to live independent of each other.
- A referencing rule consists of a parent CI type, a relationship type (such as Provisioned From::Provisioned) and a child CI type. For example, you can have a referencing rule that specifies that the CI type ‘Virtual Machine’ Provisioned From::Provisioned, the CI type ‘Image’.
- A CI can reference multiple resources (for example, a VM Instance can have a reference relation with both the Image and the Hardware templates). This CI is represented by a referencing rule for the CI with each resource that the CI can be referenced from.
- The reference rule cannot be part of the CI identification.
Rules requirements

The rules that you create are bound by the following requirements which narrow the relationships and ensure that only valid options are available in the drop-down lists in the Metadata Editor.

- Given a CI type that is as a child in a containment rule: Not this CI type or its children can be a top-level (root) parent of any other containment rule, and it cannot be in any hosting rule, either as a parent or as a child.
- Given a CI type that is a top-level (root) parent of a containment rule: It cannot be a child in a hosting rule (for example, you cannot be hosted on Tomcat, if Tomcat has any containment rules).
- Given a CI type that is a child in a hosting rule: It cannot be in any containment rule, either as a parent or a child.
- Given a CI type that is a parent in a hosting rule: It cannot be a child in any containment rule.
- Hosting rules cannot create loops such as Tomcat –runs_on- VMWare –runs_on- Tomcat.

Hosting and containment rules model

[Diagram showing containment rules and hosting rules]

Hosting rules that model the diagram:
- Tomcat 'Runs on' Hardware

Containment rules that model the diagram:
- Tomcat 'Contains' Configuration File
- Tomcat 'Contains' WAR
- WAR has two endpoints for JDBC with MySQL:
  - Inbound
  - Outbound
Valid set of rules

Tomcat Hosted Linux
Linux Hosted Computer

The second metadata entry triggers the third requirement, which is satisfied (it is a hosting rule, not a containment rule).

Create dependent relationship rules

Create hosting and containment rules (dependent relationship rules) for CI classes to help with correctly identifying dependent CIs during the business discovery process and service mapping. Discovery calls the identification API that applies dependent relationship rules.

You can create a basic hosting or containment rule in the CI Class Manager. Or, use the Metadata Editor to create groups of hosting and containment rules, and inbound or outbound endpoints in containment rules. The CI Class Manager and the Metadata Editor are synchronized, and you can use each of those tools to display and edit a dependent rule.

Create a dependent relationship rule for a CMDB class

Use the CI Class Manager to create a basic dependent relationship rule (hosting or containment relationship rule) for a CMDB class.

Role required: itil has read access, itil_admin (on top of itil) has full access.

The class for which you create dependent relationship rule, must have a dependent identification rule.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list, and select the class for which you want to create a hosting or a containment rule.
3. In the class navigation bar, click Dependent Relationships.
4. In the Dependent Relationships view, click Add dependency.
5. Fill out the details in the Add Dependent Relationship Rule dialog box.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule Type</td>
<td>Designation of whether this rule is a hosting rule or a containment rule.</td>
</tr>
<tr>
<td>This Class</td>
<td>The class that the rule applies to.</td>
</tr>
<tr>
<td>Relationship</td>
<td>The relationship type for the rule.</td>
</tr>
<tr>
<td>Target Class</td>
<td>The target class for the dependent relationship rule. The designation of this class as a child or parent class, is based on the specified Relationship.</td>
</tr>
</tbody>
</table>

6. Click Save.

You can click Reset to derived and then confirm the operation to delete all dependent relationship rules that were added specifically for the selected class. Only dependent relationships that are derived from a parent class, remain.

For more information about child and parent classes, see Table extension and classes.

Create or edit a collection of containment rules

Create containment rule for CIs to help with correctly identifying dependent CIs during the business discovery process and service mapping. Discovery calls the identification API that applies dependent relationship rules.
Role required: admin

A containment rule is a dependent relationship rule which defines a relationship between two CIs, structured as: CIType1 RelationshipType CIType2. The first CI type that you add becomes the top level CI of a containment rules group which is a chain of containment rules. The entire set of containment rules is organized as groups according to top-level CIs.

To create a containment rules group for a new CI type, you need to first add the CI Type1 of the relationship. To add a child containment rule for a CI type that exists, you need to select that CI type, and define the second portion of the relationship rule which is the relationship type and CI Type2.

To each rule within a containment rules group you can add inbound or outbound endpoints, which are noted by blue up and down arrows. After adding an endpoint, you can not add a containment rule in that branch of the containment rules hierarchy.

1. Navigate to Configuration > Metadata Editor.
2. In the Metadata Editor, click the Containment Rules tab.
3. Click Add New Rule to add a top-level rule. Or, point to a rule for which you want to add a child rule and click the green ‘+’ icon that appears on the right.
4. Complete the Add Containment Rule to <class> form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item Type</td>
<td>The CI class that the rule applies to.</td>
</tr>
<tr>
<td>Relationship Type</td>
<td>The relationship type for the rule.</td>
</tr>
<tr>
<td>Reverse Relationship Direction</td>
<td>Enable to use the reverse relationship in the rule.</td>
</tr>
<tr>
<td>Always include in Service Model</td>
<td>Enable to always include the CIs of the specified class in the Service Map if their parent CI (based on the containment relationship) is present in the Service Map.</td>
</tr>
</tbody>
</table>

5. Click Create.
6. Add an endpoint to a child rule:
   a) Point to a child rule for which you want to add an endpoint.
   b) Click the blue “+” icon that appears on the right.
   c) Complete the Add Endpoint To <class> form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint Type</td>
<td>The type of endpoint.</td>
</tr>
<tr>
<td>Inbound or Outbound</td>
<td>The direction of the endpoint.</td>
</tr>
</tbody>
</table>

d) Click Create.

Create or edit a collection of hosting rules
Create hosting rule for CIs to assist in correctly identifying dependent CIs during the business discovery process and service mapping. Discovery calls the identification API that applies dependent relationship rules.

A hosting rule is a dependent relationship rule which defines a relationship between two CIs, structured as: <CI Type1> <relationship type> <CI Type2>. To create a hosting rule, you need to add a CI type as <CI Type1> in the relationship rule, and then define the second portion of the relationship rule which is the relationship type and <CI Type2>. The entire set of hosting rules is organized as groups according to the top-level hosted CIs.
A hosting rule implicitly contains two rules, which are the reversal of each other. When you create the rule '<CI Type1> <relationship type> <CI Type2>', the rule '<CI Type2> <reversed relationship type> <CI Type1>' is automatically added.

Role required: admin

1. Navigate to Configuration > Metadata Editor.
2. In the Metadata Editor, click the Hosting Rules tab.
3. Click Add New Rule to add a top-level rule. Or, point to a rule for which you want to add a child rule and click the green '+' icon that appears on the right.
4. Complete the Add Hosted/Hosting Rule to <class> form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item Type</td>
<td>The &lt;CI Type2&gt; in the rule.</td>
</tr>
<tr>
<td>Relationship Type</td>
<td>The relationship type for the rule.</td>
</tr>
<tr>
<td>Reverse Relationship Direction</td>
<td>Check to reverse relationship in the rule.</td>
</tr>
</tbody>
</table>

5. Click Create.

Effective usage of CMDB Identification

Use CMDB Identification effectively.

Identification rules

An independent identification rule identifies a CI based on the CI's attributes, independently of other CIs.

A dependent identification rule identifies a CI by its dependent CIs and the relationships of the identified CI with those dependent CIs. Identification with a dependent identification rule is based on the dependent CIs and the relationships and qualifiers between the identified CI and its dependent CIs. Identification then requires more time than with an independent identification rule and is prone to some identification errors. Usage of dependent rules should therefore be minimized.

CI modeling determines which type of identification rules are required for proper CI identification.

Create identification rules using the following order of importance:

1. Independent identification rules — It is always preferable to create independent identification rules rather than dependent identification rules. When you model a CI, define the CI with a complete set of attributes that lend themselves to independent identification, eliminating the need to use additional CIs for identification.
2. Dependent identification rules — If it is necessary to create dependent identification rules, then define a single level of dependency. Two is the maximum number of dependency levels that is supported.
3. Avoid creating lookup identifier entries. The use of lookup identifier entry is highly discouraged as it can reduce performance. If unavoidable, ensure to first review class definitions and consider updates that allow usage of independent identification rules.
4. Limit the number of identifier entries within an identification rule, ideally to 1. A second identifier entry can further reduce performance, as will each additional identifier entry.
5. Create strong identification rules in which the strongest identifier entries and related entries are set with the highest priority.
6. Ensure that the identification rule is at the class level that it needs to be.
Payload

Create the payload using the following order of importance:

1. **Payload size** — Limit the number of CIs per payload to 500.
2. **Avoid duplicate entries in the payload.**
   
   Example: If an identification rule has a criterion attribute for the `name` field, then the following payload has duplicate items resulting in failure:

   ```javascript
   var payload = {
     items: [ {
       className:'cmdb_ci_linux_server',
       values: { 
         name:'Win Server 200',
         ram:'2048'
       }},
       { 
         className:'cmdb_ci_linux_server',
         values: { 
           name:'Win Server 200',
           ram:'4096'
         }
       ]
     ]
   };
   ```

3. **Do not pass system data such as the following in the payload.**

   ```javascript
   var payload = {
     items: [ {
       className:'cmdb_ci_linux_server',
       values: { 
         name:'Win Server 200',
         sys_domain:'global',
         sys_domain_path:'xyz',
         sys_updated_on:'2017-06-15 16:25:11',
         sys_mod_count:23,
       }
     ]
   };
   ```

4. **Provide the minimum necessary set of criterion attributes for each payload item, according to what is specified in the corresponding identification rules.**

5. **When matching CIs, use CIs’ sysIds if available.** If provided, IRE can use the sysId to directly locate a CI without requiring any criterion attributes from the identification rule. In this case, IRE does not use the sysId in the matching process.

   - Example: Independent CI that needs to be updated — sysId is available.

     ```javascript
     var payload = {
       items: [ {
           className:'cmdb_ci_linux_server',
           values: { 
           sys_id:'194876usytrr65378098',
           ram:'2048',
         }
       ]
     };
     ```

   - Example: Dependent CI that needs to be inserted. Tomcat War CI depends on Tomcat CI, and Tomcat CI depends on Linux Server CI. SysIds for the Tomcat and the Linux CIs are available.

     ```javascript
     var payload = {
       items: [ {
           className:'cmdb_ci_linux_server',
           values: { 
           sys_id:'194876usytrr65378098',
           ram:'2048',
         },
       } ]
     };
     ```
items: [{
    className: 'cmdb_ci_app_server_tomcat_war',
    values: {
        name: 'war1',
        short_description: 'my description'
    }
}, {
    className: 'cmdb_ci_app_server_tomcat',
    values: {
        sys_id: '194876usytrr65378098'
    }
}, {
    className: 'cmdb_ci_linux_server',
    values: {
        sys_id: '09876tysueyt6345laku'
    }
}],
relations: [{
    parent: 1,
    child: 0,
    type: 'Contains::Contained by', { 
        parent: 1,
        child: 2,
        type: 'Runs on::Runs'
    }
}];

- Example: Dependent CI that needs to be updated — sysId is available.

```javascript
var payload = {
    items: [{
        className: 'cmdb_ci_app_server_tomcat_war',
        values: {
            sys_id: '039387euey637465sytet',
            short_description: 'my description new'
        }
    }]
};
```

6. When inserting many CIs, all of which depend on the same CI, you should serialize your API calls. Otherwise, attempting to concurrently process many CIs can clog the system, significantly degrading overall system performance.

**Properties for Identification and Reconciliation**

Use the Identification and Reconciliation properties to configure the identification engine.

These properties are available for Identification and Reconciliation. To view and edit these properties, the admin role is required.

**Note:** To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.
## Properties for Identification and Reconciliation

- Values: info, warn, error, debug, or debugVerbose  
- Location: Add to System Properties [sys_properties] table. |

### Components installed with Identification and Reconciliation

Several types of components are installed with Identification and Reconciliation (included in the com.snc.cmdb plugin), including tables.

### Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identifier [cmdb_identifier]</td>
<td>Identification rule sets defined for different classes of CIs.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Reconciliation Definition</td>
<td>Reconciliation rules defined for different classes of CIs at the table and field level.</td>
</tr>
<tr>
<td>[cmdb_reconciliation_definition]</td>
<td></td>
</tr>
<tr>
<td>Identifier Entry</td>
<td>Rule entries with different priorities assigned to each identifier.</td>
</tr>
<tr>
<td>[cmdb_identifier_entry]</td>
<td></td>
</tr>
<tr>
<td>Data Source Precedence</td>
<td>Priorities of data sources that are authorized to update the same CI types or CI type with same sets of attributes.</td>
</tr>
<tr>
<td>[cmdb_datasource_precedence]</td>
<td></td>
</tr>
<tr>
<td>Duplicate Audit Result</td>
<td>Duplicate audit results corresponding to a specific duplicate task. These results are generated automatically during the identification process and should not be added manually.</td>
</tr>
<tr>
<td>[duplicate_audit_result]</td>
<td></td>
</tr>
<tr>
<td>Remediate Duplicate Task</td>
<td>Task to address duplication that is detected during the identification process. Records are generated automatically, and users should not add records manually.</td>
</tr>
<tr>
<td>[reconcile_duplicate_task]</td>
<td></td>
</tr>
<tr>
<td>Reclassification Task</td>
<td>Reclassification tasks that were generated during the identification process.</td>
</tr>
<tr>
<td>[reclassification_task]</td>
<td></td>
</tr>
<tr>
<td>Data Source History</td>
<td>Information about the last data source that updated each attribute. Used to determine if a data source can update a stale CI.</td>
</tr>
<tr>
<td>[cmdb_datasource_last_update]</td>
<td></td>
</tr>
<tr>
<td>Data Source Staleness Definition</td>
<td>Effective duration per data source. When effective duration is exceeded, then CMDB Health determines that the information provided by that data source is stale.</td>
</tr>
<tr>
<td>[cmdb_datasource_staleness]</td>
<td></td>
</tr>
<tr>
<td>Identification Engine Context</td>
<td>Input payload, and data source (cmdb_ci's discovery_source) that will be used as input for a specific identification engine API. Also information about which specific identification engine API will be called (identifyCI or createOrUpdateCI API).</td>
</tr>
<tr>
<td>[cmdb_ie_context]</td>
<td></td>
</tr>
<tr>
<td>Identification Engine Run</td>
<td>Specific cmdb_ie_context record that was used to run against the identification engine. Also details about the output payload returned by APIs, such as start and end time of the run and whether the run was successful.</td>
</tr>
<tr>
<td>[cmdb_ie_run]</td>
<td></td>
</tr>
</tbody>
</table>
Table

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification Engine Log</td>
<td>Identification engine logs for a specific cmdb_ie_run simulated in the identification simulation. Also details about logs level and order.</td>
</tr>
</tbody>
</table>

Note: Internal table used by identification simulation.

CMDB Health

Monitoring and maintaining the health of the CMDB is essential to an effective and continuous use of the product. Health indicators such as duplicate CIs, required CI fields, and audits contribute to the calculation of health scorecards at the CI, class, and CMDB level.

The health of the CMDB data is monitored and reported for the following KPIs, each further consisting of sub metrics:

- **Completeness**: CIs are tested for required and recommended fields that are not populated.
- **Correctness**: CIs are tested against pre-defined data integrity rules such as identification rules (to detect duplicate CIs), orphan CI rules, and stale CI rules.
- **Compliance**: The CMDB data is audited for adherence to pre-defined certificates.
- **Relationships**: The health of CI relationships is tested for indicators such as orphan and duplicate relationships. And for compliance with suggested relationships, hosting and containment rules.

After CIs are tested for various health indicators, the results are aggregated at the class level, and eventually at the overall CMDB level. You can configure how health is calculated and the weight of each KPI and each metric at every level of the aggregation. For most health tests, you can configure the health tests themselves.

CMDB Health is domain aware. If the domain separation plugin has been activated, then the CMDB dashboard displays health based on data, rules, and settings from the logged-on user domain. If rules and settings are not defined for a child domain, then the parent’s settings are applied, recursively.

CI remediation

CMDB Health provides a framework for configuring **CI remediation**. Remediation lets you proactively apply corrective actions to unhealthy CIs in a managed and standardized fashion.

Setup

You need to configure CMDB Health related system properties, and health KPI and metric rules, to customize how aggregated data is calculated and other CMDB Health behavior. To start gathering and aggregating health data, you need to enable the CMDB Health-related jobs (CMDB Health Dashboard jobs) which are initially disabled. See **Setup and configure CMDB Health** for details about enabling these jobs and about configuring other CMDB Health settings.

Domain separation in CMDB Health

This is an overview of domain separation as it pertains to CMDB Health. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Overview

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

CMDB dashboards should be set up with their own set of rules to best accommodate how the user needs them. CMDB dashboard jobs adhere to those rules to produce reports. These are covered in separate sections below.

How domain separation works in CMDB Health

For dashboards to be the most effective, users should configure the dashboard accordingly. This is done by setting up the orphan, staleness, and inclusion rules to meet their needs, and which then affect the reports displayed on the dashboard.

The settings and metrics define different aspects of each application because each domain can be configured differently. These rules are set up in addition to those that are included in the base system. There are different types of owners for different CIs; each domain has its own set of rules.

Note: Domain separation is on by default, but each domain can be configured as needed.

Health Preferences

Configure these preferences during setup:

1. Global system properties that control CMDB Health – System properties are not domain separated. To learn more see CMDB Health system properties.

2. CMDB Health Dashboard Jobs – There is a dashboard job for each major KPI, such as Completeness. That job finds the health of the CIs across all the enabled domains. There is only one job run for all domains and jobs themselves are not domain separated.

   Users can define the frequency with which they want to run jobs; the report runs for all the domains. The more domains included in the job, the longer the job runs.

3. Health Metrics – These selections are domain-separated and adhere to the established “system overrides” logic of domain separation. Changes are made according to the domain for which the user is logged in. Base system values are defined at the global domain. The overriding domain logic means these values apply for all domains. If users want different values for a domain, they must be logged in to a specific domain and change the property from there. The new property setting applies only to that domain and any domain that inherits this domain. To learn more see Health Metrics.

   Note: Regarding the Completeness, Compliance, and Correctness KPIs: Users can disable this KPI if they don’t want to see that as part of the dashboard score. All these settings are domain-separated and the user can define specific properties for the domain.

   a. Weighted averages – These settings can affect all or part of the metrics in Completeness, Compliance, Correctness, and Relationship. They can be set differently for different domains.

   b. Active – This setting is the most important because it affects how long the jobs run. The more domains with flags set to Active, the longer the jobs take. It’s best to select only those domains you wish to be Active and render the rest Active = false. You can set this in Health Preferences. The default settings for global domain are set to Active = true, but you can modify or disable specific domains the user wants to see in the dashboard. Users should consider the domain hierarchy when changing these values. If there is a large number of domains (>100) the job
can take a very long time. To mitigate this, set Active to False for all the root domains, thereby disabling all the other domains in the hierarchy. If there is a rule at the top, all child domains inherit that rule.

c. Failure Threshold, Create Task, Task Assignee Group – All these settings can be set differently for different domains depending on what is needed in each domain.

d. Exceptions – For Relationship metrics (relationship, duplicate relations, orphan relations, stale relations) the failure threshold setting is not domain separated. The Failure Threshold for the global domain is applied to all domains. For example, even if users were to override the Failure Threshold for a domain, the global domain setting for Threshold is still applied.

e. Troubleshooting / Implementation detail – These settings are stored in the `cmdb_health_metric_pref` table, which is domain separated.

Health Rules

Health rules settings are addressed here:

- Required
- Recommended
- Orphan
- Staleness

Most of the CMDB Health Rules are domain separated and provided by the users. Users can define different rules for different domains by logging in to each domain and adding/overriding rules in the CI Class Manager.

These are the rules for the different metrics:

1. Completeness
   a. Required fields – These are based on the class schema defined in the platform’s `#unique_304` and is fixed for all domains. These cannot be changed.
   b. Recommended fields – These are domain separated. The table used is `cmdb_recommended_fields`, which is domain separated. The user can set these up for different domains.

2. Correctness
   a. Duplicates – Duplicates are based on Identification rules, which are not domain separated, so the same rules apply to all domains.
   b. Orphan – Orphan rules are domain separated; there are different orphan rules for different domains. The table used is `cmdb_health_orphan_rule` and is domain separated.
   c. Staleness – Staleness rules are domain separated. The table used is `cmdb_health_staleness_rule`. The base system rule (60 days) is set for global domain so is inherited by all domains as the default rule.
3. Compliance
   a. Audit – Audit scores are based on the desired state or scripted audits defined in the compliance module by the user.

   Audits themselves are domain separated. When audit score evaluation is enabled for a domain, scores become based only on the audits visible in that domain.

   **Note:** Health Inclusion Rules are also domain separated. The table used is `cmdb_health_config`, which is domain separated.

**Health Dashboards (CMDB View/ Service View / Group View)**

If a user is logged into a domain and views a health dashboard:

1. Only scores for enabled metrics in that domain display (based on the Health Preferences Active flag as discussed above).
2. All scores are based on CIs that are visible from the specific domain. (These are regular domain visibility rules: From that domain you can see CIs in global domain, the specific domain, any child domain of that domain or any domain that gets directly or indirectly contained by that domain.)
3. The dashboard view is based on domain rules defined in domain mapping, as opposed to those provided by the logged-in user. This view overrides any additional domain visibility rules that a logged-in user might have. The admin sets the basic rules, but does not set each individual domain. The admin can give specific users or user groups additional visibility to other domains and the dashboard still does not change. The dashboard strictly follows the domain rules mentioned above, based on the domain hierarchy for the domain in which the user is logged in.
4. As explained in the Health Preferences section, users can define different preference values for any domain which impact the scores reported in the dashboard. Preferences that can impact scores include Weighted Averages, Failure Threshold, and Active.
5. As explained in the CMDB Health Rules section, the scores reported for the metrics are based on the health rules defined for them (staleness, orphan, recommended, audit, and inclusion rules) which can be defined differently for a specific domain (in the CI Class Manager). Only the required metric and duplicate metric are based on rules that apply in all domains.
6. Service View/ Group View – These reports also largely follow the above points. Typically, these views differ from various views/filters for the Health Report. One is based off business rules, the other is based off CMDB Health groups.

**Setup and configure CMDB Health**

The data collection system is highly configurable, however, the base system is minimally configured for aggregating CMDB health data. Most importantly, the CMDB Health Dashboard jobs are disabled by default and data is not collected. To display valuable and meaningful data, you should review and adjust settings.

1. Review CMDB Health KPIs and metrics to learn what CMDB Health can monitor, and what needs to be configured to enable and support each metric.
2. For each KPI and associated metric that you want monitored, define the necessary rules and fulfill other needed requirements. For example, create orphan rules for detecting orphan records, if you are interested in this metric.
3. Review and adjust the threshold ranges for best, at risk, and critical states for the CMDB health metrics scorecards - see Configure CMDB Health scorecard thresholds.

4. Set metric aggregation preferences, deactivate KPI and metrics that you are not interested in reporting, set failure thresholds, and adjust weighted averages of aggregation - see Configure KPI and metrics aggregation preferences.

5. Narrow the scope of CIs that are included in health calculations - see Create health inclusion rule.

6. Enable the Health Dashboard jobs for the KPIs that you want reported - see Enable and configure a CMDB Health Dashboard job.

7. Customize the CI dashboard (optional).

**CMDB Health system properties**

Configure the following system properties to customize how CMDB Health is monitored and evaluated.

Role required: itil_admin

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Max time in minutes for which individual metric processor will run in each scheduled cycle [glide.cmdb.health.metricProcessor.maxRunningTime] | If processing of a metric exceeds the specified time, CMDB Health processing halts until the next CMDB Health job is scheduled to run.  
  - Type: integer  
  - Default value: 120  
  - Location: Navigate to Configuration > Health Preference. In the right hand-side navigator, click System Properties.  
  For performance reasons, it is recommended not to set this property to a value greater than 120.  
  | Note: If you enter an invalid value, the default value is used. |

*Note: To open the System Property [sys_properties] table, enter sys_properties.list in the navigation filter.*
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.cmdb.logger.use_syslog.CMDBHealth | A comma-separated list that controls the level of logging of CMDB Health jobs. Logging creates entries in the system logs to capture messages generated by the health auditing process each time they run. This logging helps debugging if there is a failure. For example, to log error and info messages, set the value to ‘error,info’.  
  - Type: String  
  - Default value: error  
  - Other possible values: Comma-separated list with any of the following values:  
    - info  
    - error  
    - warn  
  Or ‘*’ which is equivalent to including all possible values.  
  - Location: System Property [sys_properties] table. |
| glide.cmdb.health.src.cmdb_health_audit_only | When set to true, disables health results from sources other than CMDB Health audit (such as cloud discovery). Only results generated by CMDB Health audit appear in the CMDB dashboard.  
For example, by default, if a CI is determined to be stale by Discovery, then that CI appears as stale in the CMDB dashboard even though CMDB Health audit did not determine that CI to be stale. To disable these stale CI health results, set the property to true.  
  - Type: true | false  
  - Default value: false  
  - Location: System Property [sys_properties] table.  
  - Learn more:  
    - CMDB Health KPIs and metrics  
    - Discovery for VMware vCenter |
| glide.cmdb.health.staleness_exclude_dependent_cis | Exclude dependent CIs for the staleness CMDB Health metric.  
When enabled, dependent CIs are not checked for staleness, regardless of any staleness or inclusion rules that are defined for the respective CI types.  
  - Type: true | false  
  - Default value: false  
  - Location: System Property [sys_properties] table. |
Enable and configure a CMDB Health Dashboard job

Enable and configure the jobs that process CMDB health tests, to start calculating CMDB health scores for the **completeness, compliance, correctness, and relationship** KPI. These health scores are then aggregated into the overall CMDB health report.

**Role required:** admin

In the base system, CMDB Health Dashboard jobs are disabled by default. Enable and configure the respective job for the CMDB health KPI that you want data collected and aggregated for. You can schedule a job to run on a recurring schedule, or execute it once at any time.

1. Navigate to **Configuration > CMDB Dashboard > CMDB View**, and then click **CMDB Health Dashboard Jobs**.
2. Select a job that you want to enable or configure.

<table>
<thead>
<tr>
<th>CMDB Health Dashboard job</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB Health Dashboard - Completeness Score Calculation</td>
<td>Script for calculating the completeness KPI of CMDB health.</td>
</tr>
<tr>
<td>CMDB Health Dashboard - Compliance Score Calculation</td>
<td>Script for calculating the compliance KPI of CMDB health.</td>
</tr>
<tr>
<td>CMDB Health Dashboard - Correctness Score Calculation</td>
<td>Script for calculating the correctness KPI of CMDB health.</td>
</tr>
<tr>
<td>CMDB Health Dashboard - Relationship Score Calculation</td>
<td>Script for calculating the CI relationships KPI of CMDB health.</td>
</tr>
<tr>
<td>CMDB Health Dashboard - Relationship Compliance Processor</td>
<td>Script for calculating compliance of relationships with suggested relationships, and with hosting and containment rules.</td>
</tr>
</tbody>
</table>

3. Review the default configuration, and update as necessary.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Job name. It is recommended that you do not modify the job's name.</td>
</tr>
<tr>
<td>Active</td>
<td>Select to activate the job.</td>
</tr>
<tr>
<td>Run</td>
<td>Configure recurring schedule of job execution, or select <strong>On Demand</strong>.</td>
</tr>
<tr>
<td>Time</td>
<td>If <strong>Active</strong> is selected, set the time (hour, minute, and second) to run the job.</td>
</tr>
<tr>
<td>Conditional</td>
<td>If selected, the scripted condition must evaluate to true before the job can run.</td>
</tr>
<tr>
<td>Run this script</td>
<td>The job's script. Modifications to the script are not recommended.</td>
</tr>
</tbody>
</table>

4. Click **Execute Now** to run the job once immediately.

After you enable a CMDB Health Dashboard job, the results for the KPI are aggregated and displayed in the CMDB dashboard and CI dashboard, at the CMDB, class, and CI levels.

**Configure CMDB Health scorecard thresholds**

Configure the thresholds for best, at risk, and critical state definitions for the KPIs and metrics scorecards. You can configure these settings globally for the entire CMDB, or individually per class.
Role required: itil has read access, itil_admin (on top of itil) has full access.

Scorecard thresholds are used to determine overall metric state, and are defined by upper and lower thresholds. For example, scorecards thresholds for completeness:

- 0 - lower threshold: Best state
- Lower threshold - upper threshold: At risk state
- Upper threshold - 100: Critical state

In the base system, upper thresholds are set to 67 and lower thresholds are set to 33 for all KPIs and metrics. You can adjust scorecard thresholds to reflect the range of failures that should be used for each health state. Applying the change to a scorecard is based on the selected class in the CI Classes list:

- If the top level Configuration Item class is selected in the CI Classes list, changes to metric scorecards apply to the entire hierarchy.
- If any other class is selected in the CI Classes list, changes to metric scorecards apply to the selected class.

For CMDB groups, you can specify a separate set of scorecard thresholds, per CMDB group/KPI or metric. See Configure CMDB groups scorecard thresholds for more details.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list, and then select a class to set scorecards for.
3. In the class navigation bar, expand Health.
4. To configure the overall scorecard, select Other Scorecards and then select Overall Scorecard.
5. To configure a scorecard for any of the KPIs (such as Compliance), or for relationship-related metrics (such as duplicate relations):
   a) Select configuration item at the top of the Hierarchy list.
   b) Click a KPI item, Completeness, Compliance, or Correctness.
   c) Click the tab CMDB Completeness Scorecard, CMDB Compliance Scorecard, or CMDB Correctness Scorecard.

When you select the top-level Configuration Item class, changes to threshold settings in any metric scorecard apply to the entire class hierarchy.

6. To configure a scorecard for any metric:
   a) In the CI Classes list, select the class to which the updated scorecard should apply to. Select the top level Configuration Item to apply the change to the entire hierarchy.
   b) Click the KPI that contains the metric for which you want to configure scorecard. For example, click Completeness to configure the Required Fields scorecard.
   c) Select the scorecard tab of the metric to configure, such as Required Fields Scorecard. You might need to click New to edit the scorecards.

7. Slide the threshold sliders, or enter specific numbers to increase or to decrease the threshold bars to fit your definitions for best, at risk, and critical levels for the scorecard.
8. Click Save.

Configure CMDB groups scorecard thresholds

Each CMDB group can have its unique set of scorecard thresholds for best, at risk, and critical state definitions for specific KPIs or metrics.

Role required: itil_admin (on top of itil)

Scorecard thresholds are used to determine overall metric state, and are defined by upper and lower thresholds:
• 0 - lower threshold: Best state
• Lower threshold - upper threshold: At risk state
• Upper threshold - 100: Critical state

In the base system, for all KPIs and metrics, upper thresholds are set to 67 and lower thresholds are set to 33. You can adjust scorecard thresholds for a specific CMDB group per KPI or metric, to reflect the range of failures that should be used in health reporting.

CMDB groups scorecard thresholds are stored in the [cmdb_health_scorecard_group_threshold] table.

1. In the search box in the navigation bar, enter `cmdb_health_scorecard_group_threshold.list` and press the Enter key.
2. In the **CMDB Health Group Scorecard Thresholds** list, click **New**.
3. Fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upper threshold</td>
<td>Upper range of percentage of CIs failing the specified metric tests, that is used to calculate best and at risk states.</td>
</tr>
<tr>
<td>CMDB Group</td>
<td>The CMDB group to which this scorecard threshold setting applies to.</td>
</tr>
<tr>
<td>Lower threshold</td>
<td>Lower range of percentage of CIs failing the specified metric tests, that is used to calculate at risk and critical states.</td>
</tr>
<tr>
<td>Metric</td>
<td>The metric to which the scorecard threshold setting applies to.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Configure KPI and metrics aggregation preferences**

Metrics health scorecards are aggregated into their respective KPI, which in return are aggregated into the overall CMDB Health report. Set aggregation preferences for KPIs, and for each of their respective metrics, deactivate KPIs and metrics that you are not interested in reporting, and adjust weighted averages of aggregation.

To start collecting and reporting CMDB health KPIs and metrics, you must first enable and configure the **CMDB health dashboard jobs**.

Role required: itil_admin (on top of itil)

The completeness KPI for example, consists of the metrics **required fields** and **recommended fields**, each contributing a different weight to the sum. You can configure the proportional weight of required fields and recommended fields within completeness to be 25 and 75 respectively. You can also configure the proportional weight of completeness, compliance and correctness within the aggregated sum of the overall CMDB health.

**Note:** Non-active KPI or metrics are displayed on the CMDB dashboard in faded coloring, displaying the most recent aggregations that were calculated when the KPI or metric was active.

If Domain Support - Domain Extensions is activated, then you can configure aggregation preferences per domain.

In the ServiceNow base system, the weights of KPIs have default settings, and metrics are globally set.

1. Navigate to **Configuration > Health Preferences**.
2. Select **Health Metrics** on the right-hand side navigator.
3. From the **Select Metric** list select one of the KPIs such as **Completeness**, or a metric.

For **Completeness, Compliance** and **Correctness**:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Activate the KPI so it is included in the aggregated CMDB health report.</td>
</tr>
<tr>
<td>Weighted Averages</td>
<td>Specify the weight of each metric in the aggregated KPI health report. The sum of weighted averages of all metrics should be 100.</td>
</tr>
</tbody>
</table>

For a metric:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Activate the metric so it is included in the aggregated health report for the respective KPI.</td>
</tr>
<tr>
<td>Create Task</td>
<td>If a record fails the metric test, create a task with details about the failure. You can then view the task on the CI dashboard, and configure remediation for the task.</td>
</tr>
<tr>
<td>Failure Threshold</td>
<td>When the threshold number of CIs that fail the health metric test is reached, health processing stops for the metric for this cycle.</td>
</tr>
<tr>
<td>Task Assignee Group</td>
<td>An assignment group for the task.</td>
</tr>
</tbody>
</table>

4. Click **Save**.

**Set a CI attribute to be mandatory**

Configure a CI attribute as mandatory so it is included in the CMDB Health tests for the **required** metric if enabled. **Required** is a metric of the CMDB Health **completeness** KPI.

Role required: itil_admin

When a field is configured as mandatory, then if the **required** metric is enabled, the CMDB health tests check whether that field is populated or not. The CMDB dashboard displays the aggregated report of the percentage of CIs for which one or more required fields is empty.

1. Navigate to **Configuration > CI Class Manager**.
2. Click **Hierarchy** to display the CI Classes list. Then select the class with the field that needs to be set as mandatory.
3. In the class navigation bar, expand **Class Info** and then select **Attributes**. In the Attributes view, click **Added**.
4. Locate the attribute that you want to set as mandatory, and then double-click its **Mandatory** value and set it to true.

The next time the form is opened, a field status indicator appears next to the field label, indicating that a value is mandatory.

**Note:** Mandatory fields are global. The field is marked as mandatory everywhere it appears on a form.
Set a CI field to be recommended

Define a list of CI fields as recommended, noting that it is desirable that they are populated by a data source such as Discovery. You can then configure the CMDB completeness KPI to include recommended fields in its aggregated health reports.

Role required: itil has read access, itil_admin (on top of itil) has full access.

Use this for fields which should not be mandatory, but that might have useful information that the CI should have. For example, a field with information that might at some point help with diagnosis. Initially, a derived class is set with the recommended fields that are defined at the parent level. You can add or remove recommended fields for a derived class, setting it with its own recommended fields, without affecting the recommended fields at the parent or sibling levels. If all recommended fields for a derived class are removed, then the derived class automatically derives the recommended fields from its parent class.

For more information about child and parent classes, see Table extension and classes.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Then select the class that contains the fields that need to be set as recommended.
3. In the class navigation bar, expand Health and click Completeness. Then click Recommended Fields.
4. In the Recommended Fields tab, use the slushbucket to move the fields that you want to designate as recommended, from the Available list to the Selected list.
5. Click Save.

Create or edit a CMDB Health orphan rule

Create an orphan rule to determine the percentage of orphan CIs in the CMDB. This sum is then aggregated into the correctness CMDB Health KPI, and weighed into the overall CMDB health report. Orphan rules are defined per class, and only a single orphan rule can be defined per class.

Role required: itil has read access, itil_admin (on top of itil) has full access.

Specify the conditions that CIs must meet to be considered an orphan CI. Specify attributes that a CI must have, relationships that a CI should not have, or both. In the relationship conditions, you can either specify that the CI has no relationships, or a set of specific relationships that the CI doesn't have.

Note: If there is a health inclusion rule for the orphan metric, then the conditions in the health inclusion rule and the conditions in the health orphan rule, shouldn't be identical.

A health orphan rule can for example, identify a CI of the cmdb_ci_computer class as an orphan CI if the CI is not set with an owner or an asset.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create an orphan rule.
3. In the class navigation bar, expand Health. Click Correctness and then click Orphan Rule.
4. Select a rule to edit if one exists, or click New. Fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class</td>
<td>The class for which the orphan rule applies.</td>
</tr>
<tr>
<td>Attributes</td>
<td>Attribute conditions that a CI must satisfy to be considered an orphan CI. For example, the filter conditions in which both the Assigned to and the Owned by fields are empty, will identify the matching CIs as orphans.</td>
</tr>
</tbody>
</table>
Create or edit a CMDB Health staleness rule

If the staleness metric is in effect, then staleness rules are used to determine the percentage of stale CIs in the CMDB. This sum is then aggregated into the correctness KPI, and weighs into the overall CMDB health calculation. Staleness rules are defined per class.

Role required: itil has read access, itil_admin (on top of itil) has full access.

The Discovery setting of certain types of CIs as stale takes precedence over a CMDB Health staleness rule defined for the CI. For more information about Discovery marking CIs as stale, see Discovery for VMware vCenter.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create a staleness rule.
3. In the class navigation bar, expand Health and then click Correctness. Click Staleness Rule.
4. Select a staleness rule to edit or click New, and then fill out the Staleness Rule form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>And/Or operation between the Attributes conditions and the Relationship conditions.</td>
</tr>
<tr>
<td>Relationship</td>
<td>The relationship conditions that a CI must fail in order to be considered an orphan CI. To specify that a CI must have no relationships, choose Any Relation and Any Class respectively.</td>
</tr>
</tbody>
</table>

5. Click Submit or Update to save the rule.

Create health inclusion rule

Filter the CIs that are included in health calculations and that appear in CMDB health dashboards by defining health inclusion rules. Health inclusion rules can be specified per domain.

Role required: itil has read access, itil_admin (on top of itil) has full access.

Evaluation for the required, orphan, recommended, duplicate and staleness health metrics, will apply only to CIs that satisfy health inclusion rules. For example, if you want scores of the duplicate metric to appear only for server and network CIs.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applies to</td>
<td>The class for which the rule applies.</td>
</tr>
<tr>
<td>Effective Duration</td>
<td>The time period that is used for the staleness test.</td>
</tr>
<tr>
<td></td>
<td>If the CI was not updated (based on Updated sys_updated_on) within the specified time period — the CI is determined to be stale.</td>
</tr>
<tr>
<td></td>
<td>If you enter a value with a prefix that is valid and a suffix that is not, such as 15 x — the valid portion of the value is used (‘15’). If the entire value is invalid — the value is ignored and the previous valid value is used.</td>
</tr>
</tbody>
</table>

5. Click Submit or Update to save the rule.
• Creating health inclusion rules at the level of the base cmdb_ci table can potentially filter out health results of all classes in CMDB health dashboards.
• Applying a health inclusion rule to the duplicate metric, is supported only in the global domain.

In addition to any health inclusion rules, identification inclusion rules also indirectly impact what appears in CMDB health dashboards for duplicate CIs. The dashboard itself uses the identification engine (IRE) to identify duplicate CIs and therefore identification inclusion rules are applied.

Inheritance of health inclusion rules:
• If there are no health inclusion rules specified for a child class, then rules specified on a parent class are applied to the child class.
• If health inclusion rules are specified for a child class, then those rules take precedence over rules specified on a parent class.

In the base system, there are no predefined health inclusion rules, in which case all CIs are included in the CMDB Health calculations.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create a health inclusion rule.
3. In the class navigation bar, expand Health and then click Health Inclusion Rules.
4. Click an existing rule to edit or click New and then fill out the Health Inclusion Rules form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applies to</td>
<td>Class this rules applies to.</td>
</tr>
<tr>
<td>Active record condition</td>
<td>Criteria that CIs must meet to be included in the evaluation for the specified health metrics.</td>
</tr>
<tr>
<td>Applies to metric</td>
<td>Metrics that the rule applies to.</td>
</tr>
</tbody>
</table>

5. Click Save or Update.

CMDB Health KPIs and metrics

The overall CMDB health score consists of three Key Performance Indicators (KPIs) which are correctness, compliance and completeness, each further consisting of sub-metrics. Each KPI and metric is associated with a scorecard that determines its contribution to the aggregated health at the overall CMDB level, class, and CI level.

You can configure which KPIs and metrics are included in the aggregated calculation, and set their weight in the aggregation. In the base system, all KPIs and all metrics are included in the aggregated health report.

Overall

An aggregation of all three KPIs (correctness, completeness and compliance), according to their overall scorecard weight settings.
Correctness

A KPI which is an aggregation of the following metrics, according to the correctness scorecard weight settings.

Orphan

Measures the percentage of orphan CIs in the CMDB. A CI can become orphan if it was unintentionally left in the CMDB when it is no longer needed. A CI is determined to be orphan if:

- The CI satisfies the criteria in an orphan rule. This criteria checks for specific attributes that a CI must have, and for CIs that have no relationships or that don't have specific relationships.
- Data is missing for the CI in its respective table, or in one of its parents’ table.

Staleness

Measures the percentage of stale CIs in the CMDB. A CI is stale if it was not updated within the Effective Duration time period that is specified in the staleness rule that applies to the class.

The base system includes a default staleness rule for the Configuration Item [cmdb_ci] class, which sets the Effective Duration time to 60 days. This rule applies to all extended CMDB classes, and can be overridden by class specific staleness rules defined by the user. To determine CI staleness, a staleness rule for the CI’s class is used if it exists, otherwise, the default staleness rule is used.

In addition, a relationship in which a stale CI is a parent or a child, is determined to be a stale relationship.

Note: Discovery marks VMware vCenter CIs that no longer physically exist, as stale. By default, this setting takes precedence over a CMDB Health staleness rule defined for the CI. When drilling-down in the CMDB dashboard to Health Results, the Source for CIs determined to be stale by Discovery, is CLOUD_DISCOVERY. Setting the glide.cmdb.health.src.cmdb_health_audit_only system property to true, ensures that the CMDB dashboard displays health results generated only by CMDB Health. For more information, see CMDB Health system properties and Discovery for VMware vCenter.

Duplicate

Measures the percentage of duplicate CIs in the CMDB using identification rules. Only independent CIs are evaluated for duplication. In a set of duplicate CIs, the count of duplicate CIs is the total number of CIs in the set, minus one. The detailed graphs for a duplicate set of CIs display all the CIs in the set.

Completeness

A KPI which is an aggregation of the following metrics, according to the completeness scorecard weight settings.

Required

Measures the percentage of CIs in which fields that are defined as mandatory, are not populated. Missing fields are tagged as incomplete noting that for this CI some information is missing. Required fields are equivalent to the fields that are specified as mandatory in the system dictionary.

Recommended

Measures the percentage of CIs in which fields that are set as recommended, are not populated. Out-of-box, no recommended fields are specified.

You can use the Add Identifier Fields In Recommended Rules scheduled job to set criterion attributes from active identification rules, as recommended fields. You can use the Remove Identifier Fields In
Recommended Rules scheduled job to unset criterion attributes from active identification rules, as recommended fields.

Compliance

Based on the results of actual CMDB audit runs.

Audit

Audit compares actual values of specified fields, against expected values defined in template and scripted audits. Based on the Last run date of audits, CMDB Health identifies the set of the most recent complete audit run, and uses those audit results. To pass the CMDB Health audit test, a CI must be in compliance with all audits for that CI. Create a compliance-type audit, for which the results are calculated into the CMDB Health compliance KPI.

Relationships

Measures the health of CI relationships, consisting of the following metrics which are not-configurable:

Duplicate relationships

Relationships that have identical parent and child CIs, identical relationship type, and an identical port. Duplicate relationships are displayed per relationship type. In a set of duplicate relationships, the duplicate relationship count is the total number of duplicate relationships in the set, minus one. The detailed graphs for a duplicate set of relationships display all the relationships in the set.

Orphan relationships

A relationship that is missing either a parent CI, a child CI, or both.

Stale relationships

A relationship in which the parent CI or the child CI is a stale CI.

A single relationship can fail more than one health test. For example, a duplicate relationship can also be stale.

Also reports the following relationship-related summaries:

- Relations not compliant with suggested relations
- Relations not compliant with containment rules
- Relations not compliant with hosting rules

CMDB Health dashboards

CMDB dashboards display CMDB health reports and let you configure the CMDB health KPIs and metrics that CIs are evaluated for.

**Dashboard** | **Use**
--- | ---
CMDB Service Dashboard  
*Configuration > CMDB Dashboard > Service View* | Main CMDB service health dashboard:
- Overall service aggregated health and detailed health for CIs per service. Aggregation is displayed from the metric level up to the overall services level.
- Displays the tasks that were generated for CIs in a service that failed a health test.
- Drill down for each KPI to a detailed report of associated metrics, broken by class.
- Manage the CMDB Health Dashboard jobs.

CMDB Group View Dashboard  
*Configuration > CMDB Dashboard > Group View* | Main CMDB groups (whose type is Health) dashboard:
- Overall CMDB health groups aggregated health and detailed health for CIs in the group. Aggregation is displayed from the CI level up to the overall group level.
- Drill down for each KPI to a detailed report of associated metrics, broken by class.
- Manage the CMDB Health Dashboard jobs.

---

**View CMDB health reports**

The CMDB dashboard serves as a central location to view aggregated health reports for your CMDB at a glance which helps you understand the CMDB health status. Also, it provides functions to address health issues, and improve CMDB health.

The CMDB dashboard requires some configuration before it can display meaningful data. Once CMDB Health is configured and the CMDB Health Dashboard Jobs are enabled, the dashboard displays data that is automatically collected and calculated on a recurring schedule. The CMDB dashboard uses the Performance Analytics framework for dashboards and employs some of the capabilities it provides. The CMDB dashboard is domain aware.

Using the CMDB dashboard requires the asset or itil role, and if the system property `glide.cms.enable.responsive_grid_layout` exists, then its value must be true. For more information, see [Enable responsive dashboards](#).

For information about sharing a responsive dashboard ([Sharing](#)), see [Share a responsive dashboard](#).

**Note:** Only users with the itil role can view a CMDB dashboard which has been shared.

Access the CMDB dashboard by navigating to *Configuration > CMDB Dashboard > CMDB View*. On the CMDB dashboard:

- Click **CMDB Health Dashboard Jobs** to enable and manage the jobs that monitor and collect health data for CIs and CI relationships.
- Click the default **CMDB Dashboard - CMDB View** dashboard to list additional CMDB drill-in dashboards.

The CMDB dashboard has two viewing modes. Click **CI Health** or **Relationship Health** to toggle between them.
CMDB Health view

The CMDB Health view is the default view for the CMDB dashboard. It contains scorecards detailing the overall health of CIs in your CMDB, per health KPI and metric. Also, it contains useful reports showing a breakdown of any duplicate, orphan or stale CIs by class, and lists the top 10 incident, alert, and change generating CIs in the CMDB.

All the default widgets in the CI Class view can be filtered using the CMDB class hierarchy tree. Initially, the class hierarchy filter is set to the root class, Configuration Item (All). Click All to select a different class, filtering all widgets on the dashboard to display data only for the selected class and its child classes.

In each scorecard widget, the horizontal bar in the center and the % number are correlated, displaying the aggregated health summary for the KPI. Health results of associated metrics are displayed underneath, each contributing according to the configuration of the metric scorecard, and its threshold.

Except for the Overall health scorecard, you can drill into any widget in the CI Class view:

- In a scorecard widget: Click the large aggregated percent number or the health bar to drill into a more detailed dashboard for that KPI.
- In a charts widget: Click a bar to display a list of all the records that the bar represents.
- In lists: Click the ‘i’ icon to view a list of all the tasks or alerts related to the CI.

Relationship Health view

The Relationship Health view displays various scorecards for health indicators of CI relationships in your CMDB. It contains charts detailing any duplicate, orphan or stale relationships, broken down by relationship type. You can drill down these charts for further details.

Changing the CI Class selection while in the Relationship view has no effect on the data displayed in this view.

Color codes

Both, the CI class view and the relationship view, use color codes when displaying aggregated health status. The status definitions are based on each scorecard’s threshold limits that are defined in the CI Class Manager.

<table>
<thead>
<tr>
<th>Color code</th>
<th>Definition</th>
<th>Default threshold setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Best</td>
<td>Less than or equal to 33</td>
</tr>
<tr>
<td>Orange</td>
<td>At risk</td>
<td>More than 33 and less than or equal to 67</td>
</tr>
<tr>
<td>Red</td>
<td>Critical</td>
<td>More than 67</td>
</tr>
<tr>
<td>Gray</td>
<td>Incomplete</td>
<td>N/A</td>
</tr>
</tbody>
</table>

Note: The icon is a notation that the maximum failure threshold for the scorecard has been reached. The tests for the metric are halted for this cycle, and all associated aggregated summaries are 0%. Review the scorecard rules which might be ineffective, or the CMDB might be in an unstable state.
Dashboard layout configuration

The CMDB dashboard uses some of the capabilities that Performance Analytics provides for responsive dashboards. You can, for example, add or remove widgets from the layout.

For information about adding a widget (Add Widgets) and changing other layout settings such as adding a tab (Create Tab) to the dashboard, see Edit a dashboard. The drop-down that appears when adding a widget, includes CMDB-related widgets that are used in CMDB dashboards and other system widgets which are typically not relevant in CMDB reports.

Domain separation

If the Domain Support — Domain Extensions Installer plugin is activated, then the CMDB dashboard is domain aware:

- The CMDB dashboard aggregates and reports health failures and scores based on user’s domain visibility of CIs. If domain visibility lets a user see a CI, then the audit rule in that user’s domain applies to that CI, whether the CI is in the user’s domain or in a contained domain. If a CI fails health tests from different user domains, then separate failure records are created.
- Users can configure KPI and metric settings specific to the needs in their domain. So different domains can have different settings such as active/inactive, and thresholds.
- A child domain derives its immediate parent's domain health configurations if the child domain does not configure its own. A child domain can override parent's configurations by modifying them.

View services health reports

The CMDB service dashboard serves as a central location to view aggregated health reports for services at a glance. Also, it lets you drill into a service to perform remediation actions that address health issues, and that improve CMDB health. The CMDB service dashboard uses the Performance Analytics framework for dashboards and employs the capabilities it provides.

Requirements

- The Event Management and Service Mapping Core plugin must be activated.
- If the system property glide.cms.enable.responsive_grid_layout exists, then it needs to be set to true. For more information, see Enable responsive dashboards.
- Role required: asset or itil

Configuration

The CMDB service dashboard requires some configuration before it can display meaningful data, using the same settings as the CMDB dashboard. The CMDB service dashboard uses the settings for the Business Service, Manual Service, and Technical Service classes. For each CI that is included in a service, the rule settings of its respective class are applied. You can customize these settings in the CI Class Manager, and on the CMDB Health Preferences page. Once CMDB Health is configured and the CMDB Health Dashboard Jobs are enabled, the CMDB service dashboard displays data that is automatically collected and calculated on a recurring schedule.

CMDB Health is domain aware. If domain separation has been activated, then the CMDB service dashboard displays health based on data, rules, and settings from the logged-on user domain. If rules and settings are not defined for a child domain, then the parent’s settings are applied, recursively.
Access

Access the CMDB service dashboard by navigating to Configuration > CMDB Dashboard > Service View.

Report details

The CMDB service dashboard displays aggregated health for services, and also details for individual services. For a specific service, the CMDB service dashboard displays aggregated health for all the CIs in that service, including the service CI itself. Also it provides useful reports about service classes such as the Business Service class. You can drill down those reports to display further details of duplicate, orphan, or stale CIs per service and lists of the top 10 incident, alert, and change generating CIs in the service.

All default widgets can be filtered using the CMDB service hierarchy tree. Initially, the service hierarchy filter is set to Business Service. Click Business Service to expand it and to select a different class, filtering all widgets on the dashboard to display data only for the selected class, its child classes, or services of that class.

In each scorecard widget, the horizontal bar in the center and the % number are correlated, displaying the aggregated health summary for the KPI. Health results of associated metrics are displayed underneath, each contributing according to the weight configuration of the metric scorecard, and its threshold.

With the exception of the Overall health scorecard, you can drill into any widget in the service dashboard:

- In a scorecard widget: Click the large aggregated percent number or the health bar to drill into a more detailed dashboard for that KPI.
- In a charts widget: Click a bar to display a list of all the records that the bar represents.
- In lists: Click the ‘i’ icon to view a list of all the tasks or alerts related to the CI.

Color codes

The CMDB service dashboard uses color codes when displaying aggregated health status. The status definitions are based on the threshold limits for each scorecard, defined in the CI Class Manager.

<table>
<thead>
<tr>
<th>Color code</th>
<th>Definition</th>
<th>Default threshold setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Best</td>
<td>Less than or equal to 33</td>
</tr>
<tr>
<td>Orange</td>
<td>At risk</td>
<td>More than 33 and less than or equal to 67</td>
</tr>
<tr>
<td>Red</td>
<td>Critical</td>
<td>More than 67</td>
</tr>
<tr>
<td>Gray</td>
<td>Incomplete</td>
<td>N/A</td>
</tr>
</tbody>
</table>

The icon is a notation that the maximum failure threshold for the scorecard has been reached. The tests for the metric are halted for this cycle, and all associated aggregated summaries display 0%.

View CMDB groups health reports

The CMDB group view dashboard serves as a central location to view aggregated health reports for CMDB groups at a glance. Also, it lets you drill into a CMDB group to perform remediation actions that address
health issues, and that improve CMDB health. The CMDB group view dashboard uses the Performance Analytics framework for dashboards and employs the capabilities it provides.

Configuration

The CMDB group view dashboard requires some configuration before it can display meaningful data, using the same settings as the CMDB dashboard. For each CI that is included in a CMDB group, the rule settings of its respective class are applied. You can customize these settings in the CI Class Manager, and on the CMDB Health Preferences page. Once CMDB Health is configured and the CMDB Health Dashboard Jobs are enabled, the CMDB group view dashboard displays data that is automatically collected and calculated on a recurring schedule.

If the system property `glide.cms.enable.responsive_grid_layout` exists, then it needs to be set to true. For more information, see Enable responsive dashboards.

CMDB Health is domain aware. If domain separation has been activated, then the CMDB group view dashboard displays health based on data, rules, and settings from the logged-on user domain. If rules and settings are not defined for a child domain, then the parent’s settings are applied, recursively.

Role required: asset or itil

Access

Access the CMDB group view dashboard by navigating to Configuration > CMDB Dashboard > Group View. Then, select a CMDB group from the CMDB Health Group List drop-down list.

Report details

For each CMDB group, the CMDB group view dashboard displays aggregated health for all the CIs in that group. You can drill down those reports to display further details of duplicate, orphan, or stale CIs per CMDB group. In each scorecard widget, the horizontal bar in the center and the % number are correlated, displaying the aggregated health summary for the KPI. Health results of associated metrics are displayed underneath, each contributing according to the weight configuration of the metric scorecard, and its threshold.

With the exception of the Overall health scorecard, you can drill into any widget in the CMDB group view dashboard:

- In a scorecard widget: Click the large aggregated percent number or the health bar to drill into a more detailed dashboard for that KPI.
- In a chart widget: Click a bar to display a list of all the records that the bar represents.
- In lists: Click the ‘i’ icon to view a list of all the tasks or alerts related to the CI.

Color codes

The CMDB group view dashboard uses color codes when displaying aggregated health status. The status definitions are based on the threshold limits for each scorecard, defined in the CI Class Manager.

<table>
<thead>
<tr>
<th>Color code</th>
<th>Definition</th>
<th>Default threshold setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Best</td>
<td>Less than or equal to 33</td>
</tr>
<tr>
<td>Orange</td>
<td>At risk</td>
<td>More than 33 and less than or equal to 67</td>
</tr>
</tbody>
</table>
The icon is a notation that the maximum failure threshold for the scorecard has been reached. The tests for the metric are halted for this cycle, and all associated aggregated summaries display 0%.

View CI health

The CI dashboard is a central location displaying health report for an individual CI, history of changes to the CI in a timeline view, and the relation formatter. The CI dashboard also displays incidents, changes, and other tasks affecting the CI, and business services affected by the CI. You can access the CI dashboard from a CI form, or from the CMDB dashboard.

Role required: asset or itil

The health scores are based on settings of CMDB Health KPIs and metrics. The report is calculated in real-time from data stored in health-related tables which the CMDB Dashboard jobs update on a recurring schedule. The completeness and correctness KPIs are always up to date, but for other KPIs, it is possible that updates to the CMDB are not reflected because one of the dashboard jobs hasn’t run yet, as follows:

- Compliance: Depends on audit cycles and on the ‘CMDB Health Dashboard - Compliance Score Calculation’ job.

To ensure that the latest updates to these KPIs are reflected on the CI dashboard, navigate to the respective dashboard job, and click Execute Now.

1. On a CI form click Dashboard.
2. Or, navigate to CMDB Dashboard > CMDB Health and click CMDB Dashboard - All to display the class hierarchy. Enter a search string and then select a CI from the Configuration Items group.
   The search results are grouped by Classes and Configuration Items that match the search string.

Various widgets in the report display CI’s health with the following color codes:

- Green: The CI passed the health test (for example, it is not a duplicate).
- Red: The CI failed the health test (for example, it is a duplicate)
- Grey: The CI was not tested for this metric, because the threshold was not set for the CI (class) in the CI module.

The report displays the change history for the CI in a timeline format, that you can zoom in or out to select a time period for which to display details for. Use the related lists tabs Change, Incident, Task, Business Services, and Alerts to further drill into additional details.

Note:

Missing rules or other class definitions can prevent some health scores from being evaluated for a CI. The results in the CI dashboard in these situations, are described below:

Duplicate
• If no identification rules ([cmdb_identifier]) are defined for the CI’s class or its ancestors: A notification to that effect appears.
• If only dependent identification rules are defined: Not applicable notification appears.

Orphan
• If the CI is excluded by health inclusion rules: Not applicable notification appears.
• If no orphan rules ([cmdb_health_orphan_rule]) are defined for the CI’s class or its ancestors: A notification about missing a rule appears.

Staleness
• If the CI is excluded by health inclusion rules: Not applicable notification appears.
• If no staleness rules ([cmdb_health_staleness_rule]) are defined for the CI’s class or its ancestors: A notification about missing a rule appears.

Audit
• If no audits ([cert_audit]) are defined for the CI (CI dashboard checks only desired states and scripted audits): Not applicable notification appears.
• If there are audits defined for the CI but the audits did not run: Not applicable notification appears.

Customize the CI dashboard
You can add, remove or re-arrange content on the CI dashboard to display the CI health statistics that are important to you.

Role required: itil_admin

On a CI form click Dashboard and customize the CI dashboard as follows:
• Drag a tile near its upper edge and drag it to a different location on the dashboard to rearrange the current layout.
• Click the X in the upper right side of a widget to hide the widget.
• Click the + sign in the upper left corner of the dashboard to add content. In the Add content dialog box, select the content to add and the location to place it.
• Click the gear icon in a widget tile to edit widget settings such as title and height.
• Click Reset to Default to revert to the base system settings.

View CI relationships health

View aggregated orphan, stale, and duplicate CI relationships in the CMDB dashboard. You can configure the relationship scorecards, but you cannot configure the underlying relationship KPI health tests.

The CMDB Health Dashboard - Relationship Compliance Processor dashboard job must run to generate data for these reports.

Role required: itil or asset

CMDB Health measures CI relationship health using a separate KPI and metrics.

Orphan relationship
A relationship that is missing parent, child, or relationship type.
Duplicate relationship
Relationships that have identical parent, child, and relationship type.

Stale relationship
A relationship in which one of the CIs is stale. For a stale CI — its associated relationships are also stale.

In addition, the following relationship compliance reports are available:

Relationships not compliant with all relationship rules
Relationships that do not comply with any relationship governance rule, including suggested relationships and dependent relationship rules.

Relationships not compliant with suggested relationships
Suggested CI relationships are used as rules to test if relationships comply with specified suggested relationships.

Relationships not compliant with containment rules
Containment rules are used to test if relationships comply with specified containment relationships.

Relationships not compliant with hosting rules
Hosting rules are used to test if relationships comply with specified hosting relationships.

For each of the compliance reports, testing a relationship requires a rule (suggested relationship, hosting rule, or containment rule) in which the parent and child CI classes match the parent and child CI classes in the tested relationship. If the relationship types in the rule and in the tested relationship do not match, then the relationship is not in compliance. If an applicable rule is not found, then the relationship is considered to be in compliance. Rules apply to the classes specified in the rule, and also to descendant classes. Therefore, when testing a relationship, rules that apply to ascendant parents of the CIs in the tested relationship are used. If there are multiple rules that match the parent and the child CI classes of the tested relationship, then the tested relationship needs to satisfy only one of these rules to be in compliance.

1. Navigate to Configuration > CMDB Dashboard > CMDB View.
2. Select the Relationship Health tab.
3. Scroll to the bottom of the page to examine the relationship compliance reports.
   Report results are grouped by relationship type, and you can drill down for further details:
   - Point to a relationship type to display its label and the % of relationships that are not in compliance.
   - Click on a relationship type to drill down to a detailed list of all the relations of that type that are not compliant. Click on a specific relationship to display more details such as the failure description. The Failure Description field lists only a single rule that the relationship did not comply with, even if there are additional rules that the relationship fails to comply with.

Create CMDB remediation rule
A CMDB remediation rule is associated with a task that was created for a failed CMDB health test. A CMDB remediation rule is applied automatically or manually to execute a remediation workflow that can, for example, delete stale CIs.

You need to first create and publish a remediation workflow that addresses the CI issue. The workflow can be a regular workflow, or an Orchestration workflow, and the table in the workflow needs to match the task type in the remediation rule. Do not configure the workflow with any filter conditions by setting If condition matches to None, so that the filters of the CMDB remediation rule will apply.

Role required: itil_admin (on top of itil)

1. Navigate to Configuration > CMDB Remediations.
2. Fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Remediation name.</td>
</tr>
<tr>
<td>Task type</td>
<td>Type of CMDB health-related tasks to apply the remediation to.</td>
</tr>
<tr>
<td>Task filter</td>
<td>Filters tasks to apply remediation to. Also applies dot-walking on CI fields so that remediation is applied to tasks associated with matching CIs.</td>
</tr>
<tr>
<td>Execution</td>
<td>• Manual: Remediation is applied manually.</td>
</tr>
<tr>
<td></td>
<td>• Automatic: The workflow is applied once, upon the creation of a task that matches the Task type and Task filter.</td>
</tr>
<tr>
<td>Active</td>
<td>Allowing the workflow to run.</td>
</tr>
<tr>
<td>Workflow</td>
<td>The CMDB remediation workflow (regular or Orchestration) that will execute automatically or manually, depending on the Execution setting. You can click the Lookup using list icon, and then click New to create a new workflow.</td>
</tr>
</tbody>
</table>

3. Click Submit.

If Execution is set to Automatic, then the business rule Run remediations for CMDBHealth task applies the remediation workflow to CIs that match the Task filter. If Execution is set to Manual, then you can manually apply the remediation workflow defined in the rule.

**Apply CMDB remediation**

Manually initiate a workflow to remediate a CI that failed a CMDB health test. For example, you can remediate CIs that are orphan or stale.

To manually apply a CMDB remediation, a CMDB remediation rule must exist, in which Execution is set to Manual.

Role required: itil_admin

Except for the duplicate and audit health metrics, you can choose to create tasks for health test failures for a metric.

To remediate failures of the duplicate metric, use de-duplication tasks.

For all metrics except for audit, each CI that failed a metric test is associated with a single task. Because a CI can fail multiple audits, a single CI can be associated with multiple audit tasks. The first of those tasks is in the Task field, and any additional tasks are in the Additional Tasks field. To remediate failures of the audit metric, refer to the audit tasks for the audits that the CI failed.

1. Navigate to Configuration > CMDB Dashboard, and then click CMDB View, Service View, or Group View.

2. Click on one of the bars in a bar chart on the page. Or, click on a metric tile that is associated with the remediation that you want to apply, and then in a detailed report click on a bar in a bar chart. For example, to remediate an orphan CI, click the Completeness tile.

3. In the Task column in the CMDB Health Results list, select the task that is associated with the CI that you want to remediate. Point to the information icon (i)
for a result record to display the CMDB Health Results dialog box with more details about the health test.
The CMDB Health Results list contains records only for the CIs that failed a metric test.

<table>
<thead>
<tr>
<th>Field</th>
<th>Column</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI</td>
<td>The CI associated with the test results.</td>
</tr>
<tr>
<td>Class Name</td>
<td>The CI's class.</td>
</tr>
<tr>
<td>Description</td>
<td>Details about the reasons for the CI failing the metric test.</td>
</tr>
<tr>
<td>Last Evaluated On</td>
<td>Time that the CI was evaluated for the metric, and which resulted in failure.</td>
</tr>
<tr>
<td>Metric</td>
<td>The CMDB Health metric associated with this test result.</td>
</tr>
<tr>
<td>Source</td>
<td>Source of the health test failure:</td>
</tr>
<tr>
<td></td>
<td>• CMDB Health Audit: Corresponds to the dashboard</td>
</tr>
<tr>

<td>• Cloud discovery</td>
</tr>
<tr>
<td>Task</td>
<td>The task associated with the health test failure.</td>
</tr>
<tr>
<td></td>
<td>For the audit metric, if there are multiple failures, then only the first task is listed.</td>
</tr>
<tr>
<td>Additional Tasks</td>
<td>If there are multiple tasks related to the audit metric, contains all tasks other than the first which is in the Task field.</td>
</tr>
<tr>
<td>Active</td>
<td>Used internally in combination with the To Delete field to determine the correct results set that this failure belongs to.</td>
</tr>
<tr>
<td>To Delete</td>
<td>Used internally in combination with the Active field to determine the correct results set that this failure belongs to.</td>
</tr>
</tbody>
</table>

4. On the task form, click Remediate.
5. In the Run Remediations dialog box, select the remediation rule that you want to apply.
   The list of remediation rules is based on the type of health metric (such as orphan, stale), and on the filter defined in the rule.
6. Click Execute.

Components installed with CMDB Health

Several types of components are installed with CMDB Health (included in the com.snc.cmdb plugin), including tables and scheduled jobs.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.
Scheduled jobs installed

</table>

**CMDB Health process tracking**

Use the following information to track and resolve issues with the CMDB Health processes.

**Logging**

By default, only error messages are logged to the syslog table, with the source name CmdbHealth. To enable logging of 'info' and 'warning' messages (which are typically logged at the start and end of each processing cycle), update the system property glide.cmdb.logger.use_syslog.CMDBHealth. For information about using this property, see [CMDB Health system properties](#).

**Processing status**

If scheduled jobs are enabled, but data is not displaying on the CMDB dashboard, you can check the processing status in the CMDB Health Metric Status [cmdb_health_metric_status] table. Depending on the status of the inactive metric, decide how to proceed.

Initially, the state of all metrics is 'In Progress'.

Possible final states of a metric:

**Complete**

All classes are processed and the number of failures is under the maximum failures threshold.

**Max Failures**

The number of failures for this metric reached the maximum failures threshold. Processing has been aborted and will start over in the next run.

**Daily Time Out Pause**
The processor reached the processing time limit. Processing is paused and will resume in the next run.

At the end of a processing cycle, the final state of a KPI depends on the final state of its associated metrics. Possible final state of a KPI:

**Complete**

All associated metrics are in Complete state and score calculation is complete.

**Incomplete**

Score is not calculated because one of the associated metrics reached its maximum failure thresholds.

**Daily Time Out Pause**

Timed out because one of the associated metrics has reached its processing time limit.

**Processing time**

If processing of a metric times out, you can find out which class takes too long to process. Use this information to find out if any validation rules are weak.

The progress of each metric is tracked in the CMDB Health Processor Status table [cmdb_health_processor_status]. Status for classes that have been processed for a metric is Complete, and for classes that are yet to be processed is Draft. By looking at the update time for each class, you can calculate the length of processing time for each class.

**Orphan records due to broken hierarchy**

Orphan rules might detect an orphan CI, which you are not able to access and delete. Or, there might be a mismatch between the list view that displays the orphan records, and the total number of records. These findings are due to records being deleted in the database from only one table in the CMDB hierarchy.

These CI records are not accessible via GlideRecord and must be deleted directly from the database. Therefore, in this case, to delete an orphan CI from the database you must get help from ServiceNow Technical Support.

Orphan test results provide the details of where exactly the hierarchy is broken. For example, the message “This cmdb_ci_linux_server CI [91054fc24f22520053d6e1d18110c713] is missing record in cmdb_ci_computer table” means that a record of that sys_id must be deleted from the CMDB, cmdb_ci, cmdb_ci_hardware, cmdb_ci_server, and the cmdb_ci_linux_server tables (the Computer class is between the Hardware and the Server classes in the hierarchy.)

**Scripted audits Skipped**

An error message is logged if the results from a scripted audit are not included in the compliance KPI. The reason can be that the script in the audit was not updated to populate its *Last ran date* field. Without a *Last ran date* value, CMDB Health is unable to identify these run results as part of a recent complete audit run, and skips those results.

**CMDB Health process status: failure threshold reached**

The CMDB dashboard displays the string ‘failure threshold reached’ when the number of CIs that are failing the metric tests, reaches the failure threshold set for the metric.

CMDB Health stops processing for this metric in the current cycle, and therefore there is no aggregated health score for the metric. Processing will be attempted again in the next cycle. Also, status in the CMDB Health Metric Status [cmdb_health_metric_status] table is set to Max Failures for this metric.
When the health score of a metric cannot be evaluated, then the processing status of the respective KPI (for example, correctness) is set to **Incomplete**. The CMDB dashboard displays the string **Incomplete score** for the respective KPI and for the CMDB Health overall score. Also, aggregated health scores for the metric are not available for any class in the CMDB hierarchy.

Review and adjust the following definitions as needed:

- Review and refine the rules defined for the metric which has reached max failures. If a rule associated with the metric is too generic, resulting in large number of failures, attempt to refine it. For Example:
  - Completeness – Review the recommended fields that are causing failures and remove the ones that are not critical for the health score. For more information see Set a CI field to be recommended.
  - Correctness – For the staleness metric, depending on the cause of the failures it might be helpful to increase the value of the `glide.cmdb.health.staleness` CMDB Health system property.

- Reduce the number of failures by fixing CI records: If after adjusting the metric test rules the max failures for some metrics is still reached, then address the failures by updating CI records with the relevant missing information.

- **Increase the failure threshold** for the metric that is failing and check if processing for this metric completes successfully in the next cycle. Increasing the failure threshold beyond 500K might reduce overall performance.

**CMDB Health process status: incomplete score**

The CMDB dashboard displays the string ‘incomplete score’ for a metric when it fails to calculate the score for the metric.

'Incomplete score’ is displayed when:

- The number of CIs that are failing the tests of one of its sub-metric, reaches the failure threshold set for the metric. In this situation, the processing status for the respective parent metric (for example, correctness) is set to ‘incomplete’ in the CMDB Health Metric Status `[cmdb_health_metric_status]` table. Processing for the failing metric in the current cycle stops, and therefore there are no aggregated health scores for the sub-metric, the parent parent metric, or the overall CMDB Health.

  To remediate, you need to resolve the underlying cause of CIs failing the sub-metric tests. See CMDB Health process status: failure threshold reached for more information about resolving the failures of the sub-metric.

- An error is encountered while processing the sub-metric.

  To remediate, examine the system logs system logs to determine the cause of the error. After fixing the cause of the problem, restart processing by manually executing the respective parent metric dashboard job.

**Duplicate CIs**

When the instance encounters duplicate CIs during identification and reconciliation, it groups each set of duplicate CIs into a de-duplication task for review and remediation.

**De-Duplication tasks**

De-duplication tasks provide details about the duplication, including a list of all the duplicate CIs. Review the details of each duplicate CI in the task and the data that was used to determine that the CI is a duplicate.

From a de-duplication task, you can run the Duplicate CI Remediator wizard to reconcile a set of duplicate CIs into a single CI, eliminating the duplication.
Duplicate CI Remediator

The Duplicate CI Remediator is a wizard-like tool that you can use to reconcile a set of duplicate CIs associated with a de-duplication task. You can choose one of the duplicate CIs to retain as an active CI, and then decide how to process the rest of the duplicate CIs. The Duplicate CI Remediator lets you set reconciliation options for attributes, relationships, and related items.

For information about using the Duplicate CI Remediator, see Remediate a de-duplication task.

Properties that affect processing of duplicate CIs

During CMDB Identification, processing of sets of duplicate CIs is determined by:

- Property `glide.identification_engine.skip_duplicates` (true by default).
- Property `glide.identification_engine.skip_duplicates.threshold` (5 by default).
- Number of duplicate CIs in a set.

For information about how these properties affect the management of duplicate CIs, see Detecting duplicate CIs.

Master CI

The master CI plays an important role in the remediation of duplicate CIs. The master CI is a single CI from a set of duplicate CIs, that remains active while the rest of the duplicate CIs in the set are potentially retired, deleted, or reconciled into the master CI. Using the Duplicate CI Remediator, you can select a master CI for a set of duplicate CIs associated with a de-duplication task.

The `duplicate_of` attribute in duplicate CIs, is used to store a reference to the master CI. For duplicate CIs which existed in an instance that was upgraded to the New York release or later, the master CI is unknown. After upgrade, `duplicate_of` for those duplicate CIs is set to 'Unknown', indicating that the CI is a duplicate but the master CI is unknown.

Duplicate CIs set

Before remediation, the CIs in a duplicate CIs set are all duplicates of each other. After remediation, a set of duplicate CIs consists of one master CI, and any number of CIs, each considered a duplicate of the master CI. The `duplicate_of` attribute of the master CI is empty. The `duplicate_of` attribute for all the rest of the duplicate CIs in the set, is a reference to the master CI of the set.

If you attempt to modify the value of `duplicate_of` directly on a CI form or by using a script, the following restrictions are enforced to ensure data integrity:

- A CI cannot be its own master CI (you cannot set a CI as a duplicate of itself).
- A CI and its master CI cannot be from different domains.
• The `duplicate_of` attribute of the master CI cannot reference any CI as its master CI (you cannot set a CI as a duplicate of another duplicate CI to create a chain of duplicate CIs).

• If you attempt to set a CI as a duplicate of another duplicate CI, then the CI is set as a duplicate of the master CI of the duplicate CI you are trying to set. If the master CI of the duplicate CI you are trying to set is 'Unknown', the operation fails.

**Example: Attempt to set a CI as duplicate of another duplicate CI**

<table>
<thead>
<tr>
<th>CI1: <code>duplicate_of = empty</code></th>
<th>CI2: <code>duplicate_of = CI3</code></th>
<th>CI3: Master CI</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attempted setting</td>
<td><code>CI1: duplicate_of = CI2</code></td>
<td><code>CI1: duplicate_of = CI3</code></td>
</tr>
<tr>
<td>Result (System enforced)</td>
<td><code>CI2: duplicate_of = CI3</code></td>
<td><code>CI3: Master CI</code></td>
</tr>
</tbody>
</table>

If CI2 is a duplicate of 'Unknown', the operation fails.

• If a master CI becomes a duplicate of another CI, then it can no longer be a master CI. All CIs that were duplicates of that master CI are set as duplicates of the new master CI.

**Example: Attempt to set a master CI as duplicate of another CI**

<table>
<thead>
<tr>
<th>CI1: <code>duplicate_of = CI4</code></th>
<th>CI2: <code>duplicate_of = CI4</code></th>
<th>CI3: <code>duplicate_of = CI4</code></th>
<th>CI4: Master CI</th>
<th>CI5: <code>duplicate_of = empty</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Attempted setting</td>
<td><code>CI4: duplicate_of = CI5</code></td>
<td><code>CI4: duplicate_of = CI5</code></td>
<td><code>CI4: duplicate_of = CI5</code></td>
<td><code>CI4: duplicate_of = CI5</code></td>
</tr>
<tr>
<td>Result (System enforced)</td>
<td><code>CI1: duplicate_of = CI5</code></td>
<td><code>CI2: duplicate_of = CI5</code></td>
<td><code>CI3: duplicate_of = CI5</code></td>
<td><code>CI5: Master CI</code></td>
</tr>
</tbody>
</table>

• If a master CI becomes a duplicate of a CI within the same duplicate CI set, then the selected duplicate becomes the master CI in the duplicate CI set. The rest of the duplicate CIs in the set are set as duplicates of the new master CI.

**Example: Attempt to set a master CI as duplicate of a CI within the duplicate CIs set**

<table>
<thead>
<tr>
<th>CI1: <code>duplicate_of = CI4</code></th>
<th>CI2: <code>duplicate_of = CI4</code></th>
<th>CI3: <code>duplicate_of = CI4</code></th>
<th>CI4: Master CI</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attempted setting</td>
<td><code>CI4: duplicate_of = CI1</code></td>
<td><code>CI1: Master CI</code></td>
<td><code>CI1: Master CI</code></td>
</tr>
<tr>
<td>Result (System enforced)</td>
<td><code>CI2: duplicate_of = CI1</code></td>
<td><code>CI3: duplicate_of = CI1</code></td>
<td><code>CI4: duplicate_of = CI1</code></td>
</tr>
</tbody>
</table>

• You cannot delete a CI that is the master CI of duplicate CIs. To delete a master CI, you must first disassociate that master CI with all of its duplicate CIs. Either delete all duplicate CIs that are associated with that master CI, or remove the reference to that master CI from all `duplicate_of` attributes in any duplicate CIs that have it.

**Review de-duplication tasks**

Review details of de-duplication tasks, and then potentially remediate a de-duplication task.
Role required: itil to view and itil_admin to remediate a de-duplication task.

If a duplicate CI is a dependent CI, then you can view the details of the dependent relationship, the Depend on CI, and any relation qualifier chain. If the dependent CI has a lookup table, then you can see the details of the respective lookup table.

1. Navigate to **Configuration > Identification/Reconciliation > De-duplication Tasks**.
2. Select a task.

### Remediate Duplicate Task form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Unique task number.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>Person who is responsible for resolving the task.</td>
</tr>
<tr>
<td>Short description</td>
<td>Description for the task.</td>
</tr>
<tr>
<td>Work notes</td>
<td>Details describing how the CI was identified as a duplicate.</td>
</tr>
</tbody>
</table>

**Note:** Not available in de-duplication tasks that were created prior to the London release.

This field also contains user notes about the decisions and steps of resolving the task.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Priority</td>
<td>Task priority.</td>
</tr>
<tr>
<td>State</td>
<td>State of the de-duplication task as it progresses through resolution.</td>
</tr>
</tbody>
</table>

3. In the related lists section, click the **Duplicate Audit Results** tab to see the list of duplicate CIs in this task. You can click a CI to display more CI details.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duplicate CI</td>
<td>Reference to the duplicate CI.</td>
</tr>
</tbody>
</table>

**Note:** This field is a document ID type, which means that it can reference any record on any table. If the referenced CI is deleted as part of resolving duplicate tasks, then this field is empty.

<table>
<thead>
<tr>
<th>Relationship</th>
<th>For a duplicate CI that is a dependent CI, this field shows the relationship between the duplicate CI and depend on CI.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depend on CI</td>
<td>If the duplicate CI is a dependent CI, then this field displays the depend on CI.</td>
</tr>
<tr>
<td>Discovery source</td>
<td>Discovery method used for the CI.</td>
</tr>
</tbody>
</table>

Analyze de-duplication tasks to determine which CIs should remain active and which of the duplicate CIs in the Duplicate Audit Results lists are stale or incorrect. Click **Remediate** to remediate a de-duplication task (requires the itil_admin role).
Manually create a de-duplication task

Manually create a de-duplication task when it cannot be automatically created. You can then use the Duplication CI Remediator to remediate the manually created task.

In some situations, duplicate CIs are not automatically detected and de-duplication tasks are not automatically generated. Such situation happens with a class for which identification rules are not defined and the identification engine cannot be applied. However, you still want to reconcile these duplicate CIs by utilizing the Duplication CI Remediator.

Use the CMDBDuplicateTaskUtils API to manually create a de-duplication task in which all duplicate CIs are specified. The de-duplication tasks that you create manually and the automatically created tasks, are stored in the same table ([reconcile_duplicate_task]) and are processed in the same manner.

**Note:** You can manually create a de-duplication task only for CMDB CIs and a CI can be specified as a duplicate CI only in a single de-duplication task.

Remediate a de-duplication task

Remediate a de-duplication task by using the Duplicate CI Remediator wizard. Use the wizard to guide you through the duplicate CI reconciliation process or to apply a custom workflow.

Important concepts associated with the Duplicate CI Remediator:

**Master CI**

The master CI is one of the duplicate CIs that you want to retain as an active CI while potentially retiring or deleting the rest of the duplicate CIs. The first step in the Duplicate CI Remediator is to select a master CI for the remediation process. The Duplicate CI Remediator lets you choose which attribute values, relationships, and related items from the duplicate CIs to reconcile into the master CI. Alternatively, you can choose not to consolidate any data and retain the master CI as it is.

**Default related items list**

A list of related items that is used globally in the Duplicate CI Remediator for all de-duplication tasks. All items from the default related items list are selected by default to be merged to the master CI, on the Merge Relationships and Related Items tab. Adding or removing items from that slushbucket does not affect the default related items list. See Manage default related items list for more information.

**Note:** Asset related tables are not included in the default related items list and therefore they are not available for merge.

Review Properties for duplicate CIs for information about important properties that affect how the Duplicate CI Remediator operates. Including the glide.duplicate_ci_remediator.dry_run property that determines if the Duplicate CI Remediator actually updates the CMDB or not.

Role required: itil user to read and itil_admin to write

As you progress through the tabs of the Duplicate CI Remediator, CIs are not updated. All updates are applied only in the final step, after you click Remediate.

**Note:**
- Merging of attributes and related items that are associated with assets is not supported in the Duplicate CI Remediator.
1. Navigate to **Configuration > Identification/Reconciliation > De-duplication Tasks**.
2. Open the de-duplication task that you want to remediate. On the task form, click **Remediate**.
3. In the Remediate dialog box, select either of the following options:
   - **Use the Duplicate CI Remediator (Recommended)**: Use the wizard to consolidate duplicate CIs according to your configurations and settings. Follow the Duplicate CI Remediator tabs to configure the reconciliation.
   - **Use a custom remediation workflow**: Use an existing CMDB remediation rule or select **Add New** to create a new one.

   - On the CMDB Remediation Rule form, set **Task type** to **Remediate Duplicate Task** and select **Active**.
   - On the Workflow form, set **Table** to **Remediate Duplicate Task [reconcile_duplicate_task]** and set **If condition matches** to **None**.
   - Ensure that the associated workflow remediates duplicate CIs.

   In the Remediate dialog box, click **Next** to start the workflow and to exit the Duplicate CI Remediator. The RemEDIATE Duplicate Task form appears, where you can update the **State** of the task.

4. On the **Select Master CI** tab in the Duplicate CI Remediator:
   a) Select the master CI for this reconciliation using either of the following lists of duplicate CIs. For any CI, you can click the **Name** link to display the CI's attributes, or click the **Related Items** link to display the number of related items.

      - **Recommended**: A subset of the **All** list, containing only system recommended master CIs. System recommendations are based on checking the duplicate CIs for the following criteria:
        - CI with most related items.
        - CI with most relationships.
        - Newest discovered CI.
        - Newest updated CI.
        - Oldest created CI.
        - Previous master CI, if one was previously selected.

      - **All**: All duplicate CIs for the de-duplication task.

   Either option lets you review a summary of the remediation settings before starting the remediation.

   b) Select one of the following options to choose whether to consolidate any attribute values, relationships, or related items from any of the duplicate CIs into the master CI:

      - **Remediate Manually**: Lets you specify which attribute values, relationships, and related items from duplicate CIs to consolidate into the master CI.
      - **Use Master CI**: Retains master CI attribute values, merges relationships, and merges only the default related items.

   Skip to step number 7 as this selection skips all configurations other than choosing the action for the duplicate CIs on the **Determine Duplicate CI Actions** page.
5. On the **Merge Attribute Values** tab review inconsistent values of each attribute. For each attribute, choose to retain the master CI's value, or choose a value from a duplicate CI for the master CI to be set with. Then click **Next**.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute</td>
<td>Attribute for which there are different values.</td>
</tr>
<tr>
<td>Master CI Value</td>
<td><strong>Attribute</strong> value in the master CI.</td>
</tr>
<tr>
<td>Other Values</td>
<td>The number of unique <strong>Attribute</strong> values within the duplicate CIs.</td>
</tr>
</tbody>
</table>

To override the master CI attribute value with a duplicate CI value:

a) Click the **Other Values** link.

b) In the attribute dialog box, click **Unique Values** to display only unique attribute values, or **All** to display all attribute values including identical values.

c) Select a value for the master CI **Attribute** to be set with.

   You can click **Reset to Original** to undo the selection of a different attribute value for the master CI.

d) Click **Select**.

**Note:** Attributes, such as system fields, discovery fields (**discovery_source**, **last_discovered**, **first_discovered**), and read-only fields (such as the asset field) do not appear in the list.

6. On the **Merge Relationships and Related Items** tab:

a) In the Merge Relationships section, select whether to merge all relationships from all duplicate CIs into the master CI. Click **View all relationships** to display all the relationships in which a duplicate CI is a parent or a child. You can click a **Parent** or a **Child** link to display more details. Orphan and duplicate relationships of duplicate CIs are deleted if you choose to merge relationships. For more information about the CMDB Health relationship KPI, see **CMDB Health KPIs and metrics**.

b) In the Merge Related Items section use the slushbucket to select related items to be merged into the master CI. Click **View all related items** to display all related tables (items) and the count of
references in each table to one of the duplicate CIs. You can click the links in Master CI Related Items and Duplicate CIs Related Items to display details about the related items.

Related items in the slushbucket have the following format:

- By default, all items in the default related items list are selected to be merged.
- Related items (tables) that have no references to a duplicate CI are not listed, unless that table is included in the default related items list.
- Since asset related tables are part of the blacklist, they are not available for merge.

See Manage default related items list for more information about configuring a default list of related items.

c) Click Next.

7. On the Determine Duplicate CI Actions tab, choose one of the following actions to perform after completing the reconciliation. Then click Next.

- **Set attributes to custom values** (recommended): Retain all duplicate CIs. Mark the duplicate CIs as invalid by setting a specific Attribute to a specific Value for all duplicate CIs. For example, set Operational Status to Retired to retire the duplicate CIs. The duplicate_of attribute of the duplicate CIs is automatically set to the appropriate master CI. Also, the duplicate CIs will not be added to any de-duplication task after this task is remediated. If the identification engine is not configured to skip duplication, ensure that identification inclusion rules are configured to exclude the duplicate CIs during identification. This configuration prevents new de-duplication tasks with the same duplicate CIs from being created after remediation.

  - **Note:** Discovery fields, system fields, read only fields, and date fields are excluded from the attributes list.

- **Delete**: Delete all duplicate CIs (only the master CI remains).

  - **Note:** Review Roll back and delete recovery for information about reverting the deletion of CIs and related records.

8. On the **Review and Confirm** tab:

a) Review the summary of the expected updates for this duplicate CIs reconciliation. Updates are based on your selections and therefore the summary includes only the details that are applicable. This summary can include details of the relationships and related items that will be merged to the master CI, the attribute values that the master CI will be set with, and the number of CIs that
will be deleted. Click Attributes, Relationships, Related Items, or Duplicate CI Actions if applicable, to display further details such as changes to attribute values.

b) Click RemEDIATE to complete the reconciliation according to your reconciliation settings. Once complete, the task State is set to Closed Complete.

The following relationships are deleted without being merged to the master CI:

• Relationships in which the type, child, or parent field is empty.
• Relationships for which merging to the master CI will result in cyclic relationships.
• Relationship for which merging to the master CI will result in duplicate relationships.

The reconciliation process runs in the background and may take a while to complete. Upon completion, the system sends a confirmation notice to the remediator of the task. Meanwhile, you can:

• Review Identification Rules: Review identification and inclusion rules and make any necessary updates to reduce CI duplication.
• Check Progress: View the task activities that are logged as the remediation progresses.
• View Master CI: View the master CI for this reconciliation process.

Special remediation scenarios

There are a few special remediation scenarios in which the Duplicate CI Remediator behaves differently.

Large number of duplicate CIs

Support for reconciliation of duplicate CIs in the Duplicate CI Remediator is limited when the number of duplicate CIs exceeds a certain threshold. This threshold is based on the value of the glide.duplicate_ci_remediator.max.cis property, which is 1,000 by default. You can update this property to increase the threshold. However, this threshold never exceeds 5,000, even if you set the property to a value greater than 5,000.

When the number of duplicate CIs for a de-duplication task exceeds the threshold, the options available in the wizard are limited:

• On the Select Master CI tab, only the Recommended list of master CIs appears, and only the Use Master CI option is available.
• Recommendations are based only on the oldest created, newest updated, and most recently discovered CIs.
• Reconciliation of attribute conflicts and CI relationships is not supported, and only default related items are reconciled.

Duplicate serial numbers:

The Duplicate CI Remediator is usually applied to duplicate CMDB CIs. However, in some situations de-duplication tasks might be created for duplicate serial numbers. When the Duplicate CI Remediator processes duplicate serial numbers, the merge of relationships from duplicate records, is not referenced and is not applied.

Manage default related items list

You can add or remove items from the default list of related items which is used globally in the Duplicate CI Remediator for all de-duplication tasks.

Role required: itil_admin
The default related items list appears on the **Merge Relationships and Related Items** tab in the Duplicate CI Remediator. Globally modifying the list affects all de-duplication tasks being remediated by the Duplicate CI Remediator.

Alternatively, you can modify the list for only a specific task in the Duplicate CI Remediator without affecting the default global list.

**Note:** Only related items in which the reference field points to Configuration Item `[cmdb_ci]` in `sys_dictionary` can be selected for the default related items list. Related items with references to any child of the Configuration Item class cannot be selected for the default related items list, but are still available for merging in the Duplicate CI Remediator for a specific task.

1. Navigate to **Configuration > Identification/Reconciliation > Duplicate CI Remediator Default Related Items**.
2. On the Default Related Items List for Duplicate CI Remediator page, use the slushbucket to add or remove items from the **Selected** list.
3. Click **Save**.

### Properties for duplicate CIs

Use the properties for duplicate CIs to configure how duplicate CIs are processed.

These properties are available for duplicate CIs. To view and edit these properties, the admin role is required.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attributes in which <code>max_length</code> exceeds this property value (4000 by default) are excluded from the <strong>Select Master CI</strong>, <strong>Merge Attribute Values</strong>, and <strong>Determine Duplicate CI Actions</strong> tabs in the Duplicate CI Remediator wizard.</td>
<td>If the <code>max_length</code> for an attribute is equal to the property value, and the size of the data exceeds the property value, then the data is truncated to the property value and the attribute appears in attribute lists.</td>
</tr>
<tr>
<td>glide.duplicate_ci_remediator.max.field_length</td>
<td>• Type: integer&lt;br&gt;• Default value: 4000&lt;br&gt;• Location: <strong>Configuration &gt; CMDB Properties &gt; Duplicate CI Remediator Properties</strong>&lt;br&gt;<strong>Note:</strong> This property impacts the performance of de-duplication tasks, therefore be cautious about setting this value.</td>
</tr>
<tr>
<td>Comma separated list of related tables in the format <code>&lt;table&gt;,&lt;reference column&gt;</code>, that are excluded from merging during duplicate CI remediation.</td>
<td>• Type: string&lt;br&gt;• Default value: cert_task.cmdb_ci,cert_audit_result.configuration_item,discovery_log.cmdb_ci,alm_hardware.ci,alm_asset.ci,fm_expense_line.ci&lt;br&gt;• Location: <strong>Configuration &gt; CMDB Properties &gt; Duplicate CI Remediator Properties</strong></td>
</tr>
</tbody>
</table>
### Property

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Threshold for the number of duplicate CIs, which if exceeded, support for reconciliation in the Duplicate CI Remediator is limited (1,000 by default). glide.duplicate_ci_remediator.max.cis | - Type: integer  
- Default value: 1000  
- Location: Configuration > CMDB Properties > Duplicate CI Remediator Properties  
- Learn more: See 'Large number of duplicate CIs' in Remediate a de-duplication task.  
This threshold never exceeds 5,000, even if you set the property to a value greater than 5,000. |
| Determines whether the Duplicate CI Remediator actually remediates CI duplication by updating records in the CMDB, or not. glide.duplicate_ci_remediator.dry_run | - Type: true | false  
- Default value: false  
- Location: Configuration > CMDB Properties > Duplicate CI Remediator Properties  
When set to false (default value), updates specified in the wizard are actually performed.  
You can set this property to true and then test run through the Duplicate CI Remediator without any records actually being updated. In this case, the work notes for the task describe the changes that will happen in an actual remediation. |

### Components installed for duplicate CI remediation

Tables installed to support duplicate CI remediation (included in the com.snc.cmdb plugin).

### Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remediate Duplicate Task [reconcile_duplicate_task]</td>
<td>De-duplication tasks.</td>
</tr>
<tr>
<td>Duplicate Audit Result [duplicate_audit_result]</td>
<td>CIs associated with each de-duplication task.</td>
</tr>
<tr>
<td>Duplicate CI Remediation [cmdb_duplicate_ci_remediation]</td>
<td>Input, selections on each tab, overall status of remediation, and results of each run of the Duplicate CI Remediator.</td>
</tr>
</tbody>
</table>

### CI Class Manager

Use the CI Class Manager to centrally view, create, or edit basic class definitions, and class settings for identification, reconciliation, and CMDB Health. To access the CI Class Manager, navigate to Configuration > CI Class Manager.
Class Basics
- Create a class
- View class basic information
- Class columns
- Add a suggested relationship
- Display all CIs for a class
- Dependency Views map icons for a class
- Delete CIs for a CMDB class

CMDB Health
- CMDB Health orphan rule
- CMDB Health staleness rules
- Set a CI field to be recommended
- Set a CI attribute to be mandatory
- CMDB health scorecard thresholds
- Health inclusion rules

Identification and Reconciliation
- Identification:
  - CI identification rules
  - Identification inclusion rules
- Reconciliation:
  - CI reconciliation rules
  - Data source precedence rules
  - Data refresh rules
- Dependencies:
  - Dependent relationship rules (hosting and containment)

Service Mapping
- Entry point types for Service Mapping
- CI types for Service Mapping and Discovery

Agent Workspace for Configuration Management Database (CMDB)
Agent Workspace for CMDB provides an easy-to-navigate interface that helps service agents access essential CMDB configuration items and drill-down to related items such as changes, incidents, and timeline.

Agent Workspace for CMDB provides:
- Key health scores for CIs
- Level 1 CI relationships
- Condensed timeline view of incidents, changes, and change requests for a CI, for the past 7, 14 (default), or 30 days
- Critical incidents and change requests for CIs
- Critical attributes related to CIs.
- Ability to create incidents and change requests for CIs, and to delete a CI

Plugins
The CMDB Workspace plugin (com.cmdb-workspace) is activated by default in a base system. The CMDB Workspace plugin adds the following to Agent Workspace:
- CMDB list category and associated filtered lists: Servers, Workstation, and Network Gear
- Configured workspace forms for common CMDB tables
- CMDB-specific widgets: CMDB Health, CMDB Relationships, and CMDB Timeline

Roles
To access Agent Workspace for CMDB, the workspace_agent and itil roles are required.
CMDB Workspace form view in Agent Workspace

Service agents see forms in the Workspace form view for the CMDB tables that this view is configured for:

The Workspace form view for CMDB tables contains the following components:

Widgets
• **CI Health:**
  Shows Critical Incidents, Change Requests, and the following CMDB Health scores: incomplete attributes, non-compliant relationships, stale relationships. Lets you open the CI Dashboard.

• **Level 1 Relationships:**
  Shows level 1 relationships. Lets you open the Dependency Views map.

• **CI Timeline:**
  Shows record changes, change requests, and incidents on a timeline. The timeline is for the past 14 days, condensing details that might be relevant to a current issue.

**Actions**
The **more** icon in the upper right corner lets you create a change, create an incident, or delete the CI.

**Related lists**
The Workspace form includes CIs' related lists such as Change Requests, Incidents, and Tasks, similar to related lists that appear on a CI form.

CMDB tables that do not have a Workspace form view configured for, appear with the default workspace form view which you cannot update. You can configure Workspace form views for any additional CMDB table that is commonly used in your organization, for which a Workspace form is not configured by default.

For example, create a new form named 'Workspace' for the Business Service class. Then, add to the Workspace form Agent Workspace components such as a form header, and CMDB-specific ribbon items such as the CMDB Health widget. Next time that you open a CI of the Business Service class in Agent Workspace, the CI appears in a Workspace form.

**Browser support for workspaces**
Do not use Internet Explorer 11 to access any workspaces. If you are on the New York release and you are using Internet Explorer 11 with any workspace, such as Service Owner Workspace, Vendor Manager Workspace, or any other type workspace, you must migrate to a modern browser before you upgrade to future releases. Internet Explorer 11 will not be supported for workspaces after the New York release. See KB0683275 for more information on Internet Explorer 11, and see Generally supported browsers for more information about browsers and what you can use across the platform.

**View CI in Agent Workspace**
View various details for a CI using Workspace form view, in Agent Workspace. The Workspace form view provides details such as key health scores, a timeline view of incidents, changes, and change requests, and critical incidents, change requests, and attributes related to CIs.

CIs appear in a Workspace form view only if a Workspace form view is configured for the respective CMDB class. Otherwise, CIs appear in the default workspace form view, which you cannot update.

**Role required:** workspace_agent and itil

1. Navigate to **Agent Workspace** and click **Agent Workspace Home**.
2. Click **Lists**, navigate to **CMDB** and then to one of the classes such as **Servers**.
3. In the class list view, select a CI.

• Click the **more** icon in the upper right area and select **Create Change**, **Create Incident**, or **Delete** to delete the CI.

• In the CI Health widget, click **CI Dashboard** to open the CI Dashboard.
- In the Level 1 Relationship widget, click **Dependency Map** to open the Dependency Views map for the CI.

### Filtered lists for CMDB

Agent Workspace for CMDB includes by default the Servers, Workstations, and Network Gear filtered lists.

To edit filtered lists, navigate to **Agent workspace > List filters**.

<table>
<thead>
<tr>
<th>Filtered list</th>
<th>Criteria</th>
<th>Table columns</th>
</tr>
</thead>
</table>
| Servers       | All CIs under the cmdb_ci_server table | • Name (name)  
• Location (location)  
• Status (install_status)  
• Operating System (os)  
• Last Discovered (last_discovered)  
• Support Group (support_group)  
• Serial Number (serial_number)  
• Asset Tag (asset_tag) |
| Workstations  | Conditions for the following operating systems:  
• Mac OS 10 (OS/X)  
• Mac OS 8  
• Mac OS 9  
• Mac OS/X  
• Windows NT 4.0  
• Windows ME  
• Windows 95  
• Windows 98  
• Windows XP  
• Windows 7  
• Windows 8.1 Enterprise  
• Windows 10  
• Windows Embedded Standard | • Name (name)  
• Location (location)  
• Status (install_status)  
• Operating System (os)  
• Last Discovered (last_discovered)  
• Support Group (support_group)  
• Serial Number (serial_number)  
• Asset Tag (asset_tag) |
| Network Gear  | All CIs under the cmdb_ci_netgear table | • Name (name)  
• Manufacturer (manufacturer)  
• Model ID (model_id)  
• Serial Number (serial_number)  
• IP Address (ip_address)  
• Location (location) |

### Agent Workspace for CMDB tables

Agent Workspace for CMDB provides a number of CMDB tables with the Workspace form view layouts.
CMDB tables in Workspace view

Agent Workspace for CMDB provides the Workspace form view for common CMDB tables:

- Hardware [cmdb_ci_hardware]
- Computer [cmdb_ci_computer]
- Server [cmdb_ci_server]
- Linux Server [cmdb_ci_linux_server]
- UNIX Server [cmdb_ci_unix_server]
- AIX Server [cmdb_ci_aix_server]
- HP-UX Server [cmdb_ci_hpux_server]
- Solaris Server [cmdb_ci_solaris_server]
- Windows Server [cmdb_ci_win_server]
- Network Gear [cmdb_ci_netgear]
- Storage Server [cmdb_ci_storage_server]
- Storage Switch [cmdb_ci_storage_switch]
- IP Router [cmdb_ci_ip_router]
- IP Switch [cmdb_ci_ip_switch]
- Wireless Access Point [cmdb_ci_wap_network]
- Load Balancer [cmdb_ci_lb]
- F5 BIG-IP [cmdb_ci_lb_bigip]
- F5 BigIP GTM [cmdb_ci_lb_f5_gtm]
- F5 BigIP LTM [cmdb_ci_lb_f5_ltm]
- Virtual Machine Instance [cmdb_ci_vm_instance]
- VMware Virtual Machine Instance [cmdb_ci_vmware_instance]
- EC2 Virtual Machine Instance [cmdb_ci_ec2_instance]
- Hyper-V Virtual Machine Instance [cmdb_ci_hyper_v_instance]
- KVM Virtual Machine Instance [cmdb_ci_kvm_vm_instance]
- Solaris Virtual Machine Instance [cmdb_ci_solaris_instance]

CMDB Workspace adds records to the following Agent Workspace tables:

- [sys_aw_crud_exclusions]: For configured lists and related lists
- [sys_aw_list]: For Servers, Computers, and Network Gear
- [sys_aw.Ribbon_component] and [sys_ux_lib_component]: For the three CMDB widgets
- [sys_aw_form_header]: For each configured CI header
- [sys_aw.ribbon_setting]: For each configured CI ribbon
- [sys_ui_form_section], [sys_ui_section], and [sys_ui_element]: For each configured CI form

View CMDB benchmarks

CMDB calculates several CMDB Health benchmarks which then display in the Benchmarks dashboard. These benchmarks are based on various CMDB Health metrics, displaying monthly averages, trends, comparisons to industry averages of your ServiceNow peers, and global benchmarks.

The CMDB Health Dashboard jobs must be enabled and health data must be collected. Also, navigate to Benchmarks > Setup and ensure that the CMDB KPIs are enabled under IT Operations Management.

CMDB provides the following benchmarks:

- % of non-compliant CIs
- % of duplicate CIs
For an instance, each of these benchmarks is the calculated monthly average for the corresponding CMDB Health metric. Calculating a monthly average requires that there is a metric result value for each day of the month. Therefore, each day on which the respective Health Dashboard job did not run, is assumed with the aggregated result from the run that is most recent to that day. The monthly average is then calculated based on the sum of all the daily aggregated results for the metric in that month, divided by the number of days of the month. For a CMDB Health Dashboard job that ran multiple times in a single day, only the results of the last run in that day are used for the monthly average calculation.

Global averages are based on the sum of monthly averages of all peer instances, divided by the number of instances (aside from instances for which the monthly average is 0).

1. Navigate to **Benchmarks > Dashboard**.
2. Click the icon and select **IT Operations Management**.
3. Click **ALL** or **CMDB**.
4. Click on a CMDB benchmark to drill down to trend data, and other benchmark details.

**CMDB APIs (CMDB SDK)**

Use CMDB APIs to create, update, and read operations on the CMDB. Domain separation is supported in CMDB APIs.

**CMDB APIs (CMDB SDK)**

Use the following CMDB APIs to create, update, and read operations on the CMDB:

- CMDBGroupAPI - Scoped
- CMDBTransformUtil - Global
- CMDBUtil - Global
- IdentificationEngineScriptableApi
- IdentificationEngine - Scoped

**Domain separation in CMDB APIs**

Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

CMDB APIs are used for accessing the CMDB from a script. CMDB stores the CI and relation information; CMDB is domain separated.

CMDB APIs support the following operations:
• Create a new CI
  • This operation goes through the Identification and Reconciliation Engine which supports domain separation when creating a CI. The domain of the caller is used for this operation.

• Update an existing CI
  • This operation goes through the Identification and Reconciliation Engine which supports domain separation when creating a CI. The domain of the caller is used for this operation.

• Create/Delete relations
  • The cmdb_rel_ci table is not domain separated.

• Query CMDB CI/Query CMDB table
  • Results are filtered by the domain(s) visible to the caller.

• Query CMDB metadata table
  • Metadata information is not domain separated.

Setting up domain separation for CMDB APIs

If domain separation is enabled for CMDB, then it is also available for CMDB APIs.

Data separation

Data is stored and domain separated in CMDB. There is no additional work needed from the CMDB API perspective.

Configuring a domain-separated environment

The configuration is done at the CMDB level.

If a domain column is present for base system application tables

See the Domain separation in CMDB Health topic.

Tenant domains and application data

There is no application-specific data to manage with CMDB.

Quick start tests for Configuration Management Database (CMDB)

Validate that Configuration Management Database (CMDB) still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.
Configuration Management Database (CMDB) quick start tests require activating the Configuration Management (CMDB) plugin (com.snc.cmdb) and the CMDB - ATF Tests plugin (com.snc.cmdb.atf).

**CMDB: CI Health Dashboard test suite**

Test suite to check whether CMDB CI Health Dashboard is functional at a basic level.

<table>
<thead>
<tr>
<th>Test</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB: Health Job Status</td>
<td>Checks whether any CMDB Health dashboard jobs, which were started 30 or more days ago, are still in progress.</td>
</tr>
</tbody>
</table>
| CMDB: CMDB Health Completeness/ Recommended | Checks whether the CI dashboard is functional for the recommended metric (included in the CMDB Health completeness KPI). This test validates:  
  • Creation of a health inclusion rule for the recommend metric.  
  • Creation of a recommended field that satisfies the health inclusion rule.  
  • Validate that the health inclusion rule is correctly applied to a test record with missing data in the recommended field. |

**CMDB: Query Builder test suite**

Test suite to verify CMDB Query Builder functions such as create query, read query, and execute query using two related user roles - cmdb_query_builder and cmdb_query_builder_read.

<table>
<thead>
<tr>
<th>Test</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB: Query Builder - cmdb_query_builder Role</td>
<td>Verify that cmdb_query_builder user role can save queries, and access and run all saved queries, in CMDB Query Builder.</td>
</tr>
<tr>
<td>CMDB: Query Builder - cmdb_query_builder_read Role</td>
<td>Verify that cmdb_query_builder_read user role can access and run all saved queries, and cannot save any query, in CMDB Query Builder.</td>
</tr>
</tbody>
</table>

**CMDB: Relationship Editor and Formatter test suite**

Test suite to verify functionality of Relationship Editor and Relationship Formatter.

<table>
<thead>
<tr>
<th>Test</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB:Relationship Editor</td>
<td>Check addition of relations to a CI and deletion of relations from a CI using itil user role.</td>
</tr>
<tr>
<td>CMDB:Relationship Formatter</td>
<td>Check accuracy of CI information, relationship types, relationships, associated records such as change tickets, and settings such as CMDB views (relationship filters), displayed for a specific CI in relationship formatter using itil user role.</td>
</tr>
</tbody>
</table>
CMDB: SDK REST API test suite

Test suite to verify functionality of CMDB SDK Rest APIs.

<table>
<thead>
<tr>
<th>Test</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB: Query CMDB Metadata</td>
<td>Test querying CMDB metadata.</td>
</tr>
<tr>
<td>CMDB: Create a relation for a CI using REST APIs</td>
<td>Test creation of a relationship for a CI in the CMDB using the CMDB REST APIs.</td>
</tr>
<tr>
<td>CMDB: Delete a relation for a CI using REST APIs</td>
<td>Test deletion of a relationship for a CI using CMDB REST APIs.</td>
</tr>
<tr>
<td>CMDB: Create a CI using REST API</td>
<td>Test creation of a CI using CMDB REST APIs.</td>
</tr>
<tr>
<td>CMDB: Query CMDB using REST APIs</td>
<td>Test querying the CMDB using CMDB REST APIs.</td>
</tr>
<tr>
<td>CMDB: Update a CI using REST APIs</td>
<td>Test updating of a CI using CMDB REST APIs.</td>
</tr>
<tr>
<td>CMDB: Query for a CI using REST APIs</td>
<td>Test querying a CI using CMDB REST APIs.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Test</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB: IRE Validation</td>
<td>Validate CI identifiers and reconciliation definitions and check indexes for CI identifiers.</td>
</tr>
<tr>
<td>CMDB: Dependency Views</td>
<td>Test functionality of Dependency Views APIs. These APIs retrieve Dependency Views map and associated map items such as context menu items, for a given CI sys_id and using itil user role.</td>
</tr>
</tbody>
</table>

Useful related lists in CI forms

By default, the forms that display manageable configuration items (CI) - computers, printers, network gear, uninterruptible power supplies (UPS), and power distribution units (PDU) - provide a number of related lists for the form.

The following related lists are common to all forms for manageable CIs.

- Network Adapters - Displays all the NICs installed on a CI.
- CI IPs - Displays all the IP addresses on this CI:
  - Computers (workstations, laptops using various Mac and Windows operating systems)
  - Windows servers
  - Linux servers
  - AIX servers
  - Solaris servers
  - Devices discovered through SNMP.
- DNS Names for CIs - Displays all the DNS names on a CI.

The IP version information appears in all IP address related lists and forms.

Note: Since all paths here click into the IP Address to DNS Names list that associates an IP address with a DNS name, this part of the common flow was not added to the tree structure.
Discovery source

A table called Source [sys_object_source] stores information identifying the source of a discovery (by ServiceNow Discovery or another product), the ID of that source, and the date/time of the last scan. To view this information, configure a CI form and add the Sources related list. This table is populated automatically when the Discovery plugin is enabled.

Activate the Extended CMDB plugins

The Configuration Management (CMDB) application provides core functionality for the configuration management database, including modules for hardware and configuration items. The separate Extended CMDB plugin includes a collection of modules for specialized configuration items, such as radio hardware, test equipment, and voice system hardware.

Role required: admin

The Configuration Management (CMDB) plugin is automatically active for all instances. You must activate related plugins to access the modules for specialized configuration items.

- CMDB Mainframe (com.snc.cmdb.mainframe)
- CMDB Radio Category (com.snc.cmdb.radio.category)
- CMDB Telecom Category (com.snc.cmdb.telecom.category)
- CMDB Test Equipment (com.snc.cmdb.test.equipment)

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   If the plugin depends on other plugins, these plugins and their activation status are listed.
3. Optional: Select the Load demo data check box.
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when first activating the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Help the Help Desk

Help the Help Desk is a tool that allows users to populate the CMDB automatically with information about their Windows computer.

Help the Help Desk is a small web application that downloads and runs locally, using a WMI login script to gather information such as serial number, computer name, disk configuration, network configuration, installed software, memory, and much more. Users have the option of using two types of SOAP authentication for running the Help the Help Desk script.

- Cookie-based authentication for Help the Help Desk
- Basic access authentication for Help the Help Desk

Note: Domain separation is not supported for Help the Help Desk.
User roles and user names

Users must have the hthd_user role, and only this role, to use Help the Help Desk from within an instance. The user should also be configured with web service access only.

For users without access to an instance, you can configure Help the Help Desk to allow users to run the script without login credentials. Users with access to an instance can also use Help the Help Desk configured in this way, but only if they have the hthd_user role.

User name cannot contain these characters: \n
Any user name that contains the \n characters prevents the Assigned to field on a computer from being populated.

Help the Help Desk device identification

Help the Help Desk uses a predefined series of queries to identify and update existing CIs in the CMDB or to create a new CI if no match is found. These queries attempt to match devices using three criteria in a certain order.

Updates to an existing CI require only a single match as the list is evaluated. For example, if a device's name has changed, but the MAC address is the same, the CI with the matching MAC address is updated.

- Serial number in the [cmdb_ci_computer] table
- MAC address in the [cmdb_ci_network_adapter] table
- Computer name in the [cmdb_ci_computer] table

Note: Discovery Identifiers are incompatible with Help the Help Desk queries.

Script include

The script include CIIdentifierForHelpDesk provides the logic for updating existing CIs or creating a new CI if no matching device exists in the CMDB. Do not modify this script. Errors introduced into this script can result in update failures or in new CIs being created for every device found.

Configure SOAP authentication for Help the Help Desk

By default, the ServiceNow system requires SOAP authentication. This affects the way in which your browser is configured for Help the Help Desk.

Role required: admin

1. Navigate to System Properties > Web Services.
2. Verify the system property for Require basic authorization for incoming SOAP requests glide.basicauth.required.soap is enabled.
3. Click Save.

Note: If you receive the error, There was a problem retrieving the XML data(0): Unknown, an authentication issue is preventing the script from sending information to your ServiceNow instance. Verify the user meets the requirements for Cookie-based authentication for Help the Help Desk or Basic access authentication for Help the Help Desk.
Cookie-based authentication for Help the Help Desk

Cookie-based authentication uses cookies generated by Windows Internet Explorer for SOAP authentication on the instance.

This type of authentication can be used to run the Help the Help Desk script at the time it is downloaded or after it has been saved to the local drive. When the script is downloaded, Internet Explorer generates a cookie using the user's login credentials, and then shares this cookie with the script. When a user attempts to run the script, the instance checks first for this cookie. If the cookie has been created, the script can authenticate on the instance through SOAP.
Cookie-based authentication

The following setup requirements are imposed on `.hta` file downloads by Microsoft.

- You must use Internet Explorer and choose to run the script while you are logged in to your instance. If you choose to use a different browser and download the script file to run later, the script will not work properly unless you have an active session on your instance with Internet Explorer.
- Disable Protected Mode and User Account Control (UAC). Protected Mode is available in Internet Explorer 7 or later in Windows Vista. UAC is a feature of Windows Vista and Windows 7.
- This feature requires that your logged in user session be persisted to the Help the Help Desk script. For this to occur, the Remember me check box in the login screen must be enabled and selected (the
default behavior). This option enables the system to write back an HTTP cookie to your browser to be persisted across sessions.

**Basic access authentication for Help the Help Desk**

An alternative to cookie-based authentication for the Help the Help Desk script is basic access authentication, which employs two properties to configure the script with credentials.

When a user logs in with the proper credentials, that user accesses the instance in the hthd_user role, which grants access to the ECC queue but limits the user's access to other features. The administrator then configures the system properties with the user name and password for the hthd_user user.

The values from these properties are automatically saved to the script file `helpthehelpdesk.js`. When this user runs the Help the Help Desk script, the instance checks for a cookie. If no cookie is found, the instance checks for the login credentials provided by the system properties, and authenticates the script automatically.

**Set up basic access authentication for the Help the Help Desk script**

You can set up basic access authentication for the Help the Help Desk script.

Role required: admin

1. Create a new user with the following values.

<table>
<thead>
<tr>
<th>User ID</th>
<th>Create an easily recognizable user name such as SOAPAUTH or SOAPONLY.</th>
</tr>
</thead>
<tbody>
<tr>
<td>First name</td>
<td>SOAP</td>
</tr>
<tr>
<td>Last name</td>
<td>Authentication</td>
</tr>
<tr>
<td>Password</td>
<td>Any password</td>
</tr>
</tbody>
</table>

2. Right-click the header bar and select Save. The record is saved, and the Related Lists appear.

3. In the Roles Related List, click Edit.

4. In the slushbucket, move the hthd_user role from the Collection list to the Roles list, and then click Save.

5. Navigate to System Definition > Help the Help Desk.

6. Add the user name and password you created to the appropriate properties, and then click Save. The password is encoded when saved.

   The login credentials from these properties are saved to the `helpthehelpdesk.js` script. When the Help the Help Desk script is run by a user logged in with these credentials (in the hthd_user role), the script is able to authenticate automatically on the instance.

**Help the Help Desk login script**

The Help the Help Desk script enables organizations to proactively scan their network to discover all Windows based hardware and the software packages installed on those devices.

This WMI-based script is included in the core ServiceNow platform functionality. This script also can be set up to run as a Windows login script and used to keep the CMDB up to date. The script is named `helpthehelpdesk.js` and can be downloaded from each customer's local instance.

**Install and use the login script**

The login script is installed on the instance and can be downloaded directly from a module.
Role required: admin

The same script is used to perform the Help the Help Desk scan, which gathers information about a user’s Windows computer and updates the CMDB.

1. Log in to your instance with Windows Internet Explorer.
2. Navigate to System Definition > Help the Help Desk Login Script.
3. Follow the download instructions in the page that appears.
4. Put the helpthehelpdesk.js file in the following folder: %SystemRoot%\sysvol\sysvol\<domain DNS name>\scripts where %SystemRoot% is usually c:\winnt or c:\WINDOWS and <domain DNS name> is the DNS name of the domain, similar to MyDomain.com. This folder is replicated to all domain controllers in the domain.
5. Open the helpthehelpdesk.js file in a text editor, such as Wordpad.
6. Check the var server line to ensure that the URL for your ServiceNow instance is correct.
The name of the instance is added automatically. It should look something like this:

```javascript
var server = "https://abctech.service-now.com/";
```

7. Ensure that basic authorization for SOAP requests is enabled in your instance, and a SOAP user is defined.
This allows the script to connect to your instance. The entry should look something like this:

```javascript
var httpUsername = "user_on_your_instance";
var httpPassword = "user's_password";
```

8. Create a Logon.bat script to run helpthehelpdesk.js as follows.

```bash
@echo off
cscript %0\helpthehelpdesk.js
EXIT
```

9. Add Logon.bat to the Logon script field on the Profile tab of the user properties dialog in the Active Directory Users and Computers MMC corresponds to the scriptPath attribute of the user object.
Logon scripts can also be configured in Group Policy. However, Group Policy only applies to clients with Windows 2000 or above. The setting in Group Policy is User Configuration, Windows Settings, Scripts (Logon/Logoff), Logon. Copy the file you want for the Logon script to the Windows clipboard.

10. Open the Logon setting in the Group Policy editor.

11. Click the Show Files button.
12. Paste the desired file in the dialog.
You can select the file and edit it in this dialog as well. This is easier than navigating in Windows Explorer to the folder where Group Policy Logon scripts are saved. However, if you do have to navigate to the folder, the path on the domain controller is:

%SystemRoot%\sysvol\sysvol\<domain DNS name>\<policy GUID>\user\scripts\logon

Again, %SystemRoot% is usually c:\winnt and <domain DNS name> is the DNS name of the domain, similar to MyDomain.com.

<policy GUID> is a hexadecimal string representing the GUID (unique identifier) of the specific Group Policy Object (GPO). Group Policies are assigned to a domain, site, or organizational unit in Active Directory.

The logon script setting applies to all users in the domain, site, or organizational unit to which the GPO applies. You will notice that you assign a logon script to all users in the container at once, rather than having to assign the scriptPath attribute for each user. This makes it much easier to assign logon scripts to many users. However, since the same Group Policy applies to all users in the domain, site, or organizational unit, you must code the logon script to accommodate all users.

Encode the Help the Help Desk password
You can use the Help the Help Desk properties to encode the password with simple base64 encoding.

Role required: admin

Configure the user name and encode the password in the properties before downloading the script. This adds the encoded password directly to the script without any further configuration.

1. Navigate to System Definition > Help the Help Desk.
2. Enter a user name and password into the properties for SOAP authentication.
3. Click **Save**.

**Customization Properties for Help The Help Desk**

SOAP authentication username for Help The Help Desk script.  

SOAP authentication password for Help The Help Desk script.  

For Discovery and Help the Help Desk, if the property is "yes", the "assigned_to" field of the CI is always overwritten; otherwise the field is not overwritten unless it is empty.  

Yes | No

For Discovery and Help The Help Desk, the following field in the sys_user table is used to associate a computer CI with a user.  

user_name

Save

The password is encoded immediately.

4. Navigate to **System Definition > Help the Help Desk Login Script**
5. Download the script.

```javascript
/* ************************* Required Variables *****************************
* The following section should be modified if the information is not correct.
***************************************************************************/

// The variable should point to your instance URL, such as https://demo.service-now.com
var server = "https://demo.service-now.com/

// If SOAP authentication is turned on on the instance. The http authentication should be provided here.
var httpUsername = "service-now-service:"
var httpPassword = "ec4w:ec4w4vswdsoQ";
```

The script downloads with the encoded password in place. If you download the script before encoding the password in the properties form, you must add the variable and encoded password manually.

### Run the Help the Help Desk script

You can run the Help the Help Desk script manually.

You also can configure Help the Help Desk to run automatically when users log into their computer. For more details, see Help the Help Desk login script.

1. On your instance, navigate to **Self Service > Help the Help Desk**.
2. Click **Start the Scan to Help the Help Desk**.
   You are prompted to run or save the discovery.hta script.
3. Run or save the discovery.hta script.
   - If your browser is Windows Internet Explorer, run the script.
   - If you are using any other browser, click **Save** and save the script to the local machine. To execute the saved script, double-click the file.

The script runs a series of WMI queries to gather information about the Windows machine. When it is finished, the data is sent back to your instance and is used to populate the configuration database (CMDB).

The error message **Error: Unable to parse SOAP document** means that the Help the Help Desk script was unable to connect to the instance to relay the information that was discovered.

### Run the discovery.hta script with browsers other than Internet Explorer

You can run the discovery.hta script with browsers other than Internet Explorer.

Browsers other than IE cannot handle files with the .hta extension. Browsers like Firefox, Safari, and Opera prompt users to download the script file, which you can then double-click to run.

However, in Windows XP (including Vista, Windows 2003 Server, and later), files downloaded from the Internet are marked with a security restriction that interferes with running the script. The typical error message introduced by this security restriction looks like this:

```javascript
eccEvent(): Access Denied
```
To remove the security lock on the downloaded file, complete the following steps.

1. **Right-click on the downloaded file and select** Properties.
   The following message is displayed on the bottom of the form: *This file came from another computer and may be blocked to protect this computer.*

2. **Click Unblock** to remove the security restriction.
   The script will run if SOAP authentication is disabled.

### Access Help the Help Desk status

Help the Help Desk displays the status of all scans in daily records. Drill down into a record for details on how the CMDB was updated within the last 24 hours from scans performed on the instance.

**Role required:** admin

1. **Navigate to** System Definition > Help the Help Desk Status.
   A new status record is created each day and displays the number of scans completed (devices scanned). The **Description** field shows Help the help desk as the source of the scan.

   ![Help the Help Desk status table]

   2. **To view the details of individual scans, open a scan record.**
   3. **In the scan record, select the Devices tab to view all the devices scanned by Help the Help Desk that day.**

   Each CI displays the device class and the activity completed: **Created CI** or **Updated CI**. By default, Help the Help Desk cannot discriminate class between servers and workstations and classifies each
CI as a **Computer**. However, if Discovery is activated on the instance, Help the Help Desk can classify CIs as either Windows servers or computers.

4. Select the **ECC Queue** tab to examine the data payload returned from each scan.

If Discovery is active on the instance, the Help the Help Desk status appears in the Discovery Status record list. These scan records are described as **Help the help desk** in the list to differentiate them from regular discoveries run from a schedule or a UI action. Open the status record to access the forms described in this page.
Determine values for the Assigned to field

This page explains how to set properties to determine which value appears in the Assigned to field when the script is run.

Role required: admin

Any user name that contains the \n characters prevents the Assigned to field on a computer from being populated.

- Navigate to System Definition > Help the Help Desk.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.wmi.assigned_to_always_overwrite</td>
<td>If the Help the Help Desk script is run on the same computer by different users, the platform overwrites the user name in the Assigned to field each time the script is run. To prevent this, set the For Help the Help Desk script, if the property is &quot;yes&quot;, the &quot;assigned_to&quot; field of the CI is always overwritten; otherwise the field is not overwritten unless it is empty [glide.wmi.assigned_to_always_overwrite] property to false (clear the check box).</td>
</tr>
<tr>
<td>glide.discovery.assigned_user_match_field</td>
<td>Help the Help Desk attempts to match a Windows user name it finds with the the user_name field of the User [sys_user] table. However, this might not be desirable if the user_name field from the User [sys_user] table contains formatting that is different from that found in Windows. The For Discovery and Help the Help Desk, the following field in the sys_user table is used to associate a computer CI with a user [glide.discovery.assigned_user_match_field] property enables you to select an alternative field for matching. For example, you can create a field called u_username, and then populate it with a user ID that can be matched against the Windows user name. In this case, replace the default value in the property with u_username.</td>
</tr>
</tbody>
</table>

View scan results

You can view the results of Help the Help Desk scans on an instance.

Role required: admin

These records provide access to logs, CI records, and the ECC Queue for all scans conducted each day. Help the Help Desk status reports are also accessible from the Discovery list.

1. Navigate to System Definition > Help the Help Desk Status.
2. Open the daily status record.

Help the Help Desk script troubleshooting

With the Help the Help Desk script, you can detect all system software on a 64-bit machine. You can also configure the Help the Help Desk script to run for users without prompting for a user name and password.
**Allow users without a ServiceNow instance login to run Help the Help Desk script**

You can configure the Help the Help Desk script to run for users without prompting for a user name and password.

Role required: admin

This setup enables users who do not have access privileges to an instance to run the script on their Windows machines without having to provide a user name and password. The script can be configured to login in automatically as a SOAP user with the hthd_user role.

1. Log in to your instance with Windows Internet Explorer.
2. Navigate to **System Definition > Help the Help Desk Login Script**.
3. Follow the download instructions in the page that appears.
4. Put the helpthehelpdesk.js file in the following folder: `%SystemRoot%\sysvol\sysvol\<domain DNS name>\scripts` where `%SystemRoot%` is usually `c:\winnt` or `c:\WINDOWS` and `<domain DNS name>` is the DNS name of the domain, similar to MyDomain.com.
   This folder is replicated to all domain controllers in the domain.
5. Open the helpthehelpdesk.js file in a text editor, such as Wordpad.
6. Check the var server line to ensure that the URL for your ServiceNow instance is correct.
   The name of the instance is added automatically. It should look something like this: `var server = "https://abctech.service-now.com/"`

```javascript
/* *************** Required Variables *******************
* The following section should be modified if the information is not correct.
* ******************************************

// The variable should point to your instance URL, such as http://demo.service-now.com
var server = "https://abctech.service-now.com";

// If SOAP authentication is turned on on the instance. The http authentication should be provided here
var httpUsername = "";
var httpPassword = "";

/* *************** Optional Variables *******************
* The following section can be modified for other purposes.
* ******************************************
```

7. Ensure that basic authorization for SOAP requests is enabled in your instance and a SOAP user is defined.
   This allows the script to connect to your instance. The entry should look something like this:

```javascript
var httpUsername = "user_on_your_instance";
var httpPassword = "user's_password";
```

8. Make the script file available to all users.

**Detect software on 64-bit systems with Help the Help Desk**

You can detect all system software successfully on a 64-bit machine.

A 64-bit browser can detect both 64-bit and 32-bit software, but a 32-bit browser cannot detect 64-bit software.

- To detect all system software, run the Help the Help Desk script from a 64-bit browser.
Enterprise CMDB

The Enterprise Configuration Management Database (ECMDB) is targeted toward businesses that want to monitor, manage, measure, track, alert on change, and generally understand business systems that consist of a large number of components, business, and support personnel.

For example, a bond trading service may have multiple application, and web servers, several databases, Linux, UNIX, and Windows servers. There will be security products, network storage, disaster recovery procedures and hardware, etc. that are necessary for the service to operate properly.

The ECMDB makes it easy to either manually enter the relationships or have them populated automatically by discovery tools. In addition to the hardware, software, network, database, and storage areas, it is beneficial to know which individuals or groups are responsible for the service from both a business perspective as well as an IT perspective. Who are the line of business users and managers? Who starts and stops the application or its components? Who monitors the log files? Who is in charge of backup and restore, business continuity, and disaster recovery?

Enterprise CMDB is available with the Configuration Management (CMDB Enterprise Edition) (com.snc.cmdb.enterprise) plugin, which is active in the base system.

CMDB Relationships

The ECMDB lets you easily track all relationships by relationship type.

The Enterprise CMDB extends the capabilities of the ServiceNow platform CMDB in the following areas.

Extended configuration item types

- Clusters
- Database Instances (Oracle, MySQL, MSFT SQL Server)
- File Systems (Direct and network attached)
- Linux Servers
- Solaris Servers
- AIX Servers

Extended relationships

Accurate description of relationships between items, and between items and people or groups, is important to understand the fabric of a business service. ECMDB provides many relationship types out of the box, but it is easy to extend the number of relationship types. Example relationship types include the following.

- Connects to
- Depends on / Provides Service to
- Powered by / Powers
- Protected by / Protects
- Disaster Recovery Provided by / Provides Disaster Recovery for

Visualization

The system can show relationships as a hierarchy using a standard treenview, flattened, or graphically, all in a simple web interface.
Auditing

Auditing of changes to configuration items is turned on by default.

Federation

Federation of third party discovery and configuration data is supported through standard synchronization offerings (SMS, LAN Desk, others) and through the CMDB Discovery [cmdb_discovery] table.

Configuration item modeling (product models)

Model driven configuration management allows the definition of CI models up front that can be associated to product maintenance lifecycles, cost centers, and support organizations, as well as provides a means for capacity and inventory planning. By defining models for CIs (which have a many to one relationship to the model), you can dynamically group actual discovered or imported CIs into logical, operational, and financial models. This facilitates an organized approach to managing your assets (CIs) in their respective domains.

Enterprise Configuration Management Database (ECMDB) action icons

Any of the following icons may appear in the ECMDB lists of related items.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>🔄</td>
<td>For currently active incidents against this configuration item</td>
</tr>
<tr>
<td>🔄</td>
<td>For currently active problems against the configuration item</td>
</tr>
<tr>
<td>🔄</td>
<td>For currently active changes against the configuration item that are not covered in the past, current, pending changes. For example, a request to update the operating system on a server that is currently in progress may display this icon.</td>
</tr>
<tr>
<td>🔴</td>
<td>For changes that were recently completed against the configuration item. Changes with an &quot;Actual_end_date&quot; in the past.</td>
</tr>
<tr>
<td>🔴</td>
<td>For changes that are planned soon against the configuration item. Changes with an &quot;Actual start date&quot; in the future.</td>
</tr>
<tr>
<td>🔴</td>
<td>For currently active changes against the configuration item that have an &quot;Actual start date&quot;</td>
</tr>
<tr>
<td>🟢</td>
<td>For outages that were recently completed against the configuration item. Outages with an &quot;end&quot; date in the past.</td>
</tr>
<tr>
<td>🟢</td>
<td>For outages that are planned soon against the configuration item. Outages with a &quot;begin&quot; date in the future.</td>
</tr>
<tr>
<td>🔴</td>
<td>For currently active outages against the configuration item that have a &quot;begin&quot; date in the past and no &quot;end&quot; date</td>
</tr>
</tbody>
</table>
This will only show up in the Tree view and indicates that a configuration item that is downstream has at least one of the above issues against it.

The system looks 5 calendar days in the past and 7 calendar days in the future when looking at recent outages and changes.

**Business service tables**

In the CMDB, the Service table [cmdb_ci_service] stores information about business services.

A business service is work or goods that are supported by an IT infrastructure. For example, delivering email service to an employee can require services such as email servers, web servers, and the work to configure the user's account. A business service management map graphically displays the configuration items (CI) that support a business service and the relationships between the configuration items.

The Service table [cmdb_ci_service] stores the business services in the CMDB.

**The Service table**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business criticality</td>
<td>The importance of this service to the business. This field can be used to determine disaster recovery strategies for this service. Default options are:</td>
</tr>
<tr>
<td></td>
<td>• 1 - most critical</td>
</tr>
<tr>
<td></td>
<td>• 2 - somewhat critical</td>
</tr>
<tr>
<td></td>
<td>• 3 - less critical</td>
</tr>
<tr>
<td></td>
<td>• 4 - not critical</td>
</tr>
<tr>
<td>Service classification</td>
<td>Designates the type of the service.</td>
</tr>
<tr>
<td></td>
<td>• Business Service (For more information, see Application services)</td>
</tr>
<tr>
<td></td>
<td>• Technical Service (For more information, see #unique_351)</td>
</tr>
<tr>
<td></td>
<td>• Service Offering (For more information, see Service offerings)</td>
</tr>
<tr>
<td></td>
<td>• Shared Service (For more information, see #unique_353)</td>
</tr>
<tr>
<td></td>
<td>• Application Service (To represent a service that is classified as a business application)</td>
</tr>
<tr>
<td></td>
<td>• Billable Service (To represents a service that is billed, or that is cost managed)</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Used for</td>
<td>Designates how this service is used. Default options are:</td>
</tr>
<tr>
<td></td>
<td>• Production</td>
</tr>
<tr>
<td></td>
<td>• Staging</td>
</tr>
<tr>
<td></td>
<td>• QA</td>
</tr>
<tr>
<td></td>
<td>• Test</td>
</tr>
<tr>
<td></td>
<td>• Development</td>
</tr>
<tr>
<td></td>
<td>• Demonstration</td>
</tr>
<tr>
<td></td>
<td>• Training</td>
</tr>
<tr>
<td></td>
<td>• Disaster Recovery</td>
</tr>
<tr>
<td>Users supported</td>
<td>The users that this service supports.</td>
</tr>
<tr>
<td></td>
<td>A reference to the Group [sys_users_group] table.</td>
</tr>
<tr>
<td>Version</td>
<td>Use this field for your own versioning processes.</td>
</tr>
</tbody>
</table>

**The Service Configuration Item Association table**

The Service Configuration Item Association table [svc_ci_assoc] binds a business service and a configuration item (CI) to track which CIs are part of each business service.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item Id</td>
<td>A reference to the Configuration Item [cmdb_ci] table.</td>
</tr>
<tr>
<td>Service Id</td>
<td>A reference to the Service [cmdb_ci_service] table.</td>
</tr>
</tbody>
</table>

**The Service Relationship Association table**

The Service Relationship Association table [svc_rel_assoc] binds a business service and a relationship to track which relationships are part of a business service.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relation Id</td>
<td>A reference to the CI Relationship [cmdb_rel_ci] table.</td>
</tr>
<tr>
<td>Service Id</td>
<td>A reference to the Service [cmdb_ci_service] table.</td>
</tr>
</tbody>
</table>

**Table form views**

When you view a table definition form, you can open the context menu, and select a form view in which to display the table. The default view for a table is the Default view. For any class that is an extension of the CMDB table, you can select the CI Definition view which provides additional access to related tables and information.
The CI Definition form view is a centralized location from which you can configure and view a table. In addition to the information that the default view displays, the CI Definition form view provides the following controls,

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Icon tab</td>
<td>View and create new NG-BSM icons for CI types</td>
</tr>
<tr>
<td>CI Identifier tab</td>
<td>View and create new CI identifiers</td>
</tr>
<tr>
<td>Reconciliation Definitions tab</td>
<td>View and create new data source definitions</td>
</tr>
<tr>
<td>Inclusion related link</td>
<td>Links to the Metadata Editor</td>
</tr>
</tbody>
</table>

To access these additional controls on the CI Definition form view, you need to first create a new table that is derived from the CMDB table, and then view it using the CI Definition form.

**Out-of-the-box Configuration Management (CMDB) Performance Analytics Solutions**

Performance Analytics solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Use the widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With solutions, you can get value from for your application with minimal setup.

**Important:** Set up and test Out-of-the-box Solutions on a sub-production instance before enabling them in production.

**Note:**
- Solutions include some dashboards that are inactive by default. You can activate these dashboards to make them visible to end users according to your business needs.
- Out-of-the-box solutions and in-form analytics provide all the configuration records required to analyze default applications. Customize these records for use in your production environment.

To enable the solutions for Configuration Management (CMDB), an admin can navigate to **Performance Analytics > Guided Setup**. Click **Get Started** then scroll to the section for Configuration Management (CMDB). The guided setup takes you through the entire setup and configuration process.

**Dependency Views**

ServiceNow® Dependency Views graphically displays an infrastructure view for a configuration item (CI) and the application or business services that it is part of and that it supports. Dependency Views indicates the status of its configuration items, and allows access to CIs related alerts, incidents, problems, changes, and services.

If Service Mapping is activated, Dependency Views maps are enhanced to display dependencies that reflect connections in service maps.
Supported browsers for Dependency Views

The latest version or service pack of internet browsers are required to view and manipulate Dependency Views maps.

The Dependency Views module supports the latest version or service pack of the following browsers:

- Firefox with the latest ESR
- Chrome latest version
- Safari version 8 or later (latest is recommended)
- Microsoft Internet Explorer (IE) version 11 and Microsoft Edge.

The Dependency Views module is not supported on tablets and on mobile devices.

Domain separation and Dependency Views

This is an overview of domain separation in Dependency Views. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Level 1

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

How domain separation works in Dependency Views

Dependency views are generated using both Configuration Item [cmdb_ci] and CI Relationship [cmdb_rel_ci] tables. The [cmdb_ci] table is domain separated, but the [cmdb_rel_ci] table is not. You can create relationships only by selecting two CIs. They should be in the same domain for you to be able to see them.
To be successful with domain separation in Dependency Views, make sure that relevant CIs are visible for the current domain. If the instance is domain separated, ServiceNow domain separation rules apply (see Related information link below).

Tenant domains will be able to see only their domain and global CIs.

**Dependency Views map**

ServiceNow® Dependency Views maps graphically display CIs that support application or business services and the relationships between the CIs.

A ServiceNow service (application service or business service) is work or goods that are supported by an IT infrastructure. For example, delivering email service to an employee can require services such as email servers, web servers, and the work to configure the user’s account.

A Dependency Views map has one starting point, called the root CI or root node of the map. The root CI is surrounded by a darker frame that repaints itself with a pulsing effect drawing the attention to the root CI. The maps can show both upstream and downstream dependencies for the root CI. By default the Dependency Views map displays 3 levels, both upstream and downstream relationships. Administrators can configure the number of levels displayed. The map collapses and expands clusters to make them easier to view. By default, clusters are collapsed.

In a Dependency Views map, map indicators indicate if a CI has any active, pending issues. You can investigate the tasks that are connected to a CI to get more details. When you return to the map from another form, the system restores the last map viewed, using the default filter and layout settings. When you click the icon

( ![ ] )  

on a CI record or on a task record that identifies a CI, the map opens.

Many of the relationships in map are created through the discovery process. You can also create, define, and delete CI relationships in the map. You can display the map from different perspectives and open specific records that relate to configuration items. The system refreshes the map automatically to reflect changes to the CMDB.

**Note:** CIs not extended from the Configuration Item [cmdb_ci] table, are not displayed in Dependency Views maps and in CI relation formatters.

The Dependency Views module is active in all instances, and includes demo data.
Dependency Views sample map

When you click the map icon

[ ]
on a CI record or on a task record that identify a CI, a map opens.

Roles

Users with the itil and ecmdb_admin roles can view maps and perform all actions in the map. Actions include access to the map views and saved filters, both from the lists in the map and from theSaved Filters module.

Dependency Views map menus and controls

Dependency Views maps contain the following menus and controls.
## Map options

The following options are available across the top of the map.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Menu</td>
<td>Menu to save, load and export views of the map.</td>
</tr>
<tr>
<td>&lt;Root CI&gt;</td>
<td>Next to the menu icon is the name of the current root node (CI) of the map.</td>
</tr>
<tr>
<td>Search</td>
<td>Enter the name of a CI, application service, or business service to load into the map. Alternatively, you can start typing to have the auto-complete feature present a list of CIs and services that match your partial value.</td>
</tr>
<tr>
<td>Vertical</td>
<td>Display the map in vertical view.</td>
</tr>
<tr>
<td>Horizontal</td>
<td>Display the map in horizontal view.</td>
</tr>
<tr>
<td>Radial</td>
<td>Display the map in radial view.</td>
</tr>
<tr>
<td>Force</td>
<td>Centers the elements around the parent CI, regardless of upstream or downstream relationships.</td>
</tr>
<tr>
<td>Group</td>
<td>Groups the elements according to their CI type.</td>
</tr>
<tr>
<td>Details</td>
<td>Displays related lists such as Problems, Changes and Related Services that are associated with the selected CI.</td>
</tr>
<tr>
<td></td>
<td>• Click a service to highlight the CIs that are associated with that service.</td>
</tr>
<tr>
<td></td>
<td>• Click <strong>Related Services</strong>, then double-click a service to display the map in the Event Management dashboard.</td>
</tr>
<tr>
<td></td>
<td>If the Event Management plugin is active, then events and alerts are also displayed.</td>
</tr>
<tr>
<td>Settings</td>
<td>Set filters for the map.</td>
</tr>
<tr>
<td>Use the navigation tools to increase or decrease the view of the map, rearrange the icons on the map, and move the map on the page.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Use the plus sign (+) to increase magnification of the map.</td>
</tr>
<tr>
<td></td>
<td>• Use the minus sign (-) to decrease magnification of the map.</td>
</tr>
<tr>
<td></td>
<td>• Click the center dot to center the map on the page.</td>
</tr>
<tr>
<td></td>
<td>• Use the direction arrows to move the page in that direction.</td>
</tr>
<tr>
<td></td>
<td>• Use the selection tool under the navigation tool to toggle between moving the entire map or moving one CI on the map.</td>
</tr>
</tbody>
</table>
### Map menu

The following options are available if you right-click the map background.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run Layout</td>
<td>Redraws the map with the current layout option.</td>
</tr>
<tr>
<td>Fit To Screen</td>
<td>Resizes the map to fit all the nodes in the map window.</td>
</tr>
<tr>
<td>Reset Filters</td>
<td>Performs the same action as the Filters &gt; Reset option.</td>
</tr>
</tbody>
</table>

### Node menu

The following options are available if you right-click a node.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Form</td>
<td>Displays the CMDB record of the selected CI in a new tab of the browser.</td>
</tr>
<tr>
<td>View Map</td>
<td>Reloads the map using the selected CI as the new root node, with the currently defined layout setting. This option does not display on the root node.</td>
</tr>
<tr>
<td>View Related Tasks</td>
<td>Displays all tasks or outages associated with the selected CI, including incidents, problems, change requests, and follow-on tasks. This option is always available, even if there are no tasks associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>View Affected CIs</td>
<td>Shows a list of all tasks that have the CI listed as an Affected CI. This option is only visible when you access the map from the map icon in a task record's Configuration item field.</td>
</tr>
<tr>
<td>View Related Outages</td>
<td>Displays all outages involving the selected CI. This option only appears when there is an outage associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>Add Relationship</td>
<td>This option displays a dotted green line that you can drag to another CI to create a relationship link. A popup dialog allows you to define the relationship type.</td>
</tr>
<tr>
<td>Expand</td>
<td>Displays all CIs and components within a clustered node, or virtual groups (virtual nodes that appear when glide.bsm.too_many_children is reached). This option appears only if the node is a cluster node or a virtual group node. If Load More was previously used, then Expand reverts the results of the Load More operation. The number of additional icons to display is bound by the value of the glide.bsm.max_nodes property.</td>
</tr>
</tbody>
</table>
Collapse

Collapses all CIs and components within a cluster node back to a single node. Also, collapses a virtual group that has been expanded. This option only appears if the node has been expanded using the Expand menu item.

If Load More was previously used, then Expand reverts the results of the Load More operation.

Run Layout From Here

This option re-runs the chosen layout using the current node. Use this option to get a new or clearer view on the same map.

Load More

Starting at the selected icon, loads the next level of the map, past the setting of Max Levels.

Virtual grouping is not applied at the newly loaded level even if the criteria for virtual grouping is met.

The number of additional icons to display is bound by the value of the glide.bsm.max_nodes property.

Relationship menu

The following options are available if you right-click a relationship link.

View Relationship Form

Opens the CI Relationship form. You can modify the Parent, Type, and Child of the relationship from this form.

Modify Relationship

Searches for and selects a new relationship for this link.

Delete Relationship

Deletes a relationship. The relationship is deleted after prompting for confirmation.

Cluster nodes in a Dependency Views map

Dependency Views maps can display cluster group nodes alongside individual CI nodes, and the child nodes of these cluster groups.

Clusters are CIs in the Cluster [cmdb_ci_cluster] table. A cluster CI is an organized set of computer CIs that work together as a single system. Each node in a cluster group represents a CI, typically a server, that can have referenced hardware, such as disks and network adapters.

Cluster nodes on a Dependency Views map can display in two modes:

- Collapsed mode: Displays only the cluster CI node without its child CI nodes. This mode avoids unnecessary clutter in large maps.
- Expanded mode: Displays the cluster CI node and all its child CI nodes.

Menu options available for a clustered node include Collapse and Expand which allow you to control the density on the map.

By default, Dependency Views collapses all cluster groups and displays clusters in collapsed mode on the map.
Annotation

Icons for cluster nodes and cluster group CI nodes are noted by the string "Cluster" and by a unique cluster icon. The system searches through all the component nodes in a cluster CI or collapsed node looking for tasks, outages, and trouble, such as incidents, problems, or change requests. This search evaluates only the number of levels that are displayed in the diagram.
An expanded cluster node displaying its child nodes
Virtual grouping of nodes in a Dependency Views map

To reduce the density on a map, Dependency Views automatically groups CIs of a similar CI type from the same level.

A large number of nodes can cause a Dependency Views map to become too dense to be helpful. Therefore, if the number of nodes with a similar CI type from same level, exceeds the value of the **Maximum number of nodes (of a similar CI type and at the same level) to display before applying virtual grouping** property, then those nodes are automatically grouped into a virtual group. A single node, the **virtual group node** is displayed to represent the virtual group, while all actual nodes in the virtual group (that are of a similar CI type), are hidden. Virtual group nodes represent CIs of a similar CI type but are not CIs by themselves and cannot have tasks assigned to them. The number of actual collapsed nodes in the virtual group is noted on the virtual group node.

By default, child nodes of a virtual group are not displayed. You can enable the **Show children of virtual groups** property to display child nodes underneath virtual groups.

Virtual grouping is not applied at the level underneath a virtual group even if the criteria for virtual grouping is met (the number of nodes with a similar CI type from that level exceeds the preconfigured property value). However, virtual grouping can happen at the following level if that criteria is met. This behavior does not depend on any property settings, and you cannot change it.

Menu options for a virtual group include Expand and Collapse, which allow you to apply virtual grouping and display only the virtual group node, or to undo the virtual grouping and display all actual nodes.

**Virtual links**

A virtual node is connected to other nodes with a virtual link. A virtual link denotes that there such link between at least one CI in the virtual group, to another CI node on the map.

**Note:** All filters do not apply to virtual groups. Therefore a virtual group displays even if it contains CIs that a filter would have excluded. Upon the expansion of a virtual group, predefined filters are applied, and any or all of the CIs that were previously virtually grouped, might no longer display on the map.

Also, when using the node menu option Load More, virtual grouping is not applied at the newly loaded level even the criteria for virtual grouping is met.
An expanded virtual group
Use Dependency Views

Use the layout controls on a Dependency Views map to display elements in different configurations for easier management. Use the filter panel on the map to display fewer levels or to filter out elements you don't want to see, then save the filter for use later. Draw new relationships between elements or edit existing relationships.

View a Dependency Views map

When you display a Dependency Views map using one of the options below, the map is centered on the root CI, and displays the layout and number of levels defined in the map properties. If Operational Intelligence is activated, then a Dependency Views map provides a mode that lets you directly access metrics information for the CIs on the map.

General role requirements:

• To access a Dependency Views map from either the navigation menu, a script API, or directly from a URL, the minimum role required is the dependency_views. Some operations that are related to icons, indicators, and menu actions require the ecmdb_admin role. Some operations that are related to properties and dependency types require the admin role.
• Dependency Views enforces ACL permissions on CIs, and visually hides them and their relationship from the map if the permission requirement is not met.

The maps generated by Dependency Views are based on D3 and Angular technology, providing a modern interactive graphical interface to visualize configuration items and their relationships.

If Service Mapping is activated, Dependency Views maps are enhanced to display dependencies that reflect connections in service maps. In addition, the list of related services in the Details section, includes application services, and technical and manual services if Event Management is activated. All CIs that are included in a service, are displayed underneath the service node on the map.

Maps provided by Service Mapping are for application services, including comprehensive maps from the perspective of application services. For more information, see Service Mapping.

Administrators can configure the setting for the default layout of the map and number of levels displayed. When you access the map from a saved view, the map opens using the properties in the saved view, and not the default map properties.

Navigate to Dependency Views and open one of these modules:

• View Map in New Tab: Opens the map in a new, full screen tab without the application navigator.
• View Map: Opens the map in the content pane of the current tab.
• Saved Views: Opens a view of a map that you previously saved.

Click a number in the Version column, and then click the

( ) icon.

Save or load a Dependency Views map

In the View Map module, use the menu icon to save and load Dependency Views maps.

1. Navigate to Dependency Views > View Map.
2. Click the view menu icon

( )

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
3. Select Save View, Load View, or Last View.

Delete a saved Dependency Views map view
Use the Saved Views module to delete a previously saved view.
1. Navigate to Dependency Views > Saved Views.
2. Use the checkbox in the first column of the table to select the map view that you wish to delete.
3. Select Delete from the Actions on selected rows drop-down menu.

Change the layout of Dependency Views map
You can select from different layout options for your Dependency Views map.
1. Navigate to Dependency Views > View Map.
2. Select one of the following layout options from the menu across the top of the view.
   • Vertical: Displays the elements in a vertical tree pattern according to their upstream and downstream relationships. This is the default value for the initial display of the map.
   • Horizontal: Displays the elements in a horizontal tree pattern according to their upstream and downstream relationships.
   • Radial: Displays the elements in a radial pattern according to their upstream and downstream relationships.
   • Force: Centers the elements around the parent CI, regardless of upstream or downstream relationships.
   • Group: Groups the elements according to their CI type.
   • Details: Displays related alerts, incidents, problems, and related services.

   Related Services displays application services, and if Event Management is activated then also technical services and manual services. You can double-click a service to display the map in the Event Management dashboard.

Filter the view of a Dependency Views map
You can filter a Dependency Views map to display specific types or categories of configuration items.
Use the filter panel to control which elements of the map are displayed and to save versions of a filter for later use.
1. Navigate to Dependency Views > View Map.
2. Click the button to open Map Settings. Click a filter strip to expand or collapse it, and to set filter items.

<table>
<thead>
<tr>
<th>Filter panel strips and options</th>

</tbody>
</table>

**View metrics for CIs in a Dependency Views map**

Operational Intelligence processes metrics data for CIs, calculates statistics and aggregations, and detects metrics anomalies. A Dependency Views map lets you switch to metrics mode to directly access the Insights Explorer that displays metrics data for CIs on the map.

The Operational Intelligence (com.snc.sa.metric) plugin must be activated to enable this functionality, and metrics data needs to be processed for the CIs on the Dependency Views map.

Open a Dependency Views map in metric mode which integrates a Dependency Views map with the Insights Explorer functionality that is tailored to the map. In this mode, you can access Insights Explorer...
functions directly from the map, to explore metrics data for the CIs on the map. All map CIs are accessible in the right hand side pane, from where you can drill into metrics data.

1. Navigate to **Dependency Views > View Map** to open a map.

2. Right-click on a CI on the map and select **View Metrics** to open the Dependency View map in metrics mode.

   In the panel on the right side, the CI that you selected on the Dependency View map is selected by default, and the list of all the metrics available for that CI are displayed.

3. Click the ‘<’ sign on the left of the CI to display all the CIs that you can explore metrics for.

   The Insights Explorer is scoped for exploring only the CIs that currently display on the Dependency Views map, and you cannot add or remove CIs from the list. If you use map settings or filters to filter out CIs from the map, the same filtering will apply to the list of CIs that you can explore metrics for.

4. Click on a CI in the CIs list or right-click on a CI on the Dependency Views map, to drill down to the CI’s metrics.

5. Click the **Dependencies Map** tab or the **Metrics** tab to switch modes:

   a) In **Metrics** mode: The full functionality of the Insights Explorer is available, you can create metric charts by dragging metrics into the canvas. You can modify chart settings, select different time ranges for the charts, and perform other actions as described in View metric values in the Insights Explorer.

   b) In **Dependencies Map** mode: Select a CI on the map to drill down to its metrics data, drop-down the **Layout** list to choose a different layout, or modify map settings.

**Perform actions on nodes in a Dependency Views map**

You can view various related items for the nodes in a Dependency Views map.

If the node is a collapsed node or represents a cluster, the incidents, problems and change requests are for all the collapsed nodes.

1. Navigate to **Dependency Views > View Map**.

2. Click the

   ![icon] icon next to a node or right-click a node on the map, to access the following menu items:

   **Node Menu**

<table>
<thead>
<tr>
<th>View Form</th>
<th>Displays the CMDB record of the selected CI in a new tab of the browser.</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Map</td>
<td>Reloads the view using the selected CI as the new root node, with the currently defined layout setting. This option does not display on the root node.</td>
</tr>
<tr>
<td>View Related Tasks</td>
<td>Displays all tasks or outages associated with the selected CI, including incidents, problems, change requests, and follow-on tasks. This option is always available, even if there are no tasks associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>View Affected CIs</td>
<td>Shows a list of all tasks that have the CI listed as an Affected CI. This option is only visible when you access the view from the view icon in a task record's Configuration item field.</td>
</tr>
</tbody>
</table>
### Export a Dependency Views map

You can export a Dependency Views map to an image in PNG format.

1. Navigate to **Dependency Views** > **View Map**.
2. Configure the map view as you want the image to appear. The exported image displays the current view of the map.
3. Click the view menu icon

   ![View Menu Icon](image)

4. Click **Export Image**.
5. Right-click the image and select **Save Image As**, **Print**, or any other menu option.

   **Note**: You can not export images from a Dependency Views map using Internet Explorer as your browser.

6. Click the "X" button to close the **Export Image** window.
View collapsed nodes in a Dependency Views map

Cluster and virtually grouped nodes can be displayed in a collapsed mode to avoid unnecessary clutter in large maps.

1. To expand a collapsed node, right-click the CI and select **Expand** from the context menu.
2. To collapse an expanded cluster node with children, right-click the CI and select **Collapse** from the context menu.

Administer Dependency Views

Users with the admin role can control the appearance and behavior of Dependency Views by configuring map indicators, map related items, map icons, and menu actions.

Create or modify map indicators

Dependency Views maps and application service maps, use icons to display additional information for a CI by displaying its related records such as alerts, outages, incidents and problems. These icons are called **map indicator**.

The default configuration includes map indicators for the following record types:

- Open incident.
- Open alert.
- Unplanned current outage.
- Planned current outage, or an open problem.
- Current, planned, or recent change request.

You can filter out the display of affected CIs, alerts, current change requests, incidents and problems from the map settings menu. Also, you can create a map indicator to define additional record types, such as trouble sources for CIs in a service. You can also modify an existing map indicator, for example to use a different color scheme or to alter the priority of a task.

The Affected CI’s map indicator appears for CIs in two related but not identical situations. It appears for CIs for which tasks such as change request, incident, or problem were directly created for, and for any CIs that were added in those tasks (parent tasks) as Affected CIs (The CI for which a task is directly created for, is automatically added as an affected CI in that task). The state of affected CI’s depends on the status of the respective parent task. For as long as the parent task is active, the associated affected CIs continue to be impacted by the task issue. In a map, the Affected CI’s indicator displays for all affected CIs for as long as the parent task is active. On a map, the Affected CI tooltip displays the details of the task records in which the CI was added as an affected CI. However, the **Details** pane does not contain an Affected CI’s tab, and no further details about affected CIs, or the associated tasks are displayed. After the parent task is closed, the Affected CI’s indicator no longer displays for any of the tasks’ affected CIs. For information about affected CIs in Change Management, see **Associate CIs to a change request**.

**Note:** Details about affected CIs are derived from the **task** and the **cmdb_ci** tables and their extensions. Therefore, if you use custom tables to store CIs for incidents, problems and changes, it affects the details that are displayed for affected CIs.

For more information on how map indicators are used to show tasks and outages in clusters and collapsed nodes, see **Cluster nodes in a Dependency Views map**.

1. Navigate to **Dependency Views > Map Indicators**.
2. Click **New** to create a new map indicator, or click the name of an indicator from the **Table** column to modify an existing map indicator.

<td>Name of the field on the selected table that contains the configuration item.</td>
</tr>
<tr>
<td>Start field</td>
<td>The record property that determines the time-point on the metric chart timeline for placing records in the Insights Explorer. Possible values depend on the selected Table. For example, the incident indicator has values such as Actual end, Actual Start, and Approval Set.</td>
</tr>
<tr>
<td>Description field</td>
<td>Name of the field on the selected table that contains the description of the configuration item.</td>
</tr>
<tr>
<td>Description</td>
<td>Text to display when hovering over the indicator. Alphanumeric characters and spaces are valid for this field.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Condition builder that specifies for which CIs to apply this indicator. For example, a CI that has a current past outage is highlighted for 5 days. You can configure a condition to designate a different timeframe for what is considered to be current.</td>
</tr>
<tr>
<td>Active in Service Map</td>
<td>Enable to make the toggle for the specified table available in the Settings dialog box for application service maps. You can then toggle between displaying or not displaying the respective records on the map.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active Dependencies</td>
<td>Enable to make the toggle for the specified table available in the Settings dialog box for Dependency Views maps. You can then toggle between displaying or not displaying the respective records on the map.</td>
</tr>
<tr>
<td>Active in Metrics</td>
<td>Enable to make the toggle for the specified table available in the Settings dialog box for the Insights Explorer. You can then toggle between displaying or not displaying the respective records on the Insights Explorer.</td>
</tr>
<tr>
<td>Label</td>
<td>Text to display for the indicator on the map.</td>
</tr>
<tr>
<td>Tooltip Label</td>
<td>The prefix portion of the tooltip (Tooltip Label : Tooltip info).</td>
</tr>
<tr>
<td>Tooltip Info</td>
<td>The suffix portion of the tooltip (Tooltip Label : Tooltip info).</td>
</tr>
</tbody>
</table>

4. Click **Submit** to enter a new map indicator. Click **Update** to modify an existing map indicator.

For an indicator to appear in a Dependency Views map, a CI must meet all filter conditions, and **Active Dependencies** must be selected.

**Create or modify map icons**

You can upload new icons or modify existing icons to customize the icon displayed for a CI in maps in Dependency Views, Service Mapping, and Event Management.

The icons used in Dependency Views maps are listed in the Map Icons module. Records in the **Map Icons** list are arranged by CI classes, such as cmdb_ci_linux_server. The path to the default image files is https://<instance name>.service-now.com/images/app.ngbsm/<image name.svg>. For information about uploading images to the database, see **Storing images in the database**.

Role required: admin or cmdb_admin roles are required to access the records in this table [ngbsm_icon] to upload new icons.

- Navigate to **Configuration > CI Class Manager**, and:
  - a) Click **Hierarchy** to display the CI Classes list.
  - b) Select a class to modify the icon for.
  - c) In the class navigator bar, expand **Class Info** and then select **Basic Info**. On the Basic Info form, click **Icon**.
  - d) In the Icons dialog box, select an icon and then click **Update**.
  - e) On the **Basic Info** form, click **Update**.
• Navigate to **Dependency Views** > **Map Icons**, and:
  a) Click **New** to create a new map icon or click the name of an existing icon in the **Label** column to modify an existing icon.
  b) Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Type</td>
<td>Label or the informal name of the CI table that this icon represents in the view.</td>
</tr>
<tr>
<td>Icon</td>
<td>Name of the icon.</td>
</tr>
<tr>
<td>URL</td>
<td>Path to the icon image using the following format: /image name.svg. Click the lock icon to enter a new path.</td>
</tr>
</tbody>
</table>

c) Fill in the fields on the form, as appropriate.
d) Click **Submit** to enter a new icon. Click **Update** to modify an existing icon.

You can modify a Dependency Views map indicator to use the new icon.

**Create a predefined filter**

Create filters to narrow down the CIs that are displayed on a Dependency Views map. You can create filters that are based on CIs' class, CIs' attributes, or CIs' relationships.

Role required: ecmdb_admin

Create a predefined filter that you can then select to determine the scope of the CIs that are displayed in a Dependency Views map. **Configuration type** filters filter by CI class, **CI filters** filter by CI attributes, and **relationship filters** filter by relationships. Only CIs that match at least one of the configuration type filters (if any exists), and at least one of the CI filters (if any exists), and at least one of the relationship type filters (if any exists) - are displayed on the map. If no filters are defined, then no filtering is applied.

**Note:** Predefined filters do not apply to virtual groups. Therefore a virtual group displays even if it contains CIs that a predefined filter would have not included. Upon the expansion of a virtual group, predefined filters are applied, and any or all of the CIs that were previously virtually grouped, might no longer display on the map.

1. Navigate to **Dependency Views** > **Predefined Filters**.
2. On the **Predefined Filters** page, click **New**.
3. Type in a **Name** for the filter. Click **Roles**, and in the **Roles** dialog box, select the roles that this filter will be available for.
4. Right-click on the page header, and click **Save**.
5. To create a configuration type filter:
   a) Click **Configuration Types**, and then click **Edit**.
   b) In the **Collection** slushbucket, select the classes that CIs must belong to in order to be displayed on the map, and move them to the **Configuration Types List**.
   c) Click **Save**.
6. To create a CI filter:
   a) Click **CI Filters**, and then click **New**.
   b) In the **CI Filters** page enter conditions to filter CIs by specific attribute values.
   c) Click **Submit**.

7. To create a relationship type filter:
   a) Click **Relationship Type**, and then click **New**.
   b) In the **Collection** slushbucket, select the relationships that CIs must have in order to be displayed on the map, and move them to the **Relationship Types List**.
   c) Click **Save**.

After creating a predefined filter, you can apply it to a map:
1. Click the icon to open **Map Settings**.
2. Select a filter from the **Predefined Filters** list.
3. Click **Apply**.

### Set a predefined filter as default

You can set a custom predefined filter as the default predefined filter for viewing maps.

1. Create the custom predefined filter to be used as the default predefined filter.
2. On the predefined filter form, click the context menu and select **Copy sys_id**.
3. Navigate to **User Administration > User Preferences**.
4. Click **New** and create a new user preference record using these values:
   - **Name**: ecmbd.ciview
   - **Type**: String
   - **Value**: Paste the sys_id of the custom predefined filter
   - **User**: Leave blank to create a system-wide setting
   - **Description**: Description of the predefined filter
   - **System**: Selected
5. Click **Submit**.

In **Map Settings**, when you select the **Default** option for **Predefined Filters**, the custom predefined filter that was set, will be applied.

### Create or modify Map Related Items

The Map Related Items module relates referenced CIs to one another, which allows them to be displayed in a Dependency Views map.

The base system configuration includes the following tables and relates them to items in the Computer [cmdb_ci_computer] and Server [cmdb_ci_server] tables.

- Disk [cmdb_ci_disk]
Some additional referenced CIs that can be related in this manner are file systems and running processes.

In the following example, computer nodes in the map are related to network adapter nodes if the **Configuration Item** field of the adapter records reference the specific CI node. Access or create a network adapter record from the Network Adapter related list in the cmdb_ci_computer record.

Dependency Views Configuration Item field

The Dependency Views map for the *JEMPLOYEE-IBM* computer shows the network adapter attached to the computer.
You can configure Dependency Views to display CIs that have no relationship record, but are related to other CIs by reference fields.

1. Navigate to **Dependency Views > Map Related Items**.
2. Click **New** to create a new related item, or click in the row of an existing CI to modify an existing map related item.
3. Fill in the fields on the form, as appropriate.
   See the Related Items form table.
4. Click **Submit** to enter a new map related item. Click **Update** to modify an existing map related item.

### Related Items form

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration item</td>
<td>CI that represents the base node or a CI in a table that extends the base node table. In the base system, the configuration item that represents the base node is Computer [cmdb_ci_computer], which includes all types of workstations and servers.</td>
</tr>
<tr>
<td>Related item</td>
<td>Table name of the related item. Only the cmdb_ci table and tables that extend it are displayed in the choice list.</td>
</tr>
<tr>
<td>Related field</td>
<td>Field that links this related item to the configuration item. In many cases, the appropriate value is automatically populated in the field after the first two fields are selected. Select the drop-down menu for additional options.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that allows you to enable or disable this record.</td>
</tr>
</tbody>
</table>

**Create or modify Dependency Views menu actions**

To modify an existing menu option, first you create a copy of the original menu action record, and then you modify the copy.

This ensures that your instance can update the record normally during the upgrade process and allows you to quickly restore the original menu option, if necessary.

1. To create a new menu option, navigate to **Dependency Views > Map Menu Actions** and click **New**. Fill in the fields on the form, as appropriate. See the Menu Action form table.
2. To modify an existing menu option, navigate to **Dependency Views > Map Menu Actions**.
3. Open the menu action you want to edit.
4. Right-click in the header and click **Insert and Stay**. This step creates a duplicate copy of the menu action and leaves it open for editing.
5. Change the name of the copied record to avoid confusion.
6. Modify the form fields as necessary and save the record.
7. Open the original record and disable it by clearing the **Active** check box.

**Menu Action form**

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name that appears as the menu option.</td>
</tr>
<tr>

</tr>
</tbody>
</table>

**Condition and script parameters for menu actions**

You can use the following condition and script parameters for menu actions.

**Condition parameters**

**Note:** The usual regular expression conventions are valid in the condition field, such as `!` for NOT, `&&` for AND, and `||` for OR.

The **Condition** field contains a boolean expression that evaluates to true or false. If the condition is true or if there is no condition, the specified option appears in the menu when you right-click a CI or a relationship link. When you select the option from the menu, ServiceNow executes the associated script.
Common Elements for Building a Condition

<table>
<thead>
<tr>
<th>Text</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Node or reference link's data on which you performed the right-click action.</td>
</tr>
<tr>
<td>item.label</td>
<td>Label of the node</td>
</tr>
<tr>
<td>item.ci_type</td>
<td>CI's type (table), such as cmdb_ci_service</td>
</tr>
<tr>
<td>item.name</td>
<td>Name of CIs. CI's type name or the table label</td>
</tr>
<tr>
<td>item.location</td>
<td>Location of the CI, such as New York</td>
</tr>
<tr>
<td>item.manufacturer_name</td>
<td>Name of the CI's manufacturer, such as Dell Inc.</td>
</tr>
<tr>
<td>item.id</td>
<td>The sys_id of the CI</td>
</tr>
<tr>
<td>item.is_selected</td>
<td>The item that is selected in the map</td>
</tr>
<tr>
<td>item.level</td>
<td>The current default level</td>
</tr>
<tr>
<td>item.locationId</td>
<td>The sys_id of the CI node's location</td>
</tr>
<tr>
<td>item.locationName</td>
<td>The full address of the location</td>
</tr>
<tr>
<td>item.manufacturerId</td>
<td>The sys_id of the CI's manufacturer</td>
</tr>
</tbody>
</table>

Valid Conditions for Condition Parameters

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item.is_collapsed</td>
<td>The node is a collapsed node</td>
</tr>
<tr>
<td>item.is_cluster</td>
<td>The node is a cluster node</td>
</tr>
</tbody>
</table>

Script parameters

Menu action scripts are executed on the client when a user clicks the menu option. You can use the same building blocks in scripts as in conditions. Menu action scripts do not function on separators. These are some additional, useful expressions for scripts:

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item.id</td>
<td>The sys_id of the CI node or relationship link</td>
</tr>
<tr>
<td>item.source</td>
<td>The sys_id of the relationship's parent or child.</td>
</tr>
<tr>
<td>item.target</td>
<td>The sys_id of the relationship's parent or child.</td>
</tr>
<tr>
<td>item.label</td>
<td>The name of the CI node, such as IronMail-SD-02.</td>
</tr>
<tr>
<td>item.location</td>
<td>The sys_id of the CI node's location</td>
</tr>
<tr>
<td>item.location_name</td>
<td>The full address of the location, such as 4616 Clairemont Drive, North Clairemont, San Diego CA.</td>
</tr>
<tr>
<td>item.manufacturer_id</td>
<td>The sys_id of the CI's manufacturer</td>
</tr>
</tbody>
</table>
Create or edit a dependency type

Use one of the dependency types provided, or create a custom dependency type with a script that will execute in real time to generate a custom view of a Dependency Views map for a specific CI.

Create a JavaScript to customize the map. The script must comply with JavaScript syntax guidelines and the directions in the default script template, and it can call platform APIs. Use a dependency type, for example:

- To narrow down and simplify a map, leaving out CIs that are not important for a specific task.
- To include only specific CIs that are hidden by default, such as qualifiers, end-points, and entry points.
- To display virtual relationships that are calculated, and that otherwise do not exist in the CMDB.
- As a tool to plan a new topology deployment that is based on existing resources.

The following dependency types are included in the base system:

**Application to Network Devices**

Returns the network devices in the network paths leading to/from the given CI.

**Network Device to Applications**

Returns the applicative CIs which are target or source of network paths containing the given network device. In addition, returns the hosts of those applicative CIs, and for an applicative CI that is an inclusion, its parent CI is returned too.

**Physical Network Connections**

Returns hosts/network devices that are physically connected to the given host or network device.

**Flow Dependencies**

Returns all the server to server connections that were discovered using the Netflow collector. The script builds a graph based on data in the [sa_flow_server_comm] table. This table contains pairs of services represented by an IP and a listening port that are communicating with each other. For more information, see Data collection and discovery using Netflow and Data collection and discovery using VPC Flow Logs.

**Show All Relationships**

Returns all qualifiers, end points, and entry points. This dependency type is disabled by default and is typically enabled for debugging and tracking purposes.

1. Navigate to Dependency Views > Dependency Types.
2. In the Load Filter Scripts list view, select an existing dependency type, or click New.
3. Enter or modify a script, adhering to the guidelines and requirements in the script template that is provided.
4. Click Submit.

In a Dependency Views map, you can click Use Dependency Type to apply a custom script defined in a dependency type.

**Properties for Dependency Views**

Use Dependency Views properties to configure how data appears in Dependency Views maps.

These properties are available for Dependency Views. To view and edit these properties, the admin role is required.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.bsm.max_nodes | The maximum number of nodes to retrieve from the database. If more nodes exist in the database, they are not displayed in the map.  
- Type: Integer  
- Default value: 1000  
- Location: **Dependency Views > Map Properties** |
| glide.bsm.max_levels | Level depth is the graph distance between the root CI and a node.  
- Type: Integer  
- Default value: 3  
- **Other possible values:** 1-49  
- Location: **Dependency Views > Map Properties** |
| glide.bsm.show_virtual_node_children | Display the continuation of the map underneath virtual group. Virtual links are used to connect virtual groups to their child nodes.  
- Type: Yes | No  
- Default value: No  
- Location: **Dependency Views > Map Properties** |
| glide.bsm.too_many_children | Maximum number of nodes (of a similar CI type and at the same level) to display before applying virtual grouping. Nodes are collapsed for the map to meet this limit.  
- Type: Integer, valid values 1 or greater  
- Default value: 10  
- Location: **Dependency Views > Map Properties** |
| glide.ngbsm.filters_remove_filtered_items | A value of true indicates that filtered out items will be removed from the graph along with any disconnected children while a value of false indicates that the items will be dimmed in color.  
- Type: Yes | No  
- Default value: Yes  
- Location: **Dependency Views > Map Properties** |
| glide.bsm.max_num_rels | The maximum number of relations to retrieve from the database. If more relations exist in the database, they are not displayed in the map.  
- Type: Integer  
- Default value: 100  
- Other values: 1 or greater  
- Location: **Dependency Views > Map Properties** |
| glide.ngbsm.filters_run_layout_automatically | A value of true indicates that when filters are changed the graph will recalculate it layout using the currently selected layout algorithm.  
- Type: Yes | No  
- Default value: Yes  
- Location: **Dependency Views > Map Properties** |
<table>
<thead>

**Connect**

ServiceNow® Connect is a real-time messaging platform that connects you to your coworkers, bypassing email and static documents.

Connect integrates with other features within the system, such as Visual Task Boards, Human Resources Management, and Customer Service Management. The Connect interface overlays the standard interface, which allows users to participate in conversations while they work.

Connect contains the following features:

- **Connect Chat**: Enables users to chat with individuals and groups, quickly share files, and collaborate on any record by connecting with the right people instantly.
- **Connect Support**: Enables support agents to provide real-time assistance to end users, using queues. Requires the Connect Support plugin.
UI16 or UI15 is required to use Connect.

**Note:**
- Connect does not replace legacy chat but offers some of the same functionality. Do not use these features concurrently.

**Explore**
- Upgrade to New York
- Connect interface
- Connect Chat
- Connect Support

**Set up**
- Activate Connect
- Activate Connect Support
- Supported browsers for Connect

**Administer**
- Properties for Connect
- Connect actions
- Configure the fields on a record card in Connect
- Properties for Connect Support

**Use**
- Start a direct or group conversation
- Follow a record in Connect
- Create an incident from a Connect Support conversation

**Develop**
- Developer training
- Developer documentation

**Troubleshoot and get help**
- Ask or answer questions in the Connect forum
- Search the HI Knowledge Base for known error articles

**Supported browsers for Connect**

The system supports Connect Chat and Connect Support on most modern browsers.

- The latest public release of Firefox or Firefox ESR
- The latest public release of Chrome
- Safari version 9.1 and later
- Internet Explorer version 11
  - Edge mode is supported.
  - Compatibility mode is not supported.
  - Setting Security Mode to High (via the Internet Options > Security tab) is not supported.
  - Internet Explorer 11 is susceptible to memory leaks, which may impact performance, especially in Windows 7.

**Activate Connect**

Connect is active by default on new instances. For upgraded instances, you can activate the Connect plugin (com.glide.connect) if you have the admin role.

Role required: admin

If you used Collaboration in the Fuji release, the Connect plugin is activated automatically.

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise they will receive the following error: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

### Properties installed with Connect

Properties are added with activation of Connect.

**Note:** To open the System Property [sys_properties] table, enter **sys_properties.list** in the navigation filter.

<table>
<thead>

### Activate Connect Support

You can activate the Connect Support plugin (com.glide.connect.support) if you have the admin role. This plugin includes demo data.

If you are currently using the legacy chat feature to provide help desk support, close any open help desk chats before activating Connect Support. Legacy chat and Connect Support should not be used concurrently. When you activate Connect Support, the system automatically sets the state of all Chat Queue Entry [chat_queue_entry] records to **Closed Complete**. This ends any open help desk chats. For more information, see [Migrate from legacy chat to Connect Support](#).

**Role required:** admin

1. Navigate to **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in [Request a plugin](#).
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise they will receive the following error: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.
### Properties installed with Connect Support

Properties are added with activation of Connect Support.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>• <strong>Location</strong>: System Property [sys_properties] table</td>
</tr>
</tbody>
</table>

### Additional plugins for Connect Support

Additional plugins are available for Connect Support. These plugins integrate Connect Support with other features and provide capabilities to track performance metrics.

You must have the admin role to activate these additional plugins. For details, see [Activate a plugin](#).

#### Additional plugins for Connect Support

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connect Support Manager’s Dashboard [com.glide.connect.managers_dashboard]</td>
<td>Provides a homepage for Connect Support, and all required configuration records. Though the plugin name contains the term dashboard, the plugin does not provide functionality related to Performance Analytics dashboards. Homepages are similar to dashboards, but do not require Performance Analytics roles to view.</td>
</tr>
</tbody>
</table>

**Note:** The Connect Support Manager’s Dashboard plugin does not activate Connect Support automatically. You must activate Connect Support to collect data for the homepage.
### Human Resources Application: HR Connect

**[com.snc.hr.hr_connect]**

Sets up a human resources (HR) chat queue and makes it available on the HR Service Portal.

**Note:** This plugin does not appear in the System Definition>Plugins list. Contact ServiceNow personnel to activate it.

If not already active, the Human Resources Application: HR Connect plugin activates these related plugins:

- **Human Resources Application: Core**
  
  **[com.snc.hr.core]**: Provides basic HR features.

### Performance Analytics - Content Pack - Service Desk Chat

**[com.snc.pa.chat]**

Provides the **Service Desk Chat Monitor** dashboard, which analyzes key Connect Support metrics and indicators.

The Performance Analytics - Content Pack - Service Desk Chat plugin activates these related plugins if they are not already active:

- **Connect Support Manager's Dashboard**
  
  **[com.glide.connect.managers_dashboard]**: See description in this table.

### Performance Analytics - Context Sensitive Analytics for Chat

**[com.snc.pa.chat.context_sensitive_analytics]**

Provides in-form analytics for Connect Support. These analytics are available as a related link on the Chat Queue Entry [chat_queue_entry] form, and also as the **Context Sensitive Analytics - Chat** dashboard.

The Performance Analytics - Context Sensitive Analytics for Chat plugin activates these related plugins if they are not already active:

- **Performance Analytics - Content Pack - Service Desk Chat**
  
  **[com.snc.pa.chat]**: See description in this table.

### Connect interface

Users can work in a compact view of Connect, which overlays the standard user interface, or in a full-screen workspace.

Connect Chat and Connect Support share the same interface, so support agents can keep track of all their conversations in one place.

### Connect overlay

The Connect overlay appears over the standard user interface. It consists of the Connect sidebar, which is the primary interface for Connect Chat and Connect Support, and any Connect mini windows that are open. Each mini window contains a header, a conversation area, and a message field.
**Note:** An administrator can disable the Connect overlay so users can only use the Connect workspace, a full-screen interface with additional Connect tools.

**Connect sidebar**

The Connect sidebar is the primary interface for Connect Chat and Connect Support. It lists your conversations and provides access to create conversations.

The sidebar is collapsed by default. Click the toggle Connect sidebar icon (in the banner frame to expand or collapse the sidebar, which appears on the right edge of the interface.

**Connect Chat**

The chat view of the sidebar is available to all users. If Connect Support is enabled, users must click the chat tab of the sidebar, which is represented by a speech bubble icon. If Connect Support is not enabled, there are no tabs in the sidebar and the chat view displays by default.

The chat view of the sidebar lists all your current Connect Chat conversations. It also contains a filter tool and a button to create conversations.
Chat view of the Connect sidebar

If you have unread messages in a conversation, a number appears by the conversation in the sidebar. Point to a conversation and click the x icon to remove the conversation from the sidebar.

**Connect Support**

The support view of the sidebar is available when Connect Support is activated. The support view is visible only to users who are agents for at least one support queue. Users must click the support tab of the sidebar, which is represented by a headset icon.

The support view displays **Queues** to which you belong. It also displays your open support conversations under **Cases**.
If you have unread messages in a conversation, a number appears by the conversation in the sidebar.

Support view of the Connect sidebar

Connect mini windows

When you open a Connect Chat or Connect Support conversation in the Connect overlay, it opens in a Connect mini window. Each mini window contains a header, a conversation area, and a message field.

Several icons appear in the mini window header and by the message field.

Note: The icons you see for each conversation depend on the conversation type and other conditions.

Chat mini window icons

<table>
<thead>
<tr>
<th>Icon</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>👤</td>
<td>Add user</td>
<td>Add a user to the conversation. This icon is visible for group and record conversations only. Administrators can enable this icon for Connect Support conversations.</td>
</tr>
<tr>
<td>Icon</td>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><img src="image" alt="icon" /></td>
<td>View document</td>
<td>View the record associated with the conversation. This icon is visible for record and support conversations only.</td>
</tr>
<tr>
<td><img src="image" alt="icon" /></td>
<td>New window</td>
<td>Open the conversation in the Connect workspace, a full-screen window with additional Connect tools.</td>
</tr>
<tr>
<td><img src="image" alt="icon" /></td>
<td>Collapse/Expand conversation</td>
<td>Hide or show the conversation. Alternatively, click anywhere in the mini window header to the left of the icons.</td>
</tr>
<tr>

<td>Attach file</td>
<td>Attach and send a file. Select one or more files and click Open. You can also add an attachment by dragging and dropping it directly in the conversation.</td>
</tr>
</tbody>
</table>

**Connect workspace**

The Connect workspace is a full-screen view of all your Connect Chat and Connect Support conversations in one place. It contains the conversation pane, which displays the conversation header and an expanded version of the mini window, and the conversation tools area.

To open the Connect workspace, navigate to **Collaborate > Connect Chat** or click the new window icon in a Connect mini window. If you do not have any recent conversations, a screen appears with helpful information about Connect.

The Connect workspace is composed of the following elements.
## Connect workspace elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sidebar</td>
<td>Provides access to conversations. The Connect sidebar behaves the same way in the workspace as it does in the Connect overlay. The only difference is that the sidebar appears on the left edge of the Connect workspace. For more information about using the sidebar, see <a href="#">Connect sidebar</a>.</td>
</tr>
<tr>
<td>Conversation pane</td>
<td>Displays the currently selected conversation.</td>
</tr>
<tr>
<td>Conversation tools</td>
<td>Provides quick access to key information, conversation members, attachments, and notification preferences for the currently selected conversation. Some of the conversation tools vary depending on the type of conversation.</td>
</tr>
</tbody>
</table>
Connect workspace
Conversation pane

The conversation pane of the Connect workspace displays the conversation header and an expanded version of the mini window.

The header displays basic conversation details like the avatar and name. You can edit these details for group or record conversations.

Below the header, messages appear in chronological order. You can enter messages in the text entry field at the bottom of the window.

Connect conversation tools

The conversation tools area in the Connect workspace contains several tabs, each represented by an icon. Click an icon to open the tab. Click the same icon again to hide the tab. The tabs you see for each conversation depend on the conversation type and other conditions.

### Conversation tool tabs

<table>
<thead>
<tr>
<th>Tab icon</th>
<th>Tab name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>📝</td>
<td>Info</td>
<td>Contains the following sections, each of which appears only if it contains information.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>Record</strong>: Lists details about the record the current conversation follows, such as record number, state, assignee, and short description. The fields displayed in this section vary by the type of record. This section is available only for record conversations.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>Related Records</strong>: Lists Visual Task Boards and task records that have been referenced in the conversation, such as incidents, problems, or changes. When you send a record number as a message or drag a record in a conversation, it appears as a link. The list displays the short description for each task. Click a task to open the record in a new browser tab. Only conversation members who have rights to view the tasks can access them.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>Links</strong>: Lists URLs that have been referenced in the conversation. Click a link to open the destination page in a new browser tab. This tab is not available for support conversations.</td>
</tr>
<tr>
<td></td>
<td>Record</td>
<td>Displays a compact form view of a record created from the current conversation, such as an incident. If more than one record has been created from the conversation, there is a separate record tab for each one. These tabs are available only for support conversations.</td>
</tr>
<tr>
<td></td>
<td>Knowledge</td>
<td>Displays a compact view of the knowledge homepage. For more information, see Share knowledge in a Connect Support conversation.</td>
</tr>
<tr>
<td></td>
<td>Base</td>
<td>Members</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Attachments</td>
</tr>
<tr>
<td></td>
<td>Notification</td>
<td>Contains settings to control which notifications you receive for the current conversation. For more information, see Edit which notifications you receive for a conversation.</td>
</tr>
</tbody>
</table>
Enable or disable Connect notifications globally

You can edit your Connect notification settings globally to enable or disable mobile, desktop, email, or audio notifications for all your Connect Chat and Connect Support conversations.

Role required: none

By default, Connect mobile, email, and audio notifications are enabled globally. You must enable desktop notifications.

An administrator can customize the sound used for audio notifications.

ℹ️ **Note:** You receive mobile notifications only if you have installed the ServiceNow mobile app.

1. In the banner frame, click the gear icon (⚙️) to open the system settings.
2. In the system settings window, click the **Notifications** tab.
3. In Notifications by Category, navigate to **Connect**.
4. Enable or disable Connect mobile, desktop, email, or audio notifications.
5. Optional: Configure the following system notifications. For more information on how to configure system notifications, see [Apply notification conditions](#).

<table>
<thead>
<tr>
<th>Notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity Stream @Mention Email</td>
<td>Sends an email alert to a user anytime they get @mentioned in an activity stream</td>
</tr>
</tbody>
</table>
| Collaboration Offline Group Message(s)| Sends email to offline users who are members of a group conversation after a certain number of minutes determined by the collaboration.email_interval property to limit spam.  
   **Note:** It takes 90 seconds after a user logs out for the system to register that the user is offline. If a message is sent to the user within 90 seconds of them logging out, then the user does not receive the notification. |
| Collaboration Offline Message Bundle | Sends email to offline users after a certain number of minutes determined by the collaboration.email_interval property to limit spam.  
   **Note:** It takes 90 seconds after a user logs out for the system to register that the user is offline. If a message is sent to the user within 90 seconds of them logging out, then the user does not receive the notification. |
| ConnectMessagePushNotification       | Uses a push notification to inform users when there are new messages in a conversation |
| ConnectNotificationPushNotification  | Uses a push notification to inform a user when they have been @Mentioned in a record |
Edit which notifications you receive for a specific conversation.

**Connect notification browser support**

The following browsers support Connect chat notifications.

**Connect chat browser support**

<table>
<thead>
<tr>
<th>Browser</th>
<th>Enable notification steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chrome</td>
<td>1. From a Chrome window, click the Chrome menu in the upper right corner.</td>
</tr>
<tr>
<td></td>
<td>2. Go to Settings &gt; Show advanced settings... &gt; Privacy &gt; Content settings.</td>
</tr>
<tr>
<td></td>
<td>3. In the Content settings window, from the notifications section, select your notification settings.</td>
</tr>
<tr>
<td>Mozilla Firefox (starting with version 44)</td>
<td>Manage browser notification settings using the information icon next to the URL.</td>
</tr>
<tr>
<td>Safari (starting with OS X Mavericks)</td>
<td>1. From a Safari window, open Preferences.</td>
</tr>
<tr>
<td></td>
<td>2. Select the notifications tab.</td>
</tr>
<tr>
<td></td>
<td>3. Select Allow or Deny to control which websites have access to notifications.</td>
</tr>
<tr>
<td>Microsoft Edge</td>
<td>Notifications are enabled by default on Windows 10 PCs and tablets starting with EdgeHTML 14. For more information, see <a href="https://blogs.windows.com/msedgedev/2016/05/16/web-notifications-microsoft-edge/#pVkwubg7uvROayyL97">https://blogs.windows.com/msedgedev/2016/05/16/web-notifications-microsoft-edge/#pVkwubg7uvROayyL97</a>.</td>
</tr>
</tbody>
</table>

**Note:** Internet Explorer does not support Connect notifications out of box.

**Edit which notifications you receive for a conversation**

You can control which types of Connect notifications you receive for each conversation and when you receive them.

Role required: none

Connect can send mobile, desktop, email, and audio notifications to inform you of messages and other activity, when you are not actively viewing Connect. You can edit your notification preferences in each conversation to control which notifications you receive for the conversation and under what circumstances. For example, if you are a member of a large group conversation, you might want to receive mobile, desktop, and email notifications for all activity, and audio notifications only when someone mentions you. You might also want to disable a certain type of notification entirely for a conversation.

By default, you receive mobile, email, and audio notifications for all activity in every conversation you belong to. You must enable desktop notifications manually. Not all browsers allow desktop notifications. For more information, see [Enable or disable Connect notifications globally](#).
An administrator can **customize the sound** used for audio notifications.

**Note:** You receive mobile notifications only if you have installed the ServiceNow mobile app.

1. Open a conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation, click the notification settings tab ( 🔔 ).
3. Edit the following settings according to your preferences.

**Note:** If a notification type is **disabled globally**, a link to enable that type appears. You must click the link before you can edit conversation-specific notification settings.

### Mobile Notification Settings
Choose to receive push notifications:
- For all activity
- Only when @ mentioned (this option is not available for direct conversations)
- Never

### Desktop Notification Settings
Choose to receive desktop notifications:
- For all activity
- Only when @ mentioned (this option is not available for direct conversations)
- Never

### Email Settings
Choose to receive email notifications:
- For all activity
- Only when @ mentioned (this option is not available for direct conversations)
- Never

### Audio Notification Settings
Choose to receive audio notifications:
- For all activity
- Only when @ mentioned (this option is not available for direct conversations)
- Never

### System Message Notifications
Enable or disable system message notifications, which are automatically generated by events like conversation membership changes and Visual Tasks.
Upload a profile picture

You can upload a profile picture in your Live Feed profile to use as an avatar in Connect Chat and Connect Support conversations.

Role required: none

Users who do not have profile pictures are represented by an avatar with their initials. Administrators can upload a profile picture in a user record which displays if there is no Live Feed photo.

1. Navigate to Collaborate > Live Feed.
2. Click the tile with your picture or initials and title.

3. Use one of the following actions to add your photo.
   - Locate the photo file you want to use and drag it over the existing photo.
   - Point to the existing picture (or tap the photo in the smartphone or tablet interface) to display the Upload a picture link. Click the link, navigate to the location of the photo you want to use, and click Open.
Drag a file into a Connect conversation

Drag and drop functionality in Connect Chat and Connect Support provides an easy way to share external attachments and links or items from within your instance.

Role required: none

You can drag several things from within an instance, including items from the application navigator, records or breadcrumbs from lists, and Visual Task Boards from the My Task Boards page.

Drag an item in a Connect mini window.

To drag a record from a list, drag the reference icon 

the record number, or a reference column value.

Connect accepts the same file extensions as the platform. For more information, see #unique_419.

Share a Visual Task Board in a Connect conversation

You can share a Visual Task Board in a Connect Chat or Connect Support conversation.

Role required: none

2. Drag a task board to a Connect mini window.

A link to the task board appears in the conversation. The task board is also listed in the conversation tools, which are visible in the Connect workspace. Only conversation members who are members of the board can access it. If you share a task board in a record conversation, it appears as a URL in the record activity stream.

Mention a user in a Connect conversation

You can get someone’s attention in a group conversation by mentioning them.

Role required: none

Users can set their notification preferences so they receive notifications only when they are mentioned. Mentioning a user creates a shortcut to view their basic information and send them a direct message.
1. Open a Connect group conversation.
2. In the message field, type the @ character.
   A suggestion menu appears with the names of the conversation members.
3. Select the person you want to mention and send the message.

**Connect administration**

Administrators can configure various performance settings and features that impact both Connect Chat and Connect Support.

**Note:** There are also administrative options specifically for Connect Chat or Connect Support. For more information, see Connect Chat administration and Connect Support administration.

**Domain separation in Connect Support and Connect Chat**

This an overview of how domain separation works in Connect Support and Connect Chat, and the expected interactions across domains to support multiple tenants. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Overview

Support: Level 1

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

Connect Support adheres to the standard domain separation patterns within ServiceNow, with some exceptions. Most notably, Connect Support allows for users in a parent or top-level domain to interact with chat_queue_entry records generated from child domains. Users can then pose questions in specifically-labeled chat_queues directly to the primary administrators of the instance.

Connect Chat supports data separation within domain separated instances. Delegated administration—the ability to override configuration settings and logic in domains—is not supported.

How domain separation works in Connect Support

Connect Support supports data separation within domain-separated instances. Delegated administration—the ability to override configuration settings and logic in domains—is not supported.

Configuration

Connect Support is configurable by system administrators only. Configuration settings apply to all domains. Overrides for configuration details and process logic in domains are not supported.

After domain separation has been enabled, the following Connect Support-related tables are not domain-separated in the base system:

- chat_queue
- connect_action

Records created from users in a child domain remain in the child domain to both the agent and the user initiating the chat. Any of the following tables represent records that support the conversation.

Records from conversations

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chat_queue_entry</td>
<td>Holds the initial question from the end user, and other metrics to determine overall support efficiency, such as wait_time.</td>
</tr>
<tr>
<td>live_group_profile</td>
<td>Represents the conversation itself</td>
</tr>
<tr>
<td>live_group_member</td>
<td>Each individual member of the support conversation</td>
</tr>
<tr>
<td>Incident and other task-based records</td>
<td>Any record generated from connect_actions.</td>
</tr>
</tbody>
</table>

How domain separation works in Connect Chat

Configuration: Connect Chat is configurable by system administrators only. Configuration settings apply to all domains. Overrides for configuration details and process logic in domains are not supported.
Actions may be made available to specific domains based on condition filters set by system administrators.

Data Management: Connect Chat messages are not assigned to a domain. Rather, visibility is restricted to conversation participants.

**Usage scenarios**

Chat with users in the same domain (Supported)
- Domain visibility allows users to see other users in the same domain.
- Examples:
  - Service Provider user may chat with another Service Provider user
  - ACME user may chat with another ACME user

Parent domain user initiates chat with child domain user (Supported)
- Domain visibility allows users to see users in child domains.
- Examples:
  - Service Provider user may initiate a chat with a Service Provider sub-contractor user
  - ACME user may initiate a chat with ACME EMEA user

Domain user initiates chat with user in a domain where visibility has been granted (Supported)
- Domain visibility allows the user initiating a chat to see users in the target domain.
- Examples:
  - Service Provider sub-contractor user may initiate a chat with an Initech user, given domain visibility
  - Service Provider users may initiate a chat with any domain user, given the contains relationship with the TOP domain
Sub-domain user initiates chat with Parent domain user (Not supported)

- Domain visibility does not allow users in child domains to see users in parent domains. This means they are unable to initiate a chat session.

**Configuration**

Administrators may configure multiple Chat Queues. Support Queues are not assigned to a domain. Assignment groups may exist in any domain.

Any user with the appropriate link can enter a queue, regardless of the user’s domain. Exposure of links to specific queues through the default user interface may be controlled using domain-specific overrides. Exposure of links to specific queues through the Service Portal may be controlled using conditions or custom coding logic.

The Reporting Dashboard contains statistics related to all queues and all agents. Statistics are not filtered according to domain. Therefore, it is not appropriate to expose this page to users within child domains.

**Data management**

Connect Support Queues are global. No domain field exists on this table and it is not suitable for domain separation.

Connect Support messages are assigned to a domain based on the domain of the user entering the queue. Members of the Assignment group for the queue must have domain visibility to the user entering the queue to participate in chat sessions.

Records generated from chat sessions display based on the agent’s home domain. However, once the record is saved with a Company value, business rules assign the newly created record to the corresponding domain.

**Usage scenarios**

In the illustration above:

- The ACME support queue is configured to be available from 8-5 on weekdays. The ACME Support group in the ACME domain provides first-level support. If more advanced support is required, users are escalated to the Service Provider’s Service Desk queue.
• The Service Desk queue is configured to be available 24x7 and is staffed by the Service Desk Group in the Service Provider domain. If more advanced support is required, users are escalated to the Tier 2 Support queue in the same domain.

Properties for Connect

The Connect Properties page provides several configuration options for Connect.

Users with the admin role can access these properties by navigating to Connect > Administration > Properties.

Note: Many of the properties also impact Connect Support.

Properties for Connect

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable Presence</td>
<td>Turns off user presence globally when enabled. Enabling this property turns off user presence throughout the platform, not just in Connect.</td>
</tr>
<tr>
<td>glide.ui.presence.disabled</td>
<td></td>
</tr>
<tr>
<td>Enable Connect in the frameset</td>
<td>Determines whether the Connect overlay is visible (enabled). This property also impacts Connect Support.</td>
</tr>
<tr>
<td>collaboration.frameset</td>
<td></td>
</tr>
<tr>
<td>Enable Connect to retrieve external link metadata in order to render richer content in messages with links to YouTube, news articles, images, etc.</td>
<td>Enables Connect to render URLs for external sites as links. When this property is disabled, URLs that point anywhere outside the instance appear as plain text. This property also impacts Connect Support.</td>
</tr>
<tr>
<td>connect.retrieve_external_link_content</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of minutes to wait before collecting unread messages and sending an email to offline users. collaboration.email_interval | Sets the number of minutes the system waits before sending a Connect notification email to an inactive user.  
- **Type**: integer  
- **Default value**: 3  
- **Location**: Collaborate > Administration > Properties  
- **Learn more**: Configure the email notification interval |
| Maximum number of latest conversations to show during search. (Default = 50) | Sets the number of results that appear when you search conversations in Connect. In the System Properties [sys_properties] table, this property appears as connect.search.conversation_limit.  
- **Type**: integer  
- **Default value**: 50 |
| Audio file to play to notify users of new messages, support conversation transfers and @mentions in Connect. connect.notification.audio_alert | Specifies the audio file to play to notify users of new messages, support conversation transfers, and @mentions in Connect. This property's value must point to the Name field of a record in the Audio File [db_audio] table. This property also impacts Connect Support.  
- **Type**: string  
- **Default value**: connect_alert.mp3  
- **Location**: Collaborate > Administration > Properties  
- **Learn more**: Customize the Connect audio notification sound |
| Comma separated whitelist of roles able to access Connect. Empty allows all roles. connect.roles | Determines which user roles are required to access Connect. When the value is blank, no role is required. This property also impacts Connect Support.  
- **Type**: string  
- **Default value**: <empty>  
- **Location**: Collaborate > Administration > Properties |

**Note**: If you choose to restrict Connect access to specific roles, consider updating the role requirements for Connect modules and other access points.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Determine whether or not a button is shown in task forms to view the Collaboration document conversation or Live Feed Record Feed related to the task. Note: The Collaboration button will only be enabled if the frameset view is also enabled with collaboration.frameset = true&lt;br&gt;glide.live_feed.task_header_button</td>
<td>Determines whether the show live feed icon ( ) and Follow button are available in the form header of tables that have the live_feed=true dictionary attribute.</td>
</tr>
<tr>
<td>Disable the legacy chat “Create or Join Chat Room” link on the Incident form (Must have Chat plugin enabled to see link)&lt;br&gt;glide.connect.enabled</td>
<td>Hides the Create or Join Chat Room related link, which appears on the Incident form when legacy chat is enabled. Legacy chat and Connect Chat should not be used concurrently and this property should not be modified.</td>
</tr>
</tbody>
</table>

**Configure the polling interval**

The polling interval determines how frequently the system polls for new Connect messages.

Role required: admin

The default interval is 10 seconds. You can change this value. The shorter the polling interval, the more frequently the system checks for new messages and the greater the impact on performance.

**Note:** This setting impacts Connect Chat and Connect Support.

1. Navigate to sys_properties.list.
2. Locate the collaboration.polling_interval property.
3. Set the Value to a different number of seconds.

Setting the polling interval to a value smaller than 2 is likely to tax the system too heavily, while a value greater than 10 is likely to result in a poor user experience.

**Disable the Connect overlay**

The Connect overlay is enabled by default and is integrated with the standard user interface. You can disable the Connect overlay.
Role required: admin

To disable the Connect overlay and remove the toggle Connect sidebar icon from the banner frame, set the `collaboration.frameset` property to `false`.

1. Navigate to Connect > Administration > Properties.
2. Locate the property called Enable Connect in the frameset (`collaboration.frameset`) and clear the check box.
3. Click Save.

When the frameset is disabled, any Connect chats open in the Connect workspace. For more information on completely disabling Connect Chat, see Disable Connect Chat.

**Customize the Connect audio notification sound**

You can replace the default Connect audio notification sound with an audio file of your choice.

Upload the audio file you want to use as the notification sound.

Role required: admin

The audio notification sound is used for all Connect conversation types, including Connect Support conversations.

1. Navigate to System UI > Audio Files.
2. Locate the audio file you want to use as the notification sound and copy the Name value.
3. Navigate to Connect > Administration > Properties.
4. Locate the property called Audio file to play to notify users of new messages, support conversation transfers and @mentions in Connect (`connect.notification.audio_alert`) and replace the default value with the name of the audio file.
5. Click Save.

End users receive audio notifications when sending and receiving support chats. Support agents only receive audio notifications for inbound chats when the chat window is not in focus.

**Administer Connect actions**

You can create or modify Connect actions to provide custom functionality in Connect Chat or Connect Support conversations.

If you want to customize the icon for a Connect action, navigate to Collaborate > Administration > Action Icons to view the available icons and their class names. Note the class name of the icon you want to use.

Role required: admin

The Connect action menu appears by the message entry field when one or more Connect actions are available for a conversation, based on defined conditions. When a user selects a Connect action, the system runs the script defined for that action.

1. Navigate to Connect > Administration > Actions.
2. Click New or open an existing record to edit a table.
3. On the form, fill in the fields.

### Connect Action form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>JavaScript condition statement that must return true for the action to be available in a conversation. For example, to show the action in Connect Support conversations only, enter `conversation.type === &quot;support&quot;</td>
</tr>
<tr>
<td>Hint</td>
<td>This field is not used.</td>
</tr>
<tr>
<td>Icon Class Name</td>
<td>Class name of the icon to use.</td>
</tr>
<tr>
<td></td>
<td>To view all available icons and their class names, navigate to Collaborate &gt; Administration &gt; Action Icons.</td>
</tr>
<tr>
<td>Order</td>
<td>Order of the action relative to other items in the Connect action menu.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to execute when the action is run. For example, to create a new incident that is based on the conversation, enter the following code:</td>
</tr>
</tbody>
</table>
|               | `response.newRecord("incident", 
|               |   { short_description: conversation.document.short_description || 
|               |     "", caller_id: conversation.document.opened_by });` |
|               | For information about the `response` object, see the ConnectActionResponse API reference documentation. |
|               | **Note:** You can only create a Connect action that is based on a task table. |
| Shortcut      | Text that triggers the action when entered after the "/" character in a conversation. |
| Title         | Text that appears in the Connect action menu. The title for each Connect action should be unique. |
Connect Actions form

Configure the fields on a record card in Connect

When a record is either linked to or create from a Connect conversation, the details of the record display as a card in the chat window.

The card view only applies to the full Connect page and the end user view of Connect Support conversations.

Role required: admin

1. Navigate to the form you want to configure fields for.
2. Right-click the header and select Configure > Form Layout.
3. Under the Form View section, select the Connect view. You may need to create a Connect view for the form. For more information on creating a form view, see Create and delete views.

4. Select the fields to appear on the card by adding or removing the fields from the Selected column. You can also adjust the order they appear on the form by moving the fields up or down. You cannot remove the Author or the Updated fields from the card regardless of whether they are on the view or not. The card always shows the Short Description field in the top even if it is in a different order in the list.

**Disable specific URLs for Connect**

Prevent users from accessing certain websites by disabling linking to specific Top-Level Domains (TLDs).

Role required: admin

1. In the navigation filter, type sys_properties.list.

2. Search for the glide.ui.url.external.top_level.domains system property.

3. In the value field, remove any TLDs that you do not want your users to have access to. For example, remove any TLDs that are commonly used for restricted websites, such as xxx or adult.

   The list of TLDs is based on the top 200 most common domains.

Any TLD not included in the value field becomes unclickable in Connect.

**Connect Chat**

Connect Chat is a real-time messaging tool that enables users to chat with individuals and groups, quickly share files, and collaborate on any record by connecting with the right people instantly.

Connect Chat animates communication around records, Visual Task Boards, topics of interest, or groups of people.

Features include:

- Direct conversations between two users.
- Group conversations between three or more users.
- Conversations linked to records. Comments and work notes appear in conversations in real time and users can update the record directly from the conversation.
- Drag-and-drop sharing of links, files, and records.

UI16 or UI15 is required to use Connect Chat.

This video demonstrates how to use Connect Chat.

This video demonstrates how to use Connect Support.

**Note:**

- Connect Chat does not replace legacy chat but offers some of the same functionality. The features should not be used concurrently.

**Connect Chat use**

All users have access to Connect Chat, a convenient way to stay updated on all the people and documents you work with in a familiar chat interface.

You can start using Connect Chat right away with virtually no setup. Connect Chat supports a few different types of conversations so you can use it as a social tool or a quick way to follow specific records.

**Start a direct or group conversation**

You can start a conversation with one or more users in Connect Chat.

Role required: none

A conversation between two users is called a direct conversation. A conversation between three or more users is called a group conversation.

1. In the chat view of the Connect sidebar, click the plus icon (+) by the filter.
   A Connect mini window appears.
2. In the To field, enter the name of the user you want to chat with.
   Suggestions appear as you type.
3. Optional: Enter additional names to create a group conversation.
   You can add or remove group conversation members later. You cannot add members to a direct conversation after you create it.
4. Press the Enter key to shift focus to the message field.
5. Send a message to create the conversation.
   The conversation is added to the Connect sidebar for quick access.

**Follow a record in Connect**

You can follow a record in Connect Chat to track activity as it happens, in a familiar chat interface. When you follow a record, you become a member of a record conversation.

Role required: whichever role is required to access the record you want to follow in Connect

You must first activate the Connect (com.glide.connect) plugin to complete this task.

Any record conversation you create in Connect becomes a record feed in live feed, and vice versa. Unlike direct or group conversations, all messages in record conversations are comments or work notes.

Note: By default, record conversations are enabled for all tables that extend Task [task]. Administrators can enable record conversations for additional tables or disable them if desired.

1. Navigate to a task record.
2. Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Follow the record</td>
<td>a. In the form header, click Follow. The system adds you as a member of the record conversation, but does not open the conversation. You can open the conversation from the Connect sidebar.</td>
</tr>
<tr>
<td>Follow the record and open a chat mini window</td>
<td>a. In the form header, click the down arrow in the Follow button. b. Select Open Connect Mini. The system adds you as a member of the record conversation and opens it in a Connect mini window.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Follow the record and open the Connect workspace | a. In the form header, click the down arrow in the Follow button.  
b. Select Open Connect Full.  
The system adds you as a member of the record conversation and opens it in the Connect workspace, the full-screen view. |

The **Follow** button is relabeled **Following**.

3. Add comments or work notes to the record directly from Connect.  
Any comments or work notes added to the record appear in the record conversation. Likewise, comments and work notes you add to the conversation appear on the record.  
a) In the record conversation, by the text entry field, click the message type icon  
(b) Select **Comment** or **Work Note**.  
c) Enter a message.  
By default, record conversation messages are added as work notes.  

Note: If you add an attachment to a record conversation, it is attached to the underlying record as well.

Edit your notification settings for the record conversation.

**Edit basic conversation details**

In Connect Chat, you can customize the avatar, name, and description for a group or record conversation.  
Role required: none  
These details are not editable for direct conversations.  

Note: The name and description for a record conversation default to the record name and short description. However, editing the name or description for a record conversation does not change anything on the underlying record.

1. Open the a group or record conversation in the Connect workspace.  
2. Click anywhere in the conversation header to the left of the icons.  
A pop-up appears to edit conversation details.  
3. Edit the conversation image, name, and description as needed.  
4. Click **Save**.

**Add or remove conversation members**

In Connect Chat, any member of a group or record conversation can add or remove other conversation members. In a direct conversation with only two people, you cannot add members to the conversation after you create it.  
Role required: none  
1. Open a group or record conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation pane, click the member list tab.

3. Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a member</td>
<td>a. Click Add Member to Group.</td>
</tr>
<tr>
<td></td>
<td>b. Use the search field to find and select a user.</td>
</tr>
<tr>
<td>Remove a member</td>
<td>a. Point to a member name.</td>
</tr>
<tr>
<td></td>
<td>b. Click the minus icon (-).</td>
</tr>
</tbody>
</table>

Create a Connect conversation from a Visual Task Board

Create a Connect Chat conversation from a Visual Task Board to collaborate with board members and keep track of activity as it happens.

Role required: none

When you create a conversation from a task board, all the board members become members of the conversation. The members are synchronized between the task board and the conversation. For example, if you remove a user from the conversation, the system automatically removes the user from the board as well.

1. Navigate to **Self-Service > Visual Task Boards**.
2. Open a task board.
3. In the board header, click the connect with board members icon ( ).
   The system automatically opens a record conversation for the board. Each board member becomes a member of the conversation.

Connect Chat administration

Administrators can configure various performance settings and features of Connect Chat.

**Note:** There are also settings that apply to both Connect Chat and Connect Support. For more information, see Connect administration.

Configure the email notification interval

The email notification interval determines how long the system waits before sending a Connect Chat email notification to an inactive user.

Role required: admin

The default interval is 3 minutes. You can change this value.

1. Navigate to **Connect > Administration > Properties**.
2. Locate the property called Number of minutes to wait before collecting unread messages and sending an email to offline users. (collaboration.email_interval) and set the value to a different number of minutes.
3. Click **Save**.
When an offline user is sent a Connect message, the collaboration.new_offline_message event fires. The system waits the amount of time provided in the collaboration.email_interval property, then triggers the collaboration.notify_offline_user and collaboration.notify_offline_user.group events (depending on if the conversation was peer to peer or a group conversation). The sysevent_email_action record listens for collaboration.notify_offline_user(.group) then builds an email notification containing all the messages from the last collaboration.email_interval minutes that the user has received in that conversation.

Enable record conversations for a table

Record conversations are enabled for all tables that extend Task [task] by default. You can configure record conversations for additional tables that extend Task.

Role required: admin

To create record conversations, users must have access to the Follow button in the form header. To show the button and thus enable record conversations for a table, the following conditions must be true.

- The live_feed dictionary attribute must be set to true for the table.
  - By default, live_feed=true for all tables that extend Task [task].
- The glide.live_feed.task_header_button property must be set to both or collaboration.
  - By default, glide.live_feed.task_header_button is set to collaboration.

1. Navigate to the list view of a table for which you want to enable record conversations.
2. Perform the appropriate action for the list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List v3</td>
<td></td>
</tr>
<tr>
<td></td>
<td>a. Click the list title menu and select Configure.</td>
</tr>
<tr>
<td></td>
<td>b. In the Configure window, click Dictionary.</td>
</tr>
<tr>
<td>List v2</td>
<td>Right-click any column header and select Configure &gt; Dictionary.</td>
</tr>
</tbody>
</table>

The list of dictionary entries for the table appears.

3. Open the dictionary entry that has Type set to Collection.
   The Dictionary Entry form appears.
4. In the Attributes related list, click New.
   The Dictionary Attribute form appears.
5. In the Attribute field, enter Live feed.
6. In the Value field, enter true.
7. Click Submit.
8. Navigate to Collaborate > Administration > Properties.
9. Locate the property called Determine whether or not a button is shown in task forms to view the Collaboration document conversation or Live Feed Record Feed related to the task (glide.live_feed.task_header_button).
10. Ensure the property is set to both or collaboration.

The glide.live_feed.task_header_button property also controls whether the show live feed icon ( ) appears. If the property is set to collaboration, the show live feed icon does not appear on form headers.
Prevent users from following records in Connect for all tables

Users can follow records in Connect for any table that extends Task [task] by default. You can disable this functionality for all tables.

Role required: admin

To disable record conversations for all tables, prevent the Follow button from appearing in all form headers by editing the glide.live_feed.task_header_button property.

1. Navigate to sys_properties.list.
2. Locate the glide.live_feed.task_header_button property.
3. Set the Value to live_feed.

Prevent users from following records in Connect for a specific table

Users can follow records in Connect for any table that extends Task [task] by default. You can disable this functionality for a specific table.

Role required: admin

To disable record conversations for a specific table, prevent the Follow button from appearing in form headers for the table. To do so, set the live_feed dictionary attribute to false for the table.

1. Navigate to the list view of a table for which you want to disable record conversations.
2. Perform the appropriate action for the list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List v2</td>
<td>Right-click any column header and select Configure &gt; Dictionary.</td>
</tr>
<tr>
<td>List v3</td>
<td>Open the list title menu and select Configure, and then select Dictionary.</td>
</tr>
</tbody>
</table>

The list of dictionary entries for the table appears.

3. Open the dictionary entry that has Type set to Collection.
   The Dictionary Entry form appears.
4. In the Attributes related list, locate the Live feed dictionary attribute.
5. Set the Value to false.
   Setting the dictionary attribute to false also removes the show live feed icon for the table.

Disable Connect Chat

You can disable Connect Chat to prevent users from being able to chat within the platform.

Role required: admin

Disabling Connect Chat hides the Connect Chat sidebar icon. Users who try to access Connect Chat from the navigation pane receive a message that says Connect has been disabled.

1. In the navigation filter, type sys_properties.list and press Enter.
2. Search for the glide.connect.chat.disabled property.
3. Set the property value to true.
Connect Support

Connect Support is a real-time messaging tool that enables support agents to easily keep track of their support cases, quickly find solutions, and resolve problems quickly.

Connect Support builds on the messaging platform provided with Connect. For general information about the Connect interface, setup, and administration, see Connect. When Connect Support is enabled, users designated as support agents have access to the support tab of the Connect sidebar.

Using Connect Support:

• Administrators can create chat queues and enable users to access live support.
• Support agents can monitor the queues to provide instant support.
• Users can share links, files, and records using drag-and-drop.

UI16 or UI15 is required to use Connect Support.

Note:

• Connect Support does not replace legacy chat but offers some of the same functionality. Do not use the features concurrently.

Monitor incoming Connect Support conversations

In the support tab of the Connect sidebar, you can monitor the queues for which you are an agent and accept incoming conversations.

Role required: none

Note: The support tab is visible only if you are an agent for one or more queues.

1. Navigate to Connect > Connect Support.
   The Connect workspace opens in a new tab.

2. Click the support tab of the Connect sidebar, indicated by a headset icon ( ).
   The support tab displays Queues to which you belong. It also displays your open support conversations under Cases. When a user starts a support conversation or an agent transfers
a conversation to a queue, any agent who belongs to the associated queue can accept the conversation. An agent can also request to transfer a conversation directly to you.

Support tab of Connect sidebar

3. Accept a conversation in one of the following ways.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept a conversation from a queue</td>
<td>Under Queues, click Accept by the queue. The conversation opens in the conversation pane and an entry appears in the Cases section of the sidebar.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Accept a transfer request</td>
<td>Under Cases, click <strong>Accept</strong> by a transfer request.</td>
</tr>
</tbody>
</table>

**Transfer request**

The conversation opens in the conversation pane. The agent who transferred the conversation can stay in the conversation.

4. **Respond to the user and help resolve the issue.**

   By default, your messages are added to the conversation record as comments and are visible to the user.

**Share knowledge in a Connect Support conversation**

The support view of the Connect workspace has a built-in knowledge tool that makes it easy to search for knowledge articles and share them in a conversation.

Role required: none

Use the knowledge tool to research user questions and provide solutions quickly and easily.

1. **Open a support conversation in the Connect workspace.**

   The knowledge tool is not available in Connect mini windows.
2. In the conversation tools area to the right of the conversation pane, click the knowledge base tab, which is represented by an open book icon.

The knowledge homepage appears in the conversation tools pane.

3. Search for articles related to the user's issue.
   For more information about finding knowledge, see Search using Knowledge Management v3.

4. To share an article in the conversation, drag a knowledge article link to the conversation pane and drop it anywhere in the drop zone that appears.
Transfer a Connect Support conversation to a different agent or queue

You can transfer a Connect Support conversation to a different agent in the queue or to a different queue.

Role required: none

1. Open a Connect Support conversation.
2. At the bottom of the conversation, click the menu icon (regation) to open the Connect actions menu.
3. In the Connect actions menu, select **Transfer**.

A transfer dialog box opens.
4. Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transfer the conversation to an agent</td>
<td>a. To start the transfer request, click <strong>Transfer</strong> by an agent's name.</td>
</tr>
<tr>
<td></td>
<td>Be sure to choose an agent who is online. A green dot on their avatar indicates that a user is online.</td>
</tr>
<tr>
<td></td>
<td>You can cancel the transfer any time before it is accepted.</td>
</tr>
<tr>
<td></td>
<td>b. When the transfer is accepted, select one of the following options in the dialog box that appears.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Stay</strong>: Remain in the conversation, which is also known as a warm transfer. This option is ideal if you want to provide the new agent with background information or introduce the user to the new agent.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Leave</strong>: Exit the conversation, which is also known as a cold transfer.</td>
</tr>
</tbody>
</table>

Transfer the conversation to a queue

Click **Transfer** by a queue.

The system automatically removes you from the conversation and the conversation enters the queue you selected.

Add a user to a Connect Support conversation

You can add additional users to a Connect Support conversation.

An administrator must enable the **glide.connect.support.add_members** property before users can be added to conversations.

Role required: none

1. Open a group or record conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation pane, click the member list tab

( )
3. Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a member</td>
<td>a. Click Add Member to Group.</td>
</tr>
<tr>
<td></td>
<td>b. Use the search field to find and select a user.</td>
</tr>
<tr>
<td>Remove a member</td>
<td>a. Point to a member name.</td>
</tr>
<tr>
<td></td>
<td>b. Click the minus icon (-).</td>
</tr>
</tbody>
</table>

The assigned support agent cannot be removed from a Connect Support conversation.

**Note:** Only the assigned support agent can create an incident from the Connect Support conversation.

---

**Escalate a Connect Support conversation**

If an escalation path is defined for a Connect Support conversation, you can use a shortcut to escalate a Connect Support conversation to a different queue.

Define an escalation path for the queue, using the **Escalate to** field on the Chat Queue [chat_queue] table. For more information, see **Administer Connect Support queues**.

1. Open a Connect Support conversation.
2. At the bottom of the conversation, click the menu icon (≡) to open the Connect actions menu.
3. In the Connect actions menu, select **Escalate**.
   A confirmation dialog box appears.
4. In the dialog box, click **Escalate**.
   The system automatically removes you from the conversation and the conversation enters the escalated queue.

---

**Create an incident from a Connect Support conversation**

You can use a shortcut to create an incident on behalf of a user, directly from a Connect Support conversation.

**Role required:** none

You might want to create an incident if you cannot resolve the user's issue over chat or if you want to create a record of the conversation to share with the user. When you create an incident from a support conversation, the system copies the conversation history to the incident activity stream as comments and work notes. Future messages are tracked in the incident as well.

**Note:** Administrators can customize the behavior of the **Create Incident** Connect action. For more information, see **Administer Connect actions**.

1. Open a Connect Support conversation.
2. At the bottom of the conversation, click the menu icon (≡) to open the Connect actions menu.
3. In the Connect actions menu, select **Create Incident**.  
   In the conversation tools area to the right of the conversation, a new incident form opens in a record tab. The system automatically sets the **Caller** field to the user who opened the support conversation.

4. Complete the form as necessary and click **Submit**.  
   Any comments or work notes in the record conversation appear as comments on the incident form. 
   Work notes do not appear in the chat for the ESS user. The chat agent can select whether a message is a Comment or Work Note in the conversation.
   
   a) In the record conversation, by the text entry field, click the message type icon

   ![Message Type Icon](image)

   b) Select **Comment** or **Work Note**.

   c) Enter a message.

By default, record conversation messages are added as comments.

**Note:** If you add an attachment to a record conversation, it is attached to the underlying record as well.

The system automatically shares the record in the conversation, copies the conversation to the record activity stream, and references the record on the Chat Queue Entry [chat_queue_entry] table. Any new journal fields added to the record do not appear in the chat. The system also changes the document ID for the conversation to reference the incident number instead of the entry in the Chat Queue Entry table.

**Connect Support chat states**

Connect Support chats move through specific states.
Connect Support chat states

<table>
<thead>
<tr>
<th>Composite state</th>
<th>State</th>
<th>Definition</th>
</tr>
</thead>
</table>
| Active          | Waiting        | • Requester/end user enters a queue by sending a message. Agent has not yet accepted it.  
• Requester/end user rejoins a session that is in a Reopenable state. |
| Work in Progress|                | • Agent accepts a chat from a queue. Both requester and agent engage in a chat session.  
• Requester/end user temporarily leaves an ongoing conversation; requester or agent does not end the session; requester rejoins session. |
| Reopenable      | Closed Abandoned| Requester/end user clicks **End Chat** button before agent accepts the request.                                                        |
| Permanently closed| Closed by Client| • Requester/end user clicks **End Chat** button after agent accepts the request.  
• Requester/end user times out.                                      |
|                 | Closed Escalated| Agent escalates an ongoing conversation by performing the Escalate action from the menu icon.                                      |
|                 | Closed Complete| Agent ends the session.                                                                                                                   |

Connect Support administration

Administrators can configure various performance settings and features of Connect Support.

**Note:** There are also settings that apply to both Connect Chat and Connect Support. For more information, see **Connect administration**.

Migrate from legacy chat to Connect Support

Connect Support is an extension of Connect. Users designated as support agents have access to the support tab of the connect sidebar. Do not use Connect Support concurrently with legacy chat.

Before you activate Connect Support, inform your support agents to close out any existing chats.

Legacy chat uses a different field to determine which state a help desk chat is in. A fix script is included in the Connect Support plugin that circumvents this issue by closing out any existing help desk chat sessions. Manually closing out any existing chats before allowing this script to run helps prevent any loss of chat information.

If you do not close out existing help desk chats, your metrics and chat queue will not work accurately.

1. **Activate the Connect Support plugin.**
   
   When you activate the Connect Support plugin, the `glide.connect.support.enabled` property redirects the legacy chat URL to Connect Support.  
   
   For more information, see **Activate Connect Support**.
2. Hide the Social IT application.
   Activating Connect Support does not completely eliminate the legacy chat module. To prevent users from using the legacy chat, hide the Social IT application menu. For more information, see Enable or disable an application menu or module.

**Properties for Connect Support**

The Connect Support Properties page provides several configuration options specifically for Connect Support.

These properties are available for Connect Support.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Should Connect be used for handling chat queue entries&lt;br&gt;glide.connect.support.enabled</td>
<td>Disables or enables Connect Support. When the property is enabled, the Service Desk Chat button in the Employee Self-Service portal opens the conversation in Connect Support, rather than legacy chat. Additionally, the Support tab appears in the Connect sidebar.&lt;br&gt;• <strong>Type</strong>: true</td>
</tr>
<tr>
<td>Number of support conversations an individual agent can have at one time (-1 is unlimited)&lt;br&gt;connect.support.conversation_limit</td>
<td>Determines how many support conversations an individual agent can have at one time. When the value is set to -1, an agent can participate in an unlimited number of conversations.&lt;br&gt;• <strong>Type</strong>: integer&lt;br&gt;• <strong>Default value</strong>: -1&lt;br&gt;• <strong>Location</strong>: Collaborate &gt; Support Administration &gt; Properties</td>
</tr>
<tr>
<td>Show agent avatar in Connect Support conversations.&lt;br&gt;connect.support.show_agent_avatar</td>
<td>Determines whether an agent's avatar is shown in a support conversation (enabled). When the property is disabled, users see the agent's name only.&lt;br&gt;• <strong>Type</strong>: true</td>
</tr>
</tbody>
</table>

*Note: The Connect Properties page contains many general Connect properties that impact Connect Support.*
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>connect.support.idle.delay</td>
<td>Determines how many seconds a user must be inactive in a support conversation before an idle countdown timer appears.</td>
</tr>
<tr>
<td>connect.support.idle.count_down</td>
<td>Determines how many seconds the idle countdown timer remains open after it appears. If the idle user does not dismiss the timer before the countdown completes, the system closes the support session.</td>
</tr>
<tr>
<td>connect.support.user.closed.conversation_limit</td>
<td>Determines how many closed conversations appear in a user's support conversation history. When the value is set to 0, all previous conversations appear in the history.</td>
</tr>
</tbody>
</table>

Administer Connect Support queues

You can define the support agents, default messages, schedule, and escalation path for each Connect Support queue.

Role required: admin

**Note:** Both Connect Support queues and legacy chat queues are stored on the Chat Queue [chat_queue] table. Do not use Connect and legacy chat concurrently.

1. Navigate to **Connect > Queues**.
2. Click **New** or open an existing queue from the list.
3. Complete the Chat Queue form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>Active</td>
<td>Not used in Connect.</td>
</tr>
</tbody>
</table>

© 2021 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignment group</td>
<td>User group that contains the support staff for the queue. Any user in the group can view the queue in the Connect sidebar and accept chats. No other users can access the queue. This field must be populated.</td>
</tr>
<tr>
<td>Average wait time</td>
<td>Average time it takes for an agent to accept a chat in the queue. This value is automatically calculated. Do not manually edit.</td>
</tr>
<tr>
<td>Confirm problem</td>
<td>Not used in Connect.</td>
</tr>
<tr>
<td>Escalate to</td>
<td>Different queue to which an agent can escalate a chat. For example, there is a queue for high priority support chats. When a queue is defined in this field, agents can access the <strong>Escalate</strong> option in conversations.</td>
</tr>
<tr>
<td>Initial agent response</td>
<td>Message that users see when an agent accepts their chat. For example, <strong>Thank you for contacting support. We are looking into your question now and will be with you shortly.</strong></td>
</tr>
<tr>
<td>Not available</td>
<td>Message that users see when they attempt to start a chat outside the defined queue <strong>Schedule</strong>. You can use HTML to format the message and include links or media.</td>
</tr>
<tr>
<td>Question</td>
<td>Initial phrase that users see when they start a new chat in the queue. For example, <strong>How can I help you?</strong></td>
</tr>
<tr>
<td>Schedule</td>
<td>Schedule that defines when the queue is available. Leave the field blank to make the queue available all the time. Users cannot start a new conversation in the queue outside the schedule hours.</td>
</tr>
</tbody>
</table>

4. To review conversations associated with the queue, add the **Chat Queue Entries** related list and review the records for the following information.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>How long the user waited and the result</td>
<td>Review information in the <strong>State</strong> and <strong>Wait time</strong> columns.</td>
</tr>
<tr>
<td>Who is actively helping employees in the queue</td>
<td>Review the names of agents in the <strong>Assigned to</strong> column.</td>
</tr>
</tbody>
</table>

### Make a Connect Support queue accessible to end users

To make a Connect Support queue accessible to end users, use the accepted URL format.

Create a queue. Create agents for the queue by assigning users to the assignment group associated with the queue.

Role required: admin

For example, you might create a module or add a link to a portal. The accepted URL format is `https://<instancename>.service-now.com/$chat_support.do?queueID=<sys_id>`.

1. Navigate to **Connect > Administration > Queues**.
2. Right-click the name of the queue to which you want to link.
3. In the context menu, select **Copy sys_id**. Follow browser instructions to copy the sys_id if browser security measures restrict this function.
4. Preview the support queue by navigating to https://<instancename>.service-now.com/$chat_support.do?queueID=<sys_id>.
5. Create a module or other link to the queue using the URL.

**Connect Support metrics**

Optional plugins provide a homepage and Performance Analytics dashboards, which contain helpful Connect Support metrics.

The reporting homepage is ideal for support managers who want a simple solution to track the recent performance of the support organization. The Performance Analytics dashboards provide a more full-featured solution for support managers who want to analyze trends over time.

Users with the admin role can activate the following plugins to use these features.

**Connect Support homepage and dashboard plugins**

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connect Support Manager's Dashboard [com.glide.connect.managers_dashboard]</td>
<td>Provides a homepage for Connect Support, and all required configuration records. Though the plugin name contains the term dashboard, the plugin does not provide functionality related to Performance Analytics dashboards. Homepages are similar to dashboards, but do not require Performance Analytics roles to view.</td>
</tr>
<tr>
<td>Performance Analytics - Content Pack - Service Desk Chat [com.snc.pa.chat]</td>
<td>Provides the <strong>Service Desk Chat Monitor</strong> dashboard, which analyzes key Connect Support metrics and indicators.</td>
</tr>
<tr>
<td>Performance Analytics - Context Sensitive Analytics for Chat [com.snc.pa.chat.context_sensitive_analytics]</td>
<td>Provides in-form analytics for Connect Support. These analytics are available as a related link on the Chat Queue Entry [chat_queue_entry] form, and also as the <strong>Context Sensitive Analytics - Chat</strong> dashboard.</td>
</tr>
</tbody>
</table>

**Note:** For more information about these plugins, including which other plugins they activate, see [Additional plugins for Connect Support](#).

**Use the Connect Support homepage**

Use the Connect Support homepage to view key indicators and metrics related to support conversations, queues, and agents.

Activate the Connect Support Manager's Dashboard plugin (com.glide.connect.managers_dashboard) to view this homepage.

Role required: chat_admin

The homepage is called **Service Desk - Chat**.

1. Navigate to **Connect > Support Administration > Reporting Dashboard**.

**Note:** Though the module name contains the term dashboard, the module does not provide functionality related to Performance Analytics dashboards. Homepages are similar to dashboards, but do not require Performance Analytics roles to view.

The Connect Support homepage, which is called **Service Desk - Chat**, opens.
2. Click a widget to drill down into its data.

Use the Connect Support dashboards
Use the Connect Support dashboards in Performance Analytics to understand trends in your support organization's performance over time.

Activate one or both of the following plugins, according to your analytics needs:

- Performance Analytics - Content Pack - Service Desk Chat (com.snc.pa.chat)
- Performance Analytics - Context Sensitive Analytics for Chat (com.snc.pa.chat.context_sensitive_analytics)

Role required: both chat_admin and pa_viewer

The Performance Analytics - Content Pack - Service Desk Chat plugin (com.snc.pa.chat) includes the Service Desk Chat Monitor dashboard, which contains the following tabs:

- **Chat Monitor By State**: Contains metrics related to closed support conversations.
- **Overview**: Contains several metrics related to support conversations, queues, and agents.
- **KPI Process**: Contains metrics that are key performance indicators (KPIs) of the Connect Support process, including the average queue response time, the average duration of support conversations, and the number of new support conversations per day.

The Performance Analytics - Context Sensitive Analytics for Chat plugin (com.snc.pa.chat.context_sensitive_analytics) includes the Context Sensitive Analytics - Chat dashboard. The dashboard contains additional metrics related to support queues, including the number of support conversations closed.

**Note**: You must license Performance Analytics to collect scores for the indicators on the dashboards. Without Performance Analytics premium, the dashboards display the indicators with no data.

1. Navigate to Performance Analytics > Dashboards.
   The last dashboard you viewed opens.
2. In the dashboard picker, under the Connect Chat group, select the dashboard you want to view.
3. View the indicators.

Configure the add support users property

To enable support agents to add users to a Connect Support conversation, add the glide.connect.support.add_members property.

Role required: admin

When the glide.connect.support.add_members property is added and enabled, support agents can add users to a support conversation. Any added user can also add other users. Only the assigned agent can create an incident from the chat. When non-support agents are added to a chat, the chat appears in their chat tab.

**Note**: Make sure you are in the Global scope when adding this property.

1. Enter sys_properties.list in the navigation filter.
   The entire list of properties in the System Properties [sys_properties] table appears.
2. Verify that the property does not exist by searching for the property name. If it does exist, update the property with the information in the following table.
3. Click New.
4. Complete the form as follows:
Out-of-the-box Service Desk Chat Performance Analytics Solutions

Performance Analytics Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Use the widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With solutions, you can get value from for your application with minimal setup.

**Important:** Set up and test Out-of-the-box Solutions on a sub-production instance before enabling them in production.

**Note:**
- Solutions include some dashboards that are inactive by default. You can activate these dashboards to make them visible to end users according to your business needs.
- Out-of-the-box solutions and in-form analytics provide all the configuration records required to analyze default applications. Customize these records for use in your production environment.

To enable the solution for Service Desk Chat, an admin can navigate to Performance Analytics > Guided Setup. Click Get Started then scroll to the section for Service Desk Chat. The guided setup takes you through the entire setup and configuration process.

Connect Support and Service Portal

Use Connect Support in your portal to allow your users to ask questions or submit requests to support agents. You configure the instance options to control the appearance of your widget and how it functions.

The Connect Support and Service Portal integration creates a Connect Support widget that you can add to a page in the Service Portal.

Activate Connect Support for Service Portal

Activate the Connect Support and Service Portal integration plugin so you can add the Connect Support widget to a portal page.

Role required: admin

Activating the Connect Support and Service Portal integration plugin automatically activates the Connect Support plugin.

1. Navigate to System Definition > Plugins.
2. Search for and activate the Connect Support and Service Portal integration plugin [com.glide.connect.support.service-portal].

After activating the plugin, the Connect Support widget appears in the list of widgets under Service Portal > Widgets. Use Connect Support in a portal by adding the widget to any page within the portal. For more information on adding a widget to a page, see Create and edit a page using the Service Portal Designer.
Configure Connect Support widget instance options

You can control the appearance of your widget and how it functions by configuring the instance options.

Role required: admin

1. Navigate to Service Portal > Service Portal Configuration and open the Service Portal Designer.
2. From the Service Portal Designer, select the page you added the Connect Support widget to. If you have not yet added the widget to a page, see Create and edit a page using the Service Portal Designer for more information.
3. Click the edit icon in the corner of the widget to open the instance options menu.
4. Complete the fields using the following table. Depending on the functionality you want to add, you may not need to add all these fields. For example, if you include the Queue ID, you do not also need to include the Queue Name or the Queue URL.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>Select a color for your widget from a list of common bootstrap colors. Themes control the overall color of a widget, but if you want your widget to be a specific color, you can select it from the list.</td>
</tr>
<tr>
<td>Queue URL</td>
<td>The URL for the Connect Support chat queue that you want questions to be directed to. For example, http://&lt;instancename.service-now.com/$chat_support.do?queueID=&lt;sys_id&gt;</td>
</tr>
<tr>
<td>Queue Name</td>
<td>The name of the queue you want the questions to be directed to. You can find a list of queue names in Collaborate &gt; Connect Support &gt; Queues.</td>
</tr>
<tr>
<td>Queue ID</td>
<td>The sys_id of the queue you want questions to be directed to. You can find this ID by going to the support queue and either copying the queue ID from the support link, or by selecting Copy sys_id from the context menu.</td>
</tr>
<tr>
<td>Message</td>
<td>The text for the button in the Connect Support widget</td>
</tr>
</tbody>
</table>
## Content Management System

The Content Management System (CMS) is a ServiceNow application that enables users to create a custom interface for the ServiceNow platform and ServiceNow applications.

The CMS application is powerful and flexible. Customers use it for a wide variety of projects, from creating entire websites to integrating with other products. The Content Management application is active by default.

This video provides an overview of the CMS application.

A CMS typically requires a systems administrator or a web developer to set up and add features. Non-technical users can use the CMS application as a tool for website maintenance. You also want to consider the timing of the addition of content management, and the maturity level of ServiceNow data. For more information, see CMS Planning.

Following are several CMS project ideas:

- Design a company-wide service catalog that offers a collection of services.
- Present a customized UI for a knowledge base.
- Create customized login pages, search pages, views of lists, tables, charts, or graphs.
- Design a complete website.
- Integrate ServiceNow with other company applications.
- Build a tailored self-service portal for end users that is in compliance with a corporate style guide.

### Example CMS sites

There are two common interface approaches within the ServiceNow community:

- An image and text-based interface similar to Amazon.com
- A search-based interface similar to Google

Both approaches have been used successfully. The approach you select depends on the needs of the people using the data and how easy it is to train them. While the two design philosophies are different, both approaches share the common goal of UI simplicity.

### Activating CMS

You must request the Content Management System (CMS) application from ServiceNow personnel. Instead of activating CMS, use Service Portal for new development. Service Portal is an alternative to CMS with a refined user experience, and is active by default in the base system. See Service Portal and Content Management and Service Portal.
Content Management design

Before building a website in the CMS, it is important to have a good understanding of what to build and who the audience is.

A high volume of content can heavily influence the look and feel of the site and the site hierarchy. When deciding the content, design for ease of maintenance for the people who take care of the system. This level of planning can be time-consuming, but is important.

Review website design prerequisites to help you set expectations, scope deliverables, and define reasonable timelines. Consider both the planning and execution of site design, to understand how sites are built, and to provide a working overview of the CMS.

Timing is important when considering the addition of content management. Successful deployments of the content management system usually take place after phase 1 processes (for example, Incident, Problem, Change, Catalog, and Knowledge) are in place. This is especially true if the team has limited website design experience. Waiting until phase 2 of deployment gives administrators time to work in ServiceNow and to understand how the organization uses the system and what business needs it meets.

Also consider the maturity level of data in the ServiceNow system. Depending on the ITIL processes used, content management is only useful and effective once the data within ServiceNow is established. Ensure that hierarchies, tasks, and workflows are well-defined. For example, before creating a catalog interface, confirm that the service catalog has been in place for some time, has been used, and contains data. The same is true for a knowledge management interface, particularly when high ratings or view counts define article placement on the page.

Content organization

Before you begin to build the CMS website, list all the content that you want to include and take the time to organize it.

A site created in CMS relies on two different types of content.
- CMS site information, such as site pages, images, and menus
- System information, such as knowledge base articles and catalog items

CMS content

Begin by listing all the content you want to host on the CMS pages. Examples include help pages, My Requests, My Approvals, and specific catalog items. Think about current solutions that you can implement immediately, and note ideas for future implementation phases.

Within CMS, you group pages to define the top-down menu structure. You establish a home or starting page, and other pages in the site reference the home page in the Parent Page reference field.

There are several ways to group, such as by audience or the purpose of the website. After listing the content to host, group it logically and identify a common name for each group, as shown in the following examples.

<table>
<thead>
<tr>
<th>IT environment groups</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Content built for</strong></td>
</tr>
<tr>
<td>End user</td>
</tr>
<tr>
<td>IT professional</td>
</tr>
</tbody>
</table>
General groups

<table>
<thead>
<tr>
<th>Purpose of site</th>
<th>Common name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reports</td>
<td>Reporting Page</td>
</tr>
<tr>
<td>Help and knowledge</td>
<td>Knowledge page</td>
</tr>
</tbody>
</table>

System content

Organize the content so the interface is easy to navigate and understandable to the user. Determine the organization based on the data that you are leveraging, both in the CMS (using sites, parent pages, pages, and navigational menus) and throughout the rest of the system. For example, within the catalog you have "category," and in the knowledge base you have "category" and "subcategory." You can use these hierarchies with filtered lists for good search results.

Organizing CMS content logically is important for long-term maintenance of the site, however, the data typically comes from other ServiceNow applications. Communicate with the administrators for these applications, such as the knowledge base, service catalog, and business service portfolio. Work with them to offer the application data appropriately through the CMS pages you create. For example, the team that created the ServiceNow corporate website in CMS began by evaluating the naming conventions used in the corporate knowledge base.

Branding elements

Branding refers to the logo, name, colors, and symbols that identify an organization. It imposes consistency in design and use of terms. Your marketing department defines branding elements and can provide them to you as you plan your CMS pages. Consider how to incorporate the following branding elements.

- Logos
- Color palette
- Tag line
- Trademarked elements
- Graphics

Site design

During planning, consider providing a core set of features with a standard appearance throughout the site. The following web design elements are often used to create a consistent look.

- Page templates
- Navigation schemes
- Header
- Breadcrumbs
- Footer
- Forms
ServiceNow features

Analyze and organize the following ServiceNow features in your instance if you plan on using any of them with CMS pages.

- Account settings
- Email
- Workflow approvals
- Filters

Team member identification

Identify the team members who assist you with website design, branding, and development.

Engage team members for each listed function before you begin to build pages for the CMS website. Each function can be performed by the same or different people.

- Gather corporate style design guidelines.
- Define the written terminology and content for the site.
- Gather and define the site flow.
- Manage the CMS project as the webmaster. The CMS webmaster is responsible for executing the design and making the site work. The following skills are required:
  - Basic ServiceNow administration skills
  - HTML
  - CSS
  - Graphic design
  - Web design

After you identify the project team members, establish who is responsible to complete the tasks involved in building the CMS website.

- Determine who owns each page.
- Set a page update schedule so owners do not overwrite each other.
- Formalize content management processes, including content review and page updates.

Data preparation

It is important that there is enough data in the ServiceNow instance before you begin to build the CMS website.

Ensure that the necessary data and content are available in the instance by taking the following actions.

- Review the ITIL processes that you intend to implement in the CMS. Ensure that the data in the instance is a mature representation of the applications being used, for example, service catalog, knowledge management, and incident management.
- Review the defined hierarchies, such as the categories and subcategories for the knowledge base or service catalog. You use these categories to design the entry page into the application.

Corporate style guide

When you build a CMS website, you design the look and feel based on guidelines in the corporate style guide.
A corporate style guide provides detailed information for designing any corporate interface, including corporate websites.

**Corporate design team**

Many organizations have a web development team that designed the corporate website. Contact this team and involve the designers early in the planning, as they provide help and give their approval to the interface you design. Without approval, there is the risk of having to redesign the entire site because it does not adhere to the organizational guidelines.

**Corporate style guide**

A corporate style guide takes the guesswork out of designing the CMS website. The example style guide shown is defined down to the pixel. Creating a site with the style guide makes it easy to create clean CSS and HTML. Without the style guide, building the site can take a great deal of time.

**Design considerations**

Some modifications to the base design for forms may be necessary. The content area of any CMS design should be no smaller than 860px, or service catalog forms are clipped. The sample style guide entry specifies the content area to be 576px, which clips service catalog forms.
Columns and topics:

1. Navigation (levels 2–4)
2. Main content
3. Info snippets
Prototypes and rapid web design

Many user interface designers use prototypes and rapid web design techniques to visualize the final product before it is developed.

Design revisions are the most time consuming and expensive phase of site design. When the team analyzes and then uses prototypes to create pages, revisions to the published pages are minimal.

Develop the prototype and print it. Review the design with the appropriate team members and annotate the prototype, and annotate what to update on each page.

Define the following elements within the prototype.
- The site map for the entire site.
- A detailed prototype of every intended page, including elements such as links, link destinations, content, page names, and page descriptions.

Content Management navigation

After you design the hierarchical structure of the site, begin planning site navigation.

Consider the following as you plan site navigation.
- Placing navigation elements on every page.
- Locating navigation elements in the same place on every page.
- Using either text or images for navigation.
- Providing visitors with an easy way to understand where they are in the site, for example, with breadcrumbs or a specific color scheme.
- Adding a site map, which is a one-page, hyperlinked, hierarchical outline of the site.
- Providing a link to the home page from every site page, as visitors often enter the site on a page other than the home page.
- Designing navigation to help visitors find information quickly with as few clicks as possible.

In the CMS, navigation menus define your site navigation. Build menus as navigational blocks to create navigation paths. The menu chosen for the task depends on the size and complexity of your site. Available menu options include the following items.
- List menus
- Two types of tab menus
- Vertical, clickable list, usually placed on the left side
- Horizontal blocks
- Vertical blocks
- Super menu (a menu of menus)

System content management

Most of the content in a CMS site is managed in different locations throughout the system.

For example, if you are building a knowledge website, the pages and blocks exist in CMS, but the knowledge articles are authored and managed in the Knowledge application. The same is true for any other type of content you plan to leverage. It is important to take time to understand the table structure of data to become acquainted with content.

Links to content are typically static, however, take time to look at the document tree and review how field values are formatted for use within the CMS. To understand the information provided below, right-click within forms in the platform and select Show XML to view the document tree for the referenced table. To
see the table values for each field, right-click the form label and choose Show - (field name) or Configure Dictionary for reference.

Look at several internet news sites for ideas on how to format dynamic list data and also the full article detail. Research blog sites, shopping sites, and any other site you find easy to use, as layout and usability design can be time-consuming. If you find a site that inspires you, emulate it in your design.

- This New York Times example has two separate list formats.
- The CNN example has several list formats on the page.
- Several different list formats are used on the ServiceNow website.

**Knowledge articles - kb_knowledge table**

When you right-click and select Show XML on any form within the system, the document tree for the referenced database table becomes reference-able. Review the following selected subset of the document tree so you can acquaint yourself with the content readily available to your site design.

```
<kb_knowledge>
  <active>true</active>
  <author;display_value= "First Last Name" >Use this field value if author name is important</author>
  <short_description>Use this field value as the link to the full article detail</short_description>
  <description>Provide this field value as a 1-2 sentence summary of the article</description>
  <number>Unique ID can be leveraged in a number of different ways</number>
  <published>Published time stamp of the article</published>
  <rating>This field value provides a 1 to 5 star rating similar to iTunes</rating>
  <sys_updated_on>Add to supplement article published timestamp</sys_updated_on>
  <sys_view_count>8</sys_view_count>
  <topic>Useful field value in creating hierarchical breadcrumbs</topic>
  <category>Also useful in organizing articles hierarchically</category>
  <use_count>Use this similar to Facebook's "like" feedback, answer to the question was this useful</use_count>
</kb_knowledge>
```
Domain separation in the Content Management System

This is an overview of domain separation and the Content Management System. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Data only

Domain separation in this application is supported at the Data only level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see Application support for domain separation.

Configure Content Management sites

Planning a CMS site involves obtaining resources, communicating with others about design, and gathering content.

Role required: content_admin or admin

The following steps are a high-level overview of how to set up a site.

1. Plan and design your content.
2. Create a site.
   The site is the container that holds all the content. To simplify your process, you can copy an existing site and edit its components. For more information on creating a site, see Create a site. For more information on copying a site, see Copy a site.
3. Add pages to the site.
   Pages contain blocks of information for the site. For more information, see Create a content page.
4. Create content blocks to customize the layout, headers, menu navigation, lists, and static and dynamic content.
   Content blocks are chunks of actual HTML that make up the content page. There are various content block types available to help with your customization. For more information, see Content blocks.
5. Add style to your site using themes, style sheets, and frames.
   Neither content sites or content pages reference style sheets directly. Configure them using the Themes or Style Sheets options. For more information, see Style in Content Management.

6. Test the site.
   After you create or modify a site, test the site to ensure that content displays properly and all links work correctly. For more information, see Test the site.

**Content sites**

A content site is a group of related content pages that have the same basic theme, layout, and URL suffix. Content sites are made up of a series of basic building blocks. The Employee Self-Service site is an out-of-box sample site that is included in the CMS activation. It provides existing, working examples or each CMS component, which you can use like a template to build your own site.

**Site components**

**Create a site**

Configure a site by either creating a new site with CMS or by editing a copy of either the ESS Portal or the Service Management Portal.

Role required: content_admin or admin
If you are creating a catalog site in CMS, follow the steps in Manage catalog sites in Service Catalog.

1. Navigate to **Content Management > Sites**.
2. Click **New**.
3. Complete the form.

Since you have not yet created pages, you cannot select the Home, Search, Login, and Gauge target pages. Add them to the site record after you create them.

### Site fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the site.</td>
</tr>
<tr>
<td>URL suffix</td>
<td>The URL suffix that identifies the site. The URL suffix is case-sensitive,</td>
</tr>
<tr>
<td></td>
<td>the suffix you enter impacts the CMS site URL used to launch the site. The</td>
</tr>
<tr>
<td></td>
<td>URL is incorporated into the URL as follows:</td>
</tr>
<tr>
<td></td>
<td>http://&lt;instance name&gt;.service-now.com/url_suffix/page.do</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: Do not use portal and cms in the URL suffix. They are reserved</td>
</tr>
<tr>
<td></td>
<td>terms and return a Page not found if you use them.</td>
</tr>
<tr>
<td>Home page</td>
<td>The page to display when the user does not specify a page name in their</td>
</tr>
<tr>
<td></td>
<td>URL: http://&lt;instance name&gt;.service-now.com/url_suffix/</td>
</tr>
<tr>
<td>Search page</td>
<td>The page that displays search results when a user searches from any page</td>
</tr>
<tr>
<td></td>
<td>within the site.</td>
</tr>
<tr>
<td>Login page</td>
<td>The page to use for logging in to the site. If specified, users must log in</td>
</tr>
<tr>
<td></td>
<td>to access the pages on the site. If left blank, no login is required to</td>
</tr>
<tr>
<td></td>
<td>access the pages within the site.</td>
</tr>
<tr>
<td>Gauge target page</td>
<td>The page that displays gauge content. When the user clicks a gauge on the</td>
</tr>
<tr>
<td></td>
<td>new site, the gauge target page opens to show the gauge content. The gauge</td>
</tr>
<tr>
<td></td>
<td>target page replaces the CMS page in the current tab.</td>
</tr>
<tr>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use external cart</td>
<td>Option to omit the default cart when rendering catalog pages within a site that contains catalog pages. Provide a catalog cart block somewhere on the site to allow users to make catalog requests.</td>
</tr>
</tbody>
</table>

Note: If you use an external cart, the no cart check box on a service catalog item has no effect. The external cart appears for all items.

4. Click **Submit**.

The following is the site record for the ESS Portal:
Copy a site

To create a new site quickly, you can copy an existing site.

Role required: content_admin or admin

The site copy option creates a complete standalone copy of the site and all its resources. If you are copying a site to create a second site, use this option after the first site is complete, tested, and production ready. This consideration is important because the blocks, CSS, and pages are duplicated to support the new site. There are various reasons why site copying is useful, such as site versioning, branding, or creating a backup.
Images are not included when you use the Copy Site option. They are stored separately in the sys_attachments table.

To copy just a few pages without duplicating all the resources (CSS, blocks, menus), use the page copy option. Page copy duplicates the page but not the resources used in the page. For more information, see Copy a page.

1. Navigate to Content Management > Sites > [Site Name].
2. On the Site form, click Copy.
3. In the dialog box that opens, type a name for the new site.

   This name is a prefix for all the site elements that are duplicated. Do not use Portal or CMS in the site name.

   A progress bar shows the copy process. When the process is complete, the Site form shows information for the new site.

Content Management security

There are several methods for securing CMS sites and pages. Site security is set in the Login page field on the site record. You can control if a page is public or private through the URL.

Every content page has its own URL that users can access outside of the platform. Depending on how the Login page or roles are defined, the URL may or may not be public.

- If the content page has no defined Read role or there is no defined Login page, any internet user can navigate to the URL and view the content page.
- If there is a defined Read role, then anyone who goes to the URL is asked to log in before they can view the site.
- If there is a defined Login page on the site record, all pages in the site are private.

Content Management URLs

The format for Content Management URLs is as follows.

```
<path to the instance> + /<site suffix> + /<page suffix> + .do
```

The <site suffix> is defined by the URL Suffix field on the site form. The <page suffix> is defined by the URL Suffix field in the page form. The URL suffix is case-sensitive.

For example, the page Austere - Site Entry has a site URL Suffix of austere and a page URL Suffix of entry. The constructed URL looks like the following URL.

```
<instance name>.service-now.com/austere/entry.do
```

If the site URL Suffix field is left blank, the <site suffix> is cms, as shown in this example:

```
instance.service-now.com/cms/page.do
```

If the page URL Suffix is left blank, the name of the page is used as shown in this example:

```
instance.service-now.com/austere/Page Name.do
```

Special characters in the name of the page have to be escaped.

Login pages instead of login rules

You set a login page on the site record to allow users to log in or out directly through the content site.

Login rules were used in earlier versions to dictate what users saw after logging in, based on their roles or permissions. Login rules still work, but their use is deprecated.
Configure CMS sites to use single sign-on (SSO)

To configure CMS to use SSO, make the view_content page private.

Because public pages do not require login, and CMS sites are public by default, CMS pages do not use SSO. Use the following procedure to turn off public-facing content pages and enable SSO.

1. Navigate to Public Pages [sys_public.list].
2. For the view_content page, set Active to false.

Content pages in CMS

Content pages are the core of the Content Management System. A content page is a web page that displays blocks of content.

Pages are built from content blocks and organized into sites. Pages display as regular webpages that are rendered in HTML. Constructing a content page requires a basic knowledge of HTML. Content pages are formed by arranging content blocks in predefined layouts. They can be used to present login pages, search pages, or ServiceNow content.

Create a content page

Pages are built from content blocks and organized into sites.

Role required: content_admin or admin

1. Navigate to Content Management > Sites.
2. Open the site to add the page.
3. In the Pages related list, click New.
4. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the page. Prefix each page name with the name of the site followed by a dash and the page function. For example, ESS - Catalog Detail and ESS - Search Results are page names within the ESS site.</td>
</tr>
<tr>
<td>URL suffix</td>
<td>The URL suffix that identifies the page. It is incorporated into the URL as follows: <a href="http://instance">http://instance</a> name.service-now.com/site/url_suffix.do</td>
</tr>
<tr>
<td>Parent page</td>
<td>The existing page that is the parent of the current page. Parent pages keep sections sortable on the site list of pages and are used to create breadcrumbs dynamically. Use CSS to define menus that give the Parent page context within the user interface.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Layout</td>
<td>The layout to use for the page. Layouts define dropzones where content blocks can be added to the page.</td>
</tr>
<tr>
<td></td>
<td>If this field is left blank, the page inherits the default layout of the site. If the site does not have a default layout, there is a single dropzone for the entire page.</td>
</tr>
<tr>
<td>Content theme</td>
<td>The theme to use for the page. Themes bundle CSS style sheets that are applied to all content within the page.</td>
</tr>
<tr>
<td></td>
<td>If this field is left blank, the page inherits the default theme of the site. Use the default theme unless the page requires a different set of CSS style sheets from the other pages in the site.</td>
</tr>
<tr>
<td>Frame buster</td>
<td>Select the check box to remove any restrictions placed by frames that contain the page. This way you avoid frame-within-frame issues that sometimes occur with improper linking.</td>
</tr>
<tr>
<td>Content site</td>
<td>The site associated with the content page. If you created the page from the related list in the site, the value defaults. The content site provides the <code>&lt;site_suffix&gt;</code> in the page URL, as follows:</td>
</tr>
<tr>
<td></td>
<td>http://&lt;instance name&gt;.service-now.com/site_suffix/page_suffix.do</td>
</tr>
<tr>
<td>Read roles</td>
<td>Users with the selected roles can view the page. Click the lock icon to select roles.</td>
</tr>
<tr>
<td>Model document</td>
<td>A document ID of a record to display by default.</td>
</tr>
<tr>
<td>Page status</td>
<td>The status for the page, such as Draft or Published.</td>
</tr>
<tr>
<td>Created by</td>
<td>The user who created the page. If your role has higher privileges than your user name and you enter your user name, the field defaults to the role. For example, if you are logged in as an Admin and you type your name, which has lower privileges, this field displays Admin.</td>
</tr>
<tr>
<td>Title</td>
<td>The title for the page. The title displays on the browser tab when the page is accessed.</td>
</tr>
<tr>
<td>Description</td>
<td>Type a description of the page that displays for users when they access the page.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Add content to a page**

After you define the page settings, set the content of the page by adding content blocks. Setting content blocks is similar to how you add content to homepages.

Role required: content_admin or admin
Note: Do not add any type of report, such as a calendar, to iFrames. For more information on adding a report directly onto a page without using iFrames, see Embedding reports in Jelly.

2. Click Add Content.
3. Select a content block from the picker.
4. Select the dropzone where the content goes.
Create content blocks by adding one of the content blocks named *New [block type]* to the page.
Copy a page

Copying pages is an efficient way to avoid duplicating the same work and to create pages quickly from a guiding master template.

Role required: content_admin or admin

1. Navigate to **Content Management > Sites** and select the site.
2. Select the page to copy.
3. Click **Copy**.
4. Rename the page.

**Note:** Do not use service_catalog to rename a page. It is already a valid page in the system.

5. Edit the page fields.
6. Click **Update**.

Assign a page to a site

If you have created multiple sites, you can add pages from one site to another site.

Role required: content_admin or admin

1. Navigate to **Content Management > Sites**.
2. Select a site.
3. In the **Pages** related list, click **Edit**.
4. Select other pages to include in the site.
5. Click **Save**.
6. Update the site.

Add a page to an application

Homepages and content pages are not added automatically to update sets and applications. They must be manually added.

Role required: content_admin or admin

1. Navigate to **Content Management > Pages**.
2. Right-click a content page record.
3. Select **Unload Portal Page**.

   The page is added to the current application and to the current update set.

Configure a private UI page for CMS links

With single sign-on (SSO) in place, you can generate email links that take users directly to tickets and applications through the CMS interface.

Role required: content_admin or admin

You accomplish this procedure by creating a private UI page to redirect CMS links. Because the page is not public, it requires authentication and redirects to SSO appropriately.

1. Check that your CMS site is private by completing the following steps.
   a) Navigate to **Content Management > Sites > [Your Site]**
   b) Verify that the **Login page** field has a page listed.

2. Create a new UI page by completing the following steps.
a) Navigate to System UI > UI Pages.
b) Click New.
c) Enter a Name, for example, redirector.
d) Enter the following Adobe Jelly code into the HTML field.

```xml
<?xml version="1.0" encoding="utf-8"?><j:jelly trim="true"
xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null"
xmlns:g2="null"><script type="script/javascript">
window.location.href="${sysparm_uri}";</script></j:jelly>
```

The CMS now supports email links with following format:

http://<path to instance>/<UI page>.do?uri=/<CMS suffix>/<record type>.do%26sys_id=<record ID>

For example:

http://<instance name>.service-now.com/redirector.do?sysparm_uri=/ess/incident.do%26sys_id=46e3e949a9fe19810069b824ba2c761a

**Note:** If you are using SAML 2.0 update 1 for SSO, use the UI page saml_redirector instead of creating a new UI page. For example, an email link to a SAML 2.0 redirector page would use the URL format: http://<instance name>.service-now.com/saml_redirector.do?sysparm_uri=/ess/incident.do%26sys_id=46e3e949a9fe19810069b824ba2c761a.

### Content Management templates

Templates are content pages that are reused to provide a consistent look and feel.

Templates are useful when creating CMS sites for the following reasons.

<table>
<thead>
<tr>
<th>Create new pages rapidly without risk by copying pages</th>
<th>Using a template to create new pages saves time because you do not have to keep repeating the same steps.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provide a restore point for pages within the system</td>
<td>Have a working template available if something goes wrong in one of the blocks or in the theme CSS. It is often easier to start over from the template instead of trying to undo complex changes.</td>
</tr>
<tr>
<td>Provide a functional reference for editors on the site project</td>
<td>Having the template as a reference ensures that pages continue to conform to the style guide.</td>
</tr>
</tbody>
</table>

### Page templates

Every page that is part of the site needs a template.

### Critical page reference fields

When you build a new site, there are four page reference fields on the site record that are critical. Understanding these pages and how they are used helps you define page templates and site defaults.

- **Home page**: landing page for the site. A home page is mandatory.
- **Search page**: page that displays search results when a user searches from any page within the site. A search page is mandatory for your site to have a Search Results block.
• Login page: a standalone login page, which is useful to force authentication for the entire CMS site.
• Gauge target page: page used to display the drill-through content from a gauge. When the user clicks a gauge, the gauge target page opens showing the drill-through content for that gauge.

Critical page reference fields

Detail pages

Depending on the data or tables that you plan to use, you may need detail pages. These detail pages use one of the content types in the following list.

• Knowledge detail page: displays a full knowledge article detail (mandatory for a knowledge site).
• Incident page: detail page for an incident record.
• Catalog page: detail page for all items, content items, order guides, and record producers.

Templates for creating sections

There are two page templates you can use when creating sections:

• Parent page: keeps sections within large sites organized and sortable on the site list of pages. Parent pages are also used to create breadcrumbs dynamically.
• Detail page: differs from the parent page in that the content area displays a full article or detail instead of a selection of related content. Detail pages must have a Current Document block.

These pages are mandatory if you plan on accessing system data. For example, if you plan on showing the service catalog in your CMS, you need the following items.

• A service catalog content type that references the [sc_cat_item table].
• A detail page that provides the full view of the item.

New templates

If the base system sample site pages are not suitable, you can create a template from scratch. Create a page and then use it as a template. For more information, see Create a Content Page.

When you save a new template, include the word "template" in the page name.

Configure a master template

An easy way to create a master template is to copy the existing ESS sample site and customize it to suit your own needs. You can also configure a master template from scratch.

Role required: content_admin or admin

Follow these steps to create a single master page and generate all important components within the site.

1. Design a layout.
   Regardless of the interface, a site can be distilled into a few simple layouts.

2. Create a theme.
   The theme defines the structure of the layouts in CSS and the base styles, such as fonts and colors. For more information, see Design themes.

3. Build the common blocks.
   Pages are composed of content blocks. Most content blocks are reused on multiple pages. For the master template, build basic blocks such as a header, side navigation, and some basic content for the main content area of the page. More detailed content can be added later, but define content for reuse on many of the site pages here. For more information, see Content blocks.

4. Build a site entry page.
   Use the common content blocks you just created to design the first page that users see when they enter the site. For more information, see Create a content page.

5. Build a detail page.
   Design the detail pages to determine how pages such as knowledge articles, catalog items, and search results are displayed. You can build a detail page by copying the site entry page and adding additional content blocks. For more information, see Copy a page.

6. Assign the pages created to the new site.
   Create the site and apply the layout and theme to the site defaults. Then, navigate to the All Pages list and specify the master template site in the Site column for each of the master template pages. For more information, see Create a site.

Customize a copy of a page template

One good source for templates is the base system sample site. It is easy to copy pages and restyle them into new page templates to meet different business requirements.

The Employee Self-Service portal is provided as a working example and design template in the following procedure.

1. Navigate to Content Management > Sites > Employee Self-Service.
2. Select a page.
   For example, to copy the ESS sample site homepage, select Portal.
3. Click Copy.
4. Rename the page.
5. Right-click in the header and select Save.
7. Point your cursor to the content block to change and click the edit icon that appears on the right. For example, change the menus, alter the layout, or add a different logo.
8. Click Update.
9. Use the page in other sites you created by assigning pages to a site.

Content types

Content types provide site-specific control of how system data defined by templates is rendered.

In the site, one page displays a list of knowledge articles, and another page displays catalog items or incidents or a combination of the two. Different themes can be used for types of content and each theme can provide different user interaction. Content types define the pages that display content from a table. Each content type corresponds to a table.

Every type of document that the CMS displays has an associated content type. Changing the content type requires knowledge of Apache Jelly scripting. However, the common content types (such as service catalog or knowledge base) come in the base system. Content types can be associated with particular sites. This association allows different sites to use different detail pages for the same content type.

Content types define three features of associated documents.

- What does a link to one of these documents look like? For example, if a list of these documents is displayed on a page, how does each entry appear?
- What does a detailed view of one of these documents look like?
- What detail page is used to display the document? This decision is important and is often an area of confusion for new CMS users.

The document content type determines the page that a list of documents points to, the list itself does not determine the page. The content from a link is displayed in a detail content block on a page. The content type determines in which detail block on a page the document content is displayed.

For example, the list block Catalog Top 5 displays the top five items in the Service Catalog table [sc_cat_item]. Because the table is [sc_cat_item], the content type sc_cat_item controls how the Catalog Top 5 list is displayed. Clicking any item in the list displays the Service Catalog Detail page with the item displayed on it according to the detail template script. These content types are applied:

- in search results to link to the correct page.
- in the Current Document block to display the current record.
- in links on lists and other places that link to record types.

Several content types are available by default for tables such as Catalog Item [sc_cat_item], Gauge [sys_gauge], and Page [content_page].

Content type defaults that are set for CMS can be overridden for individual sites. Use the Content Types related list on the site record to customize content types.

Note: To learn more about the properties that affect use of content types, see the following topics in Instance Security Hardening Settings:
- #unique_487
- #unique_488

Configure a content type

Users with the content_admin role can create a content type.
Role required: content_admin or admin

1. Navigate to Content Management > Content Types.
2. Click New.
3. Complete the Content Type form.

### Content Type form

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select the table whose content will be rendered in Content Management.</td>
</tr>
<tr>
<td>Content site</td>
<td>Select the site that will use this content type.</td>
</tr>
<tr>
<td>Media type</td>
<td>Enter one of the following media types to use with this content type.</td>
</tr>
<tr>
<td></td>
<td>• doctype: UI15 desktop interface only</td>
</tr>
<tr>
<td></td>
<td>• m: Smartphone interface only (not for CMS use)</td>
</tr>
<tr>
<td></td>
<td>• tablet: Tablet interface only (not for CMS use)</td>
</tr>
<tr>
<td>Default detail page</td>
<td>Select which page loads after a user clicks a link.</td>
</tr>
<tr>
<td>Gauge page</td>
<td>Select which page is the drill-through target for any gauge. If you display a gauge on a CMS page, then clicking the links loads the page specified here.</td>
</tr>
<tr>
<td>Summary Template</td>
<td>Write an XML script that determines how the list is displayed in the list block, if the link is displayed in a list block.</td>
</tr>
<tr>
<td>Detail Template</td>
<td>Write an XML script that determines how to display the associated information after a user clicks the link.</td>
</tr>
</tbody>
</table>

### CMS gauge support

Gauges are a graphical way to display information from an instance.

A gauge might, for example, show a bar chart breaking down all open incidents by category. Gauges are fully supported within the CMS system. This means:

1. You can put a gauge on a CMS page
2. You can control what will happen when a user clicks on a cell within that gauge

**Put a gauge on a CMS page**

You have control over the gauges on a CMS page.

1. Bring up the CMS page in edit mode.
2. Click Add Content.
3. Select the gauge you want to add.
4. Place the gauge on the page in the desired location.

**Control what happens on a click**

Since a CMS system uses multiple pages you have to tell the system which page to use to display drill through content.
In the normal (non CMS) system, when you click a bar in a bar chart or a wedge on a pie chart, you drill through and your current screen is replaced with a list of records meeting the chart's criteria. For example, if you have a gauge of Incidents by Category and you click the bar labeled Hardware you drill through to a list of all incidents with a category=hardware.

Within the CMS system, there is a similar drill through mechanism at work, but you must manually specify which page to display.

There are two different models of the drill through, use an in-place target frame to receive the content, or use another page to display the content.

Using an In-Place Target

An in-place target is a named iframe on the same CMS page as the gauge. When the gauge is clicked, the drill-through content appears within that iframe rather than changing out the CMS page. The gauge (and the rest of the page other than the target) remain in place and active.

Using a Gauge Target Page

A gauge target page is a separate CMS page that is used to display the drill-through content from a gauge. When a gauge is clicked, the current CMS page is replaced with the gauge target page and the drill-through content is rendered within that second page.

- **Gauge Target Page**
  To set a site default, select Gauge Target Page, on the site configuration page. This page is used as the drill-through target for any gauges in the system that do not have a more specific gauge page specified in their content type.

- **Gauge Page**
  To set a content-type specific page, you can specify a Gauge Page, on a content type page. Any gauges for this type of content then use that page for any drill through.

  **Note:** The gauge target on a particular content type overrides the default, site level, gauge target.

- **Gauge Target block**
  A gauge target page is a normal CMS page, with one special requirement. Somewhere on that page, there must be a Gauge Target block. This market block tells the system where to output the drill through data.

View content types

The following is an example of where you might use Content Types.

This example uses the out-of-box Employee Self-Service (ESS) site as an example.

Role required: content_admin or admin

Use any out-of-box instance of a CMS site.

   The Issue Status, or incident_status CMS page contains two content blocks: Common Answer and Current Issues. These content blocks both use Content Types to render results.
This block matches the Common Answers section of the Issue Status page. The Table field describes the Content Type associated with Common Answers.

4. Use the link to view existing Content Types.

5. Click the Content Type to view the XML that determines how the list and record are rendered in CMS. The Default Detail Page field indicates a CMS page that displays a record selected from a List of Content block.

6. Click the Information icon next to the Default Detail Page, to go to that page.

7. From the Default Detail Page, under Related Links, click **Edit Page**.

   The Detail Block contains a content type formatter. When editing or viewing the page, it is looking for a URL to be passed to determine the record to display, which is why it says "Detail record could not be located".

8. Click the pencil icon to edit and view the Detailed Content block.

   The Type drop down list has "Show the page’s current document" selected, which indicates that the document_id must be passed to this block from the CMS pages, then it can display the record based on the content type listed in the document_id.

9. From the Common Answers block, on the Self Service page, select a record.

   The page opens with a URL similar to: https://<instance name>.service-now.com/ess/knowledge.do?

   sysparm_document_key=kb_knowledge,02255450d731310013ab49547e61038e

   The table sysparm_document_key=kb_knowledge and sys_id 02255450d731310013ab49547e61038e determine the record. The associated content type, kb_knowledge, renders the content on the Default Detail Page, Portal - Knowledge Detail / url_suffix=knowledge.

Content blocks

A block is a defined piece of content within the system that can be reused.

A content page is constructed by arranging customized blocks of content on a page. Content blocks are an important part of a CMS site. Existing content such as reports, gauges, and record lists are automatically available as content blocks and more can be created within the CMS.

After defining content blocks, use them on any content page by adding them to drop zones. For more information, see **Add content to a page**.

Create content blocks after sites and pages have been designed.

Configure a content block

To configure a content block, define it in the appropriate form.

**Role required:** content_admin or admin

1. Perform one of the following actions to create a content block.

   • Navigate to **Content Management** > **Blocks** > [Block type] > **New**. The form for creating the selected block type opens.
   
   • Navigate to **Content Management** > **Blocks** > **All** and select the type of content to create from the list.
   
   • Edit a content page and add a stub block of the desired content block type. Click the link in the stub block.

2. Complete the content block form and save it.

3. Add the content block to any content page.
View CMS block tags

A CMS block tag is used for advanced block creation and site flexibility.

Role required: content_admin or admin

It is constructed as <g:content_block> {{Jelly_Tags|Jelly}} and can be used in either of the following ways.

- Blocks: to display a block inside a block.
- Layouts: to display a block inside a layout.

The tag appears in the format, <g:content_block type="<type>" id="<sys_id>"/>

An example of the block tag is included in the ESS Portal sample site.

1. Navigate to Content Management > Design > Frames.
2. Click cms_admin_home_frame.
3. View the code.

```html
<div class="cms_administration_home">
  ${body}
</div>

<!-- Would you like to pivot off of parent page instead? try this snippet -->
<j:if test="${current_page.getParentPage().getURLSuffix()=='administration'}">
  <g:content_block type="content_block_menu" id="7afc342def002000914304167b2256ac"/>
</j:if>

The defaults use the page URL suffix to define sub menus

-->
<j:if test="${current_page.getURLSuffix() == 'administration'}">
  <g:content_block type="content_block_menu" id="7afc342def002000914304167b2256ac"/>
</j:if>
<j:if test="${current_page.getURLSuffix() == 'community_inspired'}">
  <g:requires name="ess.portal.globals.jsdbx" />
  <g:content_block type="content_block_menu" id="ccd4b8c7efb70000914304167b22566e"/>
</j:if>
</div>
```

4. To see what the page looks like, navigate to the ESS Portal administration page. For example, http://instance name.service-now.com/ess/administration.do.

Types of content blocks

Content blocks, which make up content pages, are reusable pieces of content defined within the system.

Each content block can be used for a different type of content.
Configure a header block
A header block is a visual element placed at the top of pages. It provides a place for branding and other important site-wide functionality.

Role required: content_admin or admin

Some of the options that are available in headers include, global search, text size toggle, menus for navigational purposes, and the user name with logout link.

1. Navigate to Content Management > Blocks > Headers.
2. Click New.
3. Complete the form.

Header form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the header block.</td>
</tr>
<tr>
<td>Background</td>
<td>Select a background for the header logo and menus.</td>
</tr>
<tr>
<td></td>
<td>• <strong>None</strong> - No background is rendered.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Gradient/Image</strong> - Specify an image or gradient image to serve as the background.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Colored Bars</strong> - Specify colors for three different sections of the header, top, middle, and bottom.</td>
</tr>
<tr>
<td>Image</td>
<td>If <strong>Background</strong> is <strong>Gradient/Image</strong>, upload an image for the header block background. For gradients, upload a gradient image.</td>
</tr>
<tr>
<td>Top bar color</td>
<td>If <strong>Background</strong> is <strong>Colored Bars</strong>, enter a CSS color or color name to use as the background for the top menu.</td>
</tr>
<tr>
<td>Middle bar color</td>
<td>If <strong>Background</strong> is <strong>Colored Bars</strong>, enter a CSS color or color name to use as the background for the logo and text.</td>
</tr>
<tr>
<td>Bottom bar color</td>
<td>If <strong>Background</strong> is <strong>Colored Bars</strong>, enter a CSS color or color name to use as the background for the bottom menu.</td>
</tr>
<tr>
<td>Logo</td>
<td>Select a logo image. The image is also a link to the main page.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Text</td>
<td>Type the text to display beside the logo.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Select the check box and type any scripted conditions to apply in the <strong>Condition</strong> script field that appears.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the header block. The category also determines the detail page in which header block links open. Detail pages often display information in different ways.</td>
</tr>
<tr>
<td>Top Menu</td>
<td>Select a navigational menu block to use as a menu above the logo.</td>
</tr>
</tbody>
</table>
Create a navigation menu block

Navigation menu blocks enable you to create a menu of links to different content pages.

Role required: content_admin or admin

The following three objects define navigation menus.

- Menu block: The menu block defines the entire menu block and how it displays.
- Menu section: The menu sections define groups of links displayed within the block.
- Menu item: The menu items define the links within each menu section.

1. Navigate to Content Management > Navigation Menus.
2. Click New.
A gallery of available navigation menu blocks displays.

3. Select the desired menu block style.
4. Complete the Navigation Menu form to define the block.

### Navigation Menu form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the block.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of navigation menu, which determines how the links are displayed.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border style for the navigation menu block.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Select this check box to enable the use of scripted conditions. If selected, the Condition and Logged On fields appear.</td>
</tr>
<tr>
<td>Logged on</td>
<td>Select this check box to display the navigation menu block only if the user is logged on. This field appears only if Conditional is selected.</td>
</tr>
</tbody>
</table>
Configure menu sections

Menu sections define groups of links displayed within the navigation menu block.

Role required: content_admin or admin

1. Navigate to Content Management > Blocks > Navigation Menus and select a block.
2. In the Menu Sections related list, click New.
3. Complete the Menu Section form.

### Menu Section form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the menu section.</td>
</tr>
<tr>
<td>Content block menu</td>
<td>Select the navigation menu on which this menu section appears.</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select what appears when a user clicks the menu section name and icon.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the URL to display when a user clicks the menu section title and icon. This field is available only if Redirect to is set to The specified URL.</td>
</tr>
<tr>
<td>Detail page</td>
<td>Select the content page to open when a user clicks the menu section title or icon. This field is available only if Redirect To is set to A content page.</td>
</tr>
<tr>
<td>Left image DB</td>
<td>Select the image database where your site images are stored.</td>
</tr>
<tr>
<td>Right image DB</td>
<td>Select icons to appear on the left and on the right of the name.</td>
</tr>
<tr>
<td>Left image</td>
<td></td>
</tr>
<tr>
<td>Right image</td>
<td></td>
</tr>
<tr>
<td>Second level text</td>
<td>Enter a description to appear beside the menu section title.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the menu section available for use.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to indicate where this section appears on the menu relative to other menu sections.</td>
</tr>
<tr>
<td>Logged on</td>
<td>Select this check box to display the menu section only if the user is logged on.</td>
</tr>
</tbody>
</table>
4. **Click Submit.**

Configure menu items

Menu items are the links that appear within each menu section.

Role required: content_admin or admin

Not all navigation menu sections require menu items. Use menu items to link users to other pages or additional information. These steps use the ESS sample portal site as an example.

1. Navigate to **Content Management > Blocks > Navigation Menus** and select a navigation menu. For example, select the **Documentation Menu**.
2. From the **Menu Sections** related list, select a menu section. For example, select **Getting Started**.
3. From the **Menu Items** related list, click **New**.
4. Complete the form.

**Menu Item form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the menu item.</td>
</tr>
<tr>
<td>Menu section</td>
<td>Select the menu section in which this item appears.</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select what appears when the menu item name and icon are clicked.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the URL to open when the menu item title and icon are clicked. This field is available only if Redirect to is set to <strong>The specified URL</strong>.</td>
</tr>
<tr>
<td>Detail page</td>
<td>Select the content page to open when the name or icon is clicked. This field is available only if Redirect To is set to <strong>A content page</strong>.</td>
</tr>
<tr>
<td>Image</td>
<td>Select an icon to appear with the name.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the menu item available for use.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to indicate where this item appears on the menu relative to other menu items.</td>
</tr>
<tr>
<td>Logged on</td>
<td>Select this check box to display the menu item only if the user is logged on.</td>
</tr>
<tr>
<td>Roles</td>
<td>Click the lock to open a list, then select the roles that can access this menu item to restrict access by role.</td>
</tr>
<tr>
<td>Category</td>
<td>Select the category in which the menu item belongs.</td>
</tr>
<tr>
<td>Open in</td>
<td>Select the behavior of clicked links.</td>
</tr>
<tr>
<td>iFrame</td>
<td>Type the name of the iFrame where the link opens when a user clicks the menu item name and icon. Make sure that there is an iFrame on the page. This field is available only if Open In is set to Named iFrame.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

Menu types

By changing the **Type** field on the navigation menu block, you can format the same menu in different ways.

**Menu types**

<table>
<thead>
<tr>

<td>The vertical blocks menu renders the menu sections as block headings with menu items as links within the block. The blocks are arranged vertically.</td>
</tr>
</tbody>
</table>

Menu style customization

You can customize menu styles in the style sheets your site uses.

Navigate to **Content Management > Design > Style Sheets** to customize style sheets.
Supplementary page navigation menu example code

In the following example, look at the CSS class selectors and rules. Also, review how the block containers (div.cms_menu_section_blocks) are defined based on the outer container (TD.layout_content_submenu_column). The outer container is actually a part of the site layout.

This concept is clearer if you compare the styles to the styles used in the super menu further down in the example. This example shows that there is no need to make a completely new menu system. You can use CSS to change the look and feel of existing menus.

/*************************************************************************************************************************************************************/
SUB MENU VARIATIONS FOR HORIZONTAL MENUS - Section Blocks Menu
(cms_menu_section_blocks UI Macro)
*************************************************************************************************************************************************************/
TD.layout_content_submenu_column DIV.cms_menu_section_blocks {

}
Super menu sections example code

The following menu is a simple float grid. The defaults are written first. Then, below the "SUPER MENU VARIATIONS..." comment, the defaults are overwritten by adding a containing div with a unique class.

In the code that renders the header for the base system, the bottom menu resides in a table cell with the class of cms_header_bottom_menu (refer to the TD.cms_header_bottom_menu CSS selector).
4.2 2. Super Menu Sections Example Code

This menu is essentially a simple float grid. The defaults are written first. Then, below the "SUPER MENU VARIATIONS..." comment, the defaults are overwritten by adding a containing div with a unique class. In the code that renders the header for the base system, the bottom menu resides in a table cell with the class of "cms_header_bottom_menu" (note the TD.cms_header_bottom_menu CSS selector).

  border-bottom: 0px solid #CCC;
  border-left: 1px solid #DDD;
  border-top: 1px solid #EEE;
}
Example menu items and content links

The method for choosing a link target (current window, iFrame, or new window) and referencing the item linked (page, attachment, or URL) are similar. Review examples of how to link within these elements.

- A content page reference helps you select the desired page. For example, the value `home.do` links to the site homepage.
- An attachment reference allows you to reference a single file attached to the menu item or section record. If there is more than one attachment, only the first attachment is referenced. The link is then generated automatically and displays a **Browser File Save** prompt.
- The specified URL reference allows you to link to a full URL string in your instance or from another system. For example, `com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=66c313e7c0a8016b008ebela8e3d97f5&sysparm_nameofstack=b654d15bef921000914304` links to the **Ask a Question** record producer. Use this reference to link to a page in an existing intranet system.

Menu items can be seen as featured links from each section. There are many choices in URL definitions and link options. Links within the ESS Portal open content pages within the site. In turn, each page has an iFrame or set of blocks that houses the corresponding data. This method is useful for rapid prototyping, but consider where to create dynamic detail pages and use the available linking options.
Menu item

Menu items are similar to content links except they are called by the list block, not as part of a navigation menu block. Menu items and content links function the same as far as how they are defined and the options available for linking to items. Content links are meant to be called through a list block that calls the Content Link [content_link] table. Content links do not have the **Logged in** field or the **Roles** option used to control the UI experience for various roles.
Menu sections define groups of links and how the links behave.

Role required: content_admin or admin

For example, link behavior determines which page opens when the link is clicked and how it opens, such as in a new page or a new frame. Use the following procedure to view a sample menu section.

1. Navigate to **Content Management > Blocks > Navigation Menus**.
2. Click **Portal - Block Menu**.
3. In **Menu Sections** related list, click Order Things.
4. Click the reference icon next to **Detail Page** to open the page.
5. To view an example of dynamic content, follow these steps to look at the request catalog list/grid view on the ESS Portal.
   a) Add `/ess/manage.do` to your instance URL.
      For example, `https://<instance name>.service-now.com/ess/manage.do`.
   b) In the **Code Example Demos** section, click **Request Catalog List / Grid View**.
   c) Browse the catalog items.
Configure dynamic blocks
Use dynamic blocks to use scripting or to pull information from the system. Dynamic blocks are where most of your content resides.

Role required: content_admin or admin

A good use of dynamic blocks is job postings. Store the postings in knowledge articles and display the postings with a dynamic block.

Several dynamic blocks are predefined, including the following items.
- **New Content**: Each of the new content blocks allows for creating blocks while editing content pages.
- **Clean Login**: The default login page requesting user name and password, which includes a "Remember Me" check box. After the user logs in, this block triggers login rules.
- **Login**: An area that allows a logged out user to log in and a logged in user to log out. This block is especially useful on publicly available content pages.
- **Search**: The global text search field. Currently, global text search is the only form of search that can be included in a content page.
- **Search Results**: An area for displaying global text search results.

For information about Apache Jelly, see #unique_513.

1. Navigate to **Content Management > Dynamic**.
2. Click **New**.
3. Complete the Dynamic Content form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the dynamic content block.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the dynamic block. The category also determines the detail page in which dynamic block links open.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border styling for the dynamic block. For more information, see Format a frame.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Enter any scripted conditions to be applied. If selected, adds a <strong>Condition</strong> script field to the form.</td>
</tr>
<tr>
<td>Two phase</td>
<td>Select this check box to allow two phase <strong>Jelly</strong> tags.</td>
</tr>
<tr>
<td>Dynamic content</td>
<td>Enter the XML script field that determines the behavior of the dynamic block.</td>
</tr>
</tbody>
</table>

Catalog cart block
The catalog cart block is a dynamic block provided in the base system.

This block provides the same cart that is available within the service catalog. If the **site definition** has the **Use external cart** option selected, include this block in the site so users can interact with their catalog cart.

Catalog cart block is available when the **glide.sc.use_cart_layouts** property is set to false.
**Customize the list block**

List blocks are content blocks that dynamically generate a list of links to records within the instance. When a user clicks a link in a list block, the associated information is displayed in a detail page determined by its content type.

Role required: content_admin or admin

Make the list using a simple query on any table or by scripting a more advanced query. Lists are powerful and flexible. Here are some places that allow you to have complete control over the list display.

**List control**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frames</td>
<td>Frames provide a method to create decorative containers for content blocks and other elements within the site. When frames are used with the <strong>Type</strong> field, the designer has complete control over list placement.</td>
</tr>
<tr>
<td>List Type</td>
<td>The List Definitions module defines the type of lists available for content pages. On the List Block form, select a list definition in the <strong>Type</strong> field.</td>
</tr>
<tr>
<td>List Filtering</td>
<td>Provides every field in the referenced table for more granular results.</td>
</tr>
<tr>
<td>Max Entries</td>
<td>Limits the results from a table to fit the design of the block.</td>
</tr>
<tr>
<td>Order and Order Direction</td>
<td>Allows sorting by any field in the referenced table, in either ascending or descending order.</td>
</tr>
</tbody>
</table>

You can also use list blocks to create a list of links to information outside your instance. Create the external links as records on the Content Link [content_link] table, and then follow the steps in this procedure.

1. Navigate to **Content Management > Lists**.
2. Click **New**.
3. Complete form.

**List Block fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the list content block. It is used to identify the record in the instance and is not displayed on the content page. Use the <strong>Title</strong> field for that purpose.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the list content block.</td>
</tr>
<tr>
<td>Type</td>
<td>Select a list definition UI macro to format the list of links. For more information, see Configure list definitions.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border style for the list block. For more information, see Create a frame UI macro.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to enable generating a list from a script, rather than from a simple filtered query.</td>
</tr>
<tr>
<td>Query</td>
<td>Filters the results using a condition builder.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Title</td>
<td>Enter the name to display at the top of the list block when it appears in a content page.</td>
</tr>
<tr>
<td>Maximum entries</td>
<td>Set the maximum number of entries to display in this list block.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table to query for the list items. The table determines which detail page displays when a user clicks a link in the list block. For more information, see Configure a content type</td>
</tr>
<tr>
<td>Conditional</td>
<td>Select this check box to enable the use of scripted conditions. If selected, a Condition script field appears. Other fields that appear include the Logged On and Omit if empty check boxes.</td>
</tr>
</tbody>
</table>

Note: The list shows only tables and database views that are in the same scope as the list block.

4. Click Submit.

Configure list definitions
List definitions, similar to content management frames, are decorative containers that control the look and feel of lists.

Role required: content_admin or admin

Specifically, list definitions are UI macros that use Apache Jelly script to define how a list is rendered inside a list block. Site design often requires multiple list styles within the layout. Lists are often the primary form of navigation within a site, so it is important to have control over their formatting.

Configuring list definitions requires a knowledge of Apache Jelly.

1. Navigate to Content Management > Configuration > List Definitions > ..
2. Click New.
3. Complete the List Definition form.

Configure a static HTML block
Use static blocks for text that does not change. For example, use a static block for a site footer with only the company or organization name. A static HTML block allows any HTML code to be run within a page.

Role required: content_admin or admin

Anyone who edits their own HTML, Jelly, or Javascript may find the HTML editor in the static block limited. The HTML editor can also add tags or formats that advanced coders find unnecessary. For more advanced options, use dynamic blocks.

1. Navigate to Content Management > Blocks > Static HTML.
2. Click New.
3. Complete the Static Content form.

<table>
<thead>
<tr>
<th>Static content form</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Category</td>
</tr>
<tr>
<td>Frame</td>
</tr>
<tr>
<td>Active</td>
</tr>
<tr>
<td>Conditional</td>
</tr>
<tr>
<td>Static Content</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

Format an image as a static HTML block
An easy way to add an image to a CMS page is to use a static HTML block. After the block is created, you can reuse it throughout the site.

Role required: content_admin or admin

1. Navigate to **Content Management > Design > Images**.
2. Click **New**.
3. Select a **Category** to help organize the images.
4. Type the file name of the image, including the extension (such as .png).
5. Upload the file by selecting **Click to add** and browsing for the image.
6. Click **OK**.
7. Click **Update**.
8. Navigate to **Content Management > Blocks > Static HTML** and click **New**.
9. Paste the following code into the HTML block, substituting the image name as uploaded in the previous step.
   The "x" at the end of the filename is required for image caching.

   ```html
   <img src="<image_name>.gifx"/>
   ```

Now the image is a static HTML block and you can add it to any content page. Use standard HTML code to alter the image in the content block.

Configure Flash movie blocks
Use a Flash movie block to embed any Flash movie (.swf file) as an attachment or by referencing a URL in a content page.

Role required: content_admin or admin
To add streaming video or Flash video (.flv), for example, to a knowledge article, see Embed videos in HTML fields.

1. Navigate to **Content Management > Specialty Content > Flash Movies**.
2. Click **New**.
3. Complete the Flash Movie form.

Flash Movie form

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the Flash movie block.</td>
</tr>
<tr>
<td>Source</td>
<td>Specify where the Flash movie is found.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Attachment</strong>: If this choice is selected, upload the Flash movie to this record.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Link to External Object</strong>: If this choice is selected, a <strong>URL</strong> field appears. Specify the Flash movie URL and ensure that the Flash movie is publicly accessible.</td>
</tr>
<tr>
<td>Height</td>
<td>Enter the height of the Flash movie in pixels.</td>
</tr>
<tr>
<td>Width</td>
<td>Enter the width of the Flash movie in pixels.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Configure content links**

Content links are the predecessors to navigation menus. You can use content links to create navigational links to information outside of your instance.

Role required: content_admin or admin

After the content link is configured, it must be defined in a list block. List blocks use content links to reference information outside of your CMS.

1. Navigate to **Content Management > Specialty Content > Content Links**.
2. Click **New**.
3. Complete the Content Link form.

Content Link form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the content link</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select the location of the external link</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the list content block.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the site URL to open when the link is clicked. This field is available only if Redirect to is set to The specified URL.</td>
</tr>
<tr>
<td>Open in</td>
<td>Select the behavior of the clicked link.</td>
</tr>
<tr>
<td>Detail page</td>
<td>Select the page where the link opens when it is clicked. This field is available only if Redirect to is set to A content page.</td>
</tr>
</tbody>
</table>
4. Click **Submit**.
5. From **Content Management > Blocks > Lists**, create a list block that references the content links by selecting **Content Link** in the table field.
6. Create a query to determine which external links display on the page. For example, the query **Category is Search** displays any external links that have a category defined as **Search**.
7. Click **Update**.

Configure iFrames
An iFrame embeds a URL on a page within a frame. It can embed external pages or render ServiceNow content.

Role required: content_admin or admin
Configure an iFrame with forms you create in the instance and link to the page in which the iFrame resides.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the iFrame block.</td>
</tr>
<tr>
<td>Frame name</td>
<td>Type a name for the frame on the page.</td>
</tr>
<tr>
<td></td>
<td>When you use iFrames to present ServiceNow content such as forms or lists,</td>
</tr>
<tr>
<td></td>
<td>the frame name must be <code>gsft_main</code>. This name allows links within the iFrame</td>
</tr>
<tr>
<td></td>
<td>to open within the iFrame.</td>
</tr>
<tr>
<td>URL</td>
<td>Enter the URL to display in the iFrame. If you use the iFrame to display</td>
</tr>
<tr>
<td></td>
<td>ServiceNow content, start with the page name and do not include the base</td>
</tr>
<tr>
<td></td>
<td>instance part of the URL. For example, to show the list of requested items,</td>
</tr>
<tr>
<td></td>
<td>the URL is:</td>
</tr>
<tr>
<td></td>
<td><code>sc_req_item_list.do</code></td>
</tr>
<tr>
<td></td>
<td>Queries can be applied to the URL. For instance, to display a list of open</td>
</tr>
<tr>
<td></td>
<td>requested items, the URL is:</td>
</tr>
<tr>
<td></td>
<td><code>sc_req_item_list.do?sysparm_query=active=true</code></td>
</tr>
<tr>
<td></td>
<td>For more information, see <code>#unique_521</code>.</td>
</tr>
</tbody>
</table>

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Do not add any type of report, such as a calendar, to iFrames. For more information on adding a report directly onto a page without using iFrames, see Embedding reports in Jelly.

Note: To deliver ServiceNow content from a web page, see Service Portal instead.

1. Navigate to **Content Management > Specialty Content > iFrames**.
2. Click **New**.
3. Complete the iFrame form fields.
Integrate Live Feed with CMS

You can provide access to Live Feed from pages built in the Content Management System (CMS). For example, allow an end user to access your company feed via the ESS portal.

The ESS Portal template includes the Portal - Live page and Live Feed dynamic block (requires the Live Feed plugin). To provide access to Live Feed from CMS pages, add the Live Feed dynamic block to a CMS page or include the Portal - Live page in a site.

1. Navigate to Content Management > Specialty Content > iFrames.
2. Click New.
3. Complete the iFrame block form with the following values.

   **Iframe values**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name: Live Frame</td>
</tr>
<tr>
<td>Frame name</td>
<td>Type a frame name: live_frame</td>
</tr>
<tr>
<td>URL</td>
<td>Enter <a href="https://instance">https://instance</a> name/live_feed.do?sysparm_doctype=true. Replace instance name with your instance URL, for example, &lt;myinstance&gt;.service-now.com.</td>
</tr>
<tr>
<td>Sizing</td>
<td>Select Fixed Size and enter height and width pixel dimensions according to the page on which you plan to display the feed. For example, enter a width of 1024 and height of 768.</td>
</tr>
</tbody>
</table>

4. Click Submit.
5. Complete the steps in Add the block to a page.

**Iframe methods**

The following examples show how system records are pulled into an iFrame that is placed on a content page.

For system lists or forms, use the frame name gsft_main so that links work properly.
• **Order Hardware** is an example of linking to a catalog category.
  • URL: `com.glideapp.servicecatalog_category_view.do?sysparm_parent=d258b953c611227a0146101fb1be7c31&sysparm_view=`
  • Frame name: `gsft_main`

• **My Approvals List** is an example of linking to a list with a view filter and a JavaScript that reference the authenticated user.
  • URL: `sysapproval_approver_list.do?sysparm_query=approver=javascript:getMyApprovals()&sysparm_view=ess`
  • Frame name: `gsft_main`

• **Service Catalog Home Page (system)** references the system catalog page within the Service Catalog application. If you are satisfied with the way the catalog looks, this method is an easy way to bring the page into a CMS design.
  • URL: `catalog_home.do?sysparm_view=catalog_default`
  • Frame name: `gsft_main`

• **Problem Management Overview** references a homepage. `../` makes the URL string relative to system homepages. Without it, the URL string resolves to the default CMS homepage reference in the site.
  • URL: `../home.do?sysparm_view=problem_overview`
  • Frame name: `gsft_main`

---

**Configure a detailed content block**

A detailed content block displays the content of an existing document, such as an incident, knowledge article, or service management request. The document type determines the page that a list of documents points to.

Role required: content_admin or admin

The block works with content types in the **Default detail page** field. For more information, see Configure a content type.

If you plan to use a script to find a document, configure the form to add the **Script** field if it is not displayed.

1. Navigate to **Content Management > Configuration > Page Detail Settings**.
2. Click **New**.
3. Complete the Detailed Content form.

---

**Detailed Content form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the Detailed Content block.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the detailed content block. If the block <strong>Type</strong> is <strong>Show the page's current document</strong>, the category displays content from any link of the same type.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border styling for the detailed content block. For more information, see Format a frame.</td>
</tr>
<tr>
<td>Model Document</td>
<td>Select the document to display by default.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Type | Select the behavior for the block.  
  • **Show a Specific Document**: Displays the Model Document.  
  • **Show the page’s current document**: Displays the currently selected document.  
  • **Use a script to find a document**: Uses the Script field to select a particular document.

Conditional | Select the check box and enter any scripted conditions to be applied. Selecting this check box adds a Condition script field and **Logged on** check box to the form.

Script | Enter a script to find an appropriate document if the Type is set to **Use a script to find a document**. Set the **Return** to the GlideRecord of the desired document.

---

4. Click **Submit**.

### Content Management and the Apache Jelly engine

Apache Jelly is a Java-based and XML-based scripting and processing engine for turning XML into executable code.

The Apache Jelly engine closely resembles XML and should be comfortable for developers familiar with JavaScript, XML, XHTML, or HTML. In the ServiceNow instance, the Apache Jelly engine renders items such as forms, lists, and UI Pages. Apache Jelly code renders well within a dynamic content block, but can have issues when used in static blocks. You can use Jelly tags, calls, and statements, but HTML acts just like XHTML.

```xml
<?xml version= "1.0" encoding= "utf-8" ?>
<j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null" >
  <j:if test = "${current_page.getName()=='Solutions'}" >
    <h1 class = "page_name" > <b> <a href = "solutions.do?" title = "${gs.getMessage('Solutions')}" >${gs.getMessage('Solutions')}</a> </b> </h1>
    <p class = "page_description" >
      ${current_page.getDescription()}
    </p>
  </j:if>
  <j:if test = "${current_page.getName()=='IT 3.0'}" >
    <h1 class = "page_name" > <b> <a href = "solutions.do?" title = "${gs.getMessage('Solutions')}" >${gs.getMessage('Solutions')}</a> </b> |
      ${current_page.getName()}
    </h1>
    <p class = "page_description" >
      ${current_page.getDescription()}
    </p>
  </j:if>
</j:jelly>
```

Ensure that all tags are closed. If the tag is not a naturally closing tag, then place a forward slash before the end bracket. For example, a `<BR />` or an `<IMG src="cms.png" />`.

If you are unfamiliar with Jelly scripting, review these topics:

- #unique_513
Include the following tag with all Apache Jelly scripts.

```xml
<j:jelly trim= "false" xmlns:j= "jelly:core" xmlns:g= "glide" xmlns:j2= "null" xmlns:g2= "null" >
```

The tag looks complex, but keep the following information in mind.

- **Apache Jelly script uses multiple namespaces.**
- There are two types of prefixes in tags: j and g. The j prefix is used for tags that are natively part of Apache Jelly. The g prefix is used for tags that the ServiceNow platform created and is using for platform purposes.

The j2 and g2 prefixes are just like j and g, except that they are processed in a second phase. The Apache Jelly script parser runs through each j and g tag respectively. For example:

```xml
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
  <j:set var="jvar_phase1" value="Hello" />
  <j2:set var="jvar_phase2" value="World" />
  ${jvar_phase1} ${jvar_phase2}
</j:jelly>
```

In phase 1, the parser runs through all the j and g tags. It then caches the result. Before it runs the second phase, it takes the j and g namespaces and moves the namespaces to the second phase. It looks something like the following code.

```xml
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide">
  <j2:set var="jvar_phase2" value="World" />
  Hello ${jvar_phase2}
</j:jelly>
```

For subsequent calls of this script, only phase 2 is parsed.

**Note:** If you plan to use phase 2 Jelly tags (g2 and j2) on the Content Type [content_type] or Dynamic Content [content_block_programmatic] tables, select the **Two phase** option on the content form.

Another example is to create a report of all open incidents assigned to each group. For this purpose, you could use a report and save time, but it is a good example for learning Jelly. Start with the Jelly tag:

```xml
<j:jelly trim="false" xmlns:j= "jelly:core" xmlns:g= "glide" xmlns:j2= "null" xmlns:g2= "null" >
</j:jelly>
```

First, you need a list of open incidents. Use a `g2:evaluate` tag. The evaluate tag runs the script. Anything inside the tag is parsed like a business rule, so, for example, you can call global business rules, script includes, and gliderecord.

```xml
<g:evaluate var="jvar_groups" object="true">
  var now_GR = new GlideRecord("sys_user_group");
  gr.orderBy('name');
  gr.query();
</g:evaluate>
```
This script is in phase 1 because frequent changes to incident assignment groups are not expected. Also notice the var attribute on the evaluate tag. This attribute specifies what variable is set from this block. At the end of the script, there is a gr on a line by itself. That last line is what sets the variable.

You can omit the jvar_groups variable, but then all the variables in the evaluate tag become Apache Jelly variables. The object=true specifies that the variable is not a primitive data type. If object=true is omitted, the script would break because jvar_groups would only be able to hold items like integers and strings.

After the evaluate tag, loop through these groups and find the incidents for each one.

```xml
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
  <g:evaluate var="jvar_groups" object="true">
    var now_GR = new GlideRecord("sys_user_group");
    gr.orderBy('name');
    gr.query();
    gr;
  </g:evaluate>
  <table>
    <tr>
      <th>Name</th>
      <th>Incidents</th>
    </tr>
    <j:while test="${jvar_groups.next()}">
      <tr>
        <td>${HTML:jvar_groups.getValue('name')}</td>
        <td></td>
      </tr>
    </j:while>
  </table>
</j:jelly>
```

You can include normal XML in the Apache Jelly script at any time. Since there is no namespace, the Apache Jelly script does not try to parse the XML tags. Notice the j:while loop. It is a normal while loop and can iterate through a GlideRecord object. Also notice that you output a value with ${HTML:jvar_groups.getValue('name')}.

Here are the important elements:

- The outer brackets, ${}, specify the output of the variable and the phase in which the variable is output: ${} means first phase, $[] means second phase.
- HTML before the expression is for escaping the output. The expression jvar_groups.getValue('name') is being escaped for HTML. For other types of escaping, there are JS (Javascript), NS (No Script), and some other options.

To select only one record and not iterate through many records, the code looks like the following example:

```xml
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
  <g:evaluate var="jvar_groups" object="true">
    var now_GR = new GlideRecord("sys_user_group");
    gr.orderBy('name');
    gr.query();
    gr;
  </g:evaluate>
  <j:if test="${jvar_groups.next()}">
    We found ${HTML:jvar_groups.getValue('name')}
  </j:if>
</j:jelly>
```
Content management and Jelly code examples

Code examples

**Header Example Code**

This dynamic content block needs to be active and have the "Two Phase" option clicked. The g:requires tag is including the UI script defined in the system whose name is "servicenow.website.globals". The file extension in the call is .jsdbx and is used only in the call to the UI script, not in the name of the script in the system. For JSDBX, the file being called is a JavaScript(.js) defined within the database (db) that needs to be cached (x).

```xml
<?xml version= "1.0" encoding= "utf-8" ?>&lt;j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null" &gt;
  &lt;g:requires name = "servicenow.website.globals.jsdbx" /&gt;
&lt;/j:jelly&gt;
```

**Page Title and Description Example Code**

This dynamic content block needs to be active. There are two actions within this code snippet. First is a forward-looking string container that allows site translation, the ${gs.getMessage('Your Text')} string call. The second action pulls in the page title and description, ${current_page.getName()} and ${current_page.getDescription()}.

```xml
<?xml version= "1.0" encoding= "utf-8" ?>&lt;j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null" &gt;
  &lt;j:if test = "${current_page.getName()=='Solutions'}" &gt;&lt;h1 class = "page_name" &gt; &lt;b&gt; &lt;a href = "solutions.do?" title = "${gs.getMessage('Solutions')}" &gt;${gs.getMessage('Solutions')} &lt;/a&gt; &lt;/b&gt; &lt;/h1&gt;&lt;p class = "page_description" &gt; ${current_page.getDescription()}&lt;/p&gt; &lt;br /&gt;&lt;/j:if&gt;&lt;j:if test = "${current_page.getName()=='IT 3.0'}"
  &gt;&lt;h1 class = "page_name" &gt; &lt;b&gt; &lt;a href = "solutions.do?" title = "${gs.getMessage('Solutions')}" &gt;${gs.getMessage('Solutions')} &lt;/a&gt; &lt;/b&gt; &lt;/h1&gt;&lt;p class = "page_description" &gt; ${current_page.getDescription()}&lt;/p&gt; &lt;br /&gt;&lt;/j:if&gt;&lt;/j:jelly&gt;
```

**List Block Pulling From Knowledge Articles Example Code**

This code example contains one of the best tricks in the CMS. Using the type field with draws from a number of defined list definitions to make slight, or very dramatic changes, to list display. Because the UI is open to configuration and innovation, this is a good opportunity to use design skills. Anyone who can use HTML and CSS knows that a basic list can be turned into a float grid or be made inline. The combinations are limited only by what the designer can dream up and code.

In the code example, there is a custom logo field (u_logo) added to the Knowledge form. The custom field displays customer logos, partner logos, and award images on the awards page. There are a number of different sections that use this list definition so efficient reuse is taking place.

- div class="cms_knowledge_list customer_success" - Begin by creating an outer container with a unique class name that can be used as a basis for CSS style selectors and rules. From the outer container, many of the child elements can be accessed for theming.
- g:for_each_record file="$(current)" max="$(jvar_max_entries)" - Loop for list creation that calls the selected table record and the entries set on the list form.
- a href="knowledge.do?sysparm_document_key=kb_knowledge,${current.sys_id}"<img src="$(current.u_logo.getDisplayValue())" alt="${current.text}" width="110px"/> - Defines linking to the...
article detail in the knowledge base. For further reference, look at content types within the site definition and you will see some similarities. The knowledge.do? portion of the URL points to the knowledge detail page which (as mentioned above) is mandatory if you plan to call the knowledge base in your CMS site. The rest of the URL represents the syntax for calling a knowledge article by its sys_id. Each and every item housed within the system has a unique sys_id.

- `<ttt>${SP}-${SP}${current.author.first_name}${SP}${current.author.last_name}</ttt>` - This example is commented out and not used, but it is still interesting in that it has a jelly call `${SP}` and it pulls the knowledge article’s author by first and last name.

```xml
<?xml version= "1.0" encoding= "utf-8" ?>
<j:jelly trim= "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null" >

<div class = "cms_knowledge_list customer_success" ><g:for_each_record file = "${current}" max = "${jvar_max_entries}" >
<tr><td class = "cms_knowledge_list_image" >
<j:if test = "${current.u_logo.getDisplayValue() != ''}" >
<div class = "knowledge_article_logo" ><a href = "knowledge.do?sysparm_document_key=kb_knowledge,${current.sys_id}" > <img src = "${current.u_logo.getDisplayValue()}" alt = "${current.text}" width = "110px" /> </a></div>
</j:if>

</td><td width = "100%" ><a href = "knowledge.do?sysparm_document_key=kb_knowledge,${current.sys_id}" target = "_top" ><span class = "cms_knowledge_list_link" >${current.short_description}</span></a><p class = "kb_description" >
"${current.description}"
</p></td><td width = "100%" colspan = "2" class = "kb_learn_more" ><p class = "kb_learn_more" >Learn More</p></td>
</g:for_each_record></div>

</j:jelly>

Style in Content Management

Content pages can be styled with CSS, just like any HTML website.

Three elements control CSS styles:

- **Style Sheets** are records containing CSS declarations.
- **Themes** are groups of style sheets that can be invoked together.
- **Frames** are UI macros that define the outer border of individual content blocks as they appear on a content page. Frames work by calling on particular definitions in the style sheets.

Style sheets

Styles sheets are standard Cascading Style Sheets (CSS) that define the look and feel of all elements within the interface.

Cascading Style Sheets (CSS) can either be internal (stored in the database) or external (hosted on the server), based on organizational needs. To define an internal style sheet, use standard CSS in the style field. Using external CSS allows the Content Management System to use the same CSS as a corporate website or other online resource.
Use an external style sheet by defining a URL that points to the .cssx file. If you upload a .cssx file to the platform, you can reference the .cssx file using a URL.

Content pages do not reference style sheets directly. To invoke a style sheet, you assign the style sheet to a Theme using the related list on the Theme form.

Design themes
Design themes are the convergence of structure and styling, making them a critical tool for creating a powerful user interface.

For a successful project, review the corporate style guide and communicate with the corporate website art team. If the organization has an art or design department that maintains branding, include them in this process.

A theme is a collection of one or more style sheets (CSS files) that define a consistent look for a set of pages. In most environments, many pages share a few themes. Use multiple themes within a site to create stylistic differentiators between site areas. You can also use a single theme to create one unified look and feel for the site.

Customize a design theme
A theme is a collection of one or more style sheets (CSS files) that define a consistent look for a set of pages.

Role required: content_admin or admin

Themes can be invoked in any of the following ways.
• Directly by content pages.
• As the default theme of a content site.
• On the configuration page as a global default.

1. Navigate to Content Management > Design > Themes.
2. Click New.
3. Type a name for the theme and mark it as Active.
4. Right-click the form header and click Save
   The Style Sheet related list appears.
5. Use the Style Sheet related list to add style sheets to the theme.

Doctypes
The view_content html page template on which all CMS is based defaults to doctype=html.

The code looks like the following HTML source code.

```
<!DOCTYPE HTML>
```

If your CMS site does not render properly, remove the doctype from the page by setting the following property:
• glide.html.doctype.pages =
  chat_desktop, live_feed, live_feed_small, navigator, navpage11, image_browse

The following is the default for this property.
• glide.html.doctype.pages =
  chat_desktop, live_feed, live_feed_small, navigator, navpage11, image_browse, view_content

Setting this doctype offers these benefits for building new sites:
• Incorporating common practice: Use a practice that is becoming widely adopted across the Internet and can prevent certain browsers from running in quirks mode.
• Cleaner CSS and markup: Write more standards-based CSS and markup to promote code sharing.
• A step towards browser compatibility: Find solutions that work across browsers and avoid browser-specific workarounds.

Format a frame

Frames provide a way to manage decorative containers for content blocks and any other elements within the site. For example, one frame can be a container, made of div or span tags, that is styled with rounded corners.

Role required: content_admin or admin

Individual content blocks use a frame UI macro to define the frames. When viewing a content block form, the Frame field offers a choice between the different frame UI macros. The frame UI macro does not, however, have the definition for the frame within its Jelly script. Instead, it references a particular frame as defined in a style sheet.

Configuring a new frame is a two-step process.
1. Define the frame in a style sheet.
2. Create the frame UI macro to invoke the frame definition.

Define a frame in a style sheet

Add style definitions for any custom frame UI macro you create.

Role required: content_admin or admin

Each frame has its own class name.
1. Navigate to Content Management > Design > Style Sheets.
2. Select a style sheet to contain the frame definition.
   Base system themes use a separate Frames style sheet.
3. Add the following code, substituting the desired frame name and style:
   ```
   div.FRAMENAME{border:STYLE;}
   ```
4. Click Update.

Create a frame UI macro

Copy an existing frame UI macro to display content in a custom frame.

Role required: content_admin or admin

Create a custom frame UI macro if you want to control the style of the frame with your own style sheet definitions.
1. Navigate to Content Management > Design > Frames and select one of the existing frame UI macros.
2. Change the name to match the FRAMENAME you used in the style sheet.
3. Right-click the header bar and select Insert and Stay.
4. Update the frame name in the XML field as shown:
   ```
   <div class="FRAMENAME">
   ```
5. Click Submit.

   • In any content block form, select the UI macro.
Define the frame in a style sheet.

**Content Management meta tags**

Meta tags are special tags in web pages that contain information about the page but are not rendered with the page. You can define custom meta tags for content pages.

Meta tags are not noticeable to a page visitor unless the visitor looks at the page source code. Web search engines read meta tags as they "crawl" the web, identifying and organizing content. Modern website designers often use meta tags to embed "hints" to search engines about how to index or otherwise crawl the site.

Structurally, a meta tag consists of a tag and a name/content pair and looks similar to the following code.

```html
<meta name="generator" content="MediaWiki 1.16wmf4" />
```

The Content Management System allows you to define both site level and page level tags.

**Configure a page level meta tag**

A page level tag is a meta tag defined on a specific page and included on only that page.

Role required: content_admin or admin

If an individual page has a specific tag with the same name as the site, the page tag takes precedence.

1. Navigate to **Content Management > Pages**.
2. Open the page.
3. If not already included, add the **Meta Tags** related list to the form.
4. In the **Meta Tags** related list, click **New**.
5. Type a **Name** and **Content** for the tag.
6. Click **Submit**.

**Configure a site level meta tag**

A site level tag is a meta tag is defined on a site and included on every page within that site.

Role required: content_admin or admin

If an individual page has a specific tag with the same name as the site tag, the page tag takes precedence.

1. Navigate to **Content Management > Sites**.
2. Open the site.
3. If not already included, add the **Meta Tags** related list to the form.
4. In the **Meta Tags** related list, click **New**.
5. Enter a **Name** and **Content** for the tag.
6. Click **Submit**.

**Configure DIV-based layouts**

After you create your site, you can change the site layout with DIV tags.

Role required: content_admin or admin

Many web page layouts use tables for a consistent look and feel. Tables are effective for numbers and statistics, but can be limiting for designing other types of information. DIV tags are flexible block-element tags. To use DIV tags for layouts, give the tag an ID and assign attributes using CSS.

Changing to CSS and DIV tags help in the following ways:
• simplify code
• reduce the amount of code
• increase page load speed
• separate content from presentation
• help pages adapt to different device resolutions
• make pages easier for search engines to crawl
• make code more compliant with evolving web page design standards

A theme named Administration Theme - Charcoal is included as an example of CSS-driven, DIV-based layouts. To view the Administration Theme - Charcoal DIV-based layout, complete the following steps.

1. Navigate to Content Management > Design > Layouts.
2. Click Admin 1 Column
3. Review the code.

Content meta tag hierarchy

Page and site level meta tags are included in a content meta tag hierarchy.

Site and page level tags

CMS supports page level and site level tags. The system behavior is to show the sum of all page level and site level tags. For example, if you have two tags on the site and one tag on the page, all with different names, you see three tags on the page. Two are from the site and one is from the page. If both the site and the page have a tag of the same name, only the page tag is used.

**Note:** The Content Management System does not support some commonly used meta tags. For example, you cannot use the X-UA-Compatible meta tag, which allows you to specify which version of Internet Explorer a site should be rendered in.

Example: all tags have unique names

<table>
<thead>
<tr>
<th>Site Level</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakfast</td>
<td>eggs</td>
</tr>
<tr>
<td>lunch</td>
<td>sandwich</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Page Level</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>dinner</td>
<td>steak</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakfast</td>
<td>eggs</td>
</tr>
<tr>
<td>lunch</td>
<td>sandwich</td>
</tr>
<tr>
<td>dinner</td>
<td>steak</td>
</tr>
</tbody>
</table>

Example: page level tag overrides site level tag

<table>
<thead>
<tr>
<th>Site Level</th>
<th>Content</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Page Level</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakfast</td>
<td>eggs</td>
</tr>
<tr>
<td>lunch</td>
<td>sandwich</td>
</tr>
<tr>
<td>dinner</td>
<td>steak</td>
</tr>
</tbody>
</table>
Content Management integration points

Integration points use content blocks in CMS to link different applications together using static and dynamic methods.

By using integration points, users can connect to different systems from a single page. The power of the CMS is that it can display any data within the ServiceNow platform. The ESS portal, for example, connects users to a service catalog, a knowledge base, and a help and incident reporting site. Each section contains a set of links to additional content. List blocks offer the easiest way to display data dynamically. Content types define how lists link to the detailed data they reference.

Generating lists from the ServiceNow platform is straightforward, especially if you use filtering. When the CMS was first introduced, lists were the only method available to create navigational systems for sites. Content types define system record links using specific templates to define the list and the details.

- Summary template: defines the list
- Detail template: defines the detail as it is rendered in a page.

The templates work together to pass data attributes or unique record identifiers (sysid) into a single detail page that manages the data. Any attribute variations use the URL sent to the page.

Understanding how content types work can mean the difference between a site with 20 pages versus a site with 200 pages. There is a time for both types of data calls. Depending on the task, there are appropriate times to use static content and times for dynamic methods.

View links between system elements and URLs

You can view the links between your system elements and their URLs to render more specific content within your site.

Role required: content_admin or admin

See the #unique_521 page for an overview of URL syntax in the ServiceNow platform.

The Incidents list offers a quick example of viewing a form within its own tab. This viewing method illustrates how to append the URL string to render more specific content within your site.

1. Navigate to Incident > All.
2. Right-click in a blank area within the content frame and select **Open Frame in New Window** or **Open Frame in New Tab**.

The URL returned looks similar to this example.

```
<instance_name>/incident_list.do?
sysparm_userpref_module=b55b4ab0c0a80009007a9c0f03fb4da9
```

The URL is comprised of the following elements.

- `incident_list.do?` is the call to the list with no parameters passed into it. Explore context menu options and list filtering variations to see how the URL string is appended with each action.
- `incident_list.do?sysparm_query=&sysparm_view=ess` is an example of how the view is passed in the URL string.
- `incident_list.do?sysparm_query=GROUPBYactive&sysparm_view=` is how the URL looks when the **group by** option is chosen from the context menu.
- `incident_list.do?sysparm_query=category%3Dsoftware` is the result of applying a **category is software** filter to the list.

Explore all the options available within the right-click menu. Click through to the Incident form itself (incident.do) to see what the URL string does when parameters are passed into it.

**Element link examples**

View examples that show how to create a site pointing to various system data in several different data tables.

The following examples illustrate setting up access to the following system data.

- **Knowledge**: building a versatile front end for a knowledge base, from overview page to variations on the list definitions used in the site.
- **Catalog**: ideas for a business-to-consumer shopping experience that pulls various items and forms from your service catalog.
- **Service Portfolio**: using the business service portfolio to contain all defined services offered by your organization.
- **Featured reports**: methods for linking to the most important reports.
Example links to system data

Page source view

Use the tools available in your browser to view the frame source page and understand what URL address bars pass between system frame sets.

The Firefox browser, for example, has the developer tools option. This option provides an easy way to view records that render within the main content frame (gsft_main) of the ServiceNow platform. Also, Firefox quickly builds menus and links to records within the system.

This Firefox functionality is useful when stepping through the menu items section.
Static methods

Static methods in the CMS application were created for ease of use.

Form-based menu management and WYSYWIG code editing can be useful to both advanced and entry-level users. The technical ability of subject matter experts (SMEs) managing the language of your site can vary considerably. Letting SMEs write the content and having a technical resource manage the linking expedites menu and link creation within the system.
Static and dynamic methods

Navigation Menu Links

Use base system templates to group similar links for placement on the page. Though the terminology is different (menu sections and menu items), this type of linking behaves the same way as content links. For more information on creating a navigation menu block, see Create a navigation menu block.

Static HTML Details

Content blocks that are useful for areas administered by developers unfamiliar with HTML or markup. Anyone familiar with markup can use dynamic blocks because they are extendable. For more information on static HTML, see Using Content Blocks.

Content Links

The predecessors to navigation menus from when the CMS was first introduced. Use content links to make navigational links by defining several content links under the same category. Then, call the links as a list referencing the Content Link [content_link] table.

iFrame Details

Used both dynamically and statically throughout the system. Using them is an easy way to bring any form or list into your CMS pages. For more information on iFrame methods, see Using Content Blocks.
Dynamic methods

While static methods are a powerful navigational tool, you have more control over data rendering using the dynamic methods.

Reference common code in the system to make long-term maintenance of the site easier. Coding skills are useful when implementing dynamic methods.

Dynamic Blocks

These blocks are where the majority of your work resides. For more information, see Configure dynamic blocks.

Frames

Frames are meant to be decorative wrappers around any block in the system. They are mentioned with dynamic blocks because frames are essentially UI macros with the category of Frame. Frames apply the ${body} variable to a block and define where the block is inserted when rendered on the page.

Lists
Lists generate links to records based on the filtering rules you define. Lists can be sorted for presentation by any field in the corresponding record. Lists help supplement navigation and pull data from outside the CMS. For more information, see Customize the list block.

Content Types

Content types provide site-specific control of how system data defined as templates is rendered. The rendering of lists is considered first (summary templates). The next consideration is the detail template, which allows control over the record rendering.

List Definitions

List definitions enable you to extend the summary template defaults defined on the site level. Used with frames, list definitions render the same data differently based on the placement on the page or site. For more information, see Configure list definitions.

Detailed Content

Detailed content in page detail settings) are blocks that display the content of an existing document as a block on a content page. For more information, see Configure a detailed content block.

Example integration points

Each element on the page links to a specific URL point.
- **Target page frame name:** gsft_main
- **Desktop Computing URL:** category_browse.do?category=Desktop Computing
- **Business Applications URL:** category_browse.do?category=Business Applications
- **Communications Services URL:** category_browse.do?category=Communications Services
- **Infrastructure Services URL:** category_browse.do?category=Infrastructure Services
- **Hosting Services URL:** category_browse.do?category=Hosting Services

**Featured Services** links to a content page which pulls a small subset of services into an iFrame.
- **iFrame URL:** com.glideapp.servicecatalog_category_view.do?
sysparm_parent=d67c446ec0a8016500335aa37eafbc1&sysparm_view=

  - **Service Level Agreements (SLA) URL:** ../home.do?
sysparm_userpref_homepage=757e86a30a0006d401a6851639498d1

**Content Management testing**

Test your site to ensure that all pages display correctly, links go to the specified address, and images are not broken. It is important to test the site as you build it. Do not wait until just before launch to begin testing.
Also, test templates as you create them so any issues are resolved before creating other content based on the templates. Recruit as many people as possible to help you test.

Here are some general site testing guidelines:

- Test on the browsers and platforms your site visitors use
- Test on various monitors (for example, LCD and CRT)
- View pages using different screen resolutions
- View pages using different color settings
- Test all navigation and links
- Test items that can be downloaded (for example, PDF files)
- Test the search functionality
- Test site security
- If necessary, test for accessibility (for guidelines, see the W3C Website Accessibility Initiative)

**Global search in Content Management**

When you add global search to a CMS site, two different search result blocks can display, depending on the user role: global or no global.

Roles are defined at System Properties > Global Text Search.

- Search Results (Global): For users with permission to use the global search within the normal frame set. The normal frame set is defined as the default, non-CMS user interface with the set of frames.
- Search Results (No Global): For users without permission to use the global search. Searches only the knowledge base and the catalog.

The header search bar and the Search dynamic block in the base system both automatically handle the permissions and direct the user to the appropriate search results. In the base system, the search result blocks are deployed on the same Search Results content page.

In order for the global search to work properly, it is important to ensure that the DEFAULT directs users to a working content page. If not, the results from the global search link back to the frame set, not to pages within the CMS site.

**Note:** The global search is similar to the normal frame set user interface and ties to the same roles (#unique_541).

**Search Results (Global)**

Before you use the Search Results (Global) dynamic block, define content types to control the behavior a search result is clicked. If no content type is defined for a table, selecting a link on that table renders the results according to the DEFAULT content type. It is good practice to point the DEFAULT content type to a page with a normal "Current Document" detailed block. Set the content type detail (Detail Template field) to have just an iFrame.

The Search Results (No Global) dynamic block does not require any additional configuration.

**CMS translation**

You can translate CMS sites by activating internationalization plugins and manually translating custom interface strings.

Two tables support the translation of a CMS site into other languages.
• Translated Name / Field [sys_translated]: Stores strings that are shared or commonly used within a site. These include menu section names, menu item names, site breadcrumb names, link names, and footer menu links. Internationalization plugins typically provide translations for these strings. See Localization settings.
• Translated Text [sys_translated_text]: Stores unique string translations which you create when you manually translate interface elements. See #unique_544.

**View a translated CMS site**

Activating an internationalization plugin provides a quick way to see translated strings for CMS menus, breadcrumbs, and links. For a full translation, you must translate the instance manually.

The following example explains how to view a translated site in Japanese.

1. Navigate to **System Definition > Plugins**.
2. In the **Go to** filter, select **Name**, enter **I18N**, and then press the Enter key.
3. Activate both the **I18N - Japanese Translations** and the **I18N: Knowledge Management Internationalization Plugin v2** plugins.
4. Refresh the browser.
5. In the **Language** picker in System Settings, select **Japanese**.
6. Browse the site to see the translated language strings.
7. Navigate to the ESS Portal. The path is: http://Instance Name.service-now.com/ess/.
8. Browse the site to see the translated language strings in the ESS Portal.

**Credentials and connection information**

Credentials and connection information are required to gain access to a computer or network device for Discovery, Service Mapping, and Cloud Management or to perform work using Orchestration. When adding content to Share or AppStore, you can configure connections and credentials relevant to your environment without modifying built content.

Introduction to credentials, connections, and aliases

All application integrations in the ServiceNow platform use connection information, credentials, and aliases to enable their respective applications to access resources.

Before you can execute an application integration in your instance, you must create and configure the corresponding connection information and credentials. Connections pertain to an integration with a system, such as an IP address or endpoint with protocols. It contains specific details, such as database particulars, when integrating with a database. The associated credentials are the authentication data required to make the connection.

Connection information and credentials can vary between QA/Development/Production environments for the same integration. The tight coupling between this data and application metadata, such as workflow or job scheduling, make application metadata obsolete when you change environments. To alleviate this problem, the concept of an alias is introduced, to decouple connections and credentials from application metadata. These aliases allow customers to design their application metadata to pair with an alias, which resolves to connection and credential data during runtime.

There are two types of aliases, a connection and credential alias and a credential alias. Business rules enforce certain constraints on these aliases. Names must contain letters, numbers, and underscores, but cannot use special characters. The alias must be unique in a scope. If you choose to have multiple active connections, you can have more than one active connection in the same domain. If you do not choose this option, you can have only one active connection per domain.

Note: If you enable multiple active connections, the application picks one connection based on an established order. This order depends on the API you use to retrieve connection data.

You can add additional connection attributes to an alias, which are available in connection data during run time. Variables overridden by connection administration during run time should not affect the alias.

The credential alias resolves only credential data. Along with the alias data model, you can use a scriptable API that gets connection and credential data at runtime.

Upgrading credential tags

The upgrade process migrates credential tags to credential aliases. All credential tags in the Credentials [discovery_credentials] table have a corresponding credential alias with this information:

- **Name**: Unique alias name
- **Scope**: global
- **ID**: Alias name

Note: The credential tag field type changes from string to GlideList in the Credential table and the credential alias field refers to the created alias records.

Credential synchronization on MID Servers

Each MID Server in your network synchronized with the instance keeps a copy of every credential that you create. This synchronization speeds up the reading of credentials when applications like Discovery or Service Mapping need to access multiple devices on the network. The MID Servers synchronize when they find a credentials_reload job in the ECC Queue. The reload job instructs the MID Server to make a SOAP call to the instance to get the entire list of credentials in the Credentials [discovery_credentials] table, including all the field values.
The SOAP response that your instance sends to each MID Server also includes custom fields that you added to any credential form that you customized. If you added reference fields, the data in the referenced table is also sent as part of the SOAP response. This can lead to performance issues when credential synchronization occurs with multiple MID Servers. To control this, manually add these properties to the System Properties [sys_properties] table:

**Note:** To change the values in these properties, add them to the System Properties [sys_properties] table. If you do not add them, the system uses the default value.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.snc.credentials_user_fields</td>
<td>Includes all customized fields in credential sync. Set this to false if you do not want to include the fields that you added to credential forms.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> true</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> true</td>
</tr>
<tr>
<td>com.snc.credentials_recursion_depth</td>
<td>Defines the number of tables to traverse when the credential sync mechanism collects fields from reference tables. Lower this number if you are experiencing performance issues and you have customized credential forms that include reference fields to tables that also have reference fields.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> 3</td>
</tr>
</tbody>
</table>

**Domain separation for Credentials and Connections**

This is an overview of domain separation for Credentials and Connections. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Overview**

**Support: Level 1**

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

Credentials are tied to various ServiceNow features which access systems outside the instance. Credentials follow the domain separation tied to the feature employing the credentials.

Connections are protocol-specific information referencing a target host outside the instance. A connection can specify the domain to run an activity.

**How domain separation works in Credentials and Connections**

Credentials access resources outside of the instance, and are used by the #unique_558, Orchestration, #unique_560, and #unique_561 applications. These credentials are not tied to a specific domain, rather, they can be bound to an application and then follow the domain separation that the application uses.
Credentials can also be assigned to a MID Server, and then follow the domain separation specified by the MID Server configuration.

Connections access a target host using a JMS, JDBC, or HTTP(s) connection. You can specify global or a specific domain to which the connection belongs.

**Create connection attributes for IntegrationHub**

Define connection-specific variables that you can use in IntegrationHub integration steps.

- The admin role is required to create connection attributes.
- The connection_admin or admin role is required to assign attribute values.
- The action_designer or admin role is required to use attributes in a custom action.

Connection attributes are only used by integration steps, which require a subscription to IntegrationHub. For more information about activating IntegrationHub, see Request an IntegrationHub plugin.

When using an integration step, you must establish a connection with an external system. Use a Connection & Credential alias instead of defining the connection inline. An alias enables you to update the connection details once without having to reconfigure every action. Any action step that uses an alias inherits the attributes associated with it. Flow Designer displays attributes as data pills that you can drag into your action step. For example, you can create a page size attribute that becomes a REST step query parameter.

For more information about building custom Flow Designer actions, see Action Designer.

1. Navigate to **Credentials & Connections > Connection & Credential Aliases**.
2. Create or select an alias record.
3. From the Connection Attributes related list, click **New**. The Connection Attributes form opens.
4. Define the attribute label and field type. For a list of field types, see field types.
5. Click the Advanced view related link to set advanced dictionary preferences for the attribute. For example, to create an attribute with a dynamically calculated value. See Dictionary entry form.
6. Click **Submit**.
7. Define the attribute values in the connection record.
   a) Navigate to **Credentials & Connections > Connections**.
   b) Create or select a connection record with the same connection type as the alias.
   c) From **Connection alias**, select the alias with connection attributes.
   d) Save the record. The Attributes tab populates with the connection attributes defined in the alias record.
   e) Set values for the attributes.
      If the alias has **Support Multiple Active Connections** enabled, you can associate more than one connection record with an alias and define attribute values in each connection record. If there are multiple connection records with attribute values for the same alias, the connection used when the flow executes determines the attribute values. For example, suppose that you have one action that uses an alias with two active connections endpoints: production and test. The attribute resolves to the value defined by the connection used at runtime.
8. Add the alias to an integration step in Action Designer.
   a) Navigate to Flow Designer and create or select an action.
   b) Add an integration step to the action.
   c) Under Connection Details, add the alias you created attributes for.

   The connection attributes associated with the alias display as data pills in the Data pane.

   **Note:** The system does not track changes to connection attribute labels and data types after you associate the alias to a step. To refresh the connection attribute label or data type, delete the alias from the step and add it again.

### Setting up connections to target hosts

Use the connections table to set up a Basic, JMS, JDBC, or HTTP(s) connection.

### Connection Table

The Connection table (sys_connection) is the base table for all connection tables. You can set up connections for the following protocols:

- Basic connection for PowerShell and SSH
- JDBC
- JMS
- HTTP(s)

The connection table references the connection alias table, which couples the connection alias to connection information. Every connection records the following information:

#### Base connection properties

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the connection. This field must be unique on the table.</td>
</tr>
<tr>
<td>Credential</td>
<td>Specify the credential to use with this connection. This is optional.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>The connection alias resolves your connection and credentials at run time. Only one connection is active per Connection alias at any one time.</td>
</tr>
<tr>
<td>Active</td>
<td>Check to make the current connection active.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain to which the connection belongs.</td>
</tr>
</tbody>
</table>

Credential is unique across active connections, if not empty.

### Upgrading connection information

- The JDBC connection [jdbc_connection] and JMS connection [orch_jms_ds] tables are existing Orchestration connection tables that now extend from the Connection [sys_connection] table. The tables originally extended from sys_metadata. The sys_metadata related data is removed.

• The tables move from the Orchestration run time plugin [com.snc.runbook_automation.runtime] to the Credentials & Connections plugin.
• The upgrade process obtains JDBC and JMS connection information and creates corresponding connection aliases and assigns the alias to its corresponding connection.
• JDBC field name changes:
  • JDBC server is renamed to host
  • Database port is renamed to port
  • Data of the JDBC server and database migrates to host and port during the upgrade

Create a basic connection for PowerShell and SSH

Configure connection information to use with a custom activity or action that uses the PowerShell or Secure Shell (SSH) protocol.

Role required: admin or connection_admin

1. Navigate to Credentials & Connections > Connections.
2. Click New.
3. Select Basic Connection for PowerShell & SSH.
4. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the connection record.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the credential record used to authorize the connection.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the alias record to associate with this connection. Using an alias enables you to update the connection record without having to reconfigure any actions or activities that use the alias.</td>
</tr>
<tr>
<td>Host</td>
<td>Fully qualified domain name of the target host where the system runs the activity or action. For example, host.domain.com.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Select to connect to the target host through a MID Server. If selected, define fields in the Advanced MID Server Configuration section. Note: PowerShell requires a MID Server.</td>
</tr>
<tr>
<td>Active</td>
<td>Select to make this connection active.</td>
</tr>
<tr>
<td>Domain</td>
<td>Determines the domain the activity runs in. Flow Designer does not support domain separation and ignores this field.</td>
</tr>
<tr>
<td>Override default port</td>
<td>Target port used by the connection. If you leave this field blank, the system uses the default port value.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>The capabilities the MID Server must support to be eligible for selection. The system runs the action or activity from a MID Server that supports the selected capabilities. Only displays if Use MID server is selected. To learn more about how a MID Server is selected during runtime, see MID Server selection.</td>
</tr>
</tbody>
</table>
5. Click Submit.

Create an HTTP(s) connection

The HTTP(s) connection provides the information custom HTTP(s) actions or activities use to connect. Role required: connection_admin

1. Navigate to Credentials & Connections > Connections, click New, and select HTTP(s) Connection.
2. Add the following connection information and click Submit:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of this HTTP(s) connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the credential record used to authorize the connection.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Select the alias record to associate with this connection. Using an alias enables you to update the connection record without having to reconfigure any actions or activities that use the alias.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Either manually enter the connection URL or use system to build the URL based on the inputs. Default is unchecked. If checked, the connection URL is calculated from the following fields:</td>
</tr>
<tr>
<td></td>
<td>• Mutual authentication — Check box if mutual authentication is used.</td>
</tr>
<tr>
<td></td>
<td>• Protocol — If mutual authentication is not used, enter protocol. The default is HTTPS.</td>
</tr>
<tr>
<td></td>
<td>• Protocol profile — If mutual authentication is used, enter protocol profile from sys_protocol_profile.</td>
</tr>
<tr>
<td></td>
<td>• Host</td>
</tr>
<tr>
<td></td>
<td>• Port</td>
</tr>
<tr>
<td></td>
<td>• Base path — Path of the connection string.</td>
</tr>
</tbody>
</table>

Note: If mutual authentication is checked, connection URL is built: Protocol + :// + host:port + URL. If mutual authentication is unchecked, connection URL is built: Protocol profile + :// + host:port + URL.
### Option | Description
--- | ---
**Use MID server** | Check to use a MID Server for this action or activity. If selected, define fields in the Advanced MID Server Configuration section.

**Capabilities** | The capabilities the MID Server must support to be eligible for selection. The system runs the action or activity from a MID Server that supports the selected capabilities. Only displays if **Use MID server** is selected.

Required capabilities determine which MID Server is selected at runtime. To learn more about how a MID Server is selected during runtime, see **MID Server selection**.

**MID Application** | The application the MID Server must support to be eligible for selection. The system runs the action from a MID Server that supports the selected application. Only displays if **Use MID server** is selected.

To learn more about how a MID Server is selected during runtime, see **MID Server selection**.

3. Click **Submit**.

You are ready to create a custom HTTP(s) action or activity.

### Create a JDBC connection

The JDBC Connection provides the information custom JDBC actions or activities use to connect to various target databases.

You must have an appropriate JAR file, whether it is supplied with the instance or a custom JAR file.

**Note:** The ServiceNow instance supplies `mysql-connector-java-5.1.21.jar`, `sql-server-jdbc-4.0.jar`, and `ojdbc6.jar` files as part of the current release, which supports MySQL, SQLServer, and Oracle databases. Other databases, such as Sybase or DB2 Universal, must use a custom JAR file that must be uploaded to the instance before setting the JDBC connection.

Role required: connection_admin

JDBC credentials are retrieved separately by the activity designer template and support external credential storage, such as CyberArk.

1. Navigate to **Credentials & Connections > Connections**, click **New** and select **JDBC Connection**.
2. Complete the form using the fields in the table.

The database selection in the **Format** field determines which fields are available.

**JDBC connection fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Database Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>All</td>
<td>Unique name of this JDBC connection. For example, you might enter <strong>JDBC MySQLProd</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>All</td>
<td>Add credentials for JDBC provider.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Database Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection alias</td>
<td>All</td>
<td>Select the alias record to associate with this connection. Using an alias enables you to update the connection record without having to reconfigure any actions or activities that use the alias.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>All</td>
<td>Maximum elapsed time the JDBC query is allowed to run without a response.</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>All</td>
<td>Maximum elapsed time for the JDBC activity to wait while attempting to connect to the target database.</td>
</tr>
<tr>
<td>Active</td>
<td>All</td>
<td>Check the box to make this an active connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>All</td>
<td>Domain for this table. By default, the JDBC Connection [jdbc_connection] table runs in the global domain.</td>
</tr>
</tbody>
</table>
| Format                | All                      | Database type for this connection. The default choices are:  
  • MySQL  
  • Oracle  
  • SQLServer  
  • None  
  You can add Sybase or DB2 Universal to the choice list by uploading the appropriate JDBC driver JAR file to the instance. Orchestration automatically recognizes these drivers when they are loaded into the system and adds them to this list. |
<p>| Host                  | Oracle, MySQL, SQLServer| Host name or IP address of the database server.                                                                                                                                                             |
| Oracle sid            | Oracle                   | The Oracle database site identifier. The default value is orcl.                                                                                                                                              |
| Oracle port           | Oracle                   | Port that the Oracle database is using. The default value is 1521.                                                                                                                                          |
| Database name         | MySQL, SQLServer         | Name of the database.                                                                                                                                                                                         |
| Port                  | My SQL, SQLServer        | Port that the selected database is using.                                                                                                                                                                   |
| Instance name         | SQLServer                | Instance name for the selected SQLServer                                                                                                                                                                   |
| Connection URL        | All                      | URL that the MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases.                                          |
|                       |                          | <strong>Note:</strong> If the format selected is not one of the default databases, you must create the connection URL manually so that the MID Server knows how to create the connection.                                    |
| JDBC driver           | None, DB2 Universal, Sybase | The JDBC driver to use for this connection when it is not a default database.                                                                                                                                |
|                       |                          | <strong>Note:</strong> If you add a Sybase or DB2 Universal database, you must enter the driver name in this field and upload the driver JAR file to the instance.                                                           |</p>
<table>
<thead>
<tr>

<td>Check to use a MID server for this action or activity. If selected, define fields in the Advanced MID Server Configuration section.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>All</td>
<td>The capabilities the MID Server must support to be eligible for selection. The system runs the action or activity from a MID Server that supports the selected capabilities. Only displays if Use MID server is selected. To learn more about how a MID Server is selected during runtime, see MID Server selection.</td>
</tr>
<tr>
<td>MID Application</td>
<td>All</td>
<td>The application the MID Server must support to be eligible for selection. The system runs the action from a MID Server that supports the selected application. Only displays if Use MID server is selected. To learn more about how a MID Server is selected during runtime, see MID Server selection.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Create a JMS connection

Configure your system to use Java Messaging Service (JMS) with a custom JMS activity or action.

Role required: connection_admin

The MID Server must have the correct JMS connection factories for your organization. Configure those values in the mid.property.jms.command.allowed_factory_names property, found in MID Server > Properties. The default values for this property can be changed to any value or comma-separated list of values that the third-party JMS provider advertises.

1. Navigate to Credentials & Connections > Connections.
2. Click New, select JMS Connection, fill in the form, and then click Submit:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of this connection factory.</td>
</tr>
<tr>
<td>Credential</td>
<td>Add credentials for JMS provider.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Select the alias record to associate with this connection. Using an alias enables you to update the connection record without having to reconfigure any actions or activities that use the alias.</td>
</tr>
<tr>
<td>Initial Context Factory</td>
<td>Name of the JNDI class that is used to create the InitialContext. For example, to connect to ActiveMQ V5.10 (JMS Provider), the value is org.apache.activemq.jndi.ActiveMQInitialContextFactory.</td>
</tr>
<tr>
<td>Provider URL</td>
<td>Location of the running JMS provider installation. For example, to connect to ActiveMQ V5.1:tcp://ipAddressOrHostName:61616.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Check the box to make this an active connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Determine the domain the action or activity runs in.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Check to use a MID Server for this action or activity. If selected, define fields in the Advanced MID Server Configuration section.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>The capabilities the MID Server must support to be eligible for selection. The system runs the action or activity from a MID Server that supports the selected capabilities. Only displays if Use MID server is selected.</td>
</tr>
<tr>
<td></td>
<td>To learn more about how a MID Server is selected during runtime, see MID Server selection.</td>
</tr>
<tr>
<td>MID Application</td>
<td>The application the MID Server must support to be eligible for selection. The system runs the action from a MID Server that supports the selected application. Only displays if Use MID server is selected.</td>
</tr>
<tr>
<td></td>
<td>To learn more about how a MID Server is selected during runtime, see MID Server selection.</td>
</tr>
</tbody>
</table>

4. Click New, select JMS Credentials, and then provide the user name and password the MID should use to communicate with the JMS provider.
   For more information, see JMS credentials.

5. Click Submit.
   You are ready to create a custom JMS action or activity.

**Getting started with credentials**

The MID Server uses the credentials you create in the Credentials [discovery_credentials] table to access resources for Discovery, Orchestration, Service Mapping, and Cloud Management.

**How MID Servers use credentials**

By default, Windows MID Servers use the login credentials of the MID Server service on the host machine to discover Windows devices in the network. You should configure these service credentials so that they have at least local administrator privileges. For Linux and UNIX machines and network devices, the MID Server uses the SSH and SNMP credentials configured in the instance in Discovery > Credentials.

MID Servers that Orchestration uses must have access to the necessary credentials to execute commands on computers in the network as specified by the Workflow activities. Orchestration can use the same SSH and SNMP credentials as Discovery, but has two additional credentials designed for specific Workflow activities: Windows (for PowerShell) and VMware.

**Encryption and decryption**

The platform stores credentials in an encrypted field on the Credentials [discovery_credentials] table. Once they are entered, they cannot be viewed.
When credentials are requested by the MID Server, the platform decrypts the credentials using the following process:

1. The credentials are decrypted on the instance with the password2 fixed key.
2. The credentials are re-encrypted on the instance with the MID Server's public key.
3. The credentials are encrypted on the load balancer with SSL.
4. The credentials are decrypted on the MID Server with SSL.
5. The credentials are decrypted on the MID Server with the MID Server's private key.

Note: The platform does not have separate encryption keys for multi-tenant instances.

Credential order

Credentials can be assigned an order value in the Credentials Form, which forces the application to try all the credentials at their disposal in a certain sequence. If you do not specify an order value, the application tries the credentials in the Credentials [discovery_credential] table randomly, until it finds one that works, such as when Orchestration attempts to run a command on an SSH server (such as a Linux or UNIX machine), or when Discovery attempts to query an SNMP device (such as a printer, router, or UPS).

After identifying the credentials for a device, Discovery and Orchestration create an affinity between the credentials and the device using the Credential Affinity [dscy_credentials_affinity] table. All subsequent discoveries or Orchestration activities attempt to match the credentials in this table with a device for which an affinity exists. If credentials for a device change, Discovery and Orchestration try all available credentials again until they create a new affinity.

Note: If Orchestration and Discovery are installed, and credential alias is enabled, multiple affinities can exist. In this case, the platform looks up credentials for each affinity and inserts the credential for the affinity with the lowest order into the probe.

Ordering credentials is useful in the following situations:

- The credentials table contains many credentials, with some used more frequently than others. For example, if the table contains 150 SSH credentials, and 5 of those are used to log into 90% of the devices, it is good practice to configure those five with low order numbers, which places them at the top of the execution list. Discovery and Orchestration will work faster if they try these common credentials first. After the first successful connection, the system knows which credentials to use the next time for each device.
- The system has aggressive login security. For example, if the Solaris database servers in the network only allow three failed login attempts before they lock out the MID Server, configure the database credentials with a low order value.

Credential aliases

Credential aliases are available for Discovery and Orchestration.

Aliases for Discovery allow an administrator to:

- Employ a credential filtering behavior with configurable levels of compliance.
- Assign multiple credential aliases to a Discovery schedule.
- Prevent the creation of credential affinities that use inappropriate or sensitive credentials.
Aliases for Orchestration allow workflow creators to:

- Assign individual credentials to any activity in an Orchestration workflow
- Assign individual credentials to any action in Flow Designer
- Assign different credentials to each occurrence of the same activity type in an Orchestration workflow.
- Assign different credentials to each occurrence of the same action in designer flow.

External credential stores

If you do not want credentials stored in your instance, you can use external credential repositories. External credential stores save the credentials in an external site that your instance can access. CyberArk is the only supported external credential store, but other external storage solutions can be configured using the ServiceNow API.

Create a Connection & Credential alias

Define an alias to label a credential or connection record.

- The admin role is required to create an alias.
- The credential_admin and connection_admin roles have read access to the alias record.

The Connection & Credential alias defines an alias that labels a credential or connection record. The alias contains these fields.

1. Navigate to Credentials & Connections > Connection & Credential Aliases.
2. Click New.
3. Complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the alias. Can only contain alpha, number, and underscore characters. During an upgrade, the tag in the credential record migrates to a Connection &amp; Credential Alias. If the credential tag contains special characters other than alphabets, numbers, and underscores, the tag name is preserved after the upgrade. You can still use this migrated alias, but you cannot update the alias until you change the name to meet the naming restrictions.</td>
</tr>
<tr>
<td>ID</td>
<td>This field is based on the format scope_name.alias_name. The ID must be unique. If the scope is global, the ID is the alias name. For example, if you create a workday alias in global scope, the ID is set to workday. If you create a workday alias in the HR app scope, the ID is set to x_hr_app.workday.</td>
</tr>
<tr>
<td>Type</td>
<td>Select either Credential or Connection and Credential. The default is Connection and Credential.</td>
</tr>
<tr>
<td>Connection type</td>
<td>Select a connection type: Basic, HTTP, JDBC, JMS. The default is HTTP.</td>
</tr>
<tr>
<td>Support Multiple Active Connections</td>
<td>Define whether the alias supports multiple active connections. Add connections using the Connections table and associated them to the alias using the Connections related list.</td>
</tr>
<tr>
<td>Default Retry Policy</td>
<td>Select a retry policy. For more information, see Retry policy.</td>
</tr>
</tbody>
</table>
4. Click **Save**.
The Connections and Connection Attributes related lists display.

<table>
<thead>
<tr>
<th>Related list</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connections</td>
<td>Related connection records associated with this alias. After creating the alias, you can define connection records and associate them with the alias. If <strong>Support Multiple Active Connections</strong> is selected, you can associate more than one connection with an alias.</td>
</tr>
<tr>
<td>Connection Attributes</td>
<td>Define data specific to a connection and use it in an IntegrationHub integration step. For more information, see Create connection attributes for IntegrationHub.</td>
</tr>
</tbody>
</table>

Create one or more connection records to associate with the alias. For more information about creating connections, see Setting up connections to target hosts. Add connection attributes to the alias to make connection meta data available to flows in Flow Designer.

**Credential aliases for Discovery**

Credential aliases for Discovery allow an administrator to use specific credentials on Discovery schedules. You can configure behaviors for your aliases that determine how strictly the system enforces their use.

Without credential aliases, Discovery schedules can access all credentials that are defined in the instance. This behavior might not be desirable in some circumstances, particularly for credentials with elevated privileges. Credential aliases provide more control over which credentials a Discovery schedule is allowed to use and prevents the unnecessary exposure of credentials with elevated privileges.

**Note:** Credential alias is not currently supported for pattern engine.

**How credential aliases work**

A business rule called Insert Discovery Affinity & Cred Aliases (previously named Insert Discovery Affinity) runs when a record is inserted into the ECC Queue. The business rule attaches the credential aliases defined in the Discovery schedule to the probe, so that the MID Server can perform credential filtering. The MID Server's first task is to create the list of credentials to search. It filters the credentials by affinity and then by tags, if any exist. The affinities go to the top of the list, and the matching tags go to the bottom of the list. The MID Server iterates through the list until it finds a credential that works. The MID Server then creates an affinity for this credential.

If the business rule determines that an affinity exists for the device, the rule identifies the proper credential_id to use. This is the sys_id of the record in the Credentials [discovery_credentials] table. When the platform encounters an affinity with a credential alias value, defined as credential_alias in the business rule, the business rule determines whether or not the credential referenced by the affinity has the specified alias. If it does, the business rule selects the credential_id of the alias and passes that value to the MID Server. If the credential does not have the specified credential alias, any other affinities that exist for the target system are checked.

**Create a Discovery credential alias**

Create the alias and then add that alias to a credential in the credential record. You can add a credential to multiple aliases and add multiple credentials to a single alias.

Role required: admin, credential_admin (read access only), connection_admin (read access only)

A Discovery schedule only uses credentials that are contained in the aliases defined for that schedule.

1. Create an alias.
a) Navigate to Connections & Credentials > Connection & Credential Aliases.
b) Click New.
c) Enter a unique name for the alias and select Credential for the alias Type.
d) Click Submit.

The Credentials related list appears. You can add new credentials for this alias in this list but not existing credentials.
2. Configure a credential for the new alias.
   a) Navigate to **Connections & Credentials > Credentials**.
   b) Select an existing credential from the list or click **New** to create a new credential.
   c) In the credential record, unlock the **Credential alias** field and select the alias you created.
   d) Save or submit the record.
3. Return to Connections & Credentials > Connection & Credential Aliases and open your new alias. The credential you attached to the alias now appears in the related list.

4. To create an additional credential for this alias, click New in the related list and select a credential type. The alias name is pre-populated in the Credential alias field of the credential record.

5. Complete the fields in the form and submit the record.

Create and test your credentials

Create and test the credentials that Discovery, Service Mapping, Cloud Management, and Orchestration require to access hardware and software in your network.

Role required: admin

This task contains general procedures for creating credentials. Refer to the documentation for your credential type for details on specific fields and requirements.

<table>
<thead>
<tr>
<th>Supported credential types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applicative credentials</td>
</tr>
<tr>
<td>Basic authentication credentials</td>
</tr>
<tr>
<td>Chef server credentials</td>
</tr>
</tbody>
</table>
1. Navigate to one of these modules:
   - Discovery > Credentials
   - Service Mapping > Credentials
   - Orchestration > Credentials

2. Click New.

3. On the Credentials page, click a link for the credential type and complete the form. Refer to the documentation for the credential type you selected for details.
   
   You can submit a credential record first and then test it later, or test the credential immediately before saving it.
   
   Credential testing is supported for these credential types:
   - SSH (including private keys)
   - Windows
   - SNMP (including v3)
   - VMware
   - JDBC
   - JMS

4. Under Related Links, click Test credential.

   Note: Credentials are encrypted at all times during the test.
5. Complete the fields in the Test Credential dialog box.

![Test Credential dialog box](image)

**Test credentials dialog box**

**Credential test fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Credential type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target</td>
<td>Target host on which these credentials are run. This value must be an IP address for all credential types except VMware, which can be the host URL. You can not target any MID servers. Note: For JMS, this is the provider URL. The information in this URL tells JNDI how to find and access the JMS Provider. An example value for connecting to ActiveMQ V5.1, is <code>tcp://ipAddressOrHostName:61616</code>.</td>
<td>All</td>
</tr>
<tr>
<td>Port</td>
<td>Port on the target to use for this test. The system pre-populates this field with the default port for the selected credential type.</td>
<td>All</td>
</tr>
<tr>
<td>MID Server</td>
<td>MID Server to use for this test. You must use a Windows MID Server to test Windows credentials. Only Up and Validated MID Servers are available.</td>
<td>All</td>
</tr>
<tr>
<td>DB Type</td>
<td>Type of database on which to test these credentials.</td>
<td>JDBC</td>
</tr>
<tr>
<td>DB Name</td>
<td>Name of the database on which to test these credentials.</td>
<td>JDBC</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
<td>Credential type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>Initial Context Factory</td>
<td>Name of the JNDI class that is used to create the InitialContext. Using this Initial Context Factory, various JMS objects, such as JMS Connection, are created. For example, to connect to ActiveMQ V5.10, (JMS Provider), the value in this field would be org.apache.activemq.jndi.ActiveMQInitialContextFactory</td>
<td>JMS</td>
</tr>
</tbody>
</table>

6. Click **OK** to begin the test.

An indicator appears, showing that the system is attempting to contact the target using the credentials you have provided. When the instance connects to the target it displays a success message. If the instance encounters a problem with the test inputs you have provided, it displays the appropriate error message. The following are some common error messages.

- Incorrect target or port number:

  ![TCP connection failure](image)

  **TCP connection failure**

- Incorrect user name or password:

  ![Authentication failure](image)

  **Authentication failure**

- Incorrect MID Server for Windows credentials:

  ![MID Server error](image)

  **MID Server error**

7. Click **Retry** to open the test Credential dialog box and correct the input error.
8. When your credentials test is successful, click **Submit** to save the record.

**Important:** Testing credentials does not ensure that the credentials have the necessary privileges required for the intended Discovery or Orchestration workflow tasks.

### Ansible Tower credentials

Ansible Tower credentials are required to access your Ansible configuration management account. Use these credentials to manage Ansible resources through the Cloud Management application.

To integrate Cloud Management with the Ansible configuration management account, you need only to configure the user name and password for the administrator account in Ansible.

**Form fields for Ansible Tower credentials**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Provide a descriptive name.</td>
</tr>
<tr>
<td>User name/Password</td>
<td>Enter the authentication credentials for the Ansible Tower user with administrator rights.</td>
</tr>
</tbody>
</table>

**Note:** You do not need to configure the other fields.

### API key credentials

An API key is a unique code that is passed in to an API to identify the calling application or user.

### API key credentials

**API key credentials form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>API Key</td>
<td>Enter the API key.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Allow flow and workflow creators to assign individual credentials to any activity in a flow or workflow or assign different credentials to each occurrence of the same activity type in a flow or workflow.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select whether to apply these credentials to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.</td>
</tr>
</tbody>
</table>
Field	Input value
Order	Order (sequence) in which Discovery tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.

Applicative credentials

Some applications require credentials in addition to the credentials that the host machine requires. Credentials required to access these applications are referred to as applicative credentials.

A typical credential contains a user name and a password for logging into a device or application. While most applications require only one credential for accessing them, sometimes hosts and applications have separate credentials for extra security. For example, ABAP SAP Central Services (ASCS) requires applicative credentials in addition to the SSH or Windows host credentials for the server that hosts ASCS.

Note: ServiceNow applications refer to devices and applications that comprise an application service as configuration items (CIs).

Just like with host credentials, you assign applicative credentials to MID Servers.

You create applicative credentials per CI type, for example the CI type for ASCS is SAP ASCS Application [cmdb_ci_appl_sap_ascs]. The preconfigured pattern for discovering CIs belonging to this CI type contains commands that require a MID Server to use the applicative credential for this CI type. If there is more than one credential configured for this CI type, the MID Server tries using these credentials in the order you define until it finds the credential that fits.

Check the discovery requirements information in the ServiceNow documentation to determine if you need to configure applicative credentials for specific application CIs. There is no need to configure applicative credentials, if discovery prerequisites do not mention it.

Applicative credentials form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the credential. Use a descriptive name like Oracle DB or London Oracle DB (for an Oracle database). Do not use spaces or special characters for the credential name.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to use the credential.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the actual user name of the applicative credential.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the actual password of the applicative credential. Do not use spaces or special characters for the credential name.</td>
</tr>
<tr>
<td>CI type</td>
<td>Select a CI type to which the CI belongs.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>• Oracle Database: cmdb_ci_db_ora_instance</td>
</tr>
<tr>
<td></td>
<td>• Oracle E-Business Suite: cmdb_ci_db_ora_instance</td>
</tr>
<tr>
<td></td>
<td>• Oracle WebLogic Module: cmdb_ci_app_server_weblogic</td>
</tr>
<tr>
<td></td>
<td>• Tibco Enterprise Message Service (EMS): cmdb_ci_app_server_weblogic</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select whether to apply these credentials to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.</td>
</tr>
<tr>
<td>Order</td>
<td>Order (sequence) in which Discovery tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

### Basic authentication credentials

The basic authentication credential type manages access to store basic authentication credentials. These fields are available in the Credentials form for basic authentication.

**Basic Auth credentials form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential. For example, you might call it Basic Authentication.</td>
</tr>
<tr>
<td>User Name</td>
<td>Enter the user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password.</td>
</tr>
</tbody>
</table>
### Field | Input value
--- | ---
Credential ID | Enter the unique key configured for these credentials in the CyberArk external credential storage system.

The credential ID may be used as a safe override when multiple safes are in use. By default, the syntax in the Credential ID field is this: `<safe name>:<Credential ID>`. If the safe name is omitted, there must be a safe name defined in the `config.xml` file. To change the separator character from the default colon to another character, override the value with the optional `ext.cred.safe_name` parameter. The Credential ID field has a limit of 40 characters.

This field is only visible when the External storage check box is selected.

External credential store | Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. Currently, the only supported external storage system is CyberArk.

Order | Order (sequence) in which Discovery tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.

---

### Chef server credentials

Chef server credentials access chef integrations with the instance.

These fields are available on the Credentials form for Chef server type credentials. This information comes from the settings you configured when you performed Chef server installation.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>Admin Name</td>
<td>Provide the administrator name that you created during Chef server installation.</td>
</tr>
<tr>
<td>Admin Key</td>
<td>Enter the RSA private key that the Chef server generated when you created the administrator.</td>
</tr>
<tr>
<td>Validator Name</td>
<td>Enter the validator.</td>
</tr>
<tr>
<td>Validator Key</td>
<td>Enter the RSA private key that the Chef server generated when you created an organization.</td>
</tr>
<tr>
<td>Cert Name</td>
<td>Enter the certification name.</td>
</tr>
</tbody>
</table>
### CIM credentials

The CIM credential type manages access to a CIM server (also referred to as a CIMOM - Common Information Model Object Manager) for information about VMware ESX servers. This credential type is available for Discovery.

These fields are available in the Credentials form for CIM.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>

<td>Enter the user name to create in the Credentials table.</td>
</tr>
<tr>
<td></td>
<td>Avoid leading or trailing spaces in user names. A warning appears if the</td>
</tr>
<tr>
<td></td>
<td>platform detects leading or trailing spaces in the user name. For CIM</td>
</tr>
<tr>
<td></td>
<td>discovery, the user must have the admin role.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the unique key configured for external credentials in the JAR file</td>
</tr>
<tr>
<td></td>
<td>uploaded to the MID Server for an external credential system. The Credential</td>
</tr>
<tr>
<td></td>
<td>ID field has a limit of 40 characters.</td>
</tr>
<tr>
<td></td>
<td>This field is only visible when the External credential store check box</td>
</tr>
<tr>
<td></td>
<td>is selected.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Allow workflow creators to assign individual credentials to any activity in</td>
</tr>
<tr>
<td></td>
<td>an Orchestration workflow or assign different credentials to each occurrence</td>
</tr>
<tr>
<td></td>
<td>of the same activity type in an Orchestration workflow.</td>
</tr>
<tr>
<td></td>
<td>To use the credential for discovering CIs not belonging to this CI type</td>
</tr>
<tr>
<td></td>
<td>using Service Mapping and Discovery patterns, enter the table name for the</td>
</tr>
<tr>
<td></td>
<td>CI type to which the CI belongs, for example cmdb_ci_apache_web_server.</td>
</tr>
<tr>
<td></td>
<td>For more information, see Change credentials to non-default.</td>
</tr>
<tr>
<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. External credential storage is only available when the External Credential Storage plugin in activated.</td>
</tr>
</tbody>
</table>

**Note:** Currently, the only supported external storage system is CyberArk.
### Configure NetApp storage devices for CIM credentials

NetApp storage devices require additional configuration in order for Discovery to explore them.

**Role required:** admin

1. Install the SMI-S agent on the storage device host. See the Data ONTAP SMI-S Agent 5.2 Installation and Configuration Guide for instructions and requirements.

   **Note:**
   ServiceNow does not maintain the documentation on this site. Be aware that this document can change without notice.

2. Create a user account and password for the SMI-S agent.
3. Create a credential record for the SMI-S agent credentials. Set the credential type to **CIM**.

### Cloud credentials

Cloud credential types manage access to cloud-based applications, including Amazon Web Services and the Microsoft Azure cloud.

### AWS Identity and Access Management (IAM) roles

If you have a MID Server installed on Amazon EC2 in an AWS cloud, and if that MID Server is configured to discover resources within the cloud, you can use security credentials provided by AWS Identity and Access Management (IAM) roles rather than credentials managed on your instance. These AWS credentials grant permissions in the cloud through an instance profile, based on roles. These credentials are temporary and rotate automatically on a configurable interval. When an IAM role is defined for the MID Server, Discovery ignores any credentials stored on the instance in favor of the credentials granted by the role in the instance profile. For more information on AWS instance profiles, see IAM Roles for Amazon EC2.
AWS credentials

AWS Credentials form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for the AWS credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to use the credential.</td>

</tr>
<tr>
<td>Classification</td>
<td>Enter the Application Classification for CI discovery.</td>
</tr>
<tr>
<td>Order</td>
<td>Order (sequence) in which Discovery tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

### Cloud Management (CMP) node credentials

Cloud Management (CMP) node credentials associate credentials for a virtual server that Cloud Management provisions. The Cloud Management application automatically creates these credentials.

**Note:** You might need to deactivate these credentials if you no longer want them used, change the order precedence, or select a MID Server that is allowed to access them. Otherwise, you do not need to manually create or modify this type of credential.

### CMP node credentials form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The automatically generated name based on the datacenter where the virtual machine is located.</td>
</tr>

### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Order (sequence) in which Discovery tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

### SNMP credentials

Discovery explores many kinds of devices (switches, routers, printers, etc.) using the SNMP protocol. Credentials for SNMP do not include a user name, just a password, called the community string.

The default read-only community string for many SNMP devices is public, and Discovery will try that automatically. Enter the appropriate SNMP credentials if they differ from the public community string.

Discovering SNMP uses all community strings that are configured. This behavior does not apply to discovering SNMPv3.

The default Orchestration activity SNMP Query returns the object identifier (OID) of a device and requires SNMP credentials.

**SNMP community credentials**

The SNMP Community credential type manages access to discover many kinds of devices (switches, routers, printers, etc.) using the SNMP protocol. This credential type is available for Discovery, Service Mapping, and Orchestration.

Credentials for SNMP do not include a user name, just a password (the community string). The default read-only community string for many SNMP devices is public, and the system will try that automatically. Enter the appropriate SNMP credentials if they differ from the public community string.

These fields are available in the Credentials form for SNMP community.

<table>

External credential storage is only available when the <strong>External Credential Storage plugin</strong> is activated.</td>
</tr>
</tbody>
</table>

**SSH credentials**

Discovery, Orchestration, and IntegrationHub explore UNIX and Linux devices by using SSH credentials to execute commands over Secure Shell (SSH). SSH commands must run with root privileges, either with root credentials or through the use of sudo.

**Privileged commands**

The platform provides default privileged commands for the MID Server to use and the ability to add additional commands to the system. For details about using sudo and other privileged commands, see **MID Server privileged commands**.

**Commands that require root privileges for Discovery, Orchestration, and IntegrationHub**

These examples assume that the user name is **Disco**. Substitute the actual user name and ensure that the paths for the commands match the paths on the system.

**Note:** Sudo commands do not work with private key credentials, because there is no password to supply to the sudo command. A solution is to add the **NOPASSWD** option to the sudo configuration. For example, you might enter:  
```
disco ALL=(root) NOPASSWD: /usr/bin/adb, /usr/sbin/lsof, /sbin/ifconfig
```

**UNIX and Linux commands requiring root privileges**

</tbody>
</table>

For a list of privileged commands that you need for Discovery and Service Mapping, see #unique_601 for a list of the commands that require elevated rights to discover and map Unix-based hosts in your organization.

**Granting root privileges**

Use either of these approaches to allow users to run SSH commands with root privileges:

- Give root credentials. These are obviously the most powerful credentials, but may not be desirable from a security perspective. If Discovery, Orchestration, or IntegrationHub have the root credentials to any UNIX or Linux system, no further configuration is required.
- Give other credentials for Discovery, Orchestration, or IntegrationHub, but grant the user in those credentials the right to execute certain commands with root privileges, using sudo. This is a secure way to grant limited privileges. Discovery, Orchestration, or IntegrationHub use sudo on any probe that has the must_sudo parameter set to true (it defaults to false). However, each system must be configured to allow sudo to work. This is done by editing the /etc/sudoers file using the visudo command.

**Access Requirements for Non-Root Credentials**

If you do not provide Discovery with root access credentials, you must provide credentials with the following access requirements.

<table>

Specify the MID Servers that should use these credentials in the <strong>MID servers</strong> field.                                                                                                           |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>The order (sequence) in which the platform tries this credential as it attempts to log onto devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), Discovery or Orchestration tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

**VMware credentials**

The VMware credentials type manages access to vCenter credentials.

Applications that access VMware cloud resources need access to VMware credentials. For example, the VMware credential type allows Discovery to explore VMware’s vCenter running on a Windows machine to discover ESX machines, virtual machines, and resource pools. The VMware Discovery and automation API (vCenter API) now provides the globally unique serial number for computer CIs. CIM credentials are not needed to allow access to each VMware host.

**Note:** Windows credentials are not necessary for vCenter Discovery, when valid VMware credentials are used.

**Important:** Do not use VMware Type credentials for Orchestration activities that perform work on the individual virtual machines cloned by vCenter (for example, restarting a Linux VM). For these activities, the credential Type depends on the operating system of the virtual machine (either SSH or Windows).

**VMware credentials form**

If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

Windows credentials

Windows credentials provide access to Windows computers. This credential type is available for Discovery and Orchestration.

Credential requirements

Discovery and Orchestration have the following requirements for Windows credentials:

- Install a MID Server on a Windows host as a service.
- Add Windows credentials to one of these locations:
  - An entry in the Credentials [windows_credentials] table
  - A MID Server service account to run as a specific Windows user or domain account.

Granting proper permissions

To provide sufficient permissions, Windows credentials must be one of the following:

- A domain user with local administrator access on the target Windows hosts.
- A local account that has administrator privileges and User Access Control (UAC) disabled on the same target host.
- A user who meets the requirements of Windows probes and permissions (Discovery only).
- A user who meets the requirements of the Orchestration activity to be run (Orchestration only).

Note: No logon privileges are needed. Account does NOT need to be interactive.

Security around granting privileged access can be enhanced by using JEA profiles to run Discovery. For more information, see Microsoft Just Enough Administration (JEA) for Discovery.

Workgroup computers

To run Powershell commands to discover a Workgroup computer, configure the MID Server credentials for either of these users:

- Built-in administrator account on the Workgroup computer.
- Domain user on the Workgroup computer.
Multi-domain configuration

To enable Windows credentials to function across multiple domains, make sure to use the correct name formats and MID Server configuration.

Discovery and Orchestration support Windows domain credentials in both User Principal Name and Down-Level Logon Name user name formats. For example, Domain\UserName or UserName@example.domain.com. You can provide Windows workgroup credentials in the following format: WORKGROUP\UserName.

Note: You can also provide a local account by using the .\user name.

These additional actions are required to enable credentials to function across multiple Windows domains.

<table>
<thead>
<tr>
<th>Condition</th>

</tr>
</tbody>
</table>

Configure Windows credentials for the MID Server

Configure the MID Server to use either the credentials of its own Windows service or credentials from the Credentials [discovery_credentials] table.
Role required: admin

1. Configure the MID Server to use credentials from the MID Server service account.
   a) Set the MID Server service account to a user who meets the permission requirements.
   b) Verify the user name meets the name format requirements.
   c) Fill in the fields on the form, as appropriate.
   d) Verify the credentials meet domain requirements.

2. Configure the MID Server use credentials from the Credentials [discovery_credentials] table.
   a) Add individual Windows credentials to the Credentials [windows_credentials] table.
      • Verify each credential meets the permission requirements.
      • Verify each username meets the name format requirements.
      • Verify each credential meets the Windows domain requirements.
   b) [Optional] Configure the MID Server to use Powershell by setting the mid.use_powershell parameter to true. See MID Server Configuration.
   c) [Optional] By default, Discovery automatically uses the MID Server service account credentials if all credentials in the Credentials table fail. If you do not want to use the MID Server service credentials as a fall back, set the mid.powershell.local_mid_service_credential_fallback parameter to false.

Credential affinity for Discovery and Orchestration

Credential affinity is an association between a set of credentials and a device on your network.

When Discovery or Orchestration first attempts to access a device, they try all available credentials until they find the correct ones. After identifying the credentials for a device, Discovery and Orchestration create an affinity between the credentials and the device using the Credential Affinity [dscy_credentials_affinity] table. All subsequent discoveries or Orchestration activities attempt to match the credentials in this table with a device for which an affinity exists. If credentials for a device change, Discovery and Orchestration try all available credentials again until they create a new affinity.
Note: If Orchestration and Discovery are installed, and credential alias is enabled, multiple affinities can exist. In this case, the platform looks up credentials for each affinity and inserts the credential for the affinity with the lowest order into the probe.

Credentials troubleshooting

Review the `<credentials_debug>` section of the ECC queue payload to troubleshoot issues with credentials.

Certain probes support credential debugging. Credential debugging inserts a `<credentials_debug>` section in the payload that the MID Server returns to the instance ECC queue. You can view the `<credentials_debug>` section to see detailed information about the credential lookup.

The `<credentials_debug>` section appears in the payload if:

- Credentials fail for WMIRunner probe, PowerShell probe, JMS, or SSHCommand probe.
- You set the `credentials_debug` parameter to `true` for the WMIRunner, PowerShell, or SSHCommand probes. If you set the parameter to `true`, the `<credentials_debug>` section appears even if the credential lookup is successful.

The `<credentials_debug>` section shows:

- Information about the credential search, such as the credential types, tags, and affinities.
- The IP address targeted.
- Information about each credential (in order) that the MID Server used, including the type, classification, tag, name, Sys ID, and external credential ID if present.
Sample payload showing invalid credentials

Details appear for the PowerShell parameter:

- If the local MID Server credentials were used after all the Windows credentials failed.
- If the credentials were skipped because you are trying to discover the same machine that the MID Server is on.
- If the `mid.powershell.use_credentials` parameter is set to `true`.

Details appear for the SSHCommand:

- If the credential search was skipped because the target IP is blacklisted.
- If the target IP was added to the blacklist.
Note: The MID Server saves IP addresses for failed credential searches in a blacklist in cache memory. This blacklist specifies which devices the MID Server should stop trying to access. IP addresses are added to the blacklist after every credential has failed. The IP addresses are cleared from the blacklist cache either after five minutes, if the MID Server is restarted, or if the credential records on the instance are updated.

External credential storage

An instance can store credentials used by Discovery, Orchestration, and Service Mapping in an external credential repository rather than directly in a ServiceNow credentials record.

The instance maintains a unique identifier for each credential, the credential type (such as SSH, SNMP, or Windows), and any credential affinities. The MID Server obtains the credential identifier from the instance, and then uses a customer-provided JAR file to resolve the identifier from the repository into a usable credential. Currently, the ServiceNow® platform supports the use of the CyberArk vault for external credential storage.
External credential storage architecture
Credential process flow

The MID Server retrieves credentials from an external store using this process:

1. MID Server downloads credential objects from the ServiceNow Credentials [discovery_credentials] table that contain the corresponding credential ID from the target vault.

2. As each probe or pattern runs from Discovery or Orchestration jobs, the MID Server requests the credential by passing information such as credential ID, target IP address, and credential type to the Credential Resolver Java Jar file. The details about the correct credential object to retrieve from the vault are determined by the Credential Resolver.

   Many Credential Resolvers such as CyberArk call an application supplied by the third-party vault vendor running on the same machine as the MID Server. That application can often be configured to cache credentials and knows to update the cache when a credential changes in the vault, which is very important to avoid unnecessary network calls to the vault each time MID Server requests a credential. The Credential Resolver (using optional vendor application if present) makes a call to the vault to get the actual user name, password, etc.

   For Credential Resolvers supplied out-of-box (only CyberArk today), the MID Server only caches a credential for up to several seconds using encryption in MID Server process memory. This means the MID Server can make multiple requests to the Credential Resolver for the same credential even when discovering a single device. Contact third-party vendors for information about caching implementations for other Credential Resolvers.

3. MID Server executes the probe with the appropriate credential.

   Note: Credential affinity still applies. The mechanism remains the same, since the only real difference from the MID Server’s perspective is that the real credential details (user name and password) come from the third-party vault.

External credential storage logging

The MID Server posts log messages about external credential storage.

If the repository encounters an error while attempting to resolve a credentials request, the MID Server posts log messages with this prefix: `Problem with client's CredentialResolver:`

Components installed with External Credential Storage

Business rule

The External Credential Storage business rule performs the following tasks when an administrator makes any change to the Enable External Credential Storage property:

- Changes the view for the Credentials record list and form to the External Storage view. This view enables users to see the Credential ID column in the list.
- Instructs the MID Server to refresh its credentials cache in preparation for a change in the way credentials are obtained.

Property

A property called Enable External Credential Storage [com.snc.use_external_credentials] enables or disables the External Credential Storage plugin after it is activated. The property is located in Discovery.
Definition > Properties and Orchestration > MID Server Properties, and is enabled when you activate the plugin.

If you disable external credential storage with the system property, the system automatically sets all the external credentials to inactive in the instance. If you re-enable the feature with this property, the system does not reset the external credential records to active. You must reactivate each credential record manually.

Request external credential storage for Discovery and Orchestration

The External Credential Storage plugin is available by request.

Role required: admin

There are two ways to request a plugin:

• Access the HI Service Catalog directly by clicking Service Catalog > Activate Plugin on HI.
• Access the HI Service Catalog through the All Applications page on your instance by following these steps.

1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click **Request Plugin** to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.

4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**External credential storage configuration**

Configure your instance to obtain credentials from a remote repository.

These procedures assume that you already have an external repository configured with the credentials you want to protect. The credential identifier configured in the ServiceNow instance must be mapped to the actual credential in the repository through the JAR file.

To configure External Credential Storage, complete the following tasks in order.

*Create a JAR file to resolve credentials*

Create a JAR file to resolve credential identifiers sent from the MID Server into actual credentials from the repository.

Make sure to include all the credential elements that the instance expects, such as the private key.

To create a JAR file to resolve credentials:

Use this sample Java file as a template:
**Caution:** This sample is intended as a template only. Do NOT use this code in production without modifying it for your environment.

```java
package com.snc.discovery;

import java.util.*;
import java.io.*;

/**
 * Basic implementation of a CredentialResolver that uses a properties file.
 */
public class CredentialResolver {

    private static String ENV_VAR = "CREDENTIAL_RESOLVER_FILE";
    private static String DEFAULT_PROP_FILE_PATH = "C:\dummycredentials.properties";

    // These are the permissible names of arguments passed INTO the resolve() method.
    public static final String ARG_ID = "id";
    public static final String ARG_IP = "ip";
    public static final String ARG_TYPE = "type";
    public static final String ARG_MID = "mid";

    // These are the permissible names of values returned FROM the resolve() method.
    public static final String VAL_USER = "user";
    public static final String VAL_PSWD = "passwd";
    public static final String VAL_PASSPHRASE = "passphrase";
    public static final String VAL_PKEY = "pkey";
    public static final String VAL_AUTHPROTO = "authprotocol";
    public static final String VAL_AUTHKEY = "authkey";

    // the string identifier as configured on the ServiceNow instance...
    public static final String ARG_ID = "id";
    public static final String ARG_IP = "ip";
    public static final String ARG_TYPE = "type";
    public static final String ARG_MID = "mid";

    // the string user name for the credential, if needed...
    public static final String VAL_USER = "user";
    public static final String VAL_PSWD = "passwd";
    public static final String VAL_PASSPHRASE = "passphrase";
    public static final String VAL_PKEY = "pkey";
    public static final String VAL_AUTHPROTO = "authprotocol";
    public static final String VAL_AUTHKEY = "authkey";

    // the string privacy protocol for the credential, if needed...
```
```java
public static final String VAL_PRIVPROTO = "privprotocol";
// the string privacy key for the credential, if needed...
public static final String VAL_PRIVKEY = "privkey";

private Properties fProps;

public CredentialResolver() {
}

private void loadProps() {
if (fProps == null)
    fProps = new Properties();

try {
    String propFilePath = System.getenv(ENV_VAR);
    if (propFilePath == null) {
        System.err.println("Environment var " + ENV_VAR + " not found. Using default file: "+DEFAULT_PROP_FILE_PATH);
        propFilePath = DEFAULT_PROP_FILE_PATH;
    }
    else {
        InputStream propsIn = new FileInputStream(propFilePath);
        fProps.load(propsIn);
        File propFile = new File(propFilePath);
        if (!propFile.exists() || !propFile.canRead()) {
            System.err.println("Can't open " + propFile.getAbsolutePath());
        } else {
            fProps.load(CredentialResolver.class.getClassLoader().getResourceAsStream("dummycredentials.properties"));
        }
    }
}

fProps.load(CredentialResolver.class.getClassLoader().getResourceAsStream("dummycredentials.properties"));
} catch (IOException e) {
    System.err.println("Problem loading credentials file:");
    e.printStackTrace();
}

/**
 * Resolve a credential.
 */
public Map resolve(Map args) {
    loadProps();
    String id = (String) args.get(ARG_ID);
    String type = (String) args.get(ARG_TYPE);
    String keyPrefix = id + "." + type + ".";
    if (id.equalsIgnoreCase("misbehave")
        throw new RuntimeException("I've been a baaaaaaaaad CredentialResolver!");

    // the resolved credential is returned in a HashMap...
    Map result = new HashMap();
    result.put(VAL_USER, fProps.get(keyPrefix + VAL_USER));
    result.put(VAL_PSWD, fProps.get(keyPrefix + VAL_PSWD));
    result.put(VAL_PKEY, fProps.get(keyPrefix + VAL_PKEY));
    result.put(VAL_PASSPHRASE, fProps.get(keyPrefix + VAL_PASSPHRASE));
    result.put(VAL_AUTHPROTO, fProps.get(keyPrefix + VAL_AUTHPROTO));
    result.put(VAL_AUTHKEY, fProps.get(keyPrefix + VAL_AUTHKEY));
    result.put(VAL_PRIVPROTO, fProps.get(keyPrefix + VAL_PRIVPROTO));
    result.put(VAL_PRIVKEY, fProps.get(keyPrefix + VAL_PRIVKEY));

```

System.err.println("Error while resolving credential id/type["+id +"/"+type+"]");

return result;
}

/**
 * Return the API version supported by this class.
 */
public String getVersion() {
    return "1.0";
}

public static void main(String[] args) {
    CredentialResolver obj = new CredentialResolver();
    obj.loadProps();

    System.err.println("I spy the following credentials: ");
    for(Object key: obj.fProps.keySet()) {
        System.err.println(key+": "+obj.fProps.get(key));
    }
}

Import a JAR file to resolve credentials

Import a JAR file created to resolve credential identifiers sent from the MID Server into actual credentials from the repository.

After you create the JAR file, import it into the instance, where it becomes accessible to the MID Server.

1. After creating the JAR and properties files, copy the properties file to the MID Server.
2. Navigate to MID Server > JAR Files.
3. Click New.
4. Complete the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique and descriptive name for identifying the file in the instance.</td>
</tr>
<tr>
<td>Version</td>
<td>A version number for the file, if one is available.</td>
</tr>
<tr>
<td>Source</td>
<td>Location of the JAR file for reference purposes. Source information is not used by the system.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of the JAR file and its purpose in the instance.</td>
</tr>
</tbody>
</table>
5. Click the paper clip icon in the banner and attach the JAR file to the record.

6. Click **Submit**.

7. Restart the MID Server service.

   The platform makes the JAR file available to any MID Server configured to communicate with the instance.

Configure the credential identifier
Configure the credential identifier in the instance.

Role required: admin

Verify the following items:

- The **External Credential Storage** plugin must be active.
- The **Enable External Credential Storage Discovery** property is enabled.

1. Navigate to **Discovery > Credentials** or **Orchestration > Credentials**.

2. Click **New**.

3. Select a credential type.

4. Select the **External credential store** check box.

   The **User name** and **Password** fields disappear, and the **Credential ID** field appears.

5. Complete the Credentials form using the fields from the table.

6. Click **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Credential ID          | Enter the unique key configured for external credentials in the JAR file uploaded to the MID Server for an external credential system. This is the ID passed to the Java class in the parameter map:  
  ```java
  public static final String ARG_ID = "id";
  ```  
The MID Server uses this identifier to resolve the actual credentials on the repository. |
| Note                   | This field is only visible when the External credential store check box is selected.                                                       |
| Tag                    | Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow. |
| External credential store | Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. External credential storage is only available when the External Credential Storage plugin is activated. |
| Note                   | Currently, the only supported external storage system is CyberArk.                                                                         |
| Applies to             | Select whether to apply these credentials to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field. |
| MID servers            | Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select Specific MID servers from the Applies to field. |
| Order                  | Enter the order (sequence) in which the platform tries this credential as it attempts to log onto devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), Discovery or Orchestration tries the credentials in a random order. |

**Configure the credential identifier for AWS**

Configure your instance to obtain credentials from a remote repository.
Role required: cloud_admin

Verify that these plugins are active, and the MID Server has been installed:

- Discovery [com.snc.discovery]
- Cloud Management [com.snc.cloud.mgmt]
- External Credential Storage [com.snc.discovery.external_credentials]

These procedures assume that you already have an external repository configured with the credentials you want to protect. The credential identifier configured in the ServiceNow instance must be mapped to the actual credential in the repository through the JAR file.

1. Navigate to Discovery > Credentials.
2. Select a credential that your external credential storage provider supports.
3. Complete the form, using the fields from the table.

**AWS Credentials**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique and descriptive name for this credential. For example, Amazon Web Services.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use these credentials. The choices are All MID Servers or Specific MID Servers. If you select the latter, the MID Servers field appears.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to enable or disable the credential.</td>
</tr>
<tr>
<td>AWS Account</td>
<td>Master AWS account to which this credential belongs.</td>
</tr>
<tr>
<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When external storage is enabled, the Credential ID field appears. If this check box is not visible, click the menu icon in the header bar and select View &gt; External Storage from the context menu.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the Name under which this credential is stored in the external credential storage provider.</td>
</tr>
<tr>
<td>MID servers</td>
<td>Select one or more MID Servers.</td>
</tr>
</tbody>
</table>

4. Click Submit.

**CyberArk credential storage integration**

The MID Server integration with the CyberArk vault enables Orchestration, Discovery, and Service Mapping to run without storing any credentials on the instance.

**Introduction to CyberArk**

CyberArk’s Application Identity Management (AIM) product uses the Privileged Account Security solution to eliminate the need to store application passwords embedded in applications, scripts or configuration files, and allows these highly-sensitive passwords to be centrally stored, logged and managed within the CyberArk vault. This approach enables organizations to comply with internal and regulatory requirements of periodic password replacement and to monitor activities associated with all types of privileged identities, whether on-premise or in the cloud.

The instance maintains a unique identifier for each credential, the credential type (such as SSH, SNMP, or Windows), and any credential affinities. The MID Server obtains the credential identifier, credential type, and IP address from the instance, and then uses the CyberArk vault to resolve these elements into a usable credential.
The CyberArk integration requires the ServiceNow® External Credential Storage plugin, which is available in System Definitions > Plugins. The MID Server and CyberArk AIM/API client must be installed on the same machine.

Installed with CyberArk

- **Business rule**: The External Credential Storage business rule performs the following tasks when an administrator makes any change to the external credential storage property:
  - Changes the view for the Credentials record list and form to the External Storage view. This view enables users to see the Credential ID column in the list.
  - Instructs the MID Server to refresh its non-external credentials cache in preparation for a change in the way credentials are obtained.

- **System property**: A property called Enable External Credential Storage [com.snc.use_external_credentials] enables or disables the External Credential Storage plugin after it is activated. This property is located in Discovery Definition > Properties and Orchestration > MID Server Properties, and is enabled when you activate the plugin.

  **Note**: If you disable external credential storage with the system property, the system automatically sets all the external credentials to inactive in the instance. If you re-enable the feature with this property, the system does not reset the external credential records to active. You must reactivate each credential record manually.

Supported credential types

The CyberArk integration supports these ServiceNow credential types:

- CIM
- JMS
- SNMP forum
- SSH
- SSH Private Key (with key only)
- VMware
- Windows

Orchestration activities that use these network protocols support the use of credentials stored on a CyberArk vault:

- SOAP (with basic authentication overrides)
- REST (with basic authentication overrides)
- JDBC
- SSH
- PowerShell
- JMS
- SFTP

**Important**: You cannot manage credentials stored on a CyberArk vault and a custom external credential storage system using the same MID Server. The MID Server and CyberArk AIM/API client must be installed on the same machine.
CyberArk architecture

![Diagram of CyberArk architecture]
How the MID Server handles Windows accounts

Credential lookup initially attempts to match the specified credential ID to an existing value in the CyberArk vault **Name** field. If a match is found, that credential is returned. If no match is found, the credential lookup attempts to find a match using the IP address. If the IP address lookup matches more than one credential, such as Windows and Tomcat on the same server, the lookup fails. To avoid this issue, set the **ext.cred.typeSpecifier** parameter in the MID Server config.xml file to **true** to force CyberArk to return credentials that match both the credential type and the IP address. For example, if an IP address is shared by both Windows and Tomcat, a credential type of Windows returns the Windows credential only.

**CyberArk integration configuration**

These procedures include both CyberArk and ServiceNow configuration tasks, including references to the appropriate CyberArk documentation.

The credential identifier configured in the ServiceNow instance must be mapped to the credential name in the CyberArk vault. When looking up a credential, the MID Server finds the credential by matching the credential identifier to a name in vault, which must be unique. If the credential identifier is blank, then the MID Server finds the credential by IP address. To identify the credential by IP address, the system looks at the credential type to ensure that there is only one credential of that type at that address. An example of this might be when a Windows server and vCenter are both running on the same IP address. To support strict credential requirements like this in an SSH environment, a MID Server configuration parameter allows you to require that the credential type requested matches the type returned by CyberArk.

To configure your instance to obtain credentials from a CyberArk vault, complete these tasks in the order in which they appear below.

**Configure the CyberArk vault and install the AIM API**

Configure the CyberArk vault to allow MID Server access and install the CyberArk AIM API on the MID Server machine.

Role required: admin

Before starting this procedure, ensure that the **External Credential Storage plugin** is activated.

1. Configure the CyberArk vault with the application ID and authentication details that all MID Servers requesting credentials will use.
   For details, refer to the CyberArk Credential Provider and ASCP Implementation Guide.
   a) Ensure that CyberArk is configured to allow the MID Server to access the vault by creating an App-ID in CyberArk called **ServiceNow_MID_Server**.
   b) Make sure that every credential the MID Server needs is granted access to the **ServiceNow_MID_Server** App-ID.

   **Note:** You can override the default **ServiceNow_MID_Server** App-ID in the MID Server config.xml file using the ext.cred.app_id parameter. If you change the value in this parameter, make sure to configure a matching value in the vault.

2. Install the CyberArk Credential Provider, including the AIM API, on each machine that hosts a MID Server service that is used to access the credential store.
3. Provision CyberArk accounts and set permissions for application access.
   For details, refer to the CyberArk Privileged Account Security Implementation Guide.
   a) In the CyberArk Password Safe, create the privileged accounts required by Discovery,
      Orchestration, or Service Mapping to access different devices and ensure that these accounts are
      members of the safes in which the necessary credentials are stored.
   b) Add the Credential Provider and application users as members of the Password Safes where the
      application passwords are stored.

Import the CyberArk JAR file
Import the CyberArk JavaPasswordSDK.jar file into the instance to make it accessible to the MID Server.
Role required: agent_admin or admin
Before starting this procedure, ensure that CyberArk is configured to allow the MID Server access to
credentials. Ensure that the CyberArk AIM API is installed on each server hosting a MID Server that is
used to access the vault.

Use this process even if the JavaPasswordSDK.jar file already exists on the MID Server.
1. Navigate to **MID Server > JAR Files**.
2. Click **New**.
3. Complete the form using the fields in the table.

   **JAR File form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique and descriptive name for identifying the file in the instance.</td>
</tr>
<tr>
<td>Version</td>
<td>Optional version number for the file, if one is available.</td>
</tr>
<tr>
<td>Source</td>
<td>Provider of the JAR file. Source information is not used by the system.</td>
</tr>
<tr>
<td>Description</td>
<td>Optional short description of the JAR file and its purpose in the instance.</td>
</tr>
</tbody>
</table>

4. Attach the JAR file to this record.
The AIM JavaPasswordSDK.jar file comes with the AIM SDK installation files and is typically
located on the MID Server in the AIM installation directory at <install_dir>/CyberArk/
ApplicationPasswordSdk.
5. Click **Submit**.
6. Restart the MID Server service.
   The platform makes the JAR file available to any MID Server configured to communicate with the
   instance.

Configure the MID Server for CyberArk
Configure the config.xml file to grant the MID Server access to the CyberArk vault.
Role required: admin
Before starting this procedure, import the `JavaPasswordSDK.jar` file into the instance.

Manually configure the MID Server `config.xml` file with these parameters. This configuration cannot be done from the instance.

### Required configuration parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ext.cred.safe_folder</td>
<td>NameOfFolder</td>
<td>Folder to use for all credential lookups. For example, <code>root</code>.</td>
</tr>
<tr>
<td>ext.cred.use_cyberark</td>
<td>true</td>
<td>Boolean parameter indicating that this MID Server is integrated with CyberArk.</td>
</tr>
</tbody>
</table>

### Optional configuration parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ext.cred.safe_timeout</td>
<td>5 (sec)</td>
<td>Timeout of each credential lookup in the vault, specified in seconds.</td>
</tr>
<tr>
<td>ext.cred.safe_name</td>
<td>NameOfSafe</td>
<td>Default safe name used for all credential lookups. If parameters are in multiple safes, the credential ID may be specified in the format <code>&lt;safeName&gt;:&lt;CredentialID&gt;</code>. When configured like this, the <code>NameOfSafe</code> field is ignored. If all external credentials have their credential IDs specified in this format, then leave out the <code>NameOfSafe</code> field.</td>
</tr>
<tr>
<td>ext.cred.app_id</td>
<td>ServiceNow_MID_Server</td>
<td>Specifies the App-ID used to grant permission to the MID Server to access the CyberArk vault. The default value, <code>ServiceNow_MID_Server</code>, must be defined in the CyberArk vault. You can use this parameter to override the default and specify your own App-ID. If you edit the App-ID in this parameter, make sure to configure CyberArk to match.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| ext.cred.typeSpecifier | true  | Forcing an IP address lookup to return credentials that match both the CyberArk platform ID and the IP address. For example, if an IP address is shared by both Windows and Tomcat, a credential with a platform ID starting with **Win** returns the Windows credential only. When this parameter is set to true, CyberArk looks for platform IDs that begin with:  
  • Win: Windows  
  • Unix: SSH  
  • VMWare: VMware |
| ext.cred.check_ssh_type | false | When set to true, requires that the type of SSH credential returned from CyberArk matches the type of credential requested. For example, if a normal SSH username/password credential is requested and only SSH keys are available, the credential lookup fails. |

**Configure CyberArk for SNMPv2 credentials**

If your system uses SNMPv2, you can create a special file to map the attribute in a credential to the community string.

Role required: admin

Before starting this procedure, configure the MID Server to have access to the CyberArk vault.

**Note:** If the community string appears in the password field of the CyberArk credential, it is not necessary to perform this procedure.

SNMPv2 is not natively supported in CyberArk. If your organization has created custom SNMPv2 credentials in which the community string does not appear in the password field of the credential, use this procedure to map the attribute in the credential to the community string.

1. In a text editor, create a file called **CredMap.properties**, containing this code:
   ```properties```
   ```
   SNMPv2.Community=attribute_name
   ```
   2. Save the file to the `/agent` directory of your MID Server installation.

   On credential lookup, the MID Server attempts to find this attribute for the credential. If the attribute is not found, the MID Server then looks in the password field. If the password field is empty, the credential lookup fails.

**Configure the CyberArk credential identifier**

Create the unique key that CyberArk can use to identify specific credentials in the external repository.

Role required: admin
Before starting this procedure, ensure that the External Credential Storage plugin is activated, and the `com.snc.use_external_credentials` system property is set to true.

1. Navigate to Discovery > Credentials or Orchestration > Credentials.
2. Click New.
3. From the list of credential types, select a type that supports CyberArk external storage.
4. Complete the form using the fields from your credential type.
5. Select the External credential storage check box.

The User name and Password fields are replaced with the Credential ID field.

6. In the Credential ID field, enter an expression using one of these formats:
   - If all your credentials are in the same safe, configure this safe name in the MID Server config.xml file using the `ext.cred.safe_name` parameter, and then specify the credential ID by name only, as `<credential ID>`.
   - To name credentials for a given platform that reside in a specific safe, define the credential ID as `<safe>:<credential ID>:<platform ID>`.
   - If your credentials are in multiple safes, specify the credential ID in this format: `<safe><credential ID>`.
   - If you want CyberArk to look up the credential by IP address, using an alternate safe, specify the credential ID in this format: `<safe>`.
   - If you want CyberArk to look up the credential for an alternate platform ID in the same safe, use this format: `::<platform ID>`.
   - If you want CyberArk to look up the credential in a configured safe by the IP address rather than the credential ID, leave this field blank. This is the best practice for handling installations in which each server has a unique credential. Without this type of lookup, you must create a credential ID record in your instance for every server in your environment.

   **Note:** The credential ID must match the value in the Name field of the credential in the CyberArk vault. The Credential ID field has a limit of 40 characters.

7. Click Submit.

Configure AWS credentials on a CyberArk vault

Configure your CyberArk vault with the AWS credentials to be retrieved for use by your instance.

Store the credentials as an SSH key on the CyberArk vault. When you configure access to the vault on your instance, the name you give to the SSH key must also be used as the credential ID.

1. In CyberArk, go to Accounts > Add SSH Key.
2. Enter the following information:

   **CyberArk credentials**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device Type</td>
<td>Select Cloud Service.</td>
</tr>
<tr>
<td>Platform Name</td>
<td>Select Amazon Web Services - AWS - Access Keys.</td>
</tr>
<tr>
<td>AWS Access Key ID</td>
<td>Enter the AWS Access Key, as provided by AWS.</td>
</tr>
<tr>
<td>AWS IAM Username</td>
<td>Enter the AWS IAM Username, as you configured in CyberArk.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the AWS Secret Access Key, as provided by AWS.</td>
</tr>
</tbody>
</table>
3. Choose **Save**.

If you have not done so already, create a credential identifier on your instance to configure access to the CyberArk vault. For more details, see **Configure access to external credential storage for AWS**.

**Credential alias for Orchestration activities**

Credential alias gives an administrator more control over the credentials used in Orchestration activities. This is useful when an activity requires specific credentials to perform a task. You can use a credential tag to assign individual credentials to any activity in a Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.

Credential alias interacts with **credential affinity** to determine which credentials should be used for an Orchestration activity.

**How credential alias works**

A business rule called **Insert Discovery Affinity** (renamed from Insert Credential Affinity in the Geneva release) runs when a record is inserted into the ECC Queue. This rule determines whether a credential affinity exists for the device and identifies the proper **credential_id** (the **sys_id** of the record in the Credentials [discovery_credentials] table) to use. When the platform encounters an affinity with a credential alias value defined (**credential_alias** in the business rule), the business rule determines if the credential referenced by the affinity has the specified alias. If it does, the business rule selects the **credential_id** of the credential alias and passes that value to the MID Server. If the credential does not have the specified credential alias, any other affinities that exist for the target system will be checked. If no affinity references an appropriately tagged credential, the MID Server iterates through the Credentials [discovery_credentials] table and selects the credential with the appropriate tag. The MID Server then creates a new affinity for this credential.

**Check IP service affinity for Discovery and Orchestration**

You can check the IP Services table for a list of IP addresses that are associated with a protocol.

**Role required:** admin

The IP Services table maps a port to a protocol. Several mappings are provided by default for commonly used port-protocol combinations, such as port 80 for HTTP, port 22 for SSH, and port 161 for SNMP.

A system property called **glide.discovery.ip_service_affinity** allows Discovery to remember the last port of the IP address that was discovered. This property is set to **false** by default.

**Caution:** You should not modify IP services unless your organization uses custom ports.

1. Navigate to **Discovery Definition > IP Services**.
2. Filter the list to find the appropriate IP service.
3. Click the name of the service to go to that IP service page.
4. Click the **IP Service Affinities** tab for the list of IP addresses associated with that service.
Data Certification

Data Certification manages scheduled and on-demand validations of the configuration management database (CMDB) data.

Information is added to the CMDB by Discovery, by importing from third-party tools, or manually. For regulatory or procedural reasons, information in the CMDB requires checks for accuracy and certification. The person or team responsible for certification can define what information requires verification and a verification schedule. The schedule then generates a checklist for verifying the data. Individuals assigned to certification tasks answer a series of questions to verify the data.

Data certification can be performed against specific fields on specific tables. Based on the certification schedule, certification tasks are automatically created and assigned. For example, you can set up a certification to validate key information fields, such as Operating System and CPU count, on all Windows servers located in Chicago. You can then assign the tasks to the appropriate team member automatically.

Domain separated systems can use the Data Certification application.

Activate Data Certification

Activate the Data Certification plugin to access the application. Activating this plugin also activates the Version Management plugin, which manages certification filter versions.

Role required: admin

For plugin activation steps, see Activate a plugin.

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise they will receive the following error: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Installed With Data Certification

Activating the Data Certification plugin installs the following components.

Demo data is available with Data Certification. The demo data provides information including filters, schedules, instances, and tasks.

Tables

Data Certification adds the following tables:

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certification Audit Definition [cert_audit_definition]</td>
<td>Stores collections of certification schedules that can be run as a single entity.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Certification Audit Definition Elements [m2m_cert_audit_def_cert_sched]</td>
<td>Lists the certification schedules in each certification audit definition.</td>

**Script Includes**

Data Certification adds the following script includes:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CertificationAjax</td>
<td>Provides utilities that enable individual certification elements to be certified, rejected, or reverted.</td>
</tr>
<tr>
<td>CertificationTaskCreate</td>
<td>Custom code that extends the standard code for certification tasks.</td>
</tr>
<tr>
<td>CertTaskEscalationTimerPercentage</td>
<td>Updates time and percentage complete information for a certification.</td>
</tr>
<tr>
<td>CertificationUtilities</td>
<td>Provides utility functions for certification.</td>
</tr>
</tbody>
</table>

**Client Scripts**

Data Certification adds the following client scripts:

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alert If Boxes Checked</td>
<td>Certification Task [cert_task]</td>
<td>Provides a warning if the certifier attempts to leave a record without certifying the checked elements</td>
</tr>
<tr>
<td>Check Table Name</td>
<td>Certification Schedule [cert_schedule]</td>
<td>Updates the table name when a different filter is selected.</td>
</tr>
</tbody>
</table>
UI Policies

Data Certification adds the following UI policies:

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hide next scheduled run</td>
<td>Certification Schedule</td>
<td>Hides the Next Scheduled Run field when the schedule is set to run once or on demand only.</td>
</tr>
<tr>
<td>• Hide &quot;run&quot; associated fields when active is set to false</td>
<td>Certification Schedule</td>
<td>Hides the Run field when Active is set to False.</td>
</tr>
<tr>
<td>• Hide Run When Not Active</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Make table name read only</td>
<td>Certification Schedule</td>
<td>Makes the Table field read-only.</td>
</tr>
<tr>
<td>Hide Table field</td>
<td>Certification Element</td>
<td>Hides the Table field on the certification task form.</td>
</tr>
<tr>
<td>Make percent complete field read only</td>
<td>Certification Instance</td>
<td>Makes the Percent complete field read only when the State is Work in Progress, Closed Complete, Closed Incomplete, or Cancelled.</td>
</tr>
<tr>
<td>Show Assign to fields</td>
<td>Certification Schedule</td>
<td>Shows the Assign To field when the assignment type is User and hides the Assign To field for all other assignment types.</td>
</tr>
<tr>
<td>Show Group field</td>
<td>Certification Schedule</td>
<td>Shows the Assignment Group field when the assignment type is Group and hides the Assignment Group field for all other assignment types.</td>
</tr>
<tr>
<td>Show User field</td>
<td>Certification Schedule</td>
<td>Shows the User field when the assignment type is User.</td>
</tr>
<tr>
<td>Show Assignment Fields</td>
<td>Certification Schedule</td>
<td>Shows the Assign To Empty option when the assignment type is User Field or Group Field.</td>
</tr>
</tbody>
</table>

Business Rules

Data Certification adds the following business rules:

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adjust dates for cert tasks</td>
<td>Certification Instance</td>
<td>Adjusts dates for tasks belonging to the certification instance when the dates are changed for an active certification.</td>
</tr>
<tr>

<td>Certification Instance</td>
<td>Cancels all open certification tasks when an active certification is canceled.</td>
</tr>
<tr>
<td>Name</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>certification audit instance events</td>
<td>Certification Audit Instance [cert_audit_instance]</td>
<td>Sends an inserted event when an active certification audit instance is created. Sends a completed event when an active certification audit instance is marked as complete or incomplete.</td>
</tr>
<tr>
<td>certification element events</td>
<td>Certification Element [cert_element]</td>
<td>Sends a failed event when an element of a certification is marked as failed.</td>
</tr>
<tr>
<td>certification instance events</td>
<td>Certification Instance [cert_instance]</td>
<td>Sends an inserted event when an instance of a certification is created. Sends a completed event when an instance of a certification is completed.</td>
</tr>
<tr>
<td>Certification Instance Rollup</td>
<td>Certification Task [cert_task]</td>
<td>Updates the Percent complete field on the certification instance record.</td>
</tr>
<tr>
<td>certification task events</td>
<td>Certification Task [cert_task]</td>
<td>Sends an inserted event when a task is inserted. Sends a completed event when a task is deactivated. Sends a canceled event when a task is canceled.</td>
</tr>
<tr>
<td>Certification Task Values</td>
<td>Certification Element [cert_element]</td>
<td>Updates the percent complete of the parent task when a certification element is updated.</td>
</tr>
<tr>
<td>Check Certification Audit Progress</td>
<td>Certification Instance [cert_instance]</td>
<td>Updates the completion status of the audit instance as a whole when a certification that is part of an audit is complete.</td>
</tr>
<tr>
<td>Clean Certification Views</td>
<td>Certification Instance [cert_instance]</td>
<td>Cleans all related records when a certification instance is deleted.</td>
</tr>
<tr>
<td>Copy certification schedule fields</td>
<td>Certification Instance [cert_instance]</td>
<td>Copies changes to the certification schedule to the certification instance.</td>
</tr>
<tr>
<td>Merge Certification Tasks</td>
<td>Certification Task [cert_task]</td>
<td>Merges two tasks together when a task is reassigned and there is another task for the same instance with the new user.</td>
</tr>
<tr>
<td>Prevent delete of Filter with Schedule</td>
<td>Certification Filter [cert_filter]</td>
<td>Prevents the deletion of a filter that is used in a schedule.</td>
</tr>
<tr>
<td>Reassign Notification</td>
<td>Certification Task [cert_task]</td>
<td>Sends out a notification to the new and previous assignees when a task is reassigned.</td>
</tr>
<tr>
<td>Rollup State</td>
<td>Certification Task [cert_task]</td>
<td>Updates all necessary parent items when task state is changed.</td>
</tr>
<tr>
<td>Name</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Update audit reference</td>
<td>Certification Task [cert_task]</td>
<td>Makes Data Certification records compatible with Desired State records. This rule makes sure that the Audit field is correctly completed when a record is inserted using Insert and Stay.</td>
</tr>
<tr>
<td>Update audit result</td>
<td>Certification Element [cert_element]</td>
<td>Makes Data Certification records compatible with Desired State records for reporting purposes. This rule puts certified values in the Desired value column when an audit is Certified. It also puts actual values in the Discrepancy value column when an audit is Failed.</td>
</tr>
<tr>
<td>Update follow_on_task &amp; audit references</td>
<td>Certification Element [cert_element]</td>
<td>Makes Data Certification records compatible with Desired State records for reporting purposes. This rule makes certification tasks compatible with follow-on tasks and displays all tasks, regardless of origin.</td>
</tr>
<tr>
<td>Update next run time</td>
<td>Certification Schedule [cert_schedule]</td>
<td>Updates the Next scheduled run field when a schedule runs Daily, Weekly, Monthly, or Periodically.</td>
</tr>
<tr>
<td>Verify Fields</td>
<td>Certification Schedule [cert_schedule]</td>
<td>Verifies that no field is used in both Display and Certification fields when the fields of a certification schedule are changed.</td>
</tr>
</tbody>
</table>

**Formatter**

Data Certification adds the following formatter:

**Formatter**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certification Task Elements</td>
<td>Enables custom user interface formatting of elements on a certification task. For example, displays the green check mark and red exclamation point to use when certifying an element.</td>
</tr>
</tbody>
</table>
Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.ui.cert_task_activity.fields</td>
<td>System Properties [sys_properties]</td>
<td>Defines which journal field is the task activity field. Default: work_notes</td>
</tr>
</tbody>
</table>

User Roles

Data Certification adds the following user roles:

<table>
<thead>
<tr>
<th>Role</th>
<th>Contains Roles</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification_admin</td>
<td>certification</td>
<td>Can:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Create and configure certifications</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Override provided answers</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Perform certification tasks for certification task owners</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Send certification task notifications to users and owners at any time</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Cancel or delete certifications in any state</td>
</tr>
<tr>
<td>certification_filter_admin</td>
<td>certification</td>
<td>Can create and manage all data certification filters.</td>
</tr>
</tbody>
</table>
| certification             | none           | Can update active or incomplete tasks assigned to them or to groups of which they are a member. Can also update configuration items owned by them or by groups of which they are a member. Receives email notifications when assigned certification tasks.

Events

Data Certification adds the following events. The ServiceNow system uses these events to send email notifications to task owners and managers about changes in certification records.
Email Templates

Data Certification adds the following email templates:

<table>
<thead>
<tr>
<th>Name</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification.task.cancelled</td>
<td>A certification task assigned to you/your group as part of the data certification and management process has been canceled.</td>
</tr>
<tr>
<td>certification.task.reminder.inserted</td>
<td>A certification task that has been assigned to you/your group as part of the data certification and management process requires attention.</td>
</tr>
<tr>
<td>certification.task.reminder.outstanding</td>
<td>A certification task that has been assigned to you/your group as part of the data certification and management process requires attention.</td>
</tr>
<tr>
<td>certification.task.reminder.overdue</td>
<td>A certification task that has been assigned to you/your group as part of the data certification and management process is overdue.</td>
</tr>
</tbody>
</table>

Certification schedules

A certification schedule defines the information that requires certification and the frequency of execution. At each time interval specified, or on-demand, the certification schedule generates a set of certification tasks based on set conditions. Use the Preview Certification Tasks related link to preview the certification tasks generated from a certification schedule.
Certification schedule

The minimum requirements for Unix Servers are:
- CPU Speed: 3.0GHz
- RAM: 156GB
- CPU Core Count: 4
Certification tasks

A certification task represents the work of verifying the data associated with a particular record. Task owners are responsible for performing the certification tasks. Tasks have an associated workflow that sends reminders to the task owner and, if necessary, the manager of the owner at regular intervals.
Certification task

Number: TSK0009072
Assigned to: Abel Tuter
Assignment group: 
Complete by: 2018-11-13 15:04:57
State: Closed Complete
Percent complete: 100
Escalation: Normal

Short description: Ensure that all Unix Servers in South America data center meet minimum reqs
Work notes: 
Activities: 0

No activity

Certification data for Certification Task TSK0009072

<td></td>
</tr>
<tr>
<td>1.450</td>
<td>8.192</td>
<td></td>
</tr>
</tbody>
</table>
Note: If the message
Record cannot be certified until the instance is finished creating all certification tasks and elements. Reload the page to try again
appears, it signifies that:
• A large amount of data is present in the cmbd_ci and cmdb_ci_server tables.
• Data certification task processing is not complete (Data Certification jobs are still in process).

As directed, reload the page and wait for the processing to complete.

Clean up invalid elements

Use the Clean up invalid elements UI action to query and delete certification elements that reference invalid records. Each certification task has a certification schedule, and each certification schedule has Table and Filter fields. When you use this UI action, it performs the following processing:

1. Collects all available records from Table field in the certification schedule with filters that are available in certification schedule.
2. Collects all certification elements associated with the current certification task.
3. Deletes the certification elements that are no longer available for the data collected in the previous step.
4. After deleting invalid records, it recomputes the certification completion percentage using the following formula:
   \[(1 - (\text{number of certification elements pending} / \text{total no of certification elements associated})) \times 100;\]
5. If there are no certification elements with a Pending status, it marks the associated certification task as Closed, and deactivates it.
6. If there are remaining certification elements with a Pending status, it activates the associated certification task and changes its status to Work in Progress.

Certification elements

Each element of each record being certified is tracked in its own certification element record.

Also tracked are the date and time when the element was certified, comments, and the original and certified values of the field. You can view elements on individual certification tasks.
Certification elements

Certification instances

A certification instance is the collection of certification tasks for one execution of a certification schedule.
Certification instances

Certification audit instances

A certification audit instance is a collection of the certification instances and tasks generated by a single execution of the certification audit definition.
Certification audit instance

Certification audit definition

A certification audit definition is a collection of certification schedules that can be run at once.
Certification audit definition
Data Certification Overview module

The Data Certification Overview module displays various data certification-related reports on the Data Certification Console homepage.

The Overview module is a type of homepage.

The different levels of access are:

Access levels per role

<table>
<thead>
<tr>
<th>Role</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification</td>
<td>View (view overview page and refresh reports)</td>
</tr>
<tr>
<td>certification_admin</td>
<td>• View (view overview page and refresh reports)</td>

<td>• View (view overview page and refresh reports)</td>
</tr>
<tr>
<td></td>
<td>• Customize (refresh, add, delete, and rearrange reports)</td>
</tr>
<tr>
<td></td>
<td>• Edit (can edit reports)</td>
</tr>
</tbody>
</table>

Data Certification Overview Module

The Overview module includes the following reports:

Data Certification Overview Module Description

<table>
<thead>
<tr>
<th>report</th>
<th>Description</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>30/60/90 Day Aging</td>
<td>Groups tasks by the number of days (30, 60, 90, and 90 and over) since the task was opened.</td>
<td>Certification Task</td>
</tr>
<tr>
<td>Certification Instances</td>
<td>Lists all certification instances.</td>
<td>Certification Instance</td>
</tr>
<tr>
<td>Certification Progress Report</td>
<td>Groups tasks by task owner, indicating task progress as a percentage.</td>
<td>Certification Task</td>
</tr>
<tr>
<td>Certification Task Completed Report</td>
<td>Groups tasks by task owner, indicating tasks that are complete.</td>
<td>Certification Task</td>
</tr>
<tr>
<td>Exceptions To Date</td>
<td>Lists all task elements that have comments added and a state of Failed or In Progress.</td>
<td>Certification Element</td>
</tr>
<tr>

<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>Functional Roll Up</td>
<td>Lists the managers that have groups with assigned certification tasks. The report is a horizontal bar chart, grouped by status, with each bar representing a manager of an assignment group.</td>
<td>Certification Task</td>
</tr>
<tr>
<td>Hierarchical Roll Up</td>
<td>Shows the managers that have employees with assigned certification tasks (task owners). The report is a horizontal bar chart, grouped by status, with each bar representing a manager of a task owner (identified in the Assigned to field).</td>
<td>Certification Task</td>
</tr>
<tr>
<td>Upcoming Schedules</td>
<td>Lists all schedules that are scheduled to run within the next 30 days.</td>
<td>Certification Schedule</td>
</tr>
</tbody>
</table>

**Use the Data Certification Overview module**

View the status of data certification tasks.

1. Navigate to **Data Certification > Overview**.
2. Click elements within the reports to obtain more information.
   - For example, click any of the colored bars in the **Functional Roll Up** bar chart and detailed information replaces the Data Certification Console screen.
3. Update some fields directly on the overview page.

   For example, in the red box on the image shown, a certification schedule is being updated in the certification instances report.
Data certification overview module
Data Certification planning

Initial planning can make the certification process more successful.

By defining certification schedules and certification audit definitions, users with the certification_admin role establish when certifications are performed, who performs it, and what data must be certified.

Required Roles

Users with the certification_admin role can view filter versions. These users can create, update, and delete filters, if they have the proper access to necessary tables. In the base ServiceNow system, certification_admin users have limited system rights and do not have access to all the tables required for creating a filter. When assigning compliance resources, make sure to grant additional roles to the certification_admin user as needed. For example, this user requires roles that grant access to these tables:

- Company [core_company]
- Cost Center [cmn_cost_center]
- Schedule [cmn_schedule]

Planning Data Certification

Planning the data certification process requires defining:

- The certification schedule defines certification for a particular set of information on a particular table. It also generates certification tasks to perform that certification. One certification task is generated per task owner and a certification instance record groups the tasks.
- The optional certification audit definition groups some certification schedules to be performed together and generates certification audit instances to perform them.

The following questions require answers for each certification schedule:

- What information requires certification?
- When is the due date for certification?
- Who must perform the certification?

Create a certification filter

A filter is a subset of configuration items from any ServiceNow table that is created with a standard condition builder.

An example is a filter that selects all UNIX servers in the Australian data center.

With filters, you can:

- Create multiple versions of a filter and then select the version you want to use.
- Use one filter on multiple certification schedules.
- View the number of records that match your filter as you create the conditions.

Note: Be sure to create certification filters before creating certification schedules.

1. Navigate to Data Certification > Certification Filters.
2. Click New.
3. Fill in the form (see table).
4. Click Submit.

This action saves the filter as version 1.

Certification filter V1
5. To create another filter version, modify the filter conditions and click **Update**.

The system saves the new filter and increments the version number.

**Certification filter V2**

By default, the Certification Filters list shows only the current version of each filter. To see all filter versions, click **All** in the breadcrumbs.
## Certification Filter List

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Table</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unix Servers</td>
<td>Only Unix servers</td>
<td>Server [cmdb_ci_server]</td>
<td>1</td>
</tr>
<tr>
<td>Unix Server in South Africa</td>
<td>Only Unix Servers in South Africa</td>
<td>UNIX Server [cmdb_ci_unix_server]</td>
<td>1</td>
</tr>
<tr>
<td>Oracle Database</td>
<td>Only Oracle Databases</td>
<td>Database [cmdb_ci_database]</td>
<td>1</td>
</tr>
<tr>
<td>Linux Servers</td>
<td>Dell Linux servers</td>
<td>Linux Server [cmdb_ci_linux_server]</td>
<td>2</td>
</tr>
<tr>
<td>Linux Servers</td>
<td>Dell Linux servers</td>
<td>Linux Server [cmdb_ci_linux_server]</td>
<td>1</td>
</tr>
<tr>
<td>IBM Servers</td>
<td>Only IBM Servers</td>
<td>Server [cmdb_ci_server]</td>
<td>1</td>
</tr>
<tr>
<td>Data Center Zones</td>
<td>All data center zones</td>
<td>Data Center Zone [cmdb_ci_zone]</td>
<td>1</td>
</tr>
</tbody>
</table>

Displays all versions
6. To make an inactive filter the current version, open the inactive filter and click **Revert**.

This action creates a new, active version of the filter and makes all previous versions inactive.

7. To delete a single filter version, open that version record and click **Delete**.

8. To delete inactive versions of a filter, click **Delete inactive versions** under Related Links in that filter record.

You cannot delete a filter that is used in a schedule definition. The system displays a warning and the filter is not deleted.

### Certification filter revert

This action creates a new, active version of the filter and makes all previous versions inactive.

### Creating certification filters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Required] Filter name.</td>
</tr>
<tr>
<td>Description</td>
<td>[Optional] Brief description of the filter.</td>
</tr>
<tr>
<td>Number</td>
<td>[Read-only] Automatically assigned filter identification number.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Table</td>
<td>Table containing the records to be filtered. Use of the Database View [sys_db_view] table is limited by version.</td>
</tr>
<tr>
<td>Active</td>
<td>Control to make the filter available for use from the Filter field on the Certification Schedule form.</td>
</tr>
<tr>
<td>Version</td>
<td>Current version of this filter. Any significant changes to the filter make the current version inactive. The system copies the updated filter, marks it as active, and increments the version number. The system saves all versions of the filter and makes them available to users. More than one version of a filter can be marked active.</td>
</tr>
<tr>
<td>Filter condition</td>
<td>Field, operator, and value to create the condition. The available options depend on the table selected. You can view the number of records that match the filter by clicking the refresh icon.</td>
</tr>
</tbody>
</table>

**Define a certification schedule**

A certification schedule specifies the fields to display, the fields that require certification, certification task assignments, completion requirements for task owners, frequency of schedule, and detailed instructions.

Use the preview option to see what tasks are created before saving the schedule. If the tasks are not what you want, edit the schedule and preview the tasks again. The system creates certification tasks automatically when it executes a schedule.

To schedule a certification:

1. Navigate to **Data Certification > Schedule Definitions**.
2. Click **New**
3. Fill in the fields (see table).
4. Click **Submit**.

**Defining A Certification Schedule**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A schedule name.</td>
</tr>
<tr>
<td>Filter</td>
<td>A certification filter for this schedule.</td>
</tr>
<tr>
<td>Table</td>
<td>[Read-only] The table holding the records to be certified. To change the table name, select a different Filter or create a new Filter.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Display fields</strong></td>
<td>The fields displayed in the Certification Task list to provide context. These do not require certification themselves. For example, although users are not required to certify the <strong>Name</strong> field of a record, it displays so that users know what record they are certifying.</td>
</tr>
<tr>
<td><strong>Certification fields</strong></td>
<td>The fields to certify on this certification schedule.</td>
</tr>
<tr>
<td><strong>Assignment type</strong></td>
<td>A choice list to select how the certification schedule assigns the certification tasks.</td>
</tr>
<tr>
<td></td>
<td>• <strong>User Field</strong>: Select a user reference field on the table being certified. As an example, select the user named in the <strong>Managed by</strong> field to identify the user who performs the task. This selection displays the <strong>Assign to</strong> and <strong>Assign to empty</strong> fields. If the reference field on the record is empty, the value in the <strong>Assign to empty</strong> field is used.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Specific User</strong>: Select a specific user to perform the tasks. This selection displays the <strong>User</strong> field.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Group Field</strong>: Select a group reference field on the table being certified. As an example, select the <strong>Support group</strong> field to identify the user who performs the task. This selection displays the <strong>Assign to group</strong> and <strong>Assign to empty</strong> fields. All members of the group from the reference field on the record are assigned to the tasks. If the reference field on the record is empty, the value in the <strong>Assign to empty</strong> field is used.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Specific Group</strong>: Select a specific group to perform the tasks. This selection displays the <strong>Group</strong> field. All members of the named group are assigned to the tasks.</td>
</tr>
<tr>
<td><strong>User</strong></td>
<td>This field appears when:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Assignment type</strong> is <strong>Specific User</strong>. This system assigns this user to all certification tasks for this schedule.</td>
</tr>
<tr>
<td></td>
<td>• The <strong>Assign to empty</strong> field is set to <strong>Create Assigned Task</strong>, and you have selected <strong>User Field</strong> as the assignment type. The system assigns this user to certification tasks containing unassigned records.</td>
</tr>
<tr>
<td></td>
<td>You can only select users with the certification role.</td>
</tr>
<tr>
<td><strong>Assign to group</strong></td>
<td>The group field that defines the group assigned to the certification tasks. This field is available only when the <strong>Assignment type</strong> is <strong>Group Field</strong>.</td>
</tr>
<tr>
<td><strong>Group</strong></td>
<td>The specific group to which certification tasks are assigned for this schedule. This field is available only when the <strong>Assignment type</strong> is <strong>Specific Group</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Assign to</td>
<td>The user field that defines which user is assigned to the certification task. This field is available only when the <strong>Assignment type</strong> is <strong>User Field</strong>.</td>
</tr>
</tbody>
</table>
| Assign to empty       | The behavior to use if the field selected in **Assign to** or **Assign to group** is blank on the record being certified. For example, if a task must be assigned to a manager, but no manager is identified, the value in this field determines what happens. This field appears only when the **Assignment type** is **User Field** or **Group Field**. The possible selections are:  
  - **Do Not Create Task**: No task is created when the **Assign to** or **Assign to group** field is empty.  
  - **Create Unassigned Task**: Create a task, but do not assign it to any user or group. The task can be manually assigned later.  
  - **Create Assigned Task**: Create a task and assign it to the user or group specified. If you selected an assignment type of **User Field**, the **User** field is available. If you selected the **Group Field** type, the **Group** field is available.  
  The schedule automatically creates certification tasks for all records that do have "Assign to" populated, regardless of which selection you make for "Assign to empty." |
| Days to complete      | [Required] The number of days that task owners have to complete the certification tasks. When the certification schedule is part of a certification audit definition, the **Days to Complete** audit definition value overrides the value set for the certification schedule.                                                                                                                                    |
| Active                | Check box to activate this certification schedule, generating certification tasks at the scheduled date and time. Clear this check box to hide scheduling fields on the form (except **Last run date**) and not generate certification tasks.                                                                                                                                                 |
| Run                   | How often to run the schedule that generates certification tasks:  
  - Daily  
  - Weekly  
  - Monthly  
  - Periodically  
  - Once  
  - On Demand |
### Preview a certification task

Previewing certification tasks saves any changes to the Certification Schedule form and displays the tasks that are created when you execute the certification schedule.

Previewing tasks is especially useful if you want to test different combinations of options in the **Assignment type**, **Assign to**, and **Assign to empty** fields.

1. Navigate to Data Certification > Schedules > Schedule Definitions.
2. Click a certification schedule Name.
3. In **Related Links**, click **Preview Certification Tasks**.
   The tasks to be created appear at the top of the screen.

![ Certification info message ](image)

**Use a certification schedule notification**

After you define a certification schedule, the system automatically sends notifications to specific users based on the information in the schedule.

The following notifications are sent automatically:

<table>
<thead>
<tr>
<th>Time elapsed to end date</th>
<th>Email template name</th>
<th>Notification message is sent to</th>
</tr>
</thead>
<tbody>
<tr>
<td>0% (when task is created)</td>
<td>certification.task.reminder.inserted</td>
<td>Task owner or assignment group, if specified</td>
</tr>
<tr>
<td>50%</td>
<td>certification.task.reminder.outstanding</td>
<td>Task owner or assignment group, if specified</td>
</tr>
<tr>
<td>75%</td>
<td>certification.task.reminder.outstanding</td>
<td>Task owner, assignment group, if specified, and manager of the task owner, if specified</td>
</tr>
<tr>
<td>95%</td>
<td>certification.task.reminder.outstanding</td>
<td>Task owner, assignment group, if specified, and manager of the task owner, if specified</td>
</tr>
<tr>
<td>100%</td>
<td>certification.task.reminder.overdue</td>
<td>Task owner, assignment group, if specified, and manager of the task owner, if specified</td>
</tr>
</tbody>
</table>

The email templates used in the notifications can be edited, for example, to change the email message text.

**Executing a Certification Schedule**

Executing a certification schedule generates certification tasks based on the schedule.

1. Navigate to **Data Certification > Schedules > Schedule Definitions**.
2. Click a certification schedule **Name**.
3. Click **Execute Now**.

The related lists **Certification Instances** and **Certification Tasks** display the instances or tasks generated by the schedule. The amount of time it takes to generate all certification tasks depends on the size of the table selected and how many fields require certification.

---

**Execute certification schedule**

---

**Define and create a certification audit**

A certification audit is a collection of certification schedules that can be run as a single entity.

Certification audits can be useful when there are multiple certification schedules. After creating a certification audit definition, you can generate a certification audit instance. The certification audit instance is a collection of the certification instances and tasks generated by a single execution of the certification audit definition.

1. Navigate to **Data Certification > Audits > Audit Definitions**.
2. Click **New**.
3. Fill in the fields (see table).
4. Right-click the header bar and select **Save**.
5. In the **Certification Schedules** related list, click **Edit**.
6. In the **Collection** list on the left, select one or more schedules and click **Add**.
7. Click **Save**.

---

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
8. **In Related Links**, click **Create Certification Audit Instance**.

The system generates an audit instance based on the certification schedules selected. All audit instances based on this audit definition are listed in the **Certification Audit Instances** related list.

### Defining and Creating a Certification Audit

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the audit definition.</td>
</tr>
<tr>
<td>Days to Complete</td>
<td>The number of days that task owners have to complete the certification tasks created by this audit definition. Overrides the identical field on the certification schedule.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the intended audit.</td>
</tr>
</tbody>
</table>

#### Track a certification audit instance

You can view a list of all certification audit instances at any time.

1. Navigate to **Data Certification > Audits > Audit Instances**.
2. View the **Certification Instances** related list.

The list contains each of the associated instances generated as part of the audit.

### Data certification performance

After the certification process has been planned, certification tasks can be performed according to defined schedules.

Users with the certification role can perform certification tasks. The certification tasks can be tracked as part of certification instances.

### Fulfill certification tasks

After you execute a certification schedule manually or at a scheduled time, the ServiceNow system performs certain actions.

- Creates tasks for any records that meet the filter requirements in the specified table, like tasks from the Configuration Item [cmdb_ci] table.
- Assigns the new tasks to the user or group identified in one of these certification schedule fields:
  - Assign to
  - User
  - Assign to group
  - Group
- Places the new tasks in the **Work in Progress** state.
- Adds the certification schedule **Short description** and **Assigned to** values to the corresponding fields on the certification task record.
- Adds the certification schedule **Days to complete** and **Complete by** date fields to the certification task record, based on when the task is created.
Note: If the certification filter does not match any CIs, the system sets the **State** to **Closed Complete** and the **Percent complete** to **100**.

To view tasks assigned to you, navigate to **Data Certification > Tasks > My Tasks**.

The following information is tracked on the certification task record:

**Certification task record**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>An identification number for the certification task.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>The user responsible for certifying the data.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>The group responsible for certifying the data.</td>
</tr>
<tr>
<td>Complete by</td>
<td>[Read-only] A date field containing a deadline for the task. This field is automatically filled in based on the Days to Complete field on the certification schedule.</td>
</tr>
<tr>
<td>State</td>
<td>[Read-only] The current state of the certification task. The selections are: Work in Progress, Closed Incomplete, Closed Complete, and Cancelled.</td>
</tr>
<tr>
<td>Percent complete</td>
<td>The task progress as a percentage. This field is read-only when a task is in a Closed Incomplete, Closed Complete, or Cancelled state.</td>
</tr>
<tr>
<td>Escalation</td>
<td>[Read-only] The escalation level of the task. When 0–49% of the time to Complete By has elapsed, this field is set to Normal. At 50%, this field changes to Moderate and an email reminder is sent to the task owner. At 75%, this field changes to High and an email reminder are sent to the task owner and the manager of the task owner. At 95%, this field remains set to High, but a second email reminder is sent to the task owner and manager.</td>
</tr>
<tr>
<td>Short Description</td>
<td>A short description of the task. This field is automatically filled in with the text from the certification schedule of the Task description field.</td>
</tr>
<tr>
<td>Work notes</td>
<td>Information about work performed on the certification.</td>
</tr>
</tbody>
</table>

**Export the certification list**

Users with the certification_admin role can export the certifications list and save the list in Excel, CSV, XML, or PDF format. This list is useful when you have a long list of certification elements or if many different users are assigned to certify elements on a single certification schedule.

For general information and common export steps, see [List export](#).

1. Navigate to **Data Certification > Tasks > All Tasks**
2. Open a task.
3. Open any column context menu in the certification data list and complete the export.
Certify an element

The Certification Task form contains a list of all elements to be certified.

**Note:** After you certify all the elements in a task, no elements can be reverted.

1. Navigate to **Data Certification** > **Tasks** > **My Tasks**.
2. Open a certification task with a **State** of **Work in Progress**.
3. In the upper right corner of the list, select records that require certification for this task or all records that are part of this certification task.
4. Select the check box beside a certification element.
5. In **Optional comment for checked elements**, above the list, enter information that would be useful to others.

![Certification list](image)

6. **Do:**
   - Click the green check mark to certify the element.
   - Click the red exclamation point to fail the element.

7. To see the certified or failed element, set the view to **Show All Records**. A green check mark or red exclamation mark appears beside the element.

8. Point to an icon to see any certification comments.

9. Ensure that all elements have the correct certification, either accepted or rejected.
   - After you certify all elements, no elements can be reverted. When all elements of a certification task are certified or rejected, the task **State** changes to **Closed Complete**.

**View an audit result**

View audit results after you certify the elements.

1. **Navigate to Data Certification > Schedules > Audit Results.**
   - The list of data certification audit results appears, grouped by certification instances. Certified configuration items show the **Original value** only. Failed CIs contain the **Certified value** and the **Original value**.
2. Click the links in the list to open any of the related records.

Data cert audit results

Reset certifications
You cannot reset any element after all elements are certified.

- To reset individual certifications, right-click the element in the certification list and select **Revert Certification**.
- To reset the entire task to its starting point, click the **Reset all Certifications to Pending** related link.

Track a task with a certification instance
The Certification Tasks related list on the certification instance record provides information about associated tasks.

The **State** field on the certification instance record is read-only and is based on the cumulative states of the certification tasks associated with the instance. The **Percent complete** column allows users with the certification_admin role to track task progress quickly. For more information, see Track Certification Tasks.
To track a certification instance:

1. Navigate to **Data Certification > Schedules > Instances**.
2. Click a certification instance **Number**.
3. View and edit the following fields as necessary.

### Certification instance

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>[Read-only] Automatically generated identification number for the instance.</td>
</tr>
<tr>
<td>Certification Schedule</td>
<td>The certification schedule used to create the certification instance.</td>
</tr>
<tr>
<td>State</td>
<td>[Read-only] Current state of the certification instance: Work in Progress, Complete, Closed Incomplete, or Cancelled. For more information, see Track Certification Tasks.</td>
</tr>
<tr>
<td>Created</td>
<td>[Read-only] Date and time the certification instance was created. Date is filled in automatically when the Execute Now button clicks the associated certification schedule.</td>
</tr>
<tr>
<td>Complete by</td>
<td>[Required] Date and time when the certification instance must be completed. The system updates this field when it executes the schedule, using the deadline specified on the instance. All certification tasks associated with the certification instance must be marked Complete, Closed Incomplete, or Cancelled before the instance is complete.</td>
</tr>
<tr>
<td>Percent complete</td>
<td>Percentage of the instance that has reached the Closed Complete state. This field is automatically filled in based on the Percent Complete fields on the associated certification tasks.</td>
</tr>
<tr>
<td>Task Description</td>
<td>Information about the certification instance. This field automatically displays the text from the Task description field of the associated certification schedule.</td>
</tr>
<tr>
<td>Instructions</td>
<td>Field for providing instructions to the user or group performing the certification. This field is automatically filled in with information from the Instructions field on the associated certification schedule.</td>
</tr>
</tbody>
</table>

### Cancel a certification instance

Users with the certification_admin role can cancel a certification instance.

The instance must have a **State** of **Work in Progress**. Canceling a certification instance:

- Changes the certification instance **State** to **Cancelled**.
- Changes all associated **Work in Progress** certification tasks to **Cancelled**.
To cancel a certification instance:
1. Navigate to Data Certification > Schedules > Instances.
2. Click a certification instance Number.
3. Click Cancel.

**Track a certification task**

Use the certification task state to track the progress of a task.

The available task states are **Work in Progress**, **Closed Complete**, **Closed Incomplete**, and **Cancelled**.

When the state of a certification task changes, the certification instance state also changes in the following cases:

- If any certification task is in **Work in Progress** state, the certification instance is placed in **Work in Progress** state.
- If all certification tasks are in **Cancelled** state, the certification instance is placed in **Cancelled** state.
- If all certification tasks are in **Cancelled** or **Closed Complete** state, the instance is placed in **Closed Complete** state. For example, if three certification tasks are **Cancelled**, and one task is **Closed Complete**, the instance state is changed to **Closed Complete**.
- When one certification task is **Closed Incomplete** and the remainder of the tasks are **Cancelled** or **Closed Complete**, the instance is placed in **Closed Incomplete**.

To view the state of certification tasks:
1. Navigate to Data Certification > Tasks and select My Tasks or All Tasks.
2. View the State column for each task.

**Escalate a certification task**

Users with the certification_admin role can escalate a task in the Work in Progress state. To escalate a task, the task owner identified in the Assigned to field on the task record must have an associated manager.

Personalize the User form to see the Manager field.

Escalating a task:

- Sends an email message to the task owner and the manager of the task owner stating that the task has been escalated.
- Sets the manager as the new task owner.

The event that triggers the escalation is named cert_task.escalate and the email notification is named Escalation Notification. To edit the text of the email message that is sent, edit the Escalation Notification email notification directly.

For more information, see Email notifications.

To escalate a certification task from the Certification Task form:
1. Navigate to Data Certification > Tasks > All Tasks.
2. Click a certification task Number.
3. Click Escalate. If the Escalate button is not available, the user in the Assigned to field does not have an associated Manager.
Escalate a certification task from the certification task list

Escalate a certification task to notify the manager of the current task owner.

To escalate a task, the task owner identified in the Assigned to field on the task record must have an associated manager.

1. Navigate to Data Certification > Tasks > All Tasks.
2. Select the check box to the left of a certification task Number. Multiple check boxes can be selected.
3. From the Actions on Selected Rows menu below the list, select Escalate. If the Escalate button is not available, the user in the Assigned to field does not have an associated Manager. Select multiple tasks from the list. The menu option shows how many tasks are not eligible for escalation, such as Escalate (4 of 6).

Reassign a certification task

If you have the certification_admin role, you can reassign any certification task in the Work in Progress state. Tasks in Closed Complete, Closed Incomplete, or Cancelled state cannot be reassigned. When a task is reassigned, the current task owner and the new task owner are sent a message.

Role required: certification_admin

The event associated with the reassignment is named cert_task.reassign and the email notification is named Certification Task Reassignment. To edit the text of the email message that is sent, edit the Certification Task Reassignment email notification directly.

For more information, see Email notifications.

To reassign a certification task:

1. Navigate to Data Certification > Tasks > All Tasks.
2. Click a certification task Number.
3. Enter a new name in the Assigned to field.

Send certification task reminders

The Certification Task Escalations workflow sends automatic email reminders.

The Certification Task Escalations workflow sends automatic email reminders to the:

- Certification task owner.
- Assignment group, if the assignment group was specified on the Certification Task form.
- Manager of the certification task owner, if necessary and if a manager was specified on the User form.

The reminders are based on the Complete by field on the certification task record. If the Complete by date is changed, the reminder schedule automatically adjusts to reflect the new date.

Certification task reminders

<table>
<thead>
<tr>
<th>Time elapsed to end date</th>
<th>Email reminder is sent to</th>
<th>Escalate field on task record reads</th>
</tr>
</thead>
<tbody>
<tr>
<td>50%</td>
<td>task owner and assignment group (if specified)</td>
<td>Moderate</td>
</tr>
<tr>
<td>75%</td>
<td>task owner, assignment group, and manager of the task owner</td>
<td>High</td>
</tr>
</tbody>
</table>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
<table>
<thead>
<tr>
<th>Time elapsed to end date</th>
<th>Email reminder is sent to</th>
<th>Escalate field on task record reads</th>
</tr>
</thead>
<tbody>
<tr>
<td>95%</td>
<td>task owner, assignment group, and manager of the task owner</td>
<td>High</td>
</tr>
<tr>
<td>100%</td>
<td>task owner, assignment group, and manager of the task owner</td>
<td>High</td>
</tr>
</tbody>
</table>

To set reminders for different or more intervals, edit the workflow Certification Task Escalations. In addition to the email reminders sent automatically, users with the certification_admin role can send email reminders manually at any time.

### Send an email reminder from the certification task form

How to manually send email reminders from the Certification Task form.

1. Navigate to Data Certification > Tasks > All Tasks.
2. Click a certification task Number.
3. Right-click the header bar and select Resend email notifications.

### Send an email reminder from the certification task list

How to manually send email reminders from the Certification Task list.

1. Navigate to Data Certification > Tasks > All Tasks.
2. Select the check box to the left of a certification task Number. Multiple check boxes can be selected.
3. From the Actions on Selected Rows menu below the list, select Resend email notifications. Select multiple tasks from the list. The menu option shows how many notifications are outstanding and how many were sent, such as Resend email notifications (15 of 18).

### Mark a certification task as closed incomplete

Mark a task as closed incomplete if, for example, only some of the elements can be certified.

The following users can mark a task as closed incomplete:

- Users with the certification_admin role.
- User identified in the Assigned to field on the certification task record.

To mark a task as closed incomplete:

1. Navigate to Data Certification > Tasks and select All Tasks, or My Tasks.
2. Click a certification task Number.
3. In Work Notes, enter information about why the task could not be completed.
4. Click **Close Incomplete**.

If at least one task on a certification instance is marked **Closed Incomplete**, the **Completed** date and **Percent complete** fields on the certification instance record are not updated. A user with the certification_admin role can:

- Complete the incomplete task or tasks.
- Cancel the incomplete task or tasks.

When all tasks on the certification instance are **Closed Complete** or **Cancelled**:

- The system sets the **Completed** date field on the certification instance record to the current date and time.
- The **Percent complete** field on the certification instance record is set to 100 percent.

### Certification tasks cancellation

Users with the certification_admin role can cancel a certification task in the Work in Progress or Closed Incomplete state.

When a certification task is cancelled, a notification email is sent to the task owner or assignment group assigned to the task. The task owner or assignment group manager is not notified.

#### Cancel an individual task

Cancel a particular data certification tasks in the Work in Progress state.

1. Navigate to **Data Certification > Tasks > All Tasks**.
2. Find a task with a **State** of **Work in Progress**.
3. Click the task **Number**.
4. Click **Cancel**.

#### Cancel all tasks in an instance

Cancel data certification tasks in the Work in Progress state.

1. Navigate to **Data Certification > Schedules > Instances**.
2. Find an instance with a **State** of **Work in Progress**.
3. Click the instance **Number**.
4. Click **Cancel**.

All tasks in the instance with a state of **Work in Progress** are cancelled. The task owner or assignment group is notified.

The email template used for the notification is named **certification.task.cancelled**. The email templates can be edited to change the email message text, for example.

### Domain separation and Data Certification

This is an overview of domain separation and Data Certification processing. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Overview

Support: Data only

Domain separation in this application is supported at the Data only level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see Application support for domain separation.

Decision Tables

Use decision tables to help you resolve a complex decision that depends on multiple factors.

Use decisions tables to help you reach outcomes that depend on multiple factors. In these tables, each factor is a decision input. For example, if you are trying to make a decision about car insurance coverage, your inputs might include the location where the insured person lives, the age and accident history of the insured person, the car make, the car model, and the car year. This logic can save time and present a more organized, readable format than using a script. Decision tables provide a single point where you can create, view, and modify decisions.

To interact with Decision Tables in script, use the Decision Table API.

Components of a decision

Decision Table [sys_decision] records

Decision table records represent a single decision. In this record, you specify which table you want to use for your answers. This record also contains related lists where you can create your decision inputs and decisions.

Decision inputs [sys_decision_input] records

Decision input records represent your inputs that are used to obtain answers in a decision. These inputs can include a variety of types, including strings, references, true/false inputs, and dates. Each decision input has a specified input type and can be assigned a default value.

Decision [sys_decision_question] records

Each decision record represents a decision that is based on your inputs. Use the condition builder on the decision record form to create a condition that is based on the inputs for this decision. Then, you can select an answer record for this decision. The answer record can be any record from the table that you have defined in the Decision Table record. You can select the same answer record for more than one decision.

Answer records

Answer records represent answers that are reached using different decision input values. Answers records can be records on any table, but you need to choose the table when creating your Decision Table record. You could, for example, use the sys_choice table to use existing choice records. From the example about insurance coverage, you could create a table where each record contains details about the levels of insurance coverage.

Use a decision table to determine a discount rate

The following example shows a decision table. In this example, you see two inputs, Units Ordered and Cash on Delivery. The two possible answers, Yes and No, are reached depending on the answers to the two questions. For example, a customer would qualify for a silver discount when ordering more than 50 items or paying in cash, and get a gold discount if doing both.
Sample decision table — discount rates

<table>
<thead>
<tr>
<th>Decision inputs</th>
<th>Decision input entries</th>
</tr>
</thead>
<tbody>
<tr>
<td>More than 50 units ordered</td>
<td>No</td>
</tr>
<tr>
<td>Cash on delivery</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Decision Answers

<table>
<thead>
<tr>
<th>Discount</th>
<th>Silver Discount</th>
<th>Bronze discount</th>
<th>Gold discount</th>
<th>Silver discount</th>
</tr>
</thead>
</table>

Create a decision table to resolve complex decisions

Create a decision table to help you resolve a complex decision that depends on multiple factors.

Role required: decision_table_admin

1. Create or select a table to use for your decision answer records. You will associate an answer record to each decision on your decision table in later steps. This answer record is returned when that decision is reached based on your inputs. For information on creating a table, see Create a table.

2. Ensure that one field on the table that you use for your decision records has been set as the display value. This field is used as a label when you display decision answers in Flow Designer. You can use an existing table or create a new table to use for your decision records.

3. Create a record on this table to each answer in your decision.
   If you have modified an existing table, you may need to customize the form to show the new fields that you have added.

4. Create a decision table record.
   a) Navigate to Decision Tables > Decision Tables, and click New.
   b) On the form, fill in the fields.

   Decision Table form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive label for this decision.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of this decision. This field defaults to the current scope.</td>
</tr>
<tr>
<td>Answer table</td>
<td>Table that this decision uses for answer records. Select the table that you created in the previous steps.</td>
</tr>
<tr>
<td>Accessible From</td>
<td>Option to limit the availability of this decision to the current scope. Select All application scopes or This application scope only.</td>
</tr>
</tbody>
</table>

   c) Right-click the form header and select Save.
      The form refreshes with the Decision Inputs and Decisions related lists.
5. Create decision input records.
   a) In the Decision Inputs related list, click New.
   b) On the decision input form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the decision that is associated to this decision input. This field is automatically populated.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of this decision input. This field defaults to the current scope.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of data that is used for this input. When you use this decision in a flow, you can only use data pills that match this type.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate this input. This field is selected by default.</td>
</tr>
<tr>
<td>Label</td>
<td>Descriptive label for this input.</td>
</tr>
<tr>
<td>Read only</td>
<td>Check box to make this decision input read-only.</td>
</tr>
<tr>
<td>Column name</td>
<td>Column name for this input. This field is automatically populated when you give the Label field a value.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box to make this decision input mandatory.</td>
</tr>
<tr>
<td>Display</td>
<td>Check box to indicates that this decision input is the display value for reference fields.</td>
</tr>
<tr>
<td>Choice</td>
<td>Select a method for users to see a list of suggested values:</td>
</tr>
<tr>
<td></td>
<td>• List menu without -- None --</td>
</tr>
<tr>
<td></td>
<td>• List menu with -- None --</td>
</tr>
<tr>
<td></td>
<td>• Suggestion field type</td>
</tr>
<tr>
<td></td>
<td>If a choice is used, define your choices in the Choices related list at the bottom of the form.</td>
</tr>
<tr>
<td>Default Value</td>
<td>Default value for this input.</td>
</tr>
</tbody>
</table>

c) Click Submit.
   Your changes are saved and the decision table record reopens.

6. Create decision records.
   a) In the Decisions related list, click New.
   b) On the Decision form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Descriptive label for this decision table.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Application scope of this decision. This field defaults to the current scope.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which the flow evaluates decisions. The order can be important in flows that use the First decision that matches option and ends after the first match is found.</td>
</tr>
<tr>
<td>Answer</td>
<td>Answer that is used when the conditions in this decision are met.</td>
</tr>
<tr>
<td>Default Answer</td>
<td>Check box to enable this decision as the default for your decision table.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions that are needed to reach this decision. The fields available for your condition are the Decision inputs that are associated with this decision table.</td>
</tr>
</tbody>
</table>

- **c)** Click **Submit**.
  
  Your changes are saved and the decision table record reopens.

With Flow Designer, you can add your decision to the **Make a decision** flow logic. For more information about the **Make a decision** flow logic, see **Make a decision flow logic**.

### Decision table properties

Use decision table properties to set limits on the maximum number of allowed inputs and questions for decision records.

These properties are available for decision tables.

**Note**: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

#### Properties for decision tables

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.glide.decision_table.max_inputs</td>
<td>Maximum number of decision inputs that can be defined on a model (sys_decision) record.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: Empty. There are no limits on inputs when this property is left empty.</td>
</tr>
<tr>
<td></td>
<td>• Location: System Property [sys_properties] table</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>com.glide.decision_table.max_questions</td>
<td>Maximum number of decision questions that can be defined on a decision table (sys_decision) record.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: Empty. There are no limits on inputs when this property is left empty.</td>
</tr>
<tr>
<td></td>
<td>• Location: System Property [sys_properties] table</td>
</tr>
</tbody>
</table>

### E-signature

Sign electronic documents from any desktop or mobile device with e-signature. E-signature is a scoped application that enables users to sign managed documents or knowledge articles with their typed or drawn e-signature, credentials, or as an acknowledgment.

#### Role assignment

Before you begin using e-signature, you must assign the e-signature roles to the appropriate roles, groups, or users in your application. See Components installed with e-signature for more information.

#### How to use e-signature templates

Users with the e-signature administrator [sn_esign.admin] or manager [sn_esign.config_manager] role can create e-signature templates. Each e-signature template pairs a document type to sign (managed document or knowledge article) with a signature type (signature, credential, or acknowledgment). For example, you could create an e-signature template for a non-disclosure agreement that requires a typed or drawn signature.

- Configure an e-signature template

You can then use the e-signature template in task forms to request electronic signatures from users. In the HR Service Delivery application, for example, you can add HR tasks to HR cases or configure HR task templates to request electronic signatures per the selected e-signature template. See E-signature for HR for HR-specific examples.

#### Activation information

To use e-signature in your application, you must activate e-signature. For information on what components are installed with the feature, see Components installed with e-signature.

#### Activate e-signature

You can activate the e-signature plugin (com.snc.esign) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

E-signature activates these related plugins if they are not already active.
## Plugins for E-signature

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNow document viewer [com.snc.documentviewer]</td>
<td>Document viewer is a platform feature that will enable users to view enterprise class documents inline within the platform attachment instead of downloading it to the local device and then opening the documents with a locally installed viewer.</td>
</tr>
<tr>
<td>Managed documents [com.snc.document_management]</td>
<td>Managed Documents application. To enable the ability to publish to the knowledge base, activate the knowledge document plugin.</td>
</tr>
<tr>
<td>Signature pad [com.snc.signaturepad]</td>
<td>Provides a tool to allow a digital signature in a .pdf document. The Human Resources application uses this with various documents.</td>
</tr>
</tbody>
</table>

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise they will receive the following error: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

## Components installed with e-signature

Several types of components are installed with activation of e-signature, including tables and user roles.

**Note:** The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

## Roles installed

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>E-signature administrator [sn_esign.admin]</td>
<td>Can manage the e-signature module.</td>
<td>• sn_esign.config_manager</td>
</tr>
<tr>
<td>E-signature manager [sn_esign.config_manager]</td>
<td>Can manage the e-signature configurations.</td>
<td>• None</td>
</tr>
</tbody>
</table>

You can assign these roles to the appropriate roles, groups, or users in your application.

- To assign a role to another role, see Add a role to an existing role.
• To assign a role to a group, see Assign a role to a group.
• To assign a role to a user, see Assign a role to a user.

For further information on user administration and how to manage users, see User administration.

Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>E-Signature Configuration [sn_esign_configuration]</td>
<td>E-signature configuration table.</td>
</tr>
<tr>
<td>E-Signature Acknowledgement [sn_esign_acknowledgement]</td>
<td>E-signature acknowledgment table.</td>
</tr>
</tbody>
</table>

For further information on table administration and how to manage data, see Table administration.

Configure an e-signature template

Create or modify an e-signature template to define an electronic document and signature configuration for use in task forms. Each template is associated with a document type such as a managed document or knowledge article, and you can configure the template so that the signatory is required to sign the document with their typed or drawn signature, credentials, or as an acknowledgment.

Role required: sn_esign.admin or sn_esign.config_manager

1. Navigate to E-signature > E-signature template.
2. Click New or open a record.
3. Fill in the fields on the form.

E-signature template form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the e-signature template.</td>
</tr>
<tr>
<td>Task table</td>
<td>Task table that the e-signature template is associated with.</td>
</tr>
<tr>
<td>Document type</td>
<td>Document type of the e-signature template. Select one of the following:</td>
</tr>
<tr>
<td></td>
<td>(HR Service Delivery only) An HR document template is the document type for signing.</td>
</tr>
</tbody>
</table>

**Note:**
- Make sure that the Task table field is set to HR Task [sn_hr_core_task].
- The HR document template that the signatory will sign is selected on the HR case form. See Select an HR document template for an e-signature task for more information.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge article</td>
<td>A knowledge article is the document type for signing. In the <strong>Knowledge article</strong> field, select the knowledge article that the signatory will sign.</td>
</tr>
<tr>
<td>Managed document</td>
<td>A managed document is the document type for signing. In the <strong>Managed document</strong> field, select the managed document that the signatory will sign.</td>
</tr>
<tr>
<td>Signature type</td>
<td>Signature type of the e-signature template. Select one of the following:</td>
</tr>
<tr>
<td>Acknowledgment</td>
<td>The signatory acknowledges the document by accepting and completing the task.</td>
</tr>
<tr>

### Understanding Edge Encryption

Edge Encryption is a network encryption system that resides on your network and that encrypts and decrypts sensitive data as it travels between your data center and the ServiceNow cloud.

### What is Edge Encryption

The Edge Encryption proxy server is a network encryption application that, through encryption in motion, encrypts data within your network before it is sent over the Internet to your instance, where it remains encrypted at rest. When requested, the encrypted data is sent back to the Edge Encryption proxy server, which in turn decrypts your data before serving it to your web browser.

### Who uses Edge Encryption

Only a user logged into the instance through a proxy server on your network can view encrypted data in clear text. Likewise, only a security_admin user logged in to an instance through a proxy server in your network can configure and administer Edge Encryption.

Because the proxy server resides in your network, you own and manage the encryption keys, and they are never sent to the instance. As a result, ServiceNow never shows sensitive data in clear text.
Encryption and tokenization

Edge Encryption supports both encryption (through encryption configurations) and tokenization (through encryption patterns) as a means of protecting your sensitive information.

Encryption configurations

You can encrypt individual fields using encryption configurations. Edge Encryption supports AES 128-bit and AES 256-bit encryption keys. Edge Encryption supports standard, equality-preserving, and order-preserving encryption types.

In addition to attachments, you can encrypt the following field types:

- String
- Date
- Date/Time
- Journal
- Journal Input
- URL

If a Journal field marked for encryption is added to the activity stream, all user input to the field is encrypted in the activity stream.

Note: Multi-byte characters within supported field types can be encrypted.

Encryption patterns

You can use encryption patterns to tokenize strings that match regular patterns such as social security and credit card numbers. While encryption configurations should be the primary method of encryption, use encryption patterns as a supplement to secure sensitive information found outside of encrypted fields.

Note: The Edge Encryption proxy server requires a MySQL database in your network only if using order preserving encryption or encryption patterns. Clear text values are stored in the proxy database in your network. For this reason, it is critical that you secure and regularly back up your proxy database. For recommendations, see Edge Encryption components.
Edge Encryption on the Now Platform

Edge Encryption acts as a gateway between your browser and your ServiceNow instance. Traffic from your browser passes through the gateway on its way to the ServiceNow instance. The gateway, in turn, is configured to encrypt outbound data that is marked for encryption. Inbound traffic is decrypted through the gateway, and the end user sees clear text in the browser. The advantage of this implementation from a security control perspective is that the encryption and key management are handled externally from ServiceNow.

What to know before you begin

Because encryption and tokenization change the nature of your data, Edge Encryption can affect other instance processes. Before using Edge Encryption, carefully consider the impact on your instance.

Because the proxy server is installed and maintained in your network, Edge Encryption requires network administration and management. Review the network requirements to ensure a smooth implementation.
Review the following topics to understand the impact of Edge Encryption on your instance:

- Planning for Edge Encryption
- Edge Encryption system requirements
- Sizing your Edge Encryption environment
- Calculate the order-preserving and tokenization database size
- Edge Encryption limitations
- Key management

**Edge Encryption components**

Edge Encryption is comprised of the Edge Encryption proxy server that runs on a server in your network, and the Edge Encryption plugin that must be installed on your ServiceNow instance. If using order-preserving encryption types or encryption patterns, a proxy database must also be installed in your network.

**Proxy application**

When going through the Edge Encryption proxy server, the Edge Encryption plugin allows you to specify which fields, patterns, and attachments should be encrypted. You can also manage encryption rules to encrypt specific requests and schedule mass encryption jobs.

**Proxy server**

The Edge Encryption proxy server uses encryption rules to identify in an HTTP request what, if anything, needs to be encrypted and encrypts it before forwarding the request to the instance. For decryption, the Edge Encryption proxy server looks at the HTTP responses for any encrypted data and decrypts it before sending the response back to the client. In order for this to happen, all HTTP requests and responses must go through the Edge Encryption proxy server. This includes any requests originating from a browser, as well as any SOAP or REST requests.

**Proxy database**

If using order preserving encryption or encryption patterns, your proxy servers rely on a MySQL database located in your network. All proxy servers in your network must use the same database.

The proxy database contains these tables.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>db_id</td>
<td>Unique database ID</td>
</tr>
<tr>
<td>edge_token_map</td>
<td>Encryption pattern data</td>
</tr>
<tr>
<td>token_map</td>
<td>Order-preserving encryption data</td>
</tr>
</tbody>
</table>

**Backing up your proxy database**
Because encryption patterns rely on tokenization, clear text values are stored in your proxy database. If the database is lost, clear text values cannot be restored. It is critical that you maintain regular backups. To avoid data loss, back up your proxy database according to ServiceNow recommendations.

- Back up your database every 24 hours.
- Retain MySQL database binary log files for at least two days. After a backup has been restored, use the binary log to regenerate any data lost since the most recent backup. Refer to MySQL database backup best practices for your database version.

**Edge Encryption clients**

Edge Encryption uses three clients to inform the instance that the proxy is running, to synchronize requests between the proxy and the instance, and to forward all end user requests to the instance after any potential encryption.

<table>
<thead>
<tr>
<th>Client</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>heartbeat/keepalive client</td>
<td>In charge of sending a request to the ServiceNow instance every 5 seconds to let the instance know that this proxy is up and running. The requests drive the last_response_on field on the Edge proxy table, and as a consequence drive the state of the proxy. If your system has issues sending the requests, or if the request or request processing is delayed, the instance may mark the proxy as unresponsive, even if the other clients (including the one for user traffic) are up and running. This client also controls the online status of the proxy on the instance. The <code>edgeencryption.proxy.keepalive.interval</code> property controls the polling rate for this client. The default is 5 (seconds).</td>
</tr>
<tr>
<td>polling/sync client</td>
<td>In charge of various requests the proxy sends to the instance to synchronize on the Edge Encryption configuration (for example, which table, column, or attachment to encrypt, keys, jobs, rules, and tokenization patterns). The <code>edgeencryption.config.poll.interval</code> property controls the polling rate for this client. <strong>Warning:</strong> Do not change this setting. Changing the default setting of the proxy poll interval may result in synchronization delays when updating Edge Encryption settings on the instance.</td>
</tr>
<tr>
<td>default/user traffic client</td>
<td>For everything else, this client handles all end user requests and forwards them to the ServiceNow instance after any potential encryption. This client also handles responses from the instance, forwarding them to the end user after any potential decryption.</td>
</tr>
</tbody>
</table>

**Key management**

You are responsible for providing and managing the encryption keys used by Edge Encryption.
When obtaining and creating encryption keys to support the encryption types used by Edge Encryption, consider the following:

- Whether to use AES 128-bit or AES 256-bit. You must define a default AES 128-bit encryption key, even if it is not used.
- Whether to use file system, Java KeyStore, or Enterprise Key Management (EKM).
- When to rotate encryption keys.
- When and if to use a mass encryption job to re-encrypt data using the new key.

Before removing a key from the proxy configuration files and the keystore, it is critical that you decrypt all data on the instance that uses the key. You can do this by adding a new encryption key and scheduling a mass key rotation job.

**Keystores**

Edge Encryption supports the following types of key storage.

**File store**

Keys are stored in a file in a file system that is accessible by the Edge Encryption proxy. Encryption keys stored in a file are not encrypted, so it is your responsibility to protect these files.

**Java KeyStore**

Keys are stored in Java’s JCEKS KeyStore. A Java KeyStore is protected by a password, so it is more secure than storing keys in a file in the file store. A single Java KeyStore can store multiple keys, and the keys are identified by a key alias, making it easier to manage multiple keys.

**Enterprise Key Management (EKM)**

Keys are stored and retrieved with the SafeNet KeySecure or Unbound Technology key management systems.

The Edge Encryption proxy ships with the Java JCEKS KeyStore file named `keystore.jceks` in the `keystore` directory. This keystore file contains the ServiceNow public key used to validate encryption rules signed by ServiceNow.

**Note:** If using a keystore other than the base system Java JCEKS KeyStore, you must import the ServiceNow public key into your keystore. The public key alias is `servicenow`.

In addition to the encryption keys, the Java JCEKS KeyStore is used to store the RSA key pair for digitally signing the encryption configuration and encryption rules that are stored in the instance, and the digital certificate that the Edge Encryption proxy uses to establish a secure connection with the browsers and any other clients.

**SafeNet key versioning**

Use SafeNet key versioning to simplify changing keys. Instead of creating a new alias for every new key, SafeNet key versioning keeps the same alias and increments the version.

You must set up key versioning in SafeNet before you can configure SafeNet key versioning on the Edge proxy server.

**Note:** Edge proxies installed before the London release support SafeNet keys, but do not support SafeNet key versioning. If you mistakenly use a versioned key on a Kingston or earlier proxy, when you upgrade to a London or later release, the London or later proxy detects this problem, and to prevent potential data loss the proxy does not start.
You must first schedule a mass key rotation job or a single key rotation job to replace the old SafeNet versioned key with a non-versioned key, and then create a new SafeNet versioned key, if needed. This new versioned key is safe to use with the London or later proxy, and you can restart the proxy.

Encryption key configuration

If using SafeNet versioned keys, the Change Default Keys section of the Encryption Key Configuration form includes new fields for the **Key version** of the default 128-bit and 256-bit keys. **Key version** fields are grayed out and cannot be edited.

For procedures, see Configure encryption keys on the instance.

Versioned keys

If using SafeNet versioned keys, when you navigate to **Edge Encryption Configuration > Encryption Key Configuration > All Keys**, versioned keys include the **Key version**.
A version number does not appear for the initial entries you make in the Change Default Keys section of the Encryption Key Configuration form. When the proxy server requests a key from SafeNet, the system adds a new line for the alias and adds the **Key version**.

In the above example, **AES128key** is listed three times:

- The first listing, with no **Key version** indicated, is the initial entry.
- The second listing, with 1 in the **Key version** column, is the first version of the key returned from SafeNet.
- The third listing, with 2 in the **Key version** column, is the second version of the key returned from SafeNet.
- As other versions of the key are returned from SafeNet, new lines are added to record the **Key version** now in use.

### Encryption configurations and patterns

With Edge Encryption, you can encrypt fields and tokenize strings.

### Encryption configurations

You can encrypt individual fields using encryption configurations. Edge Encryption supports AES 128-bit encryption keys. If the Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction Policy files are installed, Edge Encryption supports AES 256-bit encryption keys for each encryption type. Edge Encryption supports the following types of encryption configurations.

#### Standard encryption
The encrypted value of a field is different each time the field is encrypted, even when the field value remains the same. Standard encryption is the most robust form of encryption. Fields using standard encryption cannot be sorted, grouped by, or filtered on.

**Equality-preserving encryption**

The encrypted value of a field is the same when the field value remains the same. Supports equality comparisons and group by operations on a field.

**Note:** When equality-preserving encryption is selected for a field that already contains data, performing a group by action on the field may not group fields with the same value if one is encrypted and the other is not.

**Order-preserving encryption**

Uses tokens and encryption to secure data in your proxy database. Supports equality comparisons, group by operations, and the ability to sort data. The order preserving encryption type is only supported if there is a MySQL database configured for the Edge Encryption proxy server.

**Note:** When using order-preserving encryption and the proxy database is down, updates can be made to fields using order-preserving encryption. However, the sort order will not be correct when trying to sort data based on those fields. Groups also will not work as expected. When the proxy database is again operational, schedule an order token repair job to repair missing tokens.

**Encryption types**

The following encryption types are listed in decreasing security quality.

<table>
<thead>
<tr>
<th>Encryption type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard AES 256</td>
<td>Fields cannot be filtered, sorted, or compared.</td>
</tr>
<tr>
<td>Standard AES 128</td>
<td>Fields cannot be filtered, sorted, or compared.</td>
</tr>
<tr>
<td>Equality preserving AES 256</td>
<td>Fields can be filtered using equality comparisons.</td>
</tr>
<tr>
<td>Equality preserving AES 128</td>
<td>Fields can be filtered using equality comparisons.</td>
</tr>
<tr>
<td>Order preserving AES 256</td>
<td>Fields can be sorted and equality comparison filtering can be used. Requires the use of a MySQL database in your network.</td>
</tr>
<tr>
<td>Order preserving AES 128</td>
<td>Fields can be sorted and equality comparison filtering can be used. Requires the use of a MySQL database in your network.</td>
</tr>
</tbody>
</table>

**Encryption Patterns**

You can secure sensitive data found in strings using encryption patterns. Once an encryption pattern is stored and activated, the Edge Encryption proxy server identifies strings that match the pattern in requests. Once located, the clear text string is stored in the proxy database and replaced on the instance with a token. Use encryption patterns to tokenize strings that match regular patterns such as social security and credit card numbers. While we recommend that encryption configurations be the primary method of encryption, use encryption patterns as a supplement to locate and secure sensitive information found outside of encrypted fields.
**Note:** The Edge Encryption proxy server requires a MySQL database in your network only if using order preserving encryption or encryption patterns. Clear text values are stored in the proxy database in your network. For this reason, it is critical that you secure and regularly back up your proxy database. For recommendations, see Edge Encryption components.

## Installed with Edge Encryption

Edge Encryption installs tables to store encryption-related data, system properties to configure default behavior, and the `edge_encryption` role to administer Edge Encryption.

### Tables

Edge Encryption adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edge Encryption Configuration</td>
<td>Contains encrypted fields and tables for which attachments are encrypted.</td>
</tr>
<tr>
<td>[sys_encryption_configuration]</td>
<td></td>
</tr>
<tr>
<td>Edge Encryption Rule</td>
<td>Contains a record for each rule. A rule has a name, the condition when it is used, a script, and an order field.</td>
</tr>
<tr>
<td>[sys_encryption_rule]</td>
<td></td>
</tr>
<tr>
<td>Edge Encryption Invalid Insert Log</td>
<td>Contains log messages created for attempts to save unencrypted data to an encrypted field.</td>
</tr>
<tr>
<td>[sys_edge_encryption_invalid_insert_log]</td>
<td></td>
</tr>
<tr>
<td>Edge Encryption Proxy</td>
<td>Contains information about the encryption proxy application.</td>
</tr>
<tr>
<td>[sys_encryption_proxy]</td>
<td></td>
</tr>
<tr>
<td>Edge Proxy Encryption Type</td>
<td>Used for enabling and disabling encryption types on the encryption form.</td>
</tr>
<tr>
<td>[sys_proxy_encryption_type]</td>
<td></td>
</tr>
<tr>

</tr>
<tr>
<td>sn_edge_encryption.cleartext.allowed</td>
<td>When true, allows clear text to be saved in an encrypted field. This happens when a user is accessing the instance without going through the Edge Encryption proxy. When false, the system prevents clear text from being saved in an encrypted field.</td>
</tr>
</tbody>
</table>
| • **Type**: Boolean  
• **Default value**: false  
• **Location**: System Properties [sys_properties] table |

### Roles installed with Edge Encryption

<table>
<thead>
<tr>
<th>Role title</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>edge_encryption</td>
<td>Edge Encryption proxies log into the instance as a user, with a user name and password. The user must have this role assigned.</td>
<td>None</td>
</tr>
</tbody>
</table>

### Planning for Edge Encryption

Successful implementation of Edge Encryption requires planning and preparation. Answer the following questions in the planning stage.

- Which fields are to be encrypted?
- Which encryption types are to be used?
- How many Edge Encryption proxies are needed? See [Sizing your Edge Encryption environment](#) for recommendations and considerations.
- If an order preserving encryption type or encryption patterns are to be used, where is the MySQL database located?
- Which key management system is to be used?

System administrators, network administrators, and security team members have different tasks to fulfill for implementing Edge Encryption.

- System administrators need the security-admin role. The system administrator needs to:
  - Download the Edge Encryption proxy application.
  - Set up an Edge Encryption user account for the proxies to use to connect to the instance. The user must be assigned the edge_encryption role.
  - Configure encryption keys, and set the default keys.
  - Configure Edge Encryption on the instance.
  - Schedule encryption jobs.
  - Monitor Edge Encryption.
  - Create and edit encryption rules.
Your network administrator needs to:

- Install the Edge Encryption proxy application.
- Know the network addresses for the proxy servers and the proxy database used for order-preserving encryption and encryption patterns.
- Install the proxy database to be used for order-preserving encryption and encryption patterns.
- Start and stop the proxy applications.
- Perform encryption key management.
- Determine how to map users to encryption proxy applications. This can be done with DNS settings or routing rules, and is specific to each network.
- Manage multiple proxy servers.
- Configure load balancer pools and settings.

Your security administrator must determine the encryption types to be assigned to each field.

**Edge Encryption system requirements**

You can run the Edge Encryption proxy application on servers or virtual machines that run on Microsoft Windows or Linux operating systems. For optimum performance, ensure that your configuration meets these requirements.

**Java requirements**

The host machine installing or running the Edge Encryption proxy server must maintain a supported version of Java:

- Java 8 update 121 (8u121)
- Java 8 update 141 (8u141)
- Java 8 update 151 (8u151) or later

ℹ️ Note: Java 8 update 131 (8u131) is not supported.

ℹ️ Note: Before installing the Edge Encryption proxy server, check that the $JAVA_HOME variable is pointing to a supported version of Java for each user that will run the proxy server. For example, if installing the proxy server as a local administrator on Windows, check that the $JAVA_HOME variable is pointing to the correct version of Java system-wide. If installing on Linux, check that each user that will run the proxy server has this variable correctly defined. If a supported version of Java is not found, the Edge Encryption proxy server will not run.

<table>
<thead>
<tr>
<th>Java Version</th>
<th>Enabling AES 256-bit Encryption</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java 8 update 141 (8u141) or earlier</td>
<td>Install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the <code>&lt;Java-home-directory&gt;/jre/lib/security</code> folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier.</td>
</tr>
</tbody>
</table>
Java Version | Enabling AES 256-bit Encryption
---|---
Java 8 update 151 (8u151) or later | A `java.security` file is downloaded with the update. Edit the `java.security` file to enable AES 256-bit encryption.

To edit the `java-security` file, see Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later.

**Note:** If upgrading an Edge Encryption proxy server running on Windows to a new version of Java, you may need to copy the JCE policy files from your previous Java folder to the new Java folder.

**Note:** Java does not automatically allow unlimited strength keys. You must specifically enable the use of AES 256-bit encryption.

### Proxy server minimum configuration

A proxy server requires this minimum configuration:

- 4 GB of RAM per proxy server (6 GB is recommended for most deployments).

**Note:** The proxy server host requires at least 1 GB of RAM more than the proxy server. The proxy server host needs the extra 1 GB for operating system services. For example, if you configure a proxy server to use 4 GB of RAM, you must install at least 5 GB of RAM on the proxy server host.

Because the proxy server requires at least 4 GB of memory, 32-bit JREs and 32-bit operating systems are no longer supported starting with the London release.

- 3 or more GHz CPU (4-core CPU preferred for optimum performance).
- Multiple proxy servers behind a load balancer. The number of proxy servers you need depends on the number of application nodes, the number of simultaneous users, and the number of servers needed for failover. See Sizing your Edge Encryption environment for more information.
- Ability to run concurrently with other services, depending on the server utilization and resource availability.
- Java 8.

### Proxy server supported systems

The following systems are supported:

<table>
<thead>
<tr>
<th>Supported System</th>
<th>Description</th>
</tr>
</thead>
</table>

• 64-bit systems |
## Proxy server connection requirements

The proxy server that runs the Edge Encryption application must be able to communicate with machines in your network. Make sure that the proxy server has these network privileges:

<table>
<thead>
<tr>
<th>Network Privilege</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firewall access</td>
<td>Configure any firewalls between the proxy server and the client devices to allow a connection. If your network uses a DeMilitarized Zone (DMZ) to add an extra layer of security to your Local Area Network (LAN), and if your network security protocols limit port access from within the network to the DMZ, you might have to deploy a proxy server to a machine within the DMZ.</td>
</tr>
<tr>
<td>Network access</td>
<td>Configure each client to enable the proxy server to connect with it. If network security prevents you from configuring new machines that can connect to the clients, install the proxy server on an existing machine with connection privileges.</td>
</tr>
<tr>
<td>Instance access</td>
<td>Ensure that the proxy server has network access to the instance. Make sure that you configure the proxy server network to allow traffic over TCP port 443.</td>
</tr>
<tr>
<td>Network account</td>
<td>Install the proxy server with either a local or domain administrator.</td>
</tr>
</tbody>
</table>

## Order-preserving and tokenization database system requirements

Order-preserving encryption and encryption patterns require that you configure an Oracle MySQL database for the Edge Encryption proxy server. Order-preserving encryption allows any comparison operation to be directly applied on encrypted data, without first decrypting the data. Encryption patterns let you replace string patterns with tokens (called tokenization) before they are sent to and stored in the database. Because of the size of the MySQL database, use a dedicated proxy server to run the order-preserving and tokenization database.

The minimum database system requirements include:

<table>
<thead>
<tr>
<th>MySQL Database</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version</td>
<td>MySQL database versions 5.5 to 5.7</td>
</tr>
<tr>
<td>OS</td>
<td>64-bit systems</td>
</tr>
</tbody>
</table>
### Requirements

<table>
<thead>
<tr>
<th>MySQL Database</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU</td>
<td>2 or more GHz CPU (4-core CPU preferred for optimum performance)</td>
</tr>
<tr>
<td>RAM</td>
<td>16 GB</td>
</tr>
<tr>
<td>Disk</td>
<td>Storage Area Network (SAN) or local storage (RAID 10 recommended)</td>
</tr>
<tr>
<td>Size</td>
<td>Determined by the number of potential records multiplied by the record size. See Calculate the order-preserving and tokenization database size.</td>
</tr>
<tr>
<td>Configuration</td>
<td>High availability cluster. If you are unsure of how to configure your MySQL server, contact MySQL for configuration information.</td>
</tr>
</tbody>
</table>

## Sizing your Edge Encryption environment

Choosing the number of proxy servers for your environment is an important task. Consider the number of users, redundancy needs, and acceptable latency.

### Redundancy

Maintain redundant proxy servers in case of hardware failure. Proxy servers should be located behind a load balancer to provide a functional path for all users if a proxy server is unreachable. At a minimum, ensure that two proxy servers are always available.

### Size

Size refers to the number of proxy servers required to avoid additional latency that the encryption of data produces. Depending on use, you may want to reduce the amount of latency by adding additional proxy servers. For example, if regular mass encryptions are run, add additional proxy servers to handle the load, or run the mass encryptions when the user load is light. In addition, the hardware that the proxy server runs on influences performance and latency. Proxy servers running on hardware with faster CPUs, more CPUs, and more RAM have higher throughput than slower, limited systems.

The following guidelines assume that your proxy server is running on at least the minimum hardware requirements. To determine the number of proxy servers:

- Consider setting up one proxy server for every two application nodes on the instance.
- For redundancy, set up a minimum of two proxy servers behind a load balancer.
- Add an extra proxy server for every 500 simultaneous users.
- Depending on the desired redundancy, add additional proxy servers for failover.

For example, for an instance with 2,000 users, you should have at least five proxy servers behind a load balancer. This calculation includes one proxy server for every 500 users, with an extra proxy server for failover. Determine ahead of time when you will approach a threshold of 500 users and place another proxy server in the load balancer pool.
Load balancers

To balance requests and improve server response time, distribute proxy servers in a load balancer pool. Configure load balancers to use the "least connections" method. This method connects requests to the proxy server with the fewest active connections, preventing the overloading of a single proxy.

CPU utilization

Because data encryption and tokenization are CPU intensive operations, CPU spikes while encrypting data are normal and expected. When CPU utilization is over 80% for several minutes at a time, it likely means that the proxy server has too much work to do. When this happens, latency increases for the period that the CPU utilization is high. If latency persists, adding another proxy server may help decrease the latency.

Memory

The proxy server must have a minimum of 4 GB of RAM available (6 GB recommended). Set the proxy server initial and upper bound memory limits to the recommended settings.

Calculate the order-preserving and tokenization database size

If using order-preserving encryption or encryption patterns, determine the size of your MySQL database by multiplying the number of potential records by record size.

Use a dedicated machine to run the order-preserving and tokenization database. Do not run the database on the same hardware as the proxy server.

1. Determine the potential number of records that could include fields encrypted with order-preserving encryption.
   a) Multiply the number of encryption configurations using order-preserving encryption by the number of records each configuration is applied to.
   b) To allow for growth, multiply the result by three.

2. Multiply the result of step 1 by 1,536.
   1,536 is the average size of a record in bytes.

3. If using encryption patterns, perform steps 1–2 for tokenized records and add the result to the total.

The calculated value is the recommended size in bytes for your order-preserving and tokenization database.

Edge Encryption limitations

Edge Encryption impacts system functions. Carefully evaluate the impact of encrypting a field.

Field type restrictions

You can encrypt only the following field types:

- String
- Date
- Date/Time
- Journal
• Journal Input
• URL

You cannot encrypt the following field types:
• Choice fields
• Virtual fields
• Fields in system tables, except for certain fields in sys_user
• System fields in tables
• Number fields or fields associated with an auto-numbering scheme
• Any other field type not listed above

Additional restrictions:
• When a Journal field is encrypted, the Post button is disabled, even if there are multiple Journal fields and only one of those fields is encrypted.
• Encrypted fields are not available in Go to and header filter boxes.
• When encrypting fields used as an index, you can use only order-preserving and equality-preserving encryption types. Indexed fields cannot be encrypted using the standard encryption type.

For more information, see Field types.

Filtering and searching restrictions

Standard encryption
When you select a String, Date, Date/Time, or URL field with a standard encrypted field configuration as the left operand in a filter, no filtering options are available.

Equality-preserving encryption
When you select a String, Date, Date/Time, or URL field with an equality-preserving encrypted field configuration as the left operand in a filter, the following operators are available:
• is
• is not
• is empty
• is not empty

Order-preserving encryption
When you select a String field with an order-preserving encrypted field configuration as the left operand in a filter, the following operators are available, in addition to is, is not, is empty, and is not empty:
• greater than
• less than

When you select a Date or Date/Time field with an order-preserving encrypted field configuration as the left operand in a filter, the following operators are available, in addition to is, is not, is empty, and is not empty:
• after
• before
• after or on
• before or on
**Date and Date/Time pickers**

For Date fields, use the date picker to specify the date:

![Date Picker](image1)

For Date/Time fields, use the date and time picker to specify the date and time:

![Date/Time Picker](image2)

**List condition filters**

The Show Matching and Filter Out options are supported in lists. Only exact matches are returned or filtered out.

**Note:** Adding encrypted fields in condition filters is supported in scripts such as UI policies and business rules.

**Configuration restrictions**

Restrictions and behavior of encryption configurations:

- After you add a field to the Edge Encryption Configuration table, you cannot delete the configuration record. If you no longer want a field to be encrypted, deactivate the record in the Edge Encryption Configuration table and schedule an encryption job to decrypt the data.
• If a field in a parent table is marked to be encrypted, the field is also encrypted in all inherited tables. For example, if the Short description field in the Task table is encrypted, then the contents of the Short description field in the Incident table are encrypted.

• If a field inherited from a parent table is marked to be encrypted, the field in the parent table cannot be encrypted. For example, if the Short description in the Incident table is marked to be encrypted, then the Short description in the Task table cannot be encrypted. In this example, you can encrypt the Short description in the Problem table.

• When a field with an encryption configuration defined is exported to any format, the output includes encrypted values even when exported through the proxy server.

• You cannot import data to a field with an encryption configuration defined.

• You cannot encrypt inherited Date and Date/Time fields. Date or Date/Time fields inherited from a parent table are not listed on the Column field drop-down list, and you cannot create Date or Date/Time encryption configurations for those fields.

• You can encrypt a String or URL field only from a parent table or a child table, but not both.

Instance restrictions

Impact of using Edge Encryption on the instance:

• Back-end logic cannot process encrypted data. When the instance contains encrypted data, any business rule, back-end script, or back-end feature that relies on evaluating the data in the encrypted field does not run correctly.

  Note: Data encrypted with equality-preserving or order-preserving encryption still passes equivalence checks when compared against an identical encrypted value.

• Since email processing goes from the mail systems straight to the instance and cannot pass through the Edge proxy, data sent in or out via email cannot be encrypted or decrypted by the Edge proxy.
  
  • Data and attachments in inbound emails are not encrypted.
  • Data and attachments in outbound emails remain encrypted and cannot be decrypted.

• Scripts run on the server cannot change encrypted data.

• Global search is not supported. Because global search attempts to search both encrypted and clear text data, the results may not be as expected.

• Encrypted data cannot be copied and pasted into a record where the field is not encrypted.

• Depending on the type of encryption selected, the user interface functionality for the encrypted fields is reduced. For example, being able to compare, group by, sort, and search may be impacted. Generally, the stronger the encryption selected, the more functionality is reduced.

• Except for Java KeyStore, SafeNet, and Unbound Technology, no third-party software or hardware encryption key management is supported.

• Although multiple proxy servers connected to a single instance are supported, encryption proxy cluster management and monitoring are not available. Each proxy must be managed separately.

• System configurations such as workload and the number of encrypted fields can impact the performance of encrypted fields.

• The Edge Encryption proxy server can only connect to a single instance.

• If your instance uses an Oracle database and the String field you are marking to be encrypted is greater than 2925 characters, that field cannot be sorted even when order preserving encryption is selected.

• If your instance uses an Oracle database, Unicode AL32UTF8 is the only supported character set.

• Encrypted data cannot be used in reports.
Edge Encryption installation

You can install an Edge Encryption proxy manually or using the Edge Encryption interactive installer.

Java requirements

The host machine installing or running the Edge Encryption proxy server must maintain a supported version of Java:

• Java 8 update 121 (8u121)
• Java 8 update 141 (8u141)
• Java 8 update 151 (8u151) or later

**Note:** Java 8 update 131 (8u131) is not supported.

**Note:** Before installing the Edge Encryption proxy server, check that the $JAVA_HOME variable is pointing to a supported version of Java for each user that will run the proxy server. For example, if installing the proxy server as a local administrator on Windows, check that the $JAVA_HOME variable is pointing to the correct version of Java system-wide. If installing on Linux, check that each user that will run the proxy server has this variable correctly defined. If a supported version of Java is not found, the Edge Encryption proxy server will not run.

Installing the proxy server

Installing Edge Encryption includes these steps.

• Install the Edge Encryption proxy application on a server in your network using the interactive installer or the manual installer.
• Generate the RSA key pair for digitally signing encryption configurations and encryption rules.
• Install the Java Cryptography Extension (JCE), if you plan to use AES 256 encryption.
• If you are using a secure SSL connection, obtain a server certificate and import it to the Java KeyStore.
• Set up your keystore and encryption key.
• If order preserving encryption types or encryption patterns are to be used, set up a MySQL database on a machine in your network.
• Set the desired properties. Properties are located in the edgeencryption.properties configuration file.
• Specify that a proxy server is a trusted source so that Edge Encryption can process requests coming from that proxy server.

Accessing the proxy server

Once installation is complete, point each user’s browser to an Edge Encryption proxy using the URL format: `<host>:`:<`port>`. Values are determined by the host and port properties in the edgeencryption.properties file.

As an example with the following values:

<table>
<thead>
<tr>
<th>Property</th>
<th>Example value</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.host</td>
<td>hostname.mycompany.com</td>
</tr>
</tbody>
</table>
A client will access the proxy server using the following address: http://hostname.mycompany.com:8081/.

Note: DNS settings and routing rules may be used. Host and port values are determined by your network administrator.

**Request Edge Encryption**

The Edge Encryption plugin (com.glide.edgeencryption) is available as a separate subscription.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and sub-production instances, generally within a few days.

If you do not have an account manager, decide to delay activation after purchase, or want to evaluate the product on a sub-production instance without charge, follow these steps.

**Role required: none**

1. Navigate to **System Applications > All Available Applications > All.**
2. On the All Applications page, click **Request Plugin** to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.

![Activate Plugin]

In order to enhance the user experience, we have redesigned Activate a Plugin service catalog. Please use the new HI Service Portal 'Activate a Plugin' service catalog item. You can also use Manage Instances page on Service Portal to Activate a Plugin.

Take me to the HI Service Portal Activate a Plugin Service Catalog.

4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.

| Reason/Comments | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments. |

5. Click Submit.

**Set up an Edge Encryption user account**

The Edge Encryption proxies connect to the instance as a user to obtain and update encryption configuration information. Create a user account for this purpose and give the edge_encryption role to the user.

The Edge Encryption plugin must be installed before you can assign the role.

Role required: admin

1. On your ServiceNow instance, create a user account to be used by the Edge Encryption proxy applications.
2. Assign the edge_encryption role to the user.
Download the Edge Encryption proxy server

Download the Edge Encryption proxy server application from your instance, and then copy the file to each computer that is to run the Edge Encryption proxy server.

Before starting this procedure, the Edge Encryption plugin must be installed and activated on your instance.

**Note:** The Edge Encryption proxy is officially supported only on Oracle JRE.

Role required: security_admin

1. Navigate to Encryption Configuration > Installation & Downloads > Downloads.
2. If using the interactive installer, click Download. If manually installing the proxy server, select the OS version for your proxy server.

**Note:** Because the proxy server requires at least 4 GB of memory to run, 32-bit JREs and 32-bit operating systems are no longer supported starting with the New York release.

3. Copy the installer to each computer that is to run the Edge Encryption proxy server. If manually installing the Edge Encryption proxy server, copy the ZIP file to each computer that is to run the Edge Encryption proxy server.

After downloading the Edge Encryption installer, install the Edge Encryption proxy server using the interactive installer. If installing manually, install the Edge Encryption proxy server using the command line installer.

Install the Edge Encryption proxy server using the interactive installer

Install the Edge Encryption proxy server on a Windows or Linux computer using the interactive installer.

**Note:** SafeNet KeySecure keystore files are not supported by the Edge Encryption installer. To use a SafeNet KeySecure keystore, install the Edge Encryption proxy server using the command line installer.

The Edge Encryption plugin must be installed and activated on your instance before you start this procedure. Ensure that the latest version of Java 8 is installed on the machine running the Edge Encryption installer.

The latest version of Java 8 is Java SE 8u171/ 8u172.

- Java SE 8u171 includes important bug fixes. Oracle strongly recommends that all Java SE 8 users upgrade to this release.
- Java SE 8u172 is a patch-set update, including all of 8u171 plus additional bug fixes.

Role required:

- security_admin on your ServiceNow instance
- local or domain administrator on a Windows host
- service user with full file system access on a Linux host

After installing a new proxy server, you can run the installer again to perform tests to detect issues with an installation or modify current settings. Your options include:

- **Install New:** Install a new proxy server.
- **Verify Installation:** Perform tests to detect and fix issues in a previous installation.
• **Reinstall Existing**: Perform tests to detect and fix issues in a previous installation and view or modify existing settings.

**Note**: If installing the proxy server on a Linux machine on a privileged port (port 80 or 443), you must run the installer as a root user with full file system access. To restrict file system access after the proxy server is installed, you can use the SetUID feature in the proxy installer. To enable this feature, start the installer as root or sudo root. When prompted by the installer, provide the username and usergroup of an unprivileged user. The proxy server will install with file system privileges of the given user. You can skip this step to continue the default installation with root privileges.

Use the installer to install multiple proxies for your instance on multiple machines, ensuring that the following criteria apply:

• All proxies must have the same encryption keys and the same RSA key pair used to digitally sign encryption configurations and rules.
• The encryption key must be the default key configured on the instance.
• When a proxy database is set up as part of the installation, all proxies must use the same proxy database.

You may need a proxy database for equality-preserving encryption, order-preserving encryption, or tokenization. If you do not use any of these features, you do not need a proxy database.

To use NVDA, an Assistive Technology screen reader designed to read accessibility-enabled Java applications built for keyboard users, see Configure a Windows 64-bit host to use 32-bit NVDA with Java applications.

After installing the Edge Encryption proxy server, Set the proxy server initial memory limit and upper bound memory limit.

**Install the Edge Encryption proxy server (interactive installer)**

Install the Edge Encryption proxy on a Windows or Linux computer.

1. Download the Edge Encryption proxy server installer.
2. Open the Edge Encryption proxy installer.

   **Note:** If installing on a Windows machine, you must run the installer as Administrator.

   a) To run the installer as Administrator on a Windows machine, right-click the Command Prompt and select **Run as administrator**.

   b) From the command line, navigate to the directory that contains the downloaded .jar file.

   c) Run the following command: `java -jar <file name>.jar`.

3. To install a new proxy server, select **Install New**.
   If a proxy is already installed, you can run the installer to:
   - **Verify Installation**: Perform tests to detect and fix issues in a previous installation.
   - **Reinstall Existing**: Perform tests to detect and fix issues in a previous installation and view or modify existing settings.
4. Configure the **Installation Location** and **Target ServiceNow Instance**.
   a) Click **Browse** to select an installation location or manually enter an installation path.
   b) Enter the URL of the target ServiceNow instance. Include the protocol and port number.
      `https://example.servicenow.com:443`
   c) Enter the user name and password for a user with the `edge_encryption` role on the target ServiceNow instance.

5. Click **Next**.

6. Configure the **Connection Settings** and **Proxy Settings**.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy Host</td>
<td>Fully qualified domain name of the machine on which you are installing the proxy server.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Click <strong>Detect FQDN</strong> to look up the machine's fully qualified domain name and auto-populate the <strong>Proxy Host</strong> field.</td>
</tr>
<tr>
<td></td>
<td>Along with the port, this property defines the URL used by the client to access the proxy server.</td>
</tr>
<tr>
<td>HTTP Port</td>
<td>Port on the proxy for HTTP communication.</td>
</tr>
<tr>
<td>HTTPS Port</td>
<td>Port on the proxy for HTTPS communication.</td>
</tr>
<tr>
<td>Proxy Name</td>
<td>Name of the proxy and the service. The proxy name must be unique.</td>
</tr>
<tr>
<td>Proxy Poll Interval</td>
<td>Poll interval in seconds. With the default setting, it takes 5 seconds for the proxy to learn of encryption configuration changes. Larger values cause the instance to take longer to detect proxies that have come online.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Changing the default setting of the <strong>Proxy Poll Interval</strong> can result in detection delays when a proxy comes online.</td>
</tr>
<tr>
<td>Proxy Keep-Alive Ping Interval</td>
<td>Time in seconds between pings issued by the proxy to the instance. Pings are issued periodically to verify connectivity between the proxy and the instance. The default value is 10. The minimum value is 5.</td>
</tr>
</tbody>
</table>

7. Click **Install**.
   The Edge Encryption proxy server installs. The installation may take a few minutes.

**Configure CyberArk properties protection**

Optionally, configure CyberArk properties protection to securely store Edge Encryption passwords in a centralized and secure digital vault.

You must purchase and configure CyberArk AIM (Application Identity Management) before you can configure CyberArk connection parameters and protected credentials for a proxy server. As part of the installation of the AIM client, the `JavaPasswordSDK.jar` file is installed in the AIM client installation directory. The CyberArk vault is installed on an independent hardened server, and the AIM clients allow secure access to that server.
Note: You must install the CyberArk AIM client on every host computer where an Edge proxy is installed.

In the Edge installer, you must specify the location of the `JavaPasswordSDK.jar` file to set up the CyberArk connection to the Edge proxy. You must also enter other values you defined during the AIM client installation.

Setting up CyberArk password storage is optional. If you do not want to set up CyberArk password storage, click **Skip** through the CyberArk screens.

1. On the CyberArk Connection page of the Edge Encryption installer, enter the CyberArk connection parameters.

   **CyberArk connection parameters**
   
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path to PasswordSDK.jar</td>
<td>The path to the <code>JavaPasswordSDK.jar</code> file installed on the host Windows machine during CyberArk configuration.</td>
</tr>
<tr>
<td>App ID</td>
<td>The <strong>App ID</strong> entered during CyberArk configuration.</td>
</tr>
<tr>
<td>Safe Name</td>
<td>The <strong>Safe Name</strong> entered during CyberArk configuration.</td>
</tr>
</tbody>
</table>

2. Click **Next**.

3. On the CyberArk Protected Credentials page of the installer, enter the credentials to be protected by CyberArk.
   - To use a single credential name for all protected passwords, select the **Apply one Credential Name to all Credentials** check box, enter the credential name, and click **Apply**.
   - Enter the credential name for one or more of the following fields. Credential names are the usernames entered for the SSH keys during CyberArk configuration.

   **CyberArk protected credentials**
   
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edge Encryption User</td>
<td>The CyberArk credential name for an Edge Encryption user.</td>
</tr>
<tr>
<td>Signature Key Keystore</td>
<td>The CyberArk credential name for the signature key keystore.</td>
</tr>
<tr>
<td>HTTPS Cert Keystore</td>
<td>The CyberArk credential name for the HTTPS certification keystore.</td>
</tr>
<tr>
<td>Encryption Key Keystore</td>
<td>The CyberArk credential name for the encryption key keystore.</td>
</tr>
<tr>
<td>Database</td>
<td>The CyberArk credential name for the database keykeystore.</td>
</tr>
<tr>
<td>SafeNet HTTPS Cert Keystore</td>
<td>The CyberArk credential name for the SafeNet HTTPS certification keystore.</td>
</tr>
<tr>

<td>The CyberArk credential name for the SafeNet server.</td>
</tr>
<tr>
<td>Setting</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Forward Proxy</td>
<td>The CyberArk credential name for the forward proxy.</td>
</tr>
</tbody>
</table>

4. Click Next.

**Configure the signature key**

Configure the signature key after installing the proxy server through the Edge Encryption proxy installer.

The signature key signs changes to configurations and properties made by the proxy server. The signature key must be an asymmetric RSA key pair in a JCEKS KeyStore.

**Note:** If installing multiple proxies, each proxy must use the same signature key.

1. On the Signature Key page of the Edge Encryption installer, select the keystore on the host machine to store the signature key.
   - **Create New Java KeyStore**: Enter the directory location, name, and password for the new keystore.
   - **Use Existing Keystore**: Enter the keystore file location and password.
2. Click Next.
3. Select or create a signature key.
   - **New Key**: Create a signature key for this proxy.
   - **Use Existing Key**: Use an RSA key-pair from the selected keystore.
   - **Import Existing Key**: Import an RSA key-pair from a different keystore. Browse to the keystore file, enter the password for the keystore, and select the key alias. Provide a new alias for the key.
4. Click Next.

**Configure the HTTPS certificate**

To enable clients to connect to the Edge Encryption proxy server using a secure SSL connection, import the HTTPS certificate to the proxy server.

The Edge Encryption proxy provides the HTTPS certificate to clients trying to connect.

1. On the HTTPS Certificate page of the Edge Encryption installer, select the keystore to store the certificate.
   - **Create New Java KeyStore**: Enter the directory location, name, and password for the new keystore.
   - **Use Existing Keystore**: Enter the keystore file location and password.
2. Click Next.
3. Select or import a certificate.
   - The key alias is the given alias for the certificate.
   - **Use Existing Certificate**: Use an existing certificate in the selected keystore.
   - **Import from File or KeyStore**: Import a certificate from a different keystore or a .cer file. Browse to the keystore or .cer file, enter the password, and select the alias. You must provide a new alias for the certificate.
4. Click Next.
Configure the AES 128-bit encryption key

After you configure the HTTPS certificate through the Edge Encryption proxy installer, configure the AES 128-bit encryption key to encrypt your data.

The encryption key is either a plain text file inside the /keys directory or a secret key inside a keystore. If you use a keystore for your AES 128-bit and AES 256-bit encryption keys, they must both use the same keystore.

If you are updating an SSL certificate on an Edge proxy server, see Update SSL certificate.

1. Select the encryption key location.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Store</td>
<td>Use a file to store a single encryption key. You can use an existing file in the /keys directory, or you can generate a new file. To generate a new file, enter an alias and click Generate. A file containing an encryption key is created.</td>
</tr>
</tbody>
</table>

Note: This choice designates both the storage location and the encryption key. If you select File Store, click Next and go to step 5.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create New Java KeyStore</td>
<td>Create a keystore to store the encryption key.</td>
</tr>
<tr>
<td>Java KeyStore File</td>
<td>Store the encryption key in an existing Java KeyStore file.</td>
</tr>
</tbody>
</table>

2. Click Next.

3. Select or create the encryption key.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Key</td>
<td>Create an encryption key and alias.</td>
</tr>
</tbody>
</table>

Note: You must use lowercase letters and numbers for the alias name (key name, key alias), per Java KeyStore requirements. To find out more about the keytool utility, see the Java SE Documentation.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use Existing Key</td>
<td>Use an existing encryption key in the selected keystore.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Import Existing Key</td>
<td>Import an encryption key from a different keystore.</td>
</tr>
</tbody>
</table>

4. Click Next.
5. Configure the key on the instance according to the requirements defined in your installer.
To configure the key on the instance, navigate to the instance and define a default key. See Configure encryption keys on the instance. Ensure that the key alias, size, and type match the requirements defined in the installer.
Default Encryption Key

This step requires you to go to your instance and create a default key. Click the links below and follow the instructions. Click 'Next' when you are done setting up the default key on your instance.

The 'Key alias' must be: aes128
The 'Key size' must be: 128
The 'Type' must be: Keystore

Click here for documentation
Click here to go to your default keys

<table>
<thead>
<tr>
<th>Default key requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>6. Once the key is configured on the instance, return to the installer and click <strong>Next</strong>.</td>
</tr>
</tbody>
</table>
Configure the AES 256-bit encryption key

After you configure the AES 128-bit key through the Edge proxy installer, you can optionally configure an AES 256-bit encryption key to encrypt your data.

The encryption key is either a plain text file inside the /keys directory or a secret key inside a keystore. If you use a keystore for your AES 128-bit and AES 256-bit encryption keys, both keys must use the same keystore. If you do not want to configure an AES 256-bit encryption key, click **Skip** to continue installing the proxy server.

If you are updating an SSL certificate on an Edge proxy server, see **Update SSL certificate**.

1. Select the encryption key location.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Store</td>
<td>Use a file to store a single encryption key. You can use an existing file in the /keys directory, or you can generate a new file. To generate a new file, enter an alias and click <strong>Generate</strong>. A file containing an encryption key is created.</td>
</tr>
<tr>
<td><strong>Note</strong>: This choice designates both the storage location and the encryption key. If you select <strong>File Store</strong>, click <strong>Next</strong> and go to step 5.</td>
<td></td>
</tr>
<tr>
<td>Create New Java KeyStore</td>
<td>Create a keystore to store the encryption key.</td>
</tr>
<tr>
<td>Java KeyStore File</td>
<td>Store the encryption key in an existing Java KeyStore file.</td>
</tr>
</tbody>
</table>

2. Click **Next**.

3. Select or create the encryption key.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Key</td>
<td>Create an encryption key and alias.</td>
</tr>
<tr>
<td><strong>Note</strong>: You must use lowercase letters and numbers for the alias name (key name, key alias), per Java KeyStore requirements. To find out more about the keytool utility, see the Java SE Documentation.</td>
<td></td>
</tr>
<tr>
<td>Use Existing Key</td>
<td>Use an existing encryption key in the selected keystore.</td>
</tr>
<tr>
<td>Import Existing Key</td>
<td>Import an encryption key from a different keystore.</td>
</tr>
</tbody>
</table>

4. Click **Next**.

5. Optional: If you want to use AES 256-bit encryption, do the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java 8 update 141 or earlier</td>
<td>Install the Java Cryptography Extension (JCE) and overwrite the policy files in the Java home directory. See Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier.</td>
</tr>
<tr>
<td>Java 8 update 151 or later</td>
<td>Edit the java.security policy file to allow the use of unlimited strength keys. See Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later.</td>
</tr>
</tbody>
</table>
6. To use AES 256-bit encryption, you must also configure the AES 256-bit default encryption key on the instance by navigating to the instance and defining a default key.

See Configure encryption keys on the instance. Ensure that the key alias, size, and type match the requirements defined in the installer.

7. After the key is configured on the instance, return to the installer and click Next.

**Update SSL certificate**

When updating an SSL certificate on an Edge proxy server, you must delete the old one.

Role required: admin

When updating the SSL certificate on the Edge proxy server, you must also delete the old certificate. If you don't, the old certificate (in the form of an alias in the KeyStore file) continues to be used even though the Edge proxy server is configured to use the new certificate.

1. On the Edge proxy server, list the entries in the Java KeyStore:

   ```
   keytool -list -keystore keystore.jceks -storetype jceks -storepass MY_SUPER_PASSWORD
   ```

2. Remove the old SSL certificate:

   ```
   keytool -delete -alias MY_OLD_ALIAS -keystore keystore.jceks -storetype jceks -storepass MY_SUPER_PASSWORD
   ```

3. Add the new SSL certificate into the Java KeyStore.

**Configure the Edge Encryption proxy database**

If using order-preserving encryption types or encryption patterns, you can optionally configure the Edge Encryption proxy database properties.

To use order-preserving encryption types or encryption patterns, a MySQL database running in your network is mandatory. This task connects the proxy to the database, but it does not install or configure the database.

**Note:** If using multiple proxy servers, all proxy servers must use the same proxy database. The values entered in the installer must be the same for all proxy servers.

1. Confirm or change the database URL. This URL is the location of the proxy database.
2. In the Name field, enter the name of the proxy database. The default value is `edgeencryption`.
3. Enter the username and password for accessing the proxy database.
4. Click Next.

**Launch the Edge Encryption proxy server**

After an Edge Encryption proxy is installed and configured, you can start the proxy from the installer.

1. After configuring keys on the instance and optionally configuring the proxy database, return to the Edge Encryption proxy installer and click Launch.
2. If an issue is detected, or to check the status of your proxy server, you can click **Check Status** to verify that the proxy is running. A message displays the proxy status.

![Proxy status](image)

**Congratulations!**

The Edge Encryption proxy is ready to launch. If you would like to launch it now, hit the "Launch" button. Your instance, through the proxy, is available at:

https://172.16.16.129:8002

If you encounter any errors, validate your configuration and correct as necessary. If the problem persists, contact ServiceNow support.

![Launch](image)

**Verify and troubleshoot the Edge Encryption proxy server installation**

After your Edge Encryption proxy is installed, you can verify the installation to locate problems or start and stop the proxy.

1. Open the Edge Encryption proxy installer.
2. Select **Verify Installation**.
3. Click **Proxy Directory** and select the proxy directory.
4. Click **Run Tests**.
   Test results display.
5. Click Next.
   If an issue is encountered, you can move through the installer to correct the configuration. If no issues are encountered, the installer jumps to the Launch page. You can check the proxy status, stop the proxy, or start the proxy from the Launch page.

**Install the Edge Encryption proxy server using the command line installer**

Manually install multiple Edge Encryption proxy servers in your network.

Roles required: security_admin on your ServiceNow instance and local administrator on the host machine.

If order preserving encryption types or encryption patterns are to be used, set up a MySQL database on a machine in your network if not already present.

**Note:** If using Unbound Technology encryption keys with Edge Encryption, install the proxy server using the command line installer on the Unbound client machine. The Edge Encryption proxy server must run on the same machine as the Unbound technology client.

First, set up a single Edge Encryption proxy server. After your first proxy server is successfully running, add additional proxy servers for one instance to ensure an optimal environment. See **Sizing your Edge Encryption environment** to determine the number of additional proxy servers needed.

**Install the Edge Encryption proxy server (command line installer)**

Install an Edge Encryption proxy on a 64-bit Windows or Linux computer.

Java 8 is required to run the installer.

Install the Edge Encryption proxy server on a machine in your network using the appropriate command for your target machine. If installing the Edge Encryption proxy server on a Windows machine, you must additionally install the proxy server as a Windows service.

When you upgrade the Edge Encryption proxy server, the system backs up the old proxy in the backup-dist-upgrade-<timestamp> directory under the current installation directory. The backup directory is generated during the upgrade process and stores the old proxy information.

When you run an upgrade via the command line, a dist-upgrade.log may be generated in the directory where the command runs. The dist-upgrade.log contains logs for the upgrade process.

In case of a failed upgrade, the system creates a failed-backup.dist-upgrade-<timestamp> directory. In addition, logs/wrapper.log in the original proxy directory may also contain failure information.

1. Create the installation directory.
2. Download the Edge Encryption proxy archive file to the installation directory.
3. Open the terminal and change to the installation directory.

   **Note:** If installing on a Windows machine, you must start the Windows Command Prompt with administrator privileges.

4. Run this command for the target machine and change the variables according to your configuration:
   
   ```
   java -jar edgeencryption-<version>-all.jar -m install -n <ProxyName> --instancehost <host> -p <InstancePort> --protocol https
   ```

<table>
<thead>
<tr>
<th>Option</th>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>version</td>
<td>Version number of the Edge Encryption proxy being used to perform the current operation.</td>
</tr>
</tbody>
</table>
### Option

<table>
<thead>
<tr>
<th>Option</th>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-m</td>
<td>mode</td>
<td>The operation or mode to run in (install or dist-upgrade).</td>
</tr>
<tr>
<td>-n</td>
<td>ProxyName</td>
<td>The name of the encryption proxy instance. Use a unique ProxyName to be able to identify specific proxy instances.</td>
</tr>
<tr>
<td>--instancehost</td>
<td>host</td>
<td>The host name of your ServiceNow instance (for example, mycompany.service-now.com).</td>
</tr>
<tr>
<td>-p</td>
<td>InstancePort</td>
<td>The port of your instance. When the protocol is https, the port is normally 443.</td>
</tr>
<tr>
<td>--protocol</td>
<td>protocol</td>
<td>The protocol used to access your ServiceNow instance (typically https).</td>
</tr>
</tbody>
</table>

### Note:

Do not copy and paste commands from the browser. Occasionally, copy/paste operations cause unexpected characters to be pasted to the target machine and results in the command being executed incorrectly. It is best to type out the command by hand using documentation as a reference.

To see the help screen, execute this command without arguments: `java -jar edgeencryption-<version>-all.jar`

5. If installing on a Windows machine, install the Edge Encryption proxy as a Windows service.

   a) Optionally change the name of the service. Open the `conf/wrapper.conf` file on the new proxy and set the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wrapper.ntservice.name</td>
<td>Unique name of the Edge Encryption proxy service.</td>
</tr>
<tr>
<td>wrapper.ntservice.displayname</td>
<td>Edge Encryption proxy service display name.</td>
</tr>
<tr>
<td>wrapper.ntservice.description (Optional)</td>
<td>Proxy server description.</td>
</tr>
</tbody>
</table>

If this step is not performed, the Edge Encryption proxy service is installed under the name **Edge Encryption**.

b) Save and close the file.

c) Open the Windows Command Prompt and `cd to ServerName_port/bin`.

d) Execute `edgeencryption.bat install`.

The `ProxyName_port` directory is created in the current directory. The `edgeencryption.properties` file is updated with the host, port, and protocol values from the command line.
Create and configure the RSA key pair for the digital signature

Create an RSA key pair that the proxy server can use to create the digital signature for signing changes to the encryption properties and configuration.

To generate and validate the digital signature, an RSA key pair must be generated and stored in the JCEKS Java KeyStore and each proxy must be configured to use this key pair. Generate an encryption key pair using the keytool command.

To use the keytool utility with a proxy installed on SElinux (CentOS), you must enable loading of shared libraries from the proxy java-installation directory. To do this, run the following command as root.

```
chcon -R -t texrel_shlib_t proxy_install_dir/java/jre /lib
```

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in `<proxy install dir>java/jre/bin/keytool`.

1. Change to the KeyStore directory in the proxy download directory.
2. Change the default password.

   The default password is `changeme`.

   ```
   keytool -keystore keystore.jceks -storetype jceks -storepasswd -new <newpassword>
   ```

3. Create an encryption key pair.

   **Note:** Do not enter a password for the key when the keytool utility prompts for one.

   Enter this command on a single line.

   ```
   keytool -genkeypair -alias <key alias> -keyalg rsa -keystore keystore.jceks -storetype jceks -storepass <keystore password> -keysize 2048
   ```

4. Update the encryption proxy property file (`edgeencryption.properties`).
   a) Change to the `<installation directory>/conf/` directory.
   b) Open the `edgeencryption.properties` file.
   c) Enter the properties for the digital signature.

   These properties must be the same for all proxies.

5. Save and close the `edgeencryption.properties` file.

Import and configure the certificate for secure SSL connection

To use a secure SSL connection, import a server certificate and add it to the Java KeyStore.

You must obtain the server certificate before you can add it to the Java KeyStore.

1. Add a server certificate to the Java KeyStore.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you have the RSA private key in the Java KeyStore and generated the certificate from that key.</td>
<td>keytool -import -alias keyname -file server.cert -storetype JCEKS -keystore keystore.jceks -storepass pwd</td>
</tr>
</tbody>
</table>
If you have a PKCS12 (.pfx) file that contains the RSA key and the certificate.

keytool -importkeystore -destkeystore keystore.jceks -deststoretype jceks -srckeystore <PKCS12 filename> -srcstoretype pkcs12

Make sure that the private key password is the same as the Java KeyStore password.

You can run this command to change the password.

keytool -keypasswd -keystore keystore.jceks -alias <key alias>

For testing, you can use this command to generate a self-signed certificate.

keytool -genkeypair -alias cert -keystore keystore.jceks -storetype jceks -keyalg rsa

2. Update the edgeencryption.properties file.
   a) Change to the <installation directory>/conf/ directory.
   b) Open the edgeencryption.properties file.
   c) Enter the properties for the SSL certificate.
   The certificate must be the same for all proxies connecting to the same instance.

3. Save and close the edgeencryption.properties file.

Enable AES 256-bit encryption

256-bit encryption is more secure than 128-bit encryption, and you can optionally configure AES 256-bit encryption on the Edge Encryption proxy server host. How you enable AES 256-bit encryption depends on the Java update installed on each proxy server host.

Edge Encryption supports only AES 128-bit and AES 256-bit keys.

Note: Java does not automatically allow unlimited strength keys. You must specifically enable the use of AES 256-bit encryption.

Follow the procedure for the Java version that is installed on your proxy server host:

- Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier
- Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later

Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier

Copy the Java Cryptography Extension (JCE) jurisdiction policy files to the Java home directory of each Edge Encryption proxy server host to enable AES 256-bit encryption for Java update 141 or earlier. 256-bit keys provide greater security than 128-bit keys.

Role required: admin

Your Java home directory includes the AES 128-bit policy files by default. To enable AES 256-bit encryption, you must overwrite the Java home directory policy files with the AES 256-bit policy files. You only need to download the JCE once, but you must update every Edge Encryption proxy server host.
1. Download the JCE policy 8 ZIP file from Oracle.
2. Unzip the file.
3. On each proxy server host, copy the local_policy.jar and US_export_policy.jar files into the `<Java-home-directory>/jre/lib/security` folder.

**Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later**

Edit the `java.security` policy file to enable AES 256-bit encryption for Java update 151 or later. 256-bit keys provide greater security than 128-bit keys.

Role required: admin

Perform this task in the Java home directory of each Edge Encryption proxy server host on which you want to enable AES 256-bit encryption.

1. Navigate to `<jre_home>/lib/security/java.security` on the proxy server host, where `JRE_HOME` is an environment variable for both Microsoft Windows and Linux.
2. Open the `java.security` policy file and find the line for the `crypto.policy` parameter, which is commented out by default.
3. Remove the `#` character from the beginning of the `crypto.policy` line to uncomment the line, and then save the file.

**Note:** If you do not uncomment the `crypto.policy` line, Java uses `crypto.policy=limited`, which restricts encryption to AES 128-bit keys.

**Set up a keystore and encryption keys**

Set up the keystore and encryption keys used by the Edge Encryption proxy server.

1. Carefully determine the appropriate type of keystore to use based on your organization's needs.

<table>
<thead>
<tr>
<th>Supported keystore</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File store</td>
<td>Keys are stored in a file in a file system accessed by the Edge Encryption proxy server. Because encryption keys stored in a file are not encrypted, it is your responsibility to protect these files.</td>
</tr>
</tbody>
</table>
## Supported keystore

<table>
<thead>
<tr>
<th>Supported keystore</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Java KeyStore**  | A Java KeyStore:  
• Stores keys in a Java JCEKS KeyStore.  
• Is password protected and more secure than storing keys in a file in the file system.  
• Can store multiple keys. A key alias represents each key, making it easier to manage multiple keys.  

The Edge Encryption proxy ships with the Java JCEKS KeyStore file named `keystore.jceks` in the `keystore` directory. This keystore file contains the ServiceNow public key used to validate encryption rules signed by ServiceNow. |
| **Enterprise Key Management (EKM)** | **SafeNet KeySecure**  
Keys are stored and retrieved with SafeNet KeySecure key management.  
You must secure a license with Gemalto, download the libraries, and install the SafeNet KeySecure keystore on a host machine in your network before configuring the keystore on the Edge Encryption proxy server.  
**Unbound Technology**  
The base64-encoded wrapped encryption key is stored as text file on the Edge Encryption proxy server. The Unbound Technology implementation (previously Dyadic Security) maintains control of the wrapping key.  
The Edge Encryption proxy server must run on the same machine as the Unbound technology client. |

### Note:
If using a keystore other than the base system Java JCEKS KeyStore, you must import the ServiceNow public key into your keystore. The public key alias is `servicenow`.

2. Set up the keystore and encryption keys in your local network.

**Set up a Java KeyStore keystore**

You can use a Java KeyStore keystore to store encryption keys.

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in `<proxy install dir>/java/jre/bin/keytool`.

The Edge Encryption proxy ships with the Java JCEKS KeyStore file named `keystore.jceks` in the `keystore` directory. This keystore file contains the ServiceNow public key used to validate encryption rules signed by ServiceNow.

1. Set up the keystore properties.
   a) Change to the `<installation directory>/conf/` directory.
   b) Open the `edgeencryption.properties` file.
   c) Enter the properties for the Java KeyStore.
2. Save and close the `edgeencryption.properties` file.

After setting up the Java KeyStore, Create encryption keys using the Java KeyStore keytool.

You can use the keytool shipped with the encryption proxy distribution to create AES 128-bit and AES 256-bit encryption keys.

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in `<proxy install dir>/java/jre/bin/keytool`.

To find out more about the keytool utility, see the Java SE Documentation.

**Note:** The Java KeyStore requires that the alias name (key name, key alias) use lowercase letters and numbers.

1. Change to the keystore directory, `<installation directory>/keystore/`.
2. To create the encryption key, run one of the following commands.

```
Option                  Description
AES 128                 keytool -genseckey -alias 128bitkey
                        -keyalg aes -keysize 128 -keystore
                        keystore.jceks -storetype jceks
AES 256                 keytool -genseckey -alias 256bitkey
                        -keyalg aes -keysize 256 -keystore
                        keystore.jceks -storetype jceks
```

You add the alias on the instance when you assign default keys.

**Note:** The key password must be the same as the keystore password.

### Set up a SafeNet KeySecure keystore

If you are using a SafeNet keystore, copy a set of libraries into the proxy distribution directory.

You must install and set up the SafeNet keystore before performing this step. Secure a license with Gemalto in order to download the libraries.

**Note:** On Linux, file paths use a forward slash (/).

1. Copy these files to the `<installation directory>/lib` directory:
   - `ingrianNAE-<version>.jar`
   - `ingrianlog4j-api-<version>.jar`
   - `ingrianlog4j-core-<version>.jar`
2. Change to the `<installation directory>/conf/` directory, and open the `edgeencryption.properties` file.
3. Enter the properties for the SafeNet keystore.

An example for a SafeNet keystore using username and password authentication.

```text
edgeencryption.nae.retries = 3
edgeencryption.nae.enabled = true
edgeencryption.nae.server = url
edgeencryption.nae.port = 9000
edgeencryption.nae.protocol = ssl
edgeencryption.nae.keystore.path = keystore/safenet_truststore
edgeencryption.nae.keystore.password = password
edgeencryption.nae.user = safenet_user
edgeencryption.nae.password = safenet_password
```

An example for a SafeNet keystore using client certificate authentication. This authentication method eliminates the need to store the SafeNet server username and password in the properties file.

```text
edgeencryption.nae.retries = 3
edgeencryption.nae.enabled = true
edgeencryption.nae.server = url
edgeencryption.nae.port = 9000
edgeencryption.nae.protocol = ssl
edgeencryption.nae.keystore.path = keystore/safenet_clientcert
edgeencryption.nae.keystore.password = password
edgeencryption.nae.client.certificate = cert_name
```

4. Add or create a key in the SafeNet keystore.
   You add the key name (alias) on the instance when you assign default keys.

5. Save and close the `edgeencryption.properties` file.

Upgrade from Kingston or lower to London or higher

If you use a SafeNet NAE server for key storage with Edge, before upgrading the proxy from Kingston or lower to London or higher, you must copy Gemalto SafeNet client ProtectApp JAR files and add new properties.

**Note:** On Linux, file paths use a forward slash (/).

1. Copy the following files from `<installation directory>/lib` to a directory path that is completely outside of the proxy installation directory path:
   - `ingrianNAE-<version>.jar`
   - `ingrianlog4j-api-<version>.jar`
   - `ingrianlog4j-core-<version>.jar`

2. On the current version (not upgraded) of the proxy, update the `<installation directory>/conf/edgeencryption.properties` file by adding the following two properties:
   - `edgeencryption.ekm.provider.classname = com.snc.edgeencryption.encryption.CloudEdgeNaeKeyProvider`
   - `edgeencryption.thirdparty.vendor.library.path = <directory path to the directory where you copied the jar files in step 1>`

3. Save the changes.
4. Proceed with the upgrade to London or higher.

**Set up Unbound Technology keys**

To use Unbound Technology (previously Dyadic Security) keys with Edge Encryption, store the base64-encoded wrapped encryption key as text file on the Edge Encryption proxy server and provide the wrapping key alias. The Unbound Technology implementation maintains control of the wrapping key.
Role required: security_admin

In your Unbound Technology implementation, identify both the wrapping key and the wrapped key. Use the RSA/ECB/OAEPMWITHSHA-256ANDMGF1PADDING algorithm for wrapping and padding. Export the wrapped key in base64-encoded text format. Save the file using the key alias as the name with no file extension.

Note: If using Unbound Technology encryption keys with Edge Encryption, install the proxy server using the command line installer on the Unbound client machine. The Edge Encryption proxy server must run on the same machine as the Unbound technology client.

1. Add the wrapped encryption key in base64-encoded text format to the `<proxy-installation-directory>/keys` directory. The name of the file must be the key alias with no file extension.

2. Update the `edgeencryption.properties` file.
   a) Change to the `<proxy-installation-directory>/conf` directory.
   b) Open the `edgeencryption.properties` file.
   c) Enter the File store properties. Set the value of `edgeencryption.keyfile.directory` to `keys`. This property directs the proxy server to look for the encryption key in the `<Java-home-directory>/keys` directory.
      For more information on Edge Encryption properties, see Edge Encryption proxy server properties.
   d) Uncomment the properties for the Dyadic provider configuration. Set the value of `edgeencryption.ekm.provider.rsa.wrapping.key.alias` to the wrapping key alias in your Unbound implementation.
   e) Save and close the file.

Add the encryption key alias to the instance. The encryption key alias is the file name of the wrapped encryption key added to the `<proxy-installation-directory>/keys` directory. For example, if the file in the directory is named `myunboundkey`, add this name to the Key alias field. See Configure encryption keys on the instance.

Create an encryption key stored in a file

You can use a simple text file as a keystore. Each file holds a single encryption key.

This step creates both the key storage and the encryption key.

Note: The name of the key file must match the key alias specified in the encryption keys table in the instance. See Configure encryption keys on the instance.

1. Create a file in the `/keys` folder of the proxy server installation directory.
2. Add the encryption key to the file.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AES 128</td>
<td>Place the encryption key, exactly 16 bytes, into the file.</td>
</tr>
<tr>
<td>AES 256</td>
<td>Place the encryption key, exactly 32 bytes, into the file.</td>
</tr>
</tbody>
</table>

3. Update the `edgeencryption.properties` file.
   a) Change to the `<installation directory>/conf/` directory.
   b) Open the `edgeencryption.properties` file.
   c) Enter the properties for the file store.
   d) Save and close the file.
Configure encryption keys on the instance

Edge Encryption provides the tools to manage encryption keys without taking the proxy offline.

Role required: security_admin

Before setting up new encryption keys on the instance:

1. Create the encryption key.
2. Make the new key available to all encryption proxies. Either copy the file or Java KeyStore file to each proxy, or ensure that each proxy has access to the Java KeyStore or Enterprise Key Management (EKM) device.

Key aliases must be unique. Each key alias must have the same key size and type on each proxy, or the key cannot be assigned as the default.

1. Navigate to **Edge Encryption Configuration > Encryption Key Configuration > Set Up Keys**.
2. On the Add New Keys section of the form, complete the following steps to add a new key.

   **Note:** If using SafeNet versioned keys, an additional column appears for the **Key version**. The **Key version** cannot be edited.

   **Important:** If using SafeNet versioned keys, click the **Retrieve latest key versions** link in the Related Links to retrieve the latest version of each key from the Edge proxy.

   Rows in the list with an X in the left column can be deleted. Keys that have been used as the default or that have a **Status** of **Available** cannot be deleted.

   a) Double-click in the row that says **Insert a new row**.
   b) In the edit box, enter a name for the key, then click the check mark.

   Key aliases are lowercase letters and numbers. Capital letters are changed to lowercase letters when you click **Update**. Key aliases must be unique.

   **Note:** If using Unbound technology keys, add the encryption key alias. The encryption key alias is the file name of the wrapped encryption key added to the <proxy-installation-directory>/keys directory. For example, if the file in the directory is named myunboundkey, add this name to the **Key alias** field.

   c) In the same row, double-click in the **Key size** column.
   d) In the select box, select a key size, either **128 bits** or **256 bits**, then click the check mark.
   e) In the same row, double-click in the **Type** column.
   f) In the select box, select a key type, either **File**, **Keystore**, **SafeNet**, or **Unbound**, then click the check mark.
   g) When you are done adding keys, click **Next Step**.

   You must specify an alias, key size, and key type for each key before moving on.
3. On the Keys Status section of the form, check the State of the key and ensure that it is **Available**. This may take a few minutes. When the key is **Available**, click **Next Step**.

   **Note:** If using SafeNet versioned keys, an additional column appears for the **Key version**. The **Key version** cannot be edited.

The instance tracks the status of every encryption key available to any proxy. When a key is available on all proxies, its state becomes **Available**. If the state does not change after a few minutes, check to ensure that the key is available on all proxies. If the state remains **Unavailable**, one or more of the proxies does not have the key.

<table>
<thead>
<tr>
<th>Encryption key states</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Status</strong></td>
</tr>
<tr>
<td>Available</td>
</tr>
<tr>
<td>Unavailable</td>
</tr>
</tbody>
</table>

4. On the Change Default Keys section of the form, do one of the following:

   - Type in the key alias.
   - Click the magnifying glass icon and select an alias.

   **Note:** If using SafeNet versioned keys, an additional field appears for the **Key version**. The **Key version** is grayed out and cannot be edited.

   **Note:** If using SafeNet versioned keys, choose only the most recent key version. If you choose an earlier version, the following message appears when you click **Update** or **Next Step**:

   One of the default keys chosen is not the latest version available for the key. Please use the latest version.

   **Note:** If using SafeNet versioned keys, and if the default keys are not the latest versions of the SafeNet keys, an **Update default keys to latest version** link appears in the Related Links. Click the link to update the default keys to use the latest version.

   Click **Next Step**.

5. On the Schedule Key Rotation section of the form, schedule a mass key rotation job or single key rotation job to encrypt existing data using the new encryption key.

If you do not run a mass key rotation job or single key rotation job, existing data remains encrypted with the old key until the data is accessed again.

**Configure additional properties in the Edge Encryption properties file**

After installing the Edge Encryption proxy server in your network and setting up your keystore and keys, configure the additional Edge Encryption properties.

1. Open the `<installation directory>/conf/edgeencryption.properties` file and configure the following Edge Encryption proxy server properties:

   - Target (instance) properties
• User account properties
• Proxy properties
• If using order preserving encryption types or encryption patterns, configure the Proxy database properties
• Clear text and static IV properties

2. Save and close the file.

**Configure a web proxy**

If your network uses a web proxy, you can set up the Edge Encryption proxy to use the web proxy.

If your network does not use a web proxy, leave the web proxy properties in the configuration file commented out.

The Edge Encryption proxy server supports HTTP connection to and basic authentication with the web proxy.

1. Change to the `<installation directory>/conf/` directory.
2. Open the `edgeencryption.properties` file.
3. Configure the web proxy properties.
4. Save and close the `edgeencryption.properties` file.
5. If the web proxy is using a customer-specific server certificate, add this certificate to the JVM used by the Edge Encryption proxy server to establish trust between the web proxy and the Edge Encryption proxy server.
   a) cd to `<Java home directory>/jre/lib/security/cacerts`
   b) Execute the command:
      ```
      keytool -keystore cacerts -importcert -alias <chooseAlias> -file <certificateFile>
      ```

**Set the proxy server initial memory limit and upper bound memory limit**

Set the initial memory limit and upper bound memory limit to specify how much memory the proxy server can consume. Set these limits to avoid performance issues in your Edge Encryption implementation.

As a guideline, set both the initial memory limit and the upper bound memory limit to the same value. On any machine, allocate 2 GB of the physical memory to the operating system (OS). Then allocate the rest of the physical memory to the heap using the initial memory limit and upper bound memory limit properties. For example, on a machine with 8 GB of memory, allocate 2 GB to the OS, and allocate the remaining 6 GB (6144 m) to the initial and upper bound memory.

**Important:** If your Edge Encryption proxy server is running, you must stop and restart the proxy server after updating these properties.

1. In your proxy server directory, open `<install dir>/conf/wrapper.conf`.
2. To set the initial memory limit, add the following line at the end of the file:
   ```
   wrapper.java.additional.<number>=-Xms<min_memory_in_MB>m
   ```
   Set `<number>` to the next available `<number>` in the sequence of `wrapper.java.additional.<number>` properties defined in the `wrapper.conf` file.

   For example, you have the following list of `wrapper.java.additional.<number>` properties:
   ```
   wrapper.java.additional.1=
   wrapper.java.additional.2=
   ```
The maximum `<number>` in the above list is 2. When you add the `wrapper.java.additional.<number>=-Xms<min_memory_in_MB>m` line, set `<number>` to 3, the next available number.

**Important:** Do not leave gaps in the numbering sequence.

Set `<min_memory_in_MB>` to the number of megabytes of memory remaining after allocating 2 GB of memory to the OS.

3. Set the upper bound memory limit.

Because an upper bound memory limit is not set in the base system, the proxy server can use all available memory. If other services are running on the server, you may want to set the upper bound memory limit.

Add the following line at the end of the file:

```
wrapper.java.additional.<number>=-Xmx<max_memory_in_MB>m
```

Set `<number>` to the next available `<number>` in the sequence of `wrapper.java.additional.<number>` properties defined in the `wrapper.conf` file.

For example, you have the following list of `wrapper.java.additional.<number>` properties:

```
wrapper.java.additional.1=
wrapper.java.additional.2=
```

The maximum `<number>` in the above list is 2. When you add the `wrapper.java.additional.<number>=-Xmx<max_memory_in_MB>m` line, set `<number>` to 3, the next available number.

**Note:** Do not leave gaps in the numbering sequence.

Set `<max_memory_in_MB>` to the number of megabytes of memory remaining after allocating 2 GB of memory to the OS.

4. Save and close the file.

**Example: Setting proxy server initial and upper bound memory limits**

```
wrapper.java.additional.1 = -Djava.io.tmpdir=../tmp
wrapper.java.additional.2 = -Dcloudedge.home.dist=..
# must ensure UTF8 encoding when running on Windows
wrapper.java.additional.3 = -Dfile.encoding=UTF8
# additional properties for heap settings
wrapper.java.additional.4 = -Xms6144m
wrapper.java.additional.5 = -Xmx6144m
```

Start the Edge Encryption proxy.

**Start the Edge Encryption proxy**

After an Edge Encryption proxy is installed and configured, you can start the proxy from the command line.

Before starting the encryption proxy, verify the following:

- The Edge Encryption plugin is activated on the instance.
- The `edgeencryption.properties` file on this machine has been configured.
- If using an order preserving encryption type or encryption patterns, the proxy database is running.
Note: The first time you set up the `edgeencryption.properties` file or change properties, you may not want to set the password encryption property. After you have verified that everything is working, you can set the password encryption property, shut down the proxy, and then restart the proxy.

1. Run the proxy server.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>On a Linux machine</strong></td>
<td></td>
</tr>
<tr>
<td>a.</td>
<td><code>cd</code> to <code>ServerName_port</code></td>
</tr>
<tr>
<td>b.</td>
<td>Execute <code>.startup.sh</code></td>
</tr>
<tr>
<td><strong>On a Windows machine</strong></td>
<td>Perform the following steps from the command line as admin:</td>
</tr>
<tr>
<td>a.</td>
<td><code>cd</code> to <code>ServerName_port/bin</code></td>
</tr>
<tr>
<td>b.</td>
<td>Execute <code>edgeencryption.bat start</code></td>
</tr>
</tbody>
</table>

2. Check the log on the proxy server to verify that the proxy is running.

Obfuscate passwords in the properties file

You can obfuscate passwords in the `edgeencryption.properties` file to share the properties file without revealing clear text passwords.

Make sure that the Edge Encryption proxy server is set up and successfully running before you set this property. Before setting this property, Stop the Edge Encryption proxy.

Setting this property may make it difficult to debug connection and access issues during initial startup. Only set this property in production environments after the proxy has been set up and tested successfully.

1. Change to the `<installation directory>/conf/` directory.
2. In the `conf` directory, create a text file containing a complex string or phrase that can be used as a passphrase which the proxy uses to obfuscate the passwords in the `edgeencryption.properties` file. This passphrase should be a random and complex phrase not related to the passwords themselves.
3. Open the `edgeencryption.properties` file.
4. Set the password encryption property.
5. Save and close the `edgeencryption.properties` file.

After setting this property, you can Start the Edge Encryption proxy.

Manually add an additional proxy

After the first Edge Encryption proxy is properly configured and tested, you can set up additional proxies on a Linux or Windows machine. Installing multiple proxies on the same machine is not recommended.

Add additional proxy servers on additional machines to ensure an optimal environment. See Sizing your Edge Encryption environment to determine the number of additional proxies needed.

Note: Make sure that all proxies have the same encryption keys and the same RSA key pair used to digitally sign encryption configuration and encryption rules. If a proxy database was set up as part of the installation, all proxies must use the same proxy database.

1. Install the proxy using the appropriate command. See Install the Edge Encryption proxy server (interactive installer).
2. Copy all the encryption keys and the edgeencryption.properties file from the first proxy to the new proxy.
   Encryption keys may be located in the proxy keystore, in the /keys directory, or in a SafeNet KeySecure keystore.

3. Open the edgeencryption.properties file on the new proxy.

4. Change the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.name</td>
<td>Unique name of the proxy server</td>
</tr>
<tr>
<td>edgeencryption.proxy.host</td>
<td>The server name, IP address, or fully-qualified domain name of the computer running the proxy.</td>
</tr>
<tr>
<td>edgeencryption.proxy.http.port</td>
<td>Port on the proxy for HTTP communication. Must be unique across all processes on the machine.</td>
</tr>
<tr>
<td>edgeencryption.proxy.https.port</td>
<td>Port on the proxy for HTTPS communication. Must be unique across processes on the machine.</td>
</tr>
</tbody>
</table>

5. If installing the proxy server on a Windows machine, you must change the name of the service. Open the conf/wrapper.conf file on the new proxy and add the following properties.

   **Note:** You must perform this step before launching the proxy server.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wrapper.ntservice.name</td>
<td>Unique name of the Edge Encryption proxy service.</td>
</tr>
<tr>
<td>wrapper.ntservice.displayname</td>
<td>Edge Encryption proxy service display name.</td>
</tr>
<tr>
<td>wrapper.ntservice.description</td>
<td>Proxy server description.</td>
</tr>
</tbody>
</table>

6. Save and close the file.

7. Launch the proxy using the appropriate command. See Start the Edge Encryption proxy.

**Authenticate an Edge Encryption proxy server**

Specify that a proxy server is a trusted source so that Edge Encryption can process requests coming from that proxy server.

If a proxy server is not authenticated, the console log includes the following message:

```
WARN This Edge Encryption proxy has not yet been authenticated by the instance.
Please navigate to the matching Proxy record on your ServiceNow instance and authenticate it.
```

If you attempt to access the proxy, you receive the following message: *This site can't be reached.*

To maintain the proxy in an operational state during the upgrade process, authentication is not required until after the proxy update is successful.

Role required: admin

1. Navigate to Edge Encryption Configuration > Proxies.
2. Select the proxy and click Authenticate.
The proxy moves from **Unauthenticated** to **Pending** to **Authenticated**. The status changes from **Unauthenticated** to **Pending** when you start the authentication. When authentication is complete, the status changes from **Pending** to **Authenticated**, and you can access the proxy and Edge Encryption can accept requests from the proxy.

**Note:** If you stop and restart the proxy, the proxy remains **Authenticated** and restarts successfully.

### Stop the Edge Encryption proxy

You can stop an Edge Encryption proxy from the command line.

1. **Stop the proxy server.**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On a Linux machine</td>
<td>Execute ./shutdown.sh</td>
</tr>
<tr>
<td>On a Windows machine</td>
<td>Execute edgeencryption.bat stop To remove the Windows service, execute edgeencryption.bat remove</td>
</tr>
</tbody>
</table>

2. **Check the log on the proxy server to verify that the proxy has stopped.**

### Uninstall the Edge Encryption proxy on Linux

You can uninstall the Edge Encryption proxy. If you are upgrading the proxy, it is not necessary to shut down and uninstall the current version.

You must have access to the computer running the Edge Encryption proxy.

Before shutting down the Edge Encryption proxy, ensure that no users are connected to the instance using the proxy.

The encryption proxy running on Linux operates as a single process. You can end this process to accommodate such tasks as redeploying the encryption proxy to another host machine, updating the proxy version, updating the Java version, or changing the unique name of the encryption proxy when deploying the encryption proxy on multiple proxy servers.

1. You may want to save the **edgeencryption.properties** file before deleting the distribution directory.
2. Execute the **shutdown.sh** shell script.
3. Check the log on the proxy server to verify that the proxy server is shut down.
4. Delete the files in the distribution folder.

### Uninstall the Edge Encryption proxy on Windows

You can uninstall the Edge Encryption proxy. If you are upgrading the proxy, it is not necessary to shut down and uninstall the current version.

You must have access to the computer running the Edge Encryption proxy.

Before shutting down the Edge Encryption proxy, ensure that no users are connected to the instance using the proxy.

1. You may want to save the **edgeencryption.properties** file before deleting the distribution directory.
2. Execute **edgeencryption.bat stop**
3. Execute **edgeencryption.bat remove**
4. Check the log on the proxy server to verify that the proxy server is shutdown.
5. Delete the files in the distribution folder.

**Set up multiple provider SSO with Edge Encryption**

If implementing multiple provider single sign-on (SSO) with Edge Encryption enabled, some users may need to log in to your instance through the Edge Encryption proxy server, while other users may not. Set up multiple provider SSO to enable logging in through the Edge Encryption proxy server URL or the instance URL.

- **Role required:** admin
- **Enable the Integration - Multiple Provider Single Sign-On Installer plugin** (com.snc.integration.sso.multi.installer).
- **Enable the Edge Encryption plugin** (com.glide.edgeencryption) and ensure that one or more proxy servers are set up in your network.
- **Determine the URL for the Edge Encryption proxy server that users will log in through using multiple provider SSO.** To determine the URL of an Edge Encryption proxy server, see [Edge Encryption installation](#).

- If routing all users through the Edge Encryption proxy server, set up your identify provider record and define the proxy server URL in the **ServiceNow Homepage**, **Entity ID / Issuer**, and **Audience URI** fields.
- To route some users through the proxy server and some users to the instance, create two identify provider records. Both records use the same value in the **Identity Provider URL** field. However, one of the records routes through the proxy server, while the other routes to the instance.

1. **Enable the duplication of identity provider URLs in identity provider records.**
   A unique constraint prevents duplication of the identity provider URL in two different identity provider records. You can enable duplication of the identity provider URL in multiple IdP records by setting a field to false.
   a) Navigate to **System Definition > Dictionary**.
   b) Open the definition record for the **idp** field of in the Identity Providers table [saml2_update1_properties].
   c) Configure the form to add the **Unique** field.
   d) Ensure that the value of the **Unique** field is set to **false**.

2. **Navigate to Multi-Provider SSO > Identity Providers.**
3. Create two identity provider records for the same identity provider: one using the instance URL and one using the Edge Encryption proxy server URL.
   To create an identity provider record, see [#unique_731].
   a) For the Edge Encryption proxy server URL, complete the form using these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity Provider URL</td>
<td>Imported from IdP metadata.</td>
</tr>
<tr>
<td>ServiceNow Homepage</td>
<td>The URL for your proxy server homepage. For example: https://&lt;proxy hostname&gt;:&lt;port&gt;/navpage.do</td>
</tr>
<tr>
<td>Entity ID / Issuer</td>
<td>https://&lt;proxy hostname&gt;:&lt;port&gt;</td>
</tr>
<tr>
<td>Audience URI</td>
<td>https://&lt;proxy hostname&gt;:&lt;port&gt;</td>
</tr>
</tbody>
</table>
b) Click **Submit**.

c) For the instance URL, complete the form using these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity Provider URL</td>
<td>Imported from IdP metadata.</td>
</tr>
<tr>
<td>ServiceNow Homepage</td>
<td>https://&lt;instance&gt;.service-now.com/navpage.do</td>
</tr>
<tr>
<td>Entity ID / Issuer</td>
<td>https://&lt;instance&gt;.service-now.com/navpage.do</td>
</tr>
<tr>
<td>Audience URI</td>
<td>https://&lt;instance&gt;.service-now.com/navpage.do</td>
</tr>
</tbody>
</table>

d) Click **Submit**.

4. Optional: If using more than one identity provider, modify the MultiSSO installation exit.

a) Navigate to **System Definition > Installation Exits**.
   The system displays the current list of installation exits.

b) Open the **MultiSSO** installation exit.

c) Locate the following statement in the **Script** field.

```javascript
var samlResponseTxt = request.getParameter("SAMLResponse");
if (!GlideSession.get().isLoggedIn() &&
    GlideStringUtil.notNil(samlResponseTxt)) {
    var idpRecord = this.getIdPRecord(request);
    if (idpRecord) {
        SSO_Helper.debug("IdP found based on SAML response: " +
        idpRecord.getUniqueValue());
        return new SSO_Helper(idpRecord.getUniqueValue(), false, null, true);
    }
}
```

d) Replace the statement with the following code.

```javascript
var samlResponseTxt = request.getParameter("SAMLResponse");
if (!GlideSession.get().isLoggedIn() &&
    GlideStringUtil.notNil(samlResponseTxt)) {
    /* // You have two profiles that use the same IdP entity id it
       cannot use
        // the IdP issuer / entity id from the response otherwise it may
        result in the
        // wrong IdP profile. IdP initiated login will not work
        var idpRecord = this.getIdPRecord(request);
        if (idpRecord) {
            SSO_Helper.debug("IdP found based on SAML response: " +
            idpRecord.getUniqueValue());
            return new SSO_Helper(idpRecord.getUniqueValue(), false, null, true);
        }*/
    return new SSO_Helper(null, true);
}
```

**Note:** IdP initiated login does not work in this configuration.
5. Optional: If using more than one company, #unique_732. Update the sys_id of the identity provider record depending on the user.
   - To configure a user to log in through the Edge Encryption proxy server, use the sys_id of the identity provider record that uses the Edge Encryption proxy server URL.
   - To configure a user to log in to the instance, use the sys_id of the identity provider record that uses the instance URL.

### Login URLs

<table>
<thead>
<tr>
<th>URL</th>
<th>Login destination</th>
</tr>
</thead>
<tbody>
<tr>
<td>https://&lt;instance name&gt;.service-now.com/login_with_sso.do?glide_sso_id=&lt;sys_id of IdP record for the instance URL&gt;</td>
<td>Logs in through the instance.</td>
</tr>
</tbody>
</table>

### Edge Encryption proxy server properties

The `edgeencryption.properties` configuration file located in the `<installation directory>/conf/` folder contains properties used to configure your environment.

You must restart the proxy server after making changes to any proxy server properties. Changes on the instance and changes to the `log4j.properties` do not require a proxy restart.

### Target (instance) properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.target.host</td>
<td>Host name for the instance. Must be the same for all encryption proxies connecting to the same instance. This property is set when the proxy is installed. For example, <code>instancename.servicenow.com</code></td>
</tr>
<tr>
<td>edgeencryption.target.port</td>
<td>Instance port. Must be the same for all encryption proxies connecting to the same instance. This property is set when the proxy is installed.</td>
</tr>
</tbody>
</table>
| edgeencryption.target.protocol | Instance protocol. Must be the same for all encryption proxies connecting to the same instance. This property is set when the proxy is installed. Options include: 
  - http
  - https |
User account properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.target.username</td>
<td>User name that the proxy uses to log in to the instance. The user must have the edge_encryption role. See Set up an Edge Encryption user account.</td>
</tr>
<tr>
<td>edgeencryption.target.password</td>
<td>Password that the proxy uses to log in to the instance.</td>
</tr>
</tbody>
</table>

Proxy properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.host</td>
<td>Server name, IP address, or fully qualified domain name of the computer running the proxy. Along with the port, this property defines the URL used by the client to access the proxy server.</td>
</tr>
<tr>
<td>edgeencryption.proxy.name</td>
<td>Proxy name. Must be unique for each proxy.</td>
</tr>
<tr>
<td>edgeencryption.proxy.http.port</td>
<td>Port on the proxy for HTTP communication.</td>
</tr>
<tr>
<td>edgeencryption.proxy.https.port</td>
<td>Port on the proxy for HTTPS communication.</td>
</tr>
</tbody>
</table>

SSL certificate properties

Restart your proxy if you change the value of any SSL certificate property. The system uses the HTTPS keypair on startup to establish the proxy server connection and determine how the proxy answers client requests.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.https.cert.alias</td>
<td>Alias of the certificate provided by the proxy server to connecting clients.</td>
</tr>
<tr>
<td>edgeencryption.proxy.https.keystore.path</td>
<td>Path to the keystore that contains the HTTPS certificate.</td>
</tr>
<tr>
<td>edgeencryption.proxy.https.keystore.password</td>
<td>Password for the keystore that contains the HTTPS certificate.</td>
</tr>
</tbody>
</table>

Proxy configuration locked property

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxylocked</td>
<td>When true, the proxy does not accept encryption configuration changes or encryption rule changes from the instance. Set this property on the production instance after all encryption configurations and rules are final.</td>
</tr>
</tbody>
</table>
## Proxy database properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.db.url</td>
<td>Proxy database location. Must be the same for all encryption proxies connecting to the same instance.</td>
</tr>
<tr>
<td>edgeencryption.db.user</td>
<td>User name for accessing the proxy database. Must be the same for all encryption proxies connecting to the same instance.</td>
</tr>
<tr>
<td>edgeencryption.db.password</td>
<td>Password to access the proxy database. Must be the same for all encryption proxies connecting to the same instance.</td>
</tr>
</tbody>
</table>
| edgeencryption.db.name           | Proxy database name. Must be the same for all encryption proxies connecting to the same instance.  
  • Default value: edgeencryption |
| edgeencryption.db.bootstrap.file | Bootstrap file for the proxy database. The file is relative to the `sql/` directory. Must be the same for all encryption proxies connecting to the same instance. |

**Warning:** Under normal circumstances, do not change this parameter.

## Digital signature properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.signature.keystore.path</td>
<td>Path and Java KeyStore file name.</td>
</tr>
<tr>
<td>edgeencryption.proxy.signature.keystore.password</td>
<td>Password. The default password is <code>&lt;changeme&gt;</code>. Change the password after installing the Java KeyStore.</td>
</tr>
<tr>
<td>edgeencryption.proxy.signature.keystore.keyalias</td>
<td>The key alias given as the <code>-alias</code> argument when the RSA key pair is generated.</td>
</tr>
</tbody>
</table>

## NAE device keystore properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.nae.retries</td>
<td>Number of retries to make.</td>
</tr>
<tr>
<td>edgeencryption.nae.enabled</td>
<td>Setting indicates whether an NAE device is available.</td>
</tr>
<tr>
<td>edgeencryption.nae.server</td>
<td>Name of the NAE server.</td>
</tr>
<tr>
<td>edgeencryption.nae.port</td>
<td>Port used by the NAE server.</td>
</tr>
<tr>
<td>edgeencryption.nae.protocol</td>
<td>Protocol used by the NAE server.</td>
</tr>
</tbody>
</table>
### ServiceNow DocVersion Now Platform capabilities

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.nae.keystore.path</td>
<td>Path to the keystore on the NAE server.</td>
</tr>
<tr>
<td>edgeencryption.nae.keystore.password</td>
<td>NAE keystore password.</td>
</tr>
<tr>
<td>edgeencryption.nae.username</td>
<td>User name to use to authenticate with the NAE device.</td>
</tr>
<tr>
<td>edgeencryption.nae.password</td>
<td>Password to use to authenticate with the NAE device.</td>
</tr>
<tr>
<td>edgeencryption.nae.client.certificate</td>
<td>Certificate located in the keystore on the NAE server. Set this property to authenticate using a certificate instead of a username and password.</td>
</tr>
</tbody>
</table>

### Clear text and static IV properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.customer.assigned.known.cleartext</td>
<td>Clear text to let the instance verify that all proxies are using the same keys. At startup, the proxy encrypts the clear text and sends the encrypted text to the instance. The instance does not know the clear text, nor are keys sent to the instance. This property must be the same for all proxies.</td>
</tr>
<tr>
<td>edgeencryption.encrypter.static.iv</td>
<td>Static IV (initialization vector) used in equality-preserving and order-preserving encryption. This property must be the same for all proxies and must be exactly 16 bytes (16 ASCII characters).</td>
</tr>
</tbody>
</table>

### Password property

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.encrypter.properties.password</td>
<td>Name of the file in the conf folder that contains a string used within a secure process to obfuscate passwords in the edgeencryption.properties file. If this property is not set, passwords in your properties file appear in clear text. Leave this property blank until after the proxy configuration has been set up and tested.</td>
</tr>
</tbody>
</table>

### Web proxy properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.webproxy.host</td>
<td>Web proxy name or IP address.</td>
</tr>
<tr>
<td>edgeencryption.webproxy.port</td>
<td>Port on the web proxy.</td>
</tr>
</tbody>
</table>
### ServiceNow DocVersion Now Platform capabilities

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.webproxy.user</td>
<td>User name used to connect to the web proxy. If your web proxy does not use authentication, leave this property commented out.</td>
</tr>
<tr>
<td>edgeencryption.webproxy.password</td>
<td>Password to use to connect to the web proxy. If your web proxy does not use authentication, leave this property commented out.</td>
</tr>
</tbody>
</table>

### Java KeyStore properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| edgeencryption.keystore.path                 | Path to the Java KeyStore. If using a file store or a SafeNet KeySecure keystore, leave this property commented out.  
Example: edgeencryption.keystore.path = keystore/keystore.jceks |
| edgeencryption.keystore.password             | Password the proxy uses to connect to the Java KeyStore. If using a file store or a SafeNet KeySecure keystore, leave this property commented out. |

### File store property

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| edgeencryption.keyfile.directory             | The directory specifies where key files are stored. If using the Java KeyStore or a SafeNet KeySecure keystore, leave this property commented out.  
Example: edgeencryption.keyfile.directory=keys |
|                                               | If using Unbound Technology keys, uncomment this property and set the value to the keys directory. |

### Unbound Technology provider properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| edgeencryption.ekm.provider.classname         | Internal class name for the implementation.  
**Warning:** Do not change this property. |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.thirdparty.vendor.library.path</td>
<td>Path to the Unbound API JAR file on the Unbound client machine.</td>
</tr>
<tr>
<td>edgeencryption.ekm.provider.rsa.wrapping.key.alias</td>
<td>Wrapping key alias in the Unbound Technology implementation. Must be the same for all proxies.</td>
</tr>
</tbody>
</table>

**General configuration properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.config.poll.interval</td>
<td>Poll interval in seconds. The default setting means that it takes 5 seconds for the proxy to learn of encryption configuration changes. Larger values cause the instance to take longer to detect an offline proxy.</td>
</tr>
<tr>
<td></td>
<td><strong>Warning:</strong> Do not change this property. Changing the default setting of the Proxy Poll Interval can result in detection delays when a proxy comes online.</td>

</tbody>
</table>
| `edgeencryption.proxy.keepalive.interval`     | Time in seconds between pings issued by the proxy to the instance. Pings are issued periodically to verify connectivity between the proxy and the instance.  
  • Default value: 10 (seconds)  
  • Minimum value: 5 (seconds)                                                                                                                     |
| `edgeencryption.register.retry.count`         | Maximum number of times the proxy pings the instance to try to register.  
  • Default value: 0 (no limit)                                                                                                                    |
| `edgeencryption.tokenization.exclusion.list` | Encryption patterns cannot tokenize strings found in these fields.                                                                                      |

**Proxy server performance properties**

Proxy server performance properties are not present in the configuration file by default. To change the default values, you must add the properties and restart the proxy server. For more information, see [Edge Encryption diagnostics and performance](#).  

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| `edgeencryption.stat.collection.enabled`      | Enables the collection of statistics used by the Edge Encryption proxy server performance dashboard.  
  • Default value: true  
  
  Add this property and set the value to false to disable the collection of statistics used by the Edge Encryption proxy server performance dashboard. |
| `edgeencryption.stat.collection.interval`     | Interval length in seconds during which the Edge Encryption proxy server collects statistics. The value cannot be less than 30 seconds.  
  • Default value: 30 (seconds)                                                                                                                   |

**Deprecated proxy encryption properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| `edgeencryption.encrypter.default.key128`    | Specifies the name of the current AES 128 key. An AES 128 key must be available even if it is not used. Must be the same for all proxies.  
  Perform maintenance of these keys on the instance.                                                                                               |
| `edgeencryption.encrypter.default.key256`    | Specifies the name of the current AES 256 key. Must be the same for all proxies.  
  Perform maintenance of these keys on the instance.                                                                                               |

</tbody>
</table>

**CyberArk integration with the Edge proxy server**

Use CyberArk to store passwords in a centralized and secure digital vault to secure passwords that were previously stored in clear text and secured by file access, or that were previously encrypted via a second file.

CyberArk AIM (Application Identity Management) prevents unauthorized access by eliminating hard-coded and visible passwords. AIM stores passwords in a digital vault on an independent hardened server, where the passwords are represented as digital credentials. The AIM clients (the Edge proxy servers) use CyberArk digital credentials and access the independent server to retrieve the secured passwords. No passwords are stored on the Edge proxy servers or in the instance.

**CyberArk digital vault credentials**

You must purchase and configure CyberArk before you can set up CyberArk integration with the Edge proxy server.

To add a credential to CyberArk (which is read by the Edge proxy), set the **Platform Name** of the credential to **Unix via SSH** and make sure you either create a **Custom** credential **Name** or write down the **Auto-generated** credential **Name**. When you configure the Edge proxy to use this credential, the proxy server matches this credential **Name** to the setting in the proxy.
Each credential entry holds a **Password** that is being secured, as well as a credential **Name** used by an application to access that password.

**Note:** CyberArk credentials are not encryption keys.

**Adding CyberArk during an Edge proxy installation**

The proxy installer includes a new configuration page for a CyberArk integration. This page is optional if you do not want to include CyberArk when installing your proxy with the proxy installer. You can also manually set up and configure CyberArk integration in the configuration file.
The proxy installer also includes a new page for CyberArk protected credentials. This page allows configurations of different properties using a single credential name or multiple credential names. This page is optional if you do not want to include CyberArk when installing your proxy with the proxy installer.
CyberArk password protection

Any password field in the Edge proxy installer that has a CyberArk credential configured in the CyberArk vault and specified on the CyberArk Protected Credentials page of the installer is grayed out and contains the message Protected by CyberArk.
Using a load balancer with the Edge proxy server

You can use a load balancer to balance the load across the proxy servers in your Edge Encryption proxy setup. If the load balancer and proxy servers are using different ports, specify the host name and HTTPS port of the load balancer to enable users to view responses on their browser.

Important: All production environments should include at least two Edge Encryption proxy servers for redundancy.

Edge request processing without a load balancer

If you are not using a load balancer, a request is processed as described below.

1. The user issues a request from a browser.
2. The browser sends the request to the Edge proxy server.
3. The proxy server sends the request to the ServiceNow instance.
4. The ServiceNow instance returns the response to the proxy server.
5. The proxy server adds its own port number in the response header before returning the response to the user's browser.

The request is completed successfully because the user can view the response from the proxy server at the port number specified in the response header.
Edge request processing with a load balancer

However, if you are using a load balancer, the user's browser communicates directly with the load balancer, not with the proxy server. A request is processed as described below.

Note: The following example uses 1025 as the proxy server port number.

1. The user issues a request from a browser.
2. The browser sends the request to a load balancer Virtual IP (VIP), also known as a Virtual Server.
3. The VIP is configured to point to the proxy server (for example, 10.2.200.148:1025), so the load balancer forwards the request to the proxy server.
4. The proxy server sends the request to the ServiceNow instance.
5. The ServiceNow instance returns the response to the proxy server.
6. The proxy server rewrites the location header in the response with values configured in the properties for risk-servicenow.dev.echonet:1025.
   - Host: edgeencryption.proxy.host
   - HTTP port: edgeencryption.proxy.http.port
   - HTTPS port: edgeencryption.proxy.https.port
7. The proxy server forwards the response to the load balancer with the location header pointing to the proxy server port.

The outcome depends on whether the load balancer and proxy servers are using the same port.

- If the load balancer and proxy servers are using the same port, the request succeeds because the user receives the response from the same port identified in the response header.
- If the load balancer and proxy servers are using different ports, the request fails because the user's browser communicates only with the load balancer, but the response is on the proxy server.

Solution

You could resolve the issue by simply using the load balancer and all Edge proxy servers on the same port, but this is not an ideal solution. A better solution is to enable the system to know which port the load balancer uses.

The following properties enable the Edge proxy server to reroute response messages to the load balancer if the proxy server and load balancer are using different ports.

- edgeencryption.proxy.rewrite.location.host specifies the host name used to access ServiceNow through the load balancer.
- edgeencryption.proxy.rewrite.location.https.port specifies the HTTPS port used to access ServiceNow through the load balancer.

Configure the load balancer

If the load balancer and proxy servers are using different ports, specify the host name and HTTPS port of the load balancer to enable users to view responses on their browser.

Roles required:

- local or domain administrator on a Windows host
- service user with full file system access on a Linux host

1. Login to the proxy server host as admin, domain admin, or a service user.
2. Navigate to the installation directory for the Edge proxy and select `conf/edgeencryption.properties`.
3. Set the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| `edgeencryption.proxy.rewrite.location.host` | If your Edge configuration includes a load balancer to balance the load among proxy servers, rewrites responses to the load balancer so requests can be completed.  
• If there is a load balancer in the proxy setup, specify the host name used to access ServiceNow through the load balancer.  
• **Optional:** If there is no load balancer in the proxy setup, can be set to the host name used by the proxy server. |
| `edgeencryption.proxy.rewrite.location.https.port` | If your Edge configuration includes a load balancer to balance the load among proxy servers, specifies the HTTPS port used to access ServiceNow through the load balancer.  
• If there is a load balancer in the configuration, specify the HTTPS port used to access ServiceNow through the load balancer.  
• **Optional:** If there is no load balancer in the configuration, can be set to the HTTPS port used by the proxy server. |

4. Save the file.

Requests can be completed because users can now view responses on their browser.

**Edge Encryption upgrades**

Both instance upgrades and proxy server upgrades require special consideration in an Edge Encryption environment.

**Instance upgrades**

Instance upgrades in an Edge Encryption environment require caution to ensure that Edge controls work properly after the instance upgrade.

During an instance upgrade, you should not add, edit, or delete the following:

- Edge Encryption configurations
- Edge Encryption rules
- Edge Encryption tokenization patterns
- Edge Encryption scheduled jobs
- Edge Encryption key configurations
- Edge Encryption scheduled upgrades
- Edge Encryption blacklist IP configurations
Any scheduled job running during the instance upgrade will not complete. To complete the interrupted job, rerun the job once the instance is upgraded. When you reschedule the job, the processing that occurred before the instance upgrade is not lost, and the job continues to process only the data that has not yet been processed.

**Proxy server upgrades**

Schedule a proxy upgrade to enable the instance to upgrade the Edge Encryption proxy server, or manually upgrade the proxy server at any time.

**Third party libraries**

Third party libraries, such as Gemalto, are lost during instance and proxy server upgrades if they are kept in the same directory. You can perform the following to prevent the loss of third party libraries during upgrades:

1. Manually add the following property to edgeencryption.properties:
   ```
   edgeencryption.ekm.provider.classname = com.snc.edgeencryption.encryption.CloudEdgeNaeKeyProvider
   ```
2. Add the `edgeencryption.thirdparty.vendor.library.path` vendor library location property and set it to `/path/to/jars`.
   For example:
   ```
   edgeencryption.thirdparty.vendor.library.path = /app/servicenow/libs
   ```
3. Copy the SafeNet JARs into that path.

After you install the third party libraries outside of the Edge Encryption installation, they are no longer lost during upgrades.

**Scheduled upgrades**

Schedule an upgrade to allow the instance to upgrade the proxy server at the scheduled time. This functionality is available by default after upgrading. A scheduled upgrade includes these events:

1. The proxy server checks with the instance to see if there is a new version available for upgrade. New versions generally become available when the instance is upgraded.
2. The administrator receives a notification upon logging in when a new version of the proxy server is available.
3. The administrator can Schedule an Edge Encryption proxy server upgrade for each proxy server.
   - **Note:** Only users with the security_admin role can create an upgrade schedule through the proxy server.
4. Once the upgrade is scheduled, the proxy server automatically upgrades at the scheduled time. During the upgrade, the proxy server is offline for only a short time.
   - **Note:** Because the proxy server restarts during the upgrade, it is offline for a short time. The amount of time is determined by your environment and how long it takes to stop and restart the proxy service.
5. During the scheduled upgrade, a new proxy directory is created and your configuration files are copied to the new directory. New properties are written to your existing properties file. The following files or directories in your old proxy directory are copied to the new proxy directory.

- /conf directory
- /keys directory
- /keystore directory
- java/jre/lib/security/cacerts file

As a result, your keys, keystores, settings, and certificates are preserved.

Note: Only the above files are copied to the new proxy directory. Any other customized files in the proxy server directory are not preserved during a scheduled upgrade. The upgrade log file can be found in the original proxy directory in the following folder: <original-proxy-directory>/tmp/upgrade-wrapper/bin.

Prerequisites for scheduled upgrades

Before scheduling an upgrade for an Edge Encryption proxy, ensure the following:

1. The JAVA_HOME environment variable points to a java installation on the machine that is outside the Edge Encryption proxy’s directory structure.
2. The JAVA_HOME environment variable points to a java installation that is at version 1.8_u144 or higher.
3. The -Djava.io.tmpdir parameter in the wrapper.conf file of the Edge Encryption proxy points to a directory that is OUTSIDE the Edge Encryption proxy’s directory structure, and the proxy has read/write/execute permissions on the directory. Optionally, you could comment out the parameter entirely so that Java uses its default tmp location.

Manual upgrades

Instead of creating an upgrade schedule, you can manually upgrade each proxy server through the command line. See Manually upgrade an Edge Encryption proxy server running on Linux or Manually upgrade an Edge Encryption proxy server running on Windows.

Proxy build status

You can easily identify whether a proxy server is out of date by navigating to Edge Encryption Configuration > Proxies > All. The status of your proxy build is indicated in the Proxy build column by the following colors:

Green
Your proxy server is up-to-date.
Yellow
Your proxy server is out-of-date and an upgrade is needed.
Orange
Upgrade failed. Your proxy server reverts to the old version to ensure that there is no downtime.
Troubleshoot a failed scheduled proxy upgrade

When a scheduled proxy upgrade fails, the proxy server reverts to the version you are upgrading from. All original data, keys, and configuration files are preserved. This process may take several minutes. Contact ServiceNow Technical Support to ensure a successful upgrade.

To determine the reason for the failure, you can check the **Failure Reason** in the upgrade schedule. In addition, the installation directory for the failed upgrade is maintained so that log files are available for troubleshooting.

**Note:** Before deleting any extra proxy directories, always confirm which directory is current by reviewing the log files. If the log files have recent activity, the proxy might be connected to your instance.

If a scheduled proxy upgrade fails repeatedly, you can manually upgrade your proxy server. See **Manually upgrade an Edge Encryption proxy server running on Linux** and **Manually upgrade an Edge Encryption proxy server running on Windows**.

Java minimum requirements

The host machine installing or running the Edge Encryption proxy server must maintain a supported version of Java:

- Java 8 update 121 (8u121)
- Java 8 update 141 (8u141)
- Java 8 update 151 (8u151) or later

**Note:** Java 8 update 131 (8u131) is not supported.

**Note:** Before installing the Edge Encryption proxy server, check that the `$JAVA_HOME` variable is pointing to a supported version of Java for each user that will run the proxy server. For example,
If installing the proxy server as a local administrator on Windows, check that the $JAVA_HOME variable is pointing to the correct version of Java system-wide. If installing on Linux, check that each user that will run the proxy server has this variable correctly defined. If a supported version of Java is not found, the Edge Encryption proxy server will not run.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see [Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower](#).

### Mixed proxy-version environments

Although an environment running old versions of the proxy server with up-to-date versions of the proxy server is not recommended, it is supported if all proxy servers are within the same version family as your instance. For example, if you have an instance on the New York release, your environment supports proxy servers from any New York patch or hotfix. However, the following limitations apply.

- If one proxy server supports functionality that another proxy does not support, you will see inconsistent behavior, depending on which proxy server is used.
- If a proxy server is out-of-date, it may not include recent security enhancements.

If a proxy server from a previous release is registered with a newer release of the instance, you will receive regular notifications that the proxy server is out-of-date. To ensure an optimal and secure environment, ServiceNow recommends always upgrading your proxy server to the most recent version of the software supported by your instance.

### Schedule an Edge Encryption proxy server upgrade

Create an upgrade schedule to enable the instance to upgrade an out-of-date proxy server.

To schedule an upgrade, you must be logged in to your instance through the proxy server.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see [Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower](#).

Role required: security_admin

Once the upgrade is scheduled, the proxy server automatically upgrades at the scheduled time. During the upgrade, the proxy server is offline for only a short time.

**Note:** Because the proxy server restarts during the upgrade, it is offline for a short time. The amount of time is determined by your environment and how long it takes to stop and restart the proxy service.

During the scheduled upgrade, a new proxy directory is created and your configuration files are copied to the new directory. New properties are written to your existing properties file. The following files or directories in your old proxy directory are copied to the new proxy directory.

- `/conf` directory
- `/keys` directory
- `/keystore` directory
- `java/jre/lib/security/cacerts` file
As a result, your keys, keystores, settings, and certificates are preserved.

**Note:** Only the above files are copied to the new proxy directory. Any other customized files in the proxy server directory will not be preserved during a scheduled upgrade. The upgrade log file can be found in the original proxy directory in the following folder: `<original-proxy-directory>/tmp/upgrade-wrapper/bin`.

If multiple proxy servers are out-of-date, you must schedule an upgrade for each proxy server individually.

**Note:** Avoid hosting multiple proxy servers on the same machine. However, if your environment includes this configuration, do not schedule upgrades to multiple proxies on the same machine at the same time.

1. Navigate to **Edge Encryption Configuration > Proxies > Upgrade Schedules**.
2. Click **New**.
3. Complete the form.

**Edge Encryption Proxy Upgrade Schedule form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy server</td>
<td>Proxy server being upgraded.</td>
</tr>
<tr>
<td>Target version</td>
<td>Version to which you are upgrading your proxy server. This value is read-only and set to the most up-to-date proxy version available for your instance.</td>
</tr>
<tr>
<td>Scheduled Start Time</td>
<td>Date and time on which to start the upgrade.</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the scheduled upgrade is active. If this field is not selected, the upgrade will not perform on the scheduled date and time.</td>
</tr>
<tr>
<td>Status</td>
<td>The status of the upgrade. This value is read-only. Possible statuses include:</td>
</tr>
<tr>
<td></td>
<td>• Pending</td>
</tr>
<tr>
<td></td>
<td>• Running</td>
</tr>
<tr>
<td></td>
<td>• Complete</td>
</tr>
<tr>
<td></td>
<td>• Failed</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

After an upgrade is executed, you can review the upgrade details to learn more about it. If your upgrade failed, review the **Failure Reason** to determine next steps.

**Upgrade details**

Manually upgrade an Edge Encryption proxy server running on Linux

Update a proxy running on Linux.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower.

Role required: security_admin or local administrator on the host machine

1. Copy the Edge Encryption update-archive file to the installation directory.
2. Change to the installation directory.
3. Run the following command:

   ```
   java -jar edgeencryption-dist-<version>-all.jar -m dist-upgrade -c <proxy directory>
   ```

   **Option** | **Description**
   --- | ---
   proxy directory | The directory in the installation directory where the proxy was initially installed. This directory is created by the install.

If you want to see the help screen, execute this command without arguments: `java -jar edgeencryption-dist-<version>-all.jar`

A new proxy directory is created with a current timestamp. A backup of the old proxy directory is maintained as backup.dist-upgrade_timestamp in the new proxy installation directory. The old proxy shuts down and the new proxy starts up. Any open connections/transactions on the old proxy server are terminated.

4. Check the proxy log in the new directory and the instance to verify that the new proxy is running.

Manually upgrade an Edge Encryption proxy server running on Windows

Update a proxy running on Windows.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower.

Role required: security_admin or local administrator on the host machine

1. Download the Edge Encryption proxy-update archive file to the installation directory.
2. Start the Windows cmd terminal program with administrator privileges.
3. Change to the installation directory.
4. Run the following command:

```
java -jar edgeencryption-dist-<version>-all.jar -m dist-upgrade -c <proxy
directory>
```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy directory</td>
<td>The directory in the installation directory where the proxy was initially installed. This directory is created by the install.</td>
</tr>
</tbody>
</table>

If you want to see the help screen, execute this command without arguments: `java -jar edgeencryption-dist-<version>-all.jar`

A new proxy directory is created with a current timestamp. A backup of the old proxy directory is maintained as backup.dist-upgrade_timestamp in the new proxy installation directory. The old proxy shuts down and the new proxy starts up. Any open connections/transactions on the old proxy server are terminated.

5. Check the proxy log in the new directory and the instance to verify that the proxy has been updated and is running.

**Roll back an Edge Encryption proxy server upgrade**

If a proxy upgrade is unsuccessful, you can go back to the earlier version.

If an upgrade fails when using the scheduled upgrade feature in the New York release, the proxy server will automatically roll back to the old version. The old proxy server is stored unmodified in a backup directory.

If you would like to roll back a manual upgrade, you can follow these steps.

1. Shut down the proxy.
2. Delete the new proxy directory.
3. Rename the backup directory to the proxy name.
   The backup directory is in the proxy installation directory with the name `<proxy name>_backup`
4. Start the proxy.
5. Check the proxy log and the instance to verify that the proxy is online.

**Edge Encryption configuration**

After the Edge Encryption proxy server is installed and running, manage Edge Encryption through the proxy server.

You must complete all the steps in Edge Encryption installation before creating encryption configurations and encryption patterns on the instance.

**Note:** To access the Edge Encryption configuration, you must log in through the proxy server and elevate to the security_admin role.

**Rotate encryption keys**

Perform encryption key rotation from the instance. Add a new key, change the default key assignment, and then schedule a mass key rotation or a single key rotation.
Before setting an encryption key as the default key, make the key available to each proxy. This ensures that the proxies have the key to encrypt data when the key is assigned as the default key. All proxies must have access to a key before that key can be assigned as the default key.

**Warning:** Before deleting a key from the proxy, set up and run a mass key rotation job to ensure that no data on the instance uses the key. If any information is still encrypted with that key, you cannot decrypt the information after you delete the key.

### Edge filtering and sorting behavior

Whenever you change default keys, be sure to perform a key rotation (either mass or single key rotation). Otherwise, you may receive unexpected results when sorting and filtering records. For example, consider the following scenario:

1. You create encrypted records using one encryption key.
2. You create a new key and set it as default.
3. You create a new set of encrypted records using the new encryption key.

If you filter by any encrypted field when connected through the Edge proxy, all records may not be filtered out correctly, or records may appear unexpectedly. The filter works only for records encrypted using the current default key. The records encrypted using the previous default key still appear in the list view.

If you sort by any encrypted field when connected through the Edge proxy, you see two groups of records with the same human readable text in the encrypted field.

### Schedule a single key rotation job

Schedule a job to find data encrypted using a specified key alias and then re-encrypt the data with the current default encryption key. The data is decrypted before it is re-encrypted with the default key.

**Role required:** security_admin

Before scheduling this job, update the default key in Edge Encryption Configuration > Encryption Key Configuration > Set Default Keys.

1. Navigate to Edge Encryption Configuration > Maintenance > Schedule Single Key Rotation.
2. Fill in the fields on the form as appropriate.

<table>

</tbody>
</table>

3. Click the menu icon in the form header and select **Save**.

*Estimate Record Count* is not supported when processing audited fields.

**Schedule a mass key rotation job**

Schedule a job to find data encrypted with any previous key, and then re-encrypt the data with the current default encryption keys. The data is decrypted before it is re-encrypted with the current default key.

Role required: security_admin

1. Navigate to **Edge Encryption Configuration > Maintenance > Schedule Mass Key Rotation**.
2. Fill in the fields on the form as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select **Save**.

*Estimate Record Count* is not supported when processing audited fields.

**Schedule an attachment key rotation job**

Schedule a job to find attachments encrypted using a specified key alias, and then re-encrypt the attachments with the current default encryption key. The attachment is decrypted before it is re-encrypted with the default key.
Role required: security_admin

1. Navigate to **Edge Encryption Configuration > Maintenance > Schedule Attachment Key Rotation**.
2. Fill in the fields on the form as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>

<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select **Save**.
4. To see an estimated count of records to be updated, click **Estimated Record Count**.
5. To run the job immediately, click **Execute Now**.

**Encrypt fields using encryption configurations**

Encrypt fields by creating encryption configurations.

To configure Edge Encryption, you must be connected to the instance through the proxy. Test all changes on a non-production instance before making the changes to the production instance.

**Define encryption keys**

After setting up one or more proxies and configuring a default encryption key, the instance verifies that the keys are available to all proxies. You cannot make an encryption key the default key unless all proxies have the key. Once a default key is defined, you can create encryption configurations.

**Assign fields and attachments to be encrypted**

Assigning fields and attachments to be encrypted means assigning an encryption type to the field or attachment. Before marking a field as encrypted, evaluate these issues.

- Determine what system features might be impacted.
- Examine all scripts for use of the field.
- Make any desired adjustments to the field size. After a field has been configured for encryption, the field size cannot be changed.

Marking a field to be encrypted expands the field size to store the encrypted data. The process of expanding the field size can take a long time, depending on the number of records in the table.

**Create an encryption configuration**

Select the fields to be encrypted and identify the encryption type.

Role required: security_admin

1. Navigate to **Edge Encryption Configuration > Edge Encryption Configurations > Create New**.
2. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>The table that contains the field to be encrypted.</td>
</tr>
<tr>
<td>Type</td>
<td>Whether to encrypt a table column or attachments for the table. Select <strong>Column</strong>.</td>
</tr>
<tr>
<td>Column</td>
<td>The field to be encrypted. Appears only when the <strong>Type</strong> is <strong>Column</strong>. Only String, Date, Date/Time, Journal, Journal Input, and URL fields are supported. - <strong>String and URL fields</strong>: You can add an encryption configuration to either a parent table or a child table. - <strong>Date and Date/Time fields</strong>: You can add an encryption configuration to a parent table only. You cannot add a new encryption configuration to a child table.</td>
</tr>
</tbody>
</table>

**Note:** Depending on the number of records affected by the Date and Date/Time fields you are encrypting, it may take up to a few minutes to create the encryption configuration. Make sure that you create the encryption configuration for Date and Date/Time fields when transaction volume on the instance is low.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Encryption type</td>
<td>The encryption type to use.</td>
</tr>
</tbody>
</table>

**Note:** A specific table and field combination can have only one active configuration at a time.

3. Click **Submit**.

After you add the encryption configuration record, you can create an encryption job to encrypt existing data. If you do not run an encryption job, Edge encrypts the existing data the next time the data changes.

**Deactivate an encryption configuration**

After configuring a field or a table’s attachments to be encrypted, you can stop encryption by deactivating the encryption configuration. After deactivating encryption, you can run a Decryption job for fields or an Attachment Decryption job for attachments to remove the encrypted data from the instance.

Role required: security_admin

**Warning:** Deactivating an encryption configuration does not delete the encryption record and the encryption type cannot be changed.

1. Navigate to **Edge Encryption Configuration > Edge Encryption Configurations > All**. The **Edge Encryption Configurations** list is shown.
2. Click on the encryption configuration to be deactivated. The **Edge Encryption Configuration** form is shown.
3. Click on the **Active** box.
The Active box is clear.

4. Click Update.

The Edge Encryption Configurations list is shown.

You can run a Decryption or Attachment Decryption job to decrypt data on the instance. If you do not run a job, the encrypted data is decrypted the next time it is changed.

Schedule an encryption job

You can schedule a job to find and encrypt any unencrypted data in a specified field, using the default encryption key configured for the field. If you do not create an encryption job after configuring a field for encryption, only new values are encrypted.

Role required: security_admin

1. Navigate to Edge Encryption Configuration > Encryption Configurations > All.
2. Click the field that you want to schedule an encryption job for.

The Scheduled Encryption Job form is shown with all fields populated. The bottom of the form shows records for any previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Encryption.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Estimated record count</td>
<td>Total estimated number of records to process. Populates after selecting Estimate Record Count.</td>
</tr>
<tr>
<td>Process Historical Records</td>
<td>Select to process historical records in the Audit table if the field is audited. When encrypting historical records for a field in the Audit table, both new values and old values are encrypted. To learn more about audited fields, see Auditing.</td>
</tr>
<tr>
<td>Estimate Maximum Audit Record Count</td>
<td>Estimated maximum number of audited records to process. Populates after selecting Estimate Record Count. This field is only visible when Process Historical Records is selected.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select Save.

6. To see an estimated count of records to be updated, click Estimate Record Count.
7. To run the job immediately, click **Execute Now**.

### Schedule a decryption job
You can schedule a job to decrypt data in an encrypted field, to store clear data in the instance.

**Note:** You must mark the encryption record for the field as inactive (clear the **Active** box) in order to run the decryption job.

Role required: security_admin

1. Navigate to **Edge Encryption Configuration > Encryption Configurations > All**.
2. Click the field that you want to decrypt.
3. Under **Related Links**, click **Schedule Mass Decryption Job**.

The **Scheduled Encryption Job** form is shown with all fields populated. The bottom of the form shows records for previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Decryption</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Estimated record count</td>
<td>Total estimated number of records to process. Populates after selecting <strong>Estimate Record Count</strong>.</td>
</tr>
<tr>
<td>Process Historical Records</td>
<td>Select to process historical records in the Audit table if the field is audited. When encrypting historical records for a field in the Audit table, both new values and old values are encrypted. To learn more about audited fields, see <strong>Auditing</strong>.</td>
</tr>
<tr>
<td>Estimate Maximum Audit Record Count</td>
<td>Estimated maximum number of audited records to process. Populates after selecting <strong>Estimate Record Count</strong>. This field is only visible when <strong>Process Historical Records</strong> is selected. <strong>Note:</strong> The estimate may be larger than the actual number of records processed.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select **Save**.
6. To see an estimated count of records to be updated, click **Estimate Record Count**.
7. To run the job immediately, click **Execute Now**.
Encrypt attachments using standard encryption

You can encrypt attachments for specific tables.

All attachments to a table use the same encryption type. Encrypted attachments are not searched when performing a text search. Only the standard encryption types are allowed for attachments. The order preserving or equality preserving encryption types are not allowed.

For a session bypassing the Edge Encryption proxy:

- On a record with attachment encryption activated:
  - The user can see that there are attachments and the attachment names.
  - The user cannot open or download the attachments.
  - The user cannot add new attachments.

- On a record without attachment encryption activated:
  - The user can open and download existing attachments.
  - The user can add new attachments.

For a session using the encryption proxy, the user can open and download existing attachments and add new attachments.

Configure attachment encryption

Select the tables whose attachments are to be encrypted and identify the encryption type.

Role required: security_admin

2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table whose attachments are to be encrypted.</td>
</tr>
<tr>
<td>Type</td>
<td>Whether to encrypt a table column or attachments for the table. Select Attachment.</td>
</tr>
<tr>
<td>Column</td>
<td>The table field to be encrypted.</td>
</tr>
<tr>
<td>Encryption type</td>
<td>The encryption type to use. For attachments, only Standard AES128 and Standard AES256 are allowed.</td>
</tr>
</tbody>
</table>

3. Click Submit.

After the encryption record has been added, you can create an attachment encryption job to encrypt existing attachments. If you do not run an attachment encryption job, the system encrypts new attachments when you attach them.

Schedule an attachment encryption job

You can schedule a job to find and encrypt any unencrypted attachments for a specified table, using the default encryption key configured for the table.
Role required: security_admin

1. Navigate to **Edge Encryption Configuration > Encryption Configurations > All**.
2. Click the table you want to schedule an encryption job for.

   The **Scheduled Encryption Job** form is shown with all fields populated. The bottom of the form shows records for previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Attachment Encryption.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select **Save**.
6. To see an estimated count of records to be updated, click **Estimate Record Count**.
7. To run the job immediately, click **Execute Now**.

**Schedule an attachment decryption job**

You can schedule a job to decrypt any encrypted attachments for a specified table, to store clear attachments in the instance.

**Note:** You must mark the encryption record for the table as inactive (clear the **Active** box) before the decryption job runs, otherwise, nothing happens.

Role required: security_admin

1. Navigate to **Edge Encryption Configuration > Encryption Configurations > All**.
2. Click the table with the attachments that you want to decrypt.
3. Under **Related Links**, click **Schedule Mass Attachment Decryption Job**.

   The **Scheduled Encryption Job** form is shown with all fields populated. The bottom of the form shows records for previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Attachment Decryption.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear the check mark if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select **Save**.
6. To see an estimated count of records to be updated, click **Estimate Record Count**.
7. To run the job immediately, click **Execute Now**.

### Change a field or attachment's encryption type

You can change a field or attachment's encryption type by selecting a new encryption type in the existing encryption configuration record. A specific table and field combination can only have one active configuration at a time.

Role required: **security_admin**

1. Navigate to **Edge Encryption Configuration > Encryption Configurations > All**. The **Edge Encryption Configurations** list is shown.
2. Open the record for the encryption configuration to be changed.
3. Click the **Encryption type** dropdown and select a new encryption type.

   **Note:** For attachments, only Standard AES128 and Standard AES256 are allowed.

4. If needed, run an **encryption** or **attachment encryption** job.

   It is not necessary to run an encryption job. If you do not run an encryption job, the field or attachment is encrypted using the new encryption type the next time the field or attachment is changed.

### Tokenize strings using encryption patterns

You can replace string patterns with tokens before they are sent to and stored in the instance.

To use encryption patterns, you must install and set up a MySQL database in your network. This is the same database used for order-preserving encryption. To create or edit encryption patterns, you must be connected to the instance through the proxy.

Role required: **security_admin**

You can use base system patterns, or create your own patterns. Base system patterns are advanced patterns. Encryption patterns include the following limitations.

- A pattern of all alpha characters is not allowed.
- The minimum pattern size is five characters. You can change this setting using a system property.
- The * and + quantifiers are forbidden in encryption patterns.
- Encryption patterns match complete words, not parts of strings embedded in a larger string. Words are defined by spaces and characters not available for inclusion in a pattern.
- If the same string is sent to the instance multiple times, it is replaced with the same token.
- Text search on exact matches is supported. The query string is exchanged with a token when sent to the instance, the search is performed on tokens, and when the search results are returned to the proxy server, the tokens are replaced with the clear text. Features such as stemming are not supported.

When using patterns, the clear text never leaves your network. When the proxy server matches a pattern in a request going to the instance, the proxy replaces the string with a token of the same size. The token is sent to instance instead of the clear text string. When the response is sent from the instance to the proxy server, the proxy replaces the token with the string. When viewed through the proxy server, the string displays as clear text.
1. Navigate to **Edge Encryption Configuration > Encryption Patterns > Create New**.
   Alternatively, you can navigate to **Advanced Patterns** to activate or edit a preconfigured pattern.

2. Enter the pattern name.

3. Define the **Edge pattern input type**.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic</td>
<td>A series of character types. In the Basic Pattern Input tab, click Add and select a character type. The Sample pattern displays the pattern as characters are added. Click New Block to move the next character to the next line. This enables you to group characters in a long pattern. Click X to delete the last character in the pattern.</td>
</tr>
<tr>
<td>Advanced</td>
<td>A Java RegEx expression. If advanced is selected, you cannot change the input type back to basic. In the Sample match field, enter a sample pattern to test the RegEx expression. In the Pattern field, enter a Java RegEx expression. Click Validate to verify that the expression matches the sample pattern.</td>
</tr>
</tbody>
</table>

The input type defines how you are going to enter the pattern. It does not impact how the pattern is used.

4. Click **Submit**.

**Repair or recover order-preserving encrypted data**

If you have the security-admin role, you can schedule jobs performed by the Edge Encryption proxy to repair or recover fields that use order preserving encryption.

You can schedule jobs to:

- Repair order tokens.
- Recreate the proxy database.

Running these jobs can be a time-consuming operation which might impact the performance of the Edge Encryption proxy. Schedule these jobs at a time when no users or a minimum set of users are using the system, such as midnight on the weekend.

**Schedule an order token repair job**

You can schedule a job to find and repair fields where the order token is missing.

Role required: security_admin

Use these jobs to repair individual fields in a table or to repair all fields using order preserving encryption. Run this job when the proxy database has been offline while the instance has been running, which results in order preserving fields that are missing order tokens.

1. Navigate to **Edge Encryption Configuration > Maintenance > Schedule Order Token Repair**.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Order Token Repair</strong>.</td>
</tr>
<tr>
<td>All fields</td>
<td>Select this check box to repair all tables.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select **Save**.

4. To see an estimated count of records to be updated, click **Estimated Record Count**.

### Schedule a proxy-database recovery job

Run this job when the proxy database has lost data. This job finds all records that have been encrypted with a token (order preserving encryption type) and sends them to the proxy so that the proxy database can be rebuilt.

Role required: security_admin

1. Navigate to **Edge Encryption Configuration > Maintenance > Schedule Database Recovery**.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Database Recovery</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run this job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select **Save**.

4. To see an estimated count of records to be updated, click **Estimate Record Count**.

### Blacklist requests from an IP address in your network

Because the Edge Encryption proxy server resides in your network, it may be subject to vulnerability scans by your network software. To prevent IP scanner or other requests from being forwarded to your ServiceNow instance, you can blacklist IP addresses, IP ranges, or network masks. Any connection to the proxy server from a blacklisted address is terminated and is not forwarded to your instance.

Role required: security_admin

To blacklist an IP address, you must be logged in to your instance through the proxy server.
Important: Ensure that you understand your network topology before blacklisting IP addresses in your network. If an IP address is added to the blacklist, any user with that IP address will be blocked from accessing the Edge Encryption proxy server.

1. Navigate to **Edge Encryption Configuration > Maintenance > Blacklist IP Addresses.** The Encryption Proxy IP Blacklists [edge_encryption_ip_blacklist] list view opens.
2. Click **New.**
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy server</td>
<td>The Edge Encryption proxy server that is prevented from forwarding requests from blacklisted addresses.</td>
</tr>
<tr>
<td>IP, IP range, or net-mask</td>
<td>Requests from this IP address, range, or network mask are not forwarded to your ServiceNow instance. Example values include:</td>
</tr>
<tr>
<td></td>
<td>• IP address: 10.10.10.5</td>
</tr>
<tr>
<td></td>
<td>• IP range: 10.10.10.1-15</td>
</tr>
<tr>
<td></td>
<td>• Network mask: 10.10.10.0/24</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the record is active. Only IP addresses from active records are prevented from sending requests to the instance.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the blacklist record.</td>
</tr>
</tbody>
</table>

4. Click **Submit.**
5. Repeat these steps for all other proxies for which an IP address should be blacklisted.

The Edge Encryption proxy server terminates any connection from a blacklisted IP addresses, range, or network mask and cannot forward the request to the instance.

**Encrypt data from a record producer**

Record producers allow end users to create task-based records, such as incident records, from the Service Catalog and Service Portal. If a record producer attempts to insert data into a field marked for encryption, an invalid insert message displays and the data is not saved to the field. To configure your Edge Encryption proxy server to allow inserts from a record producer, create encryption rules from the record producer record.

Role required: security_admin

Encrypting data from a record producer requires an encryption configuration defined for the target field. Check that you have created an encryption configuration for the target field and table before creating an encryption rule from a record producer. See **Create an encryption configuration.** To encrypt attachments from a record producer, **Configure attachment encryption.**

1. Log in to your instance through the Edge Encryption proxy server.
2. Navigate to **Service Catalog > Catalog Definitions > Record Producers.**
3. **Create a record producer** record or open an existing record producer record.
Two inactive encryption rules are automatically created to encrypt data sent from the record producer to the field marked for encryption.

<table>
<thead>
<tr>
<th>Encryption rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;RecordProducerName&gt;</code></td>
<td>Rule created to process POST parameters from the Service Catalog and map variables to fields in the instance.</td>
</tr>
<tr>
<td><code>&lt;RecordProducerName&gt;Json</code></td>
<td>Rule created to process a JSON payload from the Service Portal and map variables to fields in the instance.</td>
</tr>
</tbody>
</table>

5. Activate the necessary encryption rules created by the record producer.
   a) Navigate to Edge Encryption Configuration > Rules > All.
   b) Depending on where the record producer will be used, open the associated encryption rule created by the record producer and select the Active flag.
      If using the record producer in the Service Catalog, activate the `<RecordProducerName>` encryption rule. If using the record producer in the Service Portal, activate the `<RecordProducerName>Json` encryption rule.
6. Optional: Examine the Encryption rule **Action** field and add any necessary field names or statements.

If a record producer directly maps a variable to a field in a table, the encryption rule automatically maps the variable to the correct field. However, if a variable is indirectly mapped through various scripts on the platform, you may need to update the rules to map each variable to the correct field.

The below encryption rule was created from the Report Outage record producer and processes POST parameters from the Service Catalog to map variables to fields in the instance. Replace `'FILL ME IN'` with the target field.
The below encryption rule was created from the Report Outage record producer and processes a JSON payload from the Service Portal to map variables to fields in the instance. Add additional statements to map any scripted variables to the target fields.
function ReportOutageAction(request) {
    var tableName = "INCIDENT";
    // Some fields are set in script, additional parameter lines may need to be added
    // current.comments is accessed via script from notes; // assignment to current.comments does NOT replace existing values
    // current.short_description is accessed via script from short_description;
    // current.description is accessed via script from current.short_description;
    // current.entity_id is accessed via script from getEntityId();
    var jsonElementsItr = request.getJSONObject('variables');
    while (jsonElementsItr.hasNext()) {
        var jsonElement = jsonElementsItr.next();
        jsonElement.setValueFor(tableName, jsonElement.getName());
    }
}
When the payload from the record producer is examined, the error_message element contains the value for the short_description field. By adding the following statement, you can map the scripted variable error_message to the short_description field.

```javascript
if (jsonElement.getName() == 'error_message')
    jsonElement.valueFor(tableName, 'short_description');
```

The value of the **Action** field becomes:

```javascript
function ReportOutageJsonAction(request) {
    var tableName = 'incident';
    // Some fields are set in script, additional parameter lines may need to be added
    // current.comments is accessed via script from notes; // assignment to current.comments does NOT replace existing values
    // current.short_description is accessed via script from short_description;
    // current.description is accessed via script from current.short_description;
    // current.caller_id is accessed via script from gs.getUserID();
    var jsonContent = request.getAsJsonContent();
    for (var jsonElementItr = jsonContent.getIterator('variables'); jsonElementItr.hasNext();)
        {
            var jsonElement = jsonElementItr.next();
            if (jsonElement.getName() == 'error_message')
                jsonElement.valueFor(tableName, 'short_description');
            else {
                jsonElement.valueFor(tableName, jsonElement.getName());
            }
        }
}
```

The two encryption rules enable the record producer to insert values into fields marked for encryption from either the Service Catalog or Service Portal.

**Define a custom encryption rule**

It may be necessary to identify and encrypt sensitive information in HTTP requests on the way to your instance. You can write encryption rules to identify, interpret, and encrypt data in such requests, mapping fields in the request to table-field names on your instance.

**What is an encryption rule**

Encryption rules are scripts executed on the Edge Encryption proxy server to map fields in a request to fields in a table on your ServiceNow instance. An encryption rule tells the Edge Encryption proxy server how to encrypt data in custom payloads.

**Note:** Encryption rules only support ECMAScript 3 and below.

**When to use custom rules**

A set of encryption rules is included as part of the Edge Encryption plugin. These rules handle core platform use cases such as editing a field from the list edit form, updating a record from the record form, managing direct web services, and processing data from the REST API. Applications created using standard forms and lists should work without custom encryption rules.
If you develop scripted processors, scripted web services, scripted REST APIs, UIs, or Ajax scripts that contain data that should be encrypted, you must write encryption rules to find and map the data to Glide table-field names.

**Format of an encryption rule**

Rules include three parts:

- **Condition**: Identifies the type of request.
- **Action**: Maps fields in the request to fields in a table, encrypting values that map to fields with encryption configurations defined.
- **Order**: Priority of the rule. The lowest priority rule with a satisfied condition is the only rule that runs. Like business rules, rules run from lowest to highest.

Except for attachment requests, when an HTTP request hits the Edge Encryption proxy server, the Edge Encryption proxy server evaluates all encryption rule conditions in priority order until either all conditions return false, or one condition returns true. When a condition returns true, the action is executed on the request and the result is forwarded to the instance. No other conditions are evaluated. As a result, encryption rule conditions should be as specific as possible. A generic rule might evaluate as true for a request meant to be processed by another rule, causing the request to be processed by the wrong action. If a generic condition is unavoidable, the rule should be marked with a high-order value so that more specific rules are evaluated first.

**Guidelines for creating encryption rules**

Creating efficient, optimized encryption rules can reduce processing time for script validation.

**Overall guideline**: When rules get very long, do your best to minimize the number of blocks and break the rules apart whenever possible. Ideally, custom rules should apply to specific use cases, rather than encompassing several cases, with if statements in the action script.

1. Split rules whenever possible. For example,
   - Create different rules for different tables and ensure that each rule runs only on its respective table.
   - Create different rules for each record producer you are targeting, or at least for each subset of record producers. Instead of one rule targeting dozens of sys_ids, you could create several different rules targeting smaller subsets of record producers, or even create one rule per sys_id.

   **Note**: Creating multiple rules requires more maintenance. The trade-off is that multiple, simpler rules can be validated more efficiently than longer, more complex rules.

2. Minimize the number of blocks. Because the processing engine scans each block while evaluating scripts, a large number of blocks causes delays in validation. For example,
   - Replace all if blocks with an array lookup, and replace all blocks in the array lookup with just one if block.
   - Combine if blocks whenever it is possible to group them.
Encryption rule APIs

Encryption rules are written in JavaScript and utilize Edge Encryption APIs to locate and encrypt sensitive information in the body of a request. The API uses expressions similar to xPath to navigate through both JSON and XML content.

Edge Encryption APIs process the request off the stream as it is being written to the output stream. Stream parsing allows encryption rules to be network performant. However, fetching and parsing content from the body multiple times could lead to unexpected results. To account for this, requests should be processed by the action in a single pass.

When creating encryption rules, you cannot use Glide APIs, script includes, business rules, or any global parameters such as current. Because the rules are created for HTTP objects, a global request object is available.

When creating encryption rules, you cannot use APIs from the white list manager or scoped applications.

Error handling

If an encryption rule condition or action throws an exception, check the proxy log for troubleshooting information.

Inspect the client request

Before creating a custom encryption rule, you must determine the format of the client request entering the Edge Encryption proxy server.

Because encryption rules iterate over client requests and determine what, if anything, needs to be encrypted, you must understand the type of request you are creating a rule for. The format of the client request determines the structure of your encryption rule and the APIs available for use in the rule.

1. Inspect the client request.

   Depending on the source of the request, the following tools are available to inspect the request and determine the format.

<table>
<thead>
<tr>
<th>Source of request</th>
<th>Available tools</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client browser</td>
<td>Use the developer console in your browser to inspect the client request. Useful tools include:</td>
</tr>
<tr>
<td></td>
<td>• Firefox Network Monitor</td>
</tr>
<tr>
<td></td>
<td>• Chrome Network Panel</td>
</tr>
<tr>
<td>Third-party/external source</td>
<td>Use an HTTP protocol analyzer to inspect the request. Useful tools include:</td>
</tr>
<tr>
<td></td>
<td>• Wireshark</td>
</tr>
<tr>
<td></td>
<td>• HTTP Scoop</td>
</tr>
<tr>
<td></td>
<td>Alternatively, you can often use documentation for the external source to</td>
</tr>
<tr>
<td></td>
<td>determine the format of the request.</td>
</tr>
</tbody>
</table>

2. From the client request, inspect the packet and determine:
   - The client request method
   - The URL path of the request
   - The URL parameters
- The POST parameters, if any
- The format of the request body, if included

Inspecting the request provides an understanding of the fields you need to filter for and iterate over in your encryption rule. To understand the fields in the request object, see request.

**Create an encryption rule**

Encryption rules are used by the proxy to find content in HTTP requests that should be encrypted.

Role required: security_admin

Before creating an encryption rule, you must Inspect the client request to determine the format.

To create or edit encryption rules, you must be connected to the instance through an encryption proxy.

1. Navigate to Edge Encryption Configuration > Rules > Create New.
2. In the Name box, enter a name.
3. In the Request Type, select an HTTP method.
   - HTTP Post
   - HTTP Get
   - HTTP Put
   - HTTP Patch
   - HTTP Delete

   **Note:** Pre-Jakarta instances allow only HTTP Get and HTTP Post methods.

4. In the Condition box, enter a JavaScript statement defining when the rule should run.
5. In the Action box, enter a JavaScript function to be executed when the condition is true.
6. In the Order box, enter the relative priority of the rule.
7. Click Submit, or save the form.

**Encryption rule conditions**

Encryption rule conditions determine if the rule should be executed.

An encryption rule condition must return true if the rule is to handle the HTTP request; otherwise, it must return false.

As you build your condition, keep in mind that only one rule is executed per request. As a result, the condition must be as general or specific as needed to run under the intended circumstances.
Note: Be careful when performing checks on content in the condition. Excessive checks can be expensive for the proxy server and may cause increased latency when handling complex requests.

The condition can use the method type, content type, URL path, or any URL query string parameters to determine if the rule should handle the request. The condition has access to these fields via the request object. Be sure that, prior to creating an encryption rule condition, you have inspected the client request and understand the conditions needed to trigger the rule.

Note: To build efficient rules, consider easy ways to rule out requests that you do not want to be evaluated by a rule. Build your condition to return false for those requests first. This method increases performance and quickly routes the request to the correct rule faster.

Encryption rule objects and APIs are available to encryption rule conditions.

Example using path and postParams

```javascript
/*This condition checks if the request coming in has a path ending in "/sample_processor.do" and if a post parameter exists in that request called myPostParam */

function SampleCondition(request) {
    if (endsWith(request.path, "/sample_processor.do") &&
        request.postParams.myPostParam) {
        return true;
    } else {
        return false;
    }
}
```

Example using urlParams and contentType

```javascript
/* This condition checks if a url parameter exists in the query called myUrlParam and if the content type contains 'xml' (if so, you can expect the body to be an XML payload). Then, it checks if the xml payload contains myXmlTag */

function SampleCondition2(request) {
    if (request.urlParams.myUrlParam && request.contentType.indexOf('xml') > -1 &&
        request.xmlContains('myXmlTag')) {
        return true;
    } else {
        return false;
    }
}
```

Encryption rule actions

An encryption rule maps fields in a client request to fields in a table on your instance and identifies fields marked for encryption.

An encryption rule action only runs when the encryption rule condition returns true. An encryption rule identifies the data to be encrypted in your request payload. Because the rule iterates over the content in the request object, you must understand the form and structure of your request body and determine what in the request needs to be encrypted. The data to be encrypted might be located within:

- A POST or URL parameter.
- JSON or XML content within a POST or URL parameter.
• A JSON payload.
• An XML payload.

Before writing an encryption rule action, be sure to:
• Inspect the client request.
• Identify where the sensitive data is located in the request object.
• Determine the field and table name to insert data into, or understand how to dynamically pull this from the request.

Encryption rule objects and APIs are available to encryption rule actions and conditions.

Encryption rule objects and APIs

Use encryption rule APIs to parse and encrypt values in requests moving through the Edge Encryption proxy server to the instance.

The APIs available for your encryption rule depend on the format of the request object. For example, if the contentType parameter of the request object is XML, you can use the XML APIs to parse and encrypt values in the payload. After you determine the type of object in your request, you can build an encryption rule using the available APIs.

Encryption rule APIs are available in both encryption rule condition and action scripts.

request

The request object is a global object available in Edge Encryption rule action and condition scripts.

The request object is a JavaScript object that represents the client request coming in to the Edge Encryption proxy server. You must build your encryption rule to parse the request object, map request object values to fields in a table on the instance, and encrypt any sensitive data in the request object.

The request object includes the following attributes and data from the client request:

Request object fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>The path portion of the URL.</td>
</tr>
<tr>
<td>requestMethod</td>
<td>GET, POST, PUT, PATCH, DELETE.</td>
</tr>
<tr>
<td>contentType</td>
<td>The Content-Type header field.</td>
</tr>
<tr>
<td>urlParams</td>
<td>The parameters in the query string. This can also be evaluated to a String.</td>
</tr>
<tr>
<td>postParams</td>
<td>If this is a form post, this contains the post parameters.</td>
</tr>
</tbody>
</table>

request - getAsJsonContent()

Returns the request as an iterable object of type JsonNode.

This method is available only in an Edge Encryption rule if the request body is a valid JSON payload. If you are not sure what format the request body includes, check the contentType field on the request object.

Once the request is returned as a JsonNode object, you can use the JSON APIs to iterate over the object and encrypt fields.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The request as an iterable JsonNode.</td>
</tr>
</tbody>
</table>

request - getAsXmlContent()

Returns the request content as an iterable object of type XMLContent.

This method is available only in an Edge Encryption rule if the request body is a valid XML payload. If you are not sure what format the request body includes, check the contentType field on the request object. Once the request is returned as an XMLContent object, you can use the XML APIs to iterate over the object and encrypt fields.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLContent</td>
<td>The request as an iterable object of type XMLContent.</td>
</tr>
</tbody>
</table>

request - XMLContains(String path)

Returns true if the given path exists in the XML DOM.

This method is available only if the request body is a valid XML payload. If you are not sure what format the request body includes, check the contentType field on the request object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>String</td>
<td>XPath statement you are searching for.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the given path exists in the XML DOM.</td>
</tr>
</tbody>
</table>
**POST and URL parameter APIs**

POST and URL parameters can be accessed as properties of the `request` object using `request.postParams` and `request.urlParams`.

Any single parameter can be accessed as a property of the `postParams` and `urlParams` parent objects by calling `request.postParams.myParam`. Any parameter accessed this way is an object of the underlying class `ParameterValue`. Any APIs in this class can be called on any parameter.

After inspecting the client request, it may be necessary to access and encrypt parameter values from the `request` object. Depending on the data in the client request, you can encrypt values and map them to fields on the instance in multiple ways.

**Encrypt the value of a known table and field**

If you know the name of the instance table and field that will hold the encrypted data, you can explicitly define them in the encryption rule. For example, you may know that the request will be processed on the instance to create an incident and you want to encrypt the `text` parameter in the description field. In this case, you can create the following action.

```javascript
function SampleAction1() {
    request.postParams.text.valueFor('incident', 'description');
}
```

**Encrypt the value of a dynamically defined table and field**

If, conversely, you do not know the name of the field that the encrypted data will populate, you can dynamically define them using `tableName` and `fieldName`.

The below example processes a generic request that might store data in different task tables (such as incident, problem, and change_request) on the instance.

```javascript
function SampleAction2() {
    var tableName = request.urlParams.table;
    for (var parameter in request.postParams) {
        var currentParam = request.postParams[parameter];
        var fieldName = currentParam.toString();
        if (fieldName == 'text') {
            currentParam.valueFor(tableName, 'description');
        } else {
            currentParam.valueFor(tableName, fieldName);
        }
    }
}
```

This action:

- Gets the destination table from the URL parameters.
- Iterates over the URL parameters.
- Asks the Edge Encryption proxy server to encrypt any URL parameter with a name that matches a field marked for encryption.
- Looks for a specific parameter called `text` and asks the Edge Encryption proxy to encrypt the value based on the encryption configuration for the description field on the incident table.

In this example, the `valueFor()` method is not actually performing any encryption. Rather, the method asks the Edge Encryption proxy server to check whether the table/field pair in the request object is marked for encryption with an encryption configuration and, if applicable, encrypt it.
Encrypt JSON or XML within a parameter

A POST or URL parameter might include JSON or XML content. In this case, you can process the content within the parameter, iterate over the values, and encrypt required fields. In this example, the `tableName` is still accessed from a POST parameter, but the value of the field is the JSON object `data`.

```javascript
function SampleAction3() {
    var tableName = request.postParams.table;
    var data = request.postParams.data;
    var dataIterator = data.getAsJsonContent().iterator();
    while (dataIterator.hasNext()) {
        var jsonElement = dataIterator.next();
        var fieldName = jsonElement.getName();
        if (fieldName == 'text') {
            jsonElement.valueFor(tableName, 'description');
        } else {
            jsonElement.valueFor(tableName, fieldName);
        }
    }
}
```

An example of an encryption rule action that processes XML within a POST parameter.

```javascript
function SampleAction4() {
    var tableName = request.postParams.table;
    var data = request.postParams.data;
    var dataIterator = data.getAsXmlContent().getIteratorOverAllChildren();
    while (dataIterator.hasNext()) {
        var jsonElement = dataIterator.next();
        var fieldName = jsonElement.getName();
        if (fieldName == 'text') {
            jsonElement.valueFor(tableName, 'description');
        } else {
            jsonElement.valueFor(tableName, fieldName);
        }
    }
}
```

Encrypt a query

You might encounter an encoded query within a parameter in the client request that contains sensitive data. To match a field in a query to an encrypted value in the instance database, you must create an encryption rule that asks the proxy to check whether a field in the query is marked for encryption. The `encodedQueryFor()` method parses an encoded query on a given table, and checks if any fields in the query have encryption configurations.

In this example, the rule iterates over the parameters looking for the `filter` parameter, which is expected to be a Glide encoded query.

```javascript
function SampleAction5() {
    for (var parameter in request.postParams) {
        var currentParam = request.postParams[parameter];
        var fieldName = currentParam.toString();
        if (fieldName == 'filter') {
            currentParam.encodedQueryFor(tableName);
        } else {
            currentParam.valueFor(tableName, fieldName);
        }
    }
}
```
For example, if the value of filter is: short_description=My sensitive information^number=INC000056^category=Outage, the query would become short_description=<Encrypted(My sensitive information)>^number=INC000056^category=Outage on the instance.

ParameterValue - toString()
Converts the POST or URL parameter value to a string.

| Parameters |
| Name | Type | Description |
| None | | |

Returns

| Type | Description |
| String | The parameter value as a string. |

ParameterValue - getAsJsonContent()
Returns the request as an iterable object of type JsonNode.

This method is available only in an Edge Encryption rule if the request body is a valid JSON payload. If you are not sure what format the request body includes, check the contentType field on the request object.

Once the request is returned as a JsonNode object, you can use the JSON APIs to iterate over the object and encrypt fields.

| Parameters |
| Name | Type | Description |
| None | | |

Returns

| Type | Description |
| JsonNode | The request as an iterable JsonNode. |

ParameterValue - getAsXmlContent()
Returns the request content as an iterable object of type XMLContent.

This method is available only in an Edge Encryption rule. This method assumes that the request body is a valid XML payload. You can check the contentType to make sure.

Once the request is returned as an XMLContent object, you can use the XML APIs to iterate over the object and encrypt fields.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLContent</td>
<td>The request as an iterable object of type XMLContent.</td>
</tr>
</tbody>
</table>

ParameterValue - encodedQueryFor(String tableName)

Specifies that the value of the element is an encoded query on the specified table.

Calling this function on a parameter tells the proxy that the value of the parameter is an encoded query for the specified table. The proxy parses the encoded query and encrypts the fields in the encoded query that must be encrypted.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>

ParameterValue - valueFor(String tableName, String fieldName)

Specifies that the value of the element maps to the specified field in the specified table.

Calling this method on an element value tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
**XML APIs**

XML APIs can be used after calling `getAsXmlContent()` on either the request object or a ParameterValue property.

When using XML APIs to write your encryption rule, you can follow a general format:

1. Call `getAsXmlContent()` on the request object or ParameterValue property. This returns an iterable object of the XMLContent underlying class.

2. Call `getIterator()` or `getIterator(String xPath)` on the XMLContent object. This returns an XMLElementIterator object that can be used to iterate over XML elements.

3. Call the `hasNext()` method on the XMLElementIterator object to determine whether another element is available.

4. Call `next()` on the XMLElementIterator object to return the next XML element. You cannot call `next()` without first calling `hasNext()`.

5. Call `valueFor(String tableName, String fieldName)` on the XML element. This method tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted.

**Note:** To determine if you want to call `valueFor(String tableName, String fieldName)` on an XML element, you can use the `getName()` method to return the name of the element.

### Mapping to a known table-field on the instance

In this example, the XML payload will be processed on the instance to insert records in the incident table. The description field will populate short_description on the incident.

```xml
<data>
  <record>
    <name>'Test Record 1'</name>
    <description>'Test Record 1 Description'</description>
    <tag>critical</tag>
  </record>
  <record>
    <name>'Test Record 2'</name>
    <description>'Test Record 2 Description'</description>
    <tag>security</tag>
  </record>
</data>
```

The following encryption rule action can apply:

```javascript
function sampleXmlAction1() {
  var xmlContent = request.getAsXmlContent();
  // This loop iterates over all description tags that match the given path
  var xmlElementIterator = xmlContent.getIterator('data/record/description');
  while (xmlElementIterator.hasNext()) {
    var xmlElement = xmlElementIterator.next();
    xmlElement.valueFor('incident', 'short_description');
  }
}
```
This action iterates through the `description` tags and asks the proxy server to encrypt the values and insert them into `incident.short_description` on the instance.

**Note:** This rule finds all `description` tags within all `record` tags in the XML payload. If there is only one occurrence of a tag to encrypt, the rule still uses the XPath and iterator structure. However, it iterates only once in the loop.

**Mapping to an unknown table-field on the instance**

In this example, the rule iterates over the `record` tags, but does not know what tags to expect within the `record` tag. The only known is that the tags within the `record` tags match the names of the columns specified in the table URL parameter.

The rule also specifies that, if the table is `incident`, then the data in the `description` tag should be encrypted and stored in the `short_description` field on the instance.

```javascript
function sampleXmlAction2() {
    var xmlContent = request.getAsXmlContent();
    var tableName = request.urlParam.table;
    // This first iterator will iterate over all record elements
    var xmlElementIterator = xmlContent.getIterator('data/record');
    while (xmlElementIterator.hasNext()) {
        encryptFieldsInRecord(xmlElementIterator.next());
    }
}

function encryptFieldsInRecord(xmlElement) {
    // Then, iterate over all tags representing fields in the table
    var fieldIterator = xmlElement.getIteratorOverAllChildren();
    while (fieldIterator.hasNext()) {
        var field = fieldIterator.next();
        var fieldName = childElement.getName();
        // if table is incident, then description is encrypted for the short_description field
        if (tableName == 'incident' && fieldName == 'description') {
            field.valueFor(tableName, 'short_description');
        } else {
            // if table is not incident, ask the proxy to check if the given field is encrypted for the given table
            field.valueFor(tableName, fieldName);
        }
    }
}
```

In the `encryptFieldsInRecord()` function, the `valueFor()` method is called on a table and a field that are dynamically assigned based on the request. Even though the table and field names can change, the rule asks the proxy to check whether the field in the table must be encrypted based on the encryption configurations defined.

If the field is not configured for encryption, or if the tag does not match a field in the table, the proxy skips that tag. If the tag matches a field marked for encryption, then the Edge Encryption proxy server encrypts the value.
Using an encoded query

In this example, all tags have the `filter` attribute, which indicates whether the tag contains an encoded query.

```xml
<data>
  <record>
    <name filter="false">'Test Record 1'</name>
    <description filter="false">'Test Record 1 Description'</description>
    <query filter="true">category=1^name=edge</query>
  </record>
  <record>
    <name filter="false">'Test Record 2'</name>
    <description filter="false">'Test Record 2 Description'</description>
    <query filter="true">category=2^severity=3</query>
  </record>
</data>
```

The following encryption rule action can apply:

```javascript
function sampleXmlAction3() {
    var xmlContent = request.getAsXmlContent();
    var tableName = request.urlParam.table;
    // This first iterator will iterate over all record elements
    var xmlElementIterator = xmlContent.getIterator('data/record');
    while (xmlElementIterator.hasNext()) {
        encryptFieldsInRecord(xmlElementIterator.next());
    }
}

function encryptFieldsInRecord(xmlElement) {
    // this time we want to iterate over all tags representing fields in the table
    var fieldIterator = xmlElement.getIteratorOverAllChildren();
    while (fieldIterator.hasNext()) {
        var field = fieldIterator.next();
        var fieldname = childElement.getName();
        // let's look at the filter attribute, if true, then encrypt as encoded query
        if (field.getAttributeValue('filter') == 'true') {
            field.encodedQueryFor(tableName);
        } else {
            // if it is false then check if the field should be encrypted
            field.valueFor(tableName, fieldName);
        }
    }
}
```

If the `filter` attribute value is true, the rule asks the proxy server to encrypt the values in the encoded query. If false, the rule asks the proxy to check whether the field should be encrypted.

**XMLContent**

A global object that provides methods to iterate over the XML content.

You can access an `XMLContent` object by calling `getAsXmlContent()` on a `request` object.

You access XML data in a POST or URL parameter by calling `request.postParams.<parameter name>.getAsXmlContent()` or `request.urlParams.<parameter name>.getAsXmlContent()`.

**XMLContent - getIterator()**

Returns an `XMLElementIterator` object for the XML content.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLContent</td>
<td></td>
</tr>
</tbody>
</table>

XMLElementIterator

Provides methods for iterating over XML elements.

You get an `XMLElementIterator` object by calling the `getIterator()` method of the `XMLContent` class.

XMLElementIterator - hasNext()

Determines if there is another element available.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if another element is available.</td>
</tr>
</tbody>
</table>

XMLElementIterator - next()

Returns the next element in the iterator.
You cannot call `next()` without first calling `hasNext()`.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElement</td>
<td>The next XML element.</td>
</tr>
</tbody>
</table>

**XMLElement**

Provides methods for iterating through XML elements and mapping values to fields in a table.

You get an `XMLElement` object by calling the `next()` method of an `XMLElementIterator` object.

**XMLElement - getIterator(String xPath)**

Returns an `XMLElementIterator` object for the XML element based on the specified parameter.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An xPath-like expression that specifies where in the <code>XMLElement</code> object to start.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that can be used to iterate over elements in the <code>XMLElement</code> object.</td>
</tr>
</tbody>
</table>

**XMLElement - getIteratorOverAllChildren()**

Returns an `XMLElementIterator` object that includes all sub-elements for the XML element based on the specified parameter.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that can be used to iterate over elements in the <code>XMLElement</code> object.</td>
</tr>
</tbody>
</table>
**XMLElement - valueFor(String tableName, String fieldName)**

Specifies that the value of the element maps to the specified field in the specified table.

Calling this method on an element value tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted. If the table and field names are unknown, you can call the `valueFor()` method on a table and a field that are **dynamically assigned** based on the request.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**XMLElement - encodedQueryFor(String tableName)**

Specifies that the value of the element is an encoded query for the specified table.

Calling this function on an element tells the proxy that the value of the element is an **encoded query** for the specified table. The proxy parses the encoded query and encrypts the fields in the encoded query that must be encrypted.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**XMLElement - getName()**

Returns the element name.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The element name.</td>
</tr>
</tbody>
</table>

XMLElement - `getAttributeValue(String attribute)`

Returns the value of the specified attribute.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>String</td>
<td>Attribute name.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The attribute value.</td>
</tr>
</tbody>
</table>

JSON APIs

JSON APIs can be used after calling `getAsJsonContent()` on either the `request` object or a `ParameterValue` property.

When using JSON APIs to write your encryption rule, you can follow a general format:

1. Call `getAsJsonContent()` on the `request` object. This returns an iterable object of the `JsonNode` underlying class.
2. Call `getIterator()` or `getIterator(String xPath)` on the `JsonNode` object. This returns a `JsonNodeIterator` object that can be used to iterate over nodes in the JSON object.
3. Call the `hasNext()` method on the `JsonNodeIterator` object to determine whether another element is available.
4. Call `next()` on the `JsonNodeIterator` object to return the next JSON element. You cannot call `next()` without first calling `hasNext()`.
5. Call `valueFor(String tableName, String fieldName)` on the JSON element. This method tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks whether the field must be encrypted.

Note: To determine if you want to call `valueFor(String tableName, String fieldName)` on a JSON element, you can use the `getName()` method to return the name of the element.

Mapping to a known table-field on the instance

In this example, the JSON payload is processed on the instance to insert records in the incident table. The description field populates `short_description` on the incident.

```json
{
    data: {
        records: [
```
The following rule can apply:

```javascript
function sampleJsonAction1() {
  var jsonContent = request.getAsJsonContent();
  // This loop iterates over all description elements in the records array
  var jsonNodeIterator = jsonContent.getIterator('/data/records/description');
  while (jsonNodeIterator.hasNext()) {
    var jsonNode = jsonNodeIterator.next();
    jsonNode.valueFor('incident', 'short_description');
  }
}
```

This action iterates through the `description` nodes and asks the proxy server to encrypt the values and insert them into `incident.short_description` on the instance.

**Note:** This rule finds all `description` nodes within the JSON payload. If there is only one occurrence of a node to encrypt, the rule still uses the xPath and iterator structure. However, it iterates only once in the loop.

### Mapping to an unknown table-field on the instance

In this example, the rule iterates over `records`, but is not sure what nodes to expect. The only known is that for each object within `records`, the nodes match the names of the columns specified in the table URL parameter.

The rule also specifies that, if the table is incident, then the data in the `description` node should be encrypted and stored in the `short_description` field on the instance.

```javascript
function sampleJsonAction2() {
  var jsonContent = request.getAsJsonContent();
  var tableName = request.urlParam.table;
  // This first iterator will iterate over all record elements
  var jsonNodeIterator = jsonContent.getIterator('data/records');
  while (jsonNodeIterator.hasNext()) {
    encryptFieldsInRecord(jsonNodeIterator.next());
  }
}

function encryptFieldsInRecord(jsonNode) {
  // this time we want to iterate over all nodes
  var fieldIterator = jsonNode.iterator();
  while (fieldIterator.hasNext()) {
    var field = fieldIterator.next();
  }
}
```
In the encryptFieldsInRecord() function, the valueFor() method is called on a table and a field that are dynamically assigned based on the request. Even though the table and field names can change, the rule asks the proxy to check whether the field in the table must be encrypted based on the encryption configurations defined.

If the field is not configured for encryption, or if the node name does not match a field in the table, the proxy skips that node. If the node name matches a field marked for encryption, then the proxy encrypts the value.

**Using an encoded query**

```javascript
function sampleJsonAction3() {
    var jsonContent = request.getAsJsonContent();
    var tableName = request.urlParam.table;
    // This first iterator will iterate over all record elements
    var jsonNodeIterator = jsonContent.getIterator('data');
    while (jsonNodeIterator.hasNext()) {
        var jsonNode = jsonNodeIterator.next();
        if (jsonNode.getName() == 'records')
            encryptRecords(jsonNodeIterator.next());
        else if (jsonNode.getName() == 'query')
            jsonNode.encodedQueryFor(tableName);
    }
    function encryptRecords(jsonNode) {
        //we iterate over all fields in the node
        var recordIterator = jsonNode.iterator();
        while (recordIterator.hasNext()) {
            encryptFieldsInRecord(recordIterator.next());
        }
    }
    function encryptFieldsInRecord(jsonNode) {
        //this time we want to iterate over all nodes
        var fieldIterator = jsonNode.iterator();
        while (fieldIterator.hasNext()) {
            var field = fieldIterator.next();
            var fieldname = childElement.getName();
            field.valueFor(tableName, fieldname);
        }
    }
}
```

In this example, the rule iterates over data. As it finds records, it performs the same logic as in the second example, iterating over fields in each node. When it finds the query node, it calls encodedQueryFor() to encrypt values that should be encrypted in the query.

**JsonNode**

A global object that provides methods to iterate over the JSON content.

You can access a JsonNode object by calling getAsJsonContent() on a request object.

You access JSON content from a POST or URL parameter by calling request.postParms.<parameter name>.getAsJsonContent() or request.urlParms.<parameter name>.getAsJsonContent().
JsonNode - getIterator(String xPath)
Returns a JsonNodeIterator object for the JSON content.
This method can only be used on the root node, but can be used to traverse deep into the JSON object. Subsequent traversals must use the iterator() method.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An xPath expression.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNodeIterator</td>
<td>An object that can iterate over nodes in the JSON object.</td>
</tr>
</tbody>
</table>

JsonNode - iterator()
Returns a JsonNodeIterator object that iterates over all child nodes of the current node.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNodeIterator</td>
<td>An object that can iterate over nodes in the JSON object.</td>
</tr>
</tbody>
</table>

JsonNode - getAsString()
Returns the current node value as a string.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The current node value.</td>
</tr>
</tbody>
</table>

JsonNode - getAsString(String propertyName)
Returns the string value of the specified property.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propertyName</td>
<td>String</td>
<td>Name of the property.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The property value.</td>
</tr>
</tbody>
</table>

JsonNode - getName()

Returns the name of the current JSON node.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Name of the current JSON node.</td>
</tr>
</tbody>
</table>

JsonNode - valueFor(String tableName, String fieldName)

Specifies that the JSON property maps to the specified field in the specified table.

Calling this method on a JSON property tells the proxy that the value for this property maps to the specified field in the specified table. The proxy then decides if the field must be encrypted. If the table and field names are unknown, you can call the valueFor() method on a table and a field that are dynamically assigned based on the request.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

JsonNode - encodedQueryFor(String tableName)

Specifies that the value of the JSON property is an encoded query for the specified table.
Calling this function on a JSON node tells the proxy that the value is an encoded query for the specified table. The proxy parses the encoded query and encrypts the values for fields in the encoded query that must be encrypted.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**JsonNodeIterator**

You get a `JsonNodeIterator` object by calling the `getIterator()` or `iterator()` methods of the `JsonNode` class.

**JsonNodeIterator - hasNext()**

Determines if there is another property available.

<table>
<thead>
<tr>
<th>Parameters</th>
<th></th>
</tr>
</thead>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if another property is available.</td>
</tr>
</tbody>
</table>

**JsonNodeIterator - next()**

Returns the next property in the iterator.

You cannot call `next()` without first calling `hasNext()`.

<table>
<thead>
<tr>
<th>Parameters</th>
<th></th>
</tr>
</thead>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The next JsonNode.</td>
</tr>
</tbody>
</table>
print(String message)
Prints a message to the wrapper log file: <proxy server directory>/logs/wrapper_<date>.log.

This method is available only in an Edge Encryption rule action script.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>The message to be written to the wrapper log file.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Prohibited keywords

The Edge Encryption proxy validates encryption rule scripts before saving the rule. Many JavaScript keywords are not allowed in encryption rule scripts.

Prohibited keywords

<table>
<thead>
<tr>
<th>Keyword</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DIR</strong></td>
</tr>
<tr>
<td><strong>FILE</strong></td>
</tr>
<tr>
<td><strong>LINE</strong></td>
</tr>
<tr>
<td><strong>parent</strong></td>
</tr>
<tr>
<td><strong>proto</strong></td>
</tr>
<tr>
<td>Error</td>
</tr>
<tr>
<td>eval</td>
</tr>
<tr>
<td>getClass</td>
</tr>
<tr>
<td>getPrototypeOf</td>
</tr>
<tr>
<td>Java</td>
</tr>
<tr>
<td>javax</td>
</tr>
<tr>
<td>javafx</td>
</tr>
<tr>
<td>JavaImporter</td>
</tr>
<tr>
<td>load</td>
</tr>
<tr>
<td>loadWithNewGlobal</td>
</tr>
<tr>
<td>new</td>
</tr>
<tr>
<td>Packages</td>
</tr>
<tr>
<td>Object</td>
</tr>
<tr>
<td>prototype</td>
</tr>
</tbody>
</table>
**Edge Encryption dictionary attributes**

You can add Edge Encryption dictionary attributes to tables and fields.

To set an Edge Encryption dictionary attribute to true, you must enter `attribute=true` in the Attributes field. To add a dictionary attribute to a record, see #unique_801.

**Edge Encryption Excluded [edge_encryption_excluded]**

When set to true, the field or table cannot be encrypted.

- Value: true/false
- Target element: field or table
- Default value: false

**Edge Encryption Enabled [edge_encryption_enabled]**

When set to true, the field is eligible for encryption through an encryption configuration. Because this attribute is used by the system and cannot be modified, it is not always displayed to the user.

> Note: This attribute does not indicate that a field is encrypted, nor does it trigger any encryption logic on the field. Rather, the attribute determines the possibility of the field being encrypted by a user.

- Value: true/false
- Target element: field
- Default value: true for String fields

**Edge Encryption Clear Text Allowed [edge_encryption_clear_text_allowed]**

When set to true, allows server-side scripts to append non-encrypted data to an encrypted string within the field for user actions performed through the proxy server, or any server-side automated scripts, such as scheduled jobs.

- Value: true/false
- Target element: field
- Default value: false

**Domain separation in Edge Encryption**

Edge Encryption provides the ability to encrypt data from within the customer's environment through the use of specific configurations, rules, and keys defined on the Edge Encryption proxy. The Edge Encryption proxy is not domain aware and cannot support domain-specific settings. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Overview

Support: Data only

Domain separation in this application is supported at the **Data only** level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see Application support for domain separation.

How domain separation works in Edge Encryption

Edge Encryption can be used where domain-specific keys, configurations, and rules are not required.

Data integration with Edge Encryption

To integrate third-party data with an instance using Edge Encryption, you must route the data through the Edge Encryption proxy server using supported integrations. Supported integrations use base system encryption rules that map data in each payload to fields in a table.

Upload data to fields marked for encryption

Edge Encryption does not support importing data from or exporting data to Excel, CSV, XML, or other file types to or from fields with encryption configurations defined.

**ODBC driver**

Encrypt requests and query data through the Edge Encryption proxy server using the ODBC driver.

Learn more: Edge Encryption ODBC driver integration

**MID Server**

You can configure the MID Server to route data through an Edge Encryption proxy server. However, some restrictions apply.

Learn more: Edge Encryption MID Server integration

**REST/SOAP web services**

Use REST/SOAP web services to update or retrieve record data through the Edge Encryption proxy server.

Learn more: #unique_803

**JSONv2 web service**

Use JSONv2 web service APIs to update or retrieve record data through the Edge Encryption proxy server. Base system encryption rules support data retrieval and data modification APIs.

- To insert a single record using the data modification API, use the `insert()` or `insertMultiple()` methods.
- To insert multiple records using the data modification API, use the `insertMultiple()` method.

Learn more: #unique_804

To encrypt data from custom third-party integrations not listed above, create custom encryption rules. See Define a custom encryption rule.
Upload attachments to records marked for encryption

Attachments can be uploaded to tables with attachment encryption configured using REST and SOAP web services.

Edge Encryption ODBC driver integration

Configure your ODBC driver to query data encrypted by Edge Encryption. The Edge Encryption proxy server encrypts ODBC driver requests to the ServiceNow instance when Edge Encryption is integrated with the ODBC driver.

Encrypted responses from the instance are decrypted through the Edge Encryption proxy server before passing to the ODBC driver in your network.
For a successful integration, the ODBC driver must trust the Edge Encryption proxy server certificate. If the Edge Encryption proxy server certificate is signed by a Certificate Authority trusted by the ODBC driver, the Edge Encryption proxy server is automatically trusted. However, if a Certificate Authority trusted by the ODBC driver has not signed the Edge Encryption proxy server certificate, you must import the self-signed certificate to the ODBC truststore.
**Import a self-signed certificate to the ODBC truststore**

If a Certificate Authority trusted by the ODBC driver has not signed the Edge Encryption proxy server certificate, you must import a self-signed certificate to the ODBC truststore. You can export the certificate from the Edge Encryption proxy server and import it into the ODBC truststore.

To determine whether a Certificate Authority trusted by the ODBC driver has signed the Edge Encryption proxy server certificate, run the following command in the keystore directory in the proxy home directory to view a list of Certificate Authorities trusted by the ODBC driver:

```
keytool -keystore "<ODBC directory>\ip\Java\jre\lib\security\cacerts" -list
```

1. Change to the keystore directory in the proxy home directory.
2. Check the keystore for the self-signed certificate.
   a) To check the keystore for the certificate, you can run the following command to list all the items in the keystore.
   ```
   keytool -list -keystore keystore.jceks -storetype jceks -v
   ```
   b) Locate the key alias in the list of items.
3. Using the key alias, export the certificate to a .cer file.
   ```
   keytool -export -alias <key alias> -keystore keystore.jceks -storetype jceks -rfc -file <file name>.cer
   ```
4. Change to your ODBC truststore directory: ODBC\ip\Java\jre\lib\security\cacerts.
5. Import the certificate to your ODBC truststore.
   ```
   keytool -keystore cacerts -importcert -alias $<key alias> -file <file name>.cer
   ```

**Set the ODBC driver properties**

Set the ODBC driver properties to route requests through the Edge Encryption proxy server.

1. In Windows, navigate to Start > Programs > ServiceNow ODBC Management Console.
2. Expand the console tree root to: ServiceNow ODBC Manager\Manager\<installation location>\Services\ServiceNow_ODBC\Data Source Settings\ServiceNow\IP Parameters.
3. Double-click the **DataSourceIPPProperties** attribute.
4. Change the **Value** to the URL of your Edge Encryption proxy server, such as `https://<IP address>:<port>`
5. Click OK.

The ODBC driver is now configured to route requests to the instance through the Edge Encryption proxy server.

**Edge Encryption MID Server integration**

Configure the MID Server to route data through an Edge Encryption proxy server.

When integrated with the MID Server, the Edge Encryption proxy server acts as the MID Server's endpoint. The Edge Encryption proxy server then encrypts and decrypts data passing between the ServiceNow instance and the MID Server.

**Limitations when integrating with the MID Server**

When MID Server data is configured to pass through the Edge Encryption proxy server, the following limitations apply:

- Encryption of ECC Queue fields is not supported.
- Encrypted data cannot be used with Discovery or Service Mapping.

**Point the MID Server to the Edge Encryption proxy server**

To pass data from the MID Server through the Edge Encryption proxy server, update the MID Server configuration file to point the MID Server to the Edge Encryption proxy server.

When configuring the MID Server to pass through the Edge Encryption proxy server, you cannot use the web proxy properties in the MID Server configuration file to route traffic through the Edge Encryption proxy server to your instance. Instead, you must set the Edge Encryption proxy server as the MID Server's endpoint.

1. Navigate to your local MID Server directory and open the `config.xml` file.
2. Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` and change the value property to the URL of your Edge Encryption proxy server. For example, `http://hostname.mycompany.com:8081`.
   This step directs the MID Server to pass traffic to the Edge Encryption proxy server instead of the instance. The Edge Encryption proxy server then encrypts any necessary fields and passes the payload to the instance.
3. Save and close the file.
4. If running, restart the MID Server.

**Edge Encryption diagnostics and performance**

Monitor Edge Encryption proxy server performance trends and drill into errors generated by the Edge Encryption proxy server.

**Edge proxy performance**

View key Edge Encryption proxy server performance trends using the Edge Proxy graph set on the ServiceNow Performance homepage. Monitored trends include:

- Maximum and average response times between the client, proxy server, and instance.
- CPU, disk space, and memory usage of the host machine.
• Maximum and average network latency between the proxy server and the ServiceNow instance.

**Note:** Edge Encryption proxy servers with duplicate names do not report performance trends.
Maximum and average time in milliseconds to process a request. These data points are general trends over time.

- **Total Time**: Time for the proxy server to receive a request from a client and send a response. This data point is the sum of the subsequent data points.
- **Proxy Response**: Time for the proxy server to process a response from the instance.
- **Proxy-Instance Round Trip**: Time for the proxy server to send a request to the instance and receive a response. Includes network latency between the proxy server and the instance and time spent by the instance to process the request.
- **Rules**: Time for the proxy server to evaluate a request using defined encryption rules.
- **Proxy Request**: Time for the proxy server to process a client request and forward it to the instance.

**Edge Proxy Performance (Max and Average)**

Maximum and average percentage of resources used on the host machine.

- CPU Usage
- Memory Usage
- Disk Usage

**Edge Proxy Latency**

Maximum and average network latency in milliseconds at a given point in time. Latency is determined by round-trip time for a proxy server to send a simple ping to the instance and receive a response.

**Proxy Error Reports**

Navigate to [Edge Encryption Configuration > Diagnostics and Troubleshooting > Proxy Error Reports](#) to view all proxy server errors collected over the past seven days.
Errors are collected over a one-minute period. Each minute, an error report is generated. The vertical axis displays the number of error reports over the last seven days that include each error. For example, even if the DEFAULT_ERROR_CODE error is thrown multiple times over a one-minute report period, the DEFAULT_ERROR_CODE bar will only reach one on the Number of Error Reports axis.

From this view, you can:

- Click each proxy error code bar to see the report on a single error for each proxy server. From this view, you can click the bar again to view the error text in the Edge Encryption Proxy Stat table [edge_encryption_stat]. Follow links in the error text to see more information and possible remediation steps.
- Click Other to see page two of the error report.

**Note:** If you have more than one proxy server with the same name, a single DUPLICATE_PROXY_NAME error appears in the Proxy Error Report. No other errors are reported for proxy servers with duplicate names. If you encounter this error, make sure that all proxy servers have unique names.

### Additional monitoring resources

The instance tracks all encryption proxies. Each Edge Encryption proxy server registers when it starts up. The instance is notified when:

- A new Edge Encryption proxy server starts up.
- An Edge Encryption proxy server is intentionally shut down.

If an Edge Encryption proxy server attempts to register with an instance that does not have Edge Encryption installed, the proxy does not start.
All encryption configuration files are audited. Deleted records are audited on all encryption configuration files. Audit records are put in the sys_audit table. To view the history of a specific configuration record, view the record, and click **History > List** in the menu. The Mass Encryption Job is not audited.

Use the following additional resources to monitor you proxy servers.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invalid Insert Attempts</td>
<td>List of attempts to save the following data to encrypted fields:</td>
</tr>
<tr>
<td>[sys_edge_encryption_invalid_insert_log]</td>
<td>• Unencrypted data.</td>
</tr>
<tr>
<td></td>
<td>• Data that did not come from an Edge Encryption proxy.</td>
</tr>
<tr>
<td></td>
<td>The instance rejects and then logs any attempts to save this data. If you have the security-admin role, you can view the logs in the Invalid Insert Attempts list.</td>
</tr>
<tr>
<td>Job Failures</td>
<td>A list of jobs that did not execute successfully.</td>
</tr>
<tr>
<td>[sys_encryption_job_execution]</td>
<td></td>
</tr>
<tr>
<td>System logs</td>
<td>The instance periodically checks for messages from each registered proxy server. If a proxy server has not sent a message in the required time frame, an error is logged. The log message contains information about the encryption proxy and the last time the proxy pinged the instance. If the instance determines that none of the encryption proxies are online, it logs a message. These messages are added to the system log.</td>
</tr>
</tbody>
</table>

**Disable or reduce Edge Proxy statistic collection**

Prevent the Edge Encryption proxy server from sending Edge Proxy Graph Set statistics to the ServiceNow Performance homepage, or reduce the frequency of statistic collection.

Role required: admin or security_admin

By adding properties in the `edgeencryption.properties` configuration file, you can:

- Disable the Edge Proxy graph set.
- Change the interval during which statistics are collected by the Edge Encryption proxy server. By default, statistics are collected every 30 seconds.

1. In your proxy server installation directory, open the `edgeencryption.properties` configuration file located in the `<installation directory>/conf/` folder.
2. Add one of the following properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.stat.collection.enabled</td>
<td>Enables the collection of statistics used by the Edge Encryption proxy server performance dashboard.</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td></td>
<td>Add this property and set the value to false to disable the collection of statistics used by the Edge Encryption proxy server performance dashboard.</td>
</tr>
</tbody>
</table>
3. Restart the proxy server.

### Flow Designer

Flow Designer is a Now Platform® feature that gives you rich capabilities for automating processes in a single design environment. Flow Designer lets process owners use natural language to automate approvals, tasks, notifications, and record operations without coding.

You can expand Flow Designer to integrate with external instances and third-party applications with a separate subscription to IntegrationHub.

Watch this seven-minute video to learn how to create and test a flow in Flow Designer.

For developer training, see Using Flow Designer on the ServiceNow® Developer Site.

### Benefits

Flow Designer provides process owners and developers these benefits.

- Consolidates multiple Now Platform automation capabilities into a single environment so process owners and developers can build and visualize business processes from a single interface. Includes flows and actions triggered by Service Catalog events. See Create a flow with a Service Catalog trigger.
- Consolidates configuration and runtime information into a single environment so process owners and developers can create, operate, and troubleshoot flows from a single interface.
- Provides natural-language-descriptions of flow logic to help non-technical users understand triggers, actions, inputs, and outputs.
- Promotes process automation by enabling subject matter experts to develop and share reusable actions with flow designers.
- Reduces upgrade costs, with upgrade-safe Now Platform® logic replacing complex custom script.
- Reduces development costs by providing a library of reusable actions.
- Allows extending Flow Designer content by subscribing to IntegrationHub or installing spokes.

### Interactions with existing automation processes

While learning Flow Designer, make sure that you understand how existing Now Platform automation processes such as business rules and workflows change records to avoid creating conflicting logic. See the Architecture Overview to understand how Flow Designer works within the Now Platform. Avoid duplicating existing business logic from business rules and workflows. If you are replacing an existing automation process, you may need to deactivate it before replacing it with Flow Designer flows and actions.
Flow Designer content

Flow Designer consists of the following content types.

Flows

A flow is an automated process consisting of a sequence of actions and a trigger. Flows automate business logic for a particular application or process. For example, the VTB Sample Flow creates and assigns a VTB card whenever a priority 1 incident is created. Flows require some familiarity with the Now Platform tables and fields the application or process uses. Process analysts can create flows using available actions or copy an existing flow to use it as a template. You can add application-specific flows by activating the associated spoke.

Subflow

A subflow is an automated process consisting of a sequence of reusable actions and specific data inputs that allow it to be started from a flow, subflow, or script. Subflows automate generic business logic that can be applied to multiple applications or processes. For example, you could create a subflow to notify users of record changes. Subflows require some familiarity with the Now Platform tables and fields the application or process uses. Process analysts can create subflows using available actions or use an existing flow as a template.

Actions

An action is a reusable operation that enables process analysts to automate Now Platform features without having to write code. For example, the Create Record action allows process analysts to generate records in a particular table with particular values when certain conditions occur. Core actions like Create Record require some familiarity with Now Platform tables and fields. Action designers can create application-specific actions to pre-set configuration details. For example, creating a Create Incident Task action ensures that the process analyst uses the correct table and field configuration each time the action is used. You can add application-specific actions by activating the associated spoke.

Core actions

A core action is a ServiceNow-provided action available to any flow that cannot be viewed or edited from the Action Designer design environment. For example, the Ask for Approval action is a core action that allows process analysts to use Now Platform approvals. Flow Designer provides a set of core actions to automate Now Platform processes. You can add application-specific core actions by activating the associated spoke.

Action steps

An action step or step is a single reusable operation within an action. For example, the Create Record step allows action designers to specify the table and field values to use during record creation. Action steps require subject matter expertise with application tables, fields, and business logic. Application developers or IT generalists add action steps to actions from the Action Designer design environment. Flow Designer provides a set of core action steps to automate Now Platform processes. You can add application-specific action steps by activating the associated spoke.

Spokes

A spoke is a scoped application containing Flow Designer content dedicated to a particular application or record type. For example, the ITSM Spoke contains actions for managing Task records such as the Create Task action. Spokes are activated when their parent application is activated. For example, the ITSM Spoke is activated when the Incident, Problem, and Change applications are activated. Creating a spoke requires familiarity with application development as developers must add Flow Designer content to a scoped application. See Spokes for a list of available spokes.
Consolidated design and operation environment

The design environment consists of these components.

**Landing page**
Access or create actions, flows, subflows, or their execution details.

**Flow Designer**
Create and edit flows by defining a trigger and adding actions. Test flows to see if they complete successfully and to review the runtime values they generate. Activate flows to make them available for execution on your instance and to preserve their current actions, inputs, and sequence as a snapshot separate from further configuration changes.

**Action Designer**
Create and edit actions by defining inputs and adding action steps. Test actions to verify if they complete successfully and review the runtime values they generate. Copy actions to use existing actions as templates. Publish actions to activate them, which makes them available to activated flows and to preserve their current action steps, variables, and sequence as a snapshot separate from further configuration changes.

**Flow and action execution details**
View runtime information about an action or flow directly from the design environment such as the current state, actions or steps run, and values produced. Open related records from embedded Now Platform editors or in a new tab.

**Operations dashboard**
Identify and troubleshoot potential issues by reviewing action and flow executions, their result state, and their run time duration.

Getting started with flows

Create a sample flow with a trigger and base system actions that requires an approval.

Role required: admin

**Note:** While Flow Designer is designed to use the flow_designer and delegated_developer roles in most scenarios, this tutorial uses the admin role to illustrate functionality without requiring additional roles to set up records and approve requests.

The ITSM application is required to access the Task table.

Watch this 11-minute video for an introduction to using Flow Designer.

A flow can include these components:

- **Trigger:** An activity that initiates the flow, such as a record created in a specified table or a scheduled job.
- **Conditions:** Statements that determine when or how an action runs. For example, run an action only if a field is over a certain value.
- **Actions:** Operations executed by the system, such as a field value updated, approval requested, or a value logged.

To understand basic flows, create an expense approval flow. This flow:

1. Runs when an Expenses record is created.
2. Uses the total amount to determine which action to run.
3. Approves the request if it is under the specified dollar amount.

4. Requires manager approval if it is over a specified dollar amount. Another approver can be manually added.

1. Create a custom application for the flow. Creating flows and actions within an application enables you to publish flows and actions to an application repository and deploy them on other instances. While this example does not use delegated development, you can optionally delegate action and flow designer development by assigning developers to the application.
   a) Navigate to **System Applications > Studio**.
   b) Create a custom application called **Expenses Getting Started**.

2. In Studio, create an Expenses table.
   a) Click **Create Application File**.
   b) Under Data Model, select Table and click **Create**.
      A Table form opens.
   c) Complete the form with the following values.
      - Label: **Expenses**
      - Extends table: **Task**
   d) Save the form.
   e) Add three additional columns to the table.

<table>
<thead>
<tr>
<th>Column label</th>
<th>Type</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount</td>
<td>Floating point number</td>
<td>None</td>
</tr>
<tr>
<td>Destination</td>
<td>String</td>
<td>None</td>
</tr>
<tr>
<td>Requested for</td>
<td>Reference</td>
<td>User [sys_user]</td>
</tr>
</tbody>
</table>

3. Add four records to the Expenses table to use in Flow Designer tests. When you test your flow in later steps, you can specify which record is used as the trigger, enabling you to test specific record values.
   a) On the Expenses table record, click the **Show list** related link.
   b) Click **New**.
   c) Configure the form to add the **Amount**, **Destination**, and **Requested for** fields, and the **Approvers** related list.
   d) Complete the **Destination** and **Requested for** fields. In the **Amount** field, add a value under 100.00.
      Make sure that the user in the **Requested for** field in the test record has a manager assigned in the system. If the user in the test record does not have a manager, configure the User form to add the **Manager** field, and assign a manager to the user.
   e) Submit the form.
   f) Add another record to the table with an amount under 100.00.
   g) Add two more records to the table with a value over 100.00 in the **Amount** field.
4. In Studio, create a new flow.
   a) Click Create Application File.
   b) Under Flow Designer, select Flow and click Create.
   c) Select the Flow option, click Next.
   d) In the Flow Name field, enter Expense Approval.
   e) Click Submit.
      An Expense Approval flow is created in the Expenses Getting Started scope.

5. Create a trigger that runs the flow when a record is created in the Expenses table.
   • Trigger: Created
   • Table: Expenses [x_expenses_getting_expenses]

   ![Trigger Configuration](image)

   6. Add an if condition to the flow.
      a) Select Flow Logic > If.
      b) In the right-hand pane, expand the Trigger - Record Created category and the [Expenses Record] pill. Drag-and-drop the [Amount] pill into Condition 1. A data pill represents the value
of a record or a field at a particular stage in your flow. Dragging the \[\text{Amount}\] data pill from the trigger populates the condition with the value of the field in the triggering record.

c) Set Condition 1 to \([\text{Trigger}\rightarrow\text{Expenses Record}\rightarrow\text{Amount}] \text{ less than } [100.00]\).

7. Underneath action 1, click + to add an action that runs when the If condition is met.
8. Create an Update Record action that approves the request.
   - Action: **Update Record**
   - Record: Expand the **Trigger - Record Created** category and drag the **[Expenses Record]** data pill from the right-hand pane.
   - Table: Set to **Expenses [x_expenses_getting_expenses]**.
   - Fields:
     - Approval: **Approved**
     - Work notes: **Auto-approved. Amount less than $100.00**

9. Add an else condition to the flow.
   a) Select **Flow Logic > Else**.
10. Underneath action 2, click + to add an Ask for Approval action that runs when the Else condition is met.
   
a) Complete the fields in the Ask for Approval step.
   
   • **Action:** Ask for Approval
   • **Record:** Expand the [Trigger - Record Created] category and drag the [Expenses Record] data pill from the right-hand pane.
   • **Table:** Set to Expenses [x_expenses_getting_expenses].
   • **Approval Field:** Set to Approval.
   • **Journal Field:** Set to Approval history.

   ![Ask for Approval screenshot]

b) Define the rules in the Ask for Approval step.

   • [Approve] when [Anyone approves] from the field [Trigger->Expenses Record->Requested for->Manager]. [OR]
   
   • **[Anyone approves]** from the [Manual User(s)] list. Select to allow a manual approver to process an approval or rejection. A manual approver is a user manually added to the Approvers related list who can then approve the request. For example, you can manually add
a subject matter expert to a task to approve the request. To learn more about adding manual approvers, see Generate approvals using the approvers related list.

Select **Add another OR rule set** to define rejection rules. When defining approvals, make sure to include rejection rules to avoid creating flows that remain in a waiting state if there are no matching approval rules.

- **[Reject]** when **[Anyone rejects]** from the field **[Trigger->Expenses Record->Requested for->Manager]**. [OR]
- **[Anyone rejects]** from the **[Manual User(s)]** list.

![Rules](image)

**c)** Define a due date to automatically approve, cancel, or reject an approval if the request is not approved or denied by the designated time. Adding a due date ensures that the flow does not remain in a waiting state.

- **[Approve]** if pending by **[Relative date] [1][Days] from [Trigger->Expenses Record->Created]**.
- Days schedule **[8-5 weekdays excluding holidays]**.

This due date automatically approves all requests that have not been approved or denied within one day from when the request was created.

![Due Date](image)

11. **Click Save.**
12. Test the flow using a record with an amount below the designated limit.
   a) From the flow, click Test.
      The Test flow modal appears.
   b) In the Record field, select a record you created in earlier steps that has value in the Amount field under the 100.00 limit. This field is a reference to the table defined in the trigger.

      **Note:** Testing a flow bypasses the trigger conditions and immediately runs it. To test a flow with a record-based trigger, you must select a specific record to act as the trigger.
   c) Select Run Test.
   d) After the flow executes, click Flow has been executed. To view the flow, click here.
      The Execution Details open.

Because the amount is less than 100.00, the first condition is met and the request is approved.

13. Navigate back to the flow and run the test again using a record with an amount over the designated amount.
14. After the flow executes, open the flow Execution Details. Because the amount is over the designated limit, the request must be approved. Until a manager or a manual approver approves the request, the state is **Waiting**.
15. Approve the request. In an active flow, a user from the Approvers list would approve or reject the request. However, because the flow is being tested, an admin can approve the flow.
   a) Navigate to the test record.
      The associated manager appears in the Approvers related list with Requested in the State field. Alternatively, you can edit the list to add manual approvers.
   b) Change the value of the State field in the Approvers related list to Approved.
   c) Navigate back to the flow Execution Details and refresh the browser. Because the request is approved, the flow completes.

   Transform the Ask for Approval action into a reusable action using Action Designer. Actions enable flow designers to add complex actions to multiple flows with minimal configuration. See Getting started with actions.

   Getting started with actions
   Transform the Ask for Approval action into a reusable action that always requires manager approval.
   Role required: admin
Complete the steps in Getting started with flows. This tutorial replaces the Ask for Approval action in the Expense Approval flow.

Actions are made up of:

- **Inputs:** Data variables used in your action.
- **Steps:** Operations on the inputs or results from a prior step that generate data that can be used in later steps.
- **Outputs:** Data variables that represent the results of the action. These results are available to other actions in a flow.

Unlike the core Ask for Approval action where flow designers must manually configure the approval rules, this custom action always uses the same approval rules when added to a flow. You might create a reusable action if your flow designers often use an action with the same configuration. For example, if your flow designers always use the request manager approval and due date options, this action automatically uses them and therefore requires less flow configuration.

1. Open the Expenses Getting Started application in Studio.
   Alternatively, you can navigate to **Flow Designer > Designer** and select **New Action** to access Action Designer in the platform. In the Action Properties, select your scoped application in the **Application** field.

2. Create an action.
   a) Click **Create Application File**.
   b) Under Flow Designer, select Action and click **Create**.
   c) In the **Name** field, enter Ask for Manager Approval.
   d) In the **Description** field, enter Approve or reject a request based on manager approval or rejection. Allow manual approvers to be added.
   e) Click **Submit**.

   An Ask for Manager Approval action is created in the Expenses Getting Started scope.
3. Define the inputs in the Ask for Manager Approval action.
   a) Select **Create Input** and add the following values.
      - Name: **Request**
      - Type: **Reference**
      - Reference Table: **Expenses [x_expenses_getting_expenses]**

This input enables you to reference any field or record from the Expenses table. Use the data pills on the right-hand side to add the record or its fields to action steps.
4. Add an Ask for Approval step.
   a) Click the + underneath Inputs in the Action Outline.
   b) Select Ask for Approval.
   c) Complete the fields in the Ask for Approval step.
      • Record: Under the Input Variables category, drag the [Request] data pill from the right-hand pane.
      • Table: Set to Expenses [x_expenses_getting_expenses].
      • Approval Field: Set to Approval.
      • Journal Field: Set to Approval history.

d) Define rules in the Ask for Approval step. You can use the data pill picker, or drag the data pills from the right-hand pane to select the data you need.
   • [Approve] when [Anyone approves] from the field [action->Request->Requested for- >Manager]. [OR]
   • [Anyone approves] from the field [Manual User(s)].

Select Add another OR rule set to define rejection rules:
   • [Reject] when [Anyone rejects] from the field [action->Request->Requested for- >Manager]. [OR]
   • [Anyone rejects] from the field [Manual User(s)].
e) Define a due date in the Ask for Approval step.
   - [Approve] if pending by [Relative date] [1][Days] from [action->Request->Created].
   - Days schedule [8-5 weekdays excluding holidays].

This due date automatically approves all requests that have not been approved or denied within one day from when the request was created.
5. Define the outputs in the Ask for Manager Approval action. Adding an output makes data available to a flow. For example, this action outputs the approval state of the record.
   a) Select **Create Outputs** and add the following values.
      • Name: **Approval state**
      • Value: In the right-hand pane, expand the **Ask for Approval step** category and drag the **[Approval State]** data pill.

![Action Outline Diagram]

   b) Click **Save**.

6. Add a custom icon for your application that displays in Flow Designer. All actions in the application scope use the custom icon.
   a) In Studio, navigate to **File > Settings**.
      The application settings open.
   b) In the **Logo** field, select **Click to add**.
   c) Upload an icon to use with your reusable actions.
7. Test the reusable action within your flow.
   a) Return to the Expense Approval flow.
   b) Remove the 2.1 Ask for Approval action from the flow. This action will be replaced by the reusable Ask for Manager Approval action.
   c) Set Show draft actions to true.
   d) Add the Ask for Manager Approval action to your flow.
   e) In the right-hand pane, expand the Trigger - Record Created category and drag the [Expenses Record] data pill into the Request [Expenses] field.
8. Click **Save**.
9. Test the flow using a record with an amount below the designated limit.
   
a) From the flow, click **Test**.
   
The Test flow modal appears.

b) In the **Record** field, select a record you created in earlier steps that has value in the **Amount** field under the 100.00 limit. Verify that you have not already run tests using this record.

c) Select **Run Test**.

d) After the flow executes, click **Flow has been executed. To view the flow, click here**.
   The Execution Details open.

Because the amount is less than 100.00, the first condition is met and the request is approved. The Else condition is not evaluated.
10. Test a record with an amount over the designated limit. Verify that you have not already run a test on the test record. Because the amount is over the designated limit, the second condition is evaluated.
11. Approve the request.
   a) Navigate to the test record and change the value of the State field in the Approvers related list to Approved.
   b) Navigate back to the flow execution details and refresh the browser. Because the request is approved, the flow completes.

12. Navigate to the Ask for Manager Approval action and click Publish. Publishing an action enables you to activate any flow that uses it.
13. Navigate to the flow and set Show draft actions to false.
14. Click Activate. Activating a flow sets it to run every time the trigger conditions are met.

The Expense Approval flow runs every time a record is created in the Expenses table. Now that the flow is activated and working as expected, you can publish it to the application repository and deploy it to other instances.

Architecture Overview

Understand how Flow Designer works within the Now Platform to activate, trigger, and process flows and actions.
A flow consists of a *trigger* and one or more actions. The trigger specifies when to start the flow, which can be *record-based*, *schedule-based*, or *application-based*. Record-based triggers run a flow after a record has been created, updated, or deleted. The flow can use the triggering record as input for actions. Schedule-based triggers run a flow at the specified date and time. The flow can use the execution time as input for actions. Application triggers are added when the associated application is activated. For example, the MetricBase trigger is present when the MetricBase application is active.

**Flow processing**

Flow processing occurs in this sequence.

1. When the flow trigger conditions occur or an API directly calls the flow, the system creates an entry in the event queue to start the flow.
2. The scheduler processes the event and starts the flow in the background.
3. The system builds a process plan from the flow.
4. The system runs the process plan using the record that triggered the flow.
5. The system stores the execution details in a context record.

1. **Process flow triggers and API calls**

   Each time trigger conditions are met or an API directly calls a flow, Flow Designer creates an event entry. The system processes triggers after database operations. To learn more, see #unique_817. Typically, *business rules* and *workflows* that run synchronously run before a triggered flow.

2. **Process events in the queue**

   Each flow event contains a reference to the flow to start and a reference to either the triggering record or the execution time. The system processes these events using *Standard event processing* where a scheduler periodically works through the current items in the event queue in the order in which they were added. Depending on what other events are in the queue, the system may not immediately start a flow. Flow designers should expect some lag time between when the trigger conditions occur and when the flow actually starts.
3. Build the process plan

When Flow Designer pulls an event from the queue, it builds a process plan to actually run the flow. A process plan contains all the information necessary to execute a flow such as the sequence of published actions or subflows, the input values for each subflow or action, the action steps to run for each action, and the data provided by the trigger or subflow output.

Flow Designer uses a just-in-time compilation scheme to ensure that process plans contain the latest changes to flows, subflows, and actions. If no changes are detected, Flow Designer uses a cached copy of the process plan. Otherwise, it builds a new process plan.

By automatically checking for updated flows, subflows, and actions with process plans, Flow Designer enables you to apply changes from update sets and upgrades without having to edit current flows. If you move published actions to a target instance, every flow that uses the published action will automatically update the next time it is executed.

**Warning:** If changing subflows or actions used in activated flows, do not change the inputs and outputs used in the subflow or action. Changing inputs and outputs may cause errors when the activated flow is next triggered because it has not been configured to use the new inputs and outputs. Any currently running flows are unaffected by changes to inputs or outputs as the flow uses the compiled subflows and actions from the process plan.

4. Run the process plan

Flow Designer runs the process plan as the System user within the flow application scope.

When running a flow with a record-based trigger, Flow Designer stores the triggering record in memory as an instance that is represented in the interface as a data pill.

The instance contains the record values from when the flow started, which may be different than the current record stored in the database. For example, suppose that creating an incident record triggers a flow. Any changes a user makes to the incident record after the flow has started do not update the triggering record unless an action specifically looks up the current record value.

5. Store flow execution details

Flow Designer stores flow execution details in a flow context record, which contains this information.

- Flow outcome state
- Flow runtime duration
- Flow log messages
- Flow configuration and runtime values

Each time a flow runs, Flow Designer adds an entry to the Flow Executions list. Each entry has its own context record and matching execution details page.

A flow can have one of these outcome states.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td>The flow completed successfully.</td>
</tr>
<tr>
<td>In Progress</td>
<td>The flow is running. By default, a transaction quota rule prevents flows from running longer than an hour.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The flow is waiting for another event to occur. For example, a user must update a task or approval, or a record must reach a specific state. When in the waiting state, the flow is quiesced and serialized into a context record.</td>
</tr>
<tr>
<td>Canceled</td>
<td>The flow was canceled by a user.</td>
</tr>
<tr>
<td>State</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Error</td>
<td>The flow encountered an error and has stopped running. For example, an action is missing an input value, or a quota transaction rule has stopped the flow.</td>
</tr>
</tbody>
</table>

### Flow, subflow, and action life cycle

Flow Designer uses the flow or action status to describe the current state of configuration changes.

#### Flow and subflow status and activation state

The **Status** field indicates whether there is a process plan associated with the flow or subflow.

<table>
<thead>
<tr>
<th>Flow status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>Indicates that there are unsaved changes to a flow or subflow. Modified flows or subflows have not been saved.</td>
</tr>
<tr>
<td>Draft</td>
<td>Indicates that there are saved changes to a flow or subflow, which have not been stored in a process plan. Draft flows have been saved but not activated. Draft subflows have been saved but not published.</td>
</tr>
<tr>
<td>Published</td>
<td>Indicates that there is a stored process plan for the flow or subflow. Published flows have either been activated or deactivated.</td>
</tr>
</tbody>
</table>

The **Active** field indicates whether the system runs a flow or subflow.

<table>
<thead>
<tr>
<th>Active</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>True</td>
<td>Indicates that the flow or subflow is active and runs when triggered or called. The flow has been activated or the subflow has been published. Active flows run when the trigger conditions are met or when called. Active subflows run when called.</td>
</tr>
<tr>
<td>False</td>
<td>Indicates that the flow is inactive and does not run when triggered or called. An inactive flow has either never been activated or has been deactivated. An inactive subflow has never been published.</td>
</tr>
</tbody>
</table>

When working with flows, you can:

- **Save** a flow: Creates a draft of the flow.
- **Activate** a flow: Enables the flow trigger and transform the flow into a process plan.
- **Deactivate** a flow: Disables the flow trigger and prevents new flow executions. Currently running flows continue to run.

When working with subflows, you can:

- **Save** a subflow: Creates a draft of the subflow. If the subflow is modified after being published, the subflow moves into a draft state. Any active flows that use the subflow only run the published subflow.
- **Publish** a subflow: Enables you to activate a flow containing the subflow. Publishing adds the subflow to the list of available subflows in a flow.
**Action status**

The Action Designer interface does not display the configuration status of actions. To view action status, navigate to the Action Types table [sys_hub_action_type_definition] and display the Draft state field.

<table>
<thead>
<tr>
<th>Action Draft status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draft</td>
<td>Indicates that there are changes to an action that have not been published. Draft actions are only available to flows when the Show draft actions option is enabled. You cannot activate a flow containing draft actions.</td>
</tr>
<tr>
<td>Published</td>
<td>Indicates that the action has been published. Published actions are available to all flows and allow flows to be activated.</td>
</tr>
</tbody>
</table>

When working with actions, you can:

- **Save an action**: Creates a draft of the action that is only available to flows when Show draft actions is enabled. If the action is modified after being published, the action moves into a draft state. Any active flows that use the action only run the published action.
- **Publish an action**: Enables you to activate a flow containing the action. Publishing adds the action to the list of available actions in a flow. Only actions in a published state run during flow execution.

**Application development**

When designing an action or a flow, use these design considerations as a guide.

Use standard Now Platform application development capabilities to create, manage, protect, and deploy Flow Designer content. Flow and action designers typically perform these application development tasks.

- Create a custom application to store flows and actions.
- Set application permissions to share or restrict access to application data.
- Grant application developers access to Flow Designer.
- Publish custom applications to the application repository to deploy flows and actions on other instances.
Security

Control access to Flow Designer processes and records.

- Administrators can grant users access to Flow Designer by creating an application and assigning users as developers with the Flow Designer delegated development permission. Delegated development allows administrators to control whether flow designers can access features normally restricted to admin users such as assigning user roles, creating access controls, or creating scripts. See Developer permissions.

- Administrators can also grant access to Flow Designer by directly assigning users the flow_designer user role, which includes the role to view flow execution details.

  **Warning:** Directly granting a user the flow_designer role is equivalent to giving the user the admin role, because Flow Designer can run flows as the System user, which has access to all tables and all database operations.

- Flow and action designers can use standard #unique_822 to manage how their content interacts with other applications.

Action limit

By default, flows can have no more than 50 actions. To change the default behavior, increase the value of the sn_flow_designer.max_actions system property. However, consider the performance impact that a large flow may have on your instance.

Trigger options for record updates

Flow designers can specify how often a flow can update a particular record with the Run Trigger option. Use the Once option when you want a flow to run only once. The first time a record is updated, the flow runs, but any further record updates do not trigger the flow. Use the Always option when you want the flow to run every time a record is updated and there is not already an active flow running for it. For example, you might set a flow that assigns an incident record to run only once, and set a flow that notifies the incident watch list to always run. The Run Trigger field is only available for these trigger types.

- Created or Updated
- Updated

Direct recursion prevention and indirect recursion limit

To prevent instance outages and consumption of system resources, Flow Designer ignores any request to start a flow or subflow that is the result of direct recursion. Direct recursion occurs under these conditions.

- An action calls the same flow that it is part of. For example, a script step makes an API call to a flow.
- An action or subflow produces a result matching the flow trigger. For example, a flow that runs when an incident record is updated contains an update record action that updates an incident record.

Flow Designer also limits the number of times a flow can be started from indirect recursion. Indirect recursion occurs under these conditions.

- The same flow is called multiple times in a chain of subflow calls. For example, if subflow A calls subflow B, and subflow B calls subflow A, then calling either subflow produces indirect recursion.
• The same flow is triggered multiple times in a chain of subflows. For example, suppose that there are two flows triggered by record creation. Suppose that creating record A triggers flow A and also creates record B. Furthermore, creating record B triggers flow B and creates record A. Creating either record type produces indirect recursion.

By default, the system stops triggering flow runs after the run count reaches the indirect recursion limit of three runs. Administrators can change the limit by setting the system property com.glide.hub.flow_engine.indirect_recursion_limit to an integer value equal to or greater than one. The system ignores any property value less than one and instead uses a limit of one. Consider the performance impact that increasing the indirect recursion limit may have on your instance.

Note: By default, a transaction quota rule prevents flows from running longer than an hour.

Flow and action testing

Testing a flow bypasses the trigger conditions and immediately runs it. Testing a flow with a record-based trigger requires selecting a specific record to act as the trigger. Flow designers should generate appropriate sample records prior to testing.

During the design phase, you can test an inactive flow and unpublished actions by setting Show draft actions on the flow. If testing with draft actions, use these guidelines.

• Design flows and actions on a non-production instance. Only deploy active, working flows to your production instance.
• Leave Show draft actions set to true until your draft is in a final state. Once final, publish each action, set Show draft actions to false, and activate the flow.

Warning: Disabling Show draft actions before publishing your actions removes all draft actions from your flow.

• Any change you make to an active flow or published action causes it to return to a draft state. If the flow is triggered, the system only runs the activated flow and published actions, and the flow execution details only display what was run. When there is a draft of an active flow, the trigger and actions listed in the flow execution details may be different than those listed in the draft flow.

Flow Designer data

Each time you add an action to a flow, Flow Designer adds a data pill to store its results. The data pill name indicates its sequence in the flow and its data type.

Flow designers use action result data pills to provide input for other flows, actions, or subflows. Flow designers can use the sequence value in the data pill name to ensure that they select the correct data pill as an input value. When a flow runs an action, it generates the data pill runtime value, which remains the same for the duration of the flow. For example, if a data pill for [Trigger->Incident record] gets populated with incident record values at the start of a flow, the data pill preserves these values for the rest of the flow.

Data pill population

Flow Designer populates data pill values as soon as the data becomes available regardless of where the data pill is located in the flow sequence. For example, suppose that you have a flow triggered by the creation of an incident record with the following actions:

1. Update [Incident] Record that adds a text string to [Trigger->Incident Record->Short description].
2. Log the value of [Trigger->Incident Record->Short description].
3. Log the value of [1->Incident Record->Short description].

Action-1 and Action-2 both use the data pill [Trigger->Incident Record->Short description]. Since the trigger record is available as soon as the flow starts, these values are set before running these actions.

**Delayed data pill population**

When an action, flow logic, or step includes more than one data pill in the same input, the system delays running it until all data pill values have been populated. This delay might produce unexpected values or prevent flow logic from running at all.

For example, this flow produces unexpected values.

1. Update [Incident] Record that adds a text string to [Trigger->Incident Record->Short description].
2. Log the value of [Trigger->Incident Record->Short description].
3. Log the value of [1->Incident Record->Short description].
4. Log the value of [Trigger->Incident Record->Short description] and [1->Incident Record->Short description].

This flow produces the unexpected result of both data pills in Action-4 evaluating to the same value.

**Flow administration modules**

Identify and troubleshoot potential issues by reviewing action and flow executions, their result state, and their run time duration.

Flow Designer provides administrators and flow operators these modules to manage flows.

- **Today's Executions**
  Displays a list of flow context records for flows run today. Use this information to identify flows run today.

- **Active flows**
  Displays a list of flow context records for running flows where the State is Waiting. Use this information to identify flows that are waiting for a trigger or condition to continue.

- **Event Queue**
  Displays a filtered list of event records where the Queue is flow_engine and the State is Ready. Use this information to identify flows that are waiting on event processing.

- **Operations Dashboard**
  Displays a responsive dashboard containing a count of flows run and the average flow runtime. View statistics for today or over the last 30 days. Use this information to determine the health and performance of flow execution.

- **Settings**
  Displays the list of Flow and Action Settings records. Use this table to identify which actions and flows have had reporting disabled. Create records on this table to control whether reporting is done on an action or flow.

- **Properties**
  Displays the system properties used to configure how the system processes flows.
Displays transaction counts between your instance and third-party systems. The Usage Overview is not available in the base system and requires the ServiceNow® IntegrationHub subscription.

Flow Designer landing page
Access or create actions, flows, subflows, or their execution details.

Flows
The Flows screen contains all the flows that your installation of Flow Designer can use. Selecting a flow opens the flow in a new tab. You can see the scope the flow was created in, the internal name of the flow, whether the flow is published or in draft status, whether the flow is active, and update information.

Subflows
The Subflows screen contains all the subflows that your installation of Flow Designer can use. Selecting a subflow opens the subflow in a new tab. You can see the scope the subflow was created in, the internal name of the subflow, whether the subflow is published or in draft status, whether the subflow is active, and update information.

Actions
The Actions screen contains all the actions that your installation of Flow Designer can use. Selecting an action opens the action in a new tab. You can see the scope the action was created in, where the action is accessible from, whether the action is active, and update information.

Executions
The Executions screen shows a history of actions and flows run, including the current state and duration of each run.

Help
The Help landing page contains links to Flow Designer Guided Tour, Documentation, Videos, and Community Discussion.

+ New
You can create a new flow or action by selecting an action from the list.
Flow Designer system properties

Configure how the system processes flows.

These properties are available for Flow Designer.

To set Flow Designer system properties, click Flow Designer > Properties or navigate to the System Properties [sys_properties] table.

**Flows**

Automate processes with a sequence of reusable actions such as manage records, ask for approvals, create tasks, and send notifications. Define trigger conditions to start a flow and variables to pass information between actions.

All flows consist of properties, a trigger, a sequence of actions, and the data collected or created.

**Flow properties**

The flow properties information about the flow.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the flow</td>
</tr>
<tr>
<td>Protection</td>
<td>Choose whether the flow is read only by choosing from None or Read-only</td>
</tr>
<tr>
<td>Application</td>
<td>Select an application for the flow. This property is set when creating the flow and cannot be changed afterwards.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description of the flow.</td>
</tr>
<tr>
<td>Run As</td>
<td>Choose whether the flow runs as System User or the user who initiates the session.</td>
</tr>
</tbody>
</table>

**Triggers**

The trigger specifies the conditions that start the flow. When the trigger condition is true, the system starts the flow.

Flow Designer supports record-based, schedule-based, and application-based trigger types. For detailed descriptions of trigger types, see Flow trigger types.
Actions

Within **Actions**, flow designers can add actions, flow logic, subflows, or other flows.

Each action is a set of reusable business logic that produces a specific outcome when provided with its input values. Flow designers configure actions by specifying where they go in a flow sequence and by selecting the data they use as input values. As a flow runs, actions earlier in the sequence generate outcomes or output values that become available as data to actions later in the flow.

By default, the system provides a collection of core actions that can be added to any flow. Core actions cannot be viewed or edited from the Action Designer interface. Some applications include spokes which add application-specific flows and actions. Spoke actions are typically read-only but can be copied and customized. Developers may also create their custom actions from the Action Designer interface.

Flow data

Flows store any data gathered or generated as variables in the **Data** pane. Each variable has its own pill that Flow designers can use to drag the variable value to an action input or output. Flow Designer generates the pill name based on the contents and its data type. The system specifies the variable data type next to the pill.

Example flow data

Flow logic

Flows may contain *flow logic* to specify conditional or repeated actions. The system provides these flow logic options.

For detailed descriptions of flow logic types, see **Flow logic**.
Testing flows

After adding a trigger and one or more actions, flow designers can test a flow. Testing a flow sets the trigger conditions to true and runs all actions. For flows that have record-based triggers, flow designers may specify an existing test record to use as input. Flow designers should always test flows on non-production instances containing relevant demonstration data since testing a flow creates or changes records on the instance.

Flow execution details

The system generates flow execution records, log messages, and reports for each flow run. The flow context is a related record containing the current state and runtime values of the flow. The system generates a context record each time a flow is run.

Roles

To access Flows, a user must have the flow_designer or admin roles.

Design considerations

Create a subflow when you only want a flow to run from a script

A flow runs whenever its trigger conditions are met. If you want a flow to run only when it is called from a script, create a subflow instead. Since a subflow has no trigger conditions, it will only run when called by another flow or a script call.

Use flow logic or a schedule-based trigger to control flow timing

To pause a flow for a specific duration, use Wait for a duration flow logic. To run a flow at a specific time, use a schedule-based trigger. Avoid using the gs.sleep() method to wait within a flow.

More Actions

Click the More Actions ( ) button to access additional options for the flow.

Stages

Access the stages for a flow.

Manage flow catalog variables

Manage the catalog variables available to Service Catalog-triggered-flows.

Copy flow

Create a copy of the open flow in an application you specify.

Configurations

Enable or disable the Show draft actions, Show triggered flows, and Show store spokes options.

Code Snippet
Generate a code snippet to call a specific flow, subflow, or action.

**Manage security**

Enable or disable the **Callable by Client API** option.

**Flow trigger types**

The trigger specifies the conditions that start the flow. When the trigger condition is true, the system starts the flow.

**Record triggers**

Follow these design considerations when creating record triggers.

**Add conditions to only start record flows when needed**

Use conditions to specify what record values start your flow. Starting a flow only when needed consumes fewer system resources than starting a flow, pausing it, and waiting to resume the flow until a specific record condition applies. Instead of creating a flow that starts with a Wait for condition action, redesign the flow to include the wait condition as part of the record trigger.

**Create unique filter conditions for record triggers on the same table**

To prevent flows from overwriting each other, create unique filter conditions for each flow running on the same table. If multiple flows on the same table have the same filter, there is no way to know the order in which the flows will run.

**Ignore records added or updated by import and update sets**

Record triggers ignore records added or updated by applying an update set or importing an XML file. These operations apply to the entire application or table rather than an individual record.

**Replace record triggers on Service Catalog tables with Service Catalog application triggers**

Flow Designer no longer displays Service Catalog tables as options for record triggers. Instead, create flows that use the Service Catalog application trigger type.

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Starts a flow when a record is created in a specific table.</td>
</tr>
<tr>
<td>Trigger</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Updated</td>
<td>Starts a flow when a record is updated in a specific table. Requires selecting when to run the flow.</td>
</tr>
<tr>
<td></td>
<td>• <strong>For each unique change</strong>: Triggers the flow for every unique change, even if the flow is currently running.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Once</strong>: Triggers the flow once for the life of the record.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Only if not currently running</strong>: Triggers the flow for every unique change if the flow is not currently running. This behavior is the <strong>Always</strong> option in previous releases.</td>
</tr>
</tbody>
</table>

**Note:** Flows that have a record trigger that runs **For each unique change** can produce recursions when run in a non-interactive session. When such flows make a change to the trigger record, the change meets the flow trigger conditions and causes a recursion.

| Created or Updated      | Starts a flow when a record is either created or updated in a specific table. Requires selecting when to run the flow.                                                                                     |
|                        | • **For each unique change**: Triggers the flow for every unique change, even if the flow is currently running.                                                                                             |
|                        | • **Once**: Triggers the flow once for the life of the record.                                                                                                                                              |
|                        | • **Only if not currently running**: Triggers the flow for every unique change if the flow is not currently running. This behavior is the **Always** option in previous releases. |

**Note:** Flows that have a record trigger that runs **For each unique change** can produce recursions when run in a non-interactive session. When such flows make a change to the trigger record, the change meets the flow trigger conditions and causes a recursion.

**Note:** Flows including approval actions should only run the trigger once.

**Scheduled triggers**

Use scheduled triggers to start a flow after a specific date and time or repeatedly at regular intervals.

**Note:** Because flows are processed asynchronously, a flow with a scheduled trigger may not run at the exact time its trigger conditions were met. For example, if a scheduled flow is triggered during...
core business hours, the system may have to process other events in the queue before it can run the scheduled flow.

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Daily</td>
<td>Starts a flow at a specific time every day.</td>
</tr>
<tr>
<td>Weekly</td>
<td>Starts a flow at a specific time every week.</td>
</tr>
<tr>
<td>Monthly</td>
<td>Starts a flow at a specific time every month.</td>
</tr>
<tr>
<td>Run Once</td>
<td>Starts a flow once at a specific time but does not repeat. If you select a past date or time, the system schedules the flow to run as soon as possible.</td>
</tr>
<tr>
<td>Repeat</td>
<td>Starts a flow at regular intervals you define.</td>
</tr>
</tbody>
</table>

Application triggers

Use application triggers to start a flow when application-specific conditions are met.

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MetricBase</td>
<td>Starts a flow when a MetricBase trigger is met. Requires the MetricBase application. For more information, see Create a flow with a MetricBase trigger.</td>
</tr>
<tr>
<td>Service Catalog</td>
<td>Starts a flow from a Service Catalog item request. For more information, see Create a flow with a Service Catalog trigger.</td>
</tr>
</tbody>
</table>

Inbound email triggers

Start a flow when your instance receives an email.

Inbound email flows take priority over inbound email actions. If you create flows with inbound email triggers, emails are first processed by the inbound email triggers before they are processed by inbound email actions.

With inbound email actions, you don't have full control over email attachment handling or assigning the target record of an email. When you create a flow with an inbound email trigger, you can perform these actions with the Move Email Attachments to Record action and the Associate Record to Email action. For greater control over email attachments, you can also use the Look up email attachments action to access a specific attachment as a data pill.

Although you can process an inbound email with multiple inbound email actions, you can't process an inbound email with multiple flows by default. Additional configuration is required. For information on how to stop processing in inbound email actions, see Specifying the inbound email processing order.

For more information on running multiple flows on an inbound email, see Allow multiple triggers to process an inbound email.

The following diagram shows how inbound emails are processed by inbound email triggers. After the email has been classified as a reply, forward, or new email, the system tries to match the email to an active inbound email trigger. If the email meets the conditions of an inbound email trigger, the flow runs. If the flow issues stop processing, the email is finished being processed. If the flow does not issue stop
processing, the system tries again to match the email to an active inbound email trigger. If at any point the email does not match an active inbound email trigger, the system tries to match the email with an active inbound email action instead.

Processing emails with inbound email triggers

**Note:** With other types of flows, you can choose to run as a system user or the user who initiates the session. However, inbound email flows always run as the sender of the inbound email. If the system does not recognize the sender, inbound email flows will run as the Guest user. The actions
of inbound email flows are limited by user ACL restrictions. To test access controls for an inbound email flow, impersonate a typical inbound email user and manually trigger the flow.

Advanced options

Specify the user session requirements needed to start a flow with **Advanced Options**.

When to run the flow

Determine the type of session that can trigger the flow, and whether to run the flow when triggered by certain users.

Interactive session options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>

| Only Run for Non-Interactive Session        | Flow that is only triggered in non-interactive sessions. 
See [Non-interactive sessions](#). |
| Only Run for User Interactive Session       | Flow that is only triggered in interactive sessions.                        |
| Run for Both Interactive and Non-Interactive Sessions | Flow that is triggered in all sessions.                                     |

**Note:** Flows that have a record trigger that runs **For each unique change** can produce recursions when run in a non-interactive session. When such flows make a change to the trigger record, the change meets the flow trigger conditions and causes a recursion.

User options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not run if triggered by the following users</td>
<td>Flow that does not trigger for a selected list of users. Click the Add User icon to add users to the list.</td>
</tr>
<tr>
<td>Only run if triggered by the following users</td>
<td>Flow that triggers only for a selected list of users. Click the Add User icon to add users to the list.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Run for any user</td>
<td>Flow that runs for any user.</td>
</tr>
</tbody>
</table>

**Where to run the flow**

Determine whether to run the flow in the background or in the current session.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run flow in background (default)</td>
<td>Flow that runs asynchronously in the background. Use this option for flows that do not require immediate updates and to allow other system processes to run at the same time.</td>
</tr>
<tr>
<td>Run flow in foreground</td>
<td>Flow that runs synchronously in the current session. Use this option to provide immediate updates to an end user. For example, if a flow opens a task after the previous task closes, use this option to open the next task immediately after a user closes one.</td>
</tr>
</tbody>
</table>

**Note:** Running a flow in foreground may block the current session thread and prevent user input until the flow finishes. Avoid running flows in the foreground when they contain actions that cannot be interrupted, such as actions that run script. Actions or flow logic that pause a flow will not block a session.

**Create a flow**

Automate a process to run one or more actions when a trigger condition occurs.

- Set up an application in Guided Application Creator to store Flow Designer content.
- Role required: flow_designer or admin

Users with flow_designer or admin role should know the application table structure and be aware of any existing business logic associated with the target tables of a flow or subflow. Be sure to disable any conflicting business rules or workflows before creating a flow or subflow.

Creating a custom application to contain your Flow Designer content enables you to deploy the application using the application repository or the ServiceNow Store.

1. Navigate to **Flow Designer > Designer**.
2. Click **New > New Flow**.
3. On the form, fill in the fields.

**Flow Properties form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify your flow. The system computes the internal name of the flow from the name.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope to create your flow in. Global is the default.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of your flow.</td>
</tr>
</tbody>
</table>
4. Click **Submit**.
   The system displays the Flow Designer page.

5. Add a trigger.
   a) From the Trigger list, select the type of trigger.
      For more information on trigger types, see **Flow trigger types**.
      The system displays a set of fields depending on the type of trigger that you’ve selected.
   b) To specify the trigger, fill in the fields.
      For a record-based trigger, for example, fill in the table and conditions.
   c) Click **Done**.

6. To add actions, flows, subflows, or flow logic, click **Select to add an Action, Flow Logic, or Subflow**.
   a) Select an option.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>Select the desired action. Flow Designer includes a set of Actions available to flows and subflows. Alternatively, user with the action_designer role can create additional actions to add to flows. The IntegrationHub and spoke plugins install additional actions. To add draft actions from the More Actions menu, set Show draft actions to true. To view spokes available in the ServiceNow Store, set Show store spokes to true from the More Actions menu.</td>
</tr>
<tr>
<td>Flow Logic</td>
<td>Select an option to specify conditional or repeated operations.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>Subflow</td>
<td>Select a published subflow and define input values. In addition to adding a subflow as a flow action, you can enable the <strong>Show triggered flows</strong> option from the More Actions menu to select an activated flow and define the required inputs. Running a triggered flow ignores its trigger conditions and runs all actions.</td>
</tr>
</tbody>
</table>

To change the order of an action in a flow, drag the handle on the left side of the action to the desired location.

The system displays a set of fields depending on the option selected.

b) To configure the action, flow, or subflow, fill in the fields.

c) Click **Done**.

d) Repeat adding actions until complete.

7. Click **Save**.
Flow Designer saves a draft of the flow, trigger, and actions.

• Test your flow until it is ready to activate.

    **Note:** The system only triggers active flows.

• Transfer your flow to another instance.

    • **Deploy** your flow from the application repository when your application is complete and ready for release.
    • **Transfer** your flow from an update set XML file when you want to test the flow on another instance. When you save a flow, Flow Designer generates a single update set file containing its subflows and actions.

**Activate Flow Designer support for Service Catalog**

To activate this feature, activate the Flow Designer support for the Service Catalog plugin (com.glideapp.servicecatalog.flow_designer). This plugin activates related plugins if they are not already active.

Role required: admin

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.

    You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in **Request a plugin**.
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

    **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise they will receive the following error: **Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>**.

Create a flow with a Service Catalog trigger.
Create a flow with a MetricBase trigger

Start a flow when a MetricBase trigger is met. MetricBase triggers track time series data and can monitor when a threshold is reached, when a trend is detected, or when a system stops reporting data.

Role required: flow_designer or admin

MetricBase triggers are not available on the base system. The MetricBase application requires a separate subscription and must be activated by ServiceNow personnel.

1. Navigate to Flow Designer > Designer.
2. Click + New > New Flow.
3. Define the flow properties.
   For more information, see Create a flow.
4. In the Trigger section, add a trigger and select MetricBase.
5. Complete the trigger fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MetricBase Trigger</td>
<td>Select or create a MetricBase trigger record to start the flow. For types of MetricBase triggers, see MetricBase triggers.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only table that contains the metric.</td>
</tr>
<tr>
<td>Condition</td>
<td>Click Add filters to set field-based conditions that determine when the flow runs.</td>
</tr>
<tr>
<td>Condition Script</td>
<td>Define a script in the Additional MetricBase Trigger Filtering and Moderation table to prevent duplicate metric events from re-triggering a flow. For example, if a metric hovers at a defined trigger threshold, create a script that defines whether to run the flow once when the metric is met, or every time the triggering threshold is exceeded.</td>
</tr>
</tbody>
</table>

6. Add actions, subflows, and flow logic to the flow.
7. Test the flow. Once behaving as desired, activate the flow.
   For more information, see Test a flow and Activate a flow.

The MetricBase application monitors time series data on the Now Platform. When the selected trigger is met, the flow runs.

Create a flow with a Service Catalog trigger

Start a flow when a Service Catalog item is requested to automate the fulfillment process. To activate this feature, activate the Flow Designer support for the Service Catalog plugin (com.glideapp.servicecatalog.flow_designer). This plugin activates related plugins if they are not already active.

- Role required: flow_designer or admin
- Activate the Flow Designer support for the Service Catalog plugin (com.glideapp.servicecatalog.flow_designer).

Unlike a record trigger which runs on all records in a table, the Service Catalog trigger runs on all catalog item requests for a specific item when the catalog item is configured to run a specific flow. For example, you can define a flow that runs every time there is a request for a tablet. The requested item becomes the flow trigger record.

1. If not already created, create the catalog item to associate with the flow.
   a) Navigate to Service Catalog > Catalog Definition > Maintain Items.
      The Catalog Items [sc_cat_item] table opens.
   b) Click New.
c) Complete the fields.
For a detailed description of catalog item fields, see Create or edit a catalog item.

**Note:** If you plan to add stages to your flow, verify that there is not an existing workflow associated with the item that also has stages. Clear the values of the **Workflow** and **Execution Plan** fields to prevent conflicting stages from reporting to the requested item stage field.

2. Create the flow to associate with the catalog item. When triggered, this flow processes the catalog item request.
   a) Navigate to **Flow Designer > Designer**.
   b) Click **+ New > New Flow**.
   c) Define the flow properties.
      For more information, see Create a flow.
   d) In the Trigger section, add a trigger and select **Service Catalog**.
   e) Optional: Create flow-specific catalog variables available only to flow actions. See Create flow Service Catalog variables.
   f) Add actions, subflows, and flow logic to the flow.
      Some actions enable you to manage catalog items. For example, the Create Catalog Task action generates a task for the requested item, and the Get Catalog Variables action enables you to access catalog variables as data pills in the flow. See Create Catalog Task action and Get Catalog Variables action.
   g) Optional: Add stages to the flow to report progress to the requester.
      See Flow Designer stages.
   h) Test the flow. Once behaving as desired, activate the flow.
      For more information, see Test a flow and Activate a flow.

3. Add the flow to the **Flow** field of the catalog item you created.
   a) Navigate to the catalog item.
   b) In the **Flow** field, select the flow you created.

   **Note:** The **Flow** field only displays flows with a Service Catalog trigger.
   c) Click **Update**.

When the catalog item is requested, the associated flow triggers and runs the actions.

**Create flow Service Catalog variables**

Create Service Catalog variables that are only available to a specific Service Catalog-triggered-flow. Flow-specific variables are available to catalog tasks and actions in the flow.

Role required: flow_designer or admin

To activate this feature, activate the Flow Designer support for the Service Catalog plugin (com.glideapp.servicecatalog.flow_designer). This plugin activates related plugins if they are not already active.
Flow Service Catalog variables display in the Catalog Variables field of the Create Catalog Task and Get Catalog Variables actions. They display in the Flow:variablename format and are only available to the flow in which they are defined.

For more information about Service Catalog actions, see Create Catalog Task action and Get Catalog Variables action.

1. Open or create a flow with a Service Catalog trigger.
2. Click and select Manage flow catalog variables. The Flow catalog variables table opens.
3. Click New to add a new variable available to the flow.
4. Complete the form.

Variable form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>The variable type that you want to create.</td>
</tr>
<tr>
<td>Application</td>
<td>Read-only field that indicates which applications can use this variable.</td>
</tr>
<tr>
<td>Catalog item</td>
<td>Catalog item using the variable.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box to make the variable mandatory as part of the ordering process.</td>
</tr>
<tr>
<td>Note:</td>
<td>This behavior is applicable only on page load, and can be changed via client APIs.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to make the variable available for use</td>
</tr>
<tr>
<td>Selection Required</td>
<td>Check box to require users to select the check box variable. For example, use this option to require users to select an I agree check box for an agreement form. If users try to submit the agreement form without selecting the check box, an alert message is displayed to tell users that they must select the check box.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the variable is placed on the page for the catalog item. The variables are organized from top to bottom from least to greatest order value. For example, a variable with an order value of 1 is placed above other variables with higher-order values.</td>
</tr>
<tr>
<td>Global</td>
<td>If selected, the variable is available for all catalog tasks within service catalog workflows or execution plans by default. If deselected, the variable must be associated with individual catalog tasks.</td>
</tr>
<tr>
<td>Map to field</td>
<td>Maps the variable to a specific field on the table for the record producer. This field appears if the variable belongs to a record producer.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Field</td>
<td>Field that the variable maps to. This field appears if the variable belongs to a record producer.</td>
</tr>
<tr>
<td>Record producer table</td>
<td>Table that the record producer creates a record in. This field appears if the variable belongs to a record producer.</td>
</tr>
<tr>
<td>Question</td>
<td>Question to ask users ordering the catalog item.</td>
</tr>
<tr>
<td>Name</td>
<td>A name to identify the question.</td>
</tr>
<tr>
<td>Note: If this field is empty, its value is auto-populated based on the Question field for all variable types except break, container split, and container end.</td>
<td></td>
</tr>
<tr>
<td>Tooltip</td>
<td>Tooltip text to display when users point to the variable. Enter a brief note to describe the purpose of the 'Question'.</td>
</tr>
<tr>
<td>Example text</td>
<td>Hint that is displayed in the question field before a user enters a value.</td>
</tr>
<tr>
<td>Applicable for the following variables:</td>
<td></td>
</tr>
<tr>
<td>• IP Address</td>
<td></td>
</tr>
<tr>
<td>• Email</td>
<td></td>
</tr>
<tr>
<td>• URL</td>
<td></td>
</tr>
<tr>
<td>• Single Line Text</td>
<td></td>
</tr>
<tr>
<td>• Wide Single Line Text</td>
<td></td>
</tr>
<tr>
<td>• Multi Line Text</td>
<td></td>
</tr>
<tr>
<td>• Date</td>
<td></td>
</tr>
<tr>
<td>• Date/Time</td>
<td></td>
</tr>
<tr>
<td>Annotation</td>
<td>If selected, displays the help text and instructions for the variable.</td>
</tr>
<tr>
<td>Note: It is not available for break and check box variables. Help text and instructions are not available for a variable set.</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Always Expanded</td>
<td>If selected, the Help text and Instructions field value are expanded by default when the catalog item page loads. This check box appears only when the Show help check box is selected.</td>
</tr>
<tr>
<td>Help tag</td>
<td>If the Always Expanded check box is deselected, click the value specified in this field to display the Help text and Instructions field values.</td>
</tr>
<tr>
<td>Help text</td>
<td>Help information for a service catalog variable. This field is not applicable for Break, CheckBox, Container End, Container Split, Macro, and UI Page variables.</td>
</tr>
<tr>
<td>Instructions</td>
<td>Information that requires rich text formatting or adding images to support help information. Note: For HTML tables, use sizes that are within the width of the variable.</td>
</tr>
</tbody>
</table>

**Type Specifications** (The fields in this section vary for each variable type)

<p>| Variable Width      | Width for the variable on the catalog item page, to specify what percentage of the screen size that it can span. For details, see Configure a default width for service catalog variables. This field appears for all variable types except for break, container end, container start, container split, container layout, and label variables. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choice direction</td>
<td>The direction in which the choice list is arranged.</td>

</tbody>
</table>
| Reference qual               | Qualifiers to restrict data that is available in the field.  
Supports reference qualifiers and advanced reference qualifiers.  
Returns all matching results (no maximum). |
| Reference qualifier condition| Options to build conditions.  
This field appears for reference variables when Use reference qualifier is set to Simple. |
| Scale max                    | Highest value on the scale of available options for the variable.  
This field appears for numeric scale variables. |
| Scale min                    | Lowest value on the scale of available options for the variable.  
This field appears for numeric scale variables. |
| Unique values only           | Check box to require a unique value for the field.  
When this check box is selected, two records cannot have the same value for that field.  
This field appears for lookup multiple choice, lookup select box, and select box variables. |
| Use confirmation             | Check box to prompt users to reenter data to verify their entries.  
This field appears for masked variables. |
| Use encryption               | Check box to store the answer in encrypted format in the database. If not encrypted, the answer is stored in plain text format. Encryption uses Triple DES with system encryption.  
This field appears for masked variables. |
| Use reference qualifier      | Type of qualifier to use.  
This field appears for reference variables. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Validation Regex</td>
<td>Regular expression that validates the variable value. This field is displayed only for Single Line Text and Wide Single Line Text variable types. To define regular expressions, see #unique_849.</td>
</tr>
</tbody>
</table>
| Note:                | • This field is also applicable in Service Portal.  
• The max_length attribute value is valid even when the validation regex is set.  
• You cannot add a catalog item with regex validation errors to the wishlist. |
| Default Value         | Default value for the variable.                                                                                                                                                                             |
| Variable attributes   | Attributes for this variable.                                                                                                                                                                               |
| Permission            | If no role is specified in this tab for the read, write, or create actions, all users who can access the catalog item can perform these actions irrespective of their role. For example, if no role is specified for the Write roles field, all users who can access the catalog item can edit the variable value in the variable editor.  
A user with a role that does not match any of the following roles cannot set variable values even through scripting.  
These roles are not available for Label, Break, Container Split, Container End, Macro, Macro with Label, and UI Page variables. |
| Read roles            | Roles that can view the variable before or after requesting the catalog item or record producer. Only a user with the roles specified in this field can view the variable.                                           |
| Write roles           | Roles that can edit the variable in the variable editor after requesting the catalog item or record producer. If a user does not have the roles specified in this field, the variable is read-only in the variable editor.         |
| Create roles          | Roles that can create values for the variable before requesting the catalog item or record producer. If a user does not have the specified role, the variable is read-only before requesting the catalog item or record producer. |
| Availability          | If selected, the variable is visible in the item form before ordering the item, in VEditor after ordering the item, and in the cart view of the item.                                                        |
| Visible on Bundles    | If selected, the variable is visible when the item is added to a bundle.                                                                                                                                     |
Field | Description
--- | ---
Visible on Guides | If selected, the variable is visible when it is added to an order guide, or when it is added to a catalog item that is included in the order guide.  
**Note:** If an order guide has too many items and variables, consider clearing this check box on as many items as possible, to improve loading performance on order guides.

Visible on Summaries | If selected, the variable is visible on any variable summarizer of the catalog item.  
In Service Portal, the variable is visible in the RITM ticket page and the Approval page.  
In Now Mobile, the variable is visible in the RITM and the Approval records.

5. Click **Submit**.

Access the variable in the flow by adding a Create Catalog Task or Get Catalog Variables action.

**Create a flow with an inbound email trigger**

Start a flow when your instance receives an email.

Role required: flow_designer or admin

1. Navigate to **Flow Designer > Designer**.
2. Click **+ New > Flow**.
3. Define the flow properties, and then click **Submit**.  
   For more information, see **Create a flow**.
4. In the Trigger section, click the plus icon + to add a trigger.
5. Select **Inbound Email**.
6. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email conditions</td>
<td>Conditions to qualify which emails start your flow. The condition builder uses fields from the Email [sys_email] table. For example, to trigger a flow for an inbound email in which a user replies to a system notification, set the condition to [Receive type] [is] [Reply].</td>
</tr>
<tr>
<td>Reply Record Type</td>
<td>Table that is associated with the target email. For example, to trigger a flow from a reply email that a user sends from an incident record notification, select Incident [incident].</td>
</tr>
</tbody>
</table>

7. Click **Done**.
8. Add actions, subflows, and flow logic to the flow.
9. Optional: Add stages to the flow to report progress to the requester.  
   See **Flow Designer stages**.
10. Test the flow. If the test is successful, activate the flow.
   For more information, see Test a flow and Activate a flow.

When an inbound email meets the conditions that you set, the associated flow triggers and runs the actions.

*Allow multiple triggers to process an inbound email*

Configure Flow Designer to allow an inbound email to be processed by multiple inbound email triggers in a specific order.

Role required: admin

Although you can process an inbound email with multiple inbound email actions, you can’t process an inbound email with multiple flows by default. You can add a system property to let process owners use multiple triggers to process an inbound email.
Warning: Allowing multiple triggers to process an inbound email may increase maintenance and decrease system performance.

1. Add a property with the following settings:
   - Name: glide.hub.flow.inbound_email_trigger.show_advanced
   - Type: true | false
   - Value: true

   After you activate the system property, the Order and Stop processing fields appear on the inbound email trigger, as shown in the following figure.

   ![Inbound Email Trigger Image]

2. Create multiple flows with an inbound email trigger.
   For more information, see Create a flow with an inbound email trigger.
3. Specify the processing order for each of the inbound email flows:
   a) Open each flow and enter a value in the Order field.
      To give the flow higher priority over other flows, enter a lower number.
   b) Enable or disable stop processing for each flow in your sequence.
      To allow an inbound email to be processed by the next flow in your sequence, clear the Stop processing option.
      To end the sequence on a particular flow, leave the option selected in that flow.

Test a flow
Before activating a flow so other users can access it, test to make certain it works the way you expect.
Role required: flow_designer or admin. Save the flow.
1. If necessary, navigate to Flow Designer > Designer, then double click the row for the flow you want to test.
2. Click Test.
   The system displays the Test flow dialog. The contents of the Test flow dialog depend on the type of trigger: Data or Schedule. If the trigger is a Data trigger, the dialog asks for a record to use for the test.
3. If the trigger is a Data trigger, select a record to use for the test.
   When you test a flow, the system does not execute the trigger. In other words, for a trigger that fires when a record is added to a particular data, the test does not create a new record. It behaves as if a record was created. By selecting a record on the Test flow dialog, you are asking the system to act as if that record was just created.

Activate a flow
Activate a flow to make it available to other users.
Role required: flow_designer or admin
When you save a flow, you can test it, but no other users on the instance can see or run it. To make the flow available to other users, activate it.
1. Navigate to Flow Designer > Designer.
2. Double click the row for the flow you want to display it on the flow designer page.
3. Click Activate.

Edit a flow
Edit an existing flow.
Role required: flow_designer or admin
1. If necessary, navigate to Flow Designer > Designer, then double click the row for the flow you want to edit.
   The system displays the flow designer page.
2. Take the appropriate actions to edit the flow.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change the flow name or description</td>
<td>Click Edit Properties, enter the values you want into the appropriate fields, then click Update.</td>
</tr>
</tbody>
</table>

Note: You cannot change the scope of an automationHub flow after you have saved it.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To edit the trigger</td>
<td>Click the trigger description, fill in the fields as desired, then click <strong>Done</strong>.</td>
</tr>
<tr>
<td><strong>Note</strong>: Modifying triggers can result in the deletion of referenced action configurations.</td>
<td></td>
</tr>
<tr>
<td>To edit an existing action</td>
<td>Click the action description, fill in the fields as desired, then click <strong>Done</strong>.</td>
</tr>
<tr>
<td>To add a new action</td>
<td>Click the plus icon in the ACTION section then proceed as you would for adding an action to a new flow.</td>
</tr>
</tbody>
</table>

3. **To save your changes, click** **Save**.

**Delete a flow**

Delete a flow that you no longer need.

Role required: **flow_designer** or **admin**

You can only delete records that are in the same application scope as the current session.

1. If necessary, navigate to **Flow Designer > Designer** to display the flow designer page.
2. Check the selection box for the row corresponding to the flow you want to delete.
3. Click **Actions on selected rows . . .**, then click **Delete**.

**Allow flow designers to dynamically set field values**

Enable flow designers to dynamically set field values when adding the subflow or action to a flow. For example, allow flow designers to set the priority and short description of a Create Task action.

A dynamic field can only be created in a subflow action or action step that creates or updates a record, such as Create Catalog Task, Create Task, Create Record, and Update Record.

Role required: **admin** or **action_designer**

When creating or updating a record in a subflow action or action step, you can set static or dynamic values. A static value is the same every time a flow runs. A dynamic value allows a flow designer to change it every time a flow runs. For example, setting the Urgency to the static value 1 - High generates an urgent catalog task every time the flow runs.

1. Open an action in Action Designer or a subflow in Flow Designer that you want to create a dynamic value for.
2. Create an input.
   a) In the Label field, enter a label to help flow designers understand the purpose of the field. This is the label for the field when the flow designer adds the subflow or action to a flow. For example, enter Select fields.
   b) In the Type field, select Template Value. Select the table containing the record you will create or update. For example, if you are adding a Create Catalog Task action in a subflow, set the Type to Template Value.Requested Item [sc_req_item].

3. Add an action step or action that will use the template value.
   The action step or action must create or update a record. For example, add a Create Task action to a subflow that will create an incident task.

4. Drag the Template Value data pill into the Field Values or Fields field.

5. Optional: Add static values in addition to the dynamic field by selecting + Add Field Value.

   **Note:** Avoid setting static values that you want flow designers to set from the dynamic field. The flow always uses the static value from the subflow or action step over a value entered from a dynamic field. You can use static values to enforce business policies that you do not want flow designers to change.

When the subflow or action is added to a flow, a flow designer can set field values for the record being created or updated.
View activated flows for a table

View flows with record-based triggers that run on a specific table.

Role required: flow_designer or admin

1. Navigate to a table.
2. Right-click the form header and select **Configure > Flow Designer Flows**.

   The Flows table opens and displays all flows that have been activated to run on the specified table.

Actions

Actions can be added to any flow, enabling process analysts to automate Now Platform features without having to write code.

An action is a reusable operation that enables process analysts to automate Now Platform features without having to write code. For example, the **Create Record** action allows process analysts to generate records in a particular table with particular values when certain conditions occur. Core actions like Create Record require some familiarity with Now Platform tables and fields. Action designers can create application-specific actions to pre-set configuration details. For example, creating a Create Incident Task action ensures that the process analyst uses the correct table and field configuration each time the action is used. You can add application-specific actions by activating the associated spoke.

In Flow Designer, a process analyst adds actions to a flow and defines the configuration options.

Core actions

A core action is a ServiceNow-provided action available to any flow that cannot be viewed or edited from the Action Designer design environment. For example, the **Ask for Approval** action is a core action that allows process analysts to use Now Platform approvals. Flow Designer provides a set of core actions to automate Now Platform processes. You can add application-specific core actions by activating the associated spoke.

Custom actions

Using a core action enables the process analyst to configure the desired behavior within the flow. To create an action with a pre-set configuration, or to define custom configuration options, a subject matter expert can create a custom action in Action Designer.
**Action limit**

By default, flows can have no more than 50 actions. To change the default behavior, increase the value of the `sn_flow_designer.max_actions` system property. However, consider the performance impact that a large flow may have on your instance.

**Add Worknote Link to Context action**

Add a journal field entry containing a link to the current flow context record. Use the link to view the flow execution details of the current flow. You can add a flow context link to any record that has a journal field.

**Roles and availability**

- Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Set to the table name associated with the record. For example, the Task table.</td>
</tr>
<tr>
<td>Record</td>
<td>The record to be updated. Drag-and-drop a record data pill or use the data pill picker to select a record. For example, the trigger record.</td>
</tr>
<tr>
<td>Journal Field</td>
<td>The journal field to insert the link to the flow context record. For example the work notes field of a task record.</td>
</tr>
<tr>
<td>Additional Comments</td>
<td>The text you want to add to the journal field in addition to the link to the flow context record. For example, the name of the flow run.</td>
</tr>
</tbody>
</table>

**Ask for Approval action**

Request approval for a record with an approval field. You can configure a rule set for an approval, rejection, or cancellation. If a due date is added to an approval, the approval is automatically approved, rejected, or canceled if the approvers have not responded by the designated time.

**Approvals** is a platform feature that enables users or groups to approve or reject a task.

**Roles and availability**

- Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Select a record under the data panel and drag the record pill into the Record field. If selecting a table with an approval field already configured, the Approval field is set to the correct field.</td>
</tr>
<tr>
<td>Table</td>
<td>Set to the table name associated with the record.</td>
</tr>
<tr>
<td>Approval field</td>
<td>Select a field from the designated table to use for approval.</td>
</tr>
<tr>
<td>Journal field</td>
<td>Select a field from the designated table to use for journal.</td>
</tr>
</tbody>
</table>
| Rules         | Define the approval and rejection rules. Approval rules determine which users can approve or reject requests, and what happens after approval or rejection. Approval or rejection rules include:  
  - Anyone approves  
  - All users approve  
  - All responded and anyone approves  
  - % of users approve  
  - # of users approve  
  In the field beside the approval rule, add the desired approvers. To add approvers:  
    - Select individual users or groups.  
    - Drag-and-drop or select a field from a record.  
    - ![Select](select_icon.png) to allow a manual approver to process an approval or rejection. A manual approver is a user manually added to the Approvers related list who can then approve the request. For example, you can manually add a subject matter expert to a task to approve the request. To learn more about adding manual approvers, see Generate approvals using the approvers related list.  
  Define rejection rules by adding another OR rule set. When defining approvals, include rejection rules that run when there are no matching approvals. Such rejection rules prevent the flow from remaining in a waiting state. For example, if an approval can be approved by anyone, create a time-based rejection rule in case no one approves it.  
  **Note:** If you set an approval rule with no rejection rule (or vice versa) and the expected approval state is not met, the runtime value will be canceled.  
| Due Date      | Define a due date to ensure that the flow does not remain in a waiting state if the request is not approved or denied.  
  - None: The approval is not dependent on a specific date.  
  - Approve: Automatically approve the step if an action is still pending by the specified date.  
  - Reject: Automatically reject the step if an action is still pending by the specified date.  
  - Cancel: Automatically cancel the step if an action is still pending by the specified date. |
Example

TRIGGER

[Incident] Created or Updated

ACTION

1  Ask For Approval

- **Action**: Ask For Approval
- **Record**: Trigger ▶ Incident Record
- **Table**: Incident [incident]
- **Approval Field**: Approval
- **Journal Field**: Approval history

**Rules**

- **Approve**: When: Anyone approves
  - Trigger ▶ Incident Record ▶ Assigned to ▶ Manager

OR

- **Reject**: When: Anyone rejects
  - Trigger ▶ Incident Record ▶ Assigned to ▶ Manager

- **Due Date**: Approve ▼ if pending by Relative date ▼ 1 Days ▼ From

  - Days schedule: 8-5 weekdays
Output

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval State</td>
<td>State of the approval request</td>
<td>Choice</td>
</tr>
</tbody>
</table>

**Associate Record to Email action**

Associate a record with an Email [sys_email] record so that you can track which record is affected by the email.

**Roles and availability**

- Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Record</td>
<td>Email [sys_email] record that the Target Record associates with.</td>
</tr>
<tr>
<td>Target Record</td>
<td>Record to associate to the email record</td>
</tr>
</tbody>
</table>

**Output**

- This action updates the **Target** field on the Email [sys_email] record.

**Example**

In the following example, a process owner adds the Associate Record to Email action under an inbound email trigger. The user has also added a Create Catalog Task action in the flow. In the **Email Record** field, the user selects to associate a record to the email that triggered the flow. In the **Target Record** field, the user selects to associate the Catalog Task [sc_task] record that is created in the Create Catalog Task action.
Create Catalog Task action

Creates a record in the Catalog Task [sc_task] table associated to a requested item in the Requested Items [sc_req_item] table. Adds the catalog task record as data to be used in the flow.

Roles and availability

- Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.
### Fields

<table>
<thead>
<tr>
<th>Fields [Catalog Task]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Name</td>
<td>The Catalog Task [sc_task] table where the catalog task is created. This value is read only.</td>
</tr>
<tr>
<td>Requested Item [Requested Item]</td>
<td>The requested item record from the Requested Items [sc_req_item] table that this catalog task fulfills.</td>
</tr>
<tr>
<td>Short Description</td>
<td>Short description for the catalog task.</td>
</tr>
<tr>
<td>Fields [Catalog Task]</td>
<td>To add the action to a flow, set fields in the catalog task record to the desired value. For example, to set the Urgency, select <strong>Urgency</strong> and set the desired value.</td>
</tr>
<tr>
<td></td>
<td>If adding the action to a subflow, you can allow flow designers to dynamically set field values.</td>
</tr>
<tr>
<td>Wait</td>
<td>Pauses the flow until this task completes and is no longer active (active=false). Alternatively, you can add a wait condition by dragging-and-dropping a true/false field from the data panel into the <strong>Wait</strong> field. The flow only waits for the task to complete when this field is true.</td>
</tr>
<tr>
<td>Template Catalog Item [Catalog Item]</td>
<td>Select an item from the Catalog Items [sc_cat_item] table to populate the Catalog Variables slushbucket with the associated variables.</td>
</tr>
<tr>
<td>Catalog Variables</td>
<td>Select catalog variables to show on the catalog task form to provide more information or allow the fulfiller to modify the variables. You can define flow-specific variables that are displayed in the Available list. To define flow-specific variables, see Create flow Service Catalog variables.</td>
</tr>
</tbody>
</table>
Example

TRIGGER

Create Catalog Task

Action: Create Catalog Task

Table Name: Catalog Task [sc_task]

Requested Item [Requested Item]: Trigger + Requested Item Record

Short Description: Order from vendor or move from in-stock inventory

Fields [Catalog Task]: Add Field Value

Wait

Template Catalog Item [Catalog Item]: Apple iPhone 5

Catalog Variables

Available

Selected

data_plan

color

storage
carrier
duration

Delete  Cancel  Done
Create Record action

Creates a record on any table. You can dynamically add and configure fields for the record.

Roles and availability

- Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
</tbody>
</table>
| Field Values | Set the values of fields in the record to be created. For example, to set the short description to a certain value, select **Short description** and set the desired value.  
If adding the action to a subflow, you can **Allow flow designers to dynamically set field values.** |

Create or Update Record action

Create or update a record in a ServiceNow table using a single action. Update a record that exists, or create a record using the values provided.

Identification of existing records

The Create or Update Record action identifies existing records by searching for matching values in the fields that you select as unique identifiers. For example, you can specify that the short description and priority fields uniquely identify an incident. When the action finds an incident with a matching short description and priority, it updates the matching record rather than creating a new record.

Note:

- If no field is selected as a unique identifier, the action creates a record with the field values provided.
- If more than one record matches the value of the unique identifiers, the action doesn't update any records and displays an error message in the flow execution details.

Roles and availability

- Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Name</td>
<td>Table in which a record is created or updated.</td>
</tr>
<tr>
<td>Fields</td>
<td>Values of fields in the record to be created or updated. If adding the action to a subflow, you can <strong>Allow flow designers to dynamically set field values</strong>. Dynamically set field values can trigger server-side validation rules such as data policies, business rules, and dictionary-defined mandatory fields, but cannot trigger UI policies.</td>
</tr>
<tr>
<td>Determines uniqueness</td>
<td>Option for selecting the field as a unique identifier. This field appears when the required table name and fields are selected.</td>
</tr>
</tbody>
</table>

### Create Task action

Create a task on any ServiceNow task table. After you choose the task table, you can dynamically select the fields to configure the action. Defining the Parent field associates the task to a parent record.

### Roles and availability

- Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.

## Field Values

Set the values of fields in the task to be created. For example, to set the short description to a certain value, select **Short description** and set the desired value. To associate the task with a parent record, define the **Parent** field.

If adding the action to a subflow, you can **Allow flow designers to dynamically set field values**.
### Copy Attachment action

Copies an attachment from the Attachments [sys_attachment] table to a target record.

#### Roles and availability

- Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.

#### Note:

Server-side validation rules, such as data policies, business rules, and dictionary-defined mandatory fields are enforced. UI policies do not apply.

#### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Attachment Record</td>
<td>Select an attachment record from the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>Target Record</td>
<td>Select a record to attach the Source Attachment Record to, or drag a Record data pill from the data pane.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table from the list to select a Target Record.</td>
</tr>
</tbody>
</table>

### Delete Attachment action

Removes one or all attachments associated with a record and deletes the attachment record from the Attachments [sys_attachment] table.

#### Roles and availability

- Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.

#### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Record</td>
<td>Drag a Record data pill from the data pane to delete one or all attachment records from.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Table</td>
<td>Automatically populates with the <strong>Source Record</strong> table.</td>
</tr>
<tr>
<td>Attachment File Name</td>
<td>Enter the name of the attachment file to delete a single attachment associated with the selected record.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If a record has multiple attachments with same name, all matching attachments are deleted.</td>
</tr>
<tr>
<td>Delete All Attachments?</td>
<td>Select to delete all attachments associated with the selected record.</td>
</tr>
</tbody>
</table>

**Delete Record action**

Deletes a record on any table.

**Roles and availability**

- Available as a Flow Designer core action. Users with the `flow_designer` role can add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be deleted. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
</tbody>
</table>

**Get Attachments on Record action**

Access the list and count of the attachments associated with the provided source record as data pills in a flow. Use flow logic or scripting to process each attachment in the list of the attachments that the action returns.

**Roles and availability**

Available as a Flow Designer core action. Users with the `flow_designer` role can add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Name</td>
<td>Entire file name or part of the file name.</td>
</tr>
<tr>
<td>Source Record</td>
<td>Record as a data pill from the data pane or the record that the attachment is associated with.</td>
</tr>
</tbody>
</table>
Get Catalog Variables action

Access ServiceNow® Service Catalog variables as data pills in a flow.

Roles and availability

Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Submitted Request</td>
<td>Submitted request from any ServiceNow table.</td>
</tr>
<tr>
<td>[Requested Item]</td>
<td></td>
</tr>
<tr>
<td>Template Catalog Item</td>
<td>Item from the Catalog Items [sc_cat_item] table to populate the Catalog</td>
</tr>
<tr>
<td>[Catalog Item]</td>
<td>Variables list with the associated variables.</td>
</tr>
<tr>
<td>Catalog Variables</td>
<td>Catalog variables to be displayed in the data panel. Select variables or</td>
</tr>
<tr>
<td></td>
<td>single-row variable sets.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For optimal performance, avoid selecting Masked variables.</td>
</tr>
<tr>
<td></td>
<td>You can define flow-specific variables that are displayed in the Available</td>
</tr>
<tr>
<td></td>
<td>list. To define flow-specific variables, see Create flow Service Catalog</td>
</tr>
<tr>
<td></td>
<td>variables.</td>
</tr>
</tbody>
</table>

Get Email Header action

Access an email header value as a data pill in a flow.

Roles and availability

- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Record</td>
<td>Record from the Email [sys_email] table.</td>
</tr>
<tr>
<td>Target Header</td>
<td>Header from the email record. Upon completion of the action, the header</td>
</tr>
<tr>
<td></td>
<td>value is added as a data pill in the flow.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If multiple headers have the same name, the action gets the</td>
</tr>
<tr>
<td></td>
<td>value of the first header that appears.</td>
</tr>
</tbody>
</table>
Example

In the following example, a process owner adds the Get Email Header action under an inbound email trigger. In the **Email Record** field, the user selects to get an email header from the email that triggered the flow. In the **Target Header** field, the user selects to get the Subject header from the email.

Log action

Logs a message in the Flow Designer log table.

Roles and availability

- Available as a Flow Designer core action. Users with the `flow_designer` role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log level</td>
<td>Level of importance of the log message.</td>
</tr>
<tr>
<td></td>
<td>• Error</td>
</tr>
<tr>
<td></td>
<td>• Warn</td>
</tr>
<tr>
<td></td>
<td>• Info</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Log message</td>
<td>Message to display in the log. Enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>

**Look up email attachments action**

Look up files that are attached to an email so that you can perform an action on the files.

**Roles and availability**

- Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email record [Email]</td>
<td>Record from the Email [sys_email] table. For example, select the email record from the flow trigger. After you select an email record, the related Email Attachment [sys_email_attachment] record and its fields become available as data pills.</td>
</tr>
</tbody>
</table>

**Output**

- This action generates a list of Email Attachment [sys_email_attachment] records, which list the attachments that are associated with a given email record. To perform an action on an attachment, add flow logic that runs for each Attachment pill under the Email Attachment Record pill. For more information, see For each flow logic.

**Example**

In the following example, a process owner adds the Look up email attachments action under an inbound email trigger. In the Email record [Email] field, the user selects to look up files that are attached to the email that triggered the flow.
Look Up Record action

Look up a record from any table based on defined conditions.

Roles and availability

- Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions to be met by the returned record.</td>
</tr>
<tr>
<td></td>
<td>When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format <code>[reference field][is][Reference type data pill-&gt;Sys ID]</code>. For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition <code>[Requested by][is][Trigger-&gt;incident record-&gt;Caller-&gt;Sys ID]</code>.</td>
</tr>
<tr>
<td>Order by</td>
<td>Determines how to sort results when more than one record matches the defined conditions. Select the field you want to use to sort results.</td>
</tr>
<tr>
<td>Sort Type</td>
<td>Select whether to sort alphabetically in ascending or descending order.</td>
</tr>
</tbody>
</table>
**Field** | **Description**
---|---
If multiple records are found | Determines what is returned if more than one record matches the defined conditions.
  - Return only the first record
  - Fail the step

**Example**

**TRIGGER**

**Incident Created or Updated**

**ACTIONS**

1. **Look Up Incident Record**

  **Action** | Look Up Record
  **Table** | Incident [incident]

  **Conditions**

  All of these conditions must be met

  - Active
  - State
  - Short description

  or

  **New Criteria**

  **Order by** | Short description

  **If multiple records are found action** | Return only the first record

**Look Up Records action**

Look up multiple records on any table using defined conditions.
Roles and availability

- Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions to be met by the returned records. When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format <code>[reference field][is][Reference type data pill-&gt;Sys ID]</code>. For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition <code>[Requested by][is][Trigger-&gt;incident record-&gt;Caller-&gt;Sys ID]</code>.</td>
</tr>
<tr>
<td>Order by</td>
<td>Select the field you want to use to sort results.</td>
</tr>
<tr>
<td>Sort Type</td>
<td>Select whether to sort alphabetically in ascending or descending order.</td>
</tr>
<tr>
<td>Max Results</td>
<td>Maximum number of results returned.</td>
</tr>
</tbody>
</table>
Example

Lookup Attachment action

Looks up an attachment associated with a record and returns the Attachment Sys ID as a data pill.

Roles and availability

- Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.

Note: Server-side validation rules, such as data policies, business rules, and dictionary-defined mandatory fields are enforced. UI policies do not apply.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Name</td>
<td>Enter the name of the attachment to look up. If the record includes multiple attachments with the same file name, the system returns the first Sys ID encountered.</td>
</tr>
<tr>
<td>Source Record</td>
<td>Drag a Record data pill from the data pane, or select the record that the attachment is associated with.</td>
</tr>
</tbody>
</table>

Move Attachment action

Associates a record from the Attachment [sys_attachment] table with a target record. Removes the attachment from any other associated records.

Roles and availability

- Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.

Note: Server-side validation rules, such as data policies, business rules, and dictionary-defined mandatory fields are enforced. UI policies do not apply.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Attachment Record [Attachment]</td>
<td>Select an attachment record from the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>Target Record</td>
<td>Drag a Record data pill from the data pane to attach the <strong>Source Attachment Record</strong> to.</td>
</tr>
<tr>
<td>Table</td>
<td>Automatically populates with the <strong>Source Record</strong> table.</td>
</tr>
</tbody>
</table>

Move Email Attachments to Record action

Move attachments from an email to a record so that the files are available to your users when they view the record.

Roles and availability

- Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Record</td>
<td>Email [sys_email] record to move attachments from.</td>
</tr>
<tr>
<td>Target Record</td>
<td>Record to move attachments to.</td>
</tr>
</tbody>
</table>

Output

- This action updates the Email Attachment [sys_email_attachment] record. The Action field changes to Attached to Target Record.

Example

In the following example, a process owner adds the Move Email Attachments to Record action under an inbound email trigger. The user has also added the Create Catalog Task action in the flow. In the Email Record field, the user selects to move attachments from the email that triggered the flow. In the Target Record field, the user selects to move email attachments to the Catalog Task [sc_task] record that is created in the Create Catalog Task action.

![Diagram of process flow](attachment:process_flow_diagram.png)
Send Email action

Send an email to specified users or groups as an action in a flow.

Roles and availability

- Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Record</td>
<td>Record that the email is associated to. When a user sends a reply to your email, the target record is updated with the reply email content.</td>
</tr>
<tr>
<td>Table</td>
<td>Table of the target record.</td>
</tr>
<tr>
<td>Include Watermark</td>
<td>Option to apply a watermark to the email that is sent. To include a watermark, you must set a target record.</td>
</tr>
<tr>
<td>To</td>
<td>The main recipients of the email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field, such as a User record. For example, if your action involves an incident record and you want to send an email to the group assigned to the incident, drag the [Assignment group] data pill from the data panel.</td>
</tr>
<tr>
<td>CC</td>
<td>Additional recipients copied on this email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>BCC</td>
<td>Additional recipients of this email, who are visible only to the sender (blind copied). Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>Subject</td>
<td>Subject of the email. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
<tr>
<td>Body</td>
<td>The content of the message body. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>

Note: Flow Designer does not support the ${URI} parameter for creating a link to a record in the email message body. Instead, consider inserting the information from the record in the email body using data pills, or create a notification step.

Testing the email action

To verify that the email was generated when testing the action, review the email record in the Email [sys_email] table. The Headers field indicates whether the email was successfully generated. For example:
ACL restrictions apply to the Send Email action. If you configured your flow to run as the user who initiates the session, ensure that the user has access control to send email. To test access controls for a Send Email action, impersonate a typical email sender and manually trigger the flow.

**Update Record action**

Update an existing record in a table. You can dynamically add and configure fields for the record.

**Roles and availability**

- Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be updated. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set the values of fields in the record to be updated. For example, to set the short description to a certain value, select <strong>Short description</strong> and set the desired value. If adding the action to a subflow, you can <strong>Allow flow designers to dynamically set field values</strong>.</td>
</tr>
</tbody>
</table>

**Wait For Condition action**

Pause a flow until record values match a specific set of conditions.

**Roles and availability**

- Available as a Flow Designer core action. Users with the flow_designer role can add an action to a flow and define configuration details.
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Drag-and-drop an input record or a record from a previous step.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If this record is deleted while the flow is waiting, the flow stops waiting and continues running.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Select the record values necessary to resume running the flow. For example, if the condition is [State][is][Closed], the flow pauses until the condition is met. Once met, the flow moves on to the next step or action.</td>
</tr>
</tbody>
</table>

### Unsupported tables

The system does not support Wait for Condition for the following tables.

<table>
<thead>
<tr>
<th>Table Category</th>
<th>Table Names</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audit</td>
<td>Sys Audit [sys_audit], Audit Deleted Record [sys_audit_delete], Audit Relationship Change [sys_audit_relation], Audit Roles [sys_audit_role], Audit Relationship Change [sys_audit_relation], Audit Deleted Record [sys_audit_delete]</td>
</tr>
<tr>
<td>Email</td>
<td>Email [sys_email], Email Account [sys_email_account], Email Log [sys_email_log]</td>
</tr>
<tr>

<tr>
<td>Workflow</td>
<td>Workflow Execution [wf_workflow_execution], Workflow History [wf_history], Workflow Executing Activity [wf_executing], Workflow Queued Command [wf_command], Workflow Context [wf_context], Workflow Transition History [wf_transition_history]</td>
</tr>
</tbody>
</table>
**Condition Evaluation**

The condition in a Wait for Condition action is evaluated only when the record in the **Record** field is updated. Conditions must be set to be met upon a change to a record rather than a relative time period. For conditions that depend on a specific duration, consider using **Wait for a duration flow logic**.

In this example, the wait condition is valid because it is when the **Record** field is updated and the state is **Closed**.
In this example, the wait condition is invalid because it is a time relative to the **Created** date. Actions that have a condition that relies on a time interval will not be met, so the action is never performed.
Invalid wait condition

Output

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
</table>
| State | The completion status of the action as a numeric value.  
  • 0 (success)  
  • 1 (error) | Choice |
Design considerations

Follow these design considerations when creating flows that wait for a condition.

Use record triggers instead of wait conditions to start flows

If you only want a flow to run when certain record conditions are met, create a flow with a record trigger instead of starting and pausing a flow. A waiting flow consumes more system resources than a flow trigger.

Cancel flows whose resume conditions can never occur

Prevent your flows from waiting indefinitely by specifying flow stop conditions with End flow logic. To free up system resources, you can also cancel any flow whose resume conditions can never be met. For example, cancel flows waiting for incident record updates where the related incident is closed.

Flow Designer stages

Communicate the current stage of a request or flow with an end user.

When configuring stages in Flow Designer, you can:

• Create any number of stages.
• Change stage labels and names.
• Set the estimated duration for a stage.
• Import a copy of a pre-defined stage set from the Stage Sets table. To learn more about stage sets, see Workflow stage sets. Any changes made to the copy do not affect the original stage set record.

While stages can be added to a flow with a scheduled trigger, the stages are never displayed to an end user because there is no associated record for the stage field. Only use stages in flows with record and Service Catalog triggers. Stages are not supported on subflows.

View the stages of a flow in the flow execution details.

Displaying stages in a stage field

A stage field is a field of type Workflow that displays the stages of a flow to a user. For example, the Service Catalog uses a Stage field to indicate progress of a request as it is processed by an associated flow or workflow.

Stage fields display:

• Stages from flows with record or Service Catalog triggers.
• Stages from the associated flow. If the associated flow calls another flow, stages set on the child flow do not display.
• Stages from flows that have started.
State icons in stage fields cannot be modified. Limit the number of stages and the length of each stage name to represent each stage in a stage field without causing text and icons to wrap onto multiple lines.

**Note:** Only add one stage field per table. If there is more than one stage field, the system only displays stages from the first stage field defined in the table dictionary entry.

### Stage field and trigger types

Associating a flow to a stage field depends on the flow trigger type.

<table>
<thead>
<tr>
<th>Flow trigger type</th>
<th>Requirements</th>
</tr>
</thead>
</table>
| Record              | For a stage field to report stages on a record-based flow, a stage field must be present on the same table as the triggering record. When a flow has stages, Flow Designer communicates the status of each stage back to the triggering table and displays the current stage state as an icon. If more than one stage field exists on the table, only the first stage field defined in the table's dictionary definition is used.  

**Note:** Avoid creating stages for multiple flows that trigger from the same table. A stage field only displays the stages of the final flow to run. Add different conditions to each flow to ensure that the stages of one flow do not overwrite another flow. |
| Service Catalog     | If using the Service Catalog trigger, the flow must be associated with the Service Catalog item through the **Flow** field. Remove any workflows associated with the item by clearing the **Workflow** and **Execution Plan** fields. The **Stage** field displays the current stage state on any list view of the Requested Items [sc_req_item] table. |
Stage states

During flow execution, each stage can be in one of five states.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pending</td>
<td>This stage has not yet started.</td>
</tr>
<tr>
<td>In progress</td>
<td>This stage is executing.</td>
</tr>
<tr>
<td>Skipped</td>
<td>This stage was skipped and did not run. Typically, this state is reached when a conditional flow logic block is not executed.</td>
</tr>
<tr>
<td>Complete</td>
<td>This stage is complete.</td>
</tr>
<tr>
<td>Error</td>
<td>This stage has reached an error condition.</td>
</tr>
</tbody>
</table>

When designing a flow, you can manually set the flow to report an Error state. To set an Error state:

- The flow must have at least one stage defined.
- The Error can only be set within a stage. When an Error condition is reached, the current stage is set to Error.
- The Error can only be set within a conditional flow logic block.

While setting the Error state does not affect flow execution, it communicates to the user that the state of the current stage is Error. For example, if an approval is not approved within the required limit you may want to communicate an error to the user.

Each stage can have its own custom state labels. For example, suppose that you have a flow with two stages. Stage 1 could have the Pending state with the label Waiting, and Stage 2 could have a Pending state with a label of Not yet started. Flow Designer provides options to generate either the default states or approval states.

Design considerations

Follow these design considerations when creating flows with stages.

Avoid defining stages that depend upon changes within a For Each flow logic block

Flow Designer prevents you from adding stages within a For Each block. You can only add stages before or after a For Each block.

Avoid having multiple flows with stages on the same table

A stage field always displays the stage information provided by the last flow to run on a table or record. If multiple flows run on the same records, then the stages defined in one flow can in theory overwrite the stages from another flow. To avoid multiple flows overwriting each other's stages, define unique trigger conditions for each flow.

Ensure multiple flows on the same table have unique trigger conditions

Adding unique trigger conditions to each flow ensures the flows only run under those conditions and prevents the stages from one flow overwriting the stages of another flow. Specifying unique trigger conditions makes it easier to troubleshoot flows by limiting the number of flow executions that can produce record changes.

Use error stages to communicate with the user
The flow error state does not affect flow execution. A flow will continue running even if it reaches an error stage. Use a conditional flow logic block to set the error stage and communicate to the user that the state of the current stage is Error. For example, if an approval is not approved within the required limit, you may want to communicate an error to the user.

**Use the error stage to stop processing a flow**

Use a conditional flow logic block to identify when the stage is error and stop processing the flow or take some kind of remediation action. For example, you may want to change a record state or assignment when a flow reaches an error state.

**Configure stages and add them to a flow**

Configure when stages display to a user, define stage state labels, and add stages to a flow within Flow Designer.

While stages can be added to a flow with a scheduled trigger, the stages are never displayed to an end user because there is no associated record for the stage field. Only use stages in flows with record and Service Catalog triggers.

**Role required:** flow_designer or admin

1. Optional: If not already present, create a stage field on the table that triggers the flow. A stage field is a field of type Workflow that displays the stages of a flow to a user. The Service Catalog Requested Items [sc_req_item] table has a stage field by default.

   For a stage field to report stages on a record-based flow, a stage field must be present on the same table as the triggering record.

   To add a field to a table, see Add and customize a field in a table.

2. Optional: If adding stages to a flow with a Service Catalog trigger, select the flow in the **Flow** field of the Service Catalog Item [sc_cat_item] table.

   If using the Service Catalog trigger, the flow must be associated with the Service Catalog item through the **Flow** field. Remove any workflows associated with the item by clearing the **Workflow** and **Execution Plan** fields. This enables a request for a catalog item to initiate a flow specific to that catalog item.

3. Open the flow in Flow Designer.

4. Optional: Create and configure stages in the More Actions menu. Alternatively, you can create stages within the flow itself.

   a) Click ![More Actions](image) and select **Stages**.

   The Flow Stages / State menu opens.

   b) Click **New Stage** to add a new stage and configure the stage options.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Display name for the stage. Must be unique.</td>
</tr>
<tr>
<td>Value</td>
<td>Internal name for the stage. Must be unique.</td>
</tr>
<tr>
<td>Duration</td>
<td>Estimated duration displayed to the user.</td>
</tr>
<tr>
<td>Always Show</td>
<td>If selected, the stage always displays in the stage field, even if the stage is set within a flow logic block that might not execute.</td>
</tr>
</tbody>
</table>

   c) Optional: Select a stage set to import from the Stage Sets table.

   To learn more about stage sets, see Workflow stage sets. Any changes made to the copy do not affect the original stage set record.
5. Point to a location in the flow and click **Add a Stage**. Select a stage or click + to add a new stage inline.

Stages can be applied at the beginning of any Flow Designer action or flow logic block, or within an If block. Stages are not supported within a For Each flow logic block.

**TRIGGER**

[Service Catalog]

**ACTIONS**

1. **Get Catalog Variables from Apple iPhone 6s**

**Note:** The stage field displays stages in the order they are defined in the flow.

**Important:** Stages are unavailable from within a **For Each** flow logic block. You can only add stages before and after a **For Each** flow logic block.
6. Optional: Set a stage to the Error state within a conditional flow logic block.
   a) Point to a location and select **Set "Error" State**.

   To set a stage to the Error stage:
   - The flow must have at least one stage defined.
   - The Error can only be set within a stage. When an Error condition is reached, the current stage is set to Error.
   - The Error can only be set within a conditional flow logic block.

   ![Flow Diagram](image)

   When the flow reaches the indicated point, the currently executing stage is set to Error in the stage field.

   In a flow with a record-based trigger, Flow Designer communicates the status of each stage back to the triggering table and displays the current stage state as an icon. In a flow with a Service Catalog trigger, the **Stage** field displays the current stage state on any list view of the Requested Items [sc_req_item] table.

**Flow execution details**

View runtime information about an action or flow directly from the design environment such as the current state, actions or steps run, and values produced. Open related records from embedded Now Platform editors or in a new tab.

Each time a flow or action runs, the system stores information about the configuration and runtime values produced, which process analysts can view from the Flow Designer design environment **Flow Executions** tab. Select a flow execution to open its associated execution details page.

**Note:** To avoid performance issues, turn off reporting during production with the `com.snc.process_flow.reporting.level` system property. For more information, see Flow Designer system properties.
Sample execution details of the VTB Sample Flow

Each execution details page displays:
• Calling source
• Flow state
• Related record options
• Flow Statistics

Calling source

The calling source lists what started a flow or subflow.

<table>
<thead>
<tr>
<th>Source</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flow Designer Test</td>
<td>The flow started because a user selected the <strong>Test</strong> option from the Flow Designer interface. The flow trigger conditions were ignored.</td>
</tr>
<tr>
<td>CRUD Trigger</td>
<td>The flow started when the record-based trigger conditions were met.</td>
</tr>
<tr>
<td>Scheduled Trigger</td>
<td>The flow started when the schedule-based trigger conditions were met.</td>
</tr>
<tr>
<td>Metric Trigger</td>
<td>The flow started when the MetricBase trigger conditions of a <strong>MetricBase</strong> were met.</td>
</tr>
<tr>
<td>Service Catalog Trigger</td>
<td>The flow started when a Service Catalog item was requested.</td>
</tr>
<tr>
<td>Script</td>
<td>The flow started from an API method call in a script, such as a business rule.</td>
</tr>
<tr>
<td>Background Script</td>
<td>The flow started from an API method call in the <strong>Scripts - Background</strong> module.</td>
</tr>
</tbody>
</table>

Flow state

All active flows are in one of these states.

Completed

The flow successfully ran all actions. The flow statistics display configuration and run-time details for each action.

Waiting

The flow paused on an action that is waiting for some condition to be met before continuing. The flow statistics display configuration and run-time details for completed actions and configuration details for any actions waiting for a condition to be met. Flows in the Waiting state display a **Cancel Flow** UI action in the header.

Error

The flow stopped with an error. The flow statistics display configuration and run-time details for completed actions and configuration details for the action that produced the error. Flows in the Error state display a **Go to error** UI action in the header.

**Note:** When an action results in an error, the flow stops executing at that point and results in an error state.
Related record options

From the Execution details page, you can access records related to the current flow.

**Refresh Flow Data**

Use this option to update flow runtime data.

**Open Flow**

Use this option to make configuration changes and publish a new instance of the flow. Changing the flow configuration does not change any currently active flow.

**Open Context Record**

Use this option to view the flow state, run duration, and related log entries from a standard form view. This option opens the context record in a new tab.

**Open Flow Logs**

Use this link to view detailed log information about each action. This link opens the log entries list in a new tab.

**Open Current Record**

For flows that have a record-based trigger, use this link to view the triggering record in a pop-up window.

**Open Action**

Use this link to make configuration changes and publish a new instance of the action. Changing the action configuration does not change any currently active flow. This link is unavailable for ServiceNow-provided core actions.

Flow statistics

Use flow statistics to see configuration details and run-time values for each flow component. Clicking a trigger or action expands the row and displays configuration and run-time details about it.
The following types of execution details are available.

**Integration Metadata**

Use Integration Metadata to view transaction data such as connection and credential used, target host, and payload size. Integration Metadata only displays for integration steps and requires a separate IntegrationHub subscription. For more information, see Integration steps.

**Configuration Details**

Use the list of input variables to identify any configuration errors with the action. Each variable has its own row displaying its name, data type, configuration settings, and run-time value. The configuration settings display dynamic values as pills. The run-time values display generated records as a link.

**Output Data**

Use the list of output variables to identify any configuration errors with the action.

**Logs**

Use the log entries to identify potential processing or performance issues. Each log entry has its own row displaying the creation date, log level, and log message. If the action does not generate any logs, the statistics displays the string *No Logs*.

**Steps**

Use the list of steps to identify any configuration errors with the action. Each step has its own row displaying the variable name, data type, configuration settings, and run-time value. Core actions do not display steps because users cannot change their configuration.

Change the `com.snc.process_flow.reporting.serialized.val_size_limit` system property to truncate runtime values in the flow execution details step configuration. To learn more, see Flow Designer system properties.

**Run duration**

Use the run duration to identify potential processing or performance issues. Each action and step displays the duration in milliseconds. System quota rules prevent any action from running longer than a minute.

**Embedded text viewer**

Flow Designer displays large text-based configuration and runtime output records such as email output, XML payloads, or script steps using an embedded text viewer. The embedded text viewer can format text as HTML, plain text, or color-coded JavaScript. For script steps, the text viewer highlights code lines containing errors.
function execute(inputs, outputs) {
    var vtblane = new GlideRecord('vtb_lane');
    vtblane.addQuery('board', inputs.vtbBoard.sys_id);
    vtblane.query();
    vtblane.next();

    var vtbcard = new GlideRecord('vtb_card');
    vtbcard.task = inputs.task.sys_id;
    vtbcard.board = inputs.vtbBoard.sys_id;
    vtbcard.lane = vtblane.sys_id;
    vtbcard.insert();

    outputs.vtbCard = vtbcard;
}(inputs, outputs);
Viewing results for each item in flow logic

Flow Designer displays a selector control to view the configuration and run-time results for each item processed by flow logic. Select a record number to see its configuration and run-time details.
Flow execution details retention

Due to the large amount of data used for flow designer reporting, your instance uses data retention policies to delete this data after a set time period.

Scheduled table cleanup

The time period used for scheduled table cleanup depends on the type of data stored. Once a record is older than its default retention period, it is deleted if it is in a completed state and the default skip_schedule_cleanup value is false.

Flow reporting data tables

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
<th>Default retention period</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_flow_action_report</td>
<td>Flow engine context action reports</td>
<td>6 Months</td>
</tr>
<tr>
<td>sys_flow_context</td>
<td>Flow context</td>
<td>6 Months</td>
</tr>
<tr>
<td>sys_flow_flow_report</td>
<td>Flow designer executions</td>
<td>6 Months</td>
</tr>
<tr>
<td>sys_flow_step_report</td>
<td>Flow engine context step reports</td>
<td>1 Week</td>
</tr>
</tbody>
</table>

Disable scheduled cleanup

The scheduled data cleanup for a flow can be disabled by setting the Skip Schedule Cleanup [skip_schedule_cleanup] field to true on the Flow engine contexts [sys_flow_context] record for the flow.

Change scheduled cleanup times

The retention periods shown in the preceding tables can be changed from their defaults by updating the Age in seconds field on the Auto Flushes [sys_auto_flush] table.

Disable reporting on a flow

Disable reporting on a flow by creating a record on the Settings [sys_flow_execution_setting] table for the flow, and setting the Reporting field to false. Navigate to Flow Designer > Settings to access this table. Create a record, and select a flow, subflow, or action. Enable or disable reporting using the Reporting field.

**Note:** Each record on the Settings table controls reporting for a single flow, subflow, or action. A setting record cannot have a value in both the Action and Flow fields.

**Note:** Setting records do not effect actions and subflows running within a parent flow. These settings are only honored when an action or subflow is run using the action API or script API. Setting records are honored for subflows executed with the Test button.

Reporting can be disabled for all flows using a system property. To disable the flow execution details, add the com.snc.process_flow.reporting.enabled system property to the System Properties [sys_properties] table and set the value to false. If disabled, details are not saved for actions in the flow. However, the flow context record and related log messages are available. If a flow runs while the property is false, execution
details are never available for the flow, even if the property value changes. If a flow runs while the property is true, execution details are always available for the flow, even if the property value changes.

Settings [sys_flow_execution_setting] records override this system property. For example, set the property to false in your production instance to disable all reporting, and use setting records to enable reporting specific flows. Limiting reporting in this way can increase performance of flow execution on your instance.

**Unavailable flow data**

A message displays at the top of the flow report to indicate that action reports are not available for a flow because of table cleanup. The **Show Action Details** link and Action states are not available in this case. A similar message is shown to indicate when reporting for a flow has been disabled. In this case, a link to the report settings also displays.
Flow logic

Enable flows and subflows to specify conditional or repeated actions. Combine the elements of flow logic to create workflows in a graphical interface with little or no scripting.
The system provides these flow logic options.

<table>
<thead>
<tr>
<th>Flow logic option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Call Workflow</td>
<td>Run a published and active workflow from your flow. You can use the flow data as a workflow input. For example, you can specify the current record as a workflow input.</td>
</tr>
<tr>
<td>Do the following in parallel</td>
<td>You can separate a flow into blocks of actions and subflows that run in parallel, reducing the time taken to execute a flow.</td>
</tr>
<tr>
<td>Do the following until</td>
<td>Apply one or more actions repeatedly until an end condition is met. You can use the flow data to specify the end conditions.</td>
</tr>
<tr>
<td>End</td>
<td>Use this flow logic to stop a flow within flow designer.</td>
</tr>
<tr>
<td>For each</td>
<td>Apply one or more actions to each record in a list of records.</td>
</tr>
<tr>
<td>If</td>
<td>Selectively apply one or more actions only when a list of conditions is met.</td>
</tr>
<tr>
<td>Make a decision</td>
<td>You can use the decision table branching logic in situations where multiple conditional paths are required, as an alternative to nested If, Else If, or Else flow logic. For example, if you want to determine what kind of car insurance you need, you can add inputs such as your age accident history, and car model to the decision table to determine a level of insurance coverage. This logic can save you time and present a more readable format than nested if conditions or switch case statements.</td>
</tr>
<tr>
<td>Wait for a duration of time</td>
<td>Use this flow logic to give your users time to act during automated processes or to wait for a specific date and time to complete actions</td>
</tr>
</tbody>
</table>

**Flow logic inputs**

Each flow logic option displays one or more fields that are used to determine its behavior. For example, the Call Workflow flow logic has an input where you are able to select a workflow to run. Use these inputs to define the behavior of the flow and enable optional functionality depending on your needs. See flow logic option documentation for a list of the available inputs and how they control the function of that element.

**Flow logic outputs**

Flow logic options may also have outputs. These represent information that is returned by the flow logic. For example, the Make a decision flow logic has an output that contains a decision answer record representing the decision reached by the flow. See the documentation for a flow logic option to see definitions for its outputs.

**Call a workflow flow logic**

Run a published and active workflow from your flow. You can use the flow data as a workflow input. For example, you can specify the current record as a workflow input.
### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select a Workflow</td>
<td>Published and active workflow that you can select to run. The workflow that you select determines the records that are associated with it. If the workflow has inputs, Flow Designer displays them as additional flow inputs.</td>
</tr>
<tr>
<td><strong>Note</strong>:</td>
<td>To prevent the workflow from running outside of Flow Designer, modify it to remove its start conditions.</td>
</tr>
<tr>
<td>Wait?</td>
<td>Workflow that you set to true so that the flow waits for workflow completion before continuing. Only workflows that wait for completion can return certain output values to the flow. Set to false to continue running the flow separately from the workflow.</td>
</tr>
<tr>
<td><strong>Note</strong>:</td>
<td>If the workflow is canceled or its context record is deleted prior to the workflow finishing, the flow stops waiting and instead continues running.</td>
</tr>
<tr>
<td>Current</td>
<td>Current record that the workflow processes. Select a data pill that contains a record from the associated workflow table.</td>
</tr>
</tbody>
</table>

### Outputs

The flow execution details only display workflow output values that are generated while the flow is running. If you configure the flow to wait for the workflow to finish, the flow execution details can display all workflow output values. If the flow does not wait, the flow execution details only display the workflow output values that were generated before the Call a Workflow flow logic completes. If Call a Workflow completes before the workflow finishes, the workflow output values stop updating and only display the last known value.

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>State of the workflow. This value comes from the workflow context record. The state will be Complete if the workflow executes successfully. If the workflow is canceled, the workflow state is set to Canceled. If the context record is deleted prior to the workflow finishing, the workflow state is set to Invalid.</td>
</tr>
<tr>
<td>Context</td>
<td>Reference to the workflow context record.</td>
</tr>
<tr>
<td>Result</td>
<td>String that contains the result from the workflow. This value comes from the workflow context record.</td>
</tr>
</tbody>
</table>
### Output

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\textbf{Return value}</td>
</tr>
</tbody>
</table>

String that contains the return_value from the workflow. This value comes from the workflow context record.

### Calling the Routine Change workflow

In this example, the flow calls the **Routine Change** workflow. The **Wait?** option is checked, so the flow pauses until this workflow completes. The **Current** field is filled using a data pill representing the record that triggered this flow.

**Actions**

1. **Call a Workflow**

   
   Select a Workflow: Routine Change
   
   - **Wait?:** ✓
   
   - **Current:** Trigger→Incident Record→Change Request
# Execution details

## Call Workflow execution details

1. The header displays a link so that you can view the workflow progress in the Workflow Editor, the flow logic state, the start time, and the runtime duration.
2. The **Workflow Configuration** section displays how the flow logic was configured for this flow and the runtime values that were generated.
3. The **Workflow Output** section displays the output that is generated by the workflow while the flow is running.

**Note:** If you cancel the workflow or delete the context record prior to the workflow finishing, the flow logic state is set to **Complete**.

## Do the following in parallel flow logic

You can separate a flow into blocks of actions and subflows that run in parallel, reducing the time taken to execute a flow.

With this flow logic you can divide your flow into branches that contain their own actions and subflows. Each of these branches runs in parallel when the flow executes, allowing you to save time and avoid waiting for each action to complete one at a time.
Inputs

Each flow logic option added to your flow will display one or more inputs. Use these inputs to determine the behavior of the flow logic.

Branches in do the following flog logic inputs

**Do the following in parallel** flow logic does not have field inputs. Instead, it displays a plus icon that enables you to create a branch that contains actions or subflows.

The actions and subflows under each branch run in parallel. The flow continues after all parallel branches have completed.

Outputs

This flow logic has no outputs, but actions and subflows under each branch may have outputs. While the flow is running, outputs from a branch are only accessible to other elements in the same branch. After the **Do the following in parallel** flow logic completes, its outputs are accessible to the rest of the flow.

**Create two tasks in parallel when a change request is created**

In this example, a flow triggers when a new change request is created. Using **Do the following in Parallel**, two tasks are created in parallel and are assigned to different groups. The flow uses the **Number** field data pill from the triggering change request to display the number in the short description for the task.
Do the following in parallel flow logic inputs
Execution details

Do the following in parallel execution details

1. The header shows the state, start time, and runtime for the flow logic.
2. The Configuration Details section shows the state, start time, and runtime for each parallel branch.

Do the following until flow logic

Apply one or more actions repeatedly until an end condition is met. You can use the flow data to specify the end conditions.

You can use Do the following until flow logic to create a loop that repeatedly applies actions. This flow logic requires a condition specifying when to stop the loop.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition label</td>
<td>Descriptive label for the loop.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions under which the loop terminates. You could, for example, end a loop when the state of an incident changes.</td>
</tr>
</tbody>
</table>

Note: Avoid using the same record you used to trigger the flow in your condition, because the flow populates its values when the flow starts and they remain static.
Send a daily email until an incident is resolved

In this example, the flow sends a daily email about the incident, until the incident is in a closed or canceled state. Inside the **Do the following** branch, there is a step for looking up the incident record. This is necessary because the record that triggers the flow is only loaded when it is triggered. By adding this look up step, you can get the current state of the incident each time the loop runs.
Outputs

This flow logic produces no outputs.

Execution details

Execution details for Do the following until

1. The header shows the state, start time, and runtime for the flow logic.
2. This flow logic can run actions or subflows multiple times until it's condition is met. Use the arrow icons to select an iteration and its values.
3. The Actions section shows details on the actions, flows, or subflows that are run during this loop iteration.

End flow logic

Use this flow logic to stop a flow within flow designer.

End flow logic can be contained within a conditional flow logic block, such as an If, Else If, or Else flow logic block. Use this flow logic to stop a flow when certain conditions are met. You cannot add actions or flow logic after you use the End flow logic. All branches of a flow are ended when a flow reaches the End flow logic, including the Wait for a duration logic. Any branches that run in parallel also stop their progress when you use the End flow logic.
Inputs

This flow logic has no inputs.

Execution Details

When a flow ends, the flow state becomes Complete.

For Each flow logic

Apply one or more actions to each record in a list of records.

The For Each flow logic requires a list of records to act upon. The flow applies all actions within the for each flow logic to each record in that list.

Note: Iterating over a large number of records can be resource intensive, especially when the For Each logic block includes complex actions for each iteration. To avoid performance issues, turn off reporting using the com.snc.process_flow.reporting.level system property. For more information, see Flow Designer system properties.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Items</td>
<td>Data pill that contains a list of records. For example, you could use the additional Assignee list for an incident record. For information on data pills, see Flow Designer data.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Table name] Record</td>
<td>Current record in the loop.</td>
</tr>
</tbody>
</table>

Note:

To optimize performance, avoid iterating over lists with more than one thousand records. If you need to iterate over large lists, divide the lists into smaller sections and use multiple flows.

You can nest a For Each flow logic block inside of another flow logic block to repeat an action over a series of records. However, avoid nested For Each loops that process many records. Nested loops may cause the flow to run until it is stopped by the flow transaction quota rule, which prevents flows from running longer than an hour. For more information about transaction quotas, see Transaction quotas.

Send an email to each person assigned to a problem

In this example, a flow is created to send an email to each additional assignee of a problem record when a record is created. If the For Each flow logic is selected, and the Additional Assignee data pill is dragged
in from the trigger record, the **For each** logic performs actions for each user in the **Additional Assignee** field of the trigger record.

When the loop is created, a new entry appears in the Data pane on the right called **1 - For Each**. In that entry, you see an **Additional assignee list Record** data pill that contains the user information for the users in that field.

**Inputs used in for each flow logic**

In this example, you configure a flow to send an email to each user in the **Additional Assignee** field on the triggering problem record. The plus icon below this email action is used to add additional actions, such as logging, to the loop.
The flow execution details tab provides runtime information on the flow logic.

1. The header shows the state, start time, and runtime for the flow logic.

2. This flow logic can run actions or subflows multiple times. Use the arrow keys to cycle through each of these instances to see their values.

3. The Configuration Details section shows which records the flow has evaluated.

4. After the For Each section are the actions taken within it. The values for these actions change as you cycle through the actions that are taken by this flow logic.

If flow logic

Selectively apply one or more actions only when a list of conditions is met.

Use this flow logic by specifying conditions that are based on the current record. Actions or subflows can be added to the flow within the if flow logic. The flow only applies the actions within this flow logic if the conditions evaluate to true. Conditions are based on data in records, such as a records state or urgency.
Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition label</td>
<td>Descriptive label for the branch.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions under which the branch runs.</td>
</tr>
</tbody>
</table>

Perform an action on if an incident has a high urgency

In this example, the action is triggered when the incident record has a high urgency value.

```
1. If Urgent then

Condition Label: Urgent

Condition 1: Trigger Incident Record Urgency is 1 - High

Add another condition set (OR)
```
Execution details

1. The header shows the state, start time, and runtime for the flow logic.
2. The Configuration Details section shows the details about the variables that are used by the flow, including the type, configuration, and runtime values for each variable. Use the condition variable to see if the branch conditions were met.

Make a decision flow logic

You can use the decision table branching logic in situations where multiple conditional paths are required, as an alternative to nested If, Else If, or Else flow logic. For example, if you want to determine what kind of car insurance you need, you can add inputs such as your age accident history, and car model to the decision table to determine a level of insurance coverage. This logic can save you time and present a more readable format than nested if conditions or switch case statements.

The Make a decision flow logic requires that you create an external decision table for its branch paths. Each answer that is defined in the decision table results in a branch path within Flow Designer. Decision tables accept any number of inputs, include any number of decisions, and result in a finite set of decision paths. You can configure a decision table to determine a single path or multiple paths. For more information on decision tables, see Decision Tables.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decision Label</td>
<td>Descriptive label for the decision that you want to make. For example, you can create the Recommended Insurance Policy label if you want to determine the level of insurance coverage that you need. This value overrides the default action label.</td>
</tr>
</tbody>
</table>
## Input

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decision table</td>
<td>Reference to a Decision Table [sys_decision] record. This record provides the decision input answers that are available to the flow.</td>
</tr>
<tr>
<td>Execution approach</td>
<td>Approach that you select to execute your decision.</td>
</tr>
<tr>
<td></td>
<td>• <strong>First decision that matches</strong>: Runs only the branch for the first matching decision answer.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Run all decisions that match</strong>: Runs all branches with a matching decision answer.</td>
</tr>
<tr>
<td>Include otherwise</td>
<td>Option to add the <strong>otherwise</strong> branch. The flow only runs this branch when no other branch runs.</td>
</tr>
<tr>
<td>Decision table inputs</td>
<td>List of Decision Input [sys_decision_input] records that are associated with your decision table. Flow Designer displays a separate input for each record. For example, if you have decision inputs for <strong>Units Ordered</strong> and <strong>Location of Sale</strong>, an input displays for each record.</td>
</tr>
</tbody>
</table>

## Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decision answer record</td>
<td>Record that was created after the decision inputs were evaluated.</td>
</tr>
</tbody>
</table>

## Use make a decision flow logic to determine insurance coverage

In this example, the flow uses a decision from the **Insurance Coverage** decision table, which an administrator had configured to determine the insurance coverage that was based on three inputs. The flow displays all the inputs that were used by the decision table in Flow Designer. These inputs can be entered manually, or by dragging data pills into the inputs from the Data pane on the right side of the screen. Below this section, the branches for each answer are shown in the decision table.

</tbody>
</table>
The **Flow execution details** tab provides runtime information about the flow logic.

1. The header shows the state, start time, and runtime for the flow logic.
2. The action shows details about the decision table configuration and inputs.
3. Each possible answer for the decision table is represented as a branch. The state field indicates whether the branch was evaluated and the evaluation result. This section also displays details about the actions that are taken within a branch. Branches that evaluate to true are highlighted in green.

### Wait for a duration flow logic

Use this flow logic to give your users time to act during automated processes or to wait for a specific date and time to complete actions.

#### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Duration Type</strong></td>
<td>• <strong>Explicit Duration</strong>: Wait for a specific time period, such as 5 minutes.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Relative Duration</strong>: Wait for a specific time period from a selected Duration data pill or date/time value, such as 5 minutes after the flow start.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Percentage Duration</strong>: Type to specify a certain percentage of time duration between the start of the flow logic and specified end time.</td>
</tr>
</tbody>
</table>

*Note:* The percentage value must be from 0 through 100 only.

<table>
<thead>
<tr>
<th>Wait for</th>
<th>Set this value manually or select a Duration data pill from the data pill picker ( ).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <strong>Explicit Duration</strong>: Wait duration in hours, minutes, and seconds.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Relative Duration</strong>: Wait duration in hours, minutes, and seconds before or after a specific time. Select <strong>Relative Duration</strong> to specify a wait duration from a specific date.</td>
</tr>
</tbody>
</table>

*Note:* Past dates don’t affect the wait duration.

You can enter a wait value of up to 999 hours.

*Note:* The actual wait duration can vary due to the instance processing time. The flow always waits for the time that you specify for this field, but other work in the queue may add to the wait time.
### Input

<table>
<thead>
<tr>
<th>Description</th>
<th>Wait for Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait duration as a percentage of the time period between the start of flow logic and specified end time. If you select a past date for the end time, the wait duration is set to 0. This field appears when <strong>Percentage Duration</strong> is selected from <strong>Duration Type</strong>.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
<th>During the following schedule</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select the schedule used to calculate the <strong>Scheduled End date/time</strong> value from the selected wait duration. For example, waiting for a 10-hour duration as part of an 8-5 weekdays schedule causes the flow to wait for one or more business days. If you leave this field blank, the timer runs without a schedule. For information on creating schedules, see <strong>Define a schedule</strong>.</td>
<td></td>
</tr>
</tbody>
</table>

### Outputs

<table>
<thead>
<tr>
<th>Description</th>
<th>Total duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total time that the flow ran in milliseconds. You can drag this data pill into the duration fields.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
<th>End at time/date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date/time that the flow completed. You can drag this data pill into the date/time fields.</td>
<td></td>
</tr>
</tbody>
</table>

**Close an incident if it has been in the resolved state for 10 days**

In this example, a flow starts when an incident changes to resolved.
Wait 10 days after the last update to a record

In this example, the flows waits for 10-days after the incident record has been resolved.
Update a record after 10 days

In this example, the flows closes the incident record 10 days after it was resolved.
Wait for a duration of 50% of the time between the start of the flow logic and end date

In this example, the flows send a notification email to the relevant manager when a critical problem is created and 50% of the time between the problem record creation and the problem due date has lapsed.
Relative Duration type

When the duration type is **Relative Duration**, the flow logic first evaluates the relative date/time, the schedule, and finally, the duration. Schedules and date/times set in the past do not affect the wait duration. This table provides examples of how the flow processes the wait duration in these scenarios.

<table>
<thead>
<tr>
<th>Duration Setting</th>
<th>Relative Date/Time</th>
<th>Schedule</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set to 0.</td>
<td>None</td>
<td>None</td>
<td>Duration ends immediately.</td>
</tr>
<tr>
<td>Greater than 0.</td>
<td>Past date</td>
<td>None</td>
<td>Duration ends immediately.</td>
</tr>
</tbody>
</table>
### Duration Setting

<table>
<thead>
<tr>
<th>Duration Setting</th>
<th>Relative Date/Time</th>
<th>Schedule</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>Greater than 0.</td>
<td>Future date</td>
<td>None</td>
<td>Flow waits for the date/time, and then waits for the duration.</td>
</tr>
<tr>
<td>Greater than 0</td>
<td>Past date</td>
<td>Future date</td>
<td>Flow waits for schedule, and then waits for the duration.</td>
</tr>
<tr>
<td>Greater than 0.</td>
<td>Future date</td>
<td>Past date</td>
<td>Flow waits for the date/time, and then waits for the duration.</td>
</tr>
<tr>
<td>Greater than 0.</td>
<td>Future date</td>
<td>Future date</td>
<td>Flow waits for the future date, then for the schedule, and then for the duration.</td>
</tr>
</tbody>
</table>

The timer waits for the next instance of a selected schedule. For example, if you set a schedule for Monday through Friday from 8 a.m. to 5 p.m., and the timer is initiated on Saturday, the timer waits until Monday at 8 a.m. before starting.

### Execution details

```
1. Timer was scheduled to end on Tuesday, August 14, 2018, 13:50:26 PDT

Execution details for Wait for a duration flow logic
```
1. The header shows the state, start time, and runtime for the flow logic.

**Note:** The runtime value in the header only includes the time that is taken to execute the flow logic and does not include the wait duration that is specified in the flow.

2. The Configuration Details section shows details about the variables that are used by the flow, including the type, configuration, and runtime values for each variable.

**Subflows**

Define a sequence of reusable actions that can be started from a flow, subflow, or script. Define inputs and outputs to pass data to and from the subflow.

Unlike flows, subflows lack a trigger. Use a subflow when:

- You only want to start a flow by calling it from another flow or script.
- You want to create a set of reusable operations for use in multiple flows.
- You want to add flow logic in addition to actions.
- You want to specify the inputs available to the subflow when it starts.
- You want to specify the outputs available to the parent flow after the subflow ends.

All subflows consist of properties, one or more inputs, one or more outputs, a sequence of actions, and the data collected or created.

**Subflow properties**

The subflow properties specify the subflow name, application, category, description, in-flow annotation, and status. Flow designers can update the subflow name, category, description, and in-flow annotation at any time, but can only set the application during subflow creation. The subflow status is set when you save or publish a subflow.

**Subflow inputs**

Subflow inputs specify the data available to the subflow when it starts. Each input you define for a subflow becomes a configuration option in the Flow Designer interface. To use the subflow in a flow, flow designers must define a value for each mandatory input. The more inputs a subflow has, the more data flow designers must define and the more familiar they must be with the underlying data model to use the subflow effectively.

Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring a subflow to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see field types.

**Subflow outputs**

Subflow outputs specify the data available to the parent flow after the subflow completes. Subflow outputs are defined as variables with a name and data type. Subflow designers assign values to an output using the Assign Subflow Output flow logic. Output values can be based on the subflow logic conditions, action results, or a manually set value. For example, an output may have one value when a condition is met and
another value when a condition is not met. During runtime, the value of the output is determined by the condition that is met.

Consider the following example of a subflow with two conditions that both result in a value for a single output variable. The value of the variable depends on which condition is met during runtime.

**Outputs**

[Manager ID] [String]

**Actions**

- 1 Look Up [User] Record where (Created on Today)
- 2 If ([1->User Record->Title] contains Manager) then
  - 2.1 Assign Subflow Outputs [Manager ID] to [1->User Record->User ID]
- 3 Else
  - 3.1 Assign Subflow Outputs [Manager ID] to [1->User Record->Manager->User ID]

In this case, if the user's title contains "Manager" then the user ID is assigned as output. Otherwise, the subflow looks up the user's manager and assigns the user ID of the manager as output.

Flow Designer allows you to define a value for the same variable multiple times. However, if a variable is given two or more possible values without conditional logic, only the last value defined in the subflow is applied to the output at runtime.

**Outputs**

[Manager ID] [String]

**Actions**

- 1 Look Up [User] Record where (Created on Today)
- 2 Assign Subflow Outputs [Manager ID] to [1->User Record->User ID]
- 3 Assign Subflow Outputs [Manager ID] to [1->User Record->Manager->User ID]

In this example, action three overwrites the value of action two and [1->User Record->Manager->User ID] is applied to the [Manager ID] output at runtime because it was the last value defined. Typically, subflows should only include multiple values for one variable if conditional flow logic is used.

**Subflow execution details**

Access to subflow execution details depends upon the calling source of the subflow.

**When the calling source is a parent flow**

Flow Designer displays subflow execution details within the parent flow execution details. The parent flow execution details list each subflow as inline elements. You can expand a subflow step to see its execution details.

**When the calling source is a script**

Each script call to a subflow generates a separate flow execution detail page. You can view script-run subflow execution details directly from the list of flow executions.
Actions

Within Actions, flow designers can add actions, flow logic, flows, or other subflows.

An action is a reusable operation that enables process analysts to automate Now Platform features without having to write code. For example, the Create Record action allows process analysts to generate records in a particular table with particular values when certain conditions occur. Core actions like Create Record require some familiarity with Now Platform tables and fields. Action designers can create application-specific actions to pre-set configuration details. For example, creating a Create Incident Task action ensures that the process analyst uses the correct table and field configuration each time the action is used. You can add application-specific actions by activating the associated spoke.

Flow logic

Subflows can contain flow logic to specify conditional or repeated actions, or to assign output variables to subflow data. The system provides these flow logic options.

Available flow logic

<table>
<thead>
<tr>
<th>Flow logic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>For Each</td>
<td>Applies actions to each record in a list of records. Flow designers must specify the list of</td>
</tr>
<tr>
<td></td>
<td>records from the subflow data.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can nest a For Each flow logic block inside of another flow logic block to</td>
</tr>
<tr>
<td></td>
<td>repeat an action over a series of records. However, avoid nested For Each loops that process</td>
</tr>
<tr>
<td></td>
<td>many records. Nested loops may cause the flow to run until it is stopped by the flow</td>
</tr>
<tr>
<td></td>
<td>transaction quota rule, which prevents flows from running longer than an hour. For more</td>
</tr>
<tr>
<td></td>
<td>information about transaction quotas, see Transaction quotas.</td>
</tr>
<tr>
<td>If</td>
<td>Applies actions when a list of conditions is met. Flow designers can specify the conditions</td>
</tr>
<tr>
<td></td>
<td>as subflow data. Once an If condition is added, you can add an Else or Else If flow logic</td>
</tr>
<tr>
<td></td>
<td>options to define behavior when conditions are not met.</td>
</tr>
<tr>
<td>Assign Subflow Outputs</td>
<td>Assigns an output variable to subflow data. Only outputs defined in Inputs &amp; Outputs can be</td>
</tr>
<tr>
<td></td>
<td>assigned a value. Assigning outputs enables you to assign a different output variable for each</td>
</tr>
<tr>
<td></td>
<td>logical path in the subflow.</td>
</tr>
</tbody>
</table>

Testing subflows

You can test a subflow alone, or when added to a flow. When testing a subflow alone, you must define the inputs that the subflow uses in its actions. Because a subflow does not have a trigger, testing a subflow runs the actions using the defined input values.

**Note:** Flow designers should always test flows and subflows on sub-production instances containing relevant demonstration data since testing a subflow creates or changes records on the instance.

Roles

To access subflows, a user must have the flow_designer or admin role.
Create a subflow

Create a reusable sequence of actions that can be added to multiple flows.

- Role required: flow_designer or admin
- Set up an application in Guided Application Creator to store Flow Designer content.

Users with flow_designer or admin role should know the application table structure and be aware of any existing business logic associated with the target tables of a flow or subflow. Be sure to disable any conflicting business rules or workflows before creating a flow or subflow.

Creating a custom application to contain your Flow Designer content allows you to deploy it using the application repository or the ServiceNow Store.

1. Navigate to Flow Designer > Designer.
2. Click + New > New Subflow.
   The Subflow properties dialog displays.
3. Fill in the following properties:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the subflow.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope to create the subflow in.</td>
</tr>
<tr>
<td>Category</td>
<td>Logical group for subflow.</td>
</tr>
<tr>
<td>Protection</td>
<td>Select whether the subflow is read-only. You can only select a value when you create the subflow in an application scope you own. The default value is None.</td>
</tr>
<tr>
<td>In-Flow Annotation</td>
<td>Help text that appears under the subflow title in Flow Designer to help flow designers understand what the subflow does when used in a flow.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the subflow.</td>
</tr>
<tr>
<td>Run As</td>
<td>Selection to specify if the flow runs as system user or the user who initiates the session. Select the user who initiates the session option when updates should come from the user who triggered the flow. For example, when you want incident record comments to come from the current user, or approval emails to originate from the approver. Run As settings for a flow do not apply to child subflows. Running as the initiating user also ensures the actions taken during flow execution are limited by the user's ACL restrictions. Flows run by the initiating user will also respect user-specific settings like date/time format.</td>
</tr>
</tbody>
</table>

4. Create subflow inputs to specify the data available to the subflow when it starts.
   Each input you define for a subflow becomes a configuration option in the Flow Designer interface.
   To use the subflow in a flow, flow designers must define a value for each mandatory input. The more
inputs a subflow has, the more data flow designers must define and the more familiar they must be with the underlying data model to use the subflow effectively.

a) Click + to open the Inputs & Outputs pane.

b) Click + to add a new input.

c) Define the name and type for the input.

<table>
<thead>
<tr>
<th>Note: Subflow input names can't include any of the following reserved system names:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• sys_id</td>
</tr>
<tr>
<td>• sys_created_by</td>
</tr>
<tr>
<td>• sys_created_on</td>
</tr>
<tr>
<td>• sys_updated_on</td>
</tr>
<tr>
<td>• sys_updated_by</td>
</tr>
<tr>
<td>• sys_mod_count</td>
</tr>
</tbody>
</table>

d) To make the input a mandatory configuration option, select the Mandatory flag.

e) Click to view the advanced options and define values.

Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring a subflow to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see field types.

5. Create subflow outputs by defining the names and data types.

Subflow outputs specify the data available to the parent flow after the subflow completes.

a) Click + to add a new output.

b) Define the name and the data type.

Output values are assigned in later steps.

<table>
<thead>
<tr>
<th>Note: Subflow output names can't include any of the following reserved system names:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• sys_id</td>
</tr>
<tr>
<td>• sys_created_by</td>
</tr>
<tr>
<td>• sys_created_on</td>
</tr>
<tr>
<td>• sys_updated_on</td>
</tr>
<tr>
<td>• sys_updated_by</td>
</tr>
</tbody>
</table>
6. To add actions, flows, subflows, or flow logic, click **Select to add an Action, Flow Logic, or Subflow**. 
   a) Select an option.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Action** | Select the desired action. Flow Designer includes a set of Actions available to flows and subflows. Alternatively, user with the action_designer role can create additional actions to add to flows. The IntegrationHub and spoke plugins install additional actions.  
To add draft actions from the More Actions menu, set **Show draft actions** to true.  
To view spokes available in the ServiceNow Store, set **Show store spokes** to true from the More Actions menu.  
Note: Under **Not Installed Spokes**, the system displays spokes available on the ServiceNow Store based on compatibility with the ServiceNow version and application dependency on Flow Designer. |
<p>| <strong>Flow Logic</strong> | Select an option to specify conditional or repeated operations. |</p>
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subflow</td>
<td>Select a published subflow and define input values. In addition to adding a subflow as a flow action, you can enable the <strong>Show triggered flows</strong> option from the More Actions menu to select an activated flow and define the required inputs. Running a triggered flow ignores its trigger conditions and runs all actions.</td>
</tr>
</tbody>
</table>

To change the order of an action in a flow, drag the handle on the left side of the action to the desired location.

The system displays a set of fields depending on the option selected.

b) To configure the action, flow, or subflow, fill in the fields.

c) Click **Done**.

d) Repeat adding actions until complete.

7. Assign subflow outputs to a value.

You can assign a subflow output to multiple values, enabling you to create conditional outputs based on flow logic.

a) Under **Actions**, click + and select **Flow Logic**.

b) Click **Assign Subflow Outputs**.

c) In the **Name** field, select an output you created in the Inputs & Outputs section. You can only assign values to outputs that have already been given a name and data type.

d) In the **Data** field, enter a value or select a data pill from the data panel.

e) Click **Done**.

Test the subflow, and publish it when it is ready to be added to a flow or called from a script.

**Note:** You can only test or publish subflows that contain at least one action.
Test a subflow

You can test a subflow alone, or when added to a flow. When testing a subflow alone, you must define the inputs that the subflow uses in its actions. Because a subflow does not have a trigger, testing a subflow runs the actions using the defined input values. Unless updated, subsequent tests use the same inputs defined in the initial test run.

Role required: flow_designer or admin

Create a subflow that contains at least one action and save it. Flow Designer only tests saved subflows that contain at least one action.

Flow designers should always test flows and subflows on sub-production instances containing relevant demonstration data since testing a subflow creates or changes records on the instance.

1. Navigate to Flow Designer > Designer.
2. Click the subflows tab and open a saved subflow.
3. Click Test.
   The Test Subflow dialog opens.
4. Define input values for the subflow to use in its actions. The values defined are remembered on future test runs.
5. Click Run Test.
6. After the flow executes, click Subflow has been executed. To view the subflow, click here.
   The Execution Details open.

Once the subflow behaves as desired, you can publish the subflow and add it to a flow.

Publish a subflow

Publish a subflow to make it available to other users and to add it to activated flows.

Role required: flow_designer or admin

Create a subflow, test the subflow, and verify that it is working as expected.

When you make changes to a published subflow, the changes remain in the draft state until you publish the subflow again. You must publish a changed subflow to make the changes available to activated flows.

1. Navigate to Flow Designer > Designer.
2. Click the subflows tab and open a tested subflow.
3. Click Publish.

The subflow can be added to activated flows. If you update the subflow after it is published, you must click Publish again to see the changes when the parent flow is run. After publishing changes, all parent flows that use the subflow are automatically updated to use the current version.

Complex data

Use a graphical interface to work with collections of complex structured data. Help design users understand the organization of structured data, and add, remove, or configure its individual elements.

Complex data allows you to encode and store structured data in a machine-readable format such as JavaScript Object Notation (JSON) or eXtensible Markup Language (XML). You can use the Flow Designer interface to view and understand the organization of structured data as well as create data structures. For example, you can create a contact data structure consisting of information you look up from a user record such as first name, last name, and email address.

You can create complex data from these Flow Designer interfaces.
Complex data usage examples

<table>
<thead>
<tr>
<th>Flow Designer interface</th>
<th>Example usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action inputs and outputs</td>
<td>Create an action that generates an object from record data. Populate the object using record data the action looks up. See Create a custom action to generate an object from a record</td>
</tr>
<tr>
<td>Script step input and output variables</td>
<td>Write a script to create an array of objects from a list of records. See Create a custom action to generate an array of objects from a list of records. Write a script to parse a JSON document into an output of type Object.</td>
</tr>
<tr>
<td>Subflow inputs and outputs</td>
<td>Create a subflow that accepts an object as an input and uses it to call an external service.</td>
</tr>
<tr>
<td>XML parser step Target field configurations</td>
<td>Parse an XML payload into a complex data object using the XML parser step.</td>
</tr>
</tbody>
</table>

Benefits

Complex data offers these benefits.

- Parse and format data without having to write code. For example, create data variables to parse a response message or format a request message.
- Create arbitrary data structures. For example, create an issue data structure that combines information from existing interaction and incident records, or create a data structure to support a custom integration.
- View the organization of data structures. For example, an issue data structure might consist of a user object to describe who to contact about the issue and a history object to describe the work done to resolve it. You could configure a notification action with the path to the email address listed in the user object, and call an escalate issue subflow with the path to the status or reassign count from the history object.
- Allow access to data structure from API calls. For example, call an action or subflow from a script and use the predefined data structure as input values.
- Save and reuse data structures as templates. For example, save the user object as a template data structure for reuse in other actions and flows.

Data structure

A data structure is a collection of related data elements organized into a hierarchy. Each element in a data structure has its own data type and its own unique position in the hierarchy.

The Editor pane displays data structure hierarchy with indentation. The indentation level identifies whether an element is a parent, child, or sibling in the hierarchy. Parent elements have children indented underneath them, and siblings have the same indentation level.

Note: The Flow Designer interface allows you to create hierarchies with an unlimited number of child levels, but you may have to scroll horizontally to see them.

For example, this data structure consists of an Employee parent element with four child elements for ID Number, Name, Start Date, and Contact Email. The Contact Email element is also a parent element with one child.
Sample inputs for an Employee object

The Data pane displays data structure hierarchy as a tree of collapsible and expandable data pills just like it does with record variables. Parent elements have an arrow icon to collapse or expand the hierarchy.

For example, here is the Employee data structure as seen from the Data pane.

Sample data pill for an Employee object
You can use the Data pane or Data picker to select specific values from a data structure. Data structures are similar to data pills for records in that you can dot-walk or navigate to specific elements within the structure. When you select a data element, Flow Designer displays the path to it as a data pill just like any other data element selection. For example, if you select the Start Date data element, the path is [Input->Employee->Start Date].

You can use an element data path the same way you can an XPath or JPath. Sometimes you may even convert the data pill path into one of these path notations.

**Complex data types**

You build data structures using one or more **Array** or **Object** variables. Only these variable data types support child variables.

An Array variable contains values for one type of item. The parent variable is always of an Array data type, and there is always only one child variable, which is one instance of the data type supported by the array. Create Array variables when an input or output accepts multiple values of the same data type.

For example, you could create a Contact Email array to list all the email addresses associated with a given person.

<table>
<thead>
<tr>
<th>Component label</th>
<th>Data Type</th>
<th>Sample Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact Email</td>
<td>Array.String</td>
<td><a href="mailto:beth.anglin@example.com">beth.anglin@example.com</a> and <a href="mailto:beth@anglin.com">beth@anglin.com</a></td>
</tr>
<tr>
<td>Contact Email_child0</td>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>

An Object variable contains any number and arrangement of child variables that each have their own data type and values. Nesting Object variables allows you to create complex data structures similar to a table schema where one table has related records in another table. Create Object variables when an input or output accepts one or more related properties.

For example, you can create an Employee object to define information about the people who work at a company.
Sample data structure for the Employee object

<table>
<thead>
<tr>
<th>Component label</th>
<th>Data Type</th>
<th>Sample Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Employee</td>
<td>Object</td>
<td></td>
</tr>
<tr>
<td>ID Number</td>
<td>Integer</td>
<td>20190304000101</td>
</tr>
<tr>
<td>Name</td>
<td>String</td>
<td>Beth Anglin</td>
</tr>
<tr>
<td>Start Date</td>
<td>Date/Time</td>
<td>March 4, 2019</td>
</tr>
<tr>
<td>Contact Email</td>
<td>Array.String</td>
<td><a href="mailto:beth.anglin@example.com">beth.anglin@example.com</a> and <a href="mailto:beth@anglin.com">beth@anglin.com</a></td>
</tr>
</tbody>
</table>

Only these variable data types can be parents.

**Parent data types**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array.Array</td>
<td>A container for arrays. Adds a read-only child item of type Array.</td>
</tr>
<tr>
<td>Array.True/False</td>
<td>A container for true/false values. Adds a read-only child item of type True/False.</td>
</tr>
<tr>
<td>Array.Choice</td>
<td>A container for choice values. Adds a read-only child item of type Choice.</td>
</tr>
<tr>
<td>Array.Date/Time</td>
<td>A container for date/time values. Adds a read-only child item of type Date/Time.</td>
</tr>
<tr>
<td>Array.Integer</td>
<td>A container for integer values. Adds a read-only child item of type Integer.</td>
</tr>
<tr>
<td>Array.Object</td>
<td>A container for objects. Adds a read-only child item of type Object, which displays the Add Child Item option.</td>
</tr>
<tr>
<td>Array.String</td>
<td>A container for string values. Adds a read-only child item of type String.</td>
</tr>
<tr>
<td>Object</td>
<td>A container for other data elements. Displays the Add Child Item option.</td>
</tr>
</tbody>
</table>

Array and Object variables only support these child data types.

- Array
- True/False
- Choice
- Date/Time
- Integer
- Object
- String

**Note:** The data types in array and object variables are not Glide elements. There may not be complete compatibility between these items and Now platform types.
Advanced options

Object variables have advanced options to save and load data structures. These options allow you to reuse a data structure defined in one location in another. For details on advanced options see Advanced options for action inputs.

Data structure templates

Data structure templates allow you to reuse Object variables in multiple actions or subflows. For example, you can create a data structure to parse a response and then later reuse that same data structure to format a request. A template stores the list of child variables and their structure within an object. Each Object variable has an Advanced Option to save it as a template.

When you apply a template, you are creating a copy of the original structure. Any changes you make after applying a template do not affect the template, nor do they affect other actions that use the template.

Array data pills

Objects that contain array data may require For Each flow logic to process. For example, a user object that contains an array of email addresses would require a For Each flow logic loop to send a notification to each email address.

Object data pills

You can design actions that accept object data pills as input values. For example, you might create a notification action that accepts a user object as an input. If the user object consists of values for first name, last name, and addresses, then the notification action has access to all these values. To configure an action input with an object data pill, you must create an object earlier in the flow.
**Sample action that accepts an object data pill**

You can use an object data pill or any of its child elements to configure an input. When you configure an input value with an object data pill, Flow Designer makes any child elements of the object read-only, and the action uses the values provided by the object. For example, you can create a flow where one action generates a user object and another action sends a notification to the user specified in the object.
Sample action configured to use an object data pill

When you configure the child elements of an object, you must manually provide data pills for each child element of the object. For example, you can manually configure the user object with record values from an earlier action.

Script support

Create and reference complex data from a script. Use a script when your source data comes from a data stream, a REST step response, or a Look Up Records step. See Script support for complex data for more information about scripting with complex data.
Design considerations

Follow these design guidelines to create reusable and maintainable data structures.

**Minimize the number of child levels in the hierarchy**

The more child levels a data structure has, the more difficult it is to view and select any specific data variable from the hierarchy. While you can build data structures with any number of child levels, it becomes difficult to navigate and understand data structures with more than seven child levels. For the best user experience, avoid creating data structures that have so many child levels you must scroll horizontally to see and populate them.

**Create a separate object for each type of record data**

Most Flow Designer data is record data whether it is from an instance or an external system. This design method ensures that you know what the object contains and where the data came from.

**Recreate record data structures**

When building objects that receive or transmit record data, review the database dictionary entries for these records and create matching object data structures. For example, suppose that you want an object to contain data from incident and configuration item records. You might create a string element for the incident short description field and an array of strings element for the configuration item class field.

**Create objects to combine different types of records**

If you need information from multiple types of records, create an object that contains all the information you need. You can then use the object to format or parse data in Flow Designer.

**Create data structure**

Organize multiple data variables into a structure to process them as a unit and identify the individual items within it.

- Role required: action_designer, flow_designer, or admin
- Set up an application in Guided Application Creator to store Flow Designer content.
- Create an action or Create a subflow

A data structure is a collection of related data elements organized into a hierarchy. Each element in a data structure has its own data type and its own unique position in the hierarchy.

1. Create a data variable.

<table>
<thead>
<tr>
<th>Action or subflow input</th>
<th>Click Create Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action or subflow output</td>
<td>Click Create Output</td>
</tr>
<tr>
<td>XML parser step</td>
<td>See XML parser step</td>
</tr>
</tbody>
</table>

2. Set **Type** to **Object**.

The top level of a data structure hierarchy must be an Object variable.

3. Click the **Add Child Item** icon.

Flow Designer adds a child data variable to the bottom of the object list.

**Note:** You can insert a child item variable between existing variables by hovering your mouse pointer between two variables, and click the insert item icon.
that appears.

**Note:** When hovering your mouse pointer between a child and sibling variable, you will see a add child icon

Click the left side of the icon to add a new sibling variable to the child's parent, or the right side to add another child variable under the current variable.

4. Set the child variable **Label** and **Type**.
   To add another branch to the data structure hierarchy, set the Type to Object.

5. Repeat steps 3-4 for each data variable in the hierarchy.

Use the data structure to populate action, step, or subflow inputs. If you can reuse the data structure, save it as a template.

**Save data structure**

Save the data structure of child variables within an Object variable for later reuse.

- Role required: action_designer, flow_designer, or admin
- Set up an application in Guided Application Creator to store Flow Designer content.
- Create an action or Create a subflow

1. Create data structure.
2. Expand the Advanced options for the Object variable you want to save.
3. Click Save as Template.
   Flow Designer displays a pop-up dialog.
4. Enter the template name.
5. Click **Save**.
   If the template name already exists, Flow Designer displays a confirmation dialog to overwrite the existing template.

Load the data structure in another action or subflow. Make updates to the data structure and save them.

**Load data structure**

Load a data structure of child variables within an Object variable.

- Role required: action_designer, flow_designer, or admin
- Set up an application in Guided Application Creator to store Flow Designer content.
- Create an action or Create a subflow

1. Create a data variable.
2. From **Type**, select **Object**.
3. Expand the Advanced options for the Object variable whose data structure you want to replace.
4. From **Structure**, select **Start from Template**.
   Flow Designer displays the **Template** field.
5. From **Template**, select the template containing the template you want to load.
   If the Object variable has no existing data structure, Flow Designer loads the data structure into it. If the Object variable has an existing data structure, Flow Designer displays a confirmation dialog to replace the existing structure.
**Create a custom action to generate an object from a record**

Generate an object from a User record. Learn how to use an Action output to create an object from record values.

Role required: admin

Use this example to see demonstrations of these operations and steps.

- Create action inputs for the User record fields First name, Last name, and Email.
- Lookup a User record matching the action input values.
- Create an action output for a contact object.
- Save the contact object as a template.
- Map contact object values to User record field values.
- Test the action with a sample user.

1. Create an application to store your work.
   Use the Guided Application Creator.
   For example, create My Application.

   The system displays the Flow Designer landing page.

   The system displays the Action Properties dialog.

4. Enter these sample values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Contact Object From User</td>
</tr>
<tr>
<td>Application</td>
<td>My Application</td>
</tr>
<tr>
<td>Accessible From</td>
<td>All application scopes</td>
</tr>
</tbody>
</table>

5. Select Submit.
   The system displays the Action Designer interface.

6. From the Action Outline, select Inputs > Create Input.
   The system displays a new action input.

7. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>First name</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Mandatory</td>
<td>True</td>
</tr>
</tbody>
</table>

8. From the Action Outline, select Inputs > Create Input.
   The system displays a new action input.

9. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Last name</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Mandatory</td>
<td>True</td>
</tr>
</tbody>
</table>
10. From the Action Outline, select Inputs > Create Input
    The system displays a new action input.
11. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Email address</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Mandatory</td>
<td>False</td>
</tr>
</tbody>
</table>

12. From Action Outline, select Outputs > Create Output.
    The system displays a new action output.
13. Configure the output variable with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>contact</td>
<td>contact</td>
<td>Object</td>
<td>False</td>
</tr>
</tbody>
</table>

14. From the row for the contact Object, select Add Child Item.
15. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>First name</td>
<td>first_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

16. From the row for the contact Object, select Add Child Item.
17. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last name</td>
<td>last_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

18. From the row for the contact Object, select Add Child Item.
19. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email address</td>
<td>email_address</td>
<td>String</td>
<td>False</td>
</tr>
</tbody>
</table>
26. Select **Save**.
27. Select **Test**.
   The system displays the Test Action dialog.
28. Enter these test values.

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>First name</td>
<td>Abel</td>
</tr>
<tr>
<td>Last name</td>
<td>Tuter</td>
</tr>
</tbody>
</table>

29. Select **Run Test**.
   The system runs the action with the test values provided.

30. **Select Action has executed. To view the action, click here.**
   The system displays the action execution details.

31. **Review the runtime value for the action Output data.**
   The system displays output data in JSON format.
   For example, sample contact object JSON for the user Abel Tuter.

```
{
  "contact": {
    "email_address": "abel.tuter@example.com",
    "last_name": "Tuter",
    "first_name": "Abel"
  }
}
```

You have a custom action that looks up a User record and converts it into a contact object.
Customize the action to use your own logic.

**Create a custom flow to generate an object for each record in a list**

Generate an object for each User record in a list. Learn how to use flow logic to iterate through a list of records.

- **Role required:** admin
- **Create a custom action to generate an object from a record**

Use this example to see demonstrations of these operations and steps.

- Create a flow that runs on a daily schedule.
- Look up User records filtered by the Department provided as an input.
- Add flow logic that runs for each User record you looked up previously.
- Create a contact object for each User record using the custom action you created previously.
- Create a log message for each User record.

1. **Navigate to Flow Designer > Designer.**
   The system displays the Flow Designer landing page.
2. **Select New > Flow**
The system displays the Flow Properties dialog.

3. Enter these sample values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Contact Objects From Users</td>
</tr>
<tr>
<td>Application</td>
<td>My Application</td>
</tr>
<tr>
<td>Run As</td>
<td>User who initiates session</td>
</tr>
</tbody>
</table>

4. Select **Submit**.
The system displays the Flow Designer interface.

5. Select **Click to add a Trigger > Date > Daily**.

6. Select **Done** to close the trigger.

7. Select **Click to add an Action, Flow Logic, or Subflow > Action > ServiceNow Core > Look Up Records**.
The system adds the action to the flow.

8. For **Table**, select **User [sys_user]**.

9. For **Conditions**, add these values.
   • `[Department][is][Development] [AND]
   • `[Email][is not empty]

10. Configure these field values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order by</td>
<td>Name</td>
</tr>
<tr>
<td>Sort</td>
<td>a to z</td>
</tr>
<tr>
<td>Max Results</td>
<td>1000</td>
</tr>
</tbody>
</table>

11. Select **Done** to close the action.

12. Select **Click to add an Action, Flow Logic, or Subflow > Flow Logic > For Each**.
The system adds the flow logic to the flow.

13. For **Items**, select **[1->User Records]**.

   **Note**: You can select the Action 1 **User Records** data pill from the Data pane or from the Data Pill Picker button.

14. Select **Done** to close the flow logic.

15. Select the plus icon to add a child item to the For Each flow logic.

16. Select **Action > My Application > Create Contact Object**.

17. For **userRecord [User]**, select **[2->User Record]**.

   **Note**: You can select the Action 2 **User Record** data pill from the Data pane or from the Data Pill Picker button.

18. Select **Done** to close the flow logic action.

19. Select the plus icon to add a child item to the For Each flow logic.

20. Select **Action > ServiceNow Core > Log**.

21. For **Message**, select **[2.1->contact]**.

   **Note**: You can select the Action 2.1 **contact** data pill from the Data pane or from the Data Pill Picker button.
22. Select **Done** to close the flow logic action.
23. Select **Save**.

**Script support for complex data**

Create and reference complex data from a script. Use a script when your source data comes from a data stream, a REST step response, or a Look Up Records step.

Use script to create complex data when data comes from these sources.

<table>
<thead>
<tr>
<th>Data source</th>
<th>Create/map complex data from</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Stream action response stream</td>
<td>Script Parser step</td>
</tr>
<tr>
<td>REST step response</td>
<td>Script step</td>
</tr>
<tr>
<td>Look Up Records step</td>
<td></td>
</tr>
</tbody>
</table>

**Data Stream action response stream**

Data Stream actions use a parser script to map stream item values to complex object values. When writing a parser script, use JavaScript methods appropriate to the data stream format. For example, use the `JSON - Scoped` class to parse or encode a JSON data stream.

Parser scripts have access to the data stream input and output objects as well as a `targetObject` property. See **Data Stream actions** for more information about parsing a response stream to create complex data.

**REST step response**

You can convert a REST step response into one or more complex objects by parsing it with a Script step. To access a response from a Script step, you must create an input script variable and map it to the response payload from the prior REST step. See **Script step** for more information about creating script input variables.

Write a script that maps REST response values to complex object values. When writing REST response script, use JavaScript methods appropriate to the response format such as the `JSON parse()` method.

**Note:** When you use complex data as the source of a string input, Flow Designer automatically converts it into a JSON string.

You do not need to use a Script step to create a REST request from complex data. You can generate complex data in a prior action or step and then map it to a string input of the REST step. At run time, the action or flow converts the complex data into a JSON representation.

**Look Up Records step**

While flows can use **For each** flow logic to process a list of records, actions require a Script step. The Script step replaces the **For each** flow logic with JavaScript such as a **For** or **While** loop.

To access record data from a Script step, you must create an input script variable and map it to the record data from the prior look up step. See **Script step** for more information about creating script input variables.

See **Create a custom action to generate an array of objects from a list of records** for an example action that converts a list of user records into an array of contact objects.
Note: The Look Up Records action does not require a Script step to convert record data into complex data. You can create a custom action to convert a record into an object and apply For each flow logic to the custom action. See Create a custom action to generate an object from a record and Create a custom flow to generate an object for each record in a list for an example of creating a complex object without using script.

Dot-walking object structures

You can reference elements from the structure of an object by dot-walking the path of the structure. All complex data paths start with the name of the data source, which is either the global object for inputs, the global object for outputs, or the name of the array or object you created in script.

Next in the path are the names of each structural element referenced separated by period characters (also known as dots). Listing the names of structural elements is identical to dot-walking a reference field where you list the table structure to a particular reference field.

Note: A dot-walk path always lists the name of a structural element rather than its label.

For example, suppose that you define a contact object as an Output variable. The object has the following structure.
### Output Variables

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact</td>
<td>contact</td>
<td>Object</td>
<td></td>
</tr>
<tr>
<td>First name</td>
<td>first_name</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Last name</td>
<td>last_name</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Email Addresses</td>
<td>email_addresses</td>
<td>Array.Object</td>
<td></td>
</tr>
<tr>
<td>Email Address</td>
<td>email_address</td>
<td>Object</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>type</td>
<td>Choice</td>
<td></td>
</tr>
<tr>
<td>Email</td>
<td>email</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Telephone Numbers</td>
<td>telephone_numbers</td>
<td>Array.Object</td>
<td></td>
</tr>
<tr>
<td>Mailing Addresses</td>
<td>mailing_addresses</td>
<td>Array.Object</td>
<td></td>
</tr>
</tbody>
</table>

The dot-walk path to the **First name** structural element would be `outputs.contact.first_name` while the path to the **Email** structural element would be `outputs.contact.email_addresses[0].email` since you must specify an individual element of the array by its JavaScript index value.

**Note:** A dot-walk path omits the name of the repeated element within the array. For example, an array of objects does not have to specify the object element name. However, since objects are containers for other elements, you can specify a child element of the object within a dot-walk path.

### Design considerations

Keep these design considerations in mind when scripting with complex data.

#### Use string inputs to convert complex data into a JSON string

When you map complex data to a string input, Flow Designer automatically converts it into a JSON string. Instead of writing a script, you can add a string input to a REST step and map it to complex data from a prior action or step.

#### Save your objects as templates

Save your objects as templates so you can reuse them in other actions, flows, and Script steps.

#### Create script input variables to access prior data

Create a script input variable for any data you want to access from the action input or a prior step. Map the script input variable to the input or step data pill. For example, map the script input variable to a list of user records you looked up in a prior step.

#### Create a script output variable to store complex data

Create a script output variable to store any complex data your script creates. The script output variable data structure, data types, and names must match the values defined in the script. For example, create a contacts array of objects to store multiple contact objects. Save the contact object as a template so you can reuse it.

#### Map the action output to the script output variable

When you want a custom action to output complex data, add an action output and map it to the data pill for your Script step output variable. For example, create a contacts array and load the contact object template you saved earlier. Map the action output to the contacts array produced by your Script step.
Create a custom action to generate an array of objects from a list of records

Generate an array of objects from a list of User records. Learn how to use a Script step to iterate through a list of records.

Role required: admin

Use this example to see demonstrations of these operations and steps.

- Create an action input for a Department record.
- Look up a maximum of three User records for the Department action input.
- Configure a Script step to process a list of User records.
- Create a script input variable containing the list of User records.
- Write script that creates an empty contacts array.
- Write script that iterates through the list of User records.
- Write script that creates a contact object and maps User record field values to the contact object.
- Write script that populates the contacts array with the current contact object.
- Create script output variables for the contacts array and child contact object.
- Save the contact object as a template.
- Output the generated contacts array of objects as a data pill.
- Test the action with a sample department.

1. Create an application to store your work.
   Use the Guided Application Creator.
   For example, create My Application.

   The system displays the Flow Designer landing page.

3. Select New > Action
   The system displays the Action Properties dialog.

4. Enter these sample values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Contacts Array Of Objects</td>
</tr>
<tr>
<td>Application</td>
<td>My Application</td>
</tr>
<tr>
<td>Accessible From</td>
<td>All application scopes</td>
</tr>
</tbody>
</table>

5. Select Submit.
   The system displays the Action Designer interface.

6. From the Action Outline, select Inputs > Create Input
   The system displays a new action input.

7. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Department</td>
</tr>
<tr>
<td>Type</td>
<td>Record.Department [Reference.cmn_department]</td>
</tr>
<tr>
<td>Mandatory</td>
<td>True</td>
</tr>
</tbody>
</table>

8. From the Action Outline, select Add a new step.
   The system displays a list of available steps.

9. Select Look Up Records
10. Configure the step with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>User [sys_user]</td>
</tr>
<tr>
<td>Conditions</td>
<td>[Department][is][action-&gt;Department]</td>
</tr>
<tr>
<td>Order by</td>
<td>Name</td>
</tr>
<tr>
<td>Sort Type</td>
<td>a to z</td>
</tr>
<tr>
<td>Max Results</td>
<td>3</td>
</tr>
</tbody>
</table>

**Note:** This example limits the **Max Results** setting to three records just for demonstration purposes.

11. From the Action Outline, select **Add a new step**.
   The system displays a list of available steps.
12. Select **Script**.
13. For **Required Runtime**, select **Instance**.
14. From the Input Variables section, select **Create Variable**.
15. Configure the input variable with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>userRecords</td>
</tr>
<tr>
<td>Value</td>
<td>[step-&gt;Look Up Records step-&gt;Records]</td>
</tr>
</tbody>
</table>

**Note:** You can select the **User records** data pill from the Data pane or from the Data Pill Picker button.

16. For **Script**, enter the following text.

   ```javascript
   (function execute(inputs, outputs) {
       // Create an empty array
       var contactsArray = [];
       var i = 0;
       // Iterate through the list of User records
       while (inputs.userRecords.next()) {
           // Create an empty object for each iteration
           var contactObject = {};
           // Query User records to assign object values
           contactObject.first_name = inputs.userRecords.getValue('first_name');
           contactObject.last_name = inputs.userRecords.getValue('last_name');
           contactObject.email = inputs.userRecords.getValue('email');
           // Add current object to array
           contactsArray[i] = contactObject;
           i += 1;
       } 
       outputs.contacts = contactsArray;
   })(inputs, outputs);
   ```

17. From Output Variables, select **Create Variable**.
18. Configure the output variable with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>contacts</td>
<td>contacts</td>
<td>Array.Object</td>
<td>True</td>
</tr>
</tbody>
</table>

19. Expand the contacts Array.Object, and rename the child item as contact.

20. From the row for the contact Object, select **Add Child Item**.

21. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>first name</td>
<td>first_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

22. From the row for the contact Object, select **Add Child Item**.

23. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>last name</td>
<td>last_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

24. From the row for the contact Object, select **Add Child Item**.

25. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>email address</td>
<td>email_address</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

26. From the row for the contact Object, select **Toggle Advanced Inputs**.

27. From the Advanced Options, select **Save As Template**.
   The system displays the Save As Template dialog.

28. For **Enter a Name**, enter *contact*.

29. Click **Save**.

30. From the Action Outline, select **Outputs > Create Output**.

31. Configure the Action Output with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>contacts</td>
<td>contacts</td>
<td>Array.Object</td>
<td>True</td>
</tr>
</tbody>
</table>

32. Expand the contacts Array.Object.

33. From the row for the contact Object, select **Toggle Advanced Inputs**.

34. From the Advanced Options, select **Structure > Start from Template**.
   The system displays **Template**.

35. For **Template**, select the template you previously saved.
   For example, select *My application: contact*.

36. Select **Exit Edit Mode**.
   The System displays the output fields you created.

37. For **contacts**, select **[step->Script step->contacts]**.
   
   **Note:** You can select the Script step **contacts** data pill from the Data pane or from the Data Pill Picker button.

38. Click **Save**.

39. Select **Test**.
   The system displays the Test Action dialog.
40. Enter the following test value:

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Department</td>
<td>Development</td>
</tr>
</tbody>
</table>

41. Select **Run Test**.
The system runs the action with the test values provided.

42. Select **Action has executed. To view the action, click here**.
The system displays the action execution details.

43. Review the runtime value for the action **Output data**.
The system displays output data in JSON format.

For this example, the contacts object contains an array of contact objects with first name, last name, and email information for three users in the Development department.

```json
{
  "contacts": [  
    {
      "email_address": "allyson.gillispie@example.com",
      "first_name": "Allyson",
      "last_name": "Gillispie"
    },
    {
      "email_address": "alva.pennigton@example.com",
      "first_name": "Alva",
      "last_name": "Pennigton"
    },
    {
      "email_address": "andrew.och@example.com",
      "first_name": "Andrew",
      "last_name": "Och"
    }
  ]
}
```

You have a custom action that looks up the Users for a given department and converts those users into an array of contact objects.

Customize this action to use your own logic.

**Inline scripts**

Enable users with coding experience to write inline scripts that set and modify input values during the configuration of an action or flow. Use inline scripts to modify input values that require small format conversions, data transformations, or math operations.

Flow Designer displays a Script button when you configure these components.

- Action instance inputs when you configure the action for a flow
- Action instance outputs when you configure the action for a flow
- Flow logic inputs when you configure the flow logic for a flow
- Flow logic outputs when you configure the flow logic for a flow
- Step inputs when you configure the step for an action
- Subflow inputs when you configure the subflow for a flow
- Subflow outputs when you configure the subflow for a flow
Inline scripts must return values in the same data type as the input expects. For example, an inline script for a Record input must return a GlideRecord object and an inline script for a Date input must return a date-time value. Always test actions and flows containing inline scripts, and verify that there are no runtime errors in the flow execution details.

Script writers should be familiar with Now Platform table structures and field types. In addition, they should know how to work with record and system data using the ServiceNow API.

Benefits

Inline scripts offer these benefits.

- Enable simple data conversion or transformation without having to create custom actions or flows.
- Identify which input data a script affects.
- Restricted access to scripting features to users or groups who are knowledgeable with the available ServiceNow APIs.

Access to inline script

You can grant users access to online scripting by either granting them the flow_designer_scripting role or the Allow Scripting delegated development permission. Both the role and the developer permission display a script button field for each Flow Designer input.

Script button

When you enable a user to create inline scripts, Flow Designer displays a script button next to flow and step inputs.
Clicking the **Script** button opens the Script editor, which replaces the standard input interface. Enter a script to compute the input value. Script writers can use the `fd_data` object to access data from previous actions and steps. Ensure your script includes a `return` statement with the results of your script. For example, `return shortDesc;` returns the value of the `shortDesc` variable.

**Script editor for input**

Clicking the **Collapse Script** button hides the Script editor and displays a read-only version of the input. Clicking the **Expand Script** button displays the Script editor and allows you to edit the script.
Design considerations

Follow these design guidelines to create reusable and maintainable inline scripts.

**Write inline script for small non-reusable logic**

Use inline script to format or modify the data for specific inputs and use cases. For reusable logic, create an action or subflow instead.

**Create custom actions or subflows for reusable code rather than inline script**

Create custom actions or subflows for reusable or complex data logic such as changing the data type of source data. You may also want to provide custom actions or subflows for flow designers who are not comfortable with code.

**Avoid duplicating action and flow functionality**

Avoid writing inline script that duplicates action and flow functionality. For example, rather than write inline script to perform record operations, use the create and update record baseline actions.

**Avoid data type changes**

Avoid runtime errors by verifying that your inline script provides information in the same data type as the input or output expects.

**Create variables by declaring them with the var keyword**

Use the `var` keyword to declare variables so that they remain within the proper JavaScript scope. When you create a variable by assigning it a value, JavaScript may attach it to the global object, which can result in variable values persisting outside of the local scope and causing errors.

**Process records outputs with For Each flow logic and the flow data object**

Inline script can only access the `records` output of a Look Up Records action from For Each flow logic. Add a Look Up Records action to the flow to generate the records output. Add a For Each flow logic to the flow to process each record in the records output. Create an inline script reference to the For Each flow
logic using the fd_data and item objects. For example, this reference assumes the For Each flow logic is the second item in your flow outline $fd_data._2__for_each.item$.

**Use type ahead suggestions to generate references to flow and action data.**

Create references to flow and action data using the fd_data object. The script editor displays type ahead suggestions for existing flow and action data when you type $fd_data$. Select a suggestion to build references to flow and action data.

![Note: Refer to record data in a For Each flow logic using the item object.](image)

**Licensing considerations**

Inline scripts that call integration APIs are subject to IntegrationHub licensing.

**Code editor**

The code editor provides text editor support for inline scripts.

The code editor has these features for the supported language services and scripts.  
- Syntax coloring, indentation, line numbers, and automatic creation of closing braces and quotes  
- Auto-suggestions and auto-completions

```
/*
**Access Flow/Action data using the fd_data object. Script must return a value.
**example: var shortDesc = fd_data.trigger.current.short_description;
**return shortDesc;
*/
return(Math.sqrt(64));
```

**Editing tips**

- To insert a fixed space anywhere in your code, press Tab.  
- To indent a single line of code, click in the leading white space of the line and then press Tab.
• To indent one or more lines of code, select the code and then press Tab. To decrease the indentation, press Shift+Tab.
• To remove one tab from the start of a line of code, click in the line and press Shift+Tab.
• To declare variables, use the `var` keyword so that they remain within the proper JavaScript scope.

**Action Designer**

Automate a task with a sequence of related steps such as lookup a record, create a record, and log details about the record creation. Actions separate complexity from the Flow Designer environment, enabling flow designers to add actions to multiple flows with minimal configuration.

Using Action Designer, subject matter experts can:

• Create application-specific actions with pre-set configuration details, enabling process analysts to easily add actions to a flow with little configuration.
• Create scripted actions that appear code-less when added to a flow.
• Build integrations using IntegrationHub.

**Custom actions**

Unlike core actions where flow designers must manually configure flow logic, custom actions always use the same configuration when added to a flow. If your flow designers often use an action with the same configuration, you might create a reusable action.

A reusable action includes these components.

**Inputs**

*Inputs* are data variables used in your action. For example, if an action step creates a record in the incident table, your input might be a reference to the incident table. Once added as an input, the table and its fields are available to steps and outputs in the flow.

Each input you define for an action becomes a configuration option in the Flow Designer interface. To use the action in a flow, flow designers must define a value for each mandatory input. The more inputs an action has, the more data flow designers must define and the more familiar they must be with the underlying data model to use the action effectively.

Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring an action to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see field types.

**Action steps**

An *action step* or step is a single reusable operation within an action. For example, the Create Record step allows action designers to specify the table and field values to use during record creation. Action steps require subject matter expertise with application tables, fields, and business logic. Application developers or IT generalists add action steps to actions from the Action Designer design environment. Flow Designer provides a set of core action steps to automate Now Platform processes. You can add application-specific action steps by activating the associated spoke.

**Outputs**

*Outputs* are data variables that represent the results of the action. These results are available to other actions in a flow.
**Action Designer environment**

Subject matter experts build custom actions in Action Designer.

Create and edit actions by defining inputs and adding action steps. Test actions to verify if they complete successfully and review the runtime values they generate. Copy actions to use existing actions as templates. Publish actions to activate them, which makes them available to activated flows and to preserve their current action steps, variables, and sequence as a snapshot separate from further configuration changes.

**Testing actions**

After adding inputs and action steps, users with the flow_designer role can test an action. To test an action, users must provide the required inputs.

- **Note:** Inputs must be provided for all the mandatory fields.

Flow designers should always test actions on non-production instances containing relevant demonstration data since testing an action creates or changes records on the instance.

- **Note:** User must have the flow_designer or admin role to view the executions.

**Roles**

To create custom actions, a user must have the action_designer or admin roles.

**Action input and output data types**

You can define input variables for your Flow Designer actions. Input variables and data used in action steps can be defined as output variables.

Action inputs are data variables with a name and data type. You must associate some data types with a reference table, which makes the record and fields available to the action steps. Available data types include:
- Array
  - Array.Boolean
  - Array.Choice
  - Array.Datetime
  - Array.Integer
  - Array.Object
  - Array.String
- Audio
- Choice
- Color
- Condition String
- Conditions – Reference table required
- Currency
- Data Structure
- Date
- Date/Time
- Document ID – Reference table required
- Due Date
- Duration
- Dynamic Choice
- Dynamic Template
- Encrypted Text
- Field Name
- Floating Point Number
- HTML
- IP Address (Validated IPV4, IPV6)
- Icon
- Image
- Integer
- Journal
- Journal Input
- Journal List
- List
- Long
- Name-Value Pairs
- Password (1 Way Encrypted)
- Password (2 Way Encrypted)
- Percent Complete
- Phone Number (E164)
- Price
- Records – Reference table required
- Reference – Reference table required
- Script
- Script (Plain)
- String
- String (Full UTF-8)
- Table Name
- Template Value – Reference table required
- Time
Advanced options for action inputs

Use advanced options to further configure your inputs.

All

The following options are available for all advanced inputs.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name that identifies the array in script calls.</td>
</tr>
<tr>
<td>Hint</td>
<td>Text to display to flow designers so they know what information the array contains.</td>
</tr>
<tr>
<td>Default Value</td>
<td>The value used when an input value is not provided. For example, the default selection of a choice field or a default string in a string field.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>The input requires a value.</td>
</tr>
</tbody>
</table>

Some action inputs have additional options. The details of these options are listed below.

Array

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max Rows</td>
<td>The maximum number of rows you want to display in the user interface. This does not set a limit on the maximum number of rows in the array object.</td>
</tr>
</tbody>
</table>

Array.Choice

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max length</td>
<td>The maximum length the system stores for an input choice value. Use this option to restrict the length of input values stored during action design.</td>
</tr>
<tr>
<td>Choice</td>
<td>Select from:</td>
</tr>
<tr>
<td></td>
<td>• Dropdown with --None--</td>
</tr>
<tr>
<td></td>
<td>• Dropdown without --None--</td>
</tr>
</tbody>
</table>
### Choice list

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choice list</td>
<td>Select from:&lt;br&gt;• <strong>Create New Choice list</strong> to manually create choices. Use the add button (+) to create a choice with <strong>Name</strong>, <strong>Value</strong>, and <strong>Order</strong> values.&lt;br&gt;• <strong>Reference existing choice list on a table</strong> to select a choice list from and field on an existing table using the <strong>Choice Table</strong> and <strong>Choice field</strong> buttons.</td>
</tr>
</tbody>
</table>

### Array.Object

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Structure</td>
<td>Select from:&lt;br&gt;• <strong>Create Structure Manually</strong>&lt;br&gt;• <strong>Start from Template</strong></td>
</tr>
<tr>
<td>Template</td>
<td>Select a template to use for this array.</td>
</tr>
<tr>
<td>Save as Template</td>
<td>Save the current array as a template.</td>
</tr>
</tbody>
</table>

### Array.String

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max Length</td>
<td>The maximum length the system stores for an input string value. Use this option to restrict the length of input values stored during action design.</td>
</tr>
</tbody>
</table>

### Password (2 Way Encrypted) design considerations

Follow these guidelines when designing flows containing Password (2 Way Encrypted) data.

- To specify the encryption algorithm and the roles allowed to access encrypted data, see Setup encryption contexts.
- Flow Designer prevents manual entries in Password (2 Way Encrypted) values in flow inputs.
- Fields containing Password 2 data cannot be used in conditions.
• To assign a value to a password2 field, drag an existing password2 data pill. Dragging values from other field types is not supported. Flow Designer presents a warning message when password2 data is required.

• Flow Designer prevents dragging Password2 data pills into other field types, and presents a warning message when the field is incompatible type.

• Flow Designer only allows Password2 data pills to be dragged into the following field types.
  • Email body fields
  • HTML fields
  • Password 2 Fields
  • PowerShell Input Variables
  • REST fields
    • Variables
    • REST payload body
    • Query parameters
    • Headers
    • REST multi-part form values
    • Form URL-encoded values
  • SOAP fields
    • Headers
    • Envelope

Flow Designer performs a validation check when a user saves, publishes, or tests actions and flows. This check shows an alert for any data pills dropped in restricted field types and prevents the action or flow from executing. Update the action or flow to remove the invalid data pill and then retry the action.

**Retry policy**

Automatically retry failed requests when a step encounters an intermittent issue such as a network failure or request rate limit. Set a retry policy to prevent having to manually triggering the step again.

**Features**

Retry policies can be:
• Created to support connection timeouts or failed requests based on header, status, response body, error, and HTTP method.
• Applied to all actions that use a given connection alias.
• Applied directly to an action step

Retry policies can be used to define:
• The conditions that must be met to retry a step.
• The time interval to wait before retrying a step.
• The maximum number of retry attempts the step makes before stopping.

Associate a default retry policy to a Connection & Credentials alias and apply the retry policy to all HTTP connections.

Note: You can only create retry policies for REST and SOAP steps.

Create a retry policy
Create a retry policy to automatically retry failed requests when a step encounters an intermittent issue.
Role required: flow_designer or admin
1. Navigate to IntegrationHub > Retry Policy > Create New.
2. On the form, fill in the fields.

Retry Policy form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the retry policy.</td>
</tr>
<tr>
<td>Connection Type</td>
<td>HTTP</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions that must be met to trigger the retry policy. Conditions that trigger a retry policy include the is, is not, contains, and contains not operators.</td>
</tr>
</tbody>
</table>
| Retry Strategy    | • Exponential Backoff: Option to exponentially increase the time interval for the subsequent retry attempts. The multiplier is 2.  
|                   | • Fixed Interval: Option to specify a fixed time interval after which a retry attempt should be made. |
| Interval (seconds)| Time interval in seconds after which a retry attempt should be made.        |

Note: If Retry Strategy is Exponential Backoff, the time interval exponentially increases after every retry attempt till the maximum numbers of attempts is reached.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Maximum number of retry attempts. If no value is specified, the maximum number of retry attempts is based on the value provided in the <code>glide.fdih.retry.max_count</code> system property. Default value of the <code>glide.fdih.retry.max_count</code> system property is 0. For more information about system properties, see <a href="#">Available system properties</a>.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.
Retry policy with Retry Strategy as Exponential Backoff

In this example, the policy is defined to attempt retry when one of these conditions is met:

- HTTP Method is GET and Error is Connection Timeout
- HTTP Method is GET and Status Code is 429
When the condition is met, retry attempts are made for a maximum number of three times. The time interval between the retry attempts is exponentially increased. The time intervals in this example are 10 seconds, 20 seconds, and 40 seconds.

- Create Connection & Credential alias, if you do not have the required alias.
- Assign the retry policy as **Default Retry Policy** to the required Connection & Credential alias.

**Note:** A default retry policy is provided and is selected as **Default Retry Policy**. If you have created retry policies, you can select the required policy as **Default Retry Policy**.

- Create an HTTP(s) Connection in the Connections related list for the Connection & Credential alias. For more information, see credentials, connections, and aliases.
- Verify and view the details of the retry attempts by navigating to **System Logs > Outbound HTTP Requests**.

**Dynamic inputs**

Build dynamic choice and template inputs for an action. Dynamically display and assign values to the inputs during flow design.

**Note:** Dynamic inputs are not available in the base system. To use dynamic inputs in Flow Designer, you must request a ServiceNow® IntegrationHub Enterprise Pack subscription.

During flow design, dynamic inputs retrieve values and display them as inputs within an action dynamically. Dynamic input types include:

- Dynamic choice
- Dynamic template

A dynamic input must point to a data gathering action that collects the data it displays. For example, a data gathering action can retrieve values from a third-party system and populate a dynamic choice for an action that runs in an IntegrationHub spoke. To use a dynamic input in Flow Designer:

1. An action designer creates a data gathering action.
2. An action designer creates a parent action with a dynamic input that points to the child data gathering action.
3. A flow designer adds the parent action to a flow.

**Data gathering actions**

A data gathering action collects data, typically from a third-party system via a REST call, and dynamically builds its output based on the returned payload. A data gathering action must:

- Have a **script step** that contains an output variable of type JSON.
- Have an action output named **output** of type JSON whose value is derived from the script step's JSON output variable.

**Note:** The action can have multiple outputs, but there can only be one of type JSON.

- Format the payload in the script step so that **output** has a property named **data**.
• Wait for up to 300 seconds (5 minutes) to gather data before it times out.

**Note:** To change the timeout period for a data gathering action, modify the value of the `sn_flow_designer.sync_action_execution_timeout_in_seconds` system property.

### Dynamic choice

A dynamic choice displays gathered data as a list of choice values during flow design. For more information on building a dynamic choice, see Create a data gathering action for a dynamic choice.

### Dynamic template

A dynamic template displays a gathered list of fields whose associated values can be specified during flow design. Since the list of fields populates using a dynamic action, there is no need to change the flow if new fields are added to or removed from the table accessed in the data gathering action. For more information on building a dynamic template, see Create a data gathering action for a dynamic template.

### Design considerations

#### Consider dynamic inputs for third-party integrations

Dynamic inputs allow you to create flows that fetch data dynamically from external sources. In third-party integrations, dynamic inputs can provide data values pertaining to a particular endpoint. For more information on setting up third-party integrations with Flow Designer, see IntegrationHub.

#### Be aware of time required to retrieve large amounts of data

By default, dynamic inputs have up to 300 seconds to gather data before they time out. If your data gathering action needs more time to gather data, set the `sn_flow_designer.sync_action_execution_timeout_in_seconds` system property to a higher value. Long timeout values are not recommended for interactive flows where an end user must enter or select a value for the flow to continue.

#### Be aware of scripting errors

Since all data gathering actions use a script step, be aware of any potential errors that could arise from scripting. When using scripts to output JSON variables for your dynamic inputs, you may encounter errors which prevent inputs from receiving the JSON values they need. When a dynamic input scripting error occurs, the following warning message may appear.

![Warning: A dynamic action error occurred.](image)

**Message displayed for scripting error**

### Getting started with dynamic inputs

Create a sample action that builds a dynamic choice and dynamic template for use in a flow.
Role required: action_designer or admin

In this task, you will create a custom action that dynamically generates a list of tables and associated fields in your instance. To accomplish this, you will create two data gathering actions: one that collects a list of tables in your instance, and another that collects a list of fields for the selected table. Each data gathering action will consist of the following:

- A REST step to gather table and field data from your instance.
- A script step to construct the payload from the REST step’s Response Body.
- An output variable named output of type JSON.

You will then use these data gathering actions to build a dynamic choice and a dynamic template. Finally, you will create a custom action that calls the data gathering action during flow design.

Note: This task recreates the demo actions that are installed when you request a ServiceNow® IntegrationHub Enterprise Pack subscription for your instance.

1. Navigate to Flow Designer > Designer.
2. Click the New button and select New Action.
   a) Enter Get ServiceNow Tables (Dynamic) for the Name.
   b) Click Submit.
3. Under Action Outline, click the Add a new step(+) icon under Inputs and select the REST step. Enter the following information.

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Leave Use Connection Alias selected</td>
</tr>
<tr>
<td>Connection Alias</td>
<td></td>
</tr>
<tr>
<td>Build Request</td>
<td>Leave Manually selected</td>
</tr>
<tr>
<td>Resource Path</td>
<td>Enter api/now/doc/table/schema</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>Enter GET</td>
</tr>
</tbody>
</table>

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
4. Under **Action Outline**, click the **Add a new step** icon under your REST step and select the **Script** step.
   a) In the **Input Variables** section, click **Create Variable**.
   b) Enter **payload** as the **Name**.
   c) For the **Value**, click the data pill picker and select **REST Step > Response Body**.
   d) Enter the following code for the **Script**.

```javascript
(function execute(inputs, outputs) {
    var payload = JSON.parse(inputs.payload);
    var tables = payload.result
        .filter(function(table) { return table.value.indexOf('_') < 0; }) // Filter the tables we want
        .map(function(table) {
            return { label: table.label, name: table.value }; // Final, properly formatted output
        });
    outputs.tables = { data: tables }; // Final, properly formatted output
})(inputs, outputs);
```

   e) In the **Output Variables** section, click **Create Variable**.
   f) Enter **tables** for the **Label** and **Name**.
   g) Select **JSON** as the **Type**.

5. Under **Action Outline**, click **Outputs**.
   a) Click **Create Output**.
   b) Enter **output** for the **Label** and **Name**.
   c) Select **JSON** as the **Type**.
   d) Click **Exit Edit Mode**.
   e) For the **Value**, click the data pill picker and select **Script Step > tables**.

6. Click **Save** and then **test the action**.
   a) Click **Run Test**.
   b) Check the action’s execution details. Your data gathering action runs successfully if the runtime value for **tables** is a complex object containing an array of key-value pairs for **label** and **name** as shown in the following abbreviated example.

```json
{
    "data": [
        {
            "name": "sla",
            "label": "Agreement"
        },
        {
            "name": "announcement",
            "label": "Announcement"
        },
        {
            "name": "cmdb",
            "label": "Base Configuration Item"
        }
    ]
}
```
7. Click **Publish** to make the **Get ServiceNow Tables (Dynamic)** action available to other flows and actions within the **Global** scope.

8. Click the **Create flow, subflow, or action** icon and select **Action**.
   a) Enter **Get ServiceNow Fields (Dynamic)** for the **Name**.
   b) Click **Submit**.

9. Under **Action Outline**, click **Inputs**.
   a) Click **Create Input**.
   b) Enter **Table** for the **Label** and **Name**.
   c) Select **String** as the **Type**.
   d) Toggle the **Mandatory** slider so that it is active.

10. Under **Action Outline**, click the **Add a new step** icon under **Inputs** and select the **REST** step. Enter the following information.

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Leave Use Connection Alias selected</td>
</tr>
<tr>
<td>Connection Alias</td>
<td><img src="image" alt="Create new record" /> icon to create a new HTTP(s) connection, or use an existing connection for your instance. The Credential for the HTTP(s) connection must use basic auth. Additionally, the Connection URL must be the base URL for your instance, including the forward slash at the end.</td>
</tr>
<tr>
<td>Build Request</td>
<td>Leave Manually selected</td>
</tr>
<tr>
<td>Resource Path</td>
<td>Enter api/now/table/ and then click the data pill picker ( ), Select Inputs &gt; Table.</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>Enter GET</td>
</tr>
</tbody>
</table>

11. Under **Action Outline**, click the **Add a new step** icon under your REST step and select the **Script** step.
   a) In the **Input Variables** section, click **Create Variable**.
   b) Enter **payload** as the **Name**.
   c) For the **Value**, click the data pill picker ( ) and select **REST Step > Response Body**.
   d) Enter the following code for the **Script**.

```
```
(function execute(inputs, outputs) {
    var payload = JSON.parse(inputs.payload);
    var fields = Object.keys(payload.result[0]).
        map(function(property) {
            return {
                label: property.charAt(0).toUpperCase() +
                property.slice(1).replace(/\_/g, ' '),
                name: property,
                value: '' // value is always empty
            };
        });
    outputs.fields = { data: fields }; // final properly formatted output
})(inputs, outputs);

e) In the Output Variables section, click Create Variable.
f) Enter fields for the Label and Name.
g) Select JSON as the Type.

a) Click Create Output.
b) Enter output for the Label and Name.
c) Select JSON as the Type.
d) Click Exit Edit Mode.
e) For the Value, click the data pill picker () and select Script Step > fields.

13. Click Save and then test the action.
a) Enter incident for the Table input.
b) Click Run Test.
c) Check the action's execution details. Your data gathering action runs successfully if the runtime value for fields is a complex object containing an array of key-value pairs for label, name, and value as shown in the following abbreviated example.

```json
{
    "data": [
        {
            "name": "Parent",
            "label": "parent",
            "value": ""
        },
        {
            "name": "Made sla",
            "label": "made_sla",
            "value": ""
        },
        {
            "name": "Caused by",
            "label": "caused_by",
            "value": ""
        },
        {
            "name": "Watch list",
            "label": "watch_list",
            "value": ""
        }
    ]
}
```
14. Click **Publish** to make the Get ServiceNow Fields (Dynamic) action available to other actions within the Global scope.

15. Click the **Create flow, subflow, or action** icon and select **Action**.
   a) Enter Create ServiceNow Record (Dynamic) for the **Name**.
   b) Click **Submit**.

16. Under **Action Outline**, click **Inputs**.
   a) Click **Create Input**.
   b) Enter **Table** for the **Label** and **Name**.
   c) Select Dynamic Choice as the **Type**.
   d) Toggle the **Mandatory** slider so that it is active.
   e) Expand the **Advanced options**.
   f) Under **Dynamic Options**, select Get ServiceNow Tables (Dynamic) as the **Action**.
   g) Click **Create Input** to create another action input.
   h) Enter **Fields** for the **Label** and **Name**.
   i) Select Dynamic Template as the **Type**.
   j) Toggle the **Mandatory** slider so that it is active.
   k) Expand the **Advanced options**.
   l) Under **Dynamic Options**, select Get ServiceNow Fields (Dynamic) as the **Action**.
   m) Toggle the **Depends-On Another Input** slider to make it active.
   n) Select **Table** for the **Table** input.

17. Under **Action Outline**, click the **Add a new step** icon under **Inputs** and select the **Script** step.
   a) In the **Input Variables** section, click **Create Variable**.
   b) Enter **table** as the **Name**.
   c) For the **Value**, click the data pill picker and select **Inputs > Table**.
   d) Click **Create Variable** to create another input variable.
   e) Enter **fields** as the **Name and String**.
   f) For the **Value**, click the data pill picker and select **Inputs > Fields**.
   g) Enter the following code for the **Script**.

```javascript
(function execute(inputs, outputs) {
  var now_GR = new GlideRecord(inputs.table);
  gr.applyEncodedQuery(inputs.fields);
  gr.insert();
})(inputs, outputs);
```
18. Click **Save** and then test the action.
   a) Select any dynamically-generated choice value for the Table input.
   b) Click **Add Field Value**. Then, select a field and enter any value.
   c) Click **Run Test**.
   d) Check the action’s execution details. Your action runs successfully if the runtime values for Table and Field match the values you entered for the test.

19. Click **Publish** to make the Create ServiceNow Record (Dynamic) action available to flows within the Global scope.

You can now add the Create ServiceNow Record (Dynamic) action to a flow in Flow Designer. This sample action dynamically generates a list of tables and associated fields in your instance whose values you can assign during flow design.
Create a data gathering action for a dynamic choice

Create an action to collect input values to pass to a parent action as a dynamic choice.

Role required: action_designer or admin

1. Navigate to Flow Designer > Designer.
2. Click the New button and select New Action.
3. Enter a Name for your action and choose the proper Application scope. Then, click Submit.
4. Under Action Outline, click the Add a new step icon under Inputs and select the REST step. Configure your REST step to get data from the proper Base URL and Resource Path with any applicable Query Parameters for the HTTP Method GET. For more information on using the REST step in IntegrationHub, see REST step and REST in IntegrationHub.
5. Under Action Outline, click the Add a new step icon under your REST step and select the Script step. This script step must transform the REST step’s Response Body into a format that can be used as a dynamic choice for a parent action. Format the JSON output variable so that it contains a property named data with a structure similar to the following example.

```
{
    data: [
        {
            label: "Choice Option 1",
            name: "choice_option_1"
        },
        {
            label: "Choice Option 2",
            name: "choice_option_2"
        },
        {
            label: "Choice Option 3",
            name: "choice_option_3"
        }
    ]
}
```

6. Under Action Outline, click Outputs. Create an output named output of type JSON. Then, use the data pill picker to assign the data pill for the JSON output variable from your script step to the action output’s Value.

**Note:** The action can have multiple outputs, but there can only be one of type JSON.

7. Click Save and test the action. In the execution details, your data gathering action runs successfully if the runtime value for output contains the data property in the proper format.
8. Click Publish to make the action available to other flows and actions within the same application scope.
You can now use your data gathering action to populate the options that appear for a dynamic choice input in a parent action.

Create a data gathering action for a dynamic template

Create an action to collect input values to pass to a parent action as a dynamic template.

Role required: action_designer or admin

1. Navigate to Flow Designer > Designer.
2. Click the New button and select New Action.
3. Enter a Name for your action and choose the proper Application scope. Then, click Submit.
4. Under **Action Outline**, click the **Add a new** step icon under **Inputs** and select the REST step. Configure your REST step to get data from the proper **Base URL** and **Resource Path** with any applicable **Query Parameters** for the **HTTP Method GET**. For more information on using the REST step in IntegrationHub, see **REST step** and **REST in IntegrationHub**.

5. Under **Action Outline**, click the **Add a new step** icon under your REST step and select the **Script** step. This script step must transform the REST step's **Response Body** into a format that can be used as a dynamic choice for a parent action. Format the JSON output variable so that it contains a property named **data** with a structure similar to the following example.

   ```json
   {
     data: [
       {
         label: "Template Option 1",
         name: "template_option_1",
         value: ""
       },
       {
         label: "Template Option 2",
         name: "template_option_2"
       },
       {
         label: "Template Option 3",
         name: "template_option_3",
         value: "",
         type: "choice",
         choices: [
           { label: "Choice 1", value: "choice_1" },
           { label: "Choice 2", value: "choice_2" }
         ]
       }
     ]
   }
   ```

   **Note:** The JSON output structure for a dynamic template can include the optional properties **type** and **choices**.

   - **type**: Specify a valid field type to render the appropriate UI control for the dynamic template.
   - **choices**: If specifying **choice** for the **type** property, you can then specify an array of choice options that will render in a list for the dynamic template.

6. Under **Action Outline**, click **Outputs**. Create an output named **output** of type JSON. Then, use the data pill picker icon to assign the data pill for the JSON output variable from your script step to the action output's **Value**.

   **Note:** The action can have multiple outputs, but there can only be one of type JSON.

7. Click **Save** and **test the action**. In the execution details, your data gathering action runs successfully if the runtime value for **output** contains the **data** property in the proper format.

8. Click **Publish** to make the action available to other flows or actions within the same application scope.
You can now use your data gathering action to populate the options that appear for a dynamic template input in a parent action.

Dynamic input configuration options

Use these options to configure your dynamic inputs for a parent action.

Dynamic input configuration

Dynamic input options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter a label that will appear for the action input when the action is added to a flow.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the dynamic choice or template.</td>
</tr>
<tr>
<td>Max length</td>
<td>Enter the maximum character length for one choice or template field value.</td>
</tr>
<tr>
<td>Hint</td>
<td>Enter a hint to display for the dynamic input.</td>
</tr>
<tr>
<td>Choice</td>
<td>Select from</td>
</tr>
<tr>
<td></td>
<td>• Dropdown with --None--</td>
</tr>
<tr>
<td></td>
<td>• Dropdown without --None--</td>
</tr>
<tr>
<td>Default Value</td>
<td>Enter a string value to use as a default for the dynamic input.</td>
</tr>
<tr>
<td>Action</td>
<td>Select a data gathering action that generates values as JSON output.</td>
</tr>
<tr>
<td>Depends-on Another Input</td>
<td>Enable this option to require an input value from the parent action to be passed as an input to the data gathering action. If enabled, select a dependent input from the parent action.</td>
</tr>
</tbody>
</table>

### Create an action

Create a reusable component to automate one or more steps of a process.

- Set up an application in Guided Application Creator to store Flow Designer content.
- Role required: flow_designer, action_designer or admin

Action designers should know the application table structure and be aware of any existing business logic associated with the target tables of an action. Be sure to disable any conflicting business rules or workflows before creating an action.

Creating a custom application to contain your Flow Designer content enables you to deploy it using the application repository or the ServiceNow Store.

1. Navigate to Flow Designer > Designer.
2. Click the Actions tab and select New Action.
3. Fill in the Action Properties and click **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the input. This value is used as the name of the data pill in the right-hand pane.</td>
</tr>
</tbody>
</table>

**Note:** Action input names can't include any of the following reserved system names:
- `sys_id`
- `sys_created_by`
- `sys_created_on`
- `sys_updated_on`
- `sys_updated_by`
- `sys_mod_count`

<table>
<thead>
<tr>
<th>Accessible From</th>
<th>Accessible from all application scoped or only within the specified application scope.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Defined category within the application scope for an action.</td>
</tr>
<tr>
<td>Protection</td>
<td>Select whether the action is read-only. You can only select a value when you create the action in an application scope you own. The default value is None.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the action.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the action.</td>
</tr>
<tr>
<td>In-Flow Annotation</td>
<td>Help text that appears under the action title in Flow Designer to help flow designers understand what the action does when used in a flow.</td>
</tr>
</tbody>
</table>

An empty action opens.

4. Define action inputs to make data available to the action steps and outputs.

a) Select `+ Create Input` and complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the input. This value is used as the name of the data pill in the right-hand pane.</td>
</tr>
</tbody>
</table>

**Note:** Action input names can't include any of the following reserved system names:
- `sys_id`
- `sys_created_by`
- `sys_created_on`
- `sys_updated_on`
- `sys_updated_by`
- `sys_mod_count`

| Type   | Data type of the input. For supported data types, see Action input and output data types. |
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reference Table</td>
<td>Reference table for the data type. Only required for the following data types:</td>
</tr>
</tbody>
</table>
|             | • Conditions  
|             | • Document ID  
|             | • Records  
|             | • Reference  
|             | • Template Value |

### Advanced options

Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring an action to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see field types.

Click ![view advanced options](image) to view the advanced options and define values.

Inputs are represented as data pills in the right-hand pane. You can add inputs to steps and outputs in the flow by dragging and dropping data pills.

5. Add an action step to perform an operation on the action inputs.
   a) Click the + underneath Inputs in the Action Outline.
   b) Select the step you would like to perform.
   c) Complete the fields in the step.

6. Add action outputs to make data available to a flow.
   a) Select + Create Outputs and complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the output. This value is the name of the data pill in the right-hand pane when the action is added to a flow.</td>
</tr>
</tbody>
</table>

**Note:** Action output names can't include any of the following reserved system names:

- sys_id
- sys_created_by
- sys_created_on
- sys_updated_on
- sys_updated_by
- sys_mod_count

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value</td>
<td>Data used previously in the action either in a step or input. Adding a variable to the output makes the value available to the flow.</td>
</tr>
</tbody>
</table>

7. Click **Save**. Action Designer saves a draft of the action.
Test the action until it is ready to be published.

Note: By default, the system only runs published actions.

Test an action

Test an action before publishing it for other users.

• Create an action and save it.
• Role required: flow_designer, flow_operator, action_designer, or admin.

Flow designers should always test actions on non-production instances containing relevant demonstration data since testing an action creates or changes records on the instance.

1. Navigate to Flow Designer > Designer.
2. Click the Actions tab and select the action you want to test.
3. Click Test.
   The system displays the Test Action dialog. The Test Action dialog contains all the inputs.
4. Provide the inputs for the action.

   Note: Inputs must be provided for all the mandatory fields.

5. Click Run Test.

Click Action has been executed. To view the action, click here to view the action execution details. See Flow execution details for information about the executions.

   Note: Users must have the flow_operator or admin role to view the executions.

Ask for Approval step

Request approval for a record with an approval field. You can configure a rule set for an approval, rejection, or cancellation. If a due date is added to an approval, the approval is automatically approved, rejected, or canceled if the approvers have not responded by the designated time.

Approvals is a platform feature that enables users or groups to approve or reject a task.

Roles and availability

• Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Select a record under the data panell and drag the record pill into the Record field. If selecting a table with an approval field already configured, the Approval field is set to the correct field.</td>
</tr>
<tr>
<td>Table</td>
<td>Set to the table name associated with the record.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Approval field</td>
<td>Select a field from the designated table to use for approval.</td>
</tr>
<tr>
<td>Journal field</td>
<td>Select a field from the designated table to use for journal.</td>
</tr>
</tbody>
</table>

**Rules**

Define the approval and rejection rules. Approval rules determine which users can approve or reject requests, and what happens after approval or rejection. Approval or rejection rules include:

- Anyone approves
- All users approve
- All responded and anyone approves
- % of users approve
- # of users approve

In the field beside the approval rule, add the desired approvers. To add approvers:

- Select individual users or groups.
- Drag-and-drop or select a field from a record.

Select to allow a manual approver to process an approval or rejection. A manual approver is a user manually added to the Approvers related list who can then approve the request. For example, you can manually add a subject matter expert to a task to approve the request. To learn more about adding manual approvers, see Generate approvals using the approvers related list.

Define rejection rules by adding another OR rule set. When defining approvals, include rejection rules that run when there are no matching approvals. Such rejection rules prevent the flow from remaining in a waiting state. For example, if an approval can be approved by anyone, create a time-based rejection rule in case no one approves it.

**Note:** If you set an approval rule with no rejection rule (or vice versa) and the expected approval state is not met, the runtime value will be canceled.

**Due Date**

Define a due date to ensure that the flow does not remain in a waiting state if the request is not approved or denied.

- None: The approval is not dependent on a specific date.
- Approve: Automatically approve the step if an action is still pending by the specified date.
- Reject: Automatically reject the step if an action is still pending by the specified date.
- Cancel: Automatically cancel the step if an action is still pending by the specified date.
Example

1. Ask for Approval step

Approval Request Definition

- **Record**: action INCIDENT
- **Table**: Incident [incident]
- **Approval Field**: Approval
- **Journal Field**: Approval history

**Rules**

- **Approve**: When:
  - Anyone approves

- **Reject**: When:
  - Anyone rejects

**Due Date**

- Approve if pending by Relative date 1 Days From action INCIDENT

Days schedule: 8-5 weekdays excluding holidays

Output

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval State</td>
<td>State of the approval request</td>
<td>Choice</td>
</tr>
</tbody>
</table>

Create Record step

Creates a record on any table. You can dynamically add and configure fields for the record.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select <strong>Short description</strong> and set the desired value. To add dynamic values, see <strong>Allow flow designers to dynamically set field values</strong>.</td>
</tr>
</tbody>
</table>

Create or Update Record step

Create or update a record in a ServiceNow table by determining if it already exists. Add records that do not exist, and update existing ones. Identify existing records by selecting unique fields. Set field values dynamically and enforce server-side validation rules (data policy, business rules, dictionary-defined mandatory fields). UI policy does not apply.

Roles and availability

Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Name</td>
<td>Table in which a record is created or updated.</td>
</tr>
<tr>
<td>Fields</td>
<td>Values of fields in the record to be created or updated.</td>
</tr>
<tr>
<td></td>
<td>If adding the action to a subflow, you can <strong>Allow flow designers to dynamically set field values</strong>. Dynamically set field values can trigger server-side validation rules such as data policies, business rules, and dictionary-defined mandatory fields, but cannot trigger UI policies.</td>
</tr>
<tr>
<td>Determines uniqueness</td>
<td>Option for selecting the field as a unique identifier. This field appears when the required table name and fields are selected.</td>
</tr>
</tbody>
</table>

Create Task step

Create a task on any ServiceNow task table. After you choose the task table, you can dynamically select the fields to configure the action. Defining the Parent field associates the task to a parent record.
Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a task table.</td>
</tr>
<tr>
<td></td>
<td>- Catalog Task [sc_task]</td>

</tr>
<tr>
<td></td>
<td>- Standard Change Proposal [std_change_proposal]</td>
</tr>
<tr>
<td></td>
<td>- Ticket [ticket]</td>
</tr>
</tbody>
</table>
### Field Values
Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select **Short description** and set the desired value. To add dynamic values, see Allow flow designers to dynamically set field values. To associate the task with a parent record, define the **Parent** field.

### Wait
Waits to complete the step until the task completes and is no longer active (active=false). Alternatively, you can add a wait condition by dragging-and-dropping a true/false field from the data panel into the **Wait** field. The flow only waits for the task to complete when the condition field is true.

### Delete Record step
Deletes a record on any table.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be deleted. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
</tbody>
</table>

### Log step
Logs a message in the Flow Designer log table.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log level</td>
<td>Level of importance of the log message.</td>
</tr>
<tr>
<td></td>
<td>• Error</td>
</tr>
<tr>
<td></td>
<td>• Warn</td>
</tr>
<tr>
<td></td>
<td>• Info</td>
</tr>
<tr>
<td>Log message</td>
<td>Message to display in the log. Enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>

Look Up Record step

Look up a record from any table based on defined conditions.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the Conditions field. When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format [reference field][is][Reference type data pill-&gt;Sys ID]. For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition [Requested by][is][action-&gt;incident-&gt;Caller-&gt;Sys ID] where incident is an input variable for an incident record.</td>
</tr>
<tr>
<td>Order by</td>
<td>Determines how to sort results when more than one record matches the defined conditions. Select the field you want to use to sort results.</td>
</tr>
<tr>
<td>Sort Type</td>
<td>Select whether to sort alphabetically in ascending or descending order.</td>
</tr>
<tr>
<td>If multiple records are found</td>
<td>Determines what is returned if more than one record matches the defined conditions.</td>
</tr>
<tr>
<td></td>
<td>• Return only the first record</td>
</tr>
<tr>
<td></td>
<td>• Fail the step</td>
</tr>
</tbody>
</table>
Example

### Look Up Record step

<table>
<thead>
<tr>
<th>Table</th>
<th>Incident [incident]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td></td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>is</td>
</tr>
<tr>
<td><strong>State</strong></td>
<td>is</td>
</tr>
<tr>
<td><strong>Short description</strong></td>
<td>is</td>
</tr>
<tr>
<td><strong>AND</strong></td>
<td></td>
</tr>
<tr>
<td><strong>New</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Email</strong></td>
<td></td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td><strong>New Criteria</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Order by</strong></td>
<td>Short description</td>
</tr>
<tr>
<td><strong>Sort Type</strong></td>
<td>a to z</td>
</tr>
<tr>
<td><strong>If multiple records are found</strong></td>
<td>Return only the first record</td>
</tr>
</tbody>
</table>

**Look Up Records step**

Look up multiple records on any table using defined conditions.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Conditions</td>
<td>Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the Conditions field. When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format [reference field][is][Reference type data pill-&gt;Sys ID]. For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition [Requested by][is][action-&gt;incident-&gt;Caller-&gt;Sys ID] where incident is an input variable for an incident record.</td>
</tr>
<tr>
<td>Order by</td>
<td>Select the field you want to use to sort results.</td>
</tr>
<tr>
<td>Sort Type</td>
<td>Select whether to sort alphabetically in ascending or descending order.</td>
</tr>
<tr>
<td>Max Results</td>
<td>Maximum number of results returned.</td>
</tr>
</tbody>
</table>

Example

1. Look Up Records step

Table  | Incident [incident]                                                                 |
Conditions  | All of these conditions must be met                                                                                                           |
          |  | Assigned to  | is | Bow Ruggeri  |  |
          |  | AND | State | is | New  |
          |  | or |  |  | New Criteria |  |
Order by | Short description                                                                                                                       |
Sort Type | a to z                                                                                                                                           |
Max Results | 1000                                                                                                                                          |
Notification step

Trigger a notification as a step within an action by selecting a record (such as an incident, change request, problem, or user record) to trigger a notification and defining the associated notification.

Notifications is a platform feature. Before triggering a notification as an action step in Flow Designer, ensure that the notification is set up for use in the platform.

- When you create or update the notification, set the Send when field in the When to send tab of the Notification form to Triggered.
- Verify that your users have an active primary email channel and that all their notifications are active.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Drag-and-drop an input record or a record from a previous step. This is the record that will trigger a notification.</td>
</tr>
<tr>
<td>Note: Some notifications are not associated with a specific record or table, such as the Passwords Require Updating notification. If configuring such a notification, leave this field blank.</td>
<td></td>
</tr>
<tr>
<td>Table name</td>
<td>Read-only. Set to the table of the triggering record.</td>
</tr>
<tr>
<td>Notification</td>
<td>Select the notification to be triggered. The notifications that can be selected are associated with the table of the specified record. If no record was selected, you can select a notification that does not have an associated record or table. To create notifications, see Create an email notification.</td>
</tr>
</tbody>
</table>

Example

1. Notification step

<table>
<thead>
<tr>
<th>Record</th>
<th>action→incident</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Name</td>
<td>Incident [incident]</td>
</tr>
<tr>
<td>Notification</td>
<td>Incident Priority Raised</td>
</tr>
</tbody>
</table>
Payload Builder step
Enable action designers to easily create name-value pairs in JSON and XML payloads using dynamic data.

Roles and availability

• Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
</table>
| Name Value Pairs| The name-value pairs to include in the payload. Click the plus icon to add name-value pairs. Drag data pills into either field to produce dynamic payloads. The Name becomes a key in JSON and an element in XML. For example, suppose you create this name-value pair.  
  • Name: short_description  
  • Value:[action]->[short_description]  
  When the system formats the name-value pair as JSON:  
  "short_description": "[action]->[short_description]"  
  When the system formats the name-value pair as XML:  
| Omit if empty   | The option to exclude a name-value pair if the value is empty or null.  
  Note: This field is only visible after clicking the down arrow to display advanced options. |
| Output Format   | The payload file format.  
  • JSON: Select to format the payload as a JSON document.  
  • XML: Select to format the payload as an XML document. |
<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Namespace</td>
<td>The XML namespace to apply to each element. For example, when the namespace is set to <code>incident:</code>&lt;br&gt;&lt;br&gt;<code>xml&lt;br&gt;&amp;lt;incident:short_description&amp;gt;[action]-&amp;gt;[short_description]&amp;lt;/incident:short_description&amp;gt;&lt;/xml&gt;</code>&lt;br&gt;&lt;br&gt;Note: This field is only visible when the <strong>Output Format</strong> is set to XML.</td>
</tr>
<tr>
<td>Include Outer Structure</td>
<td>The option to include or exclude a top level container appropriate to the output format. When the <strong>Output Format</strong> is JSON, curly braces contain the name-value pairs. When the <strong>Output Format</strong> is XML, a specified XML element contains the name-value pairs.&lt;br&gt;&lt;br&gt;For example, when the system formats the name-value pair as JSON:&lt;br&gt;&lt;br&gt;<code>{&lt;br&gt;&amp;quot;short_description&quot; : &amp;quot;[action]-&amp;gt;[short_description]&quot;&lt;br&gt;&amp;}&lt;br&gt;</code>&lt;br&gt;&lt;br&gt;When the system formats the name-value pair as XML:&lt;br&gt;&lt;br&gt;<code>&lt;xml&gt;&lt;br&gt;&amp;lt;short_description&amp;gt;[action]-&amp;gt;[short_description]&amp;lt;/short_description&amp;gt;&lt;br&gt;&amp;&lt;/xml&gt;</code></td>
</tr>
<tr>
<td>Send Empty Structure</td>
<td>The option to send valid JSON or XML structures when the payload is empty. Enable this option to include JSON or XML structural text in the payload.&lt;br&gt;&lt;br&gt;For example, when the system formats an empty structure as JSON:&lt;br&gt;&lt;br&gt;<code>{&lt;br&gt;&amp;}&lt;br&gt;</code>&lt;br&gt;&lt;br&gt;When the system formats an empty structure as XML:&lt;br&gt;&lt;br&gt;<code>&lt;xml&gt;&lt;/xml&gt;</code>&lt;br&gt;&lt;br&gt;Disable this option to produce an empty payload. Empty payloads can occur when you select the <strong>Omit if empty</strong> option for every name-value pair, and all name-value pairs in the payload produce empty values.</td>
</tr>
</tbody>
</table>
### ServiceNow® Now Platform capabilities

#### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent Node</td>
<td>The name of the XML element that contains the name-value pairs. The default parent node element is <code>xml</code>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when the Output Format is set to XML and the option to Include Outer Structure is enabled.</td>
</tr>
<tr>
<td>Preview</td>
<td>The read-only payload the step produces.</td>
</tr>
</tbody>
</table>

### PowerShell step

Run PowerShell scripts on remote machines from your ServiceNow instance through a MID Server.

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. ServiceNow supports PowerShell 2.0 and above. PowerShell 3.0 does not support Windows 2003 Server.

**Note:** PowerShell step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

### Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Type of connection to use.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Define Connection Inline:</strong> Define connection information within the action step.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Use Connection Alias:</strong> Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action.</td>
</tr>
<tr>
<td></td>
<td>To learn more about connections and credentials, see credentials, connections, and aliases.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
