Widgets can have as many or as few dependencies as needed. However, the more you add, the more content a widget must download to render on the page. Keep dependencies as small as possible for more efficient load times.

1. Create a dependency package.

   A dependency package is a collection of JavaScript and CSS files that can be then connected to a widget.

   a) Navigate to Service Portal > Dependencies.

   b) In the dependency record, define the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of your dependency. (Useful for selecting a dependency from a dropdown list.)</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for the dependency record.</td>
</tr>
<tr>
<td>Include on page load</td>
<td>Select if you want your dependency to be loaded onto the page on the initial page load of Service Portal, or leave unchecked to load the dependency only when the linked widget is loaded onto a page.</td>
</tr>
</tbody>
</table>
2. Add files to the dependency package.

After you save the information for your dependency package, use the related lists to add JS and CSS Include files. For each related list, include the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display name</td>
<td>Name of the script include.</td>
</tr>
<tr>
<td>Source</td>
<td>Depending on whether you add a JS Include or a CSS Include, select one of these options from the list:</td>
</tr>
<tr>
<td></td>
<td>• URL</td>
</tr>
<tr>
<td></td>
<td>• UI script (for a JS Include) or Style Sheet (for a CSS Include)</td>
</tr>
<tr>
<td></td>
<td>For a JS Include, use the UI Script field to reference a UI Script found in <strong>System UI &gt; UI Scripts</strong>.</td>
</tr>
<tr>
<td></td>
<td>For the CSS Include, use the Style Sheet field to reference a record in the <strong>sp_css</strong> table.</td>
</tr>
</tbody>
</table>

3. Add a dependency package to a widget.

After you have created a dependency package and added files, create a relationship between the dependency and a widget.

a) Navigate to **Service Portal > Widgets** and find the widget record you want to add the dependency to.

b) From the Dependencies related list, click **Edit**.

c) In the slushbucket, find the dependency you created and double-click to add it to the selected items column on the right.

d) Save the page to return to the widget record.

Include a font icon in a single widget

If you only want one widget to have access to a font icon, include the font icon in a single widget.

Role required: admin or sp_admin

Adding an icon to a specific widget keeps the icon scoped and prevents it from interfering with other CSS on the page.

1. In the platform UI, navigate to **Service Portal > Widgets**, then click the widget you want to add an icon to.

2. Attach the individual icon file to the widget record.

3. In the HTML template, include something like the following:

```html
<div>
  <i class='font-family'>icon_name</i> you did it!
</div>
```
Make sure the class is exactly the same as the font family called out in the CSS. For example <i class='material-icons'> should be the same as the .material-icons included in the CSS. The icon_name should match the name of the file you attached.

4. In the CSS field for the widget, add the CSS for the font-icon definition. Most font-icon sets include a CSS file similar to the material icons one used below. Use the sys_id of the attachment as the src in the CSS.
An icon that you can select in the widget or widget instance.

To use custom font-icons across widgets, add the icon to a page or make it a widget dependency.
Include font icons as a widget dependency
You can include font icons wherever a widget is loaded by including them as a widget dependency.

Role required: admin or sp_admin

**Note:** CSS included as a widget dependency is not scoped and can disrupt other CSS on a page.

1. In the platform UI, navigate to Service Portal > CSS and create a new style sheet.
2. Attach the font-icon set to the sp_css record you created, and use the sys_id of the attachment as the src for the font icon.
3. Navigate to **Service Portal > Dependencies** and create a new dependency.
4. Attach the CSS record you created to the new dependency using the CSS Includes related list.
Internationalize a widget

Use the `$()` or `gs.getMessage()` syntax in widgets to tag strings for translation so you can localize your Service Portal content.

The `$()` or `gs.getMessage()` searches in the messages table (sys_ui_message) in the platform to see what the translation would be.
Use the HTML template to internationalize strings in a widget. Type the following in an HTML template.

```html
<div>
  <p>${This message will be internationalized.}</p>
  <p>However, this will NOT be.</p>
</div>
```

Writing text as `${message}` is the equivalent of writing `${gs.getMessage("message")}` in other parts of the system, but written as a more legible shorthand.

**Note:** In some cases, the translation might have quotes or double quotes on it. That could lead to JavaScript errors if you are using the $() syntax in the client script. The safest way to fetch a translated message is to do it in the server script. Then, assign the value to a client-side Angular binding.

### Translating strings in the client script

```javascript
function() {
  var c = this;
  c.message="${This message will be internationalized}";
}
```

**HTML template:**

```html
<div>
  <!-- The output of this text will be internationalized. -->
  <p>{{c.message}}</p>
</div>
```

### Translating strings in the server script

Use the server script to translate schema options and other values during server-side runtime.

**Server script**

```javascript
function() {
  data.message=gs.getMessage("this message contains 'quotes'");
  //You can also translate schema options using the server script
  //For example, data.message=gs.getMessage(options.title);
}
```

**HTML template**

```html
<div>
  <p>{{c.data.message}}</p>
</div>
```

### Tutorial: Build a custom widget

Follow this tutorial to build a custom widget that displays Service Catalog items. Use this tutorial as a model to help you understand the advanced scripting power of the Service Portal.

In this tutorial, you will create the Quick Order widget. This widget:

- Displays popular items to the user prior to any search.
- Queries the Service Catalog and displays available options to the user.
- Includes an embedded SC Catalog Item widget, allowing the user to view and order items within the Quick Order widget.
- Uses an Angular Provider to display a category icon beside each queried item.

Create a widget and set up a template
Create the Quick Order widget to query items in the Service Catalog.

Role required: admin or sp_admin

1. Navigate to Service Portal > Service Portal Configuration and click Widget Editor.
2. Click Create a new widget.

![Widget Editor](image)

3. Define the following values.
   - **Widget Name**: Quick Order
   - **Widget ID**: quick_order
   - **Create a test page**: Active
   - **Page ID**: quick_order
Adding a widget to a test page creates a record in each of the following tables:

- sp_page
- sp_container
- sp_row
- sp_column
- sp_instance
- sp_widget

**Note:** You can use the Page Editor in Service Portal Configuration to view the hierarchy of elements on your test page.

4. Click **Submit**.
5. From the **Widget Editor**, open the Quick Order widget.
6. Add the following simple template to the HTML field.

   ```html
   <div class="panel panel-primary">
   <div class="panel-heading">Request an item from the catalog</div>
   <div class="panel-body">
   My catalog results
   </div>
   </div>
   ``

7. Click **Save**.
8. Preview your test page in a new tab using the following URL: `<yourInstanceUrl>/sp?id=quick_order`.

Your widget template displays on the test page.
Add a server script to query an instance table

After adding your widget and creating a basic template, you can define more advanced scripts that enable the user to query data from an instance table. Using client and server scripts, you can pass the data model between the client and server by querying data from the database, displaying it to the user, and sending any updates back to the server.

Role required: admin or sp_admin

1. From the **Widget Editor**, open the Quick Order widget.
2. Select **Server Script** to open the server script field.
3. Replace the default server script with the following custom script.

```javascript
(function() {
  if (input.keywords != null && input.keywords != '')
    data.items = getCatalogItems(input.keywords);

  function getCatalogItems(keywords) {
    var sc = new GlideRecord('sc_cat_item');
    sc.addActiveQuery();
    sc.addQuery('123TEXTQUERY321', keywords);
    sc.addQuery('sys_class_name', 'NOT IN', 'sc_cat_item_wizard,sc_cat_item_content');
    sc.addQuery('sc_catalogs', '0d08b13c3330100c8b837659bba8fb4');
    sc.setLimit(100);
    sc.orderByDesc('ir_query_score');
    sc.query();
    var results = [];
    while (sc.next()) {
      if (!$sp.canReadRecord(sc))
        continue;
      var item = {};
      $sp.getRecordDisplayValues(item, sc, 'name,price,sys_id');
      item.category = sc.getValue('category');
      results.push(item);
    }
    return results;
  }
})();
```

This script performs a keyword search on the sc_cat_item table using the 123TEXTQUERY321 query method.

4. Replace the HTML template with the following script:

```html
<div class="panel panel-primary">
  <div class="panel-heading">Request an item from the catalog</div>
  <div class="panel-body">
    <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
    <ul class="list-group result-container">
      <li class="list-group-item" ng-repeat="item in c.data.items">
        <a href>{{item.name}}</a><span class="pull-right">{{item.price}}</span>
      </li>
    </ul>
  </div>
</div>
```

This template adds a search field and displays the results of the query performed in the server script using the following Angular directives. To learn more about these directives, review the Angular API Reference.

Angular directives used in the template

<table>
<thead>
<tr>
<th>Angular directive</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ng-model</td>
<td>Automatically reads and writes value changes to the model variable <code>c.data.keywords</code>.</td>
</tr>
<tr>
<td>ng-model-options</td>
<td>Configures ng-model behavior. In this template, ng-model updates the model after a user has stopped typing for 250 milliseconds.</td>
</tr>
<tr>
<td>ng-change</td>
<td>Executes <code>c.server.update()</code> after the model value changes. This function posts the data object to the server script. After the script is executed, the data object is automatically updated with the new values from the server generated data object.</td>
</tr>
<tr>
<td>ng-repeat</td>
<td>Creates a template from the parent element and child elements. For each <code>item</code> in <code>c.data.items</code>, an instance of the template is created and the expressions <code>{{item.name}}</code> and <code>{{item.price}}</code> are replaced with the values from each item.</td>
</tr>
</tbody>
</table>

5. Add the following script to the CSS - SCSS field:

```
.result-container {
  margin-top: 10px;
}
```

6. Refresh your test page preview to view the changes.

As you type in the search box, matching catalog items appear. Try searching for **ipad**.

![Request an Item from the Catalog](image)

Manage the empty state of a widget
Display a list of popular items to the user before any search terms are entered.

Role required: admin or sp_admin

Because no search has been executed when the widget initializes, the server `input` variable is undefined. This empty state may cause confusion when a user first interacts with the widget. To solve this issue, give your widget something to display when the `input` variable is empty. This initial data can guide your users when initially interacting with your widget.

1. From the **Widget Editor**, open the Quick Order widget.
2. Replace the existing server script with the following script:

```
(function() {
    if (input.keywords != null && input.keywords != '')
        data.items = getCatalogItems(input.keywords);
    else data.items = getPopularItems();

    function getCatalogItems(keywords) {
        var sc = new GlideRecord('sc_cat_item');
        sc.addActiveQuery();
        sc.addQuery('123TEXTQUERY321', keywords);
        sc.addQuery('sys_class_name', 'NOT IN',
            'sc_cat_item_wizard,sc_cat_item_content');
        sc.addQuery('sc_catalogs', '0d08b13c3330100c8b837659bba8fb4');
        sc.setLimit(100);
        sc.orderByDesc("ir_query_score");
        sc.query();
        var results = [];
        while (sc.next()) {
            if (!$sp.canReadRecord(sc))
                continue;
            var item = {};
            $sp.getRecordDisplayValues(item, sc, 'name,price,sys_id');
            item.category = sc.getValue('category');
            results.push(item);
        }
        return results;
    }

    function getPopularItems() {
        var items = [];
        var count = new GlideAggregate('sc_req_item');
        count.addAggregate('COUNT', 'cat_item');
        count.groupBy('cat_item');
        count.addQuery('cat_item.sys_class_name', 'NOT IN',
            'sc_cat_item_guide,sc_cat_item_wizard,sc_cat_item_content');
        count.addQuery('cat_item.sc_catalogs',
            '0d08b13c3330100c8b837659bba8fb4');
        count.orderByAggregate('COUNT', 'cat_item');
        count.query();
        while (count.next() && items.length < 9) {
            if (!$sp.canReadRecord("sc_cat_item",
                count.cat_item.sys_id.getDisplayValue()))
                continue; // user does not have permission to see this item
            var item = {};
            item.name = count.cat_item.name.getDisplayValue();
            item.category = count.cat_item.category.toString();
            item.price = count.cat_item.price.getDisplayValue();
            item.sys_id = count.cat_item.sys_id.getDisplayValue();
            items.push(item);
        }
        return items;
    }
});
```

This script introduces a new function `getPopularItems()` to query the database and return popular items when the `input` variable is empty.

3. Replace the HTML template with the following script:

```html
<div class="panel panel-primary">
</div>
```
This script provides a template to display the popular items returned from the server script.

4. Refresh your test page preview to view the changes.

The widget displays popular items to the user prior to any search input.

Embed an existing widget

Enable the user to view and purchase Service Catalog items in the Quick Order widget by embedding the SC Catalog Item widget.

Role required: admin or sp_admin

Instead of duplicating code, you can embed widgets to leverage pre-existing functionality. The SC Catalog Item widget is a base system widget that enables the user to view and purchase Service Catalog items.

1. Inspect the SC Catalog Item widget.
Before embedding the SC Catalog Item widget, inspect the widget to understand what data it needs access to. You may need to update your Quick Order widget client or server script to make sure that the correct data is passed to the embedded widget.

a) Navigate to `<yourInstanceURL>/sp_config?id=widget_edit`.

b) Open the SC Catalog Item widget.

c) Note that the widget ID is `widget-sc-cat-item`. You will use this ID to embed the widget model in the client script.

d) Examine the server script.

Notice that the **data** object includes a `sys_id` property populated by either the **input** or **options** objects. If neither **input** nor **options** include a `sys_id`, the `$sp.getParameter()` method retrieves the `sys_id` from the request query string.

```javascript
if (input)
  data.sys_id = input.sys_id;
else if (options.sys_id)
  data.sys_id = options.sys_id;
else
  data.sys_id = $sp.getParameter("sys_id") || $sp.getParameter("sl_sys_id");
if (!data.sys_id)
  return;

var validatedItem = new sn.sc.CatItem('' + data.sys_id);
if (!validatedItem.canView())
  return;

var data.sc_cat_item = $sp.getCatalogItem(data.sys_id, true);
  if (data.sc_cat_item.category) {
    var category2S = new sn.sc.CatCategory(data.sc_cat_item.category);
    data.category = {
      name: category2S.getTitle(),
      url: 'id=' + data.sc_category_page + '&sys_id=' + data.sc_cat_item.sys_id
    }
  }

$sp.logStat('Catalog View', data.sc_cat_item.sys_class_name, data.sys_id, data.sc_cat_item.name);
```
To populate the input object, you can pass a catalog item sys_id from the Quick Order widget client script.

2. From the Widget Editor, open the Quick Order widget.
3. Replace the Quick Order widget client script with the following script:

```javascript
function($location, spUtil) {
    var c = this;

    c.select = function(item_id) {
        if (c.openItem == item_id) {
            c.openItem = null;
            return;
        }

        renderCatalogItemWidget(item_id);
    }

    function renderCatalogItemWidget(item_id) {
        c.catalogItemWidget = null;
        spUtil.get("widget-sc-cat-item", {sys_id: item_id}).then(function(response){
            c.catalogItemWidget = response;
            c.openItem = item_id;
        });
    }
}
```

This script uses spUtil.get() to retrieve the widget model by ID (widget-sc-cat-item) and define the {sys_id: item_id} object. This object posts to the server script as input.

4. Replace the HTML template with the following script:

```html
<div class="panel panel-primary">
    <div class="panel-heading">Request an item from the catalog</div>
    <div class="panel-body">
        <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
        <h5 ng-if="!c.data.keywords">Showing the most popular items</h5>
        <ul class="list-group result-container">
            <li class="list-group-item" ng-repeat="item in c.data.items">
                <a href ng-click="c.select(item.sys_id)">{{item.name}}</a><span class="pull-right">{{item.price}}</span>
                <div class="catalog-item" ng-if="item.sys_id == c.openItem">
                    <sp-widget ng-if="c.catalogItemWidget" widget="c.catalogItemWidget" />
                </div>
            </li>
        </ul>
    </div>
    <div class="panel-footer" ng-if="c.data.keywords">
        <ng-pluralize count="c.data.items.length" when="{"0": 'No items found for ',
        '1': 'One item matching ',
        'other': 'Found {} items matching ')}">
        </ng-pluralize>
        {{c.data.keywords}}
    </div>
</div>
```

This template:
• Adds on-click behavior using the ng-click directive.
• Displays the embedded SC Catalog Item widget using the sp-widget directive.

5. Replace the CSS with the following script:

```html
..result-container {
    margin-top: 10px;
}

.catalog-item {
    background-color: #f5f5f5;
    padding: 10px;
    @include border-top-radius($panel-border-radius);
    @include border-bottom-radius($panel-border-radius);
}
```

6. Refresh your test page preview to view the changes.

When you select a search result, the item opens in the embedded SC Catalog Item widget.

Create a reusable directive and add it to a widget

Angular Providers are reusable components that can be added to multiple widgets. Using the Widget Angular Providers table, create a directive that shows a category icon next to each result in the Quick Order widget.

Role required: admin or sp_admin

Angular Providers let you build angular directives and services that can be injected into your client script controller. The code in a Provider differs from a typical Angular directive or service because it must be anonymous, without being appended to a specific module.

The Widget Angular Providers table opens.

2. Click **New** to create a new record.
3. Fill out the form.
   a) Add the type and name.
      - **Type**: Directive
      - **Name**: categoryIcon
   b) Add the client script.

```javascript
function() {
  return {
    template: '<span class="fa fa-stack fa-lg"><i class="fa fa-circle fa-stack-2x"></i><i class="fa fa-' + (scope.category ? scope.category : '') + ' fa-stack-1x fa-inverse"></i></span>',
    restrict: 'E',
    replace: true,
    scope: {
      category: '='
    },
    link: function(scope, element) {
      var _iconMap = {
        "b06546f23731300054b6a3549dbe5dd8": "tablet", /* Tablets */
        "15706fc0a0a0a7007fc21e1ab70c2f": "question", /* Can we help you? */
        "d68eb4d637b1300054b6a3549dbe5db2": "mobile-phone", /* Mobiles */
        "109cdff8c612276003b17991a09ad65": "print", /* Office and Print */
        "5d643c6a3771300054b6a3549dbe5db0": "print", /* Printers */
        "2c0b59874f7b420008eecd18110c71f": "plug", /* Peripherals */
        "2809952237b1300054b6a3549dbe5dd4": "desktop" /* Software */
      };
      scope.icon = _iconMap[scope.category] || "shopping-cart";
    }
  }
}
```

This script associates the sys_id of the Category record with the Service Catalog item. The icon that displays is the icon defined in the Category record in the Service Catalog.
### New Widget Angular Provider

**Widget Angular Provider**

<table>
<thead>
<tr>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Directive</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>

</thead>
<tbody>
<tr>
<td>categoryIcon</td>
</tr>
</tbody>
</table>

**Client Script**

```javascript
function() {
  return {
    template: '<span class="fa fa-stack fa-lg">\<i class="fa fa-circle fa-stack-2x"></i>\<i class="fa fa-' + (icon) + ' fa-stack-1x fa-inverse">\</i></span>',
    restrict: 'E',
    replace: true,
    scope: {
      category: '='
    },
    link: function(scope, element) {
      var _iconMap = {"tablet": '/\tablet\', '/\tablet\': "tablet"}/\tablet\', /[a-zA-Z0-9]+/gi, function() {
        return {
          template: '<span class="fa fa-stack fa-lg">\<i class="fa fa-circle fa-stack-2x"></i>\<i class="fa fa-\" + (icon) + ' fa-stack-1x fa-inverse">\</i></span>',
          restrict: 'E',
          replace: true,
          scope: {
            category: '='
          },
          link: function(scope, element) {
            var _iconMap = {"tablet": '/\tablet\', '/\tablet\': "tablet"}/\tablet\', /[a-zA-Z0-9]+/gi, function() {
              return {
                template: '<span class="fa fa-stack fa-lg">\<i class="fa fa-circle fa-stack-2x"></i>\<i class="fa fa-
```  

**Application**

|  |  
|---|---|
|  | Global |

[Save (M + s)]
c) Click **Save**.

4. **Associate the new Angular directive with the Quick Order Widget.**
   a) Navigate to `<yourInstanceURL>/sp_config?id=widget_edit`.
   b) Open the Quick Order widget.
   c) Under **Related Lists**, select **Angular Providers**.
   d) In the Angular Providers list, click **New** to associate an existing Angular Provider with the Quick Order widget.
   e) Add the following values to the form.
      - **Angular Provider**: categoryIcon
      - **Widget**: Quick Order
   f) Click **Save**.

5. **Add the categoryIcon directive to your Quick Order HTML template.**
   a) From the **Widget Editor**, open the Quick Order widget.
   b) Replace the HTML template with the following script.

   ```html
   <div class="panel panel-primary">
     <div class="panel-heading">Request an item from the catalog</div>
     <div class="panel-body">
       <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
       <h5 ng-if="!c.data.keywords">Showing the most popular items</h5>
       <ul class="list-group result-container">
         <li class="list-group-item" ng-repeat="item in c.data.items">
           <a href ng-click="c.select(item.sys_id)" category-icon category="item.category" style="margin-right: 10px">{{item.name}}</a><span class="pull-right">{{item.price}}</span>
           <div class="catalog-item" ng-if="item.sys_id == c.openItem">
             <sp-widget ng-if="c.catalogItemWidget" widget="c.catalogItemWidget" />
           </div>
         </li>
       </ul>
     </div>
     <div class="panel-footer" ng-if="c.data.keywords">
       <ng-pluralize count="c.data.items.length"
         when="{"0": 'No items found for ',
           "1": 'One item matching ',
           'other': 'Found {} items matching '}">
         {{c.data.keywords}}
       </ng-pluralize>
     </div>
   </div>
   </div>
   </div>
```

6. **Refresh your test page preview to view the changes.**
   A category icon displays beside each result.
Widget API reference

Service Portal includes client and server side APIs to use in widget client and server scripts.

Service Portal client-side APIs

These are Service Portal APIs that you can use in a widget client controller.
See the API reference for detailed class and method information.

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spAriaUtil</td>
<td>Show messages on a screen reader.</td>
</tr>
<tr>
<td>spContextManager</td>
<td>Make data from a Service Portal widget available to other applications and services in a Service Portal page. For example, pass widget data to Agent Chat when it opens in a Service Portal page.</td>
</tr>
<tr>
<td>spUtil</td>
<td>Utility methods to perform common functions in a Service Portal widget client script.</td>
</tr>
<tr>
<td>spModal</td>
<td>Show alerts, prompts, and confirmation dialogs in Service Portal widgets. The SPModal class is available in Service Portal client scripts.</td>
</tr>
</tbody>
</table>

Note: g_form as a global object cannot be used in a widget client controller or in a UI script.

Service Portal server-side APIs

These are Service Portal APIs that you can use in a widget server script.
<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideSPScriptable</td>
<td>Interact with data and perform record operations in Service Portal widgets.</td>
</tr>
<tr>
<td>GlideSPSearchAnalytics</td>
<td>Generate search analytics from custom Service Portal search widgets.</td>
</tr>
<tr>
<td>spScriptedFacet</td>
<td>Define facet items, filters, or mapped queries for a facets object.</td>
</tr>
<tr>
<td>spScriptedFacetService</td>
<td>Generate a multi choice or single choice facets object for an advanced search source.</td>
</tr>
</tbody>
</table>

**Widget properties**

Global variable and functions available in widget client and server scripts.

**Server script global objects**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>An object containing client-side properties set under c.data. The value is undefined until the client controller calls c.server.update().</td>
</tr>
<tr>
<td>data</td>
<td>An object containing properties set during server-side execution.</td>
</tr>
<tr>
<td>options</td>
<td>An object containing the schema option properties.</td>
</tr>
</tbody>
</table>

**Client script global functions**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>this.server.get()</td>
<td>Calls the server and sends custom input. Returns Promise.</td>
</tr>
<tr>
<td>this.server.update()</td>
<td>Calls the server and posts this.data to the server script. Returns Promise.</td>
</tr>
<tr>
<td>this.server.refresh()</td>
<td>Calls the server and automatically replaces the current options and data from the server response. Returns Promise.</td>
</tr>
</tbody>
</table>

A promise represents the eventual result of an asynchronous operation. For more information on promises, see [https://promisesaplus.com/](https://promisesaplus.com/) or [AngularJS documentation](https://angularjs.org/).

**Widget troubleshooting guide**

Use the following tools to investigate and resolve unexpected behavior in your custom Service Portal widgets.

**Reduce complexity**

Deactivate widgets unrelated to the widget you are troubleshooting to isolate parts of the page that may be causing errors or unexpected behavior. Set the active field to false on a widget record to hide the widget on the page, and prevent associated scripts from executing.

**Use the browser developer console**
All supported desktop browsers have built in developer tools. Access your browsers developer tools to view console messages and errors thrown by client-side javascript. Many of the logging tools detailed below output information to this console.

**Use the widget context menu to access information and options**

CTRL+right-click a widget to access configuration options for the widget. There are also options to output the scope and scope data object to the browser console. For more detail on this menu, see [Widget context menu](#).

**Use script methods to capture debugging output**

Several methods are available to output debugging information within your server and client-side code.

### Scripted debugging methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Availability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>console.log()</code></td>
<td>Server and client</td>
<td>Logs output to the browser developer console.</td>
</tr>
<tr>
<td><code>$sp.log()</code></td>
<td>Server</td>
<td>Logs output to the Service Portal Log Entries (sp_log) table, when the logged in user has the <code>sp_admin</code> or <code>admin</code> role.</td>
</tr>
<tr>
<td><code>gs.log()</code></td>
<td>Server</td>
<td>Logs output to the Log (syslog) table.</td>
</tr>
<tr>
<td><code>gs.warn()</code></td>
<td>Server</td>
<td>Produces warning level output in the Log (syslog) table.</td>
</tr>
<tr>
<td><code>gs.error()</code></td>
<td>Server</td>
<td>Produces error level output in the Log (syslog) table.</td>
</tr>
<tr>
<td><code>gs.addInfoMessage()</code></td>
<td>Server</td>
<td>Displays a green information message at the top of the browser window.</td>
</tr>
<tr>
<td><code>gs.addErrorMessage()</code></td>
<td>Server</td>
<td>Displays a red error message at the top of the browser window.</td>
</tr>
<tr>
<td><code>spUtil.addErrorMessage()</code></td>
<td>Client</td>
<td>Displays an error message within the browser window.</td>
</tr>
<tr>
<td><code>spUtil.addInfoMessage()</code></td>
<td>Client</td>
<td>Displays an Info message within the browser window.</td>
</tr>
<tr>
<td><code>spUtil.addTriviaMessage()</code></td>
<td>Client</td>
<td>Displays a message which automatically disappears after a short time.</td>
</tr>
<tr>
<td><code>debugger</code></td>
<td>Client</td>
<td>Sets a break point in Chrome and Firefox browsers, allowing you to step through a script line by line in the browsers developer console.</td>
</tr>
<tr>
<td>`{{data</td>
<td>json}}`</td>
<td>HTML</td>
</tr>
</tbody>
</table>

**Check for security restrictions**
Often, widget display issues are caused by access rules rather than the widget script. Verify that any records that are not accessible within a widget are accessible using the platform UI. Use the ACL debugger to ensure that your users have the expected access to records used by your widgets. For more detail on the debugger, see ACL debugging tools.

**Create a reference to the widgets scope in the console**

Use reference to a widget to manipulate scope data or manually run the widgets client and server scripts. Use the following steps to create the reference.

- 1. Right-click the widget and choose **Inspect**.
- 2. In dev tools Elements tab, click to highlight the element with attribute `widget=widget`. You can find it a few elements above the currently inspected element. This element points the $0 scripting tool at the widget.
- In the Javascript console, run the following code:

```javascript
var scopeRef = angular.element($0).scope();
```

Use the reference to your widget to change data within the console. See the following example. Remember to run AngularJS `$apply()` on the scope to apply changes to the page.

```javascript
scopeRef.data.prop1 = "Pear";
scopeRef.$apply();
```

Run any function defined in the widgets client controller from your reference using the syntax below.

```javascript
scopeRef.exampleFunction();
```

Use the refresh command to manually execute the widgets server script.

```javascript
scopeRef.server.refresh();
```

**Service Portal search**

Service Portal displays search data within a widget on the search page. To make data searchable from Service Portal, create a search source that fetches data from a single table within your ServiceNow instance, from multiple ServiceNow tables, or from an external site. Configure search options or build custom search components.

**Search sources**

A search source is a record that describes the behavior and source of searchable data. A search source defines:

- Where to retrieve search data from.
- Whether search suggestions can populate the search field based on user input.
- How a search entry displays in the search result page.

Search sources have simple and advanced configurations.

**Simple**
Define a table within your ServiceNow instance as a source of searchable data. To learn more, see Define a search source.

Advanced

Define a data fetch script to return data. A data fetch script executes on the server and returns a result array to the search widget. This method is more complex, but offers complete power over how a search executes. You are not limited to querying single tables within ServiceNow and can define a script that fetches data from multiple tables, or from anywhere on the web. To learn more, review the Tutorial: set up an external knowledge base search source.

Note: Search facets may not behave as expected if integrated into an advanced search source that queries data from a non-ServiceNow site.

Text index groups

A text index group defines how users see search results. For example, combine search results from several sources, or set the weight of certain fields. Text index groups are a Now Platform feature. To learn more, see Configure multiple tables for indexing and searching.

Associate a portal with a text index group to create common search rules and to combine search results from all search sources in the group. If you have a custom search source or portal, consider whether you want to use the base system portal_index_group text index group, or create your own text index group. The base system text index group includes the Catalog items, Knowledge, and Social Q&A Questions tables. When a user searches for an item in Service Portal, they see combined results from these tables. To add an index group to a portal, see Add a text index group to a portal.

Note: Text index groups do not support external search sources.

Typeahead settings

Typeahead returns search results as a user types in the search field. You can configure typeahead settings, or disable the feature entirely, within the search source record.

Simple

Define an icon to display beside typeahead results and the target page to display typeahead selections.

Advanced

Define a template for the typeahead result. See Create an advanced typeahead template.

Search facets

Enable your end users to filter search results for a more meaningful result set. Facets can return results based on:

- Fields in a table such as Active or Author.
- Query conditions such as (Updated)(After)(Last week).
Note: Only set search facets for indexed fields. Fields that are not indexed may take longer to return results and are not optimized for a fast search experience. Learn more: [Enable text indexing for a table](#).

Search facets render in the Faceted Search widget on the sp_search page. In new instances, search facets are enabled by default. If upgrading from a previous release, enable search facets by activating a record in the Page Route Maps (sp_page_route_map) table. See [Enable search facets](#).

**Simple**

Enable end users to refine search results for a simple search source. You can create facets for a table search source that return results based on field values or query conditions. See [Add facets to a simple search source](#).

**Advanced**

Define facets for advanced search sources using the **Facet generation script** on the search source record. Use facet APIs to create facets and assign ServiceNow facet items or mapped queries to the facet.

<table>
<thead>
<tr>
<th>API</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPScriptedFacetService</td>
<td>Creates a single or multi choice facet.</td>
</tr>
<tr>
<td>SPScriptedFacet</td>
<td>Defines facet items, filters, or mapped queries for the facet.</td>
</tr>
</tbody>
</table>

**Search analytics and suggestions**

Generate relevant search suggestions for your users and monitor search analytics to understand what your users are searching for and whether they're finding what they need. Search analytics and suggestions is a Now Platform feature. For more information, see [Search analytics and suggestions](#).

**Populate suggestion data on upgrade**

If you are upgrading from a previous release, run a script to populate search suggestions with data from a platform search table to provide search suggestions to your users. For more information, see [Populate search suggestions in Service Portal](#).

**Generate suggestions from custom widgets**

By default, the Search Events (sys_search_event) and Search Source Events (sys_search_source_event) tables collect search data from base system search widgets. To generate search analytics from custom Service Portal search widgets, use the GlideSPSearchAnalytics API. For more information, see [GlideSPSearchAnalytics](#).

**Use suggestions instead of typeahead search**

Search suggestions replaces typeahead search in Service Portal. Update the `glide.service_portal.search_as_you_type_behavior` system property to change this behavior. For more information, see [Enable and disable search suggestions](#). Service Portal search widgets automatically use whichever feature you enable.
Search configurations

When you create a simple search source, Service Portal uses the search engine settings configured on your instance. To learn more, see Search administration.

Performance recommendations

To avoid performance degradation and to ensure a fast search experience for end users, follow these recommendations.

- Limit search sources when possible to perform only the necessary query. For example, if a search only needs to return active incidents, add a condition to the search source set to **(Active) is (true)**. A search that queries only active incidents is faster than a search that queries all records in the incident table.
- Create facet items and mapped queries with no more than 30 filter items. To verify, test each search source with a variety of keywords as a user with low permissions.

**Note:** Service Portal search results display as text only. HTML tags, images, and formatting do not display in search results.

Define a search source

Configure a basic search source to query data from an instance table, or configure an advanced data fetch script to query data across multiple tables and data sources, or to pull data from anywhere on the web.

1. In the platform UI, navigate to **Service Portal > Portals** and select the portal you want to add search sources to.
2. From the **Search Sources** related list, click **New** to add a search source.
3. Define the fields on the **Search Source** form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The display value for the search category.</td>
</tr>
<tr>
<td>ID</td>
<td>The record ID. The value should be unique, and should not include any spaces or special characters.</td>
</tr>
<tr>
<td>Application</td>
<td>The scope of the search source.</td>
</tr>
<tr>
<td>Roles</td>
<td>If the Service Portal User Criteria Support plugin is not enabled, define user roles to access this search source.</td>
</tr>
<tr>
<td>Search page template</td>
<td>The HTML template that displays the search results. If defining a basic search source, you do not need to change the default template. For an example of a modified template, see Tutorial: set up an external knowledge base search source.</td>
</tr>
</tbody>
</table>

4. Complete the fields on the **Data Source** tab.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is scripted source</td>
<td>Adds an advanced data fetch script. If configuring an instance table as the data source, do not check this option.</td>
</tr>
</tbody>
</table>
### Field | Description
---|---
Data fetch script | Script defining the endpoint and API calls to fetch data. This field is only visible when Is scripted source is selected. For an example of a data fetch script, see Tutorial: set up an external knowledge base search source.

**Note:** If defining a facet generation script, inject the facets object into the data fetch script and update the script to generate data for each facet item. For an example, see the Knowledge Base and Service Catalog search sources. Search facets may not behave as expected if integrated into an advanced search source that queries data from a non-ServiceNow site.

Facet generation script | Script defining search facets for a scripted search source. Enable your end users to filter search results for a more meaningful result set. This field is only visible when Is scripted source is selected.

**Note:** If defining a facet generation script, inject the facets object into the data fetch script and update the script to generate data for each facet item. For an example, see the Knowledge Base and Service Catalog search sources. Search facets may not behave as expected if integrated into an advanced search source that queries data from a non-ServiceNow site.

Table | Select a table from the list that you want to draw your results from. You can select any table in the platform. For example, User (sys_user) or Knowledge (kb_knowledge).

**Note:** Only indexed tables return search results. Learn more: Enable text indexing for a table.

Conditions | Filters results based on defined conditions. For example, Active is True.

Primary display field | Select which field you want to display on the search results page. For example, Name.

Display fields | Select additional fields to display on the search results page. For example, User ID, Email, and City.

Paginate results | Paginates search results. True by default. If Is scripted source is selected, the value updates to false. To enable pagination for a scripted search source, see Paginate search source results.

Define the maximum number of results per query for the search source in the Search Page widget or Faceted Search widget instance options.

5. Configure **Typeahead** settings to allow search results to populate the search field based on user input.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable typeahead</td>
<td>Allows typeahead functionality. If you do not want to integrate typeahead into your search source, clear the check box.</td>
</tr>
</tbody>
</table>
### ServiceNow Capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced typeahead config</td>
<td>Optionally add an advanced typeahead script to configure the way search results display. For more information, see <a href="#">Create an advanced typeahead template</a>.</td>
</tr>
<tr>
<td>Typeahead glyph</td>
<td>Adds an icon beside each typeahead result.</td>
</tr>
<tr>
<td>Page</td>
<td>Defines a service portal page to display the selected result. For example, if form is configured, a selected typeahead result opens in a form.</td>
</tr>
</tbody>
</table>

To enable end users to refine search results, [Add facets to a simple search source](#).

**Paginate search source results**

Limit the number of results that a search source displays at one time to improve performance. End users can load more results as needed.

Role required: admin or sp_admin

If adding pagination to a simple search source, set **Paginate results** on the search source record to true. However, if adding pagination to an advanced search source, you must also modify the data fetch script to handle multiple pages of results. When a user loads more search results, the search source re-executes the data fetch script.

**Note:** If paginating a search source with advanced facets, do not modify the facet generation script to load facets based on the results from each page. Facets should enable end users to filter results from an entire result set, rather than page-specific results.

1. In the platform UI, navigate to **Service Portal > Search Sources**.
2. Open a search source to add pagination to.
3. Set **Paginate results** to true.

Enabling this field adds a **Load more results** button to the search results page. This flag automatically enables pagination for simple search sources.
4. Optional: If the search source is advanced, modify the data fetch script to handle multiple search result pages.

Update the data fetch script using one of the following GlideRecord APIs, depending on the scope of the search source.

<table>
<thead>
<tr>
<th>Scope</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global</td>
<td>setLocation() in GlideRecord</td>
</tr>
<tr>
<td>Scoped application</td>
<td>chooseWindow() in GlideRecord</td>
</tr>
</tbody>
</table>

The following is an example data fetch script for a global search source that queries the incident table and paginates results.

```javascript
(function(query, queryLocation, count) {
  var results = [];
  var gr = new GlideRecord("incident");
  gr.addQuery("123TEXTQUERY321", query);
  gr.query();
  // Here, we are utilizing queryLocation to implement pagination.
  // In practice, there are many other ways to use the
  // query_location value of the last item in the previous
  // result set to implement pagination. Your implementation
  // will vary by use case.
  gr.setLocation(queryLocation - 1);
  var resultCount = 0;
  while(gr.next() && resultCount < count + 1) {
    results.push({
      label: gr.getDisplayValue(),
      short_description: gr.getValue("short_description"),
      // Here, we are populating the query_location
      // property of each result item. This is how the
      // framework knows what value to pass into the
      // next fetched search result script execution
      query_location: gr.getLocation(),
      primary: gr.getDisplayValue(),
      state: gr.getDisplayValue("state")
    });
    resultCount++;
  }
  if (results.length == 0)
    return results;
  if(results.length > count) {
    results.pop();
  } else {
    // In order to indicate that a result in the result
    // set is the final result (that there are
    // no more results to be fetched), add this property
    // to the final element in your result set.
    results[results.length - 1].isLastResult = true;
  }
  return results;
})(query, queryLocation, count, facets);
```

For an additional example, see the Knowledge Base search source.
5. Define the maximum number of results per query for the search source in the Search Page widget or Faceted Search widget instance options.

The search page only returns the defined number of results at one time. When a user selects Load more results, the search source re-executes the query or data fetch script.

Create an advanced typeahead template

Configure the way typeahead results display with an advanced template.

1. Complete the required fields in Define a search source.
2. In the Typeahead tab of the Search Source record, select the Advanced typeahead config check box.
3. In the Typeahead template field, add an HTML template.
This example uses AngularJS bindings to display service catalog images in the typeahead results.

```html
<i class="ta-img" ng-if="match.model.type=='sc'" style="background-image:url('{{match.model.picture}}')"></i>
<i class="ta-img" ng-if="match.model.type=='sc_guide'" style="background-image:url('{{match.model.picture}}')"></i>
<i class="ta-icon fa fa-file-text-o" ng-if="match.model.type=='sc_content' && match.model.content_type == 'kb'"></i>
<strong ng-if="match.model.type=='sc_content' && match.model.content_type == 'external'">#</strong>
<span ng-bind-html="match.label | uibTypeaheadHighlight:query"></span>
```

4. **Click Update.**

Typeahead results display beside the image defined in the service catalog record.

![Typeahead results display](image.png)
Tutorial: set up an external knowledge base search source

Define an advanced search source to return data from any source on the Internet. To understand the power of search sources, follow this tutorial to set up an external knowledge base search source.

To create an advanced search source, you need an external resource that you can access via REST and basic knowledge of AngularJS.

In this integration, you will:

- Create a data fetch script that uses the ServiceNow Table API to query a knowledge base from another ServiceNow instance.
- Decode the JSON response and define the fields that the search widget expects.
- Update the search sources HTML template to open the search result in the external site.

1. In the platform UI, navigate to Service Portal > Portals and select the portal you want to add the search source to.
2. From the Search Sources related list, click New.
3. Create a name and ID for the search source. The ID should be unique, and should not include any spaces or special characters.
4. On the Data Source tab, select the Is scripted source check box.
5. Add content to the data fetch script field.

   a) Define the search function to be executed by the instance.

   This example uses a recordless RESTMessage, but you can modify this example to use a pre-configured Outbound REST web service if needed, or create a more secure authentication profile.

   (function(query) {
     var results = [];
     /* Calculate your results here. */
     var url = "https://myInstance.service-now.com/api/now/table/kb_knowledge?sysparm_query=GOTO123TEXTQUERY321%3D" + encodeURI(query) + "&sysparm_fields=sys_id%2Cnumber%2Cshort_description%2Ccategory%2Ctext";
     var ws = new sn_ws.RESTMessageV2();
     ws.setBasicAuth("search_user", "search");
     ws.setHttpMethod("get");
     ws.setEndpoint(url);
     var jsonOutput = ws.execute();
     return results;
   })(query);

   Note: In the preceding example, ws.setBasicAuth requires a user and password for the remote instance. For more detail, see RESTMessageV2.

   b) Add an if statement to the data fetch script to decode the JSON object being returned, iterate over each result, and set expected fields.

   The final data fetch script:

   (function(query) {
     var results = [];
     /* Calculate your results here. */
     var url = "https://<my-instance>.service-now.com/api/now/table/kb_knowledge?sysparm_query=GOTO123TEXTQUERY321%3D" + encodeURI(query) + "&sysparm_fields=sys_id%2Cnumber%2Cshort_description%2Ccategory%2Ctext";
     var ws = new sn_ws.RESTMessageV2();
     ws.setBasicAuth("search_user", "search");
     ws.setHttpMethod("get");
     ws.setEndpoint(url);
     var jsonOutput = ws.execute();
     results = jsonOutput.response;
     // Iterate over results and set expected fields
   })(query);
encodeURI(query) + "&sysparm_fields=sys_id%2Cnumber%2Cshort_description%2Ccategory%2Ctext";
var ws = new sn_ws.RESTMessageV2();
ws.setBasicAuth("search_user", "search");
ws.setHttpMethod("get");
ws.setEndpoint(url);

var jsonOutput = ws.execute();
if (jsonOutput) {
    var response = new JSON().decode(jsonOutput.getBody());
    results = response.result;
    results.forEach(function(result) {
        result.url = "https://myInstance.service-now.com/kb_view.do?sysparm_article=" + result.number;
        result.target = "_blank";
        result.primary = result.short_description;
    });
}
if (jsonOutput.haveError()){
    gs.addErrorMessage(jsonOutput.getErrorMessage());
}
return results;
})(query);

In this example, the following fields are set on the result object:

- **url**: If linking to an external site rather than opening the record in your ServiceNow instance, this defines where the link leads to.
- **target**: The target for the link. Set the target to _blank to open results in a new tab, otherwise leave it blank.
- **primary**: The primary field displayed in the search results.

6. Update the search page template to open the search results in the external site.

```html
<div>
    <a href="https://myInstance.service-now.com/kb_view.do?sysparm_article={{item.number}}" target="_blank" class="h4 text-primary m-b-sm block">
        <span ng-bind-html="highlight(item.primary, data.q)"></span>
    </a>
    <span class="text-muted" ng-repeat="f in item.fields | limitTo: 4">
        <span class="m-l-xs m-r-xs" ng-if="!$first"> &middot; </span>
        {{f.label}}: <span ng-bind-html="highlight(f.display_value, data.q)"></span>
    </span>
</div>
```

7. Click Update.

Test the external search in your portal. Results display under the name field value defined in step three.
Each search result opens in the external site defined in the search page template.
Example: set up a GitHub search source

Set up an advanced search source that queries data from an external site.

To create an advanced search source, you need an external resource that you can access via REST and basic knowledge of AngularJS.

1. In the platform UI, navigate to Service Portal > Portals and select the portal you want to add search sources to.
2. From the Search Sources related list, click **New**.
3. Create a name and ID for the search source.
   The ID should be unique, and should not include any spaces or special characters.
4. On the **Data Source** tab, select the **Is scripted source** check box.
5. Add content to the data fetch script field.

To set up a GitHub integration:

```javascript
(function(query) {
    var results = [];
    /* Calculate your results here. */
    var url = "https://api.github.com/search/repositories?q=" +
        encodeURIComponent(query);
    var ws = new GlideHTTPRequest(url);
    ws.setBasicAuth("YOUR_USERNAME_HERE", "YOUR_PASSWORD_HERE");
    var jsonOutput = ws.get();
    if (jsonOutput) {
        var response = new JSON().decode(jsonOutput.getBody());
        results = response.items;
        results.forEach(function(result) {
            result.url = result.svn_url;
            result.target = "_blank";
            result.primary = result.full_name;
        });
    }
    return results;
})(query);
```

6. Use the Search page template to customize the way the search results display.

```html
    <div>
        <div class="pull-right">
            <strong>{{item.language}}</strong>
            <a ng-href="{{item.svn_url}}/stargazers" target="_blank" class="m-l-sm">
                <span class="fa fa-star m-r-xs"></span>{{item.stargazers_count}}</a>
            <a ng-href="{{item.svn_url}}/network" target="_blank" class="m-l-sm">
                <span class="fa fa-code-fork m-r-xs"></span>{{item.forks}}</a>
        </div>
        <a ng-href="{{item.svn_url}}" target="_blank" class="h4 text-primary m-b-sm block">
            {{item.full_name}}
        </a>
        <p>{{item.description}}</p>
        <p>Updated <sn-time-ago timestamp="item.updated_at"></sn-time-ago> ago</p>
    </div>
```

**Enable search facets**

In new instances, search facets are enabled by default. If upgrading from a previous release, enable search facets by activating a record in the Page Route Maps ([sp_page_route_map]) table.

Role required: admin or sp_admin

Search facets render in the Faceted Search widget on the sp_search page. To enable search facets after upgrade, activate the page route map record to route your search results to render in the sp_search page.

1. Navigate to **Service Portal > Page Route Maps**.
2. Locate the Search record in the list.
   This record redirects users from the search page to the sp_search page when viewing search
   results in Service Portal. The sp_search page includes the Faceted Search widget, which
   supports search facets in both desktop and mobile environments.

3. Set the Active field to true.

When using search in Service Portal, results render in the sp_search page. Add facets to the
search source to enable end users to filter search results. To learn more about facets, see Add
facets to a simple search source.

Add facets to a simple search source

Enable end users to refine search results for a simple search source. You can create facets for a
table search source that return results based on field values or query conditions.

Role required: admin or sp_admin

In new instances, search facets are enabled by default. If upgrading from a previous release,
enable search facets by activating a record in the Page Route Maps (sp_page_route_map) table.
See Enable search facets. Create facet items and mapped queries with no more than 30 filter
items. To verify, test each search source with a variety of keywords as a user with low permissions.

Note: Only set search facets for indexed fields. Fields that are not indexed may take longer
to return results and are not optimized for a fast search experience. Learn more: Enable text
indexing for a table.

1. Navigate to Service Portal > Search Sources.
2. Open or create a simple search source.
   Simple search sources do not use a data fetch script. Rather, they define a table as the
   source of searchable data. To learn more about search sources, see Service Portal search.
3. Select the Facets related list.
4. Click New.
   The Facet form displays.
5. Complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Display name of the facet header.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the search source. This value is read-only.</td>
</tr>
<tr>
<td>Selection type</td>
<td>Type of user selection allowed:</td>
</tr>
<tr>
<td></td>
<td>• Single: Only one filter value can be selected at a time. For example, if a facet is created for the Assigned to field, the end user can select Fred Luddy or Beth Anglin, but not both at the same time. Before filtering for a new value, the user must first clear the current value.</td>
</tr>
<tr>
<td></td>
<td>• Multiple: Multiple filter values can be selected at the same time. For example, if a facet is created for the Assigned to field, the end user can select both Fred Luddy and Beth Anglin. Because multi choice results in an OR query, records assigned to either Fred Luddy or Beth Anglin display.</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the filter option displays in search results.</td>
</tr>
</tbody>
</table>
Use mapped facet filters | Maps a facet to a query condition, such as \((\text{Updated})\text{(After)}\) \((\text{Last week})\).
When selected, the **Fields** and **Sort** fields are removed from the form. After saving, define filters in the Facet Filters related list.

Order | Defines the display order when multiple facets are defined.
If some facets do not have an order value defined, facets with an order defined display first. Facets without an order defined are displayed alphabetically.

Table | Table that the query is created for. This value is read-only and defined by the table used in the search source.

Field | Field that end users can filter search results by. For example, if **Active** is selected, the user can filter search results by true or false.
Only fields of the following types are supported: True/False, Choice, Decimal, Floating Point Number, Integer, IP Address, Long, Reference, String, String (Full UTF-8), and URL.

Sort | Determines the order in which filter options display.
- **Ascending**: Sorts filter options from A to Z when alphabetical, and from lowest to highest when numerical. This is the default option.
- **Descending**: Sorts filter options from Z to A when alphabetical, and from highest to lowest when numerical.

6. Save the record.
   If **Use mapped facet filters** is selected, the Facet Filters related list appears in the facet form.

7. Optional: If **Use mapped facet filters** is selected, define facet filters. Map facet filters map a query condition to a facet label. When the end user selects the label from the facet list, the defined query executes.

   a) In the Facet Filters related list, click **New**.
   The Mapped Facet Form appears.

   b) Define the facet filter fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Display name of the facet filter option.</td>
</tr>
</tbody>
</table>
   | Order | Defines the display order when multiple facet filters are defined.
   If some facet filters do not have an order value defined, facets filters with an order defined display first. Facet filters without an order defined are displayed alphabetically. |
   | Application | The application scope of the search source. This value is read-only. |
   | Facet | The search facet that uses the mapped query. This value is read-only. |
   | Table | The table defined in the search facet. This value is read-only. |
   | Mapped query | A query condition that users can set to filter search results. For example, \((\text{Updated})\text{(On)}\text{(Today)})\. |
c) Click **Submit**. Users can filter search results based on the query defined.

**Disable facets for a search source**

Disable facets for one or more search sources by adding a system property. Once disabled, the search source does not display search facets in the Faceted Search widget on the sp_search page. You can disable facets for simple or advanced search sources.

Role required: admin or sp_admin

1. Enter `sys_properties.list` in the Application Navigator to navigate to the System Properties table.
2. Click **New**. The System Property form opens.
3. In the **Name** field, enter `glide.service_portal.disable_facets_for_search_sources`.
4. In the **Value** field, enter a comma-separated list of search source Sys IDs to disable facets for. Do not include spaces. For example, `c6170ae86721220023c82e08f585efe6,c96eb1686721220023c82e08f585efff`.
5. Click **Submit**.

Facets do not display when the defined search source is selected in the sp_search page.

**Populate search suggestions in Service Portal**

If you are upgrading from a previous release, run a script to populate search suggestions with data from a platform search table to provide search suggestions to your users. Alternatively, you can wait until users search for keywords instead of running this script.

Role required: admin

In new instances, the search suggestions are enabled by default. In upgraded instances, you must enable the search suggestions. For more information, see [Enable search suggestions](#).

The Now Platform collects search data and analytics that generate search suggestions. If you are upgrading from a previous release, the search analytics do not contain any data yet. To immediately provide suggestions to your users, you can populate the search suggestions using data from either the Text Searches (text_search) table or the Service Portal Log Entries (sp_log) table. The Service Portal Log Entries table includes search data from Service Portal only and may take less time to populate search suggestions. The Text Search table includes search data from the entire platform.

Search suggestions improve over time as more people use Service Portal. Search analytics and suggestions is a Now Platform feature. For more information, see [Search analytics and suggestions](#).

**Caution:** Populating search suggestions can be a resource-intensive task that may take a while to complete. Do not run this script during peak hours. Populating search suggestions is not supported on domain-separated instances.

1. Navigate to **System Definition** > **Scheduled Jobs**.
2. Open the **Populate Suggestions to avoid Cold Start - Portals** scheduled job.
3. Modify the script for your search implementation.
a) Define which portals the suggestions apply to. By default, the script populates suggestions in the base system service portal, but you can add as many as you want to the array.

```javascript
var portals = ["Service Portal"];
```

b) Change where the data comes from. By default, the script imports data from the Text Searches (text_search) table, but you can change the source table to the Service Portal Log Entries (sp_log) table. The Service Portal Log Entries only saves records from the last 90 days.

```javascript
var searchLogTable = "text_search";
```

c) Push data to any custom search sources in your instance. Suggestions are not enabled for external search sources. You must push data to both the search source name and the Sys ID.

For example, push text searches from the Incident table to your custom Incident search source. For more information about custom search sources, see Define a search source. By default, the system pushes text searches from the Catalog, Knowledge, and Social Q&A Questions tables to the respective search sources.

Add the following code after line 11 in the script for each of your custom search sources.

```javascript
searchSources.push("<search-source-table-name>");
searchSourceIds.push("<search-source-sys-id>");
```

If the search source table does not exist, the system does not push suggestions to that search source.

d) Save the record.

Make sure that the script includes the configuration you need. You can only run the script once.

4. Activate the record and select Execute Now.
   Running this scheduled job populates the Search Events (sys_search_event), Search Source Events (sys_search_source_event), and Search Suggestions (sys_search_suggestion) tables.

Users see suggestions when they start typing in a Service Portal search widget.

### Add a text index group to a portal

Define how users see search results. For example, combine search results from several sources, or set the weight of certain fields.

Role required: admin

If you have a custom search source or portal, consider whether you want to use the base system portal_index_group text index group, or create your own text index group. The base system text index group includes the Catalog items, Knowledge, and Social Q&A Questions tables. When a user searches for an item in Service Portal, they see combined results from these tables.

**Note:** Index tables before adding them to a text index group. To learn more about text indexing, see Enable text indexing for a table.

Text index groups are a Now Platform feature. To learn more, see Configure multiple tables for indexing and searching.
**Note:** Text index groups do not support external search sources.

1. Navigate to **Service Portal > Portals**.
2. Open the portal that you would like to add a text index group to.
3. Configure the form to add the **Text Index Group** field.
4. Add the text index group you want to the **Text Index Group** field.

Search results display according to the text index group’s rules.

**Set the default portal search source**

Use the `glide.service_portal.default_search_sources` system property to define default search sources.

Role required: **admin**

If you don’t define specific search sources for your portal, the system uses default search sources instead.

![Default search source flow chart](chart.png)

**Default search source flow chart**

1. In the Navigation filter, enter `sys_properties.list`.
   The entire list of properties in the System Properties (sys_properties) table appears.
2. On the list, find the system property `glide.service_portal.default_search_sources`, and then open the property record.
3. Copy the sys_ID of any search source you want to add into the **Value** field of the system property using a comma-separated list.
To change the order in which the default search sources show in the Search List, change the order of the IDs in the property.

You can remove the default search source behavior by deleting the property value or deleting the property altogether.

4. Click Update.

Configure Search Sources available on a page

Use contextual search to limit search results for an instance of the type-ahead search widget. With contextual search enabled, users only see type-ahead results for specific search sources. For example, searching on the Service Catalog page only shows results from the Service Catalog search source when contextual search is enabled.

1. In the Service Portal Designer (Service Portal > Service Portal Configuration > Service Portal Designer), find an instance of the type-ahead search widget.

2. Point to the widget and click the edit icon ( ).

   Alternatively, in any preview page containing the type-ahead search widget, for example the Service Catalog homepage, control + right-click to open the widget context menu. Then click Instance Options.

3. In the Contextual Search Sources field, select search sources from the list.

   Search sources listed for contextual search can be limited to just one, several, or all search sources.

   Default search sources are defined in the glide.service_portal.default_search_sources property, so even if you do not have search sources configured, type-ahead search widget still shows type-ahead suggestions. For more information on default search sources, see Set the default portal search source.

Service Portal announcements

Use announcements to broadcast messages to Service Portal users. Announcements can display in an announcement banner or an announcement widget instance.

Announcements are active on new instances. To activate announcements after upgrade, you can activate the Service Portal Announcements plugin (com.glide.service-portal.announcements).

When creating announcements, you can define the way an announcement displays.

Sort order

Announcements are displayed depending on the order defined in:

- The glide.service_portal.announcement.default.sort_order system property. See Service Portal properties.
- The Display First field in the announcement record.

If there is a tie between two records set to Display first, the sort order defined in the system property is honored.

Display location
Announcements can display in the following locations:

- Announcement banner
- Announcements widget instance
To define the announcement display location, define the announcement type in the announcement record.

**Display Style**

Using display styles, you can:
- Create a custom color scheme.
- Change the text alignment.

Announcements that appear in a banner use the display style defined in the Announcement record by default. To use the display style in an instance of the Announcements widget, you can select the **Use Display Style** instance option.

**User criteria**

If user criteria is set up for the Service Portal, you can define who can and who cannot view an announcement. Through user criteria, you can create announcements only visible to specific users, groups, roles, organizations, and more.

**Create an announcement**

Announcements display as a banner in a Service Portal or within the announcements widget.

Role required: admin, sp_admin, or announcement_admin

1. **Navigate to Service Portal > Announcements.**
   The Announcements table (announcement) displays all announcements.
2. **Click New.**
3. **Complete the form.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Internal title that does not display in the announcement.</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the announcement is active. Inactive announcements do not display.</td>
</tr>
<tr>
<td>Title</td>
<td>The display title of the announcement.</td>
</tr>
<tr>
<td>From</td>
<td>Date and time the announcement begins to display.</td>
</tr>
<tr>
<td>To</td>
<td>Date and time the announcement ends. If this field is not defined, the announcement continues to display until it is deactivated.</td>
</tr>
<tr>
<td>Summary</td>
<td>The display text of the announcement.</td>
</tr>
<tr>
<td>Display style</td>
<td>Defines the background color, text color, and text alignment of banner announcements. Base system styles include:</td>
</tr>
<tr>
<td></td>
<td>- Normal: Blue background and left-aligned, white text. This is the default style.</td>
</tr>
<tr>
<td></td>
<td>- Urgent: Red background and left-aligned, white text.</td>
</tr>
</tbody>
</table>

Announcements that appear in a banner use the display style defined in the Announcement record by default. To use the display style in an instance of the Announcements widget, you can select the **Use Display Style** instance option.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Type           | Defines where an announcement displays. By default, announcements display in the following locations:  
· **Banner**: Announcement banner above the banner frame in the Service Portal.  
· **Widget**: Instance of the announcements widget.  
You can create an announcement type to define other widget instances to display an announcement. |
| Glyph          | Glyph to display to the left of the title in banner announcements.                                                                                                                                                                                                                                                                           |
| Glyph alt text | Alternative text for the glyph icon used with screen readers.                                                                                                                                                                                                                                                                                 |
| Public         | Whether the announcement can be viewed before login.                                                                                                                                                                                                                                                                                             |
| Roles          | If **Public** is not selected, you can define roles that the announcement is visible to. If no roles are selected, the announcement is visible to all roles. If **User criteria for Service Portal** is set up and **Public** is not selected, you can define user criteria for the announcement record instead of defining roles.                                    |
| Display first  | If selected, the announcement displays before all other announcements.                                                                                                                                                                                                                                                                         |
|                | If there is a tie between two records set to **Display first**, the sort order defined in the `glide.service_portal.announcement.default.sort_order` system property is honored. See **Service Portal properties**.                                                                                                      |
| Click target   | Creates a link below the announcement body that opens to a target page or URL.  
· **None**: No link is included in the announcement.  
· **Page**: Opens a Service Portal page in the current browser tab.  
· **URL in current browser tab**: Opens a URL in the current browser tab.  
· **URL in new browser tab**: Opens a URL in a new browser tab.  
If the **Details link text** field is blank and a click target is defined, the title of the announcement is the link.                                                                                               |
| Details page   | The page that opens in the current browser tab. Available if the **Click target** is **Page**.                                                                                                                                                                                                                                               |
| Details URL    | The URL that opens in the current or new browser tab. Available if the **Click target** is **URL in current browser tab** or **URL in new browser tab**.                                                                                                                                          |
| Details link text | Link text for the page or URL click target. If this field is blank and a click target is defined, the title of the announcement is the link.                                                                                                                                               |
| Dismiss options| Determines whether the user can dismiss the announcement. Options include:  
· User can dismiss - no redisplay  
· User can dismiss for current session only  
· User cannot dismiss                                                                                                                                                                                                                                                                         |
| Portals        | Portals that display the announcement. If this value is not defined, the announcement displays in all portals.                                                                                                                                                                                                                               |

4. Save or submit the record.
5. Optional: If User criteria for Service Portal is set up and Public is not selected, you can define user criteria for the announcement record. Announcements only display to users that pass the access criteria.

6. Update the record.

If the Type is Banner, test your announcement by navigating to the portal defined in the Portals field. If the Type is Widget or a custom type, test your announcement by navigating to the page with the associated widget instance.

Create an announcement display style

Define the background color, foreground color, and text alignment of one or more announcements. Announcements that appear in a banner use the display style defined in the Announcement record by default. To use the defined display style in a widget, you can select an instance option.

Role required: admin, sp_admin, or announcement_admin

1. Navigate to Service Portal > Announcements.
2. Open an existing announcement or create a new announcement.
3. In the Display style field, click the reference lookup icon to open the referenced table. The Announcement Styles (announcement_style) list view opens.
4. Click New to create a new display style.
5. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Internal name of the display style.</td>
</tr>
<tr>
<td>Application</td>
<td>The application scope of the announcement. This value is read-only.</td>
</tr>
<tr>
<td>Background color</td>
<td>Color name or HEX value in the format #000000 for the announcement background.</td>
</tr>
<tr>
<td>Foreground color</td>
<td>Color name or HEX value in the format #000000 for the announcement text.</td>
</tr>
<tr>
<td>Alignment</td>
<td>Text alignment. Options include:</td>
</tr>
<tr>
<td></td>
<td>· Left align</td>
</tr>
<tr>
<td></td>
<td>· Center align</td>
</tr>
</tbody>
</table>

6. Click Submit.

Navigate to the Service Portal associated with the announcement record to view the announcement.

Create an announcement type

Announcement types determine where an announcement displays. Announcements include two base system types: banner and widget.

Role required: admin, sp_admin, or announcement_admin

Similar to creating a category tag, you can create alternative types to define custom locations. For example, to display an announcement only in a specific widget instance, you can create an
announcement type for that widget instance. Any announcements tagged with that type will only display in the desired widget instance.

1. Navigate to **System Definition > Tables > Announcement Consumer Type**. The Announcement Consumer Type table (announcement_consumer_type) opens.

2. In the Columns section of the form, Click **New**.

3. Define a **Name**. The name is used to associate an announcement with a widget instance.

4. Click **Save**.

5. Add the custom type to an announcement.
   a) Navigate to **Service Portal > Announcements**.
   b) Open an existing announcement or create a new announcement.
   c) In the **Type** field, select the custom type.
   d) Click **Save**.

6. If using the type in a widget, define the type as a widget instance option.
   The announcement banner only displays announcements tagged with the **Banner** type.
   a) Navigate to an instance of the Announcement widget.
   b) Control + right-click the widget instance and select **Instance Options**.
   c) In the **Type** field, select the custom announcement type.

The widget instance associated with the type displays any announcements tagged with the same type.

**Service Portal security**

Control user access to a portal.

Control who accesses your portal and what they can see in the following ways:

- **Authentication**: Configure login and single sign on for users
- **Limit page access by role**: Use roles to limit the users who can see a page.
- **Public pages**: Use the public check box on a page record to make the page publicly accessible.

**Note**: A number of portal pages that are installed by default are marked public. Filter your list of Service Portal pages for Public (is) true to identify these pages. Setting the Public value to false will prevent these pages from being publicly available.

- **User criteria**: For a more advanced way of limiting user access, create and apply user criteria to pages, widgets, widgets instances, and search sources.
- **Multifactor authentication**: If an instance is configured to require multifactor authentication, users are automatically directed to set up multifactor authentication upon initial login. For setup instructions, see [Set up multifactor authentication upon initial login](#). If multifactor authentication is optional, users can still enable or disable authentication from their user profile. For setup instructions, see [Set up multifactor authentication on your own profile](#).

**Single sign-on, logins, and URL redirects**

Service Portal uses a combination of system properties and script includes to determine how the system handles URL redirects for users logging in to the portal.
Only users who understand SSO, URL redirects, and the ServiceNow platform should make any changes.

**Single sign-on and Service Portal**

To use single sign-on with Service Portal, you must enable the Integration - Multiple Provider Single Sign-On Installer plugin (com.snc.integration.sso.multi.installer).

If you are using the system property to automatically redirect to your primary IdP, then Service Portal automatically redirects to that IdP. If you have multiple identity providers, Service Portal shows a link on the login page to **Use external login**. For more information on SSO and authentication in the platform, see [External single sign-on (SSO)](#).

**Require authentication for a Service Portal page**

If you want to require authentication for a Service Portal page, ensure that the **Public** flag on the page record is not selected. For more information, see [Create and edit a page using the Service Portal Designer](#). If a user navigates to a non-public page, they are redirected to the login page for the requested portal.

Because every page request is routed through the $sp page, this page must be public. The following values in the Public Pages sys_public table define the page as public:

- **Page**: $sp
- **Active**: true

**Configure the Service Portal login page**

Administrators can configure a login page URL redirect for a portal.

1. **Add a system property** with the following settings:
   - **Name**: glide.entry.page.script
   - **Type**: string
   - **Value**: `new SPEntryPage().getLoginURL()`

2. To customize the actual entry page, from the Script Includes table, search for **SPEntryPage**.

   **Note**: If you make changes to the script include, it won’t be upgraded with future updates.

3. Edit the script on the SPEntryPage to change the assigned portal to the portal_suffix you want. SPEntryPage uses `/sp/` as the portal path to redirect to. Enter your own portal_suffix in place of sp.

   ```javascript
   SPEntryPage.prototype = {
     initialize: function() {
       this.logVariables = false; // for debugging
       this.portal = "/sp"; // The URL suffix specified in the system property
     },
   }
   ```
Redirect to Service Portal after login

Use system properties and script includes to conditionally redirect users to a page after logging in. Follow these steps to redirect a user to Service Portal after they log in.

1. In the `sys_properties` table, add the following property:

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.entry.first.page.script</td>
<td>string</td>
<td>new SPEntryPage().getFirstPageURL()</td>
<td>First page after authentication</td>
</tr>
</tbody>
</table>

`getFirstPageURL` primarily does the following:
- Redirects to `login_redirect.do` in order to break out of the frameset (if there is one).
- Redirects to Service Portal if the user has no roles, or the full platform for everyone else.

2. Customize the after login behavior by navigating to the `SPEntryPage` script include.

**Note:** If you make changes to the script include, it won’t be upgraded with future updates.

**Note:** If you are using external authentication, ensure that your IdP supports the `RelayState` URL parameter. This parameter retains the originally requested URL while the user authenticates, and is necessary for redirection after login.

Debug Service Portal URL redirects

Debug the URL redirects for logging in to Service Portal and redirecting to the first page.

To view debug output from `SPEntryPage` and see the session variables it redirects based on:

1. Make sure the system property `glide.entry.first.page.script` has the value: `new SPEntryPage().getFirstPageURL()`.
2. From the `SPEntryPage` script include, set `this.logVariables = true`.
3. In a separate browser, log in.
4. From the system navigator, view the log output by navigating to `System Logs > System Log > All`.

Configure page security by role

Set up pages to be public or filter them by role.

Public pages won’t require a user login; anyone can access them. All other options require user authentication.

To manage your page security:

1. In the Service Portal configuration page (**Service Portal** > **Service Portal Configuration**), open the Page Editor.
2. In the Select Page list, search for the page you want to apply page security to.
3. Select the highest level node in the tree view.
4. To make a page public, select the **Public** check box. All users can access pages marked as **Public**.

5. To limit access to a certain role, add roles in a comma separated list. Users without the role listed can see links to the page if they appear in the portal. Trying to open the page results in a page not found error.

   **Note:** If you select **Public** and add a list of roles, the page is still accessible by any user.

6. To create a draft page that only administrators can see while the page is still in development, select **Draft**. Users must have the admin role to see any pages in draft. Everyone else sees a page not found error.

   ![Page with limited access by role](image-url)
User criteria for Service Portal

User criteria enables you to allow access to users based on role, department, group, location, or company. Administrators can control access to pages, widgets, widget instances, announcements, and search sources in a portal by creating and applying user criteria.

User criteria records define conditions that are evaluated against user records. When user criteria is defined, portal records are only visible to users who pass the defined conditions.

User criteria is a platform feature used in Service Portal. Learn more about user criteria in the Now Platform:

- Service Catalog: Set security for items and categories.
- Knowledge management: Select user criteria for a knowledge base.

Converting role-based permissions to user criteria records

User criteria in Service Portal replaces role-based permissions. After activating the user criteria for Service Portal plugin, you must Set the user criteria for Service Portal system property to true. When the system property is set to true, any existing roles defined for a page, widget, or search source are automatically converted into user criteria records. To disable user criteria and continue using role-based permissions, set the system property to false.

User criteria checks

User criteria uses the following checks in Service Portal to verify user access.

Page access user criteria

The following diagram shows how the system decides whether a user can access a page based on user criteria.
Widget access user criteria

The following diagram shows how the system determines whether a user has access to a particular widget or widget instance.
Activate the user criteria for Service Portal plugin

You can activate the Service Portal User Criteria Support plugin (com.glide.service-portal.user-criteria) if you have the admin role.

Role required: admin

1. Navigate to System Definition > Plugins.
   A banner notifies you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.
   
   Note:
   To redirect to the legacy list view for plugins, click the link.

   ![](image)

2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.
   You can activate the plugin directly from the All Applications page or you can view more details about the plugin before you activate it.
   - If you are certain that you have the correct plugin, click Install, and when you see the dialog box, click Activate.

   ![Activate Plugin](image)

   - To view plugin details before activation:
     1. Click the plugin name.
     2. On the form, click the Activate/Update related link.
     3. In the dialog box, review the dependent plugins.
If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.

4. If demo data is available and you want to install it, click **Load demo data**.

Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.

5. Click **Activate**.

---

**Set the user criteria for Service Portal system property**

After activating the Service Portal User Criteria Support plugin, you must set the system property to true.

Role required: admin

Setting the system property activates user criteria for Service Portal. When the system property is set to true, any existing roles defined for a page, widget, or search source are automatically converted into user criteria records. To disable user criteria and continue using role-based permissions, set the system property to false.

1. Navigate to **Service Portal > Properties**.
2. Click the check box to set the following property to true.

---

**Enable use of User Criteria records instead of Roles fields for Service Portal**

Defines permissions for Service Portal widgets, widget instances, search sources, and more.

- **Yes** | **No**

3. Click **Save**.

---

**Create a user criteria record for Service Portal**

Create a user criteria record to apply to items in Service Portal and control user access to pages, widgets, widget instances, and search sources.

You can **apply existing user criteria** to records in Service Portal through Service Portal configuration (**Service Portal > Service Portal configuration**). You can only create user criteria within the platform UI.

1. In the navigation filter, type **Service Portal**.
2. Select a page, widget, or widget instance record.
3. In the related list at the bottom of the record, select the **Can View** or **Cannot View** tab, then click **New**. If a user criteria record is already created, you can click **Edit** to apply user criteria to the page, widget, or widget instance.

User criteria records are stored in the user_criteria table.
4. Complete the fields on the form, as appropriate.

**Service Portal User Criteria**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the criteria record.</td>
</tr>
<tr>
<td>Users</td>
<td>User records to match access criteria.</td>
</tr>
<tr>
<td>Groups</td>
<td>Group records to match access criteria.</td>
</tr>
<tr>
<td>Roles</td>
<td>Roles to match access criteria.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Displays or hides the <strong>Script</strong> field.</td>
</tr>
<tr>
<td>Script</td>
<td>Defines any additional criteria, and returns true or false. This field is available only if <strong>Advanced</strong> is selected.</td>
</tr>
</tbody>
</table>

**Note:** Because scripts are evaluated dynamically, including scripts in user criteria records can decrease performance.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Application scope for the user criteria record.</td>
</tr>
<tr>
<td>Active</td>
<td>Activate or deactivates this criteria record.</td>
</tr>
<tr>
<td>Companies</td>
<td>Companies to match access criteria.</td>
</tr>
<tr>
<td>Locations</td>
<td>Locations to match access criteria.</td>
</tr>
<tr>
<td>Departments</td>
<td>Departments to match access criteria.</td>
</tr>
</tbody>
</table>
| Match All   | Determines whether all elements from each populated criteria field must match. If selected, only users who match all criteria are given access. If cleared, the user must meet one or more of the set criteria to be given access. By default, this check box is cleared so that any condition met provides a match. For example, consider a user criteria record for the following: • Locations A or B • Company C or D With **Match All** selected, only users meeting all these conditions are matched. For example, a user with a location A and a company C. With **Match All** cleared, users meeting any of these conditions are matched. For example, a user with a location B. **Note:** If you select **Match All**, ensure that you do not create contradictory conditions that can never be met. For example, if all users in location A work for company G, then the conditions in this example can never be met.

5. Click **Submit**.

**Apply user criteria to a page, widget, or widget instance**

Assign user criteria to pages, widgets, or widget instances to limit user access to content in a portal.

Activate the Service Portal User Criteria Support (com.glide.service-portal.user-criteria) plugin and set the `glide.service_portal.user_criteria_enabled` system property to **true**.

Role required: admin or sp_admin

You can apply several user criteria records to a single portal item.

1. In the Service Portal Configuration page (**Service Portal > Service Portal Configuration**), open the Page Editor.
2. Select a page from the list.
3. Select a page, widget, or widget instance node from the page tree.
4. Under related lists, click **Who Can View** or **Who Cannot View**.
5. Click New.
6. Select a criteria from the Can View or Cannot View list.

Selecting criteria from the Can View or Cannot View list applies user criteria records created in Create a user criteria record for Service Portal to the selected page, widget, or widget instance.

7. Click Save.

**Apply user criteria to a search source**

Assign user criteria to search sources to limit user access to content in a portal.

Role required: admin

You can add user criteria to custom or default Service Portal search.

1. In the Service Portal Configuration page (Service Portal > Service Portal Configuration), navigate to Portal Tables > Search Source in the header menu.
Service Portal

Create rich, engaging and modern experiences to help your business run.
Select one of the options below to continue.

- **Branding Editor**
  Customize your portal's title, logo and theme colors. Preview changes as you make them.

- **Designer**
  Create and layout pages with drag-and-drop functionality. Preview pages as you make changes.

- **Page Editor**
  Configure the properties of pages, containers and widgets from a map view.

- **Widget Editor**
  Create widgets from scratch or customize an existing one. Write HTML, CSS, and JavaScript with real-time preview.

Search Source:
- Service Portal
- Service Portal Documentation
- Service Portal Log Entry
2. Open the search source record that you would like to modify.
3. Under related lists, click **Who Can View Search Sources** or **Who Cannot View Search Sources**.
4. Click **New**.
5. Select a criteria from the **Can View** or **Cannot View** list.

Selecting criteria from the **Can View** or **Cannot View** list applies user criteria records created in [Create a user criteria record for Service Portal](#) to the selected search source.

6. Click **Save**.

**Enable e-signature for Service Portal**

You can configure e-signature in Service Portal to require re-authentication from approving users.

Role required: admin

1. Activate the Approvals with e-Signature (com.glide.e_signature_approvals) plugin.
2. Navigate to **System Definition > e-Signature Registry**.
3. Add any tables you want to require an e-signature for to the list.

With e-signature enabled, approvers are required to provide a password to approve or reject any requests. Authentication with touch ID works in the mobile app. On the mobile web, approvers...
are still required to enter a password. For more information on configuring e-signature, see Approval with e-signature.

**Service Portal SCSS Primer**

SCSS is a subset of the Syntactically Awesome StyleSheets (Sass) specification and is an extension of CSS. Every valid CSS style sheet is valid SCSS.

**SCSS variables**

SCSS variables are a way to store information that you want to reuse throughout your style sheet. You can store things like colors, font stacks, or any CSS value you think you want to reuse. SCSS uses the $ symbol to make something a variable.

SCSS supports the following data types:

- Numbers (including units)
- Strings (with quotes or without)
- Colors (name, or names)
- Booleans

Variables can also be arguments to or results from one of several available functions or mixins. During translation, the values of the variables are inserted into the output CSS document.

For example:

```scss
$font-stack: Helvetica, sans-serif;
$primary-color: #333;

body {
  font: 100%$font-stack;
  color: $primary-color;
}
```

For more information on Sass, see the [Sass/SCSS reference](#).

**SCSS functions**

List of functions for Service Portal SCSS compiler.

**RGB functions**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rgb($red, $green, $blue)</td>
<td>Creates a Color from red, green, and blue values.</td>
</tr>
<tr>
<td>rgba($red, $green, $blue, $alpha)</td>
<td>Creates a Color from red, green, blue, and alpha values.</td>
</tr>
<tr>
<td>red($color)</td>
<td>Gets the red component of a color.</td>
</tr>
<tr>
<td>green($color)</td>
<td>Gets the green component of a color.</td>
</tr>
<tr>
<td>blue($color)</td>
<td>Gets the blue component of a color.</td>
</tr>
<tr>
<td>mix($color1, $color2, ($weight))</td>
<td>Mixes two colors together.</td>
</tr>
</tbody>
</table>
### HSL functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>hsl($hue, $saturation, $lightness)</td>
<td>Creates a Color from hue, saturation, and lightness values.</td>
<td>Yes</td>
</tr>
<tr>
<td>hsla($hue, $saturation, $lightness, $alpha)</td>
<td>Creates a Color from hue, saturation, lightness, and alpha values.</td>
<td>Yes</td>
</tr>
<tr>
<td>hue($color)</td>
<td>Gets the hue component of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>saturation($color)</td>
<td>Gets the saturation component of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>lightness($color)</td>
<td>Gets the lightness component of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>adjust-hue($color, $degrees)</td>
<td>Changes the hue of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>lighten($color, $amount)</td>
<td>Makes a color lighter.</td>
<td>Yes</td>
</tr>
<tr>
<td>darken($color, $amount)</td>
<td>Makes a color darker.</td>
<td>Yes</td>
</tr>
<tr>
<td>saturate($color, $amount)</td>
<td>Makes a color more saturated.</td>
<td>Yes</td>
</tr>
<tr>
<td>desaturate($color, $amount)</td>
<td>Makes a color less saturated.</td>
<td>Yes</td>
</tr>
<tr>
<td>grayscale($color)</td>
<td>Converts a Color to grayscale.</td>
<td>Yes</td>
</tr>
<tr>
<td>complement($color)</td>
<td>Returns the complement of a color.</td>
<td>No</td>
</tr>
<tr>
<td>invert($color)</td>
<td>Returns the inverse of a color.</td>
<td>No</td>
</tr>
</tbody>
</table>

### Opacity functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>alpha($color)</td>
<td>Gets the alpha component (opacity) of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>opacity($color)</td>
<td>Gets the alpha component (opacity) of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>rgba($color, $alpha)</td>
<td>Changes the alpha component for a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>opacify($color, $amount)</td>
<td>Makes a color more opaque.</td>
<td>No</td>
</tr>
<tr>
<td>fade-in($color, $amount)</td>
<td>Makes a color more opaque.</td>
<td>No</td>
</tr>
<tr>
<td>transparentize($color, $amount)</td>
<td>Makes a color more transparent.</td>
<td>No</td>
</tr>
<tr>
<td>fade-out($color, $amount)</td>
<td>Makes a color more transparent.</td>
<td>No</td>
</tr>
</tbody>
</table>
## Other color functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>adjust-color()</td>
<td>Increases or decreases one or more components of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>scale-color()</td>
<td>Fluidly scales one or more properties of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>change-color()</td>
<td>Changes one or more properties of a color.</td>
<td>No</td>
</tr>
<tr>
<td>ie-hex-str()</td>
<td>Converts a color into the format understood by IE filters.</td>
<td>No</td>
</tr>
</tbody>
</table>

## String functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>unquote($string)</td>
<td>Removes quotes from a string.</td>
<td>Yes</td>
</tr>
<tr>
<td>quote($string)</td>
<td>Adds quotes to a string.</td>
<td>Yes</td>
</tr>
<tr>
<td>str-length($string)</td>
<td>Returns the number of characters in a string.</td>
<td>No</td>
</tr>
<tr>
<td>str-insert($string, $insert, $index)</td>
<td>Inserts $insert into $string at $index.</td>
<td>No</td>
</tr>
<tr>
<td>str-index($string, $substring)</td>
<td>Returns the index of the first occurrence of $substring in $string.</td>
<td>No</td>
</tr>
<tr>
<td>str-slice($string, $start-at, $end-at)</td>
<td>Extracts a substring from $string.</td>
<td>No</td>
</tr>
<tr>
<td>to-upper-case($string)</td>
<td>Converts a string to upper case.</td>
<td>No</td>
</tr>
<tr>
<td>to-lower-case($string)</td>
<td>Converts a string to lower case.</td>
<td>No</td>
</tr>
</tbody>
</table>

## Number functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>percentage($number)</td>
<td>Converts a unitless number to a percentage.</td>
<td>Yes</td>
</tr>
<tr>
<td>round($number)</td>
<td>Rounds a number to the nearest whole number.</td>
<td>Yes</td>
</tr>
<tr>
<td>ceil($number)</td>
<td>Rounds a number up to the next whole number.</td>
<td>Yes</td>
</tr>
<tr>
<td>floor($number)</td>
<td>Rounds a number down to the previous whole number.</td>
<td>Yes</td>
</tr>
<tr>
<td>abs($number)</td>
<td>Returns the absolute value of a number.</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### Function
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>min($numbers...)</td>
<td>Finds the minimum of several numbers.</td>
<td>Yes</td>
</tr>
<tr>
<td>max($numbers...)</td>
<td>Finds the maximum of several numbers.</td>
<td>Yes</td>
</tr>
<tr>
<td>random($limit)</td>
<td>Returns a random number.</td>
<td>No</td>
</tr>
</tbody>
</table>

### List functions

List functions return a new list rather than updating the existing list in-place.

#### Function
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>length($list)</td>
<td>Returns the length of a list.</td>
</tr>
<tr>
<td>nth($list, $n)</td>
<td>Returns a specific item in a list.</td>
</tr>
<tr>
<td>set-nth($list, $n, $value)</td>
<td>Replaces the nth item in a list.</td>
</tr>
<tr>
<td>join($list1, $list2)</td>
<td>Joins two lists into one.</td>
</tr>
<tr>
<td>append($list1, $val)</td>
<td>Appends a single value onto the end of a list.</td>
</tr>
<tr>
<td>zip($lists...)</td>
<td>Combines several lists into a single multidimensional list.</td>
</tr>
<tr>
<td>index($list, $value)</td>
<td>Returns the position of a value within a list.</td>
</tr>
<tr>
<td>list-separator($list)</td>
<td>Returns the separator of a list.</td>
</tr>
</tbody>
</table>

### Adding custom functions

```scss
@function my-calculation-function($some-number, $another-number){ @return $some-number + $another-number }
```

### SCSS nesting

SCSS lets you nest your CSS selectors in a way that follows the same visual hierarchy of your HTML.

For example:

```css
nav {
  ul {
    margin: 0;
    padding: 0;
    list-style: none;
  }
  li { display: inline-block; }
  a {
    display: block;
    padding: 6px 12px;
    text-decoration: none;
  }
}
```
The `ul`, `li`, and `a` selectors are nested inside the `nav` selector, which is a great way to organize your CSS and make it more readable. When the widget is rendered, the generated CSS looks something like the following code block:

```
nav ul {
    margin: 0;
    padding: 0;
    list-style: none;
}
nav li {
    display: inline-block;
}
nav a {
    display: block;
    padding: 6px 12px;
    text-decoration: none;
}
```

For more information on Sass, see the [Sass/SCSS reference](#).

**SCSS operators**

SCSS has a handful of standard math operators like `+`, `-`, `*`, `/`, and `%`. Use simple math to calculate widths for an aside & article. For example:

```
.container { width: 100%; }
article[role="main"] {
    float: left;
    width: 600px / 960px * 100%;
}
aside[role="complementary"] {
    float: right;
    width: 300px / 960px * 100%;
}
```

The generated CSS looks like:

```
.container {
    width: 100%;
}
article[role="main"] {
    float: left;
    width: 62.5%;
}
aside[role="complementary"] {
    float: right;
    width: 31.25%;
}
```

For more information on Sass, see the [Sass/SCSS reference](#).
### SCSS mixins

A mixin lets you make groups of CSS declarations that you want to reuse throughout your site. You can pass in values to make your mixin more flexible.

The following code block is an example for border-radius.

```scss
@mixin border-radius($radius) {
  -webkit-border-radius: $radius;
  -moz-border-radius: $radius;
  -ms-border-radius: $radius;
  border-radius: $radius;
}

.box { @include border-radius(10px); }
```

The generated CSS looks like:

```css
.box {
  -webkit-border-radius: 10px;
  -moz-border-radius: 10px;
  -ms-border-radius: 10px;
  border-radius: 10px;
}
```

For more information on Sass, see the [Sass/SCSS reference](#).

### Performance Analytics Content Pack for Service Portal

The Performance Analytics Content Pack for Service Portal enables service delivery executives to improve user engagement with your organization's portals by tracking the usage of portals in preconfigured indicators and data visualizations.

To enable the Performance Analytics Content Pack for Service Portal, install the content pack from the [ServiceNow Store](https). Purchasing a subscription to the [licensed Performance Analytics](https) is required to install the content pack.

After you enable the content pack, you can access the Service Portal dashboard by navigating to [Performance Analytics > Dashboards](https). From the dashboard picker, open the Service Portal Usage dashboard.

Assign the `pa_viewer` role to users who need to view the dashboard. You must have the `sp_admin` or `admin` role to edit the dashboard.

The Service Portal Usage dashboard has three tabs:

- **Overview**
- **Visitors**
- **Views**

You can view reports by selecting options in the interactive filter based on the Service Portal and the Service Portal User Country. The statistics provided in each tab change based on the options selected in the interactive filter.

#### Overview tab

The Overview tab displays the following widgets:
<table>
<thead>
<tr>
<th>Widget</th>
<th>Description</th>
</tr>
</thead>
</table>
| Visitors vs Views | Comparison of three metrics:  
  **Visitors**  
  Total number of unique visitors per week.  
  **Pages per Visitor**  
  Number of unique views by a unique visitor per week.  
  **Page views**

- Service Portal
- Service Portal Page
- Service Portal User Country

For more information on analyzing data with breakdowns, see Using breakdowns on dashboards.

Skills Management

Use Skills Management to associate skills with individual users or groups and assign them to tasks or projects. You can also assess the skills needed for your organization, identify gaps, and implement effective plans for hiring or training of your teams.

Skills can contain other skills. For example, if you define network as a skill, you can add router as the skill it contains. A user assigned to a parent skill grants access to a child skill. Once a skill is assigned to a group, all members of the group inherit that skill and any others contained within it. Skills management works similar to ServiceNow platform role management.

Using this application, you can:

- Manage skills for agents and your employees from a central location.
- Use a standard way to identify skills for your organization and keep them up to date.
- Group skills into categories and define skill levels to track the expertise of your resources at a granular level.
- Prevent task or project reassignments by assigning tasks to agents and projects to teams that have the right skills to work on those items.
- Identify skill gaps and resolve them by implementing effective plans for coaching and training of resources.
- Manage the effectiveness of your team by evaluating the skills your team has and determining what skills you need to work on your projects.
Integration with ServiceNow® applications

A skill is an ability to do something that comes from training, experience, and practice. As a system administrator, you can define skills for your organization and assign it to users and groups from a central location. As an application manager, you can assign users to tasks based on these skills. For example, if you are an IT manager, you can use the Skills Management application to define skills for your agents and assign those agents to resolve incidents using the ITSM application.

Group skills into categories and define skill levels to standardize skill implementation across your organization.

Use skills from the centralized location in the following applications:

- **Agent auto assignment using multiple selection criteria**
As an IT manager, reduce time and cost while resolving incidents by assigning work items to the right agent. Assess skill gaps agents have in your team and coach or train agents based on the needs. Identify and define a standard way to keep skill categories and levels consistent within your team.

- **Assignment workbench**

As a customer service manager, identify agent skills and automatically route tasks to agents who have the required skill to work on those tasks. Manage your team's effectiveness by understanding what type of skills your employees have in dynamic situations where employees are hired, leave, or get trained to take on other roles.

- **Manage Field Service and Customer Service skills**

As a field service or customer service manager, use rules to identify skills and skill levels that agents require to resolve work items such as cases, work order tasks, and agent interactions. Automate skill assignment to reduce manager work load. Automatically assign tasks to agents using Field Service dynamic scheduling.

- **HR skills management**

As an HR manager, use skills to identify the type of skills your organization needs and make hiring decisions based on those needs. Manage your team's effectiveness by understanding what type of skills your employees have in dynamic situations where employees are hired, leave, or get trained to take on other roles.

- **Project tasks**

As a project and portfolio manager, standardize how you categorize skills, define skill level types, and add skill levels for your team. Set up skills for your team in a central location and make them available within your team. Prevent project reassignments by assigning the right projects to the team members who have the right skills to work on those projects.

### Roles used in Skills Management

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
</table>
| Skill administrator (skill_admin) | - Inherits the skill manager (skill_manager) and skill user (skill_user) roles.  
|                          | - Can perform create, read, update, and delete (CRUD) operations on skills, skill levels, skill level types, skill categories, and sub categories. |
| Skill manager (skill_manager) | - Inherits the skill user (skill_user) role.  
|                          | - Can perform read operations on skills, skill levels, skill level types, skill categories, and sub categories.  
|                          | - Can assign skills to users and groups. |
| Skill user (skill_user) | Can perform read operations on skills, skill levels, skill level types, skill categories, and sub categories. |

### Activating Skills Management

The Skills Management application is activated when you enable the Skills Management (com.snc.skills_management) plugin.
Configuring skills

Create skills, identify the type of skill level it belongs to and associate skill levels for each type to define skills for your users consistently across your organization. For example, you can add French as a skill, language as the skill level type, and familiar, proficient, and expert as the skill levels.

Identify all skills you currently have and would need across your organization to begin implementing skills. For example, if you are using Customer Service, you may have agents who have Java as a technical skill and you may need agents who have experience in network administration. If you are using Human Resources, you may have employees who have coaching as a skill and you may need employees who can get new hires on board.

Associate each skill you have identified with a skill level type. For example, you can associate Java with programming as the skill level type and coaching with leadership as the skill level type.

Define skill levels for each type you have identified. As an example, you can use familiar, proficient, and expert as skill levels for the Java skill level type and beginner, intermediate, and advanced as the skill levels for the coaching skill level type.

Define skill taxonomy

Organize related skills into categories and subcategories so that you can manage skills and create reports quickly and efficiently.

Role required: skill_admin

A skill category can contain parent and child categories that together create a category hierarchy. You can add skills to the lowest category in the hierarchy.

You can build your skill taxonomy from scratch or use the sample data provided with your application.
Skill Category
Financial Management

Name
Financial Management

Description
Financial Management skills include planning, organizing, directing, and utilizing funds of the enterprise.

Parent

Category Hierarchy

View hierarchy: Parent view | Full view

Financial Management - (Current Skill)

Collection & Payments

Accounting

Budget & Finance

Update Delete

Child Categories

New Edit... Search

Parent = Financial Management

Name ▲

Accounting

Budget & Finance
2. In the Skills Categories list, click New.
3. In the Name field, enter a unique name for the category.
4. Optional: In the Parent field, select a parent category.
5. Right-click the form header and click Save.
   The category is added to the Category Hierarchy.
6. Do one of the following:
   
<table>
<thead>
<tr>
<th>To add</th>
<th>Do this</th>
</tr>
</thead>
</table>
   | Subcategories | • In the Child Categories related list, click New.  
   |          | • In the Name field, enter a unique name for the category. |
   | Skills   | • Enable the Add Skills check box.  
   |          | • Right-click the form header and click Save.  
   |          | • In the Skills related list, click New.  
   |          | • In the Name field, enter the name of the skill. |

7. Click Submit.

Create skill categories using sample data

Onboard your team quickly using the skill taxonomy framework provided with your application.
Role required: skill_admin

The sample data provides 150 records that you can use to get started with to build your skill taxonomy.
1. Activate the Skills Library Data for Skills Management (com.snc.skills_management.seed_data) plugin.
2. Navigate to Skills > Skill Taxonomy.
3. In the Skill Categories list, review each category and set the Add skills field to true for all skill categories you want to add to your application.

Define a skill level type

Define skill levels (for example, beginner, intermediate, advanced) for different skill level types (for example, a language or an IT certification) and then associate skill levels to users and define skill levels and types required for tasks.
Role required: skill_admin or admin

1. Identify skill level types.

   You can group skills that belong to the same category into a skill level type. For example, you could use language as the skill level type if Japanese and French are defined as skills. Take an inventory of every type of skill your organization needs.

2. Add skill level types, define skill levels, and associate them with a skill level type.

   After you add a skill level type, you can define different levels for that type of skill. For example, if you add language as a type of skill, you can associate familiar, proficient, and expert as skill levels. When you select French, for example, as a skill for a user, you will be able to define the user’s skill level for French as either familiar, proficient, or expert.

   a) Navigate to Skills > Skill Level Types.
   b) Click New.
   c) Enter a name and description for the skill level type and then right-click the form and click Save.
d) To associate skill levels with this skill type, add a name and value for the skill level. The value is used to measure skill gaps. For example, if you give a value of 10 for a skill level defined as proficient and a value of 25 for a skill level defined as expert, when you create a skill report to measure gaps, you will see a value of 15 as a measure for the skill gap.

3. Click Submit.

The example below shows a system administrator creating the skill level type Language, adding the skill level Proficient to that type and associating a value for the level.
**Add a skill**

Create skills to specify the competencies of your users and associate them with sub skills, users, and configuration items.

Role required: skill_admin or admin

1. **Identify skills.**
   
   Take an inventory of all skills you currently have and would need across your organization. For example, if you are using Customer Service, you may have agents who have Java as a technical skill and you may need agents who have experience in network administration. If you are using Human Resources, you may have employees who have coaching as a skill and you may need employees who can get new hires on board.

2. **Add skills.**
   
   You can associate each skill with other skills, users, or configuration items. You can assign users to tasks or projects, or identify employees with specific skills using these associations.

   a) Navigate to **Skills > All Skills.**

   b) Click **New.**

   c) Enter a name and description for the skill and then right-click the form and click **Save.**

   d) To associate sub skills to the skill, click the **Contains Skills** tab and create a new skill or add an existing skill.

   The sub skill is automatically inherited by the user or group that contains the associated skill.

   e) To specify skills for users, click the **Users** tab and create a new user for the skill or add existing users.

   f) To associate the skill with configuration items, click the **Model** tab and add one or more configuration items.

3. **Click Update.**

**Managing skills**

Manage skill assignment efficiently by simultaneously assigning a skill to multiple users or multiple skills to multiple users. Assign your agents to tasks and teams to projects based on skills.

**Assign IT skills to users**

Assign IT skills and skill levels to users to facilitate the automatic assignment of skill-based tasks to agents.

Role required: skill_manager or skill_admin

Only skill administrators can create or edit skills. Skill managers can assign skills to users.

1. Navigate to **Skills > Manage IT Skills.**

2. Do one of the following:
<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Add a skill to a user</strong></td>
<td>1. Click <strong>New Skill</strong>.</td>
</tr>
<tr>
<td></td>
<td>2. In the <strong>Skill</strong> field, enter a name for the skill.</td>
</tr>
<tr>
<td></td>
<td>3. In the <strong>Level Type</strong> field, select the type to which the skill belongs.</td>
</tr>
<tr>
<td><strong>Assign a skill to multiple users</strong></td>
<td>1. From the <strong>All Skills</strong> list, select a skill.</td>
</tr>
<tr>
<td></td>
<td>2. Click <strong>Assign/Remove Users</strong>.</td>
</tr>
<tr>
<td></td>
<td>3. Select the name of each user you want to assign this skill.</td>
</tr>
<tr>
<td></td>
<td>4. From the list, select the level for this skill for each user.</td>
</tr>
<tr>
<td></td>
<td>5. Click <strong>Assign/Remove Users</strong> again to assign the skill and skill level to the users.</td>
</tr>
<tr>
<td></td>
<td>To remove the assigned skill, select the name of the user and clear the check box for the skill.</td>
</tr>
<tr>
<td><strong>Assign multiple skills to multiple users</strong></td>
<td>1. From the <strong>All Users</strong> list, select a user.</td>
</tr>
<tr>
<td></td>
<td>2. From the <strong>Skill</strong> list, select each skill and the skill level to assign for this user.</td>
</tr>
<tr>
<td></td>
<td>3. Repeat the steps above for all users you would like assign multiple skills and associated skill levels.</td>
</tr>
</tbody>
</table>
In this example, a system administrator assigns the skill **iPhone** to multiple users and adds a skill level for each user.
In this example, a system administrator assigns multiple skills and associated skill levels to multiple users.
**Associate skills with users and groups**

Add skills to users and groups and effectively assign users to tasks and teams to projects.

Role required: skill_manager

Users automatically inherit a skill contained within a skill. Members of a group inherit all skills assigned to the group.

1. Perform one of the following actions:

<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Assign a skill to a user</strong></td>
<td>1. Navigate to Skills &gt; User Skills.</td>
</tr>
<tr>
<td></td>
<td>2. Click New.</td>
</tr>
<tr>
<td></td>
<td>3. In the Skill field, click the lookup icon and select a skill.</td>
</tr>
<tr>
<td></td>
<td>4. In the User field, click the lookup icon and select a user.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Assign a skill to a group</strong></td>
<td>1. Navigate to Skills &gt; Group Skills.</td>
</tr>
<tr>
<td></td>
<td>2. Click New.</td>
</tr>
<tr>
<td></td>
<td>3. In the Skill field, click the lookup icon and select a skill.</td>
</tr>
<tr>
<td></td>
<td>4. In the Group field, click the lookup icon and select a group.</td>
</tr>
</tbody>
</table>

2. **Optional**: In the Skill level field, click the lookup icon and select a level for the selected skill.

3. **Optional**: If the skill level is inherited, enable the Skill level inherited check box.

   You must configure the form to display the Skill level field and Skill level inherited check box.

4. Click Submit.

**Associating skills with work items**

Assign skills to tasks manually or use rules to associate them automatically to work items such as cases, tasks, or chat interactions.

**Assign skills to tasks**

Add skills and the level required for each skill to tasks. Identify whether the skill is mandatory to perform the task.

Role required: admin

1. Navigate to incident, problem, change request or any task record to which you want to associate skills.

2. In the related list, select the Tasks Skills tab.

   You must configure the related list and add Task Skill->Task to the Selected column to display this tab.

3. In the Task Skills table, do the following:

   1. In the Skill field, click the lookup icon and select a skill.
   2. In the Skill level field, select a level for the selected skill.
   3. In the Mandatory field, select true if the skill is mandatory for the selected task.

4. Click Submit.
The image below shows an administrator configuring skills for an incident task where the user is unable to access the shared folder. It is
mandatory for agents working on this task to have familiarity with IT skills.
Using rules to identify skills for work items

 Automate the identification of skills required for work items using rules, which eliminates the need to assign them manually.

 When you automate skill identification, you prevent task reassignments by assigning agents with the right skills to work on tasks and make time available for agents and managers to work on more important tasks.

 You can identify skills using rules for tasks such as cases, work order tasks, incidents, problems, and change requests and also for interactions such as chat, phone, or walk-up experience.

Create rules to assign skills to work items

 Create rules to identify skills and automatically associate them to work items.

 Role required: skill_admin or admin

 You can automatically add a skill to a case based on the product associated with the case if you enable the Product to Skill mapping table (Skill Required for Model Maintenance (cmn_m2m_skill_model)).

 A skill determination rule is created for every new skill required for a work item.

 - If a skill is no longer required for a work item, you must deactivate or remove the rule applied for the work item.
 - If two rules have the same skill associated with one work item and one rule evaluates the skill as mandatory and the other rule evaluates it as optional, then the rule that evaluates the skill as mandatory is always used.

 Note: If you create a new skill determination rule, you also need to create a corresponding business rule.

 1. Navigate to Skills > Skill Determination Rules.
 2. Click New.
 3. In the Name field, enter a name for the rule.
 4. Select the Active check box to enable the rule to assign skills to work items.
 5. From the Source table drop-down menu, select the work item source table for this rule.
 6. Using the condition builder, select the conditions to evaluate the work item.
 7. Do any of the following:

<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a simple rule</td>
<td>1. From the Type drop-down menu, select Simple.</td>
</tr>
<tr>
<td></td>
<td>2. In the Skills table, add each skill that is required for the selected work item.</td>
</tr>
<tr>
<td></td>
<td>3. If a skill is optional for selected work item, in the Mandatory field, select False.</td>
</tr>
<tr>
<td></td>
<td>4. In the Skill Level field, add a level for the skill. You must configure the form to display this field.</td>
</tr>
</tbody>
</table>

Note: You can define skill levels using the Skills Management application.
To Do this

Create a lookup rule
1. From the **Type** drop down menu, select **Lookup**.
2. From the **Lookup table** drop-down menu, select the reference table to connect to the source table.
   The **Skills Field** that connects the source and reference tables is automatically populated.
3. If this skill is mandatory, enable the **Mandatory** check box.
4. From the **Skill Level Field** drop-down menu, select a level for this skill.
5. Click **Save**.
6. In the **Field Mappings** related list, click **New**.
7. From the **Source table field** drop-down menu, select an attribute to map to the reference table.
8. From the Lookup table field drop-down menu, select an attribute to map to the source table.

Create an advanced rule
1. From the **Type** drop down menu, select **Advanced**.
2. In the **Script** window, enter a script.

8. Click **Submit**.

Activate business rules for skill determination
Enable the business rules to determine skills for cases, work order tasks, and chat interactions that are available in your application.
Role required: admin
You can also [Create a business rule](#) for tasks such as incidents, problems and change requests to associate skills to those tasks.
Create skill determination rules based on any of the following rule types:

- **Simple**
  Adds skills to work items based on a set of conditions used to evaluate the source table.

- **Lookup**
  Adds skills to work items based on selections from two different tables connected using one or more reference fields.

- **Advanced**
  Adds skills to work items using a script.

1. Enable the **Skill Determination (com.snc.skill_determination)** plugin.
2. Do one of the following:
To | Do this
---|---
Enable the business rules for cases, work order tasks, or chat interactions | • To create rules for cases, select the Active check box in the Skill determination for case business rule record.
• To create business rules for work order tasks, select the Active check box in the Skill determination for work order task business rule record.
• To create rules for chat interactions, select the Active check box in the Skill determination for interaction business rule record.

Create business rules for tasks such as incidents, problems, and change requests | 1. Open a case, work order, or chat interaction business rule record.
2. Right-click the record and select Insert and Stay.
3. In the Name field, enter a name for the business rule.
4. In the Table field, select the task table.
5. Click Update.

Routing work items to agents based on skills

Use rules to automatically route work items to agents.

For more information on routing agents to work items, see Advanced work assignments

Qualify and rank users based on skills and skill levels

Rank users so that you can select the right users based on skills needed to complete tasks. Qualify users to work on tasks such as case, work order task, or chat interaction based on the number of skills and skill levels required to work on those tasks.

Role required: skill_admin

Use the UserSkillAnalyzer API to analyze the skills and skill levels of users and the UserSkillRanking API to rank and assign them to tasks. For example, when you use the Field Service Management application to assign agents to tasks, you can analyze and rank them based on their skills and skill levels using these APIs and use dynamic scheduling to assign them to tasks.

**Note:** You must add the Matching Skill Level Gap for Dynamic Scheduling criterion to the task filter to rank agents assessed based on skill gaps. For more information on adding this criterion, see Create a task filter

1. Analyze the skills and skill levels users have to complete work items using the UserSkillAnalyzer API.

The API performs the following verification to check if users are qualified to be assigned to the work items:

1. If the user has all mandatory skills required to complete the work item, but does not have the skill level, the agent is not qualified to work on the task if the skill level is mandatory to work on the task.
2. If the user does not have all mandatory skills required to complete the task, the agent is not qualified to work on the task.

3. If the user has all skills and the skill levels required to complete the task, the agent is qualified to work on the task.

4. If the user has all skills required, but not mandatory to complete the task, the agent is qualified to work on the task.

If the user is qualified to work on the task, the API performs the following verification to analyze gaps in skill level and the total number of skills the users have to execute tasks based on the skill requirements for the work item:

1. Verifies if a work item requires a skill that does not have a level type defined.

2. Verifies if a work item requires a skill that has a level type defined but does not have the skill level defined.

3. Verifies if a work item requires a skill that has the skill level defined, but the agent does not have the skill level defined. If the skill level is mandatory to complete the task, the user who does not have those skill levels will not be assigned to those tasks.

4. Verifies whether a user has all skill levels that are mandatory, but not optional, to perform a task.

2. Rank users qualified to complete work items using UserSkillRanking API.
   The API retrieves a list of qualified users based on matching and mandatory skills and skill levels.

**Skills Management dashboard and reporting**

Use the Skills Management dashboard to analyze trends in assessing skill gaps in your organization and plan for coaching or training of your employees based on needs. Identify users and teams who have the right skills to work on tasks and projects. The Skills Management dashboard provides comprehensive reports on skill competencies of users, the tasks that require those skills, and skill gaps you can address to fulfill your organizational needs.

You can access the dashboard by navigating to Skills > Dashboard.
You can filter these reports based on the skill category and view reports for each category.
End user and roles

### Domain separation and skills management

Domain separation in Skill Management app is configured to apply to all features of the application. Separation of data is configured along with separation of logic and process. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

### Overview

**Support: Level 1**

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Domain separation and skills management. The Skills Management application enables you to track and organize skill data of service agents and employees in a domain separated environment. The skill data can be used for skill-based task

assignment, skill gap analysis to identify coaching and training needs, career growth planning, workforce optimization and skill-based hiring. All skill related tables support domain separation so that the people with skill user, skill manager and skill admin roles can view only the skill and related tasks within the (tenant) domain to which they belong.

How domain separation works in Skills Management

Domain separation is supported in Skill Management with no explicit setup or configuration requirements. Skills, skill categories, skills levels can be created in separate domains, including the global domain. When domain separation is implemented, people with skill app roles can view skill information only in the domain assigned. Domain and Domain Path columns are available for all Skill tables provided with the base system. The Domain column contains the name of the domain to which the event or alert belongs, and the Domain Path column contains the unique domain identifier.

<table>
<thead>

<td>Group skills</td>
</tr>
<tr>
<td>cmn_skill_contains</td>
<td>Define skills contained within skills</td>
</tr>
<tr>
<td>task_m2m_skill</td>
<td>Task skill information</td>
</tr>
</tbody>
</table>

Note: If the domain column is not shown, click the Update Personalized List icon and add the required column. You can also add the domain path column, if desired.

Use cases:

- A Skill Manager that belongs to the Acme domain creates a skill and wants to view and associate it to user in the Acme domain. A user must belong to the Acme domain, its parent domain, or the global domain to view the skill record.
- A Skill Manager that belongs to a parent domain tries to view a skill in a child domain. The user of a parent domain can view a skill record of the parent as well as all child domains of that parent.
- A Skill Manager that belongs to a parent domain wants to create/associate a skill on behalf of another user in the Acme domain. A user must belong to the same domain as the user for which the skill record is created.
- A Skill Manager wants to associate a record for an integrated application in the Acme domain. A user must belong to the domain of the integrated application from which a record is associated.
- A Skill Manager has access to multiple domains but wants to update a record with content within a specific domain. The domain specified for the current record drives the functionality of that record and reference fields.
Quick start tests for Skills Management

Validate that Skills Management still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Skills Management quick start tests require activating the Skills Management plugin (com.snc.skills_management).

Subscription Management setup

Because Subscription Management is active for all production instances by default, you do not need to activate a plugin. To set up Subscription Management, you assign the usage_admin role to the users who administer subscriptions. The admins allocate users to appropriate subscriptions, monitor usage of applications (both by subscribed users and by users who are not subscribed), and update subscription levels as needed.

What to do

Assign the Usage Admins

Before you (the admin user) do anything else, assign the usage_admin role to the persons who will manage subscriptions for your organization.

Admin responsibilities and activities are described in Allocating users to a Per-User subscription, Allocating your custom tables to a subscription entitlement and Monitoring how your resources are allocated for subscriptions.

View the list of your subscription applications

See View your subscription applications and allocation levels.

If your organization purchased Per-User subscriptions, the usage_admin allocates users

Note: You perform this task only for Per-User subscriptions. Your instance auto-allocates and reports on monthly usage for all other subscription types.

With a Per-User subscription, a specified number of users is entitled to use the application. You perform the following tasks:

- Build user sets.
- Allocate users to appropriate subscriptions.
- Monitor whether you have allocated the right number of users.
- Monitor and manage how users are allocated.

See Allocating users to a Per-User subscription.

If your organization purchased subscriptions that include a custom table entitlement, the usage_admin allocates custom tables to subscriptions

Some ServiceNow subscriptions include custom table entitlements to enable and track configurations and customizations. For these subscriptions, you perform the following tasks:
Allocate custom tables to subscription entitlements. For example, a single subscription might include a total entitlement of 50 custom tables. You can create custom tables for any purpose, up to the entitlement limit in the subscription.

Monitor and manage how custom tables are allocated to specific subscription entitlements.

See [Allocating your custom tables to a subscription entitlement](#).

### What to do next

**Day-to-day administration: Monitor and manage subscriptions**

See [Monitoring how your resources are allocated for subscriptions](#).

### Domain separation in Subscription Management

This is an overview of domain separation in Subscription Management. Domain separation is not supported in this application. For more information, see [Application support for domain separation](#).

### Overview

Domain separation is not supported in this application. For more information, see [Application support for domain separation](#).

### Configure the color codes for subscription allocation levels

On lists, forms, and charts, a configurable color code indicates the percentage of the subscription that has been allocated. This applies to both user and custom table allocations.

Role required: usage_admin or admin

In the example, the green color code that appears in the **Allocated** column for Financial Management, and the yellow code for the ITSA Fulfiller application, indicate that you can allocate additional users. The red code for Facilities Service Automation indicates that you have allocated more users (or custom tables) than you have purchased a subscription for.

**Note:** If the subscription contains a custom table entitlement, this color coding scheme also appears in a **Tables used** column in the Subscriptions list. To learn more about custom table allocations, see [Allocating your custom tables to a subscription entitlement](#) and [Allocate your custom tables to subscriptions](#).
1. Navigate to Subscription Management > Properties.

2. Update the Threshold for color codes (subscription.used.thresh) property setting and then click Save.

   Specify a percentage value greater than 0 and less than 100. Default: 90% of the purchased subscription limit.
   - Subscription allocation levels below the specified threshold are marked with a green color code.
   - Allocation levels between the threshold and 100% are marked yellow.
   - Allocation levels above 100% are marked red.

Subscription Management administration

You use the ServiceNow® Subscription Management application to review and manage how purchased subscriptions are used on your production instance. You can monitor usage of subscription applications to update subscription levels and to make informed decisions about subscription purchases.

What is a subscription?

In contrast to companies that sell software licenses, ServiceNow sells subscription services.

- Your organization has purchased a subscription to an application family. The subscription entitles an agreed-upon number of users or resources in your organization to use the applications.

© 2019 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
For Per-User type subscriptions only, you allocate users to the subscription. As a result, the user is subscribed to the family of applications. For other subscription types, the instance auto-allocates users or resources to the subscription.

For your organization to comply with its service contract, only subscribed users or resources should use a subscription application family.

The Subscription Management application monitors your purchased subscriptions on production instances only.

How do you use Subscription Management?

The usage_admin can perform the following tasks:

- Receive and view subscriptions that your organization has purchased.
- Monitor and adjust allocation levels.
- Plan for renewing subscriptions.
- Determine which users (by role, by user group, or by some other criterion) should be subscribed to which Per-User subscription applications.
- Build user sets.
- Manage user sets as users, roles, and groups change over time.
- Allocate users and user sets to each of the Per-User subscriptions.
- Allocate custom tables created in the instance to subscriptions with custom table entitlements.
- Monitor App Engine subscription usage and compliance.

View your subscription applications and allocation levels

The Subscriptions page lists the subscriptions that your organization has purchased and indicates how many users or resources are allocated to each subscription.

Role required: usage_admin or admin

The page lists only subscriptions that are currently active (have not expired). To view expired subscriptions as well, set the list filter to All.

1. On your production ServiceNow instance, navigate to Subscription Management > Subscriptions.

   - The page attempts to list all subscriptions that your organization has purchased. Some subscriptions do not appear. See Why a subscription might not appear in the list.
   - A color code indicates the allocation level (the number of resources that are subscribed to the application).
   - Headings on the Subscriptions list are described in Subscription form.
2. Click a subscription **Name** to open the **Subscription** form, where you can:

- View or update how users are allocated to a Per-User subscription, and how custom tables are allocated to subscriptions that contain custom table entitlements. See **Subscription form**
- View the applications, plugins, and roles that are included with a subscription.
- View history reports that provide the usage administrator with subscription status and trend information.

**Subscription form**

Use the Subscription form to view a list of applications that are associated with the subscription and to view or update how resources, such as users or custom tables, are allocated to it.

In any list of subscriptions, click a subscription name to open the Subscription form. Some fields do not appear for ServiceNow Store applications.

**Note:** For information on why a subscription is not in the list, see **Why a subscription might not appear in the list.**

<tr>
<td>Subscription Applications</td>
<td>Applications or application families that are associated with the subscription. Users that you allocate to the subscription are subscribed to the listed applications. On production instances, click the application name to view a listing of published and entitled (unpublished) plugins that are associated with the application. Activation of plugins requires a user role of admin.</td>
</tr>
<tr>
<td>Associated Roles</td>
<td>For Per-User type subscriptions, lists all roles that have been downloaded with the plugin for the application. The Requires Subscription column indicates if users with this role must be allocated to the subscription to stay in compliance. This setting comes from the user role record. To learn more, see Create a role. You might use the roles that are identified as associated roles to construct a user set. See Build a subscription user set.</td>
</tr>
<tr>
<td>Custom Tables</td>
<td>List of subscriptions that contain custom table entitlements. To learn more about custom table entitlements, and how the custom table allocation process works, see Allocating your custom tables to a subscription entitlement.</td>
</tr>
</tbody>
</table>
### List

<table>
<thead>
<tr>
<th>List</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entitlements</td>
<td>List of entitlements that are included with the subscription. An entitlement is a feature that is part of the application, such as the Employee Relations or Payroll feature in the HR application. For subscription applications, your organization can buy some entitlements and not buy others. The entitlements that appear in the list are the entitlements that your organization purchased with the subscription application. This related list appears only for subscription applications that implement entitlements.</td>
</tr>
</tbody>
</table>

### Types of subscriptions

The Subscriptions module lists all subscription types that your organization has purchased.

<table>
<thead>
<tr>
<th>Subscription type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Capacity</td>
<td>Your ServiceNow instance auto-allocates resources such as users, devices, software, or nodes to Capacity subscriptions. For example, resources like each CI that Discovery finds or each password reset request.</td>
</tr>
<tr>
<td>Max User</td>
<td>Your organization purchased a subscription for the anticipated maximum number of active ServiceNow users. To monitor overall usage, the instance auto-allocates each active user up to the limit of the Max User subscription.</td>
</tr>
<tr>
<td>PA Indicator</td>
<td>Your organization purchased a subscription for an application family that uses Performance Analytics capabilities (for example, PA for ITSM or PA for Service Management). The PA admin creates indicators on tables that are used by the applications.</td>
</tr>
<tr>
<td>Per-User</td>
<td>Your organization purchased a subscription for the number of fulfiller users for subscription applications and capabilities. By default, the instance can monitor and report on usage of the application by both subscribed users and users who are not subscribed. See Allocating users to a Per-User subscription.</td>
</tr>
<tr>
<td>Unlimited</td>
<td>ServiceNow Store apps only. Your instance auto-allocates and tracks active users to an Unlimited subscription. There is no limit to the number of users that can be allocated. An active user is any user in the sys_user table that has a user id and has the Active field set to true.</td>
</tr>
</tbody>
</table>

**Note:** You allocate users only to Per-User subscriptions. Because the instance auto-allocates all other subscription types, no action is required on your part.
Note: Some subscriptions come with an entitlement of custom tables that can be created in a production instance. To learn more about custom table entitlements and allocations, see Allocating your custom tables to a subscription entitlement.

Pooled subscriptions
When you purchase multiple qualifying subscriptions for certain types of products, such as IntegrationHub, those individual subscriptions combine into a single subscription pool. Any usage against that subscription deducts from the common pool.

For example, if you buy an IntegrationHub spoke with 1,000 entitlements, and another type of spoke with 500 entitlements, they combine into a common pool of 1,500 entitlements. This total entitlement pool appears in the Purchased field in the Subscription form. Qualifying entitlement usage for either type of spoke automatically deducts from this common pool.

Why a subscription might not appear in the list
The Subscriptions list displays the subscriptions that your organization has purchased. There are, however, several types of non-subscription items that do not appear in the list.

Why does my subscription not appear in the Subscriptions list?

- You might not see all subscription services that you have purchased because the Subscription Management application does not yet allow management of some subscription services.
- The subscription may have expired. The page lists only subscriptions that are currently active. To view expired subscriptions as well, set the list filter to All.
- Subscription data arrives on production instances only.
- Self-hosted instances do not receive subscription information.
- Subscriptions that are marked as Display only do not currently support resource allocation or monitoring.

Why is the Subscriptions list empty?

- The subscription information might not yet have arrived. The data is downloaded daily.

View the applications and plugins that are included with a subscription
You can activate a plugin that is associated with a for-fee subscription only if your organization has purchased the subscription.

Role required: usage_admin or admin

1. On your production instance, navigate to Subscription Management > Subscriptions.
   The page lists all active subscriptions for your organization. If a subscription does not appear in the list, contact your ServiceNow account representative to purchase the subscription. Some subscriptions do not appear for other reasons. See Why a subscription might not appear in the list.
2. Click a subscription name and then, on the Subscription form, click an application name in the Subscription Applications related list. (A subscription can include multiple applications.) The page lists the plug-ins that are associated with the application.
View the roles that are associated with the plugin for a subscription application

The Application Roles related list includes all roles that are loaded with the plugin for an application. The roles in the list form a good basis for constructing a user set.

Role required: usage_admin or admin

1. On your production ServiceNow instance, navigate to Subscription Management > Subscriptions, and then click a subscription name.
   The Application Roles related list includes all roles that are loaded with the plugin for an application. The fulfiller type roles in the list that are subscription roles form a good basis for constructing a user set.
2. Use the list as a basis for creating a user set.

View Subscription Management history reports

History reports provide the usage administrator with subscription status and trend information for the organization.

Role required: usage_admin or admin

Follow the How to instructions in the table.
## History reports

### Allocating users to a Per-User subscription

Use the Subscriptions module to allocate users to all Per-User subscriptions that your organization has purchased.
Example: allocate users to a Per-User subscription

In this example, your organization purchased a subscription for 200 fulfiller users. You, the usage admin, can therefore specify the 200 users—the subscribed users—who have the right to use the application family on your production instance. You can allocate users either individually or by adding user sets to the subscription.

**Note:** User sets are the preferred automated method for managing the pool of users who are allocated to a subscription. Once you configure and allocate a user set, the system regularly updates the list of members based on the conditions that you specified. You do not need to manage individual users.
1. The subscription admin allocates a mix of user sets and individual users to the 200-user subscription.

2. The 200 users that the admin allocated to the subscription are now subscribed.

5

Allocate
Guidelines for allocating users

- You allocate users only to Per-User subscriptions. The instance auto-allocates and reports on monthly usage for all other subscription types.
- When you add a user set to a subscription, the system allocates all users in the user set, up to the purchased subscription limit.
- In the case that adding the users in a user set would exceed the subscription limit, then none of the users in the user set are subscribed. Instead, all users in the user set are set to the Pending state and are listed on the Pending Users related list. Users that are currently subscribed are not affected. See Manage users in the Pending state.
- You can unsubscribe any user as needed.
- You can exclude users. Excluded users cannot be allocated to a subscription individually or through a user set. At any time, you can remove a user from the list of excluded users.

Note: If you unsubscribe a user who is a member of a user set that is associated with an auto-synced subscription, the user will be resubscribed in the next synchronization cycle. To remove such a user, exclude the user. See Exclude a user from a subscription.

Methods for allocating users

- Define user sets and then add user sets to the subscription
- Allocate individual users to the subscription (as many as are required)

Overview of the procedure for allocating users

1. Allocate users to the subscription using one or both of the following methods:
   - Build one or more user sets and add the user sets to the subscription
   - Allocate individual users

2. After you have allocated users to the subscription, you can add or remove user sets and individual users as needed. In addition, you can exclude individual users as needed.

Note: Some subscriptions come with an entitlement of custom tables that can be created in a production instance. To learn more about custom table entitlements and allocations, see Allocating your custom tables to a subscription entitlement.

Subscription user sets

User sets make it easy to specify which users should be allocated to a subscription. You can use roles, user groups, or both roles and groups as the conditions for a user to be a member of a user set (for example, everyone with the fulfiller role in the "IT department" group).

Auto-sync

When you add a user set to a subscription, the system attempts to subscribe all users in the user set. The system updates the members in a user set whenever a user update causes the user to meet or fail to meet the criteria for the user set. For example, if a user loses the “fulfiller user” role, the user is removed from the user set.
To make subscriptions self-maintaining, you can auto-sync a subscription. The system then regularly subscribes or unsubscribes users based on updates to the user sets that are assigned to the subscription. The option is described in Auto-sync a subscription to user set updates.

Note: Even if you select the Auto-sync with user sets option, you can update, remove, or manually synchronize the user set at any time.

How users are subscribed and unsubscribed

- When you add a user set to a subscription, the system allocates all users in the user set to the subscription, up to the purchased subscription limit.
- You can add a user set to any number of subscriptions.
- Users that are allocated from multiple user sets are subscribed only one time.
- In the case that adding the users would exceed the subscription limit, then none of the users in the user set are subscribed. Instead, all users in the user set are set to the Pending state and are listed in the Pending Users related list.
- When you remove a user set from a subscription, the system attempts to unsubscribe all users in the set. If a user is added from another user set, however, the user is not unsubscribed.
- Users that the usage admin has flagged as excluded are not allocated, even if other members of the user set are allocated. The usage admin can unexclude a user so that the user can be allocated.

Why a user is not subscribed when you add a user set

- The user set is empty (contains no users).
- The user had been excluded from the subscription.
- The user had already been directly allocated
- Another user set added the user (duplicate user)
- A user could not be allocated because adding the user would exceed the subscription limit. In this case, all users in the user set are set to the Pending state. The names of the users are listed in the Pending Users related list.

Why a user is not unsubscribed when you remove a user set

- The user set is empty (contains no users).
- The user was already directly allocated
- The user is added from another user set

Build a subscription user set

You can create a user set using either or both of two methods: Configure a filter (for example, filter by role) that selects particular users from the User (sys_user) table or specify a particular set of user groups from the Group (sys_user_group) table.

Role required: usage_admin or admin

1. Navigate to Subscription Management > Subscription User Sets.
2. On the Subscription User Sets page, click New and then enter a unique Name (for example, Fulfiller users in the IT department) and Description for the user set.
3. To specify a user set by filtering users:
   a) In the Source field, select User (sys_user).
b) Specify the filters that determine which users to extract from the table. The extracted users make up the user set. For example, filter for (role) (is) (itil). The Conditions setting is a standard ServiceNow condition builder.

Tip: The Application Roles related list on the Subscriptions page includes all roles that are loaded with the plugin for the application. The roles in the list (that are identified as Subscription roles) form a good basis for constructing a user set. See View the roles that are associated with the plugin for a subscription application.

c) Click ( ) to view the number of users that the filter generates. Members of the user set appear in the Subscription User Set Members related list.

4. To specify a user set based on user groups that should be included in the set:
   a) In the Source field, select Group (sys_user_group)
   b) Unlock the Groups box and add appropriate groups.
   c) Click ( ) to view the number of users that the filter generates. Members of the user set appear in the Subscription User Set Members related list.

5. When the Subscription User Set Members related list is correct, click Submit or Update. The user set that you created is available to add to any subscription.

Add a user set to a subscription
When you add a user set to a subscription, all users in the user set are allocated to the subscription.

Role required: usage_admin or admin

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription to allocate users to.
3. On the User Sets related list, click Edit.
4. The Add User Sets form displays the list of user sets that you can add. Move the desired user sets from the Collection list into the User Sets list and then click Save. The users in the list are allocated to the subscription and the number of subscribed users is updated.

Note: In the case that adding the users would exceed the subscription limit, then none of the users in the user set are subscribed. Instead, all users in the user set are set to the Pending state and are listed in the Pending Users related list. Users that are currently subscribed are not affected. See Manage users in the Pending state.

5. Optional: You can configure any subscription to check associated user sets for updates regularly and then update the list of subscribed users accordingly. On the Subscription form, select Auto-sync with user sets.

Note: If you do not select the Auto-sync with user sets option, then the user sets that you add to the subscription are never updated and the list of subscribed users does not auto-update over time.

6. On the Subscription form, click Update.

Auto-sync a subscription to user set updates
You can configure any subscription to check user sets regularly to find users who were added or removed. The system regularly subscribes or unsubscribes users based on updates to user sets.
Role required: usage_admin or admin

If the system cannot allocate a user because adding the user would exceed the subscription limit, the user is set to the Pending state and is listed in the Pending Users related list.

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription to update.
3. On the Subscription form, select Auto-sync user sets.
4. Optional: On the Subscription form, click Sync Now to synchronize and update the list of subscribed users immediately.

Remove a user set from a subscription
When you remove a user set from a subscription, the system attempts to unsubscribe all users in the set. User sets are removed regardless of the Auto-sync with user sets setting.

Role required: usage_admin or admin
1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the User Sets list, select all user sets to remove.
4. In the Actions on selected rows list, select Remove From Subscription. On the Remove User Set from Subscription pop-up, click Remove.
   All users in the selected user sets are unsubscribed. If users in the user sets are pending, then the users are removed from the Pending Users list.

Delete a subscription user set
You can delete a subscription user set only if no subscriptions use the user set.

Role required: usage_admin or admin

Note: Deleting a user set is a permanent action — the user set will no longer exist. In contrast, you can remove a user set from a subscription to unsubscribe all users in the user set — the user set will still exist.

1. Ensure that the user set is not used by any subscription.
2. Navigate to Subscription Management > Subscription User Sets and select the user set.
3. Click Delete.

Allocate an individual user from the Subscription form
In addition to adding user sets to a subscription, you can add individual users directly. Users that you allocate directly are subscribed immediately.

Role required: usage_admin or admin

Note: A user set, not individual allocation, is the preferred automated method for managing the pool of users who are subscribed to an application. Once you configure and allocate a user set, you do not need to manage individual users.

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription to allocate users to.
3. Optional: On the Subscription form, to ensure that you do not exceed the purchased subscription limit, click Limit to purchased.
4. On the Subscribed Users related list, click Edit to view a listing of the users you can add.
5. Move the desired users from the Collection list into the Subscribed Users list.
6. Click Save.

   The selected users are allocated to the subscription and the Allocated value is updated. If allocating a user would exceed the subscription limit, the user is not subscribed. Instead, the user is set to the Pending state and is listed in the Pending Users related list. See Manage users in the Pending state.
7. Click Update on the Subscription form.

Allocate an individual user from the User Record form

To simplify the process of setting up user capabilities, you can allocate or deallocate an individual user to a subscription while viewing the user data on the User form. Users that you allocate directly are subscribed immediately.

Role required: usage_admin or admin

   Note: A user set, not individual allocation, is the preferred automated method for managing the pool of users who are subscribed to an application. Once you configure and allocate a user set, you do not need to manage individual users.

1. Navigate to User Administration > Users and then click the Name of the user. The User form opens.
2. On the Manage Subscriptions related list, click Edit.

   The Edit Members slushbucket lists the subscriptions that you can allocate the user to.
3. To allocate the user, move a subscription from the **Collection** list into the **Manage Subscriptions** list.

4. **Click Save.**

   The selected users are allocated to the subscription and the **Allocated** value is updated. If allocating a user would exceed the subscription limit, the user is not subscribed. Instead, the user is set to the **Pending** state and is listed in the Pending Users related list. See **Manage users in the Pending state.**

   To deallocate the user, move a subscription from the **Manage Subscriptions** list into the **Collection** list.

5. **Click Update on the User form.**

   The **Subscriptions** related list is updated to list all subscriptions that the user is allocated to and the applications that the user is subscribed to.

### Manage users in the Pending state

Users are set to the **Pending** state when adding the users would exceed the subscription limit (the **Purchased** value).

**Role required:** usage_admin or admin

Users are added to the Pending Users list when you attempt to allocate users in the following situations:

- **User sets:** If adding the user set exceeds the subscription limit, the user set is not added and all users in the set are set to the **Pending** state.
- **Individual user:** If allocating a user directly would exceed the subscription limit, the user is not subscribed and is instead set to the **Pending** state.

#### 1. Navigate to **Subscription Management > Subscriptions.**

#### 2. Click the **Name** of the Per-User subscription.

#### 3. In the Pending Users related list, select all users to update.

#### 4. In the **Actions on selected rows** list, select an action.

<table>
<thead>
<tr>
<th>Action</th>
<th>Result</th>
</tr>
</thead>
</table>
| **Allocate selected users** | Allocates the users to the subscription and removes the user from the Pending Users list.  
  - If the **Limit to purchased** option is selected and adding the selected users would exceed the subscription limit (the **Purchased** value), then the action is not allowed.
  - If the **Limit to purchased** option is not selected and adding the selected users would exceed the subscription limit (the **Purchased** value), then the system displays a pop-up to notify you. |
| **Exclude from subscription** | Excludes the user and removes the user from the Pending Users list.  
  Excluded users cannot be allocated to the selected subscription. The auto-sync process does not add excluded users. |
| **Delete**               | Removes the selected users from the Pending Users list and performs no other action. |
Unsubscribe a user

When you remove a user from a subscription, the user is unsubscribed.

Role required: usage_admin or admin

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the Subscribed Users list, select all users to unsubscribe.
4. In the Actions on selected rows list, select Remove from subscription and then click Remove on the pop-up.

Note: If you unsubscribe a user who is a member of a user set that is associated with an auto-synced subscription, the user will be resubscribed in the next synchronization cycle. To remove such a user, exclude the user.

Exclude a user from a subscription

You can exclude users. Excluded users cannot be allocated to a specified subscription. The auto-sync process does not add excluded users.

Role required: usage_admin or admin

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the Subscribed Users list, select all users to exclude.
4. In the Actions on selected rows list, select Exclude from subscription and then click Exclude on the pop-up.

Remove a user from the Excluded list

You can unexclude a user so that the user can be allocated to a subscription.

Role required: usage_admin or admin

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the Excluded Users related list, select all users to unexclude.
4. In the Actions on selected rows list, select Delete and then click Delete on the pop-up.

The selected users are no longer excluded and are removed from the Excluded Users related list. No other action is taken.

Note: The users are not yet allocated to the subscription. You must manually add the users or synchronize the associated update set. On the Subscription form, click Sync Now to synchronize and update the list of subscribed users immediately.

Allocating your custom tables to a subscription entitlement

Allocate custom tables you create in production instances to subscriptions that include custom table entitlements. Performing this task on a consistent basis enables you to track custom table subscription compliance over time.
Custom table entitlements

A custom table is defined as any non-ServiceNow provided table that you create or install on the Now Platform. Some tables are exempted from being classified as a custom table.

Note: For a detailed description of custom table use rights, and a listing of exempt ServiceNow provided tables, see the Custom Table Guide on http://www.servicenow.com/upgrade-schedules.html.

You can freely create or install custom tables on a non-production instance. However, creation or installation of custom tables on a production instance requires a custom table entitlement that is granted with the purchase of a product subscription. For example, a single subscription might include a total entitlement of 50 custom tables.

Note: A custom table entitlement is an individual component of a subscription, but is not a type of subscription itself. Standard licensing metrics, such as fulfiller, requester, and unrestricted, and the subscription types, such as Per-User and Capacity, still apply to subscriptions with custom table entitlements. To learn more about licensing metrics and subscription types, see:

- Subscription Management administration
- Types of subscriptions

Allocating custom tables to custom table entitlements

After you finalize the purchase of a subscription with a custom table entitlement, the entitlement is delivered, with related subscription data, to your production instance. The subscription and custom table entitlement data appear in a subscription record in Subscription Management.

As your developers create and deploy new custom tables on your production instance, you use the Subscription form to allocate them to individual subscriptions. You can use Subscription Management dashboards to monitor the current table allocations and their compliance statuses, and take corrective action as needed. To learn more about how this allocation process works, see:

- Allocate your custom tables to subscriptions
- Monitor custom table allocations and subscriptions

Custom table entitlements

Scenario: Your organization has purchased three subscriptions and each has differing table entitlements.

For example, Subscription 1 has an entitlement of 100 fulfillers and a total entitlement of 50 custom tables. Subscription 2 has 20 fulfillers and a total entitlement of 25 custom tables. Subscription 3 has 5000 users and a total entitlement of five custom tables. In total, you can manually allocate up to 80 custom table to these three subscriptions as you create them in your production instance.
Multiple subscriptions with custom table entitlements

<table>
<thead>
<tr>
<th>Subscription</th>
<th>User/custom table entitlements</th>
<th>Can manually allocate up to entitlement quantity of</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>100 fulfillers/50 custom tables</td>
<td>50</td>
</tr>
<tr>
<td>2</td>
<td>20 fulfillers/25 custom tables</td>
<td>25</td>
</tr>
<tr>
<td>3</td>
<td>5000 users/5 custom tables</td>
<td>5</td>
</tr>
</tbody>
</table>

Allowing grandfathered tables on an instance

Sometimes an extra subscription with a grandfathered table entitlement may be delivered to your production instance. This type of subscription triggers an automatic allocation of grandfathered tables to the grandfathered entitlement, up to its specified maximum limit. This one-time process ensures that custom tables that currently exist in a production instance do not count against custom table entitlements for a new ServiceNow subscription. You cannot manually allocate these grandfathered tables to a subscription entitlement.

Once a grandfathered table is auto-allocated to a subscription that has a grandfathered entitlement, this mapping is permanent. Deleting a grandfathered custom table does not free up a custom table entitlement.

Multiple subscriptions with legacy and custom table entitlements

<table>
<thead>
<tr>
<th>Subscription</th>
<th>Custom table entitlements</th>
<th>Can manually allocate up to entitlement quantity of</th>
</tr>
</thead>
<tbody>
<tr>
<td>Legacy subscription</td>
<td>Up to 23 legacy tables auto-allocated upon subscription arrival</td>
<td>0 (legacy tables auto-allocated)</td>
</tr>
<tr>
<td>New Subscription 1</td>
<td>50</td>
<td>50</td>
</tr>
<tr>
<td>New Subscription 2</td>
<td>25</td>
<td>25</td>
</tr>
<tr>
<td>New Subscription 3</td>
<td>5</td>
<td>5</td>
</tr>
</tbody>
</table>

Custom table subscription allocation life cycle

The life cycle begins with the purchase of a subscription, and it continues with the allocation of custom tables. The cycle ends with the monitoring of custom table allocations over time.
3. Monitor custom table allocation over time
A subscription that contains a custom table entitlement is delivered to your production instance. Sometimes an extra subscription with a grandfathered table entitlement may also be delivered that triggers an automatic allocation of legacy custom tables to the entitlement. Subscription Management records are automatically updated to reflect the new subscription and grandfathered table entitlement. The subscription is ready for you to administer.

2. Allocate custom tables to custom table entitlements.
   - As new custom tables are deployed on a production instance, you allocate them to the relevant custom table entitlement from the subscription record.
   - Tables can be allocated to any subscription with a custom table entitlement, up to the entitlement limit.

3. Monitor custom table allocation over time.
   - Reports provide the current usage of each custom table entitlement, as well as usage over time.

Allocate your custom tables to subscriptions

Allocate specific custom tables to subscriptions that include a custom table entitlement. You perform this allocation process to maintain and track custom table compliance over time. Tracking custom table compliance ensures that your organization does not run out of custom table entitlements and enables you to plan your future subscription purchases.

Role required: usage_admin or admin

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the purchased subscription you want to allocate custom tables to.
   If a subscription contains an entitlement of custom tables, you can find the following information about the entitlement:

   Tables included
   Number of custom tables that are included in the custom table entitlement for the subscription.

   Tables used
   Number of custom tables in production that have been allocated to a subscription with a custom table entitlement. This number increments when you allocate custom tables against the entitlement for the subscription.

   The color coding indicates the percentage of custom tables that have been already allocated. To learn more about how to configure color coding, see Configure the color codes for subscription allocation levels.

3. On the Custom Tables related list, click Edit.
   A listing of all custom tables in the production instance that are eligible for allocation to the subscription appears in the Collection list.

   Note: Not all custom tables appear in this list. Examples of tables that do not appear in the list include:
   - Custom tables that are already allocated to a different subscription with a custom table entitlement.
• Custom tables that are accounted for in the process.
• Custom tables that are exempted.

4. Allocate specific custom tables to the subscription by moving them from the Collection list to the Custom Tables Inventory List.

You can only select the custom tables that meet the criteria that was outlined in the note of the previous step.

5. On the Subscription form, click Save, and then click Update.

The selected custom tables are allocated to the subscription, and the Tables used value in the Subscriptions list and form is incremented.

Monitoring how your resources are allocated for subscriptions

Manage and monitor how resources, such as users, custom tables, or nodes, are allocated to your organization’s subscriptions throughout the life cycle of your subscriptions. By monitoring the usage of your subscribed applications, you can make better decisions about your subscription purchases.

A typical subscription life cycle is as follows:

1. You receive and view subscriptions after you are notified by email that subscription information has successfully downloaded to your instance. See View your subscription applications and allocation levels.

2. You allocate your fulfiller users to Per-User subscriptions by using the Subscriptions module. Allocation is typically a one-time task with minor maintenance. To learn how to allocate users to this type of subscription, see Allocating users to a Per-User subscription.

   Note: The Now Platform instance automatically allocates all other subscription types.

3. If a subscription contains a custom table entitlement, you allocate the custom tables that are created in a production instance to the subscription entitlement. To learn how to allocate custom tables, see Allocating your custom tables to a subscription entitlement.

4. Monitor and adjust the subscription usage by verifying:
   • How many users are subscribed to specific subscriptions.
   • If you can allocate more users to specific subscriptions.
   • If you see users who are not subscribed. For example, you see out-of-policy users.
   • If some subscriptions are over-allocated. For example, too many subscribers might be allocated to a specific subscription.

   To learn how to monitor and adjust the subscription usage, see Monitor how resources are allocated to subscriptions and Monitor subscription compliance.

5. You review the historical activity of the subscriptions by verifying:
   • How usage patterns have changed over time.
   • If a particular application has a high demand.

   To learn about reviewing historical subscription activity, see View your subscription applications and allocation levels and View Subscription Management history reports.
6. You review the subscriptions that your organization has purchased and verify their allocation levels. To learn how to review subscriptions, see View your subscription applications and allocation levels.

Monitor how resources are allocated to subscriptions

Monitor how users and resources, such as nodes, transactions, or custom tables, are allocated to your subscriptions over time.

Role required: usage_admin or admin

you can do the following actions:

- Monitor how your resources, such as discovered nodes or password reset requests, use Capacity subscriptions.
- Monitor if the custom tables that are created in your production instance have been allocated to subscriptions with custom table entitlements.
- Plan and budget for upcoming or future subscription needs.
  - Assess whether you have allocated too many fulfiller users to a Per-User subscription. You might need to deallocate some users or purchase a subscription for more users.
  - Assess whether you have allocated too few fulfiller users to a Per-User subscription. You might need to allocate more users.
- Determine whether users who are not subscribed are accessing a subscription application.

Navigate to Subscription Management > Subscription Overview.

The Expired Subscriptions report lists all subscriptions where the service contract term has expired (the end date has passed). Assess whether to renew any subscription that has expired.

The following data appears for a single subscription (at least one month of data is required) in each Subscription Metrics chart:

Purchased
The number of resources that were purchased for the subscription.

Allocated
The average number of users for the month who are allocated to the subscription.

Non-subscribed users
The average number of individual users who performed fulfiller actions in the associated applications without being subscribed to the applications. You can click a data point to view an application.

In the example, the organization updated the purchased subscription from 15 to 20 users in November 2015. In April 2016, the usage administrator allocated an average of 19 users. In addition, one user who was not subscribed performed fulfiller actions in an application that was associated with the subscription.
The **Subscription Allocation** chart is a listing of all subscriptions and their allocation status as described in the table.
### Subscription Allocation report

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>One of the following values:</td>
</tr>
<tr>
<td></td>
<td>- For Per-User, Max User, PA Indicator, and Unlimited subscriptions: Name of the subscription that your organization purchased.</td>
</tr>
<tr>
<td></td>
<td>- For Capacity subscriptions: Name of the product, standard offering, option, or add-on that your organization purchased.</td>
</tr>
<tr>
<td></td>
<td>Click a subscription Name to open the Subscription form, where you can view or update how users are allocated to the subscription.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of subscription: Max User, Per-User, Capacity, or Unlimited.</td>
</tr>
<tr>
<td>Start Date</td>
<td>Start and end of the subscription period.</td>
</tr>
<tr>
<td>End Date</td>
<td></td>
</tr>
<tr>
<td>Purchased</td>
<td>Number of users or other resources that the subscription permits to access the subscription application.</td>
</tr>
<tr>
<td></td>
<td>For custom tables, it is the number of custom tables that comprise the entitlement in the purchased subscription.</td>
</tr>
<tr>
<td></td>
<td>Note: To learn more about custom table entitlements and allocations, see <a href="#">Allocating your custom tables to a subscription entitlement</a>.</td>
</tr>
<tr>
<td>Allocated</td>
<td>Number of currently allocated users or other resources, such as nodes or transactions.</td>
</tr>
</tbody>
</table>

### Monitor subscription compliance

Use the Compliance Overview module to monitor fulfiller actions by subscribed users and by users who are not subscribed to an application that your organization has purchased. In addition, a chart shows usage for applications where your organization has not yet purchased a subscription.

Role required: usage_admin or admin

Navigate to **Subscription Management > Compliance Overview** to view the following charts:

- **The Unique Application Users** chart shows the number of individual subscribed users who performed fulfiller actions in the application. Each user is counted one time only, regardless of number of accesses.
- **The Unique Out-of-Policy Users** chart shows the number of individual users who performed fulfiller actions in the application without being subscribed to the application. Each user is counted one time only, regardless of number of accesses. This chart might alert you to users in the Pending state or users who are accessing the application without being subscribed.
• The Application Use Without a Purchased Subscription chart shows the number of users who performed fulfiller actions in an application even though your organization has not purchased a subscription for the application.

Monitor custom table allocations and subscriptions

Monitor how many custom tables that are in your instance are allocated to subscriptions. Monitoring custom table allocations is a critical task in ensuring that your organization remains in compliance with subscription entitlements.

Role required: admin

1. Navigate to Subscription Management > Custom Table Subscription Overview.
2. Click a tile for more information.

<table>
<thead>
<tr>
<th>Tile</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Custom Tables</td>
<td>Total number of custom tables that you created your production instance.</td>
</tr>
<tr>
<td></td>
<td>Click the tile to view a listing of subscriptions you allocated the custom tables to.</td>
</tr>
<tr>
<td>Tables not Mapped</td>
<td>Total number of custom tables that you have not allocated to custom table entitlements in purchased subscriptions.</td>
</tr>
<tr>
<td></td>
<td>Click the tile to view a listing of the custom tables you have not allocated to custom table entitlements in subscriptions.</td>
</tr>
<tr>
<td>Custom Tables per Subscription</td>
<td>Number of custom table your subscriptions include. It includes the number of custom tables that you allocated to each subscription.</td>
</tr>
</tbody>
</table>

Monitor App Engine subscription usage and compliance

Track your App Engine subscriptions with the App Engine Usage dashboard. Use this dashboard to better understand how to manage subscription compliance.

App Engine subscriptions entitle you to develop applications and deploy custom tables in production instances. The App Engine Usage dashboard provides information about each type of active App Engine subscription in your instance and its current compliance status.

For each type of App Engine subscription present on your instance, this compliance dashboard lists:

• The total number of users that are currently allocated to each subscription.
• The number of custom tables that each user in the subscription is entitled to access.
• The list of specific users that are counted against each App Engine subscription.

The dashboard also indicates unlicensed App Engine subscription usage, so you can correct any compliance issues by user, role, or group. Unlicensed usage includes:

• Too many users that are allocated to any given App Engine subscription.
• Individual users with access to more custom tables than are allowed by available entitlements.

Analyze App Engine subscription compliance
Analyze the App Engine Usage dashboard to get a good understanding of your App Engine subscription compliance, and any issues affecting subscription compliance that may require correction.
Role required: usage_admin or admin

1. Navigate to **Subscription Management > App Engine Usage**.
2. To view the users or roles assigned to a specific App Engine subscription, click the subscription’s corresponding tile.

<table>
<thead>
<tr>
<th>Tile</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subscription</td>
<td><strong>n/n allocated</strong>&lt;br&gt;Total number of users that are currently allocated to the selected App Engine subscription and the total number of users who are licensed to use it. For example,&lt;br&gt;1. If <strong>105/100</strong> appears, the subscription is not in compliance because it has 105 currently allocated users, while only 100 users are entitled to use the subscription. A red vertical bar appears, indicating that the subscription is over-allocated and out of compliance.&lt;br&gt;Note: To fix this situation, you must remove 5 users from the subscription. To learn how to remove users, see Remove individual user access to a custom table by role or group or Remove access to a custom table for large numbers of users.&lt;br&gt;2. If <strong>85/100</strong> appears, then the subscription is in compliance because it has 85 currently allocated users, and 100 users are entitled to use the subscription. A green vertical bar appears, indicating that the subscription is in compliance.&lt;br&gt;Note: Both of these scenarios apply for all types of App Engine subscriptions.</td>
</tr>
<tr>
<td></td>
<td><strong>n–n custom tables</strong>&lt;br&gt;Total number of custom tables that each user can access for the selected App Engine subscription. For example, if <strong>1-5</strong> appears, a Starter subscription lets each entitled user to access from 1 through 5 custom tables.</td>
</tr>
<tr>
<td>Unlicensed</td>
<td>Red vertical bar and an <strong>Unlicensed</strong> message appears, indicating the unlicensed use of any of the App Engine subscriptions:&lt;br&gt;- Users with access to more custom tables than allowed by any purchased App Engine subscription that is present on the instance.&lt;br&gt;- Total number of tables that are unlicensed, or over-allocated, based on the total of all purchased App Engine subscriptions.</td>
</tr>
</tbody>
</table>
3. To view the individual users that are assigned to the selected subscription, click the Users related list.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Names of the users who can access the selected subscription. Click a user to view the user’s profile and the related lists of the custom tables and custom applications that they can access.</td>
</tr>
</tbody>
</table>

**Note:** To learn more about how to manage user compliance, including how to remove individual users that are assigned to an App Engine subscription, see [Remove individual user access to a custom table by role or group](#).  

<table>
<thead>
<tr>
<th>Entitled Custom Tables</th>
<th>Number of entitled custom tables per user. It is the total number of custom tables that each user can access for the selected subscription.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entitled Custom Applications</td>
<td>Number of entitled custom applications per user. It is the total number of custom applications that each user can access for the selected subscription.</td>
</tr>
</tbody>
</table>

4. To view the roles that grant access to the custom tables for the selected subscription, click the Roles related list.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roles Granting Access</td>
<td>Names of the individual role that grants custom table access to users that are counted in the selected subscription. Click a role to view the users that are associated with the role.</td>
</tr>
</tbody>
</table>

**Note:** To learn more about how to manage roles, including how to remove the roles that grant access to custom tables in an App Engine subscription, see [Remove access to a custom table for large numbers of users](#).  

<table>
<thead>
<tr>
<th>Entitled Custom Tables</th>
<th>Names of the custom tables that are granted access by the role.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entitled Custom Applications</td>
<td>Names of the custom applications that are granted access by the role.</td>
</tr>
<tr>
<td>Users in Subscription</td>
<td>Names of the users in the associated roles.</td>
</tr>
</tbody>
</table>
**Note:** To learn more about how to manage role compliance, see *Remove access to a custom table for large numbers of users.*

**Remove individual user access to a custom table by role or group**
Remove an individual user’s access to a role or group to fix situations where too many users have access to custom tables for the subscription.

Role required: usage_admin or admin

The Users related list in the App Engine Usage dashboard lets you view all users who currently use App Engine subscriptions. You can select any user and view their user profile. The user profile lists each custom table and related custom application that the user can access.

1. Navigate to **Subscription Management > App Engine Usage.**
2. To view the users or roles that are assigned to a specific App Engine subscription, click a subscription tile.
3. In the Users related list, click an individual user to view their standard user profile. To learn more about the standard user profile, see *User profile page.*
4. Click the Entitled Custom Tables related list to view information about the custom tables that the user can access for the subscription.

| **Entitled custom tables related list** |
|-------------------------------|--------------------------------------------|
| Fields | Description |
| Table | Name of the custom table that the user is entitled to access. |
| Application | Name of the custom application that the custom table belongs to. **Global** appears if the custom table is for global use. |
| Role | Role(s) that grant the user access to the table. |

5. To remove the selected user from the subscription, select a line in the Entitled Custom Tables listing.
6. From **Actions on selected rows,** click **Remove user’s access to table.**
7. When the **Remove User from Role** confirmation dialog appears, click **OK.**
   If you receive a message stating that access to the table was granted via an inherited role or group, you must instead remove the user from the group:
   - Click the Groups related list.
   - Select the user that you want to remove.
   - From **Actions on selected rows,** click **Delete.**
   - When the confirmation dialog appears, click **Delete.**

8. To formally remove the user’s access to the custom table, click **Confirm** when the final **Remove User from Role** confirmation dialog appears.

**Remove access to a custom table for large numbers of users**
Adjust roles or remove multiple users from those roles by granting custom table access in the subscription as needed. Use the Roles related list in the App Engine Usage dashboard to view the roles that grant user access to custom tables in a selected App Engine subscription.

Role required: usage_admin or admin
This procedure is similar to the procedure for removing custom table access for an individual user or smaller number of users. However, you may need to remove custom table access for several hundred, or several thousand users. Rather than doing this one by one, you can either:

- Remove the role or roles that grant access to the custom tables for these groups of users, depending on permissions
- Remove large groups of users from these roles.

For example, you would use this procedure if you are developing an application for use in North America and need to remove access for all European users.

1. Navigate to Subscription Management > App Engine Usage.
2. To view the users or roles assigned to that specific App Engine subscription, click a subscription tile.
3. In the Roles related list, click a role to view the Role record. To learn more about roles and how they relate to users and groups, see Roles.

   The Custom Tables related list contains information about the custom tables that the role can access for the subscription:

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Name of the custom application that the custom table belongs to. <strong>Global</strong> appears if the custom table is for global use.</td>
</tr>
<tr>
<td>Table</td>
<td>Name of the custom table that belongs to the application.</td>
</tr>
</tbody>
</table>

4. To view the users assigned to the role, click the Subscribed Users related list.

   **Subscribed users related list**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Name of the subscribed user who is assigned to the role.</td>
</tr>
<tr>
<td>State</td>
<td>Indicator of whether this role is active for the user.</td>
</tr>
<tr>
<td>Inherited</td>
<td>Indicator of whether the user has inherited this role from a parent group.</td>
</tr>
</tbody>
</table>

5. To remove users from the role, select the users in the Subscribed Users listing, and from Actions on selected rows, click Remove user's access to table.
6. When the Remove User from Role confirmation dialog appears, click OK.
7. To formally remove the user's access to the custom table, click Confirm when the final Remove User from Role confirmation dialog appears.

The selected user's access is removed from the custom table for the selected subscription. After either remediation action is complete, the subscription compliance automatically updates to reflect the change.

**Survey Management**

With the ServiceNow® Survey Management application you can create, send, and collect responses for basic surveys. If installed, you can also use the Survey widget to set up a survey within Service Portal.
Get started with Survey Management

Two versions of the application are supported, Survey Management, which is the latest version, and Legacy Surveys. Survey Management improves the user interface and extends the capabilities of the Legacy Surveys application.

Note: Survey Management does not support domain separation.

Configuring surveys

There are many options for advanced configuration in Survey Management:

- Create a survey, add questions, and choose recipients, all in one interface.
- Create conditional questions, which appear only when users answer other questions a certain way.
- Restrict a survey so only specific survey users can take it, and send invitations to those users simultaneously. Alternatively, make the survey a public survey so that any user can take the survey, even anonymous users (users who have not logged in to the ServiceNow system).

Tip: The assessment_take2 UI page should be public for public surveys. If that page is not public, anonymous users do not have access to the page and public surveys do not work.

- Set a schedule to automatically assign a survey to users and to limit how often the same user can take a survey.
- Customize the look and feel of survey questionnaires.
- Save anonymous survey responses.
- Convert survey responses to numerical scores and view them on scorecards.
- Deactivate a survey for maintenance or to retire it without deleting it.

**Note:** Because surveys use the same tables and other back-end components as assessments, you may see assessment elements such as table and field names in certain places throughout the survey feature.

### Legacy Surveys

Survey administrators can continue to use legacy survey functionality and data, however, it is recommended that you migrate legacy surveys to the Survey Management application. Concurrent use of both survey applications can cause confusion and redundancy.

Survey wizards are not impacted and cannot be migrated.

**Note:** The Legacy Surveys application is not described in the documentation that you are viewing. It is documented on the ServiceNow wiki.

### Survey Management roles

The Survey Management application uses the following roles. No role is required to take assigned survey questionnaires.

#### Survey Management roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey administrator</td>
<td>Create and administer surveys. Survey administrators know what types of surveys are necessary, when to send a survey, and to whom. Survey administrators can use all modules in the Survey application menu.</td>
<td>survey_reader, assessment_admin</td>
</tr>
<tr>
<td>survey_reader</td>
<td>View surveys and related information, such as survey responses, survey groups, scorecards, and reports.</td>
<td>none</td>
</tr>
</tbody>
</table>

### Key survey terms

These survey terms are used throughout the documentation to describe survey management functions and capabilities.
## Key survey terms

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey definition</td>
<td>Root record on which a survey is built. A survey definition contains information such as the survey name, state, and distribution schedule. Each survey definition has its own categories and questions. Survey definitions are comparable to legacy survey masters.</td>
</tr>
<tr>
<td>Public survey</td>
<td>Any user can take a public survey, even users who have not logged in to the ServiceNow system. For a completed survey, the <strong>Assigned to</strong> field value is Guest.</td>
</tr>
<tr>
<td>Survey category</td>
<td>Represents a theme for survey questions. Categories contain one or more questions. The system creates one category per survey by default. Additional categories are optional.</td>
</tr>
<tr>
<td>Survey question</td>
<td>A question that appears on a survey questionnaire for the associated survey definition. Survey questions are comparable to legacy survey questions.</td>
</tr>
<tr>
<td>Survey user</td>
<td>User who is authorized to receive invitations for a restricted survey.</td>
</tr>
<tr>
<td>Survey instance</td>
<td>Represents one survey questionnaire assigned to one user. Survey instances are comparable to legacy survey instances.</td>
</tr>
<tr>
<td>Trigger condition</td>
<td>Defines a rule that enables the system to send a survey when an action occurs on a table, such as when an incident closes. Trigger conditions are comparable to legacy survey conditions.</td>
</tr>
<tr>
<td>Scorecard</td>
<td>Visual representation of survey responses. Scorecards display a variety of data summaries for one survey definition.</td>
</tr>
</tbody>
</table>

## Survey questionnaires

All surveys that are assigned to you appear in your personal assessment and survey queue. No special role is required to complete a survey but you must be logged in and the survey must be assigned to you. When you submit a survey, the system stores your responses.

## Survey notification

If the system is configured to send email, it sends you a notification when a survey is assigned to you. The message contains a link to the survey and instructions for viewing the assessment and survey queue.
Take a survey

Surveys that are assigned to you, and that are not complete, appear in your assessment and survey queue.

Role required: none

Each assessment or survey appears as a card in the queue. The card contains helpful information, including the survey name, state, and due date, and a button to launch the questionnaire. Overdue surveys are clearly marked with a red icon and red due date. You must answer every mandatory question, indicated by a red asterisk, before you can submit the survey. If you start to take a survey but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the survey.

1. Navigate to **Self-Service > My Assessments & Surveys**.
   Users with the assessment_admin role, including survey administrators, can display other users’ assessments and surveys in addition to their own. Use the Show all and Show assigned to me related links at the bottom of the queue to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. Click **Take Survey** on a survey card to open the questionnaire.
   If there is more than one survey category, you can click the collapse or expand icon to hide or show the questions in the category.

3. Answer each question to the best of your ability.
   If you are unsure of how to respond to a question or if a question does not apply to a particular record, select Not Applicable, if available.

4. Complete one of the following steps.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save your responses without submitting them</td>
<td>Click Save. You can close the questionnaire and access it later from your queue.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The system does not save the survey if there are invalid responses, such as a letter in a date field. You must enter valid responses or remove invalid responses before you can save the survey.</td>
</tr>
<tr>
<td>Submit the survey after answering all questions</td>
<td>Click Submit. You cannot return to the questionnaire after submitting.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If there is an unanswered mandatory question or an invalid response, an error message appears and the problematic questions are temporarily highlighted.</td>
</tr>
</tbody>
</table>

Domain separation for Survey Management

This is an overview of domain separation as it pertains to Survey Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Overview

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

As a survey creator, survey_admin can create surveys in the assigned domain. A Global domain survey_admin can create or edit survey in any domain.

As a survey taker, a user can access the survey record and take the survey based on the domain of the survey record and user. Global domain users can take a survey in any domain.

How domain separation works in Survey Management

There are several main areas to consider in how domain separation works in Survey Management.

Survey Management in domain-separated instances

The following domains are available by default after activating the Domain Support-Domain Extensions Installer (com.glide.domain.msp_extensions.installer) plugin. Only ServiceNow employees can activate this plugin.

- Global
- Acme
- Cisco

Access to surveys in domain-separated instances

Based on the domain of the survey record and users, users can access the survey record and take the survey.

Global domain users can access survey records in any domain. Users in any other domain can access records in their domain and Global domain. For example, users in the Acme domain can access records in the Acme domain and the Global domain.

Global domain users can take a survey in any domain. Users in any other domain can take surveys in their domain as well as the Global domain. For example, users in Acme domain can take surveys in the Acme domain and the Global domain.

<table>
<thead>
<tr>
<th>Location of the survey record</th>
<th>Users who can access and take the survey</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Global</td>
</tr>
<tr>
<td>Global</td>
<td>Yes</td>
</tr>
<tr>
<td>Acme</td>
<td>Yes</td>
</tr>
<tr>
<td>Cisco</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Any domain user can assign a survey in that domain to the same domain user or a Global domain user. For example, an Acme domain user can assign a survey to a Global domain user or an Acme domain user. Users from other domains are not visible to the Acme domain user.

Although the Global domain user can view a survey from other domains, this user cannot assign the survey of one domain to a user from a different domain. For example, a Global domain user can assign a survey from the Acme domain to another Global domain user or an Acme domain user, but not to a Cisco domain user.
Note: When a task is closed in a child domain and the assigned survey is either in the child domain or the global domain, the user from the child domain can then take the survey.

**Trigger conditions in domain-separated instances**

A Global domain user can create a triggered condition for a survey from any domain. The Global domain user can create an incident and trigger the survey by selecting a user from the other domain in the **User field** under **Caller**. However, the Global user cannot assign the survey to the user of different domain.

A user can assign a trigger condition to a survey if the user belongs to the Global domain or the Survey domain.

If there is no domain path for a trigger condition, users from any domain can view the trigger condition. For example, in the `asmt_condition` table that has no column for the domain path, users from the Acme domain can view the trigger condition created by the Cisco domain users.

**Survey responses and results**

There is a metric result record for each user response to each question on every survey instance. Survey results for each question and category are calculated automatically based on the metric result records.

If you use survey result calculations for results and scorecards, ensure that the `positive indicator` field for the question is set appropriately, based on the answer options. To have any results, a category must contain scored questions.

**Survey responses**

Survey responses are stored in the Metric Result (`asmt_metric_result`) table and display the recipients' answers to each question in a category. To view general results, navigate to **Survey > Survey Responses**. To view results for a particular criterion, use a filter on the Metric Result (`asmt_metric_result`) table. For example, to view results based on the assignment group, apply a filter condition for assignment group.
Category results

Category results are stored in the Assessment Category Result (asmt_category_result) table and display the overall ratings for each category based on the weighted value for each scored question. To view these results, navigate to Assessments > Results > Category results and filter the results using the (Type.Evaluation method) (is) (Survey) condition.
Assessment category results

Survey scorecards

A scorecard provides a visual breakdown of survey responses, based on the way questions were answered, by category. To access a scorecard, see View a survey scorecard.

View results for all surveys

You can view the survey responses that are stored on the Metric Result (asmt_metric_result) table.

Role required: survey_admin or survey_reader

1. Navigate to Survey > Survey Responses.
   Do not confuse this module with Survey > Legacy Surveys > Survey Responses, which displays legacy survey responses.

   The Type column displays the survey definition each response is associated with.
2. Select a response to view its details.

View the results for a survey

You can view the responses for one survey definition. Survey results are stored on the Metric Result (asmt_metric_result) table.

Role required: survey_admin or survey_reader

1. Navigate to Survey > View Surveys
2. Open a survey definition.
3. Under Related Links, click View Responses, which is available only if there are results.
   The results are grouped by metric, which is what questions are called in assessments.
4. Open a metric result to view more detail.
   The metric result contains the user’s response and calculated values of interest to advanced survey administrators. Because the Metric Result table is also used by the assessment feature, many field names are not clear in the context of surveys.

Metric result fields

List of field descriptions for the Metric Result form.
## Metric Result form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td>Assessment group to which the metric result belongs. An assessment group is a container for survey instances and results generated in a single occurrence. The system generates an assessment group every time at least one survey instance is created. If multiple survey instances are created at once, such as when a survey administrator sends invitations to a list of survey users, they are all stored in the same assessment group.</td>
</tr>
<tr>
<td>Metric</td>
<td>Question that the user answered.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question the user answered.</td>
</tr>
<tr>
<td>Method</td>
<td>Assessment method. Always Assessment for surveys.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time the metric result was last updated.</td>
</tr>
<tr>
<td>Source</td>
<td>Survey definition from which the associated survey instance was generated.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User who completed the survey questionnaire.</td>
</tr>
<tr>
<td>Instance</td>
<td>Survey instance completed by the Assigned to user.</td>
</tr>
<tr>
<td>Actual value</td>
<td>Value obtained from the user response to the question. The actual value is determined by the question data type:</td>
</tr>
<tr>
<td></td>
<td>- Checkbox: The actual value is 0 if the checkbox is cleared and 1 if it is selected.</td>
</tr>
<tr>
<td></td>
<td>- Choice or Likert Scale: The actual value is equal to the Value of the metric definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>- Date, Date/Time, or String: The actual value is -1 to indicate that these data types do not contribute to category result calculations.</td>
</tr>
<tr>
<td></td>
<td>- Template: The actual value is equal to the Value of the template definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>- Yes/No: The actual value is 0 if the response is No and 1 if it is Yes.</td>
</tr>
<tr>
<td>Normalized value</td>
<td>Adjusted value that accounts for the Scale definition setting, minimum and maximum values, and other factors.</td>
</tr>
<tr>
<td></td>
<td>The equation that generates the value and an example calculation appear in Example: calculate the normalized value for a survey metric.</td>
</tr>
<tr>
<td>String value</td>
<td>Value that displays the response as it appears on a questionnaire. In some cases this is the same as the Actual value, such as when the question data type is Percentage. The string value is N/A for unanswered questions of certain data types.</td>
</tr>
</tbody>
</table>
Example: calculate the normalized value for a survey metric

The normalized value is calculated based on a linear equation and the scale definition of the metric.

Equation used to calculate the normalized value

\[
\text{Normalized value} = \frac{(\text{Input Value} - \text{Min value defined in metric})}{(\text{Max value defined in metric} - \text{Min value defined in metric})} \times \frac{\text{current metric weight}}{(\sum \text{valid metric weight})} \times \text{scale_factor}
\]

Note: The normalized values are directly proportional to the scale definition of the metric. If the scale definition is low, that is, the lower scale values are better, then \(\text{Normalized value} = 1.0 - \text{Normalized value}\).

Example

Calculate the normalized value for the Please rate the competency of the technician metric. The metric has the following values:

<table>
<thead>
<tr>
<th>Values of the metric</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Input value</td>
<td>3</td>
</tr>
<tr>
<td>Minimum value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum value</td>
<td>6</td>
</tr>
<tr>
<td>Current metric weight</td>
<td>10</td>
</tr>
<tr>
<td>Number of responses</td>
<td>6</td>
</tr>
<tr>
<td>Valid metric weight of each response</td>
<td>10</td>
</tr>
<tr>
<td>Scale factor</td>
<td>10</td>
</tr>
</tbody>
</table>

\[
\text{Normalized value} = \frac{3 - 1}{6 - 1} \times \frac{10}{(10 + 10 + 10 + 10 + 10 + 10)} \times 10 = 0.8
\]

Several data types are ignored because the values cannot be calculated. These invalid data types include string, date, and datetime.

For reporting purposes, use the Metric Result (asmt_metric_result) table.

View a survey scorecard

A survey scorecard provides a visual breakdown of survey responses by category, based on the way questions were answered.

Role required: survey_admin or survey_reader
A scorecard displays charts for survey results, in which category and question responses are analyzed and current ratings are compared with previous ratings. Users can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed surveys.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. Under **Related Links**, click **View Scorecard**. The interactive scorecard displays the following filters:

   - **Question Results**: Displays the result of all questions or an individual question.
   - **Category Results**: Displays the results of all questions associated with an individual category or all categories.
   - **Average Ratings**: Displays the result of weighted average rating for each survey question in an individual category or all categories.
   - **History**: Displays the result of all questions in comparison with their history (by calendar year or quarters).
   - **Sentiment Analysis Results**: Displays the results of sentiment analysis for the survey.

   **Note**: The scorecard link is hidden if there are no survey results to report.

---

**Survey scorecard category results**

The Category Results view is a stacked bar chart showing survey results for all questions in an individual category or all categories by respondent count.

Select a category from the list to display the questions from that category in the chart.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No
- Multiple selection
- Image Scale
- Numeric Scale

   **Note**: The **Checkbox** and **Yes/No** data types are combined into the **Boolean** data type in the Survey Designer.
Survey category results

To view details about a specific response, point to the colored bar to display the response, the number of responses, and the percentage it represents of all the responses to that question.

Survey scorecard category results detail
Survey scorecard question results

The Question Results filter displays the result of all questions or an individual question using charts or lists. For the String, Attachment, Date, Date/time, Reference, and Ranking data types, the results are displayed in the list view. The results of all other data types are displayed in the pie chart view.

Pie chart

The pie chart shows question results for all data types other than those that are displayed in the list view. See Survey question data types.

- Checkbox.
- Boolean.
- Choice.
- Likert Scale.
- Number.
- Percentage.
- Yes/No.
- Image Scale.
- Multiple Selection.
- Template. The question result shows the aggregated net promoter score (NPS) with promoters, detractors, and passives.

<table>
<thead>
<tr>
<th>Question score</th>
<th>NPS category</th>
</tr>
</thead>
<tbody>
<tr>
<td>9 or 10</td>
<td>Promoter</td>
</tr>
<tr>
<td>7 or 8</td>
<td>Passive or Neutral</td>
</tr>
<tr>
<td>0 to 6</td>
<td>Detractor</td>
</tr>
</tbody>
</table>

The result is calculated as:

- %Promoters = Number of promoters / Sample size
- %Detractors = Number of detractors / Sample size
- %Passives = Number of passives / Sample size
- NPS = %Promoters - %Detractors

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the survey designer.
Service Desk Satisfaction Survey

Survey Scorecard

How courteous and respectful was the technician who responded? (1=poor, 5=excellent)

- 2 = 2 (14.29%)
- 3 = 2 (14.29%)
- 4 = 9 (54.29%)
- 5 = 1 (7.14%)

Survey scorecard average ratings

The Average Ratings view displays the weighted average rating for each survey question in an individual category or all categories.

Use this view to learn how individual questions affect the overall rating for the category. Select a survey category from the choice list to display the chart for that category.
Service Desk Satisfaction Survey

Survey Scorecard

Average question rating in category: Service Desk Satisfaction Survey

How courteous and...  [Bar Graph]
How satisfied are...   [Bar Graph]
How satisfied were... [Bar Graph]
Please rate the t...   [Bar Graph]
Was technician ab...  [Bar Graph]

Average Normalized value
To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.

![Graph showing compare plans and benefit satisfaction](image)

**Average ratings detail**

**Survey scorecard history**

The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the **Diff** column indicate the trend of the current survey against the previous survey.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Survey Category form containing the survey questions.
3 years

To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The **Diff** column shows the discrepancy between the current ratings and the previous calendar year's ratings.

---

Survey scorecard history - 3 years
4 quarters

Quarterly surveys compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The **Diff** column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the **3rd** quarter of 2015, then the previous quarters appear as **2nd** (2015), **1st** (2015), **4th** (2014), and **3rd** (2014). All four of the previous quarters appear, whether or not there was any data for those quarters.

Survey scorecard history - 4 quarters
Export a survey scorecard as an image

You can export a scorecard as an image to use in presentations or other documents.

Role required: admin or survey_admin

1. Click the menu icon (≡) and select **Save as PNG** or **Save as JPEG** and wait for the export to complete.

2. Click **Download** and save the scorecard image to a storage location.
Survey administration

Survey administrators—users with the survey_admin role—create and maintain surveys and configure how they are distributed and published. Surveys on Service Portal are also supported.

Survey administration includes the following procedures.

- Create, customize, and publish surveys.
- Write and maintain survey questions.
- Define trigger conditions for when surveys are sent to users, such as when an incident closes.
- Maintain surveys and survey questions as the organization's needs change.

To set up surveys in Service Portal, you must first install Service Portal and then configure the Survey widget on the page. The base system includes the Survey widget.

Surveys in Service Portal

If Service Portal is installed, you can use the Survey widget to set up surveys, quizzes, assessments, risk assessments, and attestations in Service Portal. Surveys for users on mobile devices are fully supported in Service Portal.

To create an intuitive interface for your users, you can set up surveys in Service Portal. You must first install Service Portal and then configure the survey widget on the page. To learn more about configuring a widget, see configure widget instances.
To configure a Survey widget on a page, CTRL + right-click the widget heading and select **Instance Options**.

### Service Portal: Instance options (properties) for the Survey widget

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max records</td>
<td>Number of surveys to list on the Service Portal homepage. The user can click the <strong>View all</strong> link to view all items. Default: 5</td>
</tr>
<tr>
<td>Title of the widget</td>
<td>Text that appears in the title bar of the surveys widget. Default: <strong>My Surveys</strong></td>
</tr>
</tbody>
</table>
Each survey on the My Surveys page contains a progress bar and a description. The color in the progress bar increases as a survey is completed. In the case of a triggered record, the table title is used for the survey description.

For mobile users, the *Pagination setting for Service Portal view* survey designer property is set to one question per page by default.
One Click survey

A One Click survey has no introduction page in Service Portal. This survey does not have the Submit and Cancel buttons in the desktop and iPad view.

Note:
- The One Click Survey field should be selected in the survey definition.
- If the public access is enabled for a One Click survey, a user can submit the survey without having to log in.

A kiosk survey is a One Click survey with only one question of any of the following types:
- Image Scale
- Choice
- Likert Scale
- Numeric Scale
- Yes/No

When you click the answer of the kiosk survey question in Service Portal, the survey is submitted and the end note is displayed on the same page as that of the survey questions.

Note:
- A kiosk survey does not have any Submit or Cancel buttons.
- A kiosk survey cannot have a signature, dependent questions, or additional information.

URI parameters for One Click survey

Pass these URI parameters through the `createAssessment()` API to store their values in the `asmt_assessment_instance` table for both platform view and Service Portal view.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_refresh_interval</td>
<td>Refresh time (in seconds) after the survey submission to create another instance. For example, sysparm_refresh_interval=5.</td>
</tr>
<tr>
<td>sysparm_trigger_table</td>
<td>Location that is stored as the Trigger Table field in the <code>asmt_assessment_instance</code> table. For example, sysparm_trigger_table=incident.</td>
</tr>
<tr>
<td>sysparm_trigger_id</td>
<td>Location sysId that is stored as the Trigger ID field in the <code>asmt_assessment_instance</code> table. For example, sysparm_trigger_id=1c741bd70b2322007518478d83673af3.</td>
</tr>
<tr>
<td>sysparm_kiosk</td>
<td>When set to true, both sysparm_trigger_table and sysparm_trigger_id parameters should be specified. This is a mandatory parameter for kiosk requests. For example, sysparm_kiosk=true.</td>
</tr>
</tbody>
</table>
View the overview of all surveys

Use this homepage to view various survey reports such as results by metric type and state.

Role required: admin or survey_admin

You can refresh, add, delete, and rearrange widgets. All reports on the Survey Overview page have demo data.

1. Navigate to Survey > Overview.
   The following reports are available:

   **Survey Overview page**

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignment group Customer Satisfaction 90 day average</td>
<td>Metric Result (asmt_metric_result)</td>
</tr>
<tr>
<td>Service Desk Survey ‘Timely Response’ 90 Days</td>
<td>Metric Result (asmt_metric_result)</td>
</tr>
<tr>
<td>Surveys by Metric Type and State</td>
<td>Assessment Instance</td>
</tr>
<tr>
<td>Service Desk Survey ‘Overall Experience’ 60 Days</td>
<td>Metric Result (asmt_metric_result)</td>
</tr>
<tr>
<td>Service Desk Survey ‘Tech Courteous’ 90 Days</td>
<td>Metric Result (asmt_metric_result)</td>
</tr>
<tr>
<td>Service Desk Survey ‘First Call Resolve’ 60 Days</td>
<td>Metric Result (asmt_metric_result)</td>
</tr>
<tr>
<td>Service Desk Survey ‘Tech Competence’ 60 Days</td>
<td>Metric Result (asmt_metric_result)</td>
</tr>
</tbody>
</table>

2. To view the required information, click elements within the reports.
3. To refresh, edit, or close a widget, point to the widget and select the required option.

Survey designer

Users with the survey_admin role can use the survey designer. The survey designer lets you create survey categories and questions, configure the details, and publish the survey to specific users or groups.

You can assign a survey to individual users or groups who receive all the questions from all the categories. You can also customize each question and make it dependent on the response to another question. The following describes the procedures you follow to create and publish a survey.

- Create survey categories.
- Create questions within each category.
- Configure survey details, such as introductory and closing remarks and time limit.
- Select recipients for the survey.
- Publish the survey to the selected users or groups.

**Note:** The survey designer replaces the survey creator in the Legacy Surveys application. If you are using Internet Explorer version 8 or earlier, the system redirects you to the survey creator.
Survey designer elements

The survey designer is accessible from Survey > Survey Designer.

The survey designer contains the Controls tab, the Questions tab, the Categories tab, a header bar, and the design canvas.

Controls tab

To create a question, drag the appropriate data type control from the Controls palette and drop it onto the designer canvas.
The assessment engine provides a built-in result calculation feature that converts responses to scored question data types to a score from 0 through 10.

**Question data types**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Scored</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment</td>
<td>No</td>
<td>Question with a Manage Attachments icon that allows users to attach one or more files.</td>
</tr>
<tr>
<td>Boolean</td>
<td>Yes</td>
<td>Question with a check box or Yes and No choices for user responses.</td>
</tr>
<tr>
<td>Choice</td>
<td>Yes</td>
<td>List of predefined options. For more information, see the definition of the <strong>Choices</strong> field in <a href="#">Create a question in the survey designer</a>.</td>
</tr>
<tr>
<td>Date</td>
<td>No</td>
<td>Date field.</td>
</tr>
<tr>
<td>Date/Time</td>
<td>No</td>
<td>Date and time field.</td>
</tr>
<tr>
<td>Number</td>
<td>No</td>
<td>Number field with predefined minimum and maximum values. The default is 1-10.</td>
</tr>
<tr>
<td>Percentage</td>
<td>No</td>
<td>Percentage field with a prescribed range.</td>
</tr>
<tr>
<td>Scale</td>
<td>Yes</td>
<td>Predefined Likert scale. Answer options appear as radio buttons.</td>
</tr>
<tr>
<td>Numeric Scale</td>
<td>Yes</td>
<td>Selectable number scale. The default is 1-5. Answer options appear as radio buttons.</td>
</tr>
<tr>
<td>String</td>
<td>No</td>
<td>Single or multi-line text field.</td>
</tr>
<tr>
<td>Template</td>
<td>Yes</td>
<td>Choice list of templates that provide a predefined scale of options. For details, see <a href="#">Quiz scorecards</a>.</td>
</tr>
<tr>
<td>Reference</td>
<td>No</td>
<td>Choice list of fields from a specified reference table. This data type does not support reference qualifiers. For example, a user could select a user name if you specify sys_user as the reference table.</td>
</tr>
<tr>
<td>Image Scale</td>
<td>Yes</td>
<td>Question with a choice of images that can be selected. A template can be used to apply the same images to multiple questions.</td>
</tr>
<tr>
<td>Multiple Selection</td>
<td>Yes</td>
<td>Question with multiple check boxes that can be selected.</td>
</tr>
<tr>
<td>Data type</td>
<td>Scored</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>Ranking</td>
<td></td>
<td>Question with an order number to be selected for each option. One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.</td>
</tr>
</tbody>
</table>

**Questions tab**

This tab displays all metrics added to the question bank for surveys. Use the **Filter** field to search for questions. Each metric is displayed with its name and type.

**Categories tab**

This tab displays all metric categories added to the question bank for surveys. All metrics in the question bank are group under the corresponding metric category. Use the **Filter** field to search for categories or questions.

**Header bar**

The tabs on the header bar display views and a menu of functions. Click a tab to change the view on the canvas:

- **Design**: Add and configure the properties of categories and questions. This is the default view.
- **Configuration**: Create introductions and end notes for surveys and select a signature.
- **Availability**: Select the recipients for each category in the survey.

Point to the menu icon (⋮) to select an option. The list of options depends on the currently open survey:

- **Save**: Save the current survey without changing its state.
- **Preview**: Display a preview of the survey as it appears to recipients.
- **Publish**: Distribute the survey to the selected recipients.
- **Save and Publish**: Save the survey to the Draft state and distribute the survey in one step.
- **New Survey**: Open a fresh canvas for a new survey.
- **Load Survey**: View the list of existing surveys.
- **Copy Survey**: Copy the current survey.

**Design canvas**

New surveys open in the canvas of the **Design** view. The survey **Name** field appears above first category in the canvas. A blank question field appears in the category container.
Initial appearance of the Survey Designer canvas

**Configure a survey in the survey designer**

Configuration settings apply to the entire survey.

Role required: admin, survey_creator, or survey_admin

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition in Survey Designer.
3. Select the **Configuration** tab and complete the Survey Designer Configuration form.

**Configuration tab fields**

<table>
<thead>
<tr>

</tbody>
</table>

**Survey categories**

Survey categories provide a way to group questions of a similar theme for a given survey. There must be at least one survey category per survey definition and every survey question must be associated with a category. When you create a survey, the system generates one category, which all the questions belong to.

For simple surveys, one category is usually enough. Consider creating additional categories if you want to accomplish any of the following tasks.

- Separate groups of questions into collapsible sections by category on the survey questionnaire.
- Report on category scores, which are calculated based on responses for all questions within each category.

**Create a category in the survey designer**

A category represents a theme for evaluating a specific element of the survey topic and contains questions pertaining to that theme.

Role required: admin or survey_admin

When you create a survey, the system creates a default category, using the name of the survey. You can use this category, modify it, and create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate to **Survey > Survey Designer**.
2. Enter the name of the survey in the **Name** field.
   - The system uses this name as the name of the survey and of the first category.
3. To configure the category, click the gear icon in its title bar and complete the following steps in the Properties dialog box.
   a) Enter a new name and a description for the category.
   b) Enter text in the **Details** field that introduces or explains the category to recipients.
   c) Click the **X** icon to close the Properties dialog box and save your settings.
4. To add a new category, click the + icon in the title bar of an existing category.
   - The new category appears below the category that you selected to create it. You can click the **X** icon in a category header to delete a category that you added in error.

**Create a survey category in a survey**

You can modify an existing survey to add one or more survey categories.

Role required: admin or survey_admin

Only one category is required for each survey, but you can add additional categories as needed.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. In the **Metric Categories** related list, open a category or click **New**.
   - Each survey category is stored as a record on the Metric Category (asmt_metric_category) table with a modified view for survey use.
4. Enter the survey category name and description. The category name appears on questionnaires when either of the following is true.
   - There is more than one category for the survey.
   - There is only one category and its name is different from the survey definition name. If you create a survey using the survey creator, the category name is the same as the survey definition name.

5. Right-click the form header and click **Save**. The **Assessment Metrics** and **Users** related lists appear.

6. Click **Update**.

**Create a question in the survey designer**

You can create multiple questions for each category in the survey designer, but each question can only be associated with one category.

Role required: admin or survey_admin

The data type that you select for each question determines how it can be answered by survey recipients.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click the gear icon in its title bar. The Properties dialog box opens.
3. Complete the form.

**Question property fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Concise name of the question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on surveys. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type selected for this question. See the table in Controls for the available data types.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a survey. A question does not appear on surveys that are generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box to require users to answer the question. Mandatory questions are denoted by a red field status indicator and must be answered before the survey can be submitted. This field is available when the question does not have a dependency and the question type is not Boolean with a check box option.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Allow Additional Information| If selected, the Additional Information Label field is enabled. The Additional Information Label field value is displayed as a field on the survey response page to provide additional information for a question.  

**Note:** This is not applicable for the String and Template data types.  |
| Boolean option              | Whether a check box or a Yes/No list appears as the option for a Boolean question.                                                                                                                                            |
| String option               | Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options include the following.  
- Single line: Single-line text field 40 characters in length that allows strings of any length.  
- String line wide: Full page width text field that allows a single-line entry of any length.  
- Multiline: Full page width multiline text field that allows word wrap and returns |
| Min                          | Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.                                                      |
| Max                          | Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.                                                      |
| Allow not applicable         | Check box for including Not Applicable as an option for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results calculations.  
This field is available when the question does not have a dependency and the question type is not Boolean with a check box option. |
| Randomize answers            | Check box for displaying answer options in a random order. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias.  

**Note:** Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Positive indicator</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select <strong>Low values</strong> if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select <strong>High values</strong> if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.</td>
</tr>
<tr>
<td>Source Field</td>
<td>Source table field that appears as a dynamic value for the question in a triggered survey. When this field value is selected, a <code>$param$</code> placeholder is added at the end of the question label.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can move this placeholder anywhere in the question label.</td>
</tr>
<tr>
<td></td>
<td>When a user takes the survey, the question with dynamic value is included in the survey instance and <code>$param$</code> placeholder is replaced with the source field value.</td>
</tr>
<tr>
<td></td>
<td>If the record table specified in the trigger condition does not match the source table specified for the survey, or if the system fails to get the dynamic value from the source record, the <code>$param$</code> placeholder is not replaced by any value and is displayed as is in the question.</td>
</tr>
<tr>
<td></td>
<td>For example, if the survey is triggered from a PRB record and the survey question is configured with a dynamic value from Incident, the <code>$param$</code> placeholder in the survey question label is not replaced by any dynamic value and is displayed as is.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> When survey questions are translated to other languages by a survey admin, the <code>$param$</code> placeholder should not be translated.</td>
</tr>
<tr>
<td>Allow Sentiment Analysis</td>
<td>Includes this question for the sentiment analysis of a survey.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available only for String type questions.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the survey. Include details that help users understand how to answer the question.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of <strong>Choice</strong> or <strong>Scale</strong>. The system automatically adds text and values that you can edit for each option. You must have at least two options, and each option must have a unique value. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options. <strong>Note:</strong> Value numbers also contribute to the calculations of survey response scores, which can be used by advanced survey administrators.</td>
</tr>
</tbody>
</table>

![Choice value](image)

4. To create any special conditions that must be met before the question appears on the survey, click the Dependency tab. The question must have a data type of **Boolean**, **Choice**, **Scale**, or **Template**.

5. Select a question in the **Displayed when** field.

The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answer that satisfies the condition.

You can select more than one answer. Selected answers are indicated by a check mark.

The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.

7. Click the X icon to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + icon in the title bar of the existing question.

9. Drag and drop questions to change their order within a category or move them between categories.

10. To delete a question, click the X icon in its title bar.

### Survey question data types

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.
The following data types are available for surveys:

**Attachment data type**

On questionnaires, users can attach one or more files to a question.

Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached to a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See [Administering Attachments](#) for more information.

**Boolean data type**

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select **Boolean**, you must fill in the **Scale definition** field. Select **High** if it is best when users select the check box.

**Choice data type**

On questionnaires, users select a value from a list of choices.

If you select **Choice**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.
Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Date and Date/Time data types

The Date and Date/Time data types are similar.

- **Date**: On questionnaires, users select a date.

- **Date/Time**: On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.
If you select **Number**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

### Percentage data type

On questionnaires, users enter a number.

If you select **Percentage**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. Generally 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.

### Reference data type

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

**Note**: Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User (sys_user) as the reference table.
String data type

On questionnaires, users enter text. When you select **String**, the **String option** field appears. Select one of the following options to determine how the string field appears on questionnaires:

- **Single line**
Template data type

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- **Template**: Select a template.
- **Scale definition**: Select High if the answer option with the largest template definition Value is best.

Yes/No data type

On questionnaires, users select Yes or No from a list.
If you select **Yes/No**, you must fill in the **Scale definition** field. Select **High** if **Yes** is the best answer.

**Image Scale data type**

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected image</th>
<th>Unselected image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.

**Multiple selection data type**

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.
Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Edit a survey in the survey designer

You can modify surveys using the survey designer.
Role required: admin or survey_admin

You can edit a survey even after it has been distributed, with the following results.

- Added questions are available only on surveys that are distributed after this change.
- Changes to existing questions are immediately available to users before the survey is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
- Deleted questions are also deleted from the distributed surveys in user queues.

**Note:** You can only edit a survey that has the same application scope as that of your current session.

1. Navigate to Survey > Survey Designer.
2. Point to the menu icon in the survey header bar, and select Load Survey.
3. Select a survey from the list and modify it as needed.
4. Point to the menu icon in the survey header bar, and select Save or Save and Publish.
   When you publish the edited survey, the system generates survey instances for any associated survey users.

**Configure category weights for a survey**

You can assign a weight to each category in a survey. The system calculates results from the weight that you configure.

Configure the Survey Category form to display the Weight field.

Role required: admin or survey_admin

Weights are set to a value of 10 by default but can be changed.

1. Navigate to Survey > View Surveys and select a survey from the list.
2. In the Survey Definition form, select a category from the Metric Categories related list.
3. Edit the default weight value.
4. Click Update.

**View a survey instance**

A survey instance represents one questionnaire assigned to one user. You view an instance to verify that survey instances were created, to check the state of a survey instance, or to reassign a survey instance.

Role required: admin or survey_admin

1. Navigate to Survey > Survey Instances. The following sub-modules are available based on the state of the instances:
   - **Ready to take:** Displays survey instances that are ready to be taken by the user. By default, these instances are sorted in ascending order by the Number field.
   - **In progress:** Displays survey instances that are in progress. By default, these instances are sorted in ascending order by the Number field.
   - **Completed:** Displays survey instances that are complete. By default, these instances are sorted in descending order by the Taken on field.
   - **Cancelled:** Displays survey instances that are cancelled. By default, these instances are sorted in ascending order by the Number field.
• **All**: Displays survey instances in all states. By default, these instances are sorted in ascending order by the **Number** field.

2. Open a survey instance from the required sub-module. By default, the following fields are displayed in the Survey Instance form for all sub-modules other than **Completed**.

**Note:**
- When you open an instance in the **Completed** sub-module, you are redirected to the User's Response page.
- Each survey instance is stored as a record on the Assessment Instance (asmt_assessment_instance) table with a modified view for survey use.

### Survey Instance form

Survey users and groups
Survey users and survey user groups help survey administrators control who can take a survey. Survey administrators can restrict a survey so that only specified users can access it unless a survey administrator manually assigns the survey to a different user. Survey user groups provide a way to quickly designate multiple survey users.

Administering survey users
The list of survey users for a survey is visible on the Survey Definition and Survey Category forms. You can add or remove users from the list of survey users at any point. Note that designating a survey user does not automatically generate a survey instance for that user unless both of the following conditions are true:

- The survey definition Schedule period is set to Daily, Weekly, Monthly, or Yearly. In this case the system assigns a new survey instance to each survey user at the beginning of each schedule period.
- The user has no instances of the survey that are incomplete or that have not yet reached their expiration date.

You can designate survey users from the Survey Designer, the Survey Definition form, or the Survey Category form.

Note: If there are trigger conditions for a survey, do not create survey users. Instead, use the Trigger Conditions form to assign users.

Create a survey user group
Survey user groups are groups that have the Type field set to survey and display only the information most relevant to surveys. You can assign survey groups or any user group to surveys.

Role required: admin or user_admin
Though it is possible to designate members of any group as survey users, one reason to create a survey group is to view it conveniently in the survey User Groups module.

By default, the Survey Creators user group is available. When you add a user to this group, the user will be assigned the survey_creator role to create surveys, quizzes, or assessments and view only those surveys, quizzes, or assignments created by the user.

1. Navigate to Survey > Administration > User Groups.
2. Click New.
3. Complete the Group form.
4. Right-click the form header and click Save.
   The Group Members and Groups related lists appear.
5. To add group members, complete the following steps.
   a) In the Group Members related list, click Edit.
   b) Select users from the list on the left and add them to the Group Members List on the right.
   c) Click Save.

**Select recipients for a survey in the Survey Designer**

You can assign survey users while designing or modifying the survey.

Role required: admin or survey_admin

1. In the Survey Designer, click the Availability tab.
2. Under Accessible by:, select the Specific users option, then select users.
3. If desired, select the Survey groups only check box, then select survey user groups or other groups.
4. Click Save.

**Designate a survey user**

You can designate one survey user at a time from the Survey Definition form.

Role required: admin or survey_admin

1. Navigate to Survey > View Surveys.
2. Open a survey definition.
   There must be at least one category.
3. In the Survey Users related list, click New.
4. Select a User.
5. Click Submit.
   The Survey Definition form reopens.
6. Optional: To remove survey users, in the Survey Users related list, select the check box beside the user, and then select Delete from the action list below the list.

**Designate or remove multiple survey users at one time**

Use the Survey Category form to designate or remove multiple survey users at a time.

Role required: admin or survey_admin

1. Open a survey definition.
2. In the Metric Categories related list, open a category.
   You can choose any category. The system applies survey user changes to all the survey's categories automatically.
3. In the Users related list, click Edit.
4. Use the slushbucket to add or remove survey users.
5. Click Save to return to the survey category.

   The changes are also reflected in the Survey Users related list on the survey definition.

**Allow recipients to retake a survey**

You can configure a survey to allow recipients to resubmit their answers as many times as they like, up to the survey's due date.

Configure the Survey Definition form to display the Allow retake field. For more information, see Configuring the form layout.

Role required: admin or survey_admin

Results are not calculated for the survey until the configured duration has elapsed. The card in the user's queue remains visible until the due date of the survey, and a button is displayed to allow retakes.

1. Navigate to Surveys > View Surveys.
2. Select a survey from the list.
3. Select the Allow retake check box.
4. Click Update.

**Copy a survey**

Create a copy of a survey with at least one category to reduce the effort of creating another survey with similar data.

Role required: survey_admin or admin

All associated questions (type), configurations, categories, metrics, domain separation rules, and role-based categories are copied. Assigned users, category users, instances, and trigger conditions are not copied.

1. Navigate to Survey > View Surveys.
2. Open a survey definition.
3. Perform any of the following steps:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Platform</td>
<td>In the title bar, click Copy.</td>
</tr>
<tr>
<td>From Platform</td>
<td>In the title bar, select Copy from the context menu.</td>
</tr>
<tr>
<td>From survey designer</td>
<td>1. In the title bar, click Survey Designer.</td>
</tr>
<tr>
<td></td>
<td>2. In the Survey Designer title bar, point to the menu icon (⋮) on the header bar and click Copy Survey</td>
</tr>
</tbody>
</table>

**Publish a survey**

You must publish a survey to enable people to receive and complete survey instances.

Role required: admin or survey_admin
The State field on the Survey Definition form indicates whether the survey is in the Draft or Published state.

**Note:** You cannot return a survey to the Draft state after it has been published. You do have the option to deactivate a survey by clearing the Active check box.

1. Navigate to SurveyView Surveys and select a survey to publish.
2. Click Publish.
   When you publish a survey, the system generates survey instances for any associated survey users. You can assign the survey to other users manually.

**Publish a survey in the Survey Designer**

You must save changes to a survey before you can publish it to the specified recipients or groups.

Role required: admin or survey_admin

1. In the Survey Designer, point to the menu and select Load Survey.
2. Select a survey to publish.
3. To preview the survey as a user, point to the menu icon and click Preview.
4. When you are satisfied with the survey, click either Save and Publish or Publish to distribute it.
   When you publish a survey, the system sends email notifications to the recipients and to their managers. The system displays a link to the survey on a card in each recipient's My Assessments & Surveys portal.

**Customize the appearance of a survey**

Assessment and survey administrators can set properties to customize the color of various elements on the questionnaires.

Role required: admin or survey_admin

For color properties, enter either an HTML color name or hexadecimal (hex) value. For hex values, the # character is required. Values are not case-sensitive.

For example, all of the following formats are valid: LightGray, lightgray, #D3D3D3. A preview of the color appears next to the field.

Note that the customizations you make apply to all assessments and surveys.

1. Navigate to either of the following modules.
   - Assessments > Admin > Assessment Properties
   - Survey > Administration > Properties
2. On the properties page, edit the properties as needed.
   Refer to the screenshot below to see what parts of assessment questionnaires are controlled by the properties.
3. Click **Save**.
   You may need to clear the browser’s cache to see updates.

### Assessment and survey properties

You can configure a variety of properties to customize the appearance of assessment and survey questionnaires, require authentication for user signatures, open surveys in the service portal view from emails, and limit the number of items shown in a decision matrix field filter.

<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
</table>
| sn_portal_surveys.sp_survey.email_redirection | Allow survey link from email to open in service portal view (applies only for surveys) | When Yes is selected, a survey accessed from a link in an email opens in the Service Portal.  
   **Note:** This property applies only to surveys.  
   • Default value: No |
| com.snc.assessment.signature_authentication | Require authentication for user signature. | When Yes is selected, this property requires credentials for a full name signature.  
   • Default value: Yes |
| css.assessment.question.header.background.color | Assessment question header background color | Sets the background color of question headers on assessment and survey questionnaires.  
   • Default value: #767676 |
Survey definitions

A survey definition is the root record upon which a survey is built.

The survey designer generates a survey definition automatically when you save or publish the survey. Survey administrators may want to modify the survey definition to configure additional options for the survey, or to publish the survey when it is ready for distribution.

Survey administrators and survey readers can also send survey invitations directly to users from the survey definition.

Modify a survey definition

You can configure additional options for a survey definition.

Role required: admin, survey_creator, or survey_admin

1. Navigate to Survey > View Surveys.
   Each survey definition is stored as a record on the Assessment Metric Type [asmt_metric_type] table with a modified view for survey use.

2. Open a survey definition. The Response Trend chart with the weekly trend of the survey instance count, and the Survey Summary chart with the overall summary response based on instance states are displayed.

3. Modify the fields on the Survey Definition form.

   **Note:** You can only edit a survey that has the same application scope as that of your current session.

Survey Definition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Scheduled job        | Scheduled job that the system creates for this survey definition when the schedule period is a repeating interval. The system sets the scheduled job to run according to the selected schedule period. If you change the schedule period and save the survey definition:  
  - The system deletes the old scheduled job.  
If you selected a recurring schedule period:  
  - A new scheduled job is created.  
For example, if you change the schedule period from **Daily** to **Weekly** and save the record:  
  - The system deletes the daily scheduled job.  
  - Creates a weekly one set to run a week from the current date.  
This field is visible to administrators only if the schedule period is **Daily**, **Weekly**, **Monthly**, or **Yearly**. |
| Assessment duration  | The length of time to complete assigned survey instances, starting from the time the survey instance is generated. The assessment duration sets the Due date for each survey instance. The default duration is 14 days.  
Configure the form to view this field.  
**Note:** By default, the system runs the **Cancel Expired Assessments** script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states. |
| Send notifications   | Send notifications for the survey when it is published. Configure the form to see the field.                                                                                                                                                       |
| Other Options        |                                                                                                                                                                                                           |
| Sample Metric        | A metric of the current survey that you can include as an image in the email or invitation sent to a survey user. When the survey user clicks the image in the email or while previewing the HTML body, the entire survey is available to be taken.  
**Note:** You cannot edit or delete a metric that is selected in this field. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Signature**                | Acknowledgement by a survey recipient of requirements, admonitions, or policies related to the survey. The signature may require the recipient to select a check box or to type in a full signature to verify having read these assertions. You can display assertions without requiring a signature. Select an existing signature from the list or click **New** to create a new one. The signature form contains these fields:  
  - **Name**: Descriptive name for this signature.  
  - **Signature type**: Type of signature required. The selections are **Check box**, **Full name**, or **Assertion only**. If **Assertion only** is selected, no signature is required to submit the survey.  
  - **Assertion**: Text you want to display to recipients.  
  By default, a property called **Require authentication for user signature** (**com.snc.assessment.signature_authentication**) requires users to authenticate when providing a full name signature. |
| **Schedule period**          | Option that determines how often a user can take the same survey and whether the system generates survey instances on a schedule.                                                                             |
|                              | **Note**: If you use a trigger condition for a survey, ensure the schedule period is set to **No Limit**. Trigger conditions use a different method to regulate how often users can receive survey instances.                                                                 |
| **Do not show survey introduction notes** | Check box to skip the introduction notes when a survey is launched. This functionality is applicable in both the Now Platform and Service Portal product versions. |
| **Pagination setting for Service Portal view** | The setting on which the pagination is based for desktop or tablet view in Service Portal.                                                                                                                |
|                              |  - **Category**: default  
  - **Question**: 1 question per page (automatic for mobile)  
  - **None**: no pagination  
  **Note**: This field is displayed only when Service Portal is installed.                                                                                                           |
<p>| <strong>One Click Survey</strong>         | Enables a One Click survey in Service Portal.                                                                                                                                                                |
|                              | <strong>Note</strong>: This option can be selected if the <strong>Pagination setting for Service Portal view</strong> is set to <strong>None</strong>.                                                                                               |</p>

4. Save the record.

Schedule periods

The available schedule periods are **Only Once**, **No Limit**, **Daily**, **Weekly**, **Monthly**, and **Yearly**.

The default schedule period is **No Limit**. When you set the schedule period to anything except **Only Once** or **No Limit**, the system creates a corresponding scheduled job. The scheduled job performs the following actions.

- Ensures that a user can take one survey instance of the same survey per schedule period.
- Generates a new survey instance for each survey user at the beginning of the new schedule period, as long as the survey user does not have an incomplete instance of that survey. A survey instance is incomplete if the state is not **Complete**.

For example, if you set the schedule period to **Monthly** and someone attempts to send survey invitations twice in the same day, the system generates survey instances for the survey users the first time only. At the beginning of the next schedule period, the system generates another survey instance for each survey user who completed the previous one.

Schedule periods are enforced by the **Expiration date** field on the survey instance. As long as the survey instance expiration date has not passed, the assigned user cannot receive a new survey instance. When the system generates a survey instance and the schedule period is anything except **No Limit**, the **Expiration date** field is automatically set to the appropriate date. For example, if the schedule period is **Weekly**, the expiration date is a week after the survey instance is generated.

If you change the schedule period, the scheduled job updates automatically to the correct schedule. However, users who have survey instances for the survey cannot receive new survey instances until their existing survey instances expire, regardless of the new schedule period.

Consider the following example: Sal Pindell receives a survey instance when the schedule period is **Weekly**. The next day, a survey administrator changes the schedule period to **No Limit**. Sal cannot receive another survey instance until one of the following actions occurs.

- Seven days pass from the time Sal’s survey instance was generated.
- A survey administrator deletes Sal’s survey instance.
After one of these actions occurs, Sal can receive a new survey instance anytime, as long as he has no incomplete instances of the survey.

**Note:** If you use a trigger condition for a survey, ensure the schedule period is set to **No Limit**. Trigger conditions use a different method to regulate how often users can receive survey instances.

---

**Create a survey designer template question**

You can create a question that uses choice lists from a template.

Role required: admin or survey_admin

1. Navigate to **Survey > Survey Designer** and load a survey or create a new survey.
2. Drag the **Template** data type icon into a category container.
3. Click the gear icon in the question title bar to open the template properties dialog box.
4. Select a predefined scale from the list.
Question entry fields appear for that template.

5. Enter one or more questions that are appropriate for the template.
6. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
7. Click the back arrow to return to the template properties dialog box.
8. Configure the properties for the remaining questions.
9. Click the X icon to close the template properties dialog box and save your settings.

Survey questions

Survey questions appear on survey questionnaires for the associated survey definition.

The survey creator generates questions and answer options automatically. However, it provides only the basic configuration options for questions, such as the question text and the data type. You may want to create additional questions or set advanced configuration options for the questions, including making a question appear conditionally or making a question mandatory. You can also use question templates to define reusable sets of answer options.

Survey questions are available from Survey > Questions. The list displays information about each question, including the associated survey definition listed in the Type column, and the data type. Survey administrators can modify these questions.

Create or modify survey questions

You can create and administer survey questions.
Role required: admin or survey_admin

Changes to a survey, such as the addition of questions or the modification of question templates, do not apply immediately to the existing survey instances. However, the changes apply immediately to any new survey instances that are created after the changes are saved.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. In the **Metric Categories** related list, open a category.
4. In the **Assessment Metrics** related list, open an existing question or click **New**.
   Each survey question is stored as a record on the Assessment Metric (asmt_metric) table with a modified view for survey use.
5. Complete the Survey Question form.
   The fields that appear depend on the selected **Data type**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the question. When you create a survey, the question name is the same as the text in the <strong>Question</strong> field.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to use for the question, which appears on survey questionnaires.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question. The fields for the response depend on the data type.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If another question depends on this question, you cannot change the data type.</td>
</tr>
<tr>
<td>Template</td>
<td>Question template to use for the answer options.</td>
</tr>
<tr>
<td></td>
<td>This field is visible and required only if the data type is <strong>Template</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If another question depends on this question, you cannot change the template.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select <strong>Low</strong> if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select <strong>High</strong> if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.</td>
</tr>
<tr>
<td></td>
<td>This field is visible and required only when certain data types are selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box that determines whether to present the answer options for this question in a random order each time a user opens the survey. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomize answer options to help prevent this bias. This field is visible only if the data type is <strong>Choice</strong> or <strong>Likert Scale</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Randomizing answer options may make a question confusing. In general, only randomize answer options that do not follow a logical order.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box that makes the question mandatory (selected) or optional (cleared) on survey questionnaires. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator. This field is visible only when the <strong>Depends on</strong> field is empty and the data type is not <strong>Checkbox</strong>. Questions that depend on other questions and check box questions cannot be mandatory.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box that determines whether to include a <strong>Not Applicable</strong> answer option for this question on survey questionnaires. User responses of <strong>Not Applicable</strong> are excluded from results calculations. This field is visible only if the data type is <strong>Choice</strong>, <strong>Likert Scale</strong>, <strong>Template</strong>, or <strong>Yes/No</strong>.</td>
</tr>
<tr>
<td>Allow Additional Information</td>
<td>If selected, the <strong>Additional Information Label</strong> field is enabled. The <strong>Additional Information Label</strong> field value is displayed as a field on the survey response page to provide additional information for a question. <strong>Note:</strong> This is not applicable for the <strong>String</strong> and <strong>Template</strong> data types.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depends on</td>
<td>Setting used to make this a conditional question, meaning that it only appears when users answer another question a certain way. To make a question depend on another question, select an existing question from the list, which displays Checkbox, Choice, Template, and Yes/No questions of the same category as this question. Then, use the Displayed when field to set the conditions that cause this question to appear on surveys. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
<tr>
<td>Displayed when</td>
<td>Answer options for the selected Depends on question which, when chosen on surveys, display this question. This field is visible and required only when the Depends on field is set.</td>
</tr>
<tr>
<td>Min</td>
<td>Smallest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage.</td>
</tr>
<tr>
<td>Max</td>
<td>Largest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage.</td>
</tr>
<tr>
<td>String option</td>
<td>Selection that determines what kind of response text box appears for this question on survey questionnaires. This field is visible and required only if the data type is String.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Source Field</td>
<td>Source table field that appears as a dynamic value for the question in a triggered survey. When this field value is selected, a ( $(param) ) placeholder is added at the end of the question label. Note: You can move this placeholder anywhere in the question label. When a user takes the survey, the question with dynamic value is included in the survey instance and ( $(param) ) placeholder is replaced with the source field value. If the record table specified in the trigger condition does not match the source table specified for the survey, or if the system fails to get the dynamic value from the source record, the ( $(param) ) placeholder is not replaced by any value and is displayed as is in the question. For example, if the survey is triggered from a PRB record and the survey question is configured with a dynamic value from Incident, the ( $(param) ) placeholder in the survey question label is not replaced by any dynamic value and is displayed as is. Note: When survey questions are translated to other languages by a survey admin, the ( $(param) ) placeholder should not be translated.</td>
</tr>
<tr>
<td>Allow Sentiment Analysis</td>
<td>Includes this question for the sentiment analysis of a survey. Note: This field is available only for String type questions.</td>
</tr>
<tr>
<td>Related Lists</td>
<td></td>
</tr>
<tr>
<td>Assessment Metric Definitions</td>
<td>Answer options for this question. This related list is available only if the Data type is Choice or Likert Scale.</td>
</tr>
</tbody>
</table>

6. Save the record.

Note:
- Be sure to create answer options if you select the Choice or Likert Scale data type.
- You cannot delete a survey question (metric) with user responses. To delete a survey question with user responses, you should delete the responses, and then delete the survey question.
Survey question data types

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

Attachment data type

On questionnaires, users can attach one or more files to a question. Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See Administering Attachments for more information.

Boolean data type

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select Boolean, you must fill in the Scale definition field. Select High if it is best when users select the check box.

Choice data type

On questionnaires, users select a value from a list of choices.
If you select **Choice**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.

**Note:** The system sets the **Min** and **Max** fields automatically based on the **Value** settings for the associated metric definitions.

### Date and Date/Time data types

The **Date** and **Date/Time** data types are similar.

- **Date:** On questionnaires, users select a date.

- **Date/Time:** On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.
If you select **Number**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

**Percentage data type**

On questionnaires, users enter a number.

If you select **Percentage**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. Generally **0** and **100** are appropriate minimum and maximum values. If you choose values other than **0** and **100**, it is usually best to state the range of acceptable answers in the question text.

**Reference data type**

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

---

**Note**: Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User (sys_user) as the reference table.
String data type

On questionnaires, users enter text. When you select **String**, the **String option** field appears. Select one of the following options to determine how the string field appears on questionnaires:

- **Single line**
Template data type

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- **Template**: Select a template.
- **Scale definition**: Select **High** if the answer option with the largest template definition **Value** is best.

Yes/No data type

On questionnaires, users select **Yes** or **No** from a list.
If you select Yes/No, you must fill in the Scale definition field. Select High if Yes is the best answer.

**Image Scale data type**

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected image</th>
<th>Unselected image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.

**Multiple selection data type**

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.
Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

**Survey question template**

Question templates define reusable sets of answer options for survey questions.
Question templates define reusable rating scales for answering questions, where each answer option on the scale is a template definition. For example, the template named **Satisfaction** represents a satisfaction scale and contains the following template definitions: **Very Satisfied**, **Satisfied**, **Neutral**, **Dissatisfied**, and **Very Dissatisfied**.

Template definition

Templates are available for survey questions that have **Data type** set to **Template**. The following question templates are available in the base system. You can create or update a template as described in **Create a survey question template**.

**Default question templates**

<table>
<thead>
<tr>
<th>Name</th>
<th>Template definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount</td>
<td>None, Few or little, Average amount, Many, Quite a lot</td>
</tr>
<tr>
<td>Complexity</td>
<td>Very Complex, Complex, Moderate, Simple, Very Simple</td>
</tr>
<tr>
<td>Frequency</td>
<td>Never, Seldom, Sometimes, Most of the time, All of the time</td>
</tr>
<tr>
<td>Likert 5</td>
<td>Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree</td>
</tr>
<tr>
<td>Quality</td>
<td>Very Poor, Poor, Average, Good, Very Good</td>
</tr>
<tr>
<td>Satisfaction</td>
<td>Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied</td>
</tr>
<tr>
<td>Size</td>
<td>Very Small, Small, Average, Large, Very Large</td>
</tr>
</tbody>
</table>

**Create a survey question template**

You can create and administer question templates.

Role required: admin or survey_admin

Changes to a survey, such as the modification of question templates, apply to existing survey instances immediately. Templates that you create are available for use with both surveys and assessments.

1. Navigate to **Survey > Templates**.
   Each template is stored as a record on the Assessment Metric Template (asmt_template) table.
2. Click **New**.
3. Enter a **Name**.
4. Right-click the form header and click **Save**.
5. In the **Assessment Template Definitions** related list, click **New**.
Create a template definition for each answer option you want to appear on a question.

6. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Enter the text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter a numeric value, greater than or equal to zero, to which the answer option equates. Values are used in results calculations. When you view questions that use templates, answer options appear in order from smallest to largest Value. Each template definition for a given template must have a unique Value.</td>
</tr>
</tbody>
</table>

7. Click Update.

*Update min and max values to match templates*

If you use survey result calculation data, ensure that the Min and Max values for a question that uses a template are equal to the smallest and largest template definition Value.

Role required: admin or survey_admin

When you create a question of the Template data type, the system sets the Min and Max fields based on the template definition values. The fields for existing questions are not updated if you add a new template definition to a template or if you update the Value of an existing template. If the new Value is less than the minimum value or greater than the maximum value of any questions that use the template, update the questions accordingly.

1. Navigate to Survey > Questions.
2. Configure the list to show the Min and Max columns.
3. Add the following list filter condition: (Template) (is) (<select the template you updated>).
4. Ensure the Min and Max values match the smallest and largest template definition Value for the selected template.
   If the values do not match, edit the Min and Max values directly from the list.

*Note:* When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

---

**Add a metric category and metric in the question bank for surveys**

Reuse the question categories (metric categories) and questions (metrics) added in the question bank for surveys. You can add metric categories or metrics from the question bank to a survey, or from the survey to a question bank.

Role required: admin or survey_admin

Activate the Survey Question Bank Sample Data plugin (com.snc.question_bank_data) to access the demo data for the question bank.

1. Navigate to Survey > Question Bank.
2. Click New.
3. In the Metric Category form, fill the fields.
Metric Category fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the metric category.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the metric category.</td>
</tr>
<tr>
<td>Total metrics</td>
<td>Total number of metrics in the metric category. This number is automatically</td>
</tr>
<tr>
<td></td>
<td>updated when you add or delete metrics from the category.</td>
</tr>
</tbody>
</table>

4. Right-click on the title bar and click **Save**.
5. In the Assessment Metrics related list, click **New**.
6. In the Survey Question form, fill the fields. For information on these fields, see **Create or modify survey questions**.
7. Click **Submit**.

**Configure metric categories or metrics for a survey using the question bank**

Reuse question categories (metric categories) and questions (metrics) from the **Question Bank** module while creating or updating a survey.

Role required: admin or survey_admin

Activate the Survey Question Bank Sample Data plugin (com.snc.question_bank_data) to access the demo data for the question bank.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. Optional: To add metric categories to a survey from the question bank in Platform, perform the following steps.
   a) In the Metric Categories related list, click **New Category from Bank**.
      The New Category from Bank dialog box is displayed with a list of all metric categories added in the question bank.
   b) Select the required categories and click **Add Selected**.
      A copy of the metric category and the corresponding metric definitions is created in the Metric Categories related list.
4. Optional: To add metrics to a survey from the question bank in Platform, perform the following steps.
   a) In the Metric Categories related list, open a metric category definition.
   b) In the Assessment Metrics related list, click **New Metric from Bank**.
      The New Metric from Bank dialog box is displayed with a list of questions available in the question bank.
   c) Select the required metrics and click **Add Selected**.
      A copy of the metric and the corresponding metric definitions is created in the Assessment Metrics related list of the category.
5. Optional: To add a metric category to the question bank from a survey in Platform, perform the following steps.
   a) In the Metric Categories related list, open a metric category definition.
   b) Click **Add to question Bank**.
A copy of the category is created along with its metrics and metric definitions in the question bank.

6. Optional: To add a metric to the question bank from a survey in Platform, perform the following steps.
   a) In the Metric Categories related list, open a metric category definition.
   b) In the Assessment Metrics related list, open the required metric definition.
   c) Click Add to Question Bank.
      The Add to Question Bank dialog box is displayed.
   d) In the **Choose a question bank to add this question/metric** field, select a metric category that you want to add this metric to, and click **OK**.
      A copy of the metric and the corresponding metric definitions is created for the selected category in the question bank.

7. Optional: To add a metric category or metric to a survey from the question bank in Survey designer, perform the following steps.
   a) Open the survey in Survey Designer.
   b) Optional: To add a metric category from the question bank, from the Categories tab in the left panel, drag the required category banner and drop in the Design tab.
   c) Optional: To add a metric from the question bank, drag and drop the required metric from the Questions tab or the Categories tab.

---

**Note:**
- When you drag and drop a metric category, all dependencies within the category are also added to the survey.
- From the Categories tab, you can drag and drop an individual metric within a metric category.
- When you drag and drop a parent metric, all dependent questions are also added to the metric category.
- When you drag and drop a child metric, only the child question is added to the metric category.

---

**Create or modify answer options**

You must create answer options, called metric definitions, for survey questions that have Data type set to **Choice** or **Likert Scale**.

Role required: admin or survey_admin

Changes to a survey, such as the addition or modification of answer options, apply to existing survey instances immediately.

1. Navigate to Survey > Questions.
2. Open a choice or Likert scale survey question.
3. In the **Assessment Metric Definitions** related list, open a metric definition or click **New**.
   Each answer option is stored as a record on the Assessment Metric Definition (asmt_metric_definition) table.
4. Complete the Assessment Metric Definition form.
Assessment Metric Definition fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Numeric value, greater than or equal to zero, to which the answer option</td>
</tr>
<tr>
<td></td>
<td>equates. Values determine the order in which answer options appear. See the</td>
</tr>
<tr>
<td></td>
<td>example below. Values are also used to calculate survey results. Each</td>
</tr>
<tr>
<td></td>
<td>metric definition for a given question must have a different Value.</td>
</tr>
</tbody>
</table>

5. Click Submit.

On survey questionnaires, the answer options for a question appear in order from smallest to largest Value. For example, consider the survey question How do you feel? with the answer options Good, Neutral, and Bad. The following table shows the answer option order based on the Value.

<table>
<thead>
<tr>
<th>Answer option</th>
<th>Value</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Good</td>
<td>1</td>
<td>First</td>
</tr>
<tr>
<td>Neutral</td>
<td>3</td>
<td>Second</td>
</tr>
<tr>
<td>Bad</td>
<td>5</td>
<td>Third</td>
</tr>
</tbody>
</table>

If you use survey result calculations, ensure the question Scale definition is set appropriately based on the answer options. In the previous example, if you want the answer option Good to earn the highest score, the scale definition should be Low because Good has the smallest value.

Change the order of survey questions

You can easily reorder survey questions at the category level or the question level.

Role required: admin or survey_admin

You can change the order in which the questions in one category appear relative to those in other categories for the same survey definition. If you add a new question manually after you create other questions, you may want to change the order of questions.

When you create questions using the survey creator, the system sets the Order field for the first question to 101, the second to 102, and so on. After you create a new question outside of the survey creator, the Order is set to 100 by default, which means it appears before all questions generated by the survey creator.

1. Navigate to Survey > View Surveys and open the appropriate survey definition.
2. In the Metric Categories related list, edit the values in the Order column.
3. To change the order of questions within a category, complete the following steps.
   a) Open the Assessment Metrics related list.
   b) Edit the values in the Order column.
4. Click Update.

**Survey trigger conditions**

Trigger conditions specify when to send a particular survey and the persons to send it to.

Survey administrators can use trigger conditions to configure the system to generate a survey instance each time a specified action occurs on a specified table, for example, when an incident or change request closes. The system sends the survey to users that are related to the triggering record, for example, incident callers or change request assignees. You can choose to send a survey every time the condition is met, or you can set a probability for the system to send a survey at random when the condition is met.

Trigger conditions are ideal for sending transactional surveys. Transactional surveys generally measure satisfaction with a recent experience, such as closing an incident or purchasing an item.

---

**Note:** Trigger conditions are comparable to survey conditions in legacy surveys. If you migrate a legacy survey that has survey conditions, ensure that the survey conditions are deactivated before you recreate them as trigger conditions.

---

**Configure a trigger condition for a survey**

Configure trigger conditions to specify when to send a particular survey and the persons to send it to.

Role required: admin or survey_admin

1. Navigate to **Survey > Trigger Conditions**.
2. Click **New**.

**Note:** Do not specify particular users for a triggered survey because only the specified users are allowed to take the survey.

3. Complete the form.

**Trigger condition fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>Survey to send.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to run the trigger condition on. You can select only tables in the current application scope. For example, to send a survey whenever an incident closes, select the Incident (incident) table.</td>
</tr>
<tr>
<td>User field</td>
<td>Field that stores the users you want to send the survey. You can select any field, on the selected table or on a referenced table, that references the User (sys_user) table. Use the tree picker to select a field.</td>
</tr>
</tbody>
</table>

**Note:** To avoid requiring users to log in to take a survey with a trigger condition, set the survey to **Public**.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Repeat interval</td>
<td>Minimum period that must pass before the trigger condition can resend the survey to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user qualifies for multiple surveys from this trigger condition, the system can send only one survey every 30 days.</td>
</tr>
<tr>
<td>Note:</td>
<td>Ensure that the Schedule period of the selected survey definition is set to No Limit. If the schedule period is set to a different value, it prevents the trigger condition from sending surveys as expected.</td>
</tr>
<tr>
<td>Application</td>
<td>(Admin only) Application is set to Core.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this trigger condition is active (selected).</td>
</tr>
<tr>
<td>Business rule</td>
<td>(Admin only) Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the survey to the correct user. No configuration is necessary for this business rule.</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>Check box that determines whether to send the survey to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected).</td>
</tr>
<tr>
<td>Probability (%)</td>
<td>Approximate probability that the survey is sent each time the condition is met. For example, if the probability is set to 50, the system sends the survey approximately 50% of the time the conditions are met. There are no repeat interval restrictions is assumed. This field is visible and required only when Trigger randomly is selected.</td>
</tr>
<tr>
<td>Related Field 1- 4</td>
<td>Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected table. When the trigger condition generates a survey instance, the system stores the value from the triggering record. Specify up to four fields. For example, select the Incident table, Assigned to and Problem as related fields. The system stores the assigned user and problem associated with the incident as Related record 1 and Related record 2 in the survey instance record. To view the fields, configure the form for any survey instance.</td>
</tr>
<tr>
<td>Note:</td>
<td>You cannot use a related field for the ticket number because you cannot select the Number column. You can, however, use the trigger_id column of the table.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Description</td>
<td>Summary information to identify the trigger condition.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For a triggered record, the table title is used for the survey description.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder that defines the criteria that must be true to send the survey. For example, to send a survey whenever an incident closes, create the condition (\text{State} \ (\text{is}) \ (\text{Closed})).</td>
</tr>
</tbody>
</table>

You can also create a trigger condition directly from the survey creator. If you select **Certain users can take this survey, based on conditions** in the Survey User Access section, the Trigger Condition form opens automatically when you click **Save as Draft** or **Publish**.

**Trigger condition example**

You can send out auto-triggered surveys when an incident is closed or resolved.

A trigger condition is configured as follows:

- **Assessment**: Service Desk Satisfaction Survey
- **Table**: Incident (incident)
- **User field**: Caller
- **Repeat interval**: 30 days
- **Active**: true
- **Trigger randomly**: false
- **Related Field 1**: Assigned to
- **Related Field 2**: Problem
- **Condition**: (State) (is) (Closed) (or) (State) (is) (Resolved)

Fannie Steese is the caller on incident INC00004305 that is assigned to Boris Catino, a service desk technician. Boris creates PRB010101 based on Fannie's complaint and closes the incident. The system creates a survey instance assigned to Fannie so she can rate her satisfaction with the incident experience.

Because two related fields were selected as part of the trigger condition, the survey instance stores the following information from the incident:

- **User (Related Field 1)**: Boris Catino
- **Problem (Related Field 2)**: PRB010101
- **Task (automatically created)**: INC00004305

Because the task field is automatically populated, UI-based filtering by dot-walking on incidents (or any task-based table) is supported when creating a report on survey results. For example, you can query all survey instances related to incidents assigned to a group (survey reports on all incidents assigned to networking group, for instance).

**Note:** Even though the trigger condition is set to be triggered each time that the conditions are met, the Repeat interval setting ensures that Fannie does not receive another survey for another of her incidents closes within 30 days of the first incident.

**Survey report example based on task field**

One of the most common use cases for Surveys is to send out an auto-triggered survey when an incident, request, or task is closed. Once you get the survey results back, you can filter the results by users and groups related to the ticket, such as Assignment Group, or Assignee.

Filtering the survey results provides more detail on how people and teams are performing based on ticket data. Since this information is automatically captured, you can dot-walk while filtering the data (instead of utilizing a related field on the Survey trigger condition form, as previously required).
To create a report on incident-triggered survey responses by Assignment group, set up the report on the Task Assessment Details by navigating to ReportsView/Run and clicking Create a report.

Survey distribution

There are several ways for survey administrators to distribute surveys to users.

Surveys are distributed using any of the following methods.

- Send survey invitations to users
- Share a survey URL that opens the survey directly.
- Create a module that opens a survey.

Send survey invitations to users

You can send survey invitations using the Assign Survey or Send Invitations buttons on the Survey Definition form.

Role required: admin or survey_admin

Use the Send Invitations button to immediately assign survey instances to each survey user that is listed in the survey definition. Use the Assign Survey button to assign a survey instance to any one user at a time.

Each of the buttons generates survey instances assigned to the appropriate users. In addition, if the instance is configured to send email, the system generates survey notifications. For either button to be available, the survey definition must meet all of the following conditions.

- Active check box is selected.
• **State** is Published.
• Survey is associated with at least one question.

---

**Note:** You (or a trigger) can send more than one instance of a survey to a user at any time.

1. Navigate to Survey > View Surveys.
2. Select an active, published survey.
3. Complete one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign a survey to users listed in the Survey Users related list</td>
<td>Click Send invitations.</td>
</tr>
<tr>
<td>Assign a survey to any user</td>
<td>Click Assign Survey and select one or more users, and then click OK.</td>
</tr>
</tbody>
</table>

The system creates a survey instance assigned to the user or users, assuming the user is eligible to receive a new survey instance. When you use the Assign Survey button, the selected user is not saved as a survey user.

---

**Define a recipients list for surveys**

Use a recipients list to define targeted set of users for whom the survey invite can be sent. You can use a recipients list for multiple surveys.

Role required: admin or survey_admin

1. Navigate to Survey > Administration > Recipients Lists.
2. Click New.
3. In the Recipients List form, add the field information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the recipients list.</td>
</tr>
</tbody>
</table>
| Type  | Type of users to include in the list. Possible values are:  
- Contacts  
- Internal Users |
| State | State of the recipients list.  
- **New:** List has not yet been generated.  
- **In Progress:** List is currently being generated. (You can see this state only when generating a very large list of recipients.)  
- **Complete:** List is generated. |

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Method</td>
<td>Method used to generate the recipients list. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>· Upload File: Upload an Excel file with the recipients list using the specified template.</td>
</tr>
<tr>
<td></td>
<td>· Dynamic Condition: Run a script or condition builder to create the recipients list.</td>
</tr>
<tr>
<td>Choose File</td>
<td>Allows you to download an Excel template, and then upload the Excel file with user information using the specified template.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available only if the Method is Dynamic Condition.</td>
</tr>
<tr>
<td></td>
<td>The templates vary based on the entity selected in the Type field. For accounts, the template includes columns for sys_id and account number values. For contacts, consumers, and internal users, the template includes columns for sys_id and email values.</td>
</tr>
<tr>
<td>Show Script</td>
<td>If selected, displays the script to create the recipients list.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available only if the Method is Dynamic Condition.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to create the recipients list.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available only if the Method is Dynamic Condition and the Show Script check box is selected.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that stores the user information. The table is selected based on the Type field.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available only if the Method is Dynamic Condition.</td>
</tr>
<tr>
<td>User Field</td>
<td>Table field that refers to users.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available only if the Method is Dynamic Condition.</td>
</tr>
</tbody>
</table>
**ServiceNow**    New York    Now Platform Capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td>Condition builder to create the recipients list based on the specified table and user field. A condition is made up of a selected field, an operator, and a value. Add conditions using the AND and OR buttons. Delete conditions by clicking the Delete button to the right of a condition.</td>
</tr>
</tbody>
</table>

**Note:** This field is available only if the **Method** is **Dynamic Condition**.

**Note:** When the **Method** is **Dynamic Condition**, you can either use a script or a condition builder to create the recipients list.

4. Click **Submit**.
   For recipients lists created by the file upload, clicking **Submit** validates the records in the Excel file. Following validation, the system displays a pop-up window with the upload results, including valid and invalid user records.

5. Optional: To get the updated user list, navigate to the recipient list and click **Refresh Recipient List**.

**Add a recipients list to a survey**

Send the survey invites to targeted sets of users by adding a recipients list to a survey.

Role required: admin or survey_admin

Recipients lists should be pre-defined in the Recipients Lists submodule. For more information on defining recipients lists, see **Define a recipients list for surveys**.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. Perform any of the following steps.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>From Platform</strong></td>
<td>1. Under the <strong>Survey Recipients Lists</strong> related list, click <strong>New</strong>.</td>
</tr>
<tr>
<td></td>
<td>2. In the Survey Recipients Lists form, from the <strong>Recipients List</strong> list, select the required recipients list.</td>
</tr>
<tr>
<td></td>
<td>3. Click <strong>Submit</strong>.</td>
</tr>
<tr>
<td><strong>From Survey Designer</strong></td>
<td>1. Under the <strong>Availability</strong> tab, for the <strong>Accessible By</strong> field, select <strong>Specific users</strong>.</td>
</tr>
<tr>
<td></td>
<td>2. In the <strong>Add recipients lists</strong> list, select the required recipients list.</td>
</tr>
<tr>
<td></td>
<td>3. To send the survey to users, click <strong>Save and Publish</strong>.</td>
</tr>
</tbody>
</table>

4. **To send survey invites to all survey users and recipients lists**, click **Send Invitations**.

**Note:**

© 2019 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The Send Invitations UI action is available when there is at least one recipients list or survey user for the survey. If a user is available in the Survey Users related list and multiple recipients lists, the survey invite is sent only once to the user.

Embed a survey within the Outlook email client

Embed an interactive survey in the email notification sent to a user. The user can answer the survey questions and submit the survey from the email client instead of opening the survey in a new browser tab.

Role required: admin or survey_admin

The Outlook Actionable Messages plugin (com.sn_ms_oam) should be activated.

Note:

- Outlook Actionable Message (OAM) is not supported for Outlook 2016 for Mac. For information about detailed support matrix, refer to the Microsoft website.
- Actionable messages are supported only for emails sent from the @service-now.com email address. If you are sending an email from a customized email address, you should register as a new service in the Microsoft website setting the scope as Organization. Specify the provider ID value in the sn_ms_oam.outlookactionable.originator property.
- Actionable messages are based on the Sender Policy Framework (SPF)/DomainKeys Identified Mail (DKIM) validation for the email sender verification. If an email recipient receives email via an external provider, emails may not be rendered as adaptive cards.
- You cannot customize the default actionable message templates.

1. Navigate to System Notification > Email > Notifications.
2. For the Survey User Invite notification, in the What it will contain tab, add the following script in the Message field in addition to the existing information.

   ```
   ${mail_script:include_survey_actionable}
   ```

   This script includes the Outlook actionable message in the email notification sent to the user.
3. Navigate to Survey > View Surveys, and open a survey.
4. To send an email notification to the survey user, select the Send notifications check box.
5. Select the Outlook Actionable Message check box and save the survey.

Note:

- The following questions are not supported for an embedded survey:
  - Attachment
  - Date
  - Datetime
  - Template
  - Reference
  - Image Scale
  - Ranking
- Dependant questions are not supported.
- Signature is not supported.
In both the Platform UI and Survey Designer, a validation is run to ensure all survey questions are supported.

6. Click **Assign Survey** and assign the survey to a user.
   An email notification with the embedded survey is sent to the user. The user can take the survey and submit it from the email client instead of opening the survey in a new browser tab.

### Enable localization for a survey

Enable a survey user to take a survey in multiple languages.

Role required: admin or survey_admin

The plugin for the language that you want the survey to be available in should be installed.

**Note:** Localization is applicable only for public surveys.

1. Navigate to **Survey > Administration > Properties**.
2. Enable the **Enable/Disable whether to show language picker when a public survey is taken** (**show_lang_picker_for_publicsurveys**) property.
3. In the System Settings window, from the **Language** list, select the language that you want the survey to be available in.

**Note:** The **Language** list is available only when a language plugin is installed.

4. Navigate to **Survey > View Surveys** and open a public survey.
5. Enter the translated text for the survey title, questions, and answers.
6. Save and publish the survey.

**Note:** The localization is also applicable in Service Portal if the **Assessment Properties Allow survey link from email to open in service portal view (applies only for surveys)** (**sn_portal_surveys.sp_survey.email_redirection**) property is enabled.

- The survey is available for survey users in the translated language.
- Users can change the language of the survey using the language picker.

### Survey URLs

You can distribute a survey by giving survey users a survey URL.

Survey administrators can obtain one of the following types of URLs:

- A general URL for a survey, which users can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures that the person is logged in. It then searches for an instance of the associated survey that is assigned to the logged-in user.
  - If a survey instance is found, the appropriate action occurs based on the **State** of the survey instance (see table). If there are multiple active survey instances (**Ready to take** or **In progress**), the instance with the earliest due date opens.
  - If no survey instance is found, the system creates a new instance for the survey, assigns it to the user, and opens the survey questionnaire.
  - A URL for a specific survey instance, which the assigned user can open to take the survey questionnaire. The following process occurs.
• When someone opens the URL, the system ensures the person is logged in as the user the survey instance is assigned to. Only the assigned user can access the survey questionnaire.
• The appropriate action occurs, depending on the **State** of the survey instance (see table).

### Survey states

<table>
<thead>
<tr>
<th>Survey instance state</th>
<th>Action upon opening URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Ready to take:</strong> User has not saved any responses.</td>
<td>The survey questionnaire appears for the user to begin. The user can save or submit responses.</td>
</tr>
<tr>
<td><strong>In progress:</strong> User has saved at least one response.</td>
<td>The survey questionnaire appears for the user to continue. Any previously saved responses are displayed. The user can save or submit responses.</td>
</tr>
<tr>
<td><strong>Complete:</strong> User has submitted all required responses.</td>
<td>If the schedule period is <strong>No Limit</strong> or if the period restriction has expired, the survey questionnaire for a new survey instance appears for the user to begin. If the schedule period restricts the number of times a user can take the same survey, and the period restriction has not expired since the user last completed survey, an error message appears.</td>
</tr>
</tbody>
</table>

If someone opens a URL for an unpublished or deactivated survey, an error message appears.

**Obtain and distribute a general survey URL**

You can distribute a general survey URL to allow any eligible user to open a survey questionnaire.

Role required: admin or survey_admin

The general URL is available on the Survey Definition form and on the survey creator. You can also email the URL for a public survey that is published.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition from the Assessment Metric Types list.
3. To view or copy the URL, click the **View Survey URL** related link. This related link is visible only if the survey definition is **Active**.
4. To distribute the URL to users, paste the copied URL as desired, or click the **Email** button to send via email. The **Email** button is visible only for a public survey that is published.

When a survey user clicks the general survey URL, the system creates a survey instance for the survey user as long as the user does not have an instance in the **Ready to take** state. The system is configured by default to send an email notification when a survey instance is generated.

As a result, the survey user receives a second notification in addition to the notification that you sent with the general survey URL. This may confuse the survey user. To avoid this issue, you can deactivate auto-notification.

**Deactivate auto-notification for surveys**

When you send a survey notification with a general survey URL to a survey user, the user may receive a second system-generated notification. To avoid this issue, you can deactivate auto-notification.

Role required: admin or survey_admin

1. Navigate to **System Notification > Email > Notifications**.
2. Open the **Survey User Invite** notification.
3. Configure the form to add the **Send to event creator** check box to the **Who will receive** section.
   - The **Send to event creator** check box is selected by default.
4. Clear the **Send to event creator** check box.
   - The system will no longer send auto-notification messages to survey users.

**Obtain a survey instance URL**
You can distribute a survey instance URL to allow the assigned user to open a survey questionnaire.

**Role required:** admin or survey_admin

The survey instance URL is available on the survey instance record.

1. Navigate to **Survey > Survey Instances**.
2. Open the instance for the survey.
3. To view or copy the URL, click **View Instance URL** related link.
   - The related link is available only when the survey instance **State** is **Ready to take** or **In progress** and the associated survey definition is **Active**.
4. In the dialog box, select and copy the URL then click **OK** or **Cancel**.
5. Distribute the URL to the assigned user.

**Test a survey URL**
When there are survey users associated with a survey, the survey is restricted so only those users can use the survey URL. You can test the survey URL to ensure it is restricted.

**Role required:** admin or survey_admin

1. Navigate to **Survey > View Surveys** and open a survey for which you are not a survey user.
2. Under **Related Links**, click **View Survey URL**.
3. Copy the URL and click **OK** or **Cancel**.
4. Navigate to the URL.
   - You see a message that you are not authorized to take the survey.

**Create a survey module**
You can create a module that opens a survey.

**Role required:** admin or survey_admin

When a user clicks a survey module, the system performs one of the following actions, depending on the configuration options for the survey and other factors:

- Creates a new survey instance
- Opens an existing survey instance
- Displays an error message.

1. Perform the appropriate action for your version of the UI:
   - **UI16**: Point to the application menu that contains the module to which you want to add the survey module and click the edit application (pencil) icon.
   - **UI15**: Right-click the application menu you want to add the module to and select **Edit Application Menu**
2. In the **Modules** related list, click **New**.
3. Complete the following fields.
- **Link type**: Assessment
  Do not select **Survey**, which is used for legacy surveys only.
- **Assessment**: Select the survey you want the module to open.

4. Complete and save the form.

**Sharing surveys: export and import**

You can export a survey and then import it to a different ServiceNow instance.

**Note**: Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see [System update sets](#).

The system exports a single XML file that contains a survey definition (asmt_metric_type) and the associated records, including the following.

- Assessment Metric Template (asmt_template)
- Assessment Template Definition (asmt_template_definition)
- Metric definitions (asmt_metric_definition) (survey question answer options)
- Scheduled Jobs associated with the Survey (sys_trigger)
- Survey categories (asmt_metric_category)
- Survey questions (asmt_metric)
- Survey users (asmt_m2m_category_user)
- Trigger Condition (asmt_condition)

**Export a survey**

You can export a survey and then import it to another instance.

Role required: admin, survey_reader, or survey_admin

For information about update sets, see [System update sets](#).

1. Navigate to **Survey > View Surveys**.
2. Right-click the name of a record to show the context menu.
3. Select **Export Assessment**.
4. If applicable, follow the prompt in your browser to save the XML file.

**Import a survey**

You can import a survey that has been exported as an XML file. The exported XML file does not contain result data.

Role required: admin or survey_admin

**Note**: Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see [System update sets](#).

1. Verify that the target instance has assessments enabled.
2. Follow the steps in **import an XML file** to import the assessment.

**Use update sets for surveys and assessments**

Use an update set to capture changes to surveys and assessments.

Role required: admin or survey_admin

When developing surveys and assessments, you can use an update set to capture the changes and move them from a development instance to a production instance. Once an update set
is created and marked current, all of the updates to the following tables are recorded in the update set.

The following tables are now update set enabled and also extend the application file:

- Assessment Metric Templates (asmt_template)
- Assessment Template Definitions (asmt_template_definition)
- Assessment Metric Definitions (asmt_metric_definition): survey question answer options
- Schedule (sys_trigger): scheduled jobs associated with the survey
- Assessment Metric Categories (asmt_metric_category): survey categories
- Assessment Metrics (asmt_metric): survey questions
- Assessment Category Users (asmt_m2m_category_user): survey users
- Trigger Conditions (asmt_condition)

**Configure a survey in the Connect chat support**

Enable a user to take a survey after chatting with a survey agent.

Role required: admin or survey_admin

**Note:** The Connect Support plugin (com.glide.connect.support) should be activated.

1. Navigate to **Survey > Chat survey**.
2. Click **New**.
3. In the Chat Survey form, fill the fields.

**Chat Survey form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey</td>
<td>Survey whose instance should be available in Connect Support.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of chat where the survey is available.</td>
</tr>
<tr>
<td></td>
<td>- Connect: Survey is available in Connect Support.</td>
</tr>
<tr>
<td>Chat queue</td>
<td>Chat queue where the survey is available.</td>
</tr>
<tr>
<td>Active</td>
<td>Specifies if the chat survey configuration is active.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the chat survey configuration.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

When a support agent of the assignment group associated with the chat queue ends a chat with a user, the survey instance is available in the chat window for the users.

**Sentiment analysis for surveys**

You can use sentiment analysis to determine whether user responses for a survey are considered positive, negative, or neutral.

Activate the Sentiment Analysis (com.snc.sentiment_analysis) plugin.

For a survey, you can select questions that should be used for analysis. The survey responses of these questions are sent to the thirdparty platforms for analysis through the specified connector configurations.
Note: You can only use string type questions for sentiment analysis.

The sentiment analysis results are displayed under Survey > Question Sentiment Results. The sentiment label is based on the normalized score:

<table>
<thead>
<tr>
<th>Normalized score</th>
<th>Sentiment label</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1 to 0</td>
<td>Negative</td>
</tr>
<tr>
<td>0</td>
<td>Neutral</td>
</tr>
<tr>
<td>0 to 1</td>
<td>Positive</td>
</tr>
</tbody>
</table>

Configure a sentiment connector

Specify the service URL and other configuration information for third party APIs that are used for sentiment analysis.

Role required: admin

1. Change the scope of the current session to Sentiment Analysis.
2. Navigate to Sentiment Analysis > Sentiment Connector Configurations.
3. Add or edit the connector configuration for a third party vendor such as Google, IBMWatson, and MSAzure.

**Note:** By default, placeholders are available for configuring connectors for Google, IBMWatson, and MSAzure.

<table>
<thead>
<tr>
<th>Sentiment connector fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Active</td>
</tr>
<tr>
<td>Credential Alias</td>
</tr>
<tr>
<td>Default</td>
</tr>
<tr>
<td>Description</td>
</tr>
<tr>
<td>Script</td>
</tr>
</tbody>
</table>

4. Configure the connector credentials
   a) Open the record referred in the Credential Alias field.
   b) Under the Connections tab, select the connection.
   c) In the Connection URL field, enter the value.
   d) Open the record referred in the Credentials field.
   e) Enter the credential information.
Note:
- You should obtain the connection credentials from the respective third-party vendors.
- If the credential is an API key, specify its value. If the credential is basic authentication, that is, user name and password, specify the corresponding information.

f) Select the Active check box and click Update.

5. Select the Active check box for the connector configuration and click Update.

Sentiment analysis properties
You can use the sentiment analysis properties to customize the Sentiment Analysis module.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response time for the outbound call of Sentiment Analysis API (sn_nlp_sentiment.glide.sentiment.transaction.timeout)</td>
<td>Maximum time (milliseconds) expected for executing the outbound call for Sentiment Analysis API before it’s timeout.</td>
</tr>
</tbody>
</table>

Sentiment analysis results
The sentiment analysis results view contains a bar chart that displays the percentage of positive, negative, and neutral results, along with the instance count for each category.

Color indicators
Following are the color indicators in the bar chart:
- Green: Positive
- Red: Negative
- Blue: Neutral

Quick start tests for Assessments and Surveys
Validate that Assessments and Surveys still work after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Assessments and Surveys quick start tests require activating the Automated Test Framework Survey plugin (com.glide.automated_testing_impl.Survey).

<table>

**Legacy survey migration**

Users with the survey_admin role can migrate legacy survey data to create copies of legacy surveys and their related records in assessment tables. The Survey Management application, which is built on the assessment engine, is available as an alternative to legacy surveys.

The following legacy survey components are migrated:

- Survey masters
- Supported survey questions and question choices
- Survey instances
- Survey responses

Legacy survey conditions are not migrated and must be recreated as trigger conditions.

**Note:**

- The Legacy Surveys and Legacy Administration modules are available on instances upgraded from a previous release but not available for new instances. Customers using legacy survey or survey wizard should plan to migrate to the Survey Management application to create modern and high quality surveys for their users.
- The following legacy survey plugins are inactive by default, and are available upon request:
  - Best Practice - Task Survey Management (ID: com.snc.bestpractice.task_survey)
  - Survey Management (ID: com.glideapp.survey)
  - Assessment Components (ID: com.snc.assessment)
  - Survey Wizard (ID: com.glideapp.survey_wizard)
- Survey wizards cannot be migrated.

**Migrate a legacy survey**

Migrate a legacy survey and its related records to take advantage of a more powerful feature set.

Role required: admin or survey_admin

To avoid timing out for very large surveys, you can disable the transaction quota. See Transaction quotas.

1. Navigate to Survey > Legacy Surveys > Masters.
   The list of legacy survey masters appears. By default, the list shows only survey masters that have not been migrated. To show all survey masters, remove the Assessment is empty breadcrumb.

2. Open a survey and click the Migrate to New Survey Management related link or Migrate to New Survey Management in the title bar.
   A dialog box describes what happens when you migrate the survey. Note that certain types of survey questions cannot be migrated.

3. Click OK.
The system generates records on assessment tables based on the survey master, eligible questions and choices, results, and other related survey components. The original survey components are unaffected.

System messages may appear at the top of the Survey form to notify you of questions that could not be migrated and to advise you to review migrated Multiple Choice questions.

4. Optional: Click the reference icon beside the Assessment field to view the new survey definition.

5. Optional: Remove survey users from the assessment survey if you want all users to be able to take it.

When you migrate a survey, any users who have taken it are automatically associated with the assessment survey and become survey users. When there are survey users associated with an assessment survey, only those users can take it.

6. Deactivate any survey conditions associated with the survey by completing the following steps.
   a) Navigate to Survey > Legacy Administration > Survey Conditions.
   b) In the Active column, ensure the value is false for any survey conditions that reference the migrated survey.

7. Navigate to Survey > Administration > Trigger Conditions to create new trigger conditions for the migrated survey.

The Migrate to Assessment related link on the legacy survey record becomes unavailable after the migration. However, if you delete the record referenced in the Assessment field, the related link reappears and you can migrate the legacy survey again.

Survey question migration

Before you migrate a legacy survey, understand that some legacy survey questions cannot be migrated due to incompatible question types.

Legacy survey questions are migrated from the Survey Question (survey_question_new) table to the Assessment Metric (asmt_metric) table. In legacy surveys, the Type field on the Survey Question table determines how the question renders on the survey questionnaire. In assessment surveys, the Data type field on the Assessment Metric table serves a similar purpose. Certain legacy survey types are not supported in assessment surveys.

The following table shows the conversion path for each legacy survey question type to an assessment data type, if there is one.

<table>
<thead>
<tr>
<th>Legacy survey type</th>
<th>Assessment data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Break</td>

</tr>
</tbody>
</table>
### Migrated components

When you migrate a survey, the system maps records from survey tables to assessment tables.

To create a functional survey on the assessment framework, the system converts survey records to the most logical equivalent assessment survey records. This may mean multiple assessment survey records represent one legacy survey record.

<table>
<thead>
<tr>
<th>Legacy survey type</th>

</tbody>
</table>

#### Migrated components

When you migrate a survey, the system maps records from survey tables to assessment tables.

To create a functional survey on the assessment framework, the system converts survey records to the most logical equivalent assessment survey records. This may mean multiple assessment survey records represent one legacy survey record.

#### Survey component

<table>
<thead>
<tr>
<th>Survey component</th>
<th>Assessment survey components</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey master (survey_master)</td>
<td>• Survey definition (asmt_metric_type)</td>
</tr>
<tr>
<td></td>
<td>• Assessable record (asmt_assessable_record), for system use only</td>
</tr>
<tr>
<td></td>
<td>• Survey category (asmt_metric_category)</td>
</tr>
<tr>
<td>Survey question (survey_question_new)</td>
<td>• Survey question (asmt_metric)</td>
</tr>
<tr>
<td>Question choice (question_choice)</td>
<td>• Assessment metric definition (asmt_metric_definition)</td>
</tr>
<tr>
<td>Survey instance (survey_instance)</td>
<td>• Assessment group (asmt_assessment), for system use only</td>
</tr>
<tr>
<td></td>
<td>• Survey instance (asmt_assessment_instance)</td>
</tr>
<tr>
<td>Survey response (survey_response)</td>
<td>• Survey instance question (asmt_assessment_instance_question)</td>
</tr>
<tr>
<td></td>
<td>• Survey response (asmt_metric_result)</td>
</tr>
<tr>
<td></td>
<td>• Category result (asmt_category_result), for system use only</td>
</tr>
</tbody>
</table>
Migrated question review

To maintain accurate result calculations, you may need to make minor adjustments to some of the migrated survey records to ensure results are calculated correctly.

**Note:** The assessment engine provides a built-in result calculation feature that converts each survey response to a score between 0 and 10. The configuration required to maintain accurate result calculations is advanced and is not recommended for basic survey implementations. If you do not plan to use result calculation data, ignore the information in this section.

For each legacy question migrated, the system creates a survey question record on the Assessment Metric (asmt_metric) table. For legacy questions of the **Multiple Choice** and **Select Box** types, the system also creates a metric definition record, on the Assessment Metric Definition (asmt_metric_definition) table, for each legacy question choice.

**Comparable metric definitions and survey question choices**

<table>
<thead>
<tr>
<th>Survey question choice field</th>
<th>Related metric definition field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Display</td>
</tr>
<tr>
<td>Value (can be any string value)</td>
<td>Value (must be a numerical value)</td>
</tr>
<tr>
<td>Order</td>
<td>Value (metric definition with smallest Value is first)</td>
</tr>
</tbody>
</table>

When the system migrates legacy survey question choices, it uses the legacy **Order** to set each metric definition **Value**. For the legacy question choice with the smallest **Order**, the corresponding metric definition **Value** is set to 1. For the legacy question choice with the next smallest **Order**, the metric definition **Value** is 2, and so on.

The **Scale definition** field on the migrated Survey Question form determines whether smaller or bigger metric definition values equate to a good score in survey result calculations. By default, the scale definition is set to **High**, meaning bigger values are good. When you migrate a legacy survey, check that the default scale definition makes sense for each question.

For example, the following tables depict a sample migrated question and the metric definitions automatically created for it. Recall that the system uses the order of the legacy survey question choices to set the metric definition value. **Excellent** has the lowest **Order** value, so when the system creates a metric definition for this question choice, the **Value** is set to 1. In this case the default scale definition value, **High**, does not make sense, as the system will calculate the worst scores for responses of **Excellent**.

**Legacy question: Please rate the overall quality of your service.**

<table>
<thead>
<tr>
<th>Question choice text</th>
<th>Question choice value</th>
<th>Question choice order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>A</td>
<td>100</td>
</tr>
<tr>
<td>Good</td>
<td>B</td>
<td>200</td>
</tr>
<tr>
<td>Fair</td>
<td>C</td>
<td>300</td>
</tr>
<tr>
<td>Poor</td>
<td>D</td>
<td>400</td>
</tr>
</tbody>
</table>

**Migrated question: Please rate the overall quality of your service.**

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Metric definition display</td>
<td>Metric definition value</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

If there are no Order values for the legacy survey question choices, the system sets each corresponding metric definition Value based on the alphanumeric order of the legacy Text value.

Migrated question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

You may also need to change the Scale definition setting for other migrated questions. For details, see the scale definition recommendations for each survey question data type.

Task Communications Management

Task Communications Management (TCM) provides a framework for defining and managing a communication process for any entity that extends the task table.

Task Communications Management process

Task Communications Management helps you to streamline the process by creating designated communication plans for effective communication during an event. The communication plan, with its defined tasks, helps you to focus on resolving the current issue instead of deciding when to send a communication, what information to share, and whom to inform.
How Task Communications Management works

With Task Communications Management, you can predefine a communication plan for an event such as major incident, planned maintenance, and release. Each plan generally involves a series of tasks that define different communication and collaboration activities along with frequency and method of communication. For each task, you must specify the communication channel for contacting the stakeholders. You can also define templates for email and SMS messages.

After defining the task and channel for communication, you can define the contacts or the target audience to be contacted for each task.

After a communication plan is defined, the plan gets associated with the appropriate task table based on the conditions defined. Thereafter, the tasks defined in the plan get executed sequentially and stakeholders are contacted as defined in the plan. The communication plan makes communication and collaboration process smoother and brings a quicker resolution of the issue.

Task Communications Management flow in major incident management

Assume that you want an incident communication plan generated for a high-priority major incident.

- As the major incident manager, you can predefine a communication plan and the conditions that drive its attachment. In this case, the conditions are: Priority = High and Major Incident state = Accepted. Consider that the target audience is the technical stakeholders of the incident and the communication plan definition is named Technical Communications.
- The plan definition can have multiple communication task definitions such as:
  - Initiate Technical Communications
  - Technical Status Update
• Each communication task definition also specifies the channel of communication and the communication frequency (one time or recurring).
• Initiate Technical Communications uses email as a channel of communication and communication frequency is one time.
• Technical Status Update uses email and SMS as channel of communication and the communication frequency is recurring.

• The target audience for in the communications is defined as communication contact definitions on the plan definition. In this case, consider Service owners of the affected configuration items (CIs) related to the incident as technical stakeholders.
• When an incident meets these conditions, an incident communication plan together with its tasks gets attached to the incident record.
• As the major incident manager, you can effectively carry out the communication without any delay in the resolution of the major incident.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, refer to the ServiceNow Store version history release notes.

Task Communications Management plugins

The Task Communications Management plugins is activated in the base system. The plugin includes demo data.

Activate Task Communications Management

The Task Communications Management plugin (com.snc.task_communication_management) is activated when you activate the Incident Communications Management plugin (com.snc.iam) or the Incident Management - Major Incident Management plugin (com.snc.incident.mim). This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

Task Communications Management activates these related plugins if they are not already active.

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact Management (com.snc.contact_management)</td>
<td>The Contact Management plugin manages the connections between users or groups and other resources in the system.</td>
</tr>
<tr>
<td>Targeted Communications (com.sn_publications)</td>
<td>The Targeted Communications plugin provides a way to publish and send out newsletter like articles to targeted internal or external customers.</td>
</tr>
</tbody>
</table>

1. Navigate to System Definition > Plugins.

A banner notifies you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.
   You can activate the plugin directly from the All Applications page or you can view more details about the plugin before you activate it.
   - If you are certain that you have the correct plugin, click Install, and when you see the dialog box, click Activate.

   ![Activate Plugin dialog box](image)

   - To view plugin details before activation:
     1. Click the plugin name.
     2. On the form, click the Activate/Update related link.
     3. In the dialog box, review the dependent plugins.
        - If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.
     4. If demo data is available and you want to install it, click Load demo data.
        - Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.
5. Click **Activate**.

Components installed with Task Communications Management

Several types of components are installed with the Task Communications Management plugin, including tables and user roles.

**Note:** To view all other components that install with this application, see the Application Files table. For instructions on how to access this table, see [Find components installed with an application](#).

Demo data is available for this feature.

Working with Task Communications Management

The section covers topics that help you with a variety of technical concepts related to Task Communications Management such as creating communication plan definition, task definition, channel definition, and contact definition.

Define a communication plan

Define a communication plan for a task record to specify communication task and contact definitions. When specified conditions for the plan definition are met, the communication plan and its associated records are automatically attached to the task record, eliminating manual effort.

Role required: sn_comm_management.comm_plan_admin or admin

2. On the form, fill in the fields.

Communication Plan Definition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the communication plan.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Table</td>
<td>Table that the plan is attached to when the conditions are met.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of communication plan such as Technical, Internal, External, Customer.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which the communication plans must be associated to the table.</td>
</tr>
<tr>
<td>Condition based</td>
<td>Option to define whether the plan is attached to a table based on the conditions. For example, if you want to attach a communication plan to an incident of priority = 2, you can mention the condition in the Condition field.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to define whether the plan definition is active.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the plan definition.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition under which a communication plan gets attached to a table.</td>
</tr>
</tbody>
</table>

3. **Click Submit.**  
The communication plan is submitted. The communication plan definition contains the following related lists:  
- Communication Task Definitions  
- Communication Contact Definitions

Define a communication task for the plan.

**Define a communication task**

Define a communication task for a communication plan. When a plan gets attached to a table, the tasks related to the plan need to be executed to resolve the issue. You can associate multiple tasks with a communication plan.

Role required: sn_comm_management.comm_plan_admin or admin

You have defined a communication plan.

1. **Navigate to Task Communications Management > Plan Definitions.**  
2. **Click** the communication plan that you want to define a communication task for.  
3. **Click** the Communication Task Definitions related list and then click **New**.  
4. **On** the form, **fill** in the fields.

**Communication Task Definition form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Communication plan definition</td>
<td>Unique name of the communication plan definition that you are defining the task for.</td>
</tr>
<tr>
<td>Name</td>
<td>Unique name for the communication task definition.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Type                | Type of task, such as internal communication, that is applicable globally or to a particular table.  
**Note:** The value in the **Type** field helps you to filter a task by its type. The value also helps to generate a report of a particular task type or to create SLAs on any communication task. |
| Application         | Application scope of the task definition. The task definition is available for all applications or for scoped applications. |
| Order               | Order that the communication tasks appear in the plan. This field indicates which communication task to execute first. |
| Active              | Option to define whether the task is active or not.                         |
| Description         | Detailed description of the task definition.                                |
| Communication frequency | Frequency of the communication task execution. You can send the notification once or the notification can be repeated. |
| Duration            | Time by which you want to send a notification.  
For example, if the communication frequency is **One time** and the **Duration** is 15 minutes, then the notification is sent only once in 15 minutes. If the communication frequency is **Recurring**, then the notification is sent every 15 minutes. |

5. Click **Update**.  
The communication task is defined for the communication plan.

Define communication channel for the task.

**Define a communication channel**

Define a communication channel for each communication task to determine which mode of communication to use for the task when a plan is attached to a table.  
Role required: sn_comm_management.comm_plan_admin or admin

You have defined a communication plan and its related tasks.

- The modes of communication available are: email, SMS, conference, and Slack.
- For the incident table, the functionality for SMS and conference appears only if you activate the Notify plugin (com.snc.notify) and the `com.snc.iam.notify_number` property value is set to the registered notify number. The notify number is registered while configuring the Twilio account.
- For the incident table, the functionality for Slack appears only if you activate the Collaboration Services for Task Communications Management plugin (sn_tcm_collab_hook). To activate the Collaboration Services for Task Communications Management plugin, navigate to ServiceNow Store and install the Collaboration Services for Task Communications Management application. For more information, refer to **Collaboration Services for Task Communications Management**.

**Note:** For information on how to configure Slack, refer to **Configure Slack workspace**.
• **Add Channel – Conference** is mutually exclusive to **Add Channel – SMS** and **Add Channel – Email**. If you select **Add Channel – Conference**, you cannot select **Add Channel – Email** or **Add Channel – SMS**.

1. Navigate to **Task Communications Management > Plan Definitions**.
2. Click a communication plan.
3. Click the Communication Task Definitions related list and then click the task that you want to define the communication channel for.
4. On the Communication Task Definition form, click any one of the following related links based on your requirement:
   - **Add Channel – Conference**
   - **Add Channel – Email**
   - **Add Channel – SMS**
   - **Add Channel – Slack**
5. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<td><strong>Note:</strong> This SMS template must be defined in the Communication task table.</td>
</tr>
<tr>
<td>Notify provider selector</td>
<td>Lookup icon ( ) to select the selector from the Provider Selector (notify_group_selector) table.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The selector can be associated with notify number group or conference provider. Each notify number group can have one or more Notify numbers that can be used to send SMS.</td>
</tr>
<tr>
<td>Add Channel – Slack</td>
<td></td>
</tr>
<tr>
<td>Communication task definition</td>
<td>Communication task definition this channel definition is associated with.</td>
</tr>
<tr>
<td>Channel Type</td>
<td>Channel type is Slack.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.  
   A communication channel is defined for the communication task.

After creating communication tasks and communication channels for those tasks, define contacts for the communication plan.

### Define a communication contact

Define the recipients of a particular plan to determine the target audience involved in each communication task and the responsibilities the recipients are expected to handle. A notification for a task is sent to all individuals specified for that task.

Role required: sn_comm_management.communication_plan_admin or admin

You have defined a communication plan.

You can add or remove any particular communication contact manually.

1. Navigate to **Task Communications Management > Plan Definitions**.
2. Click the communication plan that you want to define the contacts for.
3. Click the **Communication Contact Definitions** related list and then click **New**.
4. On the form, fill in the fields.

### Communication Contact Definition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Type of contact such as user, group, or recipient list that you want to involve in the plan. The contact type is assigned dynamically at the time of the table execution.</td>
</tr>
</tbody>
</table>
**Table: Recipients Lists form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the recipient list.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of recipient.</td>
</tr>
<tr>
<td>State</td>
<td>(Read only) The state of the recipient list.</td>
</tr>
<tr>
<td>Setup</td>
<td></td>
</tr>
<tr>
<td>Method</td>
<td>The method used to generate the recipient list.</td>
</tr>
<tr>
<td></td>
<td>- Upload File: Upload an Excel file with the recipient information to create a recipient list. This list is static.</td>
</tr>
<tr>
<td></td>
<td>- Dynamic Condition: Use scripts or conditions to receive recipient information.</td>
</tr>
</tbody>
</table>

5. **Click Submit.**
A communication contact is defined for the communication plan.

**Define a recipient list for communication contact**

A recipient list lets you specify a filter to fetch a list of users. Use the recipient list as the contact for a particular communication plan.

Role required: sn_comm_management.comm_plan_admin or admin

Sometimes, the contacts that you want to include in a plan can only be known dynamically. For example, you might want the support group associated with a particular business service in an incident to be involved in the communication plan. The support group might change depending on the business service that you select. In such a case, a recipient list provides the flexibility to add recipients dynamically.

1. Navigate to Task Communications Management > Administration > Recipients Lists, and click **New**.
2. On the form, fill in the fields.

**Recipients Lists form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the recipient list.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of recipient.</td>
</tr>
<tr>
<td>State</td>
<td>(Read only) The state of the recipient list.</td>
</tr>
<tr>
<td>Setup</td>
<td></td>
</tr>
<tr>
<td>Method</td>
<td>The method used to generate the recipient list.</td>
</tr>
<tr>
<td></td>
<td>- Upload File: Upload an Excel file with the recipient information to create a recipient list. This list is static.</td>
</tr>
<tr>
<td></td>
<td>- Dynamic Condition: Use scripts or conditions to receive recipient information.</td>
</tr>
</tbody>
</table>

3. **Click Submit.**
A recipient list is defined for the contact.

Define a communication contact for the task.
Create a plan type

Create the communication plan type and specify whether the plan type is applicable globally or to a particular table. When you create the communication plan type, it is referenced in the communication plan definition. The type of the communication plan helps you to filter the plan by its type, generate a report of a particular plan type, or create SLAs for any communication plan.

Role required: sn_comm_management.comm_plan_admin or admin

1. Navigate to Task Communication Management > Administration > Plan Types, and click New.
2. On the form, fill in the fields.

### Communication Plan Type Lookup form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the communication plan type.</td>
</tr>
<tr>
<td>Global</td>
<td>Option to determine whether the plan type is available for all tables or for a specific table. If the check box is not selected, the Table field appears where you can select the table for which the plan type appears.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the plan type. The plan type is available for all applications or for scoped applications.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to define whether the plan type is active.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the plan type.</td>
</tr>
</tbody>
</table>

3. Click Submit.
   A communication plan type is created.

Define a communication plan.

Create a task type

Create the communication task type and specify whether the task is applicable to a particular table or is globally applicable. The communication task type helps you to filter a task by its type, generate a report of a particular task type, or create SLAs for any communication task.

Role required: sn_comm_management.comm_plan_admin

1. Navigate to Task Communication Management > Administration > Task Types, and click New.
2. On the form, fill in the fields.

### Communication Task Type Lookup form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the communication task type.</td>
</tr>
<tr>
<td>Global</td>
<td>Option to determine whether the task type is available for all tables or for a specific table. If the check box is not selected, the Table field appears where you can select the table the task type appears for.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the task type. The task type is available for all applications or for scoped applications.</td>
</tr>
</tbody>
</table>
### Define contact responsibilities

Define the different contacts or target audience involved in the communication process and their responsibility to understand the expectations from those contacts throughout the process.

Role required: sn_comm_management.comm_plan_admin or admin

1. Navigate to **Task Communication Management > Administration > Contact Responsibilities**, and click **New**.
2. On the form, fill in the fields.

#### Contact Responsibility form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global</td>
<td>Option to determine whether the contact responsibility is available for all tables or for a specific table. If the check box is not selected, the <strong>Table</strong> field appears where you can select the table that you are defining the contact responsibility for.</td>
</tr>
<tr>
<td>Name</td>
<td>Unique name of the contact, such as Business Director or Communication Manager, involved in the communication process.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of contact such as user, group, or recipient list.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that the contact is activated on when a communication plan is attached.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.
   Contact responsibilities are defined.

Define a communication contact for the task.

### View communication channel configuration

View the configuration of different communication channels that are used to contact the target audience in the communication process. By default, the communication channels available are email, SMS, Slack, and conference.

Role required: sn_comm_management.comm_plan_admin or admin

You only have read access to the Channel Configuration module. If you want to create a new channel configuration, request the channel configuration through the HI Customer Service system.

1. Navigate to **Task Communication Management > Administration > Channel Configuration**.
2. Open any communication channel record.
3. On the form, view the fields.
Communication Channel Configuration form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>(Read only) Mode of channel.</td>
</tr>
<tr>
<td>Configuration script</td>
<td>(Read only) Lookup icon (🔍) to select the script that defines the channel configuration.</td>
</tr>
<tr>
<td>Active</td>
<td>(Read only) Option to define whether the communication channel is active or not.</td>
</tr>
<tr>
<td>Classification</td>
<td>(Read only) Internally used to group the channels between conference or major incident management workbench.</td>
</tr>
</tbody>
</table>

**Configure Slack for a communication task**

Configure Slack as a mode of communication for a communication task to send direct message to the users.

Role required: sn_comm_management.comm_plan_admin or admin

Install the Collaboration Services for Task Communications Management plugin (sn_tcm_collab_hook) from ServiceNow Store.

1. Navigate to **Incident > Communication Plan Definitions**.
2. Open the communication plan where you want to add Slack as a communication channel for a communication task.
3. Open the communication task definition for which you want to add Slack as the mode of communication.
4. Click the **Add Channel – Slack** related links.
5. Click **Submit**.
   Slack gets added as a communication channel for the communication task.

**Timeline Visualizations**

A timeline visualization is a representation of an organization’s activities over time.

Typically, timeline visualizations are useful for quickly assessing the impact of future strategic and operational activities such as change requests and projects. Timeline visualizations come in two varieties: a two-dimensional (2D) view where activities are grouped by month, and a three-dimensional (3D) view where activities are grouped in lanes. Both views are interactive, and the 2D view can be printed.

Timeline administrators, users with the timeline_admin role, can set up visualizations to represent ITSM-related activities, such as incidents, problems, changes, and projects. Timeline administrators or users with the timeline_user role can personalize their timeline visualizations from the Settings pane in the visualization.

The CIO Roadmap timeline visualization shows your organization’s projects grouped by portfolios. Organizational leaders can use the CIO Roadmap to monitor and evaluate the status of current and upcoming projects.
Note: Activating timeline visualizations does not activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

Key terms for timeline visualizations

- **Lane**: A logical grouping of items on the 3D timeline visualization. For example, one lane might show pending projects while another lane shows open projects.
- **Panel**: A block that represents an item record in a 2D timeline visualization, or a block that represents one or more item records in a 3D timeline visualization.
- **Summary view**: A pop-up window that appears when a user clicks a panel in either the 2D or 3D timeline visualization. The summary view contains additional information about the record. Timeline administrators configure the information that appears in the summary view.
- **Marker**: A bar indicating the start of a month in a 3D timeline visualization.
- **Slider**: A tool used to control the time period seen in a 3D visualization.
- **Slider track**: An alternative view of the panels displayed in both the 2D and 3D timeline visualization.
Activate Timeline Visualization

An administrator can activate the Timeline Visualization plugin (com.snc.timeline_visualization) to access the functionality.

To use the CIO roadmap with timeline visualization, you must activate Project Portfolio Management (com.snc.financial_planning_pmo) plugin.

1. Navigate to System Definition > Plugins.

   A banner notifies you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:**

   To redirect to the legacy list view for plugins, click the link.

   ![Redirect to legacy view]

2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.
You can activate the plugin directly from the All Applications page or you can view more details about the plugin before you activate it.

- If you are certain that you have the correct plugin, click **Install**, and when you see the dialog box, click **Activate**.

To view plugin details before activation:

1. Click the plugin name.
2. On the form, click the **Activate/Update** related link.
3. In the dialog box, review the dependent plugins.
   
   If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.

4. If demo data is available and you want to install it, click **Load demo data**.
   
   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.

5. Click **Activate**.

---

**Installed with Timeline Visualizations**

Several components are installed with timeline visualizations.

**Tables**

Timeline visualization adds the following table.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeline Visualization (roadmap_page)</td>
<td>Stores all available timeline visualizations.</td>
</tr>
</tbody>
</table>
**Table**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Personalize Timeline (roadmap_user_page)</td>
<td>Stores timeline personalization settings for all timeline visualizations.</td>
</tr>
</tbody>
</table>

**UI Policies**

Timeline visualization adds the following UI policy.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control Timeline Visualization configuration Page to enable/disable certain fields</td>
<td>Timeline Visualization (roadmap_page)</td>
<td>Script that hides fields in the Timeline Visualization form when the form loads.</td>
</tr>
</tbody>
</table>

**Script Includes**

Timeline visualization adds the following script includes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roadmap2DUtil</td>
<td>Timeline Visualization - 2D API to generate data for lanes and panels.</td>
</tr>
<tr>
<td>RoadmapCommonUtil</td>
<td>Timeline visualization common utility to handle generic functions.</td>
</tr>
<tr>
<td>RoadmapConfig</td>
<td>Timeline visualization utility allowing configuration through the Timeline Visualization (roadmap_page) table.</td>
</tr>
<tr>
<td>RoadmapItems</td>
<td>Timeline visualization utility to get lane items.</td>
</tr>
<tr>
<td>RoadmapUtil</td>
<td>API to generate data for lanes and panels.</td>
</tr>
</tbody>
</table>

**Client Scripts**

Timeline visualization adds the following client scripts.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roadmap Color Choice</td>
<td>Timeline Visualization (roadmap_page)</td>
<td>Sets color values for the color choice fields in the timeline visualization configuration page.</td>
</tr>
<tr>
<td>Roadmap Item Table</td>
<td>Timeline Visualization (roadmap_page)</td>
<td>Allows changing the color fields for the Item_color_key whenever there is a change to the panel table.</td>
</tr>
<tr>
<td>Roadmap On Load</td>
<td>Timeline Visualization (roadmap_page)</td>
<td>Loads the personalized version of the roadmap/visualization.</td>
</tr>
<tr>
<td>Roadmap Panel Table Change</td>
<td>Timeline Visualization (roadmap_page)</td>
<td>Allows changing the field name for Item_color_key whenever...</td>
</tr>
<tr>
<td>Name</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>there is a change to the panel/visualization table.</td>
</tr>
</tbody>
</table>

**Business Rules**

Timeline visualization adds the following business rule.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check only one default</td>
<td>Timeline Visualization (roadmap_page)</td>
<td>Checks if another visualization is already set as default when user sets a new visualization as the default.</td>
</tr>
</tbody>
</table>

**Timeline visualizations roles**

Timeline visualizations provides two roles.

<table>
<thead>
<tr>
<th>Roles</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Role Title (Name)</strong></td>
</tr>
<tr>
<td>Timeline administrator [timeline_admin]</td>
</tr>
<tr>
<td>Timeline user [timeline_user]</td>
</tr>
</tbody>
</table>

**Create a Timeline Visualization**

Set up timeline visualizations for the organization’s leaders by creating a timeline that provides visual representations of the organization’s operational and strategic activities.

Role required: timeline_admin

Additionally, create timeline visualization views to define what data appears in the summary window when a user clicks a panel on the timeline.

**Note:** Activating timeline visualizations doesn’t activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

- Navigate to Timeline Visualization > Create New and create a new record.
## Timeline Visualization Configuration Form

The image depicts a form for configuring a timeline visualization within the ServiceNow platform. The form includes sections for selecting labels and colors for various statuses, as well as fields for defining panel configurations and filtering and sorting options. The form allows for customization of visual elements to enhance the display of project timelines in the Now Platform Capabilities feature.
### Timeline visualization configuration form field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the visualization.</td>
</tr>
<tr>
<td>Panel table</td>
<td>Table that provides the records displayed as lanes and panels in the timeline.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The list shows only tables and database views that are in the same scope as the visualization.</td>
</tr>
<tr>
<td>Relationship field</td>
<td>Field on the table that contains values displayed as lane titles. Typically this field is a reference field or a field that contains a limited range of values.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The CIO Roadmap timeline visualization is a ServiceNow customized visualization for the Project application that does not use the Relationship field.</td>
</tr>
<tr>
<td>Show slider</td>
<td>Check box that enables (selected) or disables (cleared) displaying the timeline slider that users move to change the dates shown.</td>
</tr>
<tr>
<td>Panel name</td>
<td>Field from the Panel table that contains the values displayed in the panel body.</td>
</tr>
<tr>
<td>Panel date</td>
<td>Field from the Panel table that contains the date values displayed in the panel head in 3D view and in the panel body in 2D view. These dates also determine placement of panels on a lane. Only date and date-time fields are available on the choice list.</td>
</tr>
<tr>
<td>Default</td>
<td>Check box that sets (selected) or removes (cleared) the default status of a visualization when you have more than one defined for a specific table. Applications that include a visualization use the default visualization.</td>
</tr>
<tr>
<td>Max items per lane</td>
<td>Maximum number of items that are displayed in a lane in 3D view. The default value is 500.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The field is not visible on the form by default. Configure the form to add this field.</td>
</tr>
<tr>
<td>Max items per lane 2d</td>
<td>Maximum number of items that are displayed in a lane in 2D view. The default value is 99.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The field is not visible on the form by default. Configure the form to add this field.</td>
</tr>
</tbody>
</table>
## Timeline visualization configuration filtering and sorting form field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lane condition</td>
<td>Condition builder used to create filters and apply sorting to values that are used as lanes in 3D view visualizations. For example, if you set [(Name) (is not) (IT)] as a lane condition for the CIO Roadmap, then IT no longer appears as a lane in the roadmap, nor does it appear as a lane option in the Settings pane. Removing the filter restores the IT lane to the visualization and to lane options in the Settings pane. To order the results, specify sorting based on relevant field names. For example, to order the portfolio names so that they appear in reverse alphabetical order on the CIO Roadmap, set the sort fields to [(Name) (z to a)].</td>
</tr>
<tr>
<td>Panel condition</td>
<td>Condition builder used to create filters and apply sorting to values that are used as panels in 2D and 3D view visualizations. For example, if you set [(State) (is one of) (Pending, Open, Work in Progress)] as the panel condition for the CIO Roadmap, only projects that are in one of those states appear on the roadmap.</td>
</tr>
</tbody>
</table>

## Timeline visualization configuration color options form field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Panel color key</td>
<td>Field from the Panel table that contains values used for color coding the information displayed. The field selected here determines the values that are available in the Label fields on the form. The CIO Roadmap uses State, which is a field in the Project table. Panels on the CIO Roadmap are color coded according to the project state, which can be Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Skipped. Note: You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap. Examples of other fields that are suitable for this selection include Priority, Risk, and Approval.</td>
</tr>
</tbody>
</table>

Note: You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.
### Create a Timeline Visualization view

The timeline visualization view determines which record details appear in the pop-up summary window when a user clicks a panel.

You can create one timeline visualization view per table. For example, if your view shows incident records, you can create a view on the Incident table to show only certain information, such as the incident number, priority, and short description.

If no Timeline Visualization view exists, all panels use the default view that shows all the fields that currently appear on the default view of the form for that table. After you create a Timeline Visualization view for a table, all panels then use that view.

For example, to create a Timeline Visualization view using the Incident form:

1. Navigate to **Incident > All**.
2. Open an incident.
3. Right-click the form header and select **Configure > Form Layout**.
4. Under **Form view and section**, go to the **View name** field and select **New**.
5. Enter **timeline visualization** in the **View** name field.
6. Click **Ok** to create the timeline visualization view.
7. Add fields to or remove items from the timeline visualization view using the **Available** and **Selected** columns.
8. Click **Save**.
Planning Your Timeline Visualization

Before creating a timeline visualization, you should have a clear idea of the information that you want to display.

This planning process helps you identify the required table and fields, and determine filtering and sorting requirements. Since users can personalize the visualization, avoid setting restrictive filters that may prevent users from finding categories that they are accustomed to seeing. You can use the CIO Roadmap as a starting point for creating your own timeline visualizations.

Note: Activating timeline visualizations doesn't activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

Use Timeline Visualization

Timeline Visualization provides a high-level view of an organization's strategic and operational activities over time.

Organizational decision makers can use the information in visualizations for activities such as planning future projects and estimating resource requirements. Users can personalize the information displayed with the visualization Settings pane.

Activating the Timeline Visualization application does not install the CIO Roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap. CIO Roadmap is a timeline visualization that displays an organization's IT projects and portfolios. This following sections use the CIO Roadmap to demonstrate features of timeline visualizations.

Lanes, markers, and panels

Lanes, markers, and panels are the fundamental elements of a timeline visualization. appear in the 3D view only.

Note: Lanes and markers are available in the 3D view only. A panel in the 2D view always represents a single record, while panels in 3D view may represent one or more records.

Lanes

A lane is a channel in which activities are grouped. A visualization can display up to eight lanes at a time. While viewing a visualization, you can use the Settings pane to show or hide individual lanes.

Note: The number of items displayed in a lane depends on the Max items per lane and Max items per lane 2d settings on Timeline Visualization form.

Markers

Markers are horizontal lines that cross all lanes and identify a transition to the next month.

Panels

Panels in both 2D and 3D views are color coded according to values that the administrator selects during the initial setup.
In 2D view, panels are grouped by month and stacked in chronological order, from the earliest date to the latest date. By default, the 2D view opens with the current month displayed on the left side of the visualization. You can print visualizations from the 2D view using the browser’s print option. In 3D view, panels are grouped in lanes and ordered by date, from earliest to latest. The date that appears on the panel determines its placement in 2D and 3D view. The date displayed is based on a value the timeline administrator selects during initial setup.

Panels appear in the CIO Roadmap according to the planned completion date for the project. In 3D view, projects with the same planned date of completion are consolidated into a single panel. In 2D view, projects with the same planned date of completion are displayed as individual panels.

Panel headers in the CIO Roadmap are color coded based on project state. However, in 3D view, if a panel represents more than one project, the panel header is colored black. The Settings pane contains a key showing each available project state and the corresponding color.

**Note:** Activating timeline visualizations doesn’t activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

To view additional information about a panel:

- Click a panel for a single record while in 2D or 3D view to open a summary window that contains additional information. Click the heading in the summary window to open the full record.
- Click a panel that represents multiple records to open a list of those records. Click a record number to open the full record.

The timeline administrator can configure the information that appears in summary windows.

### Personalize Timeline Visualizations

You can configure settings for timeline visualizations like lane and panel conditions, colors, and labels.

**Personalization**

Open the Settings pane and click **Configure**. Complete the form as appropriate (see table).
Visualization personalization

Timeline visualization personalization form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lane conditions</td>
<td>Condition builder used to create filters and apply sorting to values that are used as lanes in 3D view visualizations. For example, if you set (Name) (is not) (IT) as a lane condition for the CIO Roadmap, then IT no longer appears as a lane in the roadmap, nor does it appear as a lane option in the Settings pane. Removing the filter restores the IT lane to the visualization and to lane options in the Settings pane. To order the results, specify sorting based on relevant field names. For example, to order the portfolio names so that they appear in reverse alphabetical order on the CIO Roadmap, set the sort fields to (Name) (z to a).</td>
</tr>
<tr>
<td>Panel conditions</td>
<td>Condition builder used to create filters and apply sorting to values that are used as panels in the visualization. For example, if you set (State) (is one of) (Pending, Open, Work in Progress) as the panel condition for the CIO Roadmap, only projects that are in one of those states appear on the roadmap.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Panel color key</td>
<td>Field from the Panel table that contains values used for color coding the information displayed. The field selected here determines the values that are available in the Label fields on the form. The CIO Roadmap uses State, which is a field in the Project table. Panels on the CIO Roadmap are color coded according to the project state, which can be Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Skipped. Examples of other fields that are suitable for this selection include Priority, Risk, and Approval.</td>
</tr>
</tbody>
</table>

| Label 1, Label 2, Label 3, Label 4 | Values to be color coded. The values available are determined by the Panel color key field. For example, the CIO Roadmap is based on the Project table and has the Panel color key set to the State field, which contains the values Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped. You can set specific colors for up to four values from the selected field. Other values are shown in the Default color. |

| Default color       | Color applied to values that are not selected for labels. For example, the CIO Roadmap color codes and creates labels for the values Pending, Open, Work in Progress, and Closed Complete. The additional values, Closed Incomplete and Closed Skipped, use the default color. |

| Color 1, Color 2, Color 3, Color 4 | Colors that correspond to each of the Label field values. For example, if Label 1 is the Pending state, and Color 1 is red, then panels for projects in the pending state are red. |

**Note:**

- Activating timeline visualizations doesn't activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.
- If the **Max items per lane** field is set to more than 1000, you may observe a delay when displaying the timeline data using Internet Explorer (IE) as the browser.

**The Settings pane**

Element names in the Settings pane vary based on the table and fields used to create the visualization.
The Settings pane contains the following elements:

**Settings pane elements**

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>Identifies the type of information that is color coded on the timeline, such as state or priority. It also lists the color assigned to each possible value, such as pending state and open state.</td>
</tr>
<tr>
<td>Element</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Configure</td>
<td>Allows you to personalize a visualization by creating filters on lane information and panel information, specifying sort order for results, and reassigning panel colors. These changes affect your view of the visualization only.</td>
</tr>
<tr>
<td>View</td>
<td>Allows you to switch between 2D and 3D view.</td>
</tr>
<tr>
<td>View &lt;table&gt; List</td>
<td>Opens a separate browser tab showing the complete record list for the associated table.</td>
</tr>
<tr>
<td>Portfolio</td>
<td>Allows you to click lane names to add or remove them from the visualization. While the visualization is in 2D view, the Settings pane displays a Show all &lt;records&gt; button that allows you to override lane filters applied to the initial setup.</td>
</tr>
</tbody>
</table>

**Use the slider and slider track**

The slider and slider track are useful for quickly navigating to any point in time on a visualization.

**Note:** Activating timeline visualizations doesn't activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

For the CIO Roadmap, the slider track allows you to quickly view the distribution of projects over time and determine project states. While in 3D view, click and drag the slider to move the timeline forward or backward. In 2D view, click and drag the slider track right or left to move the timeline forward or backward.

The slider track provides an alternative view of panels on a visualization. For the CIO Roadmap, a colored dot in the slider track indicates the presence of one or more projects for a given day. The different dot colors correspond to different project states. This allows you to scan the slider track to identify projects of interest by their color, and then use the slider or slider track to quickly navigate to those projects. For example, if you are interested in projects that are in a pending state, you can use the slider to navigate to the colored dots that represent that state.

**Note:** Dots in the slider track do not correspond one-to-one with panels in a visualization. A dot represents the presence of one or more projects on a given date. In 3D view, if there is more than one project for a given day, all of the projects for that day are combined into a single panel on the roadmap. When the slider track is populated, projects in a multi project panel are analyzed for project state and then represented as appropriately colored dots in the slider track.

Similarly, you can use the slider or slider track in conjunction with the calendar to quickly navigate to any point in time. For example, if you are concerned about resource issues in April 2014 because you see a large cluster of dots during that time, dragging the slider or slider track to those dots brings those projects into view. Click the individual panels to view additional information.

**View timeline visualization**

You can view timeline visualizations from a project.

1. Navigate to Project > Projects > All.
2. Scroll to the bottom of the list and click the Timeline Visualization related link.
By default, the CIO Roadmap opens in three-dimensional (3D) view with the current date at the forefront of the timeline. You can use the Settings pane to change between two-dimensional (2D) and 3D view. As soon as you view a timeline visualization, it is considered personalized. After that, you see your personalized view even if the timeline administrator makes changes to the default visualization.

**Note:** Activating timeline visualizations doesn’t activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

Timeline administrators can create timeline visualizations on other tables. If you are not sure whether a timeline visualization exists for a certain application, use the application navigator to open the application of your choice, and click **All**. If a timeline visualization exists for the application’s table, a Timeline Visualization related link appears.

**Work with timeline visualizations**

There are various tools that allow you to move visualizations backward and forward in time depending on whether you are in 2D or 3D view.

The following options are available for navigating between months.

**2D views**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dragging</td>
<td>Hold down the left mouse button and drag the slider track right or left to view other months.</td>
</tr>
<tr>
<td>Left and right arrow keys</td>
<td>Press the left or right arrow keys on the keyboard to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Mouse wheel button</td>
<td>Scroll the wheel to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Right and left navigation arrows</td>
<td>Click the arrows to move from month to month. Arrows do not appear if there are no additional months to view.</td>
</tr>
</tbody>
</table>

The following options are available for navigating stacked panels.

**Navigating stacked panels**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dragging</td>
<td>Hold down the left mouse button and drag the stack up or down to view other panels.</td>
</tr>
<tr>
<td>Up and down navigation arrows</td>
<td>Click the arrows in a stack to view additional panels for the same month. Arrows do not appear if there are no additional panels to view.</td>
</tr>
</tbody>
</table>

The following options are available for navigating in 3D view.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dragging</td>
<td>Hold down the left mouse button and drag the slider along the slider track to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Mouse wheel button</td>
<td>Scroll the wheel to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Up and down arrow keys</td>
<td>Press the arrow keys to move the timeline forward or backward.</td>
</tr>
</tbody>
</table>

**Visual Task Boards**

Visual Task Boards (VTB) transform the navigation of lists and forms into an interactive graphical experience.

With Visual Task Boards, you can view and update multiple task records, which appear as cards that can be moved between lanes. An activity stream on the board displays recent activity so you can easily track changes to tasks. You can add task cards from any table that extends Task to intuitively and easily track updates and edit records directly from the board. Any user can use task boards, regardless of role, though access control rules (ACLs) may limit which cards each user can see. The Visual Task Board interface provides a graphic-rich environment suited for managing and collaborating on records. For example, a support manager might create a board for her team to track their assigned incidents by state in real time.

**Note:** UI16 or UI15 is required to use Visual Task Boards.

Visual task boards have domain separation at the data level only. For more information, see [Domain separation in Visual Task Boards](#).

The following podcast offers additional information on the use of Visual Task Boards.

- **Explore**
  - Task board structure
  - [Domain separation in Visual Task Boards](#)

- **Set up**
  - Activate Visual Task Boards
  - Supported browsers for Visual Task Boards

- **Administer**
  - Configure a task board
  - Configure Visual Task Boards labels
  - Configure the task board card view

- **Use**
  - Create a freeform board
  - Create a data driven board
  - Task cards

- **Develop**
  - Developer training
  - Developer documentation
  - Installed with Visual Task Boards

- **Troubleshoot and get help**
  - Ask or answer questions in the Visual Task Boards forum
  - Search the HI Knowledge Base for known error articles
  - Contact ServiceNow Technical Support

**Activate Visual Task Boards**

Visual Task Boards are active by default on new instances. For upgraded instances, you can activate the Visual Task Boards plugin (com.glide.ui.vtb) if you have the admin role.
Role required: admin

1. Navigate to **System Definition > Plugins**.

   A banner notifies you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:**

   To redirect to the legacy list view for plugins, click the link.

2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in *Request a plugin*.

3. Activate the plugin.

   You can activate the plugin directly from the All Applications page or you can view more details about the plugin before you activate it.

   - If you are certain that you have the correct plugin, click **Install**, and when you see the dialog box, click **Activate**.

   ![Activate Plugin](image)

   - To view plugin details before activation:
     1. Click the plugin name.
     2. On the form, click the **Activate/Update** related link.
     3. In the dialog box, review the dependent plugins.
        - If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.
     4. If demo data is available and you want to install it, click **Load demo data**.

Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin.
on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.

5. Click **Activate**.

### Domain separation in Visual Task Boards

This is an overview of domain separation in the Visual Task Boards application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

#### Overview

**Support: Data only**

Domain separation in this application is supported at the **Data only** level, meaning it supports the data security model of separating visibility of data from one domain to another. To learn more, see [Application support for domain separation](#).

#### Installed with Visual Task Boards

Several types of components are installed with Visual Task Boards.

### Tables installed with Visual Task Boards

Tables are added with activation of Visual Task Boards.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Board Member (vtb_board_member)</td>
<td>Stores a record for each member of each task board.</td>
</tr>
<tr>
<td>Private Task (vtb_task)</td>
<td>Stores a record for each personal task on each freeform board.</td>
</tr>
<tr>
<td>Visual Task Board (vtb_board)</td>
<td>Stores a record for each task board.</td>
</tr>
<tr>
<td>Visual Task Board Card (vtb_card)</td>
<td>Stores a record for each task card on each task board.</td>
</tr>
<tr>
<td>Visual Task Board Card History (vtb_card_history)</td>
<td>Stores records for certain task card changes, such as lane or assignee changes. Each record indicates the previous value and the new value.</td>
</tr>
<tr>
<td>Visual Task Board Lane (vtb_lane)</td>
<td>Stores a record for each lane on each task board.</td>
</tr>
</tbody>
</table>

### Properties installed with Visual Task Boards

Properties are added with activation of Visual Task Boards.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vtb.board.upload_limit</td>
<td>Sets the maximum file size in megabytes allowed for each task card attachment.</td>
</tr>
<tr>
<td></td>
<td>* Type: integer</td>
</tr>
<tr>
<td></td>
<td>* Default value: 10</td>
</tr>
<tr>
<td></td>
<td>* Location: System Property (sys_properties) table</td>
</tr>
</tbody>
</table>

**Script includes installed with Visual Task Boards**

Script includes are added with activation of Visual Task Boards.

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VisualTaskBoards</td>
<td>Provides general utilities for Visual Task Boards.</td>
</tr>
<tr>
<td>VTBBoardSecurity</td>
<td>Provides security utilities to control board access.</td>
</tr>
<tr>
<td>VTBGetBoardsByUser</td>
<td>Provides a method that retrieves all the boards a specified user owns or is a member of.</td>
</tr>
<tr>
<td>VTBTaskSecurity</td>
<td>Provides security utilities to control task access.</td>
</tr>
</tbody>
</table>

**Client scripts installed with Visual Task Boards**

Client scripts are added with activation of Visual Task Boards.

<table>
<thead>
<tr>
<th>Client script</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Kanban Choice</td>
<td>Visual Task Board</td>
<td>Adds the <strong>Kanban Board</strong> option to the Lane field field. This option indicates that the task board is a flexible board.</td>
</tr>
<tr>
<td>(vtb_board)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Business rules installed with Visual Task Boards**

Business rules are added with activation of Visual Task Boards.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add members to live group</td>
<td>Board Member (vtb_board_member)</td>
<td>If a Connect Chat conversation is created for a task board, this business rule adds the board members as conversation members.</td>
</tr>
<tr>
<td>Remove member from live group</td>
<td>Board Member (vtb_board_member)</td>
<td>If a Connect Chat conversation exists for a task board and a user is removed from the board members, this business rule removes the user from the conversation members.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Remove member from VTB</td>
<td>Live Group Member (live_group_member)</td>
<td>If a Connect Chat conversation exists for a task board and a user is removed from the conversation members, this business rule removes the user from the task board members.</td>
</tr>
<tr>
<td>Sync board name to Connect</td>
<td>Visual Task Board (vtb_board)</td>
<td>If a Connect Chat conversation exists for a task board and someone updates the board name, this business rule updates the conversation name.</td>
</tr>
<tr>
<td>Sync chat name to VTB board</td>
<td>Live Group Profile (live_group_profile)</td>
<td>If a Connect Chat conversation exists for a task board and someone updates the conversation name, this business rule updates the board name.</td>
</tr>
<tr>
<td>Sync Members With VTB</td>
<td>Live Group Member (live_group_member)</td>
<td>If a Connect Chat conversation exists for a task board and a user is added to the conversation members, this business rule adds the user as a board member.</td>
</tr>
<tr>
<td>Update Board on Card Change</td>
<td>Visual Task Board Card (vtb_card)</td>
<td>Triggers the system to update the task board when changes occur to the cards.</td>
</tr>
<tr>
<td>Update Board on Lane Change</td>
<td>Visual Task Board Lane (vtb_lane)</td>
<td>Triggers the system to update the task board when changes occur to the lanes.</td>
</tr>
<tr>
<td>update board on lane change</td>
<td>Board Member (vtb_board_member)</td>
<td>Triggers the system to update the task board when changes occur to the board members.</td>
</tr>
<tr>
<td>VTB Previous Additional Assignees</td>
<td>Private Task (vtb_task)</td>
<td>Triggers the system to send an email notification to users when they are designated as additional assignees for cards.</td>
</tr>
</tbody>
</table>

### Notifications installed with Visual Task Boards

Notifications are added with activation of Visual Task Boards.

<table>
<thead>
<tr>
<th>Notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VTB member addition notification</td>
<td>Sends an email notification to the member about their addition to the board.</td>
</tr>
<tr>
<td>VTB member deletion notification</td>
<td>Sends an email notification to the member about their removal from the board.</td>
</tr>
<tr>
<td>VTB additional assignee notification</td>
<td>Sends an email notification to users when they are designated as additional assignees for tasks.</td>
</tr>
<tr>
<td>VTB assignee notification</td>
<td>Sends an email notification to users when they are designated as the primary assignees for personal tasks.</td>
</tr>
</tbody>
</table>
### Notification

<table>
<thead>
<tr>
<th>Description</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>VTB lane change notification</td>
<td>Sends an email notification to a task’s assignees when the task changes lanes.</td>
<td></td>
</tr>
<tr>
<td>VTB lane limit reached</td>
<td>Sends an email notification to the board member that the number of tasks in the lane has reached the set lane limit.</td>
<td></td>
</tr>
<tr>
<td>VTB lane limit exceeded</td>
<td>Sends an email notification to the board member that the number of tasks in the lane has exceeded the set lane limit.</td>
<td></td>
</tr>
<tr>
<td>VTB card movement across vertical lanes and swimlanes</td>
<td>Sends an email notification to the board member with the details of the card moved and the member who moved the card.</td>
<td></td>
</tr>
</tbody>
</table>

### Supported browsers for Visual Task Boards

The system supports Visual Task Boards on most modern browsers.

**Supported browsers**

- The latest public release of Firefox or Firefox ESR
- The latest public release of Chrome
- Safari version 12
- Internet Explorer version 11
  - Edge mode is supported.
  - Compatibility mode is not supported.
  - Setting Security Mode to High (via the Internet Options > Security tab) is not supported.
  - Internet Explorer 11 is susceptible to memory leaks, which may impact performance, especially in Windows 7.

**Note:** VTB loading is comparatively slower on Internet Explorer 11 browsers

The recommended limit to include various elements to the board while working on Internet Explorer and Edge browsers is as follows

**Browser Limits**

<table>
<thead>
<tr>
<th>Browser</th>
<th>Scenario</th>
<th>Cards</th>
<th>Vertical Lanes</th>
<th>Swimlanes</th>
</tr>
</thead>
<tbody>
<tr>
<td>IE</td>
<td>Without Swimlane</td>
<td>500</td>
<td>20</td>
<td>0</td>
</tr>
<tr>
<td>IE</td>
<td>With Swimlane</td>
<td>500</td>
<td>5</td>
<td>10</td>
</tr>
<tr>
<td>Edge</td>
<td>Without Swimlane</td>
<td>1000</td>
<td>20</td>
<td>0</td>
</tr>
<tr>
<td>Edge</td>
<td>With Swimlane</td>
<td>1000</td>
<td>10</td>
<td>10</td>
</tr>
</tbody>
</table>

- Access Visual Task Boards on your mobile device using either a browser or the native mobile app. See for more information.
Scripting support

Visual task boards do not interact with client scripts. Use a UI policy or a data policy instead.

Task board structure

Different types of task boards work for different kinds of task management. However, all board types share the same overall structure.

Task board Types

<table>
<thead>
<tr>
<th>Board type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Freeform boards</td>
<td>Display all types of task records, including personal tasks. Members of freeform boards can add and remove task cards and lanes.</td>
</tr>
<tr>
<td>Flexible boards</td>
<td>Display tasks that match a filter against a particular table. Members of flexible boards can add task cards. Cards are removed automatically when the tasks no longer match the filter conditions. Members can define custom lanes, similar to a freeform board.</td>
</tr>
<tr>
<td>Guided boards</td>
<td>Similar to flexible boards except that guided board lanes correspond to field values and cannot be edited in most cases.</td>
</tr>
</tbody>
</table>

You can identify the task board type by the icon beside the board name.

- The freeform board icon: (   )
- Flexible board icon: (   )
- Guided boards: (   )
Sample Visual Task Board dashboard

All boards have these elements. The color of the left boundary of a card represents the color you choose in the color palette for that board.

**Task board elements**

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quick panel</td>
<td>Displays labels and users associated with the board. Board members can use the quick panel to quickly label or assign tasks. Members can also configure what appears in the quick panel.</td>
</tr>
<tr>
<td>Element</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Lanes</td>
<td>Organize cards on a board into vertical groups. These groups often represent the status of the task, such as To Do, Doing, and Done. When using a guided board, each lane represents a possible field value. For example, a board on the Incident table can display one lane for each State value such as New, Active, or Resolved. Users can move cards from one lane to another to update the task that card represents.</td>
</tr>
<tr>
<td>Cards</td>
<td>Represent individual tasks that you can assign to users. You can add comments, attachments, and labels to cards. Each card is tied to a task record; updating one immediately updates the other. For freeform boards, each card represents a personal task. For flexible and guided boards, each card represents a record from the list that board was created from. For more information, see Create Flexible and Guided boards topic.</td>
</tr>
<tr>
<td>Task board tools</td>
<td>Displays board information, board members, the board activity stream, and board labels.</td>
</tr>
</tbody>
</table>
| Board header | Displays the board name in the title bar. You can rename the board by double-clicking on the board name. Filter the tasks in the board by:  
  - Entering the title or number of the task card  
  - Selecting any one of the options in the Due By drop-down |
| Swimlanes | Organize cards on a board into horizontal lanes. These lanes often represent the user assigned to a task. You can add any number of swimlanes to the board, and move cards from one user to another easily. |
Sample Visual Task Board elements

Visual Task Board use

Any user can create, view, and edit freeform, flexible, and guided visual task boards, and add users to these boards as members.

You can create a freeform board and add cards from multiple task tables, or create a flexible or guided board from an existing list of records.
Create a freeform board

You can create freeform Visual Task Boards (VTBs) for tracking any kind of task or project.

Role required: none

1. Navigate to **Self-Service > Visual Task Boards**.
2. Next to My Task Boards, click **New**, or if you have never created a task board before click **Create New Visual Task Board**.
3. From the Create New Board window, click **Freeform**.
   A new task board opens with the default freeform lanes, **To Do**, **Doing**, and **Done**.
4. Click the board name and enter a new name.

After the board is created, board members can:

- Add and modify lanes
- Create and modify task cards
- Add and remove members
- Configure the look and feel

Create a data driven board

You can create a flexible or guided data driven Visual Task Board (VTB) for any table that extends Task, such as Incident or Change.

Role required: none

1. Navigate to **Self-Service > Visual Task Boards**.
2. Next to My Task Boards, click **New**, or if you have never created a task board before click **Create New Visual Task Board**.
3. From the Create New Board window, click **Data Driven Board**.
4. From the Task Table list, select a base table of tasks on which to base your board, for example, an incident table.
5. Optional: From the Lane Field list, select the field you want to use for the lane headers. Create a Flexible board with editable lane headers by selecting **None**.

   The type of board that is created and the lanes that appear on the board depend on which type of column you select. If you select a reference or choice column, the board is a **guided board**. Each lane in a guided board represents one possible value for that column and the cards appear in the appropriate lane. For example, if you create a guided task board for incidents using the **State** column, the board shows one lane for each incident state, such as **New** or **Closed**. If you select a column that is not a reference or choice, the board is a **flexible board** and the board shows the default lanes, **To Do**, **Doing**, and **Done**, with all cards in the **To Do** lane.

6. Optional: **Create a filter** to show only the records you want to work with.

   For example, you might filter out incidents that are not assigned to you.

   Any card that no longer fits the parameters of the filter is automatically removed from the task board.
7. Optional: Click the board name and enter a new name.

   **Note:** For guided boards created from choice fields, such as **State**, the system creates a lane for each possible choice value. For guided boards created from reference fields, the system creates a lane only for each value in use by a task card. Lanes are added as needed if the reference field values change.
After the board is created, board members can:

- Add and modify lanes
- Create and modify task cards
- Add and remove members
- Configure the look and feel

Delete a task board

You can delete any task board you own.

Role required: none

Deleting a board does not impact the underlying task records. However, you cannot recover a board after you delete it.

1. Navigate to **Self-Service > Visual Task Boards**.
2. Under **Boards you own**, point to a board and click the delete icon (X).
3. In the confirmation dialog, click **Delete**.

Add or modify task board lanes

Any board member can change the names and add new lanes to accommodate the task workflow you want to track. When you create a freeform or flexible task board, it includes the default lanes **To Do**, **Doing**, and **Done**.

Role required: none

Unlike guided boards, the lanes on a freeform or flexible task board do not match possible field values.

**Note:** You cannot remove lanes from guided boards.

1. Open a task board.
2. Perform any of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Create a new lane</strong></td>
<td>1. Scroll past the last lane and click <strong>Add Lane</strong>.</td>
</tr>
<tr>
<td></td>
<td>2. Enter a title for the lane, then press the Enter key.</td>
</tr>
<tr>
<td></td>
<td>The <strong>Add Lane</strong> option is always available for freeform and flexible boards. It is available for guided boards only if the lanes are based on a reference field, such as <strong>Assigned to</strong>.</td>
</tr>
<tr>
<td><strong>Rearrange lanes</strong></td>
<td>Click a lane header and drag the lane to the desired drop zone. To cancel the move, press the Escape key while you drag the lane.</td>
</tr>
<tr>
<td></td>
<td>You can also change the lane order from the board configuration menu.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| **Hide a lane**     | 1. Click the lane menu (_LANE_ ) in a lane header.  
2. Select **Hide Lane**. You can restore hidden lanes from the board configuration menu.                                                                                         |
| **Delete a lane**   | 1. Click the lane menu in a lane header.  
2. Select **Delete Lane**.  
3. In the confirmation dialog box, click **Delete**. When you delete a lane on a freeform or flexible board, all the cards in the deleted lane are archived.      |
| **Exclude Child Table Records** | 1. Click **Info** icon (  )  
2. Under **Structure** menu, select **Exclude Child Table Records**.                                                                                   |

The **Delete Lane** option is always available for freeform and flexible boards. It is available for guided boards only if the lanes are based on a reference field, and only for lanes that contain no cards.

**Task cards**

Visual Task Board task cards can represent a personal task or a record on a table.

You can add task cards, edit task card details, add labels to cards, and access the underlying task record the card represents, depending on the board type.
**Note:** Each board can display up to 2,000 cards by default. When the number of tasks exceeds the maximum, a warning appears and the system determines which cards to show by most recent update time. Administrators can configure a different maximum card limit.

---

### Freeform board tasks

You can add personal task cards directly to lanes on a freeform board. You can also add other kinds of task cards to a freeform board from a list or form.

**Add a personal task to a freeform board**

You can add cards directly to a freeform board lane. These cards are called personal tasks and represent records on the Private Task (vtb_task) table.

**Role required:** none

1. In a lane header, click the lane menu (⋮) and select **Add Task**. Alternatively, click **Add Task** at the bottom of a lane.
   - A new task card appears in the lane.
2. Enter a short description for the new task card.
3. To save the card, click another area of the board or press **Enter**.

**Add a task to a freeform board from a form**

You can add a task card to a freeform board from any table that extends Task. These cards represent records on whichever table you add them from.

**Role required:** none

You can add cards from multiple task tables, such as Incident or Problem, to the same freeform board.

1. Open a task record, such as an incident.
2. Click the menu icon (⋮) or right-click the form header to show the form context menu.
3. Select **Add to Visual Task Board**.
   - A pop-up window appears with a list of freeform task boards.
4. Click the name of the board you want to add the card to. A confirmation message appears.
5. To view the board, click the board name in the confirmation message. The task appears in the first lane by default.

Add a task to a freeform board from a list
You can add a task card to a freeform board from any table that extends Task. These cards represent records on whichever table you add them from.
Role required: none
You can add cards from multiple task tables, such as Incident or Problem, to the same freeform board.
1. Navigate to a list of task records, such as Incident > Open.
2. Perform either of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add one task</td>
<td>Right-click a record and select Add to Visual Task Board</td>
</tr>
<tr>
<td>Add multiple tasks</td>
<td>Select the check box beside each record you want to add and select Add to Visual Task Board from the actions choice list</td>
</tr>
</tbody>
</table>

A pop-up window appears with a list of freeform task boards.
3. Click the name of the board you want to add the card to. A confirmation message appears.
4. To view the board, click the board name in the confirmation message. The task appears in the first lane by default.

Data driven board tasks

You can add a task to a flexible or guided task board. Add a task to a flexible or guided board Cards in a flexible or guided board represent records on whichever table the board is associated with.

Role required: none

1. In a lane header, click the lane menu ( ) and select Add Task. Alternatively, click Add Task at the bottom of a lane.
   A pop-up window appears with a new record. Fields are populated based on any filter conditions for the board and, for guided boards, the lane you add the card to.
   Consider the example of a guided board that shows incidents with the Software category, with a lane for each assignee. If you add a card to the ITIL User lane, the new incident record Category and Assigned to fields are automatically set to Software and ITIL User.

2. Complete the form and click Submit. A new task card appears in the lane.

Edit Visual Task Board card details

Edit the details of the card by clicking a card on a Visual Task Board. A pop-up window appears with additional details of the card.

Role required: none
You can edit various the card details. Updating these values also updates the underlying task record.
Can't log into SAP from my laptop today

Tried to connect to SAP and all I see is a "Connecting..." message but nothing else happens.
2. Click a card on the board. The details for the card appear in a pop-up window.

3. From the card details pop-window, you can:
   - Rename the card by clicking the card title and providing the new name.
   - Modify the short description.
   - Add comments or work notes in the activity stream.
   - Edit the users assignee to tasks.
   - Add a label to the card by clicking one or more of the available labels.
   - Add or edit the Due Date. If the completion of a task exceeds the due date, the date appears in red.

Add an attachment to a task card
You can add an attachment to a record within a task board.

Role required: none

Adding an attachment to a task card also adds the attachment to the underlying task record.
Add attachment

1. Click a card.
2. Click the attachment tab (_attachment).  
3. Click **Add Attachment** and select a file to add as an attachment.  

### Label a task card  
Labels help categorize tasks and visually distinguish them on the task board.  

**Enable** labels for the board.  
Role required: none  
You can filter the visible tasks to show only those with certain labels. Labels appear on cards as colored dots.  

---  
My desk phone does not work  
![Labels]  
INC00000041  
a day ago  

---  

### Task card labels  
You can add one or more labels to a task card.  

Do one of the following actions.  

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Add a label to a card from the quick panel | 1. Drag a label from the quick panel directly to a task card.  
2. Drop the label in the drop zone. |
| Add a label to a card from the card details | 1. Open the card details for a task.  
2. Click the details tab (details).  
3. Under **Labels**, select one or more labels. Point to a label to display its name.  
4. Close the card detail pop-up window. |

You can use configuration options to **rename or disable** labels or to **hide** labels altogether.  

### Assign a task card to a user  
Assignees represent ownership of task cards and the associated records. Each task card can have one primary assignee and multiple additional assignees.
You can filter the visible tasks on a board to show only tasks assigned to a certain user. Assignees appear on cards as avatars.

When a card changes lanes, all the assignees receive an email notification.

For flexible and guided boards, the primary assignee corresponds to the underlying task's **Assigned to** field. For example, on a board created from the Incident table, if you add Joe Employee as the primary assignee for a card, the associated incident is assigned to Joe. Note that assignment rules on the associated table may restrict who you can make the primary assignee of a card. If you attempt to assign a task card to a user in a way that violates an assignment rule, a notification appears and the assignment does not take place.

**Note:** Assignees are not automatically granted access to the board. Only members can access the board.

Do one of the following actions.
### Option: Add an assignee from the quick panel

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Drag a user's avatar from the quick panel directly to the task card.</td>
</tr>
<tr>
<td>2. Drop the avatar in the <strong>Primary</strong> or <strong>Additional</strong> drop zone.</td>
</tr>
</tbody>
</table>

### Option: Add an assignee from the card details

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Open the card details for a task.</td>
</tr>
<tr>
<td>2. Click the assignees tab ( ).</td>
</tr>
<tr>
<td>3. Click <strong>Add Primary Assignee</strong> or <strong>Add Additional Assignee</strong>. The <strong>Add Primary Assignee</strong> option is not available if there is already a primary assignee.</td>
</tr>
<tr>
<td>4. Select a user.</td>
</tr>
<tr>
<td>5. Close the card detail pop-up window.</td>
</tr>
</tbody>
</table>

The system sends an email notification to inform the new assignee of the change.

### Visual Task Board checklists

Checklists help you track the progress of tasks on your Visual Task Board.

Checklists are available as a tab in the card details.
Sample checklist

You can add, remove, or rearrange checklist items. You can also save a checklist as a template for future use on other cards. Any user can create or edit a checklist. When the compact card view is disabled, the task card displays a progress bar to show how many items are complete.
You can also use checklists with task records in the standard interface. For more information, see Checklists.

Create a checklist for a card
You can create a unique checklist for each Visual Task Board card or create a task from a checklist item.

Role required: none

1. Open the card details for a task.
2. Click the checklist tab (✓).
3. Click Add Item.
4. Enter text for the checklist item.
5. Press the Enter key to add the checklist item.
6. Create as many additional checklist items as desired.
7. To delete a checklist item, click the minus (-) icon.
8. To reorder checklist items, click the drag icon (拖动) and drag a checklist item to a different position in the list.
9. To create a task from a checklist item:
   a) Point to a checklist item and click the create task icon (创建任务).
b) Select the type of task you want to create. 
   An administrator can configure which task types are available.
   The new task record appears in a pop-up window. The short description is automatically
   populated with the checklist item text.

c) Fill in the form with additional detail as necessary.

d) Click **Update**.

**Create checklist template**
A template saves time by creating checklist items automatically. You can add, edit, or remove
checklist items without impacting the template.

Role required: none

1. Open the card details for a task.
2. Click the checklist tab (✓).
3. Add items to the checklist that you want to save as part of the template.
4. Click the more icon (๒).
   The more icon does not display unless you have added an item to the checklist, or if you have
   a pre-existing checklist template.
5. Select **Save as Template**.
6. In the dialog box, enter a descriptive template name to identify the checklist.
   When a user creates a checklist from a template, all templates are listed in alphabetical order
   and there is no way to filter which templates appear. To provide a better user experience,
   consider implementing a naming system for checklist templates. For example, include the
   name of the table or another identifier to clarify how the checklist should be used.
7. Click **Save**.

Create a checklist from a checklist template by selecting the template from the more icon.

**Delete a checklist from a card**
You can remove a checklist from a Visual Task Board card.

Role required: none

1. Open a task card that contains a checklist.
2. Click the checklist tab (✓).
3. Click the more icon (๒).
4. Select **Remove Checklist**.
   A confirmation dialog box appears.
5. Click **Delete**.

**Configure which types of tasks can be created from checklist items**
A system property controls which types of tasks you can create from a Visual Task Board checklist
item.

Role required: admin

You might want to add custom tables or remove tables you do not use.

1. Navigate to **sys_properties.list**.
2. Locate the `glide.ui.create_task_type_option_list` property.

3. Edit the `Value` to add or remove tables.

You can add any table that extends Task (task). Use the table name, not the label. For example, you would enter `change_request`, not Change Request. Ensure the tables listed are separated by commas, with no spaces.

The property value populates the task type selection list users choose from when they create a task from a checklist item. Note that users can only see task types for which they have the appropriate access roles.

Archiving a card

Archiving a card is a non-destructive way to remove a card from a freeform board. You can archive cards you are no longer working on to reduce visual clutter.

Role required: none

**Note:** You can only archive cards on a freeform board.

- Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Archive one card from the lane view</strong></td>
<td>1. Point to a card and click the X icon that appears in the corner.</td>
</tr>
<tr>
<td></td>
<td>2. In the confirmation dialog, click <strong>Archive</strong>.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Archive one card from the card details</strong></td>
<td>1. Click a card and view the <strong>Details</strong> tab.</td>
</tr>
<tr>
<td></td>
<td>2. Under <strong>Tools</strong>, click <strong>Archive</strong>.</td>
</tr>
<tr>
<td></td>
<td>3. In the confirmation dialog, click <strong>Confirm</strong>.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| **Archive all the cards in a lane**         | 1. In the lane header, click the more options icon ( ).  
2. Select Archive All Tasks.  
3. In the confirmation dialog, click Archive. |

- To see all archived cards for the current board, from the board navigation panel, open the board information menu ( ) and click View Archived Tasks.
- To restore an archived card, point to it and click Restore.

### Access a task record from a VTB card

You can open the form view of any task card. Viewing a task record on a form allows you to see all fields for that record, including fields that are not visible in the card details.

Role required: none

Access a task record using one of the following options.

- Access the record from the task card by clicking the record number on the task card.
- Access the record from the card details by doing the following:
  a) Open the card details for a task.
  b) Click the record number in the header.

### Move a card to a different lane

You can move a card from one lane to another.

Role required: none

When you move a card to a different lane on a guided board, the field on which the lanes are based is updated to reflect the new lane value.

1. Open a Visual Task Board.  
2. Select a card and drag it to a different lane.  
   To cancel the move, press the Escape key while you drag the card.

**Note:** All mandatory fields on a record must be filled in to move the associated card to a new lane. For example, assume you have a guided board based on the Incident (incident) table, with a lane for each State. The Close code and Close notes fields become mandatory when the State changes to Closed. If you attempt to move an incident card from the New lane to the Closed lane, a pop-up view of the form appears and prompts you to fill in the mandatory fields.

### Move a card to a different board

You can move a card from one freeform board to another.

1. Open the card details.  
2. In the details tab ( ), click Move Card.
3. In the pop-up window that appears, select the board and lane to move the card to. The board selection list displays freeform boards only.

**Task board tools**

The task board tools area in a Visual Task Board contains several tabs, each represented by an icon.

Click an icon to open the tab. Click the same icon again to hide the tab. The tabs you see for each conversation depend on the conversation type and other conditions.

**Conversation tool tabs**

<table>
<thead>
<tr>
<th>Tab icon</th>
<th>Tab name</th>
<th>Description</th>
</tr>
</thead>
</table>
| ![Info icon](image) | Info | Contains the following information about the task board:
  - Board Name
  - Board type
  - Board Owner
  - Number of members
  - Number of assignees
  - Number of lanes
  - Number of tasks
  - Table name
  - Filter conditions (visible on data driven boards only)
  - Lane field (visible to the board owner, on data driven boards only)
  - Swimlane field - To change Swimlane field for the board
  - Due Date field - To change the Due Date field for the board.
  - URL |
| ![Members icon](image) | Members | Lists all members and assignees of the board. You can add or remove board members, promote assignees to be members, and filter the board by member or assignee. |
| ![Labels icon](image) | Labels | Use labels to visually distinguish tasks on the task board. Filter board contents by toggling the label. You need to [enable labels](#) before being able to use this tab. |
| ![Activity icon](image) | Activity | Displays all of the activity for cards on the board. |
## View board information

You can display key information about any task board.

**Role required:** none

<table>
<thead>
<tr>
<th>Tab icon</th>
<th>Tab name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Configuration icon]</td>
<td>Configuration</td>
<td>Configure the settings for the task board. This setting is only available for the board owner. For more information, see Configure a task board.</td>
</tr>
</tbody>
</table>
Board owner’s view of board information

1. Open a task board.
2. Click the board information icon (i).

Add a board as a favorite

Add boards you access frequently to the application navigator using the favorite option.

Role required: none
Adding a board as a favorite is only available in UI16.

1. Navigate to **Self Service > Visual Task Boards**.
2. From the board you want to favorite, select the information icon from the board tools. Then select the star.
3. Remove the board as a favorite by clearing the star icon.

View a task board in a list
You can view a task board in the list view using the board information option.
Role required: none
1. Open a task board.
2. From the task board tools, click the board information icon (i).
3. Click **View List** at the bottom of the information panel.
The cards from the board open in the list view.

**Note:** The freeform board list view only shows cards made by the board and no other tasks that might be added manually.

Add or remove a task board member
You can add and remove task board members using the members tab of the activity stream. You can also promote assignees to board members.
Role required: none
Only members of a task board can access the board. Any board member can add or remove other members.
1. On a Visual Task Board, open the task board tools.
2. Click the members tab.

3. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a member</td>
<td>1. In the <strong>Users</strong> section, click <strong>Add Members</strong>.</td>
</tr>
<tr>
<td></td>
<td>2. Enter a user's name or select a user from the drop-down menu.</td>
</tr>
<tr>
<td>Remove a member</td>
<td>1. In the <strong>Members</strong> section, point to a user.</td>
</tr>
<tr>
<td></td>
<td>2. Click the remove icon (−).</td>
</tr>
<tr>
<td>Promote an assignee to a member</td>
<td>1. In the <strong>Assignees</strong> section, point to a user.</td>
</tr>
<tr>
<td></td>
<td>2. Click the upward arrow icon.</td>
</tr>
<tr>
<td>Promote all assignees to members</td>
<td>In the <strong>Assignees</strong> section, click <strong>Promote All</strong>.</td>
</tr>
</tbody>
</table>
Visual Task Board SLA indicators

SLA (service level agreement) indicators alert board members if any cards on the board have breached SLAs.

When SLA indicators are enabled, a status bar appears on each card that has an associated SLA. If any cards have breached SLAs, an alert appears at the top of the board and a filter option appears in the quick panel. The indicator displays the elapsed percentage of the SLA. If there are multiple SLAs associated with a task card, the indicator displays the status of the SLA with the greatest elapsed percentage.
Visual Task Board with SLA indicators enabled
Any board member can enable SLA indicators from the board configuration menu. The setting applies to the current user only.

**Share a Visual Task Board in a Connect conversation**

You can share a Visual Task Board in a Connect Chat or Connect Support conversation.

Role required: none

1. Navigate to **Self-Service > Visual Task Boards**.
2. Drag a task board to a Connect mini window.
   - A link to the task board appears in the conversation. The task board is also listed in the conversation tools, which are visible in the Connect workspace. Only conversation members who are members of the board can access it. If you share a task board in a record conversation, it appears as a URL in the record activity stream.

**Create a Connect conversation from a Visual Task Board**

Create a Connect Chat conversation from a Visual Task Board to collaborate with board members and keep track of activity as it happens.

Role required: none

When you create a conversation from a task board, all the board members become members of the conversation. The members are synchronized between the task board and the conversation. For example, if you remove a user from the conversation, the system automatically removes the user from the board as well.

1. Navigate to **Self-Service > Visual Task Boards**.
2. Open a task board.
3. In the board header, click the connect with board members icon ( ).
   - The system automatically opens a record conversation for the board. Each board member becomes a member of the conversation.

**Visual Task Board accessibility**

Several accessibility improvements are included in Visual Task Boards.

**Skip links**

Skip links allow you to tab directly to the main content on a page. When accessibility mode is enabled, task boards include a skip link to view tasks as a list. The View tasks as a list skip link switches all the task cards to the table view. For more information on viewing task boards in a list view, see View a task board in a list.

**View card details**

With accessibility mode enabled, visual indicators appear on task cards that users can tab to in order to open card details. For more information, see View card details in a task board.

**View card details in a task board**

With accessibility mode enabled, tab through cards in a task board. Use the card details button to view task card details.
Enable accessibility from the General tab of the system settings menu.

Role required: none

1. Navigate to **Self-Service > Visual Task Boards**.
2. Open an existing task board.
3. Press the Tab key to navigate through the board to get to a task card.
4. Press the Tab key to navigate through the card until the Open Card Details button appears.

5. Press **Enter** to open the card.
6. To exit the card, press **Escape**.

**Configure a task board**

You can configure several options to customize the look and feel of the board.

Role required: none

1. From the task board tools, click the menu icon.
2. Click **Advanced Settings**. In the **Theme** section, select a color from the palette. The selected theme is applied to the background of the board, lane header, add card button, quick filter, tab header, quick panel and board header. It also appears as the color for the board on the My Task Boards page. This setting applies to the user’s boards only.
In the Quick Panel section, toggle the options to customize the quick panel.

**Note:** Unless otherwise noted, these settings apply to the current user only.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Panel</td>
<td>Quick panel is visible on the board.</td>
</tr>
<tr>
<td>User Names</td>
<td>User names appear next to user avatars in the quick panel.</td>
</tr>
</tbody>
</table>
### ServiceNow New York Now Platform Capabilities

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Labels</td>
<td>Labels appear on cards and in the quick panel. This setting applies to all users.</td>
</tr>
<tr>
<td>Label Names</td>
<td>The label name appears beside the colored icon for that label in the quick panel. This setting is available only when Show Labels is enabled.</td>
</tr>
</tbody>
</table>

When all the options are enabled, a quick panel looks like this:

#### View options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compact Cards</td>
<td>Decreases the lane width and card information. Thumbnail images do not appear on the card.</td>
</tr>
<tr>
<td>Show Card Info</td>
<td>Displays card information on each card. Card information typically includes details like the task state, date opened, and last user to update it. This setting is available only when Compact Cards is disabled.</td>
</tr>
<tr>
<td>Show Card Attachment</td>
<td>Cards display the first image attached to that card as a thumbnail. This setting is available only when Compact Cards is disabled.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Show SLAs</td>
<td>SLA status indicators appear on cards and alerts appear when one or more card has a breached SLA. SLA status indicators are hidden when Compact Cards is enabled. This setting is available only when SLAs are associated with the tasks on the board.</td>
</tr>
</tbody>
</table>

5. Under Advanced Settings, in the **Lane Configuration** section, show or hide lanes by selecting or clearing the check box for each lane. Rearrange lanes by dragging and dropping them in the list.

### Configure Visual Task Boards labels

Labels help categorize tasks and visually distinguish them on the task board. You can disable or rename labels using the labels tab of the activity stream.

**Role required:** none

Every board will have seven labels by default.

---

Any board member can edit the labels on a board. All the labels are visible on the **Quick Panel** under **Labels**

1. From the task board tools, click the **Labels** tab.
2. Turn on the **Show Labels** button if it is turned off. You can see seven default labels.

- Users with global_tags_creator role can add more labels to the board and rename the label.

To add labels, click **Add Labels**. Newly added label remains in off state by default. You can assign any color or no color to the label. To rename the label, click the label text and enter new value.

To change the color of the label, click the **Select color** icon beside the label. Select the color of your choice from the color picker and click **Save**.

- To disable or enable a specific label, toggle the button next to the label. To turn on or turn off a specific label, toggle the button next to the label. Only turned on labels show up in the quick filter and can be applied to a card.

- Board owner can delete the label by clicking **Delete Label** icon next to the label.
To filter the cards by labels, type the Label name in the Search bar or click Add to Filter icon against the label. Once you filter by the label, you can only see cards with that label.

**Labels on Card Details Page**
When user clicks the card, the card opens with the details of the card. It contains all the applied labels under Details tab.

Under the Labels tab, the toggle button for applied labels is On and Off for the labels that are not applied.
Configure Visual Task Boards with swimlanes

Swimlanes enable you to create an environment with horizontal lanes in addition to vertical lanes. Swimlanes use only compact cards in the task board.

Role required: none

You can add swimlanes in the following types of the visual task board.

- Freeform Board
- Flexible Board
- Guided Board

You can perform following activities when you choose swimlanes in Visual Task Boards.

- Name and rename the swimlanes as per your choice.
- Move the tasks horizontally and vertically as needed from one user to another.
- Drag the cards across swimlanes.
- Reorder swimlanes as per choice by dragging them or from Lane Configuration.
· Collapse and expand swimlanes as per your choice.

1. Navigate to **System Definition > Self-service > Visual Task Boards**.
2. Click **New** and select the board type.
   - Freeform Board
   - Data Driven Board
3. Configure swimlanes in the boards as follows:
   a) In a freeform board, activate the swimlanes by sliding the swimlanes toggle in the **Info** tab to the right.

   The following figure shows a sample freeform board created with swimlanes.
b) To enable swimlanes in a Data Driven Flexible board, select **None** in **Vertical Lane Field** from the drop-down.

c) Click **Next** and slide the toggle under the **Info** tab to the right.

The following figure shows a data driven flexible board created with swimlanes.
d) To enable swimlanes in a data drivenguided board, select **Vertical Lane Field** and **Swimlane Field** while creating the board. You can also add swimlanes to the existing guided board by selecting **Swimlane Field** under **Info** tab in the board.
The following figure shows a data driven guided board with swimlanes.
Modify the query or lane field for an existing board

For flexible and guided boards, you can edit the board query or lane field. This ability enables you to change the board contents while preserving the member list, board configuration settings, and, if applicable, Connect Chat conversation history.

Inform the board members that you plan to change the board query or lane field. If you or any members have manually sorted cards within a lane, the order may be reset.

Role required: none but you must be the board owner

The board query consists of filter conditions that determine which tasks the board tracks. For example, you might edit the query so the board shows only active incidents, rather than all incidents.

The lane field is the field on the underlying table that defines the lanes. For example, you might change the lane field so the lanes represent incident states, rather than assignees. This change is called a lane field pivot. Lane field pivots also make it possible to convert a flexible board to a guided board or vice versa.

1. Open a task board.
2. Click the board information icon (i) by the board name.
3. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Edit the board query** | 1. Under Board Filter, click **Edit Filter** to open the condition builder.  
2. Add and remove conditions as needed to edit the query.  
3. Click **Save**. |

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Change the lane field** | 1. Click the **Lane Field** picker and select a field or the **None** option.  
Guided boards have the **Lane Field** set to a field, such as **State**. Flexible boards have the **Lane Field** set to **None**. You can change the **Lane Field** value accordingly to change the board type.  
2. In the confirmation dialog, click **OK**. |

The board reloads to reflect the changes.

Configure WIP Lane Limit

You can set a limit to the number of cards added to a lane. If the limit is not set, any number of cards can be added to a lane by default.

Role required: admin

1. Open the Visual Task Board.
2. Click on the lane header.
3. Select **Set Lane Limit**. **Set Lane Limit for <name of the lane>** window appears.
4. Enter the number you want to set for the specific lane. Leave blank, if you want set no limit to the lane.
5. Click **Save**.

The number appears on the lane header.

If the number of cards exceeds the set limit, the Red symbol appears on the lane header for all the board members.

If a card is moved to a lane with exceeded WIP lane limit, the error message appears on the top of the page. The member who moves a card to the lane with exceeded limit can view the error message.

### Configure the card limit for Visual Task boards

Freeform and Data Driven boards can display up to 2,000 cards by default. You can change the default card limit by adding a property.

**Role required:** admin

You can set card limit for both Freeform board and Flexible and Guided board in Data Driven board.

1. **Add a new system property** with the following field values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.vtb.board_max</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
</tbody>
</table>

2. Set the **Value** to the maximum number of cards allowed for each board.

   **Note:** Performance degradation may occur if you set the **Value** to a number greater than 1,000, especially on tablet devices.

### Configure the task board card view

Configure the fields that appear in a card on a task board.

**Role required:** admin

1. Navigate to the form you want to configure fields for.
2. Right-click the header and select **Configure > Form Layout**.
3. Under the Form View section, select the VTB view.

   You may need to create a VTB view for the form. For more information, see [Create and delete views](#).
4. Select the fields to appear on the card by adding or removing the fields from the **Selected** column. You can also adjust the order they appear on the form by moving the fields up or down.

**Workflow**

Workflow provides a drag-and-drop interface for automating multi-step processes across the platform. Each workflow consists of a sequence of **activities**, such as generating records, notifying users of pending approvals, or running scripts. The graphical Workflow Editor represents workflows visually as a type of flowchart. It shows activities as boxes labeled with information about that activity and transitions from one activity to the next as lines connecting the boxes.

### Getting started with workflows

The graphical Workflow Editor provides a drag-and-drop interface for automating multi-step processes across the platform.

### Parts of a workflow

Workflows consist of these parts.

#### Properties
Specify configuration settings such as the workflow name, the table whose records the workflow acts on, and the conditions under which to run it.

#### Activities
Specify the sequence of operations the workflow performs such as generating records, notifying users of pending approvals, or running scripts.

#### Transitions
Specify the conditions under which to run an activity.

#### Exit conditions
Specify the conditions under which to run a transition.
Contexts
Store historical runtime information about a specific workflow run in a Workflow Context record.

Versions
Store historical design information about a specific workflow in a Workflow version record.

Workflow life cycle

A workflow starts when a triggering event occurs. Common triggers include a record being inserted into a specific table, or a particular field in a table being set to a specified value. For example, you might create a workflow that runs whenever a user requests approval for an item they want to order from the catalog. You can also schedule workflows to run periodically or call them from scripts such as business rules.

When an activity completes, the workflow transitions to the next activity. An activity might have several different possible transitions to various activities, depending on the outcome of the activity. Continuing the example above, if the user's request is approved, the activity might transition to an activity that notifies someone to order the item. If the user's request is denied, the activity might transition to notifying the user that their request has been denied.

The graphical Workflow Editor represents workflows visually as a type of flowchart. It shows activities as boxes labelled with information about that activity and transitions from one activity to the next as lines connecting the boxes.

At each step in a workflow:
1. An activity is processed and an action defined by that activity occurs.
2. At the completion of an action by an activity, the workflow checks the activity's conditions.
3. For each matching condition, the workflow follows the transition to the next activity.

When the workflow runs out of activities, the workflow is complete. The Workflow Context stores the execution history of the activities and transitions run. The Workflow Version stores the design history of the activities, transitions, and exit conditions available to run.

Workflow properties

The workflow properties specify when to run a workflow and what records it acts on. For more information about workflow properties, see Workflow properties.

Workflow activities

A workflow activity contains instructions that are processed by the workflow.

Activities can include running scripts, manipulating records, waiting for a set period of time, or logging an event. Workflow conditions determine whether or not the activity is performed. Activities can be added, removed, or rearranged. Transitions can be drawn between activities.

This is an activity that triggers a notification:
Workflow runs activities as the user session that starts them. Workflows started from record operations will run activities as the user session that performed the record operation. Workflows started from schedules or restarted from timers run activities as the System user. Workflows started from script calls run activities as the user session that started the script.

For more information on available activities and their behaviors, see Workflow activities.

Transitions

After the workflow condition is evaluated, the workflow transition determines which activity is performed when the workflow condition is met.

This is a transition that always leads from the Change Approved script to the Change Task activity:

Sample activity

Sample transition

Exit conditions

After a workflow activity is performed, the workflow condition is evaluated to determine which transition is activated.

The condition determines behavior based on a change being approved or rejected:
Sample exit conditions

Workflow example

During workflow editing or while an unpublished workflow is running, only the person who checked out the workflow can view the changes.

After a workflow is published, it is available to other users. The workflow moves through the process as defined in the Workflow Editor. The entire workflow is represented in one screen. For example, this is the Standard Change workflow:
Workflow editor

The Workflow Editor is an interface for creating and modifying workflows by arranging and connecting activities to drive processes.

You can manage multiple workflows in the same screen, create custom workflow activities, and use existing activities as data sources. Users with the workflow_creator role can create workflows. Users with the workflow_admin role can create, modify, delete, and publish workflows.

To open the Workflow Editor, navigate to Workflow > Workflow Editor. For information about using the editor, see Create a workflow.
Welcome screen

The editor opens with the Welcome page, which displays a list of active, published workflows. From this tab, you can open existing workflows, create new workflows, and open help resources related to workflow.

New Workflow button
Click to create a new workflow

Palette tabs
Workflows: Workflow activities and workflows you can use as subflows.
Core: Available workflow activities appropriate for the selected workflow. Contents can include activities provided by the base system and those purchased with orchestration.
Packs: Orchestration activity packs downloaded from the ServiceNow® App Store, organized by vendor and scope. Custom activities and workflows that you scope also appear as packs. Only visible if the orchestration plugin is installed.
Custom: Orchestration custom activities available. Only visible if the orchestration plugin is installed.
Data: Activities in the current workflow that output data. You can use these activities as data sources for other activities. Only visible if the orchestration plugin is installed.

Note: If your workflow welcome page does not look like this example, you may have customized the workflow welcome page before upgrading to New York. You can update the workflow welcome page to the latest version by editing the UI pages.

Navigate to System UI > UI Pages > Workflow Editor welcome. In the UI page record for workflow_editor_welcome, scroll to the Versions related list. Select the row for the version corresponding to the upgrade to New York, right-click and select Revert to this version.

Workflow canvas
After you open or create a new workflow, the system displays the workflow canvas. On the canvas you interact with the Workflow Editor through several different elements: the canvas itself, the canvas tabs, the title bar, the palette, and the palette tabs.

The drawing canvas is where you add activities and configure transitions for checked out workflows. Add an activity by dragging it from the palette to the workflow in the canvas. For more information, see Create a workflow.

- Canvas tabs: Contains tabs for accessing workflows being edited or created.
- Title bar: Displays the workflow name and status. Provides a menu and controls for configuring, testing, and validating workflows.
- Canvas: Provides the working surface for creating new workflows or editing existing ones.
- Palette tabs: Contains tabs for accessing activities being edited or created.
- **Palette**: Contains all available workflow activities and existing workflows you can use as subflows. Drag activities and subflows to the canvas to create new workflows or edit existing ones.

**Workflow user interface**

**Workflow palette**

The default workflow palette contains workflow activities and existing workflows you can use as subflows.

The basic workflow palette contains these tabs:

- **Workflows**: Displays existing workflows and provides controls for creating new ones.
- **Core**: Displays baseline workflow activities available to all systems and Orchestration activities (when Orchestration is activated).

**Workflows tab**

The **Workflows** tab lists existing workflows that you can edit or use as subflows in other workflows. Double-click a workflow to open it in the canvas. To add a workflow as a subflow, drag it to another workflow in the canvas. Click the + icon to create a new workflow.

**Core tab**

The **Core** tab contains the standard activities available by default to all workflows and any activities purchased with Orchestration, organized by category. Click the arrow icons to expand or collapse the activity lists under each category. To add an activity to a workflow, drag it to the canvas. For more information, see [Add an activity to a workflow](#).
Workflow editor title bar

When a workflow is opened in the canvas, the title bar displays the workflow title and the workflow status in italics. Possible states are Checked out by <name> and Published.
Workflow editor title bar

Controls on the right side of the title bar manage the workflow.

- **Workflow Properties**: Opens the current workflow's properties form.
- **Start**: Runs the workflow. This control is only available for workflows running on the Global table that are accessible from all application scopes. To test workflows that are on other tables, insert a record into that table that meets the condition of the workflow.
- **Validate**: Tests the workflow prior to publication. Validation detects potential problems that can prevent the workflow from publishing or cause the workflow to fail. For more information, see [Workflow Validation](#).
- **Help**: Opens documentation to help you create the workflow.

Workflow menu

Click the menu icon in the title bar for additional options to configure the workflow.
Accessing the workflow menu

These menu options are available:

<table>

<td>Edit Stages</td>
<td>Opens the Workflow Stages list. For more information, see Workflow stages. For tables with a column of Type = Workflow.</td>
</tr>
</tbody>
</table>

**Workflow editor keyboard navigation**

The platform includes accessibility features that support Web Content Accessibility Guidelines (WCAG) 2.0 level A and make the interface accessible to users with disabilities.

These features improve the user experience when accessing platform functions with screen readers and keyboard navigation. In general, you use the following set of standard keyboard navigation functions:

- **Press Tab** to navigate major groupings in a pre-defined sequence. This usually includes moving between standard interface controls (fields and lists) in a module, or between records within a tab.

  Press **Shift Tab** to move backwards in a pre-defined sequence.

- **Use arrow keys (left, right, up, down)** to navigate between individual elements within a group. This usually includes moving between tabs, or between available selections within a specific control (for example, within a list).

- **Press Enter** to select a control or tab, or enter text within a control.
The Workflow Editor is constructed in a unique manner. It includes a series of main (left) panel tabs, a series of side (right) panel tabs, and a drawing canvas for workflow creation or editing. As such, it has its own unique set of keyboard accessibility functions and commands.

**Welcome page keyboard commands**

Use keyboard commands to navigate and operate the Workflow Editor Welcome page.

### Workflow drawing canvas keyboard commands

Use keyboard commands to navigate and operate the Workflow Editor canvas.

<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a core activity to a checked out workflow in the Workflow drawing canvas</td>
<td>If a checked out workflow is open in the Workflow drawing canvas, core activity records display in the <strong>Core</strong> tab. To select a core activity and place it in the checked out workflow:</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Core activity records only display when a checked out workflow is open in the Workflow drawing canvas. Other tabs display in the side panel only if Orchestration functions are enabled.</td>
</tr>
<tr>
<td>1. In the Workflow drawing canvas, press <strong>Shift Tab</strong> until <strong>Skip to Workflow Side Panel</strong> appears in the upper left corner.</td>
<td></td>
</tr>
<tr>
<td>2. Press <strong>Enter</strong> to position the cursor in the <strong>Workflows</strong> tab in the side panel.</td>
<td></td>
</tr>
<tr>
<td>3. Press the right arrow key to navigate to the <strong>Core</strong> tab.</td>
<td></td>
</tr>
<tr>
<td>4. Press <strong>Tab</strong> or the down arrow key to navigate down the listing of core activities.</td>
<td>- To open a core activities folder (for example, Approvals), press the right arrow key.</td>
</tr>
<tr>
<td></td>
<td>- To navigate up the list, press the left or up arrow keys.</td>
</tr>
<tr>
<td>5. Press <strong>Tab</strong> to select a core activity and open the New Activity dialog to specify properties for it.</td>
<td></td>
</tr>
<tr>
<td>6. After creating the activity, remember to link it to another activity in the workflow.</td>
<td>See Create a connection from a condition on one activity to the next activity that follows in <em>Workflow drawing canvas keyboard commands</em>.</td>
</tr>
</tbody>
</table>
Select Workflow Actions menu command (for example, *Validate Workflow* or *Publish Workflow*)

1. Press *Tab* until the context menu ( ) is highlighted.
2. Press *Enter* to open the context menu.
3. Use the down arrow key to move to the command, then press *Enter* to select it.
<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
</table>
| Set general workflow properties      | 1. Press Tab until ![info_icon] is highlighted.  
2. Press Enter to open Workflow Properties.  |
| Navigate from activity box to activity box. | Simply press Tab or use the arrow keys (right, left, up and down) to navigate from activity to activity within the workflow. Note: Depending on the complexity and number of activity boxes in the workflow, the sequence of navigation is not always predictable. Depending on how you are navigating within the workflow, the navigation sequence is generally (but not always) row-by-row, and focus is usually placed on the nearest activity box. |
| Modify a selected activity.          | 1. Navigate to the activity box, then press Enter to select it and place it in Edit mode. When you select an activity box, it appears as highlighted.  
2. Once in Edit mode, use Tab to move around within the activity box to change or access elements such as:  
   - Activity Properties (✓)  
   - Title  
   - Node context menu  
   - Delete Node (✗)  
   - Condition Properties  
   - Node conditional context menu (คำถาม)  
   - Node conditional port options (๑)  
   Note: All elements in a selected activity are only accessible when working with a checked out workflow. When working with a published workflow, you can only access its activity properties and title.  
3. Press Enter to select an element, or press Esc to escape an element without making changes. |
<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
</table>
| Add a condition to an activity.                         | 1. Within an activity box, select **Always** to access **Condition Properties**.  
2. In **Condition Properties**, specify the conditions for the activity. |
| Create a connection from a condition on one activity to the next activity that follows | 1. Within an activity box, select **Node conditional context menu** ( ).  
2. Select **Link to...** to create a connection to the next activity box that follows, or select **Delete** to delete an existing connection. |
| Add a core or custom activity                           | 1. Within an activity box, select **Node conditional port options** ( ).  
2. Select **Add Core Activity** to access Workflow Activity Definitions to add a new core activity, or select **Add Custom Activity** to add a custom activity to the workflow. |
| Move an activity box                                    | 1. Press **Tab** to navigate to the activity box, enter press **Enter** to select it.  
2. Use the arrow keys to move the activity box. To move the activity box one pixel at a time, press **Shift** while using the arrow keys. |
| Validate a workflow                                     | 1. Press **Tab** until **✓** is highlighted.  
2. Press **Enter** to validate the workflow.  
You can also select **Validate** from the Workflow Actions menu. |
| Run a workflow                                           | 1. Press **Tab** until **✓** is highlighted.  
2. Press **Enter** to run the workflow.  
**Note:** If the workflow is tied to a database table, this function is disabled. The workflow runs when the proper table conditions are activated (for example, insertion of a new record into the table). |
<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
</table>
| Close workflow drawing canvas| 1. Press **Tab** until (on the right side of the tab that contains the name of the workflow) appears.  
2. Press **Enter** to close the canvas. |
| Publish a workflow           | 1. Press **Tab** until the context menu ( ) is highlighted.  
2. Press **Enter** to open the context menu.  
3. Use the down arrow key to move to the **Publish** command, then press **Enter** to select it. |
| Jump to Top                  | After tabbing through the entire workflow, appears at the bottom of the listing. Press **Enter** to jump to the top of the Workflow drawing canvas. |

**Workflow management**

Create, edit, validate, and publish workflows to automate multi-step processes across the platform. Understand workflow activities and variables and how to use them effectively. Take a deeper look at how workflows are constructed, validated, and used.

**Create a workflow**

Automate a multi-step process by creating a workflow with the Workflow Editor.

- You must have the workflow_admin or workflow_creator role to use the Workflow Editor.
- If you are designing the workflow as part of an update set process, see *Workflow movement with update sets* before creating the workflow.

1. Navigate to **Workflow > Workflow Editor**.  
The **Welcome** tab of the Workflow Editor opens.  
2. On the **Workflows** tab in the palette, click **New Workflow**.

</tbody>
</table>
A simplified version of the New Workflow form opens.

3. Fill in the Name and Table fields
4. (Optional) Add a Description.
5. (Optional) Do one of the following:
   a) If the Conditions UI section is displayed, specify a Condition if needed and edit the fields. (The Conditions UI section shows only if the selected table supports conditions for launching workflows. For example, if you select the sc_req_item table, conditions are not applicable and the Conditions UI section is not displayed.)
   b) If the Stages UI section is displayed, check that the State rendering and Stage order fields contain the correct information. (The Stages UI section shows only if the selected table supports stages. For example, if you select the sc_req_item table, the Stages UI section is displayed.)

6. Click Submit.

The new workflow is created with the Begin and End activities connected by a single transition.

7. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
   For more information, see Work on workflows.

8. To change advanced settings for the workflow, click the Properties icon i. If you make changes, click Update.

Workflow properties

In the properties of a workflow, you can configure settings such as its application scope, start conditions, schedule, inputs, stages, and run time metrics. You can also view information such as the workflow author, version, and history.

When you create a new workflow, the following fields are available in the dialog box:

- Name
- Table
- Description
- If condition matches
- Condition
If you click **Diagrammer view**, in **Related Lists**, the following UI sections are available in the dialog box:

- General
- Conditions
- Inputs
- Activities
- Application
- Schedule
- Stages
- Estimated Runtime

### General

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A name to identify the workflow.</td>
</tr>
<tr>
<td>Table</td>
<td>The table for the workflow to run on. Workflows that run on specific tables can still interact with other tables. Select <strong>Global (global)</strong> to run the workflow on all tables.</td>
</tr>
</tbody>
</table>

**Note:** The list shows only tables and database views that are in the same scope as the workflow. Also, all users who edit the workflow must have access to the necessary tables and domains.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Checked out</td>
<td><em>(Read-only)</em> When the workflow was checked out. Automatically set by the <strong>Checkout</strong> action in the workflow menu.</td>
</tr>
<tr>
<td>Checked out by</td>
<td><em>(Read-only)</em> The user who has this workflow checked out. This value is automatically set by the <strong>Checkout</strong> action in the workflow menu.</td>
</tr>
<tr>
<td>Published</td>
<td><em>(Read-only)</em> Check box to indicate whether the workflow has been published. Automatically set by the <strong>Publish</strong> action in the workflow menu.</td>
</tr>
<tr>
<td>Description</td>
<td>The purpose of the workflow.</td>
</tr>
</tbody>
</table>

### Conditions

Create conditions to trigger the workflow. The Conditions section does not appear if you select a table, such as `sc_req_item`, that does not require a condition.
### Field | Description
--- | ---
If condition matches | When the condition evaluates to true, the workflow launches an active context:
- **None**: The workflow is not automatically started by the workflow engine. To run this workflow, write a script to start the workflow.
- **Run the Workflow**: The default value. The workflow engine starts the workflow if the information in the **Condition** field matches a record that is inserting into the table.
- **Run if no other workflows match yet (deprecated)**: The workflow only runs if no other workflows are running on the execution thread that started this workflow. Avoid using.
- **Run if no other workflows matched**: The workflow only runs if no other workflows are running on a specific record. For example, there are four workflows inserted into the Incident table, which have a condition such as `short_desc` contains `test`. A new workflow, which has **If condition matches** is set to **Run if no other workflows match yet**, only runs if none of the four workflows have started running on the Incident record.

#### Inputs

The Inputs section lists all the activities in the current workflow that input data, the data type, and the default value. The Inputs section is only available after a workflow has been created. To create a variable, click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Displayed column label. Localized depending on user locale.</td>
</tr>
<tr>
<td>Reference</td>
<td>Input field from another table.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type. For example, integer or string.</td>
</tr>
<tr>
<td>Default value</td>
<td>Value used if you do not provide a value.</td>
</tr>
</tbody>
</table>

### Activities

The Activities section enables you to set activity pinning and maximum activity count.
### Activity pinning

List of options that control updates to custom activities at the workflow level. Pinning protects custom activities from being updated automatically when downloaded from the ServiceNow Store. For more information, see [Workflow activity pinning](#). The possible options are:

- **Set by activity**: Allows all activities in the workflow to use their own pinning settings. This is the default pinning option.
- **Pin all activities**: Pins all activities in the workflow to their current version.
- **Unpin all activities**: Allows all activities in the workflow to be updated.

### Max activity count

The maximum number of activities performed by the workflow. This value is used to prevent infinite loops and is set to 100 by default. When the stated maximum count is reached, the workflow is canceled. If this field is blank, the maximum count is set to -1, and the workflow is canceled.

### Application

The Application section enables you to see application scope and scope restrictions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>(Read-only) Scope of this activity. For more information, see Application Scope.</td>
</tr>
</tbody>
</table>
| Accessible from | Scope restrictions for this workflow. Possible settings are:  
- **All application scopes**: Workflow is accessible to all application scopes.  
- **This application scope only**: Workflow access is limited to the scope named in the Application field.  
For more information see [Workflow scope](#). |

### Schedule

Use the Schedule section to create a schedule for this workflow using the schedule builder.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delivery based on</td>
<td>The schedule type for this workflow. Possible types are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>User-specified duration</strong>: Duration based on a user-specified value.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Relative duration</strong>: Duration calculated from a preconfigured schedule,</td>
</tr>
<tr>
<td></td>
<td>such as 8-5 weekdays.</td>
</tr>
<tr>
<td>Expected time</td>
<td>User-defined interval. This field is visible when the schedule type is</td>
</tr>
<tr>
<td></td>
<td><strong>User-specified duration</strong>.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Preconfigured schedule that determines when this workflow runs.</td>
</tr>
<tr>
<td>Timezone</td>
<td>Time zone for this instance.</td>
</tr>
</tbody>
</table>

### Stages

The Stages section appears if you select a table with **Type = Workflow**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stage</td>
<td>Displays the workflow stage progress on the selected table. Optionally, select</td>
</tr>
<tr>
<td></td>
<td><strong>Stage rendering</strong> and <strong>Stage orders</strong> schemes to customize the</td>
</tr>
<tr>
<td></td>
<td>appearance of the stage field. The default values cover typical scenarios.</td>
</tr>
<tr>
<td>Stage rendering</td>
<td>The renderer to use when displaying stage icons on a form or list view. For</td>
</tr>
<tr>
<td></td>
<td>more information about renderers, see <a href="#">Workflow stage renderers</a>.</td>
</tr>
<tr>
<td>Stage order</td>
<td>The order of workflow stages when you view a workflow field in a list. Select</td>
</tr>
<tr>
<td></td>
<td><strong>Computed</strong> to let the workflow engine compute the stage order from the</td>
</tr>
<tr>
<td></td>
<td>order of execution in the workflow. Select <strong>User Specified</strong> to use the</td>
</tr>
<tr>
<td></td>
<td><strong>Order</strong> field from that <a href="#">Workflow stages</a>.</td>
</tr>
<tr>
<td>Name</td>
<td>The name of the stage as it appears in workflow fields.</td>
</tr>
<tr>
<td>Duration</td>
<td>Time allocated for the specific stage.</td>
</tr>
<tr>
<td>Order</td>
<td>The order of workflow stages when you view a workflow field in a list. Select</td>
</tr>
<tr>
<td></td>
<td><strong>Computed</strong> to let the workflow engine compute the stage order from the</td>
</tr>
<tr>
<td></td>
<td>order of execution in the workflow. Select <strong>User Specified</strong> to use the</td>
</tr>
<tr>
<td></td>
<td><strong>Order</strong> field from that <a href="#">Workflow stages</a>.</td>
</tr>
<tr>
<td>Value</td>
<td>The value of the stage when it is referenced from elsewhere in the system,</td>
</tr>
<tr>
<td></td>
<td>such as in a script.</td>
</tr>
</tbody>
</table>
Estimated Runtime

The Estimated Runtime section opens the controls for configuring the ERT for the workflow. Core workflows included in the base system are not configured for estimated run time by default. All new workflows are configured with default ERT values automatically. You can edit existing run time estimates or configure new ones for any existing workflow. For details about how estimated run times are configured and calculated, see Workflow run time metrics.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requires ERT</td>
<td>Check box to indicate that this workflow requires an estimated runtime configuration.</td>
</tr>
<tr>
<td></td>
<td>You can use the ERT calculations to determine if workflows are running longer or shorter than expected and to identify errors in workflow processing. By default, new workflows require an ERT.</td>
</tr>
<tr>
<td>Estimated Run Time</td>
<td>The initial estimate for the workflow’s run time.</td>
</tr>
<tr>
<td>Number of data points</td>
<td>(Read only) The number of times the system has compared the estimated run time to an actual run time result.</td>
</tr>
<tr>
<td>Outlier Percentage Threshold for ERT</td>
<td>(Required) The percentage deviation from the estimated run time that identifies an outlier workflow run time. The system uses a default value of 20. For more information, see Outlying workflow run times.</td>
</tr>
</tbody>
</table>

Create a workflow from a table

Automate a multi-step process by creating a workflow from the list view of any table that supports workflows.

- If you are designing the workflow as part of an update set process, see Workflow movement with update sets before creating the workflow.

1. Open a table, such as Incident or Problem, in list view. For example, navigate to Incident > Open.
2. Right-click in the column header and select Configure > Workflows.
The **Workflow Versions** on that table appear in a list.

3. **Click New.**
   The **Workflow Version** opens in **New Workflow** view. The **Table** field is filled in with the table you selected in step 1 and is read-only.

4. **Enter Name.**
5. (Optional) **Enter Description.**
6. (Optional) **Edit conditions fields as necessary.**
7. **Click Submit.**
   The new workflow is added to the **Workflow Versions** list.
8. **Click the workflow Name.**
   The new workflow is created with the **Begin** and **End** activities connected by a single transition.
9. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users. For more information, see *Work on workflows*.

10. (Optional) To change advanced settings for the workflow, click the **Properties** icon. If you make changes, click **Update**.

---

**Create a workflow for a new service catalog item**

When you create a new service catalog item, you can create a new corresponding workflow at the same time.

- If you are designing the workflow as part of an update set process, see *Workflow movement with update sets* before creating the workflow.

1. Navigate to **Service Catalog > Catalog Definitions > Maintain Items**.
2. At the top of the form, next to **Catalog Items**, click **New**.

   ![New button](image)

   The Catalog Item form opens.

3. Add a **Name**.
4. Next to the **Workflow** field, click the lookup icon .
5. Next to Workflow at the top, click **New**.
The Workflow version dialog opens in the New Workflow View. The Table field is set to Requested Item (sc_req_item) and is read-only.

6. Add a Name.

7. (Optional) Add a Description.

8. (Optional) Change the stage information as necessary.

9. Click Submit.
The new workflow is created with the **Begin** and **End** activities connected by a single transition.

10. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
    For more information, see *Work on workflows*.
11. To change advanced settings for the workflow, click the **Properties** icon.
12. Click **Update**.
    If you close the Workflow Editor, you can see the Catalog Item record. Note that the workflow is added to the Workflow field. The Show Workflow and Information icons appear next to the **Workflow** field. Hover over the information icon to view a read-only summary of the workflow.

### Create a workflow for an SLA Definition

Automate a multi-step process by creating a workflow from an SLA definition.

- If you are designing the workflow as part of an update set process, see *Workflow movement with update sets* before creating the workflow.

1. Open a list of SLA definitions. For example **Facilities > SLA Definitions** or **Service Level Management > SLA Definitions**.
2. At the top of the form, next to **SLA Definitions**, click **New**.
3. Select **Contract SLA** or **Service Offering SLA**.
    The SLA Definition or Service Offering SLA form opens.
4. Next to the **Workflow** field, click the lookup icon.
5. Next to **Workflow** at the top, click **New**.
The Workflow Version dialog shows in the New Workflow view. The Table field is set to SLA Definition (contract_sla) or Service Offering SLA (service_offering_sla) and is read-only.

6. Enter Name.
7. (Optional) Enter Description
8. (Optional) Edit conditions fields as necessary.
9. Click Submit.

The new workflow is created with the Begin and End activities connected by a single transition.
10. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
   For more information, see [Work on workflows](#).

11. (Optional) To change advanced settings for the workflow, click the Properties icon. If you make changes, click Update.

### Ending workflows with multiple branches

A workflow is complete when it reaches the **End** activity, even if there are still active branches of the workflow in progress. To ensure that both branches are completed, add a **Join** activity to resolve the branches.

For example, the following figure shows a workflow with two branches that execute independently. When Task 1 and Task 2 of Branch B are completed, the workflow is marked complete even if the Branch A tasks are not completed.

![Workflow with uncompleted branch](image)

For both branches to complete, add a **Join** activity to resolve the branches. When one branch reaches the join, the workflow waits for the other branch. When both branches are complete, the workflow reaches the end. The **Incomplete** condition of the **Join** activity is met only if one of the branches cannot be completed.

Workflow with completed branches

Work on workflows
To complete a workflow, you add workflow activities, validate the workflow, and publish it.

Add a workflow activity
Activities determine the functionality of the workflow.
Role required: workflow_admin, workflow_creator, or admin
When they are created, all workflows contain Start and End activities.
For more information, see Workflow activities.
1. Open a workflow.
2. Check out the workflow.
3. Drag a workflow activity from the Activities menu into the workflow body.
4. Populate the Workflow Activity form that appears.

Validate a workflow
You can manually validate a workflow from the Workflow Editor. You can generate a workflow validation report from the Workflow Version form.
Role required: workflow_admin, workflow_creator, or admin
Running a workflow on a new node automatically attempts to validate the workflow. If validation is successful, the system updates the workflow version record to indicate the workflow has been validated and marks the record as updated by the user who ran the workflow.
1. Open the workflow to validate in the Workflow Editor.

   When the workflow is loaded, the workflow validator icon appears in the toolbar.

   Welcome  Item Designer - Approvals  
   Item Designer - Approvals - Checked out by me (global)

2. Click the validator icon to run a series of validation tests on the current workflow version and generate a report.

© 2019 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
3. Complete the following steps to generate a workflow validation report from the Workflow Version form:
   a) Navigate to Workflow > Administration > Workflow Versions, and select a workflow to validate.
   b) Under Related Links, click Validate Workflow.

Publish a workflow

When a workflow is complete, publish the workflow so that it is available to all users.

Before you publish a workflow, validate it to test it for issues that might cause it to fail, such as missing subflows or disconnected transitions. For more information, see Workflow validation.

Role required: workflow_admin, workflow_creator, or admin
To publish a workflow:

1. Navigate to Workflow > Workflow Editor.
2. Open the workflow that you want to publish.
3. In the title bar, click the menu icon and select Publish.

If you published a new version of workflow, the changes are not applied to running workflow contexts. Any currently running workflow context continues using the workflow version that was available when the workflow started. The next time the workflow runs, it uses the new version.

**Determine whether a workflow can run**

A workflow can run only if a checked out version is available to the user who has it checked out, and a valid, published version is available for all users with permission to run it.

Role required: workflow_admin, workflow_creator, or admin

1. In the navigation filter, enter `wf_workflow.list`, and then open one of the workflows.
2. In the Versions related list, check for all of the following conditions:
   a) There is only one workflow version in a state of Checked out and Checked out by.
   b) There is only one version and it is not checked out. This version must be both Active and Published.
      You may need to personalize the list and add the Active column.
   c) If there are multiple versions, only one is Published.

These checks determine the only two conditions under which a workflow can run:

- A checked out version of a workflow is available for the user who has it checked out.
- A valid, published version of a workflow is available for all users who have permission to run the workflow.

Main flows containing subflows that do not meet one of these two conditions are not permitted to execute against a current record transaction. Instead, a critical log entry detailing the subflow state is added to the Workflow Context record. To enable the workflow to execute on the next appropriate transaction, remove the subflow from the main flow or modify the published and active states of the subflow.

**Edit a published workflow**

You can edit a published workflow after you check it out.

Role required: workflow_admin, workflow_creator, workflow_publisher, or admin

*Note:* You cannot check out or delete workflows that are associated with a read-only application file.

To check out a workflow:

1. Navigate to Workflow > Workflow Editor.
2. Open the workflow that you want to edit.
3. In the title bar, click the menu icon and select Checkout.

A new version of the workflow is created and assigned to you.

If you are in a different domain than the published workflow, the new workflow version is created in your domain.
After you finish editing the workflow, validate and publish the workflow to make the new version available to other users.

**Copy a workflow between two application scopes**

Application scoping protects applications by identifying and restricting access to application files and data. You can copy a workflow created in one application scope (for example, Test) to another (Production) as needed.

Role required: admin

1. On the Home page, click ![settings icon], located next to the logged in user name.
2. In the **Developer** tab, in the **Application** field, select the application scope (for example, Test) in which you want to operate the ServiceNow platform.
3. Close the System Settings page.
4. Navigate to **Workflow > Workflow Editor**.
5. Create a workflow in the Workflow Editor. For more details, see [Create a workflow](#).
6. In the Workflow Editor, click ![workflow icon].
7. In the **Application** tab, **Application** is set to the current application scope selected in System Settings.
8. In **Accessible from**, select **All application scopes** if the workflow is available to all application scopes, or select **This application scope only** if it is only available to, and accessible in the current application scope only.
   Only those workflows that are accessible from all application scopes can be copied to another application scope.
9. Go back to the Homepage, click ![settings icon].
10. In the **Developer** tab, in the **Application** field, select the application scope (for example, Production) to which you want to copy the workflow.
11. Navigate to **Workflow > Workflow Editor**.
12. Refresh the page, then open the same workflow you created.
   An **Out of scope workflow, workflow belongs to <scope name> scope** message appears, where <scope name> is the application scope in which the workflow was originally created.
13. In the Workflow Editor, click ![workflow icon].
14. Select **Copy**.
   The **Workflow Name** dialog appears:

   ![Workflow Name dialog]

   a) In **Workflow Name**, type the new name for the copied workflow.
   b) Click **OK**. The system creates a workflow in the current application scope.
15. In the Workflow Editor, click 🔄.

16. In the Application tab, Application is set to the current application scope.

17. In Accessible from, select This application scope only if to make the newly copied workflow a private one that cannot be accessed from outside current scope.

18. Click Update.

A new workflow record is created in the selected application scope and marked as private if designated as one in the Workflow Editor.

**Workflows used as subflows**

A workflow can launch another workflow as an activity.

The parent workflow triggers the subflow and then waits for the subflow to complete before continuing. Run the workflow validation tool prior to publishing to detect missing subflows and other dependency problems, such as those involving update sets.

The Workflows tab in the Workflow Editor contains a list of the workflows available for use as subflows.

![Workflows available to use as subflows](image)

Make sure that the selected subflow is active. If the subflow is inactive, the main workflow will hang with a **Loading** message. If you place an inactive subflow into a workflow, the subflow appears with a red banner, indicating that it cannot run. An active subflow is highlighted in blue when selected.
**Subflows and the Create Task activity**

If a workflow contains a *Create Task* activity that has executed on the current record, additional task activities in the workflow might not execute as expected.

This can happen when the same subflow containing a Create Task activity runs more than once in a parent flow. When the subflow reruns and attempts to execute the *Create Task* activity again, the system reopens the first task activity instead and does not create an additional task.

**Note:** An alternative to creating duplicate subflows that use the *Create Task* activity is to add a *Run Script* activity to the workflow that creates a task with a script.
The same create task activity runs twice in a workflow

In this configuration, the workflow does not run the same subflow containing a *Create Task* activity more than once. This allows the workflow to create additional tasks.
Running different subflows containing the Create Task activity

Pass a variable from a workflow to a subflow

Use this process to pass variables from a parent workflow to a subflow.

Role required: workflow_admin, workflow_creator, or admin

**Note:** You can also use the Return Value activity in the subflow to return values to the parent workflow. Make sure to have a Return Value on every ending transition path.

1. Prepare the subflow to accept variables from the parent workflow by defining the inputs.
2. Include the subflow in the parent workflow and connect the inputs to the parent workflow variables.

**Note:** Subflows on the Requested Item (sc_req_item) table in the Service Catalog cannot accept variables from parent workflows.

Define inputs for a subflow

Define the input variables for a workflow to request from parent workflows when it is launched as a subflow.

All inputs are stored in the Variables (var_dictionary) table.

1. In the editor, open and check out the workflow.
2. In the title bar, click the menu icon and select **Edit Inputs**.
3. In the Workflow Inputs window, click **New**.
4. Populate the record with the definition of the variable, including the column name, the label that is displayed to the user, and the type of field.

5. Click **Submit**.

**Invoke a subflow in a workflow**

Use this procedure to add a subflow to a workflow.

1. In the Workflow Editor, open and check out the parent workflow.
2. Drag the subflow from the **Workflows** tab to the parent workflow.
3. In the New Activity dialog box, define the variables defined by the subflow’s **Inputs**.

   These fields can accept both static values or variables in the following format:

   ```
   ${(variable_name)}
   ```

4. Click **Submit**.

   The workflow triggers the subflow at the appropriate time and passes the variables as indicated by the **Inputs** definition.

**Prepare a subflow**

Review the process of preparing a subflow for use in a parent workflow, and for preparing the parent workflow to use a subflow.

1. In the editor, open and check out the workflow that you want to use as a subflow.
2. In the title bar, click the menu icon and select **Edit Inputs**.
3. In the Workflow Inputs window, click **New** in the **Variables** list.

4. Add a new variable depending on the type of values that it is going to store.

The following example sets up a string value.

5. Click **Submit**.

6. Close the **Workflows Inputs** dialog.

7. Create a **Run Script** activity on the subflow.

   - Set the value from the parameter to a field on the current form. This is important because the **Notification** activity can only pull values from the current variable and not from the newly added variable. The following example sets the value in the **Description** field.

     ```javascript
     current.description = workflow.inputs.bluesubvariable;
     ```

   - Create a new field on the request form but do not display the field. This serves as temporary storage.
8. Create a **Notification** activity on the subflow. Use `${description}` in the subject to return the value from the field.
This is what the subflow would look like:
Prepare a workflow to use a subflow
After you create a subflow, use this procedure to prepare the parent workflow.

1. On the parent workflow, create a variable similar to what you did on the subflow, but name it something different.

   In the following example, the variable is named **Blue Main Variable**.

2. Click **Submit**.
3. Insert a **Run Script** activity to return the value from a field to the newly created variable.

   In this example, the value of the **Short Description** field is returned and given to the newly created variable.

   
   ```
   workflow.scratchpad.bluemainvariable = current.short_description;
   ```
4. Click **Submit**.
5. In the subflow activity, set the **Blue Sub Variable** to pass the `bluemainvariable` to the `bluesubvariable`.

```javascript
${workflow.scratchpad.bluemainvariable}
```

This is what the main workflow looks like:
Using variables in a workflow

Within workflow there are several different types of variables that are available.

Some variables define, describe, or compose the pieces of the workflow (such as workflow activities). Some variables are available specifically to facilitate the execution of a workflow (such as scratchpad variables). Some variables define, describe, or compose the data records being manipulated by the workflow process (for example, the elements of a Glide Record that are defined in a dictionary.xml file describing a record, such as an incident).

Activity variables

Activity variables are properties specifically associated with a workflow activity.

These are the inputs that appear on the activity definition when a specific activity is dragged onto the workflow canvas. These variables are properties that define, compose or describe the workflow activity, or the work it is designed to perform.

Activity variables are declared in a related list within the Workflow Activity Definition.

To add, view, or modify a variable:

1. Navigate to Workflow > Activity Definitions.
2. Select a workflow activity, such as Approval - User.
3. In the Activity Variables section or tab, add, view, or modify the variables. Activity variables are defined using the same fields as Dictionary records.

Note: If defining a new activity variable that is dependent on another activity variable, put the prefix “vars.” before the name of the parent activity variable. For example, if the child field is dependent on a field named parent, put the value vars.parent in the Dependent field.

To control the visibility of an activity variable on the workflow canvas after the activity has been dragged to the canvas, use a UI policy on the wf_activity table.

To access the variables or assign values to these variables within the workflow activity, use the vars variable of the workflow activity.

activity.vars.variable_name = new_variable_value

Workflow input variables

Workflow variables are external values that are passed into and referenced by a workflow during its execution.

Workflow variables can be declared externally in a script and passed into a main workflow or they can be declared within a main workflow and passed as inputs to a subflow.

Note: There is a specific kind of input variable for any workflow that is declared against the table Requested Item (sc_request_item). To understand the use of these variables see Workflow catalog variables.

Workflow variables are declared in a form available from the Workflow Editor gear menu.

To add, view, or modify a variable:

1. Navigate to Workflow > Workflow Editor.
2. Edit and checkout a workflow.
3. Select the Workflow Activities menu and select Edit Inputs.
4. Select an existing variable or click New.
Note the **Column name** field. Use this value when accessing the variable from a script.

Workflow variables do not appear on the workflow canvas, they are only available for view from the Workflow Activity menu.

The input variables are available to use in scripts. To access an input variable from a script:

```javascript
var input = workflow. variables. variableName //get the workflow variable identified by column name.
```

**Assigning values to variables from outside of workflow**

After being declared in a workflow, values can be assigned to the variables from where the workflow is kicked off.

The following example demonstrates how a workflow variable's value can be set in a script include, business rule, or UI action:

```javascript
//Declare an instance of workflow.js
var wf = new Workflow () //Get the workflow id
var wfId = wf. getWorkflowFromName ( "Workflow Name" );
//Start workflow, passing along name : value pair(s) for mapping to variable
//where input_var_name is the name of the variable declared in gear menu
//and input_var_value is whatever that value should be for this execution of
//workflow
wf. startFlow (wfId , null , "Workflow Name" , {input_var_name :
  input_var_value } );
```

Another example that demonstrates a more readable way of passing multiple variables involves declaring an object, adding the names/values to the object, and passing it:

```javascript
//Declare an instance of workflow.js
var wf = new Workflow ()
//Get the workflow id
var wfId = wf. getWorkflowFromName ( "Workflow Name" );
//Start workflow, passing along object containing name/value pairs mapping to inputs expected by the workflow
var vars = { };
vars. input_var_name1 = input_var_value1;
vars. input_var_name2 = input_var_value2;
// add as many variables as your workflow is expecting, then pass the object
wf. startFlow (wfId , null , "Workflow Name" , vars );
```

**Assigning Values for Subflow Inputs from inside of a Main Workflow**

If a workflow that accepts inputs is called from within another workflow, those input values can be set from the workflow canvas within the UI of the workflow activity. Each input variable declared for a subflow will have a text box input area displayed on the activity. Within these text boxes, the variables can be set with any value either from the scratchpad or from within the current record.

For more information, see [Workflows used as subflows](#).
Reading the Value of a Workflow Input Variable

The value of a Workflow input variable is accessible anywhere within the workflow that accepts javascript by dot walking the current workflow object:

```
var readValue = workflow.inputs.variable_name;
```

Workflow scratchpad variables

Store and share string-based variables as name-value pairs between workflow activities. The scratchpad is global to the instance of the running workflow and as such, is available equally to all activities.

Declaration

The scratchpad itself is automatically available to an executing workflow and requires no specific declaration. Variables are declared and stored in the scratchpad simultaneously by referencing it. For example:

```
workflow.scratchpad.variableName = variableValue;
```

Display

View activity scratchpad values from the Workflow Activity History Scratchpad (wf_history_scratchpad) table. Workflow Activity History Scratchpad is also an embedded list in Workflow Activity History records.
Sample Workflow Activity History Scratchpad records

</tr>
</tbody>
</table>
Access and Assignment

Use standard JavaScript object notation to access or assign scratchpad values. For example, use this format to assign a particular scratchpad variable value.

```
workflow.scratchpad.variableName = variableValue;
```

Use this format to assign a JavaScript variable to a scratchpad variable.

```
var myValue = workflow.scratchpad.variableName;
```

Current variables

Current is the database GlideRecord that kicked off the workflow, either by association to the table in the Workflow properties table or by being associated with a catalog item.

Declaration

Variables in current are the columns that are defined in the dictionary.xml file that support the database record. There is no way at runtime to add variables to the current record.

Display

Variables of a current record are displayed on the Glide Forms and Lists throughout the applications that use them.

Access and Assignment

To access the variables or assign values to the variables within the workflow activity, get the value from the current record by referencing the Glide Element.

```
var myVarValue = current.getElement(nameOfTheField);
```

or

```
var myVarValue = current.fieldName;
```

or

```
current.variableName.setValue( "A Variable Value");
```

Workflow catalog variables

Workflows that are associated with the Requested Item (sc_req_item) table have a specific type of workflow input.

The inputs into this workflow are essentially question:answer pairings that, when associated with a specific catalog task, become options on the task form. These options are generated by that catalog task activity within a workflow.
Scope

For the purposes of Service Catalog and workflow, a variable’s scope determines its availability to a catalog task activity within a workflow. You can define variables as global or catalog item-specific. When a variable is associated to a catalog item and the workflow generating the catalog task is associated to the catalog item, the variable scope determines which variables are available for mapping within the catalog task activity in a workflow. If a workflow is associated with Requested Item (sc_request_item), and is not specifically associated with a catalog item, any catalog variable with a blank Cat Item field value is available to all catalog task activities within the workflow.

Declaration

You can declare requested item catalog variables at the catalog item level or at a global level.

You can declare global catalog variables using the Workflow Editor context menu.

Also see, Global variable declaration option 2.

1. Navigate to Workflow > Workflow Editor.
2. Open and check out a workflow that runs against the Requested Item (sc_req_item) table.
3. Click the menu icon and select Edit Catalog Variables.
4. Click New to create a new variable or select an existing variable.
5. Select the Global check box.
6. Click Submit.

Global variable declaration option 2

You can declare global catalog variables using the Service Catalog.

1. Navigate to Service Catalog > Item Variables.
2. The list of variables that appears in the workspace has a default filter of Cat Item != <blank>. Change the filter to Cat Item = <blank> and run the query.
   The catalog variables that appear are available to any catalog task that is initiated from within a workflow.
3. Click New to create a new variable.
4. Leave the Cat Item field blank.
5. Select the Global check box.
6. Click Submit.

Also see, Global variable declaration option 1.

Catalog item specific variable declaration option 1

You can declare a catalog item-specific variable.

These variables are only available to the catalog item referenced in the Cat Item field on the variable record.

1. Navigate to Service Catalog > Catalog Variables > Item Variables.
   Note the list of variables that appears in the workspace has a default filter of Cat Item != <blank>.
2. Enter or select a catalog item in the Cat Item reference field.
   Selecting a Cat Item restricts the scope and availability of the catalog variable to that specific catalog item.
3. Click Submit.

Also see, Catalog item specific variable declaration option 2.
Catalog item specific variable declaration option 2
You can declare a catalog item-specific variable directly from a catalog item record.

Creating a catalog variable in this way automatically sets the **Cat Item** reference to the catalog item selected.

1. Navigate to **Service Catalog > Catalog Definitions > Maintain Items**.
2. Select or create an a catalog item.
   - Note the **Variables** related list. All variables declared using this related list have a **Cat Item** reference value of the current catalog item.
3. From the **Variables** related list, click **New**.
4. Ensure that the **Cat Item** field correctly references the catalog item previously selected or created.
5. Go to or open the **Question** section or tab.
6. Add a **Question**.
7. Add a **Name**.
   - Variable names should not include white space and cannot begin with a number.
8. Click **Submit**.
   - Also see, **Catalog item specific variable declaration option 1**.

**Display**

Catalog specific item variables are visible in several places depending on where in the process the variable is viewed.

Declaration can happen and variables can be seen from within the menu, inside both the **Maintain Items** module and in the **Item Variable** modules of the Service Catalog.

Within a workflow, the Catalog Specific Item variables are available to the **Catalog Task** activity in the form of a slushbucket at the bottom of the **Catalog Task** activity. Item variables that are selected, are the question and answer pairs that will appear on the task that is generated by that instance of **Catalog Task** when executing that workflow.

If a workflow is associated with a specific catalog item, the association acts as a filter for item variables that appear in the slushbucket of the **Catalog Task** activity.

The last place the variables are seen is in the task form that is generated by the Catalog Task Item. The variables selected in the slushbucket are the question and answer pairs that appear to the user on the task form.

**Access and assignment**

The Catalog Item Variables are available and assigned to a specific **Catalog Task** activity (thereby to a specific task) using the slushbucket entry of a catalog task.

The user working the task enters the values of the variables.

To access the values of a Catalog Item Variable inside a script:

```javascript
var gr = current; // or create and query a new GlideRecord
var itemVariable = gr.variables[variableName]; //access the service catalog variable identified by the variable name.
var itemVariableValue = itemVariable.getValue();
var itemVariableName = itemVariable.getName();
var itemQuestion = itemVariable.getQuestion(); //All GlideappQuestion API are accessible on itemQuestion
```
Workflow events

The system employs two types of events: registered platform events and workflow events.

Registered platform events

Registered events are created in business rules and are used for such tasks as sending email notifications when records are inserted into the database. Workflow events are registered within workflows only and are not used anywhere else in the platform. Registered platform events can be triggered by a workflow for external use, but cannot be used within a workflow.

Workflow events

Workflow events follow different rules than platform events that are registered using the event registry. Platform events are entered into the Event Registration (sysevent_register) table and are available for platform processes to use. Workflow events are triggered exclusively for the workflow engine and are used only to direct the work of executing workflow contexts. When an event is registered in a workflow, it is attached to a currently executing activity in the registered_events column of the Workflow Executing Activity (wf_executing) table.

Workflow events also can be broadcast to a workflow from any scripting source that has access to the workflow context, such as a script include or a Run Script activity. In this case, the event, such as cancel, is passed to all records in the Workflow Executing (wf_executing) table for a specific context.

Whether by registry or by broadcast, an event is handled by the activity definition associated with the currently executing activity. Each activity definition comes with a set of handlers. For example, most activities come with onExecute, onCancel, and onUpdate event handlers. As an example of a more specific event, the Approval - User activity also comes with onDetermineApprovalState, which is specific to the work of the approval activity.

Multiple parallel events

A single workflow can have multiple event threads running concurrently, such as when a workflow has timers that overlap on separate workflow branches. If any additional thread completes before the first thread, the system stores event information from the additional thread on the Workflow Queued Commands (wf_command) table. After the first thread completes, the system retrieves the information stored by the additional thread and proceeds through the workflow with the event information from each thread.

Workflow events in the base system

Several workflow events are available in the base system.
### Workflow events in the base system

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
<th>Purpose</th>
<th>To use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
<tbody>
<tr>
<td>activityComplete</td>
<td>String value used by activity definitions to respond to the onActivityComplete event handler.</td>
<td>Informs records in the Workflow Executing Activity (wf_executing) table about the completion of other activities in the same workflow context.</td>
<td>If the activity is allowed to set the boolean value for wf_executing.notify_termination, then set the value to true (activity.notify_termination = true) during the onExecute event.</td>
<td>Workflow Engine, Process Terminations</td>
<td>Current thread, current mutex</td>
<td>Join activity</td>
</tr>
<tr>
<td>otherEvent</td>
<td>String value used by the Join activity to respond to an otherEvent.</td>
<td>Informs records in the Workflow Executing Activity (wf_executing) table about an otherEvent that has completed.</td>
<td>The Join activity transitions from n number of preceding activities. These preceding activities all create a wf_executing record, which causes a check to see if the record already exists. If the Join already exists, then the Join created by the executing transition sets the wf_executing record for deletion.</td>
<td>Join activity</td>
<td>Current thread, current mutex</td>
<td>Join activity, onOtherEvent event handler</td>
</tr>
<tr>
<td>timer</td>
<td>String value used by workflow activities to respond to a Timer activity that has expired.</td>
<td>Allows wf_executing records to be informed about a timer activity that has completed and has fired the timer event.</td>
<td>The Timer activity schedules a job that calls a script. The script calls fireEvent (wf_executing, timer).</td>
<td>Worker thread, private mutex</td>
<td>Timer activity via a scheduled job</td>
<td>Timer activity, onTimer event handler</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>
<td>Source</td>
<td>Thread</td>
<td>Listeners</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
<td>---------</td>
<td>--------</td>
<td>--------</td>
<td>--------</td>
<td>-----------</td>
</tr>
<tr>
<td>execute</td>
<td>String value used by workflow activities to respond to a Timer activity that has expired.</td>
<td>Informs a record in the wf_executing table with the initial state of Executing to proceed with its primary work.</td>
<td>The workflow engine, for each transition executed, creates an executing record with a state of Executing. Once created, the executing record is put in a queue for processing. For each item in the queue, the Rhino globals are established, the activity definition that drives the executing record is instantiated, and the run() function is called. When the state of a record is Executing, this function always calls onExecute.</td>
<td>Workflow engine, via the WFActivity Handler</td>
<td>Current thread, current mutex</td>
<td>All activities, onExecute event handler</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>
<td>Source</td>
<td>Thread</td>
<td>Listeners</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
<td>---------</td>
<td>--------</td>
<td>--------</td>
<td>--------</td>
<td>----------</td>
</tr>
<tr>
<td>execute (specific to Lock)</td>
<td>String value used by the Lock activity to respond to a waiting lock that is ready to make another attempt to obtain a specific lock. This execute is different than the previous execute because it is called on a separate thread, at specified intervals, and is treated as an outside event.</td>
<td>Informs a wf_executing record waiting to execute that the specified wait interval has passed and that it should attempt to get the lock again.</td>
<td>Lock activity schedules a job with a script that uses the workflow script include's fireEvent(wf_executing, 'execute') method.</td>
<td>Lock activity via a scheduled job</td>
<td>Worker thread, private mutex</td>
<td>Lock activity, onExecute event handler</td>
</tr>
<tr>
<td>determineApprovalState</td>
<td>String value used by approval activities to respond to a change in the overall approval status of the current record.</td>
<td>Informs wf_executing records for approval activities about an approval that completed and triggered the timer event.</td>
<td>Approval Coordinator both registers for the event and triggers the event. The child approvals have listeners that determine their approval state.</td>
<td>Approval Coordinator triggers the event during its onExecute event handler.</td>
<td>Current thread, current mutex</td>
<td>Approval Coordinator, Approval - User, and Approval - Group all have onDetermineApprovalState event handlers. If the state is anything but Requested, the activity is considered finished, and the approval state (Approved, Rejected, Cancelled) is set to the wf_executing.result column.</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>
<td>Source</td>
<td>Thread</td>
<td>Listeners</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
<td>---------</td>
<td>--------</td>
<td>--------</td>
<td>--------</td>
<td>-----------</td>
</tr>
<tr>
<td>cancel (from within activity definitions)</td>
<td>String value used by workflow activities to respond to a request for cancellation.</td>
<td>Informs all wf_executing records in a context that the workflow is being canceled.</td>
<td>The End activity uses the global <code>workflow.broadcastEvent('cancel')</code> to interrupt the currently running workflow records. This changes the state of those records to <strong>Cancelled</strong>.</td>
<td>End activity</td>
<td>Current thread, current mutex</td>
<td>All activities, <code>onCancel</code> event handler</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>
<td>Source</td>
<td>Thread</td>
<td>Listeners</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------</td>
</tr>
<tr>
<td>cancel (outside current context)</td>
<td>String value used by workflow activities to respond to a request for cancellation.</td>
<td>This event is the same as the cancel event above and handled the same. However, the management of this event is subtly different. This event informs all workflow records in a context that the workflow is being canceled. The event is managed via the onCancel event handler of each executing activity definition, but the event is called differently. In particular, the call to cancel from outside an activity definition is blocked by the current mutex. This is a significant difference in that the event does not interrupt a currently executing activity that is still operating within the parameters of the current mutex.</td>
<td>Any script can call cancel on a known executing context via the workflow script include. For example, var w = new Workflow(); w.cancel(context); //where context is a GlideRecord of the context to be canceled.</td>
<td>Any script include, scheduled job, UI action, or other source</td>
<td>Current thread, private mutex</td>
<td>All activities, onCancel event handler</td>
</tr>

### Glide events relative to workflows

Workflow uses several Glide events.

#### Workflow Glide events

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
<th>Purpose</th>
<th>To Use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
<tbody>
<tr>
<td>Insert</td>
<td>Global event set upon the insert of a GlideRecord that causes the script engine, and through that the workflow engine, to wake up.</td>
<td>Starts workflows that are associated with the current GlideRecord either by reference, as in request items and SLA timers, or by conditions associated with the GlideRecord’s table.</td>
<td>There is no explicit customer-facing use for this in a workflow. It is part of the Glide engine, and with this event, the only thing workflows can do is start. Workflows can also be started manually using a script.</td>
<td>Workflow Engine, RunEngine</td>
<td>Current thread, current mutex</td>
<td>User action of insert</td>
</tr>
<tr>
<td>Update</td>
<td>Global event set upon the update of a GlideRecord that causes the script engine, and through that the workflow engine, to wake up.</td>
<td>Looks to the Workflow Context (wf_context) table to find running workflows that are associated with the current GlideRecord by document ID.</td>
<td>There is no explicit customer-facing use for this in a workflow. It is part of the Glide engine, and with this event, the only thing workflows can do is advance through the next set of transitions.</td>
<td>Workflow Engine, RunEngine</td>
<td>Current thread, current mutex</td>
<td>User action of update of a GlideRecord</td>
</tr>
</tbody>
</table>
### Workflow event-specific functions

There are several functions that relate specifically to workflow events.

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
<th>Purpose</th>
<th>To Use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete</td>
<td>Global event set upon the delete of a GlideRecord that causes the script engine, and through that the workflow engine, to wake up.</td>
<td>Looks to the Workflow Context (wf_context) table to find running workflows that are associated with the current GlideRecord by document ID.</td>
<td>There is no explicit customer-facing use for this in a workflow. It is part of the Glide engine, and with this event, the only thing workflows can do is advance through the next set of transitions.</td>
<td>Workflow Engine, RunEngine</td>
<td>Current thread, current mutex</td>
<td>User action of delete of a GlideRecord</td>
</tr>
<tr>
<td>Query</td>
<td>Global event set upon the query of the Glide database that causes the script engine, and through that the workflow engine, to wake up.</td>
<td>Looks to the Workflow Context (wf_context) table to find running workflows that are associated with the current GlideRecord by document ID.</td>
<td>There is no explicit customer-facing use for this in a workflow. It is part of the Glide engine, and with this event, the only thing workflows can do is advance through the next set of transitions.</td>
<td>Workflow Engine, RunEngine</td>
<td>Current thread, current mutex</td>
<td>User action of query of a GlideRecord</td>
</tr>
</tbody>
</table>
### Workflow event-specific functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Purpose</th>
<th>Use</th>
<th>Thread</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>registerForEvent</td>
<td>Function in the workflow environment that writes events represented as strings to the wf_executing.registered_events field.</td>
<td>The workflow events are just strings. When an activity that has registered for an event executes, a comma-delimited set of events is stored with the Workflow Executing Activity (wf_executing) record. When the event is triggered in the workflow context, the wf_executing table looks for all executing records that contain the string that represents the event in the wf_executing.registered_events field.</td>
<td>The global variable workflow that is available to all Workflow Activity (wf_activity) records is the source of the call. For example, from inside a Run Script activity, a designer can write: workflow.registerForEvent('myEventName');</td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>
</tr>
<tr>
<td>unRegisterForEvent</td>
<td>Function in the workflow environment that removes a string value representing an event that has been written to the wf_executing.registered_events field.</td>
<td>The workflow events are just strings that are written to the wf_executing.registered_events field. When an activity unRegisters for an event, the comma-delimited set of events stored with the Workflow Executing Activity (wf_executing) record is searched, and if that string is found, it is removed.</td>
<td>The global variable workflow that is available to all Workflow Activity (wf_activity) records is the source of the call. For example, from inside a Run Script activity, a designer can write: workflow.unRegisterForEvent('myEventName');</td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>

<tr>
<td><code>fireEvent</code> (eventRecordSysId, eventName)</td>
<td>Function in the workflow environment that sends an event to a specific Workflow Executing Activity (wf_executing) record. The <code>eventRecordSysId</code> is the sys_id of a GlideRecord of the type <code>wf_executing</code>.</td>
<td>This is the same as the <code>fireEvent</code> above, except that it accepts an ID and returns the Workflow Executing Activity (wf_executing) record.</td>
<td>The Workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: <code>var w = new Workflow(); w.fireEvent(eventName);</code></td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
<tr>
<td><code>fireEvent</code> (eventRecordSysId, eventName, optionalJSONObject)</td>
<td>Function in the workflow environment that sends an event to a specific Workflow Executing Activity (wf_executing) record. The <code>eventRecordSysId</code> is the sys_id of a GlideRecord of the type <code>wf_executing</code>.</td>
<td>This is the same as the <code>fireEvent</code> above, except that it accepts an ID and returns the Workflow Executing Activity (wf_executing) record.</td>
<td>The Workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: <code>var w = new Workflow(); w.fireEvent(eventName);</code></td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
<tr>
<td><code>broadcastEvent</code> (contextId, eventName)</td>
<td>Function in the workflow environment that sends an event to all currently running Workflow Executing Activity (wf_executing) records in a specified context, regardless of their state.</td>
<td>This is the same as the <code>fireEvent</code> above, except that it accepts an ID and returns the Workflow Executing Activity (wf_executing) record.</td>
<td>The Workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: <code>var w = new Workflow(); w.broadcastEvent(eventName);</code></td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
</tbody>
</table>
## Event-specific workflow activities

The following workflow activities trigger events.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Purpose</th>
<th>Use</th>
<th>Thread</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>broadcastEvent(eventName)</td>
<td>Function in the workflow environment that sends an event to all currently running Workflow Executing Activity (wf_executing) records in the current context, regardless of their state.</td>
<td>This should not be confused with <code>broadcastEvent</code> above. This event is only available to current Workflow Executing Activity (wf_executing) records.</td>
<td>This is available only through the global workflow variable of the current context. The following is an example of its use from within an activity definition's script: <code>workflow.broadcastEvent(eventName)</code></td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>
</tr>
</tbody>
</table>
## Event-specific workflow activities

<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Description</th>
<th>Purpose</th>
<th>To Use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Event</td>
<td>Requires an event from the event registry rather than a workflow event. This activity is located in the Notification category of the workflow tree.</td>
<td>Fires the notification event specified in the Workflow Activity (wf_activity) table.</td>
<td>1. Navigate to System Policy &gt; Events &gt; Registry</td>
<td>Event Registry</td>
<td>Event</td>
<td>On the notification thread, outside of workflow</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>2. Create an event.</td>
<td></td>
<td>Thread</td>

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>3. Navigate to System Policy &gt; Templates and create an email template</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>4. Navigate to System Policy &gt; Email &gt; Notifications.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>5. Create a new notification that is triggered by the event you created and sends the template you created.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>6. On the workflow canvas, drag the Create Event activity onto the canvas and associate it with the newly registered event.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Workflow stages

Workflows can indicate workflow progress by updating any field designated as a stage field. For example, the Incident (incident) table has an **Incident state** field that indicates progress, but the service catalog uses the **Stage** field.

To indicate the workflow's progress through the possible stage values, the interface updates the **Stage field** selected in the workflow properties. Available fields depend on the table used by the workflow. If the field provides a choice list, then the choices are available as stage values for the workflow. If the field is a workflow field, it displays an icon to indicate the workflow's progress, as with the Service Catalog's **Stage** field.

![Service Catalog Stage field with icons](image)

<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Description</th>
<th>Purpose</th>
<th>To Use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Wait for WF Event</strong></td>
<td>Listens for workflow events, as described in the <em>Workflow Events in the Base System</em> table, and only within the current context. This activity is located in the <strong>Conditions</strong> category of the workflow tree.</td>
<td>Waits for another transition branch of the current context to trigger an event.</td>
<td>Takes an event name as input. When the activity is executed, the specified event name is added to a string array stored in the <strong>registered_events</strong> column. The values in this column are in a list of all events the activity waits for when it is executing.</td>
<td>The <strong>Wait for WF Event</strong> activity has a generic <code>onUnhandledEvent</code> that tests the current event against the value that was passed to the variable. If they match, the <strong>Wait for WF Event</strong> moves the workflow forward.</td>
<td>Triggered in the current thread or from a script include</td>
<td>The <code>onUnhandledEvent</code> of the <strong>Wait for WF Event</strong> activity</td>
</tr>
</tbody>
</table>
After stages are added to the workflow, they can be assigned to each workflow activity. If an activity with an assigned stage is encountered when the workflow runs, the workflow engine assigns the stage to the record associated with the workflow context.

For workflows that use the Requested Item (sc_req_item) table, the stage field is automatically set to the **Stage** field of the table and cannot be changed. The stage state displayed for a workflow running on the Requested Item table is based on the state of the workflow activities.

- If an activity is active, then the stage is shown with the state of **In progress**.
- If an activity is in the **Pending** or **Completed** state, the stage reflects this state.
- If an activity is canceled, **Request Cancelled** appears in the **Stage** field. The "Cancelled" label set in the wf_stage table is a reserved word, and does not display in the **Stage** field.

### How stage values are derived

Stage values are derived from various sources in the interface.

**Note:** An updated method for managing workflow stages as a set is also available. For information about grouping and reusing stages, see **Workflow stage sets**.

Stage values are derived from the following sources:

- **Choices for Stage column:** Choices defined for the column selected as the **Stage** column for the workflow.
- **Default stages for table:** Stages defined in the Stage Default (wf_stage_default) table for the table selected.
- **Workflow-specific stages:** Applied only to the workflow for which they were defined in the Workflow Stage (wf_stage) table.
- **Stage values in existing records:** Values from the designated **Stage** column in the table assigned to the workflow are inherited from existing records.

If the stage field for a workflow is the table column named **Stage**, then the progress of the workflow appears in any list view containing the **Stage** column.
Stage values shown in the list views are accompanied by the state, based on the workflow activities being executed. If an activity has a stage specified for it, and the activity is currently active in the workflow, then the stage is shown with a state of In progress. Similarly, if the activity is in the Pending or Completed state, the stage reflects this state.

Example

If the workflow table is Request Item (sc_req_item), then the stage field is automatically set to the Stage column of that table and cannot be changed. The following stage values for the request item are displayed in a choice list from the Dictionary Entry (sys_dictionary) table:

- Waiting for Approval
- Fulfillment
- Delivery

In addition, the Request Item table has the following default stages:

- Request Cancelled
- Completed
Note: If an activity is cancelled, Request Cancelled appears in the Stage field. The "Cancelled" label set in the wf_stage table is a reserved word, and does not display in the Stage field.

When you edit available activity stages in the Workflow Editor, the list displays the following stage values:

- Waiting for Approval
- Fulfillment
- Delivery
- Request Cancelled
- Completed

The following diagram depicts the process used to gather stage values from the Request Item table to populate the Stages list in workflow activities.
Note: If you are creating a workflow with a table other than Request Item (sc_req_item), you must select a Stage field in the workflow properties for the workflow to have stages.

Use workflow stages

You can add or modify workflow stages.

Role required: workflow_admin, workflow_creator, or admin

1. Navigate to Workflow > Workflow Editor.
2. Create a new workflow by clicking **New** or open an existing workflow.

3. In the Workflow Properties form, if the table is not the Requested Item (sc_req_item) table, select a field to display stages in the **Stage** field property.

   *Available fields* depend on the table selected for the workflow.

4. After assigning a list of stages to the workflow, you can set a stage value in any of the workflow activities that provide a **Stage** field in their dialog box.

   Setting a stage value in a workflow activity tells the workflow engine to assign that stage to the record associated with the workflow context when the activity is encountered during a run.

   When an activity starts with a specified stage, the platform updates the **Stage** field with the current value. In workflows run against the Requested Item (sc_req_item) table, the *sc_req_item.stage* field is defined as a workflow type field.

   When displaying the stages for a workflow on the Requested Item (sc_req_item) table, the stage state is based on the state of the workflow activities. If an activity has a stage specified for it, and the activity is currently active in the workflow, then the stage is shown with an *In progress* state. Similarly, if the activity is in the *Pending* or *Completed* state, the stage reflects this state.

5. To edit the workflow-specific stages for an existing workflow, click the gear icon in the header bar and select **Edit Stages**. Again, these stage values are combined with the choices, defaults, and existing values.
Workflow stages

To optimize the use of stages, you can assign a stage to multiple activities in a workflow. For example, if your workflow uses the following activities to create tasks:

1. Get approval
2. Order equipment
3. Receive equipment
4. Add equipment to CMDB
5. Set up equipment
6. Install software
7. Configure software
8. Deliver to user

The following stages might be used:

- Approval
- Order
- Configure
- Deliver

A good practice is to assign stages to the activities as follows:

<table>
<thead>
<tr>
<th>Activity</th>
<th>Assigned stage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get approval</td>
<td>Approval</td>
</tr>
<tr>
<td>Order equipment</td>
<td>Order</td>
</tr>
<tr>
<td>Receive equipment</td>
<td>Order</td>
</tr>
<tr>
<td>Add equipment to CMDB</td>
<td>Order</td>
</tr>
<tr>
<td>Set up equipment</td>
<td>Configure</td>
</tr>
<tr>
<td>Install software</td>
<td>Configure</td>
</tr>
<tr>
<td>Configure software</td>
<td>Configure</td>
</tr>
<tr>
<td>Deliver to user</td>
<td>Deliver</td>
</tr>
</tbody>
</table>

Examples of stages added to workflow activities

When the Order equipment, Receive equipment, or Add equipment to CMDB activity is active, the Stage display shows that the Order stage is In progress.

Add and translate stages

You can add default stages to use for a table, and stages to existing workflow

Add default stages for a table

You can assign a stage set as a default set to any number of tables.

The stages in the assigned stage set pre-fill the workflow version stages when you create a new workflow for the associated table.

1. Navigate to Workflow > Default Stages (by table).
2. Click New.
3. Select a stage Set.
   - You can create a new set by clicking New, typing a name, and clicking Submit.
4. Select a corresponding Table.
5. Click Submit.
   - The stages in the selected stage set are automatically added to any new workflows that use the corresponding table.

Add a stage to an existing workflow

If a stage required for a workflow has not been imported or is not in the stage set assigned to the workflow table, you can add it to the workflow manually.

1. Navigate to Workflow > Workflow Editor.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select Edit Stages.
4. In the Workflow Stages list, click New.
5. On the Workflow Stage form, fill in the fields as appropriate.
   - Do not use a Name or Value field value that already exists in the base system.
Workflow stage fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the stage as it appears in workflow fields.</td>
</tr>
<tr>
<td>Value</td>
<td>The value of the stage when it is referenced from elsewhere in the system, such as in a script.</td>
</tr>
<tr>
<td>Duration</td>
<td>The default duration for the stage. Currently not used.</td>
</tr>
</tbody>
</table>

6. Click Submit.
7. Publish the workflow.

Add a stage to a workflow activity
After stages are added to a workflow, you can assign them to the workflow activities.

1. Navigate to Workflow > Workflow Editor.
2. Open and check out the workflow.
3. Double-click the activity.
4. In the Stage field on the Activity Properties form, find and select the stage to display when the workflow reaches the activity.
5. Click Update.

Translate workflow stages
You can provide translations for workflow stage names so the names appear in the language selected for the instance.

The instance must already have language internationalization plugins installed. For more information, see Activate a language.

Language-specific text appears in workflow fields displayed in a list, workflow stage sets, and the Workflow Editor for users with that language selected. Language-specific text does not automatically appear when displaying stages on a form. To translate stages on a form, add translated text to the workflow field choices.

You can add translated text for any language enabled on the instance. For example, to translate workflow stages into French:

1. Set the interface language to French.
2. Navigate to Workflow > Workflow Editor.
3. Open and check out a workflow.
4. In the title bar, click the menu icon and select Edit Stages.
5. Edit the Name field for each stage and enter the text to display to French users. Do not change the Value field.
6. Confirm that the workflow stages display the French text.

Alternatively, to translate stages for multiple workflows at once, you can directly edit the Workflow Stages (wf_stage) table. For example, to translate workflow stages from multiple workflows into French:

1. Set the interface language to French.
2. In the application navigation filter, enter \texttt{wf\_stage.list}. 

© 2019 ServiceNow, Inc. All rights reserved.
3. Edit the Name field for each stage and enter the text to display to French users. Do not change the Value field.

**Workflow stage sets**

Stage sets are named groups of workflow stages commonly used together. Create a stage set and assign it as a default set to any number of tables. You can import the choice list values of a workflow field as stages for a workflow, and export a stage set to create a new one.

A single stage set usually represents a process, such as the stages required to display the progress of a service catalog request. You can also assign a stage set as the default set for workflows on specific tables.

In an active context, workflow stages provide summary-level feedback about the progress of a workflow. Stage icons display the status of each activity as it is being driven by a workflow. The system updates a Stage field, defined in the workflow properties, to indicate the progress of the workflow through the possible stage values.

**Updates to workflow stage values**

During an upgrade, the system makes changes to the Value field of records in the Workflow Stage (wf_stage) table.

- All entries are made lowercase.
- All spaces and special characters are replaced with underscores.

These changes support System localization and enable workflows to display translated text in the Stage field.

*Create a new stage set*

You can create a new stage set by creating a stage set record and adding stage set entries manually.

Create a stage set record only when you want additional stages that are not available on the table by default.

1. Navigate to Workflow > Stage Sets.
2. Click New.
3. Enter a Name that indicates the purpose of the stage set. For example, you can create a Requested Item stage set to hold the stages commonly used by inventory tracking workflows or service catalog fulfillment workflows.
4. Click Submit.
5. Open the new stage set record.
6. In the Stage Set Entries related list, click New.
   - Each stage set entry can be used as the Stage for an activity in a workflow that uses this stage set.
7. Enter a Name that indicates the stage name to appear in workflow fields.
8. Enter a Value to use when referencing the entry, such as in a script.
9. Click Submit.
10. In the Stage Set Entries related list, ensure that each entry has a unique Order value.
    - Enter a low value for stages that should appear early in the workflow and a higher value for later stages.
The stage set can be added to a workflow or assigned as the default stage set for workflows that are created for a specific table.

**Use a default stage set**
You can assign a stage set as a default set to any number of tables.

The stages in the assigned stage set pre-fill the workflow version stages when you create a new workflow for the associated table.

1. Navigate to **Workflow > Default Stages (by table)**.
2. Click **New**.
3. Select a **Table**.
4. Select the **Set** you want to assign to the selected table.
5. Click **Submit**.

**Import stages from a choice list**
You can import the choice list values of a workflow field as stages for a workflow.

Create a choice list as follows:
- Add a custom field of Type **Workflow** to the table.
- Configure the custom field to use a choice list.
If you are creating a new field, set the Choice List type to Display without --None-- and create the choices for the newly created field.

For more information, see Create a workflow stage field.

1. Navigate to Workflow > Workflow Editor.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select Properties.
4. In the Workflow Properties dialog box, click the Stages tab.
5. From the Stage field list, verify that the correct workflow field is selected.
6. In the Related Links section, click Import Stages from Choice List.
7. In the dialog box asking you to confirm that you want to import the choice list, click OK.
8. Click Update.

The stage set can be added to a workflow or assigned as the default set for workflows that are created for a specific table.

Export a stage set from a workflow
You can create a new stage set by exporting the stages from an existing workflow as a set, instead of manually adding stage set entries to a stage set record.

1. Navigate to Workflow > Workflow Editor.
2. Open and check out the workflow containing stages that you want to export as a new stage set.
3. In the title bar, click the menu icon and select Edit Stages to open the Workflow Stages dialog box.
4. In the Related Links section, click Export to Stage Set.
5. Enter a unique Name for the new stage set.
6. Click OK.

The stage set can be added to a workflow or assigned as the default set for workflows that are created for a specific table.

Add a stage set to a workflow
You can add any number of stage sets to an existing workflow.

When multiple stage sets have stage set entries with the same Value, the stage appears on the workflow only once.

1. Navigate to Workflow > Workflow Editor.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select Edit Stages to open the Workflow Stages dialog box.
4. In the Related Links section, click Import from Stage Set.
5. Select the stage set.
6. Click Ok.
7. Import additional stage sets as needed for the workflow.

After you add all necessary stage sets to the workflow, you can add them to the workflow activities. For more information, see Add a stage to a workflow activity.

Create a workflow stage field

Workflows can provide a summary of workflow progress by updating any field of the Workflow type. If the field is a workflow field, it displays an icon to indicate the workflow stage progress.

Role required: admin
In a form, the workflow field displays the current stage as a choice list value.

In a list, the workflow field displays stage icons that represent the series of states, stages, phases, or tasks within a workflow. The stage icons are populated using the activity stages from the associated workflow. For more information, see Workflow stages.

To create a workflow stage field:

1. Navigate to Workflow > Default Stages (by table).
2. Right-click near a column header and select Configure > List Layout.
3. Create a new field in lower right.
4. On the form view of the table used by the workflow, create a field with the Type set to Workflow.
   For detailed steps, see Add and customize a field in a table.
5. Click Save.
6. Right-click the field label and select Configure Dictionary.
7. Open a dictionary entry.
8. In the Choice List Specification section of the Dictionary Entries form, select Dropdown with --None-- from the Choice list.
9. Click Update.
10. To ensure that the workflow field properly displays stages on the form, define a choice for each workflow stage.
    - To create workflow stages using a choice list that already has choices, you can import the stages from the choice list. A stage is created for each choice defined for the Stage field selected in the workflow properties. For detailed steps about importing a choice list, see Import stages from a choice list.
    - The Value of each choice must match the Value of the corresponding workflow stage.
    - Do not use spaces in the Value field for either choices or stages. Use underscores in place of spaces.
    - Make the choice list read-only. If a user changes the stage value for a record from the choice list rather than allowing the workflow to control the value, the workflow-driven, legacy, and linear renders may not work as intended. You can also use business rules or events to ensure the workflow progresses accordingly.

   For detailed steps on defining choice lists, see Define an option for a choice list.
11. To see workflow stages as icons, add the field to the list layout of the workflow table.
For detailed steps, see Configure the list layout.

After you create or update the workflow field:

- Unless the workflow uses the Requested Item (sc_req_item) table, ensure that the workflow field is selected from the Stage field list in the workflow properties. For detailed steps, see Select a stage field. If a workflow uses the Requested Item table, the stage field is automatically set to the Stage field of the table and cannot be changed.
- Work through the workflow. Any other updates made to the workflow field, such as updates from business rules or other scripts, can interfere with displaying workflow stages.

Select a stage field

A Stage field allows the workflow context to show additional workflow information, such as the stage name and the estimated completion time for an activity.

Ensure that the workflow field you want to use as the stage field is configured to properly display stages. For detailed steps, see Create a workflow stage field.

Unless the workflow uses the Requested Item (sc_req_item) table, you can specify which field from the workflow table is the stage field. For workflows that use the Requested Item (sc_req_item) table, the stage field is automatically set to the Stage field of the table and cannot be changed.

To add or edit a workflow stage field:

1. Navigate to Workflow > Workflow Editor.
2. Create or check out the workflow.
3. In the title bar, click the menu icon and select Properties.
4. In the Workflow Properties dialog box, click the General tab.
5. In the Table list, verify that the table containing the workflow field is selected.
6. Click the Stages tab.
7. From the Stage field list, select the workflow field.
8. Click Update.

Display approvers in workflow stage fields

Enable workflow stage fields to display approvers, change the number of approvers to display, or disable displaying approvers.

Role required: admin

By default, only workflow stage fields that use the Workflow-driven renderer can display a list of approvers. Only these workflow stage renderer types support displaying approvers.

- Linear renderer
- Main flow renderer
- Workflow-driven renderer

1. Navigate to Workflow > Administration > Properties.
   The system displays the Workflow Properties page.
2. Set the following properties.
### Property

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of approvers to show if approvers are displayed for workflow stages. Only valid for supported list v2 renderers. glide.workflow.renderer.show_approver_limit | Sets the maximum number of approvers to display within a workflow stage field. The system displays an ellipsis character when there are more approvers than the display limit allows.  
- Type: integer  
- Default value: 5 |
| Show approvers when displaying workflow stages with the Linear renderer. glide.workflow.renderer.linear.show_approval | Enables (true) or disables (false) the Linear renderer to display approvers.  
- Type: true | false  
- Default value: false |
| Show approvers when displaying workflow stages with the Main flow renderer. glide.workflow.renderer.mainflow.show_approval | Enables (true) or disables (false) the Main flow renderer to display approvers.  
- Type: true | false  
- Default value: false |
| Show approvers when displaying workflow stages with the Workflow-driven renderer. glide.workflow.renderer.workflowdriven.show_approval | Enables (true) or disables (false) the Workflow-driven renderer to display approvers.  
- Type: true | false  
- Default value: true |

3. **Click Save.**

4. **Add stages to workflows that have associated workflow stage fields.**

   **Note:** If you add stages to a subflow, the parent workflow must also have stages.

5. **For each approval activity you want to display approvers, select a Stage value.**
   
   For example, the sample workflow **Service Catalog Item Request** has two approval activities. The first **Approval - User** activity has a Stage value of Dept. Head Approval. The second **Approval - User** activity has a Stage value of CIO Approval.

   The workflow stage field renderers you enabled display approvers up to the approver display limit. For example, a Workflow-driven stage field displays up to five approvers when the workflow reaches an approval stage. **Workflow stage field icons and tooltips**

   A workflow stage field displays icons to indicate the workflow stage.

   Based on the stage renderer selected for the workflow, these icons may display a tooltip with additional information.

   **Workflow field icons**

<table>
<thead>
<tr>
<th>Icon</th>
<th>Workflow stage</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="current_active_step_icon" alt="Current active step" /></td>
<td>Current active step</td>
</tr>
<tr>
<td><img src="approval_pending_icon" alt="Approval pending" /></td>
<td>Approval pending</td>
</tr>
</tbody>
</table>
Stage tooltips

Based on the stage renderer selected for a workflow, workflow stage icons may display tooltips with detailed information about a stage.

**Stage renderers and tooltip behavior**

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Tooltip behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Legacy</td>
<td>When a user points to a stage, the tooltip displays the name of the stage. In the expanded view, the activity status appears in parentheses next to the stage.</td>
</tr>
</tbody>
</table>
When a user points to a stage, the tooltip displays the name of the stage. If the stage is a gated approval, the tooltip also shows the name of the approver. In the expanded view, the activity status appears in parentheses next to the stage.

If you do not want the approver’s name included in the tooltip, navigate to **System Properties > Service Catalog** and clear the **Show the current pending approver’s name in the stage widget mouseover** check box.

**Show the current pending approver’s name in the stage widget mouseover**

- Yes
- No

**Property for displaying pending approver’s name**

**Workflow stage renderers**

Workflow stage renderers determine how a workflow displays stages in a workflow field.

There are multiple renderers available.

**Note:** Most workflows should use the workflow-driven renderer. This renderer is used by default for all workflows. Use a different stage renderer only after careful consideration and to satisfy specific requirements for how the stages appear.
Workflow-driven

Use the workflow-driven renderer as much as possible. This renderer displays icons for stages using the stage state controlled by the workflow. Icons are displayed in a way that is meaningful for many situations. This renderer can display stages from a main workflow and subflows. The order of the icons is determined by the expected path of the executing workflow. As the workflow progresses, stages on paths that the workflow did not take are removed from the display. Stages from paths other than the expected path are not included unless the workflow follows that path.

The **Stage order** field on the **Stages** tab has two options:

- Computed uses the actual workflow path in order
- User-specified uses the order specified in the **Order** column on the Workflow Stages record

**Note:** If the workflow context for a request item has been deleted, the stages for that request item can no longer be rendered. This stage history is stored on the workflow context.

Main flow

The main flow renderer displays icons for stages defined in the main workflow only. Use this renderer when you do not want to expose the details of the subflows. For example, a single main workflow may run several subflows to handle implementation details. The stages in these subflows do not provide useful information for the user who starts the workflow, but are useful when editing the subflow. In this scenario, using the main flow renderer leads to the best user experience. The stage field displays the high-level process of the workflow without exposing unnecessary details.

The **Stage order** field on the **Stages** tab has two options:

- Computed uses the actual workflow path in order
- User-specified uses the order specified in the **Order** column on the Workflow Stages record

Linear

Linear rendering displays all stage icons from the main workflow and all subflows within a single workflow field on a list or form. It displays icons in a linear sequence regardless of the paths the workflow follows as it executes. This renderer uses stages defined in both the main workflow and any subflows that the main flow launches. The icons appear in the user-specified order. Skipped stages do not appear.

Use this renderer when the workflow stages must display in a consistent order and the actual details of how the workflow runs are less important. For example, a workflow may revisit or revert to previous stages based on one or more *Condition Workflow activities*. Displaying these loops in the stage field does not provide useful information to the user. In this scenario, using the linear renderer leads to the best user experience. The stage field displays the predefined process, including stages from subflows, in a consistent order.

For example, you can create a service catalog workflow that uses a subflow to complete delivery of the requested item. The following images illustrate the main flow and subflow for ordering corporate-branded supplies.
Linear main flow

The linear renderer displays all these stages in one workflow field. The parent workflow specifies the **Waiting for approval**, Fulfillment, and **Completed** stages. The subflow specifies the **Delivery** and **Waiting for Task**, and **Delivery OK** stages.

**Progress bar**

The progress bar renderer displays a single progress bar instead of a sequence of stage icons. This renderer is particularly useful when you want to display the general progress of the workflow as a percent. Each stage in the workflow controls an equal percentage of the progress bar. For example, if a workflow has 10 stages, reaching each stage causes the workflow field to display an additional 10% of the progress bar. Stage names do not appear in the progress bar.
The progress bar renderer provides a way to display the status of a workflow that has a large number of stages. Other rendering options may provide a better user experience when rendering fewer than four stages in a single workflow.

The **Stage order** field on the **Stages** tab has two options:

- **Computed** uses the actual workflow path in order
- **User-specified** uses the order specified in the **Order** column on the Workflow Stages record

---

**Legacy**

The legacy renderer displays stages in the same way as releases prior to Dublin. When an instance is upgraded from a release prior to Dublin, all existing workflows are set to use the legacy renderer. Whenever possible, use a different stage renderer instead. If you want your workflow to maintain pre-Dublin behavior, use the Legacy option. The legacy renderer sometimes assigns incorrect data to and/or reports incorrect data from the workflow stage field. If possible, we recommend all workflows use the Workflow-driven renderer.

With the legacy renderer, you can create and reference a custom workflow field icon set by setting the icons attribute to a new script include. For example, to use the `WorkflowIconsSCR` script include to define which icons to use, add the attribute `icons=WorkflowIconsSCR` to the **Attributes** field of the dictionary entry for the workflow field. To use the default icon display behavior, use the attribute `icons=WorkflowIconsStages`.

The legacy renderer works with all tables except the Requested item (sc_req_item) table. In this case, use the requested item renderer instead.

---

**Requested item**

The requested item renderer functions the same way as the legacy renderer, but is for use with the Requested item (sc_req_item) table.

Only in Now Mobile, default stage renderer is used.

Select a stage renderer

In most cases, the default workflow-driven renderer should be used. If you have specific requirements for displaying stages, you can select a different stage renderer.

Consider the following when selecting a stage renderer:

- **Use** the workflow-driven renderer if possible. This is the default renderer that should be used in most cases.
- **Use** the legacy renderer only if your instance was upgraded from a release prior to Dublin and you want your workflow to maintain pre-Dublin behavior.

To use linear, main flow, or progress bar rendering, satisfy the following requirements.
### Linear and progress bar renderer requirements

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Requirements</th>
</tr>
</thead>
</table>
| Linear     | - The parent workflow and all subflows must modify the same current record.  
- In the properties for all subflows, the Stage field value for all subflows must match that of the parent workflow.  
- The parent flow and all subflows must contain the same stages. Use a stage set to ensure the parent flow and all subflows have the same stages.  
- On the workflow canvas, each workflow needs only the stages used directly by that workflow. It is not necessary to add stages from subflows to activities on the parent flow, or stages from the parent flow to activities on the subflows. |
| Main flow  | - The workflow contains subflows.  
- You do not want or need to reveal the details about the subflows. |
| Progress bar | - The workflow properties must have a Stage ordering value of User-defined  
- There must be workflow stages within the workflow.  
- Because stage names do not appear in a workflow field when using the progress bar renderer, you can simplify stage names to represent a percentage of the workflow. For example, if a process has four main steps, name the workflow stages as 25%, 50%, 75%, and 100%. Enter the numerical value of each stage, such as 25, in the Value and Order fields. |

To select a stage renderer:

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Properties**.
4. In the Workflow Properties dialog box, click the **Stages** tab.
5. From the **Stage rendering** list, select a stage renderer.
   - If you are using two workflows to update two unique workflow fields on a single record, both workflows must use a non-legacy renderer. You can select a different stage renderer for each workflow but do not select **Legacy** for either one.
   - If you want to use the linear renderer, make sure you select **Linear** in the properties for the parent workflow and all subflows.
6. Click **Update**.
Workflow fields with deleted records

Workflow fields may indicate when a record required by the workflow is deleted. After a referenced record is deleted, the reference in the primary record is no longer valid. If the stage renderer detects a reference that is no longer valid, the stage field displays a message about the deleted record.

Administrators can restore deleted records. For more information, see Use the Deleted Records module to restore a deleted record.

Workflows with missing records

The image shows a list with two workflows. The top request does not have an associated request item. The bottom request has an associated request item, but the item does not have an associated workflow context.

Workflow validation

Workflow validation examines different characteristics of a workflow to locate issues that might prevent the workflow from being published or cause it to fail. The validation report summarizes the results of each separate workflow validation.

Validation prevents workflows with critical flaws from executing and resulting in an unstable or incomplete state. There are a number of validators in the base system that notify workflow designers of potential problems. For example, multiple End activities, disconnected transitions, incorrect table references, missing subflows, and dependencies affected by update sets. A workflow validation report displays the results from each validator, including a message explaining what was found. The system automatically validates a workflow when you publish it. You can also run validation on a workflow directly from controls in the Workflow Editor.

Highlighting critical errors

The graphical Workflow Editor highlights critical errors when a workflow is loaded. In this example, a subflow is missing and is not available to the parent workflow for the current user. The graphical Workflow Editor indicates the error when the parent workflow loads by highlighting (in red) the activity that calls the subflow. To correct the error in the parent workflow, click the validate icon in the header bar and inspect the error description in the validation report.
Validate missing subflow

Validations at publishing

If you attempt to publish an invalid workflow or a workflow with potential problems, the system displays an error message and blocks the operation, if necessary. When validation error messages appear, click the validate icon in the graphical Workflow Editor to see the error report.

Validation warning

A validation warning notifies you that a potential problem exists in a workflow but permits you to publish the workflow. Validation warnings appear when:

- You edit and then attempt to publish a workflow that is included as a subflow in another workflow. The system cannot determine how your changes will affect the parent workflow and alerts you of the relationship.
- A workflow activity uses a different table than the table assigned to the workflow. The system alerts you of the potential conflict.

Publish Confirmation

Validation warning. Click the validation button in the toolbar to get details:

Validate Summary - Workflow version contains Warnings - Total checks performed:15 (Info:13 Warn:2, Critical:0)

Publish this workflow with warnings?

Validation warning

Validation failure
A validation failure notifies you that a critical error has occurred in the workflow that prevents you from publishing the workflow. An example of a critical error is a missing subflow.

Validation failure

Workflow validation report

Validators display three notification levels: CRITICAL, WARN, and INFO. The designer can publish a workflow that returns WARN or INFO level validation, but not a workflow that returns an overall validation level of CRITICAL.
Workflow Validation Report

Workflow Validation Report for Workflow "Item Designer - Approvals"
Validate Summary - Workflow version contains Warnings - Total checks performed: 15 (Info: 14, Warn: 1, Critical: 0)

Report columns

Workflow validation report

Header summary
The header of the validation report summarizes the entire validation run against the specified workflow.

- **Validate Summary**: The overall score reflects the most severe notification level encountered during the validation.
- **Total checks performed**: The total number of validations run is also broken down to show the number at each notification level.

Report columns
The body of the report displays the results of each individual validation check that was performed. The columns are **Type**, **Level**, and **Message**. You can sort and filter these columns as you would any list.

**Workflow termination and external dependencies levels**

<table>
<thead>
<tr>
<th>Name</th>
<th>Implication</th>
</tr>
</thead>
<tbody>
<tr>
<td>Info</td>
<td>Provides information about the current workflow version. An example of an information level message is one that names the lowest common table in the workflow. Workflows at this validation level are considered valid and publishable.</td>
</tr>
<tr>
<td>Warning</td>
<td>Alerts the user that the validator detected anomalies in the workflow that might compromise its ability to execute. An example of a warning level message is one that alerts you to a missing activity input transition. Workflows at this validation level are considered valid and publishable.</td>
</tr>
<tr>
<td>Critical</td>
<td>Names a workflow element containing a critical error that prevents the workflow from executing successfully. Examples of this are missing or invalid subflows and missing transitions. Workflows at this validation level cannot be published or run in production.</td>
</tr>
</tbody>
</table>

**Message**

The validation message provides a detailed description of the results, including table names, update sets, and other specifics.

For the procedure to validate a workflow and generate a validation report, see [Validate a workflow](#).

**Workflow validator**

ServiceNow offers several workflow validators for workflow designers to test their workflows.

This page lists all available workflow validators. See [Workflow validation](#) for information on using workflow validators and the workflow validation report to see the type of information that is returned.

**Hanging workflows and update sets**

**ValidateTransitionOut**

The ValidateTransitionOut validator finds activity conditions with no exit transitions.

**Validation summary**

- **Risk**: Activity conditions might not transition to the next activity, which could cause the workflow to hang.
- **Severity Level**: Warning
- **Valid Result**: Valid
- **Valid Message**: All conditions have transitions.
- **Invalid Result**: Invalid
- **Invalid Message**: This workflow contains <condition count> activity conditions without an output transition.
- **Suggested Action**: If this is a conscious design decision, there is no corrective action. Otherwise, find the condition cited in the validator and add an appropriate transition to the next activity.
- **Publishable**: Yes
- **Runnable**: Yes
- **Related Information**: None

**Troubleshooting**

Design choices made when creating a workflow on the canvas might legitimately use an activity without an exit condition. In the first example, the Notification and Timer activities both execute at the start of the workflow. The Timer is the entity that decides when the workflow ends. In this situation, executing the Notification, but not transitioning away, keeps the design simple and adds no risk. The validator finds and reports the missing transition from the Notification activity as a Warning that the designer can ignore.
Condition with no valid transition

In the second example, the Notification activity has no exit transition. The designer missed this because of the layout. The transition from the Timer activity passes behind the Notification activity and appears to connect the exit from the Notification activity to the End. In workflows with more than 10 or 15 activities, it might be difficult to see all the transitions clearly. This workflow’s designer intended for the Notification activity to transition to the End.

No condition out

This validator directs the designer to the specific activity and condition that does not have an exit transition. The designer then makes the decision whether or not to respond to the warning.

ValidateTransitionIn

The ValidateTransitionIn validator finds activities that do not have inbound transitions and cannot execute in the workflow.

Validation summary

- **Risk:** Activities that do not have inbound transitions have no means of being executed in the workflow. If other logic builds from these activities, the workflow could hang, with no means of moving forward.
- **Purpose:** Find activities that do not have inbound transitions.
- **Severity Level:** Warning.
- **Valid Result:** Valid.
- **Valid Message:** All activities in this workflow have at least one inbound transition.
- **Invalid Result:** Invalid.
- **Invalid Message:** This workflow contains <activity count> activity conditions without an input transition.
- **Suggested Action:** Either remove the activities to reduce confusion and make the workflow easier to understand or provide the appropriate inbound transition.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** None

**Troubleshooting**

Although the activities detected in this validator do no harm to the execution of the workflow, the designer needs to know that there are activities on the canvas that cannot execute and serve no purpose, particularly in a production system. This error is typically caused by a visual misinterpretation of the drawing.

This example workflow appears to be perfectly valid. Under closer inspection, however, we see that the transition from **Set Values** does not stop at **Approval - User** (there is no arrow end). Instead, that transition goes directly to **End**. As a result, **Approval - User** cannot execute. Because there is an activity in the workflow based on the approval's condition routing, it appears that the designer intended for the approval to execute and that a correction is needed.

This validator directs the designer to the specific activity and condition that has no inbound transition. The designer should establish a transition or remove the activity.
The **ValidateDanglingTransition** validator finds and reports any transitions that do not terminate on an activity.

**Note:** These transitions are not drawn on the workflow canvas, but are still present in the database.

**Warning:** This is a critical error that prevents a workflow from running.

### Validation summary

- **Risk:** A workflow with dangling transitions will silently hang a workflow with no recovery options.
- **Severity Level:** Critical
- **Valid Result:** Valid
- **Valid Message:** Valid
- **Invalid Result:** Invalid
- **Invalid Message:** Invalid
- **Suggested Action:** Remove or connect the offending transition. Get the source activity name from the validation report details and resolve the issue. Then, run the validation again to test your changes.
- **Publishable:** No
- **Runnable:** No
- **Related Information:** None

### Troubleshooting

On rare occasions, the destination of a workflow transition becomes null. The workflow canvas shows no evidence of the transition, but at run time, the workflow hangs when it encounters one of these dangling transitions. If the **ValidateDanglingTransition** validator reports this condition at publishing time, it blocks the publication action until the issue is resolved. If this condition is detected on a runtime check, the workflow is not allowed to execute against a current record’s transaction. Instead, the system adds a critical log entry detailing the activity with the faulted transition to the current record’s workflow context. To enable the workflow to execute on the next appropriate transaction, remove the faulted transition from the workflow model.

To find and remove the faulted transition:

1. Make note of the workflow version and activity that contains the faulted transition as indicated in the validator details.
2. Navigate to **Workflow > Administration > Workflow Version**.
3. In the list of workflow versions, select the workflow that has the faulted transition.
4. On Workflow Version form, add the workflow activities related list. Click the menu icon, select **Configure > Related Lists**, move **Workflow Activity-->Workflow Version** from the **Available** list to the **Selected** list, and click **Save**.
5. In the **Workflow Activities** related list, select the activity cited in the validator.
6. In the Workflow Activity form, view the **Workflow Transitions** section or tab and identify the transition in that list that has no value or a null value in the **To** column.
7. Delete this transition.
8. Return to the workflow version and re-run the validation check.

The Critical warning should disappear. The workflow should execute as expected on the next appropriate transaction.

**ValidateSubflows**

The ValidateSubflows validator detects any workflows included as subflows that are either inactive, deleted, or not available as a published workflow for the current user.

Any of these conditions cause the workflow to hang when the workflow activity in the main flow is encountered.

---

**Warning:** This is a critical error that prevents a workflow from running.

---

**Validation summary**

- **Risk:** A parent workflow that transitions to a deleted subflow hangs indefinitely, with no recovery options.
- **Severity Level:** Critical
- **Valid Result:** Valid
- **Valid Message:** This workflow contains `<count>` valid subflows.
- **Invalid Result:** Invalid
- **Invalid Message:** This workflow contains `<invalid count>` invalid subflow(s) of `<total subflow count>` total subflows.
- **Suggested Action:** Remove the link in the parent workflow to the questionable subflow, examine the subflow to ensure that it is valid and published, or that it is checked out to the current user. After making the correction to the state of the subflow, run the validation again to test your changes.
- **Publishable:** No
- **Runnable:** No
- **Related Information:** Workflows used as subflows

---

**Troubleshooting**

When a workflow runs, regardless of whether it is a subflow or a main flow, the script engine determines which version of a workflow should execute, given the current user and workflow conditions. When a workflow is checked out by the same user who is running the workflow, the checked out version is the version that executes. If the user is not the same person who has the workflow checked out, the published version of the workflow executes. If there is no published workflow, no workflow runs.

One scenario addressed by the ValidateSubflows validator is when a workflow:

- Is checked out to User A.
- Is a subflow in a parent workflow being run by User B.
- Has no published alternative to the subflow being run by User B.

When this occurs, the parent workflow runs to the execution of the unpublished subflow and then hangs at that activity, with no means to transition forward. Main flows that encounter this condition in a subflow are not permitted to execute against a current record's transaction. Instead, a critical log entry detailing the subflow's state is added to the current workflow's Workflow Context record. To correct the problem, remove the subflow from the main flow, or
publish the subflow so it is available to User B. This allows the workflow to execute on the next appropriate transaction.

Another scenario addressed by the ValidateSubflow validator is when a workflow:

• Is a subflow in a parent workflow being run by any user.
• Has no published alternative to the subflow, because the workflow has been deleted or all versions of the workflow are unpublished or inactive.

Note: You cannot delete a from a list or form workflow that is a subflow. However, you can create one of these unstable conditions with advanced scripting, SQL options, or incomplete update sets that contain main flows, but not the referenced subflows. When troubleshooting a workflow that triggered this validator, consider the history of the subflow while assessing the error condition.

ValidateScriptForCurrentDotUpdate

The ValidateScriptForCurrentDotUpdate validator finds workflow activities with scripts that use the current.update() function.

Calling current.update() causes significant performance delays in transaction processing and might cause an instance to hang.

Validation summary

• Risk: At best, a workflow that uses current.update() in scripts experiences degraded performance. In the worst case, the workflow enters an infinite, recursive loop that crashes the server.
• Severity Level: Warning
• Valid Result: Valid
• Valid Message: The JavaScript in this workflow has no instances of 'current.update()'.
• Invalid Result: Invalid
• Invalid Message: This workflow uses 'current.update()' in <count of current.update references> JavaScript statements.
• Suggested Action: Remove current.update() from the activity scripts cited by this validator. Workflows execute within a transaction, and current is updated, or possibly inserted, at the end of the transaction, as appropriate. There is no need to explicitly update the record during the transaction.
• Publishable: Yes
• Runnable: Yes

Problems with current.update() in workflow scripts

A workflow initiates execution in one of these ways:

• Script Engine: If a workflow is assigned to a specific table, and given a run condition, the workflow runs on INSERT.
• Script: Any business rule, script include, background script, or client script can initiate a workflow using the workflow script include and calling startFlow().

The workflow engine initiates a workflow based on the matched criteria of the current record being inserted. The transaction for current is managed by the script engine and not the workflow. Workflows that progress on the update() of the current record are not invoked via the workflow engine, but as a call from either a client script or business rule. In either case, the script engine is
invoked, and the current record is put in memory. Edits and modifications to any current fields are made and are available to other activities and scripts that are executed in the same transaction.

When appropriate, other engines that run in sequence with the workflow engine, such as the business rule engine or field normalization, are invoked against the same current record transaction. Any changes made to current through these scripts and activities modify the record in memory. These changing values are available for reference in any other transactions called from activities and scripts in the same INSERT transaction. When all expected changes are executed, the current record is inserted.

When one of these scripts calls `current.update()` on a record that has yet to be inserted, the action forces an unnecessary and error-prone database transaction. If a record is not yet in the database, it cannot be updated. Business rules that trigger on `update()` on a record that is in the process of being inserted can cause a very unstable and potentially infinite looping condition.

**Troubleshooting**

This validator detects the use of `current.update()` in any of the editable script fields. Do not call `current.update()` from within a workflow script. In the event of an INSERT or UPDATE of current, the changes made to current are available to all scripts executing in the same transaction, and the script engine stores all changes in the database. Leave the update of current to the engine. Use the scripts only for setting and referencing the current field values.

**ValidateLowestCommonTable**
The **ValidateLowestCommonTable** validator reports the lowest table in the Glide hierarchy that the workflow uses.

For example, the Requested Item (sc_req_item) table is the lowest table in a workflow containing a **Catalog Task** activity. This information is significant to a designer who wants to change the table against which an existing workflow runs after adding activities to the canvas.

| Note: | This validator provides information only. It does not indicate an error or warning condition. |

**Validation summary**

- **Risk:** This validator informs only and has no risk associated with it.
- **Severity Level:** Data/Information
- **Valid Result:** Valid
- **Valid Message:** The lowest common table in this workflow is <<table_name>>.
- **Invalid Result:** N/A (informational only)
- **Invalid Message:** N/A (informational only)
- **Suggested Action:** None
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow activities

**ValidateTableChange**
The **ValidateTableChange** validator reports any activities in the workflow that are invalid given the table associated with the workflow version.

For example, a workflow version that is associated with the Change Request (change_request) table but has a **Catalog Request** activity on the canvas is invalid, since the activity is not compatible with the selected table.
Validation summary

- **Risk**: If the current record at runtime does not originate from the table specified by the lowest common table, the activities for the lowest common table cannot set specific values.
- **Severity Level**: Warning if the table that is associated with a workflow is higher in the table hierarchy than the lowest common table required for the workflow activities.
- **Valid Result**: Valid
- **Valid Message**: All activities are valid for the newly selected table
- **Invalid Result**: Invalid Activity
- **Invalid Message**: This workflow contains <count of invalid activities> invalid activities for the newly selected table.
- **Suggested Action**: Make one of these changes:
  - Change the workflow to not require the activities associated with the lowest table reported.
  - Modify the workflow to use a table that contains the lowest common table in its hierarchy.
  - Ensure that the current record meets the requirements of the at-risk activities.
- **Publishable**: Yes
- **Runnable**: Yes
- **Related Information**: Workflow activities

Troubleshooting

Navigate to Workflow > Administration > Activity Definitions. Note the Table column in the list. Each activity that is not global is associated with a table.

When you select a table in the Workflow Properties form, the activity menu presents only activities that are compatible with the selected table. Associating a table with a workflow activity enables the system to make certain decisions about the activity that affect value comparison, condition routing, or the setting and getting of field values in the current record.

When a workflow is set to the Global (global) table, it is possible that the process executing the workflow ensures that the current record meets the requirements of the activities identified by this validator. In that case, the activity still works as expected. If that assurance cannot be guaranteed by the user process, do not use the activity identified by the validator without assigning a table that meets the requirements of all the activities on the canvas.

This validation check ensures that the table specified by all the activities in a particular workflow is included in the hierarchy of the table selected for the workflow.

**ValidateParentFlow**
The **ValidateParentFlow** validator reports any workflows that use the workflow as a subflow.

Validation summary

- **Risk**: There is no risk in a workflow being a subflow. This is only a warning that other workflows are at risk from dramatic changes to a subflow.
- **Severity Level**: Warning
- **Valid Result**: Valid
- **Valid Message**: Currently <workflow version name> is not a subflow.
- **Invalid Result**: None
- **Warning Message**: This workflow version (<workflow version name>) is required as a subflow in <workflow version count> other workflows.
Troubleshooting

The system warns the workflow designer at publishing time and during validation that a workflow is a subflow. This warning reminds the designer that changes to the current workflow have the potential to affect workflows cited in the validation report or other workflows already running in production. Regardless of how simple the change to a workflow that is a subflow, thoroughly test all parent flows cited in this validation report before publication.

When a workflow is a subflow, changes that can cause it to become invalid include:

- Changing the data types of input variables. Verify that all parent workflows cited in this validation report can pass the correct value type.
- Adding input variables. Verify that all parent workflows cited in this validation report are able to pass all variable values into the subflow.
- Changing or removing the return value of a workflow. Verify that any changes to the return value of a workflow are compatible with the requirements of all the parent flows.
- Changing the table on which the workflow runs. Verify that the table selection is compatible with all parent flows.

**Note:** To delete a workflow that is a subflow, first remove the dependency by removing the subflow from all parent flows cited in this validation report. After the dependencies are cleared, a user with the proper role can delete the subflow.

**ValidateSingleEnd**

The ValidateSingleEnd validator finds and identifies multiple End activities in a single workflow.

Multiple End activities in a workflow might be intentional and have no affect on the workflow, or might be a mistake that the designer needs to correct.

**Validation summary**

- **Risk:** If the execution paths to the End activities are not mutually exclusive, then the first End encountered completes the workflow and cancels all other executing activities.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** This workflow contains 1 End activity.
- **Invalid Result:** Invalid Activity
- **Invalid Message:** This workflow contains <count of ends> End activities.
- **Suggested Action:** Remove extraneous End activities that are not intended as part of the design.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** None
Troubleshooting

As soon as an End activity is encountered in the workflow, the workflow completes even if there are other viable execution paths leading to a second End activity that is still executing. Those executing activities are canceled as part of the End activity's clean up actions. Therefore, the results of designing workflows with multiple Ends must be carefully considered.

In the case of large workflows, it is often more intuitive to read the workflow when there are multiple End activities. In the following example, the paths to the two Ends are mutually exclusive execution paths. If this was a large workflow, with many activities between Branch and the second End, the value of the multiple ends becomes apparent. Tracing a No response from User is invalid to a single End behind 33 other activities would be significantly more difficult. There is no risk in this workflow design because there is no reason for other activities to execute if the End after the Notification activity terminates the workflow.

![Workflow Diagram]

Mutually exclusive execution paths

The next example has multiple End activities in execution paths that are not mutually exclusive. A Yes response from User is valid causes the Set Values activity to finish immediately. By reaching its End activity first, this execution path cancels the Approval for Apps and the DB Task activities, which might not be the desired outcome. If the paths are all expected to complete before End, the activities should come to a Join (as in the previous example) that transitions to a single End.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Mutually inexclusive execution paths

**Note:** To add the second End, right-click to copy the original End activity and paste it onto the canvas. In most cases, a single End is the best and most reliable way to ensure that all activities expected to execute prior to workflow completion, do so successfully.

**ValidateUpdateSetDependencies**

The **ValidateUpdateSetDependencies** validator identifies all the subflows called in the current workflow and determines if any of those subflows are being edited in a different (in progress) update set.

This warning informs the user that this workflow and one or more of its dependencies are being actively modified in a way that will not deploy concurrently to another instance without additional effort.

For information about update sets, see [Create and select an update set](#).

**Validation summary**

- **Risk:** If a parent workflow is edited in one update set and its dependent subflow is edited in another, the two workflows might not be compatible when moved to a different instance. Making independent changes, such as to common or expected values, can make the two workflows incompatible.
- **Severity Level:** Warning
- **Valid Result:** Valid

© 2019 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
• **Valid Message:** There were no Update Set dependency issues found.
• **Invalid Result:** Invalid
• **Invalid Message:** This workflow has dependent workflows that are in a different update set.
• **Suggested Action:** Modify and deploy both workflows in the same update set. If you must modify dependencies in separate update sets, use one of these methods:
  • Ensure that all update sets migrate concurrently.
  • Prior to deploying the main flow update set, merge the dependencies into one update set before completing that update set.
• ** Publishable:** Yes
• **Runnable:** Yes
• **Related Information:** [Workflow movement with update sets](#)

### Troubleshooting

A workflow is added to an update set only when the workflow is published. This validator issues a warning when either of the following conditions exist:

- A published subflow is in a different update set than the parent workflow and that update set is In progress.
- A subflow is checked out by another user, who is working in a different update set than the current user.

**Note:** This validator does not look for update sets that have been closed. It looks only at update sets that are In progress or at the update sets of all subflows being used by the current workflow that are checked out to users who are working in a different update set.

### Example

Following is an example of an at-risk development scenario in which two users create dependencies between workflows in different update sets.

**User A:**
1. Sets Update Set A to the current update set.
2. Checks out Workflow A.
3. Changes the return value of the **String** type in Workflow A to a **Reference/User** type.
4. Publishes Workflow A, causing an entry into Update Set A.

**User B:**
1. Sets Update Set B to the current update set.
2. Checks out Workflow B.
3. Includes Workflow A as a subflow.
4. Uses the user reference return value from Workflow A as an approval assignment.
5. Publishes Workflow B, causing an entry into Update Set B.
Risks

- User B moves Update Set B to a different instance that has an older version of Workflow A. The return value is not a user reference, which causes the outcome of Workflow B to be different than it was when tested in development.
- User B moves Update Set B to a new instance that does not have a version of Workflow A. Workflow B experiences a validation failure at runtime and cannot execute. A log entry is added to the workflow log of the current record.

Possible solutions

Solution 1
Migrate the parent workflow and all dependent workflows to a new instance together using the same update set.

1. Set the update set to the one you want to migrate to new instances.
2. Check out and republish the workflows that need to be included.
   - This action forces an entry into the current update set.
3. Complete the update set with all dependencies.
4. Follow standard procedures for migrating update sets to local instances.

Solution 2
Move dependent workflows between update sets.

1. Identify the update set containing the main workflow to be migrated.
2. Navigate to System Update Sets > Local Update Sets.
3. Find and select the update set that contains the dependencies to the main workflow.
4. In the Customer Updates related list, select the workflow version of the subflow you want to move.
5. Select the update set containing the parent workflow in the Update set field.
   - If this field is not on the Customer Update form, configure the form and add the field.
6. Click Update.
   - The base system moves the dependent subflow to the update set selected.
7. Repeat steps 4-6 to add additional dependent subflows to the parent flow update set.

ValidateUpdateSetParentDependencies
The ValidateUpdateSetParentDependencies validator identifies all the workflows that call the current workflow as a subflow and determines if any of those parent workflows are being edited in a different update set that is in progress.

This warning informs the user that this workflow and one or more workflows that depend on this workflow are being actively modified in a way that will not deploy concurrently to another instance without additional effort.
Validation summary

- **Risk:** If a parent workflow is edited in one update set and its dependent subflow is edited in another, the two workflows might not be compatible when moved to a different instance. Making independent changes, such as editing common or expected values, can make the two workflows incompatible.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** There were no Update Set dependency issues found.
- **Invalid Result:** Invalid
- **Invalid Message:** This workflow has dependent workflows that are in a different update set.
- **Suggested Action:** Modify and deploy both workflows in the same update set. If you must modify dependencies in separate update sets, use one of these methods:
  - Ensure that all update sets migrate concurrently.
  - Prior to deploying the main flow update set, merge the dependencies into one update set before setting that update set to complete.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow movement with update sets

Troubleshooting

A workflow is added to an update set only when the workflow is published. This validator issues a warning when either of the following conditions exist:

- A published subflow is in a different update set than the parent workflow and that update set is In progress.
- A subflow is checked out by another user, who is working in a different update set than the current user.

**Note:** This validator does not look for update sets that have been closed. It looks only at update sets that are In progress or at the update sets of all parent workflows that call the current workflow and are checked out to users who are working in a different update set.

Example

Following is an example of an at-risk development scenario in which two users create dependencies between workflows in different update sets.

**User A:**

1. Sets Update Set A to the current update set.
2. Checks out Workflow A.
3. Changes the return value of the **String** type in Workflow A to a **Reference/User** type.
4. Publishes Workflow A, causing an entry into Update Set A.

**User B:**

1. Sets Update Set B to the current update set.
2. Checks out Workflow B.
3. Includes Workflow A as a subflow.
4. Uses the user reference return value from Workflow A as an approval assignment.
5. Publishes Workflow B, causing an entry into Update Set B.

**Risks**

- User B moves Update Set B to a different instance that has an older version of Workflow A. The return value is not a user reference, which causes the outcome of Workflow B to be different than it was when tested in development.
- User B moves Update Set B to a new instance that does not have a version of Workflow A. Workflow B experiences a validation failure at runtime and cannot execute. A log entry is added to the workflow log of the current record.

**Possible solutions**

**Solution 1**

Migrate the parent workflow and all dependent workflows to a new instance together using the same update set.

1. Set the update set to the one you want to migrate to new instances.
2. Check out and republish the workflows that need to be included.
   - This action forces an entry into the current update set.
3. Complete the update set with all dependencies.
4. Follow standard procedures for migrating update sets to local instances. For information about update sets, see *System update sets*.

**Solution 2**

Move dependent workflows between update sets.

1. Identify the update set containing the main workflow to be migrated.
2. Navigate to *System Update Sets > Local Update Sets*.
3. Find and select the update set that contains the dependencies to the main workflow.
4. In the *Customer Updates* related list, select the workflow version of the subflow you want to move.
5. Select the update set containing the parent workflow in the *Update set* field.
   - If this field is not on the Customer Update form, configure the form and add the field.
6. Click *Update*.
   - The base system moves the dependent subflow to the update set selected.
7. Repeat steps 4-6 to add additional dependent subflows to the parent flow update set.
ValidateInputVarUpdateSetDependencies

The ValidateInputVarUpdateSetDependencies validator examines update sets to ensure that workflow input variables for a given workflow have not been deleted in different update sets than those currently In progress.

Validation summary

- **Risk:** Workflows and their input variables are not moved together in a single update set. The deletion of input variables is captured in a different update entry. If these two entries are not in the same update set, the workflow execution can be unstable.
- **Purpose:** Determine whether input variables that belonged to this workflow were deleted in a different update set.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** There were no Input Variable Update Set dependency issues found.
- **Invalid Result:** Invalid
- **Invalid Message:** There are input variables that have been deleted and logged in a different update set.
- **Suggested Action:** If the deletion is not intended to be separate from the workflow, ensure that both update sets are committed concurrently to the new instance, or merge both payloads into a single update set.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow movement with update sets

Troubleshooting

Workflow input variables get individual entries in the Customer Update related list in the current user's update set. This validator reports to the user when workflow input deletions have happened in an update set other than the current user's update set.

Follow the instructions for Input variable removal when the validator issues this warning.

ValidateWorkflowEndStages

The ValidateWorkflowEndStages validator checks that in workflows with stages, the end activity of the workflow has a stage named Complete or Completed.

If the workflow has stages associated with it, but does not have the completed stage on the end activity, then the stage indicator will not show that the workflow completed.

Validation summary

- **Risk:** The stage indicator will not show the workflow is completed.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** Workflow end stages are valid.
- **Invalid Result:** invalid
- **Invalid Message:** End activity A found with invalid stage 'S.'
- **Suggested Action:** If this is not by design, make the appropriate changes.
- **Publishable:** Yes
- **Runnable:** Yes

• **Related Information:** Workflow activities

**Troubleshooting**

Check the workflow for an end activity. Ensure that this activity assigns a stage named Complete or Completed.

*ValidateWorkflowStageColumn*

The `ValidateWorkflowStageColumn` validator detects and reports when the stage field (stage column) for a workflow is not correct or is unusable.

**Validation summary**

- **Risk:** The stage indicators may not display appropriate information.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** Workflow stage values are valid.
- **Invalid Result:** Warning
- **Info Summary:** Stage warnings found.
- **Invalid Messages:**
  - Table T does not have a column named C.
  - Workflow for table T has stages, but no stage column.
  - Table T has a stage column "C," but no stages are set by activities.
  - Workflow on table T has stage column "C" that is not type=workflow.

- **Suggested Action:** If this is not by design, make the appropriate changes.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow activities, Workflow stages

**Troubleshooting**

To check the stage column:

1. Open and check out a workflow.
2. Open the workflow version properties dialog by clicking the menu icon and selecting **Properties**.
3. View the **Stages** tab or section.
4. Check that the assigned stage column is actually a column in the table to which the workflow is associated.
5. Check that the column is type=workflow.

**Tip:** Stage columns should not be choice lists. If they are, the list appears read-only in form views, since changing that column value outside the workflow engine does not ensure safe tracking of stage states.

*ValidateWorkflowStateValues*

The `ValidateWorkflowStateValues` validator checks a number of stage aspects in workflow activities for correctness.
This validator has multiple possible error messages.

**Validation summary**

- **Risk:** The stage indicators may not display appropriate information.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** Workflow stage values are valid.
- **Invalid Result:** invalid
- **Warning summary:** Stage warnings found.
- **Invalid Messages:**
  - Stage with empty name is not allowed.
  - Stage with empty value is not allowed.
  - Cannot have more than one stage with the same name: x.
  - Cannot have more than one stage with the same value: y
- **Suggested Action:** If this is not by design, make the appropriate changes.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow activities

**Troubleshooting**

Use the following procedure to troubleshoot this validator:

1. Open and check out a workflow.
2. Open the list of stages for the workflow by clicking the menu icon and selecting **Edit Stages**.
3. Check the names and values.
   - Ensure that the names and values are unique and are not empty.
4. If the same stage name or value appears more than once, remove one of the rows. It is then very important to go through the workflow and reassign stages in the activities that used the removed stage.
Workflow Stages

Validate Workflow State Values

Tip: Make a list of which activities assign which stages.

Workflow concepts

You can do many things using the Workflow Editor.

- Modify core activities and exit conditions.
- Create custom activities and reuse the data for other workflows.

See Orchestration activity designer.
- Download activity packs from the ServiceNow Store and create packs for upload.
- **Edit workflows** graphically.
- **Define transitions** between workflow activities.
- For the table that corresponds to the workflow, customize business rules.
- Summarize workflow progress through **stages**.
- **Validate workflows** to identify potential problems.
- **Publish workflows** for other users.
- **Edit multiple tables** without needing to directly modify them.

### Workflow versions

To prevent users from making changes to a workflow that affect other users of the system, workflows must be checked out before they can be edited.

Only one user can check out a workflow at a time. When a workflow is checked out, changes apply only to the user who has the workflow checked out. Other users can continue to use the published workflow. After the changes are complete, the workflow can be published so that it is available to all users.

**Note:** Because each workflow has a unique sys_id, different workflows can have the same name. This is typically expected in a domain-separated environment where users in different companies cannot see each other’s workflows because they are in different domains. However, this can lead to confusion in other environments. In general, give each workflow a unique name to prevent workflow designers from making changes to the wrong workflow.

When a new version of an existing workflow is published, the changes are not applied to running workflow contexts. Any currently running workflow context continues using the workflow version that was available when the workflow started. The next time the workflow runs, it uses the updated, published version.

### Workflow scope

Workflow application scope determines the access that an application has to the information in a workflow, specifically to the data contained in the activities in that workflow.

When a workflow is created, it inherits the application scope from the gear menu for the logged in user. This scope cannot be changed in the Workflow Editor. When the workflow executes, it runs in this scope and can only be called from a different application if the workflow’s accessibility setting permits access to all scopes (public). Otherwise, the workflow’s application scope is private to the application.

**Note:** Any script that is created in the Workflow Editor, such as an advanced script in an If activity, runs in the scope of the workflow. All core activities provided in the base system or for Orchestration run in the scope of the workflow.

Custom activities run in their own scope, even if it is different from that of the workflow. The scope of a custom activity can be private or public. Any script that runs inside a custom activity with a scope can only access outside artifacts that are within the scope of that activity or artifacts that are configured to run in any scope. Conversely, an outside artifact can only access the script inside that private activity if the outside artifact is running in the same scope. Activities with public scopes can interact with outside artifacts in any application scope.

You can use private activities as part of a workflow that has a public application scope. These activities are protected from reaching outside of the workflow or from being reached from outside the workflow. For details about setting application scoping for custom activities, see the field description table for the appropriate activity template.
Note: Custom activities uploaded to the ServiceNow Store must be configured as accessible to all application scopes.

Workflow scope restrictions

There are some restrictions to public and private application scopes.

During runtime, publicly scoped workflows can access other application resources, as long as these resources are set to be accessible to all application scopes. Privately scoped workflows in a private application scope can only access resources private to its scope. Due to scope access boundaries, any privately scoped workflows that make calls out to other scoped resources fail with either an exception or a hung activity while waiting for returned results. This occurs when making calls to these common global resources:

- ECC queues
- Tasks
- Approvals
- Events
- SLA timers
- Timers
- Script includes
- Business rules
- Workflow APIs

As you design workflows, validate the visibility and accessibility of all resources prior to deployment.

See Application scope.

For information on how to configure the scope for a workflow, see Workflow properties.

Domain separation and Workflow

This is an overview of domain separation and the Workflow application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Data only

When domain separation is enabled, workflows and workflow activities inherit the domain of the user who publishes or creates them.

How domain separation works in the Workflow application

While workflows are managed by multiple tables, only the following tables are used for domain separation features:

- Workflow (wf_workflow) and Workflow Version (wf_workflow_version): used for delegated administration or process separation.
- Workflow Context (wf_context): used for data separation.
**Note:** The Workflow Version table (wf_workflow_version) table does not contain a domain field; Workflow Version records inherit their domain from the parent Workflow record.

The Workflow Editor displays a workflow's domain in the title bar after the workflow name.

![Workflow Editor Domain](image)

**Workflows and delegated administration**

Delegated administration allows child domains to inherit workflows from higher up the domain hierarchy and to override them with domain-specific versions if necessary.
Workflow and delegated administration

Workflow records in the Workflow (wf_workflow) and Workflow Version (wf_workflow_version) tables are considered processes. A user in a child domain may check out but not copy a workflow from a parent domain. When a user in a child domain checks out a workflow from a parent domain, the system creates a version of the workflow in that user's domain. This new version is a unique record in the Workflow (wf_workflow) table. After the user publishes this new workflow, other users
in the child domain use the new workflow, which overrides the workflow from the parent domain. The original workflow in the parent domain is no longer visible to users in the child domain.

For example, a managed service provider (MSP) hosts ITSM services for several companies, including ACME and Initech, on a single instance. As administrators, the MSP creates a Change Request - Emergency workflow that applies to all domains because it was created in the TOP domain, which is the highest domain in the domain hierarchy. This workflow overrides the global Change Request - Emergency workflow and specifies that emergency change requests require approval from the CAB approval group. Because of delegated administration, every domain in the hierarchy sees and uses this workflow. Now suppose the ACME domain requires a different approval policy where emergency change requests require approval from the emergency CAB approval group. The MSP creates another version of the Change Request - Emergency workflow in the ACME domain. This workflow overrides the version in the TOP domain and only applies to users in the ACME domain.

**Workflow permissions**

When a user starts a new workflow, the workflow runs with that user’s domain and credentials. The workflow preserves a user’s domain and credentials until an activity causes the workflow to wait, such as an approval activity waiting for approval or rejection. When the stopped workflow resumes, such as when a user approves a request, the workflow uses the credentials of the approving user, but continues to run within the domain of the original user.

**Workflows and data separation**

Data separation restricts workflow contexts to users who are either in the same domain of the workflow or are members of a parent domain.
Workflow and data separation

Workflow records in the Workflow Contexts (wf_contexts) table are considered data. Data separation restricts workflow contexts to users who are either in the same domain of the workflow or are members of a parent domain. While a user in a parent domain can see running workflows, child domains cannot see data upwards.
in a child domain, a user in a child domain cannot see running workflows in a parent domain. If necessary, administrators can use visibility or contains domains to expand who can see domain-specific data.

For example, when an ACME user requests something from the service catalog, a Service Catalog Request workflow context is created in the ACME domain. Similarly, a service catalog request from an Initech user creates a workflow context in the Initech domain. An MSP user in the TOP domain can see both workflow contexts because it is the parent domain for both the ACME and Initech domains. However when an ACME or Initech user logs in, data separation prevents them from seeing each other’s service catalog requests. This is expected behavior because each workflow context contains data specific to that domain, such as the item requested and the request’s approval history.

**Workflow engine operation order**

The workflow engine runs in a predefined order relative to business rules and database operations. It caches commonly-used published workflows to improve performance.

The **Run after bus. rules run** workflow property defines if a workflow is **Default** or **Deferred**.

The diagram below shows the workflow engine order of operations and when Default and Deferred flows are executed. For a more general overview of engine operation order, see **Execution order of scripts and engines**.
Before business rules (order <1000)
Do not use current.update() here

Default workflows
Do not use current.update()

Before business rules (order >=1000)
Do not use current.update()

Database operation (insert, update, delete)
The current record is inserted or updated at the end of the database operation.

After business rules (order <1000)
Use current.update() if there is no deferred workflow

Deferred workflows
Do not use current.update()
Workflow caching

The workflow engine caches commonly-used published workflows to improve performance. Caching significantly reduces the number of database queries per workflow. By default, the engine caches up to 300 unique workflow versions. Caching very large workflows may reduce this number as the cache size cannot exceed the Java Virtual Machine (JVM) heap size.

To change the maximum number of cached workflow versions, navigate to Workflow > Administration > Properties and modify the value of the The max number of models that will be concurrently held in the LRU cache (glide.workflow.model.cache.max) property. You must restart the instance to apply this change.

Workflow tables

For full flexibility, workflows store information over a number of different tables. Usually tables containing workflow information are not edited one-by-one. Instead, use the Workflow Editor to edit workflows. The following lists are provided for reference purposes.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workflows</td>
<td></td>
</tr>
<tr>
<td>Column Renderer (column_renderer)</td>
<td>A renderer widget for a stage column. Stage renderers are written in Jelly as a UI Macro. The default is Workflow-Driven; it covers most workflow related stage scenarios.</td>
</tr>
<tr>
<td>Version (wf_versionable)</td>
<td>Tracks different versions of element definitions (wf_element_activity).</td>
</tr>
<tr>
<td>Workflow (wf_workflow)</td>
<td>The master records of workflows.</td>
</tr>
<tr>
<td>Workflow Binding (wf_workflow_binding)</td>
<td>History of workflows run and the triggering record. Workflow Binding records prevent the system from running workflows again when the associated Workflow Context record has been deleted.</td>
</tr>
<tr>
<td>Workflow Context (wf_context)</td>
<td>Individual instances of a workflow being used.</td>
</tr>
<tr>
<td>Workflow Execution (wf_workflow_execution)</td>
<td>Synthetic &quot;current&quot; records for workflows that run on Global.</td>
</tr>
<tr>
<td>Workflow Instance (wf_workflow_instance)</td>
<td>Connections of workflows to subflows.</td>
</tr>
<tr>
<td>Workflow Version (wf_workflow_version)</td>
<td>Particular versions of a workflow, either published versions or versions that have been checked out.</td>
</tr>
<tr>
<td>Activities</td>
<td></td>
</tr>
<tr>
<td>Activity Designer (wf_element_activity)</td>
<td>Custom activity definitions.</td>
</tr>
<tr>
<td>Activity Variables (wf_activity_variable)</td>
<td>Variables for activities.</td>
</tr>
<tr>
<td>Workflow Activity (wf_activity)</td>
<td>Activities as they are being used in workflows.</td>
</tr>
<tr>
<td>Workflow Activity Definition (wf_activity_definition)</td>
<td>Definitions of activities that can be used in a workflow.</td>
</tr>
<tr>
<td>Workflow Executing Activity (wf_executing)</td>
<td>Individual instances of activities being performed in active contexts.</td>
</tr>
</tbody>
</table>

Workflow components

<td>Stage Set (stage_set)</td>
<td>A named set of stages that can be used to populate workflow stages for multiple workflows.</td>
</tr>
<tr>
<td>Stage Set Entry (stage_set_entry)</td>
<td>The stages that belong to a named stage set.</td>
</tr>
<tr>
<td>Stage Set for Table (stage_set_table)</td>
<td>Defines a relationship of a stage set to a table so that the stage set can be used as the default stages when a new workflow is created for the table. This replaces the wf_default_stage table and is the view that shows when you click Default Stages (by table) in the menu.</td>
</tr>
<tr>
<td>Workflow Stage (wf_stage)</td>
<td>Definitions of stages used by workflows.</td>
</tr>
</tbody>
</table>

**Workflow administration**

Tailor workflows exactly the way you want them.

**Workflow roles**

Certain roles are required to use workflows.
Workflow roles

<table>
<thead>
<tr>
<th>Role title (name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity creator (activity_creator)</td>
<td>Creates and edits custom workflow activities, reuses custom activity data, and manages activity packs downloaded from the ServiceNow Store.</td>
</tr>
<tr>
<td>Web service administrator (web_service_admin)</td>
<td>Accesses and uses REST and SOAP messages in the Orchestration activity designer. Creates and edits custom activities that use the REST web service and SOAP web service templates.</td>
</tr>
<tr>
<td>Workflow administrator (workflow_admin)</td>
<td>Creates, edits, publishes, and deletes graphical workflows. Warning: Granting this role to a user is equivalent to giving the user the admin role, because workflow Script activities bypass access controls and grant access to all tables and database operations. Script activities do not bypass application scope settings.</td>
</tr>
<tr>
<td>Workflow creator (workflow_creator)</td>
<td>Creates new graphical workflows. Warning: Granting this role to a user is equivalent to giving the user the admin role, because workflow Script activities bypass access controls and grant access to all tables and database operations. Script activities do not bypass application scope settings.</td>
</tr>
<tr>
<td>Workflow publisher (workflow_publisher)</td>
<td>Publishes graphical workflows.</td>
</tr>
</tbody>
</table>

Administering workflow contexts

The workflow context performs the activities and transitions defined in the workflow with the new record as current.

Workflow in ServiceNow names a running workflow a Workflow Context. The Workflow Context maintains the state of the overall process in the Workflow Context record. The Workflow Context maintains the state of the individual activities as they execute in a series of related lists. These lists maintain the state of currently executing activities, the result of finished activities, and the execution path the workflow took through the process model.

The Workflow Context canvas provides a visual representation of the execution path the workflow took through the process model. The state of each activity (finished, executing, cancelled, error) is represented using the color palette. The executed paths are represented in the color blue; the non-executed paths are represented in grey. Active and historic workflow contexts, as well as the activities within them, can be viewed using the Live Workflows section of the Workflow application menu.
Viewing a workflow context

Workflow contexts can be found in two places:

- From the Workflow Context related link on the form of the task being powered by the workflow.
- By navigating to Workflow > All Contexts and selecting an active context.

Displaying workflow progress

Two related links on the Workflow Context form allow you to view the progress of a workflow in different formats.

- Show Timeline displays the workflow context as a timeline.
- Show Workflow displays the workflow context in the graphical Workflow Editor.

Graphical interface

To view the workflow context in the graphical Workflow Editor interface, click the Show Workflow link from either the workflow context record or the current record.
Show workflow

In the top right hand corner are two controls:

| Refreshes the workflow context. |
| Displays a key of the colors used in the workflow to denote the state of activities and transitions: |
Execution order

View tooltip text in the workflow context graphical view to see the execution order of individual activities.

In **Workflow > Live Workflows > Active Contexts** or **All Contexts**, Open the context you want to examine. Click **Show Workflow**, and point to a finished or executing activity. The tooltip shows error data, execution time, and the order in which the activity executed in the workflow. Use this data to help troubleshoot activities in an error state.
Cancel a workflow

Canceling a workflow stops the workflow from executing and sets the workflow context **State** to **Canceled**. To cancel an executing workflow, you can use the `cancelContext(context)` script. You can define an `onCancel` script to clean up unresolved workflow activities.

Canceling a workflow attempts to stop the workflow gracefully by injecting a cancel command into the workflow engine.

1. Navigate to **Workflow > Active Contexts**.
2. Select a workflow context record.
3. Select the **Cancel** related link.
   A confirmation window appears.
4. Click **OK**.
The Wait for Cancel window appears. The workflow engine attempts to cancel the workflow gracefully.

If the workflow does not respond to the cancel command, the Force Cancel window appears.

5. Click **Force cancel** to interrupt the thread the workflow is actively executing or click **Continue waiting** to continue waiting for the workflow to cancel gracefully.
Warning: Whenever possible, allow a workflow to cancel gracefully. Forcing a workflow to cancel can leave related workflows and scripts in an unresolved state. You can use an on-cancel script to clean up unresolved artifacts from a cancelled workflow.

Cancel a workflow with the `cancelContext(context)` script
To cancel an executing workflow, you can use the `cancelContext(context)` script. This script can be useful in cases where a workflow must be canceled in response to an event or where a user must manually cancel a workflow.

For more information, see the API reference.

Define an on-cancel script
Canceling a workflow can leave records or scripts in an unresolved state. For example, canceling a service catalog workflow may leave catalog items in the requesting user's cart. An administrator can specify an On-cancel script that runs when the workflow transitions to the Canceled state. This script can notify users, log information, or resolve the state of any scripts run within a workflow activity. The `sys_id` of the workflow context is available in this script using the `context_sys_id` variable.

On-cancel scripts run asynchronously from the global scope. Your instance workload determines when the system schedules and runs the on-cancel script.

Important: Since the system runs on-cancel scripts from the global scope, they cannot call or run scoped script includes.

1. Navigate to Workflow > Workflow Versions.
2. Select a workflow version that you have checked out.
   Workflow versions that are not checked out are not editable.
3. Edit the On-cancel script field.
   You may need to configure the form to add this field.
4. Click Update.

This example script adds a comment to a Requested Item (sc_req_item) record indicating the workflow for that request has been canceled.

```javascript
var grContext = new GlideRecord("wf_context");
grContext.get(context_sys_id);
var grReq = new GlideRecord("sc_req_item");

// The current record may not exist, make sure it exists before modifying it.
if (grReq.get(grContext.id)) {
    grReq.comments = "The workflow processing this item was Canceled. Contact your system administrator for further information.";
    grReq.update();
}
```

Scheduling a workflow
In addition to being run based on conditions, workflows can also be scheduled to perform at a particular time, similar to a scheduled job.

Scheduled workflows do not have a defined current record and do not run on specific records within a table. Due to this behavior, certain activities that depend on a current record, such as
**Create Task** or **Catalog Task** are unavailable on scheduled workflows. If your workflow requires one of these activities, consider using a scheduled job that inserts a record to start the workflow instead of using a scheduled workflow.

To schedule a workflow, navigate to Workflow > **Scheduled Workflows** and click **New**. Populate the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the scheduled workflow.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Select an existing published workflow to be triggered at the specified date, time, or interval.</td>
</tr>
<tr>
<td>Active</td>
<td>If selected, the scheduled workflow will be triggered at the appropriate time.</td>
</tr>
<tr>
<td>Application</td>
<td>Specifies the type of application, such as Global.</td>
</tr>
<tr>
<td>Run</td>
<td>A choice list to determine when the workflow should be triggered. Options are:</td>
</tr>
<tr>
<td></td>
<td>· Daily: At a particular hour every day.</td>
</tr>
<tr>
<td></td>
<td>· Weekly: On a particular day of the week.</td>
</tr>
<tr>
<td></td>
<td>· Monthly: On a particular day of the month.</td>
</tr>
<tr>
<td></td>
<td>· Periodically: After every set duration.</td>
</tr>
<tr>
<td></td>
<td>· Once: At one specific date and time.</td>
</tr>
<tr>
<td>Time</td>
<td>For daily/weekly/monthly scheduled workflows, the time of day to run the workflow.</td>
</tr>
<tr>
<td>Day</td>
<td>For weekly scheduled workflow, the day of the week to run the workflow. For monthly scheduled workflows, the day of the month to run the workflow.</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>For periodical workflows, the interval between workflows, beginning from the Starting date and time.</td>
</tr>
<tr>
<td>Starting</td>
<td>For periodical workflows, the first date and time to run the workflow. For scheduled workflows run once, the date and time to run the workflow.</td>
</tr>
</tbody>
</table>

**Workflow movement with update sets**

The system tracks workflows in update sets differently than other records because workflow information is stored across multiple tables.

Changes made to a workflow version are not added to the update set until the workflow is published, at which point the entire workflow is added into the update set. Update sets store workflows as a single Workflow (wf_workflow) record and only retain the latest version with the update type of Workflow.

For information about update sets, see **System update sets**.

**Workflow update set migration use case - simple**

Create a new workflow with no dependencies and then migrate the workflow in an update set.

1. User A selects Update Set A.
2. User A creates a new workflow called Workflow A.
3. User A publishes Workflow A.
   A customer update set record is added to Update Set A containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.

4. User A completes Update Set A and migrates it to the production instance.

5. Update Set A commits successfully.

6. Workflow A works as expected.

**Workflow update set migration use case - subflow dependency (success)**

Successfully edit and migrate an existing workflow and its dependent subflow.

1. User A selects Update Set B.

2. User A checks out Workflow A.

3. User A adds a subflow called Workflow B to Workflow A.
   Assume that Workflow B was previously published and migrated to the production instance.

4. User A publishes Workflow A.
   A customer update set record is added to Update Set B containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.

5. User A completes Update Set B and migrates it to the production instance.

6. Update Set B commits successfully.

7. Workflow A works as expected with Workflow B as a subflow.

**Workflow update set migration use case - subflow dependency (failure)**

Edit and migrate an existing workflow from a test instance to a production instance that fails to run on the production instance because of a missing dependent subflow.

1. User A selects Update Set C.

2. User A checks out Workflow A.

3. User A adds a subflow called Workflow B to Workflow A.
   Assume that Workflow B was previously published, but has not been migrated to the production instance.

4. User A publishes Workflow A.
   A customer update set record is added to Update Set C containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
   Notably absent from Update Set C is the subflow called Workflow B. Workflow B was published before User A selected Update Set C.

5. User A completes Update Set C and migrates it to the production instance.

6. Update Set C commits with warnings.

7. Workflow A is invoked on the production instance with the following results:
   Workflow A fails the runtime validation check and is prevented from running on the production system. The system adds to the workflow context a workflow log entry detailing the cause of the failure, notably the absence of a dependent workflow.
To learn more about the validation checks on workflow dependencies and update sets see [ValidateUpdateSetDependencies](#).

**Workflow update set migration use case - subflow dependency (risk)**

Multiple users migrate a workflow from a test instance to a production instance without proper coordination. This use case can succeed, but only when each user understands the dependencies and properly migrates the dependent parts of the workflow to the new instance. This example does not represent an update set failure, although update sets are most often blamed in this use case. Validation increases the visibility of workflow dependencies across multiple update sets and provides designers with better information. In most cases, the warnings do not prevent an action, but only identify risk. The designer is responsible for taking action on advice given in the validation checks.

1. User A selects Update Set C.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B that returns a **User ID**.
   
   **Note:** Assume that Workflow B was previously published and migrated to the production instance.
4. User A uses the return value of Workflow B to generate approvals.
5. User B selects Update Set D.
6. User B checks out Workflow B (the subflow in Workflow A).
7. User B modifies the return value of the workflow by changing it from a **User ID** to a **String Message**.
8. User A publishes Workflow A.
   
   **Note:** A dialog box displays warnings associated with Workflow A and encourages User A to validate the workflow before publishing.
9. User A cancels publishing and **validates** Workflow A.
10. User A is warned that Workflow B was modified by a user in a different update set.
11. User A ignores this warning and publishes Workflow A.
   
   **Note:** A customer update set record is added to Update Set C containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
12. User A completes Update Set C and migrates it to the production instance.
13. Workflow A is invoked on the production instance and runs successfully using the older version of Workflow B already on the system.
14. User B publishes Workflow B.

   **Note:** User B is not warned of the Update Set C dependency, because the update set is no longer in progress. However, User B is informed via a dialog box that there are warnings associated with the workflow version and is instructed to validate Workflow B. If User B cancels publication and validates the workflow, User B is warned that there are workflows that use Workflow B as a subflow. Knowing the return value was changed,
User B should test those workflows as well. See ValidateUpdateSetDependencies to understand the parameters of update set warnings.

15. User B finally publishes Workflow B.

Note: A customer update set record is added to Update Set D containing an XML payload, including the published Workflow B and all activity dependencies.

16. User B completes Update Set D and migrates it to the production instance.
17. Update Set D commits without warnings.
18. Workflow A is invoked on the production instance and fails to run successfully, because the return value of Workflow B no longer generates a User ID.

Input variable movement

You can add input variables to existing workflows and add them to update sets.

When you submit the new variables, an entry is made into the current update set that reflects the addition of a variable to the Variables (var_dictionary) table. Unlike the workflow version that only writes to the update set when the workflow is published, the variables write individual update entries into the currently selected update set immediately upon submission.

Input variable movement use case - two input variables

An existing workflow already contains two input variables.

1. User A checks out the workflow.
2. User A adds two input variables.

ServiceNow adds to the current update set one customer update record for each new variable.

The current workflow now has 4 input variables: the two that were present prior to check out and the two new ones.

3. User A publishes the workflow.

There are now three related customer update records: two for new variables, and one for the published workflow. The XML payload of the new workflow version now includes all input variable database entries. So while the two original input variables do not have individual customer update records, all four variables are migrated to the local instance with the payload of the newly published workflow version.

4. Verify variables included in a specific workflow.
5. User A completes the update set.
6. Adding Input Variables - Success

User A migrates and commits the update set to a local instance where the original workflow version had previously been committed.

- The two existing input variables are already present because of the earlier version.
- The system adds the two new input variables when the user commits the update set.
- The system preserves the two legacy input variables on the instance receiving the update set. The update set does not overwrite these variables.
- The new published workflow version uses all four variables.
- The user tests the new workflow version and it runs as expected.
Verify variables included in a specific workflow
You can verify the variables that are included in a specific workflow.

1. Navigate to System Update Sets > Local Update Sets.
2. Select the active update set.
3. Select the customer update entry for the workflow.
4. View the XML Payload.
5. Search for the name of one of the columns or search for var_dictionary.
   There is one var_dictionary entry for each input variable.

Input variable removal
Deleting workflow input variables, like insert and update actions, creates a customer update record in a user's current update set.

These deletions migrate to a new instance with the update set, regardless of whether the workflow that owns the input variables is published in the same update set. Plan carefully and use caution when editing a workflow and selecting update sets.

Input variable removal risk
An existing workflow already contains two input variables.

1. The workflow was migrated to a production instance with the two variables.
2. On a development instance, User A selects Update Set A and checks out the workflow.
3. User A removes one input variable and all references to it in the workflow.
   The system enters into Update Set A one customer update record reflecting the deletion of the input variable. No record is added for the new workflow version which no longer depends on the input. This does not happen until the workflow is published.
4. User A continues working on other features in Update Set A that need to be moved to production.
5. User A completes Update Set A and migrates it to the production instance without publishing the workflow.
   The update set entry that deletes the workflow input variable now applies to the production instance. The prior version of the workflow is running on this instance and still references the missing variable.

Input variable removal solution
When editing workflows, particularly when deleting input variables, be sure to use a single update set for all variable editing and workflow publishing.

If necessary, merge the update set into a more general set targeted for deployment after the workflow is published. For information about update sets, see System update sets.

---

**Note:** If a workflow version is already running on a production system and input variables are deleted from a newer version, those deletions could affect transactions already running against the earlier version. Use extreme caution when deleting workflow input variables and plan the migration carefully.

---

Input variable removal prevention
Prior to publishing a workflow version, the system validates the workflow model to assist the designer in planning for deployment.

This validation warns of critical errors that can prevent a workflow from running successfully, but also warns of dependencies and conflicts in update sets. See ValidateUpdateSetDependencies for more details.

Avoiding duplicate workflows

Update sets manage the published state of all versions of a workflow prior to committing the workflow version on a local instance.

The last version of a workflow committed as an Insert or Update using an update set becomes the currently published version, regardless of the publishing sequence for the workflow versions.

Commit a workflow in an update set
Follow the steps in this page to commit a workflow in an update set.

1. Workflow A - Version 1 is created and published in Update Set A.
2. Update Set A is completed and migrated to a local instance.
3. When the update set is committed, the system sets all prior versions of Workflow A to published = false.
   In the first migration, there are no prior versions.
4. Workflow A - Version 1 becomes the only published version of the workflow.

Update set migration example
It is not possible to have multiple published versions as a result of update set commits. However, this does not eliminate risk, and care should be taken when migrating update sets.

Consider this example:

1. Workflow A - Version 1 is migrated and committed to the production instance.
2. Update Set B is created.
3. Update Set C is created.
4. Workflow A - Version 2 is published in Update Set B.
   A customer update record is added to Update Set B with the Version 2 payload.
   A customer update record is added to Update Set B with the Version 1 workflow left unpublished.
5. Update Set B is completed.
6. Workflow A - Version 3 is published in Update Set C.
   A customer update record is added to Update Set C with the Version 3 payload.
   A customer update record is added to Update Set C with the Version 2 workflow left unpublished.
7. Update Set C is completed.
8. Update Set C is migrated and committed to the production instance.
   Workflow A - Version 1 is set to unpublished.
   Workflow A - Version 2 update is skipped since Update Set B, which contains Version 2, was never migrated.
   Workflow A - Version 3 is committed and becomes the only published version of the workflow.

Update set migration risk
Update Set B is migrated and committed to the production instance.

1. Workflow A - Version 3 is set to unpublished.
3. Workflow A - Version 2 is committed and becomes the only published version of the workflow.
The workflow has gone back a version, perhaps unintentionally. The regressed version becomes the currently published version.

**Workflow timelines**

The system provides a timeline view of history activities associated with a workflow context. Timelines display a linear calendar of activities, such as tasks and approvals, defined by their start and end dates. Each activity on the timeline is represented by a span, which is displayed as a horizontal, colored bar. Each span has a label and a tooltip that contains additional information about the activity. The left pane displays all the activities in the context (or contexts) in an expandable hierarchy. You can change the timeline's perspective for a more granular view of the data.

**Note:** Workflow timelines reflect context history only and are not real-time gauges of workflow activity.

**Use a timeline**

By default, the timeline displays all activities and transitions requested when first opened. Collapse any part of the hierarchy in the activity pane and the timeline adjusts automatically. Date/time and duration controls enable you to scale the timeline to view all the elements at once. To display a timeline, click a UI action within a Workflow Context record.

1. Navigate to Workflow > Live Workflows > Active Contexts.
2. Select a context.
3. In Related Links, click Show Timeline to display the timeline for the entire context.

The timeline opens with all activities expanded and the view set to Max, which displays the entire timeline at the width of the pane. The title of the timeline is in the form Workflow context: <context name>, Requested Item: <requested item number>.
4. Use the Range Selectors at the top of the timeline to change the perspective.

The increments go from one day to one year. To limit the timeline to an increment between the start date of the first span and the end date of the last span, click **Max**.

5. Use the starting and ending calendar fields to select the timeline perspective. These fields control the same perspective as the slider at the bottom of the timeline.

6. Use the pink slider at the bottom of the timeline to change the perspective.
1. Move the slider from right to left to view all the spans on a long timeline.

2. Adjust the end points of the slider to make arbitrary changes to the magnification.

A narrow slider zooms in on the spans and provides a more detailed view of complex timelines. A wide slider pulls the view out and makes more of the timeline visible on the screen.

7. To focus the timeline view on selected activities, expand or collapse the activity tree.

    Spans not visible in the activity tree are not shown in the timeline pane.

8. Hover over an activity span to display a tooltip with information about the activity.

    This action highlights the activity in the activity pane.
9. Hover over the transition between two activities to highlight the activity and the predecessor activity in the activity pane.

10. Double-click a span to display a history record for that activity.
    History records shows information such as the **State** and the starting and ending times.
Timeline for a selected activity

You can display a partial workflow timeline.

1. Navigate to Workflow > Live Workflows > Active Contexts.
2. Open a Workflow Context record.
3. On the Workflow Activity History related list, select one or more individual activities.
4. Click Show Timeline from the action menu.
   
   The resulting view is a snapshot of the timeline, showing only the selected activities and their transitions, if any.
5. Collapse the tree to confine the view even further.
6. To view a timeline displaying activities from different contexts:
   You might use this feature to display a subflow’s context with the parent workflow context.
   1. Navigate to Workflow > Live Workflows > History.
   2. Select individual history items from the list.
   3. Select the Show Timeline option from the actions menu.

   History items are arranged in a hierarchy in the activities pane under their contexts. The timeline title is **Multiple Contexts**. The timeline draws only the activities and relationships of the history items selected.

**View subflows in a workflow timeline**

In a workflow timeline, subflow spans appear as a different color than the activities of the main workflow.
Workflow context: iPhone4, Requested Item: RITM0010025

Workflow timeline subflow

Workflow error handling

The personalized JavaScript that users create in workflow activity variables is vulnerable to run-time syntax errors. Available error information is available in a tooltip when you point to a workflow activity in an error state.

In the base system, workflow activities do not provide condition routing on the error state. As a result, the workflow progresses based on the state of the current record. For example, a workflow contains an Approval - User activity that uses an advanced script to add additional approvers. A syntax error in the script results in no approvers being added. Because a state of no approvers is a valid return, even without the syntax error, the approval activity is skipped and the workflow progresses along a positive path. However, this might not be a valid response for the workflow designer who does not want the workflow to progress along the positive path without approvers.

Workflow error handling detects and logs syntax errors and provides a state that the workflow designer can use to add error conditions to the workflow. Use error handling to locate syntax errors in advanced script fields for these workflow activities:

- Approval - User
- Approval - Group
- Catalog Task
- Create Task
- If
- Run Script
- Notification

</tbody>
</table>

Workflow error tracking features

Error handling provides visual cues within the workflow, such as error descriptions for activities in pop-ups, and detailed log records.

Banners

Look for an activity with a red banner, indicating that a syntax error has occurred in a script field. All activities that provide error handling, with the exception of Catalog Task and Create Task, display a red banner for this error.

![Switch]

Check assignment group

Always

Tooltips

Point to the activity displaying a red banner to view information about the error. A tooltip shows the State and Result of the activity and provides a brief Fault Description (except for task activities). Note that this approval continued as skipped despite the error given in the fault description. See Workflow error handling for the information available to each activity.
Execution order

Tooltip text in the Workflow Context graphical view displays the execution order of individual activities, which assists in troubleshooting.

To view the order in which a workflow activity was executed:

1. Navigate to **Workflow > Live Workflows > Active Contexts** or **All Contexts**.
2. Open the context you want to examine.
3. Click **Show Workflow**.
4. Hover the cursor over a finished or executing activity.
   - A tooltip appears showing error data, execution time, and the order in which that activity executed in the workflow. You can use this data to help troubleshoot activities in an error state.
Workflow log

View the log in the Workflow Context form for more information about the syntax error in the activity. Since task activities do not display a red banner when a syntax error has occurred, you must view the log if you suspect the workflow has not run properly. Examine the error description in the log, and then inspect the script in the activity named in the log.

To view the activity by name, navigate to Workflow > Administration > Properties and enable the Log workflow debug messages property.
In this example, an SSH activity named File Read specifies an invalid MID Server.

<table>
<thead>
<tr>
<th>Activity name</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scope Debug</td>
<td>EXIT SCOPE: Moving from scope ssh_pack to rhino.global</td>
</tr>
<tr>
<td>Engine Debug</td>
<td>running File Read(c7dd7e49b822053/21f821101c7d1: event=execute)</td>
</tr>
<tr>
<td>Activity Error</td>
<td>The MID Server (crdenmo_mid) is not valid</td>
</tr>
<tr>
<td>Activity Error</td>
<td>File Read(c7dd7e49b822053/21f821101c7d1: MID Server crdenmo_mid is not valid)</td>
</tr>
<tr>
<td>Engine Debug</td>
<td>completed File Read(c7dd7e49b822053/21f821101c7d1: event=execute)</td>
</tr>
<tr>
<td>Scope Debug</td>
<td>ENTER SCOPE: Moving from scope Global to ssh_pack</td>
</tr>
</tbody>
</table>

Error handling log

If the credentials used by an activity in the workflow fail, and the activity cannot authenticate on the target, a message describing the failure appears in the Workflow Log related list. The message displays the target IP address and the credential details.
Create an error condition exit

An administrator can reroute the workflow when a script error occurs by creating an error condition exit for specific activities within the workflow. This allows the workflow to process script errors in a predictable way and not create undesirable results.

1. Open and check out a workflow.
2. Right-click in the top portion of the activity for which you want to create an error exit.
3. Select Add condition from the context menu.
4. Add a condition exit with the following values:
   - Name: Error
   - Condition: activity.state=='faulted'
5. Click Submit.
The **Error** exit appears on the activity.

6. Connect the **Error** exit to another activity for handling the error state, such as **Notification** or **Log Message**.

Reconfigure an approval condition

Approval activities react differently to script errors than the other activities.

Approval activity script errors can prevent an approval from being processed successfully. This, in turn, can cause the approval to complete as **Skipped**, which can appear to be an **Approved** state. To prevent this from happening, reconfigure the **Approved** exit as follows:

1. Open an approval workflow and make sure it is checked out.
2. On an approval activity, double-click the **Approved** exit.
3. Add the following script to the **Condition** field:
   ```javascript
   && activity.state != 'faulted'
   ```
   This prevents the activity from continuing down the normal path in an error state and ensures that **Skipped** or **Approved** is the desired state.
4. Click **Update**.

Workflow run time metrics

You can enable the collection of workflow run time metrics to determine whether workflows are performing as expected or consuming additional resources.

Outlying run times for a workflow are identified by comparing actual run times to an outlier range calculated with the outlier threshold and estimated run time defined in the workflow properties.

You can monitor the results of these metrics on the Workflow Operations Dashboard and custom homepages with workflow gauges.

Enable workflow run time metrics

Provide an estimated run time that can be compared to actual workflow run times.
For baseline workflows, you must also manually enable the collection of run time metrics. The system automatically enables the collection of run time metrics for new workflows.

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Properties**.
4. In the Workflow Properties dialog box, click the **Estimated Runtime** tab.
5. To enable the collection of run time metrics, check that the **Requires ERT** option is selected.
6. Open a configuration from the **Estimated Run Time** column.
7. In **Estimated Run Time**, enter an initial estimate for the workflow's run time.
   - The system compares this initial estimate to actual run time results to create outlier reports. The system can automatically update this field in certain circumstances. Workflow designers can also manually update this field.
8. In the **Outlier Percentage Threshold for ERT** field, enter the percentage deviation from the estimated run time that identifies an outlier workflow run time.
   - The system uses a default value of **20**.
9. Click **Update**.

**Outlying workflow run times**

Workflow run times are identified as outliers when they are longer or shorter than the outlier range that is computed for the workflow.

The outlier range is automatically computed with the **Estimated Run Time** and **Outlier Percentage Threshold for ERT** values in the workflow properties. These values are used in the following formulas.

Formulas for computing workflow outlier ranges

<table>
<thead>
<tr>
<th>Value computed</th>
<th>Computation used</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outlier Value</td>
<td>Estimated Run Time * (Outlier Percentage Threshold for ERT / 100)</td>
<td>10 seconds * (20 / 100) = 10 seconds * 0.2 = 2 seconds</td>
</tr>
<tr>
<td>Outlier Range</td>
<td>(Estimated Run Time - Outlier Value) to (Estimated Run Time + Outlier Value)</td>
<td>(10 seconds - 2 seconds) to (10 seconds + 2 seconds) = 8 to 12 seconds</td>
</tr>
</tbody>
</table>

When a workflow runs within the outlier range, its estimated run time is automatically updated.

If a workflow has an outlying run time, it appears in any outlier workflow gauges on the Workflow Operations Dashboard and custom home pages.

**Workflow estimated run time updates**

When a workflow runs within the outlier range, its estimated run time is automatically updated.

The estimated run time is updated with the cumulative moving average of the latest run time value in relation to previous run times. The computed value is rounded to the nearest second and stored as a **GlideDateTime**.

For example:

<table>
<thead>
<tr>
<th>Data point</th>
<th>Latest value</th>
<th>Cumulative running average (CRA)</th>
<th>CRA after rounding to the nearest second</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>10 seconds</td>
<td>10 seconds</td>
<td>10 seconds</td>
</tr>
<tr>
<td>2</td>
<td>12 seconds</td>
<td>11 seconds</td>
<td>11 seconds</td>
</tr>
<tr>
<td>Data point</td>
<td>Latest value</td>
<td>Cumulative running average (CRA)</td>
<td>CRA after rounding to the nearest second</td>
</tr>
<tr>
<td>------------</td>
<td>--------------</td>
<td>----------------------------------</td>
<td>----------------------------------------</td>
</tr>
<tr>
<td>3</td>
<td>9 seconds</td>
<td>10.333 seconds</td>
<td>10 seconds</td>
</tr>
</tbody>
</table>

**Note:** Because the system rounds to the nearest second, the calculation is less precise with short durations.

You can also manually update the estimated run time in the workflow properties.

**Workflow pause utility**

Workflow Pause Utility provides functionality you can use to pause or resume all workflow contexts, a subset of qualified workflow contexts, or individual workflow contexts. You designate the data and time of day at which the paused workflows should resume, and can manually resume individual workflows as needed.

Once activated, the Workflow Pause Utility plugin (com.glideapp.workflow.pause) updates several tables when you pause or resume workflows. Each table stores specific data related to each paused or resumed workflow.

**wf_pause_request**

Records every workflow pause request. The system automatically updates and inserts records in this table whenever you pause workflow contexts. It tracks user-specified resume time, whether the pause request is still active, and the total number of workflow activities that paused or resumed.

**wf_pause_status**

Records the status of each workflow context you pause. When you pause workflow contexts, the plugin waits until the current executing activity finishes, and pauses it before the next activity starts. It tracks the specific activity on which the workflow context was paused and whether it has resumed. If the workflow is paused, it tracks the time at which it is scheduled to resume.

**wf_pause_group_request**

Pauses the specific set of workflow contexts you designate using filtering in Group Pause Requests. You can manually pause all currently active workflows by clicking the Pause All check box.

**wf_pause_snapshot**

Before pausing and after resuming a workflow, the table records a snapshot of the current state of the workflow context. The table also records the state of the currently executing activity on the paused workflow context.

**Use examples**

When you take down an instance for maintenance, you can pause all or selected active workflow contexts, and then resume them after you complete the maintenance.

You have an integration workflow context that hits an internal service that is down for maintenance. You can pause all instances of that workflow context from
progressing to the next activity, allowing time for the internal service to be restored. Then, the paused workflow contexts can be resumed.

**Activate workflow pause utility**

You can activate the Workflow Pause Utility plugin (com.glideapp.workflow.pause) if you have the admin role. This plugin may include demo data and activates related plugins if they are not already active.

Role required: Workflow_admin or workflow_publisher, workflow_creator

1. Navigate to **System Definition > Plugins**.

A banner notifies you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

**Note:**
To redirect to the legacy list view for plugins, click the link.

2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in [Request a plugin](#).

3. Activate the plugin.

   You can activate the plugin directly from the All Applications page or you can view more details about the plugin before you activate it.

   - If you are certain that you have the correct plugin, click **Install**, and when you see the dialog box, click **Activate**.

   ![Activate Plugin](image)

   - To view plugin details before activation:
     
     1. Click the plugin name.
2. On the form, click the **Activate/Update** related link.

3. In the dialog box, review the dependent plugins.
   If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.

4. If demo data is available and you want to install it, click **Load demo data**.
   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.

5. Click **Activate**.

---

**Pause and resume individual workflows**

To pause individual workflow contexts, specify the date and time of day at which the workflow context should resume. When a workflow context is paused, the system saves basic information about the pause request, such as the resume date and time, in the `wf_pause_request` table. A workflow context automatically resumes at a specified date and time of day, but paused workflow context can be manually resumed as needed.

Role required: Workflow_admin or workflow_publisher, workflow_creator

Install and activate the Workflow Pause Utility plugin.

1. Navigate to **Workflow > Live Workflows > Active Contexts**.
2. Select the individual workflow context you are pausing.
   **Workflow Context** appears.
3. In Related Links, click **Pause**.
   A **Workflow Pause Inputs** dialog appears.
4. In the **Workflow Pause Inputs** dialog:
   a) Click ![calendar](calendar_icon) to select the date, and enter the time of day (in hours, minutes, and seconds) at which the workflow should resume. You can select the current date or future date, but you must enter a time of day in the future.
   For example, to pause the workflow context at 13:30:00 (1:30 pm), select the date from the calendar, and then enter 13, 30, and 00 into the respective **Time:** fields.
   b) Click ![checkmark](checkmark_icon) when finished.
   c) The selected date and time of day appear in the **Resume At** field.
   d) Click **OK** to return to Workflow Contexts.
   The selected workflow is now paused. Use **Workflow pause request** to monitor its status.

5. Paused workflows resume on the date and time of day specified in the **Resume At** field. To manually resume a currently paused workflow context:
   a) Navigate to **Workflow > Live Workflows > Active Contexts**.
   b) Select the individual workflow context you are pausing.
   **Workflow Context** appears.
c) In Related Links, click Resume.

### Pause and resume all or multiple workflows

Use Workflow Pause Group Requests to pause, or resume, groups of workflows, or all active workflows. If pausing a group of workflows, use filtering functions to select the workflows. If pausing all active workflows, select the Pause All check box to indicate that all currently active workflows should be paused.

Role required: Workflow_admin or workflow_publisher, workflow_creator

Install and activate the Workflow Pause Utility plugin.

1. Navigate to Workflow > Operations > Group Pause Requests.  
   Workflow Pause Group Requests appears and displays existing workflow pause group requests.
2. Click New.  
   Workflow Pause Group Request appears, and assigns a workflow pause group request ID.
3. To pause all active workflows, select Pause All, then click Update. To pause a filtered group of active workflow contexts, skip this step.  
   All currently active workflow contexts in the instance are paused until you resume them. Use Workflow pause request to monitor their status.
4. To pause a filtered group of active workflow contexts, use the Filter field, specify the conditions for the search, then click Update.  
   Workflow Pause Group Requests appears, and displays the results of the workflow group search. It assigns a workflow pause group request ID and indicates if the group is active (true = paused) or inactive (not yet paused).
5. To update, resume or delete a specific workflow pause group request, select it.  
   Workflow Pause Group Request appears, and displays the selected workflow pause group request.
6. If the selected workflow pause group request is active (paused), and you do not want to pause it, click Do Not Pause Incoming Workflows. If the selected workflow pause group request is inactive (not yet paused), click Pause to pause it.
7. For the paused workflow group request, use the Resume At field to specify the date and time of day at which the paused workflow contexts should resume.
   a) Click the calendar icon to select the date, and enter the time of day (in hours, minutes, and seconds) at which the workflow contexts should resume. You can select the current date or future date, but you must enter a time of day in the future.
      For example, to pause the workflow context group at 13:30:00 (1:30 pm), select the date from the calendar, and then enter 13, 30, and 00 into the respective Time: fields.
   b) Click when finished.
   c) The selected date and time of day appear in the Resume At field.
   d) Click OK to return to Workflow Pause Group Request.
8. Click Submit.
9. Paused workflow contexts automatically resume on the date and time of day specified in the Resume At field. To manually resume currently paused workflow contexts:
   a) Navigate to Workflow Pause Group Requests.
b) Select the workflow pause group request to resume. 
*Workflow Pause Group Request* appears.

c) Click **Resume**, and then click **Update**.

10. Workflow Group Pause Request also contains the following information fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Indicates if workflow group is paused.</td>
</tr>
<tr>
<td>Completed Resume Activity Count</td>
<td>Number of resumed workflow context activities that are completed.</td>
</tr>
<tr>
<td>Filter</td>
<td>Standard filtering fields used to specify the conditions for selection of a group of workflow contexts.</td>
</tr>
<tr>
<td>Log</td>
<td>Activity work notes generated by the group pause request.</td>
</tr>
<tr>
<td>Not Transitioned Workflow Count</td>
<td>Number of workflow contexts that were not transitioned when the group pause request was placed. When a group pause request is placed, the affected workflow contexts are paused before start of the next activity.</td>
</tr>
<tr>
<td>Resume Act Count</td>
<td>Number of workflow context activities resumed after the group pause completed.</td>
</tr>
<tr>
<td>Pause Act Count</td>
<td>Number of paused workflow context activities.</td>
</tr>
<tr>
<td>Requester Name</td>
<td>Name of the person requesting the workflow context pause.</td>
</tr>
<tr>
<td>Pause percentage</td>
<td>Total percentage of workflow contexts that are paused.</td>
</tr>
<tr>
<td>Resume Percentage</td>
<td>Total percentage of workflow contexts that have resumed.</td>
</tr>
<tr>
<td>Total Workflow Count</td>
<td>Total number of workflows matching the specified filter conditions that are being paused.</td>
</tr>
<tr>
<td>Paused Workflow Count</td>
<td>Number of current paused workflow contexts.</td>
</tr>
</tbody>
</table>

**Monitor workflow pause requests**

You can monitor the status of workflow pause requests using Workflow Pause Request.

Role required: Workflow_admin or workflow_publisher, workflow_creator

You must install and activate the Workflow Pause Utility plugin.

1. **Navigate to Workflow > Operations > Pause Requests.**
   
   *Workflow Pause Requests* appears and displays existing workflow pause requests.

2. **Select the workflow pause request.**
   
   *Workflow Pause Request* appears, and displays the selected workflow pause request.
### Workflow pause request fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Req Number</td>
<td>Unique assigned pause request number.</td>
</tr>
<tr>
<td>Completed Resume Activity Count</td>
<td>Number of workflow context activities resumed after the pause completed.</td>
</tr>
<tr>
<td>Pause Active</td>
<td>Selected indicates the workflow context is currently paused. Cleared indicates it is not.</td>
</tr>
<tr>
<td>Transitioned During Pause</td>
<td>Number of workflow contexts that transitioned when the pause request was placed. When a pause request is placed, the affected workflow contexts are paused before start of the next activity.</td>
</tr>
<tr>
<td>Workflow Context</td>
<td>Reference number for the paused workflow context.</td>
</tr>
<tr>
<td>Log</td>
<td>Activity work notes generated by the group pause request.</td>
</tr>
<tr>
<td>Paused Act Count</td>
<td>Date and time of day (h:m:s) at which the paused workflow context is resuming.</td>
</tr>
<tr>
<td>Requester Name</td>
<td>Name of the person who requested the workflow pause.</td>
</tr>
<tr>
<td>Resume Act Count</td>
<td>Number of workflow context activities resumed after the pause completed.</td>
</tr>
<tr>
<td>Resume At</td>
<td>Date and time of day (h:m:s) at which the workflow contents are scheduled to resume.</td>
</tr>
<tr>
<td>Table</td>
<td>Related record table name.</td>
</tr>
<tr>
<td>Application</td>
<td>Application in which the workflow context is executing.</td>
</tr>
<tr>
<td>Exec Act Count</td>
<td>Number of activities executing when the workflow context was paused.</td>
</tr>
<tr>
<td>Group Pause Request</td>
<td>Reference number for the associated group pause request, if any. Appears only if pause request was the result of a group pause request.</td>
</tr>
<tr>
<td>Is Workflow Complete</td>
<td>Selected indicates the workflow context is complete. Cleared indicates it is not.</td>
</tr>
<tr>
<td>Is Workflow Stuck</td>
<td>Selected indicates the workflow context is stuck. Cleared indicates it is not.</td>
</tr>
<tr>
<td>State</td>
<td>Current state of the workflow context - Paused or Resumed.</td>
</tr>
<tr>
<td>Stuck Activities Count</td>
<td>The number of workflow context activities that are stuck.</td>
</tr>
<tr>
<td>Stuck Act Count To be subtracted for Pause Percentage</td>
<td>Writer to whom the documentation request is assigned.</td>
</tr>
</tbody>
</table>
Encrypted workflow scratchpad

The Encrypted Workflow Scratchpad plugin (com.snc.encrypted.scratchpad) provides encrypted scratchpad support for workflow context and workflow executing activities.

The platform supports encryption on most fields, and workflows can execute on tables with encrypted fields. Encrypted data is typically stored in the workflow scratch pad for workflows that execute using encrypted fields and must access this data after processing an approval, timer, or create task activity.

Data in the workflow scratchpad is not encrypted by default. The Workflow engine supports scratchpad encryption and executing activity records only when the Encrypted Workflow Scratchpad plugin is activated. Once activated, data stored in the wf_context and wf_executing scratchpads is protected by a private workflow engine encryption context, and is prevented from being stored in plain text.

Activate encrypted workflow scratchpad

Activate the Encrypted Workflow Scratchpad plugin (com.snc.encrypted.scratchpad) if you have an admin role.

Role required: admin

The Encrypted Workflow Scratchpad plugin must be activated via a ServiceNow Technical Support request. You should activate and thoroughly test the plugin in a non-production instance. Only after you satisfied with the results should you activate it in a production instance.

When activating it in a production instance, you should pick a low transactional volume time to do so. Prior to its activation, first activate the Workflow Pause Utility (com.glideapp.workflow.pause), and then pause all active workflows. Refer to Workflow pause utility. After activating the Encrypted Workflow Scratchpad plugin, resume all paused workflows.

Encrypted Workflow Scratchpad activates these related plugins if they are not already active.

**Plugins for Encrypted Workflow Scratchpad**

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Encryption Support</td>
<td>Allows text fields and attached files to be encrypted.</td>
</tr>
<tr>
<td>(com.glide.encryption)</td>
<td></td>
</tr>
</tbody>
</table>

1. Navigate to System Definition > Plugins.

A banner notifies you that you are in the All Applications page, which contains plugins and ServiceNow Store applications.

**Note:**

To redirect to the legacy list view for plugins, click the link.

2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.
You can activate the plugin directly from the All Applications page or you can view more details about the plugin before you activate it.

- If you are certain that you have the correct plugin, click Install, and when you see the dialog box, click Activate.

To view plugin details before activation:

1. Click the plugin name.
2. On the form, click the Activate/Update related link.
3. In the dialog box, review the dependent plugins.
   - If your plugin requires dependent plugins, they are activated automatically when you activate your plugin if they are not active already.
4. If demo data is available and you want to install it, click Load demo data.
   - Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.
5. Click Activate.

Once you install and activate the plugin, resume all paused workflows. Refer to Pause and resume all or multiple workflows.

Troubleshoot workflows

Troubleshooting tools for workflows enable administrators to isolate execution paths, compare contexts, and track incomplete activities.

The workflow timeline provides a visual representation of the workflow, including transitions and the elapsed time for each activity. A troubleshooting tool for highlighting execution paths helps users perform forensics on a workflow. The highlighting feature can group multiple execution paths in various colors and can isolate rollback processing. Use the workflow highlighter to isolate
incomplete tasks and approvals. You can also enable a workflow performance timing feature to troubleshoot slow workflows.

**Execution path troubleshooting in timelines**

Use the controls in a workflow timeline to isolate specific execution paths or compare multiple execution paths over time.

Timelines show how the activities in the workflow progressed in relation to one another over time. Isolate execution paths and follow transition lines between subflows and the main flow. Processing times provide a view of the workflow that you cannot get from the workflow diagram. Tooltips give precise information about each activity, such as duration.

![Workflow timeline troubleshooting](image)

**Execution history table**

Highlight execution paths and rollbacks to locate activities that may have been left in an unresolved state.

Rollbacks, cancels, and deletions during the execution of a workflow can prevent some activities from fully completing. Use highlighting in the execution history table to determine which activities in the workflow were left in an unresolved state.

1. Run the workflow.
2. Navigate to **Workflow > All Contexts**.
3. Select a context to troubleshoot.
4. In the Workflow Context form, select the **Workflow Activity History** related list.
5. Right-click an activity and select **Workflow Debug > Toggle Execution Path Highlighting** from the context menu.

All activities in that execution path are highlighted in a color selected by the platform. The debug path shows all activities that completed successfully during the workflow.

6. Right-click a rollback activity and select **Workflow Debug > Toggle Rollback Highlighting** from the context menu.

The platform highlights the rollback path (restarted activities) in a different color. Each color represents a group of activities that were part of the same rollback execution. The highlighting includes the activity that initiated the rollback. If you right-click an activity that was not part of a rollback, no rows are highlighted.

**Note:** The rollback activity itself appears in both execution path and rollback highlighting.
7. To remove highlighting, right-click in the list and select an option to clear execution path or rollback highlighting.

You can clear individual rollback paths or all rollback highlighting.

Use the Workflow Operations Dashboard

On the Workflow Operations Dashboard, view and add widgets to help you monitor workflows. Review the performance of workflows and determine which workflows must be improved.

Role required: workflow_admin

The different levels of access are:

- **View**: View the dashboard and refresh report widgets.
- **Customize**: Refresh, add, delete, and rearrange widgets.

On the Workflow Operations Dashboard, you can click widget elements to view the records they represent. You can also add new report widgets that are not displayed by default.

1. To view the Workflow Operations Dashboard, navigate to **Workflow > Operations > Workflow Operations Dashboard**.

The default reports on the dashboard include:

- Workflow contexts providing run time metrics
- Active workflows started during a specified time period
- Workflows run between yesterday and today
- Workflows by state for the current month
- Aged workflow contexts for the past month

2.

To find and add more widgets, click the Add Content icon ( ) in the upper left corner of the dashboard.

If a workflow consistently appears as an outlier and there is no error causing the run time values, you can use its historical run time values to calculate a new estimated run time value. Then update the estimated run time in the workflow properties.

**Workflow gauges**

Multiple gauges are available to help you review the performance of workflows. You can add these gauges to the Workflow Operations Dashboard or custom homepages.

**Workflow gauges**

<table>
<thead>
<tr>
<th>Content</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ERT Dashboard Controls &gt;</strong></td>
<td></td>
</tr>
<tr>
<td>Outlier Finished Workflows for ERT (Percentage Outlier)</td>
<td>Identifies workflows that finished, but did not finish within estimated runtime (ERT) values. Enter an outlier percentage to see workflows that ran outside the specified runtime range.</td>
</tr>
<tr>
<td>Outlier Long Running Workflows for ERT (Percentage Outlier)</td>
<td>Displays workflows running longer than the configured runtime threshold.</td>
</tr>
<tr>
<td><strong>Workflow Dashboard &gt;</strong></td>
<td></td>
</tr>
<tr>
<td>Workflows Without Current Record</td>
<td>Displays workflow contexts that do not have an associated current record.</td>
</tr>
<tr>
<td><strong>Gauges &gt; Workflow Context</strong></td>
<td></td>
</tr>
<tr>
<td>Number of Active Workflows Started Hourly Over Time (Yesterday)</td>
<td>Displays the total number of running workflows per hour over a given time period. By default, it displays the number of workflows that ran per hour over the previous day (yesterday).</td>
</tr>
<tr>
<td>Outlier Finished Workflows Not Cumulated to ERT</td>
<td>Displays workflow contexts that are finished outside the estimated runtime outlier value and not cumulated to estimated run time value.</td>
</tr>
<tr>
<td>Running Workflow Contexts</td>
<td>Displays the total number of running workflows.</td>
</tr>
<tr>
<td>Successfully Finished Workflows Cumulated to ERT</td>
<td>Displays the total number of successfully completed workflows whose running duration is cumulated to the estimated run time value.</td>
</tr>
<tr>
<td>Workflows by State (This Month)</td>
<td>Displays the total number of workflows run in a month grouped by the current state.</td>
</tr>
<tr>
<td>Aged Workflow Contexts (Running Since Last Month)</td>
<td>Displays the total number of workflow contexts running for a given period of time by workflow name. By default, it displays the total number of workflow contexts running over the last month.</td>
</tr>
<tr>
<td>Workflows Run Between Yesterday and Today (by Table)</td>
<td>Displays workflows that have run in the last day grouped by table name.</td>
</tr>
</tbody>
</table>
Workflow performance timing

The workflow engine can generate detailed performance timing data that is useful for troubleshooting slow workflows.

An administrator must enable this functionality.

When workflow performance timing is enabled, the workflow engine tracks key performance data, including various execution speed metrics. The Workflow Timing (wf_workflow_timing) table stores the data, with a record for each workflow context. The workflow timing record is updated when the workflow engine completes the workflow, waits for an activity to complete, or otherwise exits the workflow execution.

Workflow estimated run time properties

Administrators can enable the collection of workflow run time metrics by setting Estimated Run Time (ERT) properties.

Administrators can use ERT metrics to determine if workflows are running longer or shorter than expected and to identify errors in workflow processing. The system displays run time metrics on the Workflow Operations Dashboard.

Enable workflow performance timing

Workflow performance timing is disabled by default. You can create a system property to enable it.

Role required: admin

Add a system property with the following specifications.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.workflow.show_timing</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

Workflow activities

Workflow activity properties reference

Each activity performs a different task, such as running a script, sending notifications, or requesting approvals. Activities can succeed or fail, which can result in actions performed by other activities.

For information about configuring different types of activities, click an activity name in the list below or see Workflow activities reference.

Core activities provided in the base system

- Approval and rollback workflow activities
- Condition Workflow activities
- Notification workflow activity
- Notify workflow activities
- Subflow activities
Activities provided with Orchestration

The following activities are included with Orchestration.

- Active Directory activity pack
- Orchestration activities
- PowerShell activities
- Puppet activities

Templates provided for creating custom activities

If Orchestration is active on your system, users with the proper roles can create custom activities using the ServiceNow Orchestration activity designer. For information about the templates Orchestration provides for creating custom activities that you can upload to the ServiceNow Store, see Orchestration custom activity templates.

Workflow activities reference

Workflow activity reference, organized by category.

Each activity performs a different task, such as running a script, sending notifications, or requesting approvals.

Workflow runs activities as the user session that starts or advances them. Workflows started from record operations will run activities as the user session that performed the record operation. Workflows started from schedules or restarted from timers run activities as the System user. Workflows started from script calls run activities as the user session that started the script.

Approval and rollback activities

Approval and rollback activities generate and manage approvals. Not all workflows can include approval activities. For more information, read Approval and rollback workflow activities.

Note: Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Action</td>
<td>The Approval Action activity performs an approval action on the current task.</td>
</tr>
<tr>
<td>workflow activity</td>
<td></td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>Activity</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Approval - User</td>
<td>The Approval - User activity creates one or more individual user approvals.</td>
</tr>
<tr>
<td>workflow activity</td>
<td></td>
</tr>
<tr>
<td>Generate workflow activity</td>
<td>The Generate activity immediately creates task or approval records from any task or approval activities placed after the Generate activity in the workflow path. These pre-generated tasks and approvals start when the task and approval activities are reached during flow execution. This allows a task to have a set of associated pre-generated sequential tasks or approvals, but still require them to be completed in order.</td>
</tr>
<tr>
<td>Manual Approvals</td>
<td>The Manual Approvals activity watches and manages any approvals that users add manually outside of the workflow process. This activity only selects approvals that are in the Not requested state.</td>
</tr>
<tr>
<td>workflow activity</td>
<td></td>
</tr>
<tr>
<td>Rollback To activity</td>
<td>The Rollback To activity transitions directly to the activity specified by the outgoing transition line arrow.</td>
</tr>
<tr>
<td>activity</td>
<td></td>
</tr>
</tbody>
</table>

**Condition activities**

Condition activities provide conditional branching and logical operation functionality for workflows.

**Note:** Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If workflow activity</td>
<td>The If activity checks a condition or script to determine if a Yes or No transition should be taken.</td>
</tr>
<tr>
<td>Switch workflow activity</td>
<td>The Switch activity checks if the value of a passed field or variable is equivalent to one of several case values.</td>
</tr>
<tr>
<td>Wait for condition</td>
<td>The Wait for condition activity causes the workflow to wait at this activity until the current record matches the specified condition.</td>
</tr>
<tr>
<td>workflow activity</td>
<td></td>
</tr>
<tr>
<td>Wait for WF Event</td>
<td>The Wait for WF Event activity causes the workflow to wait at this activity until the specified event is fired.</td>
</tr>
<tr>
<td>workflow activity</td>
<td></td>
</tr>
</tbody>
</table>

**Notify activities**

Notify workflow activities manage calls and SMS messages in Notify.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forward call activity</td>
<td>The Forward Call activity forwards a Notify call to an E.164-compliant phone number.</td>
</tr>

<tr>
<td>------------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Play workflow activity</td>
<td>The <strong>Play</strong> activity plays a sound file on a Notify call.</td>
</tr>
<tr>
<td>Record workflow activity</td>
<td>The <strong>Record</strong> workflow activity records audio from a user on a Notify call.</td>
</tr>
<tr>
<td>Reject workflow</td>
<td>The <strong>Reject</strong> workflow activity rejects an incoming Notify call.</td>
</tr>
<tr>
<td>Say workflow activity</td>
<td>The <strong>say</strong> workflow activity allows you to play a message, using text to speech, on a Notify call.</td>
</tr>
<tr>
<td>Forward to notify client workflow activity</td>
<td>The <strong>forward to notify client</strong> workflow activity connects a phone call to a Notify WebRTC client.</td>
</tr>
<tr>
<td>Call workflow activity</td>
<td>The <strong>Call</strong> activity makes outbound phone calls using a Notify workflow. This workflow activity can be added to any table.</td>
</tr>
<tr>
<td>Join conference call workflow activity</td>
<td>The <strong>Join Conference Call</strong> activity connects an incoming or outgoing call to a Notify conference call.</td>
</tr>
<tr>
<td>Send SMS workflow activity</td>
<td>The <strong>send SMS</strong> workflow activity to send short text messages using Notify to users’ phones. This workflow activity can be added to any table.</td>
</tr>
<tr>
<td>Queue workflow activity</td>
<td>The <strong>Queue</strong> activity places an active Notify call in a queue.</td>
</tr>
</tbody>
</table>

### Notification activities

Notification workflow activities notify users of events that occur during the workflow.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Event workflow activity</td>
<td>The <strong>Create Event</strong> activity adds an event to the event queue, but does not immediately fire the event.</td>
</tr>
<tr>
<td>Notification workflow activity</td>
<td>The <strong>Notification</strong> activity sends an email or SMS message to specified users or groups.</td>
</tr>
</tbody>
</table>

### Subflow activities

Subflow activities run and manage workflows from a parent workflow.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parallel Flow Launcher workflow activity</td>
<td>The <strong>Parallel Flow Launcher</strong> activity launches multiple subflows in parallel.</td>
</tr>
</tbody>
</table>

### Task activities

Task activities create and modify workflow tasks.
**Note:** Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

## Task activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Worknote workflow activity</td>
<td>The <strong>Add Worknote</strong> activity adds text to the Worknotes field of the current incident record.</td>
</tr>
<tr>
<td>Attachment Note workflow activity</td>
<td>The <strong>Attachment Note</strong> activity adds an attachment to the current record.</td>
</tr>
<tr>
<td>Catalog Task workflow activity</td>
<td>The <strong>Catalog Task</strong> activity creates a service catalog task record.</td>
</tr>
<tr>
<td>Create Task workflow activity</td>
<td>The <strong>Create Task</strong> activity generates a record on any of the tables that extend Task (task).</td>
</tr>
</tbody>
</table>

## Timer activities

Timer activities pause workflows for set periods of time.

**Note:** Timer activities run as the System user because the system scheduler advances the workflow.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SLA Percentage Timer workflow activity</td>
<td>The <strong>SLA Percentage Timer</strong> activity pauses the workflow for a duration equal to a percentage of an SLA.</td>
</tr>
<tr>
<td>Timer workflow activity</td>
<td>The <strong>Timer</strong> activity pauses the workflow for a specified period of time.</td>
</tr>
</tbody>
</table>

## Utility activities

Utility activities provide controls over the path of the workflow, and other useful tools.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Branch workflow activity</td>
<td>The <strong>Branch</strong> activity splits the workflow into multiple transition paths from a single activity.</td>
</tr>
<tr>
<td>Join workflow activity</td>
<td>The <strong>Join</strong> activity unites multiple execution paths into one transition.</td>
</tr>
<tr>
<td>Lock workflow activity</td>
<td>The <strong>Lock</strong> activity prevents other instances of this workflow from continuing past this activity until the lock is released.</td>
</tr>
<tr>
<td>Log Message workflow activity</td>
<td>The <strong>Log Message</strong> activity writes a message to the workflow log.</td>
</tr>
<tr>
<td>Log Trace Message workflow activity</td>
<td>The <strong>Log Trace Message</strong> activity writes a trace message to the workflow log.</td>
</tr>
</tbody>
</table>
## Activities provided with Orchestration

The following activities are included with Orchestration.

- Active Directory activity pack
- Orchestration activities
- PowerShell activities
- Puppet activities

## Templates provided for creating custom activities

If Orchestration is active on your system, users with the proper roles can create custom activities using the ServiceNow Orchestration activity designer. For information about the templates Orchestration provides for creating custom activities that you can upload to the ServiceNow Store, see [Orchestration custom activity templates](#).

## Approval and rollback workflow activities

Approval and rollback activities generate and manage approvals.

Approval and rollback activities are not available in some workflows.

- With two exceptions, approval and rollback activities are only available when the workflow runs on a table that extends Task. The exceptions are the [Approval - User](#) and [Approval Action](#) activities, which are available globally.
- Approval and rollback activities are available only if approval engines are turned on for the table on which the workflow runs. If approval engines are enabled for the table, approval activities appear greyed out and cannot be selected. To learn more about how workflow and approval engines interact, read [Approval workflow activities and approval engines](#).

### Approval Action workflow activity

The **Approval Action** activity performs an approval action on the current task.

Use this activity to mark the current task record as approved or rejected.
Note: When an Approval Action activity is used to mark a task approved, the activity marks all pending approvals as No Longer Required. This activity behaves differently from Set Values or Run Script when used to set the Approval field’s value.

Results

The result value of the activity is the final approval disposition selected by the approver. The result value can be Approved or Rejected. A workflow designer can assign a result value using the activity.result variable from within a script field of the activity.

Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>The action to perform on the task. Options are:</td>
</tr>
<tr>
<td></td>
<td>· Mark task approved</td>
</tr>
<tr>
<td></td>
<td>· Mark task rejected</td>
</tr>
<tr>
<td></td>
<td>· Mark task requested</td>
</tr>
<tr>
<td></td>
<td>· Disregard pending approvals: the system sets approval records to no longer required and marks the activity as approved.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition runs after this activity.

Note: Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always</td>
<td>The event or condition that causes the approval to move to the next workflow step.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.
Approval Action activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the execute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Approval Coordinator workflow activity

The Approval Coordinator activity creates an approval whose outcome depends on the outcome of one or more child activities, including one or more Approval - User, Approval - Group, and/or Manual Approval activities.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

To create an Approval Coordinator activity, first drag the activity onto the workflow canvas, causing the activity form to display. On the activity form, fill in the appropriate fields, then click Submit.

After you click Submit, the activity appears on the workflow canvas. From there, specify the child activities by clicking the links that appear on the body of the activity.

When the Approval Coordinator activity completes, all pending approvals that were created by any of the Approval Coordinator approval activities are immediately set to No Longer Required. If a single user is called as an approver twice by the same workflow, such as when a single user is both a product approver and an executive approver, any approvals for that user after the first are skipped.

Results

The result value of the Approval Coordinator activity depends on the approval actions taken by the approvers and the approval conditions specified in the Wait for field. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

Input variables

Input variables determine the initial behavior of the activity.
## Approval Coordinator activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Wait for</strong></td>
<td>Indicate what to wait for to indicate that the approval activity is approved or rejected. Options are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Any child activity to be approved</strong>: Any child activity (User, Group, or Manual Approval) that completes with a result of approved causes the Approval Coordinator activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>- <strong>All child activities to be approved</strong>: All child activities of the Approval Coordinator activity must complete with a a result of approved to cause the Approval Coordinator activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>- <strong>The first approval or rejection from any child activity</strong>: The first child activity that completes with a result of approved or rejected causes the Approval Coordinator activity to complete with the same result.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Condition based on script</strong>: Call a script to determine how to manage an approval or rejection.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>When a rejection occurs</th>
<th>Specify what the coordinator should do when it sees a rejection from any one of the child activities. Options are:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only appears if <strong>Wait for</strong> is set to <strong>All child activities to be approved</strong> or <strong>Any child activity to be approved</strong></td>
<td>- <strong>Reject the approval</strong>: Immediately complete the Approval Coordinator activity with a result of rejected.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Wait for other responses before deciding</strong>: Wait until we get other responses from other child activities before making an approval or rejection decision.</td>
</tr>
<tr>
<td></td>
<td>This allows users to change their minds until a decision is made.</td>
</tr>
<tr>
<td></td>
<td>In addition, if <strong>Wait for</strong> is set to <strong>Any child activity to approve</strong> then a single child activity completion with a result of approved will cause the Approval Coordinator activity to complete with a result of approved even if other child activities have completed with a result of rejected.</td>
</tr>
</tbody>
</table>
### Approval Coordinator Activity Conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users from the groups have approved the request based on the <strong>Wait for</strong> rules.</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the <strong>Wait for</strong> rules.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the <code>execute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
</tbody>
</table>
### State Description

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Approval - Group workflow activity**

The **Approval - Group** activity creates approval records for each member of a specified group.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

The group approval is approved or rejected based on the user approvals, according to the logic specified in the **Wait For** field.

### Results

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. By default, the result value is the final approval disposition. This disposition depends on the approval actions taken by the approvers and the approval conditions specified in the **Wait for** or **When Anyone Rejects** fields. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

### Input variables

Input variables determine the initial behavior of the activity.

**Approval - Group activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval - Group When</td>
<td>Specify when this activity generates a group approval record.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions which, if met, cause the group approval to be generated. If the conditions are not met, the approval is skipped.</td>
</tr>
<tr>
<td>Approval - Group Approvers</td>
<td>Specify the groups whose approval will be requested.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Groups                | The groups whose approval will be requested.  
To edit this field, click the lock icon. To select specific groups by name, use the lookup list. To select groups from field values on the current record at runtime, click the tree icon.  
Each member of the group will be assigned an individual approval record.  
If no group is selected, the activity automatically sets the approval to **Approved**. |

### Approval - Group Condition

Specify how the activity decides to approve or reject the group approval, based on the responses from individual members of the group.

<table>
<thead>
<tr>
<th>Wait for</th>
<th>A choice between different approval logics to determine which individual approvals or rejections result in approval or rejection of the activity's approval. Options are:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- <strong>An approval from each group</strong>: Any user from each group can approve and the first approval from each group causes the activity to complete with a result of <strong>approved</strong> (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>- <strong>An approval from any group</strong>: Any user from any group can approve and the first approval from any group causes the activity to complete with a result of <strong>approved</strong>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>An approval from everyone from all groups</strong>: All users from all groups must approve to cause the activity to complete with a result of <strong>approved</strong> (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>- <strong>First response from each group</strong>: The first approval or rejection from any user in each group is used to indicate the state of the group approval (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>Indicate what happens when any user rejects their approval request. Options are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Reject the approval</strong>: Immediately complete the activity with a result of <strong>rejected</strong>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>First response from any group</strong>: The first approval or rejection from any user in any group causes the activity to complete with a result of <strong>approved</strong> or <strong>rejected</strong>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Condition based on script</strong>: Each time a user approves or rejects, the Approval script is called to determine if the activity should complete.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Approval script</td>
<td>If the <em>Wait for</em> variable is set to <em>Condition based on script</em> this script is called to determine how to handle an approval or rejection. The script needs to set the variable answer to approved or rejected to indicate the overall status for this approval.</td>
</tr>
<tr>
<td></td>
<td>This script is responsible for setting the approval state for each group that is part of this approval activity before returning the overall approval state for all of the groups.</td>
</tr>
<tr>
<td></td>
<td>When called, the following variables are available to the script for all the groups that are part of this approval activity:</td>
</tr>
</tbody>
</table>
|                        | counts.total = total number of groups that are part of this approval  
|                        | counts.approved = # of groups that approved so far  
|                        | counts.rejected = # of groups that rejected so far  
|                        | counts.requested = # of groups that are pending approval  
|                        | counts.not_requested = # of groups that are not pending approval  
|                        | counts.not_required = # of groups that approval is not required  
|                        | And for each group:                                                                                                                                  |
|                        | groups[group_id].total = total number of users that are part of this group's approval  
|                        | groups[group_id].approved = # of users that approved so far  
|                        | groups[group_id].rejected = # of users that rejected so far  
|                        | groups[group_id].requested = # of users that are pending approval  
|                        | groups[group_id].not_requested = # of users that are not pending approval  
|                        | groups[group_id].not_required = # of users that approval is not required  
|                        | groups[group_id].approvalIDs[state] = array of user ids that are at the specified approval state |

Note: Iterate the groups using:
```
for (var id in groups) {
  var group = groups[id];
  ...
}
```

Note: Get group object using the following code (to get things like the group name being iterated on):
```
var objGroup = fncGetGroupObj(id);
var strGroupName = objGroup.name;
```

function fncGetGroupObj(sidGroupApproval) {
  var objGroupApproval = new GlideRecord('sysapproval_group');
  objGroupApproval.get(sidGroupApproval);
  var objGroup = new GlideRecord('sys_user_group');
  objGroup.get(objGroupApproval.assignment_group.sys_id);
  return objGroup;
}

Approval scripts also allow computations. For example, if only half of the approvals are required:
```
if (counts.approved/counts.total > .49) {
  answer = 'approved';
} else if (counts.rejected/counts.total > .50) {
  answer = 'rejected';
}
```
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| When anyone rejects | A choice between different approval logics to determine which individual rejections result in rejection of the activity’s approval. Options are:  
  - **Reject the approval**: Immediately complete the activity with a result of rejected.  
  - **Wait for other responses before deciding**: Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made. |
| Approval - Group Schedule | Specify how workflow calculates the approval record’s expected start date and due date. Once you’ve made a selection for ‘Due date based on’, and ‘Schedule based on’, the appropriate fields will display. |
| Due date based on | Select how workflow determines the task’s duration, due date, and schedule.  
  - **A user specified duration**: The duration is based on a user specified value.  
  - **A relative duration**: The duration is calculated from a relative duration (such as End of Next Business Day).  
  - **A date/time or duration field**: The duration is based on the value of a field on the current record.  
  - **Script**: The duration is returned by a script. |
<p>| Duration | The specific number of days and hours. Only appears when <strong>Due date based on</strong> is set to <strong>A user specified duration</strong>. |
| Relative duration | The general number and length of business days. Only appears when <strong>Due date based on</strong> is set to <strong>A relative duration</strong>. |
| Due date field | The date/time or duration field. Only appears when <strong>Due date based on</strong> is set to <strong>A date/time or duration field</strong>. |
| Due date script | The script that sets ‘answer’ to the number of seconds for the duration. Only appears when <strong>Due date based on</strong> is set to <strong>Script</strong>. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schedule based on</td>
<td>The basic schedule the timer uses to count working hours. If a schedule is specified, the duration will only be considered for times that are specified on the schedule. For example, if the duration is 2 hours and the workflow begins at 4:00pm on a schedule that is 8am - 5pm, then it ends at 9:00am the next day. The options are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>This workflow's schedule</strong>: The schedule uses workflow context date, time, and an optional <strong>Time zone based on</strong> value.</td>
</tr>
<tr>
<td></td>
<td>- <strong>A specific schedule</strong>: The schedule uses a pre-defined Schedule and an optional <strong>Time zone based on</strong> value.</td>
</tr>
<tr>
<td></td>
<td>- <strong>A schedule field</strong>: The schedule uses a value from a table and an optional <strong>Time zone based on</strong> value.</td>
</tr>
<tr>
<td>Schedule</td>
<td>The predefined Schedule from a list.</td>
</tr>
<tr>
<td></td>
<td>Only appears when <strong>Schedule based on</strong> is set to <strong>A specific schedule</strong>.</td>
</tr>
<tr>
<td>Schedule field</td>
<td>A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.</td>
</tr>
<tr>
<td></td>
<td>Only appears when <strong>Schedule based on</strong> is set to <strong>A schedule field</strong>.</td>
</tr>
<tr>
<td>Time zone based on</td>
<td>The time zone for calculating the duration. The time zone may be based on:</td>
</tr>
<tr>
<td></td>
<td>- <strong>No time zone</strong>: Default. Workflow uses the GMT time zone.</td>
</tr>
<tr>
<td></td>
<td>- <strong>A specific time zone</strong>: A specific <strong>Time zone</strong> that you choose from a choice list.</td>
</tr>
<tr>
<td></td>
<td>- <strong>A time zone field</strong>: A <strong>Time zone field</strong> to track time duration from a field on the form.</td>
</tr>
<tr>
<td>Time zone</td>
<td>Select the time zone you want from the choice list.</td>
</tr>
<tr>
<td></td>
<td>Only appears when <strong>Time zone based on</strong> is set to <strong>A specific time zone</strong>.</td>

<tr>
<td>Advanced</td>
<td>Select this check box to write a script for determining additional users to request approvals from. Use the <strong>Additional groups script</strong> to customize group approvals.</td>
</tr>
</tbody>
</table>
### Conditions

The following conditions determine which transition runs after this activity.

**Note:** Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

#### Approval - Group activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users from the groups have approved the request based on the Wait for rules.</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the Wait for rules.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

#### Approval - Group activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the execute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>
Approval - User workflow activity
The **Approval - User** activity creates one or more individual user approvals.

Results

The result value is the final approval disposition. This disposition depends on the approval actions take by the approvers and the approval conditions specified in the **Wait for** or **When Anyone Rejects** fields. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

Input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval - User When</td>
<td>Specify when this activity generates a user approval record.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions which, if met, cause the individual approval to be generated. If the conditions are not met, the approval is skipped.</td>
</tr>
<tr>
<td>Approval - User Approvers</td>
<td>Specify the users whose approval will be requested.</td>
</tr>
<tr>
<td>Users</td>
<td>The users for the approval. Use the tree icon to select user reference fields from the current record to create approvals, such as <code>${assigned_to}</code>. If no user is selected, the activity automatically sets the approval to Approved.</td>
</tr>
<tr>
<td>Groups</td>
<td>Groups whose members should also receive approvals. Note that this is different than the <strong>Approval - Group</strong> activity, which creates a group approval in addition to the individual approvals. The tree icon can be used to select group reference fields from the current record to create approvals, such as <code>${assignment_group}</code>.</td>
</tr>
<tr>
<td>Approval - User Condition</td>
<td>Specify how the activity decides to approve or reject the approval, based on the responses from individual approvers.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Wait for</td>
<td>A choice between different approval logics to determine which individual approvals result in approval of the activity's approval. Options are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Anyone to approve</strong>: Any user can approve and the first approval causes the activity to complete with a result of <strong>approved</strong>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Everyone to approve</strong>: All users must approve (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>- <strong>First response from anyone</strong>: The first approval or rejection from any user causes the activity to complete.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Condition based on script</strong>: Each time a user approves or rejects, the Approval script is called to determine if the activity should complete.</td>
</tr>
<tr>
<td>When anyone rejects</td>
<td>A choice between different approval logics to determine which individual rejections result in rejection of the activity's approval. Options are:</td>

**Approval - Advanced**

If desired, write a script for determining additional users to request approvals from.

**Advanced**

Select this check box to write a script for determining additional users to request approvals from.
### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional approvers script</td>
<td>If the <strong>Advanced</strong> check box is selected, this script is called to determine any additional user approvals to be created. The script needs to set the variable <code>answer</code> to a comma-separated list of user ids and group ids or an array of user and group ids to add as approvers. For example:</td>
</tr>
</tbody>
</table>

```javascript
answer = [];
answer.push('id1');
answer.push('id2');
```

### Conditions

The following conditions determine which transition runs after this activity.

**Note:** Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

#### Approval - User activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users approved the request based on the <strong>Wait for</strong> rules.</td>
</tr>
<tr>
<td>Rejected</td>

<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

#### Approval - User activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the <code>execute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>
Generate workflow activity
The Generate activity immediately creates task or approval records from any task or approval activities placed after the Generate activity in the workflow path. These pre-generated tasks and approvals start when the task and approval activities are reached during flow execution. This allows a task to have a set of associated pre-generated sequential tasks or approvals, but still require them to be completed in order.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

By default, the workflow does not create any tasks or approvals until it reaches them in the workflow.

The Generate activity follows all transitions through the workflow to each activity. For each activity:

- If it is a task activity, creates the task and sets:
  - The State to Pending
  - The Expected Start Date
  - The Due Date

  **Note:** Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

- If it is an approval activity, creates the approvals and sets:
  - The approval State to Not Requested
  - The Expected Start Date
  - The Due Date

  **Note:** Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

Expected start dates and due dates are calculated based on the Expected Duration of all of the tasks and approvals between the Generate activity and the activity being updated. In the case of a branched path (between a Branch and Join activity), the longer duration will be used for any post-branch activities.

The Generate activity can be used more than once, and any tasks or approvals will be refreshed with updated information. This is useful in situations where the list of approvers or other important information is still editable while the workflow is in process and it may be necessary to update or correct the generated approvals or tasks.

To exclude a set of activities from the Generate activity, select the Skip during generate check box on any condition and its transitions will not be followed during the generate process. By default, the following conditions have the Skip during generate check box selected:

- Rejected (for any of the approval activities)
- No condition of If activity
- Continue condition of Turnstile activity
- Incomplete condition of Join activity

Input variables
Input variables determine the initial behavior of the activity.
### Generate activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate approvals</td>
<td>If selected, approvals are created when running the Generate activity. If cleared, the approvals are used to compute their estimated duration, but no approvals are created.</td>
</tr>
<tr>
<td>Generate tasks</td>
<td>If selected, tasks are created when running the Generate activity. If cleared, the tasks are used to compute their estimated duration, but no tasks are created.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The activity is executing.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
</tbody>
</table>
Example

In this example, the following approvals are generated:

- Approval-2
- Approval-3

Approval-4 is skipped since the `Rejected` condition of Approval-3 has `Skip during generate` selected.

Here is an example of using the `Generate` activity that describes the expected start and due dates:
Generate workflow start and due date

In this example, if the Generate activity is run on Jan 1, 2016, the following expected start dates and due dates would be set for the generated tasks.

<table>
<thead>
<tr>
<th>Task</th>
<th>Expected Start Date</th>
<th>Reason</th>
<th>Due Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task 2 (1 day)</td>
<td>Jan. 2, 2016</td>
<td>Task 1 is 1 day</td>
<td>Jan. 3, 2016</td>
</tr>
<tr>
<td>Task 4 (1 day)</td>
<td>Jan. 3, 2016</td>
<td>Task 3 is 2 days</td>
<td>Jan. 4, 2016</td>
</tr>
<tr>
<td>Task 5 (1 day)</td>
<td>Jan. 4, 2016</td>
<td>Task 4 ends the latest before the Join</td>
<td>Jan. 5, 2016</td>
</tr>
</tbody>
</table>

Notice that Task 5 starts on Jan. 4, 2016 since the longest path (based on due dates) to the Join is Task 3/Task 4.

Manual Approvals workflow activity

The Manual Approvals activity watches and manages any approvals that users add manually outside of the workflow process. This activity only selects approvals that are in the Not requested state.

Note: This activity is only available when the workflow runs on a table that extends Task.

If there are no pending manual approvals when this activity executes, the activity immediately completes with a result of approved. This activity does not create approval records. Use this activity to pause the workflow when a user adds a manual approval to a record with an associated workflow, and it is in the Not requested state. The workflow waits for the approval to be closed before proceeding.

Results

The workflow designer can assign a result value using activity.result from within a script field of the activity. By default, the result value of the activity is the final approval disposition determined by the approval actions take by the approvers. Possible result values are:

- Approved
Input variables

Input variables determine the initial behavior of the activity.

Manual Approvals activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for</td>
<td>Indicate what to wait for to indicate that the approval activity is approved or rejected. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Any manual user or group approval: Any user can approve and the first approval causes the activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>• All manual user or group approvals: All users must approve (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>• The first response from any manual approval: The first approval or rejection from any user causes the activity to complete.</td>
</tr>
<tr>
<td>When anyone rejects</td>
<td>Indicate what happens when any user rejects their approval request. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Reject the approval: Immediately complete the activity with a result of rejected.</td>
</tr>
<tr>
<td></td>
<td>• Wait for other responses before deciding: Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made.</td>
</tr>
<tr>
<td></td>
<td>In addition, if Wait for is set to Anyone to approve then a single approval will cause the activity to complete with a result of approved even if one or more users reject.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition runs after this activity.

Note: Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

Manual Approvals activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users from the groups have approved the request based on the Wait for rules.</td>
</tr>
</tbody>
</table>
### Condition

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the <strong>Wait for</strong> rules.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

**Manual Approvals activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the <code>execute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Rollback To workflow activity**

The **Rollback To** activity transitions directly to the activity specified by the outgoing transition line arrow.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

**Rollback To** determines which activities to reset based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, not the execution order. **Rollback To** then marks all the approvals that have transitioned between the rollback and the transitioned to activity as **Not Yet Requested** and the tasks as either **Open** or **Pending**.

Use the **Rollback To** activity for all workflows in which multiple rollbacks are required. **Rollback To** has no variables.

### Conditions

The conditions determine which transition runs after this activity.

**Rollback To activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always</td>
<td>The event or condition that causes the approval to revert to the previous workflow step.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
</tbody>
</table>
### Condition

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

#### Rollback To activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the <code>execute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

#### Rollback To behavior

The **Rollback To** activity transitions directly to the activity specified by the transition line arrow. Use the **Rollback To** activity for all workflows that use multiple or nested rollbacks. **Rollback To** resets the targeted task (the direct transition) to **Open**. All tasks that have executed between the **Rollback To** activity and the targeted task (rolled back task) are set to **Pending**.

(0) Begin
(1) Log Message
(2) Task 1
(3) Task 3
(4) Task 2
(5) Timer
(6) Approval 1
(7) Roll back to first task
(8) Task 1
(9) Task 2
(10) Approval 1
(11) Log approval
(12) Join
(14) Send email
(15) End
The state of (3) Task 3 does not change, since this activity does not directly transition from the rollback target activity. To see what activities were rolled back, select the Workflow Transition History related list and look at the Rolled back column.

The Rollback To activity (7) updates the following activities:

(8) Task 1: reset to Open
(9) Task 2: reset to Pending
(10) Approval 1: reset to Not Yet Requested
Rollback To workflow transition

Rollback To activity
When conditions in a workflow trigger a Rollback To activity, the workflow moves processing backward to a specified activity in the workflow and resets certain activities that have already executed back to their original state. This is useful when handling an unexpected failure or as part of a programmed logical flow.

When an activity is reset during a workflow rollback, the following happens:

- Approvals are reset to Not Requested.
- Tasks are reset to either Open or Pending. A rollback workflow path cannot create new tasks.

Activities that perform external system operations, such as deleting a file or sending an email, are not rolled back. Only approval and task activity states are reset.

A workflow can contain a single rollback, multiple rollbacks, or nested rollbacks in more complex workflows. The Rollback To activity resets activities based on the actual workflow sequence.
(transition line attachments) of activities between itself and the transitioned to activity, rather than using the execution order to determine where processing should restart.

**Condition Workflow activities**

Condition activities provide conditional branching and logical operation functionality for workflows.

**If workflow activity**

The **If** activity checks a condition or script to determine if a **Yes** or **No** transition should be taken. If the workflow creator specifies both the **Condition** and the **Advanced** script, both must evaluate successfully for activity to take the **Yes** transition.

**Results**

The workflow designer can assign a result value using activity.result from within the **Script** field on the activity record. By default, the result value of the activity is the final result of the condition or script specified. Possible result values are:

- **Yes**
- **No**

**Input variables**

The following variables determine the behavior of the activity.

*Note:* Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.

**If activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>If specified and the current record matches the condition, the <strong>Yes</strong> transition is taken.</td>
</tr>
<tr>
<td>Advanced and Script</td>
<td>To specify a script, select the <strong>Advanced</strong> check box. You may then enter a script that is evaluated. If your script sets the variable answer to <strong>yes</strong>, then the <strong>Yes</strong> transition is taken. Otherwise, the <strong>No</strong> transition is taken.</td>
</tr>
</tbody>
</table>

**Conditions**

The following conditions determine which transition comes after the activity.

**If activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Taken when the condition, if specified, matches and the <strong>Advanced</strong> script, if specified, returns yes.</td>
</tr>
</tbody>
</table>
## States

The activity state tells the workflow engine what to do with the activity.

### If activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

### Switch workflow activity

The **Switch** activity checks if the value of a passed field or variable is equivalent to one of several case values.

The switch activity behavior is similar to a switch statement in Java.

When creating a switch activity, select a **Variable** or **Field** to check against activity conditions for a matching field value. When the value passed in this variable or field matches the value defined in the **Condition** field of the activity condition, the workflow progresses through that activity condition.

Note: Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.

### Results

The variable or field selected in the **Variable** or **Field** activity variable determines the possible result values.

### Input variables

The following variables determine the behavior of the activity.
Switch activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select Variable or Field as the type of value to check against available conditions. This selection sets the label and available options for the other field.</td>
</tr>
</tbody>
</table>
| Variable or Field | Select the source of the value compared against the switch activity conditions. The field label and available options depend on the Type selection.  
  • Variable: select any service catalog variable.  
  • Field: select any field from the Table defined in the workflow properties. |

States

The activity state tells the workflow engine what to do with the activity.

Switch activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Example

You can create a switch activity that sets different field values on an incident based on the Assignment group of the incident record.
Switch activity example

The **Field** selected is the incident **Assigned to** field.

Switch activity Field
If the value of the **Assigned to** field of the workflow-triggering incident is **Service Desk** or **Field Services**, the workflow populates values on the incident record before continuing. If the **Assigned to** value is **Hardware**, the workflow continues without populating any field values.

Condition type (Standard, Else, or Error) is used. For more information, see *Manage workflow activity conditions*.

**Hardware group condition**

The **Wait for condition** activity causes the workflow to wait at this activity until the current record matches the specified condition.

The workflow evaluates the **Wait for condition** activity each time the current record is updated. Use this activity to pause a workflow indefinitely until a particular criteria is met by a record update. To pause a workflow for a timed duration see *Timer workflow activities*.
For workflow to consider the condition met, all conditions specified – whether in the builder or in a script – must be true.

**Note:** A *Wait for condition activity* should only be used to wait for an external event such as a record update, and not one from a workflow setting a value. If you have a workflow setting a value and want to wait for that same field to be seen as ‘changed,’ try inserting a one-second timer.

### Results

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. The activity transitions when the result value is true.

### Input variables

The following variables determine the behavior of the activity.

**Note:** Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.

#### Wait for condition activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>The workflow is paused at this activity until this condition matches the current record.</td>
</tr>
<tr>
<td>Condition script</td>
<td>If specified, the workflow is paused at this activity until this script sets the answer variable to true.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

#### Wait for condition activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>
**Wait for WF Event workflow activity**

The **Wait for WF Event** activity causes the workflow to wait at this activity until the specified event is fired.

Use this activity to wait for another activity to fire an event. Events from other activities are fired in a script using the `workflow.fireEvent('eventName')` API call.

**Results**

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. This activity transitions when the specified event fires.

**Input variables**

The following variables determine the behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for Event</td>
<td>An event name to trigger the workflow.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Notify workflow activities**

Notify workflow activities manage calls and SMS messages in Notify.

All Notify workflows that manage a phone call must run on the `notify_call` table. Call-related Notify activities can be added only to workflows where the `Table` field value is **Notify Call (notify_call)**.

You can identify if an outbound call was answered by a human or by an answering machine from within a Notify workflow by evaluating the `current.is_human` variable, such as with an `If` workflow.
activity. This variable is set by the telephony provider when an outbound call is answered. This variable is always true for inbound calls.

**Note:** Do not add a Timer activity between multiple Notify activities that interact with active phone calls.

**Important:** When creating a Notify workflow, set the workflow **If condition matches** field to **None**. Notify controls which workflow to run based on the configured number groups.

Forward call workflow activity

The **Forward Call** activity forwards a Notify call to an E.164-compliant phone number. If the person receiving a forwarded call hangs up, the forward call activity completes and transitions to the next activity. Any further Notify activities in the workflow run for the caller only.

Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phone number to call</td>
<td>Enter the phone number to forward the call to.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be answered before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the conversation.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity. The forward call activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the phone number to call is invalid.

Input workflow activity

The **Input** activity creates a phone menu by presenting a list of options on a Notify call.

Input Variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of digits</td>
<td>Specify the maximum number of digits the caller can enter. A caller can enter fewer digits than the maximum and press the Finish key to complete the entry.</td>
</tr>
<tr>
<td>Finish key</td>
<td>Specify the key a caller can press on their phone when finished selecting a menu option.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Specify the amount of time to wait before closing the menu automatically when the caller does not select a menu option.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to build the phone menu, instead of using the activity conditions.</td>
</tr>
<tr>
<td>Script</td>
<td>Define the script to build the phone menu. The script must specify an answer variable as a JavaScript object with the following format:</td>
</tr>
</tbody>
</table>

```javascript
answer = {
  "1": {
    "play": "https://some_url.com/options/one.mp3",
    "myCustomData": "some data here"
  },
  "2": {
    "play": "https://some_url.com/options/two.mp3",
    "myCustomData": "some other data here"
  },
  "3": {
    "speak": "type 4 to speak to a representative",
    "language": "en-US",
    "myCustomData": "some more data here"
  }
};
```

The script may specify either a text-to-speech string and language code or the URL of a prerecorded message for each entry. You can also add optional attributes to store related information, such as myCustomData in the example above.

**Note:** The script object continues to support the say attribute for backward compatibility.

### Conditions

The conditions determine the transition that comes after this activity.

The **input** activity does not specify any conditions by default. You must define conditions to build the phone menu. Each condition is one option on the phone menu. Notify reads the text from each condition **Name** to the caller, up to 100 characters per condition.
You can specify a language for each condition by prefixing the message with the language code, in the format `xx-XX:<Message>`. For example, add `fr-CA:` for Canadian French. Available languages are stored on the Notify Language (`notify_language`) table.

The condition that the activity transitions through depends on the digits entered by the caller. Set the condition `Condition value` to `parseInt(workflow.scratchpad.digits) == <expected digits>`. For example, to transition through a condition when the caller presses the number 3, set the `Condition` to `parseInt(workflow.scratchpad.digits) == 3`.

You can add an error condition to this activity. The activity transitions through the error condition if the advanced script returns an invalid value, or if the text to say for a condition is empty.

**Scratchpad Entries**

The activity uses the workflow scratchpad to write persistent values.

**Values written to scratchpad**

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.digits</td>
<td>The digits entered by the caller, as a string.</td>
</tr>
<tr>
<td>workflow.scratchpad.menu&lt;activity name&gt;</td>
<td>The entire <code>answer</code> variable, if using the advanced script option. You can access this menu from other activities after this activity successfully executes. For example, if the activity name is <code>choices</code>, you can access values from the menu using:</td>
</tr>
</tbody>
</table>

```javascript
var previousActivity = "choices";
var choicesMenu = workflow.scratchpad.menu[previousActivity];
var menuItem = choicesMenu[workflow.scratchpad.digits]; // Selects the menu item based on the caller's input.
var selectedValue = menuItem.myCustomData; // get the custom data for the selected menu item.
```

**Hangup workflow activity**

The **Hangup** activity disconnects an active Notify phone call.

You can use the **hangup** activity to disconnect only calls that have been answered. Use the **reject** activity to disconnect calls that have not been answered.

**Play workflow activity**

The **Play** activity plays a sound file on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.
### Input Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the URL of a sound file to play. If the URL is inaccessible, or if the audio file mime type is not supported by the telephony provider, the <strong>play</strong> activity is skipped.</td>
</tr>
<tr>
<td>Loop</td>
<td>Enter the number of times the sound file should play.</td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity. The **play** activity does not specify any conditions by default.

You can create an error condition to handle errors with the sound file. The activity transitions through the error condition if the specified sound file is not available, or has an unsupported mime type. Supported mime types are listed on the Notify Audio MIME Types (notify_mime_type) table.

**Record workflow activity**

The **Record** workflow activity records audio from a user on a Notify call.

### Input Variables

Input variables determine the initial behavior of the activity.

#### Input Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max duration (in seconds)</td>
<td>Enter the maximum duration, in seconds, allowed for a recording.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait before ending a recording automatically when the caller is silent.</td>
</tr>
<tr>
<td>Finish Key</td>
<td>Specify the key a caller can press on their phone to end the recording.</td>
</tr>
</tbody>
</table>

### Scratchpad Entries

The activity uses the workflow scratchpad to store persistent values.

The **record** activity adds the **recording** variable to the workflow scratchpad. This variable stores metadata about the recording, such as URI, ID, and duration. You can access the following values from this variable.

#### Values written to scratchpad

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recording.recordingDuration</td>
<td>The duration of the recording, in seconds.</td>
</tr>
<tr>
<td>recording.from_number</td>
<td>The caller’s phone number, including country code.</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>recording.notify_number</td>
<td>The Notify phone number used to respond to the call, including country code.</td>
</tr>
<tr>
<td>recording.recordingID</td>
<td>The ID used by the telephony provider to identify the recording.</td>
</tr>
<tr>
<td>recording.recordingURL</td>
<td>The URL from the telephony provider to access the recording.</td>
</tr>
</tbody>
</table>

**Reject workflow**

The **Reject** workflow activity rejects an incoming Notify call.

You can use the **reject** activity to disconnect only calls that have not yet been answered. Use the **hang up** activity to disconnect calls that have been answered.

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reason</td>
<td>Select a reason for rejecting the call, such as busy.</td>
</tr>
</tbody>
</table>

**Say workflow activity**

The **say** workflow activity allows you to play a message, using text to speech, on a Notify call.

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text to say</td>
<td>Specify the text to read.</td>
</tr>
<tr>
<td>Language</td>
<td>Select the language and locale to use when reading text.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to define the language and message, instead of using the Text to say and Language values.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script to set what text is read on the call. The script must return a string that defines the language and the text to read. For example, to play an English-language message, return {language: ‘en-US’, text: ‘Text to read’}.</td>
</tr>
</tbody>
</table>

**Forward to notify client workflow activity**

The **forward to notify client** workflow activity connects a phone call to a Notify WebRTC client.
Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Select the user to connect the call to.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine which client to connect to, instead of using the User variable.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which client to connect to. This script should return a GlideRecord for a single User (sys_user) record.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be connected before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the call.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity. The Forward to Notify Client activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if there is an issue with the Notify client.

Call workflow activity

The Call activity makes outbound phone calls using a Notify workflow. This workflow activity can be added to any table.

Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify Number</td>
<td>The Notify phone number to make the call from. When you initiate a call, the outgoing call workflow for the number group associated with this number runs.</td>
</tr>
<tr>
<td>Phone number to call</td>
<td>The E.164-compliant phone number to call.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine number to call, and the Notify number to call from instead of using the Phone number to call and Notify Number variables.</td>
</tr>
</tbody>
</table>
### Conditions

The conditions determine which transition comes after this activity. The **call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the call could not be set up due to invalid data returned by the advanced script.

**Join conference call workflow activity**

The **Join Conference Call** activity connects an incoming or outgoing call to a Notify conference call.

Notify includes the workflows Notify: (Re)join Conference Call and Notify: Join Conference Call Via SMS to demonstrate how to use the **join conference call** activity to connect inbound and outbound calls, and inbound SMS messages to a conference call.

### Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced</td>
<td>Select this check box to display advanced configuration options.</td>
</tr>
<tr>
<td>Script</td>
<td>Specify advanced configuration options using JavaScript, such as if the new participant should be muted upon joining the conference call. You can access values from the workflow scratchpad.</td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity. The **join conference call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the **conference_call** scratchpad variable is not set.

### Scratchpad entries

The activity uses the workflow scratchpad to read persistent values.
Values read from scratchpad

<table>
<thead>
<tr>
<th>Scratchpad variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.conference_call</td>
<td>A GlideRecord for a single conference call record. A call processed by this activity is added to this conference call. If this value is not specified, the <strong>join conference call</strong> activity will log an error. When initiating an outgoing call workflow using the Notify API <strong>call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall)</strong> method, this scratchpad value is set automatically to the conference call GlideRecord. For incoming call workflows, or workflows initiated using a different mechanism, you must explicitly set this scratchpad value.</td>
</tr>
</tbody>
</table>

### Enable the hangupOnStar attribute

System administrators can enable the **hangupOnStar** attribute and use it in the **Join Conference Call** workflow activity. When **hangupOnStar** is enabled (set to true), participants in a conference call can press the * button to disconnect from the call. Control is returned to the workflow, which can be used to trigger customer-defined actions.

To enable the **hangupOnStar** attribute:

1. Navigate to **Workflow > Administration > Workflow Versions**.
2. Open the Notify: (Re)join Conference Call workflow.
3. Click the **Show Workflow** related link.
4. To modify the workflow, click the WorkFlow Actions icon and click **Checkout**.
5. Open the Join Conference Call workflow activity.
6. Enable the **Advanced** check box to display the **Script** field.
7. Set the **hangupOnStar** attribute to true. The default setting is false.
8. Click **Update**.
9. Click the WorkFlow Actions icon and click **Publish** to save the changes.

*Send SMS workflow activity*

The **send SMS** workflow activity to send short text messages using Notify to users’ phones. This workflow activity can be added to any table.

### Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>Select the Notify phone number to use to send the SMS message.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use JavaScript to determine which numbers to send the message to, and the Notify number to use to send the message.</td>
</tr>
<tr>
<td>To</td>
<td>Select any number of users to send the message to. The user record must have a E.164-compliant phone number or notification device configured for SMS messages.</td>
</tr>
<tr>
<td>To (groups)</td>
<td>Select any number of groups to send the message to. All members of that group with an E.164-compliant phone number or SMS notification device receive the message.</td>
</tr>
<tr>
<td>Message</td>
<td>Enter the message to send. You can add field values from the current record by using the Select variables box. You can also add values from the workflow scratchpad. If a field and a scratchpad variable have the same name, the field value is used. Because you can use variables in this message, it is not possible to determine the length of the message at design time. If the activity sends a message that is longer than supported by the telephony provider, the message is truncated and the instance logs a warning.</td>
</tr>
<tr>
<td>To (script)</td>
<td>Enter a script to determine which numbers to send the message to, and the Notify number to use to send the message. The script should return a JavaScript object with the format <code>{notify_number: &quot;...sys_id...&quot;, users: [...], groups: [...], numbers: [...]}</code>. Specify the users or groups to send the message to as an array of sys_id values. Specify other numbers as an array of E.164-compliant phone numbers. This field appears only if Advanced is selected.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. This activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the Notify number used to make the call is not configured correctly or unable to send SMS messages, or if an error occurs while sending the SMS.

Queue workflow activity

The Queue activity places an active Notify call in a queue.

Add the Queue activity to a workflow on the Notify Call (notify_call) table to put the current call on hold. This activity does not specify any input variables.

The queue that the call is added to is given a random ID.
Workflow notification activities

Notification workflow activities notify users of events that occur during the workflow.

Create Event workflow activity
The Create Event activity adds an event to the event queue, but does not immediately fire the event.

The event processor typically processes the event within one minute. This activity triggers any business rules or email notifications that would normally be triggered by the event.

Results

Finished: the activity added the event to the event queue.

Input variables

Create Event activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event name</td>
<td>The name of the event to create. From the Event Name lookup list, select the event to add to the queue. If the event requires parameters, specify them in the Parameter script field.</td>
</tr>
</tbody>
</table>

Parameter 1

The first parameter of the event.

Note: If this parameter is a string value, it must be within quotes (“ ”).

Parameter 2

The second event parameter.

Note: If this parameter is a string value, it must be within quotes (“ ”).

Notification workflow activity
The Notification activity sends an email or SMS message to specified users or groups.

Input variables

Notification activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Addressees</td>
<td>The users who will be recipients of the email.</td>
</tr>
<tr>
<td>To</td>
<td>The members of the groups that will be recipients of the email.</td>
</tr>
<tr>
<td>To (groups)</td>
<td>If selected, the script in the To (script) field is called to specify additional recipients of the email.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To (script)</td>
<td>If Advanced is selected, this script is called and should set the variable answer to a comma-separated list of user or group sys_ids that you want to add as recipients of the email.</td>
</tr>
<tr>
<td>Message</td>
<td>The email body that is sent. To include the value of a field in the message body, place the cursor at the point in the text where you want the field's value inserted. Then click the + icon next to Fields and select the field you want.</td>
</tr>
<tr>
<td>Subject</td>
<td>The subject line of the email.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

#### Notification activity states

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the run function of the activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
</tbody>
</table>

### Timer workflow activities

Timer activities pause workflows for set periods of time.

#### SLA Percentage Timer workflow activity

The SLA Percentage Timer activity pauses the workflow for a duration equal to a percentage of an SLA.

A workflow must run on the Task SLA table to use this activity.

**Note:** Timer activities run as the System user because the system scheduler advances the workflow.

### Results

#### SLA Percentage Timer activity results

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td>The activity successfully reached the specified duration</td>
</tr>
<tr>
<td>Result</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Cancelled</td>
<td>The activity or workflow was canceled before the timer reached the specified duration</td>
</tr>
</tbody>
</table>

**Input variables**

Input variables determine the initial behavior of the activity.

**SLA Percentage Timer activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Percentage</td>
<td>The duration to pause the workflow for, as a percentage of the current SLA</td>
</tr>
</tbody>

<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The activity is in this state very briefly while initializing, after which it immediately changes to Waiting.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine waits until the SLA reaches the specified percentage. The engine then transitions the workflow to the next activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Timer workflow activity**

The Timer activity pauses the workflow for a specified period of time.

This duration can be an absolute time value or a relative value based on a defined schedule. It is best to adjust the Duration so the workflow can progress in a timely manner. To pause a workflow indefinitely until a condition is met, see wait for condition.

**Note:** Timer activities run as the System user because the system scheduler advances the workflow.

<td></td>
</tr>
</tbody>
</table>

## States

The activity state tells the workflow engine what to do with the activity.

### Timer activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The Timer activity is in this state very briefly while initializing, after which it immediately changes to Waiting.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine waits until the timer reaches the specified duration. The engine then transitions the workflow to the next activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

## Example

You can use a **Timer** activity to pause the workflow until the end of the business day.
Timer example

In this example, the script evaluates the time between the `now` variable and the `eod` variable. The `eod` variable is defined, in 24 hour time, as 4:00 PM. The script then sets the `answer` variable to the difference between these variables, in seconds, and logs a message.

```javascript
// get now and calc end of day (4:00pm)
var now = new Date();

var eod = new Date();
eod.setHours(16);
eod.setMinutes(0);
eod.setSeconds(0);

answer = (eod.getTime() - now.getTime()) / 1000;
```
Task workflow activities

Task activities create and modify workflow tasks.

Task activities are only available when the workflow runs on a table that extends Task.

Add Worknote workflow activity

The Add Worknote activity adds text to the Worknotes field of the current incident record.

A workflow must run on the Incident table to use this activity.

Note: Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

Input variables

Add Worknote activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work Note</td>
<td>The text to add to the incident record.</td>
</tr>
</tbody>
</table>

Attachment Note workflow activity

The Attachment Note activity adds an attachment to the current record.

Note: This activity is only available when the workflow runs on a table that extends Task.

This activity allows the use of irregular HTML tags to reference attachments, specifically the [code] tag. Entries in a journal field that use irregular HTML do not work if the glide.ui.allow_deep_html_validation property is true. This property is set to false by default.

Note: Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

Results

- Finished: the activity added the attachment to the record.

Input variables

The following variables determine the behavior of the activity.

Attachment Note activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>General</td>
<td></td>
</tr>
</tbody>
</table>
**Catalog Task workflow activity**

The **Catalog Task** activity creates a service catalog task record.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

A user must complete the catalog task. This activity is available only for workflows running on the Catalog Request Item (sc_req_item) table.

**Note:** Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

**Results**

You can assign a result value using `activity.result` from within a script field of the activity. The final **State** value of the catalog task record determines the result value for the **Create Task** activity. Possible result values are:

- Closed complete
- Closed incomplete
- Closed skipped
- Deleted
- Cancelled

**Input fields**

The values you enter in the following fields determine the behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Catalog Task Activity Settings</td>
<td>The following fields specify the behavior of the Catalog Task Activity.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Task Table</td>
<td>The table on which this activity runs. In most cases, leave set to the default value: (sc_req_item).</td>
</tr>
<tr>
<td>Priority</td>
<td>The value you want assigned to the Priority field for the new task.</td>
</tr>
<tr>
<td>Wait for completion</td>
<td>If selected, the workflow activity waits for the task to complete before continuing. If cleared, the task is created but the workflow proceeds.</td>
</tr>
</tbody>
</table>

**Catalog Task Record Settings**

The following fields specify the field values that this activity sets for the catalog task it creates.

<table>
<thead>
<tr>
<th>Task value from</th>
<th>Specify how you want to populate fields on the new task.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fields</td>
<td>Fields: a predefined set of fields including Fulfillment group, Assigned to, Short description and Instructions.</td>
</tr>
<tr>
<td>Template</td>
<td>Template: an existing template for the selected task table.</td>
</tr>
<tr>
<td>Values</td>
<td>Values: values that you specify using a Set Values widget.</td>
</tr>
</tbody>
</table>

After you select a value for Task value from, additional fields specific to that value appear on the form.

<table>
<thead>
<tr>
<th>Fulfillment group</th>
<th>The group that is responsible for completing the task. Populates the Assignment group field on the new task.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assigned to</td>
<td>The user who is responsible for completing the task. Populates the Assignment to field on the new task.</td>
</tr>
<tr>
<td>Short description</td>
<td>A short description for the task. Populates the Short description field on the new task.</td>
</tr>
<tr>
<td>Instructions</td>
<td>The task instructions for the user to complete prior to closing the task. Populates the Description field on the new task.</td>
</tr>
<tr>
<td>Template</td>
<td>The values in the task will be populated from the values in the template you select.</td>
</tr>
<tr>
<td>SetValues</td>
<td>Select any field on the task record to a value you specify here.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Check Advanced if you want to use a script to assign values on the catalog task. When you check Advanced, a text box appears where you can enter your script.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Advanced Script</td>
<td>Set additional values for the task in this script. This script is run after the task values are set using the Fields, Template or Values you have specified. Use the variable task when setting additional values, for example: task.short_description = current.short_description;</td>
</tr>
<tr>
<td>Catalog Task Variables</td>

</tbody>
</table>
| Schedule based on            | The basic schedule the timer uses to count working hours. If a schedule is specified, the duration will only be considered for times that are specified on the schedule. For example, if the duration is 2 hours and the workflow begins at 4:00pm on a schedule that is 8am - 5pm, then it ends at 9:00am the next day. The options are:  
  - **This workflow’s schedule**: The schedule uses workflow context date, time, and an optional time zone based on value.  
  - **A specific schedule**: The schedule uses a predefined Schedule and an optional Time zone based on value.  
  - **A schedule field**: The schedule uses a value from a table and an optional Time zone based on value. |
| Schedule                     | The predefined Schedule from a list.                                                                                                          |
| Schedule field               | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a dialog. |
| Time zone based on           | The time zone for calculating the duration. The time zone may be based on:  
  - **No time zone**: Default. Workflow uses the GMT time zone.  
  - **A specific time zone**: A specific Time zone that you choose from a choice list.  
  - **A time zone field**: A Time zone field to track time duration from a field on the form. |
| Time zone                    | Select the time zone you want from the choice list.                                                                                          |
| Time zone field              | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a dialog. |

**States**

The activity state tells the workflow engine what to do with the activity.
Catalog Task activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Create Task workflow activity

The **Create Task** activity generates a record on any of the tables that extend Task (task).

**Note:** This activity is only available when the workflow runs on a table that extends Task.

If the **Wait for completion** check box is selected, the workflow context waits for a user action on the task, such as Complete or Incomplete, and then progresses based on the user action.

**Note:** Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

Results

You can assign a result value using `activity.result` from within a script field of the activity. By default, the final **State** value of the task record determines the result value for the **Create Task** activity. Possible result values are:

- Closed complete
- Closed incomplete
- Closed skipped
- Deleted
- Cancelled

Input variables

The following variables determine the behavior of the activity.

Create Task activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Task Activity Settings</td>
<td>The following fields specify the behavior of the Create Task Activity.</td>
</tr>
<tr>
<td>Task type</td>
<td>The type of task to create. Select from the corresponding task table for the workflow.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Priority</td>
<td>The default priority assigned to the task.</td>
</tr>
<tr>
<td>Wait for completion</td>
<td>If selected, the workflow activity waits for the task to complete before continuing. If cleared, the task is created but the workflow proceeds.</td>
</tr>
</tbody>
</table>

Create Task Record Settings
The following fields specify the field values that this activity sets for the task it creates.

<table>
<thead>
<tr>
<th>Task values from</th>
<th>The values used to create the task may either come from:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fields</td>
<td>• <strong>Fields</strong>: a predefined set of fields including <strong>Fulfillment group</strong>, <strong>Assigned to</strong>, <strong>Short description</strong> and <strong>Instructions</strong>.</td>
</tr>
<tr>
<td>Template</td>
<td>• <strong>Template</strong>: an existing template for the selected task table.</td>
</tr>
<tr>
<td>Values</td>
<td>• <strong>Values</strong>: values that you specify using a Set Values widget.</td>
</tr>
</tbody>
</table>

| Fulfillment group             | The group that is responsible for completing the task. Populates the **Assignment group** field on the new task.                           |
| Only appears when Task value from is set to Fields |                                                                                                                                 |

| Assigned to                   | The user who is responsible for completing the task. Populates the **Assignment to** field on the new task.                                |
| Only appears when Task value from is set to Fields |                                                                                                                                 |

| Short description             | A short description for the task. Populates the **Short description** field on the new task.                                             |
| Only appears when Task value from is set to Fields |                                                                                                                                 |

| Instructions                  | The task instructions for the user to complete prior to closing the task. Populates the **Description** field on the new task.            |
| Only appears when Task value from is set to Fields |                                                                                                                                 |

| Task template                 | A template that is used to fill in values for the task.                                                                                   |
| Only appears when Task values from is set to Template |                                                                                                                                 |

| Set values                    | A widget that is used to specify values for any fields of the task.                                                                    |
| Only appears when Task values from is set to Values |                                                                                                                                 |

<p>| Advanced                      | Check <strong>Advanced</strong> if you want to use a script to assign values on the catalog task. When you check <strong>Advanced</strong>, a text box appears where you can enter your script. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Advanced Script | Set additional values for the task in this script. This script is run after the task values are set using the Fields, Template or Values you have specified. Use the variable task when setting additional values, for example:  
```javascript
    task.short_description = current.short_description;
``` |

**Task Schedule**

<table>

<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Utility workflow activities**

Utility activities provide controls over the path of the workflow, and other useful tools.

**Branch workflow activity**

The **Branch** activity splits the workflow into multiple transition paths from a single activity.
To add a transition path, drag the **Branch** activity onto the canvas. When the Branch activity properties form displays, click **Submit** to add the activity to the canvas. Once the activity is on the canvas, right click in the activity body, then click **Add Condition**.

All transitions from this activity execute concurrently. This activity provides a single **Always** condition. You can draw any number of transitions from this condition. Using this activity is equivalent to drawing multiple transitions from a single condition of another activity.

Branching can affect the behavior of rollback activities. See **Rollback To activity** for more information.

**Join workflow activity**

The **Join** activity unites multiple execution paths into one transition.

Use this activity to cause a workflow to wait for all activities in multiple paths to finish before continuing. If multiple concurrent workflow paths meet without a **Join** activity, any subsequent activities execute twice.

To add Join to the canvas, click **Submit**. On the canvas, connect incoming transitions from each activity you want to act as a predecessor to the Join activity. Then connect outgoing transitions to the two exit conditions: Complete and Incomplete.

**Results**

Provide an Incomplete transition out of a **Join** whenever it is possible for any predecessor activities to follow a transition path that does not lead to the **Join** activity.

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td><strong>Join</strong> exits along the Complete path when the system has determined that all predecessor activities have completed and transitioned to the <strong>Join</strong>.</td>
</tr>
<tr>
<td>Incomplete</td>
<td><strong>Join</strong> exits along the Incomplete path when the system determines that at least one predecessor activity completed but transitioned along a path that bypassed the <strong>Join</strong> activity.</td>
</tr>
</tbody>
</table>

**Lock workflow activity**

The **Lock** activity prevents other instances of this workflow from continuing past this activity until the lock is released.

Several instances of the same workflow may run concurrently. For example, if a workflow is triggered when a record is added to a particular table and multiple records are added one after the other, that workflow will be triggered multiple times: once by each record insertion. In such cases, you can use the lock activity to ensure that this instance of the workflow has completely finished one or more activities before any other instance of the workflow can proceed.

A workflow can explicitly release a lock with the **Unlock** activity. The lock may also be released when the **Max duration** is reached.

When an instance of the workflow reaches the **Lock** activity, it attempts to obtain a lock using the key specified in the lock activity. If another instance has already obtained the lock and has not yet released it, this lock attempt fails. The instance continues trying to obtain the lock until **Max attempts** has been reached.

**Note:**
We recommend placing a one-second timer activity before the lock activity. This helps prevent a rare condition in which the lock activity may not be able to distinguish one workflow instance from another. This condition can occur because the entity owning the lock is not the specific workflow instance, but rather the code-execution thread in which that instance is running. In most cases, each workflow instance runs on a different thread, but adding a timer activity ensures that this is the case.
Example of Lock Activity Preceded by Timer Activity

Since a **Lock** activity can only temporarily prevent processing of other workflow instances, do not add activities that cause the workflow to wait between a **Lock** and **Unlock** activity block. This
may cause the **Unlock** activity to be unable to acquire the lock to release it and instead take 60 seconds to complete. Restricted wait activities include:

- Approval activities
- Task activities
- Timer activities
- Wait for condition activity
- Wait for WF Event activity

### Results

**Lock activity results**

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity successfully obtained a lock. This instance of the workflow can proceed past this point, but other instances cannot until the lock is released.</td>
</tr>
<tr>
<td>Failure</td>
<td>After attempting to obtain the lock <strong>Max attempts</strong> times, the activity could not obtain the lock.</td>
</tr>
</tbody>
</table>

### Input variables

Input variables determine the initial behavior of the activity.

**Lock activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>A unique mutex key. The <strong>Unlock activity</strong> activity uses this key to release the lock.</td>
</tr>
<tr>
<td>Duration</td>
<td>The maximum time the lock persists. The lock is released after it reaches this duration. Releasing a lock this way is equivalent to running the <strong>Unlock</strong> activity.</td>
</tr>
<tr>
<td>Max. duration</td>
<td></td>
</tr>
<tr>
<td>Lock attempts</td>
<td>Specify how the activity behaves if the lock attempt is denied. If the final lock attempt fails, the activity state will be set to ‘timeout’ and the activity result will be set to ‘failed’.</td>
</tr>
<tr>
<td>Max. attempts</td>
<td>Specify the maximum number of times the activity may attempt to obtain the lock.</td>
</tr>
<tr>
<td>Delay between attempts</td>
<td>The amount of time required after a failed lock attempt before another lock attempt is allowed.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.
Lock activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Waiting</td>
<td>The workflow engine is waiting to obtain a lock.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity successfully obtained the lock.</td>
</tr>
<tr>
<td>Timeout</td>
<td>The activity could not obtain a lock within the number of attempts specified by the Max. attempts input variable.</td>
</tr>
</tbody>
</table>

**Log Message workflow activity**

The **Log Message** activity writes a message to the workflow log.

Use this activity to add entries to the workflow's log for debugging or tracing purposes.

**Input variables**

Input variables determine the initial behavior of the activity.

**Log Message activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message</td>
<td>The message to log. This variable can be a string or a JavaScript expression that evaluates to a string.</td>
</tr>
</tbody>
</table>

**Log Trace Message workflow activity**

The **Log Trace Message** activity writes a trace message to the workflow log.

The trace message includes the activity name, the event that invoked the workflow, and the table of the current record. There are no variables or conditions. To log other data, use the **Log Message workflow activity** activity.

**REST Message legacy workflow activity**

The legacy **REST Message** activity enables an administrator to override the REST endpoint or supply the variables configured in the REST Message module.

This activity is deprecated in the New York release and no longer shows up in the Workflow canvas for new workflow development. New workflows should use the **Orchestration REST Activity** templates instead.

Existing workflows using it will continue to work as designed. To edit this activity in an existing workflow, you must **re-activate the activity**.

The **REST Message** activity executes a dead link REST function (POST, PUT, GET, or DELETE) on an endpoint using values defined in the function record.

**Note:** If you want to use a MID Server to send the REST message, the MID Server must be accessible by the instance and configured to use SSH.
# Input variables

## REST Message activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rest Message</td>
<td>Name of the REST message to run. This is a reference field to the REST Message (sys_rest_message) table (System Web Services &gt; Outbound &gt; REST Message).</td>
</tr>
<tr>
<td>REST Message Function</td>
<td>Function to call that is defined in a REST message function. This is a reference field to the HTTP Method (sys_rest_message_fn) table (System Web Services &gt; Outbound &gt; REST Message). Available functions are put, post, get, or delete. You can edit functions in the HTTP Methods related list in each REST Message record.</td>
</tr>
<tr>
<td>REST Endpoint</td>
<td>REST endpoint to use instead of the Endpoint defined in the HTTP Method record. Leave this field blank to use the defined endpoint in the REST Message Function record.</td>
</tr>
</tbody>
</table>
| Rest Message Variables       | Values to use for variables defined in the HTTP Method record. Use the following format for the string:  

\[
\text{name1=value1, name2=value2, \ldots}
\]

For example, use `name=${nameValue}, id=${idValue}` where name and id are function variables. If either the variable name or value contains a comma or equal sign, escape those characters with a backslash.                                                                                                                                                                                                                                                                                                                                                                  |
| Rest Message MID Server      | Check this box if you want to use a MID Server to send the REST message. A MID Server might be necessary to reach an endpoint within a firewall or a subnetwork that is not visible from the instance. If this check box is selected, but no MID Server is defined in the MID Server field, the workflow automatically attempts to find a MID Server based on IP range and the REST capability.                                                                                                                                                                                                 |
| MID Server                   | Name of the MID Server to use. This field is available when Use MID Server is selected. The workflow ignores this parameter if the use_midserver parameter is disabled.                                                                                                                                                                                                                                                                                                                                |
| Sensor Script                | The script to execute after the request has been made and a response has been received. You can access the full response body from the activity.output variable.                                                                                                                                                                                                                                                                                                                               |
Return Value workflow activity

The **Return Value** activity returns a value to a parent workflow, when run from a subflow.

This activity has no variables or conditions. For more information, see [Workflows used as subflows](#).

Use this activity within a subflow to store data that the parent flow can access. The **Return Value** activity adds the data from the subflow’s `value` variable to the parent workflow’s scratchpad.

### Scratchpad entries

The activity uses the workflow scratchpad to read and write persistent values.

**Return Value activity scratchpad entries**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>The activity writes the value from the subflow <code>value</code> variable to the parent scratchpad. The parent workflow activity that runs the subflow includes a Map return value to variable that defines where the parent workflow stores the returned data. This data can be scalar, a stringifiable JavaScript object, or an expression that evaluates to a stringifiable JavaScript object.</td>
</tr>
</tbody>
</table>

Run Script workflow activity

The **Run Script** activity runs the specified script in the scope of the workflow version.

**Note:** All changes to `current` are automatically updated. There is no need to call `current.update()`.

### Input variables

Input variables determine the initial behavior of the activity.

**Run Script activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script</td>
<td>Script to execute.</td>
</tr>
</tbody>
</table>

Set Values workflow activity

The **Set Values** activity sets values on the current record when the workflow quiesces or ends.

### Input Fields

The values you enter in the following fields determine the behavior of the activity.
Set Values Activity Input Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set these values</td>
<td>From the list on the left, select the field on the current record whose</td>
</tr>
<tr>
<td></td>
<td>value you want to set when the workflow quiesces or ends. In the user-input</td>
</tr>
<tr>
<td></td>
<td>field to the right, select or enter the value to which you want that field</td>
</tr>
<tr>
<td></td>
<td>set.</td>
</tr>
</tbody>
</table>

**Note:** Avoid setting the same fields from different `Set Value` activities. The workflow only sets the value specified by the last `Set Values` activity run before quiescing or ending.

**Note:** Using the `Set Values` activity to set the Approval field on a task does not cancel pending approvals. To approve a task in a workflow, use the `Approval Action` activity instead.

**SOAP Message legacy workflow activity**

The legacy `SOAP Message` activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.

This activity is deprecated in the New York release and no longer shows up in the Workflow canvas for new workflow development. New workflows should use the `Orchestration` SOAP Activity templates instead.

Existing workflows using it will continue to work as designed. To edit this activity in an existing workflow, you must **re-activate the activity**.

**Input variables**

**SOAP Message activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP Message</td>
<td>soap_message</td>
<td>The SOAP Message defined under the System Web Services plugin's Outbound SOAP Message (sys soap_message) table. (System Web Services &gt; Outbound &gt; SOAP Message)</td>
</tr>
<tr>
<td>SOAP Message Function</td>
<td>soap_message_function</td>
<td>The function to call that is defined in the SOAP Message. Functions are listed in the SOAP Message Functions related list in each SOAP Message record.</td>
</tr>
<tr>
<td>SOAP Endpoint</td>
<td>soap_endpoint</td>
<td>Endpoint to use instead of the SOAP endpoint value in the SOAP Message Function record. Leave this field blank to use the defined endpoint in the SOAP Message Function record.</td>
</tr>
<tr>
<td>Field</td>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Variables</td>
<td>variables</td>
<td>Variables to substitute into the SOAP Envelope defined in the SOAP Message Function record. Use this format for the string: name1=value1, name2=value2, ... If either the name or value contains a comma or equal sign, escape these characters with a backslash.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>use_midserver</td>
<td>Check box for using a MID Server to send the SOAP message. A MID Server might be necessary to reach an endpoint within a firewall or a sub-network that is not visible from the instance. If this check box is selected (true), but no MID Server is defined in the MID Server field, Workflow automatically attempts to find a MID Server.</td>
</tr>
<tr>
<td>MID Server</td>
<td>midserver</td>
<td>Name of the MID Server to use. This field appears when you select the Use MID Server check box. The workflow ignores this parameter if the use_midserver parameter is disabled.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>sensor_script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full XML response body from the activity.output object.</td>
</tr>
</tbody>
</table>

**Turnstile workflow activity**

The Turnstile activity limits how many times a workflow can pass through the same point.

Use this activity to prevent infinite loops. This activity is useful alongside the Rollback To workflow activity.

**Results**

You can assign a result value using the activity.result variable from within a script field of the activity. By default, the activity script evaluates if the activity should continue to iterate or stop.

**Turnstile activity results**

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continue</td>
<td>The Allowed iterations value is greater than the number of times the workflow accessed this activity.</td>
</tr>
</tbody>
</table>
### Input variables

Input variables determine the initial behavior of the activity.

**Turnstile activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowed iterations</td>
<td>Number of times the workflow can pass through this activity before the turnstile ends the loop.</td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity.

**Turnstile activity conditions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continue</td>
<td>If the workflow has returned to this point an amount of times less than the allowed iteration.</td>
</tr>
<tr>
<td>Cancel</td>
<td>If the workflow has returned to this point an amount of times more than the allowed iteration.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

**Turnstile activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is triggered.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Unlock workflow activity**

The **Unlock** activity releases a lock that was previously placed by the **Lock** activity.
To release a lock, specify the same lock key that was specified in the Lock activity. If the Lock activity had a Duration specified, and that duration has already passed, the lock will already be released.

### Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lock key</td>
<td>The Mutex key that releases the lock. This key must match the key specified by a Lock activity. For more information, see Lock activity.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Finished</td>
<td>The activity successfully released the lock.</td>
</tr>
</tbody>
</table>

### Subflow activities in workflow

Subflow activities run and manage workflows from a parent workflow.

The Parallel Flow Launcher subflow activity is available.

**Parallel Flow Launcher workflow activity**

The Parallel Flow Launcher activity launches multiple subflows in parallel.

Workflows running in parallel execute simultaneously and may complete in any order. The activity can launch a single subflow or multiple subflows as needed. You can manage the input values and values returned for each subflow.

**Note:** The Parallel Flow Launcher activity waits until all subflows are completed before proceeding. If any subflow does not finish, the activity waits indefinitely.

**Note:** Do not launch a large number of subflows with the Parallel Flow Launcher activity. If overused, this activity can overburden the instance. For launching very large numbers of subflows, consider putting the Parallel Flow Launcher inside a loop controlled by a turnstile or other conditional activity and having it do batches.

### Activity variables

Activity variables determine the initial behavior of the activity.
### Parallel Flow Launcher activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parallel Flow Launcher configuration</strong></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>A unique name for the activity.</td>
</tr>
<tr>
<td>Stage</td>
<td>The stage to display when the workflow reaches the activity.</td>
</tr>
<tr>
<td>Inputs</td>
<td>Inputs to the subflows to run. Specify an array of name: value pairs for each input defined in the workflow being launched. The name and data type of each input variable entered must match those used by the subflow that this activity launches. For a detailed example, see Parallel Flow Launcher Example.</td>
</tr>
<tr>
<td><strong>Parallel Flow Launcher selection</strong></td>
<td></td>
</tr>
<tr>
<td>Workflow</td>
<td>The workflow to run.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Check Advanced, to enter a script that uses a WorkflowCoordinator object to manage the subflows. When you check Advanced, a text box appears where you can enter a script that specifies a unique workflow for each set of input variables. See WorkflowCoordinator object for more information.</td>
</tr>
<tr>
<td><strong>Parallel Flow Launcher Iteration</strong></td>
<td></td>
</tr>
<tr>
<td>Count</td>
<td>If not specified by an input set, Count determines the number of subflows executed in parallel from this activity. If the Advanced option is not selected, ensure that this field is populated with a valid number.</td>
</tr>
<tr>
<td>Max flows</td>
<td>The maximum number of workflows this activity can launch. If this value is a positive integer, it overrides the max parameter used in the WorkflowCoordinator constructor.</td>
</tr>
<tr>
<td>Max simultaneous</td>
<td>The maximum number of parallel workflows this activity can run at one time. If this value is a positive integer, it overrides the poolsize parameter used in the WorkflowCoordinator constructor.</td>
</tr>
<tr>
<td><strong>Parallel Flow Launcher Process</strong></td>
<td></td>
</tr>
<tr>
<td>Process flow complete</td>
<td>To specify a script that runs after each subflow completes, check Process flow complete. If you check this field, a text box labelled Flow complete appears, where you can enter the script to run.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Flow complete</td>
<td>The script that runs each time a subflow finishes. This field is available when the Process flow complete option is selected.</td>
</tr>
<tr>
<td></td>
<td>The same script functions and variables available in other workflow scripts, such as those in the Run Script activity, are available here. For more</td>
</tr>
<tr>
<td></td>
<td>information, see <a href="#">Completed subflow values in scripts</a>.</td>
</tr>
<tr>
<td></td>
<td>The variable “flow” is available to this script. It is an object that contains the following information about the flow that is finishing:</td>
</tr>
<tr>
<td></td>
<td>flow.output (String): The value that the subflow returns to the parent if it executed a Return Value activity before ending.</td>
</tr>
<tr>
<td></td>
<td>flow.index (Number): The zero-relative index of the subflow that finished.</td>
</tr>
<tr>
<td></td>
<td>flow.contextId (String): The sys_id of the workflow context for the completed subflow.</td>
</tr>
<tr>
<td></td>
<td>flow.inputs (Object): The inputs that were passed to the subflow when its context was created and started.</td>
</tr>
<tr>
<td></td>
<td>flow.status (String): The final state of the context. This corresponds to the state column in the subflow context record, which has possible</td>
</tr>
<tr>
<td></td>
<td>values of executing, finished, cancelled, or faulted. (Since the flow is completed, it cannot be executing at this point.)</td>
</tr>
<tr>
<td>Parallel Flow Launcher Split</td>
<td>To specify a script that runs after all subflows have finished, check Process finished. If you check this field, a text box labelled Finished Script appears where you can enter the script to run. The ‘coordinator’ variable is made available to this script and is an object that allows access to any of the finished subflows using the getFlow(index) method. For example:</td>
</tr>
<tr>
<td>Process finished</td>
<td></td>
</tr>
<tr>
<td></td>
<td>for (var i = 0; i &lt; coordinator.getNumFlows(); i++)</td>
</tr>
<tr>
<td></td>
<td>writeFlowResultsToTable( i, coordinator.getFlow(i) );</td>
</tr>
</tbody>
</table>
### Fields
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Finished script | The script that runs after all subflows launched by the activity are complete. You can use variables that contain completed flow information in this script. The 'coordinator' variable is made available to this script and is an object that allows access to any of the finished subflows using the getFlow(index) method. For example:  
```js
for (var i = 0; i < coordinator.getNumFlows(); i++)
    writeFlowResultsToTable( i, coordinator.getFlow(i) );
```
This field is available when Process finished is selected. |

### States
The activity state tells the workflow engine what to do with the activity. To view an activity's state, point to the activity. A pop-up window shows the State and Result of the activity. If the activity is in an error state, the pop-up window provides a brief Fault Description.

**Parallel Flow Launcher activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Waiting</td>
<td>The activity is waiting for all subflows to finish. All subflows have started and some may have finished.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity successfully completed all of the subflows.</td>
</tr>
<tr>
<td>Error</td>
<td>The activity encountered an error.</td>
</tr>
</tbody>
</table>

### WorkflowCoordinator object
A WorkflowCoordinator object specifies which subflows to run and the input variables to pass to those subflows.

When using a WorkflowCoordinator object, you can create a Parallel Flow Launcher activity that launches multiple subflows. When using the activity without a WorkflowCoordinator object, you can only launch a single subflow multiple times. Use one of the following methods to specify a WorkflowCoordinator object for the activity when the Advanced activity input variable is selected.

- Reference a workflow scratchpad variable that contains an existing WorkflowCoordinator object. To save a WorkflowCoordinator object to the scratchpad, call the `save(variableName)` function on the WorkflowCoordinator object. You can reference the object using the value passed in the `variableName` parameter. For example, you can create a WorkflowCoordinator object in a Run Script activity, save the object using `<object>.save('coord')`, and then call this object by entering `coord` in the Workflow activity variable of a subsequent Parallel Flow Launcher activity.

© 2019 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
- Define the WorkflowCoordinator within the Workflow activity variable. Add the `javascript:` identifier at the beginning of the script. The Parallel Flow Launcher example shows how to use a WorkflowCoordinator object in this way.
- Create a factory class to define the WorkflowCoordinator object. The system does not provide a factory class for WorkflowCoordinator by default.

Completed subflow values in scripts
The Parallel Flow Launcher activity exposes additional variables you can use in scripts.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>coordinator</td>
<td>The WorkflowCoordinator used when running the subflows. You can use this variable in the Finished script to perform any final operations. Additionally, you can use the WorkflowCoordinator in a later workflow activity by passing the activity name or sys_id to the WorkflowCoordinator.load('&lt;Activity&gt;') function. For example, to load the WorkflowCoordinator object from a Parallel Flow Launcher activity called Launch Subflows, enter <code>var coord = WorkflowCoordinator.load('Launch Subflows');</code> in a later activity.</td>
</tr>
</tbody>
</table>
| flow | The subflow launched by the activity that completed most recently. You can use this variable in the Flow complete script to perform any post-processing operations on each subflow. To get a complete subflow from a coordinator object, use `var flow = coord.getFlow(I);` where I is the numeric index of the subflow based on the order it was launched. These values are available from the completed subflow:  
- **index:** the numerical index of this subflow based on the order it was launched  
- **workflow:** the sys_id or name, depending on which you passed to the WorkflowCoordinator constructor, of the workflow used for this subflow  
- **inputs:** any input values provided to the launched subflow  
- **status:** status of the subflow context  
- **output:** the value returned by the subflow  
- **contextId:** the sys_id of the workflow context for the subflow |

Parallel Flow Launcher example
This example shows how to use the Parallel Flow Launcher activity with an array of input values and with a WorkflowCoordinator object.
Sample workflow

This example shows a SQL-based web server with four application nodes. A single subflow runs to provision the database, and multiple parallel subflows each configure an application node. Finally, a separate set of parallel subflows configures the nodes to use a load balancer and sets up the server DNS.

Parallel flow launcher business case

Provision the application nodes

The first Parallel Flow Launcher activity launches the Provision Node subflow four times. The activity passes a unique IP address to each subflow from an array in the Inputs variable. The scripts defined in the Flow complete and Finished script variables write log messages regarding the status of the subflows.
**Activity Properties: Parallel Flow Launcher**

**Name:** Provision application nodes

**Stage:**

**Inputs:**
- `u_host: '192.168.0.10,`
- `u_host: '192.168.0.20,`
- `u_host: '192.168.0.30,`

**Advanced:**

**Workflow:** Provision Node

**Count:**

**Max flows:** 25

**Max simultaneous:** 5

**Process flow complete:**

**Flow complete:**

```javascript
1 // To access the flow that completed, use the 'flow' variable.  
2 // var flowOutput = flow.output;  
3 // workflow.debug("Provision Node Finished. Context: " + flow.contextId);  
```

**Process finished:**

**Finished script:**

```javascript
1 // To access the set of completed workflows use the 'coordinator' variable.  
2 // var flowResult = coordinator.getFlow(1).output;  
3 // workflow.debug("All Nodes Provisioned");  
```
Add nodes to the load balancer

The second **Parallel Flow Launcher** activity uses WorkflowCoordinator objects to specify which subflows to run. The `coordinator` variable stores the completed flow information from the previous **Provision Nodes** activity. The script then retrieves the IP address and port for each node that was provisioned. The `coord2` WorkflowCoordinator object runs the **Add Node to Load Balancer** subflow once for each node, using the retrieved IP address and port information as input variables. Finally, the `coord2` WorkflowCoordinator object runs the **SetupDNS** subflow once to configure the load balancer.

```javascript
var coordinator = WorkflowCoordinator.load('Provision Nodes');
var coord2 = new WorkflowCoordinator({
  workflow: 'Add Node to Load Balancer'
});

for (var i = 0; i < coordinator.getNumFlows(); i++) {
  var ip = coordinator.getInput(i).ip;
  var port = coordinator.getInput(i).port;
  coord2.add({
    ip: ip,
    port: port
  });
}
var loadBalancerIP = '10.0.20.10';
coord2.add({
  ip: loadBalancerIP,
  hostname: 'www.snow1.net',
  'SetupDNS':
});
coord2;
```

Specifying which subflows to run

**Workflows used as subflows**

A workflow can launch another workflow as an activity.

The parent workflow triggers the subflow and then waits for the subflow to complete before continuing. Run the workflow validation tool prior to publishing to detect missing subflows and other dependency problems, such as those involving update sets.

The **Workflows** tab in the Workflow Editor contains a list of the workflows available for use as subflows.
Workflows available to use as subflows

Make sure that the selected subflow is active. If the subflow is inactive, the main workflow will hang with a **Loading** message. If you place an inactive subflow into a workflow, the subflow appears with a red banner, indicating that it cannot run. An active subflow is highlighted in blue when selected.
Subflows and the Create Task activity

If a workflow contains a *Create Task* activity that has executed on the current record, additional task activities in the workflow might not execute as expected.

This can happen when the same subflow containing a Create Task activity runs more than once in a parent flow. When the subflow reruns and attempts to execute the *Create Task* activity again, the system reopen the first task activity instead and does not create an additional task.

---

**Note:** An alternative to creating duplicate subflows that use the *Create Task* activity is to add a *Run Script* activity to the workflow that creates a task with a script.
The same create task activity runs twice in a workflow

In this configuration, the workflow does not run the same subflow containing a Create Task activity more than once. This allows the workflow to create additional tasks.
Running different subflows containing the Create Task activity

**View workflow activity descriptions**

 tooltips are available for workflow activities to help you understand how to use each activity.

1. To view an activity description in the *Workflow Editor*, point to the icon for the activity in the palette.
2. To modify activity descriptions, navigate to Workflow > Administration > Activity Definitions and edit the Description field.

**Note:** To view more information about an activity, double-click the activity on the canvas and then click the help icon in the title bar of the Activity Properties window.

**Elements in workflow activity definitions**

Each activity can specify a number of elements that control the behavior of the activity or are controlled by the activity.

Not all activities specify all possible elements. See [Workflow activities](#) for links to the activities provided by default. Each activity description includes a detailed explanation of the specific elements offered by that activity.
Workflow activity elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Results</td>
<td>The possible <code>activity.results</code> value. The activity result usually determines which condition the activity transitions through.</td>
</tr>
<tr>
<td>Scratchpad entries</td>
<td>Scratchpad variables the activity depends on to run, or variables the activity writes to the scratchpad.</td>
</tr>
<tr>

<td>Values that control the behavior of the activity. Fields to set these values appear on the Activity Properties form when a new activity is added to a workflow. See Activity variables for more information.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Determines which transition the activity follows after completing. See Manage workflow activity conditions for more information.</td>
</tr>
<tr>
<td>States</td>
<td>Determines how the workflow handles the record being executed.</td>
</tr>
</tbody>
</table>

Add an activity to a workflow

Available activities are displayed in the Core, Packs, and Custom tabs in the Workflow Editor palette.

1. In the Workflow Editor, check out a workflow.
2. To add a workflow activity, drag it from the Core, Packs, or Custom tab to the canvas and drop it on a transition line in the workflow body.

The transition turns blue when it is connected to the new activity. The designer adds the activity to the flow at that point and displays the property form for the new activity.

If an activity is greyed out, approval engines are enabled for the table on which the workflow runs. To use the activity, turn approval engines off for the table.
Unavailable activities and approval engines

3. Create any additional conditions needed for the activity and ensure that all exits are connected.

4. Run the workflow validation tool prior to publishing to detect missing or disconnected transitions that can cause a workflow to hang.

**Note:** All activity descriptions have a Table value. If this value is Global, the activity is available for use with any workflow regardless of the table selected in the workflow properties. Activities that identify a specific table appear in the palette only if the table configured for the workflow matches or extends the table identified in the activity.
Adding an activity to a workflow

Duplicate a workflow activity

You can duplicate an activity used in a workflow, including all the configured properties.

1. Right-click the activity and select **Copy Activity** from the context menu.
   
   The system automatically duplicates the activity, but does not create transitions.

2. Double-click the copy and configure the properties appropriately.

3. Drag the activity to a location in the workflow.

4. Add **transitions**.
Manage transitions between workflow activities

Transitions define the processing path of the workflow, depending on conditions defined in each activity.

All conditions in an activity must have a transition and all transitions must have a connection to another activity or to the End activity.

Note:

Run the workflow validation tool prior to publishing to detect missing or disconnected transitions that could cause a workflow to hang.

1. Add transitions to the workflow using either of these methods:
   - Drag and drop an activity directly onto a transition line to connect it to the adjacent activities. The transition line turns blue when the connection is made. The system updates the transitions automatically to reflect the new sequence.
- Drag the activity to an open area in the canvas and create the transitions manually. Click the yellow square on the right side of the activity condition and drag a connector to the next task.
2. You can draw multiple transitions from the same activity condition if the activity executes concurrently.

3. To remove a transition, click to highlight it, and then press **Delete**.

**Custom activity transitions**

Controls on the **Approval - User** activity enable an administrator to add additional workflow transitions to the activity other than the default transitions of **Approved** or **Rejected**.

Transitions defined using this method do not become a permanent feature of the **Approval - User** activity. After a new transition is configured, that transition must be applied manually to subsequent instances of the activity, where desired.

**Manage workflow activity conditions**

Activities contain default conditions that determine which transitions are followed.

For example, the **Approval - User** activity has two conditions, **Approved** and **Rejected**.
You can use a JavaScript condition check to create custom conditions on Core workflow activities. (Custom activities do not support this feature.)

1. Right-click the activity and select **Add Condition** from the context menu.
2. In the New Workflow Condition dialog box, fill in the fields as appropriate (see table).

### New Workflow Conditions form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The label that is displayed on the workflow.</td>
</tr>
<tr>
<td>Activity</td>
<td>Name of the activity for which this condition is submitted. This value is populated automatically by the system.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of this condition.</td>
</tr>
<tr>
<td>Condition</td>
<td>A JavaScript condition check. The following variables are available:</td>
</tr>
<tr>
<td></td>
<td>- <strong>current</strong>: Current record that the workflow is running against.</td>
</tr>
<tr>
<td></td>
<td>- <strong>activity.result</strong>: Result value set by the activity upon completion.</td>
</tr>
<tr>
<td></td>
<td>- <strong>activity</strong>: Workflow Executing Activity (wf_executing) record. Used for advanced condition checks.</td>
</tr>
<tr>
<td></td>
<td>- <strong>activity.vars</strong>: Variables associated with the Workflow Executing Activity record. Used for advanced condition checks.</td>
</tr>
<tr>
<td>Skip during generate</td>
<td>If selected, the <strong>Generate activity</strong> does not follow this transition to generate approvals or tasks.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.
4. To change the order in which conditions appear on the workflow activity, right-click the activity and select **Reorder Conditions**.

A dialog box appears, with a list of the available conditions.
List of conditions in the current activity

5. Drag the conditions to a new position in the list.
6. Click OK.

Activity result value

The result value specified by an activity controls the condition through which the activity transitions.

Use the result value as part of the Condition field in the activity. For example, if the Condition field of an Approval - User activity contains activity.result == 'rejected', the activity transitions through that condition when a rejection is received from the approver. Result values are set in the Script field of the activity definition.

Edit the workflow activity properties form

Customize which workflow variables appear on an activity properties form and how the variables are arranged on the form.

1. Navigate to Workflow > Administration > Activity Definitions.
2. Scroll to the activity that you want to work with and click the activity name.
3. On the Workflow Activity Definition form, click the Edit Variables Layout related link.
4. On the Form Design page for the Activity Properties form, add and remove activity variables. The activity variables appear as separate items that you can rearrange on the form.

For more details on using the form design interface, see Using the form designer.
Using workflow approval activities and rolling back workflows

When you work with approvals, you need to understand how approval activities interact with approval engines, how to correct a skipped approval workflow activity, and how rollbacks work.

Approval workflow activities and approval engines

Approvals can be managed by approval activities or approval engines, but not both. Approval activities can be used if approval engines are not turned on for the table associated with the workflow.

Approvals can be managed by approval activities or approval engines, but not both. Trying to use both can cause a range of issues. Approval activities are not available (greyed out) in the palette if approval engines are used on the specified table. If you hover over a greyed out approval activity in the palette, a comment with more information is provided. For more information about approvals and approval engines, see Approvals.

Unavailable approval activities

To turn approval engines off for the table, navigate to the System Properties > Approval Engines and change the setting for the table to Turn engines off.
Turn off approval engines

Correct a skipped workflow approval activity

While a workflow is in an active context, an approval activity can skip to the next activity.
An approval activity might skip for the following reasons:

- The approval user or group is missing or invalid (for example, sys_id).
- The approval user or group became inactive after the approval record was created.
- The activity is a dot-walked field, such as current.opened_by.department.manager, and it has a missing or invalid approval user or group.
- The business rule on the table that is associated with the workflow is invalid.

To correct a missed approval activity:

1. Navigate to **Workflow > Live Workflows > All Contexts**.
2. Click the date and time in the **Started** column for the workflow that is incorrectly processing approval activities.
3. In Related Links, click **Show Workflow**.
4. Review the portion of the workflow that executed, and then do one or more of the following:
   - Verify that after approval, the workflow progressed to the next activity. If a workflow failed to progress, check the business rules. For more information, see **Debugging business rules**.
   - Point to each processed approval activity to find activities where the **State** is **Finished** and **Result** is **Skipped**.
5. Navigate to **Workflow > Workflow Editor** and open the workflow.
6. Double-click the skipped approval activity.
7. Click **Users** or **Groups**.
8. Assign an active user or group for the approval activity. For more information, see **Workflow error handling**.

**Rollback To activity**

When conditions in a workflow trigger a **Rollback To** activity, the workflow moves processing backward to a specified activity in the workflow and resets certain activities that have already executed back to their original state. This is useful when handling an unexpected failure or as part of a programmed logical flow.

When an activity is reset during a workflow rollback, the following happens:

- Approvals are reset to **Not Requested**.
- Tasks are reset to either **Open** or **Pending**. A rollback workflow path cannot create new tasks.

Activities that perform external system operations, such as deleting a file or sending an email, are not rolled back. Only approval and task activity states are reset.

A workflow can contain a single rollback, multiple rollbacks, or nested rollbacks in more complex workflows. The **Rollback To** activity resets activities based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, rather than using the execution order to determine where processing should restart.

**Rollback To behavior**

The **Rollback To** activity transitions directly to the activity specified by the transition line arrow.

Use the **Rollback To** activity for all workflows that use multiple or nested rollbacks. **Rollback To** resets the targeted task (the direct transition) to **Open**. All tasks that have executed between the **Rollback To** activity and the targeted task (rolled back task) are set to **Pending**.

(0) Begin
(1) Log Message
(2) Task 1
(3) Task 3
(4) Task 2
(5) Timer
(6) Approval 1
(7) Roll back to first task
(8) Task 1
(9) Task 2
(10) Approval 1
(11) Log approval
(12) Join
(14) Send email
(15) End
The state of (3) Task 3 does not change, since this activity does not directly transition from the rollback target activity. To see what activities were rolled back, select the Workflow Transition History related list and look at the Rolled back column.

The Rollback To activity (7) updates the following activities:

(8) Task 1: reset to Open
(9) Task 2: reset to Pending
(10) Approval 1: reset to Not Yet Requested
Rollback To workflow transition

Using variables in Notify workflow activities

Certain Notify workflow activities support variable substitution for reading text to callers.

Certain Notify workflow activities allow you to use variables, such as those from the workflow scratchpad, to determine the activity behavior. Each activity supports a maximum of 20 variables. The following activities allow variable substitution:

<table>
<thead>
<tr>
<th>Activity</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Say</td>
<td>Supports variable substitution in the Text field only.</td>
</tr>
<tr>
<td>Input</td>
<td>Supports variable substitution in the Text field only.</td>
</tr>
<tr>
<td>Play</td>
<td>Supports variable substitution in the URL field only.</td>
</tr>
</tbody>
</table>
### Scratchpad variables

You can call variables from the workflow scratchpad or the activity scratchpad using the syntax `$(variable_name)`. You do not need to include either `workflow.scratchpad` or `activity.scratchpad` before the variable name. For example, to use the variable `activity.scratchpad.langCode = 'en-US'`, call `$(langCode)` within the activity. If the scratchpad does not contain the specified variable, the variable evaluates to an empty value.

You can get values from objects on the scratchpad using the format `$(object.value)`. For example, you can get the name of a user object, such as `workflow.scratchpad.user = {name: 'john.smith'}` by calling `$(user.name)`.

### The digit variable

The **Input** activity exposes the `$(digit)` variable. Use this variable in each condition presented by the activity. The number read to the user is determined automatically by each condition. The caller can press that number to cause the activity to transition through that condition.

### Use multiple timer activities in one workflow

Workflow timer activities store data independently of each other in an activity-specific scratchpad.

Previously, all timer activities in a workflow accessed a single, shared scratchpad, which could lead to conflicts when adding multiple timer activities to one workflow.

Timer scratchpads entries hold these values:
- `workflow.scratchpad.endTime`
- `workflow.scratchpad.realStartTime`
- `workflow.scratchpad.retroactiveSecsLeft`

### Publish a custom workflow activity

When a user creates a custom activity and saves or submits it, that activity appears in the **Custom** and **Packs** tabs of the designer palette, but is only visible to the user who created it.

When configuration is complete, the user clicks **Publish**, which makes the activity accessible to other users on the instance with the `workflow_admin` or `activity_creator` role. Published activities are available for upload to the ServiceNow Store, can be added to workflows, and can be edited by any user with the proper roles.

To edit a published activity, click **Checkout**. When an activity is checked out by a user, only that user can modify it. The fields of a checked out activity are read-only for all other users. When the checked out activity has been modified successfully, the user publishes it again. The system adds a new version of this activity to the Custom tab in the Workflow Editor palette.

---

**Note:** Activities you create and publish are only visible in the Packs tab if they were created in the current application scope.
Locked versions

Problems can arise if an activity version is checked out by a user and not checked back in, for example, when the user is sick or leaves the company. An activity in this state cannot be checked out for update.

A user with the admin role can return a locked activity to a published state. The administrator opens the locked activity from the Custom tab of the Workflow Editor, selects the checked-out version, and selects Force Checkout, and then Publish.

Workflow activity pinning

Workflow administrators can pin a custom activity to prevent the system from automatically updating that activity when a new version is downloaded from the ServiceNow Store.

You can pin or unpin individual activities or set pinning within workflow properties that controls the versions used for all the activities in that workflow. This can result in two workflows using different versions of the same activity.

Note: Activity pinning and unpinning applies to the custom activities downloaded from the ServiceNow Store only, and does not apply to newly published activity definitions made locally on your instance. To make use of these locally updated custom activities, you must check out your workflow and manually add the activities.

Workflow Activities
  Workflow activities overview 3926

Workflow Activities
  multiple timer activities in one workflow 4024
  Notify 2370, 3961
  SLA Percentage Timer 3972
  Timer 3973
  timer activities 3972
workflow activity
  Forward to notify client 2379, 3966
  queue 2380, 3970
  Send SMS 2373, 3969
Workflow activity
  Call 2372, 3967
  Forward call 2374, 3962
  Hang up 2377, 3964
  Join conference call 2371, 3968
  Reject call 2379, 3966
  Say 2379, 3966
Workflow Activity
  Input 2375, 3962
  Play 2377, 3964
  Record 2378, 3965
Workflow Administration
  error 3911
  errors 3905, 3910
  workflow timelines 3899, 3899, 3903, 3904
Workflow Concepts
  data separation 3880
  delegated administration 3878
  domain separation 3877
  restrictions 3877
  workflow caching 3884
  workflow engine operation order 3882
  workflow permissions 3880
  workflow scope 3876
  workflow tables 3884
  workflow versions 3876
  workflows 3877, 3878, 3880
Workflow Editor 3764
Workflow Error Handling
  approval condition 3911
Workflow Events 3817, 3817, 3824, 3825, 3829
Workflow Field 3842, 3844, 3845, 3846, 3847, 3852
Workflow icons 3845
workflow movement with update sets
  avoiding duplicate workflows 3898
  commit a workflow in an update set 3898
  input variable movement 3896, 3896, 3897
  input variable removal 3897, 3897, 3897
  update set migration 3898, 3898
  workflow update set migration 3893, 3894, 3894, 3895
workflow run
  determine 3798
  workflow run time metrics 3925
Workflow stage icons 3845
workflow stage sets
  add a stage set 3842
  create a stage set 3840
  export a stage set 3842
  import a choice list 3841
  use default 3838, 3841
Workflow Stages 3831, 3835, 3838, 3838, 3839, 3839
Workflow validation 3796, 3852
Workflow Validator
  validate subflows 3861
  ValidateDanglingTransition 3860
  ValidateInputVarUpdateSetDependencies 3872
  ValidateLowestCommonTable 3863
  ValidateParentFlow 3864
  ValidateScriptForCurrentDotUpdate 3862
  ValidateSingleEnd 3865
  ValidateTableChange 3863
  validateTransitionIn 3858
  ValidateTransitionOut 3857
  ValidateUpdateSetDependencies 3867
  ValidateUpdateSetParentDependencies 3869
  ValidateWorkflowEndStages 3872
  ValidateWorkflowStageColumn 3873
  ValidateWorkflowStateValues 3873
workflows
  add activities 3796
  cancel with a script 3892
  cancelContext(context) methods 3892
  check out 3798
  create 3782, 3789, 3791, 3793
  edit 3798
  ending with multiple branches 3795
  error tracking for 3906
  invoking subflows in 3804
  palette 3768
  passing variables to a subflow 3803
  prepare for adding subflow 3808
  preparing a subflow for 3804
  publish 3797
  selecting activities for 3768
  subflow inputs 3803
  subflows in 3800, 4004
Workflows 1171
