- If the AQI review was performed on the first version of the article, the system sends an email notification to the author of the article.
- If the AQI review was performed on subsequent versions of the article, the system sends an email notification to the author and creator of the article versions.

**Note:** The notification includes the AQI review score and AQI review result. You can customize the content and design of the notification emails.

To save the pending review to complete later, click Update and return to the Article Checklist Summaries list. The checklist with pending reviews is added to the My Pending AQI Checklists queue. When you want to complete the AQI reviews, navigate to Knowledge > My Pending AQI Checklists and complete the reviews.

To view all the AQI reviews you completed, navigate to Knowledge > My Completed AQI Checklists.

### View all pending and completed AQI reviews

View checklists of all users to monitor the pending and completed reviews.

Role required: knowledge_admin or admin

1. Navigate to Knowledge > Article Quality Index
2. Do one of the following:
   - To view all completed AQI checklists, select All Completed AQI Checklists.
   - To view all pending AQI checklists, select All Pending AQI Checklists.

### Delete AQI reviews

Delete an AQI review that was created by mistake or is no longer required.

Roles required:

- To delete an AQI in a submitted state: admin or knowledge admin
- To delete an AQI not in a submitted state: knowledge admin or the reviewer who initiated the AQI

1. Navigate to Knowledge > Articles > My Pending AQI Checklists.
2. Select all checklist reviews you would like to delete.
3. Click Delete.
Enable creating an article from a customer service case

You can enable authors to reuse information in a case by copying case details into an article template. Use the pre-defined customer service source case table to article template target table configuration or create custom configurations between the two tables to copy information from a case to an article.

- The Knowledge Management Advanced plugin must be active.
- The KCS for Customer Services Management property must be enabled.
- The pre-defined KCS article template or a newly created article template must be active.

**Note:** You can do one of the following to create an article from a case:

- Use the pre-defined Case KCS Article mapping as is or modify the field mappings between the case source table and article template target table.
- Create a new article template target table and map it to the case source table and customize the field mappings between them. For information on creating article templates, refer to Create an article template.

- Knowledge users use the Create Knowledge button in a case form to create an article from a case and must have "can contribute" permission for at least one active knowledge base to create an article from a case. For information on user permissions, see Knowledge Management roles.

Role required: sn_customerservice.customer_admin or admin

The pre-defined Case KCS Article mapping is stored in the CSM Table Map (csm_table_map) table. This configuration has the sn_customerservice_case source case table configured to the kb_template_kcs_article target article template table with the four field mappings pre-configured between the tables. You can customize the existing field mappings or map additional fields between the tables.

1. In the application filter navigator, type csm_table_map.list.
2. Click Case KCS Article.
3. From the Target Table list, use the pre-defined KCS article template table or select the newly created article template table.
4. Map each customer service case field that must be used to create knowledge articles.
   a) In the Basic Field Mapping related list, click New.
      To map fields, fill in the following fields:

      **Customer service case table to article template target table field mapping**

      | Field          | Instructions                                      |
      |----------------|---------------------------------------------------|
      | Source Field   | Select the field in the source case table that contains the information to be copied to the field in the article template target table. |
      | Target Field   | Select the field in the article template target table to which you need information copied to from the field in the source case table. |

   b) Click Submit.
c) To map fields using advanced scripts, select the **Advanced Field Mapping** check box and then map the fields between the source and the target table using advanced scripts in the **Advanced Field Mapping** tab.

**Note:**

If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.

If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

d) To customize when and how the Create Knowledge button is displayed, use the condition builder in the **Condition** tab or select **Use Advanced Condition** check box and configure using advanced scripts.

**Note:** If you change the target table in the Case KCS Article mapping, also update the scripts with the configuration changes for display of this button.

---

5. Click **Update**.

---

**Enable creating a knowledge article from an incident**

Enable users to quickly and easily reuse information from an incident in a knowledge article.

Role required: admin

Perform the following steps to enable creating a knowledge article from an incident. You can also create a knowledge article from an incident using an article template. For more information, see *Create a knowledge article from an incident using an article template*.

**Note:** Once you have performed the configuration steps, knowledge users can select the Knowledge check box on the Incident form to create an article from an incident. They must have Can Contribute access to at least one active knowledge base to create an article.

**Create field mapping from an incident to a knowledge article**

Copy information from an incident into a knowledge article by creating custom mapping between the Incident table and the KCS article table.

Role required: admin

- Ensure that the Knowledge Advanced plugin (com.snc.knowledge_advanced) is active.
- Ensure that the KCS Article template is active.

1. Navigate to **Knowledge > Administration > Article Templates**.
2. Set the **Active** field to **true** for the KCS Article template.

---

1. In the filter navigator, type `csm_table_map.list`.
2. Click **New**.
3. In the **Mapping Name** field, enter **Incident KCS Article**.
4. In the **Source Table** field, enter **Incident**.
5. In the Target Table field, enter KCS Article.
6. Right-click the form header and Save.
7. In the Basic Field Mapping related list, click New.
8. Create mappings for the following fields.

<table>
<thead>
<tr>
<th>Source Field</th>
<th>Target Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sys ID</td>
<td>Source Task</td>
</tr>
<tr>
<td>Short description</td>
<td>Short description</td>
</tr>
<tr>
<td>Resolution notes</td>
<td>Resolution</td>
</tr>
</tbody>
</table>

Note: You can create field mappings for more fields, as required.
- In the Source field, select the field in the source Incident table that contains the information to be copied to the field in the article template target table.
- In the Target field, select the field in the article template target table to which you need information copied to from the field in the source Incident table.

9. To customize when and how the Knowledge check box is displayed, click the Condition tab.
10. To map fields using advanced scripts, select the Advanced Field Mapping check box.
11. On the Advanced field Mapping tab, paste in the following code.

```javascript
(function (source,target) {
    // Get the first comments from incident and use it as Issue description for article
    var notes = source.comments.getJournalEntry(-1);
    var entries = notes.split("\n\n");
    var comment = "";
    if(entries[entries.length-2]){
        comment = entries[entries.length-2];
        var part = comment.toString().indexOf(""");
        if(part != -1){
            comment = comment.toString().substring(part+2).replaceAll("\r\n","\n"+"<br/
        }
    }if(comment)
    target.kb_issue = comment;
})(source,target);
```

The first comment on an incident is mapped to the Issue Description field in the knowledge article.

Note: If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.

If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

Add a property to enable creating knowledge article from incidents

Add a property, which is required to allow users to create a knowledge article from an incident.
Role required: admin

1. In the Filter navigator, enter `sys_properties.list`.
2. Click New.
3. Fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>enable_kcs_incident</td>
</tr>
<tr>
<td>Description</td>
<td>Enable Knowledge Centered Services (KCS) for Incident Management.</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

4. Click Submit.

Create a UI action to enable creating knowledge articles from incidents

Create a UI action to add the Knowledge check box to the Incident form.

Role required: admin

1. Navigate to System UI > UI Actions.
2. Click New.
3. Fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Knowledge</td>
</tr>
<tr>
<td>Table</td>
<td>Incident</td>
</tr>
<tr>
<td>Action name</td>
<td>create_knowledge</td>
</tr>
</tbody>
</table>

4. Select the Client check box.
5. Select the List v3 Compatible check box.
6. Select the Form button check box.
7. In the Onclick field, enter `createKnowledgeClient()`.
8. In the Condition field, enter `gs.getProperty("enable_kcs_incident") == 'true' && new global.CSMTableMapUtil (current).findMapByName("incident_kcs_article") && new global.KBKnowledge().canCreate()`.
9. In the Script field, enter the following code.

```javascript
function createKnowledgeClient() {
    if (g_form.modified) {
        alert(new GwtMessage().getMessage('You have unsaved changes. Please save them to continue.'));
    }else{
        //Call the UI Action again but skip the 'onclick' function
gsftSubmit(null, g_form.getFormElement(), 'create_knowledge');
        //MUST call the 'Action name' set in this UI Action
    }
}
```
Enable creating a knowledge article from an HR case

Enable users to quickly and easily reuse information from an HR case in a knowledge article.

Role required: admin

- Ensure that the Human Resources Scoped App: Core (com.sn_hr_core) plugin is active.
- Ensure that the Developer Application is set to Human Resources: Core.

**Note:** To check, navigate to the Settings icon and then Developer > Application.

Perform the following steps to enable creating a knowledge article from an HR case.

**Note:** Once you have performed the configuration steps, knowledge users can select the Knowledge check box on the HR Case form to create an article from an HR case. They must have Can Contribute access to at least one active knowledge base to create an article.

Create field mapping from an HR case to a knowledge article

Copy information from an HR case into a knowledge article by creating custom mapping between the HR case table and the KCS article table.

Role required: admin

- Ensure that the Knowledge Advanced plugin (com.snc.knowledge_advanced) is active.
- Ensure that the Developer Application is set to Human Resources: Core.
- Ensure that the KCS Article template is active.

1. Navigate to Knowledge > Administration > Article Templates.
2. Set the Active field to true for the KCS Article template.

1. In the filter navigator, type `csm_table_map.list`.
2. Click New.
3. In the Mapping Name field, enter HR Case KCS Article.
4. In the Source Table field, enter HR Case.
5. In the **Target Table** field, enter **KCS Article**.
6. Right-click the form header and **Save**.
7. In the **Basic Field Mapping** related list, click **New**.
8. Create mappings for the following fields.

<table>
<thead>
<tr>
<th>Source Field</th>
<th>Target Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sys ID</td>
<td>Source Task</td>
</tr>
<tr>
<td>Short description</td>
<td>Short description</td>
</tr>
<tr>
<td>Close notes</td>
<td>Resolution</td>
</tr>
<tr>
<td>Description</td>
<td>Cause</td>
</tr>
</tbody>
</table>

**Note:** You can create field mappings for more fields, as required.
- In the **Source** field, select the field in the source HR Case table that contains the information to be copied to the field in the article template target table.
- In the **Target** field, select the field in the article template target table to which you need information copied to from the field in the source Incident table.

9. To customize when and how the **Knowledge** check box is displayed, click the **Condition** tab.
10. To map fields using advanced scripts, select the **Advanced Field Mapping** check box.
11. On the **Advanced field Mapping** tab, paste in the following code.

```javascript
(function (source) {
  // Get the first comments from HR case and use it as Issue description
  for article
    target.short_description=source.short_description+"";
    target.kb_resolution=source.close_notes+"";
    target.kb_cause=source.description+"";
    var notes = source.comments.getJournalEntry(-1);
    var entries = notes.split("\n\n");
    var comment = "";
    if(entries[entries.length-2]){
      comment = entries[entries.length-2];
      var part = comment.toString().indexOf("")
      if(part != -1){
          comment = comment.toString().substring(part+2).replaceAll("\r\n","<br/>
        }]
      }if(comment)
        target.kb_issue = comment;
      
      //Only if selected article type is active
      var tem = new GlideRecord("kb_article_template");
      tem.addQuery("child_table","kb_template_kcs_article");
      tem.addActiveQuery();
      tem.query();
      if(!tem.hasNext())
          return false;

      //Do not allow to create the knowledge again
      var gr = new GlideRecord("kb_knowledge");
      gr.addQuery("source",source.sys_id);
      gr.query();
      if(gr.next())
          return false;
```
The first comment on an HR case is mapped to the **Issue Description** field in the knowledge article.

**Note:** If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.

If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

### Add a property to enable creating knowledge articles from HR cases

Add a property, which is required to allow users to create a knowledge article from an HR case.

**Role required:** admin

Ensure that the Developer Application is set to **Human Resources: Core**.

1. In the Filter navigator, enter `sys_properties.list`.
2. Click **New**.
3. Fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td><code>enable_kcs_hr</code></td>
</tr>
<tr>
<td>Description</td>
<td>Enable Knowledge Centered Services (KCS) for HR Service Delivery.</td>
</tr>
<tr>
<td>Type</td>
<td><code>true</code> or <code>false</code></td>
</tr>
<tr>
<td>Value</td>
<td><code>true</code></td>
</tr>
</tbody>
</table>

4. Click **Submit**.

### Create a UI action to enable creating knowledge articles from HR cases

Create a UI action to add the Knowledge check box to the HR case form.

**Role required:** admin

Ensure that the Developer Application is set to **Human Resources: Core**.

1. Navigate to **System UI > UI Actions**.
2. Click **New**.
3. Fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Knowledge</td>
</tr>
<tr>
<td>Table</td>
<td>HR Case</td>
</tr>
</tbody>
</table>
4. Select the **Client** check box.
5. Select the **List v3 Compatible** check box.
6. Select the **Form button** check box.
7. In the **Onclick** field, enter `createKnowledgeClient()`.
8. In the **Condition** field, enter `gs.getProperty("sn_hr_core.enable_kcs_hr") == 'true'
   && new global.CSMTableMapUtil
   (current).findMapByName("sn_hr_core.hr_case_kcs_article") && new
   global.KBKnowledge().canCreate()`.
9. In the **Script** field, enter the following code.

```javascript
function createKnowledgeClient() {
  if (g_form.modified) {
    alert(new GwtMessage().getMessage('You have unsaved changes.
Please save them to continue.'));
  }else{
    //Call the UI Action again but skip the 'onclick' function
    gsftSubmit(null, g_form.getFormElement(), 'create_knowledge');
    //MUST call the 'Action name' set in this UI Action
  }
}

//Code that runs without 'onclick'
//Ensure call to server-side function with no browser errors
if (typeof window == 'undefined')
  CreateKnowledgeServer();

function CreateKnowledgeServer() {
  current.update();

  var map = new global.CSMTableMapUtil (current);
  map.findMapByName("sn_hr_core.hr_case_kcs_article");
  var targetURL = map.getTargetURL();
  var referenceLink = "&sysparm_collection=sn_hr_core_case&sysparm_collectionID="+current.sys_id
  +"&sysparm_collection_key=task&sysparm_link_collection=m2m_kb_task&sysparm_collectionRelatedField=kb_knowledge&sysparm_referring_url=sn_hr_core_case.do
  %3fsys_id%3d"+current.sys_id;
  if(targetURL)
    action.setRedirectURL(targetURL[0]+referenceLink);
}
```
10. Click **Submit**.

**Use Knowledge Management**

Share your ideas and experience by creating a knowledge article. Search and find information such as self-help, troubleshooting, and task resolution in knowledge bases. Review, provide feedback on knowledge articles, and resolve issues yourselves rather than contacting customer service or an internal helpdesk.

Role required: none

Use Knowledge Management in one or more of the following ways.
Knowledge Management guide for users

After knowledge bases are set up, you can start searching and creating articles. If Social Q&A was activated for the knowledge base, you can also submit answers or answer questions for other users.

Requirements

Role required

All users can read knowledge articles. Users with at least one ServiceNow role can create and edit knowledge articles in a knowledge base, unless the knowledge manager has restricted access to the knowledge base or knowledge articles.

If you need these permissions, contact the knowledge manager or knowledge administrator for the knowledge base.

What to do

Create knowledge articles

If you have the required permissions for a knowledge base, you can create articles for it. You can create articles from the Self-Service application menu or by importing Word documents.

You can also create knowledge articles from incidents and problems.

Search for knowledge articles

From the Knowledge homepage, you can select a knowledge base to search for articles and answers. You can view only the knowledge bases to which you have access.

Access to knowledge using your mobile device is supported.

Ask and answer questions

If Social Q&A was activated for a knowledge base, you can ask and answer questions. You can also browse and vote on answers.

Next steps

After articles are created, you can perform the following tasks to make sure that articles are organized in the right knowledge bases and retired when appropriate. If existing knowledge bases do not fit your needs, you can request a new knowledge base.

- Move a knowledge article
- Retire a knowledge article
- Request a knowledge base

Knowledge Management homepage features

The Knowledge Management Service Portal homepage displays knowledge articles and social Q&A items organized by knowledge base and category, as well as featured content and popular articles. Learn how to navigate the homepage to search for and find useful and relevant information quickly.
To use the Knowledge Management Service Portal, the Knowledge Management — Service Portal plugin (com.snc.knowledge_serviceportal) must be activated.

**Note:** It is active by default for customers on the Madrid and later releases. Existing or upgrade customers must activate the plugin and enable the glide.knowman.serviceportal.enable_redirect property.

Your organization can customize the homepage, so it may look different to the following image. You must be logged in to view the knowledge homepage.

**Knowledge Management homepage features**

<table>

<tr>
<td></td>
<td><strong>Note</strong>: Shows a hierarchy of categories if the administrator configured the <strong>Show category hierarchy (valid for kb_category only)</strong> instance option for the facet widget.</td>
</tr>
</tbody>
</table>

**Other filter facet widgets**

Use filter facets to refine your search results.

The selections you make filter the items displayed in the search results list. The search results list updates to display only those items that match your selections. Deleting a selection from the filter facet or breadcrumb reverses the filtering in the list.

Clear selected filter options by:

- Deleting a single option from the search results list header.
- Clicking **Clear all** in the search results list header.
- Clicking **Clear** in the filter facet widget header.

- **Author**: lists the names of the authors for the knowledge articles included in the search results list
- **Tags**: lists the available knowledge tags
- **Resource**: lists the types of items available, such as knowledge articles and social Q&A
- **Rating**: lists article ratings from 0-5 stars (clicking a rating displays articles that have the selected rating and higher)
- **Last Modified**: lists selections based on the timing of knowledge item modifications such as Past Month or Past Week
- **View Count**: lists the knowledge item view counts such as More Than 50 or Less Than 10. Set the number of days to consider when calculating view count using the `glide.knowman.view_age.days` property.

**View additional search results**

Depending on the system setup, view additional search results using one of these options:

- **Standard Pagination**: displays the search results in multiple pages.
- **Infinite Scroll**: displays the search results while scrolling.

**Note**: If a custom widget on the knowledge search results page uses the `KnowledgeSearchService` angular service, you must add the `sn.knowledgeApplication` dependency to enable the functionality of the custom widget.

1. Navigate to **Service Portal > Dependencies**.
2. In the **Name** field, search for the `sn.knowledgeApplication` dependency.

3. If a message appears, click **here** to edit.
   
   You have to be in the **Knowledge Management - Service Portal** application to edit.

4. Click **Update**.

The search functionality in Knowledge Management Service Portal pages uses the **Knowledge Base Search** search context to fetch results. As an administrator, you must not update the definition of this search context because it may impact the search behavior. For more information about contextual search, see **Contextual search concepts**.

---

**Knowledge Management article view page features**

View the knowledge article you selected, including the article number, short description, and article content. Give feedback or comment on an article.

**Note:** If you select a question, the article view page displays the question, any answers to the question, and a text box for providing an answer.

</tbody>
</table>

**Note:** If enabled, users can subscribe to articles, view article versions, and create feedback for articles that are rated as not helpful.

**Knowledge article URL parameters**

You can add parameters to an article URL to view the latest version and an existing translation.

**Knowledge article URL structure**

The knowledge article URL appears in the following structures:

- **Accessed from Service Portal:** https://<instance-name>.service-now.com/kb?id=kb_article_view&sysparm_article=<article number>&sysparm_language=<language code>

  For example, the URL https://yourbusiness.service-now.com/kb?id=kb_article_view&sysparm_article=KB0010053&sysparm_language=EN returns the article with the most recent version in the selected language, if the translation for the selected language exists.

- **Accessed from Knowledge Base View (kb_view) UI page:** kb_view.do?sysparm_article=<article number>&sysparm_language=<language code>

  For example, the URL https://yourbusiness.service-now.com/kb_view.do?sysparm_article=KB0010044&sysparm_language=en returns the article with the most recent version in the selected language, if the translation for the selected language exists.

**Note:** The listed parameters can include the sys_id in the url parameter.
Parameters

The following parameters are available for knowledge article URLs.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Possible values</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_article</td>
<td>Returns the most recent article version. For example, <a href="https://yourbusiness.service-now.com/kb?id=kb_article_view&amp;sysparm_article=KB0010053">https://yourbusiness.service-now.com/kb?id=kb_article_view&amp;sysparm_article=KB0010053</a>.</td>
</tr>
<tr>
<td>sysparm_language</td>
<td>Returns the most recent article version in the input language if a translation exists. For example, <a href="https://yourbusiness.service-now.com/kb?id=kb_article_view&amp;sys_id=3b07857187032100deddb882a2e3ec20&amp;sysparm_language=EN">https://yourbusiness.service-now.com/kb?id=kb_article_view&amp;sys_id=3b07857187032100deddb882a2e3ec20&amp;sysparm_language=EN</a>.</td>
</tr>
</tbody>
</table>

Create a knowledge article

Knowledge contributors can create and edit knowledge articles within a knowledge base to share information across your organization.

You must have Can Contribute access to at least one active knowledge base.

To view an article template, you must activate the article templates feature and enable the desired templates.

Users with at least one role can create and edit knowledge articles. These users are known as knowledge contributors. Users without any role can read articles and submit feedback, but cannot create or edit articles.

Some knowledge bases may allow only certain users to contribute. For example, a member of the IT department can create knowledge articles in the IT knowledge base, such as desktop support information or articles describing company IT processes.

1. There are three ways of creating knowledge articles.
   - Navigate to Self-Service > Knowledge and click the Create an Article icon.
   - Navigate to Knowledge > Articles > Create New.
   - From the Knowledge Management homepage, click the Overflow icon and then Create Article.

2. On the Create new article page, select a knowledge base.
   The list of article templates to select in the next step is filtered according to the article templates available for the selected knowledge base.

   **Note:**
   On the Create new article page, you can select to Switch to older version of this page or Switch to updated version of this page (recommended).

3. Select an article template.
4. Click Next.
   The Knowledge form is displayed based on the article template selected.
5. Fill in the fields on the form, as appropriate.
### Knowledge form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Base</td>
<td>The knowledge base selected for this article.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> An article can only be associated with one knowledge base.</td>
</tr>
<tr>
<td></td>
<td>You can change the knowledge base, but only if the selected article template is available in the knowledge base.</td>
</tr>
<tr>
<td>Category</td>
<td>The category for this article. Select a Knowledge Base before you can select a category. Articles without a category appear on the knowledge homepage in the (empty) category.</td>
</tr>
<tr>
<td>Ownership Group</td>
<td>The ownership group for this knowledge article. An ownership group consists of a group of members and a manager who are responsible for approvals, ensuring article quality, and feedback tasks. Ownership groups can publish, edit, and retire knowledge articles that they are associated with.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If no ownership group is assigned, the article automatically goes to the knowledge administrator and knowledge manager for approval.</td>
</tr>
<tr>
<td>Language</td>
<td>Language in which you are creating the article. The list is populated based on the languages enabled for the selected knowledge base.</td>
</tr>
<tr>
<td>Schedule publish date</td>
<td>Date in future when the article is published automatically. If approvals are enabled, the approval process must be completed before this date.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Valid to</td>
<td>The date this knowledge article expires. Articles do not appear in search results after the Valid to date or if the Valid to date is blank. The default value of the Valid to field is derived from the Article Validity field configured for the knowledge base (see Create a knowledge base). The Valid to date starts from the date the article was created until the number of days specified in the Article Validity field. If the Article Validity field is blank, the default date in the Valid to field for the knowledge article is set to January 1, 2100. An article author or editor can select whether to keep or change the default Valid to date. Note: If the system date format or user preferences is set to use yy year format, you might face issues when the Valid to date is set to the default date. Contact your system administrator or modify the user preferences to use a date format with the yyyy year format. For more information, see Global date and time field format and Personalize the system date format topics.</td>
</tr>
<tr>
<td>Article type</td>
<td>The type of article, either HTML or wiki. Note: This field is only visible in the standard template.</td>
</tr>
<tr>
<td>Workflow</td>
<td>(Read-Only) The publication state of the article, such as Draft, In Review, or Published. When inserting a new article from an existing article, the state of the new article is reset to Draft.</td>
</tr>
<tr>
<td>Source</td>
<td>The task this knowledge article was created in response to, if any. This field is set automatically when you create the knowledge article from a task record.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Attachment link</td>
<td>Check box for downloading an attached file automatically when a user accesses the article, instead of opening the article view. Add one or more attachments to the article to use this option.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You may attach multiple files, but most web browsers permit users to download only the first one. To ensure download of all the files, bundle them into an archive, such as with WinZip, and attach the archive. The Attachment link option applies to articles accessed from search links only. Articles accessed from links within other knowledge articles will not automatically download an attached file.</td>
</tr>
<tr>
<td>Display attachments</td>
<td>Check box for displaying attachments to users viewing this knowledge article. Attachments appear below the article text. Add one or more attachments to the article to use this option.</td>
</tr>
<tr>
<td>Short description</td>
<td>The title of the article. This title appears when browsing and searching knowledge, and at the top of the article.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If contextual search is enabled, the knowledge articles similar to the entered short description text appear in the Knowledge results section.</td>
</tr>
<tr>
<td>Article body</td>
<td>Content for the article. Use the HTML editor to create content. A preview of the content appears when browsing and searching knowledge.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can’t create knowledge articles with content exceeding the server limit of Now Platform. By default, the server limit is 1 MB. This limit doesn’t include attachments. To create knowledge articles with content exceeding the server limit, disable the glide.knowman.check_article_size property (from the System Property (sys_properties) table). However, some actions on the larger knowledge article might fail.</td>
</tr>
</tbody>
</table>

6. Optional: To search for similar articles, enter the text in the Related Search field or continue with the default text in the Knowledge results section. If the Knowledge results section is not
displayed on the Knowledge form, a system administrator can configure the form layout to add the Contextual Search Results field to the form.

- To find knowledge articles that have high text similarity with the entered search text, choose Similar Articles (ML).

**Note:** This option is available only when the Predictive Intelligence feature is enabled and your system administrator has trained the similarity solution for Knowledge Management. For more information, see Train the similarity solution for Knowledge Management to find related articles.

- To find knowledge articles that match the entered search text, choose Search Articles.

7. Optional: To view the entire article in a pop-up window, click the link to the article title.
8. Click Submit to create the article.

After saving the article record, you can add tags to further organize the article.

Any additional steps required to publish the article, such as approvals, depend on the publishing workflow for the knowledge base.

- If there is no approval workflow set up, the article is immediately published.
- If an approval workflow is set up and Ownership Group is configured, an email notification with a link to the article is sent to the ownership group members assigned to the article for approval.
- If an approval workflow is set up and Ownership Group is not configured, an email notification with a link to the article is sent to the knowledge base manager for approval.
- If the article is approved, it is published and an email notification is sent to the author or reviser of the article.
- If the article is rejected, an email notification is sent to the author or reviser of the article to revise and resubmit it for publishing.

**Edit a knowledge article**

Knowledge contributors can edit/update knowledge articles within a knowledge base to update information shared across your organization.

**Role required:** knowledge

Users with at least one role can edit knowledge. These users are known as knowledge contributors. Users without any role can read articles and submit feedback, but cannot edit articles.

However, Knowledge managers can configure User Criteria to restrict access to certain Knowledge bases. For example, only members of the IT department can create or edit knowledge articles in the IT knowledge base, such as desktop support information or articles describing company IT processes.

**Note:** If the article versioning feature is enabled, only the knowledge administrator, knowledge managers, and author can edit the checked-out version of an article. If the feature is disabled, any users with contribute access to an article can edit the draft version of the article. An administrator can disable the article versioning feature by setting the glide.knowman.versioning.enabled property (from the System Property (sys_properties) table) to false.

Edit an article using one of these options.

- Edit published/unpublished articles with Versioning enabled:
1. Navigate to Knowledge > Articles.
2. Select an article from the Published or Unpublished category.
3. From the article, click Checkout and edit the article.
4. To save changes to:
   - an unpublished article, and to publish it at the same time, click Publish.
   - a published article, or to save changes to an unpublished article without publishing it, click Update.

   - Edit published articles from the Knowledge homepage or Service Portal:
     1. Navigate to one of the following modules:
        - Self-Service > Knowledge
        - Knowledge > Homepage
        - Knowledge Service Portal homepage
     2. From the Knowledge homepage, search for and select the article to edit.
     3. From the article, click Edit, then from the Knowledge form record, edit the desired editable fields.

     4. Click Update to save changes.

     **Note:** You can’t modify knowledge articles with content exceeding the server limit of Now Platform. By default, the server limit is 1 MB. This limit doesn’t include attachments. To modify knowledge articles with content exceeding the server limit, disable the glide.knowman.check_article_size property (from the System Property (sys_properties) table). However, some actions on the larger knowledge article might fail.

If you edited an unpublished article, any additional steps required to publish an article, such as approvals, depend on the publishing workflow for the knowledge base.
Map related articles

Discover similar information across articles on a topic while viewing an article. You can manually map related articles or have the application automatically present related articles using machine learning (ML) algorithms.

Role required: knowledge

To edit the article, you must have knowledge contributor access for the associated Knowledge Base.

You can manually map related articles when editing an article. In the Related Articles section on the Knowledge Management article view page, these manually mapped related articles appear before the related articles that are predicted through the Knowledge Management similarity solution.

Note: An administrator can train the solution definition for Knowledge Management within the Predictive Intelligence feature to find related articles. For more information, see Train the similarity solution for Knowledge Management to find related articles.

1. On the Now Platform, open the knowledge article for which you want to map related articles.
2. On the Knowledge form, click the Related Articles related list.
3. Click Edit.
4. On the Edit Members form, move the desired articles from the available articles in the Collection column to the Related Articles List column.
5. Click the up or down icon to arrange the articles in the order in which you want them to appear in the Related Articles section on the article view page, and then click Save.

Note: Knowledge administrators can configure the number of articles shown in the Related Articles section using the instance options.

Map catalog items related to an article

Manually map catalog items related to a knowledge article to enable employees to request the related product or service.

Role required: knowledge

To edit the article, you must have knowledge contributor access for the associated Knowledge Base.

1. On the Now Platform, open the knowledge article for which you want to map related catalog items.
2. On the Knowledge form, click the Related Catalog Items related list.
3. Click Edit.
4. On the Edit Members form, move the desired catalog items from the available catalog items in the Collection column to the Related Catalog Items List column.
5. Click the up or down icon to arrange the articles in the order in which you want them to appear in the Related Items section on the article view page, and then click Save.

Note: Knowledge administrators can configure the number of catalog items shown in the Related Items section using the instance options.
Comment on a knowledge article

Comment on a knowledge article or reply to a comment.

Role required: Admin

1. Navigate to the Knowledge Management Service Portal.
2. Click the article you want to comment or reply to a comment on.
3. Click **Click here to comment on this article** or **Reply**.
4. Enter your comment or reply and add links, images, and attachments as required.

   **Note:** Attachments to comments posted in the Knowledge Management Service Portal are not displayed in the Live Feed. If attachments to comments are posted in Live Feed, they are displayed in the Knowledge Management Service Portal.

   If antivirus protection is enabled, all attachments are automatically scanned for viruses once the comment is posted. Attachments are only displayed once the scan is finished and successful.

   If you are the author of the comment, you can delete it. All comments and replies underneath are automatically deleted.

5. Click **Submit**.

   **Note:** You can only view comments in the Live Feed if the Use Live Feed for Knowledge feedback property is active. It is inactive by default.

   Comments posted in Live Feed before upgrading to release version New York are not shown hierarchically in the Knowledge Management Service Portal. Comments posted in Live Feed after upgrading to release version New York are shown hierarchically in the Knowledge Service Portal.

The following table illustrates how comments and replies to comments are displayed depending on where you are viewing them.

<table>

Create knowledge from an incident, problem, or case

Create a knowledge article, so the next time the issue comes up the resolution is easy to find.

Depending on the value of the `glide.knowman.submission.workflow` property, knowledge created from an incident, problem, or case may require additional approval. When this property is true, a submission record is created instead of a knowledge article. A user with the knowledge role must approve the submission to create a knowledge article.

1. Open a resolved incident, problem, or case.
2. Select the Knowledge check box on the form.
3. Close the incident, problem, or case.
   A new draft knowledge article is created.
4. If additional approval is required, navigate to Knowledge > Open Submissions.
5. Select a submission record.
6. Review the submission to ensure the content and settings are correct.
7. Click Create Article.
   A new draft knowledge article is created. Articles created this way are added to the
   knowledge base specified in the property glide.knowman.task_kb.

Knowledge feedback
You can view and contribute to feedback on knowledge articles.

Feedback options
You can submit feedback for knowledge articles in these ways:
- Flag an article as incorrect or inappropriate.
- Provide a rating value for the article.
- Mark an article as helpful or not helpful.
- View comments, add a new comment, or reply to existing comments.

Users can view comments directly on the article. Knowledge managers can view the other types
of feedback by navigating to Knowledge > Feedback.

Administrators and knowledge managers can disable some feedback options using fields on the
Knowledge Base form. Administrators can configure feedback options using properties.

Flagging articles
You can flag an article for incorrect or inappropriate content. Click Flag Article in the article
header to open a new window, allowing you to enter suggested changes.

- Flagged comments do not appear on the Article View page. Users with the admin,
  knowledge_admin, and knowledge_manager roles can access flagged articles by navigating to
  Knowledge > Articles > All Flagged. Users with the knowledge role can access their flagged
  articles by navigating to Knowledge > Articles > My Flagged.
- If disabled, the author of the article and users with the admin, knowledge_admin, and
  knowledge_manager roles can see all flagged comments. Other users can see only their own
  flagged comments.

Note: You cannot disable flagging for an article until you have disabled the flagging for all
feedback comments for that article.

Flagged comments are stored in the Knowledge Feedback (kb_feedback) table but not the Live
Feed Messages (live_message) table.
Rating articles

The five stars below the article title allow you to indicate the article’s effectiveness on a scale of 1 to 5.

Marking articles

The question Helpful? at the bottom of the article allows you to indicate the usefulness of the article with a simple Yes or No answer.

Comments

Knowledge comments at the bottom of the article use live feed to enable a conversation around a knowledge article. For example, you can post replies to comments, add attachments, or Like comments. The glide.knowman.use_live_feed property controls the display of knowledge article comments. If enabled, the system uses live feed to manage and display feedback on knowledge articles.

Note: Unauthenticated users and users with only the snc_external role can’t add or view attachments for comments.

Import a Word document to a knowledge base

Import a Word document to create a knowledge article.

You must have Can Contribute access to at least one active knowledge base.

Role required: knowledge

This feature is active by default for customers on Madrid and later releases.

Existing customers on release versions prior to Madrid use the Word import functionality on the Knowledge V3 homepage.

Upgrade customers use the Word import functionality on the Knowledge V3 homepage by default. If required, add the Import Articles module to the Application Navigator.

These styles and elements are preserved when importing a .doc or .docx file into a knowledge base. Styles and elements not included in this list may not be preserved when importing a document.

- Titles
- Headings
- Images

Note: Images may not be aligned exactly as in the Word document you import.

- Links
- Bold text
- Italic text
- Underlined text
- Ordered and unordered lists

Note: After import, the bullets in an unordered list are replaced with dots.
• Tables

Note: Only default heading settings are supported. Custom heading styles are imported using the default settings for those styles. Table styling and borders are not supported.

1. Navigate to Knowledge > Articles > Import Articles.
2. Enter the knowledge base to add the article to.
3. Optional: Select a Category from within the knowledge base.

Note: Use the category picker to add a category. The picker does not differentiate between the different category levels. You can select a category or sub category and add it to the Category field.

4. Optional: Select the Publish check box to start the publishing workflow for each imported article immediately after the import finishes.

Note: The Publish check box appears only when the Show publish checkbox on the knowledge import pop-up property is enabled. To enable the property, navigate to Knowledge > Administration > Properties and select the check box for the Show publish checkbox on the knowledge import pop-up property.

5. Select one or more Word files to import.
6. Click Import.

An article is created in the selected knowledge base and category using the content from the uploaded document.

• If you uploaded multiple documents, one article is created for each.
• If you use knowledge internationalization, the language of the article is set to the system language selected.
• When the upload completes, a pop-up window displays the number and short description of the articles. Click an article to view the full record.
• If any errors occur during the upload, a pop-up window displays the error.
• If the Publish check box is activated, knowledge articles go into Review or Published state, depending on the workflow attached to the knowledge base.
• If the Publish check box is not activated, the knowledge articles go into Draft state and are then reviewed before publishing.

Create an article version by importing a Word document

Import a Word document to a knowledge article to create a new version.

• Ensure that the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is installed.
• You can only upload new versions to articles that are in Draft or Published state.
• You cannot upload new versions to articles that are created using an article template or if the article type is Wiki.

Role required: admin
1. Navigate to Knowledge > Articles.
2. Click an article.
3. Click the Upload New Version related link.
4. Add the file you want to import.
5. Optional: Select the **Copy Attachments** check box to copy all attachments to the knowledge article.

**Note:** If the article is published, the attachments are added to a new article version. If the article is in draft, the attachments are added to the existing knowledge article. The draft article does not appear in the knowledge base (KB) for users until it is reviewed and published.

6. Click **Import**.
   A draft version is created and sent to approvers to approve or reject. Once the article is approved, it is displayed in the **Article Versions** related list.

**Social Q&A question view page**

View the question you selected as well as any answers. Answer a question or give feedback to a question.
How long does it usually take to set up my router?

Let's face it: Each router is different, and getting the right combination of settings, while setting up the router can be confounding. For example, even some reasonably experienced PC hands may not understand the differences between security settings or know that WPA-2 offers better protection than WEP and ordinary WPA.

With these considerations in mind how long does it usually take to setup my routers?

Various vendors have tried to make things simpler with easy-setup CDs or one-click connection buttons, but they can not cover every possible circumstance. Router setup instructions go the extra mile by explicitly detailing the order in which you need to you plug everything in before you run the CD. (Cable modems in particular should be powered on before you connect your router to them.) That is a nice touch – but it assumes you have read the printed instructions that came with the router. This helps in setting up the router relatively quickly.

## Knowledge subscriptions

Subscribe to knowledge bases and knowledge articles and receive email notifications about new articles and article revisions or comments.

- **Subscribed to a knowledge base:**
  - Knowledge base owners are auto-subscribed to all articles in the knowledge bases they own. They receive email notifications when new articles are created or revised (published) in the knowledge base.
  - Users who subscribe to a knowledge base receive email notifications when new articles are created in the knowledge base or if the existing articles are revised (published).

- **Subscribed to a knowledge article:**
  - Knowledge authors are auto-subscribed to the articles they create. They receive email notifications when the articles they created are checked out or revised (published) by other authors, and if the articles receive user comments.
  - Users who subscribe to an article receive email notifications when the article is revised (published).

Users can set their Knowledge notification preferences using **System Settings**.
The knowledge subscription feature is available for both the Knowledge Management v3 user interface and the Knowledge Management Service Portal.

If the article versioning feature is enabled, the following notifications are also sent:

- An article is checked out
- An article is revised
- A new version of an article is published

### Subscribe to a knowledge base

Subscribe to a knowledge base and receive notifications when articles are added to that knowledge base.

Role required: knowledge

Users can subscribe to a knowledge base from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

1. Navigate to **Knowledge > Homepage**.
2. Click the **Subscribe** link on the knowledge base tile.
   The link changes to **Subscribed** and includes a check mark.

### Unsubscribe from a knowledge base

Unsubscribe from a knowledge base.

Role required: knowledge

Users can unsubscribe from a knowledge base from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

**Note:** If you subscribe to an article and then subscribe to the knowledge base, unsubscribing from the knowledge base also unsubscribes you from the article.

1. Navigate to **Knowledge > Homepage**.
2. Point to and click the **Subscribed** link on the knowledge base tile, which toggles to **Unsubscribe**.
   After unsubscribing you from the knowledge base, the link toggles to **Subscribe**.

### Subscribe to a knowledge article

Subscribe to a knowledge article within a knowledge base.

Role required: knowledge

Users can subscribe to a knowledge article from either the Knowledge Management V3 user interface or the Knowledge Management Service Portal.

**Note:**

Users who are already subscribed to a knowledge base are also subscribed to the articles within that knowledge base.

To subscribe to articles from the base service portal (https://<instance name>/sp?), you must navigate to the **Knowledge Management Service Portal** pages (for example, https://<instance name>/sp?id=kb_home) from the base service portal.

1. Navigate to **Knowledge > Homepage**.
2. Click **Subscribe** at the top of the knowledge article.
The system shows an information message about the article subscription and the button toggles to **Subscribed**. If the email notification contains an article link, the link points to the Knowledge Management Service Portal. The email notification for a subscribed article includes the knowledge article ID, short description, and link to the article.

**Unsubscribe from a knowledge article**

Unsubscribe from a knowledge article.

Role required: knowledge

Users can unsubscribe from a knowledge article from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

Note: If you are subscribed to a knowledge base and you unsubscribe from an article in that knowledge base, you must also unsubscribe from the parent knowledge base.

1. Navigate to **Knowledge > Homepage**.
2. Point to and click **Subscribed**, which toggles to **Unsubscribe**.
   If you are subscribed to the knowledge article, this action results in an information message that the article subscription has been removed. If you are also subscribed to the parent knowledge base, proceed to the next step.
3. If you are subscribed to the parent knowledge base, click **Yes** on the Unsubscribe pop-up window.
   This action results in an information message that the knowledge base subscription has been removed.

**Set knowledge notification preferences**

Set notification preferences for knowledge bases and knowledge articles.

Role required: knowledge

Users can set notification preferences from the Knowledge menu or from the Knowledge Management Service Portal.

1. Navigate to the Notification Settings page.

```
<table>
<thead>
<tr>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From the Knowledge application</td>
<td>Click the Notification Settings module.</td>
</tr>
<tr>
<td>From the Knowledge Management Service Portal</td>
<td>Click the user name in the portal header and then click Notification Settings.</td>
</tr>
</tbody>
</table>
```

2. Click the Notification Preferences tab.
3. Click **Knowledge Base** and enable or disable the knowledge base notification options.
4. Click **Knowledge Articles** and enable or disable the knowledge article notification options.

**Manage knowledge subscriptions**

Manage knowledge base and knowledge article subscriptions from the Notification Settings page.

Role required: knowledge

Users can manage knowledge subscriptions from the Knowledge application or from the Knowledge Management Service Portal.

1. Navigate to the Notification Settings page.
### Knowledge blocks

Simplify knowledge authoring for writers and knowledge consumption for readers with knowledge blocks. Knowledge blocks are reusable pieces of content secured by user criteria that you can add to knowledge articles in a knowledge base. The user criteria controls which users can read or not read the block content in an article or search, enabling users to more easily view content that is relevant to them.

Knowledge blocks are available for use in Now Platform only.

#### How to use knowledge blocks

To use knowledge blocks, a knowledge administrator or manager must enable the knowledge blocks feature for each knowledge base in which the blocks will be used.

- Enable knowledge blocks for each knowledge base

Knowledge contributors can create knowledge blocks and insert them into articles in a knowledge base:

> **Note:** Knowledge blocks are not supported in articles of type wiki.

- Create a knowledge block
- Add knowledge blocks to a knowledge article
- Preview a knowledge article with knowledge blocks

Knowledge block content can be read or not read in an article or search based on user criteria set at the knowledge base and knowledge block level. See Select user criteria for a knowledge block for more information.

#### Holiday calendar with location-specific knowledge block content

You are part of an enterprise HR organization that maintains a company knowledge base. You want to create a holiday calendar so that employees know which days of the year are company holidays. Since the company has multiple locations and holiday dates vary based on where the employee is located, there are several ways that you could create the knowledge article.

One way is that you could create a knowledge article for each location, with an article for Location A, Location B, and so on.

- Pros: simplified consumption. Employees have a single article to search for and read.
• Cons: more work for HR. HR has multiple articles to manage and update for each location where the company has employees.

Another way is that you could create a single knowledge article that includes sections for each location.

• Pros: simplified authoring. HR has a single article to manage and update.
• Cons: more work for employees. Employee must scroll through and disregard extraneous content to find the section in the article that pertains to them.

With knowledge blocks, you can create a single knowledge article with location-specific block content secured by user criteria. This approach helps to reduce the workload for both HR and employees. As an HR agent, you have a single article to manage and update. Employees have a single article to search for and read, with the user criteria ensuring that they only view content that is relevant to them.

If you are using a custom search or knowledge article viewer

If you are using a custom search or knowledge article viewer with your application, you should integrate it with the appropriate knowledge or knowledge blocks API. (Integration is only necessary if you are using a custom search or knowledge article viewer.)

• Integrating a custom search or knowledge article viewer with knowledge blocks

Activation information

To use knowledge blocks in your application, you must activate knowledge blocks. For information on what components are installed with the feature, see Components installed with knowledge blocks.

Note: Activating knowledge blocks automatically activates Knowledge Management Advanced, which enables advanced features such as article versioning. Knowledge blocks can be used with or without the article versioning feature. To disable the feature, see Disable the article versioning feature.

Activate knowledge blocks

You can activate knowledge blocks (com.snc.knowledge_blocks) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

Knowledge blocks activates these related plugins if they are not already active.
Plugins for knowledge blocks

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Management Advanced</td>
<td>Enables advanced features for Knowledge Management, such as article versioning. For a full list of features, see activate the Knowledge Management Advanced plugin.</td>
</tr>
</tbody>
</table>

**Note:** Knowledge blocks can be used with or without the article versioning feature. To disable the feature, see Disable the article versioning feature.

1. Navigate to **System Definition > Plugins**.
   
   A banner notifies you that you're in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:** To redirect to the legacy list view for plugins, click the link.

2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.
   
   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.
   
   - If you're certain that you have the correct plugin, click Install, then in the Activate Plugin dialog box, click Activate.
To view plugin details before activation:

1. Click the plugin name.
2. On the form, click the **Activate/Update** related link.
3. In the dialog box, review the dependent plugins.
   
   If your plugin requires dependent plugins, they're activated automatically when you activate your plugin if they're not active already.
4. If demo data is available and you want to install it, click **Load demo data**.

Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.

5. Click **Activate**.

### Components installed with knowledge blocks

Several types of components are installed with activation of the knowledge blocks plugin, including tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Block (kb_knowledge_block)</td>
<td>Knowledge blocks table.</td>
</tr>
<tr>
<td>KB Knowledge to Block (m2m_kb_to_block)</td>
<td>KB knowledge to block table.</td>
</tr>
<tr>
<td>KB Knowledge to Block History (m2m_kb_to_block_history)</td>
<td>KB knowledge to block history table.</td>
</tr>
</tbody>
</table>

Note: The Application Files table lists the components installed with this application. For instructions on how to access this table, see *Find components installed with an application*.

Demo data is available for this feature.

### Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Block (kb_knowledge_block)</td>
<td>Knowledge blocks table.</td>
</tr>
<tr>
<td>KB Knowledge to Block (m2m_kb_to_block)</td>
<td>KB knowledge to block table.</td>
</tr>
<tr>
<td>KB Knowledge to Block History (m2m_kb_to_block_history)</td>
<td>KB knowledge to block history table.</td>
</tr>
</tbody>
</table>

For further information on table administration and how to manage data, see *Table administration*.

### Enable knowledge blocks for each knowledge base

Enable the knowledge blocks feature for each knowledge base where you plan to use the blocks. Once enabled, you can create knowledge blocks to add to knowledge articles within a knowledge base.

Make sure that the knowledge blocks (com.snc.knowledge_blocks) plugin is activated.
Role required: knowledge_admin or knowledge_manager

1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Open the knowledge base record.
3. In the Knowledge Base form, select the Enable blocks check box.

   **Note:** If the Enable blocks check box is not visible, you can add the field to the form by right-clicking the form header and navigating to Configure > Form Layout.

4. Click Update.

   **Note:** If you decide to later disable the knowledge blocks feature, all knowledge blocks within the knowledge base must be deleted before you can clear the box.

Create knowledge blocks to use within the enabled knowledge base.

**Create a knowledge block**

Create or modify a knowledge block to define a reusable piece of content that can be inserted into knowledge articles in a knowledge base. The knowledge block is secured by user criteria, which controls what users, groups, roles, companies, locations, or departments can read or
not read the content in an article or search, enabling users to more easily view content that is relevant to them.

Role required: user must have contributor access to the knowledge base.

1. Navigate to **Knowledge > Knowledge Blocks > Create New.**
2. Click **New** or open a record.
3. Fill in the fields on the form.

**Knowledge Block form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>This field is automatically set to a knowledge block number.</td>
</tr>
<tr>
<td>Knowledge base</td>
<td>Name of the knowledge base.</td>
</tr>
</tbody>
</table>

**Note:** The knowledge blocks feature must be enabled for each knowledge base that you plan to create blocks. See **Enable knowledge blocks for each knowledge base.**

<table>
<thead>
<tr>
<th>Category</th>
<th>Name of the knowledge category or subcategory.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ownership Group</td>
<td>Ownership group for the knowledge block. This field appears when the ownership groups feature is enabled.</td>
</tr>
</tbody>
</table>

**Note:** Knowledge blocks can be used with or without the ownership groups feature. To learn more about ownership groups, including how to enable the feature, see **Enable ownership groups.**

<table>
<thead>
<tr>
<th>Can read</th>
<th>User criteria to apply for read access at the knowledge block level.</th>
</tr>
</thead>
</table>

**Note:** User criteria set at the knowledge base and knowledge block level control which users can read or not read block content within an article. To learn more about selecting user criteria for a knowledge block, see **Select user criteria for a knowledge block.**

<table>
<thead>
<tr>
<th>Cannot read</th>
<th>User criteria to apply for cannot read access at the knowledge block level.</th>
</tr>
</thead>
</table>

**Note:** User criteria set at the knowledge base and knowledge block level control which users can read or not read block content within an article. To learn more about selecting user criteria for a knowledge block, see **Select user criteria for a knowledge block.**

<table>
<thead>
<tr>
<th>Valid to</th>
<th>Date that the knowledge block expires. After the valid to date:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>· Knowledge article viewer will no longer display expired knowledge block content in the associated knowledge article.</td>
</tr>
<tr>
<td></td>
<td>· Search will no longer return knowledge articles if the keywords are contained in the expired blocks.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short Description</td>
<td>Description of the knowledge block.</td>
</tr>
<tr>
<td>Text</td>
<td>Text of the knowledge block.</td>
</tr>
<tr>
<td>Version</td>
<td>This field is automatically set to a version number when the article versioning feature is enabled.</td>
</tr>
<tr>
<td><strong>Note:</strong> Knowledge blocks can be used with or without the article versioning feature. To learn more about article versioning, including how to disable the feature, see <a href="#">Article versioning</a>.</td>
<td></td>
</tr>
<tr>
<td>Article type</td>
<td>This field is automatically set to HTML.</td>
</tr>
<tr>
<td><strong>Note:</strong> Knowledge blocks are only supported with HTML knowledge articles.</td>
<td></td>
</tr>
<tr>
<td>Workflow</td>
<td>This field is automatically set to the publication state of the block, such as Draft, Published, or Retired.</td>
</tr>
<tr>
<td>Source task</td>
<td>Not applicable.</td>
</tr>
</tbody>
</table>

4. Click **Save** or **Update** to create or update the block.

5. Click **Publish** to publish the block.

**Note:** Any additional steps required to publish the knowledge block, such as approvals, depend on the publishing workflow for the knowledge base. See [Knowledge workflows](#) for more information.

After the knowledge block is published, you can add the block to an article within the knowledge base.

**Select user criteria for a knowledge block**

Control which users can read or not read knowledge block content within an article in a knowledge base by setting user criteria at the knowledge base and knowledge block level. As a knowledge contributor, you can apply user criteria at the knowledge block level.

Role required: user must have contributor access to the knowledge base.

1. Navigate to **Knowledge > Knowledge Blocks > All**.
2. Open a knowledge block.
3. Apply the desired user criteria for the **Can Read** and **Cannot Read** fields.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can Read</td>
<td>User criteria to apply for read access at the knowledge block level.</td>
</tr>
<tr>
<td>Cannot Read</td>
<td>User criteria to apply for cannot read access at the knowledge block level.</td>
</tr>
</tbody>
</table>

**Note:**

- You can use existing or create new user criteria records. To create a new record, see [Create user criteria for controlling access to knowledge bases and articles](#).
- If a user meets any **Can Contribute** criteria at the knowledge base level, they can read all knowledge block content, regardless of the **Can read** and **Cannot read** criteria set at the knowledge block level.

- If a user meets any **Cannot read** criteria at the knowledge block level, they cannot read the block content, regardless of the **Can read** criteria set at the knowledge block level.
1. User meets any of the following:
   - admin role
   - knowledge_admin role
   - knowledge base owner
   - knowledge base manager
   - Can Contribute user criteria
   (If no user criteria is set, then any user with at least one role can contribute articles.)

2. (If no user criteria is set, then any user can read articles.)

Can Contribute access at knowledge base level?

Yes

Can Read access at knowledge base level?

Yes

Cannot read block

No

Can Read access at block level?

Yes

Can read block

No

Can read access at block level?
4. Right-click the form header and click **Save**.

- To finish and publish the block, see *Create a knowledge block*.
- To add the block to an article, as well as preview the article by impersonating different users, see *Add knowledge blocks to a knowledge article*.

## Retire a knowledge block

You can retire a published knowledge block so that it is no longer available for users to view or search. A knowledge block can only be retired if it is not being used in any knowledge articles.

Role required: user must have contributor access to the knowledge base.

1. Navigate to **Knowledge > Knowledge Blocks > Published**.
2. Open the applicable record.
3. In the **Articles** related list, verify that the knowledge block is not being used in any knowledge articles.

   **Note:** A knowledge block can only be retired or deleted if it is not being used in any knowledge article, including any retired article or previous version of an article.

4. Click **Retire** to retire the knowledge block.

   **Note:** Any additional steps required to retire the knowledge block, such as approvals, depend on the workflow for the knowledge base. See *Knowledge workflows* for more information.

## Add knowledge blocks to a knowledge article

You can insert one or more knowledge blocks into a knowledge article within a knowledge base. Each knowledge block is secured by user criteria, which controls who can read or not read the content in an article.

Role required: user must have contributor access to the knowledge base.

1. Navigate to **Self-Service > My Knowledge Articles**.
2. Click **New** or open a record.

   On clicking **New**, you are provided options to select an article template. The article templates appear when you activate them in the **Knowledge > Article templates**.

3. Select an article template.

   **Note:** You can add or remove knowledge blocks in more than one HTML field of any article template including custom templates.

4. Fill in the fields on the form, as appropriate.

   For further details on creating a knowledge article, see *Create a knowledge article*.

   **Note:** Knowledge blocks are only supported with HTML knowledge articles. Make sure that the **Article type** field is set to HTML.

5. Click **Add Blocks** to open the **Add Blocks** side panel.

   **Note:** If the **Add Blocks** button is not visible, make sure that the knowledge blocks feature is enabled for the knowledge base that the article is in. See *Enable knowledge blocks for each knowledge base* for more information.
6. In the **Add Blocks** side panel, you can search for, do an advanced search, view, and insert knowledge blocks into the article. You can also create blocks directly from the side panel.

**Note:**
- You can configure the number of search results displayed in the **Add Blocks** side panel using the `glide.knowman.add_blocks.search_results` property. By default, the minimum number of search results displayed is 6 and the maximum number of search results displayed is 25. See *Knowledge properties* for more information.
If there are knowledge blocks you cannot find, make sure that the blocks are published, in the same language, and in the same knowledge base as the article.

7. In the **Article body**, you can rearrange knowledge blocks within an article.

<table>
<thead>
<tr>
<th>Option</th>
<th>Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you are using a mouse</td>
<td>1. Click the block to select it.</td>
</tr>
<tr>
<td></td>
<td>2. Drag and drop the block within the article.</td>
</tr>
<tr>
<td>Option</td>
<td>Steps</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>-----------------------------------------------------------------------</td>
</tr>
<tr>
<td>If you are using a keyboard</td>
<td>1. Place your cursor to the left of the block.</td>
</tr>
<tr>
<td></td>
<td>2. Press the right arrow key to select the block.</td>
</tr>
<tr>
<td></td>
<td>3. Use Ctrl+x and Ctrl+v to cut and paste the block within the article.</td>
</tr>
</tbody>
</table>

The following GIF shows an example of a user moving a knowledge block within an article using a keyboard.
List ready for your next day off! Here's a list of company holidays in your region:

**KBB0010002**
Company Holiday Calendar - Location A

**Holiday**

**KBB0010003**
Company Holiday Calendar - Location B
8. Click **Save** or **Update** to create or update the article.

**Note:** You can preview the article with the blocks by user or, if published, date. See *Preview a knowledge article with knowledge blocks* for more information.

9. Click **Publish** to publish the article.

**Note:** Any additional steps required to publish the knowledge article, such as approvals, depend on the publishing workflow for the knowledge base. See *Knowledge workflows* for more information.

---

**Preview a knowledge article with knowledge blocks**

Preview a knowledge article with knowledge blocks by user or, if published, by date. For an unpublished article, you can preview the article by user by impersonating different users to see how the article displays or hides block content (based on the user criteria set at the knowledge base and knowledge block level). For published articles, you can preview the article by both user and date to see how the article appears in past versions for different users.

Role required: user must have contributor access to the knowledge base.

1. Navigate to **Knowledge > Articles**, and open one of the modules, such as **Unpublished** or **Published**.

2. Open the knowledge article with knowledge blocks.

3. In the **Related Links** section, click **Preview Article with Blocks**.
4. Preview the article as one of the following.

<table>
<thead>
<tr>
<th>Option</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unpublished article</td>
<td>Preview the article by user. In the View As field, you can search for and impersonate different users to see how the article appears based on the can and cannot read access of the user.</td>
</tr>
</tbody>
</table>
### Integrating a custom search or knowledge article viewer with knowledge blocks

If you are using a custom search or knowledge article viewer with your application, you can integrate that custom search or viewer with the appropriate knowledge or knowledge blocks API.

**Note:** Integration is only necessary if you are using a custom search or knowledge article viewer.

**KBPortalServiceImpl - Global**

The `KBPortalServiceImpl` API is included with Knowledge Management V3 (com.snc.knowledge3) as a script include. It provides methods to use with knowledge, such as integration with a custom search.

- **KBPortalServiceImpl - KBPortalServiceImpl()**
  Instantiates a `KBPortalServiceImpl` object in a global application.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **KBPortalServiceImpl - getResultData(Object request)**
  Returns search results based on keywords from the knowledge article and from relevant knowledge block content that the user has access to read.

  If you have activated the knowledge blocks feature and are using a custom search for knowledge with your application, your search may not return relevant articles when keywords are contained in the blocks. To return search results based on keywords from the article and from relevant block content that the user has access to read, you must call the `getResultData()` method inside your custom search.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request</td>
<td>Object</td>
<td>JSON object to refine the search.</td>
</tr>
</tbody>
</table>
## Integrating a custom search with knowledge blocks

```javascript
function doKeywordSearch(queryText, count, queryLocation) {
    var results = [];

    // To set up the request.
    var request = {
        keyword: queryText,
        language: "",

        // To pass data to filter on different metadata.
        variables: {
            kb_knowledge_base: ['Knowledge'],
            kb_category: '',
            author: ['']
        },

        // Provide the following.
        context: gs.getProperty('glide.knowman.sp.search_context', 'Knowledge Search'),
        resource: 'Knowledge',
        order: "relevancy,true",

        // Provide the pagination variables.
        start: queryLocation,
        end: queryLocation+count,
        attachment: false,

        // Provide any additional metadata you want to include in your results.
        knowledge_fields: [
            "number",
            "sys_id",
            "published"
        ]
    };

    // To execute the search.
    var response = new KBPortalServiceImpl();
    response.getResultData(request);

    // To send the search results back to the UI or to store results in your object.
    for (var i = 0; i < response.results.length; i++) {
        result = response.results[i];
        var article = {};
        article.sys_id = result.meta.sys_id.display_value;
        article.number = result.meta.number.display_value;
        article.short_description = result.meta.short_description;
        article.title = result.title;
        article.published = result.meta.published.display_value;
    }
}
```

The KBBlock API is included with knowledge blocks (com.snc.knowledge_blocks) as a script include. It provides methods to use with the knowledge blocks feature, such as integration with a custom knowledge article viewer.

**KBBlock - KBBlock()**

Instantiates a KBBlock object in a global application.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

**KBBlock - getArticleContent(GlideRecord knowledgeRecord)**

Gets knowledge articles with relevant knowledge block content that a user has access to read.

If you have activated the knowledge blocks feature and are using a custom knowledge article viewer with your application, your viewer may not display articles that expand the relevant block content. To expand block content that a user has access to read, you must call the getArticleContent() method inside your custom viewer.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>knowledgeRecord</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>String</td>
</tr>
</tbody>
</table>

**Integrating a custom knowledge article viewer with knowledge blocks**

```javascript
// This function returns the article text with expanded block content.
function getArticleText(kbSysId) {
  var knowledgeRecord = new GlideRecord('kb_knowledge');
  var kbText='';
  if(knowledgeRecord.get(kbSysId)) {
    kbText = knowledgeRecord.text;
    // Expand the block content if necessary...
    kbText = kbText.expandBlockContent();
  }
  return kbText;
}
```
if (new GlidePluginManager().isActive('com.snc.knowledge_blocks')) {
    kbText = new KBBlock();
    kbText.getArticleContent(knowledgeRecord);
} else {
    kbText = knowledgeRecord.getValue('text');
}
return kbText;

// This is an example of how to call the function defined above.
var kbText = getArticleText('01a1ca5b6710130038876c3b5685efd3');

Knowledge Management V3 homepage

The Knowledge Management V3 homepage displays knowledge articles and social Q&A questions organized by knowledge base and category, as well as featured content and popular articles.

To view the default knowledge homepage, navigate to Self-Service > Knowledge.

Note:
The knowledge homepage is not compatible with Internet Explorer 9 or earlier. Using one of these browsers will cause you to be redirected to the legacy knowledge portal.

The Knowledge V3 homepage is not customizable. Use the Knowledge Management Service Portal for an easily configurable user experience.

If you access knowledge from a service management application, the knowledge homepage for the associate application opens.

From the homepage, you can import a Word document to a knowledge base using the Import Articles button.

Note: From Madrid, you can import a word document from the Import Articles module available in the Application Navigator. This feature is active by default for customers on Madrid and later releases. Existing customers on release versions prior to Madrid use the Word import functionality on the Knowledge V3 homepage. Upgrade customers use the Word import functionality on the Knowledge V3 homepage by default. If required, add the Import Articles module to the Application Navigator. If you add the module, the Import Articles button does not appear on the Knowledge V3 homepage.

You can also create a new article using the Create An Article button, or ask a question using the Post a Question button.

- Import a Word document
- Create an article
- Ask a question

Note: You must have user criteria ‘Can contribute’ permission for at least one active knowledge base, otherwise these buttons do not appear. See Migrate to Knowledge Management v3 and Knowledge manager.
You can select a knowledge base to browse articles and questions within that knowledge base. You can view only knowledge bases you can access.

Articles and questions are organized by category or by tag. Categories are listed alphabetically. While browsing, you can filter content by type to view only knowledge articles, only social Q&A questions, or only unanswered questions. You can sort content by most recent update or by number of views.

You can comment on an article. There is no HTML formatting available for comments on the Knowledge V3 homepage.

Existing customers on release versions prior to New York can view knowledge article feedback comments in the following ways.

- On the Knowledge V3 homepage.
- If the Knowledge Management — Service Portal plugin (com.snc.knowledge_serviceportal) is installed, on the Knowledge Service Portal.
- If the Use Live Feed for knowledge feedback property is active, in the Live Feed.

For new customers on New York and later releases, comments can only be viewed in the Knowledge Service Portal.

An administrator can configure the knowledge homepage to display the number of articles and questions within each category. This count includes articles and questions from subcategories. To display the article and question count, set the knowledge homepage property `Display or hide the count of articles and questions in the category and child categories (glide.knowman.show_number_on_categories)` to true.

Search using Knowledge Management v3

Search for knowledge articles and social Q&A questions from the knowledge homepage using the search bar on the Knowledge Management v3 homepage.

Search results include only articles and questions you are authorized to read. The search results count do not take into consideration any security rules set for the articles. The number of articles you can access may be lower than the count displayed in the search results page. Documents that are attached to articles are also listed in the search results.

```
Note: To change how the attachments are displayed in the search results, set the How to display attachments in Knowledge Search Results glide.knowman.search.attachment property. Attachments can be displayed with a snippet, link only, or not at all.
To use wildcards in your search, navigate to Contextual Search > Search Contexts > Knowledge Base Search and select Enable wildcard searches.
```

Sort knowledge content by relevancy, most recent update, or number of views.

Filter results using the check boxes that appear. Filtering options appear depending on the search text.

### Filtering options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select if you want to view knowledge articles, social Q&amp;A questions, or both. This option is only available if Social Q&amp;A is enabled.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>

</table>
ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Language</td>
<td>The multi-language search feature is available when more than one supported language is enabled.</td>
</tr>
</tbody>
</table>

1. To enable multi-languages, activate the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) or activate one of the internationalization plugins for the language you require.

   | Note: Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin. |

2. To display search results in all available languages simultaneously, enable the glide.knowman.enable_multi_language_search property.

   a. Navigate to Knowledge > Administration > Properties > Knowledge Search Properties > Enable multi language search and select the Yes check box.

   b. Enter sys_properties.list in the filter navigator, search for the property to configure, and in the Value field, enter true.

   | Note: By default, the glide.knowman.enable_multi_language_search property is not enabled. Search results are displayed based on the language you select in the language filter on the Search page. |

Import a Word document to a knowledge base using Knowledge Management V3

Import a Microsoft Word document using Knowledge Management v3 homepage to create a knowledge article.

You must have user criteria "Can contribute" permission for at least one active knowledge base.

The import articles button does not appear in the following conditions:

- The Import Articles module is available on the Application Navigator. This feature is active by default for customers on Madrid and later releases.
- You cannot contribute to any knowledge base.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Note: An administrator can control the visibility of the Import Articles button by setting the other knowledge property Hide the 'Import' functionality (button and drag-n-drop) for all users (glide.knowman.import.hide_import_functionality) to true.

Role required: None

You can import Microsoft Word .doc and .docx files.

Note: The file extension must be lowercase.

When you import a document, text content from the document is used to create the knowledge article. The articles support all editing functions supported by the TinyMCE editor. All HTML supported by TinyMCE such as tables, lists, and links, as well as styling such as bold and italics, are preserved. Images from the document are added as attachments to the knowledge article and embedded in the article body.

Note:
You can import multiple files at a time. Closing the browser or navigating away cancels any in-progress uploads but does not delete articles created from completed imports. You cannot import documents to knowledge from mobile devices.

The following styles and elements are preserved when importing a .doc or .docx file into a knowledge base. Styles and elements not included in this list may not be preserved when importing a document.

- Titles
- Headings
- Images
- Links
- Bold text
- Italic text
- Underlined text
- Ordered and unordered lists
- Tables

Note: Images may not be aligned exactly as in the Word document you import.

Note: After import, the bullets in an unordered list are replaced with dots.

Note: Only default heading settings are supported. Custom heading styles are imported using the default settings for those styles. Table styling and borders are not supported.

1. Navigate to Self-Service > Knowledge.
2. Perform one of the following actions.
   - Click Import Articles and select one or more document files.
   - Drag one or more document files onto the knowledge homepage.
3. Select the Knowledge base to add the new article to.
   You can select only knowledge bases you can contribute to.
4. Optional: Select a **Category** from within that knowledge base.

   **Note:** Use the category picker to add a category. The picker does not differentiate between the different category levels. You can select a category or sub category and add it to the **Category** field.

5. Optional: Select the **Publish** check box to start the publishing workflow for each imported article immediately after the import finishes.

   This check box applies only when importing to v3 knowledge bases and only if the **Show publish checkbox on the knowledge import pop-up** property is set to **Yes** on the Knowledge Management properties form. You cannot automatically publish articles imported to v2 knowledge bases.

   Knowledge v2 articles go into **Draft** state. Knowledge v3 articles go into **Review** or **Published** state, depending on the workflow attached to the knowledge base (Approval Publish or Instant Publish).

6. **Click Import.**

   A new article is created in the selected knowledge base and category using the content from the uploaded document. If you uploaded multiple documents, one article is created for each. If you use knowledge internationalization, the language of the new article is set to the currently selected system language.

   After the upload completes, a popup window appears displaying the number and short description of the newly-created articles. Click an article to view the full record.

   If any errors occur during the upload, a popup window appears to display the error.

---

Select a knowledge article category

Knowledge articles within a knowledge base are grouped by category. These groups can help you define the knowledge base taxonomy, and can help users find articles within that knowledge base.

As a knowledge contributor, when editing a knowledge article you can select categories using the Category picker, and add or edit categories if enabled for the knowledge base.

1. Click the reference lookup icon beside the **Category** field.
2. Select an existing category, or click the add category icon (+) to add a new category.

   After you select a category, you can click the pen icon to rename that category. Press the enter key or click outside the selected category to save the change.

   **Note:** Clicking **Cancel** while selecting a category cancels selecting a new category, but does not revert any changes you make to the categories such as renaming or adding new categories.

3. Fill in the fields on the form, as appropriate.
4. Optional: Select or add a subcategory.
5. **Click OK.**

---

Move a knowledge article

You can move articles between knowledge bases.

1. Edit a knowledge article.
2. Change the **Knowledge Base** field value.
After moving an article, the Apply Default Values dialog box prompts you to populate certain fields in the article with default values from the new knowledge base. If the new knowledge base has no default values, the dialog box does not appear.

3. Click **OK** to overwrite fields with the default values, or **Cancel** to leave all fields unchanged.

A knowledge manager can define default values for articles in knowledge bases you manage using the **Set default knowledge field values** field on the Knowledge Base form.

4. Click **Update**.

### Retire a knowledge article

Retired knowledge articles are not available to users except for administrators and knowledge administrators who can view them.

A knowledge article has an associated retirement workflow, similar to the publishing workflow. This allows administrators to configure these workflows, defining an approval and review process for retiring knowledge if appropriate.

When editing an article, click **Retire** to launch the retirement workflow associated with that article. If the article requires approval prior to retirement, the article goes to a pending approval state, and the workflow either finishes upon approval or cancels if rejected by a required approver. The article number associated with the retired article is not available for reuse.

**Note:** Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.
Instant retire and Approval retire workflows

Republish a retired article

Instantly republish a retired article.

Role required: admin or knowledge admin
There may be cases where you’ll need to republish a retired article. For example, an admin may want to temporarily retire an article when its information doesn’t currently apply, but will at a later date. An administrator or knowledge administrator who can view retired articles can instantly republish these without having to go through an approval workflow.

1. Navigate to Knowledge > Articles > Retired.
2. Select a retired article and click Republish.

The article is instantly published as the previous last published version.

**Create a knowledge article from a customer service case**

Reuse information from a customer service case by creating knowledge articles from cases.

Your administrator must [enable creation of articles from customer service cases](#).

Role required: sn_customerservice_agent or knowledge

1. Navigate to Customer Service > Cases > All.
2. Select a case from which you want to create a knowledge article.
3. Click Create Knowledge.
   The relevant fields are automatically copied from the case to the record that opens.
4. In the Knowledge base field, enter the name of the knowledge base in which you want this article to display.
5. Click Submit.

**Request a knowledge base**

If existing knowledge bases do not fit your needs, you can request a new knowledge base through the service catalog. If the request is approved, you are added as the owner of the new knowledge base.

Role required: none

If no knowledge base exists that fit your needs, all users can request a new knowledge base.

1. Navigate to Self-Service > Service Catalog.
2. Select Can We Help You?.
3. Select the Request Knowledge Base catalog item.
4. Enter the reason you want the knowledge base, and a name for the knowledge base.
5. Click Submit.

You are notified when the request is approved or rejected. If the request is approved, you are added as the owner of the new knowledge base. You can then assign managers and manage articles in the new knowledge base.

Knowledge bases created through this request process are inactive by default, so you must activate the knowledge base to make it available for users.

**Use knowledge on mobile devices**

All users can access knowledge from mobile devices to search for and view knowledge articles and social Q&A questions.

**Browse knowledge on mobile devices**

You can browse knowledge bases using a mobile device.
Navigate to **SELF-SERVICE > Knowledge Base**.

**Mobile Knowledge View**

Browse Knowledge by tapping on a category and browsing articles or subcategories.
Mobile Knowledge Categories

Note: Select the desired category and click the close icon (×) for the selected category to reflect in the search results.

View knowledge articles and questions on mobile devices

You can read knowledge content using a mobile device.
Tap a title to view the article or question.
**Note:** You cannot edit or add comments to knowledge articles on the mobile interface. If using Social Q&A, you can perform all functions such as adding and editing questions, answers, and comments through the mobile interface.

**Search knowledge on mobile devices**

Find a specific article or question by searching on a particular term.
Knowledge demand insights

Identify knowledge gaps and improve content of your knowledge base using the Knowledge Demand Insights feature.

The Knowledge Demand Insights feature automates the discovery of knowledge gaps in your knowledge bases. Knowledge gaps are topics on which knowledge bases are missing knowledge articles.

Addressing knowledge gaps has the following benefits:

- Improve effectiveness of self-service: Self-service users get more relevant information for research, troubleshooting, and how to queries.
- Increase case or incident resolutions: Having relevant information available helps you deflect future cases.
- Improved case resolution: Agents can find more relevant knowledge articles to solve cases, incidents, problems, and so on.
Activation information

The Knowledge Demand Insights feature requires the Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml). For more information, see Predictive Intelligence for Knowledge Management and Additional plugins for Knowledge Management.

High-level configuration overview

To configure the Knowledge Demand Insights feature, use the Knowledge Management guided setup. The guided setup takes you through the entire setup and configuration process.

Configuring the Knowledge Demand Insights feature involves the following steps:

1. A user with the admin role configures business rules, solution definitions, and scheduled jobs for each task.
2. A user with the admin role configures tasks for the knowledge gap analysis and assigns the appropriate roles.

   Note: By default, the Knowledge Demand Insights feature includes Demand Insights for Incidents and Demand Insights for Cases dashboards for incidents and customer service cases, respectively. For other tasks, you can create a dashboard.

3. A user with the admin or assignment_rule_admin role configures assignment rules to automatically assign feedback tasks of type Knowledge gap.

   Note: If no assignment rules are configured, a knowledge admin or knowledge manager can later use the Feedback Management feature in the Knowledge module to manually assign a feedback task.

Configure solution definitions to find gaps in a knowledge base

The Knowledge Demand Insights feature finds knowledge gaps by comparing knowledge bases with existing tasks. To enable comparing knowledge bases with a task type, you must first configure similarity and clustering solution definitions.

This task describes the process for configuring a solution definition.

Instead of doing the configuration through this procedure, consider using a guided setup. Navigate to Knowledge > Administration > Guided Setup, click Get Started, and then scroll to the Knowledge Demand Insights section.

Role required: admin

Configure one similarity type and one clustering type solution definitions for each task type: incidents, customer service cases, or other tasks. A similarity solution definition collects and compares your existing records to new similar records. A clustering solution definition groups similar records into clusters so you can address them collectively or identify patterns.

1. Navigate to Knowledge Demand Insights > Solution Definitions.
2. In the Solution Definitions (ML view) list, search for and select the similarity solution definition for the task type.
   - For customer service cases, select Demand Insights: Similar Cases and Knowledge (ml_sn_global_similar_cases_and_kbs).
- For incidents, select **Demand Insights: Similar Incidents and Knowledge (ml_sn_global_similar_incidents_and_kbs)**.
- For tasks other than customer service cases and incidents, click **New** to create another similarity solution definition.

3. On the Similarity Definition form, verify the default field values for customer service cases or incidents, or fill in the values for a custom configuration.

**Note:** If the application scope isn’t set to Knowledge Management - Machine Learning, you cannot edit the form and a warning message appears. To make the form editable, click the word **here** at the end of the message.

### Similarity Definition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique name for your similarity solution.</td>
</tr>
</tbody>
</table>
| Word Corpus            | Defines which knowledge articles and tasks are selected for knowledge gap analysis. 
                          | If you don’t have a relevant word corpus, follow the steps in Create a word corpus. |
| Table                  | Table that contains the knowledge article records. Set the value to Knowledge (kb_knowledge) unless you use a different table for storing knowledge articles. 
                          | After you assign a table value, the number of records that match the filter conditions is displayed as a link. |
| Fields                 | Fields from the Knowledge table selected for knowledge gap analysis.         |
| Filter                 | Filter conditions applied on the Knowledge table to filter knowledge article records for knowledge gap analysis. |
| Test Table             | Table that contains the task records that you want to compare with knowledge article records. |
| Test Fields            | Fields from the task table selected for knowledge gap analysis.              |
| Processing Language    | Dominant language of the dataset you’re training on the solution definition. Note that English processing is applied to all datasets by default. For example, if you select Italian, the system processes the data in both English and Italian. 
<pre><code>                      | **Note:** The term processing indicates some of the language-specific steps used as part of training a solution. These steps might include tokenizing words, removing stop words, and stemming. |
</code></pre>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stopwords</td>
<td>Common terms in the processing language that are excluded from the search, for example, prepositions. When you select your processing language, the system automatically adds a Stopwords list that uses the same language. For example, if your processing language is Italian, the <strong>Default Italian Stopwords</strong> list appears. The <strong>Default English Stopwords</strong> list also appears in your selection as well.</td>
</tr>
<tr>
<td>Training Frequency</td>
<td>Frequency with which the model for similarity solution definition must be retrained.</td>
</tr>
<tr>
<td>Update Frequency</td>
<td>Frequency with which to include new records in the model for the similarity solution definition.</td>
</tr>
</tbody>
</table>

4. Submit and train the solution definition.
   - For a new solution definition record, click **Submit & Train**.
   - For an existing solution definition record, click **Update & Retrain**.

5. In the Solution Definitions (ML view) list, search for and select the clustering solution definition for the task type.
   - For customer service cases, select **Demand Insights: Case Clusters Need Knowledge (ml_sn_global_cases_need_knowledge_cluster)**.
   - For incidents, select **Demand Insights: Incident Clusters Need Knowledge (ml_sn_global_incidents_need_knowledge_cluster)**.
   - For tasks other than customer service cases and incidents, click **New** to create another clustering solution definition.

6. On the Clustering Definition form, verify the default field values for customer service cases or incidents, or fill in the values for a custom configuration.

   **Note:** If the application scope isn’t set to Knowledge Management - Machine Learning, you cannot edit the form and a warning message appears. To make the form editable, click the word **here** at the end of the message.

### Clustering Definition form

<table>

<tr>
<td>Training Frequency</td>
<td>Frequency with which the model for clustering solution definition must be retrained.</td>
</tr>
</tbody>
</table>

7. Submit and train the solution definition.
   - For a new solution definition record, click **Submit & Train**.
   - For an existing solution definition record, click **Update & Retrain**.

Complete the KB curation configuration form to define the scheduled jobs for demand insights. For more information, see Configure a scheduled job for Knowledge Demand Insights.

**Configure a scheduled job for Knowledge Demand Insights**

Configure the combination of the task table and similarity and clustering solution definitions that are processed in a scheduled job for a task type. You can create another demand insights configuration or modify an existing configuration to define a scheduled job for demand insights. This task describes the process for configuring a scheduled job.
Instead of doing the configuration through this procedure, consider using a guided setup. Navigate to **Knowledge > Administration > Guided Setup**, click **Get Started**, and then scroll to the Knowledge Demand Insights section.

Ensure that you have configured a similarity type and clustering type solution definitions for a task type. For more information, see *Configure solution definitions to find gaps in a knowledge base*. Role required: admin

A scheduled job for each task type runs business rules and then executes the similarity and clustering solution definitions. In the Demand Insights Configuration module, you configure the combination of the task table and similarity and clustering solution definitions that are processed in a scheduled job for a task type. This configuration is optional for customer service cases and incidents.

**Note:** For task types other than customer service cases and incidents, a user with the admin role must also perform the following tasks:

- Assign the `sn_km_ml.knowledge_curation_user` role and the appropriate roles for the task type to the users performing the knowledge gap analysis. To assign roles, perform the Assign knowledge curator roles guided setup task, which are available in the Knowledge Demand Insights section of the Knowledge Management guided setup.
- Create a demand insights dashboard for the task type. To create a dashboard, see *Create or configure a responsive dashboard*.

1. Navigate to **Knowledge Demand Insights > Demand Insights Configuration**.
2. Configure the combination of the task table and similarity and clustering solution definitions that are processed in a scheduled job.
   - For customer service cases, select `sn_customerservice_case`.
   - For incidents, select `incident`.
   - For tasks other than customer service cases and incidents, click **New** to create another combination.
3. On the KB curation configuration form, verify the default field values for customer service cases or incidents or fill in the values for a custom configuration.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Curation table</td>
<td>Name of the table you want the data to pull information from. For example, for customer service cases, select Case <code>(sn_customerservice_case)</code> and for incidents select Incident <code>(incident)</code></td>
</tr>
<tr>
<td>Fields</td>
<td>Fields in the curation table that include the ID of knowledge articles, for example, the knowledge article ID KB07276660 in the field resolution notes,</td>
</tr>
<tr>
<td>Query condition</td>
<td>Conditions for filtering the number of tasks from the curation table. You can create conditions using the condition builder (see <code>Condition builder</code>).</td>
</tr>
<tr>
<td>Similarity solution definition</td>
<td>Similarity solution definition for your task type. For example, for customer service cases, select <code>Demand Insights: Similar Cases and Knowledge</code>.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clustering solution definition</td>
<td>Clustering solution definition for your task type. For example, for customer service cases, select Demand Insights: Case Clusters Need Knowledge.</td>
</tr>
</tbody>
</table>

4. Click **Update** for incidents or customer service cases or **Submit** to save a custom configuration.

Set the frequency of the scheduled job for your task. For more information, see *Set the frequency of knowledge gap analysis*.

### Set the frequency of knowledge gap analysis

Set the frequency of the scheduled job for your task to automatically run knowledge gap analysis.

This task describes the process for setting the frequency of knowledge gap analysis.

Instead of doing the configuration through this procedure, consider using a guided setup. Navigate to **Knowledge > Administration > Guided Setup**, click **Get Started**, and then scroll to the Knowledge Demand Insights section.

Role required: **admin**

1. Navigate to **Knowledge Demand Insights > Scheduled Jobs**.
2. In the Scheduled Jobs list, select the scheduled job for your tasks in the **Name** column.
   - For customer service cases, select **(Knowledge Curation): Generate Case Clusters**.
   - For incidents, select **(Knowledge Curation): Generate Incident Clusters**.
   - For tasks other than customer service cases and incidents, create another scheduled job. For more information, see *Create a scheduled job*.
3. On the Scheduled Script Execution form, either accept the default value of running the analysis once a quarter (every 90 days) or change the frequency.

   **Note:** For best performance results, try not to perform knowledge gap analysis more frequently than once a month.

4. Click **Update**.

   **Note:** If the application scope is not set to Knowledge Management - Machine Learning, a warning message appears and the **Update** button is not available. Click the word **here** at the end of the message to change the scope and click **Update**.

5. Optional: To run the job immediately, click **Execute Now**.

The knowledge gap analysis is repeatedly run at the duration as configured in the scheduled job.

Create assignment rules to assign knowledge gap feedback tasks. For more information, see *Assign knowledge gap feedback tasks to content authors*.

### Assign knowledge gap feedback tasks to content authors

Create assignment rules to assign knowledge gap feedback tasks to authors or groups of content creators.

Role required: **admin or assignment_rule_admin**
Knowledge gap feedback tasks created through the Knowledge Demand Insights feature create feedback tasks of type **Knowledge gap**.

1. Navigate to **Knowledge Demand Insights > Knowledge Gap Assignment**.
2. In the Assignment Rules list, click **New**.
3. On the Assignment rule form, fill in the fields.

### Assignment rule form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name for the assignment rule.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the assignment rule. Only active assignment rules take effect.</td>
</tr>
<tr>
<td>Applies to tab</td>
<td>Table to store the feedback tasks on knowledge articles. This field is automatically set to Knowledge Feedback Task (kb_feedback_task).</td>
</tr>
<tr>
<td>Table</td>
<td>Conditions for assigning feedback tasks of the Knowledge gap type. This field is automatically set to (Feedback_Task_Type) (is) (Knowledge_gap). You can add more conditions as appropriate.</td>
</tr>
<tr>

<td>User assigned the feedback task type of knowledge gap.</td>
</tr>
<tr>
<td>Assign to tab</td>
<td>Ownership group assigned the feedback task type of knowledge gap.</td>
</tr>
<tr>
<td>Script tab</td>
<td>Script you can use to specify more complex conditions for assignment rules using dynamic variables and loops.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

---

**Analyze knowledge gaps from a demand insights dashboard and create knowledge gap feedback tasks**

Use the demand insights dashboard for your tasks to analyze candidate knowledge gaps and create knowledge gap feedback tasks.

You must have read access to the tasks that you want to analyze and the `sn_km_ml.knowledge_curation_user` role.

A demand insights dashboard displays topics for which your knowledge bases do not have adequate knowledge coverage. You can create and assign knowledge gap feedback tasks for a topic so your knowledge bases can better be used to solve and deflect any issues described in a task. Tasks represent customer service cases, incidents, problems, and so on.

1. Navigate to **Knowledge Demand Insights** and select the demand insights dashboard for your tasks, or navigate to **Self-Service > Dashboards**.
   - For customer service cases, select **Demand Insights for Cases**.
For incidents, select **Demand Insights for Incidents**.

**Note:** For tasks other than customer service cases and incidents, you can create another dashboard or update an existing dashboard. For more information, see Create and use dashboards.

2. To view similar tasks grouped together, click a bar in the Pareto chart. Each bar represents a collection of similar tasks grouped together because they are likely to be on the same topic. The bars covering the largest number of tasks start from the left in a descending order. The blue line indicates how many bars you must analyze to cover 80% of all tasks that don’t have good knowledge coverage. For more information, see Pareto chart for Knowledge Demand Insights.

3. Optional: To generate a representative sample to see a smaller list, in the Knowledge Curation tasks list, click **Generate representative sample**. If the Knowledge Curation Tasks list is large, you can generate a representative sample subset of a Knowledge Curation Tasks list. This smaller list aims to accurately reflect the characteristics of the tasks included in the main list.

4. Analyze the sample and select knowledge gaps (feedback tasks) for which you want to create a knowledge gap.

5. In the Knowledge Curation tasks list, click **Create Knowledge Gap for Selected**.

6. In the Create Knowledge Gap dialog box, enter instructions for addressing the knowledge gap and click **OK**. Provide a summary of your analysis so that knowledge authors have the necessary information to create an article from the feedback task.

A common feedback task for all the selected tasks is created and appear in the Knowledge Management application. If the assignment rules are set, the feedback tasks are assigned to an ownership group or an author. In the Knowledge Curation Tasks list, the Is knowledge gap created column value for the selected tasks is set to **true**.

**Pareto chart for Knowledge Demand Insights**

The Pareto chart for Knowledge Demand Insights enables you to visualize candidate knowledge gaps and prioritize the order in which knowledge gaps should be resolved.

The following information is available in the Pareto chart for Knowledge Demand Insights:

- The left Y axis is the count of tasks with no or insufficient knowledge coverage.
- The right Y axis is the cumulative percentage of the total number of tasks evaluated.
- Each bar represents a collection of similar tasks that don’t have good knowledge coverage. The bars are arranged in a descending order such that the collection with most number of tasks appears in the left. This order enables you to resolve the largest collection first. When you point to a bar, you view the number of tasks included within the bar and the cumulative percentage.
- The line graph shows the cumulative percentage of tasks that are included in each collection.
- The blue line indicates the 80% of total number of tasks that have no or insufficient knowledge coverage. The intersection of the blue line and the line graph indicates the minimum number of collections that need to be resolved so that 80% of tasks can be covered.

**Pareto chart for demand insights**

The following figure displays a Pareto chart for identifying candidate knowledge gaps for incidents.
Demand Insights for Cases dashboard

The Demand Insights for Cases dashboard enables you as a customer service case manager to identify which cases have no or insufficient knowledge coverage. You can then create feedback tasks for knowledge gaps to deflect such cases.

The Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml) includes the Demand Insights for Cases dashboard. For more information, see Predictive Intelligence for Knowledge Management and Additional plugins for Knowledge Management.

### Translation management

Translation management allows you to manage translation tasks created for published knowledge articles. You can manage multi-language knowledge bases by using automated translation tasks and translation APIs. You can configure languages for a knowledge base containing the articles.

Knowledge articles are authored and published in various languages. As an administrator you can configure the required languages for a knowledge base and ensure that users can create articles only in the configured languages.

You can choose a default language when you log in to an instance. The list of languages are listed based on the internationalization language plugins you have installed.

The translation management feature allows you to perform the following:

- translate published knowledge articles that are missing translations manually or use the machine translation option to automatically translate the knowledge article
- create translation tasks automatically for the languages you have specified
- configure assignment rules and auto-assign tasks for a language, knowledge base, or category to a translator or a group of translators

The translation management feature is available only if you have installed required plugins and set a system property.

The required plugins are:

- Knowledge Management Advanced plugin
- I18N:Knowledge Management Internationalization Plugin v2 or Internationalization language plugins

Enable the `glide.knowman.translation.enable_translation_task` property for using the translation management feature.

- All Open Tasks
- My Assigned Tasks
- Translator Mapping

### Enable languages for a knowledge base

You can select the languages you want enabled at a knowledge base level. Users can then create articles only for selected languages.
Role required: knowledge_admin or admin

1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Click New to create a knowledge base or select an existing knowledge base.
3. Click the lock icon to unlock the Languages field.
4. Select the languages from the list.

Note:
You can also remove languages from the list if you decide that you do not want to create a translation task in that language.

5. Click Submit or Update.

Create translation assignments
To ensure accurate translations, you can assign knowledge articles to language experts. Identify the language experts and create assignment rules to automatically assign translation tasks to language experts and groups.

Role required: knowledge_admin or admin

Assignment rules are applied only if the task is not already assigned to another user or group.

1. Navigate to Knowledge > Translation Management > Translator Mapping.
2. Click New to create a new assignment rule or select an existing rule to modify.
3. Enter a name for the assignment rule in the Name field.
4. In the Applies To tab, perform the following.
   a) Select a table from the Table dropdown for example, Knowledge Translation Task (kb_translation_task).
   b) Specify the conditions that must be met before the task is assigned to the user or group.
5. Click the Assign To tab and select the user or group you want to assign the task to.
   An email notification is sent to the translator with a link to the translation task and source article.
6. Click the Script tab to enter a script to further customize the assignment rule.
7. Click Submit.

Auto-create translation tasks
Manage multi-language knowledge bases by using automated translation tasks and translation APIs. Translate published knowledge articles in languages configured for the knowledge base containing the articles.

Role required: knowledge_admin or admin

You can auto-create translation tasks in specified languages. The available languages are determined by the language plugins you have installed.

1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Click New and fill out the Knowledge Base form to create a knowledge base or click on an existing knowledge base.
3. Unlock the Languages field and select the languages for which you want to create tasks from the dropdown.
4. Select **Auto-create translation tasks**.
   If **Auto-create translation tasks** is unchecked, you must create the tasks manually after the article is published.

5. Click **Submit** or **Update**.

---

**Note:**
- Unlocking the **Languages** field displays the languages you have installed.
- **Open a knowledge article and click Knowledge Translation Tasks related list to view the associated translation tasks.**
- **To cancel a task, add an appropriate reason for cancellation in the Cancellation notes field and click Cancel.**

---

**Translate a knowledge article**

You can start translating articles once they are published and assigned to you for translation.

**Role required:** admin, knowledge_admin, or knowledge

1. Navigate to **Knowledge > Translation Management > My Assigned Tasks**.
2. In the Knowledge Translation Tasks page, select one of the listed translation tasks assigned to you.
   The Knowledge Translation Tasks page lists all knowledge translation tasks assigned to you.
3. Click **Translate**.

**Note:** If you want to do a translation directly from an article, use the **Translate** related link on the article page.

The **Translate from** and **Translate to** panes are side-by-side for easy viewing, as shown in the following figure.
4. Click **Machine translate**, which automatically translates to the targeted languages.
   For configuring the translation API, see *Dynamic Translation*.

5. Click **Create draft article** to create a draft version of the translated article.
   If a translated article is already present for that language, a new draft version overwrites an existing translated content.

6. Click **Publish**.
   The newly created draft is listed in the *Translated Versions* tab.

### Translate knowledge blocks within an article

Knowledge blocks may be available within a knowledge article. You can translate these knowledge blocks before translating an article.

**Role required: translator**

If a selected article indicates that a knowledge block is missing a translation, you must translate the knowledge block before you can translate the article.

1. Navigate to **Knowledge > Translation Management > My Assigned Tasks**.
2. In the Knowledge Translation Task page, select a translation task and click Translate.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>A message stating that the knowledge article contains one or more knowledge blocks that have missing translations is displayed.</td>
</tr>
</tbody>
</table>

3. Click on the link in the message to view the list of blocks that require translation.
4. Click the block that requires translation and click Translate.
The newly translated blocks appears in the Translated Block Versions related list.

**Request missing translations for available languages**

You can create translation tasks manually for the languages you have configured. Some of the tasks may not have tasks created for all the languages. You can manually create tasks for the languages through the Request Translations option. The option is available even if the auto-create translation task option is enabled.

Role required: admin

Verify that the glide.knowman.translation.enable_translation_task property is set to true.

1. Navigate to Knowledge > Articles > Published.
2. Select an article from the list of published articles.
3. Click Request translations in Related Links.
The Request translations window displays all the languages. The selected languages already have translation tasks created.
4. Select the languages from the list that are unselected.
5. Click Submit.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>If a task is already open for a particular language, you cannot select the same language again.</td>
</tr>
</tbody>
</table>

The translation tasks for the article are created and listed in the Knowledge Translation Tasks tab.

**Now Mobile for Knowledge Management**

Access knowledge articles from anywhere using the Information applet on the Now Mobile app. You can view recently viewed and most popular articles, search for articles, browse articles by category, and provide feedback for articles.

To access articles from the Information applet on the Now Mobile app, you must first download the ServiceNow mobile application on an iOS platform from the Apple App Store or on an Android platform from the Google Play Store.
Make sure your administrator has activated the Now Mobile app. For more information, see Activate the Now Mobile app.

After you access an article, you can view the author, published date, number of views, and the overall rating details of the article. In addition, you can respond to and evaluate articles and view related items and related articles.

Activation information

The Information applet is available on the Now Mobile app. The ServiceNow Mobile Request - Knowledge Management Screens and Applet Launcher plugin (com.glideapp.knowledge.mobile_requestor) activates the Information applet. The Information applet is activated by default for both new and upgrade customers.
View the most popular or recently viewed articles in the Now Mobile Information applet

The Information applet on the Now Mobile app enables you to access knowledge articles from a mobile device.

You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

1. Access your instance using the mobile application.
2. On the Now Mobile app, tap Information.
3. Access your recently viewed or the most popular knowledge articles

<table>
<thead>
<tr>
<th>Information applet article views</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Section</strong></td>
</tr>
<tr>
<td>Recently Viewed</td>
</tr>
<tr>
<td>Popular</td>
</tr>
</tbody>
</table>

**Note:** Tap See All to view the complete list of articles within the selected section.

Browse articles in the Now Mobile Information applet

You can browse articles within a category in the Now Mobile Information applet to see articles related to a particular subject or grouping.

You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

1. Access your instance using the mobile application.
2. On the Now Mobile app, tap Information.
3. In the Browse section, tap a category from the categories list to view articles and child categories associated with the selected category.

**Note:** Tap See All to view the complete categories list.

4. Tap further categories until you view the articles list associated with the desired category. The articles associated with a parent category are grouped under a dummy child category labeled as Other.
5. To view an article, tap the article in the articles list.

Search for an article in the Now Mobile Information applet

You can search for an article in the Now Mobile Information applet.

You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

1. On the Now Mobile app, tap Information.
2. Tap Search for Services, Articles or People, and enter a search term related to the article.
3. Tap the search icon on your app keyboard.
   The app displays search results.
4. Tap Articles to view only articles in the search results.
5. Tap an article in the search results to view the article content.

View an article in the Now Mobile Information applet

You can view the author, published date, number of views, and the overall rating details of the article in the Now Mobile Information applet. In addition, you can respond to and evaluate articles and view related items and related articles.

You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

1. On the Now Mobile app, tap Information.
2. Search for or select the desired article from the sections available in the Information applet.
   The article page displays the content and associated information for the selected article such as author, published date, number of views, and the overall rating. The page also displays the following sections:

<table>
<thead>
<tr>
<th>UI component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Related Articles</td>
<td>Up to five related articles that are manually mapped, automatically predicted, or both. The manually mapped articles appear first in the Related Articles section. This section appears only when related articles are available for the selected article.</td>
</tr>
</tbody>
</table>
3. Optional: Respond to and evaluate the article.

**Respond to and evaluate articles in the Now Mobile Information applet**

You can contribute to feedback on knowledge articles by rating an article, marking an article as helpful or not helpful, and posting and replying to comments for an article in the Now Mobile Information applet.

You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

1. On the Now Mobile app, tap **Information**.
2. Select the desired article.
3. Contribute to the article feedback by rating it, marking it as helpful or not helpful, or leaving a comment.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rate the article</td>
<td>Tap the star icons displayed on the article to indicate its effectiveness on a scale of 1 to 5. For ratings between 1 to 3 stars, a feedback task is automatically created for the article and assigned to the author or ownership group, as configured.</td>
</tr>
<tr>
<td>Mark an article as helpful or unhelpful</td>
<td>Tap the helpful icon (👍) or the not helpful icon (👎).</td>
</tr>
<tr>
<td>Type your comment here</td>
<td>Enter a comment and click <strong>Submit</strong>.</td>
</tr>
<tr>
<td>View all comments and replies posted for the article</td>
<td>Scroll down to the Comments section.</td>
</tr>
<tr>
<td>Like a comment on the article</td>
<td>Underneath a comment, tap the like icon (👍).</td>
</tr>
<tr>
<td>Reply to a comment on the article</td>
<td>Underneath a comment, tap the reply icon (💬), enter your comment in the text box that appears, and then tap <strong>Submit</strong>.</td>
</tr>
<tr>
<td>Delete any previous comments or replies you posted earlier</td>
<td>Go to a comment or reply, and then tap the delete icon (🗑️). If a message appears, tap <strong>OK</strong>. Only users who have posted the comment, knowledge administrators, and knowledge owners can delete a comment.</td>
</tr>
</tbody>
</table>

**Note:** Tap **See All** to view the complete list of articles within the selected section.
Knowledge article authoring in Agent Workspace

Complete your job efficiently by creating, editing, and publishing knowledge articles in Agent Workspace.

Knowledge Management features specific to agents and authors are available in Agent Workspace. Perform any knowledge administration-related tasks such as creating a knowledge base, managing access to knowledge articles, enabling an article template, and so on using the Now Platform interface.

You can perform the following Knowledge-related tasks in Agent Workspace:

- Create a knowledge article using a default or custom article template.
- Manage all unpublished and published knowledge articles authored by you.
- Address feedback tasks assigned to you.
- Compare two knowledge article versions.
- Request translations for published untranslated knowledge articles.
- Complete translation tasks assigned to you.
- Map related articles and related catalog items to a knowledge article.
- Add affected products to a knowledge article.
- Use Agent Assist to avoid creating knowledge articles with duplicate content.

The authoring experience for knowledge articles in Agent Workspace is similar to the one in Now Platform with the following exceptions:

- Knowledge blocks can’t be created or associated with knowledge articles. However, you can view articles containing knowledge blocks.
- Knowledge articles of type Wiki aren’t supported.
- Knowledge article categories can’t be created.

Activation Information

The Knowledge list in Agent Workspace is available with the activation of the Agent Workspace plugin (com.glide.core-ui-components). When you install and activate the Agent Workspace plugin, the sn-component-workspace-knowledge plugin for using Knowledge Management in Agent Workspace is also installed and activated.

View a knowledge article in Agent Workspace

View a knowledge article in Agent Workspace, including the article number, short description, and article content.

You must have read access to the knowledge article.

Role required: agent_workspace_user

1. Navigate to Agent Workspace > Agent Workspace Home.
2. View knowledge articles authored by you or by other people.
   - View all articles by navigating to Lists > Knowledge > All Articles.
   - View articles authored by you by navigating to either Lists > Knowledge > My Articles - Published or Lists > Knowledge > My Articles - Unpublished.
3. Click the link to the knowledge article that you want to view.
4. Optional: View the knowledge article in another language by selecting a language in the Language list.
5. Optional: Copy the link to the knowledge article to your clipboard by clicking the more actions icon (*** and then clicking Copy link.

6. Optional: View another version of the knowledge article by selecting the version of the knowledge article in the Version list.

**Note:** The Version list appears only when the article versioning feature is enabled.

The selected version of the article opens in a knowledge article view page displayed in another tab within Agent Workspace. The tab name includes the knowledge article number and its version number.

**Viewing knowledge article details in Agent Workspace**

View the details of a knowledge article in Agent Workspace.

The knowledge article view page in Agent Workspace provides several details about a displayed article.
IT | Announcements

Email Interruption Tonight at 11:00 PM

If the site is UP but you can’t access the page, try one of the below solutions:

Browser Related Problems

For a full refresh for the site. This can be achieved by pressing CTRL + F5 keys at the same time on your favorite browser (Firefox, Chrome, Explorer, etc.)

Try alternative urls such as m.outlook.com

Clear the temporary cache and cookies on your browser to make sure that you have the most recent version of the web page. For instructions choose your browser.

Fix DNS Problems

A Domain Name System (DNS) allows a site IP address (192.168.x.x) to be identified with words (*.com) in order to be remembered more easily, like a phonebook for websites. This service is usually provided by your ISP.

Clear your local DNS cache to make sure that you grab the most recent cache that your ISP has. For Windows - (Start > Command Prompt > type ”ipconfig /flushdns” and hit enter). For details choose your operating system.

If you can access a website at office or from a 3G network yet it’s not working on your computer, it is a good idea to use an alternative DNS service other than your ISPs. OpenDNS or Google Public DNS are both excellent and free public DNS services.

Check our help page for step-by-step instructions on how to change your DNS.

### Article information in the knowledge article view page in Agent Workspace details

<table>
<thead>
<tr>
<th>Details</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge base</td>
<td>Knowledge base that stores the knowledge article and the article category. In the figure, IT is the knowledge base and Announcements is the knowledge article category.</td>
</tr>
<tr>
<td>Read time</td>
<td>Average time to read the knowledge article, which can help you decide whether you have time to read the article.</td>
</tr>
<tr>
<td></td>
<td>The read time is calculated based on an average reading speed of 200 words per minute. For articles in languages such as Chinese, Japanese, and Korean, the read time is calculated based on an average speed of 500 characters per minute. If images are present in an article, the read time is calculated using the following rules:</td>
</tr>
<tr>
<td></td>
<td>• For the first image add 12 seconds, for the second image add 11 seconds, and so on.</td>
</tr>
<tr>
<td></td>
<td>• If there are more than 10 images, after the tenth image add 3 seconds for each image.</td>
</tr>
<tr>
<td>Last updated time</td>
<td>Last time the knowledge article was updated in number of days for the current week, number of weeks, or number of years.</td>
</tr>
<tr>
<td>Number of views</td>
<td>Number of times the knowledge article was viewed in the past number of days set by your system administrator in the <code>glide.knowman.view_age.days</code> property.</td>
</tr>
<tr>
<td>Average rating</td>
<td>Result of the weighted average rating of the knowledge article based on numeric 1 through 5 ratings. The average rating is carried on the next version of the article.</td>
</tr>
<tr>
<td>Knowledge article content</td>
<td>Text and images of the knowledge article.</td>

Provide feedback for a knowledge article in Agent Workspace

Provide feedback on a knowledge article by rating the article, marking the article as helpful or not helpful, and posting and replying to comments for the article in Agent Workspace.

You must have read access to the knowledge article.

Role required: agent_workspace_user

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > All articles.
3. Click the link to the knowledge article that you want to view.
4. Provide feedback for the article.

<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mark an article as helpful or unhelpful</td>
<td>For the Helpful field, click Yes or No. If you mark the article as not helpful, a dialog box is displayed where you can select a reason for your feedback and enter additional details. If actionable knowledge feedback is enabled, a feedback task is automatically created for the article and assigned to the author or ownership group. For more information, see Enable actionable knowledge feedback. After you enter your feedback, a percentage value of how many other users found the article helpful is displayed.</td>
</tr>
<tr>
<td>Flag the article</td>
<td>Click the more actions icon ( ), and then click Flag Article to report an article that contains incorrect or inappropriate content. A dialog box is displayed in which you can provide the reason for the flag. A feedback task is automatically created for the article and assigned to the author or ownership group, as configured.</td>
</tr>
<tr>
<td>Rate the article</td>
<td>Click the star icons displayed on the article to indicate its effectiveness on a scale from 1 through 5. Administrators can configure the glide.knowman.feedback.enable_actionable_feedback_for_rating property to ensure that feedback tasks are automatically created and assigned when a lower rating is posted. For more information, see Knowledge properties.</td>
</tr>
<tr>
<td>Enter your comment</td>
<td>In the Type your comment here text box, enter a comment and click Post Comment.</td>

**Create a knowledge article in Agent Workspace**

Create a knowledge article in Agent Workspace to share information across your organization.

You must have contribute access to the knowledge base within which you want to create the knowledge article.

**Role required:** agent_workspace_user

1. Navigate to **Agent Workspace > Agent Workspace Home**.
2. Optional: Check whether a knowledge article on this subject is already available by going to **Lists > Knowledge > All Articles** and setting a filter to search for possible matching articles.
3. Click **New**.
4. Create the knowledge article by either selecting an article template or using the default template.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Selected article template</strong></td>
<td>Select an article template to create a knowledge article using defined fields and values. In the Create Article dialog box: 1. From the Knowledge Base list, select a knowledge base. 2. From the Article Template list, select the desired article template.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The Article Template list is populated based on the article templates configured for the selected knowledge base.</td>
</tr>
<tr>
<td><strong>Default Standard template</strong></td>
<td>Create a knowledge article using the default Standard template.</td>
</tr>
</tbody>
</table>
5. On the Knowledge form, fill in the fields.

**Note:** If you are using an article template, the fields that are available will vary.

### Knowledge form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge base</td>
<td>Knowledge base in which the knowledge article is stored. You can associate a knowledge article with one knowledge base only. If you are using an article template, you can modify this value only if the template is available in the other knowledge base.</td>
</tr>
<tr>
<td>Category</td>
<td>Category for the knowledge article. This value helps users find the article within a selected category. You can select only categories available within the selected knowledge base. Articles without a category appear in the (empty) category.</td>
</tr>
<tr>
<td>Ownership Group</td>
<td>Ownership group for the knowledge article. An ownership group consists of a group of members and a manager who are responsible for approvals and feedback tasks. Ownership groups can publish, edit, and retire knowledge articles that they are associated with.</td>
</tr>
<tr>
<td>Version</td>
<td>Automatically generated article version number. This number is incremented when changes are made to a published article.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Publishing workflow state of the knowledge article, such as Draft, In Review, or Published. For a new article, the workflow state is set to Draft.</td>
</tr>
<tr>
<td>Language</td>
<td>Language in which you are creating the knowledge article. The list is populated based on the languages enabled for the selected knowledge base.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short description</td>
<td>Title of the knowledge article. This title appears when browsing and searching for knowledge article, and at the top of the article.</td>
</tr>
<tr>
<td>Article body</td>
<td>Content for the knowledge article. Use the editing functions in the HTML editor to create content.</td>
</tr>
<tr>
<td>Source Task</td>
<td>Task this knowledge article was created from. This field is set automatically when you create the knowledge article from a task, such as an incident or a customer service case, or from a submission record.</td>
</tr>
<tr>
<td>Scheduled publish date</td>
<td>Future date when the knowledge article will be published automatically. For more information, see Schedule a knowledge article for publishing in Agent Workspace.</td>
</tr>
</tbody>
</table>
| Valid to              | The date this knowledge article expires. Articles do not appear in search results after the Valid to date or if the Valid to date is blank.  

The default value of the Valid to field is derived from the Article Validity field configured for the knowledge base (see Create a knowledge base). The Valid to date starts from the date the article was created until the number of days specified in the Article Validity field. If the Article Validity field is blank, the default date in the Valid to field for the knowledge article is set to January 1, 2100.  

An article author or editor can select whether to keep or change the default Valid to date. |

Note: Knowledge articles similar to the entered short description text will appear in Agent Assist.  

Note: If the system date format or user preferences is set to use yy year format, you might face issues when the Valid to date is set to the default date. Contact your system administrator or modify the user preferences to use a date format with the yyyy year format. For more information, see Global date and time field format and Personalize the system date format topics.

6. Optional: Research for content related to knowledge article you’re authoring using Agent Assist.
   a) In the contextual side panel, click the Agent Assist icon (🔍).
      The search results in Agent Assist display default content based on the text-based search.
   b) Click the select a search resource icon (🔍), and then select a search resource.
      For example, to view knowledge articles, select Knowledge Articles.
   c) Optional: In the search results, you can click a resource item, such as a knowledge article, to view its content in Agent Assist.

   Tip: For better readability, you can resize the contextual side panel for Agent Assist. For a full view of the selected resource item content, click Full View. The resource item content opens in another tab within the Agent Workspace.

7. Optional: Check whether your content matches content in an existing article.
   a) Enter search text in the text box available in Agent Assist or retain the default text, which is the short description of the knowledge article.
   b) Click the lookup icon (🔍).
   c) Select a search resource by clicking the Select a search resource icon (🔍).
      - To find knowledge articles that have high text similarity with the entered search text, choose Similar Articles (ML).

   Note: This option is available only when the Predictive Intelligence feature is enabled and your system administrator has trained the similarity solution for
Knowledge Management. For more information, see Train the similarity solution for Knowledge Management to find related articles.

- To find knowledge articles that match the entered search text, choose Knowledge Articles.

8. Optional: Attach a file with supporting information by clicking the attachments icon (🔗) in the contextual side panel and selecting the file.

9. Click Save.
The article is saved and appears in the My Articles - Unpublished list and additional functionality becomes available on the form.

10. Optional: Either add to or modify the article details or publish the article.

- Add to or modify the article details.
  For more information, see Edit a knowledge article in Agent Workspace.
- Publish the article by clicking Publish.
  A knowledge article is published depending on the workflow setting of its knowledge base:
  - Knowledge - Instant Publish: The knowledge article is immediately published unless it is scheduled to be published at a later date.
  - Knowledge - Approval Publish: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

For more information, see Schedule a knowledge article for publishing in Agent Workspace.

When published, your knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version number of the knowledge article is updated. For more information, see Knowledge article version numbers.

After you create and publish a knowledge article, you can perform the following actions related to the article:

- Request translations for the knowledge article. For more information, see Request translations for missing languages in Agent Workspace.
- Retire the knowledge article. Click Retire to enable the retirement workflow. For more information, see Retire a knowledge article.
- Translate the knowledge article directly from the knowledge article. For more information, see Translate a knowledge article in Agent Workspace.
- Delete the published knowledge article. Click Delete. If the Delete button isn't displayed, click the more actions icon (⋮), and then click Delete.

  Note: Only users with the admin role can delete a published knowledge article.

Publish a knowledge article in Agent Workspace

Publish a knowledge article to make it available to users.
You must have contribute access to the knowledge base that stores the knowledge article you want to publish.

Role required: agent_workspace_user

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > My Articles - Unpublished.
3. Click a knowledge article link.
4. On the knowledge form, click Publish.

A knowledge article is published depending on the workflow setting of its knowledge base:

- **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.
- **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

For more information, see Schedule a knowledge article for publishing in Agent Workspace.

When published, your knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version of the article is incremented based on the version number pattern.

**Edit a knowledge article in Agent Workspace**

Edit knowledge articles within a knowledge base in Agent Workspace to update information shared across your organization.

You must have contribute access to the knowledge base that stores the knowledge article you want to edit.

Role required: agent_workspace_user

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > All Articles.
3. Click a knowledge article link.
4. On the Knowledge form, click Edit.
5. If the article versioning feature is enabled, click Checkout for a published knowledge article.
   - You can only edit the latest version of a knowledge article.
6. Access the relevant related lists to modify the information.

<table>
<thead>
<tr>
<th>Related list</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Details</td>
<td>Knowledge article content and its metadata.</td>
</tr>
<tr>
<td>Feedback</td>
<td>Feedback received on the published versions of the article. To view more details about the feedback, in the Comments column, click a link for the desired version of an article.</td>
</tr>
<tr>
<td>Feedback Tasks</td>
<td>Details about the feedback task created for a knowledge article version.</td>
</tr>
<tr>
<td>Approvals</td>
<td>Approval history of the knowledge article.</td>
</tr>
<tr>
<td>Article Versions</td>
<td>Version history of the knowledge article.</td>
</tr>
</tbody>
</table>
7. Optional: Research for content related to knowledge article you’re authoring using Agent Assist.
   a) In the contextual side panel, click the Agent Assist icon (🔍).
      The search results in Agent Assist display default content based on the text-based search.
   b) Click the select a search resource icon (🔍), and then select a search resource.
      For example, to view knowledge articles, select Knowledge Articles.
   c) Optional: In the search results, you can click a resource item, such as a knowledge article, to view its content in Agent Assist.

   **Tip:** For better readability, you can resize the contextual side panel for Agent Assist.
   For a full view of the selected resource item content, click Full View. The resource item content opens in another tab within the Agent Workspace.

8. Optional: Check whether your content matches content in an existing article.
   a) Enter search text in the text box available in Agent Assist or retain the default text, which is the short description of the knowledge article.
   b) Click the lookup icon (🔍).
   c) Select a search resource by clicking the Select a search resource icon (🔍).
      - To find knowledge articles that have high text similarity with the entered search text, choose Similar Articles (ML).
Note: This option is available only when the Predictive Intelligence feature is enabled and your system administrator has trained the similarity solution for Knowledge Management. For more information, see Train the similarity solution for Knowledge Management to find related articles.

- To find knowledge articles that match the entered search text, choose Knowledge Articles.

   
   - Attach a file with supporting information by clicking the attachments icon () in the contextual side panel and selecting the file.
   
   - Download, remove, or rename an existing attachment by clicking the menu icon () displayed for the attachment.

10. Click Save.
    The article is saved and appears in the My Articles - Unpublished list. If the article versioning feature is enabled, the version of the knowledge article is incremented by 0.01. For more information, see Knowledge article version numbers.

11. Optional: Publish the article by clicking Publish.
    The knowledge article is published depending on the workflow setting of its knowledge base:
    
    - **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.
    
    - **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

    For more information, see Schedule a knowledge article for publishing in Agent Workspace.

    When published, the knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). For more information, see Knowledge article version numbers.

**Map a related article in Agent Workspace**

Discover similar information across articles on a topic while viewing a knowledge article. You can manually map related articles or have the application automatically present related articles using machine learning (ML) algorithms.

You must have contribute access to the knowledge base that stores the knowledge article for which you want to add related articles.

Role required: agent_workspace_user

If you have manually mapped related articles when editing an article in Agent Workspace, those articles are listed in the Related Articles section on the Knowledge Management article view page in the Knowledge Management Service Portal before the related articles that are predicted thorough the Knowledge Management similarity solution.
Note: An administrator can train the solution definition for Knowledge Management within the Predictive Intelligence feature to find related articles. For more information, see Train the similarity solution for Knowledge Management to find related articles.

1. Navigate to **Agent Workspace > Agent Workspace Home**.
2. Go to **Lists > Knowledge > All Articles**.
3. Click the link to the knowledge article for which you want to map related articles.
4. In the Related Articles related list, click **New**.
5. On the Related Articles form, fill in the fields.

### Related Articles form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Option to enable the mapping to the related knowledge article.</td>
</tr>
<tr>
<td>Related knowledge article</td>
<td>Knowledge article that contains related information. You can click the search for record icon ( ), to access the list of available knowledge articles.</td>
</tr>
<tr>
<td>Knowledge article</td>
<td>Number of the knowledge article for which you are adding the related knowledge article.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which you want the article to appear in the Related Articles section on the Knowledge Management article view page. A lower value means that a knowledge article has the greater priority to appear in the Related Articles section. The default value is 100.</td>
</tr>
</tbody>
</table>

6. Click **Save**.

The mapped articles are available in the Related Articles section on the Knowledge Management article view page in the Knowledge Management Service Portal. See **Knowledge Management article view page features**.

**Note:** Because system administrators can configure the number of knowledge articles shown in the Related Articles section, not all mapped related articles might appear in the Related Articles section. For more information, see **Configure knowledge related articles widget instance options**.

**Map a related item in Agent Workspace**

Manually map catalog items related to a knowledge article in Agent Workspace to enable employees to request the related catalog item.

You must have contribute access to the knowledge base that stores the knowledge article for which you want to add related articles.
Role required: agent_workspace_user

1. Navigate to **Agent Workspace > Agent Workspace Home**.
2. Go to **Lists > Knowledge > Published** for a published article or **Lists > Knowledge > Unpublished** for an unpublished article.
3. Click the link to the knowledge article for which you want to map a related item.
4. On the Knowledge form, click the Related Catalog Items related list.
5. Click **New**.
6. On the Related Catalog Items form, fill in the fields.

### Related Items form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Option to enable the mapping to the related catalog item.</td>
</tr>
<tr>
<td>Catalog item</td>
<td>Catalog item related to the knowledge article.</td>
</tr>
<tr>
<td></td>
<td>You can click the search for record icon ( ) to access a list of available catalog items.</td>
</tr>
<tr>
<td>Knowledge article</td>
<td>Number of the knowledge article for which you are adding the related catalog item.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which you want the catalog item to appear in the Related Items section on the Knowledge Management article view page. A lower value means that a catalog item has the greater priority to appear in the Related Items section. The default value is 100.</td>
</tr>
</tbody>
</table>

7. Click **Save**.

The mapped catalog items are listed in the Related Items section on the Knowledge Management article view page in Knowledge Management Service Portal.

**Note:** Because system administrators can configure the number of catalog items shown in the Related Items section, not all mapped related catalog items might appear in the Related Items section. For more information, see *Configure related catalog item widget instance options*.

### Add an affected product to a knowledge article in Agent Workspace

Add affected products to a knowledge article to view the products associated with the knowledge article.

The Knowledge Product Entitlements plugin (com.snc.kb_product_entitlements) must be activated to use the Knowledge Product Entitlements application. Installing this plugin adds the Affected Products related list to the Knowledge form. For more information, see *Knowledge product entitlements*.

You must have contribute access to the knowledge base that stores the knowledge article for which you want to add affected products.
Role required: agent_workspace_user

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > All Articles.
3. Click the link to the knowledge article for which you want to add a related product.
4. On the Knowledge form, in the Affected Products related list, click New.
5. On the Knowledge Related to Products form, in the Configuration item field, click the search for record icon (🔍).
6. In the Configuration item dialog box, click the related product.
7. Click Save.

Schedule a knowledge article for publishing in Agent Workspace

Set a specific time and day for a knowledge article to be published in Agent Workspace automatically.

You must have contribute access to the knowledge base that stores the knowledge article you want to schedule for publishing.

Ensure that the system administrator verifies the following settings:

- Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated. For more information, see Activate the Knowledge Management Advanced plugin.
- The article versioning feature is enabled. For more information, see Article versioning.

Role required: agent_workspace_user

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > My Articles - Unpublished Articles.
3. Click an article link.
4. In the Scheduled publish date field, click the show calendar icon (📅).
5. Select any future date in the calendar.
6. In the Select Time field, enter a time in the format hh:mm:ss.
7. Click OK.
8. Click Publish to enable the publishing workflow.

Tip: If you want to cancel an article’s scheduled publication and move the article back to the Draft state, click Recall.

The knowledge article is published on the scheduled publish date depending on the following workflow settings of its knowledge base:

- If the knowledge base workflow is set to Knowledge - Instant Publish, the knowledge article is automatically published on the scheduled publish date. The Workflow field on the Knowledge form of the article is updated to Scheduled for publish.
- If the knowledge base workflow is set to Knowledge - Approval Publish, the knowledge article is published on approval completion. The Workflow field on the Knowledge form of the article is updated to Review.

The approval completion affects the scheduled publishing as follows:

- If the approvals are completed before the scheduled publish date, the Workflow field on the Knowledge form of the article is updated to Scheduled for publish and the article is published on the scheduled publish date.
- If the approvals are completed after the scheduled publish date, the article is published immediately on the approval completion.

**Work on a feedback task in Agent Workspace**

Start working on a feedback task, request clarifications, and resolve or close the feedback task in Agent Workspace. You can view all feedback tasks assigned to you or your ownership group.

You must have contribute access to the knowledge base that stores the knowledge article you want to work on.

Role required: agent_workspace_user

A feedback task is created based on the following types of feedback sources.

<table>
<thead>
<tr>
<th>Source</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User feedback</td>
<td>Knowledge article was marked as not helpful or given low ratings.</td>
</tr>
<tr>
<td>Internal feedback</td>
<td>Knowledge article was flagged.</td>
</tr>
<tr>
<td>Knowledge gap</td>
<td>Knowledge gap feedback task was created for one or more tasks using the Knowledge Demand Insights feature.</td>
</tr>
<tr>
<td>Knowledge gap - manual</td>
<td>Knowledge gap feedback task was created manually from a task, such as a customer service case or an incident.</td>
</tr>
<tr>
<td>Other</td>
<td>Feedback for a knowledge article from other sources.</td>
</tr>
</tbody>
</table>

**Note:** When you upgrade your instance, for any existing records that don’t have any feedback task type set or don’t match with supported types, the feedback task type is automatically set to Other.

1. Navigate to **Agent Workspace > Agent Workspace Home**.
2. Click **Lists > Knowledge > My Tasks - Feedback**.
3. Click the link to a feedback task number.
4. On the Knowledge Feedback Task form, review the feedback given by the submitter.
5. Work on the feedback task.
To Do this

Start working on the feedback task
From the State list, select Work in progress.
You can save the feedback task, edit the knowledge article for which the feedback task was added, or create another knowledge article from a feedback task if the information in the existing article is irrelevant or obsolete. For more information, see Create a knowledge article from a feedback task in Agent Workspace and Edit a knowledge article from a feedback task in Agent Workspace.

Request clarification from the feedback submitter
1. From the State list, select Awaiting information.
2. In the Additional comments field, enter the information you need from the submitter of the feedback task.

When you save the feedback task form, an email notification is sent to the feedback task submitter.

Resolve the feedback task
1. From the State list, select Resolved.
2. From the Resolution Code list, select a code for resolving the feedback task.
3. In the Resolution notes field, enter the reason for the resolution.

When you save the feedback task form, an email notification is sent to the feedback submitter to accept or reject the feedback.

Note: If the submitter accepts the feedback resolution, the state for the feedback task is automatically set to Closed.

Close the feedback task without the submitter having to accept the feedback resolution
From the State list, select Closed.

6. Optional: In the Compose section, enter comments, which all viewers can see, or work notes, which only internal users can see.

7. Optional: Track the time spent on each state for a feedback task by clicking the Knowledge Feedback Task Metrics tab and then clicking a link to the state in the Value column.

8. Click Save.

The feedback task is updated.

Create a knowledge article from a feedback task in Agent Workspace
When working on a knowledge article feedback task, if the current knowledge article doesn’t address the issue, you can create another knowledge article from within the task. A feedback task is created for a knowledge article when the article is flagged, marked as not helpful, or rated low, or a knowledge gap feedback task is created on a topic.

You must have contribute access to the knowledge base that stores the knowledge article.

Role required: agent_workspace_user
A feedback task is created in the following ways:

- When a user provides a feedback for the knowledge article. For more information, see *Provide feedback for a knowledge article in Agent Workspace*.
- When knowledge gap feedback tasks are created on a topic from a demand insights dashboard. For more information, see *Analyze knowledge gaps from a demand insights dashboard and create knowledge gap feedback tasks*.

1. Navigate to **Agent Workspace > Agent Workspace Home**.
2. Go to your tasks list.
   - For feedback tasks created through knowledge gaps or if a knowledge article was marked as not helpful or rated low, go to **Knowledge > My Tasks - Feedback**.
   - For tasks created when an article was flagged, go to **Knowledge > My Tasks - Flagged**.
3. In the **Number** column, click the link to a feedback task assigned to you or your ownership group.
4. Click **Create Article**.
5. Create the knowledge article by either selecting an article template or using the default template.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Selected article template</strong></td>
<td>Select an article template to create a knowledge article using defined fields and values.</td>
</tr>
<tr>
<td></td>
<td>In the Create Article dialog box:</td>
</tr>
<tr>
<td></td>
<td>1. From the Knowledge Base list, select a knowledge base.</td>
</tr>
<tr>
<td></td>
<td>2. From the Article Template list, select the desired article template.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: The Article Template list is populated based on the article templates configured for the selected knowledge base.</td>
</tr>
<tr>
<td></td>
<td>3. Click <strong>Create Article</strong>.</td>
</tr>
<tr>
<td><strong>Default Standard template</strong></td>
<td>Create a knowledge article using the default Standard template.</td>
</tr>
</tbody>
</table>
6. On the Knowledge form, fill in the fields.

**Note**: If you are using an article template, the fields that are available will vary.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge base</td>
<td>Knowledge base in which the knowledge article is stored. You can associate a knowledge article with one knowledge base only. If you are using an article template, you can modify this value only if the template is available in the other knowledge base.</td>
</tr>
<tr>
<td>Category</td>
<td>Category for the knowledge article. This value helps users find the article within a selected category. You can select only categories available within the selected knowledge base. Articles without a category appear in the (empty) category.</td>
</tr>
<tr>
<td>Ownership Group</td>
<td>Ownership group for the knowledge article. An ownership group consists of a group of members and a manager who are responsible for approvals and feedback tasks. Ownership groups can publish, edit, and retire knowledge articles that they are associated with.</td>
</tr>
<tr>
<td>Note: This field is available only if the glide.knowman.ownership_group.enabled property is enabled. If no ownership group is assigned and approvals are required to publish a knowledge article, it is automatically submitted for approval to the knowledge administrator and knowledge manager. For more information, see Enable ownership groups.</td>
<td></td>
</tr>
<tr>
<td>Version</td>
<td>Automatically generated article version number. This number is incremented when changes are made to a published article.</td>
</tr>
<tr>
<td>Note: This field is available if the article versioning feature has been enabled.</td>
<td></td>
</tr>
<tr>
<td>Workflow</td>
<td>Publishing workflow state of the knowledge article, such as Draft, In Review, or Published. For a new article, the workflow state is set to Draft.</td>
</tr>
<tr>
<td>Language</td>
<td>Language in which you are creating the knowledge article. The list is populated based on the languages enabled for the selected knowledge base.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Short description</td>
<td>Title of the knowledge article. This title appears when browsing and searching for knowledge article, and at the top of the article.</td>
</tr>
<tr>
<td></td>
<td><em>Note:</em> Knowledge articles similar to the entered short description text will appear in Agent Assist.</td>
</tr>
<tr>
<td>Article body</td>
<td>Content for the knowledge article. Use the editing functions in the HTML editor to create content.</td>
</tr>
<tr>
<td>Source Task</td>
<td>Task this knowledge article was created from. This field is set automatically when you create the knowledge article from a task, such as an incident or a customer service case, or from a submission record.</td>
</tr>
<tr>
<td>Scheduled publish date</td>
<td>Future date when the knowledge article will be published automatically. For more information, see Schedule a knowledge article for publishing in Agent Workspace.</td>
</tr>
<tr>
<td>Valid to</td>
<td>The date this knowledge article expires. Articles do not appear in search results after the <code>Valid to</code> date or if the <code>Valid to</code> date is blank.</td>
</tr>
<tr>
<td></td>
<td>The default value of the <code>Valid to</code> field is derived from the <code>Article Validity</code> field configured for the knowledge base (see Create a knowledge base). The <code>Valid to</code> date starts from the date the article was created until the number of days specified in the <code>Article Validity</code> field. If the <code>Article Validity</code> field is blank, the default date in the <code>Valid to</code> field for the knowledge article is set to January 1, 2100.</td>
</tr>
<tr>
<td></td>
<td>An article author or editor can select whether to keep or change the default <code>Valid to</code> date.</td>
</tr>
<tr>
<td></td>
<td><em>Note:</em> If the system date format or user preferences is set to use <code>yy</code> year format, you might face issues when the <code>Valid to</code> date is set to the default date. Contact your system administrator or modify the user preferences to use a date format with the <code>yyyy</code> year format. For more information, see Global date and time field format and Personalize the system date format topics.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Article type</td>
<td>Type of the article, which is automatically set to HTML. This field is available in the Standard template only.</td>
</tr>
<tr>
<td></td>
<td>Note: The Wiki article type isn’t supported in Agent Workspace.</td>

</tbody>
</table>

7. Optional: Research for content related to knowledge article you’re authoring using Agent Assist.
   a) In the contextual side panel, click the Agent Assist icon (🔍).
      The search results in Agent Assist display default content based on the text-based search.
   b) Click the select a search resource icon (🔍), and then select a search resource.
      For example, to view knowledge articles, select Knowledge Articles.
   c) Optional: In the search results, you can click a resource item, such as a knowledge article, to view its content in Agent Assist.

   **Tip:** For better readability, you can resize the contextual side panel for Agent Assist. For a full view of the selected resource item content, click Full View. The resource item content opens in another tab within the Agent Workspace.

8. Optional: Check whether your content matches content in an existing article.
   a) Enter search text in the text box available in Agent Assist or retain the default text, which is the short description of the knowledge article.
   b) Click the lookup icon (🔍).
   c) Select a search resource by clicking the Select a search resource icon (🔍).
      - To find knowledge articles that have high text similarity with the entered search text, choose Similar Articles (ML).

   **Note:** This option is available only when the Predictive Intelligence feature is enabled and your system administrator has trained the similarity solution for
Knowledge Management. For more information, see *Train the similarity solution for Knowledge Management to find related articles.*

- To find knowledge articles that match the entered search text, choose **Knowledge Articles**.

9. **Click Save.**
   The article is saved and appears in the My Articles - Unpublished list and additional functionality becomes available on the form.

10. Optional: Either add to or modify the article details or publish the article.

    - Add to or modify the article details.
      For more information, see **Edit a knowledge article in Agent Workspace.**
    - Publish the article by clicking **Publish.**
      A knowledge article is published depending on the workflow setting of its knowledge base:

      - **Knowledge - Instant Publish:** The knowledge article is immediately published unless it is scheduled to be published at a later date.
      - **Knowledge - Approval Publish:** The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

      For more information, see **Schedule a knowledge article for publishing in Agent Workspace.**

      When published, your knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version number of the knowledge article is updated. For more information, see **Knowledge article version numbers.**

After you create and publish a knowledge article, you can perform the following actions related to the article:

- Request translations for the knowledge article. For more information, see **Request translations for missing languages in Agent Workspace.**
- Retire the knowledge article. Click **Retire** to enable the retirement workflow. For more information, see **Retire a knowledge article.**
- Translate the knowledge article directly from the knowledge article. For more information, see **Translate a knowledge article in Agent Workspace.**
- Delete the published knowledge article. Click **Delete.** If the **Delete** button isn’t displayed, click the more actions icon (**...**), and then click **Delete.**

**Note:** Only users with the admin role can delete a published knowledge article.

---

**Edit a knowledge article from a feedback task in Agent Workspace**

When working on a knowledge article task, you can edit the knowledge article from within the task. A feedback task is created for a knowledge article when the article is flagged, marked as not helpful, or rated low, or a knowledge gap feedback task is created on a topic.

**Role required:** You must have contribute access to the knowledge base that stores the knowledge article.
Role required: agent_workspace_user

1. Navigate to **Agent Workspace > Agent Workspace Home**.
2. Go to your tasks list.
   - For feedback tasks created through knowledge gaps or if a knowledge article was marked as not helpful or rated low, go to **Knowledge > My Tasks - Feedback**.
   - For tasks created when an article was flagged, go to **Knowledge > My Tasks - Flagged**.
3. In the **Number** column, click the link to a feedback task assigned to you or your ownership group.
4. Click **Edit Article**.
5. If the article versioning feature is enabled, click **Checkout** for a published knowledge article. You can only edit the latest version of a knowledge article.
6. Access the relevant related lists to modify the information.

### Knowledge form related list

<table>
<thead>
<tr>
<th>Related list</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Details</td>
<td>Knowledge article content and its metadata.</td>
</tr>
<tr>
<td>Feedback</td>
<td>Feedback received on the published versions of the article. To view more details about the feedback, in the Comments column, click a link for the desired version of an article.</td>
</tr>
<tr>
<td>Feedback Tasks</td>
<td>Details about the feedback task created for a knowledge article version.</td>
</tr>
<tr>
<td>Approvals</td>
<td>Approval history of the knowledge article.</td>
</tr>
<tr>
<td>Article Versions</td>
<td>Version history of the knowledge article.</td>
</tr>
<tr>
<td>Translated Versions</td>
<td>Translated versions of the knowledge article. This related list appears only when the translation management feature is enabled. To translate a knowledge article, click <strong>New</strong>. The <strong>New</strong> button on this related list appears when the glide.knowman.translation.enable_translation_task property is disabled.</td>
</tr>
<tr>
<td>Translation Tasks</td>
<td>Tasks submitted for translating the article. This related list appears when the Translation Management feature and the glide.knowman.translation.enable_translation_task property to enable creation of translation tasks are enabled. For more information, see Knowledge properties.</td>
</tr>
<tr>
<td>Related Articles</td>
<td>Related articles mapped to the knowledge article. For more information, see Map a related article in Agent Workspace.</td>
</tr>
<tr>
<td>Related Catalog Items</td>
<td>Related catalog items mapped to the knowledge article. For more information, see Map a related item in Agent Workspace.</td>
</tr>
</tbody>
</table>
7. Optional: Research for content related to knowledge article you’re authoring using Agent Assist.
   a) In the contextual side panel, click the Agent Assist icon (🔍).
      The search results in Agent Assist display default content based on the text-based search.
   b) Click the select a search resource icon (🔍), and then select a search resource.
      For example, to view knowledge articles, select **Knowledge Articles**.
   c) Optional: In the search results, you can click a resource item, such as a knowledge article,
      to view its content in Agent Assist.

     **Tip:** For better readability, you can resize the contextual side panel for Agent Assist.
     For a full view of the selected resource item content, click **Full View**. The resource
     item content opens in another tab within the Agent Workspace.

8. Optional: Check whether your content matches content in an existing article.
   a) Enter search text in the text box available in Agent Assist or retain the default text, which is
      the short description of the knowledge article.
   b) Click the lookup icon (🔍).
   c) Select a search resource by clicking the Select a search resource icon (🔍).
      - To find knowledge articles that have high text similarity with the entered search text,
        choose **Similar Articles (ML)**.

     **Note:** This option is available only when the Predictive Intelligence feature is
     enabled and your system administrator has trained the similarity solution for
     Knowledge Management. For more information, see **Train the similarity solution
     for Knowledge Management to find related articles**.
      - To find knowledge articles that match the entered search text, choose **Knowledge
        Articles**.

9. Click **Save**.
    The article is saved and appears in the My Articles - Unpublished list. If the article versioning
    feature is enabled, the version of the knowledge article is incremented by 0.01. For more
    information, see **Knowledge article version numbers**.

10. Optional: Publish the article by clicking **Publish**.
    The knowledge article is published depending on the workflow setting of its knowledge base:
      - **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is
        scheduled to be published at a later date.
      - **Knowledge - Approval Publish**: The knowledge article is published on approval completion
        unless it is scheduled to be published at a later date.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States
and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
For more information, see *Schedule a knowledge article for publishing in Agent Workspace.*

When published, the knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). For more information, see *Knowledge article version numbers.*

**Compare knowledge article versions in Agent Workspace**

Select and compare two versions of a knowledge article in Agent Workspace to view the differences between them.

You must have contribute access to the knowledge base that stores the knowledge article.

Role required: agent_workspace_user

1. Navigate to **Agent Workspace > Agent Workspace Home.**
2. Click **Lists > Knowledge > All Articles.**
3. Click the link to a knowledge article for which you want to compare two versions.
4. Click **Edit** to open the Knowledge article form.
5. In the Article Versions related list, select the two versions of the article to compare.
6. Click **Compare.**

The **Compare versions** tab opens within Agent Workspace and lists the fields for the selected versions in a side-by-side format. Any differences between the two versions are highlighted as shown in the following example image.
Example: Compare article versions

Recall an article that is being reviewed in Agent Workspace

Recall an article that is being reviewed to stop the approval process.
You must have contribute access to the knowledge base that stores the knowledge article you want to schedule for publishing.
Ensure that the article versioning feature is enabled. For more information, see Article versioning.
Role required: agent_workspace_user

The author of a knowledge article, knowledge administrators, and system administrators can recall the article. If an ownership group is assigned to a knowledge article, the ownership group manager and ownership group members can also recall the knowledge article.

If a version of a knowledge article is in the Review workflow state, you can recall only the corresponding version to make additional changes. Recalling the article results in a minor version increment.

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > All Articles.
3. Click the link to the article in Review workflow state that you want to recall.
4. On the Knowledge form, click Recall.

The article opens in edit mode and the workflow state of the article is changed to Draft. The version number of the article increments by 0.01.

Approve a knowledge article in Agent Workspace

Approve a knowledge article that is awaiting your review in Agent Workspace.

Role required: agent_workspace_user

If the article versioning feature is enabled, only users who are assigned as approvers can modify a knowledge article that is in the Review state. If you are not an approver but need to modify the article, consider recalling the article. For more information, see Recall an article that is being reviewed in Agent Workspace.

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > All Articles.
3. Click the link to the article in Review workflow state that you want to approve.
4. Click Edit.
5. In the Approvals related list, in the State column, click Requested.
   The Approval form opens in another tab within Agent Workspace.
6. From the State list, select Approved.
7. Click Save.
   The approved knowledge article is published immediately or on the scheduled publish date, if the article is scheduled for publishing. If the article versioning feature is enabled, the version number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). On the Knowledge form of the article, the workflow state changes to Published.
   The new published version of the article is added to the Article Versions related list on the Knowledge form. The version is also available in the All Articles list in Agent Workspace, go to Knowledge > All Articles.

Request translations for missing languages in Agent Workspace

Request to translate a published knowledge article in available languages by creating a translation task in Agent Workspace.

You must have contribute access to the knowledge base that stores the knowledge article.

Ensure that the system administrator verifies the following settings:

- Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated.
- I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) is activated.
Note: The 18N: Internationalization plugin (com.glide.i18n) activates the 118N: Knowledge Management Internationalization Plugin v2 plugin.

- The `glide.knowman.translation.enable_translation_task` property is set to `true` in the Now Platform interface. For more information, see Knowledge properties.

Role required: agent_workspace_user

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Click Lists > Knowledge > All Articles.
3. Click the link to a knowledge article for which you want to create a translation task.
4. On the Knowledge form, click Edit.
5. Click Request translations.
6. In the Request translation dialog box, select one or more available languages in the Select languages list.
   - If a language appears grayed out, a translation is already in progress or has been completed for that language. Some languages might not be available if the system administrator has configured only specific languages for the knowledge base in which the article is contained.
7. Click Submit.

The translation task is created for the article in the selected languages and assigned to a group or user based on assignment rules, if configured.

Translate a knowledge article in Agent Workspace

Translate published knowledge articles to make them available in other languages.

You must have contribute access to the knowledge base that stores the knowledge article.

Ensure that the system administrator verifies the following settings:

- Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated.
- 118N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) is activated.

Note: The 18N: Internationalization plugin (com.glide.i18n) activates the 118N: Knowledge Management Internationalization Plugin v2 plugin.

- The `glide.knowman.translation.enable_translation_task` property is set to `true` in the Now Platform interface. For more information, see Knowledge properties.

Note: When the `glide.knowman.translation.enable_translation_task` property is set to `false`, translate the knowledge article by clicking New in the Translated version related list of a Knowledge form. The Knowledge form that is displayed to translate the article is based on the article template of the source knowledge article. You can enter your translation content in the Knowledge form. For more information about the Knowledge form, see Create a knowledge article in Agent Workspace.

Role required: agent_workspace_user

If you have contribute access to a knowledge article, you can translate a knowledge article directly from the knowledge form.

If your system administrator has configured languages for the knowledge base, you can translate into those languages only. For more information, see Create a knowledge base.
Note: The translation management feature isn't available for knowledge blocks in Agent Workspace.

1. Navigate to **Agent Workspace > Agent Workspace Home**.
2. Click **Lists > Knowledge > All Articles**.
3. In the **Number** column, click the link to a knowledge article that you want to translate.
4. Click **Edit**.
5. Click **Translate**.

Note: The **Translate** button is not available if the glide.knowman.translation.enable_translation_task property is disabled, translations of the knowledge article are available in all available languages, or a translation task has already been created for all the available languages.

The Original language and Translated language sections appear side by side for easy viewing, as shown in the following figure. The text in the Translated language section still appears in the original language content.

6. Provide the translation in the Translated language section.
- If dynamic translation is enabled, click **Machine translate** to automatically replace the draft content in the Translated language section with machine-translated content in the targeted language. For more information, see **Dynamic Translation**.

  When you click **Machine translate**, any draft content in the Translated language section is automatically replaced with the machine-translated content.

- If dynamic translation is not available, replace the draft content in the Translated language section with your translated text.

7. Click **Create draft article** to create a draft version of the translated article.

8. Click **Publish**.

When the translated version of the knowledge article is published, a new knowledge number is assigned to the translated version. The translated version is available in the All Articles list in Agent Workspace. Also, the Translated Versions related list on the Knowledge form of the original and translated knowledge article is updated with all the translated versions.

**Translate a knowledge article from a translation task in Agent Workspace**

Translate a published knowledge article for which you have been assigned a translation task. You must have contribute access to the knowledge base that stores the knowledge article. Ensure that the system administrator verifies the following settings:

- Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated.
- I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) is activated.

  **Note:** The I18N: Internationalization plugin (com.glide.i18n) activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.

- The **glide.knowman.translation.enable_translation_task** property is set to true in the Now Platform interface. For more information, see **Knowledge properties**.

Roles required: agent_workspace_user

A translation task is created for a knowledge article when a request for translation is submitted or its knowledge base is configured to automatically create translation tasks. For more information, see **Request translations for missing languages in Agent Workspace** and Create a knowledge base.

  **Note:** The translation management feature isn't available for knowledge blocks in Agent Workspace.

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Click Lists > Knowledge > My Tasks - Translation.
3. In the Number column, click the link to a translation task.
4. Click Translate.

  **Note:** The Translate button is not available if the **glide.knowman.translation.enable_translation_task** property is disabled, translations of the knowledge article are available in all available languages, or a translation task has already been created for all the available languages.
The Original language and Translated language sections appear side by side for easy viewing, as shown in the following figure. By default, the Translated language section includes the original language content.

5. Provide the translation in the Translated language section.
   - If dynamic translation is enabled, click Machine translate to automatically replace the draft content in the Translated language section with machine-translated content in the targeted language. For more information, see Dynamic Translation.
   
   When you click Machine translate, any draft content in the Translated language section is automatically replaced with the machine-translated content.
   - If dynamic translation is not available, replace the draft content in the Translated language section with your translated text.

6. Click Create draft article to create a draft version of the translated article.
7. Click Publish.

When the translated version of the knowledge article is published, a new knowledge number is assigned to the translated version. The translated version is available in the All Articles list in Agent Workspace. Also, the Translated Versions related list on the Knowledge form of the original and translated knowledge article is updated with all the translated versions.
Migrate to Knowledge Management v3

Knowledge Management has significantly changed with the introduction of knowledge v3 starting with the Fuji release.

Knowledge Management v3 has several key differences from Knowledge Management v2, the version of Knowledge Management that was available until Eureka release. The knowledge v3 plugin is activated by default starting with the Fuji release.

The following podcast provides more information on what is new in Knowledge Management v3.

When upgrading from Eureka or earlier versions, if you intend to use the new features available in knowledge v3, you have to migrate legacy knowledge content and any customizations you have made to the Knowledge Base applications.

The following video provides more information on how to migrate from Knowledge Management v2 to v3.

### Key differences

<table>
<thead>
<tr>
<th>Legacy Knowledge</th>
<th>Knowledge v3</th>
</tr>
</thead>
<tbody>
<tr>
<td>One knowledge base.</td>
<td>Multiple knowledge bases.</td>
</tr>
<tr>
<td>A single lifecycle workflow shared by all articles.</td>
<td>Separate, customizable workflows available for each knowledge base.</td>
</tr>
<tr>
<td>Two-level organizational structure with <strong>Topic</strong> and <strong>Category</strong>. A single</td>
<td>Category structure with any number of levels. Each knowledge base has a unique</td>
</tr>
<tr>
<td>organizational taxonomy shared by all articles.</td>
<td>category taxonomy.</td>
</tr>
<tr>
<td>Permissions defined per article using roles and ACLs.</td>
<td>Permissions defined per knowledge base or article using user criteria.</td>
</tr>
</tbody>
</table>

### Knowledge Management v3 migration process

When you upgrade from Eureka or earlier, consider a multi-step migration process. This process ensures you can access existing knowledge content and allows you to fully migrate at your own pace.

Review automatic changes before upgrading. These changes are applied immediately when upgrading and may impact existing functionality.

1. Migrate knowledge functionality to use your customized functionality with the Knowledge Management v3 enhancements.
2. Migrate knowledge content to use the Knowledge Management v3 enhancements with your existing knowledge articles.

### After migration to Knowledge Management v3

These items are relevant to getting the full range of new functionality after you migrate.

- You must configure knowledge access controls based on user criteria to ensure that users can access existing knowledge content. Since access control in knowledge v3 is intended to be based on user criteria alone, users may be unable to access v2 or v3 knowledge articles, or have restricted access, with preexisting ACLs.
• If the home page was customized in knowledge v2, custom layout and links are not saved in knowledge v3.

• Images added using the **Image** field in a knowledge article form do not display in the Knowledge v3 or Knowledge Service Portal pages. The article search results page displays the knowledge base icon next to all articles from the knowledge base.

### Automatic changes after Knowledge Management v3 migration

Upgrading to Knowledge Management v3 automatically changes knowledge functionality including the knowledge user interface and security model.

### Default knowledge base

When you upgrade from Eureka or earlier, a default knowledge base is created, titled Knowledge, that contains all knowledge articles from the previous version.

After the upgrade, you can add and edit articles in this knowledge base.

Articles in the default knowledge base continue to use legacy functionality, such as role-based access controls. Any customizations you made to knowledge functionality before the upgrade are preserved in the default knowledge base.

### Knowledge search changes

By default, the legacy knowledge portal uses knowledge v3 search with limited filtering options.

You can filter results only by knowledge base. Search results include only those articles the current user can view based on user criteria. ACLs do not restrict search results.

### Knowledge security changes

Knowledge v3 manages access to articles with user criteria rather than roles and ACLs.

Existing ACLs on the Knowledge (kb_knowledge) table are preserved, but with the following changes.

- A version of **3** indicates that a knowledge base uses the knowledge v3 functionality.
- A version of **2** indicates that a knowledge base uses legacy functionality.

New ACLs introduced by knowledge v3, such as field-level controls, apply to all knowledge bases.

When you upgrade from Eureka or earlier, any custom ACLs you implemented for the Knowledge table still apply to any knowledge records in the default knowledge base. Knowledge v3 updates ACLs that exist before upgrade so they only apply to Knowledge (kb_knowledge) records where this field value is 2.

**Note:** These changes affect the default knowledge base. Even if you are not using the new knowledge functionality, the legacy knowledge behavior may change if you have made customizations to ACLs on the Knowledge (kb_knowledge) table. Ensure you configure knowledge access controls after upgrading to prevent unexpected behavior.

Because Knowledge v3 introduces ACLs for the Knowledge (kb_knowledge) table, if you do not have high security enabled, you may notice differences in default behavior. See KB0549970 for information about configuring Knowledge v3 without high security.

### Knowledge article view changes

The Knowledge application uses the kb_view UI page to display knowledge articles.
UI page

The following changes apply automatically when you upgrade from Eureka or earlier:

- The existing kb_view page is renamed to kb_view_customer. The kb_view_customer page is used to display articles in the default knowledge base, preserving the legacy user experience.

  Note: By default, the kb_view_customer page is publicly accessible. As an administrator, you can change this behavior by modifying the sys_public table record for this page and clearing the Active field in the record.

- A new kb_view page is used. This becomes the primary page used to display articles that are not in the default knowledge base.

You should review all customizations introduced around the legacy kb_view UI page.

- URLs should not be updated as the new kb_view page redirects to the correct page depending on the article.
- Customizations made to the kb_view UI page are automatically copied to the kb_view_customer page on upgrade.
- Other customizations that affect kb_view may need to be copied or modified to apply to kb_view_customer. For example, an ACL defined for kb_view may need to be duplicated to provide security coverage for kb_view_customer.

Feedback

Legacy feedback functionality is retained for knowledge articles displayed in the legacy article view. Users can continue to use the feedback options to view, add, and reply to comments on these legacy articles. Legacy comments are retained in the Knowledge Feedback (kb_feedback) table.

To retain the legacy comment functionality with new knowledge articles, set the Use Live Feed for Knowledge feedback property (glide.knowman.use_live_feed) to false. This property is set to false by default.

Knowledge portal changes

While the legacy knowledge portal, kb_home, has not changed in Knowledge v3, we strongly recommend that you consider moving to the new Knowledge v3 home page, $knowledge.do.

UI page

You can search articles from the knowledge portal and filter search results by knowledge base, and by language if the instance uses knowledge management internationalization. This portal also appears for users on older browsers, such as Internet Explorer 9, instead of the knowledge homepage.

Navigation add-ons are available in the legacy knowledge portal. Navigation add-ons of the Link type appear in the top-right of the portal. To add navigation add-ons of the Search type, you must customize the kb_home UI page.
Search

By default, the legacy knowledge portal uses knowledge v3 search with limited filtering options. You can filter results only by knowledge base. Search results include only those articles the current user can view.

Knowledge submissions

Knowledge submissions created from tasks continue to work in knowledge v3 with minor changes.

By default, the Topic and Category fields no longer appear on the Submission form due to the knowledge v3 category changes.

The property glide.knowman.submission.workflow no longer appears on the knowledge properties UI page. To enable knowledge submissions, set this property to true on the System Properties (sys_properties) table.

See creating knowledge from incidents and problems for instructions on using knowledge submission in knowledge v3.

Migrating Knowledge access controls

Access to knowledge articles is controlled based on the user criteria for the knowledge base.

Important: If you do not migrate existing knowledge ACLs to user criteria, users may be unable to access knowledge articles, or may be able to access restricted articles.

User criteria records, rather than ACLs, control basic create, read, update, and delete operations for knowledge articles as well as which search results appear. This may lead to unexpected behavior if your configuration depends on ACLs to control access.

To ensure users are able to access the correct knowledge articles, migrate any ACL-based security settings to user criteria. This process may include creating additional knowledge bases and moving existing content to these knowledge bases, depending on your security model. For a detailed explanation and migration examples, refer to KB0550924 Understanding User Criteria and ACLs in Knowledge v3.

This video demonstrates how to manage article-level access controls during migration from Knowledge Management v2 to v3.

Knowledge functionality migration

You can migrate knowledge functionality to use your customized functionality with the knowledge v3 enhancements.

Replaced knowledge modules

When you are ready to migrate to knowledge v3, you can activate the v3 modules and deactivate the legacy modules.

Use the tables below to identify which knowledge v3 modules to activate and which legacy modules to deactivate. When activating a knowledge v3 module, deactivate the knowledge v2 module with the same name to ensure users access the correct module.

You can use the enablev3anddisablev2menus.txt backup script to enable knowledge v3 menus and disable knowledge v2 menus.
### Knowledge v3 modules

</tbody>
</table>
Knowledge article publish and retire workflows

With knowledge v3, article state is controlled by workflows.

In the legacy knowledge base, article state was controlled by UI actions. UI actions from previous versions are available only in the default knowledge base.

To preserve your article publishing and retirement process in new knowledge bases, create workflows that follow these processes. To create these workflows, copy the default workflow that best matches your process and modify that copy. After creating workflows that use your article publishing and retirement processes, use these workflows as the Publish workflow and Retire workflow for the new knowledge bases.

Knowledge article category structure

With knowledge v3, all knowledge articles are organized by category and subcategory within knowledge bases.

The default knowledge base uses the legacy category structure; knowledge articles are organized by topics and categories.

Before you migrate articles, create a category structure for these articles in the destination knowledge bases. This structure can reproduce your legacy topic and category structure or can be extended to take advantage of the knowledge v3 category functionality.

Knowledge content migration

To use the new functionality available in knowledge v3 with legacy articles, you must migrate these articles out of the default knowledge base.

To migrate knowledge content, move articles out of the default knowledge base by changing the Knowledge Base value for each article. The state of the article remains unchanged when moving articles. After selecting a new knowledge base, assign a category to each article using the category structure defined in the new knowledge base.

After you migrate a knowledge article, the legacy feedback functionality is automatically replaced with the new knowledge feedback mechanisms. Legacy feedback is copied to the Live Feed Message (live_message) table to ensure previously submitted feedback is available for knowledge v3 articles.

Social Q&A

If Social Q&A is activated for a knowledge base, you can ask questions and respond to questions from other users. You can also vote on helpful questions and answers.
Social Q&A extends the Knowledge application. All questions and answers are associated with a knowledge base. Social Q&A uses Knowledge access controls, search, and the knowledge homepage.

Social Q&A is available on mobile devices using the mobile knowledge interface. You can perform all Social Q&A functions on mobile, such as asking and answering questions.

Note: Social Q&A is not compatible with Internet Explorer 9 or earlier. Navigating to a Social Q&A page using one of these browsers will cause a browser support warning to appear.

Enable social Q&A for a knowledge base

As a knowledge manager, you can enable social Q&A for a knowledge base you manage.

Role required: knowledge_manager

You can set the limit for the number of times users can post questions, answers, and comments, or subscribe to the questions using the Knowledge Social Q&A properties section.

All Social Q&A questions and answers are associated with a knowledge base. The Enable social questions and answers check box on the Knowledge Base form controls if users can view and ask questions.

Social Q&A uses user criteria from the knowledge base to determine which users have access to questions.

1. Navigate to Knowledge > Knowledge Bases.
2. Select a knowledge base you manage.
3. Select the Enable social questions and answers check box.
   This check box only appears if the Social Q&A plugin has been activated.
4. Click Update.

You can disable Q&A for a knowledge base by clearing the Enable social questions and answers check box. Disabling Q&A does not delete existing questions and answers associated with this knowledge base, but prevents users from browsing or searching for those questions and answers.

Social Q&A questions

Social Q&A organizes information by question.

You can browse and search for questions from the Knowledge homepage (Self-Service > Knowledge). Questions appear along with knowledge articles organized by knowledge base, category, and tags.

Click on a question to view the question details, as well as responses and comments. You can add responses and comments, vote on existing responses, share questions, and edit your own questions and answers from the question details. Click on a picture profile to view the user's profile.

Ask a social Q&A question

As a Social Q&A user, you can ask questions that other users can respond to.

Roles required: None

1. Navigate to Self-Service > Knowledge.
2. Click Post a Question.
3. Enter a value for the following fields.
Question fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Enter the question you have.</td>
</tr>
<tr>
<td>Question details</td>
<td>Enter additional details about the question that may help other users provide an answer.</td>
</tr>
<tr>
<td>Knowledge base</td>
<td>Select the knowledge base this question relates to. You can select only knowledge bases configured to allow Q&amp;A.</td>
</tr>
<tr>
<td>Category</td>
<td>Select the knowledge category this question relates to. You can select only categories within the selected knowledge base. Questions without a category appear on the knowledge homepage in the (empty) category.</td>
</tr>
<tr>
<td>Tags</td>
<td>Enter one or more tags that describe the question.</td>
</tr>
</tbody>
</table>

4. Click **Post Question**.

To accept the answer, click the **Accept** link from within the answer. The accepted answer moves to the top of the list of answers. You can unaccept an answer by clicking **Unaccept**.

**Note:** You must be the owner of the question or the knowledge manager to accept an answer.

**Answer a question**

As a user, you can answer a question another user has asked. The owner of the question or the knowledge manager can then accept the answer.

Roles required: None

As a knowledge manager or the owner of a question, you can accept an answer as the correct answer. That answer then appears above other answers for the question.

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Enter an answer in the **Your answer** field.
4. Click **Submit**.

**Comment on a question or answer**

You can comment on a question or an answer to provide additional information relevant to that question or answer.

Roles required: None

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Within the question or answer you want to comment on, click the **Comment** link.
4. Enter the comment text.
   Comments have a maximum length of 140 characters.
5. Click Post comment or press the Enter key.

**Edit a question, answer, or comment**

You can edit questions, answers and comments you submit, or in knowledge bases you manage.

Role required: None

1. Navigate to Self-Service > Knowledge.
2. Select a question.
3. Within the question, answer, or comment you want to edit, click Edit.
4. Edit the details as needed.
5. Optional: When editing a question, click Advanced to make changes to the question record.
6. Click Update.
   Click Undo to discard the changes and close the editor.

**Vote on a question or answer**

As a Social Q&A user you can vote on a question or answer to promote it.

Role required: None

Vote up questions that you want users to answer, and answers that you believe accurately resolve questions. Alternatively, vote down questions that you do not find useful, or answers that you believe are incorrect. You can vote for each question or answer only once, but you can change your vote.

Answers with a higher score appear above answers with a lower score when viewing a question. A pinned answer appears above other answers regardless of votes.

**Note:** You cannot vote for your own questions or answers.

1. Navigate to Self-Service > Knowledge.
2. Select a question.
3. Click the up or down arrow next to the question or answer you want to vote on.
   The score for that question or answer changes depending on your vote.

You can change your vote by clicking the other arrow.

**Subscribe to a question**

You are automatically subscribed to any question you ask, so you receive notifications when another user votes on, comments on, or answers the question. If you want to receive notifications for a question asked by another use, you can manually subscribe to the question.

Role required: None

You automatically subscribe to any question you ask.

1. Navigate to Self-Service > Knowledge.
2. Select a question.
3. Click the subscribe icon

If you want later to stop receiving notifications about this question, click the unsubscribe icon.
Delete a question, answer, or comment

You can delete questions, answers, or comments that you submitted.

You can delete only questions, answers, and comments you submitted. Knowledge managers can delete any question, answer, or comment within knowledge bases they manage.

Role required: none

1. Navigate to **Self-Service > Knowledge**.
2. Select a question or answer.
3. Within the question, answer, or comment you want to delete, click the **Delete** link.

Deleting a question also deletes all answers and comments associated with that question. Deleting an answer also deletes all comments associated with that answer.

Share a question

You can generate a URL directly to a question and related answers.

Role required: None

1. Navigate to **Self-Service > Knowledge**.
2. Select the question that you want to share.
3. Click **Share**.

Some browsers do not allow adding content directly to the clipboard. You may need to manually copy the URL from the popup that appears.

Distribute the URL to share the question.

**Social Q&A internationalization support**

The Social Q&A questions and answers are automatically associated with the language that is set for the interface.

You can only browse and search for questions in the language currently set for the interface. For example, if a Social Q&A user has set French as the interface language, any questions that the user asks is associated with the French language. All Social Q&A users who want to view those questions must have their interface language set to French.

**Note:** For Social Q&A internationalization to take effect, you must clear the platform cache and browser cache after selecting the desired language.

**Social Q&A search**

Users can search for specific questions from the knowledge homepage.

Social Q&A uses knowledge search to provide search results. Searching knowledge returns questions that contain the search terms in the question title or the question details, or in the accepted answer.

By default, knowledge search results include both knowledge articles and questions. You can filter results using knowledge search controls, such as filtering by knowledge base or author.

Social Q&A results also appear with knowledge articles when using global search.

Social Q&A uses the Contextual Search feature to generate search results. Questions appear in Contextual Search results, such as when creating an incident. The Social QA Question Search Context and Social QA Question Searcher records define the Social Q&A search. To ensure Social Q&A search functions as intended, do not modify these records.
Social Q&A tags

Tags organize questions and provide information about the question subject matter.

Social Q&A shares available tags with other applications allowing you to organize records consistently across the instance. Tags are stored on the Tags (label) table.

You can view a list of tags and filter by tag from the knowledge homepage. Clicking on a tag displays a list of knowledge articles and questions with that tag.

Only users who can edit a question can edit the associated tags. By default, only the question owner and knowledge managers can add or remove tags on questions.

Legacy: Chat

Chat is deprecated in the Istanbul release.

Note: The Connect feature provides an updated instant messaging platform, which is activated by default for new instances. The legacy chat and Connect features should not be used concurrently. There is no migration path from legacy chat to Connect.

Chat provides real-time communication via instant messaging between users in a ServiceNow instance. Features include:

- One-to-one chats (instant messaging) between users.
- Chat rooms for conversations with multiple users. Chat rooms may be public (any user can join) or private (only invited users can join).
- Chat rooms linked to task records. Users can work together to solve issues, and conversation history can be shared by everyone who needs to reference it.
- Help desk chat. End users can access live support via instant messaging. Service desk staff can resolve basic issues in real-time or create incidents directly from chat requests for more extensive issues.
Chat Desktop

Legacy: Get started with Chat

Get started with legacy chat.

Role required: admin

1. Establish use guidelines. Social media can improve communication and aid productivity. To get the most out of these tools, establish clear and simple social media guidelines that foster information sharing and a comfortable work environment.

2. Activate the Chat plugin to enable the legacy chat and legacy Help Desk Chat features.

3. Configure security settings. Users must log in to use the legacy chat features in the base system. The standard system security settings and Social IT-specific security settings are available. To learn more about setting up these features, refer to the plugin activation pages.
   - Chat rooms may be Public (any user can join) or Private (only invited users can join).
• Administrators can limit who can read chat messages on tasks and who can create chat rooms.

Legacy: Installed with Chat

What components are installed with legacy chat.

Demo data is available for legacy chat. The demo data creates a chat queue called Help Desk Chat that is supported by the assignment group Chat Support. Additionally, the Help Desk Chat link is added to the header of the Employee Self-Service portal. To learn more, see Set Up Chat Queues for Help Desk Chat.

Other:

• Event: A new event called chat.invite is registered to trigger an email notification when users are invited into a chat room.
• Email Notification: An email notification called Chat Room Invite is added to send when users are invited to a chat room.

Legacy: Fields installed with legacy chat

Legacy chat adds fields.

<table>
<thead>
<tr>
<th>Display name (Table name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header (content_block_header)</td>
<td>Adds the Help Desk Chat link to the ESS portal page.</td>
</tr>
</tbody>
</table>

Legacy: Properties installed with legacy chat

Legacy chat adds properties.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.chat.invite_fields | Comma-separated list of fields used to generate the invites when creating a chat room from a task. The user is presented with check boxes for each of the specified fields to select the invites for the chat room. The fields should be references or glide_lists of sys_user or sys_user_group.  
  • Type: string  
  • Default value: assignment_group,watch_list  
  • Location: Social IT > Chat Administration > Properties |
| glide.chat.show_emoticons | Setting that determines whether to display emoticons in conversations.  
  • Type: true | false  
  • Default value: true  
  • Location: Social IT > Chat Administration > Properties |
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.chat.sound.message_received.mp3                              | Sound played when a message is received in chat (mp3).  
  - Type: string  
  - Default value: media/rcvmsg.mp3x  
  - Location: Social IT > Chat Administration > Properties                                                                                         |
| glide.chat.sound.message_received.ogg                               | Sound played when a message is received in chat (ogg).

  - Default value: itil  
  - Location: Social IT > Chat Administration > Properties                                                                                     |
### glide.short_poll_delay

**Description:** Short polling delay for XMPP requests. Enter a value in milliseconds. The minimum value is 250.

With short polling, the browser sends a request to the server in fixed intervals defined by the property. To minimize performance impact, it is recommended that this value is set greater than or equal to the default value.

- **Type:** integer
- **Default value:** 1000 (one second)
- **Location:** Social IT > Chat Administration > Properties

### Legacy: Script includes installed with legacy chat

Legacy chat adds script includes.

<table>

<tr>
<td>ChatUtils</td>
<td>Provides utilities for chat conversations.</td>
</tr>
</tbody>
</table>

### Legacy: Tables installed with legacy chat

Legacy chat adds tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chat Actions (chat_actions)</td>
<td>Defines additional chat window menu items. Access at Social IT &gt; Chat Administration &gt; Actions (administrator and chat_admin).</td>
</tr>
<tr>
<td>Chat Channel (chat_channel)</td>
<td>Stores chat channels, which are chats between members. This table is extended by Chat thread (chat_thread) (a one-to-one chat) and chat_room (a multi-user chat). Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Channel Member (chat_channel_member)</td>
<td>Relationship table that associates channels and members. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Message (chat_message)</td>
<td>Stores instant messages sent from any chat window. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Presence (chat_presence)</td>
<td>Stores presence (status) information for a user. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Queue (chat_queue)</td>
<td>Stores the groups and schedules for providing support via instant message. Defined at Social IT &gt; Chat Administration &gt; Queues (administrator and chat_admin).</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Chat Queue Entry (chat_queue_entry)</td>
<td>Stores user requests for live support. Extends Task (task). On a chat queue record, the Chat queue entries related list displays the entries that are associated with that chat queue. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Room (chat_room)</td>
<td>Stores chat rooms (multi-user chat). Extends Chat channel (chat_channel). Can be modified if necessary (such as to change a chat room from public to private), but should almost always be managed by system functionality.</td>
</tr>
<tr>
<td>Chat Roster (chat_roster)</td>
<td>Maintains users that are associated with a user’s My Friends list. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Roster Member (chat_roster_member)</td>
<td>Tracks users that are members of a chat room. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Chat Thread (chat_thread)</td>
<td>Stores one-to-one chats. Extends Chat channel (chat_channel). Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Live Headline (live_headline)</td>
<td>Sends system messages. For example, the system may send a message when a user enters or leaves a chat room. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Live Poll Message (sys_live_message)</td>
<td>System table that stores and manages chat messages. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Live User (sys_live_user)</td>
<td>System table that stores and maintains chat users. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Stores the last live sequence number (sys_live_last_sequence)</td>
<td>Stores the last sequence ID. Extending or modifying data in this table is not recommended.</td>
</tr>
</tbody>
</table>

**Legacy: Business rules installed with legacy chat**

Legacy chat adds business rules.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chat Queue (Task.active) Updater</td>
<td>Chat Queue Entry (chat_queue_entry)</td>
<td>Sets the chat queue entry Action field to Waiting when the action changes.</td>
</tr>
<tr>
<td>SNC - Chat Queue Average Wait Time</td>
<td>Chat Queue Entry (chat_queue_entry)</td>
<td>When a chat queue entry is accepted, calculates the average wait time for the queue by averaging the last 20 chat queue entries.</td>
</tr>
</tbody>
</table>
Legacy: Chat use

Legacy chat allows you to interact and collaborate through real-time instant messages with other users in an instance.

Use legacy chat to:

- Initiate or participate in chat conversations with one or multiple users.
- Initiate or participate in chat conversations that are attached to task records (such as an incident).
- See when other users are available to chat.

To open the chat desktop, navigate to Social IT > Chat.

**Note:** Service desk staff may also provide live support to other users via help desk chat.
Legacy: Update your profile

Your profile identifies your contributions to legacy chat conversations.

Your profile identifies your contributions to conversations. It is created automatically the first time you use chat and consists of:

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>From your user account in ServiceNow. Your name appears on your messages and in the member list of any chat room you join.</td>
</tr>
<tr>
<td>Picture</td>
<td>Select any picture. Your picture appears beside your name in other users’ favorites list and at the top of your favorites list.</td>
</tr>
</tbody>
</table>

To update your profile picture:

1. Click your picture in the top of the favorites list.
2. Browse to the desired picture file and click Open.

**Note:** Changes to your profile picture affect legacy chat and live feed if the Live Feed plugin is activated.

Legacy: Update your status

In legacy chat, your status lets other users know whether you are available to chat.
Your status lets other users know whether you are available to chat. Your current status is indicated by the color of the icon in the upper right of your favorites list, beside your name. View the status of other users in your favorites list.

To change your status:
1. Click the status icon beside your name.
2. Select a status (see table).

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
<th>Appears to others</th>
</tr>
</thead>
<tbody>
<tr>
<td>Online</td>
<td>Indicates that you are available to chat.</td>
<td>Green icon:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Beth Anglin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Chat available</td>
</tr>
<tr>
<td>Away</td>
<td>Indicates that you are not available because you are away.</td>
<td>Red icon:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Beth Anglin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Away</td>
</tr>
<tr>

<td></td>
<td>• On the phone</td>
<td>In a meeting</td>
</tr>
<tr>
<td></td>
<td>• Out to lunch</td>
<td>Chat away msg</td>
</tr>
<tr>
<td></td>
<td>You cannot create a custom message from the chat desktop.</td>
<td></td>
</tr>
</tbody>
</table>
### Status

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
<th>Appears to others</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invisible</td>
<td>Indicates that you are not available. You can send and receive messages when your status is <strong>Invisible</strong>. You appear as <strong>Offline</strong> to other users.</td>
<td>Black icon: &lt;br&gt;![ Beth Anglin ](attachment: Beth Anglin) &lt;br&gt;Chat offline</td>
</tr>
<tr>
<td>Offline</td>
<td>Indicates that you are not available. You cannot send or receive messages when your status is Offline. Users that are not logged in appear as Offline.</td>
<td>Black icon: &lt;br&gt;![ Beth Anglin ](attachment: Beth Anglin) &lt;br&gt;Chat offline</td>
</tr>
</tbody>
</table>

### Legacy: Use your favorites list

In legacy chat, your favorites list appears on your chat desktop and provides certain functions.
Favorites list

- Users:
  - *Add another user* in the system to your favorites list.
  - See if your favorite users are available to chat. Users are organized alphabetically and in sections by status.
  - Start a conversation by double-clicking a name.
  - Expand or collapse a section by clicking *Online* or *Offline*.

- Rooms:
  - See the list of your favorite chat rooms.
  - Join a chat room by double-clicking its name.

- Favorites list toolbar:
  - Options (*Chat window menu*):
    - access a menu with options to *add a favorite user*, *view online users*, *create a chat room*, and *view chat rooms*.
  - Add User (*Add friend*):
    - *add a favorite user*.
  - Create Room (*Add room*):
    - *create a chat room*.
  - Invitations (*Chat invitation*):
    - respond to invitations to *join chat rooms*.
To expand or collapse a section in the favorites list, click the section header or click the arrows (↑) on the section header.

Legacy: Add a favorite user

How to add a user to your favorite users list in legacy chat.

1. Click the Add User button.

2. Begin typing a user name and select a user from the list, or click the reference lookup and select a user from the table.

3. Click OK.

Legacy: Remove a favorite user

How to remove a favorite user in legacy chat.

To remove a user from your favorite users list, right-click the user’s name and select Remove From List.

Legacy: View an online user

How to view a list of all users who are available to chat (status of Online) in legacy chat.

1. Right-click the Users section header or click Options on the toolbar.

2. Select Show Online Users.
   - Start a one-to-one chat with a user on the list by double-clicking a name.
   - Send Message or Add To Friend List by right-clicking a name.
Legacy: View a room

How to view a list of all public chat rooms in legacy chat.

1. Right-click the **Rooms** section header or click **Options** on the toolbar.

   ![Chat window menu](image)

2. Select **Public Rooms**.
   - To join a room, double-click a name or right-click and select **Join Room**. See **Joining Chat Rooms**.
Legacy: Start a one-to-one chat

How to start a one-to-one chat in legacy chat:

- To start a chat with one user in your favorites list, double-click the user's name or right-click and select **Send Message**.
- To start a chat with one available user, double-click the user's name on the online users list. See **Viewing Online Users**. Send a message to start a conversation.

Legacy: Create a chat room

How to start a chat with multiple users from the legacy chat desktop.

To start a chat with multiple users from the chat desktop (requires access rights):

1. Click **Create Room** on the favorites list toolbar.

2. Enter the room details (see table).
3. Click **Create Room**. An invitation appears in the favorites list of all invited users and a new chat window opens on your chat desktop.
### Create Room

<table>

</thead>
<tbody>
<tr>
<td>Room name</td>
<td>Enter a name to appear on the chat window header or click the Generate a unique room name button (Room name generator) to use a system-generated name. The default name for a room created from a task is Chat Room for &lt;Task Number&gt;.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a room description that appears under the name in the rooms list. The default description for a room created from a task is &lt;Short Description&gt;.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter a password, if desired. If a password is specified, only users with the password can join the chat room.</td>
</tr>
<tr>
<td>Room avatar</td>
<td>Upload an image that appears beside the room name in the list of rooms. Click the picture and browse to the desired image file.</td>
</tr>
</tbody>
</table>
| Features    | Select all applicable check boxes:  
  * Public if all users can see the room in the rooms lists.  
  * Members Only if only invited users can join the room.  
  * Temporary if the room is not saved once all participants have left. This feature is not available for rooms created from tasks; task chat rooms are always available on the task record. |
| Invite      | Add invited users by using the glide list. For a room created from a task, you can also select all applicable check boxes:  
  * Assignment group: invite all users in the assignment group for the task.  
  * Watch list: invite all users on the watch list for the task.                                                                                                                                    |

Legacy: Create a chat room for a task
How to start a legacy chat with multiple users from a task record.

Note: This procedure is not possible if the Connect feature is enabled.

1. Open the record (example, an incident on which you are working).
2. Click the **Create or Join Chat Room** related link.

3. If a chat room already exists, click a name to join the existing chat room. If no chat room exists, continue to the next step to create a new room.

4. Click the **create** link at the bottom of the window.

5. Enter the room details as you would for a **chat room**.

6. Click **Create Room**. An email notification is sent and appears in the favorites list for all invited users (the assignment group and the watch list, if selected, and additional invited users).

7. In the **New Room Created** message, click **Join Room**.
   
   - A new chat window opens on your chat desktop.
• All invited users are listed in the chat member list. Invited users that are not currently participating in the chat are listed in gray.

Legacy: Join one-to-one chats

In legacy chat, when another user starts a chat by sending a message to you, a chat window opens on your chat desktop. To join the chat, click the window.

Legacy: Join a chat room

How to join a chat room in legacy chat.

1. If another user invites you to join a chat room, an invitation appears in your favorites list.

   ![](Chat_invitation.png)

   Chat invitation

2. To respond, click the invitation.

   A window opens that displays the room name, room description, and the name of the user who invited you.

   • To join the chat, click **Join**. When the chat window opens on your chat desktop, click the window.
   • To ignore the invitation, click **Decline**.

   ![](Chat_room_joins.png)

   View invitations

   To rejoin a favorite chat room that you have left, click the chat room name in the Rooms section of the favorites list.

   To join a public chat room without an invitation, right-click the Rooms section header and select **Public Rooms**. Double-click a room name on the list.

Legacy: Join a chat room for a task

In legacy chat, if another user invites you to join a chat room from a task record, you receive an email notification.

1. Click the link in the email notification.
2. If a prompt for a password appears, enter the password listed in the email notification.
3. When the chat window opens on your chat desktop, click the window.

Legacy: Join a chat room from a task record without an invitation

How to join a chat room in legacy chat without an invitation.

<i>Note: This procedure is not possible if the Connect feature is enabled.</i>

1. Open the task record.
2. Click the Create or Join Chat Room related link.
3. Click a chat room name.
4. If a prompt for a password appears, contact the person who created the chat room for the password.
   If a chat room has a password, only users with the password can join the chat.
5. When the chat window opens on your chat desktop, click the window.

Legacy: Chat windows

In legacy chat, a chat window appears on your chat desktop for each chat conversation that you start or join.
Legacy: Send messages in legacy chat

How to send messages in legacy chat.

To chat with other users that have joined the conversation, enter your message in the text field at the bottom of the window and press **Enter**. The message appears in the other users’ chat windows.

To send a link, type the full URL (example, http://www.service-now.com). When the message is sent, the text appears blue and any user in the conversation can click it to follow the link.

To send a smiley face, type a colon followed by a close parentheses (:)). When the message is sent, a smiley face appears in place of the text. For more emoticons, see *Sending Emoticons in Messages (Smileys)*.

Chat activity is indicated with the following alerts:

- When a new message is posted to an inactive browser tab, the tab name blinks.
- When a new message is posted to an inactive chat window, the window header appears in yellow and blinks.

</table>
Legacy: Change the display

How to change the display of legacy chat.

To view the chat window menu, click the gear button ( ) in the bottom left.

- To show or hide timestamps, select Show Timestamps from the chat window menu or press F2.
- To show or hide the chat member list, select Show Members from the chat window menu or press F4.

To resize the window, point to the lower corner (left or right). When the pointer changes shape, drag the window to the desired size.

To move the window, point to the header. When the pointer changes shape, drag the window anywhere on your chat desktop.

To close a chat window, click the X in the upper right corner.

Legacy: Invite a user into a chat

How to invite another user into a chat in legacy chat.

1. Select Invite User from the chat window menu.

   Chat window menu

2. Begin typing a user name and select a user from the list, or click the reference lookup and select a user from the table.

   Search icon

3. Click OK.

   An invitation is sent to the selected user. One-to-one chats are automatically converted into temporary chat rooms.

Legacy: Add a favorite room

How to add a favorite room in legacy chat.

To add a room to your favorites, click the chat window and select Add To Favorites from the chat window menu.

Chat window menu
Legacy: Remove a favorite room
How to remove a favorite room in legacy chat.

To remove a room from your favorites, right-click the room name and select Remove From List.

Legacy: Set your chat preferences
Use the Chat Window Preferences to set audio notifications and default chat window display options in legacy chat.

Use the Chat Window Preferences to set audio notifications and default chat window display options. The default display options control how a chat window looks when you first open it. You can still control the display options for an individual window as described in Changing the Display.

To view your chat preferences, click your name in the upper left corner of the chat desktop and select Chat Preferences.

Chat preferences

To set your preferences, select or clear the check boxes next to the options, then click Update.

<table>

</tbody>
</table>

Legacy: Delete a chat room
You can delete chat rooms in legacy chat.
Role required: chat_admin

Note that when you delete a chat room, the system also deletes the records for any chat members and messages.

1. In the application navigator filter, enter chat_room.list.
2. Delete multiple chat rooms from the list or open a chat room record and click Delete.

Legacy chat administration

Users with the chat_admin role can administer various aspects of legacy chat.

Define chat room access rights

Control the access rights for creating a chat room so that not all users can create a chat room.

Role required: chat_admin

To define the access rights for creating chat rooms:

1. Navigate to Social IT > Chat Administration > Properties.
2. Locate the property Comma-separated list of roles that are allowed to create chat rooms.
3. Enter user roles. A user must have one of the specified roles to create a chat room.

Change chat room message read access

In legacy chat, you can associate a chat room with a record, such as an incident, and add the chat messages to a Chat Activity journal field on the form.

Role required: admin

By default, a user can read the chat messages for a room if either of the following is true:

- The room is public
- The user is a member of the room

To change chat room message read access:

- Modify the Chat message access control rule or create a new rule.
- Read access to the messages displayed is handled by the access control list security operation chat_messages_read on the Chat room (chat_room) table.

View a legacy chat message as a journal field

You can view all chat messages in one place by viewing them as a journal field.

Chat rooms can be linked to any task record in the following ways:

- Create a room from the record.
- Create a record from a chat room, such as creating an incident from a Help Desk Chat.

To view the chat messages as a journal field:

- Configure the task record form to select the Chat Activity field.
- The maximum number of chat messages that are displayed by this field is 1000.
Chat Activity

2011-01-21 13:48:35: Chat Room for INC0010010 - I can't access the shared server

2011-01-12 15:11:43: Help Desk Chat - rachel user

[2011-01-12 23:12:05] rachel user: I can't access the shared server

[2011-01-12 23:12:49] Fred Luddy: Where are you?

[2011-01-12 23:12:56] rachel user: I'm at home on the VPN

[2011-01-12 23:13:38] Fred Luddy: I'll open an incident for you to get the update

[2011-01-12 23:14:03] rachel user: Great, thanks!

Chat actions

Chat actions are additional items that appear in the chat window menu (requires the Chat plugin). Administrators and users with the chat_admin role can define chat actions.
Add actions to the legacy chat window menu

You can create new actions and add them to the chat window menu.

1. Navigate to Social IT > Chat Administration > Actions.
2. Select an action to edit or click New.
3. Enter the chat action details and click Update or Submit.

The following example demonstrates how to add a chat action that appears only on windows where the user is a Help Desk Agent. The action appears on the menu as Show User Type and opens a popup window that indicates a current user of queue_agent.

- **Action Name**: Show User Type
- **Active**: Select the check box.
- **Order**: 100
- **Client Show Condition**:
  ```javascript
  answer = g_chat.getChatType() == 'queue_agent';
  ```
- **OnClick Action Script**:
  ```javascript
  alert('The current user is: ' + g_chat.getChatType());
  ```
Chat action details

You can define a chat action name and the script that runs when the action is selected.

### Chat action details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Name</td>
<td>Enter a label for the action as it appears in the menu.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate or clear the check box to deactivate the action. Only active actions may appear in the menu.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order in which the action appears in the menu. Standard menu items (such as Show Timestamps) always appear at the top of the chat menu, followed by chat actions in order.</td>
</tr>
<tr>
<td>Client Show Condition</td>
<td>Define the conditions under which this menu option appears. The show condition must set the pre-defined answer variable to a boolean value.</td>
</tr>
<tr>
<td>OnClick Action Script</td>
<td>Enter the JavaScript code that runs when the menu item is selected.</td>
</tr>
</tbody>
</table>

### Available methods associated with the g_chat variable

The g_chat variable is a legacy chat window object that is available in the Client Show Condition and OnClick Action Script of a chat action definition.

### Method Summary

The following table defines the available methods associated with this object.

<table>
<thead>
<tr>
<th>Return Object</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>getActiveUsers()</td>
</tr>
<tr>
<td></td>
<td>Returns the active users.</td>
</tr>
<tr>
<td></td>
<td>Returns:</td>
</tr>
<tr>
<td></td>
<td>Array - Returns the active users.</td>
</tr>
<tr>
<td>String</td>
<td>getChannelJID()</td>
</tr>
<tr>
<td></td>
<td>Returns the channel JID, which is a sys_id for a record chat_channel table.</td>
</tr>
<tr>
<td></td>
<td>Returns:</td>
</tr>
<tr>
<td></td>
<td>String - Returns the channel JID.</td>
</tr>
</tbody>
</table>
## Return Object

<table>
<thead>
<tr>
<th>Return Object</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td><strong>getChatType()</strong>&lt;br&gt;Determines the chat window type.&lt;br&gt;Returns:&lt;br&gt;String - Returns one of the following values that specifies the type of user:&lt;br&gt;• queue_agent: Help Desk Chat support agent&lt;br&gt;• queue_user: Help Desk Chat end user&lt;br&gt;• group_chat: The individual is a member of a chat room (multiple users)&lt;br&gt;• conversation: The individual is a member in a private chat with another user</td>
</tr>
<tr>
<td>String</td>
<td><strong>getChatQueueAgent()</strong>&lt;br&gt;Returns the <code>sys_id</code> for agent that is administering this thread.&lt;br&gt;Returns:&lt;br&gt;String - Returns the <code>sys_id</code> of the chat queue agent.</td>
</tr>
<tr>
<td>String</td>
<td><strong>getChatQueueUser()</strong>&lt;br&gt;Returns the <code>sys_id</code> for end user of the chat queue.&lt;br&gt;Returns:&lt;br&gt;String - Returns the <code>sys_id</code> of the chat queue user.</td>
</tr>
<tr>
<td>String</td>
<td><strong>getThreadID()</strong>&lt;br&gt;Returns the thread ID. This returns the same value as <code>g_chat.getChannelJID().getID()</code>.&lt;br&gt;Returns:&lt;br&gt;String - Returns the thread ID.</td>
</tr>
</tbody>
</table>

### Legacy: Help desk chat

Communicate with service desk staff using instant messaging.

**Note:** The Connect Support feature provides an updated messaging platform similar to help desk chat. The help desk chat and Connect Support features should not be used concurrently. There is no migration path from help desk chat to Connect Support.

Users can communicate directly with service desk staff using instant messaging in a ServiceNow instance (requires the Chat plugin.)

- Users access live support from the Employee Self-Service portal.
- Service desk staff provide support from the chat desktop.

### Legacy: Use help desk chat to get support

You can contact service desk staff.

2. Log in to your ServiceNow account. Only logged in users can use chat.
3. In the upper right, click the Service Desk Chat button. A chat window opens.
4. Enter your question in the text field at the bottom of the window and press Enter.
   1. A message confirms that you have entered the chat queue and indicates your position and estimated wait time.
   2. When a service desk staff member accepts your chat and begins working on your question, another message appears.
5. Chat with your service desk agent via instant messaging.
   service desk staff may lead you through troubleshooting, ask clarifying questions, or create an incident record to address your question.

**Note:** Administrators can configure Service Desk Chat to be accessible on content management (CMS) pages.

---

**Service Desk Chat Window**

**Legacy: Use help desk chat to provide support**

Staff who are assigned to chat support can provide live support via instant messaging. Administrators and users with the chat_admin role can assign chat support staff (see Set Up Chat Queues for Help Desk Chat).

To provide users with live support using chat:

1. Navigate to **Social IT > Chat** to open your chat desktop.
A chat queue agent window appears on your chat desktop for each chat queue you are assigned to. If no agent windows appear, ask an administrator to add you as a member of the assignment group for a chat queue.

The chat queue agent window displays the number of users in the queue and how long they have been waiting.

Every member of the assignment group sees the associated chat queue agent window.

2. Click **Answer Next User** to answer the next user or click **Answer** beside a specific user in the queue. A chat window opens.

Only the agent and the user can see the chat window.

Provide support via instant messaging. Chat queue agents can access additional support functions in the chat window menu:

- **Invite User**: invite another expert to assist with a support chat. An invitation appears in the favorites list of an invited user.
- **Create Incident from Chat**: create a new incident record with the initial question as the short description and the support chat as a linked chat room (accessible from the Create or Join Chat Room related link on the Incident form).

**Note**: Administrators can edit this action or add additional actions to the chat window menu.
Chat Queue Agent

Legacy: Set up chat queues for help desk chat

Help desk chat allows users to communicate directly with Service Desk staff via instant messaging in an instance.

Chat queues define the schedules, staff, and system messages for help desk chat. Administrators and users with the chat_admin role can set up chat queues.

Define a chat queue for legacy chat
How to define a chat queue for legacy chat.

Note: The Chat Queue (chat_queue) table is also used by Connect Support. Legacy chat and Connect Support should not be used concurrently.

1. Navigate to Social IT > Chat Administration > Queues.
2. Select a chat queue to edit or click New.
3. Enter the chat queue details and click Update or Submit.

Chat queue details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name that end users see as a title for the queue.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate or clear the check box to deactivate the chat queue.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>Select the group that contains the support staff for the chat queue. Every agent sees the chat queue on their chat desktop and can answer any user that is waiting in the queue. To assign staff members to the group, see Assign Service Desk Staff to a Chat Queue.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Select a schedule that defines when a queue is available (see Use Schedules). If the queue is always available, clear the field.</td>
</tr>
<tr>
<td>Question</td>
<td>Enter the initial question that end users see when they open a new Help Desk Chat. For example, How can I help you?</td>
</tr>
<tr>
<td>Confirm problem</td>
<td>(Optional) Enter the confirmation message that end users see when they enter an initial question. For example, Thank you for contacting support. Your problem has been submitted and an agent will be with you shortly.</td>
</tr>
<tr>
<td>Initial agent response</td>
<td>(Optional) Enter the message that end users see when an agent accepts their chat. For example, Thank you for waiting. I am looking into your question now and will be with you shortly.</td>
</tr>
<tr>
<td>Not available</td>
<td>Enter the message that end users see when a Help Desk Chat request is not accepted because the queue is outside its scheduled availability (defined by the Schedule field).</td>
</tr>
</tbody>
</table>

Assign service desk staff to a chat queue
Chat queue agents are Service Desk staff that are members of a chat queue's assignment group.

To assign agents to a chat queue:
1. Navigate to User Administration > Groups.
2. Select an existing assignment group or click New.
3. Enter or modify the group details (see Create a Group).
4. Right-click the header and select Save.
5. In the Group members related list, click Edit.
6. Using the slushbucket, add support staff to the group.
7. Navigate to Social IT > Chat Administration > Queues.
8. Select the chat queue for which the group provides support.
9. In the Assignment Group field, select the group.
Chat queue group

Make help desk chat accessible to an end user

Users access live support from the Employee Self-Service Portal (ESS Portal).

Users access live support from the Employee Self-Service Portal (ESS Portal). To make a Help Desk Chat queue accessible to end users, add a link to the ESS Portal (requires the Content Management Plugin).

To change the default link in the ESS header:

1. Navigate to Content Management > Headers.
2. Open Portal - Header.
3. In the Chat queue field, enter the chat queue that users access by clicking the link in the ESS header. Clear the field to remove the chat queue link.
4. Click Update.
Chat queue link

Add a custom link elsewhere on the ESS portal
How to add a custom help desk chat link on the ESS portal.

1. Navigate to **Content Management > Static HTML**.
2. Click **New**.
3. Enter a **Name**.
4. In the **Static content** field, click **Toggle HTML Source** to edit the field in HTML source mode.

5. Create a link to the desired Help Desk Chat queue (see *Link Syntax*).
6. Click **Submit**.
7. Add the new content block to the desired location on the portal (see *Adding Content to the Page*).

**Link syntax**
To open a Help Desk Chat queue from a custom link on the ESS Portal, you must call the **CustomEvent.fire** method using appropriate arguments.

To open a Help Desk Chat queue from a custom link on the ESS Portal, you must call the **CustomEvent.fire** method using appropriate arguments. Details of the API call and an example that generates an anchor link are provided below.

**API Call:**
```
CustomEvent.fire(LiveEvents.LIVE_EVENT,
LiveEvents.LIVE_WINDOW_JOIN_QUEUE_QUERY, CHAT_QUEUE_SYS_ID,
CHAT_QUEUE_SYS_NAME);
```

where the variables are:
- **CHAT_QUEUE_SYS_ID**: Specifies the sys_id for the chat queue.
• **CHAT_QUEUE_SYS_NAME**: Specifies the name of the chat queue (must match the value the Name field of the chat queue record).

Example: This example creates an anchor link that opens the Help Desk Chat queue.

```html
<a href="#" onclick="CustomEvent.fire(LiveEvents.LIVE_EVENT, LiveEvents.LIVE_WINDOW_JOIN_QUEUE_QUERY, 'c54f0a0b452db84664f409c79c', 'Help Desk Chat'); return false;">
  Help Desk Chat
</a>
```

Monitor chat queues
Chat queues can yield useful Key Performance Indicators (KPI) for evaluating support effectiveness.

- **Queue Wait Time**: amount of time a user waits in the queue before a help desk agent accepts the request.
- **Percentage of Chats Abandoned**: users that exit the queue before an agent responds (user stopped waiting).
- **Percentage of Chats Accepted**: requests that are answered by an agent.

**Note**: This information is not calculated automatically. Administrators may calculate these values based on data collected by chat queues.

Monitor help desk chat tasks
Help Desk Chat requests are tracked in the Chat queue entries table, which appears as a related list on the associated chat queue record.

Help Desk Chat requests are tracked in the Chat queue entries table, which appears as a related list on the associated chat queue record. Because this table extends the Task table, administrators can take advantage of core task functionality. For example, administrators can attach Service Level Agreements (SLAs) to chat queue entries to evaluate the response time of Help Desk Chat support.

Legacy Notify
Legacy Notify enables organizations with a Twilio account to send notifications using text and voice messages.

**Note**: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

Legacy Notify also allows conference calls between ServiceNow users to enable quick communications.

When Legacy Notify is active, you can configure ServiceNow to automatically generate and send notifications to selected contacts, for instance when a new incident communication plan is raised in the incident communications management process.

Users with the notifynow_admin role can set properties and monitor message and conference call activities.
Legacy Notify has been implemented for use within Incident Communications Management. Refer to the Notify API documentation for details on how to implement Legacy Notify for use within other ServiceNow applications.

**Working with Legacy Notify**

Follow this process to enable and use Notify.

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Set up a Twilio account to provide phone connectivity for Notify.
2. Activate Notify.
3. Configure Notify to use Twilio.
4. Begin using Notify immediately within Incident Communications Management.
5. Use the Notify API with other ServiceNow applications to provide SMS, voicemail, email, and conference calls for those applications.

**View a Legacy Notify question**

Questions contain a response action and a set of response choices. Use these questions to simplify communications. Then, you can monitor the resulting communication thread.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

For example, the process can be used to ask members of a specific on-call group to acknowledge or reject an incident. Depending on the answer from the first team member, the incident is assigned to that person or an SMS question is sent to the next on-call member. In this example, the questions are used as part of a workflow.

To see a list of predefined questions both Notify and On-Call Scheduling need to be active.

1. Navigate to Notify > Questions.
2. Click the question On-Call responsibility Accept/Reject to see the question details.
3. Click the **Notify Response Choices** related list to view or edit the choices. The person who receives the SMS question can either choose to accept or reject the assignment. If the assignment is accepted, the **Response action** can be that the incident is actually assigned to that person. The response action is a script that you can modify or replace. If the assignment is rejected, an SMS question may be sent to the next person in the escalation chain, and so on. You can combine questions with a workflow to automate a process like on-call scheduling escalation.

**Notify Question**

Create a question in Legacy Notify

Define a question that can be sent to users.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to **Notify > Questions**.
2. Click **New**.
3. Fill in the fields, as appropriate.
### Notify New Question form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a description of the question.</td>
</tr>
<tr>
<td>Question</td>
<td>Enter the question you want to send. You can enter variables in the question with the <code>{ }</code> tags, for example, <code>{0}</code>. When using more than one variable, use consecutive numbering. When using multiple variables, reference them by specifying their position in the parameter list, starting from <code>{0}</code>. The variable is picked up by the script and translated into, for example, an incident or a problem number.</td>
</tr>
<tr>
<td>Params</td>
<td>Enter parameters which map to the fields on the record that the workflow was triggered for. This enables the message to show dynamic data. Multiple parameters should be separated by a comma. For example, <code>number</code>, shows the incident number in case the workflow was triggered from an incident. A second parameter could be, for example <code>short_description</code>.</td>
</tr>
<tr>
<td>Response Action</td>
<td>Select the action that must be taken. This is a script that can be modified, or you can create a new script by clicking the search button and selecting New. Several examples of scripts are shown. Write your own script and click Submit.</td>
</tr>
</tbody>
</table>

4. Click Submit.

### Create a new response choice in Legacy Notify

Create a new response choice to allow users to select that response for a Notify question.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Questions.
2. Open the notify question you have just created.
3. Click New to create a new notify response choice.
4. Fill in the fields, as appropriate.

### Notify New Response Choice form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>The abbreviation for the response choice in the text message. For example, ACC for accept or REJ for reject.</td>
</tr>
<tr>
<td>Text</td>
<td>The text displayed for this response choice.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating the order in the list of response choices. Choices with lower order numbers are listed before choices with higher order numbers.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

### View Legacy Notify messages

Applications implementing Notify, such as Incident Communications Management, can send Short Message Service (SMS) text messages to relevant contacts under predefined conditions, such as when a new incident communication plan has been created.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see [Notify](#).

1. Navigate to **Notify > Messages**.
2. Click a message to see the message details.

![SMS Outbox](#)

### SMS Outbox Details

### View Legacy Notify conversations

The Notify Conversation (notifynow_conversation) table tracks bi-directional communications and adds the ability to have more than one active conversation with the same phone number at the same time.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see [Notify](#).

The thread number is combined with the phone number to link the SMS or email response to the correct conversation. Conversations remain active until a response is received or until they are...
automatically deactivated after the thread release time runs out. The default thread release time is 10 days. To change this value, add the `nn.thread.release.age` property.

1. Navigate to Notify > Conversations.
2. Click a conversation record to see the conversation details.

<table>
<thead>
<tr>
<th>Table:</th>
<th>Incident [incident]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Thread:</td>
<td>1</td>
</tr>
<tr>
<td>State:</td>
<td>Ended</td>
</tr>
<tr>
<td>Answer:</td>
<td>f95b02eb271100a0d4d45</td>
</tr>
<tr>
<td>Source:</td>
<td>Incident: INC0000049</td>
</tr>
</tbody>
</table>

### Notify Conversation Details

The State of the conversation can have one of the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ended</td>
<td>The conversation has been completed.</td>
</tr>
<tr>
<td>Failed</td>
<td>The conversation has failed.</td>
</tr>
<tr>
<td>Pending</td>
<td>The SMS or email is waiting to be sent.</td>
</tr>
<tr>
<td>Sent</td>
<td>The SMS or email has been sent.</td>
</tr>
<tr>
<td>Unanswered</td>
<td>The SMS or email has not been answered.</td>
</tr>
</tbody>
</table>

**Note:** The mode of conversation cannot be changed during one conversation thread. For example, you cannot switch between SMS and email during one conversation.

### View Legacy Notify conference calls

Applications that use Notify, such as Incident Communications Management, can launch and maintain conference calls between involved parties.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Conference Calls.
2. You can also access conference call information from the relevant record, such as the Conference Calls related list in an incident communication plan record.
3. Click a conference call in the list to view details.
Notify Conference Call Details

3. Click the arrow beside the check box to expand a Participant entry. This shows participant session information, including details of the conference calls that the participant has been involved in.

4. Click a Participant name to see more detailed information about that participant.
Legacy public conference calls

A Notify conference call can be public.

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

The Private field on the conference call record indicates if a call is private (selected) or public (not selected). By default, all calls created automatically, such as those created through Incident Communications Management, are public. You can create private calls using the Notify API initiateConferenceCall method.

When created, public conference calls generate an associated Code which is sent via SMS to all invited participants. These participants can distribute the code to allow other users to join the public call. An administrator can control the format of the code using the property glide.notifynow.conference_call.code.pattern. Anyone with the code can connect to a public conference call using one of these methods:

- By calling the Twilio phone number and entering the code for that conference call.
- By sending the code in an SMS message to the Twilio phone number. Participants that join a public call this way are considered ad-hoc participants, indicated on the participant record.

Administering Legacy Notify

An administrator can set up Notify, manage Notify properties and conference call participants.
Configuring legacy Notify to use the Twilio service

Each ServiceNow instance using Notify requires a valid Twilio account and telephone number. Refer to the Twilio documentation for detailed instructions.

After the Twilio account is set up, perform the following to use that account with Notify:

- Associate the account with Notify
- Configure Twilio with ServiceNow endpoints

Associate a Twilio account with Legacy Notify

Associate a Twilio account with your instance to use that account for legacy Notify.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to **Notify > Administration > Properties.**
2. Enter the **AccountSID**, **AuthToken** and **phone number** values. These values can be obtained from the Twilio dashboard:
Twilio Dashboard

When the Twilio account details are entered in the Notify Properties page, the account status is updated.

3. (Optional) To use Notify on multiple ServiceNow instances, activate Notify on each instance and create a separate Twilio account and telephone number for each instance.

Note: Some telephone numbers are voice capable, but not SMS capable. This is shown in the Notify properties with relevant messages. Two methods are available to check this: `isSMSCapable` and `isVoiceCapable`.

Configuring the Twilio service with endpoints in legacy Notify

In order for the Twilio service to receive Notify commands, the Request URL field value for every Twilio telephone number must point to the ServiceNow instance that uses Notify with that Twilio telephone number.

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

To set these values, do one of the following:

- Define them manually in the Twilio service dashboard.
- Ensure the fields are blank in the Twilio service dashboard, then open the Notify Properties page. Notify automatically configures the correct endpoints if the Request URL fields are blank.

Set these values from within the Twilio service dashboard.
Twilio Numbers Dashboard

The notifyusa values underlined in the image should be replaced with your ServiceNow instance name, for:

- Voice Request URL: https://notifyusa.service-now.com/NotifyNowCallProcessor.do
View and edit legacy Notify properties

You can view and edit Notify properties.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Administration > Properties.
2. Fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Status</td>
<td>Information showing the status of the associated Twilio account.</td>
</tr>
<tr>
<td>Twilio AccountSID</td>
<td>The Twilio account AccountSID, acting as the user name for that account.</td>
</tr>
<tr>
<td>Twilio AuthToken</td>
<td>The Twilio account AuthToken, acting as the password for that account. See Associating a Twilio Account.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Twilio SMS and voice enabled phone number</td>
<td>The Twilio number that Notify will use. Telephone numbers must be entered in the E.164 format and need to exist under the Twilio account. See Associating a Twilio Account.</td>
</tr>
<tr>
<td>Number of frequent conference call participants to be displayed</td>
<td>The number of people to display in the frequently called list.</td>
</tr>
<tr>
<td>Voice</td>
<td>The voice used for Notify communications. Select <strong>woman</strong> or <strong>man</strong> to provide female or male voice support for English, Spanish, French, German, and Italian. Select <strong>alice</strong> to provide female voice support for a wider range of languages.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

**Legacy Notify account status messages**

Account status messages are visible on the Notify Properties page.

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Your account is ready for use</td>
<td>Notify is correctly configured and ready for use.</td>
</tr>
<tr>
<td>Your Twilio AccountSID or AuthToken are not valid</td>
<td>An incorrect value has been entered in the AccountSID or AuthToken fields in the Notify properties.</td>
</tr>
<tr>
<td>Your Twilio phone number is not valid</td>
<td>Incorrect telephone number information is defined in the Notify properties.</td>
</tr>
<tr>
<td>Your Twilio phone number does not have properly configured endpoints</td>
<td>The Request URL endpoint settings have not been properly configured.</td>
</tr>
<tr>
<td>Your Twilio account is not configured properly</td>
<td>One or more of your Twilio account settings is incorrect. Open the Twilio dashboard and check the settings.</td>
</tr>
</tbody>
</table>

**Manage Legacy Notify conference call participants**

As a Notify administrator, you can mute, unmute, and kick participants on a conference call.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see **Notify**.

Muting a participant prevents that person from speaking on the conference call but does not notify any participants, including the muted participant. Kicking a participant removes that person from the conference call and sets the **Response** field for the participant session to kicked.

1. Navigate to **Notify > Conference Calls**.
2. Select an active conference call.
3. In the **Notify Conference Call Participants** related list, select a participant.
4. Click the button for the action you want to perform, such as **Mute** to mute the participant.
You can perform these actions for multiple participants as a single operation using the Actions on selected rows choice list on the Notify Conference Call Participants related list.

**Installed with Legacy Notify**

Activating the Notify plugin adds or modifies tables, user roles, script includes, and other components.

*Note:* This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

**Tables**

Notify adds or modifies the following tables.

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Answer [notifynow_answer]</td>
<td>Information for possible answers to the SMS question sent.</td>
</tr>
<tr>
<td>Conversation [notifynow_conversation]</td>
<td>Information for the conversation thread.</td>
</tr>
<tr>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Information for conference call records.</td>
</tr>
<tr>
<td>NotifyNow Participant Session [notifynow_participant_session]</td>
<td>Information regarding conference call sessions for individual conference call participants.</td>
</tr>
<tr>
<td>Participant [notifynow_participant]</td>
<td>Information regarding individual conference call participants.</td>
</tr>
<tr>
<td>Question [notifynow_question]</td>
<td>Information for the possible questions in the SMS.</td>
</tr>
<tr>
<td>Response_action [notifynow_response_action]</td>
<td>Information for the notify response action associated with the question.</td>
</tr>
<tr>
<td>Response_choice [notifynow_response_choice]</td>
<td>Information for the notify response choice associated with the question.</td>
</tr>
<tr>
<td>SMS Messages [notifynow_message]</td>
<td>Information for the actual SMS messages sent.</td>
</tr>
</tbody>
</table>

**Properties**

Notify adds the following system properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.notifynow.frequent_participant_count</td>
<td>The number of frequent conference call participants to be displayed.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>glide.notifynow.voice</td>
<td>The voice used for Notify communications.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.accountsid</td>
<td>The Twilio account AccountSID.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.token</td>
<td>The Twilio account AuthToken.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.phonenumber</td>
<td>The Twilio number that Notify will use.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.answering_machine_detection</td>
<td>A boolean flag to enable or disable answering machine detection. Set to true to use answering machine detection. Set to false to continue the call.</td>
</tr>
<tr>
<td>nn.thread.release.age</td>
<td>The number of days after which the conversation thread release time runs out. Defaults to 10 days.</td>
</tr>
<tr>
<td>glide.notifynow.conference_call.code.pattern</td>
<td>The pattern used to generate a conference call code for public conference calls. Number signs (#) in the pattern are replaced with random numbers when a code is generated.</td>
</tr>
<tr>
<td>glide.notifynow.fix_invalid_phone_number</td>
<td>A boolean flag to enable or disable automatic correction of invalid phone numbers. Twilio might incorrectly prefix non-US phone numbers with 1. When this property is true, the instance automatically removes the 1 for non-US calls. When this property is false, you might be incorrectly identified when reconnecting to a call using SMS.</td>
</tr>
</tbody>
</table>

**User Roles**

Notify adds the following user roles.

**User Roles**

<table>
<thead>
<tr>
<th>Role</th>
<th>Contains Roles</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifynow_admin</td>
<td>None</td>
<td>Administrator with privileges for Notify functionality.</td>
</tr>
</tbody>
</table>

**UI Actions**

Notify adds the following UI actions.
UI Actions

<table>
<thead>
<tr>
<th>UI Action</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initiate Conference Call</td>
<td>Incident Communication Plan</td>
<td>Adds a link to the Incident Communication Plan form, if that plugin is activated, which displays a dialog box for starting a conference call with selected participants.</td>
</tr>
<tr>
<td></td>
<td>[incident_alert]</td>
<td></td>
</tr>
<tr>
<td>Invite to Conference Call</td>
<td>NotifyNow Conference Call</td>
<td>Adds a link to the Notify Conference Call form which displays a dialog box for adding more users to an active conference call.</td>
</tr>
<tr>
<td></td>
<td>[notifynow_conference_call]</td>
<td></td>
</tr>
</tbody>
</table>

Script Includes

Notify adds the following script includes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IncidentAlertConferenceCall</td>
<td>A utility JavaScript Prototype class allowing users to initiate the conference call and add other users to the conference call. Should be used in conjunction with the slushbucket UI page (notifynow_participant).</td>
</tr>
</tbody>
</table>

Business Rules

Notify adds the following business rules.

<table>
<thead>
<tr>
<th>Business Rule Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMS on new Incident Communication Plan</td>
<td>Incident Communication Plan</td>
<td>Sends an SMS to any default contacts added when an incident communication plan record is created.</td>
</tr>
<tr>
<td></td>
<td>[incident_alert]</td>
<td></td>
</tr>
<tr>
<td>Conference Call Allowed</td>
<td>Incident Communication Plan</td>
<td>Displays or hides the initiate conference call UI action by storing true or false in g_scratchpad.conferenceCallAllowed.</td>
</tr>
<tr>
<td></td>
<td>[incident_alert]</td>
<td></td>
</tr>
<tr>
<td>Business Rule Name</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------</td>
<td>--------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Update Conference Call Started IA Activity</td>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Logs when a conference call started by writing to an incident communication plan's comment field if the source record is from the incident_alert table.</td>
</tr>
<tr>
<td>Update Conference Call Finished IA Activity</td>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Logs when a conference call ended and what actions the conference call participants took by writing to an incident communication plan's comment field if the source record is from the incident_alert table.</td>
</tr>
</tbody>
</table>

**Workflow Activities**

Notify adds the following workflow activities.

**Workflow Activities**

<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Activity Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send Notify SMS</td>
<td>Notify</td>
<td>Sends an SMS message (maximum 1600 Characters) to an E.164 compliant mobile phone number of the selected recipients and/or groups.</td>
</tr>
<tr>
<td>Send Notify SMS Question</td>
<td>Notify</td>
<td>Sends predefined SMS Question message (maximum 1600 Characters) to an E.164 compliant mobile phone number of the selected recipients and/or groups. This is one of two main activities for workflow On-Call Assign by Acknowledgement. In a predefined message, the recipient is asked to assign himself to a newly created incident. The same message also contains predefined answers.</td>
</tr>
<tr>
<td>Activity Name</td>
<td>Activity Category</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Send Email Question</td>
<td>Notify</td>
<td>Sends email generated from email template containing notification that recipient is the current On-call resource for a newly created task. This is one of two main activities for the workflow On-Call Assign by Acknowledgement. In a predefined message, the recipient is asked to assign himself to a newly created incident. The email contains two links that enable the user to accept or reject assignment.</td>
</tr>
</tbody>
</table>

### Legacy Notify API

The legacy Notify API provides functionality for sending emails, sending SMS messages, and setting up conference calls.

Use this when you want to use Notify functionality with applications on your system.

**Note:** This API is included with the legacy Notify functionality. For APIs included in the current Notify feature, see the Notify, NotifyAction, NotifyPhoneNumber, and NotifyClient APIs.

### NotifyNow - getReadyState()

Indicates whether Notify is set up correctly or not.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message False when trying to run the function in a script.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if Notify is set up correctly, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
gs.log(((nn.getReadyState()) ? "OK" : "NOT OK"));
```
NotifyNow - getStatus()

Returns the current status of Notify configuration.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message Unauthorized when trying to run the function in a script.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>One of the possible status messages.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_NUMBER_MESSAGE</td>
<td>The account does not have a telephone number set up. Ensure that you set up the telephone number for the account.</td>
</tr>
<tr>
<td>NO_ENDPOINTS_MESSAGE</td>
<td>The account does not have its endpoints set up correctly. Ensure that you set up the endpoints for the account.</td>
</tr>
<tr>
<td>ACCOUNT_OK_MESSAGE</td>
<td>The account is active and ready for use.</td>
</tr>
<tr>
<td>ACCOUNT_NO_AUTH</td>
<td>The Twilio AuthToken is not valid.</td>
</tr>
<tr>
<td>ACCOUNT_NOT_CONFIGURED</td>
<td>Twilio AccountSID or AuthToken is not valid.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
gs.log(nn.getStatus());
```

NotifyNow - initiateConferenceCall(String() conferenceCallParticipants, String conferenceCallTitle)

Initiate a new conference call.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallParticipants</td>
<td>String</td>
<td>One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.</td>
</tr>
<tr>
<td>conferenceCallTitle</td>
<td>String</td>
<td>Title of the conference call. This parameter has a maximum length of 40 characters.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The conference call record, or null if there was an error.</td>
</tr>
</tbody>
</table>

This initiates a conference call with E.164-compliant phone numbers for participants, without the optional source record parameter and and does not send any conference call details via SMS or email.

```javascript
var participants = ['+31205655548', '+31205655552', '+31652825393'];
// set up conference call
var nn = new SNC.NotifyNow();
var conferenceCall = nn.initiateConferenceCall(participants, "testing12");
gs.log('started conference call: ' + conferenceCall.getUniqueValue());
```

**NotifyNow - initiateConferenceCall(String() conferenceCallParticipants, String conferenceCallTitle, GlideRecord sourceRecord, Boolean private)**

Initiate a new conference call.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallParticipants</td>
<td>String</td>
<td>One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.</td>
</tr>
<tr>
<td>conferenceCallTitle</td>
<td>String</td>
<td>Title of the conference call. This parameter has a maximum length of 40 characters.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>Source record to associate to the conference call such as an incident or problem number.</td>
</tr>
<tr>
<td>private</td>
<td>Boolean</td>
<td>Value to control if a conference call is private. This value defaults to false.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The conference call record, or null if there was an error.</td>
</tr>
</tbody>
</table>

This initiates a conference call with participants that have a E.164-compliant phone number and participants from the sys_user table and sends conference call details via SMS and email to all participants.

```javascript
// define phone number participants
var participants = ["+31205655548", "+31205655552", "+31652825393"];

// we also want to add two Dutch sys_user participants
var user = new GlideRecord("sys_user");
user.addNotNullQuery("mobile_phone");
user.addQuery("mobile_phone", 'STARTSWITH', '316');
user.setLimit(2);
user.query();

// add users to the participant array
while (user.hasNext() && user.next()) {
    gs.log('adding user ' + user.getValue('name') + ' with phone number ' + user.getValue('mobile_phone') + ' to the participant array');
    participants.push(user.getUniqueValue());
}

// define a source record to associate with the conference call
var source = new GlideRecord("cmdb_ci");
source.query("asset_tag", "P1000167");
if (source.hasNext() && source.next()) {
    // set up conference call
    var nn = new SNC.NotifyNow();
    var conferenceCall = nn.initiateConferenceCall(participants, "testing 1 2", source);

    // check if the conference call was successfully created
    if (conferenceCall != null) {
        gs.log('started conference call: ' + conferenceCall.getUniqueValue());
    } else {
        gs.log('could not start the conference call :(');
    }
```
NotifyNow - isCallable(String participant)
Determines whether a user is callable or not.
A user must have a valid phone number to be callable. A user who is already in an active session
is not callable.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>String or GlideRecord</td>
<td>A sys_user or notifynow_participant record, or an E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Whether this participant can be called or not.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
gs.log('by number: ' + nn.isCallable('+31612345678'));

var user = GlideRecord('sys_user');
user.query('sys_id', '13d39544eb5201003cf587b9d106fea9');
if (user.hasNext() && user.next())
  gs.log('by user: ' + nn.isCallable(user));

var participant = GlideRecord('notifynow_participant');
participant.query('sys_id', '33b11430eb1201003cf587b9d106feb9');
if (participant.hasNext() && participant.next())
  gs.log('by participant: ' + nn.isCallable(participant));
```

NotifyNow - isSMSCapable()
Checks if the telephone number associated with the Twilio account is capable of sending SMS messages.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the telephone number associated with the Twilio account is capable of sending SMS messages.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('The twilio number is SMS capable: ' + ((new SNC.NotifyNow().isSMSCapable()) ? 'yes' : 'no'));
```

### NotifyNow - isSMSCapable(String userID)
Checks if a user is able to send SMS messages.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of the user you want to check for an SMS-capable phone number.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>If the user can send SMS messages.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('the user is able to send SMS messages (e.g. has a SMS device): ' + ((new SNC.NotifyNow().isSMSCapable('<user sys_id>')) ? 'yes' : 'no'));
```

### NotifyNow - isVoiceCapable()
Checks if the telephone number associated with the Twilio account is capable of setting up phone calls.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the telephone number associated with the Twilio account is capable of setting up phone calls.</td>
</tr>
</tbody>
</table>

```
gs.log('the Twilio number is Voice capable: ' + ((new SNC.NotifyNow().isVoiceCapable()) ? 'yes' : 'no'));
```

**NotifyNow - isVoiceCapable(String userID)**

Checks if a user is able to make voice calls.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of the user you want to check for a voice-call capable phone number.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Whether the user has a voice-call capable phone number.</td>
</tr>
</tbody>
</table>

```
gs.log('the user is able to send SMS messages (e.g. has a SMS device): ' +
    ((new SNC.NotifyNow().isVoiceCapable('someuserid')) ? 'yes' : 'no'));
```

**NotifyNow - kick(GlideRecord participant)**

Removes a participant from a conference call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The conference call participant to remove from the call.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was removed, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // kick participant
    result = new SNC.NotifyNow().kick(participant);
    gs.log('participant kicked: ' + result);
}
```

NotifyNow - mute(GlideRecord participant)

Mutes a participant on a conference call.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The conference call participant to mute.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was muted, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // mute participant
    result = new SNC.NotifyNow().mute(participant);
    gs.log('participant muted: ' + result);
}
```

NotifyNow - umute(GlideRecord participant)

Unmutes a participant on a conference call.
### Parameters

| Name        | Type         | Description                                               |
|-------------|--------------|---------------|----------------------------------------------------------|
| participant | GlideRecord  | The muted conference call participant to unmute.         |

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was unmuted, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // unmute participant
    result = new SNC.NotifyNow().unmute(participant);
    gs.log('participant unmuted: ' + result);
}
```

### NotifyNow - sendEmailQuestion

**Send an email question to an email address.**

The `sendEmailQuestion` method produces a question body and requires users to click a link to indicate their choice.

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // unmute participant
    result = new SNC.NotifyNow().unmute(participant);
    gs.log('participant unmuted: ' + result);
}
```

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>emailAddress</td>
<td>String</td>
<td>Email address to send the question to.</td>
</tr>
<tr>
<td>question</td>
<td>String or GlideRecord</td>
<td>The question record to send or the sys_id of a question record.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>An optional source record to associate to the SMS question, such as an incident.</td>
</tr>
<tr>
<td>emailSubject</td>
<td>String</td>
<td>Optional text to override the default email subject.</td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
<td></td>
</tr>
<tr>
<td>String</td>
<td>The conversation sys_id.</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates using the default email subject.

```javascript
var user = GlideRecord("sys_user");
user.get("email", "someone@somedomain.com");
new SNC.NotifyNow().sendEmailQuestion(user.getValue('email'),
  "b6b34500bf3111003cf585ce2c0739ce", user);
```

This example uses dot-walking and specifies a source record and email subject.

```javascript
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com",
  "b6071733bf1111003cf585ce2c07390f", current,
  "Please answer this question");
```

This example uses dot-walking and specifies an email subject but no source record.

```javascript
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com",
  "b6071733bf1111003cf585ce2c07390f",
  "Please answer this question");
```

**NotifyNow - sendSMS(String phoneNumber, String smsBody)**

Sends an SMS message to an E.164-compliant mobile phone number.

Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>smsBody</td>
<td>String</td>
<td>The message to send, maximum 1600 characters.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
new SNC.NotifyNow().sendSMS("+31612345678", "This is a message without source record");

NotifyNow - sendSMS(String phoneNumber, String smsBody, GlideRecord source)

Sends an SMS message to an E.164-compliant mobile phone number.
Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>smsBody</td>
<td>String</td>
<td>The message to send, maximum 1600 characters.</td>
</tr>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>The source record to associate with this SMS message.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

var source = new GlideRecord("my_table");
source.query("my_field", "my_value");

if (source.hasNext() && source.next()) {
    // send a text message
    var nn = new SNC.NotifyNow();
    var message = "this is just a test";
    var number = "+31612345678";
    nn.sendSMS(number, message, source);
}

This example uses dot-walking and the current record as the source record.

new SNC.NotifyNow().sendSMS("+31612345678", "this is a test", current);
**NotifyNow - sendSMSQuestion(String phoneNumber, String question, GlideRecord sourceRecord)**

Sends an SMS question.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>An E.164-compliant phone number to send the message to.</td>
<td></td>
</tr>
<tr>
<td>question</td>
<td>String or GlideRecord</td>
<td>The question record to send or the sys_id of a question record.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>An optional source record to associate to the SMS question, such as an incident.</td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The conversation sys_id, or null if the SMS was not sent successfully.</td>
</tr>
</tbody>
</table>

```javascript
var question = new GlideRecord("notifynow_question");
question.query();

// get the first question
if (question.hasNext() && question.next()) {
    // send the sms question
    var number = "+31612345678";
    var nn = new SNC.NotifyNow();
    nn.sendSMSQuestion(number, question.getUniqueValue(), current);
}
```

**NotifyNow - addConferenceCallParticipant(String conferenceCall, String participant)**

Adds ad-hoc users to an ongoing conference call.

When the method is called with a phone number for the participant parameter and there is exactly one sys_user record that matches the phone number, that sys_user record will be related to the participant. The participant's phone number field will be left blank because the phone number is in the sys_user record. If there are several sys_user records that match the phone number, or if there are no results, the participant's phone number field will be filled in, and there will be no stored reference to sys_user because the user is not known.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCall</td>
<td>String or GlideRecord</td>
<td>The sys_id or GlideRecord of an active conference call.</td>
</tr>
<tr>
<td>participant</td>
<td>String or GlideRecord</td>
<td>The sys_id or GlideRecord of a user with an E.164-compliant phone number, or an E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The participant record of the new participant that was added to the conference call.</td>
</tr>
</tbody>
</table>

// add a new participant by conference call sys_id (string) and phone number (string)
var nn = new SNC.NotifyNow();
gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', '+31612345678'));

// add a new participant by conference call sys_id (string) and user record (GlideRecord)
var user = new GlideRecord('sys_user');
user.query('user_name', 'myUserName');
if (user.hasNext() && user.next()) {
    var nn = new SNC.NotifyNow();

    gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', user));
    // you could have added the user by sys_id as well:
    // nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', user.getValue('sys_id'));
} else {
    gs.log('no such user');
}

// add a new participant by conference call record (GlideRecord) and phone number (string)
var conferenceCall = new GlideRecord('notifynow_conference_call');
conferenceCall.query('title', 'IA0001001');
if (conferenceCall.hasNext() && conferenceCall.next()) {
    var nn = new SNC.NotifyNow();

    gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', user.getValue('sys_id')));
gs.log(nn.addConferenceCallParticipant(conferenceCall, '+31612345678'));
} else {
    gs.log('no such conference call');
}

**NotifyNow - convertLocalPhoneNumberToE164(String userId, String phoneNumber)**

Converts a local phone number to an E.164-compliant phone number based on a user's location.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userId</td>
<td>String</td>
<td>The sys_id of a sys_user record to get location information from.</td>
</tr>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The phone number.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

var localPhoneNumber = '01784 221600';
var userName = 'Heath Vanalphen';

var user = new GlideRecord('sys_user');
user.get('name', userName);
var E164Number = new SNC.NotifyNow().convertLocalPhoneNumberToE164(user.getUniqueValue(), localPhoneNumber);
gs.log('converted: ' + localPhoneNumber + ' to ' + E164Number + ' based on ' + user.getValue('name') + '\''s location (' + user.getValue('location') + ')');

**NotifyNow - getConferenceCallParticipants(String conferenceCallId, Boolean isCallable)**

Returns all participants for a conference call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallId</td>
<td>String</td>
<td>The ID of the conference call.</td>
</tr>
</tbody>
</table>
### Name

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>isCallable</td>
<td>Boolean</td>
<td>An optional flag to return either only the users you can call (true) or those you cannot call (false).</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The participants</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106fe37');

while (user.hasNext() && user.next()) {
    if (user.getValue('participant')) {
        gs.log('user: ' + user.getValue('sys_id'));
    } else {
        gs.log('phone number: ' + user.getValue('phone_number'));
    }
}
```

```javascript
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106fe37', true);

while (user.hasNext() && user.next()) {
    if (user.getValue('participant')) {
        gs.log('user: ' + user.getValue('sys_id'));
    } else {
        gs.log('phone number: ' + user.getValue('phone_number'));
    }
}
```

```javascript
var conferenceCallId = '32b11430eb1201003cf587b9d106feb8';

// get all participants
gs.log('all conference call participants:');
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants(conferenceCallId);
gs.log(user);

// get all callable participants
gs.log('all conference call participants we can call:');
user = nn.getConferenceCallParticipants(conferenceCallId, true);
gs.log(user);
```
// get all un callable participants
gs.log('all conference call participants that are already in an
active session and whom we cannot call:');
user = nn.getConferenceCallParticipants(conferenceCallId,
false);
gs.log(user);

NotifyNow - getFrequentlyCalledUsers(Number limit)

Returns a number of frequently-called users, up to the limit parameter, in alphabetical order.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>limit</td>
<td>Number</td>
<td>The maximum number of results.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The frequently called users in alphabetical order.</td>
</tr>
</tbody>
</table>

var nn = new SNC.NotifyNow();
var fc = nn.getFrequentlyCalledUsers(10);

while (fc.hasNext() && fc.next()) {
    gs.log("got user " + fc.getValue('name') + ' - ' +
    fc.getValue('sys_id'));
}

NotifyNow - getPreferredE164VoiceNumber(GlideRecord user)

Returns a user's preferred E.164-compliant phone number for voice calls.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number or null.</td>
</tr>
</tbody>
</table>
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164VoiceNumber(userID);
gs.log('the preferred phone number for setting up voice calls is ' + E164Number + ' for user with id: ' + userID);

NotifyNow - getPreferredE164SMSNumber(GlideRecord user)
Returns a user's preferred E.164-compliant phone number for SMS messages.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number or null.</td>
</tr>
</tbody>
</table>

var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164SMSNumber(userID);
gs.log('the preferred phone number for sending SMS notifications is ' + E164Number + ' for user with id: ' + userID);

NotifyNow - getPreferredEmailAddress(GlideRecord user)
Returns a user's preferred email address

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the email address from.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The email address or null.</td>
</tr>
</tbody>
</table>
Live Feed

Live Feed is a social IT application that provides a place to post and share content in a ServiceNow instance.

Live Feed content forms a searchable knowledge source for sharing information within an organization. Main features include the following:

- Users can post, reply to, and rate messages, including links and images.
- Administrators can set up automatic messages that are generated when specific records are updated throughout the system.
- Users can subscribe to receive email notifications when new messages are posted.
- Users who take advantage of the accessibility options in the platform can tab through a live feed to navigate.

Live feed includes different types of feeds.
Note: Live Feed v2 is active for all new instances by default. If you are upgrading from an earlier version of ServiceNow, you need to activate live feed v2 to use these features.

Live feed can be domain separated at the data level only. For more information on live feed and domain separation, see Domain separation in Live Feed.

Live Feed browser support

The Live Feed v2 plugin does not support Internet Explorer 7 through 9.

Users who access the instance from those browser versions can use Live Feed v1 functionality.

Users who access the instance from browsers that are compatible with HTML5 can use Live Feed v2 functionality.

Activate Live Feed

Live Feed is active for all instances. An administrator can activate the Live Feed plugin if it is not already active.

1. Navigate to System Definition > Plugins.

   A banner notifies you that you're in the All Applications page, which contains plugins and ServiceNow Store applications.

   Note: To redirect to the legacy list view for plugins, click the link.

2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.

   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

   - If you're certain that you have the correct plugin, click Install, then in the Activate Plugin dialog box, click Activate.
To view plugin details before activation:
1. Click the plugin name.
2. On the form, click the Activate/Update related link.
3. In the dialog box, review the dependent plugins.
   If your plugin requires dependent plugins, they're activated automatically when you activate your plugin if they're not active already.
4. If demo data is available and you want to install it, click Load demo data.
   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.
5. Click Activate.

Administer live feed

Administrators and users with the live_feed_admin role can configure live feed security and provide access to live feed from content management pages. Administrators can also set up live feed table notifications.

Document feeds

A document feed is a live feed group that is associated with a record, such as an incident or change.

Document feeds allow users to work on tasks and other records through the live feed interface. Users can post messages in live feed that are automatically maintained as comments or work notes on the record, if the record has these journal fields.

The benefits of using document feeds include the following.

- Improving communication between users working on the same record.
To use document feeds, activate the Live Feed Document plugin, which is active by default in new instances. See Use live feed to work on records to learn how to use this feature.

The system automatically creates a document group for the feed when a user follows or shows a record on live feed. The system also creates a document group when a user creates a new record on a table that has live feed enabled.

The following list describes features of the document feed group.

- Is unlisted; it does not appear when users view all groups on live feed.
- Automatically approves membership for every user who can access the record.
- Uses the record number as the group name.
- Uses the record short description as a group description.
- Maintains all messages posted to live feed on the record, if the record has a journal field for comments. If the record has a standard text field for comments, each live post overwrites the field value.
- Maintains all messages posted on the record in live feed if the record has a journal field for comments. When the group is created, existing messages are added to the document feed.

A user who participates in live feed becomes a member of the group.

Add a live feed UI action on a table

You can add UI actions on a table to allow users to follow records in live feed.

Role required: ui_action_admin or admin

1. Navigate to System Definition > UI Actions.
2. Open one of the live feed UI actions, for example, the Follow on Live Feed list UI action.
3. In the Table field, select the table name.
4. Right-click the header and select Insert to create a copy of the UI action for the desired table.
5. Repeat steps 1 – 4 for all live feed UI actions.

Configure document feeds

You can configure a table to support document feeds.

Role required: personalize_dictionary or admin

Configuring a table to support document feeds includes the following steps:

1. Add live feed to a form header.
2. Add Follow on Live Feed and Show Live Feed as list and form UI actions.

Security configuration for document feeds

Document feeds honor the access control rules (ACLs) for the associated record. Users can only view messages on the document feed if they have access to the same information on the record. Consider the following examples.

- If an ACL allows a user to read and create comments on an incident, then the user can view and add messages posted as comments on the incident feed.
• If an ACL restricts a user from reading work notes, then the user cannot view messages posted as work notes on the incident feed.

Note: Access control rules are only checked when a user first accesses the document feed. After users view the feed, an administrator must remove them manually to change their access.

Disable a record feed

You can disable live feed functionality from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to System Definition > Dictionary.
2. Open the dictionary entry for the table.
3. Add live_feed=false in the Attributes field.
4. Click Update.

Note: If the Collaboration feature is activated, you can remove the show live feed icon ( lick here) from all form headers. Set the glide.live_feed.task_header_button property to collaboration.

Disable a document feed

You can disable a document feed from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to System Definition > Tables.
2. Open the table record.
3. Clear the Live feed check box.
4. Click Update.

Business rule installed with Live Feed Document

This business rule is installed with Live Feed Document. There are no tables, roles, or notifications installed with it.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Feed integration</td>
<td>Writes journal comments to the live feed if there is a group for this record.</td>
</tr>
</tbody>
</table>

Record feeds

A record feed is a live feed group that is associated with a record, such as an incident or change. Record feeds allow users to work on tasks and other records through the live feed interface. Users can post messages in live feed that are automatically maintained as comments or work notes on the record if the record has these journal fields.

You can use record feeds to:

• Improve communication between users working on the same record.
- Improve visibility into progress for end users.
- Provide a single place to see updates on multiple records.
- Save feed history in the record so that knowledge is not lost in an email chain.

Live feed document

Note: Many of these features are part of live feed v2.

Activate live feed document

The Live Feed Document plugin is active by default.

Administrators can enable record feeds in an instance by activating the Live Feed Document plugin, which activates the Live Feed plugin, if it is not active. For upgrades, administrators must activate the plugin.

1. Navigate to System Definition > Plugins.

   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   Note: To redirect to the legacy list view for plugins, click the link.

   You have been redirected to All Applications. To see the Plugins list click here

2. Find the plugin using the filter criteria and search bar.
You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in "Request a plugin."

3. **Activate the plugin.**

You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

- If you're certain that you have the correct plugin, click **Install**, then in the Activate Plugin dialog box, click **Activate**.

- To view plugin details before activation:
  1. Click the plugin name.
  2. On the form, click the **Activate/Update** related link.
  3. In the dialog box, review the dependent plugins.
     
     If your plugin requires dependent plugins, they're activated automatically when you activate your plugin if they're not active already.
  4. If demo data is available and you want to install it, click **Load demo data**.
     
     Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.
  5. Click **Activate**.

**Configure record feeds**

Configure a table to support record feeds. You can add the Show Live Feed button in the form header and add the UI actions Follow on Live Feed and Show Live Feed as List and Form.

By default, the Show Live Feed icon appears on the form header for all tables that extend task, including the Incident, Change Request, and Problem tables, and in the list and form context menus for all task tables.
Add live feed to a form header
Add the Live Feed button in the form header for a table.

1. Type `sys_properties.list` in the Application Navigator.
2. Open the record for `glide.live_feed.task_header_button`.
3. In the Value field, change the value to `both`.

**Note:** By default, the value is `collaboration` so that the property is supported in the Collaboration (com.glide.collaboration) plugin. Changing the value to `both` allows the system property to be supported in Collaboration and Live Feed.

4. Click Update.
5. Navigate to System Definition > Tables.
6. Open the table record.
7. If the Live feed check box does not appear on the form, configure the form layout to add the Live feed field.
8. On the form, select the Live feed check box.
9. Click Update.

Alternatively, you can add `live_feed=true` to the Attributes field in the dictionary entry for the table.

The Live Feed button appears on the overflow menu of the form header.

Add live feed to a context menu
Add live feed UI actions on a table.

1. Navigate to System Definition > UI Actions.
2. Open one of the live feed UI action, for example, Follow on Live Feed.
3. In the **Table** field, select the table name.
4. Right-click the header and select **Insert** to create a copy of the UI action for the desired table.
5. Repeat steps 1 – 4 for all live feed UI actions.

### Disable a record feed

You can disable live feed functionality from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to **System Definition > Dictionary**.
2. Open the dictionary entry for the table.
3. Add `live_feed=false` in the **Attributes** field.
4. Click **Update**.

**Note:** If the Collaboration feature is activated, you can remove the show live feed icon (●) from all form headers. Set the `glide.live_feed.task_header_button` property to `collaboration`.

### Configure security

Record feeds honor the access control rules (ACLs) for the associated record.

Users can only view messages on the record feed if they have access to the same information on the record. For example:

- If an ACL allows a user to read and create comments on an incident, then the user can view and add messages posted as comments on the incident feed.
- If an ACL restricts a user from reading work notes, then the user cannot view messages posted as work notes on the incident feed.

**Note:** Access control rules are only checked when a user first accesses the record feed. After users view the feed, an administrator must remove them manually to change their access.

### Live feed table notifications

Live feed table notifications generate automatic live feed messages. The Live Feed plugin must be activated to use table notifications.

When a record is inserted or updated on a specific task table and the notification conditions are met, a message is generated and posted to the specified group or to the company feed. Table notifications are supported for all task tables and all task types by default.

Administrators and users with the `live_feed_admin` or `chat_admin` roles can set up table notifications for any table in an instance.

### Set up table notifications for task tables

You can set up a table notification for a task table to enable automatic live feed messages.

Role required: `live_feed_admin` or `chat_admin`

1. Navigate to **Collaborate > Feed Administration > Table Notifications**.
2. Click **New** or select a notification to open it.
3. Complete the form.

### Live Table Notification fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the table for which notifications are generated.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The list shows only tables and database views that are in the same scope as the table notification.</td>
</tr>
<tr>
<td>Post to chat rooms</td>
<td>Select the check box to generate the notification in chat rooms that are associated with the record. This applies to task records only and requires that the Chat plugin is active.</td>
</tr>
<tr>
<td>Post to live feed</td>
<td>Select the check box to generate the notification on live feed.</td>
</tr>
<tr>
<td></td>
<td>If record feeds are not set up and the <strong>Feed group</strong> field is blank, the notification is posted to the company feed.</td>
</tr>
<tr>
<td>Record Feeds</td>
<td>Select the fields to post for record feeds.</td>
</tr>
<tr>
<td></td>
<td>This field is available only if <strong>Post to live feed</strong> is selected.</td>
</tr>
<tr>
<td>Application</td>
<td>Select the application that contains this record.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to enable the notification.</td>
</tr>
<tr>
<td>Insert</td>
<td>Select the check box to generate the notification when a record is inserted into the database.</td>
</tr>
<tr>
<td>Update</td>
<td>Select the check box to generate the notification when a record is updated.</td>
</tr>
<tr>
<td>Feed</td>
<td>Select the live feed team to which you want to post messages. This field is available only if <strong>Post to live feed</strong> is selected. Clear the field to post notifications on the company feed.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Create the condition that must be met to generate the notification.</td>
</tr>
<tr>
<td></td>
<td>If you add a condition statement, the system evaluates the condition first and parses the <strong>Before script</strong> field only if the condition is met. You may choose to leave this field blank and include conditions in the script.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description of the table notification.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Message</td>
<td>Construct the automatic message you want to generate. You can include field values as variables and a link to the record. To add a variable, position the cursor in the text and then click the field name in the Select variables field. To add a link to the record, enter <code>${URI}</code> in the message text as shown in the following example.</td>
</tr>
<tr>
<td>Before script</td>
<td>Create a script that runs before a notification is generated. The script runs only if the condition evaluates to true or is empty. The following variables are available in the script.</td>
</tr>
<tr>
<td></td>
<td>· <em>current</em>: the GlideRecord object that triggered the notification.</td>
</tr>
<tr>
<td></td>
<td>· <em>changedFields</em>: an ArrayList of fields changed on submit. Use changedFields.contains(©fieldname©) to check for change.</td>
</tr>
<tr>
<td></td>
<td>· <em>answer</em>: set answer to false to cancel the notification.</td>
</tr>
<tr>
<td></td>
<td>· <em>profileSource</em>: set to a valid GlideRecord object to define the profile that is posting the message.</td>
</tr>
<tr>
<td></td>
<td>· <em>profileID</em>: set to a live_profile sys_id to define the profile that is posting the message; by default it is the current record. Overrides profileSource if both are specified.</td>
</tr>
</tbody>
</table>

Any custom variable created in the script is also exposed to the message in the form of `$myVariableName`.

4. Click **Submit** or **Update**.

**Set up table notifications for non-task tables**

Table notifications are supported for all task tables by default, and you can set up a table notification for any other table.

Role required: live_feed_admin or chat_admin

1. Navigate to **System Definition > Business Rules**.
2. Open the **live feed events** business rule.
3. In the Advanced section, select and copy the text in the **Script** field.
4. Click the back arrow on the top, left to exit the record and return to the Business Rules list.
5. Click New.
6. Enter the following values at the top of the form.
   - Name: Enter a name, such as live feed events for my table.
   - Table: Select the table for which you are setting up a notification.
   - Active and Advanced: Select these check boxes.

7. In the When to run section, enter the following values.
   - When: Select before.
   - Insert, Update, and Delete: Select the check boxes.

8. In the Advanced section, paste the script from the live feed events business rule into the script box.
9. Click Submit.

The live feed events business rule runs on the non-task table. It fires the live_feed.update event, which is associated with the Live Feed Update script action. The script action sets up variables and processes the table notifications.

After saving the business rule, create a live feed table notification record for the new table as you would for a task table.

Live feed table notification examples

The following examples demonstrate how to set up different types of table notifications that are useful for live feed.

Workaround posted
This example demonstrates a table notification that generates an automatic message on live feed whenever a workaround is added to an open problem.

- Table: Problem (problem)
- Active: Select the check box.
- Update: Select the check box.
- Post to live feed: Select the check box.
- Conditions: (State) (is) (Open)
- Description: Workaround Posted
- Message:

```
 SYS_UPDATED_BY posted a workaround for URI.
 Short description: Short description
```

- Before script:

```java
// only post to live feed when the Workaround field changes
answer = changedFields. contains ( "work_around" ) ;
```
Example workaround message

Problem resolved (advanced)
This advanced example demonstrates a table notification that generates an automatic message on live feed whenever a problem is closed.

It also adds a message about the assigned user and posts the message from the assignment group profile instead of the problem record.

- **Table**: Problem (problem)
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions**: (Problem State) (is) (Closed/Resolved)
- **Description**: Problem Resolved
- **Message**:

  Problem ${number} - ${short_description} has been resolved. ${fixedByMsg}

- **Before script**:

  ```java
  // cancel if we didn't just change the problem state if (!changedFields.contains("problem_state"))
  answer = false;
  ```
Example problem resolved message

Opportunity won (non-task)
This example demonstrates a table notification on a non-task table. It generates an automatic message on live feed whenever a sales opportunity is won, if you have activated the Sales Force Automation plugin.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Create a **business rule** on the Opportunity (sales_opportunity) table that matches the **live feed events** business rule on the task table.

Create a table notification with the following values:

- **Table**: Opportunity (sales_opportunity)
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions**: (State) is (Closed Won)
- **Description**: Opportunity won
- **Message**:

```text
${owner} closed a sale with ${account}!
```

- **Before script**:

```java
//make the message appear to come from the assigned salesperson if there is one if (!current.owner.nil())
profileSource = current.owner.getRefRecord(); //need GlideRecord object
```

---

**Example opportunity won message**

**Related feeds table notification**
This example demonstrates table notifications to be sent out to related feeds.
For this example, whenever the status of a story changes to **Complete**, a table notification message is sent to the related sprint, release, or epic. Messages are posted only if the related feed already exists; this notification does not create a new feed.

- **Table**: Story (rm_story)
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Record feeds**: Move **Sprint**, **Release**, and **Epic** to the **Selected** column.
- **Conditions**: (State) (changes to) (Complete)
- **Description**: Story is done; message to Epic, Release, and Sprint
- **Message**: 
  
  ${URI} status changed to ${state}

---

**Live feed security and table access**

By default, administrators and users with the live_feed_admin role can configure live feed security and view all live feed tables.

You can also modify the following live feed tables.

- **Live Table Notification** (live_table_notification): set up automatic messages that are generated when specific records are updated throughout the system.
- **Live Feed Message** (live_message): modify only if necessary, such as to delete an inappropriate message or restore a message that a user accidentally deleted. This table is typically managed by system functionality.

Extending or modifying data in any live feed chat table is not recommended.

---

**Domain separation in Live Feed**

This is an overview of domain separation and Live Feed. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

---

**Overview**

**Support: Level 2**

This application fully supports domain separation. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

Parent and child domains define the live feed content that can be viewed and shared with other users.

- A user in a parent domain can see users and content within their domain and within all child domains that are lower in the domain hierarchy.
- A user in a child domain can see users and content within their domain but cannot see the parent domain or other child domains at the same level in the domain hierarchy.
Enable domain separation for live feed

Domain separation for the Live Feed application is available starting with the Eureka release. For users upgrading to Eureka, a sys_domain column is added to existing live feed-related database tables. For existing database records, the value of the sys_domain field is set to empty (global). This allows the domain separation feature to work with existing live feed records.

Show or hide the live feed application for a domain

The administrator can live feed visibility for a domain. This includes:

- Displaying live feed in the application navigator.
- Following a document feed for a record.
- Viewing live feed from a record.

Use live feed with domain separation

All of the live feed features are available to users within a domain and work the same way, with some exceptions to visibility.

- Posting and sharing content
  - Users in a child domain can interact with other users in the same domain. This includes posting and replying to messages, deleting messages, attaching files and links, and rating content.
  - Users in a parent domain can interact with other users in the same domain and with users in any child domains. Messages that are added to child threads by parent users are given the visibility of the child domain, not the parent domain.

- Viewing content
  - Users in a child domain can view content that resides within their domain. This includes filtering by feed, sorting, searching, and viewing older messages.
  - Users in a parent domain can view content that resides within their domain and within any child domains.
  - My Feed shows messages, teams, and hashtags based on the user's domain. Showing another user's feed only shows posts visible in the current user's domain.

- Using hashtags
  - Hashtags are separated by domain. Users in a child domain can use all of the hashtag functions within their domain. This includes tagging messages, viewing available hashtags, changing hashtag names, and searching and filtering by hashtag.
  - Users in a parent domain can use all of the hashtag functions within their domain and can see hashtags in any child domains.

- Using teams
  - Teams are separated across domains. Users in a child domain can join and follow teams within their domain, and can invite other users within their domain to join teams.
  - Users in a parent domain can join and follow teams that belong to their domain or to any child domains.

- Exceptions to teams

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
New teams are created in the user's domain. However, if the team has a record associated with it, the team is created in record's domain.

New threads in an existing team are created in the domain of the existing team.

When a user is creating a new team from a document, if the document domain is not empty or global, the team domain needs to be changed to be the document's domain.

For a document-generated team, when the domain of the document changes, the domain of all related live feed records changes as well.

**Subscribing to email notifications**

Users can subscribe to email notifications from users and teams within their domain only.

**Limit live feed access by role**

All active users in the instance have access to live feed by default. live_feed_admin and admin

1. Complete the following steps to define the roles that allow users to see the Live Feed module.
   
   a) Perform the appropriate action for your version of the UI:
      
      - UI16: Navigate to System Definition > Application Menus > Collaborate and select Live Feed.
      - UI15: Right-click the icon beside the Live Feed module and select Edit Module.
   
   b) Enter the roles that have access in the Roles field.
   
   c) Click Update.

2. Complete the following steps to define the roles that allow users to see live feed from a mobile device.
   
   a) Navigate to System Definition > Applications (Mobile).
   
   b) Click Live Feed.
   
   c) Enter the roles that have access in the Roles field.
   
   d) Click Update.

3. Use the following settings in the Access Control form to create access control rules to limit who can view the live_feed pages.
   
   - **Type**: ui page
   
   - **Operation**: read
   
   - **Name**: create one access control rule record for each of the following pages
     
     - live_feed
     
     - live_feed_small
     
     - $live_feed
     
     - $live_feed_small
   
   - **Requires role**: in this related list, add roles to define who can access the live feed pages. Users who do not have these roles cannot access live feed.

**Manage live feed message content**

Users can remove their own messages from feeds. If necessary, administrators can remove inappropriate messages that are posted by any user.
live_feed_admin and admin

For security reasons, any HTML code is automatically stripped out of a message before it is posted. This measure ensures that users cannot modify any page settings by posting a message.

1. Navigate to Collaborate > Feed Administration > Messages.
2. Open the message to be removed.
3. In the State field, select deleted. You may need to configure the form to add this field.
4. Click Update.

Live feed team security

You can restrict who can create teams by modifying an access control rule.

Modify the following access control rule.

- **Table**: Live Group Profile (live_group_profile)
- **Operation**: create

Restrict hashtag renaming

You can restrict who can rename hashtags.

You restrict hashtag rename by modifying the following access control rule:

- **Table**: Live Tag (live_tag)
- **Operation**: write

Provide access to live feed from CMS pages

You can provide access to live feed from pages built in the Content Management System (CMS). For example, allow an end user to access your company feed via the ESS portal.

Role required: content_admin or admin

The ESS Portal template includes the **Portal - Live page** and **Live Feed** dynamic blocks. To provide access to live feed from CMS pages, add the Live Feed dynamic block to a CMS page or include **Portal - Live page** in a site.

1. Navigate to Content Management > iFrames.
2. Click New.
3. Enter the iFrame block details.

### iFrame block fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name such as Live Frame.</td>
</tr>
<tr>
<td>Frame Name</td>
<td>Enter a frame name, such as live_frame.</td>
</tr>
<tr>
<td>URL</td>
<td><a href="https://INSTANCE/live_feed.do?sysparm_doctype=true">https://INSTANCE/live_feed.do?sysparm_doctype=true</a></td>
</tr>
<tr>
<td></td>
<td>where INSTANCE is your instance URL (example, (instance name).service-now.com)</td>
</tr>
<tr>
<td>Application</td>
<td>Displays scoping information.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Sizing</td>
<td>Select <strong>Fixed Size</strong> and enter height and width pixel dimensions according to the page where you plan to display the feed (for example, width of 1024 and height of 768).</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
5. Add the block to a page.

**Components installed with live feed**

Several types of components are installed with Live Feed.

Demo data is available with Live Feed.

**Tables installed with live feed**

Live Feed plugin installs the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link attachments (live_link)</td>
<td>Stores links and attachments that are added to messages.</td>
</tr>
<tr>
<td>Live Favorite (live_favorite)</td>
<td>Stores the favorite conversations, user groups, and messages.</td>
</tr>
<tr>
<td>Live Feed Searches (live_feed_search)</td>
<td>Stores live feed text searches. Access at <strong>Collaborate &gt; Feed Administration &gt; Search Log</strong>.</td>
</tr>
<tr>
<td>Live Follows (live_follow)</td>
<td>Maintains users’ follow preferences for user feeds.</td>
</tr>
<tr>
<td>Live Group Profile (live_group_profile)</td>
<td>Stores conversation properties, including name, description, and public status. Also stored are user group properties, such as name, description, and public status.</td>
</tr>
<tr>
<td>Live Group Member (live_group_member)</td>
<td>Maintains the member lists for conversation and user group.</td>
</tr>
<tr>
<td>Live Mention (live_mention)</td>
<td>Stores the profiles mentioned in a message. References sys_user table.</td>
</tr>
<tr>
<td>Live Message Tag (live_message_tag)</td>
<td>Stores messages associated with user-created tags. Appears as a related list on Live Tag records.</td>
</tr>
<tr>
<td>Live Messages (live_message)</td>
<td>Stores messages. References sys_user table. Access at <strong>Collaborate &gt; Feed Administration &gt; Messages</strong>.</td>
</tr>
<tr>
<td>Live Poll (live_poll)</td>
<td>Stores a poll question.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Live Poll Cast (live_poll_cast)</td>
<td>Stores profiles of users who voted for a particular option in a poll.</td>
</tr>
<tr>
<td>Live Poll Options (live_poll_option)</td>
<td>Stores poll options.</td>
</tr>
<tr>
<td>Live Table Notification (live_table_notification)</td>
<td>Generates automatic table notifications, such as when a user reads live feed for the first time and when a high priority incident is opened. Access at Collaborate &gt; Feed Administration &gt; Table Notifications.</td>
</tr>
<tr>
<td>Live Tag (live_tag)</td>
<td>Maintains user-created tags. Access at Collaborate &gt; Feed Administration &gt; Tags.</td>
</tr>
<tr>
<td>Live Tag Follows (live_tag_follow)</td>
<td>Maintains users’ follow preferences for tags.</td>
</tr>
<tr>
<td>Messages Liked by (live_message_like)</td>
<td>Maintains like ratings for posts. Access at Collaborate &gt; Feed Administration &gt; Likes.</td>
</tr>
</tbody>
</table>

**User roles installed with Live Feed**

Live Feed plugin installs the following user roles.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
</table>
| live_feed_admin   | Can manage live feed functions. For example, users with the live_feed_admin role can:  
|                   | - Set up table notifications for task tables.                          |
|                   | - Set up table notifications for non-task tables.                       |
|                   | - Limit live feed access by role.                                       |
|                   | - Manage live feed message content.                                      |
| chat_admin         | Can manage chat functions (if the Chat plugin is activated). For example, users with the chat_admin role can:  
|                   | - Change chat room message read access.                                |
|                   | - Define chat room access rights.                                        |

**Script includes installed with Live Feed**

Live Feed plugin installs the following script includes.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LiveMsgUtil</td>
<td>Provides helper functions for working with live_message records.</td>
</tr>
<tr>
<td>LiveFeedFilter</td>
<td>Queries filters for working with live_feed records.</td>
</tr>
<tr>
<td>LiveFeedUtil</td>
<td>Provides helper functions for working with live_feed records.</td>
</tr>
</tbody>
</table>

**Business rules installed with Live Feed**

Live Feed plugin installs the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feed Group Creator Becomes Admin</td>
<td>Live Group Profile</td>
<td>Designates the group creator as the group administrator.</td>
</tr>

### Email notifications installed with Live Feed

Live Feed plugin installs the following email notifications.

<table>
<thead>
<tr>
<th>Email notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Feed Feed Member Accepted</td>
<td>Sends an email to the administrator when a user has accepted to join the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Declined</td>
<td>Sends an email to the administrator when a user has declined to join the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Invited</td>
<td>Sends an email to a user when they have been invited to join a feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Left</td>
<td>Sends an email to the administrators when a user has left the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Removed</td>
<td>Sends an email to user when they have been removed from the feed.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Email notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Feed Feed Member Request</td>
<td>Sends an email to administrators when an user requests to join a feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Request Accepted</td>
<td>Sends an email to the user when their request to join a feed is accepted.</td>
</tr>
<tr>
<td>Live Feed Feed Request Rejected</td>
<td>Sends an email to the user when their request to join a feed has been rejected by an administrator.</td>
</tr>
<tr>
<td>Live Feed MsgReply Subscription</td>
<td>Sends an email when a reply or reply_to_reply message is inserted into the thread of a message in a feed.</td>
</tr>
<tr>
<td>Live Feed Team Member Accepted</td>
<td>Sends an email to administrators when a user accepts an invitation to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Declined</td>
<td>Sends an email to administrators when a user declines an invitation to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Invited</td>
<td>Sends an email when a user is invited to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Left</td>
<td>Sends an email when a user leaves a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Removed</td>
<td>Sends an email when an administrator has removed a user from a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Request</td>
<td>Sends an email when a user requests to join a team.</td>

<tr>
<td>Live Message Liked</td>
<td>Sends an email to the creator of a message when another user likes the message.</td>
</tr>
<tr>
<td>Live Message Mention</td>
<td>Sends an email to a user when that user is mentioned in a message.</td>
</tr>
<tr>
<td>Live Message New Posts Subscription</td>
<td>Sends an email to subscribed users when a new (not reply) message is posted.</td>
</tr>
<tr>
<td>Live Message Reply</td>
<td>Sends an email to all users in a feed thread when a user posts a reply (live_message.replied event).</td>
</tr>
</tbody>
</table>

**Use Live Feed**

Live Feed provides many methods you can use to share content with others in your organization.
Depending on your role, there are several different types of feeds you can access, teams you can join and share information with, and hashtags you can use for categorizing messages.
Use hashtags in Live Feed

Hashtags are words marked with a hash symbol (#) in messages. Hashtags are a way to categorize messages by keyword or topic for improved search results.

For example, to identify messages associated with VPN questions, add the hashtag #VPN in the message text.

Note: Many of these features are part of live feed v2. If you are using live feed v1, or have not activated live feed v2, see Legacy Live Feed.

Tag messages

To tag a keyword or topic in a message, enter a # symbol before the word. A link to the hashtag is added beneath the message and all feed users can search and filter by the hashtag to find the message.

Tips for using hashtags effectively include:

- Limit the number of hashtags per message (no more than 3 is a good guideline).
- Use hashtags only in messages that are relevant to the tagged topic.
- Write a message first, and then add hashtags only if they add value. Answer the question, "What are you working on?", rather than "What hashtags apply to what you are working on?"
- Use camel case to create a hashtag that is more than one word long. For camel case, remove the space and use an uppercase letter to start each word. For example, to create a topic about the service desk, use #ServiceDesk.
View an available hashtag

View a hashtag from any feed.

1. Navigate to Collaborate > Live Feed.
2. Click Hashtags in the sidebar.
   
   Any hashtags already defined are displayed. Up to 36 hashtags can be displayed, and options are available for searching and sorting the hashtags. When searching, you do not need to include the hash symbol (#).
3. Click a hashtag to view all messages containing that hashtag.

Change a hashtag name and merge a hashtag

Over time, users may create many hashtags with similar names, such as competitive, competitor, and competition. To combine hashtags for better searching and filtering, change the names of similar hashtags to a standard name.

Administrators can restrict who can rename hashtags.

1. Navigate to Collaborate > Live Feed.
2. Click Hashtags in the sidebar to reveal the currently defined hashtags.
3. Turn off the filter to show all hashtags.
4. Point to the hashtag you want to change. If you have the rights to edit hashtags, an edit tag (️) appears.
5. Click the edit tag icon.

![Hashtags](image)

**Edit tag**

6. Enter a new hashtag name.
7. Press Enter.
   - If the new name is different than the other hashtags, the new hashtag name replaces the old hashtag name on the list and in the text of any messages that include the hashtag.
   - If the name is the same as one of the existing hashtags, the hashtags will be merged. For example, if you have two hashtags called Competitive and Competitors, and you change the name of Competitors to Competitive, all of the messages previously tagged Competitors are changed to Competitive and the Competitors hashtag is removed.

_i Note:_ If a hashtag is removed from the message, renaming that hashtag does not change the message text.

**Add an image to a hashtag**

You can add an image at the domain level of already defined hashtags if you have the admin role.
1. Click Hashtags in the sidebar.
2. Select the appropriate hashtag.
- Locate the image in your file system, and then drag-and-drop the image onto the add an image icon ( ).
- Click the add an image icon ( ), select the image file, and click Open.

4. To change the image, simply drag-and-drop a new image onto the old one, or click on the existing one and select a new image.

When you view a message that contains a hashtag with an image, that image appears in the hashtag heading bar.

Follow and unfollow a hashtag

You can view all postings assigned a specific hashtag by following the hashtag. You can also unfollow the hashtag if you no longer want to view those postings.

1. Navigate to Collaborate > Live Feed.
2. Click Hashtags in the sidebar.
3. Select the hashtag you want to follow.
4. Click Follow.
Follow tag

A confirmation message appears.

5. Click X to dismiss the message.
   To unfollow a hashtag, repeat the same steps and click Unfollow.

Bookmark hashtags

The live feed interface uses the standard bookmarking functionality for hashtags.

In UI15, the live feed interface uses the standard *bookmarking functionality* for hashtags. You can drag-and-drop group feeds and hashtags from the Feed Summary section to the Edge for quick access.
As a participant in a conversation, you can remove hashtags from messages that have already been posted.

1. Navigate to the posted message.
2. Click **Hashtags** in the message posting.

The hashtags associated with the message are displayed, along with the removal icon.
Use teams in Live Feed

Users can be combined into teams for the purpose of subscribing to specifically-focused feeds. Teams can be created based on any criteria that makes sense for your organization. For example, you can create a team called IT Developers and subscribe the team to feeds such as Coding Standards, AngularJS Development, and ServiceNow Customization Best Practices. When a new developer is added to the IT Developers team, that user automatically has rights to participate in all of the feeds followed by the team.

Create a live feed team

When you create a team, you become the team administrator. As team administrator, you can:

- Modify team properties
- Accept or reject membership requests
- Remove members from the team
- Delete the team

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. Click **Create Team**.

4. Enter a **Name** to appear at the top of the feed and in messages posted to the team. This name links to the team feed.
5. Enter a **Description** to appear at the top of the feed and under the team name in the list of all teams.

6. Select the access level for the team:
   - **Public Team**: In the list of all teams, any user can see the name of this team. Any user can also see the feed and join the team. Messages in a public team appear in the Company Feed with a link to the team feed.
   - **Private Team**: In the list of all teams, any user can see the name of this team, but not the feed. Messages in private teams do not appear on the Company Feed.

   When **Private Team** is selected, the **Show this team for anyone to find and request to join** check box is displayed. Select this check box to allow any user to search for this team and request to join it. Clear the check box to allow only invited users to see the feed and join the team.

7. Click **Create**.
   The team is created with you as the team administrator.

---

**Documentation**

Users interested in finding ways to improve the product documentation

<table>
<thead>
<tr>
<th>Members</th>
<th>Pending members</th>
<th>Feeds</th>
</tr>
</thead>
</table>

**Administrators**

- **System Administrator**

**Members**

- No active members.

---

**Note**: A team administrator can create one or more group feeds specifically for the members of this team by clicking the **Group Feeds** tab and **Create Group Feed**. Additionally, the team can be invited to join a feed. Having multiple feeds for the team facilitates focused discussions on topics of interest to the team and allows the team to selectively invite other teams and members to collaborate on specific feeds.
Automatic team creation

If you create a record on a table that has live feed enabled, such as the Incident table, and click Follow/Show Live Feed for the record, a record feed is created for the record.

The record feed name is based on the table name.

Join a team

You can join a public team, accept an invitation, or request access to a team.

As a team member, you can:

- **View messages** posted to the team (team feed). Non-members can also view the feed for a public team.
- **View a list of team members.**
- **Invite another team to join the team.**
- **Subscribe to team email notifications.**
- **Leave** the team.

1. Navigate to **Collaborate > Live Feed.**
2. Click **Teams** and click **All Teams.**
   - If you received an invitation, click **Accept.** You can **Decline** the invitation if you do not want to join the team.
   - If the team is public, click **Join.**
   - If the team is private, click **Request.** The team administrator receives an email notification and must accept your request before you can join the team.

View a team feed

View a team feed to see messages belonging to that team.

1. Navigate to **Collaborate > Live Feed.**
2. In the sidebar, click your profile picture, then select the **Teams** tab.
   - To view a team you belong to, select the team name.
   - To view a public team you do not belong to, select **All Teams** and then click the team name.
     
     You must be a member to view the feed for a private team.

View a team member

View a list of members belonging to a live feed team.

1. Navigate to **Collaborate > Live Feed.**
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
   
   You must be a member of the team to view the members.
4. Click **Members.**
   
   The list of team members appears, organized by team administrators and team members.

Invite a new member

You can invite another user to join a team.

1. Navigate to **Collaborate > Live Feed.**
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the **Pending members** tab.
5. In the **Add User** field, enter the name of the user you want to invite. The invited member's picture appears.

---

**Remove a member**

If you are team administrator, you can remove any member from the team.

1. Navigate to **Collaborate > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the **Members** tab.
5. Click Remove below the member name.
6. Click Remove again in the confirmation box that opens.

**Note:** You can remove members regardless of their current state. That is, you can remove members who have already joined the team or whose membership is pending.

**Subscribe to team and email notification**

Users can subscribe and unsubscribe to receive email notifications generated by feeds the team participates in.

Email notifications are generated whenever actions such as posting messages, replies, likes, polls, and @mentions are performed.

All notifications related to a top-level message, such as replies, mentions, and likes, are sent out with the same subject. The subject line defaults to **Live Feed** followed by the beginning of the subject line from the top-level message. For example, if the subject of the feed is **IT Support**, the email notification's subject will be **Live Feed IT Support**.

1. Navigate to **Collaborate > Live Feed**.
2. Click **Teams** and select the team name.
3. Click the subscribe icon (_attach).
Subscribe a team to feed notification

A team administrator can subscribe a team to specific feeds so the members of the team receive email notifications.

1. Navigate to Collaborate > Live Feed.
2. Click Teams and select the team name. You can use the advanced search to locate team of which you are the administrator.
3. Click Feeds.
4. Click the subscribe icon (to subscribe) beside the feed name.

Reply to email notifications using email

After receiving an email about a posted message or a reply, you can reply to live feed with your email client.

The body of the reply email becomes a reply to the live feed message. Any attachments included in your reply email are included in the live feed reply.

Leave a team

You can give up membership to a team by leaving that team.

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. Click Leave beside the team name.

Modify a team

If you are team administrator, you can modify an existing team.

1. Navigate to Collaborate > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
4. Click the edit icon (to modify).
5. Modify the team properties as needed.
6. Click Save.

Manage a membership request

When a user requests membership to a private team, the team administrator receives an email. If you are the team administrator, you can manage membership requests.

1. Navigate to Collaborate > Live Feed.
2. Click Teams and select the team name.
   If one or more users have been invited to the team, the Pending members tab shows the number of invitations sent.
Pending members

3. Click **Pending members**.

This shows the users who have received invitations, but who have not yet accepted.
Invited members

4. You can cancel a user's invitation by clicking **Remove**.
5. You can invite another user to the team by entering their name in the **Add user** field and clicking the Invite member (➕) button.

Delete a team

If you are the team administrator, you can delete a team.

1. Navigate to **Collaborate > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the edit icon (fcntl).
5. Click **Delete**.
6. Click Yes to confirm deletion. The team is deleted from live feed. Messages posted to a private team are deleted; messages posted to a public team remain on the company feed without a team link.

If you delete a team that is associated with an active record, such as an incident that has not yet been closed, the team becomes active again when any user modifies that record or follows the record on live feed. The first user who modifies the record becomes the team administrator. The previous messages that existed as part of the record feed are not deleted.

Use live feed to work on records

A record feed is associated with a record, such as an incident or change.

Record feeds help users collaborate on records by providing a place for anyone who can access the record to share messages and post attachments specific to that record.

With record feeds, users can:

- Follow record feeds and post messages in live feed. These messages can also be automatically maintained in the comments or work notes journal fields on records.
- View live feed from records.
- Work on multiple records from My Feed.
- Access live feed team functions, such as sending invitations and subscribing to email notifications.

Any users with access to the record can also use the record feed. By default, record feeds are available on the incident, change, and problem tables. Administrators can configure record feeds for additional tables.
How Document Feeds Work

The Live Feed application creates a document group for each document feed. The document group:

- Automatically approve membership for every user who can access the record.
- Uses the record number as the group name.
- Uses the record short description as a group description.
• Maintains all messages posted on the record in live feed (if the record has a journal field for comments). When the group is created, existing messages are added to the document feed.
• Lists the group when users select View all groups on their live feed interface, unless the record associated with the document feed has been closed. When the state of the record is closed, the live feed group becomes inactive and unlisted.
• Automatically adds users to the document group when they view the record.

Document Group Creation

When a user follows or shows a record on live feed, a live feed group is automatically created and associated to the record (if one does not already exist). The user becomes a member of the group and can use live feed to work on the record. If the user can access work notes on the record, the user also becomes a group administrator.

A live feed group is also automatically created when a user creates a record on a table that uses document feeds, such as the Incident table. The user who creates the record becomes the administrator of the group, and any other user who modifies the same record automatically joins the group.

Add Live Feed to a homepage

Add live feed to a homepage so it is the first thing you see when you log in.

1. Click Add content at the top of the homepage.
2. Select Live Feed in the left panel.
3. On the bottom of the window, click Add here in the appropriate layout position, then close the window.

Note: Administrators can add live feed to a global homepage to make it available for all homepage users by default. By default, users with any role can add live feed to their homepage. Administrators can restrict this ability.
Modifying and deleting document feeds

The user who creates a record feed becomes the group administrator, which allows the user to modify the following record feed properties.

- **Name**: default value is the record number.
- **Description**: default value is the record short description.
- **Picture**: default value is a thumbnail image of the record.

Feed administrators can also delete the feed. When deleted, the feed is removed from live feed but messages remain in the journal field of the associated record.

Viewing Live Feed from records

Interact with the record feed in any form that has live feed enabled.
The record feed appears in a pop-up window. The record feed also appears on the record form's activity formatter if the administrator enables the record feed system property (glide.ui.show_live_feed_activity).

To access a record feed from the form, do one of the following:

- Click the **Show Live Feed** button in the form header. This displays the live feed pop-up.
- Right-click the form header and select **Show Live Feed**. This also displays the live feed pop-up.
- Scroll down to the activity formatter area on the form. Click one of the following tabs:
  - **Live Feed**: click to show a text box to type in the feed.
  - **Activity**: click to show the activity summary. The activity filter determines the content in the activity summary.
If the activity formatter or the Live Feed and Activity tabs are not visible, administrators can do the following:

- Configure the form layout and add Activities (filtered) to the form. This adds the activity formatter.
- Personalize the form layout and add Activities (filtered) to the form. This adds the activity formatter.
• Go to **System Definition > Tables**, access the table associated with the record, and verify that the `live_feed` dictionary attribute is set to true on the form. This adds live feed to the activity formatter.

• Go to **Collaborate > Feed Administration > Properties** and enable the following property: **Toggle the display of the live feed tab in the activity formatter**

**Working with record feeds**

When a user follows a record, the user becomes a member of a private group for the record.

Team members can:

• View the record feed from live feed.
• View a list of group members (other users who are following the record).
• Invite another user to join the group. Only users who have access to the record have access to the record feed.
• Subscribe to email notifications.
• Leave the team to stop following the record.

*Follow a record feed from a form*

You can follow records that have a record feed associated with them from within the record form.

1. Navigate to the record in a list or form.
2. Click the **Show on Live Feed** icon in the header.
Follow Task

Follow a record feed from a list
You can follow records that have a record feed associated with them when viewing a list of records. This method allows you to select multiple records to follow.

1. Navigate to a list of records (for example, Assigned to me).
2. Select the Action check box beside each record to follow.
3. In the Actions choice list, select Follow on Live Feed.
Follow My Tasks

Post a message to a record feed
Use live feed to post a message to a record feed.

1. Open the record feed in one of the following ways:
   - From your homepage (must already be following the record)
   - As a team in live feed (must already be following the record)
   - From My Live Feed (must already be following the record)
   - From the **Live Feed** pop-up window
   - From the **Live Feed** tab on the activity formatter
   - Click the **Show Live Feed** button in the form header.

2. Compose the message and add images and links.
3. (My Live Feed only) In the To list, select the record where you want to post the message.
4. (Optional) Select the **Work Notes** check box to post the message as a work note. Only users with access to work notes on the record can post and see work notes. This option is only available for records that have a journal field.
5. Click **Post**.

**Note:** If the record has journal fields for comments or work notes, your message is automatically added to the appropriate field on the record. If the record has a
standard text field for comments on the activity formatter, each live post overwrites the field value. Comments added through live feed start with #LiveFeed on the activity formatter.

Use feeds in Live Feed

Feeds allow users to create focused discussions in Live Feed.

Live feed includes different types of feeds. The user who creates a group or record feed becomes the feed administrator. This user configures the access level for the feed:

- **Public**: any user can see the name on the list of all feeds, view the feed, and join it. Messages appear on the company feed with a link to the public feed.
- **Private**: any user can see the name on the list of all feeds, but only invited members can view the feed and join. Messages do not appear on the company feed.

**Note**: The concept of groups has changed in live feed v2 (starting with the Fuji release).

Create a group feed

Group feeds are created by users so that members with similar interests can find that information in one place. Individual users or teams can join group feeds.

1. Navigate to Collaborate > Live Feed.
2. Click Group Feeds and click All Feeds.
3. Click Create Group Feed.

![Create group feed](image)

**Create group feed**

4. Enter the feed name and description. These will appear in the list of group feeds.
5. Indicate how members can join the feed:
   - **Public Feed**: Select this to allow anyone to view and join the group feed.
   - **Private Feed**: Select this to restrict membership to only members invited by the administrator.
When Private Feed is selected, the Show this feed for anyone to find and request to join check box is displayed. If it is selected, any user can search for this group feed and join it. If the check box is not selected, only users who are invited can see the feed and join the group feed.

6. Click Create.

Create record feeds

When a user views a record on a table that has live feed enabled, such as the Incident [incident] table, the user can click the Show live feed button at the top of the form to automatically create a record feed.

When a user who has write access to a record's work_notes journal field clicks the Show live feed button, that user becomes the record feed administrator. If, for example, a customer calls technical support to report an incident and the customer clicks Show live feed on a record, a record feed is created, but the customer is not the record feed administrator. When a support representative later opens the incident and participates in the record feed, the user becomes the feed administrator.

Record feeds are, by default, private unlisted. That is, only invited members can see the name of the record feed in the list of feeds, and join it. Record feed administrators, however, have the ability to change the access level at any time. This can be helpful if, for example, a user is working on a sales opportunity and wants customers to be able to participate in a record feed without granting them access to the records.

Control how live feed is enabled for records

A property called glide.ui.show_live-feed_activity controls whether live feed is automatically enabled for all records.

This glide record is disabled by default. If the property is enabled, a record feed is automatically created whenever a record is viewed, and you become a member of that feed.

A second property, glide.live-feed.auto_join_document_group, enables automatic membership to a record feed whenever the associated document is visited and the user clicks Show Live Feed.

View the activity stream in record feeds

When you view record feeds, live feed displays the activity stream for the document.

For example, for an incident feed, the screen displays recent activity for the incident. The activity stream is updated whenever anything is changed in the associated record.
Live feed activity stream

Note: The information in the activity stream is subject to the same ACL rules as those for viewing the underlying document.
Participate in a feed

When you join a feed, you become a feed member.

Feed members can:

- **View messages** posted to the feed. Non-members can also view the messages for a public feed.
- **View a list of feed members.**
- Invite another user to join the feed.
- Subscribe to feed email notifications.
- **Leave the feed.**

1. Navigate to **Collaborate > Live Feed.**
2. Click either **Group Feeds** or **Record Feeds**, and then click **All Feeds.**
### All feeds

- If you received an invitation, click **Accept**. You can **Decline** the invitation if you do not want to join the feed.
- If the feed is public, click **Join**.
- If the feed is private, click **Request**. The feed administrator receives an email notification and must accept your request before you can join the feed.

### Mark a feed as a favorite

Top-level messages in feeds can be marked as favorites on a per user basis only.
You can also search for messages marked as favorites, and remove the favorite designation as needed.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then click **All Feeds**.
3. In the list of feeds, click the star icon (⭐️) adjacent to the feed name you want to mark as a favorite.

To unfavorite a message, click the star icon (⭐️) of a message that is already a favorite.

### View a feed

You have several options for viewing a feed.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**.
   - This displays a list of feeds you belong to and an option to view all feeds.
   - To view a feed you belong to, select the feed name.
   - To view a public feed you do not belong to, select **Show All** and then click the feed name.
     You must be a member to view the feed for a private feed.

   **Note:** If you navigate away from the live feed application and then back again, the system displays the feed you last visited if you are a member of it.

### View a feed member

View a specific member of a group feed.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**.
   - This displays a list of feeds you belong to and an option to view all feeds.
3. Click the feed name.
   - The list of feed members appears, organized by feed administrators and members.

### Invite a new member to a group feed

The feed administrator can invite another user or a group to join a feed.

When a team is added to a feed, all members of the team also indirectly become members of the feed. Only users, and not teams, can be the feed administrators. A team member who is following a feed can become administrator by directly inviting another user to the feed.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click the **Pending members** tab.
4. In the **Add user or team** field, begin entering a user or team name and select a user or team from the suggestion list.
   - The invited user or team members receive an email notification.

### Invite a new member to a record feed

The feed administrator can invite another user or a team to join a record feed.
When a team is added, each of the individual members of the team become members of the feed. That is, if Team ABC is added to a feed, the feed does not show that Team ABC is a member. Instead, the feed shows each of the individual members of Team ABC as members of the feed.

When users are invited, their membership state is initially Invited. When they accept the invitation, the system checks their access to the work_notes journal field. If they have write access, they become administrator members; otherwise, they become active members.

1. Navigate to Collaborate > Live Feed.
2. Click Record Feeds and select the record feed name.
3. Click the Pending members tab.
4. In the Add user or team field, begin entering a user or team name and select a user or team from the suggestion list.

If you invite a team, the individual members of the team are invited.

The invited users receive an email notification.

**Remove a member from a feed**

The feed administrator can remove any member from the feed.

1. Navigate to Collaborate > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click the Members tab.
4. Locate the member you want to remove and click Remove.
Remove member

**Note:** You can remove members regardless of their current state. That is, you can remove members who have already joined the feed or whose membership is pending.

---

**Subscribe to a feed**

Direct members of a feed can subscribe and unsubscribe to the feed in order to receive email notifications whenever any activity in the feed occurs, such as new messages being posted, replies, likes, polls, and @mentions.

Individual indirect members—that is, members of a team that is participating in a feed—cannot subscribe or unsubscribe from a feed directly. If the team administrator subscribes the team to a feed, the individual members receive an email notification for activities in the feed such as new messages being posted, replies, likes, polls and @mentions.

All notifications related to a top-level message, such as replies, mentions, and likes, are sent out with the same subject. The subject line defaults to **Live Feed** followed by the beginning of the subject line from the top-level message. For example, if the subject of the feed is **IT Support**, the email notification's subject will be **Live Feed IT Support**.

1. Navigate to **Collaborate > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click the subscribe icon (✉️).

You can click the unsubscribe icon (🗑️) to stop receiving email notifications.

**Note:** If a team is subscribed to receive email notifications for a feed, but a member of the team did not subscribe to the team, that member does not receive the email notifications.

**Navigate between live feed and other modules**

If you are participating in a feed and navigate to another module, when you return to live feed it displays the feed you were previously viewing if it is public or if it is a private feed that you are a member of.

For example, assume you are viewing a public feed and then navigate to a particular incident record. Upon returning to live feed, the feed you were previously viewing opens. If you were last viewing a private feed that you are not a member of, returning to live feed opens the Company Feed.

**Leave a feed**

Members can choose to leave a group feed.

1. Navigate to Collaborate > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click Leave.

**Note:** If you leave a feed associated with a record, such as an incident, you automatically rejoin that feed if you modify the associated record again.

**Delete a feed**

If you are a feed administrator, you can delete the feed.

1. Navigate to Collaborate > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click Delete.
4. Click Yes to confirm deletion.

The feed is deleted from live feed. Messages posted to a private feed are deleted. Messages posted to a public feed remain on the Company Feed without a feed link.

**Live Feed UI overview**

The Live Feed user interface provides many methods you can use to share content with others in your organization.

**Update your Live Feed profile**

Your profile information includes a photo or image, and tabs for different types of information including messages, feeds, teams, followers, and those who are following you. You can update your profile information and picture at any time.
Note: The functionality described here applies to HTML5-compliant browsers, such as Chrome, Firefox, Safari and IE10 and above.

1. Navigate to Collaborate > Live Feed.
2. Click your name or title displayed below your picture.

The profile record opens.
3. Click the pencil icon next to About Me and type a short description about yourself that you want to share with others who view your profile. This is text that you might not necessarily want to change on a regular basis.

4. You can change your profile photo using either of the following two methods:
   - Locate the photo file you want to use, and drag-and-drop it over the existing photo.
   - Hover over the existing picture (or tap the photo in the case of the smartphone or tablet interface) to display the Upload a picture link. Click the link, navigate to the location of the photo you want to use, and click Open.
Upload a picture

**Note:** Your profile picture is used by the Connect and legacy chat features as well if they are activated.

**Work with Live Feed messages**

This portion of the UI gives the user access to various types of messages and tools for grouping and categorizing messages. Also included are methods for identifying which user feeds you are following and which users are following you.
Tools for working with live feed messages

<table>
<thead>
<tr>
<th>Menu section</th>

<tr>
<td></td>
<td>used to categorize messages by keyword or topic for improved search results</td>
</tr>
<tr>
<td></td>
<td>messages filtered from all conversations that include specific hashtags.</td>
</tr>
</tbody>
</table>

View another Live Feed user

When a requester user, one that has no ServiceNow role, is viewing a feed and points to another user’s picture, information for the user appears from the Business Card view of the User (sys_user) table.

You can customize ACLs to increase the amount of information you want displayed for users with different roles.
If you click a user's name or title, the user's profile appears. Click the tabs to view different types of information for the user.
Follow other Live Feed users

As you use Live Feed, you can follow the message threads of other users.

1. Navigate to a thread that the user you want to follow is engaged in.
2. Click that user's name or point to the user's picture.
   A Follow link appears in the user's profile.
3. Click **Follow**.
4. To stop following the user, navigate to **People > Following**.
5. Click **Unfollow**.
6. To view people who are following you, navigate to **People > Followers**.

**Select feeds**

A feed is a stream of related messages. You can use the feed selector to switch between feed types and to view specific group feeds and record feeds.

1. Use the **Search** field to locate any type of feed. As you type in the **Search** field, the results are dynamically displayed. For example, if you type **INC**, records that are incidents are forced to the top of the results list.
2. You can also select the following types of feed information.

<table>
<thead>
<tr>
<th>Feed</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>My Live Feeds</td>
<td>Displays the following posts:</td>
</tr>
<tr>
<td></td>
<td>• messages from users you follow</td>
</tr>
<tr>
<td></td>
<td>• messages with hashtags you follow</td>
</tr>
<tr>
<td>Company Feed</td>
<td>Displays all posts, except those posted to</td>
</tr>
<tr>
<td></td>
<td>private or unlisted groups.</td>
</tr>
<tr>
<td>Add Group Feed</td>
<td>Allows you to add a group feed.</td>
</tr>
</tbody>
</table>
Follow feeds
You can view users who are following you or other users you are following. To view users who are following you or other users you are following, click People in the sidebar. The system shows 10 most recent followers or users you are following.

![People](image)

If either list contains more than 10 users, a Show More link appears.

**Note**: If you are following a particular user whose profile changes, that user moves to the front of the Following list. This alerts you to changes in the profile of a user you are following.

Bookmark feeds and hashtags
The live feed interface uses the standard bookmarking functionality for feeds and hashtags. In UI15, you can drag-and-drop group feeds and hashtags from the Feed Summary section to the Edge for quick access.
Bookmark a hashtag

Add Live Feed to your homepage

You can add Live Feed to your own homepage or to a global homepage.

1. Navigate to a homepage.
2. Click the add content icon (\+) in top left corner of the homepage.
3. Select Live Feed in the left panel.
4. On the bottom of the window, click Add here in the appropriate layout position, then close the window.
Post content in Live Feed

In Live Feed, you can post new messages and replies to existing messages for all users in the feed. You can also send a reply message to a team or record.

Post a live feed message

You can post a message to open a new feed.

1. Navigate to Collaborate > Live Feed.
2. Click the feed to which you want to post your message, for example My Live Feed, Company Feed, and so on.
3. Enter a message in the Share your thoughts field. Use hashtags, if you want.
4. As needed, click , , , or to add a poll, attachment, or screenshot image, respectively.
5. Click Post.

Reply to a live feed message

To participate in an existing thread of a feed, you can compose and submit a reply message. By default, the message is visible to all members of the feed.

1. Navigate to Collaborate > Live Feed.
2. Locate the message you want to reply to.
3. Type your reply in the message box and click Reply.
   As needed, you can add hashtags, attachments, links, or knowledge base articles.
4. To limit who can view the reply to a single individual, select a user from the To choice list.
5. Click Reply.
6. By default, 7 replies are visible for each message. To view additional replies, click Show all replies. Any reply to a reply includes a Threads link.
7. Click Threads to view all of the replies within the selected reply in reverse chronological order within the Message Thread pop-up window, similar to an email thread.
Attach files, links, images, and knowledge articles to messages

In addition to entering text, you can attach files, such as images, documents, and spreadsheet files in any ServiceNow supported file type to live feed messages.

Administrators can manage attachment file settings, such as supported file types and maximum attachment file size, by editing system properties.

You can also include links to user-defined URLs and knowledge articles contained in your instance's knowledge base.

Note: The functionality described here applies to HTML5-compliant browsers, such as Chrome, Firefox, Safari and Internet Explorer 10 and above. Significant differences while using different browsers are highlighted.

Attach a file to a post or reply

You can attach files to a post by dragging a file into a post or pasting an image from the clipboard.

Use the paperclip icon ( ) to drag files into a post. Additionally, you can paste images into a post or reply from the clipboard.

1. Do one of the following:
   - While composing a post or reply (see Reply to a Message), locate one or more images or other supported types of files, and drag them into the message box.
   - Click the paperclip icon ( ) in the message box, navigate to the location of the files you want to attach, select them, and click Open.

2. To add more files, drag-and-drop additional files into the text box below the displayed files or images, or click the plus sign.
Attaching files

3. If you want to delete an attachment before posting the message, click the trashcan icon adjacent to the attachment.
4. Enter a comment to share your thoughts about the image.
   
   ![Image of company feed with attachment]

   **Note:** The Post button is enabled only after you add the comment.

5. Click Post or Reply.
6. If you added files that do not contain previews and then posted the message, they will be listed in the message box with a Download link.
7. Click the link to download the files.

**Copy an image from the clipboard**

In addition to adding files to a message, you can also copy images to the clipboard and paste them into a message or reply.

1. Click into the **Comment** box and add a comment.

<table>
<thead>
<tr>
<th>Here is how to drag-and-drop tags in order to bookmark them.</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image.png" alt="Drag-and-drop tags" /></td>
</tr>
</tbody>
</table>

2. Click the **Add an image** button. The **Screenshots** dialog box opens.

3. Right-click the **Paste an image here** box and select **Paste** to paste the image from the clipboard.
4. To add another image, repeat the previous steps.
5. When you finish pasting images into the message, click **Done**.
6. To change the link text, click **Pasted Image** and enter a new label.
7. When you finish, click **Post** or **Reply**.
8. To remove an image, click the trash can icon adjacent to the link.
9. To make changes to an existing image, click the edit icon (✏️).
Add a link to a post or reply

Add or modify a link to a live feed post.

1. Click into the **Comment** box. The **Add a link** button appears.
2. Click the **Add a link** button. The **URL** and **Link text** fields appear.

Add a URL

3. Enter the URL and the text you want to appear as the link.
4. To add another link, click the link icon under the **URL** field.
5. When you have finished entering your message, click **Post** or **Reply**.
To remove a link, click the trash can icon adjacent to the link. To make changes to an existing link, click the edit (edit) icon.

**Add a knowledge article link to a post or reply**

Use the ID of a knowledge article to post it as a reply to a live feed conversation.

1. While composing a post or reply, type the ID of the knowledge article you want to link to. You do not need to identify the knowledge article ID as a hyperlink; live feed recognizes it as such and automatically converts it into a link when the message is posted.
2. When you are finished entering your message, click Post or Reply.

**Add a poll to a message**

When you are posting a message, you have the option of creating a poll in order to record your viewers’ opinions. As users take the poll, their feedback statistics are displayed within the feed.

1. Open the feed where you want to create a message with a poll.
2. Enter the message with an invitation to take the poll in the Share your thoughts box.
3. Click the poll (poll) icon.
4. In the **Question** field, enter the question on which you are soliciting opinions.
5. In the **Option** fields, enter possible responses to the query.
6. To add more response options, click **Add more options**.
7. Click **Post**.
   After the poll is posted, users who view the message can vote. After they vote, their pictures appear next to their response, with others who have voted for the same option.

**Note:** Only the poll creator can view results without casting a vote. Other members can see results only after casting a vote or if the poll is closed.
An email notification with the poll result is sent to all participants of the poll informing them that the poll is closed.

**Add mentions to a message**

An @mention is any posted update that contains @username anywhere in the body of the message.

The user’s name, with a link to that user’s feed, is inserted into the message. Additionally, the mentioned user receives an email notification about the mention. This is a great way of bringing attention to other members in a conversation. All @mentions are included in the logged-in user’s My Feed.

**Note:** If an @mention is used by a member of a team, only members of that team appear in the auto-suggest list.

1. While entering a message or reply in a conversation, type @username anywhere in the message. As you type, an auto-suggest list appears with names and pictures of users that
match your entries. For example, if you type @t, the auto-suggest list shows the pictures and names of all users with names that start with T.

2. Click the user you want to add. That user’s name is inserted into the @mention in the body of the message.

   ![User selection](image)

   **Note:** My Feed displays @mentions of you and the teams you are a member of. Profile feeds for another user display only @mentions of that user.

### Like a message

Like a message to provide feedback to the author.

1. Navigate to **Collaborate > Live Feed**.
2. Click **Feeds**.
3. Locate the feed that contains the message you want to like.
4. Under the message title, click **Like**.
   - If the message has previously been liked, the number of likes for a message displays next to the Like link.
   - For a top-level message, the profile pictures of the first 5 users who liked a message are displayed. Any additional users who liked the message can be viewed by hovering over the **# more** link. If the logged-in user has liked the message, that user's image will appear first, followed by the image of the user who last liked the message.
   - For a reply, you must hover your mouse pointer over the **count** link to view the users who liked the message.

   **Note:** After a message has been liked, it cannot be unliked.
Delete a message

Users can delete any of their own posts or replies. A conversation administrator can also delete messages.

1. Hover over the message you want to delete.
2. Click the trash can icon in the upper-right-hand corner of the message box.
3. Click **Delete** in the confirmation box.
   The message disappears from the feed.

Managed Documents

Use the ServiceNow® Managed Documents application to control electronic documents within your instance.

After parameters have been set by the administrator and the Knowledge Document plugin installed, documents can move through the managed document cycle.

**Note:** Step through the process below on your test (or any non-production) instance.

Managed Document features

Managed Documents is a lightweight, ITIL-based solution for creating and managing electronic documents within your instance.

This application adds a layer of control around any document by providing workflow, storage, security, and categorization options. It can be used for a variety of internal documents, such as policies and procedures, compliance documentation, and knowledge articles. Because it is integrated within the instance, Managed Documents offers a seamless alternative to 3rd-party systems.

**Features**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check-in/Check-out</td>
<td>Track revisions, approval history, and automated notifications for approvers and reviewers. Useful for compliance and risk authors, policy and procedure writers, and contract administrators.</td>
</tr>
<tr>
<td>Categorization</td>
<td>Classify documents for organization and search.</td>
</tr>
<tr>
<td>Access control</td>
<td>Share documents with selected users.</td>
</tr>
<tr>
<td>Revision control</td>
<td>Track changes to documents.</td>
</tr>
<tr>
<td>Digital signature for approval</td>
<td>Integration with the Approval with E-Signature plugin.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Support consistent content review and approval.</td>
</tr>
<tr>
<td>Security</td>
<td>Use high security setting.</td>
</tr>
</tbody>
</table>
# Managed Document concepts

The following concepts explain Managed Documents: Managed Document, Document Collection, Document Revisions, and Document Parameters.

## Concepts

<table>
<thead>
<tr>
<th>Concept</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Managed Document</td>
<td>The <strong>Document</strong> <em>(dms_document)</em> table contains the documents controlled through the managed documents process.</td>
</tr>
<tr>
<td>Document Collection</td>
<td>The <strong>Document Collection</strong> <em>(dms_collection)</em> table allows related documents to be grouped together.</td>
</tr>
<tr>
<td>Document Revisions</td>
<td>Because managed documents must have clear records of individual versions of a document, revisions (including the file) are attached to the master document record through a related list. Document revisions are controlled to keep a standard naming scheme and consistent version numbers. Once a document revision is ready, it can be submitted for review.</td>
</tr>
<tr>
<td>Document Parameters</td>
<td><strong>Attention:</strong> Parameters do not control application or document security. Parameters only organize documents, they do not affect who can access documents. To grant access to the Managed Documents application, you can assign a role. To grant access to a specific document, set user and group permissions. Each document can be associated with predefined parameters. The parameters can help with grouping documents.</td>
</tr>
<tr>
<td></td>
<td>- Type: Defines the type of document being controlled. Documents of the same type use the same controls.</td>
</tr>
<tr>
<td></td>
<td>- Classification: Defines document restriction level, such as public, restricted, or confidential.</td>
</tr>
<tr>
<td></td>
<td>- Audience: Defines the groups with access to the document, such as internal or external.</td>
</tr>
<tr>
<td></td>
<td>- Name Formats: Defines the format of document names, ensuring that documents of the same type have the same name scheme assembled from name components.</td>
</tr>
<tr>
<td></td>
<td>- Name Components: Defines the document values used in the name formats.</td>
</tr>
<tr>
<td></td>
<td>- Approval Rules: Defines the approvals the document must have before it can be published.</td>
</tr>
</tbody>
</table>
Install the Managed Documents plugin

The Managed Documents plugin is available for activation by users with the admin role.

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   If the plugin depends on other plugins, these plugins and their activation status are listed.
3. (Optional) Select the Load demo data check box.
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when first activating the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Managed Documents plugin

This page describes the applications and modules, database table structure, scripts, and roles.

Database table structure

The following tables are added:

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revision (dms_revision)</td>
<td>The document revisions.</td>
</tr>
<tr>
<td>Audience (dms_audience)</td>
<td>The intended document readers.</td>
</tr>
<tr>
<td>Classifications (classification)</td>
<td>The document restriction level, such as public or confidential. (Does not define access to the document. Document security is set in user and group permissions.)</td>
</tr>
<tr>
<td>Type (dms_type)</td>
<td>The document purpose.</td>
</tr>
<tr>
<td>Component (dms_component)</td>
<td>The components of name formats. The value field is a dot-walking expression that is evaluated. An exception is made for the revision because it does not exist when the revision name is generated.</td>
</tr>
<tr>
<td>Name format (dms_name_format)</td>
<td>The composition of components to generate revision names.</td>
</tr>
<tr>
<td>Approval sequence (approval_sequence)</td>
<td>The approval sequences that users need to follow.</td>
</tr>
<tr>
<td>Approval Rule (dms_approval_rule)</td>
<td>The criteria that records of the dms_document table must match. Used to automatically add approvers to a document.</td>
</tr>
<tr>
<td>Collection (dms_collection)</td>
<td>The document groups created by the user.</td>
</tr>
</tbody>
</table>
Scripts

Business rules that are added to sys_script

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update Document</td>
<td>Changes the state of a document depending on its revisions.</td>
</tr>
<tr>
<td>Add Approvers</td>
<td>Populates the list of approvers in the document.</td>
</tr>
</tbody>
</table>

Script includes that will be added to sys_script_include

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DocumentManagement</td>
<td>Contains the main logics for the Managed Documents plugin.</td>
</tr>
<tr>
<td>DocumentManagementDB</td>
<td>Contains methods to perform CRUD operations on the database.</td>
</tr>
<tr>
<td>DocumentManagementSecurity</td>
<td>Helps manage the security of the Managed Documents system.</td>
</tr>
<tr>
<td>DocumentManagementAjax</td>
<td>Updates the details of the temporary revision that is created when opening the upload/check in revision form.</td>
</tr>
<tr>
<td>DocumentAttachmentAjax</td>
<td>Renames an attachment file.</td>
</tr>
<tr>
<td>DocumentRevisionWorkflowHelper</td>
<td>Helps perform basic workflow operations on a revision.</td>
</tr>
<tr>
<td>DocumentManagementApprovalMatcher</td>
<td>Helps obtain the user and group approvers for a document that matches approval rules.</td>
</tr>
<tr>
<td>DocumentApproverHelper</td>
<td>Contains logics to handle document approvers.</td>
</tr>
<tr>
<td>DocumentManagementUtils</td>
<td>Useful methods.</td>
</tr>
<tr>
<td>DocumentReferenceQualifiers</td>
<td>Static methods that return reference qualifiers.</td>
</tr>
</tbody>
</table>

Client script that is added to sys_script_client

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document type change</td>
<td>Updates the name format field in the revision settings section of the document. Each type has a default name format.</td>
</tr>
</tbody>
</table>

Roles

This plugin introduces two new roles:
## Roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>document_management_user</td>
<td>This role enables a user to access the Managed Documents plugin, create documents, and search for documents. Document reviewers and approvers need the document_management_user role to access the Managed Document plugin. (Please note that reviewers and approvers can also access a document revision from an approval record.)</td>
</tr>
<tr>
<td>document_management_admin</td>
<td>This role enables a user to change administrative settings for the Managed Documents plugin.</td>
</tr>
</tbody>
</table>

**Note:** Each document has individual permissions, so even if a user is given the document_management_user role and has permissions to the application, the user can only view documents to which they have been given access.

### Create a new managed document record

Configure the properties and policies for a managed document.

1. Navigate to **Managed Documents > Create New**.
2. In the **Name** field, type **Policy**.
3. In the **Requested by** field, add your name.
4. In the **Owner** field, add your name.
5. In the **Reviewer** field, add your name.
6. In the **Type** field, select **Policy**.
7. In the **Classification** field, select **Confidential**.
8. In the **Audience** field, select **Internal**.
9. Under **Revision Settings**, select the **Auto increment revision** option.
10. Click **Submit**.
Check in a document after making changes

After making changes to a document, check the revised document into Managed Documents.

1. Open the document record.
2. Click the **Upload/Check in Revision** related link.
3. Click **Choose File**, select the revised file, and click **Open**.
4. Check that the **Name** and **Revision Number** contain the updated number.
5. Ensure that the **Check in** option is selected.
6. Click **OK**.
   The Document Revisions list updates to contain the most recent revision.

<table>
<thead>
<tr>
<th>Name</th>
<th>Revision number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Policy_POL_0.1</td>
<td>0.1</td>
</tr>
<tr>
<td>Policy_POL_0.2</td>
<td>0.2</td>
</tr>
</tbody>
</table>

Check out a document to make changes

After a document is added to a managed document record, check the file out to make changes. Checking documents in and out keeps a record of document changes and ensures that only one person at a time is editing the document.

1. Open the document record.
2. Select the **Check Out Document** related link.
3. Select **Download file**.
4. Click **Check Out**.
5. Open the file and make a small change.
6. Save the document with the same name, but a new revision number. For example, **Policy_POL_02.txt**.
Publish a document in Managed Documents

After the document is reviewed and approved, publish the document within Managed Documents.

1. Open the document record.
2. In the Document Revisions list, click the name of the revision that was approved and is listed in the Ready for Publishing stage.
3. In the header bar, click **Publish Revision**.
4. In the Publish revision dialog box, check that the name and revision number are correct and click **Publish**.
   In the Document Revisions list, the revision you just published is now in the Published stage.

Send a document out for review and approval

When a document is ready, send it out for review and approval. If a reviewer or approver is not identified in the document record, the document is moved directly to the publishing stage.

1. In the Document Revisions list, right-click the revised document and select **Submit Revision**.

Because you identified yourself as the reviewer, you receive an approve request email message.

2. In the email message, click the link next to **Click here to view Approval Request**.
3. (Optional) View the document by clicking the attachment name under **Document Revision**.
4. Click **Approve**.
   The Approvals page displays and lists the document you just approved.
5. Open the document record.
6. In the Document Revisions list, the revision you approved is now in the Ready for Publishing stage.

Upload a document as an attachment

After creating a document record, add the document to the record as an attachment.

1. Open the document record.
2. Select the Upload/Check in Revision related link.

3. Click Choose File.
4. Select a simple document, such as a text file, and click Open.
5. Check that the name reads Policy_POL_0.1.
6. Click OK.

The document is listed under Document Revisions.

Defining Document Parameters

Before using the Managed Documents application, the user with the document_management_admin role needs to set the parameters that define the kinds of documents to be managed through the application. Managed Documents provides both base and custom parameter options.

Defining Document Parameters

The following document parameters should be defined:

- **Type**: identifies the purpose of the document. The type also determines the default document format and name format.
- **Classification**: indicates the security level assigned to the document and determines who can view or edit the document.
- **Audience**: specifies the intended readers of the document.
- **Name format**: specifies the name format to use when a document revision is added.
- **Name components**: are individual identifiers used inside a name format. Name components define a reference path (often by dot-walking) that holds the value specific to the document.
- **Approval rules**: determine which approvers are added to documents (in addition to the Reviewers specified on the document record).

Defining Types

To define a new type, navigate to Managed Documents > Administration > Type and click New.
The following types are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Code</th>
<th>Label</th>
<th>Name format</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>-- None --</td>
<td>null</td>
<td>-- None --</td>
<td>null</td>
<td>1</td>
</tr>
<tr>
<td>policy</td>
<td>POL</td>
<td>Policy</td>
<td>Default Policy</td>
<td>2</td>
</tr>
<tr>
<td>guideline</td>
<td>GUI</td>
<td>Guideline</td>
<td>Default</td>
<td>3</td>
</tr>
<tr>
<td>procedure</td>
<td>PROC</td>
<td>Procedure</td>
<td>Default</td>
<td>4</td>
</tr>
<tr>
<td>contract</td>
<td>CON</td>
<td>Contract</td>
<td>Default</td>
<td>5</td>
</tr>
</tbody>
</table>

Note: For documents with a Type of Contract, a Contracts related list appears on the document record, listing any contracts the document is associated with.

### Defining Approval Rules

To define a new approval rule, navigate to **Managed Documents > Administration > Approval Rules** and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique identifier for the approval rule.</td>
</tr>
<tr>
<td>Active</td>
<td>A check box indicating whether this approval rule is used.</td>
</tr>
<tr>
<td>Condition</td>
<td>A condition builder that determines which documents use this approval rule.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the approval rule.</td>
</tr>
</tbody>
</table>

Once the approval rule is saved, the Approvers related list defines which approvers are added if the conditions in the Condition field are met.

The following approval rules are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internal policy</td>
<td>type=Policy ^ audience=Internal</td>
</tr>
</tbody>
</table>
### Defining Audiences

To define a new audience, navigate to **Managed Documents > Administration > Audience** and click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audience Name</td>
<td>A unique name for the audience.</td>
</tr>
<tr>
<td>Audience Code</td>
<td>A short code for the audience. Referenced as a name component for the name format.</td>
</tr>
<tr>
<td>Label</td>
<td>A label to display in the <strong>Audience</strong> choice list.</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating this audience’s sequence in the choice list.</td>
</tr>
</tbody>
</table>

The following audiences are available in the base system.

<table>
<thead>
<tr>
<th>Audience</th>
<th>Audience code</th>
<th>Label</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>internal</td>
<td>INT</td>
<td>Internal</td>
<td>1</td>
</tr>
<tr>
<td>external</td>
<td>EXT</td>
<td>External</td>
<td>2</td>
</tr>
</tbody>
</table>

### Defining Classifications

Define a new classification on the Classification form.

Navigate to **Managed Documents > Administration > Classification** and click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the classification.</td>
</tr>
<tr>
<td>Code</td>
<td>A short code for the classification. Referenced as a name component for the name format.</td>
</tr>
<tr>
<td>Label</td>
<td>A label to display in the <strong>Classification</strong> choice list.</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating this classification’s sequence in the choice list.</td>
</tr>
</tbody>
</table>

The following classifications are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Code</th>
<th>Label</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>P</td>
<td>Public</td>
<td>1</td>
</tr>
<tr>
<td>restricted</td>
<td>R</td>
<td>Restricted</td>
<td>2</td>
</tr>
<tr>
<td>confidential</td>
<td>C</td>
<td>Confidential</td>
<td>3</td>
</tr>
</tbody>
</table>

Defining Name Components

Name components define the document values used in the name format.

For example, the name component `document.audience.code` dot-walks from the document record to the audience Code.

To define a new name component, navigate to Managed Documents > Administration > Components and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique identifier for the name component.</td>
</tr>
<tr>
<td>Short Description</td>
<td>A short description of the name component value.</td>
</tr>
<tr>
<td>Value</td>
<td>The path to the field holding the value used for the name format. Defined relative to a current revision record.</td>
</tr>
</tbody>
</table>

For example:
- Enter `revision` to use the revision Number field on the revision record.
- Enter `document.name` to use the Name field on the revision's referenced document.
- Enter `document.audience.code` to use the Code field for the audience referenced by the document.

This dot-walking approach makes it possible to get any value related to the revision into the name format.

**Note:** The `revision` component is a special component replaced by the appropriate revision number (rather than querying a value related to the current record). The revision is either automatically incremented or uses the latest revision number, depending on the setting on the document form.

The following components are defined in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Short description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audience code</td>
<td>Displays the code assigned to the document audience.</td>
<td><code>document.audience.code</code></td>
</tr>
<tr>
<td>Classification code</td>
<td>Displays the classification code.</td>
<td><code>document.classification.code</code></td>
</tr>
<tr>
<td>Document name</td>
<td>Displays the document name.</td>
<td><code>document.name</code></td>
</tr>
<tr>
<td>Revision</td>
<td>Displays the document revision.</td>
<td><code>revision</code></td>
</tr>
<tr>
<td>Type code</td>
<td>Displays the code assigned to the document type.</td>
<td><code>document.type.code</code></td>
</tr>
</tbody>
</table>
Defining Name Formats

The name format automatically generates a name for a document revision by arranging name components in a standard code to match naming conventions.

For example, a name format with the name components **Type Code**, **Document Name**, and **Revision Number** and the separator ``,` would be formatted as:

```
TYPECODE-Name-RevNumber.fileformat
```

In this example, a policy (code POL) named **IT Off-Boarding Policy**, with revision number **1.0**, and uploaded as a **.docx** file would have the name:

```
POL-IT Off-Boarding Policy-1.0.docx
```

To define a new name format, navigate to Managed Documents > Administration > Name Formats and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the name format.</td>
</tr>
<tr>
<td>Separator</td>
<td>A separator to put between each of the components. Hyphens (-) and underscores (_) are commonly used. Using alphanumeric characters can create a confusing name format.</td>
</tr>
<tr>
<td>Description</td>
<td>A description of the name format.</td>
</tr>
</tbody>
</table>

Use the related list to add name components. Use the **Order** field to set the sequence in which name components are used.

The following name formats are defined in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Separator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>-</td>
<td>The default format. Document name and revision separated by an underscore.</td>
</tr>
<tr>
<td>Default Policy</td>
<td>-</td>
<td>The format for the policy document type.</td>
</tr>
<tr>
<td>Development documentation</td>
<td>(no separator)</td>
<td>The format for the software documentation type.</td>
</tr>
<tr>
<td>Development Sources</td>
<td>(no separator)</td>
<td>The format for the development and code sources type.</td>
</tr>
<tr>
<td>Intranet Improvement</td>
<td>(no separator)</td>
<td>The format for documents that describe intranet use.</td>
</tr>
</tbody>
</table>

Defining Document Workflow

In the base system, all managed documents use the Managed Documents workflow after the **Active** check box is selected.
Document workflow

The document parameters defined in the workflow are often used as conditions to trigger more specific workflows, such as type-specific workflows or classification-specific workflows. If different
kinds of documents should follow different workflows, use the Graphical Workflow Editor to create new workflows.

**Knowledge document**

The Knowledge Document plugin extends the Managed Documents plugin by providing the functionality for managed documents to be published to the knowledge base.

**Installed with knowledge document**

These elements are installed with the knowledge document plugin.

**Dependencies**

The Knowledge Document plugin depends on the Managed Documents plugin. Activating Knowledge Document activates Managed Documents.

**Tables**

<table>
<thead>
<tr>
<th>Display Name (table_name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Records</td>
<td>A many-to-many table storing the relationship between a document and a knowledge article.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>UI action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link to Knowledge</td>
<td>Creates or updates a knowledge article related to the current document, depending on whether a knowledge article already exists.</td>
</tr>
</tbody>
</table>

**Scripts**

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KnowledgeDocument</td>
<td>Holds the main logic for the Knowledge Document plugin.</td>
</tr>
<tr>
<td>KnowledgeDocumentDB</td>
<td>Class that gets, inserts, and updates data for the Knowledge Document plugin.</td>
</tr>
</tbody>
</table>
Knowledge settings fields

These fields appear on the Managed Document form Knowledge Settings section.

**Knowledge settings**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Behavior</td>
<td>Defines the process performed when the Link to Knowledge related link is clicked. Select <strong>Always create record</strong> to create a new knowledge article with the latest published revision attached. The knowledge article is then linked to the document. Select <strong>Update existing record</strong> to update the existing knowledge article to the latest published revision. If no knowledge articles exist for the document, a new knowledge article is created. The <strong>Update existing record</strong> option is not available when many knowledge articles are linked to a document.</td>
</tr>
<tr>
<td>Type</td>
<td>Specifies the type of knowledge article. Use Knowledge or any option that extends the kb_knowledge table. For example, if you have the IT GRC plugin installed to create GRC policies, select the type Policies. Note that when a knowledge article is created, the <strong>Type</strong> field becomes read-only.</td>
</tr>
<tr>
<td>Topic</td>
<td>Defines the subject of the document. Adds the topic information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Published</td>
<td>Date that the article should be published. Adds publishing date information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Valid to</td>
<td>Date that the article expires. Adds valid to date information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Short description</td>
<td>A few words or short phrase describing the knowledge article. Adds the short description to the same field in the knowledge article.</td>
</tr>
</tbody>
</table>

Create a version of a knowledge article from a managed document

You can create a new version of a knowledge article from the managed document record.

- The Knowledge document plugin (com.snc.knowledge_document) must be enabled.
- The Knowledge Management Advanced plugin (com.snc.knowledge_advanced) must be enabled.

1. Navigate to Managed Documents > Documents > All.
2. Click a document.
3. Click Upload/Check In Revision.
4. Enter a Name and a Note for the revised document.
5. Choose a file.
6. Click OK.
7. Click the Link to Knowledge related link.
The uploaded document is updated to the latest published version of the knowledge article. If the knowledge article is in Draft, Review, or Retired state, it is not updated unless the reviser and author of the managed document are the same.

If the author of the managed document and the reviser is not the same and the knowledge article is checked out, the article has to be published before any changes can be made.

8. Select the knowledge article to view.

Create a document

After Managed Documents parameters have been set by the administrator, documents can be created, requested, checked out, edited, checked in, copied, and, if necessary, rolled back to an earlier version.

Once documents have been added to the Managed Documents application, they can be grouped into document collections.

Approval process

During the approval process, the approver approves or rejects the document. A document goes through the approval process after the review process.

Approval workflow

After the document has been reviewed, submit the document for approval. If the document does not have an approver, the approval process is omitted.

When the document is Active, the workflow Document Management Default is used to manage approvals:
If the approver rejects the document, the author and owner are notified and the document review is cancelled. The author, owner, and approver should discuss what changes need to be made to the document. When the document is ready, a new review can be initiated.

If the final approver approves the document, the author and the owner are notified. Once final approval is successful, the document stage changes to **Ready for Publishing** in the Document Revisions list.

**Process modification for multiple approvers**

If there are multiple approvers, the approval process works in sequence and multiple approvers can be assigned to a single sequence. For example:

Sequence 1: approvers A and B
Sequence 2: approvers C and D
Sequence 3: approver E

Because the sequences take place in ascending chronological order, approvers A and B receive the approval request first (approvers C, D, and E are not part of the process yet). Similar to the review process, the first approver to act within a sequence dictates what happens to the document. If approver A acts first and rejects the document, the approval process stops and the state is set to Cancelled. Approver B's status is changed to No Longer Required. If approver A acts first and approves the document, the process stops and approver B's status is changed...
to No Longer Required. Then, the document moves to approval sequence 2. After at least one approver in each sequence approves the document, the author and the owner are notified that the document has been approved.

**Review process**

During the review process, the reviewer approves or rejects the document. Sometimes a document will have multiple reviewers.

If the reviewer rejects the document, the author and owner are notified and the review is cancelled. The author, owner, and reviewer should discuss what changes need to be made to the document. If the reviewer approves the document, the author and owner are notified that the review was successful and the document can move to the approval stage.

If multiple reviewers are assigned to a document, the first reviewer to act dictates what happens to the document. For example, there are two reviewers, A and B. If reviewer A acts first and rejects the document, the review process stops and the revision state is set to Cancelled. Reviewer B receives a notification email stating that the review was rejected and their status is changed to No Longer Required. If reviewer A acts first and approves the document, the review process stops and the document can move to the approval stage. Reviewer B's status is changed to No Longer Required.

**Enable electronic signature for approval**

This topic explains how to enabling electronic signatures for approval. Electronic signatures are helpful if you must obtain a digital signature for compliance or auditing purposes.

You can activate the **Approval with E-Signature plugin** to require that users type in a user name and password when reviewing and approving documents.

The digital signature is not tracked or stored in the document record. Users must simply type in a user name and password after clicking the **Approve** or **Reject** button.

![Approver Authentication](image)

**Digital signature**

After activating the Approval with E-Signature plugin, ensure that a row in the e-signature registry table is created for the **dms_document_revision** table.

1. Navigate to **System Definition > e-Signature Registry**.
2. Check if **dms_document_revision** is already listed and **Enabled** is set to **true**.
3. If not listed, click **New**.
4. In **Table name**, select **Document Revision**.
5. Select **Enabled**.
6. Click Submit.

Publish an approved revision

This topic explains how to publish a document revision that has been approved.

Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

Publish the approved revision from the Document Revisions list.

1. Navigate to the document record.
2. In the Document Revisions List, click the revision marked Ready for Publishing.
3. Click Publish Revision to display the Publish dialog box.

The revision number matches the latest revision number. If your standard is to change the revision number when the document is published, such as incrementing the version number to 1.1 or 1.0.1, the change can be made on this dialog box manually.

4. Click Publish.

The published revision is highlighted in green and the stage of previous revisions is automatically changed to Retired.
Submit a revision for draft review

This topic explains how to submit a document draft for review.

Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

When a draft of the document is ready, submit the draft for review. If the document does not have reviewers identified in the Reviewers field of the document record, the review process is omitted.

1. Navigate to the document record.
2. Right-click the appropriate revision.
3. Select Submit Revision.

   The revision stage is set to Awaiting Review.
The document name and parameters are changed to read-only. The document state is set to **Active**.

**Create or request a new document**

Once an administrator has set parameters for the Managed Documents application, you can create or request new documents.

1. Navigate to **Managed Documents > Create New**.
2. Complete the following fields:

   **New document fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>An identifying number for the document. Automatically generated using number maintenance.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Name</td>
<td>A name for the document. Note that the name for the document is combined with other naming components (as defined by the <code>name format</code>) to create the names for each document revision.</td>
</tr>
<tr>
<td>Requested by</td>
<td>The person asking that the document be created or updated.</td>
</tr>
<tr>
<td>Owner</td>
<td>The approver of the document request. Also responsible for setting completion date with requesters and authors.</td>
</tr>
<tr>
<td>reviewers</td>
<td>The user or users who review the document and provide feedback to owners and authors.</td>
</tr>
<tr>
<td>Department</td>
<td>The department responsible for the document.</td>
</tr>
<tr>
<td>Type</td>
<td>The document purpose. This is a choice list derived from the <code>type parameters</code>.</td>
</tr>
<tr>
<td>Classification</td>
<td>The document classification, based on security, audience, and confidentiality. This is a choice list derived from the <code>classification parameters</code>.</td>
</tr>
<tr>
<td>Audience</td>
<td>The document readers, such as external or internal. This is a choice list derived from the <code>audience parameters</code>.</td>
</tr>
<tr>
<td>State</td>
<td>The current status of the document in the editing and publication process.</td>
</tr>
<tr>
<td>checked out by</td>
<td>The user who currently has the document checked out.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the document.</td>
</tr>
<tr>
<td>Revision Settings</td>
<td></td>
</tr>
<tr>
<td>Name format</td>
<td>The format for the name of each individual revision of the document. For more information, see <code>Defining Name Formats</code>.</td>
</tr>
<tr>
<td>Revision format</td>
<td>A choice between the two digit (0.x) or the three digit (0.0.x) revision format.</td>
</tr>
<tr>
<td>Auto increment revision</td>
<td>If selected, the revision number automatically increments each time the document is revised.</td>
</tr>
</tbody>
</table>

The **User Permissions** related list determines which users have rights to view and contribute to the document:

**User permissions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>A reference to a user who is entitled to read and contribute to the document.</td>
</tr>
</tbody>
</table>
### Field | Input value
--- | ---
**Type** | A choice list describing how the user can interact with the document. Options are:
- Reader - The user can read the document versions.
- Editor - The user can upload new versions.
- Owner - The user can edit the document.

The **Group Permissions** related list determines which groups have rights to view and contribute to the document:

#### Group permissions

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Group</strong></td>
<td>A reference to a group of users who are entitled to read and contribute to the document.</td>
</tr>
</tbody>
</table>
| **Type** | A choice list describing how group members can interact with the document. Options are:
- Reader - Group members can read the document versions.
- Editor - Group members can upload new versions.
- Owner - Group members can edit the document. |

### Specify an approver

You can specify approvers for a document record after you save it.

You can have one approver or multiple approvers. For example, set multiple approvers to have one person do a quality check of the document and a different individual to serve as a final approver. Approvers are assigned a number. The lowest number (usually number one) approver always goes first, then any other approvers in ascending chronological order. Multiple approvers can have the same sequence number. For example, two approvers can do a quality check and be assigned sequence number 1. Then, two individuals can be final approvers and be assigned sequence number 2.

1. Navigate to the document record.
2. Right-click in the document header bar and select **Add Approver**.
3. Add a user name.
4. Select a sequence number from the drop-down list. (Lower numbers approve before higher numbers. For example, approver number one approves before number two.)
5. Click **Add User**.
6. Repeat steps 2-5 to add more approvers.

### Check in a document

Check in the document after you revise it so other users can check out the document.

1. Navigate to the document record.
2. Select the **Upload/Check In Revision** related link.
3. Click **Browse** and navigate to the revised file.
4. Click **Open**.
5. Check the Name and Revision Number.
6. Click **OK**.

The **Document Revisions** related list updates to contain the most recent revision:

---

### Copy a document

A document can be duplicated at any time. This is useful if you have an existing document that you want to use as a base for a new document.

1. Navigate to the document record.
2. Right-click the header bar and select **Copy Document**.

An information message with a link to the new document displays:

3. Click **OK**.

The new document is renamed and includes the word "Copy."

**Note:** Only the latest revision is copied.

---

### Deactivate a document

To change the document state to **Inactive**, deactivate the document. This is useful when changes to a document have been put on hold. An inactive document can be reopened at any time.

1. Navigate to the document record.
2. Right-click the header bar and select **Deactivate Document**.

**Note:** To activate a document, right-click on the header and click **Reopen Document**.
Reopen a deactivated document

A document that has been deactivated can be reopened.

1. Navigate to the document record.
2. Right-click the header bar and select Reopen Document.

Roll back a document

A document can be rolled back to an earlier revision at any time. Before rolling back to an earlier revision, ensure that the document is not checked out and that you have Editor or Owner permissions for the document.

1. Navigate to the document record.
2. In the Document Revisions list, click the revision to which you want to roll back.
3. Right-click the header bar and select Rollback. The Rollback to Revision dialog box displays. The name and revision number are new. The note specifies the revision to which you are rolling back.

4. Change any information on the Rollback to Revision dialog box as necessary.
5. Click OK. The latest revision is now the revision you selected for rollback.

Cancel a document

Change the document state to Cancelled when no more changes will be made to the document.

When canceling a document, there is no confirmation message, so ensure that you want to cancel the document.

1. Navigate to the document record.
2. Right-click the header bar and select Cancel Document.

An info message confirms the cancellation:

The State is set to Cancelled:
Check out a document

Documents in the Managed Documents application can only be revised by one user at a time. Check out the document to revise it.

1. Navigate to the document record.
2. Select the Check Out Document related link.
3. Select Download file to download the current version of the document when it is checked out.
4. Click Check Out.

After checking out a document, you can edit the document and make any necessary changes.

Create a document collection

A document collection is a set of individual documents. After documents have been uploaded into Managed Documents, organize the documents by grouping them into collections.

1. Navigate to Managed Documents > Document > My Collections.
2. Select New.
3. Type in a Name.
4. (Optional) Type in a Description.
5. Click Submit.
6. Click the name of the collection you created.
7. Click Edit.
8. On the left, double-click an available document or select a document and click Add.
9. Click Save. The Document Collection page displays and the individual documents in the collection are listed:

![Document Collection](image1)

**Upload a document**

Upload a document into a saved record. You can upload text files, spreadsheets, presentations, PDF files, and more.

1. Navigate to the document record.
2. Click the **Upload/Check In Revision** related link.
3. Click **Choose File** and navigate to the file.
4. Click **Open**.
5. Check the Name and Revision Number.
6. Click **OK**.

After the initial document is uploaded, subsequent revisions can be created by checking out the document.
Domain separation and Managed Documents

This is an overview of domain separation in Managed Documents. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

No support

- The domain field may exist on data tables, but no logic exists to manage data.
- This level is not considered domain-separated.

MetricBase

The MetricBase application stores time-series data, which is data that is sampled at regular intervals. You can graph the stored data or use it with triggers to execute Flow Designer flows. MetricBase helps developers working with IoT-based applications that monitor or act on large amounts of machine-generated data.

How MetricBase works

You use MetricBase to deal with large amounts of data by using a smaller summary of that data that is stored in the MetricBase database. For example, an instance might store CPU usage. With MetricBase, you might summarize that data by storing the average CPU usage for every five-minute interval. You can graph the data or you can use it with Flow Designer to trigger flows.

MetricBase works with:

- An instance that stores machine-generated data
- A server that has the MetricBase application and database

On a very high level, when using MetricBase, you can:

1. Define the sampling rate for the data (float) on an instance. For example, you can sample the machine-generated data that is stored on an instance once every five minutes. This sampling rate is called the time-series definition.

2. Use a MetricBase API to send data from the instance to the MetricBase database at the rate that is prescribed by the time-series definition. If you send the data to MetricBase at a different rate, you get an error.

3. Use the Reporting application to graph the time-series data that is stored in MetricBase, or create triggers that execute Flow Designer flows. The time-series data remains in the MetricBase database for a prescribed amount of time, after which MetricBase deletes the data.
This figure shows that machine-generated data is sampled every 4 seconds. You send the average of the values in each sampling period to the MetricBase database, which stores the data until its expiration date.

**Benefits**

- MetricBase integrates seamlessly with ServiceNow IoT-based applications that monitor or act on large amounts of machine-generated data.
- MetricBase collects, retains, analyzes, graphs, and acts on time-series data.
- MetricBase works with Flow Designer to trigger flows and with Reporting to generate reports.

**Use cases**

- Create graphs about metrics, such as about CPU usage over time.
- Generate an email if the average CPU usage is more than 85% in the last 5 minutes.
- Train a machine language model to detect anomalies and execute a Flow Designer trigger when an anomaly is detected.
- If MetricBase detects a gap in data submitted for 10 minutes or more, generate an email.
- If the average of the collected data is less than 10 or greater than 500 in the last 5 minutes, generate an alert.
- If memory usage is likely to exceed 90% in the next 10 minutes, generate an alert.

**MetricBase demo**

Use the MetricBase Demo plugin to familiarize yourself with MetricBase. The demo contains sample metrics, triggers, and a scheduled job that collects and stores data. Use the demo to explore MetricBase before you set it up. The Data Explorer, which comes with the demo plugin,
provides a place to experiment with MetricBase JavaScript APIs. The demo plugin is separate from the MetricBase plugin. Make sure to request both.

**Next**

*Request the installation* of the MetricBase and MetricBase Demo plugins.

**Purchase the MetricBase product**

The MetricBase application requires a separate subscription and must be activated by ServiceNow personnel. Be sure to request the MetricBase Demo plugin, which includes sample tables, metrics, triggers, and data.

Role required: none

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and subproduction instances, generally within a few days.

When ServiceNow personnel install the MetricBase Demo plugin, they also connect your instance to the server that contains the MetricBase database. A MetricBase database can connect with only one other instance. For example, a clone of the original instance can’t talk to the same database as the original instance.

- *Play with MetricBase* to get familiar with it.
- *Define and collect MetricBase data.*

**Getting familiar with MetricBase**

After ServiceNow personnel install the MetricBase and MetricBase Demo plugins, you can use the demo to get familiar with MetricBase.

**Prerequisites**

- MetricBase and the MetricBase demo plugins must be installed by ServiceNow personnel.
- Role required: admin

**MetricBase Demo**

With the MetricBase Demo plugin, you can experiment with MetricBase without configuring it or knowing much about it. The plugin includes sample time-series data and triggers in your MetricBase database to help you visualize the data and see how triggers operate. The demo also includes scheduled time-series data updates, as if they had been received from an instance, so you can test the functionality of the included triggers.

In the demo, a fictional fleet of drones has been outfitted with sensors that broadcast their metrics, including their speed, altitude, and battery life over time.

1. Navigate to **MetricBase Demo > Drones**
   - to see the name, model, length, width, altitude, and speed for all drones in the fleet.
2. Click **MetricBase Demo > Metrics** to see how the metrics are defined.

In the Time Series Metrics list, the column values specify the table where the drone's time-series metrics are stored, the names of all the metrics that are stored for each drone, and the retention policy for each metric. The retention policy specifies how frequently measurements are taken, and how long MetricBase retains that data.

Now that you've seen the drone data and learned how to find it, let's see how the data was collected using a retention policy.

3. Click a retention policy.

The Retention Policy form shows the definition for the policy. In the following example, this metric is measured once a minute for the first 8 days, then once every 10 minutes for the following 94 days, and then once an hour for the following 397 days. After that, the system discards the data.
For more information on retention policies, see *Define and collect time-series data.*

4. To see how the data is aggregated during the Retention Durations, click the left arrow («) at the top of the Retention Policy Schedules window to return to the Time Series Metrics list.

5. Click a table name.

The Time Series Metric definition shows the **Retention policy aggregator.** This aggregator summarizes the data as, for example, the average, maximum, or minimum value in the aggregation period. In the following example, the admin clicked the table for the speed metric. The result is that MetricBase stores the speed averages during each sampling period in the MetricBase database.

Now that you understand how the data was collected using retention policies, let's see how to display the data in lists and graphs.

6. Notice the parameter fields that start with **Display.** In this example, they mean that the speed values that are displayed in the list view of drones are the last speeds recorded in every hour interval for each drone.

These **Display** fields control what appears in the list view of the drones only. They have nothing to do with the retention policy.
7. Display the list view of a table by entering `<table-name>.list` in the **Field navigator** field. For example, `mb_demo_drone.list`. All drone data appears. In the example from the previous step, the speed column would contain the **Last** value of the sampling period.

8. Click **MetricBase Demo > Drones** and look at the speed (kph) column. From the previous step, you know that these values are the last speeds recorded for each drone up to an hour ago. The values are the same as you would get by using the `.list` command.

9. Click the speed value of the first drone. The following graph shows the speed of the drone that was measured hourly.

![Graph showing drone speed](image)

**Note:** You might need to select a different **Time Span** field value to get a clearer graph. For example, try **1 Day**. The speed is a sine wave because it's artificially generated. Hover over the sine wave to see the actual measurements.

10. Click the left arrow (<) to return to the list of drone metrics, right click on one drone type (**Model** column), and select **Show Matching**. Only the drones of the selected type appear.

11. Click the menu icon (**☰**) next to the **Altitude** column heading and select **Time Series Chart**. You see a graph that shows the altitude measurements of the Warbler-T7-type drones.

![Graph showing drone altitude](image)

You might like to change the **Time Span** value for a clearer graph.

12. In the **Transform** field, select **Envelope**. You see a graph that shows the minimum and maximum (envelope) altitudes for the fleet of Warbler T7 drones over time.
13. Click the left arrow (<) to return to the list of drone metrics.

14. Click the menu icon (≡) next to the Altitude column heading and select **Time Series Chart Designer** to see another way of visualizing the data.

15. In the Create a Report page that displays in the Reporting application, vary with the graph parameters.

   **Note:** In the following steps, to stay on the same page, click **Run**. To advance to the next page when designing the graph, click **Next**.

   a. Change the **Last** value to one day and click **Next**.
b. In the Style pane, change the **Chart color** value and click **Run**.

c. Click **Type**, select the kind of graph to display, and click **Run**.
d. Click **Configure**, select a transform to run on the data from the **Transform** list, and click **Run**.

e. Edit the report title, which is above the graph, and click **Run**.

f. Click **Configure**. In **Time range**, select the time line to display on the graph.

**Note:** **Relative** uses the **Last** timespan relative to the present time. For example, if **Last** is 1 hour, the time line in the graph always spans the previous hour. You can add this report to your dashboard to show the metrics in the previous hour.
You’ve displayed drone data in lists and graphs. Now, let’s define a trigger that executes when data that you monitor reaches a threshold value.

16. Click MetricBase Demo > Trigger Definitions.
   The MetricBase Trigger Definitions list, shows the name (Name) of the trigger, the metric (Metric) the trigger monitors, the table (Table name) the metric that it is in, the trigger description, and whether the trigger is active. Triggers kick off flows when metrics meet trigger thresholds. An example is when a drone flies too low. For more information about triggers, see Trigger Workflows.

17. Click Low-Battery Drone.
   The MetricBase Linear Predictor trigger form displays the definition of the Low-Battery Drone trigger.
In this example, the trigger monitors the Remaining Battery (%) metric (Metric) in the Drone table (Table name) every 10 minutes (Window). If the battery life is trending downward (Trend) and is 80% likely (Confidence Level) to reach 20% (Threshold) within 20 minutes (under Window for Level 1), the trigger executes. Although it fires, nothing happens until you associate this trigger with a flow. The flow defines the actions to take.

18. Click MetricBase > Triggers.
Flow Designer opens.
19. Click + **New** > **New flow** to associate a trigger that is defined in the system to a flow.

20. In the **Name** field, name the flow and click **Submit**.
21. Click **Click to add a Trigger** and select **MetricBase** in the list.

22. In **MetricBase Trigger**, select a trigger that already exists and click **Done**. 
   Alternately, you could click the plus sign to the right of **MetricBase Trigger** to create a new trigger.

23. Click **Click to add an Action, Flow Logic, or Subflow**.

24. Click **Action** to specify the actions to take when the trigger fires. 
   The Action modal appears.
25. Select a domain of actions from the left column and the specific action to take in the right column.

26. Click **Save** and **Activate**.

   The flow doesn't execute unless it is activated. For more information about Flow Designer, see *Flow Designer*.

The following table summarizes the modules in the MetricBase demo.

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drones</td>
<td>Table that keeps metrics on drones, such as speed and altitude. Each record is a different drone. You can add records.</td>
</tr>
<tr>
<td>Fleets</td>
<td>Table that maintains metrics about groups of drones. Each record is a different fleet. You can add records.</td>
</tr>
<tr>
<td>Data Generators</td>
<td>Table that defines how data is created for the drone records. This field is provided for informational purposes. You cannot change or add records.</td>
</tr>
<tr>
<td>Metrics</td>
<td>List of metrics that are defined in the system. This list is the same table as MetricBase &gt; Time Series Metrics. You can add metric fields.</td>
</tr>
<tr>
<td>Scheduled Jobs</td>
<td>Scheduled job that is created for the demonstration application. The job runs every five minutes to add data to the demo tables in the MetricBase database. You can change the schedule.</td>
</tr>
<tr>
<td>Trigger Definitions</td>
<td>List of triggers that are defined in the demo. This list is the same table as MetricBase &gt; MetricBase Triggers &gt; Trigger Definitions. You can create additional triggers.</td>
</tr>
<tr>
<td>Module</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Anomaly Logs</td>
<td>List of logs that result from triggers firing. The <strong>Low-Flying Drone</strong> trigger creates the anomaly logs.</td>
</tr>
<tr>
<td>Data Explorer</td>
<td>Widget that enables you to experiment with MetricBase JavaScript APIs using the demonstration application data. See Get Familiar with <strong>MetricBase APIs</strong> for more information.</td>
</tr>
</tbody>
</table>

**Next topics**

- *Set up MetricBase.*
- Explore the MetricBase JavaScripts APIs.

**Define and collect MetricBase data**

MetricBase stores time-series summaries of much larger data collections. In MetricBase, you specify the metric that you want to store, how often to collect it, and how long to store it in the MetricBase database. Then, you send the data from an instance to the MetricBase server at the rate that you define using MetricBase REST or JavaScript APIs. In this way, you can monitor a much large data collection with MetricBase summaries of it.

- *Install MetricBase*
- Role required: clotho_admin

You use MetricBase to work with large amounts of machine-generated data by storing a smaller summary of that data in MetricBase.

You use MetricBase to define how often you will send data to MetricBase and what the aggregation of that data is, for example, maximum, minimum, average, or last. This data is called **time-series data**. For example, if you collect drone speeds on an instance, you might send the average the drone speed for every two minutes to the MetricBase database. This data might be one of many time-series metrics that you collect. You might also collect altitude and battery life. MetricBase stores each metric as a column in its database.
Retention schedules specify how long MetricBase stores the time-series data in the MetricBase database. The syntax is `<retention duration> @ <time-series-definition>`. For example, 30 Days @ 5 Minutes, means that the specified metric is sampled every 5 minutes and that data remains in the MetricBase database for 30 days.

Retention policies include multiple retention schedules with coarser granularity the longer that the data is kept. For example, the Coarse retention policy stores sampled data every:

- Hour for one week (7 Days @ 1 Hour interval)
- Two hours for one month (31 Days @ 2 Hour interval)
- Day for 13 months (397 Days @ 1 Day interval)

In this policy, the specified metric is measured every hour for the first 7 days, every other hour for the next 31 days, and once a day for next 397 days. MetricBase deletes data that is older than 435 days.

To see the list of all supported retention policies, navigate to MetricBase > Retention Policies.

1. Navigate to MetricBase > Time Series Metrics and click New to create a time-series definition.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Intuitive name for the Metric field name. For example, altitude could be the label for the metric field name, mb-altitude.</td>
</tr>
</tbody>
</table>
### Table name
Name of the table to add the metric to in the MetricBase database. For example, in the MetricBase Demo, the mb_drone table stores all of the drone data. Each column in the table is a different metric, for example, altitude, length, and speed.

### Metric field name
Name of the time-series metric being recorded. For example, mb-altitude. You can think of it as the name of a column in the MetricBase database table.

### Retention policy
Sampling frequency and how long MetricBase keeps the values in the database. You cannot customize the value. For a definition of the values, click the magnifying glass and then a policy. The coarser the sampling rate, the less data is stored. Use the coarsest sampling rate that works for your dataset. For example, do not collect data every minute if collecting it once an hour suffices.

### Retention policy aggregator
Operator that is used to aggregate all of the data in a sampling period. For example, last, minimum, maximum, and average.

### Display value aggregator
Aggregation method that is used only when using `<table-name>.list` where `<table-name>` is a table in the MetricBase database. This value is unrelated to the retention policy. For a definition of the options, see MetricBase transforms.

### Display value aggregate duration
Duration that is used to calculate the aggregation only when using the list view. For example, `<table-name>.list` where `<table-name>` is a table in the MetricBase database. This value is unrelated to the retention policy.

---

You've created a time-series specification for a metric that you want to track.

3. Click Submit.

4. Sample the data according to the time-series specification and send it from an instance to the MetricBase database server.

There are many ways to send the data to the MetricBase database. The following example shows how to use REST and JavaScript APIs. For information about the MetricBase REST APIs, see the Clotho Time Series API. For information on the MetricBase JavaScript APIs, see Client, Data, DataBuilder, Transformer, TransformPart, TransformResult.

**Note:** You must send the data at the rate that is prescribed by the time-series definition. If you send the data at a different rate or for a different duration, you receive an error. Make sure to aggregate the data according to the time-series metric definition. Also, the MetricBase database only stores values of data type float.

You can gain experience with the APIs by using the Data Explorer. For more information, see Get familiar with MetricBase APIs.
Store time-series data using REST and JavaScript APIs

The following examples store time-series data in the MetricBase database using REST and JavaScript APIs. The following example uses REST.

```bash
curl -X POST -H "Content-Type: application/json" -H "Accepts: application/json"
  "https://<your_instance.servicenow.com>/api/now/v1/clotho/put?align_time"
  -d "{"seriesRef":{"subject": "<sys_id-of-data-source>"},
    "table": "<metricbase-table>",
    "metric": "$<metric-name>"}, "start": "<start-time-of-data>",
    "values": [0.0, 1.4, 1.1, 1.0, 0.9]}" -u username:passwd
```

- `sys_id-of-data-source`—Sys ID of the object that generates the metric. For example, in the MetricBase Demo, this would be the sys_id of a drone.
- `metricbase-table`—Name of the table in the MB database that stores the time-series data.
- `metric-name`—Metric field name of the metric that is recorded in the database.
- `start-time-of-data`—Time that the data was sampled from the instance, for example, 2019-04-02T03:00:00Z.

**Note:** Line returns were introduced into the curl statement to make it fit on the page. To use the code, remove the line returns.

If you prefer to use a JavaScript API to store the time-series data in the MetricBase database, here’s a similar example:

```javascript
var count = 60 * 48; // 2 days of data
var values = [];
for (var i = 0; i < count; i++) {
    values.push(Math.random());
}
var gr = new GlideRecord('<metricbase-table>');
gr.get('<sys_id-of-data-source>');
var start = new GlideDateTime();
start.addSeconds(-1 * 60 * count);
var dataBuilder = new sn_clotho.DataBuilder(gr, '<metric-name>').add(start, values);
new sn_clotho.Client().put(dataBuilder);
```

- `sys_id-of-data-source`—Sys ID of the object generating the metric. For example, in the MetricBase Demo, this would be the sys_id of a drone.
- `metricbase-table`—Name of the table in the MB database that stores the time-series data.
- `metric-name`—Metric field name of the metric that is recorded in the database.

- If you use a predictive model to detect anomalies, create a predictive model. To see how, refer to [Detect anomalies using predictive models](#).
- View the metrics that are stored in the MetricBase database. To see how, refer to [View the metrics](#).
• Set up triggers that execute Flow Designer flows. To see how, refer to Set up triggers.

Detect anomalies in MetricBase data using predictive models

Use statistical models to determine significant anomalies in real-time using MetricBase triggers. You will need to train a model using representative data that has already been stored in MetricBase.

Role required: admin

MetricBase creates a model by training a representative sample of your time series data to determine the model parameters. The training process determines the model parameters that best fit your data, to distinguish normal data from anomalous data. MetricBase supports the following model types:

• Probabilistic Exponentially Weighted Moving Average (PEWMA), a moving average algorithm that uses a probability factor to determine how it reacts to change in data
• Autoregressive Integrated Moving Average (ARIMA), a moving average algorithm that factors in previous errors and values
• Seasonal Trend decomposition using Loess (STL), a seasonal algorithm for decomposing time series data into seasonal and trend components
• Holt-Winters (HW), a seasonal algorithm that decomposes the trend and seasonal components to determine the level

Note: MetricBase selects the most appropriate model type when you select Find Best Fit Model from the model class list.

After you have a model trained from your data, you can trigger flows when new data is significantly different than the trained data.

1. Navigate to MetricBase > MetricBase Models and click New.
2. On the form, fill in the fields.

Model New Record form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model name</td>
<td>Name of the model. The name can be any combination of alphanumeric characters. This model name is not the same as the model class. In general, the name relates to the value in Group by.</td>
</tr>
<tr>
<td>Table name</td>
<td>Name of the table that contains the training data.</td>
</tr>
<tr>
<td>Metric</td>
<td>Name of the metric that you use to train the model. The metric must belong to the table.</td>
</tr>
<tr>
<td>Created</td>
<td>Date that you trained the model.</td>
</tr>
<tr>
<td>Filter</td>
<td>Filters that you use to exclude some of the data in the dataset.</td>
</tr>
</tbody>
</table>

Note: When choosing data to train your model, try to select data that demonstrates an expected behavior to reduce anomalies in the training set.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group by</td>
<td>You can use <strong>Group by</strong> as a discriminator field for your model data. For example, if you want to create a data model over a group of production servers whose performance differs by role (such as database or application server roles) then you would choose role as the <strong>Group by</strong> field. The training process creates one model per role in the group of records selected by the filter. You do not have to manually create a model for each role.</td>
</tr>
<tr>
<td>Model Class</td>
<td>The algorithm to use when training data. Select a moving average algorithm (PEWMA, ARIMA), a seasonal algorithm (STL, HW), or choose <strong>Find Best Fit Model</strong>. The default is <strong>Find Best Fit Model</strong>, which tries each algorithm and selects the one which appears to have the best fit over the training set.</td>
</tr>
<tr>
<td>Training Dataset Start Date</td>
<td>MetricBase time series data for the metric starting with this date.</td>
</tr>
<tr>
<td>Training Dataset End Date</td>
<td>MetricBase time series data for the metric ending with this date.</td>
</tr>
<tr>
<td>Valid until</td>
<td>Date that serves as a reminder to consider retraining the model. If the model is performing well, there's no need to retrain it. The model can continue working past this date.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to use the trained model. Once the model is active it becomes available for use as a Flow Designer trigger.</td>
</tr>
</tbody>
</table>

3. Click **Submit and Train**. MetricBase trains the model. When complete, the model appears on the **MetricBase Model Instances** tab.

4. Click the model name. The modeling data appears as does the model string with the parameters optimized by the training.
5. Optional: Click the model name and then click **Set Model** to change the model parameters. You can edit the model parameters when you want to override the settings for training your model. The graph does not update, you are saving the revised model string.
You can create a Flow Designer trigger for this model. For more information, see Create a model trigger.

Access MetricBase data

Access the time-series data that you sent to the MetricBase database in the way that is convenient to you.

Role required: admin

You can access and visualize time-series data in the MetricBase database by using:

- Reporting application
  You can generate reports and graphs from the time-series data that is stored in the MetricBase database. For more information, see Create reports from MetricBase time-series data.
- Table lists using the .list command
  For more information, see View MetricBase data using the list command.
- REST or JavaScript APIs
  For more information, see View MetricBase data using REST and JavaScript.

Access MetricBase data using the list command

Use the list command on a table in the MetricBase database to view time-series data. The data reveals the behavior of the entity that supplies the data.

Role required: admin

1. On the MetricBase instance, in the application navigator, type <table-name>.list, and press the Enter key.
   <table-name> is the name of the table in the MetricBase database that contains the metric you want to view.
2. Click the menu icon above the metric column, and select Time Series Chart.

3. Change the Time Span and Transform fields to evaluate the data.

4. Optional: Adjust the data:
   a) Select one of the transforms: Add, Multiply, or Divide.
   b) In the Value field, enter the number to add, multiply, or divide the metric data by and click Submit.

   Note: The adjusted data is not saved in the MetricBase database.

Retrieving MetricBase data using REST and JavaScript

Use JavaScript or REST APIs to retrieve time-series data from the MetricBase database and to run transforms on the data. The transformations enable you to visualize time-series data in a variety of ways.

For more information about MetricBase time-series data transformations, see MetricBase transforms.

Using REST

For information about the MetricBase REST APIs that return time-series data from the MetricBase database, see:

- Clotho Time Series API, which inserts, retrieves, and transforms data in the MetricBase database.
- MetricBase Data Explorer that comes with the MetricBase Demo, and enables you to experiment with the APIs.

Using JavaScript

For information about the MetricBase JavaScript APIs that return time-series data from the MetricBase database, see:

- Client — Execute transforms on the MetricBase database and receive the results.
- Data — Return the object that contains the result of a transform.
- DataBuilder — Create a series of data points for a metric.
- Transformer — Manipulate time-series data to prepare the data for evaluation and analysis.
- TransformPart — Specify details of the transform to be done.
- TransformResult — Return the object that contains the result of the transformation.

Analyze time series data with JavaScript APIs

This example returns the average CPU usage over the specified time for each XYZ computer.

```javascript
// Query the cmdb_ci_computer table for the records for
var gr = new GlideRecord('cmdb_ci_computer');
gr.addEncodedQuery('manufacturer=xyz');
gr.query();
```
// Create a DataSelector object and specify the metric
// (cpu_percentage),
// the transform (avg), and label (avg cpu)
var transform = new
sn_clotho.Transformer(gr).addMetric('cpu_percentage').avg()
          .label('avg-cpu-percentage');

// Run the transform between startTime and endTime.
// startTime and endTime are GlideDateTime
var data = transform.execute(startTime, endTime);
var values = data['avg-cpu-percentage'].getValues();

Filter data
Developers can use SQL WHERE clauses in transformation scripts to filter data in
report visualizations. Transformations in clotho aggregations apply mathematical
functions on metric records. Use SQL WHERE clauses in transformation scripts to filter
data. In the following example, the WHERE clause filters out all results except those
results where mb_demo_mt_speed equals 100.

var eqCon = new sn_clotho.Condition().eq(100);
var builder = new sn_clotho.Transformer(drones);
var fit = builder.metric("mb_demo_mt_speed").where(eqCon);

MetricBase triggers
Time-series data that is stored in the MetricBase database can trigger Flow Designer flows. These
triggers can log incidents, send emails, and create other alerts.

You use MetricBase to define a trigger on an instance. When you associate the trigger with a Flow
Designer flow, the trigger definition transfers from your instance to the MetricBase server. When
you make the trigger and flow active, the trigger monitors the time-series data that is stored in the
MetricBase database. When data meets the triggering conditions, MetricBase adds the trigger
alert to the Trigger queue. The instance regularly polls that queue. When the polling finds a trigger
waiting in the queue, the Flow Designer flow executes on the instance.
For more information about time-series policies, see *Define and collect MetricBase data.*

**High-level overview of implementing triggers**

1. Define one or more of the following triggers on an instance:
   - *Band trigger* — Triggers when a metric value falls within a range of values.
   - *Linear Predictor trigger* — Triggers when a series of values trend toward and are expected to reach a specified value.
   - *Gap trigger* — Triggers when values are not received for a period of time.
   - *Model trigger* — Triggers when a trained model detects anomalous behavior.

2. Create a *trigger condition* to add additional requirements for a trigger to execute a flow. For example, data often fluctuates over time. Small fluctuations can cause unwanted, duplicate triggering events. A Condition Script can prevent that erroneous duplication.

3. *Associate the trigger with the flow it executes* using Flow Designer.

4. Test the trigger and workflow.

5. Activate the trigger.

**Deleting triggers**

You can’t delete a trigger in MetricBase if it is associated with a flow in Flow Designer. To delete a trigger, you must first delete the flow in Flow Designer and then you can delete the trigger in MetricBase.
Legacy triggers

Legacy triggers are deprecated. You can't create new ones; you can only carry forward ones that already exist. To see them, navigate to Legacy triggers.

Create a MetricBase band trigger

Create a MetricBase band trigger that detects when a metric value falls within a range of values.

Role required: admin

Band triggers execute when metrics fall outside of or within a range of values.

2. On the MetricBase Trigger Creation form, click Band Trigger - Detects and takes action when metric value meet certain threshold or is within a range. On the MetricBase Band Trigger form, you can see the table and tracked metric but not the band trigger parameters.
3. On the form, fill in the fields.

MetricBase Band Trigger form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the band trigger.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

#### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table name</td>
<td>Table in the MetricBase database that contains the metric that you want to monitor. The only tables that appear when you click the search icon are the tables that you specified in the time-series metrics. If you select a metric before you select a table, only tables that have that metric appear in the Table name modal.</td>
</tr>
<tr>
<td>Metric</td>
<td>Table metric that you want to monitor that is specified by the Table name. The only metrics that appear when you click the search icon are the metrics in that table. If you select a metric before you specify a Table name, the metrics in all your time-series metrics appear. After you select a metric, only the tables that contain that metric appear when you click the search icon that is next to the Table name.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the trigger.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the trigger.</td>
</tr>
<tr>
<td>Aggregator</td>
<td>Aggregation value that you select: None, Max, Min, or Average. None means that you use the last value in the collection interval.</td>
</tr>
</tbody>
</table>

4. Click Save.
5. In the MetricBase Band Trigger Levels area, double-click each cell to add values that specify trigger parameters.

#### MetricBase Band Trigger Levels

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>Numbers that indicate increasing severity. For example, you might define the CPU usage for level 1 to be above 85% and the CPU usage for level 2 above 90%. Each level should trigger a different flow. Level is often used in Conditional Scripts.</td>
</tr>
<tr>
<td>Function</td>
<td>Function that makes the Value the maximum or minimum value of the lower end of the band and defines whether trigger values are inside or outside of the band. For example, if the Function is Less than, the trigger executes when the metric goes below band.</td>
</tr>
<tr>
<td>Value</td>
<td>Lower end of the band. See the following image.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Band Function</td>
<td>Function that makes the <strong>Band Value</strong> the maximum or minimum value of the upper end of the band and defines whether trigger values are inside or outside of the band. For example, if the <strong>Band Function</strong> is <strong>Greater than</strong>, the trigger executes when the metric goes above the band. See the following image.</td>
</tr>
<tr>
<td>Band Value</td>
<td>Upper end of the band. See the following image.</td>
</tr>
<tr>
<td>Tolerance</td>
<td>Tolerance range, plus or minus the <strong>Value</strong> and <strong>Band Value</strong>. Select a tolerance to prevent repeatedly executing a trigger for small fluctuations in the data. Once a trigger executes, the data must exceed the tolerance to execute the trigger again. See the following image.</td>
</tr>
</tbody>
</table>

For example, if the **Function** is **Less than**, the **Value** is 100, the **Band Function** is **Greater than**, the **Band Value** is 200, and the **Tolerance** is 0, the trigger executes for all values that are less than 100 and greater than 200.

6. Optional: Add additional rows in the table to create multi-layered triggering behavior.
   Typically, each additional row indicates a more severe condition and the Flow Designer flow that is associated with the level warns with increasing severity. For example, level 1 might define the band from 100 through 200. Level 2 might define the level from 50 through 250.

7. Click **Update**.

8. Optional: Add a triggering condition that determines whether or not a trigger executes a Flow Designer flow.
   For more information, see **Create a triggering condition**.

   Associate this trigger with a Flow Designer flow. For more information, see **Assign a trigger to a flow**.
Create a MetricBase linear predictor trigger

Create a MetricBase linear predictor trigger to detect when a metric is likely to cross a specified threshold within a specified period of time.

Role required: admin

The linear predictor trigger uses past data to generate a line that predicts future values. When MetricBase predicts that the linear value will reach a threshold, the trigger executes.

If the most recent data point reaches the threshold, the trigger executes regardless of the linear prediction.

Trigger parameters include how much past data to use in the calculation of the prediction, how far ahead to look, and the level of confidence that you accept.

2. Click Linear Predictor Trigger - Predicts and takes action when a metric follows an upward or downward trend and is expected to reach a given threshold in the future.
3. On the form, fill in the fields.

**MetricBase Linear Predictor Trigger form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name that you give the trigger.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table in the MetricBase database that contains the metric that you want to</td>
</tr>
<tr>
<td></td>
<td>monitor. The only tables that appear when you click the search icon are</td>
</tr>
<tr>
<td></td>
<td>the tables that you specified in the time-series metrics.</td>
</tr>
<tr>
<td></td>
<td>If you select a metric before you select a table, only tables that have</td>
</tr>
<tr>
<td></td>
<td>that metric appear in the <strong>Table name</strong> modal.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Metric</td>
<td>Table metric that you want to monitor that is specified by the <strong>Table name</strong>. The only metrics that appear when you click the search icon are the metrics in that table. If you select a metric before you specify a <strong>Table name</strong>, the metrics in all your time-series metrics appear. After you select a metric, only the tables that contain that metric appear when you click the search icon that is next to the <strong>Table name</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the trigger.</td>
</tr>
<tr>
<td>Window</td>
<td>Length of time that you want to use to calculate the line that predicts the future course of the value. For example, you might want to use the last 10 minutes of data to calculate the linear predictor. If the value is too long, the line does not reflect current trends. If the value is too short, the line might follow the raw values too closely and not accurately reflect the overall trend of the values. The value must be at least 10 times the sampling period that is defined by the sampling rate of your <strong>Metric</strong>. The format is hours:minutes:seconds. Do not confuse this value with the value of <strong>Window</strong> in the trigger level. That value specifies how far into the future that you want the linear predictor to look to see if the <strong>Metric</strong> is likely to cross the <strong>Threshold</strong>.</td>
</tr>
<tr>
<td>Confidence Level (%)</td>
<td>Percentage that specifies how tolerant you are of the real data fitting the linear prediction of the data. For example, a confidence level of 95% means that the real value must be within 5% of the predicted value in order to execute a trigger. If you only want to trigger when the real values are close to the predicted values, choose a high confidence percentage. If you are willing to accept real data that varies more significantly from the predicted values as being valid, select a lower confidence level, for example, 80%.</td>
</tr>
<tr>
<td>Trend</td>
<td>Direction of the trend: increasing or decreasing. For example, the value is increasing or decreasing toward the <strong>Threshold</strong>.</td>
</tr>
<tr>
<td>Threshold</td>
<td>Target value that the metric is expected to reach before the trigger executes.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the trigger.</td>
</tr>
</tbody>
</table>

4. **Click Save.**
   In the MetricBase Linear Predictor Trigger Levels form, you can create multiple trigger levels of increasing severity. For example, you can configure the battery level to be 80% for level one and at 90% for level two.

5. In the MetricBase Linear Predictor Trigger Levels area, double-click each cell to add values that specify trigger parameters.

**MetricBase Linear Predictor Trigger Levels**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>Numbers that indicate increasing severity. For example, you might define level 1 to be CPU use is predicted to reach 85%. Level 2 might be CPU use is predicted to reach 90%. Each level can trigger a different Flow Designer flow.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function</td>
<td>Function to use on the value. For example, <strong>Less than or is</strong>.</td>
</tr>
<tr>
<td>Window</td>
<td>How far into the future that you want the linear predictor to look to see if the metric is predicted to cross the threshold. Do not confuse this value with the <strong>Window</strong> value in the trigger definition form. That value specifies how much data to use (measured in time) to calculate the slope of the predictor line.</td>
</tr>
</tbody>
</table>

6. **Click Update.**

7. **Optional:** Add a triggering condition that determines whether or not a trigger executes a Flow Designer flow.
   For more information, see [Create a triggering condition](#).

Associate this trigger with a Flow Designer flow. For more information, see [Assign a trigger to a flow](#).

### Create a MetricBase gap trigger

Create a MetricBase gap trigger to alert you when MetricBase stops receiving data.

**Role required:** admin

Gap triggers execute when MetricBase stops receiving data for a specified period.

You can define multiple trigger levels to indicate different severities. For example, you can set a gap of 15 minutes as level 1, a gap of 30 minutes as level 2, and so on. Each level should trigger a different Flow Designer flow. The difference between gap durations on different levels must be at least 10 minutes. For example, if you set level 1 to a gap of 15 minutes, you must set level 2 to a gap of 25 minutes or more.

**Note:** If you make the gap durations between levels less than 10 minutes, MetricBase displays an error message and deletes the level that you added.

MetricBase calculates how often to poll data by taking the difference between gap durations on different levels and dividing them by 2. For example, if level 1 triggers after 20 minutes of missing data and level 2 triggers after 40 minutes of missing data, the polling frequency is \((40-20)/2 = 10\)
minutes. The maximum polling frequency is every 5 minutes, and the minimum frequency is every 30 minutes. If a trigger has only one level, the polling frequency is 30 minutes.

MetricBase searches through the data that is stored in the MetricBase database, not through incoming data. For that reason, a gap trigger might execute after the gap when data is missing. For example, if MetricBase polls the database every 10 minutes and the gap is 30 minutes of missing data, the trigger might execute as late as 40 minutes after the data was last received.

1. Navigate to **MetricBase > Flow Designer > Trigger Definitions > New.**
2. In the MetricBase Trigger Creation form, click **Gap Trigger - Detects and takes action when no data is received for a metric.**
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the trigger.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table in the MetricBase database that contains the metric that you want to monitor. The only tables that appear when you click the search icon are the tables that you specified in the time-series metrics. If you select a metric before you select a table, only tables that have that metric appear in the <strong>Table name</strong> modal.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the trigger.</td>
</tr>
<tr>
<td>Metric</td>
<td>Value the trigger monitors in the MetricBase database.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the trigger.</td>
</tr>
</tbody>
</table>

4. Click **Save.**
5. In the MetricBase Gap Trigger Levels area, double-click each cell to add values that specify trigger parameters.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>Numbers that indicate increasing severity. For example, you might define level 1 to be no data for 1 minute. Level 2 might be no data for 5 minutes. Each level should trigger a different flow.</td>
</tr>
<tr>
<td>Function</td>
<td>Function, <strong>Greater than or is</strong>, which means that this trigger executes when the gap in received data is greater than the value that you specify in the <strong>Window</strong> field.</td>
</tr>
<tr>
<td>Window</td>
<td>Length of time that no data has been received that executes the trigger. The format is hours:minutes:seconds. For example, 00:20:00 means that this trigger executes after 20 minutes of missing data.</td>
</tr>
</tbody>
</table>

6. Click **Update.**
7. Optional: Add a triggering condition that determines whether or not a trigger executes a Flow Designer flow.
   For more information, see **Create a triggering condition.**

Associate this trigger with a Flow Designer flow. For more information, see **Assign a trigger to a flow.**
Create a MetricBase model trigger

Model triggers execute when the time-series data deviates from expected values.

Role required: admin

Probabilistic exponentially-weighted moving average (PEWMA) is the only model type supported. MetricBase uses this model to create a definition of expected, normal values.

1. Click **MetricBase > Flow Designer > Trigger Definitions** and click **New**.
2. Click **Model Trigger - Detects and takes action when a metric value deviates from the trained model.**

The MetricBase Model Trigger form specifies the table and metric used to train the model.

3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name the model trigger.</td>
</tr>
<tr>
<td>Model</td>
<td><em>Trained model</em> this trigger uses.</td>
</tr>
<tr>
<td>Metric</td>
<td>Automatically filled in based on the model.</td>
</tr>
<tr>
<td>Table name</td>
<td>Automatically filled in based on the model.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the trigger.</td>
</tr>
<tr>
<td>Description</td>
<td>Explanation of the trigger.</td>
</tr>
<tr>
<td>Spike Direction</td>
<td>Trigger execution criteria. Specify whether you want to trigger only on anomalies that occur above predicted values, only on anomalies that occur below predicted values, or both.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Window</td>
<td>Amount of data to use when calculating the moving, weighted average; the longer the window, the more data. The recommendation is 30 times the sampling interval. For example, if the time-series data is sampled every minute, make this value 30 minutes. Values must be multiples of the sampling interval.</td>
</tr>
<tr>
<td>Active</td>
<td>Turns on the trigger.</td>
</tr>
</tbody>
</table>

Note: For the Window value, very short durations make the weighted average move with the data itself and fail to detect anomalies. Very long durations make the weighted average unresponsive to current trends in the data and may cause false triggers.

4. Click Save.
5. In the MetricBase Model Trigger Levels area, double-click each cell to add values that specify trigger parameters.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>Numbers that indicate increasing severity. For example, you might define level 1 to be 3 standard deviations from the mean. Level 2 might be 5 standard deviations. Each level should trigger a different Flow Designer flow. Level is often used in Conditional Scripts.</td>
</tr>
<tr>
<td>Function</td>
<td>Always Greater than or is, meaning that in order to trigger, the time-series metric must be greater than or equal to the number of standard deviations from the mean specified in Number of Standard Deviations.</td>
</tr>
<tr>
<td>Number of Standard Deviation</td>
<td>Float value specifying the number of standard deviations the time-series metric must be away from the mean to trigger an alert at this level.</td>
</tr>
</tbody>
</table>

6. Optional: Add additional rows in the table to create multi-layered triggering behavior. Each successive row should indicate a more severe condition.
7. Click Update.
   The MetricBase Trigger Definitions page displays the list of defined triggers.
8. Test your model and trigger on real data before deploying to production.
9. Optional: Add a triggering condition that determines whether or not a trigger executes a Flow Designer flow.
   For more information, see Create a triggering condition.

Associate this trigger with a Flow Designer flow. For more information, see Assign a trigger to a flow.

Execute triggers conditionally

MetricBase triggers execute based on a single metric. Condition Scripts impose additional requirements that determine whether a trigger kicks off a flow.

Role required: admin

Condition Scripts execute when conditions for a trigger are met but before the trigger executes a Flow Designer flow. In that way, Condition Scripts can prevent triggers from executing flows even when trigger conditions are met. For example, data often fluctuates over time. Small fluctuations
can cause unwanted, duplicate triggering events. A Condition Script can prevent that erroneous duplication.

Condition Scripts always return True (trigger) or False (do not trigger). To learn how to write these scripts, see Scripting in ServiceNow Fundamentals. To experiment with scripts, see Get familiar with MetricBase APIs.

You can create and save Condition Scripts in MetricBase but you associate them with triggers using Flow Designer.

1. Click MetricBase > MetricBase Triggers > Trigger Condition Script > New.
2. On the Additional MetricBase Trigger Filtering Condition New Record form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the Condition Script.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of the Condition Script. The value, Global, means that the action applies to all applications.</td>
</tr>
<tr>
<td>Description</td>
<td>Explanation of what the Condition Script does.</td>
</tr>
<tr>
<td>Script</td>
<td>Field to enter the JavaScript. Make it returns True to execute a flow. See the next step.</td>
</tr>
</tbody>
</table>

3. Write the Condition Script.

   The key part of these scripts is the conditional statements. If all evaluate true, the script returns True and the flow executes, otherwise it does not. The following example script triggers a flow when a drone is traveling too fast at a low altitude (defined by level 1). The example shows a typical approach to writing a Condition Script.

   a) Get the trigger definition.
   b) Get the record (current) that is causing the triggering event.
   c) Get the time from the record that the trigger conditions were satisfied.
   d) Get the trigger level, which defines the trigger parameters.
   e) Use these parameters to return True if the level 1 trigger conditions are met and travel_state equals traveling or speeding.

   ```javascript
   function filter(/*GlideRecord*/ triggerDefinition, /*GlideRecord*/ current, /*GlideDateTime*/ start, /*int*/ level) {
     // retrieve current travel state of drone
     var travel_state = String(current.travel_state);

     // the drone is traveling at a significant speed, and the altitude just went below the threshold
     if (((travel_state === 'traveling') || (travel_state === 'speeding'))
          && (level === 1)) {
       return true; //process this trigger
     }

     return false; // don't process this trigger
   }
   ```

   Note: Condition Scripts must execute quickly.

4. Click Submit.
Use Flow Designer to **associate a flow with a trigger**. When configuring a flow, you can select a Condition Script you created.

**Assign a trigger to a flow**

Now that you created a trigger, use Flow Designer to specify the flow a trigger executes. The flows provide alerts for unexpected behavior.

Role required: admin

Triggers, by themselves, execute nothing. After defining a trigger in MetricBase, you use Flow Designer to associate the trigger with a flow.

1. Navigate to **MetricBase > Flow Designer**.
   
   Flow Designer displays a list of triggers associated with Flow Designer flows.

2. Click **New > New Flow**.
3. Enter values for the modal fields and click **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the flow to execute. The system computes the internal name of the flow from the name.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope to create your flow in. Global is the default.</td>
</tr>
<tr>
<td>Protection</td>
<td>Option to make the flow read-only. Selecting read-only prevents users who do not own the application scope from making changes to the flow. You can only select a value when you create the flow in an application scope you own.</td>
</tr>
<tr>
<td>Description</td>
<td>Explanation of why you are associating this flow with the trigger.</td>
</tr>
<tr>
<td>Run As</td>
<td>Choose whether the flow runs as System User or the user who initiates the session. Use the user who initiates the session option when the update should come from the user who triggered the flow. For example, comments to incident records that should come from the current user, or approval emails that should originate from the approver. Settings on a flow do not apply to child subflows. When run as the user who initiates the session, flow actions are limited by the user's ACL restrictions. Flows run by the initiating user respect user-specific settings like date/time format.</td>
</tr>
</tbody>
</table>

**Note:** When choosing the option to run as the user who initiates the session, ensure that security restrictions do not prevent users who will trigger the flow from performing the flow actions.

A tab opens and the tab name is the value for **Name**.

4. Click **Click to add a trigger** to specify the trigger that kicks off this flow. A modal displays that enables you to find and select a trigger type.

5. Scroll and select **MetricBase** for the trigger type. The Flow Designer form displays.
6. Under **TRIGGER**, fill in the form to define the trigger to associate with this flow.
   a) Beside **MetricBase Trigger**, click the magnifying glass to select an existing trigger or click the plus sign (+) to define a new trigger.
   b) Optionally, add requirements for the flow to execute by clicking **Add Filter** and adding filter conditions, for example, **flight-status is-not landed**.
   c) Optionally, beside **Condition Script**, click the magnifying glass to select a condition script or click the plus (+) to **create a script**.

   Condition scripts add additional requirements for a trigger to execute a flow.

7. Under **ACTIONS**, click **Click to add an Action, Flow Logic, or Subflow** and select a category in the first column and a flow action in the second column.
8. Click **Done**.

9. Test the flow.
   a) Navigate to **Flow Designer > Designer**, and double-click the flow.
   b) Click **Test**.
      The Test flow dialog box displays. The contents of the Test flow dialog depend on the type of trigger: Data or Schedule. If the trigger is a Data trigger, the dialog asks for a record to use for the test.
   c) Select a record in the dialog box and click **Submit**.

   ![Test flow dialog box](image)

   **Note:** When you test a flow, the system does not execute the trigger, and therefore does not create a new record. By selecting a record in the Test flow dialog box, the system acts as if that record was just created. For more information, see *Test a flow.*

10. Click **Activate** to activate the trigger.
The flow will not execute unless you activate it.

**Maintain MetricBase**

View the status of MetricBase and debug its triggers.

**View MetricBase status and statistics**

You can view the status of the MetricBase database.  
Role required: admin

1. View the status of the MetricBase instance.
   a) Navigate to **System Diagnostics > Stats > Stats**
   b) Scroll down to find **MetricBase Statistics**

2. View the metrics monitored by MetricBase and statistics about them.
   a) Click **MetricBase > MetricBase Status**
      The MetricBase Status page displays all of the metrics tracked in MB.
b) Click the gear icon.
The Personalize List Columns modal displays.
c) Select and move metrics from the **Available** column to the **Selected** column to display the metric and click **OK**.

The metrics display on the MetricBase Status page.
### View trigger logs

Trigger logs show different levels of trigger malfunctions.

Role required: admin

1. Navigate to **MetricBase > MetricBase Triggers > Trigger logs**.
2. Click one of the trigger logs.
3. Under **Related Links**, click **Show Log Entries**.
4. Optional: Change the default values in the **Enter parameters for log file entries to browse** form to select the log entries to view and click **Submit**.

### Debug MetricBase

You can display the results of debugging scripts in MetricBase.

Role required: admin

1. Navigate to **System Diagnostics > Session Debug > Debug MetricBase**.
When the page you are on submits queries to MetricBase, you see the transforms and how long they took on the bottom of the page. Submitting a lot of MetricBase queries may slow down the page load time significantly.

2. To view a history of the debug script’s execution, click [available here](#).

3. Click **Update**.
   Session debug tracking for MetricBase activities starts and the MetricBase Status page displays.

### Get familiar with MetricBase APIs

Experiment with MetricBase APIs using Data Explorer that is part of the MetricBase Demo application. Data Explorer uses the data installed with the MetricBase Demo application.

- **Role required**: clotho_admin
- **Data Explorer** is a playground where you can see and edit example scripts that visualize data included with the MetricBase Demo application. The example scripts use the MetricBase JavaScript APIs. For information on the MetricBase JavaScript APIs, see *Client, Data, DataBuilder, Transformer, TransformPart, TransformResult*.
  
  Example scripts use either:
  
  - **Transforms**, which use the *Transformer* method.
  - **Machine Language**, trained models that predict expected behavior. All the scripts without "Transform" in their title use Machine Language.

1. **Navigate to** MetricBase Demo > Data Explorer.
   The **Data Explorer** displays.
When you run a script, the data visualization appears under **Data Explorer Script Result Display**.

2. Select one of the sample scripts to run in the **Example Script** menu.
3. Click **Load Example**.
4. Click **Run**.
   The script displays the data visualization under **Data Explorer Script Result Display**.
5. Optional: Change the values or statements in the script or write an entirely new script and click **Run**.

   **Note:** If you want to save the changes you made in the script, click **Save**.

6. Under **Server Output**, look at the server's response that might include error information.
### Example scripts

<table>
<thead>
<tr>
<th>Example script</th>
<th>Definition and visualization</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Simple Transform</strong></td>
<td>Uses the transformer API to display a single time-series metric, the average speed of the drones: <code>transformer.metric('mb_demo_mt_speed').avg()</code>.</td>
</tr>
</tbody>
</table>

![Graph showing time-series data over time](image-url)
<table>
<thead>
<tr>
<th>Example script</th>
<th>Definition and visualization</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simple Transform with Grouping</td>
<td>Uses the transformer API to display a group of time-series metrics, the average altitude of the fleet of the drones:</td>
</tr>
<tr>
<td></td>
<td>transformer.groupBy(&quot;fleet&quot;).metric(&quot;mb_demo_mt_altitude&quot;).avg().label('avg - %g:fleet:')</td>
</tr>
<tr>
<td>Normal Model</td>
<td>Models normal data, which approximates a bell-shaped or Gaussian curve for distributed values.</td>
</tr>
<tr>
<td>Example script</td>
<td>Definition and visualization</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td>Linear Model</td>
<td>Creates a line to summarize the current data and predict future values. This example, about the remaining charge in drone batteries, graphs both the trained model values and the average of the values.</td>
</tr>
</tbody>
</table>

```javascript
var builder = new sn_clotho.Transformer(drones);
var fit = builder.metric("mb_demo_nt_rem_battery").resample(100).fit({model:"linear"}).label("Fitted");
b builder.metric("nb_demp_mt_rem_battery").avg().label("Original");
```

![Graph showing linear model and average values]
### Example script

#### Seasonal Trend Decomposition Model

Uses a seasonal trend model so that data can be subtracted to reveal non-seasonal trends. This model is similar in purpose to the Holt Winters model but arrives at the result using different algorithms.

```javascript
var builder = new sn_clotho.Transformer(drones);
var metric = "nb_demo_mt_rem_battery";
var fit = builder.metric(metric).fit({'model:"STL",periodicity:"PT2H",innerCycles:1,
outerCycles:10})
```

#### Holt Winters Model

Uses the Holt Winters, seasonal trend model so that data can be subtracted to reveal non-seasonal trends. This model is similar in purpose to the Seasonal Trend Decomposition model but arrives at the result using different algorithms.

#### ARIMA Model

The most general class of models for predicting time-series data that has no trend, meaning all the data has the same value or the values fluctuate sinusoidally around the mean.
Domain separation and MetricBase

This is an overview of domain separation and the MetricBase application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Support level: Basic**

- There is business logic to ensure data goes into the proper domain for the application’s service provider use cases.
- In the application, the user interface, cache keys, reporting, rollups, aggregations, and so on, all consider domain at run time.
- The owner of the instance needs to be able to set up the application to function normally across multiple tenants.

Use case: As a service provider when I use chat to respond to a tenant-customer’s message, the client must be able to see my response.

<table>
<thead>
<tr>
<th>Example script</th>
<th>Definition and visualization</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Deviation Model</strong></td>
<td>Uses chisquare model to show the differences between the real data and the model’s prediction.</td>
</tr>
<tr>
<td>var metric = &quot;nb_demo_mt_rem_battery&quot;; builder.metric(metric).deviation(model, &quot;chiSquare&quot;);</td>
<td></td>
</tr>
</tbody>
</table>
MID Server

The Management, Instrumentation, and Discovery (MID) Server is a Java application that runs as a Windows service or UNIX daemon on a server in your local network. The MID Server enables communication and the movement of data between a ServiceNow instance and external applications, data sources, and services.

The MID Server initiates all communications with the ServiceNow® instance. This communication is recorded as records in the ECC Queue, which acts as the communication log between the instance and the MID Server. The MID Server picks up any work it has to do from the ECC Queue and returns the results of that work to the queue.

This video gives you an overview of the MID Server:

Setting up the MID server

1 Connect
2 Install
3 Configure
4 Encrypt

Ensure that the MID Server can connect to elements inside and outside your network
Download and install the MID Server on a Linux or Windows host
Configure your MID Server
Configure MID Server security
Ensure that the MID Server can connect to elements inside and outside your network
Download and install the MID Server on a Linux or Windows host
Configure your MID Server
Configure MID Server security

This documentation provides detailed instructions for setting up a functioning MID Server for use with ITOM applications. Click the icons to go to each task’s portal page. These procedures help you prepare your system, download and run the installer, and configure MID Servers to run in your environment. After you get a valid MID Server up and running, you can add security and encryption to protect your data.

At the bottom of each page is a link to the reference materials you need, such as MID Server system requirements, configuration parameters, and instructions for monitoring your MID Server. Use the additional links at the bottom to move through the content within a specific category or return to the MID Server setup to access a different portal.
If you are new to the MID Server or an experienced user who wants to set up a MID Server quickly, you can use the MID Server Guided Setup. This wizard walks you through the process of installing and configuring a MID Server with default settings in just a few steps.

Upgrading the MID Server

The MID Server checks with the instance periodically to see if an upgrade is necessary. If the MID Server detects that a new version is available for upgrade, it downloads the installer from install.service-now.com and runs the package automatically. You can also elect to upgrade the MID Server manually. See MID Server upgrades for details.

Resolving MID Server issues

You can search the HI Knowledge Base for troubleshooting articles or monitor the MID Server status and track active issues from within the instance. See Resolving MID Server issues for details.

ServiceNow applications that use the MID Server

- Discovery
- Orchestration
- Service Mapping
- Event Management
- Operational Intelligence
- Cloud Management
- IntegrationHub
- Cloud Insights

External applications that use the MID Server

- Import Sets
- Microsoft SMS/SCCM
- LANDesk Maintenance Suite
- Microsoft System Center Operations Manager (SCOM)
- Microsoft MIIS

MID Server version compatibility

The version of the MID Server must be compatible with the version of the instance. Otherwise, the MID Server cannot process commands or communicate with the instance.

The instance determines which version of the MID Server is allowed. The MID Server version must at a minimum belong to the same major release, such as Madrid. If the MID Server version belongs to the same major release, it can, but does not have to, belong to the same minor version, such as Madrid Patch 1. In this case, communication with the instance might still be possible, but it is always suggested that you upgrade to the latest version.

Caution: You can pin the MID Server to a specific version, but you should be aware that the version might become out of date.
Configure MID Server network connectivity

Prepare the network for MID Servers to connect with the instance and access the download site. The network must be prepared before installing or configuring the MID Server. If computers or devices have additional security measures, that security may interfere with MID Servers on those systems.

Role required: admin

Prerequisites: Make sure that the host machine meets the requirements specified in the MID Server system requirements.

The MID Server host computer must have access to the ServiceNow download site at install.service-now.com to upgrade automatically. If you have a self-hosted ServiceNow environment that blocks access to the download site, you must import the MID Server installer package into your MID Server hosts manually. For instructions, see KB0760123 in the Self-Hosted knowledge base.

Firewalls and proxy configurations may block calls to the OCSP Entrust server, which prevents the MID Server from working. You may need to change your firewall permissions so the OCSP traffic to go through properly. For more information and resolutions, see the HI Knowledge Base article [KB0813636].

The host machine must have these network privileges:

- **Firewall access**: Configure any firewalls between the MID Server and the target devices to allow a connection. If your network uses a DMZ, and if your network security protocols limit port access from within the network to the DMZ, you might have to deploy a MID Server to a machine within the DMZ to probe the devices there.
- **Network access**: Configure target devices to allow the MID Server probe to connect. If network security prevents you from configuring new machines that can connect to the targets, install the MID Server on an existing machine with connection privileges.
- **Network account**: Install the MID Server with the proper account, either local or domain administrator.

Additionally, for the MID Server to access your ServiceNow instance, satisfy these prerequisites:
- Network access to the ServiceNow instance: Configure the network that the MID Server uses to allow traffic over TCP port 443.
- A MID user: Create a ServiceNow user record for the MID Server to use. This user record must have the mid_server and import_admin roles.

<i>Note: Verify that the baseline public page InstanceInfo is active for the MID Server to connect to the instance.</i>

1. Configure the network to allow MID Server network connectivity to the ServiceNow instance over TCP port 443.
2. Configure basic authentication for SOAP communications with the ServiceNow instance.
3. Navigate to System Web Services &gt; Scripted Web Services &gt; Scripted SOAP Services.
4. Confirm that the following web services are active:
   - GetMIDInfo
   - InstanceInfo
   - MIDAssignedPackages
   - MIDFieldForFileProvider
   - MIDFileSyncSnapshot
   - MIDServerCheck
   - MIDServerFileProvider
5. Type **sys_public.list** in the navigation search field and press Enter. The Public Pages record list appears.
6. Verify that the **InstanceInfo** public page is active, to allow the MID Server to validate its version.
7. Ensure that the MID Server host computer can access the download site at install.service-now.com.

After the network is prepared, proceed to **Installing the MID Server**.

Prepare network connections for MID Servers

Before you install the MID Server, perform the necessary prerequisites that it needs to connect to elements inside and outside your network. This includes network privileges and security considerations.

Security considerations

Sometimes computers or devices have additional security measures configured, and these measures may interfere with the MID Server’s ability to run commands or queries on those systems.

For example, a Linux server might be configured to allow only certain IP address to connect to it via SSH. Similarly, a network router might be configured to allow only certain IP address to query SNMP on it. To allow access in such cases, use one of the following methods:

- Update the configuration of those computers or devices to allow the desired MID Server to run commands or query them. For example, a network router might be configured to only allow the network management systems to query SNMP on it. In that case, add the MID Server as though it were another network management system.
- Install a MID Server on a computer that already has access to the computers or network devices with such restrictions. For example, to use Discovery within a DMZ (where...
communication from outside the DMZ will be severely restricted), install a MID Server on a computer that is already in the DMZ.

External connectivity requirements

These requirements are specifically for the use of MID Servers with the ServiceNow® Discovery and Orchestration products.

The MID Server communicates securely on port 443 to the instance and requires no inbound connections. In some cases, it might be necessary to allow this communication through the firewall if the MID Server fails to register on the instance. To determine if the application or a network security restriction is to blame for connection failure, attempt to telnet to the instance on port 443 from the server that is hosting the MID Server application. If this connection fails, then the problem could be a web proxy (since 443 is an https connection) or a Firewall rule preventing external TCP connections from that host. Contact network security personnel for the proxy information to add to the config.xml file, or request that the firewall be configured to allow access using one of the following syntaxes:

- `<source IP>` to `<any>`
- `<source IP>` to `<ServiceNow>` any established
- `<source IP>` to `<instance_name.service-now.com>` 443

Important: The MID Server host computer must have access to the ServiceNow download site at install.service-now.com to upgrade automatically. If you have a self-hosted ServiceNow environment that blocks access to the download site, you must import the MID Server installer package into your MID Server hosts manually. For instructions, see KB0760123 in the Self-Hosted knowledge base.

Internal connectivity requirements

These methods are used for discovering various devices on a network and are specifically for the use of MID Servers with the Discovery and Orchestration products.

- **SSH**: For UNIX-like machines, Discovery and Orchestration use SSH protocol, version 2 to access target machines. SSH is a network protocol that allows data to be exchanged using a secure channel between two networked devices. SSH communicates on port 22 within an encrypted datastream and requires a login to access the targets using two available methods of authentication: a user name and password combination and a user name and shared private key. Specify SSH authentication information and type in the **Credentials** module. If multiple credentials are entered, the platform tries one after the other until a successful connection is established or all are ultimately denied. To provide for application relationships a limited number of SUDO commands must be available to be run. Additional details to these requirements can be found in UNIX/Linux commands requiring root privileges for Discovery and Orchestration.

- **WMI**: For Windows machines, Discovery uses the Windows Management Instrumentation (WMI) interface to query devices. Due to security restrictions for WMI, the MID Server application executing the WMI queries must run as a domain user with local (target) administrator privileges. When Discovery detects activity on port 135, it launches a WMI query. The response from the Windows device is sent over a Distributed Component Object Model (DCOM) port configured for WMI on Windows machines. This can be any port. Ensure that the MID Server application host machine has access to the targets on all ports due to the unique nature of the WMI requirements.
• **Windows PowerShell:** PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. Orchestration uses PowerShell to run Workflow activities on Windows machines. PowerShell must be installed on any MID Server that executes these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 3.0 to 5.1. Orchestration activities for PowerShell require a credentials Type of Windows.

• **SNMP - Network:** For network devices, Discovery uses an SNMP scan to get device specific MIBs and OIDs. SNMP is a common protocol used on most routers, switches, printers, load balancers and various other network enabled devices. Use a community string (password) for authentication when scanning a device via SNMP. Many devices have a default community string of public which Discovery uses by default when querying a target. Define additional community strings in the SNMP credentials form which are tried in succession, along with public, until a successful query returns. In addition to the credentials, the platform also requires the ability to make SNMP requests on port 161 from the MID Server to the target. If Access Control Lists (ACLs) are in place to control the IP addresses that can make these queries, ensure that the IP address of the MID Server is in the ACL. Discovery supports SNMP versions 1, 2c, and 3.

• **WBEM:** Web-Based Enterprise Management (WBEM) defines a particular implementation of the Common Information Model (CIM), including protocols for discovering and accessing each CIM implementation. WBEM requires either of two ports, 5989 or 5988 and uses the HTTP transport protocol. WBEM supports SSL encryption and uses CIM user name/password credentials. Discovery launches a WBEM port probe to detect activity on the target ports and to append gathered data to a classification probe that explores CIM Servers.

### Installing the MID Server

Download and install the MID Server on the host machine, test the connection, and then validate the MID Server. Use the manual procedures or the guided setup. Set up multiple MID Servers for load balancing and domain separation. These procedures prepare it for use with any application.

### Prerequisites

Ensure that the **MID Server system requirements** and **MID Server connection prerequisites** are met before you install the MID Server manually or use the guided setup utility.
MID Server manual installation

The manual process requires these setup tasks, performed in the order shown here:

1. Create the MID Server user account and grant the appropriate role to this user.
2. Download the installer file for the host machine.
3. Install the MID Server on a Linux or Windows host.
4. Validate the MID Server to ensure that it is trusted to access credentials used by the instance for automations.
5. Test connectivity between the MID Server and the instance for automatic upgrades.
6. Optionally, deploy multiple MID Servers in your network for load balancing or when domain separation is enabled.

MID Server guided setup

Alternatively, the MID Server Guided Setup streamlines the process and allows you to set up a basic MID Server quickly.

Create the MID Server user and grant the role

To communicate with the instance, MID Servers need a user ID and the appropriate role. Create the user ID for a MID Server and grant the ID the `mid_server` role. To prevent MID Server validation failure, the system runs business rules to monitor the settings selected for MID Server users.

Role required: admin

The MID Server connects to an instance by using the SOAP web service. To allow authentication with the instance, create a separate user account for each MID Server or share the same account across multiple MID Servers. Grant each MID Server user the `mid_server` role, which is required for the MID Server user on any instance on which basic authentication is enabled. The
mid_server role allows the MID Server to access protected tables when strict SOAP security is in place. The system adds the necessary SOAP roles automatically with this role.

**Note:** The strict SOAP security feature, enabled by default for any instance that uses basic authentication, protects all tables with Access Control Lists (ACL).

1. From the instance, navigate to **User Administration > Users**.
2. Click **New**.
3. Complete the fields in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>User name for the MID Server user. This name is specified in the <code>mid.instance.username</code> parameter of the configuration file that the MID Server installer creates. For details, see <strong>MID Server parameters</strong>.</td>
</tr>
<tr>
<td>First name</td>
<td>The user’s first name.</td>
</tr>
<tr>
<td>Last name</td>
<td>The user’s last name.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for the MID Server user. This password is specified in the <code>mid.instance.password</code> parameter of the configuration file that the MID Server installer creates.</td>
</tr>
</tbody>
</table>

4. Right-click the header and select **Save**.
5. Under the **Roles** related list, click **Edit**.
6. Select the **mid_server** role for this user.
   Each MID Server account must have this role to access protected tables.
7. Click **Save**.
8. Confirm that the MID Server account was created successfully and the account has connectivity to the instance.
   a) On the host machine where you intend to install the MID Server, open a browser and navigate to the instance.
   b) Use your new MID Server user credentials to log in.
      If the login is successful, then any MID Servers you install on that host will be able to connect to the instance.

**MID Server role validation**

Real-time system validation of MID Server role assignments prevents incompatible settings.

To prevent MID Server validation failure and ensure that your MID Server is configured correctly, the system runs several business rules that monitor the roles and settings you select for your MID Server user. The instance displays a warning and blocks the change when you attempt to save an incompatible configuration.

**Elevated privileges not permitted**

The mid_server role cannot be configured for elevated privileges. The **Invalid MID Server settings** business rule runs on the Role (sys_user_role) table and prevents the **elevated_privileges** field from being set to true for the mid_server role.
Warning for elevated privileges on the mid_server role

Relationship table protection

The User Role (sys_user_has_role) table creates the relationship between the User (sys_user) and the Role (sys_user_role) tables.

- **Incompatible role**

  The mid_server and security_admin roles are incompatible and cannot be assigned to the same user. The system determines the user's current role and runs the **Security Admin incompatible with MID** business rule on the User Role (sys_user_has_role) table. This rule prevents an administrator from adding the security_admin role for a user who currently has the mid_server role.
Warnings for incompatible security_admin role assignment

- **Incompatible user role and user record settings**

  The **Incompatible MID Server user role** business rule runs on the User Role (sys_user_has_role) table to protect its data from incompatible configurations. Validation for this related table ensures that an administrator cannot assign the mid_server role to a user who already holds the security_admin role.

**What to do next**

*Download* the MID Server files for your operating system.

**Download the MID Server files**

Download the MID Server installer package through the instance and make it available for installation on the host. Allow the local network to access the authorized IP addresses to ensure that you can download the installation package and receive automatic upgrades.

Role required: admin

---

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The IP address of the MID Server download site (install.service-now.com) can change without notice. To ensure that you can download the MID Server installation package and receive automatic MID Server upgrades, allow local network access to these IP addresses:

- 149.96.5.98
- 149.96.6.98

**Note:** Download the MID Server first and then enable Discovery, Orchestration, or any integration that requires the use of the MID Server.

1. On the ServiceNow instance, navigate to **Mid Server > Downloads**.
2. Select and download the MID Server for the appropriate operating system.
   For the best performance, install the 64-bit MID Server for your operating system.

**Note:** ServiceNow will discontinue support for 32-bit MID Servers in a future release.

### MID Server downloads

3. Save the download file to a temporary file on the local drive.
4. Move the file into the designated MID Server folder you create for your operating system and run the installer from that location.

Install the MID Server on the host computer.

- **Linux**
- **Windows**
Install a MID Server on Linux

Install MID Servers with the MID Server installation package and verify it is active. The package includes an installer that automatically configures OpenJDK to run in the environment. The MID Server can use an existing JRE rather than the provided OpenJDK. Uninstall the MID Server to redeploy it.

Verify that the host computer satisfies the **MID Server system requirements**.

Role required: admin, mid_server

OpenJDK version 1.8.0_231 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures OpenJDK to run in your environment. No additional configuration is required. This version supports both 32-bit and 64-bit MID Servers. For the best performance, install the 64-bit MID Server for your operating system. The MID Server requires a minimum JRE version 1.8.0_161, and recommended version 1.8.0_231. If you are using a lower version than 1.8.0_161, you may see encryption related issues. If the MID Server is configured to use an external JRE and the JRE is detected to be incompatible, the MID Server instead uses the bundled JRE. If this fails, or the MID remains on an incompatible JRE version, the MID automatically stops.

---

**Note:** ServiceNow will discontinue support for 32-bit MID Servers in a future release.

Testing showed that the MID Server works as expected with Oracle Java 11 version 11.0.5 and Oracle JRE 8 version 1.8.0_231. However, Oracle JRE 8 version 1.8.0_231 requires the workaround described in the HI Knowledge Base article *MID Server running Oracle JRE version 8 (KB0784442)*. In order to use Java 11 on Windows MID Servers, refer to *Install Java 11 on Windows MID servers (KB0752451)*.

Upgraded MID Servers might use different Java versions depending on their release level.

- MID Servers upgraded from Kingston and earlier use the OpenJDK provided with the MID Server installer. This version of the OpenJDK was tested and certified for use with these MID Servers.
- MID Servers upgraded from London continue to use the same JRE you configured for London. The MID Server supports JRE 1.8.
Click this link to view the installation video:

1. From the Linux command line, type `mkdir -p /servicenow/mid server name` to create the installation directory. You need to have read/write/execute permissions on this folder.

2. Extract the downloaded MID Server archive file, `mid.os.zip` into the `servicenow/mid server name/` directory. Use the MID Server name created in the instance or create a new name that you will use for this MID Server moving forward.
The resulting directory structure is `/servicenow/<mid server name>/agent.`

3. Change to the `servicenow/mid server name` /agent directory, and enter the following command to start the MID Server installer: `./installer.sh`.
If you prefer to manually configure the MID Server instead, skip to step 13.

4. Use the installer to enter the following information.
ServiceNow instance URL

ServiceNow MID Server username

ServiceNow MID Server password

Use proxy

Proxy host

Proxy port

Proxy username

Proxy password

Test your connection

Next

Field | Description
--- | ---
ServiceNow instance URL | Enter the full URL of your instance, for example: https://mycompanyinstance.service-now.com
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNow MID Server username</td>
<td>Enter the user name of the MID Server user that you already created. The MID Server user must have the mid_server role.</td>
</tr>
<tr>
<td>ServiceNow MID Server password</td>
<td>Enter the password for the user in the ServiceNow MID Server username.</td>
</tr>
<tr>
<td>Use proxy</td>
<td>Select this check box if your MID Server communicates through a proxy to connect to the instance.</td>
</tr>
<tr>
<td></td>
<td>Note: Your proxy server must use Basic Authentication for the MID server to connect to the instance.</td>
</tr>
<tr>
<td>Proxy host</td>
<td>Enter the proxy server host name or IP address. Do not include the protocol in the host name. For example, enter proxyserver.domain.com, not <a href="https://proxyserver.domain.com">https://proxyserver.domain.com</a>.</td>
</tr>
<tr>
<td>Proxy port</td>
<td>Enter the port through which the proxy server communicates. If you leave this field blank, it should use the proxy server's default port number.</td>
</tr>
<tr>
<td>Proxy username</td>
<td>Enter the user name that has administrator rights to the proxy server.</td>
</tr>
<tr>
<td>Proxy password</td>
<td>Enter the password for the user name.</td>
</tr>
</tbody>
</table>

5. Click **Test your connection** to validate the credentials and instance information. If you encounter any errors, verify the information that you input.

6. Click **Next**.

7. Configure the MID name parameters (see table).
   The wrapper settings are not applicable for Linux operating systems and are disabled for this installation.
Configure MID Name Parameters

*MID Server name: My_Linux_mid_server
MID service wrapper name: snc_mid
MID service wrapper display name: ServiceNow MID Server

Wrapper settings have been disabled as they are not being used for this OS.

8. Click **Next** to view the summary.
Your MID Server has been successfully configured!

To begin using the MID Server:

1. Click **Start MID Server**.
2. Click **MID Servers List Page**. It may take a few seconds for your MID Server to appear.
3. Click on the record for "My_Linux_mid_server" then click **Validate** under Related Links.

For installation details, you may check the log files at: /agent
9. Click Start MID Server.  
The local host starts the MID Server.

**Note:** If the MID Server fails to start, the cause might be a duplicate name or multiple services that point to the same executable path. See MID Server fails to start for details.

10. Click Mid Servers List Page.  
The installer opens the MID Server list from your instance.

11. Select the MID Server name from the list.

**Note:** It may take a few seconds for the MID Server time to establish a connection with your instance.

The system displays the MID Server record.

12. From Related Links, click Validate.  
The MID Server Validated changes to Yes.

13. To configure the MID Server manually, change to the `servicenow/mid server name`/agent directory, and then edit the `config.xml` file as follows:

   a) Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` and change the value to the URL of your instance.

   b) Enter the MID user credentials in the `mid.instance.username` and `mid.instance.password` parameters.  
      By default, the MID Server, uses basic authentication for SOAP messages. The password value is also encrypted authentication.

   c) Find the `<parameter name="name" value="YOUR_MIDSERVER_NAME_GOES_HERE" />` element and change the value for the MID Server name.

   d) Optional: Enter connection information for the proxy server. Remove the appropriate comment tags from the proxy configuration information.  
      For example, you can configure these parameters:
      
      - `mid.proxy.use_proxy`
      - `mid.proxy.host`
      - `mid.proxy.port`
      - `mid.proxy.username`
      - `mid.proxy.password`

14. Start the MID Server and verify that it is active.

   a) In the MID Server home directory (`agent`), execute the shell script `start.sh` to start the new MID Server.

   b) Log into the instance and navigate to MID Servers > Servers to verify that your new MID Server has a Status or Up.

      Additional log information appears here:
      
      - The MID Server log on the instance.
      - The corresponding `agent0.log.0` and wrapper logs (`wrapper.log`) in the MID Server `agent\logs` folder.

15. To configure the MID Server to restart automatically when the host is restarted, run `${base_install_dir}/agent/bin/mid.sh install` as root.

   This command installs the MID Server as a daemon service and adds the auto start scripts to the `init.d` directory.
16. To stop the MID Server, navigate to the MID Server home (agent) directory and execute the stop.sh shell script.

17. To restart a stopped MID Server, navigate to the MID Server home (agent) directory and execute the restart-service.sh script, using one of these commands:
   - ./restart-service.sh
   - sh restart-service.sh
   - bash restart-service.sh

Configure a Linux MID Server to use an existing JRE

You can choose to use an existing JRE for your MID Server rather than the OpenJDK provided with the MID Server installer.

Ensure that your JRE version is supported. See MID Server system requirements for details.

Role required: admin

By electing to use your own JRE, you are responsible for upgrading it as necessary. For a detailed procedure and cautions regarding changing the JRE, see KB0778272.

1. Navigate to this file in the MID Server installation directory:
   `agent/conf/wrapper-override.conf`

2. To specify the existing Java executable that you want to use, add this line to the file:
   `wrapper.java.command={your_java_executable}`

   For more information, see the Java service wrapper property documentation.

3. Save the file.

Run Linux MID Servers as non-root users

Run MID Servers as non-root user on a Linux machine to improve security. Multiple MID Server can be installed as services so they can start by themselves after system reboots.

Role required: root

The MID Server must be installed on the host machine using the procedure in Install a MID Server on Linux. Supported versions for this procedure are Linux Red Hat 6 or newer, Ubuntu 1404 or newer, and CentOS 6 or newer.

1. Stop any MID Server running on the host with the command `bin/mid.sh stop`.
2. Remove any MID Servers on the host with the command `bin/mid.sh remove`.
3. Edit the file `mid.shconf_override`. 

Note: You cannot install more than one MID Server service as a daemon on a Linux host. This is a limitation of the Tanuki wrapper service.
4. Add the MID Server's name using the lines `APP_NAME=` and `APP_LONG_NAME=` to run it as a service.
   To prevent errors, the `APP_NAME` of each MID Server must be unique.
5. Optional: To run multiple MID Servers as services on the same host, add an `APP_NAME` and `APP_LONG_NAME` for each instance.
[root@CentOS6 ~]# cat /opt/midservers/mid_centos6_1/bin/mid.shconf_override
APP_NAME="mid_centos6_1"
APP_LONG_NAME="ServiceNow MID Server MID_CENTOS6_1"

[root@CentOS6 ~]# cat /opt/midservers/mid_centos6_2/bin/mid.shconf_override
APP_NAME="mid_centos6_2"
APP_LONG_NAME="ServiceNow MID Server MID_CENTOS6_2"

6. Add the name of the non-root user to operate the account using the line `RUN_AS_USER=`.
7. Optional: Add the name of the group to own the entire agent directory using the line `GROUP_NAME=`.
8. Set the line `PROMPT_BEFORE_OWNERSHIP_CHANGE=` to either `true` to prompt the user for confirmation before any changes to file permissions are applied. The file permission change is applied to the entire agent folder and everything inside recursively. The changes include blocking other users' access to the entire agent folder, changing the owner to `$RUN_AS_USER` if specified, and changing the group to `$GROUP_NAME` if specified.
9. Reinstall the MID Server with the command `bin/mid.sh install`.

Note:
To prevent errors, make sure to stop and remove any existing MID Server services before start new ones. During the first installation, a root user is required to call `bin/mid.sh install`. Reinstalling the MID Server applies the changes in `mid.shconf_override`. Then the non-root user specified in `mid.shconf_override` is able to start/stop/restart the service without elevated privileges.

For more information about managing the whitelist and file permission enforcement, see [File permission enforcement for Windows MID Servers](#). Running a Linux MID Server with a non-root account may result in issues with PolicyKit in some systems. See [PolicyKit issues with Linux MID Servers using non-root accounts](#) for more information.

Uninstall a Linux MID Server
The MID Server runs as a stand-alone service. You can remove a stand-alone MID Server service to accommodate such tasks as redeploying the MID Server to another host machine or changing the unique name of a MID Server when deploying multiple MID Servers.

Role required: admin

1. To stop the running MID Server service, navigate to the MID Server home (`agent`) directory and run `stop.sh`.
2. From a command prompt, go to the `\agent\bin` directory in the MID Server installation directory.
3. Confirm that the MID Server is stopped by executing the `bin/mid.sh status` shell script.
4. After the MID Server stops, delete the files in the `agent` directory.

Validate the MID Server to prepare it for use.

Install a MID Server on Windows

Install MID Servers with the MID Server installation package and verify it is active. The package includes an installer that automatically configures OpenJDK to run in the environment. The MID Server can use an existing JRE rather than the provided OpenJDK. Uninstall the MID Server to redeploy it.

- Verify that the host computer satisfies the **MID Server system requirements**.
- The MID Server requires the minimum PowerShell version 3.0 and supports versions up to PowerShell 5.1.
- Ensure that the Microsoft Application Experience Lookup Service is enabled on the MID Server host. If this service is disabled, the MID Server auto-upgrade might fail, causing the MID Server to go down. For information on managing issues with the Application Experience service, see **KB0597552**.

**Role required:** admin or mid_server

---

OpenJDK version 1.8.0_231 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures OpenJDK to run in your environment. No additional configuration is required. This version supports both 32-bit and 64-bit MID Servers. For the best performance, install the 64-bit MID Server for your operating system. The MID Server requires a minimum JRE version 1.8.0_161, and recommended version 1.8.0_231. If you are using a lower version than 1.8.0_161, you may see encryption related issues. If the MID Server is configured to use an external JRE and the JRE is detected to be incompatible, the MID Server instead uses the bundled JRE. If this fails, or the MID remains on an incompatible JRE version, the MID automatically stops.

**Note:** ServiceNow will discontinue support for 32-bit MID Servers in a future release.

Testing showed that the MID Server works as expected with Oracle Java 11 version 11.0.5 and Oracle JRE 8 version 1.8.0_231. However, Oracle JRE 8 version 1.8.0_231 requires the workaround described in the HI Knowledge Base article **MID Server running Oracle JRE version 8 (KB0784442)**. In order to use Java 11 on Windows MID Servers, refer to **Install Java 11 on Windows MID servers (KB0752451)**.
Upgraded MID Servers might use different Java versions depending on their release level.

- MID Servers upgraded from Kingston and earlier use the OpenJDK provided with the MID Server installer. This version of the OpenJDK was tested and certified for use with these MID Servers.
- MID Servers upgraded from London continue to use the same JRE you configured for London. The MID Server supports JRE 1.8.

Click this link to view the installation video:

1. Log in to the Windows host machine where you want to install the MID Server.
2. Create a folder for the MID Server on the top level of the drive such as ServiceNow\MID Server1.
3. Download the MID archive file into the new folder.
4. Right-click the archive and select Extract All.
5. Navigate to the service-now\<mid server name>\agent folder that was created when the file was extracted.
6. Run installer.bat to start the MID Server installer.
   To configure the MID Server manually, skip to step 16.
7. Use the installer to enter the following information.
Configure Instance Connectivity

- ServiceNow instance URL: https://(inst.name).service-now.com/
- ServiceNow MID Server username: midserver
- ServiceNow MID Server password: ***********
- Use proxy: checked
- Proxy host: proxyserver.domain.com
- Proxy port: 3238
- Proxy username: proxyuser
- Proxy password: ***********

Test your connection

</tr>
</tbody>
</table>

11. Click **Next** to view the summary.
12. Click **Start MID Server**.
   The local host starts the MID Server.

   **Note:** If the MID Server fails to start, the cause might be a duplicate name or multiple services that point to the same executable path. See **MID Server fails to start** for details.
13. Click **Mid Servers List Page**.
The installer opens the MID Server list from your instance.

14. Select the MID Server name from the list.

**Note:** It may take a few seconds for the MID Server time to establish a connection with your instance.

The system displays the MID Server record.

15. From **Related Links**, click **Validate**.
The MID Server **Validated** changes to **Yes**.

16. To configure the MID Server manually, edit the `config.xml` file with a text editor such as WordPad:
   a) Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` element and change the value to the URL of your instance.
   b) Enter the MID user credentials in the `mid.instance.username` and `mid.instance.password` parameters.
      By default, the MID Server uses basic authentication for SOAP messages. The password value is also encrypted authentication.
   c) Optional: Find the `<parameter name="name" value="YOUR_MIDSERVER_NAME_GOES_HERE" />` element and change the value for the MID Server name.
   d) Optional: Enter connection information for the proxy server. Remove the appropriate comment tags from the proxy configuration information.
      For example, you can configure these parameters:
      - `mid.proxy.use_proxy`
      - `mid.proxy.host`
      - `mid.proxy.port`
      - `mid.proxy.username`
      - `mid.proxy.password`

17. Start the MID Server and verify that it is active.
   a) In the MID Server home directory (`agent`), execute the batch file `start.bat` to start the new MID Server.
   b) Log into the instance and navigate to **MID Server > Servers** to verify that the **Status** of your new MID Server is **Up**.
      Additional log information appears here:
      - The MID Server log on the instance.
      - The corresponding `agent0.log.0` and wrapper logs (`wrapper.log`) in the MID Server `agent\logs` folder.

18. To stop the MID Server, use either of these procedures:
   - **Windows command line**: From the MID Server home directory (`agent`), run `stop.bat`.
   - **Windows Services console**: Right click **ServiceNow <MID Server name>**, and then select **Stop**.

19. To restart a stopped MID Server, use either of these procedures:
   - **Windows command line**: In the MID Server home directory (`agent`), run `Restart.bat`. 
Configure Windows MID Server service credentials

MID Server service credentials are required to manage the MID Server service on the host machine, including its ability to successfully auto-upgrade.

By default, the MID Server service runs as a **Local System** account. This account has privileges to create and run the MID Server service and to download, create, and move files for the MID Server auto-upgrade process.

Windows service credentials are not the same as the MID Server user credentials, which allow communication between the MID Server and the instance. You must configure both of these credentials separately. See [Create the MID Server user and grant the role](#) for instructions on MID Server user credentials.

**Attention:** This procedure is optional. Allowing the MID Server service to run as a Local System account is sufficient for a majority of users.

1. Open the Windows Services console.
2. Double-click the ServiceNow `<MID Server name>` service for each MID Server.
3. Select the **Log On** tab.
4. Set **Log on as** privileges with the user account (local or on a domain) that has local admin access to the MID Server host.
   The MID Server upgrade process deploys a temporary Windows service which requires local administrator privileges.
5. In the **General** tab, set the **Startup type**.
   The field is set to **Automatic** by default.
6. Click **OK**.
7. Restart the ServiceNow `<MID Server name>` service, and make sure that ServiceNow\`<MID Server name>\`\agent\logs\agent0.log does not have error messages. If the MID Server does not start, see the ServiceNow knowledge article Review the agent log for MID Server errors (article KB0535148).
8. On the instance to which this MID Server is connected, navigate to **MID Server > Servers**. If Discovery is installed, alternately navigate to **Discovery > MID Servers**.
   All MID Servers connected to this instance are listed.
9. Make sure that the Status of the MID Server you just installed is **Up**.

Manually install a MID Server as a Windows Service

If you did not start the MID server at the end of the installation procedure, you can manually install the MID Server to run as a Windows service.

Role required: admin

You can install a MID Server as a Windows service in these operating systems:

- Windows Server 2008
- Windows Server 2012
- Windows Server 2016
- Windows Server 2019

1. Open the agent directory in the directory you created for the MID Server installation files. For example, the path might be `C:\ServiceNow\MID Server1\agent`. 
2. Right-click the `start.bat` file, and select **Properties**.
3. Select the option to **Run as administrator**.
4. Double-click the `start.bat` file to install the Windows service.

**Configure a MID Server on Windows to use an existing JRE**

You can choose to use an existing JRE for your MID Server rather than the OpenJDK provided with the MID Server installer.

Ensure that your JRE version is supported. See **MID Server system requirements** for details.

Role required: admin

By electing to use your own JRE, you are responsible for upgrading it as necessary. For a detailed procedure and cautions regarding changing the JRE, see **KB0778272**.

1. Navigate to this file in the MID Server installation directory:
   ```
   agent/conf(wrapper-override.conf
   ```
2. To specify the existing Java executable that you want to use, add this line to the file:
   ```
   wrapper.java.command={your_java_executable}
   ```
   For more information, see the Java service wrapper property **documentation**.
3. Save the file.

**Run a Windows MID Server as a non-admin**

MID Servers can be configured to run using non-administrative accounts. Using non-admin accounts in conjunction with file permission enforcement can improve security by restricting access to MID Server files.

Role required: admin

Install the MID Server on a Windows machine using an administrator account. Create a Windows user account without administrative privileges.

Running a MID Server with a non-admin account has limitations and changes the behavior of other applications. The following behavior changes can occur:

- The MID Server account needs appropriate credentials to run a Discovery schedule. If the credentials are insufficient, the MID Server falls back to the user account's privileges. A non-admin user account may not have the necessary privileges to access the Discovery target.
- Enhanced Application Dependency Mapping (ADME) and File Based Discovery (FBD) may not work by default. To correct this issue, non-admin users need to be given permission to read/write to the Admin Share folder.
- Non-admin accounts cannot initiate upgrade services in versions prior to the Orlando release.

1. Run the MID Server service as LocalSystem or as a user with admin rights.
2. Add the non-admin account name to the MID Server parameter `mid.windows_host.file_permissions.allow_list`.
   This adds the non-admin account to the whitelist. More information about `mid.windows_host.file_permissions.allow_list` can be found in the **MID Server parameters** list.
3. Restart the MID Server.
   The new file permission enforcement rules take effect when the MID Server starts.
4. Switch the MID Server to the non-admin service account.
5. Restart the MID Server.

For more information about managing the whitelist and file permission enforcement, see **File permission enforcement for Windows MID Servers**.
Uninstall a Windows MID Server

The MID Server runs as a stand-alone service. You can remove a stand-alone MID Server service to accommodate such tasks as redeploying the MID Server to another host machine or changing the unique name of a MID Server when deploying multiple MID Servers.

Role required: admin

1. Stop the running MID Server service, using either of these procedures:
   - Windows command line: From the MID Server home (agent) directory, run `stop.bat`.
   - Windows Services console: From the Windows Services console, right-click the ServiceNow MID Server name and then select `stop`.

2. From a command prompt, go to the `\agent\bin` directory in the MID Server installation directory and double-click the `UninstallMID-NT.bat` file.

Validate the MID Server to prepare it for use.

Validate the MID Server

You must manually validate the MID Server after it is installed to enable it to execute automation tasks. You can invalidate a MID Server you suspect has been compromised to prevent it from accessing automation credentials in the instance or executing outbound ECC probes.

Role required: agent_admin, admin

Make sure that the MID Server version is compatible with the instance.

Validation restricts access to automation credentials to trusted MID servers only.

When you validate a MID Server, you specify the capabilities it can use, the applications that use it, and the IP ranges it is allowed to explore. You will be prompted to set the initial selection criteria when you validate MID Servers that do not already have capabilities, applications, or IP ranges already configured. You do not have to set the initial selection criteria to actually validate the MID Server. See MID Server selection for more information on capabilities, applications, and IP ranges.
1. Navigate to **MID Server > Servers**.
2. Open the new MID Server you created from the list of MID Servers.
3. Under **Related Links** click **Validate**.
   The Set Initial Selection Criteria window appears if there are no records in the Supported Applications, IP Ranges, or Capabilities related lists.
4. On the Set Initial Selection Criteria window, use the switches to enable or disable selection criteria for this MID Server:
   - **Allow ALL capabilities**: Allow all capabilities for Orchestration and Event Management to use this MID Server.
   - **Allow ALL applications**: Allow all applications that use MID Servers to use this MID Server.
   - **Allow ALL IP ranges**: Make all IP ranges valid for this MID Server, meaning that it can target any IP address.

   ![Set Initial Selection Criteria](image)

5. Click **OK**.
   The **Validated** field on the dashboard is set to **Validating**, and then set to **Yes** after the validation completes.
6. To invalidate a MID Server, open the record for the MID Server you suspect has a security issue.
7. Under **Related Links**, click **Invalidate**.
   Invalidating a MID Server forces it to clear its memory and restart. The MID Server generates a new keypair on restart.

   *Test network connectivity* to ensure that the MID Server can upgrade automatically.
**Test MID Server connectivity**

Confirm that the MID Server host is able to communicate with the instance. Resolve any issues with the network connectivity such as conflicts with firewalls, access control lists, and routing errors. Successful communication is necessary for automatic upgrades.

**Role required:** admin

---

1. Use PING to test connectivity with the host on the network (ping<host IP>).
2. If no ping response is returned, use TRACEROUTE to see where traffic might be stopped (traceroute<host>).
3. Use TELNET to connect to any of the TCP ports (telnet<host> <port>).
4. Use an SNMP scanning tool to determine if a potential network device is responsive.
5. Resolve the most likely issues around network connectivity:
   - **Routing:** Confirm that the MID Server host has network access to the IP ranges you are attempting to discover.
   - **Firewalls:** Confirm access to the physical firewalls that protect a large environment such as the Data Center. Confirm access to any logical firewalls that protect an individual computer. MID Server communications are initiated inside the firewall and therefore do not require any special firewall rules or VPNs.
   - **Access Control Lists (ACL):** Confirm that ACLs contain the IP addresses based list on SNMP network devices that allows communication to a particular target.
   - **Resolve all issues with your network teams to better understand your topology.** Deploy additional MID Servers if necessary to help keep your network secure. Configure access from your existing MID Server host to networking components.
6. Verify that the MID Server service is running on the host:
- **Windows:** In the Windows Services console, locate the ServiceNow (MID Server name) and confirm that each MID Server has the Started Status value.
- **Linux:** Ensure that the agent0.log.0.lck appears in the /servicenow/ MID Server name]/agent folder.

7. After each MID Server restart, open the agent0.log.0 and address all error messages.
8. From the ServiceNow instance, navigate to MID Server > Servers.
9. Review and verify that all MID Servers that are connected to the instance are listed.
10. Verify that the Status is Up for the MID Servers.

This concludes the installation of a single MID Server. If necessary, continue to deploy multiple MID Servers from a single host in your network. Otherwise, begin configuring your MID Server.

### Install multiple MID Servers on a single system

Install multiple MID Servers on the same host computer. Multiple MID Servers can support each other with load balancing, as well as use domain separation. The number of MID Servers required is determined by factors like network policies, security restraints, and the reliability of the host computer.

Role required: admin, mid_server

---

You can install multiple MID Servers on a Linux or Windows host or on a virtual machine. Installing multiple MID Servers may involve other setup steps depending on your network configuration.

**Important:** Only one MID Server service can be a daemon on a Linux host. This is a limitation of the Tanuki wrapper service.

1. Log in to the host system or virtual machine where you want to install multiple MID Servers.
2. Create a directory for each MID Server on the top level of the drive.
   - Make sure you create a unique and descriptive name for each MID Server, such as MIDServer_SMS_Int or MIDServer_Disc1.
3. Extract the downloaded MID Server archive file into each MID Server directory.
When the extract completes, there should be a directory path similar to the following for each MID Server: ServiceNow<MID Server name>\agent.

4. For each MID Server, run the installer appropriate to the host's operating system.

**MID Server installers**

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Installer path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>/agent/installer.bat</td>
</tr>
<tr>
<td>Linux</td>
<td>/agent/installer.sh</td>
</tr>
</tbody>
</table>

5. Use the installer to enter the following information.

   - URL to your instance
   - User credentials to run the MID Server
   - Proxy server connection details
   - MID server name
   - MID server service wrapper name and display name (Windows systems only)

   **Note:** The MID Server user must have the mid_server role.

6. From the installer, click **Start MID Server**.
The local host starts the MID Server.

7. Click **Mid Servers List Page**.
   The installer opens the MID Server list from your instance.

8. Select the MID Server name from the list.
Note: It may take a few seconds for the MID Server time to establish a connection with your instance.

The system displays the MID Server record.

The MID Server Validated changes to Yes.

All MID Server installation procedures are complete. Proceed to configure your MID Server.

Multiple MID Server deployments

Depending upon how you use the MID Server (for an external integration, Discovery, Service Mapping, or Orchestration) and the load placed on it, you might find it necessary to deploy multiple MID Servers in your network.

Factors determining the number of MID Servers your network will require to support external applications that integrate with ServiceNow include the following:

- The security constraints in your network.
- Your network policies.
- The amount of traffic between ServiceNow and the integrations.
- The reliability of the MID Server machines.

Network policies and security

Security policies in your network (firewalls between network segments, for example) might make direct communication impossible between your instance and an integration’s data source (JDBC, LDAP, etc.). To retrieve data for the instance, you can install a MID Server that has access to both the data source and the instance.

These network policies can determine if you need to install multiple MID Servers in your environment:

- **Access control lists (ACL):** If your security policy controls access to network devices (e.g., switches and routers) with an ACL, it might be necessary to install one or more MID Servers on a machine in the network that is already on the ACL.
- **DMZ:** Your network policy might require you to install one or more MID Servers in your DMZ to probe the devices there. This is common in networks that tightly regulate the ports that are opened on the inside firewall.
- **Probe types:** If you are conducting probes of different operating systems, your network policy might require a separate MID Server for each type of probe (e.g., one MID server for Windows WMI probes and another for SSH probes on UNIX).

Load balancing

Deploy multiple MID Servers where capacity is an issue, as when Discovery has to gather information about thousands of configuration items quickly. In a high volume environment, it might be necessary to deploy multiple MID Servers as load balancers for certain transactions. For example, JDBC data transfers can tie up the resources of a MID Server, making it unable to respond to other requests. The following operations between an integration might require separate MID Servers in a busy network:

- File exports
• Running scripts
• JDBC data sources
• Reading files

High availability model

Avoid installing MID Servers for critical integrations on a machine that might experience any type of planned outage or an outage caused by overloaded processes. If necessary for reliability, consider deploying these types of MID Servers to dedicated machines for high reliability.

Note: Do not integrate with an external application on a MID Server provisioned for ServiceNow Discovery or Orchestration.

Wide area network (WAN)

When determining where to deploy MID Servers in a WAN, consider the bandwidth available between your local area networks. In most cases, install a MID Server on each LAN to probe devices locally, rather than deploying MID Servers that must probe devices across slow WAN connections. An alternative to this type of deployment is to install MID Servers that probe other LANs via VPN connections that take advantage of fast Internet connections. If the bandwidth of your WAN connections is comparable to that of your Internet connection, then there is no performance impact in running MID Server probes across WAN connections.

Domain separation

In deployments where domain separation is enabled and domains are configured to form a hierarchy, place the MID Servers at the lowest domain level.
Deploying MID Servers with domain separation

Use MID Server guided setup

MID Server guided setup provides a sequence of tasks that help you install a MID Server with the proper user account and validate the MID Server. If you are setting up a MID Server for the first time, this is a good way to get one up and running in your environment quickly.

Role required: admin
You are guided through a series of configuration activities that create a fully qualified MID Server. A progress indicator on each screen allows you to monitor your progress on each task.

Each configuration activity provides the following resources to help you:

- Contextual embedded help.
- Links to comprehensive documentation on the ServiceNow product documentation site.

**Important:** You must complete MID Server configuration before you can launch any other IT Operations Management guided setup.

1. Navigate to **Guided Setup > ITOM Guided Setup**.
   The IT Operations Management Guided Setup welcome screen appears.

2. Take one of the following actions:
   - If none of the MID Server installation and configuration tasks are complete, click **Get Started**.
   - If you have completed any of the MID Server installation and configuration tasks, click **Continue** to return to the task list.
   - Select the MID Server icon in the progress bar on the left side of the category screen to display the MID Server category pane at any time.
3. Click **Continue**.

   The IT Operations Management Guided Setup category screen appears. The controls for starting the MID Server tasks are at the top of the list. These tasks must be completed before you can set up the other applications that rely on the MID Server.

4. In the MID Server pane, click **Get Started**.

   The MID Server task list appears with a description of each task.
**MID Server**

The MID Server runs as a Windows service or a UNIX daemon to facilitate communication and the movement of data between a ServiceNow instance and external applications, data sources, and services. Complete the activities in this category to create a user for the MID Server, download the installation package, and validate the MID Server after installation.

- **Create MID User**
  - Add Notes
  - Last updated 35m ago by System Administrator
  - Unlock by completing Create MID User

  Create the user account that the MID Server needs to authenticate on the ServiceNow instance.

- **Download & Install MID**
  - Add Notes
  - Unlock by completing Create MID User

  Select and download the appropriate MID Server installer archive for the operating system.

- **Validate MID**
  - Add Notes
  - Unlock by completing Download & Install MID

  You must validate the network connection between the MID server and your instance before the MID server is permitted to access automation credentials or execute any outbound IEC probes.
5. Click **Configure** to create the MID Server user and follow the instructions in the help pane that appears on the right side of the screen.

**Attention:** If you configured MID Servers manually prior to starting Guided Setup, select from that information to complete each specific task.

6. When you have provided the requested information for the MID Server user, click **Submit**, and then click **Mark as Complete** at the bottom of the help pane.

The view returns to the task list. Notice that the circular progress indicator for the category shows 33% of the MID Server configuration complete. The progress indicator on the left side of the screen shows the completion percentage for all the IT Operations Management tasks.

7. Click **Configure** for the next task, **Download & Install MID**.

OpenJDK version 1.8.0_231 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures OpenJDK to run in your environment. No additional configuration is required. This version supports both 32-bit and 64-bit MID Servers. For the best performance, install the 64-bit MID Server for your operating system. The MID Server requires a minimum JRE version 1.8.0_161, and recommended version 1.8.0_231. If you are using a lower version than 1.8.0_161, you may see encryption related issues. If the MID Server is configured to use an external JRE and the JRE is detected to be
incompatible, the MID Server instead uses the bundled JRE. If this fails, or the MID remains on an incompatible JRE version, the MID automatically stops.

**Note:** ServiceNow will discontinue support for 32-bit MID Servers in a future release.

8. Validate your new MID Server.

If necessary, deploy multiple MID Servers from a single host in your network. Otherwise, proceed to configure your MID Server.

**Configuring MID Servers**

After installing and validating your MID Servers, ensure that they have access to sufficient system resources, probe the proper targets, and communicate with the instance as expected. Configure MID Server selection criteria, create clusters for failover protection, and set up MID Servers in different domains to protect data.

Some of these configuration procedures rely on data found in the MID Server references home page. See that page for links to the parameters, properties, and privileged commands you need to fine tune the behavior of your MID Servers. You can apply controls to individual MID Servers or to all the MID Servers in your environment. Remember to restart the MID Server after any configuration change for those changes to take effect.

**MID Server selection**

MID Servers are selected for use based on three criteria: applications, IP address or range, and capabilities. You can designate specific applications for a given MID Server, such as Discovery or Orchestration. You can specify an IP address or a range that a MID Server is allowed to work within. Some applications require specific capabilities, and so are restricted to MID Servers with those capabilities.
Configure the way your instance selects a MID Server, either by application, IP address ranges, network capability, or behavior.

**MID Server capabilities**
Create capabilities that define the specific functions of a MID Server within an IP address range.

**MID Server IP range auto-assignment**
Configure the system to automatically assign a qualified MID Server to a subnet by that subnet’s IP address range.

**Map an IP address to a DNS name**
Map host server DNS names to IP addresses if your MID Server manages resources within defined IP ranges.

**Configure MID Server as WinRM trusted host**
Add servers, which are part of WinRM, as trusted hosts on all MID Servers that Discovery or Service Mapping use for discovery.

**File permission enforcement for Windows MID Servers**
To improve security, Windows MID Servers will enforce Windows file permission restrictions. This will prevent compromised accounts from accessing unauthorized files by restricting their permissions to the minimum necessary for their role.

**MID Server clusters**
MID Server clusters are groups of MID Servers which provide support to each other in the forms of load balancing and fail-over protection. Work sent to a MID Server that is part of a cluster is automatically balanced between all the MID Servers in that cluster. MID Servers in a fail-over cluster each have a configured order that the platform uses to determine which MID Server to use next in case of failure.

**Create a MID Server cluster**
Create a MID Server cluster for load balancing and fail-over protection.

**Set thread use**
Set the number of threads your MID Server uses for the desired MID Server speed, based on hardware capabilities and competing applications running on the host.

**Domain separation**
Domain separation segregates MID Servers based on the records they can access. The credentials configured in a MID Server’s config.xml file determine which records that MID Server can read, update, or create. You can specify MID Server policy records that only MID Servers from the same domain can use.

**MID Server domain separation**
Set up your MID Servers in different domains to restrict the records and credentials that a MID Server can access.

**Synchronize a JAR file to MID Servers**
Upload a JAR file to an instance and synchronize it to all MID Servers connected to that instance. Use JAR file synchronization to create policies that only a MID Server from the same domain can use.

**MID Servers used for credential-less Discovery**

MID Servers that are used for *credential-less Discovery* require special configuration to run Network Mapper (Nmap) commands on target computers.

*Install and uninstall Nmap on a MID Server*

You must install Nmap on each MID Server running on a Windows host. When given the proper capability, those MID Servers can discover some basic information about CIs in your network if normal authentication fails.

**MID Server extensions**

*vCenter event collector*

The vCenter event collector listens for vCenter-related events and updates the CMDB accordingly. The event collector allows the CMDB to be updated with changes to virtual machines (VMs), in addition to the updates detected by Discovery. A change to a VM is sent as an event from the vCenter server to the vCenter event collector. When an event is received, the CMDB is updated accordingly. Full vCenter Discovery does not need to rerun. For some events, such as powered on and powered off events, Discovery does not need to run again at all. For most events, Discovery runs only on the necessary vCenter resource.

*SNMP trap collector extension*

The SNMP trap collector is a MID Server extension that listens for SNMP traps from the devices on your network. Upon receiving a trap, the MID Server sends the trap to the instance for further processing by Event Management. If Event Management is not active, traps are not processed and are discarded by the instance.

**MID Server selection**

You can configure MID Server selection by application, IP address ranges, network capability, or behavior. Specific MID Servers can be assigned to particular tasks, or the MID Server can be selected automatically. MID Servers can use domain separation to limit the scope of discoveries and event management.
MID Server criteria

MID Servers offer these types of criteria that help an application determine which MID Server to use:

- **Application**: The application that you specify on the MID Server. You can designate these applications for a specific MID Server:
  - Discovery
  - Orchestration
  - Service Mapping
  - Event Management
  - Operational Intelligence
  - Cloud Management

An **ALL** application option is also available. By default, this option includes all applications except Event Management alert aggregation and RCA, which requires an exclusive MID Server. You can configure which applications are included in the **ALL** designation.

- **IP address or range**: The IP address or the IP ranges that the MID Server is allowed to work within. You can specify an IP address or IP range in the application, such as on a Discovery schedule or an Orchestration activity, and for the MID Server. If the IP configured in the application matches the IP address or falls within the allowable IP range configured on the MID Server, a match is possible, and that MID Server passes this criteria. To have the instance automatically assign IP ranges (subnets) to available MID Servers, see Using MID Server IP range auto-assignment.

- **Capabilities**: The network capability an application needs to use, such as the **PowerShell Orchestration activity** or the Flow Designer **PowerShell step**. Some applications, like Cloud Management and alert aggregation and RCA, require a specific capability.

**Note**: Discovery and Service Mapping can also use behaviors, which determine the type of port probes used during the port scan phase of Discovery. Both Discovery and Service Mapping use a behavior to discover load balancers running on Linux. Other applications do not use behaviors. Behaviors are not used for auto-selection, default
How an application selects a MID Server

If you do not specify a specific MID Server for an application to use, the application tries to select one. Each application relies on different criteria to select an appropriate MID Server.

<table>
<thead>
<tr>
<th>Application</th>
<th>Supported Application on the MID Server</th>
<th>IP address range</th>
<th>Capability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery</td>
<td>The Discovery or ALL application must be specified on the MID Server.</td>
<td>Discovery uses IP ranges that you configure on the Discovery Schedule form to see if they fall within the IP ranges that you configure on the MID Server, or the ALL IP ranges option must be selected on the MID Server.</td>
<td>N/A</td>
</tr>
<tr>
<td>(Select Auto-Select MID Server on the Discovery schedule)</td>
<td></td>
<td></td>
<td><strong>Note:</strong> Any configured behaviors are ignored.</td>
</tr>
<tr>
<td>Orchestration</td>
<td>The Orchestration or ALL application must be specified on the MID Server.</td>
<td>The target IP address that you configure in an Orchestration activity must fall within the IP ranges that you configure on the MID Server, or the ALL option must be selected on the MID Server.</td>
<td>The capability that is required for an Orchestration activity must match the capabilities you configure on the MID Server, or the MID Server capability must be set to ALL.</td>
</tr>
<tr>
<td>Alert aggregation and RCA (as part of Event management)</td>
<td>The Service Analytics application must be specified on the MID Server.</td>
<td>N/A</td>
<td>One of these capabilities must be present on the MID Server: the <strong>RCA</strong> capability for alert aggregation and RCA and the <strong>Metrics</strong> capability for Operational Intelligence.</td>

<td>N/A</td>
<td>The Cloud Management or ALL capability must be added.</td>
</tr>
</tbody>
</table>

### Using a specific MID Server

Discovery and Event Management can use a MID Server that you specifically call out.

**Note:** Selecting a specific MID Server is not the same as specifying the default MID Server for an application. A specific MID Server is always used. If it is Down or not validated, the application does not execute commands against the MID Server. A default MID Server is fallback that is used when the auto-selection of MID Servers does not find any eligible MID Server.

<table>
<thead>
<tr>

</tbody>
</table>
Domain separation

If you are using domain separation, you can configure MID Servers to be in separate domains. The domain that the MID Server is in affects how the application selects the domain:

- **Discovery and Service Mapping**: On the Discovery schedule, the MID Servers and clusters that available for selection are limited to the same domain of the user who is configuring the schedule. This also applies to the auto-selection option: only MID Servers in the same domain as the user can be automatically selected.

- **Alert aggregation and RCA (Event Management)**: The metrics for a business service is done on the MID Server that is in the same domain as the business service. Otherwise, a MID Server from the global domain is used.

**MID Server selection test**

If Service Mapping is active, you can preview which MID Server that Service Mapping uses for a specific target device or computer. To do this, navigate to **Service Mapping > MID Servers** and click **MID Selection Test**. Enter the IP address and an optional application and capability, and then click **OK**. The name of the MID Server that Service Mapping will use appears in the window.

**Configure a default MID Server for each application**

You can configure a default MID Server that an application can use if all other possible MID Servers are unavailable. You can narrow down the list of applications that are included in the definition of **ALL**.

Role required: agent_admin or admin

---

Applications are only available when their respective plugins are activated.

The default MID Server is used when applications fail to find a suitable MID Server that matches configured criteria during auto-select. The default MID Server for the **ALL** application is used if the default MID Server for the specific application is not available. Some applications also offer a property to set the default MID Server.
Important: If you configure a MID Server for ALL IP ranges (type **Include**) and also create an IP range of type: **Exclude** for the same MID Server, the system ignores the excluded IP range for that MID Server.

The default MID Server does not need to meet any criteria (application, IP range, behavior, or capability) to be used. Specifying a default MID Server is optional, and you can use a MID Server as the default for more than one application.

<table>
<thead>
<tr>
<th>Application</th>
<th>Additional notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery</td>
<td>Discovery attempts to use the default MID Server when the Discovery schedule specifies <strong>Auto-Select MID Server</strong> and Discovery cannot find any MID Servers with the correct application and IP range.</td>
</tr>
<tr>
<td>Orchestration</td>
<td>Orchestration attempts to use the default MID Server when it cannot find any MID Servers with the capabilities that you define in the Orchestration activity. You can also specify a default MID Server. The value in that property automatically synchronizes with the default MID Server you select in the Orchestration application.</td>
</tr>
<tr>
<td>Alert aggregation and RCA</td>
<td>Not applicable. The MID Server is selected if it has the RCA capability. Route to right MID by domain.</td>
</tr>
<tr>
<td>Service Mapping</td>
<td>If there are no MID Servers with matching application, capability, or IP range, Service Mapping uses the default MID Server.</td>
</tr>
<tr>
<td>Event Management</td>
<td>You can specify a default MID Server for Event Management using the mid.server.connector_default system property. Event Management does not use the default MID Server in the application record.</td>

<td>N/A</td>
</tr>
</tbody>
</table>

1. Navigate to **MID Server > Applications**. The list of installed applications that can use MID Servers appears.
2. Click the name of an installed application.
3. Select a MID Server from the list in the **Default MID Server** field.
4. To select additional MID Servers for this application, click **Edit** in the **MID Servers** related list and select alternate MID Servers that this application is allowed to use.
5. Click **Update**.

**Select applications to include in the definition of ALL for a MID Server**

You can narrow down the list of applications that are included in the definition of ALL.

Role required: agent_admin or admin

You can specify the ALL application for a MID Server, which means that the MID Server is allowed to work with any of the applications that require MID Servers, such as Discovery, Event Management, Service Mapping, and so on. But you might not want all applications to be included in the definition of ALL. For example, you might want to exclude Service Mapping from the ALL definition if you already have a dedicated MID Server to work with Service Mapping.

1. Navigate to **MID Server > Applications**. The list of installed applications that can use MID Servers appear.
2. If you do not see the **Included in application ALL** column, you can personalize the list and add it.
3. For each application, double-click the value in the **Included in application ALL** column.

4. Change the value to **true** (to include) or **false** (to exclude).

**Configure an IP address range for the MID Server**

You can manually configure an IP address range for the MID Server to explore.

Role required: agent_admin or admin

Applications, such as Discovery and Orchestration, can specify an IP range or the specific IP address of a target. When the application looks for a MID Server to use during auto-selection, it chooses a MID Server whose IP range includes the application’s range or specific IP address. Applications also use other criteria, such as the MID Server’s supported application or capability. See **MID Server selection** for more information.

**Note:** This is a manual configuration procedure. To learn how the system can assign IP address ranges to selected MID Servers automatically, see **Using MID Server IP range auto-assignment**.
These applications use IP ranges as follows:

- **Orchestration**: Use the IP address of the target machine (together with the capability) to select the correct MID Server for Orchestration activities. See the procedure in this topic to configure the IP address.
- **Service Mapping**: Select the MID Server whose IP address range matches the IP in the discovery request. See *MID Server configuration for Service Mapping* for more information.
- **Discovery**: Can select an IP address range using the same criteria as Service Mapping. Discovery can also use a *quick IP range* that you specify in the Discovery schedule.

**Tip**: You can also use the **ALL** IP range, which allows the MID Server to be used with any range of IP addresses that an application specifies. This only allows the MID Server to access IP ranges, it does not mean that the MID Server can actually reach all of the IP ranges. To function with an application, the MID server must have access to the IP ranges that the application needs.

Valid IP address ranges can be as follows:

- An IP address in dotted decimal or hexadecimal format. The hexadecimal format can be explicitly prefixed with 0x, this is not mandatory. Here are examples:
  - 10.11.144.155
  - 0xA0B909B
  - 0x0A0B909B

- An IP address range in dotted decimal or hexadecimal format. Here are examples:
  - 10.11.144.150-10.11.144.160
  - 0xA0B9096-0xA0B90A0
  - 10.11.144.150-0xA0B90A0

- An IP network address with the net mask specified after a slash (/) in regular notation (0-32 inclusive) or in IP address notation. Here are examples:
  - 10.11.144.0/24 10.11.144.0/255.255.255.0
  - 10.11.144.0/0xFFFFFFFF
  - 0xA0B90000/24
  - 0xA0B90000/0xFFFFFFFF

1. Navigate to **MID Server > IP Ranges**.
2. Click **New**.
3. Complete the form, using the fields in the table.
When associating MID Servers with IP address ranges, Orchestration uses the IP address of the target machine to select the correct MID Server to use for Orchestration activities. This functionality ensures that a MID Server with connectivity to the target is chosen to perform the Orchestration activity.

<table>
<thead>

<td>- Include: Include the specified IP range.</td>
</tr>
<tr>
<td></td>
<td>- Exclude: Exclude the IP address range.</td>
</tr>
</tbody>
</table>

**Note:** If a MID Server is configured for ALL applications, any IP addresses configured for exclusion are ignored by the system. If your goal is to configure default MID Servers for separate applications in your system, see Configure a default MID Server for each application.

<table>
<thead>
<tr>
<th>Range</th>
<th>Enter the range in a valid format.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Related list</td>
<td>MID Servers</td>
</tr>
</tbody>
</table>

4. Click **Save**.

**Important:** IP ranges assigned manually prior to using auto-assignment in the Discovery Quick Start are affected as follows:

- Individual IP ranges are retained and appended to the ranges assigned automatically by the system for the designated MID Server.
- If the MID Server was configured with the ALL ranges selection, the auto-assignment feature overwrites that designation with the ranges it finds.

Open the ALL IP range record and configure the MID Servers that you want to use with any set of IP addresses.

**Override the MID Server selection filter**

You can use the override feature to write your own filter condition that overrides the normal MID Server selection criteria for an application. An override has precedent over the default filter and can be defined for a specific selection condition.

Before attempting to create an override filter, be sure you understand the criteria the platform uses to select MID Servers. See MID Server selection for details.

Role required: admin
Ensure that the MID Server can connect to elements inside and outside your network

Download and install the MID Server on a Linux or Windows host

Configure your MID Server

Configure MID Server security

Note: The override feature is intended for Cloud Management and Cloud Discovery only. The Override by capability filter is provided by default.

There are four MID Server selection filters included in the base ServiceNow system. These filters are applied to all MID Servers in order until the system finds a matching condition:

- Status Filter
- App Filter
- Capability Filter
- IP Filter

Important: The override feature allows multiple filter types but only one override filter for each filter type. The Override selector filter type overrides all other filters and takes complete control of the MID Server selection. If this type is active, it is the only filter applied.

1. Navigate to MID Server > Mid Selector Override.
   The list of MID Server overrides appears.
2. Click New to create a new filter.
3. Complete these fields:
   - **Name**: Unique name for this override. Ensure that you can identify the override type by the name.
   - **Script**: Condition for this filter. Create the MID Server selection logic for your override in this field, using the directions provided in the function template. Look at the Override by capability filter as an example before starting to create your filter.
   - **Type**: Type of override being configured. Select one of the four default filters to override with your condition, or select Override selector to create a filter that overrides all the others.

4. Click Submit.
```javascript
// Function filter on MIDServerJS array
(function filter(MIDServerJS Array /* candidateMIDList */, MIDServerJS Array /* defaultSelectedMIDList */) {
    Native JS Object /* midSelectorContext */, MIDServerParamJS /* requestedParameters */ {
        if (defaultSelectedMIDList.length > 0) {
            // Return first selected MID
            return defaultSelectedMIDList;
        }
        // Check if this is cloud capability - if not nothing to do
        if (!hasCloudCapability(requestedParameters.capabilities)) {
            return defaultSelectedMIDList;
        }
        // Get first non cloud capability (e.g. AWS) - there should be only one more
        var capability = getNonCloudCapability(requestedParameters.capabilities);
        if (capability) {
            console.warn("MID Selection filterOnCapability could not find a capability for provider!");
        }
        return defaultSelectedMIDList;
    }
    // Get MID with AWS capability
    var ids = getMidsWithCapability(capability);
    if (ids.length > 0) {
        return ids;
    }
    ids = getMidsWithCapability('Cloud Management');
    getMidsWithoutCapability(ids, capability);
```
Using MID Server IP range auto-assignment

Discovery Quick Start can automatically assign ranges of IP addresses, called subnets, to qualified MID Servers. This subnet auto-assignment requires SNMP credentials for read-only access to routers Discovery uses. The Automation Status Set form shows summary details of subnet Discoveries and the IP range assignments for associated MID Servers.

To be automatically assigned to a subnet, a MID Server must be:
- In a running (Up) state.
- Successfully validated.
- Able to access one or more subnets in your network.

The subnet assignments that the instance makes for your MID Servers are stored in the Automation Status Set (automation_status_set) table. For details about MID Server auto-assignment, see Discovery Quick Start.

Important: You must auto-assign at least one MID Server to create a schedule automatically.

Required SNMP OIDs for MID Server IP range auto-assignment

Customers who use network service providers must request specific SNMP access to use MID Server IP range auto-assignment.

IP range auto-assignment requires SNMP credentials for read-only access to all routers that Discovery uses to identify subnets. In addition, your service provider must grant the following SNMPWALK access:
- iso.org.dod.internet.mgmt.mib-2.ip.ipRouteTable (1.3.6.1.2.1.4.21)
  - ipRouteDest (1.3.6.1.2.1.4.21.1.1)
  - ipRouteNextHop (1.3.6.1.2.1.4.21.1.7)
  - ipRouteType (1.3.6.1.2.1.4.21.1.8)
  - ipRouteMask (1.3.6.1.2.1.4.21.1.11)
- iso.org.dod.internet.mgmt.mib-2.ip.ipForward.ipCidrRouteTable (1.3.6.1.2.1.4.24.4)
View automation status sets and IP range assignments

The Automation Status Set form shows summary details of a subnet Discovery and the subsequent IP range assignments for MID Servers selected for automatic subnet assignment.

Role required: admin

1. Navigate to MID Server > Automation Status Sets.
2. Select a status record for a subnet Discovery you want to view.

The form contains read-only status information about the selected Discovery, the subnets found, and the range assignment process for the MID Servers you selected for auto assignment.

**Important:** IP ranges assigned manually prior to using auto-assignment in the Discovery Quick Start are affected as follows:

- Individual IP ranges are retained and appended to the ranges assigned automatically by the system for the designated MID Server.
- If the MID Server was configured with the ALL ranges selection, the auto-assignment feature overwrites that designation with the ranges it finds.
The Automation Status Set shows the IP range assignments for the MIO Servers selected for automatic range configuration. All auto-populated MIO Server ranges from this process are subnets only. This form includes summary details of the Discovery that identified the available subnets and their ranges.

### MIO Servers

- Name: daw-143corp.org
- Status: Down
- Validated: Yes
- Version: track$n-04-14-2016_02-08-2017_1805
- MIO_User

Actions on selected row:
3. Select the **Subnets Discovered** related list to view the list of subnets available for assignment.

4. Select the **IP Range Assignments** related list to view the IP ranges that were assigned to a MID Server.

**Caution:** IP ranges identified by Discovery are stored in the IP collection (ip_address_collection) table, which is only used for MID Server IP range auto-assignment in the Jakarta release. This table is intended for future development and **should not** be used in any customizations, including column additions, business rules, or scripting actions.
File permission enforcement for Windows MID Servers

To improve security, Windows MID Servers enforce Windows file permission restrictions. The enforcement limits access to the MID Server files to a restricted whitelist of users and groups.

File permission enforcement for Windows MID Servers goes into effect on the MID Server on start up in Orlando. By default the agent folder is locked to three user accounts and groups: the local admin group, the system account, and the user account the Windows MID Server is using. The list of permitted user accounts is managed by a whitelist, which is controlled by the MID Server parameter `mid.windows_host.file_permissions.allow_list`. This parameter takes a string of comma separated group names, user names, and security identifiers (SID). Group and user names must follow SAM account naming requirements. Domain accounts must be specified by using the SID.

Roll back file permission changes

Changes to the file permissions are recorded, and the last used settings are saved in the `/etc` folder as a backup. The file is `fileperm.aclsave`. Open a command prompt and run the command `icacls <agent_folder> /restore <agent_folder>/etc/fileperm.aclsave` where `<agent_folder>` is name of your agent folder.

Run a MID Server as a non-admin

To run a MID Server as a non-admin user, it must first be installed using an admin account. Then add the non-admin user to whitelist and restart the MID Server. Once the new enforcement rules run, the MID Server can be switched to the non-admin service account. See Run a Windows MID Server as a non-admin for more information on setting up non-admin Windows MID Servers, or Run Linux MID Servers as non-root users for Linux MID Servers.
Map an IP address to a DNS name

Associate the IP address to a DNS name to ensure the appropriate MID Server is selected. The IP Address range configuration determines which MID Server is selected. If the MID Server manages resources within defined IP ranges, all host servers must have their DNS names mapped to an IP address.

Role required: admin

The association of an IP address to a DNS name ensures that the appropriate MID Server is selected based on the IP Address range configuration. If this is not done, Orchestration reverts to the default MID Server.

If Discovery cannot discover the server and resolve the DNS name to an IP address, you must create the mapping manually.

**Important:** The platform does not map localhost to 127.0.0.1 automatically. You must create that mapping using this procedure.

1. Enter `cmdb_ci_dns_name.list` in the navigation filter.
   
   A list of DNS names appears.

2. Check the list for your host server.
   
   If the server does not appear in the list, continue with this procedure.

3. Click New.

4. Enter the fully-qualified domain name (FQDN) of the host server in the Name field.

5. Right-click in the form header and select Save from the context menu.

6. In the IP Address related list, click New.

7. In the IP Address field, enter the IP address of your host server.

8. In the Nic field, select eth0 or your preferred network interface controller.

9. Leave the Netmask field blank.

10. Click Submit.
Configure MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range, allowing an application to select the most appropriate MID Server. Configure capabilities on MID Servers for applications like Orchestration, Cloud Management, and Service Mapping.

Role required: admin or sm_admin

Several applications use capabilities, IP ranges, and MID Server selection to narrow the pool of MID Servers the applications need.

**Note:** At least one capability is required for each MID Server used by Orchestration. See MID Servers for Orchestration for more information.

The following capabilities are available by default with Discovery:

<table>
<thead>
<tr>
<th>All</th>
<th>IBM</th>
<th>Resolve DNS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ansible</td>
<td>JDBC</td>
<td>REST</td>
</tr>
<tr>
<td>AWS</td>
<td>NetApp</td>
<td>SNMP</td>
</tr>
<tr>
<td>Azure</td>
<td>Nmap</td>
<td>SOAP</td>
</tr>
<tr>
<td>Chef</td>
<td>OpenStack</td>
<td>SSH</td>
</tr>
<tr>
<td>Cloud Management</td>
<td>PowerShell</td>
<td>VMware</td>
</tr>
<tr>
<td>Google</td>
<td>RCA</td>
<td>WMI</td>
</tr>
</tbody>
</table>

1. Navigate to **MID Server > Capabilities**.
2. Select an existing capability. You can also select **ALL** to include all capabilities.

**Note:** Ensure that each IP address range has MID Servers with the necessary capabilities to complete the Orchestration activities on that network segment.

3. Create a new capability:
a) Click **New**.

b) Configure the value for a custom capability. An example is a capability for **DOMAIN**, with a value of **service-now**.

c) Click **Submit**.

4. Click **Edit** in the MID Servers related list to add MID Servers to the capability.
5. Select one or more MID Servers for this capability from the **Available** list.
6. Click **Save**.

The capability defined here also appears in the primary record for this MID Server.

**MID Server capabilities**

MID Server capabilities define the specific functions of a MID Server within an IP address range.

**Nmap capability**

The **Nmap** capability is only assigned to MID Servers for which the Network Mapper (Nmap) scanner has been installed for **credential-less Discovery**. This capability cannot be added to or removed from any MID Server manually. For instructions on installing or uninstalling Nmap, see [Install and uninstall Nmap on a MID Server](#).

**MID Server capability values**

Capabilities provided in the base system do not have a defined value string. A MID Server configured to use a capability that has no value can locate any device using that capability's protocol. If a capability has a defined value, the MID Server using that capability finds only those devices using that protocol that match the value string exactly. The exception to this is the Resolve DNS capability, which is configured to resolve any DNS name into an IP address using a partial string match.

Starting with the madrid release, the (**capability name**):(**value**) combination appears in the slushbucket when you add a capability to a MID Server. This combination allows you to see all the capabilities that have different values, even if the capability name is the same. For example, if you are using the Cloud Management capability, and you use the value field to specify the us-west logical datacenter on one of the capability records, you can see the combination in the **Collection** list.
Scripted MID Server capability value matching

You can use value tests to create capabilities that find devices using values without requiring exact string matching. Action on these values is controlled by a user-defined script.

The Resolve DNS capability is provided in the base system and is configured to resolve DNS names into IP addresses for devices whose names end with a specified domain name. The capability Value entered is automatically prefaced with a dot during processing to match domain syntax. This value can contain one or more sub-domains, but must include the end of the domain string. Matching devices must end with the identical syntax. The script for the Resolve DNS capability determines if a device name matches the criteria defined by Value. If a match exists, the platform performs the address resolution automatically. For example, if the value for the Resolve DNS capability is service-now.com, the MID Server with this capability finds lnxlab01.sandiego.service-now.com and dbsrv101.sanjose.service-now.com. If the value is changed to sandiego.service-now.com, then the MID Server finds only lnxlab01.

**Note:** If Value in the Resolve DNS capability is blank, then all domains match.
To view the script for evaluating this capability, navigate to **MID Server > Capability Value Tests** and select **Resolve DNS** from the list.

### Configure a MID Server cluster

Group multiple MID Servers to form clusters, then configure clusters for fail-over protection or load balancing. Load-balancing clusters automatically balance work between each MID Server to
improve stability and performance. Fail-over clusters have a configured order used to determine which MID Server to use next if a failure occurs.

Ensure that each MID Server in the cluster has the appropriate capabilities for the job. A MID Server in a fail-over cluster must have the same capabilities (or expanded capabilities) as the MID Server it is expected to replace.

Role required: admin

You can select a MID Server cluster from the Discovery Schedule form.

1. Navigate to **MID Server > Clusters**.
2. Click **New**.
3. Name the cluster and select the cluster type: **Failover** or **Load Balance**.
4. Right click in the header bar and select **Save** from the context menu.
5. Click **Edit** in the **Includes MID Servers** Related List.
6. Select appropriate MID Servers for this cluster from the slushbucket.

**MID Server clusters**

MID Server clusters enable multiple MID Servers with the appropriate capabilities to be grouped together for load balancing and fail-over protection.

**External data sources**

For performance and reliability reasons, these data sources should not be used with MID Server clusters. These external data sources should only be used with dedicated MID Servers.

- LDAP
- Export sets
- JDBC data sources

**Note:** If a MID Server in a cluster fails, the fail-over MID Server starts over at the beginning of the ECC queue task even if much of the information from the JDBC data source
How clusters work

MID Servers in clusters must be able to connect to the instance and to all the devices with which they are expected to communicate. If all MID Servers in a cluster are down, the discovery is canceled. Make sure all the MID Servers are added to any Access Control List (ACL) in use. MID Server clusters are managed by a business rule called MID Server Cluster Management, which checks to see if the MID Server assigned to a job in the ECC Queue belongs to a cluster.

Load balancing

If the cluster business rule determines that a MID Server is part of a load balancing cluster, the application using the MID Server automatically balances the work between the MID Servers in that cluster. It is good practice to put MID Servers with the same capabilities in a load balancing cluster.

Fail-over protection

MID Servers in a fail-over cluster each have a configured order that the platform uses to determine which MID Server to use next in case of failure. MID Servers in a fail-over cluster work independently and do not load balance with other MID Servers in that cluster (although they might also be members of load balancing clusters). When a MID Server fails, the MID Server Cluster Management business rule selects the highest available MID Server in the order to take over the work. The selected MID Server checks the ECC Queue and starts with jobs that are either Processing or Ready.

Note: MID Server clustering does not support the ECC queue topics Command or SystemCommand. If these commands are received, the clustered MID Servers do not redirect the ECC queue to another MID Server. The ECC queue records stay on the ECC queue without being processed.

Configure a fail-over MID Server with at least the same capabilities as the MID Server it is intended to relieve.

Note: If a MID Server fails while the Shazzam probe is running and auto-selection is configured, failover is not available. The Shazzam discovery stops. Discovery does not automatically choose another MID Server.

MID Server cluster event

The following event is triggered when the platform cannot find a MID Server with the appropriate capabilities to replace a MID Server in a fail-over cluster. Use this event to create an email to notify appropriate users that the cluster has failed.
MID Server cluster event

<table>
<thead>
<tr>
<th>Event</th>
<th>Table</th>
<th>Description</th>
<th>Business Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid_server.cluster.down</td>
<td>MID Server Cluster</td>
<td>A MID Server cluster has failed</td>
<td>MID Server Cluster Management</td>
</tr>
</tbody>
</table>

Combining clusters

A MID Server can be added to both types of clusters at the same time. This diagram shows a scenario in which a MID Server from a load balancing cluster (MID Server D) is also present in a fail-over cluster. If MID Server D fails, MID Server E in the failover cluster is available to the load balancing cluster to perform the tasks previously assigned to MID Server D.

Specifying a specific MID Server cluster

You can specify a specific MID Server cluster for a Discovery schedule. The discovery process uses that cluster only. You cannot chain clusters or specify a single MID Server that belongs to multiple clusters.

Distributed MID Server clusters for Operational Intelligence

The distributed MID Server cluster type is used exclusively in Operational Intelligence, which analyzes Event Management events and generates anomaly alerts. These MID Servers communicate with one another to distribute and balance the workload. For details, see MID Server distributed clusters for Operational Intelligence

Set MID Server thread use

The three parameters: threads.interactive.max, threads.expedited.max, and threads.max define the maximum numbers of worker threads that can run simultaneously in each pool. Change the number of threads used by the MID Server according to performance requirements. MID Servers which compete with other programs for CPU time can use fewer threads than the default. MID Servers which need more speed, and have a host computer powerful enough, can use more threads.

Role required: admin
Changing the thread parameters can affect the MID Server performance. The interactive thread pool is designed for executing interactive messages including system commands and heartbeats. They are typically lightweight, so usually there is no need to change the default value. The expedited thread pool is designed for executing messages that have higher priority than the standard ones but less than interactive ones. Unless you have applications that produce a lot of expedited messages, there is no need to change the default value for threads.expedited.max. The standard thread pool is the busiest pool. Most probes are using it and they can take a lot of system resources such as CPU, memory, and so on. You can set the MID Server to use as few as five threads without issue. To increase the speed of the MID Server if the host is powerful enough or lightly loaded with other programs, you can increase the threads setting. The threads setting depends on the limitation of the CPU speed, memory, and operating system of the host machine. You might have to experiment to find the optimal threads count that works best when the MID Server is busy so it does not exhaust the host machine’s hardware limitations. This means you may have to refine the thread count to best meet your situation. The following general observations may be useful:

- PowerShell is resource intensive and threads may not scale linearly.
- Most MID Server tasks require file handles to do their job.
  - Windows: On the Windows operating system, file handles are available in a fixed quantity. If you configure too many MID Server threads on a Windows host, the MID Server can consume all the file handles before approaching maximum CPU usage. This situation appears as an Out of file handles error in the MID Server log and indicates that the MID Server is trying to use too many threads.
  - UNIX and Linux: UNIX and Linux hosts have a much different scheme for allocating file handles. Generally, you can increase MID Server thread use on these operating systems until the CPU of the host is overloaded. See your OS documentation for monitoring CPU usage.
  - Each thread on the MID Server requires some memory. Exactly how much memory varies considerably from task to task and depends on the equipment being discovered. To increase the number of threads, you might have to increase the amount of memory that Java uses. If you configure insufficient memory, an Out of memory error appears in the MID Server log.
  - You can set threads.max as high as 200, however, this setting may need to be changed depending on the OS. For example, Windows-based MID Servers running Discovery uses
Powershell which is resource intensive. In this case, you may exhaust the CPU power of the host machine with just 50 threads count.

Follow the steps below to change the config.XML file. Alternatively, use the threads.max connection parameter. See MID Server Connection parameters for more details.

1. Open the \agent\config.xml file using any text editor.
2. Locate the following lines:
   ```xml
   <!-- MID Server Threads -->
   <parameter name="threads.max" value="25"/>
   ```
3. Edit the value. Keep in mind the cautions described above.
4. Save the record.
5. Restart the MID Server service.

Install and uninstall Nmap on a MID Server

If you decide to use credential-less Discovery in your network, you must install Nmap on each Windows MID Server that you want to use for this purpose. Self-hosted customers whose network security does not permit downloads from install.service-now.com must use a specific manual process to install and configure Nmap.

Role required: mid_admin

- Assign MID Server IP ranges to all deployed MID Servers. The quickest and most reliable way to do this is with the Using MID Server IP range auto-assignment feature available in the Discovery Quick Start wizard. This method ensures that the set of MID Servers configured to access an IP address range is comprehensive.
- Identify the IP ranges you want to explore with credential-less Discovery. Ensure that these ranges can only be accessed by MID Servers with Nmap installed, running on supported Windows hosts.
- Use the All option for selecting IP ranges and observe these requirements:
  - Restrict the use of this feature to Windows MID Servers only.
  - Ensure that Nmap is installed on each of these MID Servers.
- Ensure that the MID Servers can access the entire customer network.

- When you create a Discovery schedule with Nmap enabled, observe these requirements for the MID Server selection options:
  - **Specific MID Cluster**: Verify that Nmap is installed on all MID Servers in the cluster, where each MID Server in the cluster is configured to access the same set of IP ranges.
  - **Auto-Select Mid Server**: When running horizontal Discovery, verify that Nmap is installed on at least one of the MID Servers that can access the Discovery schedule’s configured MID Server IP ranges.
  - **Specific MID Server**: Verify that Nmap is installed on each MID Server that can access the schedule’s configured MID Server IP Ranges.

**Note:** To use credential-less Discovery for Service Mapping, install Nmap on all MID Servers that can access the Discovery schedule’s configured MID Server IP ranges.

Role required: agent_admin

The Discovery - IP Based (com.snc.discovery.ip_based) plugin provides connection to the installer for Nmap and the programming elements that allow a Windows MID Server to run approved scripts on target CIs for credential-less Discovery. MID Servers on which Nmap is installed can execute an Nmap command configured to perform reverse DNS name resolution, discover MAC addresses, or gather OS information on target CIs without using credentials. The Discovery - IP Based plugin is activated automatically when the Discovery (com.snc.discovery) or Event Management and Service Mapping Core (com.snc.service-watch) plugins are activated.

**Service Mapping and Nmap**

Service Mapping does not check for the presence of the Nmap capability and selects the MID Server based on the IP address only. To ensure that Service Mapping does not select a MID Server without the Nmap capability, install Nmap on all MID Servers assigned to the IP address ranges for which you want credential-less Discovery to be available. If Service Mapping selects a MID Server for credential-less Discovery that does not have Nmap capabilities, this error message appears in the map at the site of the CI being discovered: Nmap is not installed on MID Server. Verify all MIDs configured to handle selected IP Address have Nmap Capability. Nmap root directory path does not exist: <path>

**Amazon Web Service AWS**

Running Nmap scans to or from any resource within the Amazon Web Service AWS environment is tightly regulated and requires the permission of AWS through the AWS Vulnerability/Penetration Testing Request form. AWS only permits testing of EC2 and RDS instances that you own. Tests against any other AWS services or AWS-owned resources are prohibited. In addition, any Nmap scan of a permitted instance must be performed within an approved time window. For these reasons, credential-less Discovery within an AWS environment is not appropriate, and if a violation of their policy occurs, could result in expulsion from the service.

**Supported operating systems**

Nmap is supported on all editions of these operating systems, including virtual machines and 64 bit systems:
- Windows 2008
- Windows 2012
- Windows 2016

**MID Server requirements**
Nmap can be installed on MID Servers that meet these requirements:

- Status is Up.
- MID Server is validated.
- MID Server does not already have the Nmap capability.

**Warning:** The MID Server installation path must not contain the following characters:
- ( )
- {}
- [

The Nmap installer replaces these characters with spaces. This prevents the installer from finding the correct path, and the installation fails. An example of a path that will fail is `C:\MIDServers\MID(1)\agent`.

1. Navigate to **MID Server > Servers**.
2. Open the desired MID Server record.
3. Under **Related Links**, select **Enable Credential-less Discovery**.
   A confirmation dialog box appears.

4. Click **Yes** to continue with the installation.
   The instance runs the Nmap installer from [https://install.service-now.com](https://install.service-now.com), a site within a ServiceNow datacenter that contains installers for the platform. This progress notice appears during installation:
The Logs tab in the MID Server record shows the message: Running system command: installNmap.

5. Click OK if you want to hide the dialog box while the installer continues to run in the background.

Installing Nmap also installs Npcap on the host, if it is not already installed. Npcap is Nmap's packet capture library for Windows that allows Nmap to perform port scans quickly and to identify the family of the operating system running on the target. Npcap is installed once on the host and can be used by any other application that requires it, such as Wireshark.

Note: If a more recent version of Npcap is already installed on the Windows MID Server host, Nmap is installed without Npcap. If an older version of Npcap is installed on the host, the Nmap installer upgrades it to the newer version.

The installation process has either of these outcomes:

- **Success**: These conditions indicate a successful installation:
  - The version of Nmap that is installed appears in the Nmap version field in the MID Server record
  - The Related Link changes to Disable Credential-less Discovery.
  - The Nmap capability is assigned to the MID Server and appears in the Capabilities tab of the MID Server record.

- **Failure**: If the installation fails, an error message is logged to the MID Server Issue (ecc_agent_issue) table. If you run the installer again with success, the issue is marked as Resolved.

6. To uninstall Nmap for a selected MID Server, select Disable Credential-less Discovery under Related Links in the MID Server record.

This dialog appears during the uninstallation process:

The Logs tab in the MID Server record shows the message: Running system command: uninstallNmap.

Attention: Because Npcap can be used by other applications, uninstalling Nmap does not automatically uninstall Npcap. You must uninstall Npcap manually, after determining that no other dependencies exist.

Install Nmap on a self-hosted system

Use this procedure to install Nmap on MID Server host machines in a self-hosted environment that does not allow network access to the ServiceNow® install.service-now.com download site.

Role required: admin, maint

You must install Nmap manually on each MID Server host, and then configure the instance to execute credential-less Discovery.
Note: This procedure does not apply to self-hosted customers whose MID Server hosts can access install.service-now.com from within their network.

1. Navigate to MID Server > Properties (MID Server Property (ecc_agent_property) table) and open the record for the mid.nmap.version property. This property contains the version of Nmap that you must install. Record the version number.

2. Download the correct installer executable from one of these URLs:
   - https://nmap.org/dist/: If the Nmap version in the property is 7.50, the executable you need is https://nmap.org/dist/nmap-7.50-setup.exe.

3. Create a folder called nmap in the MID Server agent folder of every MID Server you want to use for credential-less Discovery.

4. Copy the Nmap installer file that you downloaded to the nmap folder and rename it to nmapInstaller.exe.

5. Run the agent\scripts\PowerShell\NmapInstallation.ps1 script and pass it the following parameters in the order in which they appear.
   This script runs the nmapInstaller.exe file.
1. **$operation**: Task that NmapInstallations.ps1 will process. To install Nmap, the task is install.

2. **$nmap_root_path**: Complete path for the nmap folder that you create in step 4.

3. **$nmap_self_installer**: Complete path for nmapInstaller.exe file that you copied in step 5.

4. **$nmap_command**: Complete path for the Nmap install command. The NmapInstallations.ps1 script installs Nmap in the nmap folder created in step 4. This parameter is `$nmap_root_path
map.exe`.

5. **$nmap_uninstall_command**: Complete path for the Nmap uninstall command. This command is `$nmap_root_path\Uninstall.exe`.

6. **$nmap_npcap_version**: The Npcap version installed with Nmap. This value must be the same as the value of the mid.nmap_npcap.version property in the MID Server Property (ecc_agent_property) table.

7. **$nmap_safe_scripts**: List of safe scripts that Nmap uses. You can retrieve this list from the mid.nmap.safe.scripts property in the MID Server Property (ecc_agent_property) table.

6. Set up the parameters in the NmapInstallation.ps1 script in this order:

   ```plaintext
   .\NmapInstallations.ps1 $operation $nmap_root_path $nmap_self_installer $nmap_command $nmap_uninstall_command $nmap_npcap_version $nmap_safe_scripts
   ```

   For example, the script might look like this:

   ```powershell
   PS C:\MidServers\mid1\agent\scripts\PowerShell> .\NmapInstallations.ps1 "install"
   "C:\MidServers\mid1\agent\nmap" "C:\MidServers\mid1\agent\nmap\nmapInstaller.exe"
   "C:\MidServers\mid1\agent\nmap\nmap.exe"
   "C:\MidServers\mid1\agent\nmap\Uninstall.exe" "0.91"
   "allseeingeye-info.nse,amqp-info.nse,db2-das-info.nse,drda-info.nse,freelancer-info.nse,
   ike-version.nse,mcafee-epo-agent.nse,mqtt-subscribe.nse,openlookup-info.nse,oracle-tns-version.nse,
   quake1-info.nse,quake3-info.nse,rfc868-time.nse,rpcinfo.nse,snmp-info.nse,ventrilo-info.nse,
   weblogic-t3-info.nse,xmpp-info.nse"
   ```

7. After installation is complete, add the **Nmap** capability to each MID Server you want to use for credential-less Discovery.
Attention: Only a maint user can add the Nmap capability to a MID Server. Contact ServiceNow Technical Support to request temporary maint access to your instance.

a) On the instance, open the MID Server record.
b) Select the Capabilities related list.
c) Click Edit.
d) Select Nmap from the list of available capabilities and click Save.

Uninstall Nmap on a self-hosted system

Use this procedure to uninstall Nmap in a self-hosted environment that does not allow network access to the ServiceNow install.service-now.com download site.

Role required: admin, maint

Nmap must be manually uninstalled from each MID Server host machine and then disabled on the ServiceNow instance.

1. Run Uninstall.exe in the nmap folder on each MID Server host configured for credential-less Discovery.
2. After uninstallation is complete, delete the nmap folder from the agent folder.
3. Remove the Nmap capability from each MID Server record.

Attention: Only a maint user can remove the Nmap capability from a MID Server. Contact ServiceNow Technical Support to request temporary maint access to your instance.

a) On the instance, open the MID Server record.
b) Select the Capabilities related list.
c) Click Edit.
d) Remove Nmap from the active capabilities list and click Save.
Configure MID Server as WinRM trusted host

In environments using Windows Remote Management (WinRM), Discovery or Service Mapping can discover servers using the WinRM protocol. Add servers, which are part of WinRM, as trusted hosts on all MID Servers that Discovery or Service Mapping use for discovery.

Role required: mid_admin

Ensure that the MID Server can connect to elements inside and outside your network
Download and install the MID Server on a Linux or Windows host
Configure your MID Server
Configure MID Server security

MID Server cannot access servers using the WinRM protocol unless these servers are configured as trusted hosts for this MID Server.

Perform this procedure on each MID Server used by Service Mapping or Discovery.

1. On the MID Server, open the command-line shell.
2. To add all servers to the TrustedHosts lists, run the following command:
   ```bash
   winrm s winrm/config/client @{TrustedHosts="*"}
   ```
3. To add specific servers to the TrustedHosts list, run the command with the comma-separated hosts instead of the asterisk (*), for example:
   ```bash
   winrm s winrm/config/client @{TrustedHosts="serverA,serverB,serverC"}
   ```

MID Server domain separation

Use the MID Server user role to configure MID Servers to access separate domains. The credentials in the config.xml file of a MID Server determine which domains it can access. Specific MID Server policy records can be restricted for use only by MID Server from the same domain.
The records that can be read, updated, or created by a MID Server are determined by the credentials configured for that MID Server in the config.xml file. These are the user credentials that a MID Server uses to access the instance and specify which domain’s records that MID Server can access.

You can create versions of these specific MID Server policy records that only a MID Server from the same domain can use. This process separation is supported for records in tables that extend MID Server Synchronized Files (ecc_agent_sync_file):

- MID Server MIB File (ecc_agent_mib)
- MID Server JAR File (ecc_agent_jar)
- MID Server Script File (ecc_agent_script_files)

**Note:** Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. The attachments do not appear because the Attachments (sys_attachment) table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

---

**Set up domain separation for MID servers**

Set up domain separation through the MID server user role and the MID Server configuration file.

Role required: admin, agent_admin

1. **Configure a MID Server user** within a specified domain with the proper mid_server role.
2. Specify this user within the MID Server config.xml file. When you set the MID Server user credentials in the config.xml file, make sure they are in the proper domain.

If you must change the MID Server domain:

1. Stop the MID Server and delete the ecc_agent record.
2. Update the MID Server config.xml with the new user in the new domain and restart the MID Server service.

If you need to create versions of specific MID Server files that only MID Servers in your domain can use:
1. Open or create a record in one of these MID Server modules:
   - SNMP MIBs
   - JAR Files
   - Script Files

2. Update an existing domain policy or submit a new record.

   **Note:** Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. The attachments do not appear because the Attachments (sys_attachment) table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

Configure a multi-domain MID Server

You can create a MID Server in the global domain that can explore targets in other domains.

Before configuring a multi-domain MID Server:

- Activate the Domain Support - Domain Extensions Installer (com.glide.domain.msp_extensions.installer) plugin.
- Ensure that your instance is domain separated.

Role required: admin

1. Type `sys_properties.list` in the navigation filter and press Enter.
2. Locate the `glide.ecc.enable_multidomain_mid` property.
3. Set the value of the property to `true`.

   **Note:** Enabling this property has no effect on existing MID Servers. MID Servers in a domain prior to setting this property, remain in that domain.

4. Create a MID Server in the global domain.
   A MID Server created in the global domain after this property is set to `true` can explore any domain for which it has the credentials. However, this MID Server is restricted to trying only the credentials for the target domains requested by ECC Queue inputs.

   **Caution:** If you reset the `glide.ecc.enable_multidomain_mid` property to `false` after creating a multi-domain MID Server in the global domain, that MID Server writes all the data it receives to the global domain and not to the correct domains.

Synchronize a JAR file to MID Servers

You can upload a JAR file to an instance and synchronize it to all MID Servers, or write custom probes that use the synchronized JAR file.

Role required: admin, agent_admin
The MID Server JAR File (ecc_agent_jar) table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see Set up domain separation for MID servers.

**Caution:** Synchronizing a JAR file with this procedure causes all MID Servers connected to the instance to restart automatically.

1. Navigate to MID Server > JAR Files.
2. Click New.
3. Complete the following fields:
   - **Name:** A unique and descriptive name for identifying the file in the instance.
   - **Version:** A version number for the file, if one is available.
   - **Source:** Location of the JAR file for reference purposes. Source information is not used by the system.
   - **Description:** Short description of the JAR file and its purpose in the instance.
4. Click the paper clip icon in the banner.

5. In the Attachments dialog box, click **Browse** and select the file you want to attach.
The platform attaches the JAR file to the record and restarts the MID Servers to synchronize the file. It is not necessary to update the record to attach the file.

**vCenter event collector**

The vCenter event collector is a MID Server extension that listens for vCenter-related events and updates the CMDB accordingly.

The event collector allows the CMDB to be updated with changes to virtual machines (VMs), in addition to the updates detected by Discovery. A change to a VM is sent as an event from the vCenter server to the vCenter event collector. When an event is received, the CMDB is updated accordingly. Full vCenter Discovery does not need to rerun. For some events, such as powered on and powered off events, Discovery does not need to run again at all. For most events, Discovery runs only on the necessary vCenter resource.

For example, if a VM is turned off, the vCenter server sends the event `VmPoweredOffEvent`. The vCenter event collector receives and processes the event and the CMDB is updated to reflect that the state of the corresponding VM is set to **off**.

---

**Important:** With this extension, Discovery can only modify the state of a VM which exists in the CMDB. When an event with "CreatedEvent" occurs in its name, such as `VmCreatedEvent`, Discovery scans that VM and then creates the CI using the data it collects. When a new event occurs involving that CI, Discovery can update the existing record without launching another scan.

**Note:**

vCenter event collector supports domain separation by inheriting the domain of the specified Mid Server in the event collector context. However, it does not support multi-domain Mid Server configuration.

See [Discovery for VMware vCenter](#) for supported versions of vCenter.

---

**How vCenter events are processed**

The MID Server listens for the vCenter events configured in the vCenter Event Collector form. When one of these events is returned from vCenter, the instance parses the payload with a business rule that converts the vCenter event into a system event (sysevent). The instance then uses that sysevent to perform tasks, such as email notification.

---

**Note:** If the MID server is paused when a vCenter event occurs, the MID server still processes the event. In this case, it is possible for the event collector to display a status of **Started**.

---

The resulting sysevents contain these values:

- **Name**: Name of the system event created from the vCenter event. This value is always `automation.vcenter`.
- **Parm1**: vCenter event that was returned. This event must be associated with an event collector record.
- **Parm2**: Event data provided by vCenter, in JSON format.
Log entries for vCenter events

Supported vCenter events

The following events are the only vCenter events handled by the base system when Discovery is activated. If you have upgraded your instance from an earlier version, you might not have the default events added with later releases. To use the missing events, manually add them.

<table>

</tbody>
</table>

**Configure and run the vCenter event collector extension**

Configure the vCenter event collector extension in the MID Server module, and then add or remove supported events.

Before configuring event collectors, perform these tasks:

- Deploy and start a MID Server.
- Ensure that the MID Server has access to the vCenter.
- Run discovery on the vCenter.

Role required: agent_admin, admin

Multiple MID Servers can listen to the same vCenter instance, but each MID Server and each vCenter can have only one event collector record associated with it. Make sure you configure the events on the event collector record that specify the correct MID Server.

**Note:** You can add events to the vCenter event collector. However, not every event is supported by the base system event handlers. If you want to handle events other than those supported in the base Discovery system, you must create a script action to process the events. For instructions, see Script actions. As a reference, the instance processes the...
vCenter events in the base system with a script action called **Discovery: Process vCenter events**. Do not edit or delete this script action.

To configure the vCenter event processor extension:

1. Navigate to MID Server > Extensions > vCenter Event Collectors.
2. Click New or open an existing extension.
3. Fill in the fields, as appropriate from the table.
4. Right-click in the header bar and click Save in the context menu.

The **vCenter Event** related list appears, containing the default events that the system is configured to handle.

5. To select a different vCenter event, click Edit in the **vCenter Event** related list and browse for the event.

The slushbucket does not display all the available events in the opening list. Use the filter to browse for events not displayed.

6. Under Related Links click Start to save the events in this collection and start the collector.

The Related Links in this form work as follows:

<table>
<thead>

</tr>
</tbody>
</table>
| Status        | This field auto-populates with the status of the collector. This field is blank until the collector is started. After issuing a command to the collector, you see one of these values:  
  - Started: The collector is running.  
  - Stopped: The collector is not running.  
  - Offline: The MID Server is down.  
| Error Message | Message describing any error that causes a command, such as Start or Stop, to fail. This field only appears when the value in the Status field is Error. |
| Execute on    | Location for running this collection. The possible options are Specific MID Server or Specific MID Server Cluster. |
| MID Server    | The name of the designated MID Server if you selected Specific MID Server in the Execute on field. The name of the designated MID Server cluster if you selected Specific MID Server Cluster. If you selected the MID Server cluster option, an algorithm determines which server in the cluster runs the collector. |
| vCenter       | The IP address or hostname of the vCenter server.                          |
| Executing on  | (Read-Only) The name of the MID Server on which the collector is running. This field shows the name of the MID Server even if the MID Server is down. If the collector is stopped by the user, this field is empty. |

**SNMP trap collector extension**

The SNMP trap collector is a MID Server extension that listens for SNMP traps from the devices on your network.

Upon receiving a trap, the MID Server sends the trap to the instance for further processing by Event Management. If Event Management is not active, traps are not processed and are discarded by the instance.
For the SNMP trap collector extension to receive traps from network devices, each device must designate the MID Server that runs the SNMP trap collector extension as a recipient of the trap. See the documentation for the network device to configure your hardware to do this. Generally, the SNMP trap collector extension should run on only one MID Server per VLAN. Multiple MID Server recipients on the same VLAN causes duplicate data in the CMDB. If network devices are separated by VLANs, multiple MID Servers may have trap collectors installed.

To configure multiple SNMP trap collector extensions, configure each in a separate record, with a unique name, and a designated MID Server.

**Configure the SNMP Trap Collector Extension**

For the SNMP trap collector extension to receive traps from network devices, each device must designate the MID Server that runs the SNMP trap collector extension as a recipient of the trap.

Role required: admin

1. Navigate to **MID Server > Extensions. > MID SNMP Trap Listener**
2. Click New or open an existing extension.
3. Fill in the fields from the table, as appropriate.
4. Click Submit or Update.

<table>
<thead>
<tr>
<th>Field name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for this SNMP trap collector extension for easy identification.</td>
</tr>
<tr>
<td>Short description</td>
<td>A description of the MID Server extension, if more description than the Name is necessary.</td>
</tr>
<tr>
<td>Extension</td>
<td>(Read-Only) The extension type is automatically set to TrapExtension.</td>
</tr>
</tbody>
</table>
### Field Name | Description
--- | ---
**UDP port** | The port number that your network hardware uses when sending a trap to the designated MID Server. Port numbers 1024 and above are recommended. Port numbers 1023 and lower may be system reserved and can result in access violations for MID Servers that are not running with administrative credentials.

**Status** | (Read-Only) The status of the trap collector extension. This field is blank until the extension is run. After it is run, the value may be:
- **Started**: The extension is running.
- **Stopped**: The extension is not running.
- **Offline**: The MID Server is down.
- **Error**: The extension failed with an error.

**Execute on** | The location for running this extension: a Specific MID Server or a Specific MID Server Cluster. The recommended setting is Specific MID Server. Network hardware typically has to be configured to send to a specific IP address. If the listener moved to a different MID Server in the cluster, the trap would not be received.

**MID Server** | The name of the designated MID Server if you selected Specific MID Server in the Execute on field. The name of the designated MID Server cluster if you selected Specific MID Server Cluster in the Execute on field. If you selected Specific MID Server Cluster, a ServiceNow algorithm determines which server in the cluster runs the extension.

**Executing on** | (Read-Only) The name of the MID Server on which the extension is running. This field shows the name of the MID Server even if the MID Server is down. If the extension is stopped by the user, this field is empty.

### Related Links
In Related Links, run any of the following actions against the SNMP trap collector extension:

| Related Link | Description |
--- | ---
**Start** | Starts the extension if it is currently not running. The extension is started on the configured MID Server and port number. |
**Stop** | Stops the running extension on the configured MID Server. No action is taken if the extension is not running. |
**Restart** | Stops, then starts the extension on the configured MID Server and port number. |
**Test** | Verifies that the configured MID Server can run the SNMP trap collector extension on the specified port. Running a test does not affect any extensions that are currently running. |

### Securing and encrypting MID Server data

After configuring your MID Server, you can add security by encrypting MID Server parameter values in the *config.xml* file. Encryption protects data that the MID Server returns to the ECC Queue. Other available security options include the authorization of SOAP requests, restricting access to the MID Server configuration file, and establishing secure socket layer (SSL) connections.

### How MID Server password encryption works

The *username* and *password* are initially set in the *config.xml* file on the MID Server. When the MID Server retrieves the credentials, it replaces the clear-text password with an encrypted password automatically, using an AES128 encryption algorithm. In continued efforts to improve MID Server security, the encryption algorithm has been enhanced. The MID Server also maintains an encryption key that is generated each time it starts and remains in memory and not on the hard disk. When credentials need to be sent from the instance to the MID Server, the following process takes place:

1. The instance retrieves the encrypted *password* and the unencrypted *username* from the instance database table.
2. The instance decrypts the encrypted *password*, and then re-encrypts it using the MID Server encryption key.
3. The **username** and re-encrypted **password** are sent to the MID Server through the encrypted TLS session was already established between the MID server and the instance.

4. The MID Server receives the credentials and decrypts the **password** in memory before using the credentials for remote operations. At no point is the credential password stored on the disk in an unencrypted format.

**Note:** In the Orlando release, the MID Server requires a minimum JRE version 1.8.0_161, and recommended version 1.8.0_181. If you are using a lower version than 1.8.0_161, you may see encryption related issues.

**Security options**

The MID Server provides built-in security options for other content in the configuration file, such as the default encryptor, Windows Data Protection API, and options for custom encryption.

*Encrypt or decrypt MID Server configuration file values*

You can encrypt and decrypt any value in the MID Server `config.xml` file.

*ECC queue data encryption with the automation API*

Use the automation API to encrypt sensitive probe data that is sent from an instance to the MID Server through the ECC Queue.

*MID Server configuration file security*

Protect sensitive MID Server configuration data in the `config.xml` file using internal and external data encryption and external data storage.

*Rekey a MID Server*

Rekey a MID Server to force it to restart and generate a new private key. Typically, this process is only necessary if the MID Server keystore is compromised.

*Add SSL certificates for the MID Server*

Add certificates to the MID Server to communicate over SSL.

*MID Server authentication credentials and SOAP requests*

For added security, enforce basic authentication on each incoming SOAP request to the MID Server.

*Attach a script file to a file synchronized MID Server*

Attach a script file and synchronize it to a MID Server to prevent Windows enhanced security from blocking MID Server download files it determines are dangerous.

**Encrypt or decrypt MID Server configuration file values**

The value of any MID Server parameter in the `config.xml` file can be encrypted. The attributes for all encrypted values are managed from within the configuration file, including the security attribute of the login password.

Role required: admin
1. Navigate to the `agent` directory that was created when the MID Server was installed and open the `config.xml` file using a text editor such as WordPad.

2. Locate or add the parameter you want to encrypt.

   For example, you might want to protect your proxy server passwords by configuring this parameter:

   ```xml
   <parameter name="mid.proxy.password" value="securepassw0rd"/>
   ```

3. Add the encryption attribute `secure="true"`.

   ```xml
   <parameter name="mid.proxy.password" secure="true" value="securepassw0rd"/>
   ```

4. Restart the MID Server.

5. Open the `config.xml` file

   The encrypted password appears as follows:

   ```xml
   <parameter name="mid.proxy.password" secure="true" value="encrypted:rhrfUNYrZAI8/BkTtZmNAs=="/>
   ```

6. To decrypt this or any other value in the `config.xml` file and display the value in clear text:
   a) Stop the MID Server.
   b) Set the `secure="true"` attribute to `false`.
   c) Replace the encrypted value with the clear text value.
   d) Restart the MID Server.
ECC queue data encryption with the automation API

The automation API encrypts sensitive probe data that is sent from an instance to the MID Server through the ECC Queue.

You can use the automation API to encrypt data that you send from a custom application to the ECC queue and prevent that data from appearing in clear text. For example, you can encrypt a password used by a MID Server to authenticate on a REST endpoint.

Methods

The API provides these methods:

- `encrypt()`
- `isEncrypted()`

The following example shows how you might call these methods:

```javascript
var automation_api = new sn_automation.AutomationAPI();
var password = 'xyz';
var encrypted_password;
if (automation_api.isEncrypted(password))
    encrypted_password = password;
else
    encrypted_password = automation_api.encrypt(password);
```

The `encrypted_password` value can then be passed safely to the ECC Queue and on to the desired MID Server.

MID Server configuration file security

Sensitive MID Server configuration data can be protected using several different schemes, including internal and external data encryption and external data storage.
The MID Server provides the following built-in security options for content in the `config.xml` file:

- **Default security provider**: Secures the data in the `config.xml` file by encryption. When the MID Server is restarted, any unencrypted data is encrypted and written to the `config.xml` file. The default security provider offers these encryption options:
  - **Default encryptor**: Default process for encrypting data in the MID Server `config.xml` file. See [Encrypt or decrypt MID Server configuration file values](#) for details.
  - **Windows Data Protection API (DPAPI)**: The operating system performs the data encryption, rather than the MID Server. DPAPI encryption is based on the logged in user’s account. When this scheme is used, the data can only be decrypted by the same user account. If the account changes, the data must be re-encrypted.
  - **Custom encryption**: Implement the `IMidServerEncrypter` interface to create your own custom encryption scheme to manage sensitive `config.xml` data.

- **CyberArk**: Data security is provided by CyberArk's Privileged Account Security system, which moves sensitive data from the `config.xml` file to a secure CyberArk vault. This solution does not encrypt the data.

- **Custom external storage**: Implement the `ISecuredConfigProvider` interface to create your own custom external storage system to manage sensitive `config.xml` data.
Encrypt MID Server configuration data with DPAPI

Windows Data Protection API (DPAPI) encrypts sensitive data from the `config.xml` file, based on the MID Server user account.

Role required: admin

DPAPI encryption provides another level of security for data such as credentials, IP addresses, and URLs in the MID Server `config.xml` file. The operating system performs the data encryption, rather than the MID Server. DPAPI encryption is based on the logged in user's account. When this scheme is used, the data can only be decrypted by the same user account. If the account changes, the data must be re-encrypted.

1. Open the `config.xml` file in a text editor. This file is located in the `/agent` folder in your MID Server installation path.
2. Enable this parameter and value:
   ```xml
   <parameter name="mid.secure_encrypter" value="com.service_now.mid.services.config.WindowsDPAPIEncrypter"/>
   ```
3. Save the configuration file.
4. Restart the MID Server.

Any values in clear text in the config.xml file are encrypted by the operating system.

5. Follow this procedure if you need to change the MID Server user account that is used for encryption.
   a) Stop the MID Server service.
   b) Open the config.xml file in a text editor.
      This file is located in the /agent folder in your MID Server installation path.
   c) Re-enter all the encrypted values in clear text.
   d) Make the changes to the MID Server user account in the ServiceNow® instance.
   e) Restart the MID Server service.
      The data is re-encrypted by the operating system, based on the new MID Server user account.

Use CyberArk as a secure configuration provider

You can use a CyberArk vault to secure any sensitive data from the MID Server config.xml file.

Role required: admin

CyberArk is commonly used to secure credentials in its external vault. However, a MID Server parameter in the config.xml file enables you to store other types of data in CyberArk.

1. Open the config.xml file in a text editor.
   This file is located in the /agent folder in your MID Server installation path.
2. Enable this parameter and value:
   <parameter name="mid.secure_config.provider"
   value="com.service_now.mid.services.config.CyberArkSecuredConfigProvider"/>
3. Configure specific data to secure in the CyberArk vault, as shown in these examples.
   a) Secure the MID Server credentials by setting this parameter to match the ID and Type for that data in your CyberArk configuration.

   <parameter name="mid.instance.username" secure="true" value="cyberark:
   id=<CyberArk ID>, type=<CyberArk type>"/>
   <parameter name="mid.instance.password" secure="true" value="cyberark:
   id=<CyberArk ID>, type=<CyberArk type>"/>

   b) Secure the URL of the instance by setting this parameter to match the ID and Type for that data in your CyberArk configuration.

   <parameter name="url" secure="true" value="cyberark:
   id=<CyberArk ID>, type=<CyberArk type>"/>

4. Save the configuration file.
5. Restart the MID Server.

Change MID Server configuration file security schemes

The MID Server provides several schemes for securing sensitive data in the config.xml file and allows you to switch between these options to suit your security requirements.
Role required: admin

1. Stop the MID Server service.
2. Open the `config.xml` file in a text editor.
   This file is located in the `/agent` folder in your MID Server installation path.
3. Re-enter all the encrypted values in clear text.
4. Disable the previous security scheme and configure the MID Server to use the new provider.
5. Restart the MID Server service.
   The data is re-secured or encrypted, based on the security scheme you have selected.

MID Server `ISecuredConfigProvider` interface

Use the methods in this interface to create custom providers that manage secured parameter values in the MID Server `config.xml` file.

**Note:** These methods are contained in the `snc-automation-api.jar` file, located in the MID Server installation folder.

**initialize**

This method initializes the provider with additional configuration parameters and does not return a value.

**Example**

```java
void initialize(java.util.Properties properties,
               IMidServerEncrypter encrypter)
throws java.lang.Exception
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>Initialization properties.</td>
</tr>
<tr>
<td>encrypter</td>
<td>Encrypter to use if the provider is encryption based.</td>
</tr>
</tbody>
</table>

**Exception**

`java.lang.Exception`

**isParameterValueSecured**

This method checks to see if the parameter value has been secured or not. This method returns a `boolean` type value.
Example

```java
boolean isParameterValueSecured(java.lang.String paramValue)
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>paramValue</td>
<td>The parameter value.</td>
</tr>
</tbody>
</table>

**Returns**

The parameter returns `true` if the parameter value is secured.

**secureParameterValue**

This method secures the parameter value if it has not been secured. This method returns a `string` type value.

Example

```java
java.lang.String secureParameterValue(java.lang.String unsecuredParameterValue) throws java.lang.Exception
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unsecuredParameterValue</td>
<td>The unsecured parameter value.</td>
</tr>
</tbody>
</table>

**Returns**

This method returns the unsecured parameter value.

**Exception**

```java
java.lang.Exception
```

**unsecuredParameterValue**

This method returns the unsecured value of the parameter. This method returns a `string` type value.
Example

java.lang.String unsecuredParameterValue(java.lang.String parameterName)

throws java.lang.Exception

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameterName</td>
<td>The parameter name.</td>
</tr>
</tbody>
</table>

Returns

This parameter returns the unsecured value.

Exception

java.lang.Exception

MID Server IMidServerEncrypter interface

Use the methods in this interface to create a custom external encrypter for the MID Server config.xml file.

ℹ️ Note: These methods are contained in the snc-automation-api.jar file, located in the MID Server installation folder.

initialize

This method initializes the encrypter with additional configuration parameters and does not return a value.

Example

void initialize(java.util.Properties properties)

throws java.lang.Exception

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>Initialization properties.</td>
</tr>
</tbody>
</table>
encrypt

This method encrypts the unencrypted data and returns a `byte()` type value.

Example

```java
byte[] encrypt(byte[] unencryptedData)
  throws java.lang.Exception
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unencryptedData</td>
<td>The data unencrypted.</td>
</tr>
</tbody>
</table>

Returns

Encrypted data

Exception

```
java.lang.Exception
```

decrypt

This method decrypts encrypted data and returns a `byte()` type value.

Example

```java
byte[] decrypt(byte[] encryptedData)
  throws java.lang.Exception
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>encryptedData</td>
<td>The data decrypted.</td>
</tr>
</tbody>
</table>
Returns

Decrypted data.

Exception

java.lang.Exception

Rekey a MID Server

Rekey a MID Server to generate a new private key. Private keys are used to decrypt automation credentials, so that MID Servers can transmit information securely. Key pairs are initially generated when a MID Server is validated, and MID Servers should be rekeyed periodically to meet security requirements.

Role required: admin

When the MID Server comes back online, the system automatically validates the new key, and the MID Server resumes processing automation tasks.

Automation credentials are secured by encrypting them in the instance with the MID Server’s trusted public key prior to transmission. When the MID Server is created, it generates a keypair, consisting of a public and private key. After the MID Server is validated, it can use the private key to decrypt automation credentials. You should occasionally rekey the MID Server to meet your organizations security requirements.

1. Navigate to MID Server > Servers.
2. Open the MID Server whose keypairs you want to rotate.
Add SSL certificates for the MID Server

Configure the MID Server to connect to a source over SSL.

Role required: admin

You can add certificates to the MID Server if you want communication to occur over SSL. You can add these certificates to the cacerts keystore file:

- Signing Certificate Authority (CA) certificate
- MID Server certificate

1. Open a command prompt and navigate to the folder containing the JRE keytool. This is the location of the JRE you installed. An example path might be: `C:\Program Files\Java\jre1.8.0_161\bin`

2. Import a certificate into the MID Server’s cacerts keystore, using this command:
   `keytool -import -alias <certificate alias> -file "<path to certificate>" -keystore "<path to the JRE>\lib\security\cacerts"

   For example, you might enter: `keytool -import -alias MyCA -file "C:\myca.cer" -keystore "C:\Program Files\Java\jre1.8.0_161\lib\security\cacerts"

   **Note:** The keytool prompts you for a certificate password. If the certificate is for a CA, the keytool also asks whether to trust the certificate authority. To add a certificate to an instance, see Upload a certificate to an instance.

MID Server authentication credentials and SOAP requests

Set basic authentication credentials to update the web service invocation data. For added security, you can enforce basic authentication on each incoming SOAP request to the MID Server.
Basic authentication credentials and SOAP requests

You can enforce basic authentication on each request. The MID Server is not able to communicate through a proxy server if the proxy server supports only NTLM authentication. You can use basic authentication with a proxy server or create an exception for the MID server host.

Supplying basic authentication information, regardless of whether it is required, has an added advantage. The web service invocation creates or updates data using the supplied credentials. For example, when you create an incident record, the journal fields have the user id of the basic authenticated user instead of the default Guest user. This behavior allows you to identify data added by a specific MID Server.

You can set basic authentication credentials for SOAP requests. Each SOAP request contains an Authorization header as specified in the Basic Authentication protocol.

**Note:** The setting for enforcing strict security controls how the instance uses the credentials you provide for the MID Server. When the setting is enabled, you must provide a user ID with access to the tables the MID Server is trying to access. When the setting is disabled, any valid user ID allows the MID Server to access to all tables.

**Note:** To learn more about properties that affect SOAP request processing, see Basic auth: SOAP requests in Instance Security Hardening Settings.

Require basic authorization for incoming SOAP requests

Enforce basic authentication on each incoming SOAP request to the MID Server.

Role required: admin

1. Navigate to System Properties > Web Services.
2. Select the check box for Require basic authorization for incoming SOAP requests.
3. Click Save.
4. To provide basic authentication credentials for a MID Server, navigate to C:\Program Files \ServiceNow\<MID Server name>\agent and edit the config.xml file, as follows:
a) Find the element `<parameter name="mid.instance.username" value=""/>` and enter the instance administrator user name as the value. For example, you might enter `<parameter name="mid.instance.username" value="admin"/>`.

b) Find the element `<parameter name="mid.instance.password" value=""/>` and enter the configured password for this instance as the value. For example, you might enter `<parameter name="mid.instance.password" value="abc123"/>`.

## Attach a script file to a file synchronized MID Server

You can attach a script file to synchronize to a connected MID Server. Windows Internet Explorer enhanced security blocks downloaded files that it determines are potentially dangerous. However, synchronizing the files avoids this security problem.

Role required: admin

Enhanced security in Windows browsers, such as Internet Explorer, blocks downloaded files that it determines are potentially dangerous. This would block files downloaded for use by the MID Server. You would need to unblock each file manually through the browser.

To get around this issue, use file synchronization. File synchronization requires you to proactively take script files from your instance and save them on the MID Server. The files on the instance and the MID server stay synchronized, but there is no longer any need for the MID Server to download the whole file. File synchronization also protects any updates you make in those script files from being overwritten during the upgrade of an instance.

You can attach multiple files, but the last attached file gets synchronized to the MID Server. If you delete the attachment, the script file becomes inactive, and the synchronized file is deleted from the MID Server.

1. Navigate to **MID Server > Script Files**.
2. Open the file to which you would like to attach the script file, or click New to create a new file.

3. Select Use attachment, and then click the paperclip icon to add the attachment.
   When Use attachment is checked, an attached script file overrides the script contained in the Script field. If this check box is cleared, the script in the Script field is used instead of the attachment.

   The script file attachment name must match the MID Server script file name, since the record can contain other attachments.

4. Click Update to initiate the synchronization process.
   Ensure that the file name matches the script name. If you receive the error message: File type not permitted or mime type does not match the file content, request that your administrator turn off mime type validation on attachments. The system property glide.security.file.mime_type.validation controls this setting.

Enable script file synchronization for Windows enhanced security

Windows Internet Explorer enhanced security blocks downloaded files that it determines are potentially dangerous.

Script files synchronized with the MID Server are stored on the instance in the MID Server Script File [ecc_agent_script_file] table, which you can access in the MID Server > Script Files module.

When the MID Server first connects to the instance, the instance creates a directory called \scripts in the MID Server root. The instance then creates a parent directory in the path \scripts\<parent name> using definitions from the ecc_agent_script_file table. Finally, the instance creates the script files themselves inside the parent directory using the records from the ecc_agent_script_file table.

The record for the parent directory looks like this:
The instance creates each script file in the parent directory on the MID Server using the record **Name** from the ecc_agent_script_file table as the file name and the **Script** field payload as the file contents. A script file record looks like this:
The synchronization of the script file continues to work as if the script was manually added to the form.

See [Attach a script file to a file synchronized MID Server](#) for instructions on how to attach a script file.

**Note:** The MID Server Script File (ecc_agent_script_file) table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see [Set up domain separation for MID servers](#).

**MID Server upgrades**

Upgrade MID Servers manually, or automatically through their host computers. The instance automatically tests to identify issues before MID Servers upgrade. Pin MID Servers to specific versions using system properties.

**Warning:** The MID Server cannot auto-upgrade on a Windows host if the Windows Application Experience service is disabled. For information on the error that is displayed and instructions for re-enabling this service, see [KB0597552](#).
Access to the MID Server download site

The MID Server host computer must have access to the ServiceNow download site at install.service-now.com to upgrade automatically. If you have a self-hosted ServiceNow environment that blocks access to the download site, you must import the MID Server installer package into your MID Server hosts manually. For instructions, see KB0760123 in the Self-Hosted knowledge base.

MID Server access to OCSP blocked

Firewalls and proxy configurations may block calls to the OCSP Entrust server, which prevents the MID Server from working. You may need to change your firewall permissions so the OCSP traffic to go through properly. For more information and resolutions, see the HI Knowledge Base article (KB0813636).

Upgrade methods

- **Automatic**: Allow the instance to automatically upgrade the MID Server. This functionality is available by default. Automatic upgrade occurs:
  - Every hour, when the MID Server checks with the instance to see if there is a different version available for upgrade. You cannot modify this time period.
  - When the instance is upgraded and the MID Server for that version is different than the version currently on the MID Server.
  - When the MID Server pre-upgrade test passes without an error. Any errors encountered during this automatic test prevent the upgrade from occurring until the issues are resolved. The pre-upgrade test is enabled by default, but can be disabled by adding and setting a system property.

- **Manual**: Manually start the upgrade by clicking a related link on the MID Server record. Use this method when you do not want to wait until the next hourly automatic update or if your upgrade failed and you want to force an upgrade. The MID Server automatically runs the pre-upgrade test before upgrading. Any errors encountered during this test prevent the upgrade from occurring until the issues are resolved. See Upgrade the MID Server manually for instructions.

The Upgrade state

The instance initiates the upgrade by sending the autoUpgrade system command to the MID Server. Starting with MID Servers upgrading from an Istanbul version MID Server, the MID Server Status is changed to Upgrading while the upgrade is running. The Upgrading state is similar to the Paused state. This is done to avoid potential miscommunication between the new version of the instance and the previous version of the MID Server during upgrade. For the upgrade to run, MID servers must be in the Up state and must be validated.

While in the Upgrading state, you cannot resume or restart the MID Server. However, you can perform the same actions that you can when the MID Server is in the Paused state. After a successful upgrade, the queued output is sent to the instance and the MID Server starts retrieving new commands to process. The status also changes to Up.

When the instance sends the autoUpgrade system command to the MID Server, if it is Down or Paused, or if it has not been validated, the command remains in the ECC Queue until the MID Server status changes to Up. Then the command is processed.
**Note:** If you are using an Istanbul instance but you are upgrading a pre-Istanbul MID Server to Istanbul, these upgrade states are not available. They are only available for MID Servers that are already on Istanbul.

## Failed upgrades

Failed upgrades are handled differently based on the version you are upgrading to:

- Upgrade to another major release (such as Istanbul to the next full release): the status changes to **Upgrade Failed**.
- Upgrade from a minor version within a release (such as Jakarta patch 1 to patch 2): the MID Server continues using the version it is currently running. It does not perform the upgrade and the status eventually changes to **Up**, assuming the MID Server was already functioning properly.

## Upgrading MID Servers in the Down state

If a MID Server is in the **Down** state, it cannot process the upgrade command. When the MID Server changes to **Up**, it immediately checks to see if an upgrade is necessary. If it does need to upgrade, the upgrade process starts before the MID Server processes any other commands.

## Upgrade error messages

The MID Server can display the following upgrade error messages.

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unable to refresh packages</td>
<td>Generic error when the error is not handled by a defined error message.</td>
</tr>
<tr>
<td>Failed to query instance for MID Server buildstamp</td>
<td>Instance is unavailable or there is a major version mismatch between the MID Server and the instance.</td>
</tr>
<tr>
<td>Not a valid package buildstamp</td>
<td>InstanceInfo returned an assigned buildstamp that was not in the correct format, such as a version mismatch.</td>
</tr>
<tr>
<td>Method failed (&lt;instance URL&gt;) HTTP/1.1 409 Conflict with code: 409</td>
<td>MID Server auto-upgrade request rejected when number of concurrent upgrades exceeds 2. The configured number of available semaphores for MID Server upgrades on the instance is set at 2 to prevent performance degradation.</td>
</tr>
</tbody>
</table>

**Note:** The MID Server re-sends the request every 20 seconds until it can get the semaphore.
MID Server Upgrade History

Use the MID Server Upgrade History module for troubleshooting problems with MID Server upgrades. The module contains a record of each instance upgrade. Those records provide step-by-step status details for each MID Server's upgrade process. If an error occurs, it is noted in the step and a message is dynamically generated with further details. The table cleanup job automatically deletes issues that haven't been detected for 30 days, regardless of their state. For further information, see MID Server Upgrade History.

MID Server pre-upgrade check

The instance automatically tests the MID Server’s ability to upgrade on your system prior to the actual upgrade, to identify issues that could cause a MID Server outage or require re-installation.

Each MID Server contains an AutoUpgrade monitor that compares the MID Server version with that of the instance to determine if the MID Server needs to upgrade. If the AutoUpgrade monitor discovers that the MID Server version is out of date, the monitor runs pre-upgrade validation tests for that MID Server. If an issue is detected, a message is logged to the MID Server Issue (ecc_agent_issue) table, and the upgrade is blocked. The AutoUpgrade monitor continues to run every hour, until all the tests pass. If there are no blocking issues, the MID Server downloads the appropriate upgrade package and begins the upgrade process.

Failed tests leave the MID Server in one of these states:

- **Upgrade Failed**: For upgrades to a different release family, such as from London to Madrid.
- **Up**: For upgrades within the same release family, such as an upgrade to a patch.

Errors, such as insufficient disk space for the installer or lack of connectivity to the download server, are written to both the MID Server agent log and to the MID Server Issue (ecc_agent_issue) table. These errors are published before the actual MID Server upgrade occurs and must be resolved before the upgrade can continue. You can view issues from the MID Server Issue (ecc_agent_issue) table in any of these locations:

- **MID Server Issues** related list in a MID Server record.
- **MID Server > Server Issues** navigation module.
- **MID Server Issues** gauge on the MID Server dashboard.

Pre-upgrade tests

The pre-upgrade validation tests check these requirements:

- At least 1 GB of free disk space
- Access to the download site at install.service-now.com
- Permission to execute these file operations:
  - Extract a ZIP archive to a **temp** folder.
  - Copy files from the **temp** folder to the **agent** folder.
  - Read a text file.
  - Delete the pre-upgrade contents.
- For Windows, ensure that the **Log On As** user for the Windows service is either LocalSystem or a user that is part of the local Administrator group. By default, domain administrators are added to the local Administrator group when joining a computer to a domain. If the PowerShell script that performs this test does not return the expected output, the system logs a warning to the MID Server Issue (ecc_agent_issue) table, but the test passes.
**Data provided**

When the instance encounters issues during the pre-upgrade check, it populates these fields in the MID Server Issue (ecc_agent_issue) table:

### MID Server issue fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last detected</td>
<td>Date and time the issue was last detected.</td>
</tr>
<tr>
<td>Short description</td>
<td>Contents of the generated message that specifies a possible issue with available disk space, download server access, or file permissions.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Name of the MID Server affected by a pre-upgrade test failure.</td>
</tr>
<tr>
<td>Issue source</td>
<td>The process that identified the issue. For all issues with MID Server pre-upgrade testing, the source is UpgradeCheck.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the issue. Possible states are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>New</strong>: Starting state when the instance creates the issue.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Acknowledged</strong>: State set by the administrator when they first examine the issue.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Resolved</strong>: Ending state indicating that the issue has been resolved. If the scheduled job does not encounter the issue when it runs again, the instance automatically sets the state to this value. If the issue cannot be resolved automatically, the administrator must resolve the issue and manually set the state to this value.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain for the MID Server. For all issues derived from MID Server pre-upgrade testing, the domain value is inherited from the domain of the MID Server user.</td>
</tr>
<tr>
<td>Count</td>
<td>Number of times an issue has been detected. Each time the pre-upgrade tests run and encounter the same issue, the AutoUpgrade monitor increments this field.</td>
</tr>
</tbody>
</table>

### Errors that block the upgrade

These messages describe issues detected by the pre-upgrade test and published to the MID Server Issue (ecc_agent_issue) table. Failure of any of these tests blocks the upgrade.

- **Not enough free disk space. The system reports \(<n> bytes free\):** This message is displayed when less than 1 GB of free disk space is detected on the MID Server host. This error is also written to the MID Server agent log.
• **Unable to download updates from the install server**: This message indicates that either the MID Server host does not have permission to download the installation package from install.service-now.com, or network problems prevent connection. This error is also written to the MID Server agent log.

• **Unable to extract contents of pre upgrade check zip**: This message indicates that the service account on the MID Server host does not have permission to extract the pre-upgrade ZIP archive to the temporary folder specified by the system property, `java.io.tmpdir`. On a UNIX host, the value for this property is typically `/tmp` or `/var/tmp`. On Microsoft Windows hosts, the path is `C:\WINNT\TEMP`.

• **Unable to create folder <upgrade check file path>**: This message indicates that the MID Server service account does not have permission to create the `upgradeCheck` folder for the pre-upgrade checking files in the `agent/package` path.

• **Unable to verify file permissions: <message>**: This message indicates an exception has occurred when checking file permissions, such as a file that does not exist or access failure.

• **MID Server Windows Service is not running as LocalSystem or a local Administrator**: This message warns that the Windows service is not running with the desired permissions.

**Non-blocking warnings**

These warnings are displayed in the MID Server Issue (ecc_agent_issue) table and do not prevent a Windows MID Server from upgrading:

• **WARN: Unable to parse $logOnAsUser**: This message warns that the Log On As User value for the Windows service is not in either of these expected formats:
  - user@domain.company.com
  - domain\user

• **WARN: Unable to look up Log On As user's groups**: When the instance attempts to look up the logged on user's group memberships, it executes the `net user <username>` command. The instance expects a certain output structure by the Windows service from this command and issues this warning if the expected output does not match the actual output.

These PowerShell warnings are written only to the MID Server agent log. Because PowerShell is not required to use a MID Server, these configuration issues do not prevent a Windows MID Server from upgrading. However, these warnings might indicate issues in your environment that require attention.

• **Skipping PowerShell upgrade checks since PowerShell is not usable**: PowerShell 3.0 (at a minimum) is not installed or `powershell.exe` is not available to the MID Server service user.

• **Continuing with upgrade, but the following issue was encountered during upgradeCheck: <exception message>**: This message indicates that there was an issue running the PowerShell portion of the pre-upgrade tests.

**Disabling the pre-upgrade check**

A MID Server configuration parameter called `mid.upgrade.run_precheck` is set to `true` by default, which allows the automatic pre-upgrade test to run. To disable these tests for a single MID Server, add this parameter to that MID Server's `config.xml` file and set it to `false`. To disable these tests for all MID Servers, add a new record to the MID Server Property (ecc_agent_property) table called `mid.upgrade.run_precheck`. Set the value of this property to `false` and leave the MID Server field blank.
Pinning a MID Server to a specific version

You can pin all the MID Servers in your environment to a specific version by setting a system property, or you can configure specific versions for individual MID Servers.

**Note:** Do not pin the MID Server to a specific version for a significant amount of time, especially if you upgrade the instance. Under most circumstances, let the instance determine which MID Server version to use.

Version control properties

These system properties control the version for all MID Servers:

- **mid.buildstamp:** Identifies the MID Server version with an identifier based on the date of the build. This property uses the format of **mm-dd-yyyy-hhmm**. The MID Server checks for version information hourly. If no override version is configured, the MID Server looks at the **mid.buildstamp** property for the version to use. This property resets itself to the default version (the version that matches your instance version) when the instance is restarted or upgraded, so any user changes are lost at that time. The system appends the release name and patch information to the date and time format.

  **Caution:** This property is not visible by default and should not be configured.

- **mid.version.override:** Sets an override condition for the current version for all MID Servers in your environment. This action pins the MID Servers to a single version and disables the automatic upgrade feature. This property is not visible in the base system and must be added to the System Property (sys_properties) table when it is set. For details, see [Add a system property](#).

  When the MID Servers check the version each hour, they look at the **mid.version.override** property first. If this property is empty, the MID Servers get their version information from the **mid.buildstamp** property. If an override version is configured, the MID Servers use this value and ignore the version information in the **mid.buildstamp** property. This override value remains when the instance is restarted and is passed to the MID Servers.

  **Attention:** The value in the **mid.version.override** property is cleared during an upgrade, which forces the MID Server to reset itself to the version in the **mid.buildstamp** property.

Version control configuration parameter

To pin specific MID Servers on a desired version, set the **mid.pinned.version** parameter with the name of that version in the **config.xml** file of each MID Server. Use the format **<version>-mm-dd-yyyy**. This setting overrides the property setting for the pinned MID Server version. For instructions, see [Add a MID Server parameter](#).

**Note:** The value set in this parameter is not affected by an upgrade.

Upgrade the MID Server manually

You can manually upgrade MID Servers at any time if you do not want to wait for the automatic upgrade.

Role required: mid_server or admin
For the upgrade to run, MID servers must be in the **Up** state and must be **validated**. The MID Server automatically runs the **pre-upgrade test** before upgrading. Any errors encountered during this test must be resolved for the upgrade to proceed.

The MID Server is upgraded to the version specified by build stamp on the instance, or by the **upgrade property** that you specify.

1. **Navigate to** Discovery > MID Servers or Orchestration > MID Server Configuration > MID Servers.
2. **Open the record of the MID Server** that you want to upgrade.
3. **Click Upgrade MID under Related Links.**
4. **Confirm that you want to perform the upgrade.**

## Resolving MID Server issues

Troubleshoot problems with the MID Server to find solutions. Monitor the MID Server to receive alerts about issues as they occur. Troubleshooting procedures exist to resolve specific problems with the MID Server. The Knowledge Base on Hi contains several articles to help you troubleshoot MID Server issues.

## Monitor the MID Server

Monitoring a MID Server involves verifying entries in log files, confirming network connectivity, and checking MID server status.

- If the MID Server is on a Windows host, navigate to the Windows Services console, locate the service name that matches the name that appears from the wrapper-override.conf file. If the MID Server process is the only Java process running on the host, monitor the memory used by java.exe and alert on less than the maximum configured memory defined in the `~\agent\conf\wrapper-override.conf` folder.
- Ensure that the `agent0.log.0.lck` file appears in the `~\agent\logs` folder to confirm that the MID Server running and logging system activity in the `agent0.log.0` file.
- Review the following logs for warning, critical, and severe errors: `~\agent\logs\agent0.log.0` `~\agent\logs\wrapper.txt` See [Manage ECC Queue content for a MID Server](#) to see how to open log entries from the instance.
- **Test MID Server connectivity** to confirm that the MID Server host is able to communicate with the instance. Resolve any issues with the network connectivity such as conflicts with firewalls, access control lists, and routing errors.
- From the MID Server instance, navigate to the MID Servers page, and review the status of the MID Server. For additional information, click a Name.
- Set up email, SMS, and push notifications to alert you when issues occur with MID servers. The MID Server Down notification is enabled by default. See [Notifications](#) for details.

## Troubleshooting procedures

The following procedures provide information on resolving specific problems with the MID Server. Knowledge Base articles also cover a wide range of issues. If you are encountering problems which are not covered in these procedures, search the Knowledge Base for related articles. For instance, if you are experiencing symptoms such as the MID Server going down or not responding,
or CIs being duplicated during discovery, see KB0597571 for information and recommended solutions.

**MID Server active issues**

The ServiceNow® instance has a dedicated table that publishes active issues with MID Servers and alerts administrators when a MID Server is in danger of exceeding its resources.

**Active MID Server post-cloning credential issues**

The system provides automatic processes to detect and notify you of possible MID Server credential issues after instance cloning.

**MID Server resource threshold alerts**

The instance displays warnings when a MID Server breaches its resource thresholds for CPU and JVM memory usage, enabling users to create email notifications or custom scripts when a breach occurs.

**MID Server user connectivity issues**

The instance writes issues involving MID Server user logins and network connectivity to the MID Server Issue (ecc_agent_issue) table and creates events you can use in custom scripts or to send email notifications.

**Interpreting MID Server user debugging output**

Debugging output from the system log is available in either a summary or detailed view for MID Server user issues, but must be enabled manually.

**MID Server Upgrade History**

Use this module to troubleshoot errors that occur during the MID Server upgrade process. The MID Server Upgrade Histories table contains a record of each instance upgrade. The MID Server Upgrade Stages table shows the status of each MID Server and its upgrade progress, including any errors encountered.

**MID Server active issues**

The ServiceNow® instance has a dedicated table that publishes active issues with MID Servers and alerts administrators when a MID Server is in danger of exceeding its resources.

The MID Server Issue (ecc_agent_issue) table displays a number of common issues that a MID Server can experience, as they occur. Error checking processes attempt to pinpoint the most likely cause of the issue. Informative error messages name the affected MID Server and explain the possible cause of the issue. The ecc_agent_issue table retains its records for 30 days.

To access records in this table, navigate to **MID Server > Server Issues**.

Supported MID Server active issues:

- Bad user credentials after instance cloning.
- Unsupported Java Runtime Environment (JRE) on the MID Server host.
- Approaching resource thresholds for CPU usage and JVM memory.
- Errors detected during pre-upgrade testing.
- User authentication and authorization failures.
- Network connectivity interruptions and role configuration errors.
Example MID Server Issue record

**MID Server fails to start**

When a newly installed MID Server fails to start or shuts down prematurely, improper configuration could be to blame.

**Duplicate MID Server names**

When the MID Server service starts, it verifies that it is the only active (not down) MID Server with that name. If the MID Server discovers another active MID Server with the same name, the starting MID Server waits 5 minutes and sends another query. The MID Server repeats this query three times and logs each attempt in the agent log. If the MID Server still detects a duplicate after this cycle, it creates a record in the *MID Server Issue (ecc_agent_issue)* table and shuts down.
Note: The record in the MID Server Issue (ecc_agent_issue) table cannot be resolved automatically by the instance. Close this record manually for accounting purposes. Either mark the issue Resolved or delete it.

Upgraded MID Servers running multiple services

Beginning with the New York release, a batch file in the MID Server installer package ensures that only one Windows MID Server service is configured for an executable path (MID Server installation folder). Previous versions have not checked for this configuration. Upgraded MID Servers that run multiple services with the same executable path are prevented from starting. If you experience this issue, follow this procedure to reconfigure the MID Server to use only one service:

1. Delete the unwanted Windows service by running `sc.exe delete <service name>` from the command line.
2. Open the wrapper-override.conf file in the MID Server installation folder.
3. Change the wrapper.name and wrapper.displayname parameters to the service name that you want to keep.
4. Restart the MID Server.

Active MID Server post-cloning credential issues

The system provides automatic processes to detect and notify you of possible MID Server credential issues after instance cloning.

During an instance clone, the MID Server (ecc_agent) table is not copied from the source instance, but the User (sys_user) table is copied. As a result, the source MID Server user credentials copied into the target instance might not match those used by the existing set of MID Servers used by the target. Bad credentials can cause those MID Servers to be down for the target instance. Processes on the instance notify you if a MID Server is down from suspected bad credentials following an instance clone.

Table for post-cloning credential issues

The MID Server Issue (ecc_agent_issue) table stores active MID Server issues after an instance clone. Records in this table show a MID Server’s current state, evaluation times, and the Issue source. For cases in which a MID Server for a cloned instance is down because of possible bad credentials, the Issue source is InstanceClone. Data from the MID Server Issue (ecc_agent_issue) table are displayed in a related list on a MID Server record. Records in this table are removed if they have not been detected for 30 days. Ongoing issues reappear as they occur.

Post-cloning cleanup script and scheduled jobs

A cleanup script called Bad MID Server credentials after clone runs on the target instance after cloning and calls a script included called BadMIDCredentialAfterClone. This script includes schedules the execution of the following jobs on the Schedule Item (sys_trigger) table:

- BadMIDCredentialAfterClone-1: Runs 15 minutes after clone execution.
- BadMIDCredentialAfterClone-2: Runs 75 minutes after clone execution.
These jobs log to the MID Server Issue (ecc_agent_issue) table any MID Servers that existed on the target instance prior to the clone that are in the **Down** state. These MID Servers are not ready for normal processing and might be down due to invalid credentials resulting from the cloning process. The state of MID Servers added to the target instance after the clone is not evaluated.

**Note:** The MID Server log shows that the MID Server user associated with the target instance could not be authenticated or was missing the proper role.

### Business rule that checks for bad credentials

The **Check for bad MID credential after clone** business rule monitors the MID Server (ecc_agent) table for MID Servers that are transitioning from **Down** to **Up**. If the business rule finds a MID Server making that transition, the rule attempts to find a matching MID Server in the MID Server Issue (ecc_agent_issue) table that has an issue source of **InstanceClone** and a state other than **Resolved**. If a match is found, the business rule updates the state of the MID Server in the (ecc_agent_issue) table to **Resolved**.

### Resolving MID Server issues

The error message in the MID Server Issue (ecc_agent_issue) table names the affected MID Server user. This message appears each time the business rule runs and finds a MID Server that is down from suspected bad credentials: MID Server not operational (status: Down), possibly due to recent clone. Verify credentials for logged in User 'local-midserver'.

Attempt to resolve the issue first by comparing the user's credentials with the credentials that the affected MID Server is expecting. If the credentials are incorrect, fix the problem and check the MID Server status again. If the credentials are correct, but the MID Server remains down, check the Knowledge Base for other possible causes.

### MID Server resource threshold alerts

The instance displays warnings when a MID Server breaches its resource thresholds for CPU and JVM memory usage, enabling users to create email notifications or custom scripts when a breach occurs.

The MID Server Issue (ecc_agent_issue) table warns users when a MID Server exceeds configured thresholds of its allocated CPU and memory resources. These warnings are published before the MID Server experiences performance degradation or an out-of-memory error, enabling the administrator to increase resources and avoid downtime. Administrators can use a registered event to send email notification to selected recipients, advising them of any threshold breaches, or to create a custom script to do some other type of work. The instance continues to update the MID Server Issue (ecc_agent_issue) table to keep unresolved issues current.

By default, CPU and memory threshold alerts are disabled and no alerts are published to the MID Server Issue (ecc_agent_issue) table. To enable both types of alerting, add these properties to the System Property (sys_properties) table, and then set their values to **true**:

- **mid.threshold.resource.breach.enable.cpu.alerts**
- **mid.threshold.resource.breach.enable.memory.alerts**

For details on adding system properties to the platform, see [Add a property using sys_properties.list](#).
Evaluation process

This processing occurs whether or not alerting is enabled:

1. Every 10 minutes, each MID Server transmits its CPU and memory consumption metrics to the instance. The instance inserts CPU metrics into the **Mean CPU used %** field of the ECC Agent Scalar Metrics (ecc_agent_scalar_metric) table and memory metrics into the **Max memory used %** field of the ECC Agent Memory Metrics (ecc_agent_memory_metric) table.

2. After a successful insert, the following business rules run on each table, invoking a script that calls an appropriate function. Each function takes an average of the metric sets inserted into the tables, based on the configured sampling intervals.
   - **Update cpu mean on MID Server Status**: Calls the MIDResourceThresholdBreach.checkCpuUsage() script include.
   - **Update max memory on MID Server Status**: Calls the MIDResourceThresholdBreach.checkMemoryUsage script include.

Each function takes an average of the metric sets inserted into the tables, based on the configured thresholds and sampling intervals. The instance first looks at each MID Server for configuration parameters that set custom threshold values or sampling intervals for that MID Server. If no configuration parameters for these attributes are found, the instance looks in the System Properties (sys_properties) table for custom values to use. If no properties are found, the instance uses the default threshold and interval values from the code.

Note: Both the threshold percentages and the sampling intervals are configurable. See Configuring thresholds and sampling intervals for details.

Alerting process

When alerting for CPU or memory thresholds is enabled, this processing occurs:

1. If the aggregated average metric value equals or exceeds the configured percent threshold, the instance triggers the **mid.threshold.resource.breach** event. Administrators can use this event to create email notifications for threshold breach alerts or to create a custom script.

2. The instance inserts a record of the breach into the MID Server Issue (ecc_agent_issue) table with a **State** value of **New** and a **Count** of 1, and then publishes a message containing all the pertinent details of the breach. An example of this message is:**Mean CPU used % has exceeded threshold (96>=91) for a 40 minute interval span, occurring after start date 2017-01-11 14:25:19.** This message appears in the **Short description** field of the MID Server Issue form and in the event. You can copy any part of the message into your email notifications.

MID Server issue states

When the administrator first examines an issue in the MID Server Issue (ecc_agent_issue) table, the administrator can change the **State** of the issue to **Acknowledged** to indicate that the issue is being addressed. Each time the instance detects a breach, it attempts to match the breach with an existing issue. If a MID Server already has an issue record for that breach in a **State** of **New** or **Acknowledged**, the instance updates the **Last Detected** field with the current date/time and increments the **Count** field in the existing record. This prevents the creation of duplicate records in the MID Server Issue (ecc_agent_issue) table and records the number of times after the
initial incident that the breach reoccurred. The administrator can increase MID Server resources gradually and watch the effect on the Count field. When the counter stops incrementing, the administrator knows that the MID Server has adequate resources. When the MID Server resource have been adjusted appropriately, the administrator sets the State to Resolved. If a new threshold breach is logged that matches a MID Server issue with a State of Resolved, the instance creates a new issue record.

**Note:** Any record in the MID Server Issue (ecc_agent_issue) table that has not been updated in 30 days is deleted, regardless of its state.

**Recommendations for resolving resource issues**

Administrators have the opportunity to resolve any resource issues with a MID Server when they receive notification of the event. Follow these recommendations for reducing the strain on MID Server resources:

- **JVM memory:**
  - Allocate more max memory to the MID Server. For more information, see [Set the MID Server JVM memory size](#).
  - Add additional MID Servers to share the workload. For more information, see [MID Server clusters](#).
  - Reduce the amount of concurrent processing for the MID Server. This includes segmenting IP Address ranges into smaller segments for a Discovery schedule or loading smaller segments of data within an import job.

- **CPU:** Reduce the activity on the host or migrate the MID Server to a new host with more available resources.
## Tables used for resource threshold evaluation

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server Issue (ecc_agent_issue)</td>
<td>Stores data on various types of MID Server issues, including breaches of configured CPU and memory thresholds. Fields used for resource threshold breaches are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>count</strong>: Number of times a previously reported threshold breach occurs, if the event is not marked <strong>Resolved</strong>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>last_detected</strong>: Current date and time a threshold breach is detected. This field is updated each time a previously detected breach is found, if it is not marked <strong>Resolved</strong>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>message</strong>: Descriptive message summarizing the conditions that triggered the threshold breach event. This message includes the actual percentage of CPU and memory calculated and the configured thresholds that were breached.</td>
</tr>
<tr>
<td></td>
<td>- <strong>mid_server</strong>: Name of the MID Server experiencing the resource threshold breach.</td>
</tr>
<tr>
<td></td>
<td>- <strong>source</strong>: The issue source for the breach. These are the possible sources:</td>
</tr>
<tr>
<td></td>
<td>- <strong>CpuMIDResourceThresholdBreach</strong>: CPU threshold issue sources.</td>
</tr>
<tr>
<td></td>
<td>- <strong>MemoryMIDResourceThresholdBreach</strong>: Memory threshold issue sources.</td>
</tr>
<tr>
<td>MID Server Status (ecc_agent_status)</td>
<td>Stores the percentages used for the CPU and memory resources, averaged over configurable intervals for each resource. The fields used are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Mean CPU used %</strong></td>
</tr>
<tr>
<td></td>
<td>- <strong>Max Memory used %</strong></td>
</tr>
<tr>
<td>ECC Agent Scalar Metric (ecc_agent_scalar_metric)</td>
<td>Stores the CPU usage data inserted by each MID Server every 10 minutes. The table field used by resource threshold alerting is <strong>mean</strong>.</td>
</tr>
<tr>
<td>ECC Agent Memory Metric (ecc_agent_memory_metric)</td>
<td>Stores the memory usage data inserted by each MID Server every 10 minutes. The table field used by resource threshold alerting is <strong>max_used_pct</strong>.</td>
</tr>
</tbody>
</table>
### Business rules that check for threshold breaches

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update cpu mean on MID Server Status</td>
<td>Runs after the MID Server inserts a record into the ECC Agent Scalar Metric (ecc_agent_scalar_metric) table. This business rule triggers the MIDResourceThresholdBreach script include function that evaluates threshold settings to determine if the MID Server has breached its configured CPU resource thresholds.</td>
</tr>
<tr>
<td>Update max memory on MID Server Status</td>
<td>Runs after the MID Server inserts a record into the ECC Agent Memory Metric (ecc_agent_memory_metric) table. This business rule triggers the MIDResourceThresholdBreach script include function that evaluates threshold settings to determine if the MID Server has breached its configured memory resource thresholds.</td>
</tr>
</tbody>
</table>

### Configuring thresholds and sampling intervals

You can use the default threshold percentages and sampling intervals or configure custom values using either of these methods:

- **Add system properties** to the instance and change the default values for all MID Servers.
- **Add configuration parameters** to change the default resource values for individual MID Servers.

The system properties and the configuration parameters use the same names.

<table>
<thead>
<tr>
<th>Property/configuration parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid.threshold.mean_cpu.aggregate_interval_span</td>
<td>Number of 10 minute units in the interval for sampling CPU usage data. The default interval is 30 minutes (3 x 10 min.)</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> 3</td>
</tr>
<tr>
<td>mid.threshold.mean_cpu.percent</td>
<td>Usage percentage of the total CPU resources that initiates a threshold breach alert.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> 95</td>
</tr>
<tr>
<td>mid.threshold.mean_max_memory.aggregate_interval_span</td>
<td>Number of 10 minute units in the interval for sampling memory usage data. The default interval is 30 minutes (3 x 10 min.)</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> 3</td>
</tr>
<tr>
<td>mid.threshold.mean_max_memory.percent</td>
<td>Usage percentage of the total memory resources that initiates a threshold breach alert.</td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> 95</td>
</tr>
</tbody>
</table>
MID Server resource reporting

The MID Server dashboard contains two reports that give you views into the consumption of CPU and JVM memory resources. These reports show usage over the previous 30 days.

- **Avg Percentage of CPU Used**: Trending the daily average on CPU usage helps illustrate the amount of CPU processing that the MID Server host consumes. MID Servers deployed on the same host will report the same CPU usage.
- **Avg Percentage of Max Memory Used**: The maximum used percentage (max_used_pct) is a useful metric for determining if the MID Server has enough memory resources. This metric is a percentage of the max used memory over the total available memory. Trending this over time provides a visualization of how much memory is needed by the MID Server.

MID Server user connectivity issues

The instance writes issues involving MID Server user logins and network connectivity to the MID Server Issue (ecc_agent_issue) table and creates events you can use in custom scripts or to send email notifications.

Records in the MID Server Issue (ecc_agent_issue) table can provide insight into why your MID Server user cannot log in or why a MID Server cannot connect to the instance. The system displays records for connectivity problems in this table that include informative error messages suggesting possible causes. By default, a scheduled job called MIDUserConnectivity runs every four hours and launches the MIDUserConnectivity script include to evaluate MID Server connection activity. Records in the MID Server Issue (ecc_agent_issue) table reflect the status of MID Server login attempts and connectivity at the time the scheduled job runs.

From the perspective of the instance, the MID Server is Down when:

- User authentication fails
- User authorization fails.
- Network issues prevent MID Server from establishing a TCP/IP connection.

Note: To associate a user with a MID Server, navigate to the servicenow/<mid_server name>/agent/config.xml file and enter the user credentials in the mid.instance.username and mid.instance.password parameters. Make sure to restart the MID Server to activate your changes.

How issues are logged

User authentication failures and authorization issues are logged automatically to the MID Server agent log file. The message for both is the same: **User cannot be authenticated or is missing the proper roles**. If the issue is related to authorization, the agent.log file shows the list of missing roles.

When debugging is enabled, MID Server issues are logged to the system log (syslog) and are available for display in either a summary or a detailed format. You can also change the sampling interval from the default 4 hours to something shorter for tracking your remediation efforts. For instructions on enabling and configuring debugging for MID Server user issues, see [Test remediation efforts for MID Server user connectivity issues](#).
Data provided

When the instance encounters user connectivity issues, it opens a record in the MID Server Issue (ecc_agent_issue) table.

Example user authentication error message

The MID Server Issue table contains these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last detected</td>
<td>Date and time the issue was last detected.</td>
</tr>
<tr>
<td>Short description</td>
<td>Contents of the generated message that specifies a possible issue with the named user or the MID Server.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MID Server</td>
<td>Empty in the Jakarta release.</td>
</tr>
<tr>
<td>Issue source</td>
<td>The process that identified the issue. For all issues with MID Server user connectivity, the source is MIDUserConnectivity.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the issue. Possible states are:</td>
</tr>
<tr>
<td></td>
<td>· New: Starting state when the instance creates the issue.</td>
</tr>
<tr>
<td></td>
<td>· Acknowledged: State set when the administrator first examines the issue.</td>
</tr>
<tr>
<td></td>
<td>· Resolved: Ending state, set by the instance, indicating that the issue has been resolved. If the scheduled job does not encounter the issue when it runs again, the instance automatically sets this value.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain associated with the MID Server user account.</td>
</tr>
<tr>
<td>Count</td>
<td>Number of times an issue has been detected. Each time the scheduled job runs and encounters the same issue, it increments this field.</td>
</tr>
</tbody>
</table>

**User authentication failure**

The credentials that the instance uses to authenticate a MID Server user are configured in the MID Server Configuration Parameters (ecc_agent_config) table. If the MID Server user attempts to log into the instance with invalid credentials, the instance rejects the connection, and writes the login.failed event to the Events (sysevents) table for the user. Administrators can use this event in a custom script or in email notifications for authentication failure.

![Note: If user authentication fails, user authorization is not attempted.](image)

**User accounts associated with a MID Server**

Either of the following messages in the MID Server Issue (ecc_agent_issue) table indicate authentication failure for user accounts that are associated with a MID Server:

- Login authentication failure for User `<user name>` associated with 1 down MID Server. Check password on MID server.
- Login authentication failure for User `<user name>` associated with `<n>` down MID Servers. Check password on MID servers.

The necessary conditions for these messages to appear are:

- The Status field in the MID Servers (ecc_agent) table that is associated with the MID Server indicates that the MID Server is Down.
- The user identified in the MID Server Configuration Parameters (ecc_agent_config) table is the user that one or more MID Servers is configured to use for authentication and authorization when connecting to the instance. The record in the (ecc_agent_config) table must have these values:
- Parameter name (param_name) field set to `mid.instance.username`.
- Value (value) field set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.

- The Events (sysevent) table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The record created in the (sysevent) table contains these field values:
  - Event Name (name) field is set to `login.failed`.
  - Parm1 (parm1) field is set to the user’s name.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

**User accounts with the mid-server role not associated with a MID Server**

The following message appears when a user with the mid_server role who is not associated with a MID Server fails to authenticate: **Login authentication failure for User <user name> with mid_server role not associated with a MID Server.**

The necessary conditions for this message to appear are:

- The User Roles (sys_user_has_role) table contains a record linking the sys_id associated with the user record stored in the (sys_user) table, with the sys_id associated with the mid_server role record stored in the (sys_user_role) table.
- The user is not identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events (sysevent) table contains posts showing that the last login attempt associated with the user failed during the scheduled time period.
  - The (sysevent) table contains a record with the Event Name (name) field set to `login.failed`.
  - The Parm1 (parm1) field is set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

**User authorization failure**

The user authorization check occurs after the MID Server has successfully authenticated on the instance. In this step, the system ensures that the user account associated with a MID Server is granted the minimum roles required. A SOAP web service called `MIDServerCheck` performs the role checking on the instance. If the MID Server user has the proper roles, the connection is allowed and a `login` event is written to the Events (sysevents) table. If the user does not have the proper roles, the instance writes a `login.authorization.failed` event to the Events (sysevents) table. This event provides a comma separated list of the user’s missing roles. Administrators can use this event in custom scripts or in email notifications for authorization failure.

Authorization can fail if a user is missing the mid_server role or any of the important SOAP roles, as in these cases:
- If the user has the soap_script role, the MIDServerCheck SOAP web service runs to check for the appropriate MID Server roles. If the user lacks the mid_server role or any of the other SOAP roles, authorization fails, and the `login.authorization.failed` event is created.

- If the user is missing the soap_script role, that user is not authorized to launch the MIDServerCheck SOAP web service, which checks for all required MID Server roles. Authorization fails, but the `login.authorization.failed` event is not created. When this occurs, the instance displays this message: Connectivity of MID Server user `<user name>` cannot be detected by the instance.

Users associated with one or more down MID Servers

Either of the following messages in the MID Server Issue (ecc_agent_issue) table indicate authorization failure for user accounts that are associated with a MID Server that is Down:

- Login authorization failure for User `<user name>` associated with 1 down MID Server. Re-assign mid_server role to grant all required roles.
- Login authorization failure for User `<user name>` associated with `<n>` down MID Servers. Re-assign mid_server role to grant all required roles.

The MIDUserConnectivity script includes identifies active users associated with one or more down MID Servers whose last login attempt within the reporting period failed user authorization. This message is generated when user authorization failures are detected and reported by the MIDServerCheck scripted web service. However, user authorization failures are not reported for users who are not assigned the soap_script role. Should this occur, problems with the user are reported by the network connectivity message.

This message appears in the MID Server Issue (ecc_agent_issue) table when:

- The user may or may not have the mid_server role.
- The user is identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events (sysevent) table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The (sysevent) table contains a record with these settings:
  - Event Name (name) field set to `login.authorization.failed`.
  - Parm1 (parm1) field set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.

  **Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

Users with the proper role not associated with a MID Server

The following message appears when a user with the mid_server role who is not associated with a MID Server fails authorization: `Login authorization failure for User `<user name>` with mid_server role not associated with a MID Server.`

This message is generated when user authorization failures are detected in which the user account, with the mid_server role, is not identified as a configured MID Server user in the (ecc_agent_config) table. It is possible that the user account was associated with a MID Server at the time of the failure.

This message appears in the MID Server Issue (ecc_agent_issue) table when:
The user has the mid_server role. The User Roles (sys_user_has_role) table has a record linking the sys_id associated with the user record stored in the (sys_user) table, with the sys_id associated with the mid_server role record stored in the (sys_user_role) table.

The user is not identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.

The Events (sys_event) table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The (sys_event) table contains a record with these settings:

- Event Name (name) field set to login.authorization.failed.
- Parm1 (parm1) field set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

### Network issues

A network issue can prevent the MID Server from connecting to the instance’s TCP/IP server to begin a session. In this case, the instance marks the MID Server as **Down**, because the instance failed to receive the MID Server heartbeat within the prescribed 5 minute interval.

**Users associated with down MID Servers who have not attempted to log in**

Either of the following messages in the MID Server Issue (ecc_agent_issue) table name users associated with MID Servers who have not attempted to log in during the reporting period:

- **User <user name> is associated with 1 down MID Server. No login attempts within reporting period.**
- **User <user name> is associated with <n> down MID Servers. No login attempts within reporting period.**

The MIDUserConnectivity script include reports active users associated with down MID Servers where network connectivity cannot be detected by the instance.

This message appears in the MID Server Issue (ecc_agent_issue) table when:

- The user may or may not have the mid_server role.
- The user is identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user which one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- There are no login attempts, either failed or successful, recorded in the Events (sys_event) table for the user during the scheduled reporting period.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

**Users not associated with MID Servers who have not attempted to log in**

The following message appears when a user with the mid_server role who is not associated with a MID Server has not attempted to login during the configured reporting interval: **User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.**
The MIDUserConnectivity script includes reports of active users with the mid_server role not associated with a MID Server, where connectivity cannot be detected by the instance.

This message appears in the MID Server Issue (ecc_agent_issue) table when:

- The user has the mid_server role. The User Roles (sys_user_has_role) table has a record linking the sys_id associated with the user record stored in the (sys_user) table, with the sys_id associated with the mid_server role record stored in the (sys_user_role) table.
- The user is not identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- There are no login attempts, either failed or successful, recorded in the Events (sysevent) table for the user during the scheduled reporting period.

**Note:** The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

**Configuration issues**

Any of the following messages, discussed above, can indicate a configuration issue:

- **Login authentication failure for User <user name> with mid_server role not associated with a MID Server.**
- **Login authorization failure for User <user name> with mid_server role not associated with a MID Server.**
- **User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.**

These are some common configuration errors:

- An administrator neglected to associate the user record with the MID Server record as shown in the MID Server Configuration Parameters (ecc_agent_config) table. This table is read-only and cannot be updated directly. To associate a user with a MID Server, configure the user name and password in the MID Server's config.xml file and restart the MID Server.
- During the process of reconfiguring a MID Server to use a different account for TCP/IP connection, the administrator has not yet removed the mid_server role from the account or deleted the account.
- A multipurpose user account was created and granted a large number of roles, including the mid_server role, although this account was never intended to be used as a MID Server account.

**User who successfully authenticates and authorizes but might not need mid_server role**

The following message appears when a user with the mid_server role who is not associated with a MID Server successfully logs in: **User <user name> with mid_server role successfully connected but not associated with a MID Server. The mid_server role should be reserved for MID Server use only.**

The MIDUserConnectivity script includes reports of active users with the mid_server role who are not identified as a configured MID Server user, and whose last login attempt was successful during the scheduled time period. This message suggests that the user’s credentials are being used by a system administrator or a process that is not running on a MID Server. The assumption here is that the mid_server role should only be used for applications deployed to a MID Server. The presence of this message reminds the system administrator to remove extraneous mid_server roles from user accounts that do not require them.

This message appears in the MID Server Issue (ecc_agent_issue) table when:
The user has the mid_server role.

The user is not identified in the MID Server Configuration Parameters (ecc_agent_config) table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.

The Events (sys_event) table contains posts showing that the last login attempt associated with the user succeeded during the scheduled time period. The (sys_event) table contains a record with these settings:

- Event Name (name) field set to login.
- Parm1 (parm1) field set to the user’s name, corresponding to the User ID (user_name) field in Users (sys_user) table.

Note: The MID Server (mid_server) field in the MID Server Issues (ecc_agent_issue) table is empty (=NULL).

Test remediation efforts for MID Server user connectivity issues

After attempting to resolve a user connectivity issue that appears in the MID Server Issue (ecc_agent_issue) table, you can test your remediation efforts without having to wait until the next scheduled reporting period by shortening the sampling interval.

Role required: admin

Reconfigure the sampling interval using this procedure and then examine the results in the MID Server Issue (ecc_agent_issue) table. You can set any time span for the sample, but you should define a window of not less than 5 minutes, since this is the default interval of the MID Server heartbeat that reports its status. The recommended method for configuring a shorter sampling interval is to copy and modify the code from the MIDUserConnectivity scheduled job, and then run it manually in the background script utility.

Caution: Avoid editing the script in the MIDUserConnectivity schedule record. If you make any change to this record, it will not be updated when you upgrade the instance.

1. Navigate to System Definition > Scheduled Jobs.
2. Open the MIDUserConnectivity scheduled job.
3. Copy this line from the Run this script field:

   MIDUserConnectivity(0).checkConnectivity(4 * (60 * 60 * 1000));

   This code sets the 4 hour sampling interval in milliseconds and turns debugging off with the MIDUserConnectivity(0) value.
4. Navigate to System Definition > Scripts - Background.
5. Paste the code from the scheduled job into the Run script field.
6. Set the sampling interval to 5 minutes by changing the time calculation to (5 * 60 *1000).

   The modified command looks like this: MIDUserConnectivity(0).checkConnectivity (5 * 60 *1000);
7. Click Run script.
8. Open the record of the MID Server that had the issue and select the MID Server Issues related list.

   The issue is updated as follows:
   - If the issue persists, the Count column is incremented, and the Last detected column shows the current date and time.
   - If the issue no longer exists, the system changes the State to Resolved.
9. Optionally, you can enable debugging by selecting a level, and then run the script again to see the breakdown for each condition evaluated. Use these settings to select a debugging level:

- For a summary view, enter `MIDUserConnectivity(1)`.
- For a detailed view, enter `MIDUserConnectivity(2)`.

For details about the type of debugging information provided, see *Interpreting MID Server user debugging output*.

**Interpreting MID Server user debugging output**

Debugging output from the system log is available in either a summary or detailed view for MID Server user issues, but must be enabled manually.

To enable debugging and display all connectivity issues in either of the available formats, you must run a method manually on your instance. For instructions on enabling debugging, see *Test remediation efforts for MID Server user connectivity issues*. For information about each error condition and how records are created in the MID Server Issue (ecc_agent_issue) table, see *MID Server user connectivity issues*.

**Available formats**

You can configure the instance to generate a simple summary of the issue or a detailed output that identifies users and MID Servers. Summaries provide a quick look at the issue conditions, by count, while the detailed view allows you to examine roles, MID Server associations, and login activity by named users.

In this summary example of an authorization issue, the instance evaluates each condition and indicates how many users met that condition. You can see that a MID Server is down and that one of two users configured for a MID Server failed authorization. Because this is a summary, neither the MID Server nor the users are named.
Authentication failure

When a MID Server user cannot authenticate on the instance, the system displays these error messages in the detailed output:

- Login authentication failure for User <user name> associated with 1 down MID Server. Check password on MID server.
- Login authentication failure for User <user name> associated with <n> down MID Servers. Check password on MID servers.
- Login authentication failure for User <user name> with mid_server role not associated with a MID Server.

In this example, three users with the mid_server role, midserver2, local-midserver, and ardis.maison, failed to authenticate. Two of these users were configured for MID Servers that were Down, and the other user was not configured for any MID Servers. Each of these users has an authentication failure and is named in the appropriate error message.

MID Server ID map

The debugging output lists all MID Servers that are marked as **Down** and maps them to their user accounts by the MID Server **sys_id**. This map includes all user accounts that have the mid_server role, whether or not they are associated with a MID Server. If there are no **Down** MID Servers, the map is not displayed in the debugging output.

The map is presented in three sections:

- User accounts not associated with any MID Servers.
- User accounts associated with **Down** MID Servers, identified by their **sys_id**.
- The **sys_id** of each **Down** MID Server, identified by name.

*** Script: Log Object: MIDUserConnectivity: userIDMIDServerMap

```javascript
Object
  ardis.maison: Object
    sys_domain: string = global
    mid_server: Array of 0 elements
  midserver2: Object

MID Server ID map

Authorization failure

If a user is missing any of the required roles, the instance generates these authorization failure messages:

- **Login authorization failure for User <user name> associated with 1 down MID Server. Re-assign mid_server role to grant all required roles.**
- **Login authorization failure for User <user name> associated with <n> down MID Servers. Re-assign mid_server role to grant all required roles.**
- **Login authorization failure for User <user name> with mid_server role not associated with a MID Server.**

In this example, three users with the mid_server role, **midserver2**, **local-midserver**, and **ardis.maison** have failed authorization. One user is not associated with any MID Server, but the other two users are. The system has logged an authorization failure, indicating that the user is missing at least one critical role. To see what roles are missing, look at the comma separated list in
the Parm2 field in the `login.authorization.failed` event record. This record is the most recent login attempt in the Event (sysevent) table for the user account within the reporting period.

  [1]: string = Login authorization failure for user local-midserver associated with 1 down M2S server. Re-assign mid_server role to grant all required roles.
  [2]: string = Login authorization failure for user ardira.maloon with mid_server role not associated with a M2S server.

  *** Script: MIDUserConnectivity: processing completed
```
Network issues

Network issues may exist for these users who are associated with MID Servers, but who have not attempted to log in during the reporting period:

- User `<user name>` is associated with 1 down MID Server. No login attempts within reporting period.
- User `<user name>` is associated with `<n>` down MID Servers. No login attempts within reporting period.

Network issues may also exist for these users who are NOT associated with MID Servers, and who have not attempted to log in during the reporting period: User `<user name>` with mid_server role is not associated with a MID Server. No login attempts within reporting period.

In this example, no login attempts have been detected for midserver2, local-midserver, and ardis.maison, all of whom have the mid_server role. Two of those users are associated with MID Servers that are marked Down. The other user is not associated with any MID Server. None of these users has attempted to log in to the system within the configured reporting interval. The system assumes that these users would make an attempt to log in unless network issues prevented them from doing so.

**Note:** By default, the sampling period is 4 hours. However, during debugging or remediation, the sampling period can be reset to a value that matches the MID Server heartbeat interval of 5 minutes, or greater.

**Users with no network activity**

**Script: Log Object: MIDUserConnectivity: doNotAutoResolveMessages**

Array of 3 elements:
- [0]: string = User midserver2 associated with 1 down MID Server. No login attempts within reporting period.
- [1]: string = User local-midserver associated with 2 down MID Servers. No login attempts within reporting period.
- [2]: string = User ardis.maison with mid_server role not associated with a MID Server. No login attempts within reporting period.

**Network issues involving these users**

**Script: MIDUserConnectivity: processing completed**
Configuration issues

Any of the following messages can indicate a user configuration issue:

- Login authentication failure for User <user name> with mid_server role not associated with a MID Server.
- Login authorization failure for User <user name> with mid_server role not associated with a MID Server.
- User <user name> with mid_server role successfully connected but not associated with a MID Server. The mid-server role should be reserved for MID Server use only.
- User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.

In this example, a user with the mid_server role has logged in successfully within the configured sampling interval. However, this user is not configured for a MID Server and might have the role in error.
Detailed debugging log for MID Server user account login

**MID Server Upgrade History**

Use this module to troubleshoot errors that occur during the MID Server upgrade process. The MID Server Upgrade Histories table contains a record of each instance upgrade. The MID Server Upgrade Stages table shows the status of each MID Server and its upgrade progress, including any errors encountered.

**MID Server Upgrade Histories**

Users with admin or agent-admin roles can find detailed information for any MID Server upgrade in the Upgrade History module for MID Server. Whenever an instance is upgraded, all MID Servers in the Up state are upgraded automatically. The Upgrade History module uses the MID Server Upgrade Histories table (ecc_agent_upgrade_history). This table shows the following information:
- The old instance version.
- The new version.
- The number of successfully upgraded MID Servers.
- The number of MID Servers with pending upgrades. MID Servers have pending upgrades if the upgrade has failed or is in progress.

**MID Server Upgrade Stages**

Select an instance record to see more details about the MID Servers upgraded with that instance. The Pending Upgrades and Complete Upgrade Details related lists use the MID Server Upgrade Stages table (ecc_agent_upgrade_history_stage). MID Servers pinned to a specific version generate an entry with a blank MID Upgrade History on the MID Server Upgrade Stages table (ecc_agent_upgrade_history_stage).

<table>
<thead>
<tr>
<th>MID Upgrade History</th>
<th>Refers to a corresponding record in the (ecc_agent_upgrade_history) table.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stage</td>
<td>Shows the progress of the MID Server through each stage of the upgrade process.</td>
</tr>
<tr>
<td>State</td>
<td>Shows the status of each stage.</td>
</tr>
<tr>
<td>Message</td>
<td>Displays dynamically generated messages about the upgrade stages, such as the file path to download directories or extract folders. It also displays information about any errors encountered, even if those errors do not block the upgrade.</td>
</tr>
</tbody>
</table>

**MID Server reference information**

MID Server reference information includes system requirements and other information you need to configure a MID Server for your specific needs.

- Ensure that the MID Server can connect to elements inside and outside your network
- Download and install the MID Server on a Linux or Windows host
- Configure your MID Server
- Configure MID Server security
- Ensure that the MID Server can connect to elements inside and outside your network
- Download and install the MID Server on a Linux or Windows host
- Configure your MID Server
- Configure MID Server security
System clones and the MID server

See KB0547597 for information on what to do with MID Servers when you are cloning your instance.

Reference topics

System requirements
Use the minimum system requirements to allocate resources for computers hosting MID Servers.

ECC Queue
Learn about the External Communication Channel (ECC) Queue, which is the connection point between the MID Server and the instance. Jobs that the MID Server needs to perform are saved in this queue until the MID Server is ready to handle them.

MID Server Dashboard
Use the reports and gauges in the MID Server dashboard to monitor ongoing operations.

MID Server properties
Use MID Server properties to control the behavior of all MID Servers or a particular MID Server.

MID Server parameters
Use MID Server parameters to control the behavior of a particular MID Server.

MID Server protected records and reserved characters
Some MID Server records cannot be altered. Certain special characters are pre-defined in XML and cannot be used in passwords.

MID Server privileged commands
To discover certain information on a host server, the MID Server must run SSH commands with higher privileges. The platform provides default privileged commands for the MID Server to use and the ability to add additional commands to the system.

MIDSystem methods
MIDSystem variables (referred to by the variable name ms.) provide a variety of methods to get information about the MID Server.

MID Server heartbeat
Configure the interval that the instance uses when it checks the "heartbeat" of MID Server. By default, the instance checks the MID Server for a response every 5 minutes.

Set JVM memory size
Modify the JVM setting for your MID Server from the default size to suit the amount of work your MID Server does in your network.

Pause the MID Server
Pause the MID Server to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

MID Server system requirements
Use these minimum system requirements to allocate resources for computers hosting MID Servers.
MID Server supported systems

Windows server

To discover Windows-based servers, run Service Mapping patterns, or execute Orchestration commands on Windows devices, the MID Server must be installed on a Windows server. The MID Server supports these Windows operating systems, including virtual machines and 64-bit systems:

- Windows Server 2008
- Windows Server 2012
- Windows Server 2016
- Windows Server 2019

**Note:** .NET Framework version 3.5, 4.0, 4.5, 4.6, or 4.7 is required for Service Mapping support and for Windows pattern-based discovery.

Linux

The MID Server is supported on these Linux versions for virtual machines and 64-bit systems:

- Linux Red Hat 6 and above
- Ubuntu 1404 (Ubuntu 14) and above
- CentOS 6 and above

**Note:** On 64-bit Linux systems, you must install the 32-bit GNU C library (`glibc`). The installation command for CentOS is: `yum install glibc.i686`.

OCSP connectivity requirements

The Online Certificate Status Protocol (OCSP) is the protocol used to determine the revocation status of SSL/TLS certificates. When certificates are exchanged and validated, the MID Server needs to determine if the certificate has been revoked and shouldn't be trusted.
OCSP works by using a client, such as a MID Server, to receive a certificate from an HTTP website. The client sends a request to an OCSP responder: a server operated by the certificate authority (CA) that issued the certificate. The OCSP responder’s response to the client indicates whether the certificate is valid or has been revoked.

In order to connect, the MID Server requires access to:

- servicenow.com
- install.service-now.com
- ocsp.entrust.net (or other OCSP CA)

While SSL/TLS certificates are always issued with an expiration date, there are certain circumstances in which a certificate must be revoked before it expires (for example, if its associated private key may have been compromised). Therefore, the current validity of a website’s certificate must always be checked by clients regardless of its expiry date.

Clients fail a connection when they can’t check the revocation status of a certificate. Firewalls and proxy configurations may block calls to the OCSP Entrust server, which prevents the MID Server from working. You may need to change your firewall permissions so the OCSP traffic to go through properly. For more information and resolutions, see the HI Knowledge Base article [KB0813636].

PowerShell requirements

The MID Server requires the minimum PowerShell version 3.0 and supports versions up to PowerShell 5.1.

Java version support

OpenJDK version 1.8.0_231 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures OpenJDK to run in your environment. No additional configuration is required. This version supports both 32-bit and 64-bit MID Servers. For the best performance, install the 64-bit MID Server for your operating system. The MID Server requires a minimum JRE version 1.8.0_161, and recommended version 1.8.0_231. If you are using a lower version than 1.8.0_161, you may see encryption related issues. If the MID Server is configured to use an external JRE and the JRE is detected to be incompatible, the MID Server instead uses the bundled JRE. If this fails, or the MID remains on an incompatible JRE version, the MID automatically stops.

Note: ServiceNow will discontinue support for 32-bit MID Servers in a future release.

Testing showed that the MID Server works as expected with Oracle Java 11 version 11.0.5 and Oracle JRE 8 version 1.8.0_231. However, Oracle JRE 8 version 1.8.0_231 requires the workaround described in the HI Knowledge Base article MID Server running Oracle JRE version 8 (KB0784442). In order to use Java 11 on Windows MID Servers, refer to Install Java 11 on Windows MID servers (KB0752451).

Upgraded MID Servers might use different Java versions depending on their release level.

- MID Servers upgraded from Kingston and earlier use the OpenJDK provided with the MID Server installer. This version of the OpenJDK was tested and certified for use with these MID Servers.
- MID Servers upgraded from London continue to use the same JRE you configured for London. The MID Server supports JRE 1.8.
MID Server supports Java 8 and Java 11 on any supported operating system. However, CPU monitoring is disabled by default on Windows with Java 11 because an outdated SIGAR library causes the MID Server to crash. If you decide to patch the SIGAR library, you can re-enable CPU monitoring. See CPU and maximum memory usage for more information on how to enable CPU monitoring.

**Java Service Wrapper**

The MID Server installer includes the Tanuki Software Java Service Wrapper, version 3.5.40.

**Setting the JVM Memory size**

The MID Server installs with 1 GB of JVM memory. If the suggested memory size for your product is greater than 1 GB, see Set the MID Server JVM memory size for the procedure to override the default setting.

**Deployment types**

System requirements for your instance are determined by the needs of the individual products you use that require a MID Server.

**Standard deployments**

The following products are considered 'standard' because their MID Servers share the same minimum disk space and memory requirements:

- Discovery
- Event Management
- Integrations
- Orchestration
- Service Mapping

The minimum standard requirements pertain to both a single product and a combined product deployment. You can deploy a single MID Server for multiple standard products without significantly increasing the disk or memory requirements.

**High resource deployments**

Cloud Management Platform (CMP) and Operational Intelligence are processing intensive and require more resources for each MID Server than the standard products. Install MID Servers for these products on dedicated hosts that do not support MID Servers for other products.

**Recommended MID Server minimum requirements**

All configurations listed here require a quad core processor with a speed of 2 GHz or greater and were calculated for a Windows Server 2012 R2 host.

**Note:** The MID Server minimum system requirements for 25 concurrent threads includes resource overhead that is independent of the number of threads. As a result, the system requirements for 200 threads do not require a linear increase in resources. You can set the MID Server to use as few as 5 threads without issue. To increase the speed of the MID Server if the host is powerful enough or lightly loaded with other programs, you can increase the
threads setting. The threads setting depends on the limitation of the CPU speed, memory, and operating system of the host machine. You might have to experiment to find the optimal threads count that works best when the MID Server is busy so it does not exhaust the host machine’s hardware limitations. This means you may have to refine the thread count to best meet your situation.

Important: You can set threads.max as high as 200, however, this setting may need to be changed depending on the OS. For example, Windows-based MID Servers running Discovery uses Powershell which is resource intensive. In this case, you may exhaust the CPU power of the host machine with just 50 threads count.

MID Server minimum system requirements for 25 concurrent threads (base system)

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>
</tr>
<tr>
<td>Cloud Management Platform (CMP)</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
<tr>
<td>Operational Intelligence</td>
<td>36 GB</td>
<td>16 GB</td>
</tr>
<tr>
<td>Standard</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
</tbody>
</table>

MID Server minimum system requirements for 200 concurrent threads (customer configured)

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>

</tr>
<tr>
<td>Standard</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
</tbody>
</table>

Use case 1: Single MID Server deployed for multiple standard products

In this example, Service Mapping, Discovery, and Orchestration share a MID Server with 25 threads that is installed on a dedicated host. The disk space and memory requirements specified here satisfy the minimum recommended requirements for the combined product deployment.
One MID Server for multiple standard products

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>

<td>OS memory</td>
<td>JVM memory</td>
</tr>
<tr>
<td>Service Mapping + Discovery + Orchestration</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
</tbody>
</table>

Use case 2: Multiple MID Servers deployed to a single host

In this example, three MID Servers (not clustered) are assigned to different standard products. All three MID Servers are deployed to a single host, where each MID Server has 25 threads. The required resources are calculated as follows:

- **Total disk space required**: Add the recommended disk space for the operating system from the OS column to the sum of the values in the MID Server + product column for all products mapped.
- **Total memory required**: Add the recommended memory for the operating system from the OS memory column to the sum of the values in the JVM memory column for all products mapped.

Monitoring performance

To ensure that the MID Server resource allocations are sufficient for your environment, monitor performance during peak periods of product execution from the MID Server dashboard.
MID Server supports Java 8 and Java 11 on any supported operating system. However, CPU monitoring is disabled by default on Windows with Java 11 because an outdated SIGAR library causes the MID Server to crash. If you decide to patch the SIGAR library, you can re-enable CPU monitoring. See CPU and maximum memory usage for more information on how to enable CPU monitoring.

**MID Server ECC Queue**

The External Communication Channel (ECC) Queue is a connection point between an instance and the MID Server. Jobs that the MID Server needs to perform are saved in this queue until the MID Server is ready to handle them.

**Asynchronous Message Bus**

The MID Server subscribes to messages published by the Asynchronous Message Bus (AMB), which notifies the MID Server that it has pending tasks in the ECC Queue. If a job exists in the ECC Queue for that MID Server, the MID Server sets the status to "I'm working on it." When finished working on a requested job, the MID Server reports back to the ECC queue with the results.

The MID Server opens a persistent connection to the instance through the AMB)Client and listens on the `/mid/server/<mid_sys_id>` AMB channel. When an output record is inserted into the Queue (`ecc_queue`) table, an AMB message is sent to the MID Server's channel. The MID Server receives this message and immediately polls the ecc_queue table for work.

The MID Server polls the ECC queue on the regular interval defined in the `mid.poll.time` configuration parameter, regardless of AMB message activity. The default polling interval is set to 40 seconds, but can be reconfigured. This polling of the ECC queue at a regular interval is done in case the AMB connection is dropped.
**Note:** The AMB client on the MID Server does not work in all environments and might need to be disabled to avoid performance issues. To disable AMB in your environment, set the `mid.disable_amb` parameter to `true`. When you disable AMB, the MID Server reverts to a default polling interval of 5 seconds, unless the `mid.poll.time` parameter is set to a different value.
ECC Queue information

You can access the ECC Queue by navigating any of these paths:
- Discovery > Output and Artifacts > ECC Queue
- Discovery > Discovery Schedules > {schedule name} > {Discovery status record}
- ECC > Queue
- {Discovery Status record} > ECC Queue

An ECC Queue provides the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent</td>
<td>The name of the external system that this messages is either from or to. If the message is from or to a MID Server, the agent name is in the form mid.server.xxx, where xxx is the name of a particular MID Server.</td>
</tr>
<tr>
<td>Topic</td>
<td>The name of the probe the MID server ran. If you are using a pattern for discovery, the Horizontal Pattern probe appears.</td>
</tr>
<tr>
<td>Name</td>
<td>The actual command the probe ran. For example, if Topic is SSHCommand, then the Name field contains the actual shell command to run. If you are using a pattern for discovery, the following appears: Pattern Launcher: followed by the name of the pattern and the multipage number.</td>
</tr>
<tr>
<td>Source</td>
<td>The IP address that the discovery is to run against. A few probes run against multiple IP addresses; in those cases, this field contains a human-readable description.</td>
</tr>
<tr>
<td>Response to</td>
<td>This optional field contains a reference (sys_id) to the ECC Queue message that this message is in response to. Discovery makes extensive use of this field to track the hierarchy of messages that result from a given scheduled Discovery. Click the record icon for the value in this field to open the ECC Queue record for the activity that spawned the current probe or sensor record.</td>
</tr>
<tr>
<td>Queue</td>
<td>An indicator of whether this message was is an input message or an output message.</td>
</tr>
<tr>
<td>State</td>
<td>The state of the current ECC queue record. States update automatically.</td>
</tr>
<tr>
<td>Processed</td>
<td>The time when this message was processed.</td>
</tr>
<tr>
<td>Created</td>
<td>The time when this message was created.</td>
</tr>
<tr>
<td>Sequence</td>
<td>The unique sequence number for this message. This value is automatically generated when an ECC Queue record is inserted. Its use is deprecated.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Error string</td>
<td>An error message, if an error occurred during processing. This field is hidden on the standard form unless there was an error.</td>
</tr>
<tr>
<td>Payload</td>
<td>The body of the message in XML format. The returned XML has a root tag of <code>&lt;results&gt;</code> containing one or more <code>&lt;result&gt;</code> tags and a single <code>&lt;parameters&gt;</code> tag. The parameters are simply an echo of those sent to the MID server in the probe; they vary from probe to probe, but in general they tell the probe the details of what it is to do and how it should behave. The result tags are the most interesting ones; they contain the actual data generated by the probe.</td>
</tr>
</tbody>
</table>

**ECC queue controls**

The ECC Queue form contains these related links:

<table>
<thead>
<tr>
<th>Related link</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run again</td>
<td>Runs the probe again. You can re-run probes when you encounter a failed discovery or other unexpected results.</td>
</tr>
<tr>
<td>Go to CMDB item</td>
<td>Open the CI record for the CI that was updated during the discovery.</td>
</tr>
<tr>
<td>Go to Sensor</td>
<td>Open the record for the associated sensor.</td>
</tr>
</tbody>
</table>

**Manage ECC Queue content for a MID Server**

The ECC Queue allows you to create ECC Queue messages, access MID Server log entries, and retrieve statistics from an individual MID Server record.

Role required: admin, mid_server

1. Send remote commands through a MID Server to a hosting device directly from the ECC Queue without running Discovery.
   a) Navigate to the ECC Queue and click **New**.
   b) Create a message with these settings:

   - **Agent**: The name of the MID Server that executes the command.
   - **Topic**: Command
   - **Name**: The actual command that you want to process. For Windows, this is expressed in a DOS command line structure. For Linux, the structure could be a bash command line entry.
   - **Queue**: Output
   - **Payload**: With proper XML tags, you can specify the command here instead of in the **Name** field. The advantage to this is that the command is not restricted by the **Name** field length of 120 characters. Use the following XML format for the command:

   ```xml
   <parameters>
   <parameter name="name" value="ACTUAL_COMMAND_LINE"/>
   ```
2. Access entries in the ECC Queue that show `agent0.log.0` logs and `wrapper.log` logs for an individual MID Server.
   a) Open a MID Server record.
   b) Under Related Links, click Grab MID Logs.
      ECC queue records appear in the list using the following filter:
      • (Topic) (is) (SystemCommand)
      • (Source) (is) (grabLog)
      • (Agent) (is) (your MID Server)

      Only `agent0.log.0` and `wrapper.log` entries appear. These logs are also accessible in the `~\agent\logs\` file path.
   c) To open a log entry, click the link under the Created column.

3. Access the `queue.stats` topic for useful information about individual MID Servers, such as memory and CPU usage data.
   a) Open a MID Server record.
   b) Under Related Links, click MID Statistics.
      ECC queue records appear in the list using the following filter:
      • (Topic) (is) (queue.stats)
      • (Agent) (is) (your MID Server)

**MID Server dashboard**

The MID Server dashboard is a central place for MID Server users to monitor ongoing operations. The dashboard consists of reports and gauges that display information from the MID Server Status table.
**MID Server status gauge**

The MID Server Status gauge on the dashboard displays basic information about each MID Server. This information comes from the MID Server Status (ecc_agent_status) table.

<table>
<thead>
<tr>
<th>MID Server Status</th>
<th>Name</th>
<th>Host name</th>
<th>Status</th>
<th>Validated</th>
<th>Version</th>
<th>Max memory used %</th>
<th>Mean CPU used %</th>
<th>Pending jobs</th>
<th>Processing jobs</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>MId</td>
<td></td>
<td>Passed</td>
<td>Yes</td>
<td>03-08-2015, 09-30-2016</td>
<td>33.17</td>
<td>1.34</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>MId2</td>
<td></td>
<td>Up</td>

<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>MId4</td>
<td></td>
<td>Passed</td>
<td>Yes</td>
<td>03-08-2015, 09-30-2016</td>
<td>58.4</td>
<td>63.3</td>
<td>0</td>
<td>518</td>
</tr>
</tbody>
</table>

**MID Server Dashboard gauge**

If the version is not compatible, the MID Server status is not changed to **Down** in the MID Server dashboard. So it might still appear to be processing commands when it actually is not doing so. You must check the MID Server **Version** on the dashboard.

See **KB0535181** for additional MID Server troubleshooting information.

The icons in the **Version** column indicates the following:

- **Red**: Incompatible. The MID Server and instance do not belong to the same release. You must **upgrade the MID Server** and verify that it is not pinned to an older version with the **mid.version.override** property. The MID Server will not be upgraded until the parameter is cleared.
- **Yellow**: Compatible, but an upgrade is recommended. This indicates that the MID Server version belongs to the same family as the instance, but not the same version.
- **Green**: Compatible. No upgrade necessary.
- **Gray**: Incompatible. The instance cannot detect the version.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the MID Server.</td>
</tr>
<tr>
<td>Host name</td>
<td>The name of the system that hosts the MID Server.</td>
</tr>
<tr>
<td>Status</td>
<td>The status of the MID Server.</td>
</tr>
<tr>
<td>Validated</td>
<td>Whether or not the MID Server was validated.</td>
</tr>
<tr>
<td>Max memory used %</td>
<td>The highest percent usage of memory on the system that hosts the MID Server, in the configured sampling interval. The default interval is 30 minutes, but this value is user configurable. See <strong>MID Server resource threshold alerts</strong> for details.</td>
</tr>
<tr>
<td>Column</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Mean CPU used %</td>
<td>The average percent usage of CPU on the system that hosts the MID Server, in the configured sampling interval. The default interval is 30 minutes, but this value is user configurable. See MID Server resource threshold alerts for details.</td>
</tr>
<tr>
<td>Pending jobs</td>
<td>Number of pending ECC queue jobs for that MID Server.</td>
</tr>
<tr>
<td>Processing jobs</td>
<td>Number of processing ECC queue jobs for that MID Server.</td>
</tr>
<tr>
<td>Version</td>
<td>The version of the MID Server. An icon indicates the validity of the MID Server:&lt;br&gt;  - <strong>Red</strong>: Incompatible. The MID Server and instance do not belong to the same release. You must upgrade the MID Server and verify that it is not pinned to an older version with the mid.version.override property. The MID Server will not be upgraded until the parameter is cleared.&lt;br&gt;  - <strong>Yellow</strong>: Compatible, but an upgrade is recommended. This indicates that the MID Server version belongs to the same family as the instance, but not the same version.&lt;br&gt;  - <strong>Green</strong>: Compatible. No upgrade necessary.&lt;br&gt;  - <strong>Gray</strong>: Incompatible. The instance cannot detect the version.</td>
</tr>
<tr>
<td>User</td>
<td>The login name of the user. An icon indicates the validity of the user:&lt;br&gt;  - <strong>Red</strong>: Incompatible. The user does not have the mid_server role or the user does not match the value in the mid.instance.username parameter (in the config.xml configuration file). Reconfigure the MID Server user and verify that it works.&lt;br&gt;  - <strong>Green</strong>: Compatible. The user has the mid_server role and matches the user in the configuration file.</td>
</tr>
</tbody>
</table>

**CPU and maximum memory usage**

MID Server supports Java 8 and Java 11 on any supported operating system. However, CPU monitoring is disabled by default on Windows with Java 11 because an outdated SIGAR library causes the MID Server to crash. If you decide to patch the SIGAR library, you can...
re-enable CPU monitoring. To re-enable CPU monitoring, set the MID Server parameter `mid.monitoring.force_sigar_cpu_monitoring` to True. See Add a MID Server parameter for instructions on how to set MID Server parameters.

This graph shows the average percentage of CPU usage on all the systems that host MID Servers in the last 30 days.

This graph shows the average percentage of maximum memory used by all the systems that host MID Servers in the last 30 days.
MID Server properties

Properties control the behavior of all MID Servers or a particular MID Server.
Ensure that the MID Server can connect to elements inside and outside your network
Download and install the MID Server on a Linux or Windows host
Configure your MID Server
Configure MID Server security

The MID Server properties are in the MID Server Property (ecc_agent_property) table and can be accessed by navigating to **MID Server > Properties**. To set these properties, you must add them, if they are not already present.

**MID Server properties**

**alias_filtering_behavior**
Sets the behavior of Discovery aliases. Behaviors define how strictly the system enforces the use of credential aliases in Discovery schedules.

The choices for behaviors are:
- **strict**: Aliases defined for the credential must match the aliases configured for the probe.
- **loose**: The probe’s credential is used if it contains all the aliases specified in the schedule.

- Type: string
- Default value: loose

**com.glide.closure_max_rows_per_table**
Sets the maximum number of rows allowed in a table. This property is not visible by default and must be added.

- Type: integer
- Default value: 200000

**concurrent.dist.download**
Sets the number of concurrent MID Server auto-upgrades permitted by the instance. The default value of this property is 2, which allows the MID Server to use 2 of the 4 semaphores available on the instance for upgrading. If your instance has more than 4 INT semaphores, you can increase the value in this property to allow more concurrent upgrades.

- Type: integer
- Default value: 2
glide.stored_proc.data_type.validation

Stops validation of data types in stored procedure parameters. Use this property if you use Orchestration to run a stored procedure on MySQL, Oracle DB, and MS-SQL databases and you want to avoid performing data type validation. Restart the MID Server service after you change the value of this property.

- Type: true | false
- Default value: false

mid.aws.sts.assume_role.disable_credential_caching

Set this property to true to prevent the caching of temporary AWS credentials for Cloud Discovery.

- Type: true | false
- Default: false

mid.aws.sts.assume_role.credential_ttl_minutes

Set the number of minutes you want to cache temporary AWS credentials for Cloud Discovery.

- Type: integer
- Default: 60

mid.ca.certificate.api.request.retry.count

Indicates how many times the Certificate Import query will retry after the rate limit has occurred.

- Type: integer
- Default: 3

mid.ca.certificate.api.request.retry.interval

Used to delay Certificate import from CAs when the rate limit has occurred.

- Type: integer
- Default: 30000

mid.discovery.max_pattern_payload_size

Defines the maximum overall payload size for the payload of results that come from patterns.

- Type: integer (bytes)
- Default value: 300000

You can also configure this as a configuration parameter on a individual MID Server.

mid.discovery.max_payload_size

Specifies the maximum string length of Discovery results that the MID Server sends to the instance. If the Discovery probe results exceed the limit, the MID Server discards them and returns a warning message.

For probes, this applies only to those probes where the Used by Discovery field is true. For patterns, this applies to the Horizontal Pattern probe.

Set the value to any negative number to disable the payload limit and allow payloads of any size to be sent to the instance. For example, -1.

- Type: integer (bytes)
• Default value: 5000000

You can also configure this as a configuration parameter on a individual MID Server.

**mid.discovery.multiprobe.skip_others_on_error**

Prevents probes in a multi-probe from iterating through available credentials when another member probe has already failed or timed out. If this property is set to false, each probe in the multi-probe attempts to connect to the target with the same invalid credentials. This condition results in longer probe execution times on the MID Server.

This property is not visible by default and must be added to the sys_properties table to change the value.

• Type: true | false
• Default value: true

**mid.eccq.max_payload_size**

Specifies the maximum string length of a payload that the MID Server sends to the instance. The MID Server verifies the size of the payload before sending it to the instance. If the payload size exceeds the limit, the MID Server discards it and returns an error message in the payload.

• Type: integer (bytes)
• Default value: 20000000

You can also configure this as a configuration parameter on a individual MID Server.

**mid.max_ci_count_per_page**

Defines the size of each chunk in a payload of results that come from patterns. The chunk can be greater than this value, depending on the relationships of the CIs.

• Type: integer (bytes)
• Default value: 300000

You can also configure this as a configuration parameter on a individual MID Server.

**mid.powershell.target_base_dir**

Specifies the location of the target base folder used for Discovery using WMI. If another network share is mounted on each Window’s target, the folder may be changed by updating this property.

• Type: string
• Default value: admin$ share

**mid.probe.collect_debug_info**

An optional property to collect debug information. If this property is set to true, the probe collects credential debug information when it runs and puts that information in the payload of ECC input message. It doesn’t affect how Discovery works.

• Type: true | false
• Default value: false

**mid.probe.use_legacy_forward_dns**

Enables the legacy DNSNameResolver probe and disables the default DNSNameResolver probe. See Probes used by Orchestration for more information.
- **Type**: true | false
- **Default value**: false

**mid.probe.use_legacy_reverse_dns**
Enables the legacy DNS probe and disables the default DNS probe. If you experience problems with the features of the default DNS probe, use this property to disable those features. The default DNS probe's features include being lightweight and faster due to executing in parallel, while the legacy probe is throttled by the MID Server because it executes in serial. The default probe utilizes DNS lookup by the MID Server host OS to make use of the OS maintained DNS cache, while the legacy probe does not. Consequently, after a DNS lookup by the default probe fails in Windows systems, the OS also tries looking up by NETBIOS name.
- **Type**: true | false
- **Default value**: false

**mid.process_flow.log_listener.max_size**
Sets the maximum size in bytes of memory available to save log messages for Flow Designer actions running on a MID Server. The MID Server stores up to the limit in memory and discards additional log messages, then sends the messages back to the instance along with the execution plan.
- **Type**: integer (bytes)
- **Default value**: 10485760

**mid.property.jdbc_operations**
Tells the JDBCOrchestrationProbe what JDBC operations it is allowed to execute. Edit this property value to allow JDBC Orchestration activities to perform more operations. All operations are comma separated. Select a MID Server in the MID server field to define specific operations for that MID Server, or leave the field empty to apply the list of operations to all MID Servers. This property requires the Orchestration plugin.
- **Type**: string
- **Default value**: select, update, insert, delete, show, create, describe, begin, if, end, not, exists

**mid.property.jms.command.allowed_factory_names**
Comma delimited list of Java Messaging Service (JMS) connection factories that the MID Server requires for a custom JMS activity or action. This property requires the Orchestration plugin.
- **Type**: string
- **Default value**: connectionFactory, queueConnectionFactory, topicConnectionFactory

**mid.property.ssh.use_snc**
Enables the use of the SNCSSH client for Discovery and Orchestration. Change this property to false to use J2SSH. This property applies to all MID Servers connected to the instance.
- **Type**: true | false
- **Default value**: true

**mid.sa.prefer_powershell**
Enables MID Server to use PowerShell Remoting.
- **Type**: True | False
• Default value: false

**mid.security.validation.endpoints**

Allows for a list of external endpoints to enforce strict verification security checks. The default value is ".servicenow.com", so all requests that initiate at the MID Server going to any ServiceNow domains and sub-domains automatically go through validation checks. You can also enter a comma-separated list of other endpoints that you want to enforce with these same checks including direct URLs or * wildcard for example, samsung.aws.com or *aws.com. To turn this feature off, remove all listed values. If you deleted the property, contact Support to reimport it.

• Type: string
• Default value: *.servicenow.com

**mid.servicewatch.max_concurrent_connections**

Defines the maximum number of concurrent tasks sent to an individual host by a single MID Server.

• Type: integer
• Default value: 7

**mid.shazzam.regulator.interval_ms**

Sets the interval, in milliseconds, in which Shazzam can launch packets.

• Type: integer
• Default value: 1

**mid.shazzam.regulator.packets_per_interval**

Sets the number of packets that Shazzam can launch in the time interval specified by the mid.shazzam.regulator.interval_ms property.

• Type: integer
• Default value: 1

**mid.shazzam.threads**

Specifies the number of concurrent threads that Shazzam uses. Setting this or the mid.shazzam.max_scanners_per_thread parameter to 0 disables Shazzam multi-thread optimization.

• Type: Integer
• Default value: 5

**mid.shazzam.max_scanners_per_thread**

Specifies the number of concurrent scanners processed by each Shazzam thread. Setting this or the mid.shazzam.threads parameter to 0 disables Shazzam optimization.

• Type: Integer
• Default value: 100

**mid.sm.discolog.max_log_size**

Limits the length of the log statements in the Horizontal Discovery Log. If the results are truncated, the Command results reports, "Result is larger than (value) characters and was truncated by the logger."
mid.sm.discolog.max_object_size
Limits the length of the object in the Horizontal Discovery Log. Objects in the log statement are truncated to the number of characters set by this property’s value. This property only affects the object character size in the Horizontal Discovery Log. The following message appears if an object is limited by this property “The max object size reached the maximum limit of [value]. To adjust this use the mid property mid.sm.discolog.max_object_size.”

mid.snmp.use_getbulk
Specifies whether to use GETBULK to receive a large amount of data in batches. This can be used to globally configure all MID servers.

shazzam.chunk_size
Maximum number of IP addresses Shazzam can scan in parallel. This property primarily controls outbound port consumption.

Create a MID Server property
Use a MID Server property to control either the behavior of all MID Servers or a particular MID Server.

Role required: admin
You set MID Server properties to override MID Server parameters. Configure MID Server properties in the MID Server plugin. Do not configure MID Server properties in the glide.properties file that is located in the properties folder of the agent. The glide.properties file gets overwritten during the upgrade process.

1. Navigate to MID Server > Properties.
2. Click New.
3. Fill in the fields, as appropriate (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the property name.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Value        | You can enter the value you want the property to have.  
|              | **Note:** If you are amending JDBC operations through the mid.property.jdbc_operations properties, you can enter verbs like BEGIN, END, IF, or common PL/SQL block statements. This will assist in being able to run CREATE or ALTER statements. You might have to restart the MID server before running some of the statements. |
| MID Server   | Leave this field blank to set a MID Server property that affects all MID Servers. To set a MID Server property for a particular MID Server, select the MID Server.                                                       |

4. After setting any MID Server properties, restart the MID Server to ensure the properties sync with the instance.

**MID Server parameters**

Parameters control the behavior of a particular MID Server and have lower precedence than MID Server properties.

- Ensure that the MID Server can connect to elements inside and outside your network
- Download and install the MID Server on a Linux or Windows host
- Configure your MID Server
- Configure MID Server security

To add a parameter to a MID Server, see Add a MID Server parameter.

**Important:** Changes to parameters only take effect when the MID Server is started (or restarted).
Note: The value of any MID Server parameter in the config.xml file can be encrypted. See Encrypt or decrypt MID Server configuration file values for more information.

Required parameters

Note: Using special characters in an XML configuration file requires you to encode them.

url
Specifies the URL to the associated instance. Normally the URL is similar to https://instance.service-now.com, where you replace instance with the instance name. If you host your own instance, use the URL set by your organization.

- Type: string
- Default value: none

mid_sys_id
Records the MID Server record’s unique identifier. This parameter should be empty when you initially configure a MID Server. Do not change the value.

- Type: string
- Default value: automatically set (GUID)

name
Use this parameter to supply a name that is meaningful for you. If you do not supply this parameter, the MID Server uses the default value. A set of business rules synchronizes the name in the configuration file with the name in the MID Server record. The business rules ensure that changing the name in one location also changes the name in the other location.

- Type: string
- Default value: YOUR_MIDSERVER_NAME_GOES_HERE

mid.instance.username or glide.glidesoap.username
If the ServiceNow instance has authentication enabled, as it is by default, set this parameter to define the user name the MID Server should use to log in to the instance. This user should have the mid_server role on the ServiceNow instance in order to access necessary tables and fields. You can use this parameter to define user names with special characters.

- Type: string
- Default value: none

mid.instance.password or glide.glidesoap.password
If your ServiceNow instance has authentication enabled, as it is by default, set this parameter to define the password the MID Server should use to log in to the instance. You can use this parameter to define passwords with special characters.

- Type: string
- Default value: none
CIM parameters

**mid.cim.batch.size**
Specifies the maximum number of messages sent at once to a CIM server.

- Type: integer
- Default value: 1

**mid.cim.request.interval**
Specifies the number of milliseconds to wait between requests to the same Common Information Model Object Manager (CIMOM).

- Type: integer
- Default value: 0

**mid.cim.host.connection.limit**
Specifies the maximum number of simultaneous connections to each CIMOM. A value of zero disables simultaneous connections.

- Type: integer
- Default value: 0

Connection parameters

**glide.mid.fast.responses**
Instructs the MID Server to try sending messages to the instance as soon as they are ready. Normally the MID Servers end messages to the ServiceNow instance serially (that is, one message at a time). Since many probes can be run in parallel, there can be multiple messages transmitted simultaneously to the instance. Setting this parameter to `true` may decrease the time between a probe's completion and its response arriving at the instance. However, the multiple simultaneous messages consume resources, decreasing the overall instance responsiveness. If there are communications problems, this parameter's value can also cause a logjam on the MID Server, as threads normally used for running probes may become consumed for sending messages. Generally, leave this parameter out of your configuration. Setting it to `true` is meaningful only under very special circumstances.

- Type: true | false
- Default value: false

**glide.mid.max.sender.queue.size**
Places an upper limit on how large the queue is allowed to get. The MID Server starts deleting queued messages if this limit is exceeded. When the MID Server generates messages to the ServiceNow instance faster than it can send them, it queues them temporarily on the file system of the MID Server's host. This queue is normally quite small, and is completely emptied as soon as the MID Server processing slows for a short period. However, this queue can grow in size when there are communication problems between the MID Server and the instance, and especially if there is an integration running on the MID Server.

The parameter is of the form `{number}\{multiplier}`, where `{number}` is any positive decimal number including non-integers, and the optional multiplier is any spelling of bytes, kilobytes, megabytes, gigabytes, or terabytes (only the first character is tested, and the test is case-
insensitive). The default multiplier is bytes. White space is liberally tolerated. The following strings all represent valid parameters: "1000000000", "0.5m", "5 GB", "7.67gigas", "145.69392 meg", and "1.1 terra".

- Type: string
- Default value: 0.5 GB

**instance.date.format**

Specifies the format the instance uses for dates and times. The primary impact of setting this parameter is to allow the MID Server to correctly refresh its start and stop times on the MID Server record in ServiceNow. The format of this date/time string is identical to that used by the Java SimpleDateFormat class.

- Type: string (Date format)
- Default value: yyyy-MM-dd HH:mm:ss

**mid.disable_amb**

Disables the Asynchronous Message Bus (AMB) Client. When AMB is enabled, the MID Server uses a default polling interval of 40 seconds. When the AMB client is disabled, the default polling interval switches to 5 seconds. If you set a polling interval with the **mid.poll.time** parameter, the MID Server uses that value whether or not the AMB client is enabled.

- Type: true | false
- Default value: false

**mid.https.truststore.password**

Sets the trustStore password that is required for HTTPS connections with the Asynchronous Message Bus (AMB) Client.

- Type: string
- Default value: none

**mid.https.truststore.path**

Path to the trustStore to be used by the MID Server for TLS transactions (Asynchronous Message Bus (AMB) Client). Add this parameter only if you want to change the default path.

- Type: string
- Default: Path to the JRE trustStore bundled with the MID Server

**mid.instance.skip_basic_auth**

Allows the MID Server to connect to an instance using cookies instead of basic authentication credentials. When set to true, it uses cookies first. However, if the connection fails, the MID Server will try to connect again using basic authentication credentials.

- Type: true | false
- Default value: true

**mid.jmx.enabled**

Enables a JMX server on the MID Server, which exposes some management information to JMX consoles. Implementing JMX requires additional configuration of the Java runtime environment. Setting this parameter to true is only recommended for those with detailed knowledge of the Java security architecture and a specific need for JMX.

mid.poll.time
Sets the default MID Server polling interval (in seconds). The polling interval is the amount of time the MID Server waits before checking the ECC queue for work when the ECC queue is not busy. The MID Server polls the ECC queue using this interval if the AMB client connection is dropped.

**Note:** The default polling interval resets to 5 seconds when the AMB client is disabled.
If you configure the `mid.poll.time` parameter, the MID Server uses this polling interval whether or not the AMB client is connected.

* Type: integer (seconds)
* Default value: 40

threads.interactive.max
Sets the maximum number of interactive worker threads that can run simultaneously in the interactive thread pool. See [Set MID Server Thread Use](#).

* Type: integer
* Default value: 10

threads.expedited.max
Sets the maximum number of expedited worker threads that can run simultaneously in the expedited thread pool. See [Set MID Server Thread Use](#).

* Type: integer
* Default value: 20

threads.max
Sets the maximum number of standard worker threads that can run simultaneously in the standard thread pool. This parameter provides direct control over what CPU resources the MID Server consumes on the computer that hosts it. See [Set MID Server Thread Use](#).

* Type: integer
* Default value: 25

**Important:** You can set threads.max as high as 200, however, this setting may need to be changed depending on the OS. For example, Windows-based MID Servers running Discovery uses Powershell which is resource intensive. In this case, you may exhaust the CPU power of the host machine with just 50 threads count.

Credentials parameters

mid.aws.instance_profile_name
Name of the AWS IAM role configured on the EC2 instance. When configured, the MID Server uses the temporary credentials granted to this role by the AWS instance profile to Discover cloud resources.

* Type: string
ServiceNow Orlando Now Platform capabilities

- Default value: None (User must provide a non-blank value)

**mid.credentials.provider**
Specifies the Java class name of the credentials provider.
- Type: string
- Default value: com.service_now.mid.creds.standard.StandardCredentialsProvider

**mid.secure_credentials.key_pairs.provider**
Class that the MID Server uses to generate secure key pairs.
- Type: string
- Default value: com.service_now.mid.keypairs.provider.standard.StandardKeyPairsProvider

**Debug parameters**

**debug.logging**
(Deprecated) Specifies whether to enable logging of MID Server events and messages (both sent and received). Normally this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.
- Type: true | false
- Default value: false

This parameter has been replaced by the `mid.log.level` parameter.

**debug**
(Deprecated) Specifies whether to enable debug logging on the MID Server. Normally this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.
- Type: true | false
- Default value: false

This parameter has been replaced by the `mid.log.level` parameter.

**file.probe.template.debug**
Specifies whether to debug file probe templates.
- Type: true | false
- Default: false

**mid.cim.debug**
Specifies whether to enable debug logging for CIM, WBEM, SLP, or SMI-S.
- Type: true | false
- Default value: false

**mid.ssh.debug**
Enables SSH debug information in the log file. The parameter usage depends on whether the ServiceNow SSH client is enabled.

When the ServiceNow SSH client is enabled, the parameter functions as follows:

- **Type:** string
- **Default value:** false

The following string values are valid for the ServiceNow SSH client:

- **true:** Enables SSH debug information in the log file.
- **false:** Disables SSH debug information in the log file.
- **<IP Addresses>:** Specify which IP ranges to enable SSH debug information in the log file. You can enter IP addresses in the following formats:
  - An IP range defined by a slash and the number of bits in the subnetwork. For example, the string `10.10.10.0/24` scans 24 bits of IP addresses from 10.10.10.0 to 10.10.10.254.
  - An IP range defined by a dash. For example, the string `10.10.11.0-10.10.11.165` scans the IP addresses from 10.10.11.0 to 10.10.11.165.
  - A comma-separated list of specific IP addresses. For example the string `10.10.11.200,10.10.11.235` scans the IP addresses 10.10.11.200 and 10.10.11.235.
- **deferred:** Logs SSH debug information in memory unless an error or warning occurs. If an error or warning occurs, the platform publishes the debug information to the log file. This ensures that only the part of the log file pertaining to the error or warning is recorded. If no error or warning is detected, the platform deletes the unused log data from memory when the session closes. Each session stores up to 1000 log messages. If the session exceeds 1000 log messages, the deferred log discards the oldest log message to make room for the newest log message.

When the ServiceNow SSH client is disabled, the parameter enables or disables SSH debug information in the log file:

- **Type:** true | false
- **Default value:** false

**mid.log.level**

Specifies the logging level for the MID Server. Possible values are:

- debug
- info
- warn
- error

**Note:** Values are case insensitive.

- **Type:** string
- **Default value:** info

**mid.http.idle_connection_monitor.debug**

Enables debug logging for the Idle Connection Monitor.

- **Type:** true | false
- **Default value:** false
DNS parameters

**mid.dns_scan.regulator.interval_ms**
Specifies the interval between DNS scans in milliseconds.
- Type: integer
- Default value: 10

**mid.dns_scan.regulator.packets_per_interval**
Specifies the number of regulator packets per DNS scan.
- Type: integer
- Default value: 1

**mid.dns_scan.default_name_servers**
Specifies the host names or IP addresses of the default name servers.
- Type: string
- Default value: none

**mid.dns_scan.additional_name_servers**
Specifies the host names or IP addresses of any additional name servers.
- Type: string
- Default value: none

**mid.dns_scan.load_balancing_enable**
Specifies whether to enable load balancing of name servers.
- Type: true | false
- Default value: false

**mid.probe.use_legacy_forward_dns**
Enables the legacy DNSNameResolver probe and disables the default DNSNameResolver probe. See Probes used by Orchestration for more information.
- Type: true | false
- Default value: false

**mid.probe.use_legacy_reverse_dns**
Enables the legacy DNS probe and disables the default DNS probe. If you experience problems with the features of the default DNS probe, use this parameter to disable those features. The default DNS probe's features include being lightweight and faster due to executing in parallel, while the legacy probe is throttled by the MID Server because it executes in serial. The default probe utilizes DNS lookup by the MID Server host OS to make use of the OS maintained DNS.
cache, while the legacy probe does not. Consequently, after a DNS lookup by the default probe fails in Windows systems, the OS also tries looking up by NETBIOS name.

- Type: true | false
- Default value: false

**Event Management parameters**

**mid.probe.event.bulk_size**
Specifies the maximum size of an event payload, in MB.

- Type: integer
- Default value: 120

**mid.probe.event.wait_time**
Waiting period on an empty queue for sending events.

- Type: integer
- Default value: 1000

**mid.probe.event.send.enabled**
Enables or disables the sending of events.

- Type: true | false
- Default value: true

**mid.probe.event.queue.max_size**
Specifies the maximum size permitted for the event queue before incoming events are rejected.

- Type: integer
- Default value: 100,000

**mid.probe.event.queue.use_bulk**
Specifies whether events are sent to the server singly or in bulk. If this parameter evaluates to true then events are sent to the server in bulk.

- Type: true | false
- Default value: true

**mid.probe.event.suppress.whitespaces**
Allows line breaks in description fields for multi-line events. Apply this parameter to each MID Server used with event connector instances. Choices are:

- all
- leave_as_is
- keep_newline

- Type: string
- Default: all
**mid.em.metric.metric_to_ci_map_limit**
Specifies the maximum number of active metrics allowed per CI map.
- Type: integer
- Default value: 200,000

**mid.em.metric_binding_timeout_seconds**
Specifies the number of seconds to wait before resending unhandled events.
- Type: integer
- Default value: 300

**mid.em.metric_binding_timeout_max_seconds**
Specifies the maximum number of seconds to wait before resending unhandled events.
- Type: integer
- Default value: 10800

**mid.em.metric_max_elapsed_time_before_refresh**
Specifies the maximum number of seconds before the metric source type cache is refreshed in memory.
- Type: integer
- Default value: 60

**mid.em.metric_max_sql_string_length_for_types**
Specifies the maximum length of the string (composed of types) used for an SQL command.
- Type: integer
- Default value: 30000

**mid.em.statistics_report_period_sec**
Specifies the period, in seconds, between statistics reports to the instance. Use 0 to disable reporting. This parameter requires a restart.
- Type: integer
- Default value: 60

**mid.em.metric_connector_max_run_time_seconds**
Specifies the maximum number of seconds to collect metrics in every cycle.
- Type: integer
- Default value: 300

**mid.em.metric_connector_history_min**
Specifies the number of minutes to go back in history to retrieve metrics.
- Type: integer
- Default value: 180

**mid.em.metric_event_logging**
Specifies the level of metric and event logging. Choices are:

- none
- all
- events
- metrics
- metrics:<filter>
- events:<filter>

  - Type: string
  - Default value: none

**mid.em.metric_connector_late_arrivals_delay**

Specifies the number of seconds to delay when collecting metrics.

  - Type: integer
  - Default value: 30

**FTP connection parameters**

**mid.ftp.max_pool_size**

Specifies the maximum size of the FTP Connection Pool, in megabytes.

  - Type: integer
  - Default value: 25

**mid.ftp.max_per_target**

Specifies the maximum number of the FTP connections per target.

  - Type: integer
  - Default value: 5

**mid.ftp.max_conn_idle_time**

Specifies the maximum amount of time, in milliseconds, that an FTP connection can sit idle in the pool.

  - Type: integer
  - Default value: 300000

**mid.filesystem.max.ls**

Specifies the maximum number of files that can be returned in the filesystem list directory command.

  - Type: integer
  - Default value: 10000
Logging parameters

disable_monitors
Specifies whether to disable the MID Server from actively checking for monitors on the instance.
- Type: true | false
- Default value: true

mid.show.queries
Instructs the MID Server whether to log details about every query it makes to the ServiceNow instance. Typically this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.
- Type: true | false
- Default value: false

disable.remote.logging
Prevents the MID Server from logging any information to the MID Server log on the instance. Relatively little information is logged on the instance in any case, but setting this parameter to true eliminates all logging to the instance.
- Type: true | false
- Default value: false

disable.status
Prevents the MID Server from sending a status report to the instance every 10 minutes.
- Type: true | false
- Default value: false

Pattern parameters

mid.parsing.max_field_size
Sets the maximum character length of strings stored as temporary variables while patterns are run. Strings longer than this parameter’s value are truncated to equal the value. Use the parameter to increase the limit when parsing longer strings.

⚠️ Warning: Exceeding the max field size limits of the SQL database implementation cause errors.
- Type: integer
- Default value: 1024

mid.sa.discovery.pattern_string_attributes.deduplicate
Reduces memory consumption for pattern execution context attributes by eliminating duplicate strings.
- Type: true | false
Proxy server parameters

**mid.instance.use_proxy** or **mid.proxy.use_proxy**
If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to **true** to instruct the MID Server to use the proxy. You must also set the proxy server's host and port, and perhaps the user name and password as well.
- Type: true | false
- Default value: false

**mid.proxy.host**
If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to define the proxy's host.
- Type: string
- Default value: none

**mid.proxy.password**
If your MID Server must go through a web proxy to access the ServiceNow instance, and your proxy requires a password, set this parameter to define that password.
- Type: string
- Default value: none

**mid.proxy.port**
If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to define the proxy's port.
- Type: integer (0-65535)
- Default value: 80

**mid.proxy.username**
If the MID Server must go through a web proxy to access the ServiceNow instance, and the proxy requires a user name, set this parameter to define that user name.
- Type: string
- Default value: none

Request timeout override parameters

**mid.sa.cloud.request_timeout**
Sets the timeout in milliseconds for cloud requests. This parameter overrides the **glide.http.timeout** system property, which specifies the maximum number of milliseconds to wait before an outbound REST transaction times out.
- Type: integer
mid.http_classy.request_timeout

Sets the timeout in milliseconds for HTTP classification requests with the HTTP - Classify probe. This parameter overrides the glide.http.timeout system property, which specifies the maximum number of milliseconds to wait before an outbound transaction times out.

- Type: integer
- Default value: 30000

Security parameters

mid.windows_host.file_permissions.allow_list

Sets a white list for Windows file permissions enforcement to improve security. The parameter takes a string of comma separated group names, user names, and SIDs. Group and user names must follow SAM account naming requirements. Domain accounts can be specified by using the SID.

- Type: string (comma separated group and user names)
- Default value: None

mid.windows_host.file_permissions.enforce

Enables the MID Server to use Windows file permissions enforcement to improve security. Setting this parameter to false will prevent the MID Server from updating the file permissions white list, but will not revert the file permissions.

- Type: true | false
- Default value: true

Shazzam parameters

mid.shazzam.regulator.interval_ms

Sets the interval, in milliseconds, in which Shazzam can launch packets. This parameter works with the mid.shazzam.regulator.packets_per_interval parameter to set the number of packets allowed in this interval. By default, Shazzam launches one packet each millisecond.

- Type: integer
- Default value: 1

mid.shazzam.regulator.packets_per_interval

Sets the number of packets that Shazzam can launch in the configured time interval. This parameter works with the mid.shazzam.regulator.interval_ms parameter, which sets that interval. By default, Shazzam launches one packet each millisecond.

- Type: integer
- Default value: 1

mid.shazzam.chunk_size
Specifies the maximum number of IP addresses that Shazzam scans in parallel. This parameter primarily controls outbound port consumption.

- Type: integer
- Default value: 100

**mid.shazzam.threads**

Specifies the number of concurrent threads that Shazzam uses. Setting this or the **mid.shazzam.max_scanners_per_thread** parameter to 0 disables Shazzam multi-thread optimization.

- Type: integer
- Default value: 5

**mid.shazzam.max_scanners_per_thread**

Specifies the number of concurrent scanners processed by each Shazzam thread. Setting this or the **mid.shazzam.threads** parameter to 0 disables Shazzam multi-thread optimization.

- Type: integer
- Default value: 500

**SNMP configuration parameters**

**mid.snmp.enable_auto_public**

Specifies whether to use the SNMP public community string automatically if no other SNMP credentials were successful.

- Type: true | false
- Default value: true

**mid.snmp.request.timeout**

Specifies the timeout value for the first OID request, in milliseconds. For subsequent requests (for example, table OIDs), the **mid.snmp.session.timeout** configuration parameter (see below) takes effect.

- Type: integer
- Default value: 1500

**mid.snmp.session.timeout**

Specifies the timeout value for subsequent OID request, in milliseconds. SNMP communication is stateless and does not have a session or connection in the normal sense. The system regards a positive response from the first OID request as a sign that it should expect prompt responses to subsequent requests. While the default is short, it may be useful to increase this parameter value to the same value as that used for **mid.snmp.request.timeout**.

- Note: You can override this parameter with the **timeout** SNMP probe parameter.

- Type: integer
- Default value: 1500

**mid.snmp.session.timeout**

Specifies the timeout value for subsequent OID request, in milliseconds. SNMP communication is stateless and does not have a session or connection in the normal sense. The system regards a positive response from the first OID request as a sign that it should expect prompt responses to subsequent requests. While the default is short, it may be useful to increase this parameter value to the same value as that used for **mid.snmp.request.timeout**.

- Note: You can override this parameter with the **establish_session_timeout** SNMP probe parameter.
- Type: integer
- Default value: 500

**mid.snmp.use_getbulk**

Specifies whether to use GETBULK to receive a large amount of data in batches. This can be used to configure an individual MID Server.

- Type: true | false
- Default value: True

GETBULK can also be set at the probe level or globally for all MID servers. Settings are listed in the order of precedence:

- **SNMP probe parameter**
- **MID Server configuration parameter**
- **MID Server properties**

**mid.snmp.use_snmp4j**

Use the Snmp4j library for SNMP communication. This is a strict requirement for SNMPv3. This parameter should only be set to **false** based on advice from ServiceNow Technical Support.

- Type: true | false
- Default value: true

**mid.snmp.use_snmp_v1_v2c**

Use the Snmp4j library for SNMP communication. This is a strict requirement for SNMPv3. This parameter should only be set to **false** based on advice from ServiceNow Technical Support.

- Type: true | false
- Default value: true

**mid.snmp.use_snmp_v3**

Attempt communication using the SNMPv3 protocol version. Requires configuration of SNMPv3 credentials.

- Type: true | false
- Default value: true

**SSH Discovery parameters**

By default, the MID Server is configured to search for SSH commands in the following paths and the logged-on user’s default paths:

- /usr/sbin
- /usr/bin
- /bin
- /sbin

**mid.connection_cache**

Specifies whether to cache connections. Set to **false** to disable connection caching. This parameter applies to SSH connections only.
mid.ssh.set_path
Specifies whether to set the PATH environment variable for SSH commands.
- Type: true | false
- Default value: true

mid.ssh.local
Specifies whether to execute commands for the MID Server host machine (localhost) via SSH rather than from a console. This allows long-running commands to execute properly. This parameter applies to the legacy SSH client only.
- Type: true | false
- Default value: false

mid.ssh.connections_per_host
Controls the number of concurrent probes the MID Server can run against a given host. Lowering the number of concurrent connections can slow Discovery.
- Type: integer
- Default value:
  - 7 for the ServiceNow client
  - 3 for the legacy SSH client

mid.ssh.sudo_preserve_environment
Specifies whether to use sudo to preserve the environment for SSH.
- Type: true | false
- Default value: false

mid.ssh.path_override
Overrides the default paths set before executing a command. Enter one or more override paths delimited by a colon (:). The default path is /usr/sbin: /usr/bin: /bin: /sbin.
The ServiceNow SSH client accepts the following prefixes in front of the path_override value.
- append: Appends the override path to the end of the host’s path. This is the default behavior.
- replace: Replaces the host path with the path_override value.
- prepend: Appends the override path to the front of the host path.

mid.ssh.use_snc
Enables the ServiceNow SSH client (SNCSSH) on individual MID Servers. SNCSSH is a ServiceNow implementation of an SSH client and is active by default for all MID Servers on new instances, via a MID Server property. Enabling the ServiceNow SSH client disables the legacy J2SSH client.
Important: Mixing SSH client types for MID Servers connected to the same instance is not a good practice.

- Type: true | false
- Default value: false

**mid.ssh.max_retries**

Specifies the maximum amount of times to retry an SSH operation after a time-out. The system sleeps two seconds between each connection attempt. By default, the MID Server retries once only. Set the parameter to 0 to disable retries.

- Type: integer
- Default value: 1

**mid.ssh.alt_rm**

Sets a different SSH remove file command.

- Type: string
- Default value: none

**mid.ssh.initial_delay_ms**

Delays sending any SSH probe commands to a server after connecting to the target for the time specified, in milliseconds. This parameter applies to the legacy SSH client only.

- Type: integer (milliseconds)
- Default value: 0

**mid.ssh.suppress_history**

Suppresses the generation of the SSH history file. This parameter applies to the legacy SSH client only.

- Type: true | false
- Default value: false

**mid.ssh.socket_timeout**

Specifies the timeout value for the SSH socket to prevent issues created by a socket timeout. Some devices, such as systems with embedded controllers like UPSs and PDUs, that have SSH enabled require more time to respond to an authentication request. The default value of 2 minutes ensures such requests do not timeout prematurely.

- Type: integer (milliseconds)
- Default value: 120000 (2 minutes)

**mid.ssh.channel_timeout**

Specifies the amount of time that the MID Server waits for activity on the SSH socket before closing the connection. If there has been no activity on the SSH socket for the specified timeout value, the MID Server closes the connection. Some devices, such as systems with embedded controllers like UPSs and PDUs, that have SSH enabled may require more time to respond to an authentication request.

- Type: integer (milliseconds)
- Default value: 120000 (2 minutes)

**mid.ssh.session_timeout**
Specifications the amount of time that a cached session remains in memory after last use. Excessively small values tend to decrease performance. This parameter applies to the ServiceNow SSH client only.
- Type: integer (milliseconds)
- Default value: 300000 (5 minutes)

**mid.ssh.command_timeout_ms**
The timeout duration, in milliseconds, for the execution of an SSH command.
- Type: integer (milliseconds)
- Default value: 300000 (5 minutes)

**mid.ssh.use_keyboard_interactive**
Uses the keyboard interactive authentication mode in SSH daemons on which it is activated.
- Type: true | false
- Default value: false

**Caution:** An issue exists in Mac OS X Sierra and later with the authentication order of the **password** and **keyboard-interactive** modes that can cause Discovery to fail. For details about this issue and the configuration required for proper SSH authentication, see [KB0623600](#).

**mid.ssh.dh_group_length_min**
Specifies the minimum group length in bits used for generating a "shared secret" key in Diffie-Hellman key exchange. The larger the key the more secure the SSH connection is but at the cost of performance.
- Type: integer (bits)
- Default value: 1024

**mid.ssh.dh_group_length_max**
Specifies the maximum group length in bits used for generating a "shared secret" key in Diffie-Hellman key exchange. The larger the key the more secure the SSH connection is but at the cost of performance.
- Type: integer (bits)
- Default value: 2048

**mid.ssh.shells_supported**
Defines the bourne-compatible shells supported by the MID Server. This value is a comma-separated list of supported shells, such as **ksh**, **dsh**, **bash** and **sh**.
- Type: string
- Default value: ksh,bash,sh

**mid.ssh.discard_lrc_error**
Discard long running command error output, emulating legacy behavior.
• Type: string
• Default value: j2ssh - true, sncssh - false

mid.ssh.pool_thread_ratio
Ratio of the SSH session pool capacity to the configured MID Server thread number (threads.max), expressed as a percentage. The number of permitted pool capacity sessions is set in this parameter. Regardless of the value set in this parameter, the system never permits the pool capacity to fall below 25 sessions.
• Type: integer
• Default value: 150

mid.ssh.disable_privilege_check
This parameter has no effect if the target is using a privileged command other than sudo. For more information, see MID Server privileged commands.

The remainder of this section only applies to targets which run sudo. When this parameter is set to true, the MID Server assumes that the user configured in the credential has the privilege to run the given command using sudo. The MID Server assumes the target user can run any command string following sudo on the target. When this parameter is set to false, the MID Server runs "sudo -l" on the target to verify the command which follows sudo has permission to run on the target. Regardless of this parameter's value, the MID Server always validates that sudo by itself can be run on the target.

Some releases do not show this parameter in the MID Configuration Parameters pull down list. In this case, you may optionally add this parameter in MID Properties.
• Type: true | false
• Default value: false

Upgrade parameters

mid.pinned.version
Name of the version to which this MID Server is pinned.
• Type: string
• Default value: MID buildstamp

Note: To see the MID buildstamp for your instance, type stats.do in the navigation filter. An example of the buildstamp format is london-06-27-2018__patch3-10-24-2018_11-11-2018_0542.

mid.upgrade.use_proxy
If your MID Server must go through a web proxy to access the upgrade URL, set this parameter to true to instruct the MID Server to use the proxy. You must also set the proxy server's host and port. If the instance proxy user name and password are set, they are used for the upgrade proxy as well.
• Type: true | false
• Default value: false

glide.mid.autoupgrade.proxy_host or glide.glidesoap.proxy_host
If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's host here.

- Type: string (URL)
- Default value: none

**glide.mid.autoupgrade.proxy_port or glide.glidesoap.proxy_port**

If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's port here.

- Type: integer (0-65535)
- Default value: 80

**glide.mid.autoupgrade.proxy_user**

If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's user name here.

- Type: string (URL)
- Default value: none

**glide.mid.autoupgrade.proxy_password**

If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's password here.

- Type: string
- Default value: none

**Windows Discovery parameters**

**mid.monitoring.force_sigar_cpu_monitoring**

Enables CPU monitoring on Windows MID Server hosts using Java 11. An outdated SIGAR library causes the MID Server to crash. If you patch the SIGAR library, set this value to `true` to enable CPU Monitoring for Windows with Java 11.

- Type: true | false
- Default value: false

**mid.powershell_api.session_pool.max_size**

Specifies the maximum number of sessions allowed in the session pool.

**Note:** Setting or changing this parameter requires restarting the MID Server.

- Type: integer
- Default value: 25

**mid.powershell_api.session_pool.target.max_size**

Specifies the maximum number of sessions allowed in the pool per target host.
**Note:** Setting or changing this parameter requires restarting the MID Server.

- **Type:** integer
- **Default value:** 2

**mid.sa.prefer_powershell**
Enables MID Server to use PowerShell Remoting.
- **Type:** true | false
- **Default value:** false

**mid.powershell_api.winrm.use_ssl**
Requires the use of SSL certificates for HTTPS connections using WinRM.
- **Type:** true | false
- **Default value:** false

**mid.powershell_api.winrm.additional_pssesion_options**

**mid.powershell_api.winrm.remote_https_port**
Configures the port for connecting to Windows servers using PowerShell over HTTPS.
- **Type:** integer
- **Default value:** 5986

**mid.powershell_api.winrm.remote_port**
Configures the port for connecting to Windows servers using PowerShell over HTTP.
- **Type:** integer
- **Default value:** 5985

**mid.powershell_api.winrm.skip_ssl_cert_check**
Skips the SSL certificate check when using WinRM for HTTPS connections.
- **Type:** true | false
- **Default value:** false

**mid.powershell_api.winrm.skip_ssl_cert_check_options**
Skips specific SSL certificate checks when using WinRM for HTTPS connections. Configure the MID Server to skip checks for certificates from a Certification Authority (CA), from the Common Name (CN) that identifies the host associated with the certificate, and for revoked certificates.
- **Type:** string
- **Default value:** -SkipCACheck -SkipCNCheck -SkipRevocationCheck

**mid.powershell.use_credentials**
Determines the credentials to use for Discovery with PowerShell. A setting of true directs the MID Server to run probes with the Windows credentials from the credentials table. To run probes with the credentials of the user for the MID Server service, set this parameter to false.

- Type: true | false
- Default value: true

### mid.powershell.path

Enables an administrator to point to a specific PowerShell on a MID Server in cases where more than one PowerShell is installed. Supply the path to the folder containing the PowerShell executable, for example, C:\mypowershell or C:\mypowershell\. ServiceNow automatically appends the string powershell.exe to the path. Configure this parameter when both a 32-bit and 64-bit PowerShells are active on the same MID Server, and it becomes necessary to launch the correct PowerShell for the context. 64-bit Windows employs file system redirection and the MID Server runs as a 32-bit application. If trying to specify a path in %WinDir%\System32, Windows automatically redirects to %WinDir%\SysWOW64. To avoid redirection, specify the path as %WinDir%\Sysnative. For example, instead of C:\WINDOWS\system32\WindowsPowerShell \v1.0\, specify C:\WINDOWS\sysnative\WindowsPowerShell\v1.0\. 

**Note:** On a 64-bit version of Windows XP, a Microsoft hotfix may be required to enable this.

To discover applications running on a 64-bit Windows machine, the MID Server must be running on a 64-bit Windows host machine.

- Type: string (path)
- Default value: none

### mid.powershell.enforce_utf8

Enable this parameter to force commands on a target Windows system to return UTF-8 encoded output. Disabling it allows the target system to use its default encoding. This parameter is only valid when PowerShell is enabled.

Setting this value to false may result in incorrect values in the CMDB when non-ASCII characters are returned by a probe.

- Type: true | false
- Default value: true

### mid.powershell.local_mid_service_credential_fallback

Enables automatically falling back to MID Server service credentials if all other credentials fail.

- Type: true | false
- Default value: true

### mid.powershell_api.idle_session_timeout

Specifies the timeout value of idle PowerShell sessions in seconds.

**Note:** Setting or changing this parameter requires restarting the MID Server.

- Type: integer
- Default value: 60
mid.powershell.command.parameter_passing
Enable this parameter to allow passing PowerShell parameters from the command line.
- Type: true | false
- Default value: false

mid.powershell.command.script.parameter_passing
Enable this parameter to allow passing PowerShell scripts from the command line.
- Type: true | false
- Default value: true

mid.windows.management_protocol
Enables administrators to select the Windows management protocol used for device and process classification. Options include: WMI and WinRM.
- Type: string
- Default value: WMI

mid.windows.probe_timeout
Sets the timeout interval for all Windows probes on a specific MID Server. This value is overridden by the values configured for individual probes with the wmi_timeout probe parameter.
- Type: integer
- Default value: 300

mid.powershell.jea.append_username
Specifies whether user name of the current user will be appended to the JEA endpoint.
- Type: true | false
- Default value: False

mid.powershell.jea.endpoint
JEA configuration name (endpoint) on remote servers that the MID Server will connect to. Set to JEA_DISCO_BASIC.
- Type: string
- Default value: ""

Add a MID Server parameter

Use a MID Server parameter to control the behavior of a particular MID Server.
Role required: admin
1. Navigate to MID Server > Servers.
2. From the list of MID Servers, select a MID Server to configure.
3. Select the Configuration Parameters related list.

This shows all the parameters currently in the MID Server's configuration file. If there are any passwords, they are displayed in asterisks for security reasons. See MID Server parameters for a list of available parameters.
Defining MID Server configuration parameters

4. To add parameters, click **New**, and then complete the form.

After the form is submitted, the configuration file for that MID Server is modified to include the new parameter. Changes to existing parameters are reflected in the MID Server configuration file as well. Changes made to the MID Server configuration file do not take place immediately, but rather the next time the MID Server is restarted. The MID Server form has a related link for restarting the MID Server.
Note: ServiceNow prevents you from saving changes, such as modifying or deleting parameters, that would cause the MID Server to lose communications with the instance. For example, you cannot change the url parameter. Any changes to these protected parameters must be made directly in the config.xml file for that MID Server.

5. (Optional) Set parameters in the config.xml file.

   MID Server configuration is controlled by an XML file called config.xml. This file is located in the /agent directory, in the MID Server installation directory. You can edit this file directly to make any configuration changes to protected parameters. Many configuration changes, such as those that do not disrupt communication between the MID Server and the ServiceNow instance, may also be made from the instance.

   The structure of the config.xml file is simply an outer parameters tag and a series of inner parameter tags. Each parameter tag has name and value attributes.

   - To change the value of a parameter, edit the value attribute.
   - To add a parameter, add another parameter tag with its name and value.
   - To delete a parameter, delete the entire parameter tag.

   The order of the parameters within the file is not important. Notice the green comment sections in the sample. Use these elements to add useful comments to the configuration file.

Note: When configuring the MID Server for use with a proxy server, be sure to remove the comment tags around the proxy sections that you configure.
MID Server config.xml file

Note: The sample file here is from a Firefox browser. Conventional text editors, such as Notepad, WordPad, or TextEdit, do not display colors and variable fonts.

MID Server protected records and reserved characters

Some MID Server records cannot be altered. Certain special characters are pre-defined in XML and cannot be used in passwords.
MID Server Records that cannot be altered

These records cannot be modified or deleted.

<table>
<thead>
<tr>

</tbody>
</table>

Using special characters in an XML file

The XML specification defines five predefined entities that represent special characters, and requires that all XML processors honor them. If these characters are used in a password, you will experience unexpected results.

The following characters represent the five pre-defined entities:

- "
- &
- ' 
- <
- >

If you use the pre-defined entity characters in an XML file, such as the MID Server configuration file, you need to encode them. To encode pre-defined entities into an XML document:
For example, to specify the password as `test&` in the MID Server config.xml file:

```
<parameter encrypt="true" name="mid.instance.password" value="test&amp;"/>
```

### MID Server privileged commands

To discover certain information on a host server, the MID Server must run SSH commands with higher privileges. The platform provides default privileged commands for the MID Server to use and the ability to add additional commands to the system.

An example of information that requires elevated privileges is information about storage disks on a host server, retrieved with the `fdisk -l` command. If your system cannot use sudo commands, you must configure the hosts in your network to use one of the other privileged commands. You can configure different privileged commands for different hosts. However, Discovery supports only one privileged command per host.

**Important:** You can edit supported privileged commands, but do not delete them.

For a list of possible SSH commands requiring root privileges, see [SSH credentials](#).
SSH privileged escalation command requirements

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| sudo    | - Host must support the `sudo -S -p <password>` command and return the correct list of allowed SSH commands.  
- Credentials provided for Discovery must be able to run the command `sudo -S -p <password> <commands>`.  
- Credentials provided for Discovery must be able to run the command `sudo -S -p <password> <commands>`.  
- Discovery does not support any other `pbrun` options, such as a password prompt.  
- The instance must be able to reach the target host via SSH. |
| pbrun   | - Host must support the `pbrun -v` command and return the correct version of PowerBroker.  
- Credentials provided for Discovery must be able to run `pbrun <commands>`.  
- Discovery does not support any other `pbrun` options, such as a password prompt.  
- Discovery does not support any other `pfexec` options, such as a password prompt. |
| pfexec  | - Host must support the `pfexec id -a` command and return the correct ID.  
- Credentials provided for Discovery must be able to run `pfexec <commands>`.  
- Discovery does not support any other `pfexec` options, such as a password prompt. |
| dzdo    | - Host must support the `dzdo -v` command and return the path to dzdo in standard output.  
- Credentials provided for Discovery must be able to run `dzdo <commands>`.  
- Discovery does not support any other `dzdo` options, but Discovery supports password authentication for dzdo. |

Long-running commands with sudo

Configure J2SSH and ServiceNow SSH to prevent long running commands using sudo from failing when the MID Server disconnects.

ServiceNow SSH allows probes to run sudo against individual commands or an entire, long-running script. This is also supported for the `pbrun` and `pfexec` privileged commands.

Sudo for individual commands

You can run sudo against individual commands within a probe, but only if all the following sudoer configurations are performed on the target:

- The `!requiretty` option is required.
- Allow individual commands to be run by the user in the provided credential with `NOPASSWD` configured.
The target specifies an individual sudo call in the command or referenced scripts. For example, set sudo as "sudo fdisk -I" or "${sudo:fdisk -I}" rather than "must_sudo" for the entire script.

Note: Running sudo against individual commands with ServiceNow SSH produces detailed and useful entries in the sudo logs on the target computer.

Running sudo on an entire script

If any of the required sudoer configuration requirements for individual commands is not in place, Discovery applies sudo to the initial and complete probes, and does not execute sudo remotely inside the command. This condition can be forced by setting must_sudo on the probe and eliminating any sudo commands within the probe.

This approach prevents long running commands from failing when the probe disconnects, but cannot specify individual commands in the sudoers configuration.

Logging

The logs from ServiceNow SSH sudo activity run against an entire script show cryptic entries, such as /tmp/.run.aef13123fe124123, which prevent administrators from controlling permissible commands and knowing the exact command that was run. Sudo run against individual commands produces more detailed log entries, such as /sbin/fdisk –l.

Add a new privileged command for use by the MID Server

Add a new privileged command to the Privileged Command (privileged_command) table that is available to your MID Servers.

Role required: admin

Important: Do not delete any of the supported commands.

1. Navigate to MID Server > Privileged Command and click New.
2. Complete these fields:
   - Command: The name of the privileged command.
   - Password Prompt: The password prompt displayed to the user for this privileged command, or a regular expression that matches this password prompt. If this field is empty, no password is required for this privileged command, and no prompt is displayed. SUDO commands do not require a password prompt.
3. Click Submit.

Configure the MID Server to use specific privileged commands

You can configure the MID Server to use specific commands in a defined order.

Role required: admin

1. Navigate to the list of MID Servers using one of the following paths:
   - MID Server > Servers
   - Discovery > MID Servers
   - Orchestration > MID Servers
2. Select the MID Server you want to configure.
3. Click the menu icon in the header bar and select View > Advanced from the context menu.

4. In the Privileged Command related list, click Edit.
5. Select the command you want this MID Server to use and click Save.

The default order of privileged commands is 100, but you can change the order as necessary. The privileged command with the smallest order number is tried first.
List of privileged commands to use for a MID Server

Create a pbrun profile privileged command

You can create a special configuration for the pbrun privileged command that allows it to run as a profile.

Role required: discovery_admin, admin

Of all the privileged commands, only the pbrun command can be configured to run as a profile, and only one of these special pbrun configurations can function on a MID Server.

Important: Edit the existing pbrun record for this purpose. The system ignores any additional commands you create for pbrun.

1. Navigate to MID Server > Privileged Command.
2. Select pbrun from the list.
3. In the Privileged Command record, edit the value in the Command field to use the format pbrun -u <profile>.
   For example, you can set pbrun -u admin as a command to run with an admin profile.
4. Click Update.

Return to Configuring MID Servers.

MIDSystem methods

MIDSystem variables (referred to by the variable name ms.) provide a variety of methods to get information about the MID Server.
Ensure that the MID Server can connect to elements inside and outside your network
Download and install the MID Server on a Linux or Windows host
Configure your MID Server
Configure MID Server security

This example writes a message to the log:
```java
ms.log('Attempting to log in with user: ' + 
   this.getParameter('user'));
```

**MID Server heartbeat**

The instance checks the MID Server for a response every 5 minutes, using a synthetic transaction monitoring system.
Ensuring MID Server Connectivity

1. Ensure that the MID Server can connect to elements inside and outside your network.
2. Download and install the MID Server on a Linux or Windows host.
3. Configure your MID Server.

Checking for a heartbeat

ServiceNow instances send a synthetic transaction via the Heartbeat probe to every MID Server every 5 minutes. The Heartbeat probe functions exactly as a normal probe does and is sent by writing an output record to the ECC queue. A MID Server retrieves the record when it queries the ECC queue for work. The MID Server processes the probe just as it would any other probe and responds back to the instance. If the instance does not detect a response from a MID Server, the instance marks that MID Server as Down. If the MID Server responds, the instance considers the MID Server to be functioning and communicating properly with the instance.

Note: Make sure that your MID Server can communicate on port 443. See Configure MID Server network connectivity and MID Server system requirements for more information.

System events

When a MID Server transitions from one state to another, one of these events is triggered:

- **mid_server.up**: The MID Server goes from a status of Down, Paused, or Upgrading to a status of Up.
- **mid_server.down**: The MID Server goes from a status of Up to a status of Down.
- **mid_server.paused**: The MID Server is paused.
- **mid_server.upgrading**: The MID Server is being automatically upgraded because the instance is being upgraded.

You can use these events to send notifications or trigger actions that you specify in scripts.

Scheduled job

To change the trigger interval for the Heartbeat probe, navigate to System Scheduler > Scheduled Jobs > Scheduled Jobs. Open the MID Server Monitor record and edit the interval.
ServiceNow Orlando Now Platform capabilities

**MID Server heartbeat trigger interval**

**Set the MID Server JVM memory size**

The MID Server starts with a default JVM memory allocation, but you can modify this setting in the configuration file.

Role required: admin
In the base ServiceNow system, the MID Server JVM memory is set to 1024 MB, which is configured in the \agent\conf\wrapper-override.conf file in the MID Server installation directory. This setting might not be appropriate for the way your organization uses the MID Server. If you want the MID Server to work harder, allocate more resources to it. If the MID Server is located in a small branch office and runs in an environment where memory allocation is shared between a print server, mail server, or web proxy server, the allocation might have to be reduced.

**Note:** For a complete list of minimum MID Server requirements, see *MID Server system requirements*.

1. Open the \ServiceNow\<MID Server name>\agent\conf\wrapper-override.conf file in a text editor.
   
   For more information about this file, see *Installing Multiple MID Servers on a Single System*.

2. Locate the following lines in the file:

   # OPTIONAL: Maximum Java Heap Size (in MB)
   wrapper.java.maxmemory=1024

3. Edit the memory allocation.
4. Remove the comment tag (#) from the memory allocation parameter.
5. Save the file.
6. Restart the MID Server service.

**Pause the MID Server**

Pause the MID Server to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

Role required: agent_admin
Ensure that the MID Server can connect to elements inside and outside your network.

Download and install the MID Server on a Linux or Windows host.

Configure your MID Server.

Configure MID Server security.

You can only pause validated MID Servers. You might want to pause the MID Server when your network infrastructure is undergoing changes. This prevents applications like Discovery from throwing errors during a particular maintenance window.

A paused MID Server continues processing commands that it had already retrieved before it was paused. When you resume the MID Server, the MID Server starts retrieving new commands to process.

1. Open the MID Server record.
2. Select a running MID Server that has been validated.
3. On the MID Server form, select Pause MID under Related Links.
   The state of the MID Server changes to Paused.

A paused MID Server

4. To resume MID Server processing, select Resume MID under Related Links.

MID Server pause

The MID server can be put into a Paused state to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.
Unlike stopping the MID Server from the Windows or Linux server command line on the MID Server machine, pausing the MID server is something that you can do from the instance. The MID Server pause feature is available starting with the Istanbul release.

**Note:** You can only pause validated MID Servers.

You can still perform these actions when the MID Server is paused:

- Access the MID Server logs and delete log entries.
- View MID server statistics. While the MID Server is in the **Paused** state it stops generating statistics. But you can still view the statistics generated before you paused the MID Server.
- Retrieve the MID Server thread dump.
- Make and save configuration changes and property changes to the server. The changes take effect after the MID Server is resumed.
- Clear the ECC queue.

The MID server heartbeat continues to function while the MID Server is in the **Paused** state. If the MID Server is upgraded while it is in the **Paused** state, the MID Server state automatically changes to **Up** after successful upgrade. It does not return to the **Paused** state.

During **MID Server selection**, paused MID Servers can still be selected but are prioritized below MID Servers that are not paused.

**Events that occur during MID Server pause**

The vCenter and SNMP event collectors, continue to run and process events when you pause the MID Server. These events are not part of the normal synchronous communication that the MID Server has with the instance that you see in the ECC queue. Events are still relayed to the instance and can even trigger actions on records in the instance, such as a CI update. For example, if vCenter detects that a virtual machine goes down or is deleted, a vCenter event makes a change to the status of the corresponding CI record for that virtual machine.

To prevent these events from being processed, stop the extensions from running. For more information, see:

- Configure and run the vCenter event collector extension
- Configure the SNMP Trap Collector Extension

**Notifications**

Email setup

All email notifications use the email properties that you define for your instance and the email accounts that you set up. Your email service can also affect the successful transmission of incoming and outgoing email.

Email accounts

Email administrators set up email accounts to allow the system to connect to external mail services such as POP3, SMTP, or IMAP servers. You can use the ServiceNow-provided email accounts or create your own accounts for your own email services.

Email properties

Use Email Properties to configure settings for inbound and outbound email. Email properties apply to all email accounts.

Email service size restrictions

Your email service, whether you are using a standard ServiceNow email configuration or an alternate email configuration, determines the successful transmission of incoming or outgoing emails based on a maximum email size. An email configuration consists of your instance, email server, and email client.

- Standard email configurations – For instances that use the standard email configuration, the ServiceNow mail servers cannot send or receive emails larger than approximately 50 MB (before encoding), including the email header, body text, and attachments. Email messages are encoded by an email client, which increases total email message size. The maximum ServiceNow mail server size restriction is 75 MB (after encoding). The maximum email size limit is enforced regardless of any configured attachment size limits.

- Alternate email configurations – If your email service uses a company-owned or third-party server, the approximate size restriction of 50 MB (including the email header, body text, and attachments) may still apply. However, your service might support different maximum total file sizes for inbound and outbound emails. Check with the email administrator of your email service to verify email size limits.

For details on how encoding can affect email message size and email transmission, see KB0521772.
Email service availability

Email service is intentionally shut down on instance clones to prevent resending already delivered email. Upgrades no longer require an extended interruption of email service. Instances continue to process email during an upgrade. For a possible explanation for undelivered emails, see the blog post Whitelisting emails sent from the ServiceNow infrastructure by a ServiceNow Technical Support Engineer in the Now Community.

For instructions on creating and sending custom emails when events on the instance occur, see the tasks in Email and SMS notifications.

Instance-to-instance communication via email

Use Web services to communicate between two instances.

Designate untrusted and trusted email domains

Using Instance Security Center, you can monitor the blocked and allowed incoming email metrics for your instance. For more information, see Designate email domains as untrusted or trusted.

Next steps after enabling email

After enabling email on your instance, consider performing several of these important tasks.

- Test the email configuration by routing all email to a single user (set the glide.email.test.user property).
- Review the baseline notification categories, email notifications, and templates to determine if they meet your business needs.
- Review the baseline inbound email actions to determine if they meet your business needs.
- Determine if you want to use email layouts to add consistent content elements.
- Determine if you want to use email filters to restrict the email the instance receives.
- Determine if you want to implement a retention policy to archive and destroy email at certain intervals.
- Determine what kind of watermarks outbound email uses to associate records with email messages.
- Determine if you want to create users when the instance receives an email from an unrecognized user.
- Set the precedence of outgoing mail. By default, the instance sends email with a precedence of bulk (set the glide.smtp.precedence_bulk property).
- Consider preventing untrusted users from triggering inbound actions to prevent unwanted email from affecting your instance.
- Implement a spam filter to restrict unwanted messages sent to your custom email addresses.

Basic email setup

All production instances can send and receive email using ServiceNow-provided resources. The instance has an email address of instance@service-now.com.
Network layout for standard email configuration
Basic email services and features

- Mail servers maintained by ServiceNow.
  - Encrypt mail with opportunistic TLS (Transport Layer Security) if supported by your mail servers.
    If your internal mail servers send and receive messages via a TLS-encrypted channel, ServiceNow mail servers support that communication.
  - Provide a dedicated mailbox for your instance.
- Pre-configured email accounts to connect to ServiceNow mail servers.
  - An SMTP account sends email to your primary Mail Exchange (MX) server from your instance email address of instance@service-now.com.
  - A POP3 account receives email sent to your instance email address of instance@service-now.com.
- High availability features from ServiceNow datacenters.
- Spam detection for incoming email.

Administrators who want to use basic email services can do so by enabling the email properties for sending and receiving email.

Enable basic email

Enable basic email to use ServiceNow-provided email servers and accounts.

Role required: admin

1. Navigate to System Properties > Email.
2. Configure these email properties and click Save.

<table>
<thead>
<tr>

Advanced email setup

With an advanced email setup, you can use your own SMTP server, POP3 server, or both.

Setting up your own email environment can be useful if you want to use existing filtering, retention, or compliance aspects of your internal email architecture. You can set up email in several ways:

- Use your own SMTP server to forward email to ServiceNow servers.
- Use your own SMTP server to send email.
- Use your own POP3 server to receive email.
- Use your own SMTP and POP3 servers to send and receive email.
- Use an OAuth 2.0-enabled SMTP server to send email from a third-party service.
- Use an OAuth 2.0-enabled IMAP server to receive email from a third-party service.

The following procedures assume that you enabled basic email properties.
Enable using your own SMTP server

Enable using your own SMTP server so that you can leverage the existing filtering, retention, or compliance aspects of your own SMTP server while also using the ServiceNow POP3 server.

- Role required: admin
- Email server required: SMTP
- Basic email properties: enabled

You can combine your own internal email architecture with the ServiceNow email architecture to handle email. The following diagram demonstrates how you would use your own SMTP server alongside the ServiceNow POP3 server.
1. Navigate to System Mailboxes > Administration > Email Accounts.
The system displays the list of available email accounts.

2. Locate the record for **ServiceNow SMTP** and change **Active** to **false**.

3. Click **New**.

4. Create an email account record for your SMTP server where the **Type** is **SMTP**.

5. From **Related Links**, click **Test Connection**.
   
   If the email account is valid, the system returns a success message.
Configure the SMTP server in your internal email architecture to forward email from the custom email address to the instance email address. Implement a spam filter on the custom email address.

**Enable using your own POP3 server**

You can use your own POP3 server to store and receive email for the instance.

- **Role required:** admin
- **Email server required:** POP3
- **Basic email properties:** enabled

1. On your POP3 server, create a mailbox for your instance that has a custom email address. For example, create a mailbox for service-desk@company.com.
2. Navigate to System Mailboxes > Administration > Email Accounts. The system displays the list of available email accounts.
3. Optional: If you do not want to receive email sent to the instance@service-now.com mailbox, locate the record for ServiceNow POP3 and change Active to false. An instance can receive email from multiple POP3 accounts at the same time. Leaving the ServiceNow POP3 account active allows the instance to receive email sent to the instance default email address.

4. **Click New.** The system displays a blank Email Account form.
5. **Create an email account record for your POP3 server where the Type is POP3.**
6. From Related Links, click Test Connection. If the email account is valid, the system returns a success message.

Enable using your own SMTP and POP3 servers

You can use your own SMTP and POP3 servers to send email from the instance and to store and receive email for the instance.

- Role required: admin
- Email servers required:
  - SMTP
  - POP3
- Basic email properties: enabled

1. On your POP3 server, create a mailbox for your instance. For example, create a mailbox for service-desk@company.com.
2. Navigate to System Mailboxes > Administration > Email Accounts. The system displays the list of available email accounts.
3. Locate the record for ServiceNow SMTP and change Active to false.

4. Optional: If you do not want to receive email sent to the instance@service-now.com mailbox, locate the record for ServiceNow POP3 and change Active to false.

An instance can receive email from multiple POP3 accounts at the same time. Leaving the ServiceNow POP3 account active means that the instance receives email sent to its default email address.
5. Click **New**.
   The system displays a blank Email Account form.

6. Create an email account record for your SMTP server where the **Type** is **SMTP**.

7. From **Related Links**, click **Test Connection**.
   If the email account is valid, the system returns a success message.

8. Click **New**.
   The system displays a blank Email Account form.

9. Create an email account record for your POP3 server where the **Type** is **POP3**.

10. From **Related Links**, click **Test Connection**.
If the email account is valid, the system returns a success message.

Connection Test

Connection Successful
OAuth email authentication

OAuth enables your instance to receive and send email through a third-party email account.

Open Authentication (OAuth) is an open standard for authorization that provides administrators with an authorization method when connecting to incoming IMAP and outgoing SMTP servers. OAuth enables an instance to receive and send email from a third-party account, such as Gmail, without having to enter the credentials for that account.

The OAuth 2.0 implementation requires you to obtain an access and refresh token from your third-party email provider for each third-party email account. The tokens are automatically saved to the instance database. They provide authorization for all email communication between the instance and the authorized third-party account. A scheduled job regularly checks to see if email access tokens are valid. If the access token is not valid, but the refresh token is, the instance automatically regenerates a new access token.

OAuth 2.0 support is available starting with the Geneva release. The OAuth implementation supports IMAP and SMTP accounts only. POP3 is not supported. OAuth 1.0 is no longer supported.

Note: Customer email accounts configured to use OAuth 1.0 authentication with Gmail cease to function as of April 20, 2015. See KB0546976 for more information.

Activating the Email - OAuth support for IMAP and SMTP plugin allows you to use OAuth with email. If you upgrade to Geneva or later instances and are already using OAuth 1.0, activate the plugin again.

See Outbound REST with OAuth 2.0 profile tutorial - integrating with Google Contacts API for an example of using an OAuth 2.0 profile to authenticate an outbound REST message with Google to retrieve contact information. Also see OAuth 2.0 for more information on OAuth 2.0 support in the instance.

Activate the OAuth email authentication plugin

OAuth email authentication requires the Email - OAuth support for IMAP and SMTP plugin.

Role required: admin

1. Navigate to System Definition > Plugins.

   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   Note: To redirect to the legacy list view for plugins, click the link.

   You have been redirected to All Applications. To see the Plugins list click here

2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.

   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

   • If you’re certain that you have the correct plugin, click Install, then in the Activate Plugin dialog box, click Activate.
To view plugin details before activation:
1. Click the plugin name.
2. On the form, click the **Activate/Update** related link.
3. In the dialog box, review the dependent plugins.
   
   If your plugin requires dependent plugins, they're activated automatically when you activate your plugin if they're not active already.
4. If demo data is available and you want to install it, click **Load demo data**.
   
   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.
5. Click **Activate**.

---

**Enable OAuth 2.0 for email**

Setting up OAuth 2.0 for email requires you to obtain access and refresh tokens from your email provider.

- Role required: admin
- Plugin required: Email - OAUTH support for IMAP and SMTP

1. Log in to your third-party email account, such as Gmail, and enable OAuth 2.0.
2. Obtain the following from your third-party email account:
   
   - client ID
   - client secret
   - authorization URL
   - token URL
   - redirect URL
   - token revocation URL
3. Navigate to **System OAuth > Application Registry**.
4. Click New.
5. Click Connect to a third party OAuth Provider to create an application registry record that email uses.
6. Use the information you obtained from your third-party email account to fill in the fields on the form. See Use a third-party OAuth provider for instructions. Create the OAuth application registry record and its associated OAuth Entity Profile and OAuth Entity Scope records.
7. Click Submit.
8. Navigate to System Mailboxes > Administration > Email Accounts. The system displays the list of available email accounts.
9. Optional: If you do not want to receive email sent to the default instance email address, locate the record for ServiceNow POP3 and change Active to false. The system can receive email from multiple POP3 and IMAP email accounts.
10. Locate the records for ServiceNow SMTP and change Active to false.

11. Click New. The system displays a blank Email Account form.
12. Create an email account record for your OAuth 2.0 SMTP server where the Type is SMTP.
13. For Authentication, select OAuth 2.0.
14. For OAuth Profile, select the application registry record you created.
15. Click Authorize Email Account Access to obtain the access and refresh tokens. Another browser window opens asking you to authorize the account access on the third-party email account.
16. Authorize the access.
17. Click New. The system displays a blank Email Account form.
18. Create an email account record for your OAuth 2.0 IMAP server where the Type is IMAP.
Use the same **Authentication** and **OAuth profile** settings as the OAuth SMTP email account.

**Email accounts**

Email accounts store the connection details and credentials the system uses to access external email servers and services.

By default, instances come with email accounts for ServiceNow-managed SMTP and POP3 servers to send and receive email. These accounts cannot be modified, but can be deactivated if you do not want to use them. To connect to other email servers and services you must create email accounts for them. You can create email accounts for servers and services that use these protocols:

- SMTP
- POP3
- IMAP

Note: The system only allows one SMTP email account to be active at a time and sends all email through this account. You can however receive email from multiple POP3 or IMAP accounts.

The system stores individual email accounts in the **sys_email_account** table. Create separate email accounts to send and receive email. Use **email properties** to define how the system processes email for all email accounts.

By default, the ServiceNow POP3 server provides each instance with its own mailbox at the address instance@service-now.com. Likewise, the ServiceNow SMTP server sends email from the address instance@service-now.com. To create another mailbox, provision your own POP3 or IMAP server and create an email account to the server on the instance. To change the sent from email address, update the address in the email account you use for sending email.

Emails received via a POP3 or IMAP server account are stored in the Email (sys_email) table and then deleted from the account.
A ServiceNow configured email account

Configure an email account

You can create email accounts in addition to the accounts provisioned for you.

- Role required: admin
- Email server: a compatible email server
  - SMTP
  - POP3
  - IMAP
**Warning:** An SMTP server that uses a localhost or loopback (127.0.0.1) IP address is not accepted as a compatible email server. For more information, see KB0724199.

1. Navigate to **System Mailboxes > Administration > Email Accounts**.
2. Click **New**.
3. Fill in the fields on the form (see table).

**Email Account fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name to identify this Email Account.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of mail server. The choices are:</td>
</tr>
<tr>
<td></td>
<td>- Email Reader</td>
</tr>
<tr>
<td></td>
<td>- POP3</td>
</tr>
<tr>
<td></td>
<td>- IMAP</td>
</tr>
<tr>
<td></td>
<td>- Email Sender</td>
</tr>
<tr>
<td></td>
<td>- SMTP (only one active account permitted)</td>
</tr>
<tr>
<td>Authentication</td>
<td>The type of authentication used for the email account to connect to the email server. The choices are <strong>Password</strong>,** OAUTH**, and <strong>OAUTH 2.0</strong>. The Email - OAuth support for IMAP and SMTP plugin must be active for the OAuth options to be visible.</td>
</tr>
<tr>
<td>OAuth Provider</td>
<td>Select the OAuth application registry record for this account. This field appears if you selected <strong>OAUTH 2.0</strong>.</td>
</tr>
<tr>
<td>Server</td>
<td>The remote server to which this account connects. To activate a server for an on-premise installation, enter the full address (FQDN) of the node (for example, node.customerdomain).</td>
</tr>
<tr>
<td>Active</td>
<td>Determines if this Email Account is active.</td>
</tr>
<tr>
<td>ServiceNow Configured</td>
<td>Indicates if this account is provisioned by ServiceNow. This field is read-only. If you create an account, this option is not selected.</td>
</tr>
<tr>
<td>Email user label</td>
<td>A display value used for outgoing messages. This field is for SMTP type accounts only.</td>
</tr>
<tr>
<td>User name</td>
<td>The user name or ID to authenticate an email address. The value in this field is also the <strong>From</strong> address when the instance sends email. If you are using SMTP, this must be a full email address. The value in the <strong>From</strong> field can override this (for SMTP accounts).</td>
</tr>
</tbody>
</table>

**Note:** The address in the **From** field on the Notification form takes precedence over this field.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password</td>
<td>The password when the <strong>Authentication</strong> type is <strong>Password</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You may need to increase the size of this field to accommodate longer passwords. By default, this field has a size of 40 characters.</td>
</tr>
<tr>
<td>From</td>
<td>(SMTP only) The From address used for notifications sent with this account. This address takes precedence over the <strong>User name</strong> field. If nothing is present in this field, the User name is used as the return address for notifications sent from the instance.</td>
</tr>
<tr>
<td>Connection Security</td>
<td>The type of secure connection. Choose a setting:</td>
</tr>
<tr>
<td></td>
<td>- None: No secure protocol is used.</td>
</tr>
<tr>
<td></td>
<td>- STARTTLS: Upgrades an insecure connection to a secure connection using the SSL/TLS encryption protocol, if your email server supports TLS.</td>
</tr>
<tr>
<td></td>
<td>- SSL/TLS: Connect to an SSL/TLS encrypted port to secure the connection. Email is encrypted between the ServiceNow instance and your mail server.</td>
</tr>
<tr>
<td></td>
<td><strong>Warning:</strong> Selecting a less secure protocol like <strong>STARTTLS</strong> or <strong>None</strong> may expose your data. To better ensure the security of data in your email server, select <strong>SSL/TLS</strong>.</td>
</tr>
<tr>
<td>Port</td>
<td>Connection TCP port.</td>
</tr>
</tbody>
</table>
4. Click **Submit**.

5. Click the test connection link at the bottom to test the SMTP, POP3, or IMAP account.

The system displays a pop-up window with the results of the connection test.

![Connection Test]

If the test succeeds, click **Close** to return to the email account record. If the test fails, click **View Logs** to display more information about the test results.
The system uses the email account to send or receive email.
Enable the system to send or receive email.

**Multiple email readers**
Organize POP3/IMAP email accounts into email account groups (subsets of email accounts) that can be processed by multiple email reader jobs. To improve the performance of inbound email account processing, you can incrementally add email account groups and if needed, email reader jobs to process email account groups concurrently.

**How email account group processing works**
By default, the email reader job processes POP3/IMAP email accounts serially, which can result in longer processing times when you have many email accounts. It can also be difficult to identify any problematic email accounts that might contribute to slower processing times.

To reduce email account processing time, you can create one or more email account groups that contain subsets of your email accounts. Organizing your email accounts into groups enables the default email reader job to process each email account group separately. After creating one or more email account groups, you can then add another email reader job to process account groups concurrently.

Use the `glide.email.inbound.account_group_processing` system property to activate email account group processing.

During email account group processing:
- The system stores the email accounts in the Email Account Groups (`sys_email_account_group`) table.
- The default email reader job runs every two minutes. The email reader chooses the account group to be processed based on the account group processing state and the date and time that the group was last processed.
  - Claimed state: If an account group has a claimed state, the email reader is processing the account group. If you defined other email reader jobs, no other email reader job can claim the group for processing.
  - Unclaimed state: If an account group is unclaimed, the account group is available for processing by the email reader.
- The email reader job processes the email accounts contained in the selected account group.
- The email reader job chooses the next available account group for processing and continues processing that account group.

You can monitor the processing of each email account group by using the Email Account Groups (`sys_email_account_group`) table. Each account group record includes the processing duration (how long it takes for the email reader to process all the accounts in the group).

After you review the processing times for your email account groups, determine whether to make further adjustments in email account group processing. For example, you can create another email account group or create another email reader job to process your email account groups in parallel. You define additional email reader jobs using the Schedule (`sys_trigger`) table.
Set up email account group processing

To set up email account group processing, you must have the email_account_admin or admin role.

1. **Create email account groups.**

   Define one or more email account groups that contain a subset of your POP3/IMAP email accounts. Your base system includes a default email account group. Any POP3/IMAP accounts not contained in an email account group are processed as part of the default email account group.

2. **Enable email account group processing**

   Navigate to sys_properties.list and locate the glide.email.inbound.account_group_processing system property. Set the Value to true. The email reader job starts processing the email account groups that you created.

3. **Monitor email account group processing.**

   Check the status of your email account groups to see if processing time has been reduced. Determine whether the additional groups sufficiently reduce account processing time or consider adding another email reader job to further reduce processing time.

4. **Create an email reader job.**

   As part of fine-tuning email account group processing, create an email reader job to process email account groups concurrently, in addition to the default email reader job.

Create email account groups

Define an email account group that contains a subset of your POP3/IMAP email accounts. The email reader job automatically processes each email account group as scheduled.

Role required: admin or email_account_admin

1. Navigate to System Mailboxes > Administration > Email Account Groups and click New.
2. Fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the account group.</td>
</tr>
<tr>
<td>Email Accounts</td>
<td>A subset of POP3/IMAP email accounts. Select the email accounts that make up the group.</td>
</tr>
<tr>
<td>Note: When you add an email account to a group, it cannot be reused in other account groups.</td>
<td></td>
</tr>
<tr>
<td>Active</td>
<td>Check box that enables the email account group for processing. New account groups are active by default.</td>
</tr>
<tr>
<td>Default</td>
<td>Read only. Check box that indicates the account is the default email account.</td>
</tr>
<tr>
<td>Status</td>
<td>Read only. Processing state of the email account group: Unclaimed or Claimed.</td>
</tr>
<tr>
<td>Claimed by</td>
<td>Read only. ID of the email reader job currently in progress.</td>
</tr>
</tbody>
</table>
3. Click **Create**.
   The system updates the Email Account Group (sys_email_account_group) table with the new account group. Use this table to monitor email account group processing.

- Review **email account group processing**.
- Determine if you want to continue fine-tuning email account processing. You could add another email account group or another email reader job to process email account groups concurrently.

**Enable email account group processing**
Enable the email reader job to start processing your email account groups so that you can reduce the time it takes to process inbound email accounts.

**Create email account groups.**

Role required: admin

Add a system property with the following settings:
- Name: `glide.email.inbound.account_group_processing`
- Type: true | false
- Value: true

Check the status of your email account groups to see if processing time has been reduced. For more information, see **Monitor email account groups**.

To further reduce processing time, consider creating another email reader job to process inbound email accounts. For more information, see **Create an email reader job**.

**Monitor email account groups**
Use the Email Account Groups (sys_email_account) table to check the status of email account groups processed by email reader jobs.

1. **Create email account groups.**
2. **Enable email account group processing.**

Role required: email_account_admin or admin

1. Navigate to **System Mailboxes > Administration > Email Account Groups**.
2. Review the processing details for each account group:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the email account group.</td>
</tr>
<tr>
<td>Active</td>
<td>The operational state of the email account group. The value true indicates</td>
</tr>
<tr>
<td></td>
<td>that the account is enabled for email account processing.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Claimed by</td>
<td>The ID of the email reader job if the job is running on the account group.</td>
</tr>
<tr>
<td>Default</td>
<td>The default indicator. The value true indicates that the email account group is the default.</td>
</tr>
<tr>
<td>Email Accounts</td>
<td>The names of the email accounts contained in the email account group.</td>
</tr>
<tr>
<td>Last Processed</td>
<td>The day and time that the email reader job last processed this account group.</td>
</tr>
<tr>
<td>Processing Duration</td>
<td>The length of time (in hours, minutes, seconds) to process the account group.</td>
</tr>
<tr>
<td>Status</td>
<td>Processing state of the email account group:</td>
</tr>
<tr>
<td></td>
<td>- Unclaimed: The account group is available for processing by the next email reader job.</td>
</tr>
<tr>
<td></td>
<td>- Claimed: An email reader job is processing the current account group.</td>
</tr>
</tbody>
</table>

Email account group — unclaimed processing state
If fine-tuning email accounts, consider doing one of the following:

- Create another email account group.
- Create another email reader job to process email account groups concurrently.

**Create an email reader job**

If you created email account groups to fine-tune inbound email account processing, you can create an email reader job to process those account groups concurrently, in addition to the default email reader job.

1. **Create email account groups.**
2. **Enable email account group processing**

**Role required:** email_account_admin or admin

1. In the Navigation filter, type `sys_trigger.list`.
2. In the `sys_trigger` table, select the Email Reader job record.
3. In the Email Reader job form:
   1. Enter a unique name for the email reader job to be added so that you can differentiate it from the default email reader job.
   2. If needed, change the time interval for this email reader job.
4. From the form context menu, click **Insert**.
   Another email reader job is created. This job runs concurrently with the default email reader job to process email account groups.

**Monitor email account group processing** and determine if the additional reader job reduces processing time. If needed, you can continue fine-tuning email account processing. For example, you might consider adding another email account group.

**Email properties**

The Email Properties page is where you can configure settings for inbound and outbound email.
Email properties are available from either of these modules:

- **System Mailboxes > Email Properties**
- **System Properties > Email Properties**
Email Properties

Email accounts can be created or modified in the Email Accounts tab. Email account connection status and diagnostics information can be found on the Email Diagnostics page.

Outbound Email Configuration

Email sending enabled: Yes
Send all email to this test email address (non-production testing): Yes
Append timestamp to dates and times in sent email: Yes
Create visible watermark in sent email. If false, create invisible watermark via hidden Div tag: Yes
Resend email if server returns these SMTP error codes: 421,450,451,452
Do not resend email if server returns these SMTP error codes: 500,501,502,503,504
Resend email when server returns unknown SMTP error codes: Yes
Roles that can view email in the Activity formatter when including “Sent/Received Emails”: Yes
Number of journal entries (Additional comments, Work notes, etc.) included in email notifications (1 means all): 3

Inbound Email Configuration

Email receiving enabled: Yes
Identify email as a reply by these subject prefixes: re:,awr:,Accepted:,Tentative:,Declined:
Identify email as a forward by these subject prefixes: Fw:,Fwd:
Discard everything below this text if found in a reply body: (comma separated, case sensitive)
Automatically create users for incoming emails from trusted domains: Yes
 Default password for users created from email sent from trusted domains: [must reset upon login]
Trusted domains when creating new users from incoming email (ignore email from untrusted domains unless from an existing user; use * for all domains): service-now.com
Email accounts are configured in the System Mailboxes > Administration > Email Accounts module. For more information and instructions, see Configure an email account.

Email diagnostics are available from the System Mailboxes > Email Diagnostics module.

Note: To learn more about the security properties that affect email processing, see Email security and SMTP authentication (deprecated) in the Instance Security Hardening Guide.

Outbound mail configuration

The Outbound Mail Configuration section of the Email Properties page contains properties for sending email.
Outbound Email Configuration

Email sending enabled

☑ Yes | No

Send all email to this test email address (non-production testing)

Append timezone to dates and times in sent email

☑ Yes | No

Create visible watermark in sent email. If false, create invisible watermark via hidden div tag.

☑ Yes | No

Resend email if server returns these SMTP error codes

421, 450, 451, 452

Do not resend email if server returns these SMTP error codes

500, 501, 502, 503, 504, 550, 551, 552, 553, 554

Resend email when server returns unknown SMTP error codes.

☑ Yes | No

Roles that can view email in the Activity formatter when including "Sent/Received Emails"

itil

Number of journal entries (Additional comments, Work notes, etc.) included in email notifications (-1 means all).

# Inbound email properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.read.active</td>
<td>Email receiving enabled</td>
<td>Specifies whether to enable or disable the inbound mail server.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Type: true</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Default value: true</td>
</tr>
<tr>
<td>glide.email.reply_subject_prefix</td>
<td>Identify email as a reply by these subject prefixes</td>
<td>Specifies the comma-separated list of prefixes in the subject line that identify an email reply.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Type: string</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Default value: re:, aw:, r:, Accepted:, Tentative:, Declined:</td>
</tr>
</tbody>
</table>

**Note:** The case of the reply prefix in the email, for example RE:, must exactly match the case of the prefixes defined in this property. If, for example, an email contains the Re: prefix and only RE: is defined in the property, the email will not be recognized as a reply. Therefore, it is a best practice to define multiple versions of the prefix, including mixed-case versions, such as RE:, Re:, and so on.
<table>

</table>
| glide.pop3readerjob.create_caller      | Automatically create users for incoming emails from trusted domains | Controls the behavior when an instance receives an email from an email address not associated with a user record. If this property is set to **true**, the instance creates a new user record for the email address and places that new user in the **Caller** field of any tickets created. If the property is set to **false**, the instance places **Guest** in the **Caller** field of any tickets created.  
  - Type: true | false  
  - Default value: false  
  - Learn More: Enabling Automatic User Creation |
| glide.user.default_password            | Default password for users created from email sent from trusted domains. (must reset upon login) | Specifies the password for new users created from incoming email. Users must reset the password at first login.  
  - Type: string  
  - Default value: password  
  - Learn More: Enabling Automatic User Creation |
| glide.user.trusted_domain              | Trusted domains when creating users from incoming email. | Comma-separated list of trusted domains for which the instance automatically creates a user based on incoming emails. Use an asterisk (*) to trust all domains. If an email is not from a trusted domain, the instance processes the inbound email as a ‘guest user’ but it does not create a guest user in the instance.  
  - Type: string  
  - Default value: asterisk (*)  
  - Learn More: Enabling Automatic User Creation |

**Note:** To learn more about the security properties that affect email processing, see *Email security* in the Instance Security Hardening Guide.
Email image filtering properties

Use email image filtering properties to control how inbound email images attach to a target record.

When a user sends an email to the system, email images (such as logos or email signatures) attach to the target record by default. These images are also visible in the activity stream of the target record. The system then replicates these images, which can cause duplicate image attachments to the target record and also duplicate images in the activity stream.

To filter images from emails and reduce duplicate image attachments to target records, configure the following properties in the System Properties (sys_properties) table. Use these properties to:

- Specify the email image sizes eligible for filtering.
- Choose an action that controls image attachment behavior and image visibility in the activity stream.

**Note:** These properties do not delete attachments. You can verify attachment records in the Attachments (sys_attachment) table.

### Email image filtering properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.inbound.image_sys_attachment.filter.minimum_bytes</td>
<td>Minimum image size in bytes for inbound email images to attach to the target record. Any image that is below this size limit is subject to the image filtering behavior that you set in the glide.email.inbound.image_sys_attachment.filter.action property. To disable image filtering entirely and attach all email images to the target record, set the minimum byte size to 0.</td>
</tr>
<tr>
<td></td>
<td>- Type: Integer</td>
</tr>
<tr>
<td></td>
<td>- Default value: 0</td>
</tr>
<tr>
<td>glide.email.inbound.image_sys_attachment.filter.action</td>
<td>Specifies the image filtering behavior.</td>
</tr>
</tbody>
</table>

**Note:** Regardless of the action you select, the image is visible when you choose to Preview HTML Email or Show Email Details in the activity formatter.

<table>
<thead>
<tr>
<th>Type: Choice list</th>
</tr>
</thead>
<tbody>
<tr>
<td>AttachTarget - Associate the image to the target record. The image is visible in the activity formatter and in the attachment to the target record.</td>
</tr>
<tr>
<td>AttachEmail - Attach the image to the email record. The image is not visible in the activity formatter of the target record nor in the attachment to the target record.</td>
</tr>
<tr>
<td>AttachNone - Do not attach the image to a record. You can select this option to attach the image manually at a later time.</td>
</tr>
<tr>
<td>Default value: AttachEmail</td>
</tr>
</tbody>
</table>
Email digest properties

Several properties are available to manage digest intervals for email digests. The following properties are available for the email digest feature.

**Note:** To open the System Properties (sys_properties) table, enter `sys_properties.list` in the navigation filter.

### Properties for email digest intervals

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.digest.default_interval</td>
<td>The sys_id of the default email digest interval available to users.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type:</strong> string</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default value:</strong> 28d157e07f1332007f005212bdfa9116</td>
</tr>
<tr>
<td></td>
<td>- <strong>Location:</strong> System Property (sys_properties) table</td>
</tr>
<tr>
<td>glide.email.digest.max_intervals</td>
<td>The maximum number of email digest intervals that can be defined.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type:</strong> integer</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default value:</strong> 100</td>
</tr>
<tr>
<td></td>
<td>- <strong>Location:</strong> System Property (sys_properties) table</td>
</tr>
</tbody>
</table>

Learn more: For details on digest intervals, see [Create or modify email digest intervals](#).

Advanced email properties

Use advanced email properties to fine-tune the way your instance sends or receives email. Add these properties to the System Property (sys_properties) table before they can be used to overwrite the defaults.

**com.glide.email.max_read**

Specifies the maximum number of emails a POP3 reader should process concurrently.

- **Type:** integer
- **Default value:** 20

**com.snc.on_call_rotation.reminders.showtz**

Specifies whether to show a user’s time zone.

- **Type:** true | false
- **Default value:** false

**glide.email.allow_duplicate_message_ids**

Allows storing of emails with duplicate message IDs and adds error message “Duplicate message-id encountered, prevented loop.”
• Type: true | false
• Default value: true

glide.email.email_client.check_attachment_availability

Enables a system scan of each file that a user attaches to an email draft in the email client. If a file is found to be infected with a virus, the user can't send the email with the attached file. The user must remove the attachment to send the email.

• Type: true | false
• Default value: true

glide.email.email_with_no_target_visible_to_all

Email that is missing a target record or whose target record is the email are made visible to any user regardless of their roles. By turning this property to false, the user is restricted unless they sent in the record or have an admin role.

• Type: true | false
• Value: false

glide.email.inbound.calendar_behavior

Specifies how the system stores calendar data, such as an invitation or an invitation response. Enter one of these options (not case sensitive):

• Attach: Store the calendar data as an attachment on the associated record, such as the incident or change that triggers an invitation.
• Ignore: Discard the calendar data.
• Inline: Store the calendar data as text in the email Body field.
• Type: string
• Default value: Attach

glide.email.inbound.check_attachment_availability

Prevents users from downloading and using virus-infected files that are attached to inbound emails.

The system detects infected files in an email by checking the ServiceNow virus header. If there are multiple email attachments, the system scans the files via Antivirus Scanning. All attachments that are found to be infected are made unavailable for use.

• Type: true | false
• Default value: true

glide.email.inbound.convert_html_inline_attachment_references

Specifies whether to convert inbound email HTML so email images appear in the email HTML body preview. The system displays broken cid (content ID) links in place of images received when this property is disabled. The format in which the system displays an email image depends on the property setting at the time the email is received, not the current property setting.

• Type: true | false
• Default value: true

glide.email.inbound.generate.missing.html.part

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Enables the system to generate HTML text for inbound emails that contain only a plain text message.
- Type: true | false
- Default value: true

**glide.email.inbound.generate.missing.text.part**
Enables the system to generate plain text for inbound emails that contain only an HTML message.
- Type: true | false
- Default value: true

**glide.email.inbound.max_attachment_count**
Sets the maximum number of attachments allowed per inbound email.
- Type: integer
- Default value: 30
- Location: System Property (sys_properties) table

**glide.email.inbound.max_body_chars**
Sets the maximum body size in characters allowed per inbound email.
- Type: integer
- Default value: 524288

**glide.email.inbound.max_total_attachment_size_bytes**
Sets the maximum total attachment size in bytes allowed per inbound email.
- Type: integer
- Default value: 18874368
- Location: System Property (sys_properties) table

**glide.email.mail_to**
Specifies the email address for sending notifications that use the ${mailto:} variable.
- Type: string
- Default value: SMTP email address that is active by default

**glide.email.name_split**
Specifies the delimiter used between first and last names in an email address. For example, a delimiter of "." (period) in the email address john.smith@company.com tells the system to look for a user record for John Smith.
- Type: string
- Default value: period (.)

**glide.email.notification.save_when_no_recipients**
Controls whether a notification-generated sys_mail record is saved even if there are no recipients. Used along with other notification recipient logging properties, this property enables investigating problems with notifications.
- Type: true | false
- Default value: true

**glide.email.outbound.check_attachment_availability**

Prevents users from sending emails that contain virus-infected files.

If an outbound email contains an attachment that was previously marked as infected via Antivirus Scanning, then the system doesn't send the email. An event is created to indicate that the email attachment is not available for use.

- Type: true | false
- Default value: true

**glide.email.outbound.header.auto_submitted**

Stores the value used in the "Auto-submitted" outbound email header. Clear the property value to remove the "Auto-submitted" header from all outbound emails. Some spam filters flag auto-generated email as spam.

- Type: string
- Default value: auto-generated

**glide.email.outbound.max_attachment_count**

Sets the maximum number of attachments allowed per outbound email.

- Type: integer
- Default value: 30
- Location: System Property (sys_properties) table

**glide.email.outbound.max_body_chars**

Sets the maximum body size in characters allowed per outbound email.

- Type: integer
- Default value: 524288

**glide.email.outbound.max_total_attachment_size_bytes**

Sets the maximum total attachment size in bytes allowed per outbound email.

- Type: integer
- Default value: 18874368
- Location: System Property (sys_properties) table

**glide.email.override.url**

Sets the URL to use in emailed links in place of the instance URL. The URL should end with nav_to.do. An example value is https://servicenow.customerdomain.com/production.nav_to.do. This property is suitable for customers who use custom redirect URLs for their instances.

- Type: string
- Default value: instance URL

**glide.cms.use_email_override_url**
Forces the system to use the `glide.email.override.url` property, rather than the `glide.servlet.uri` property, when a notification has a link to a CMS page in an instance.

- **Type:** true | false
- **Default value:** false
- **Location:** System Property (sys_properties) table

### glide.email.append.timezone

Appends the user time zone to all date and time values in outbound email messages (for example, 2018-07-02 04:01:14 PST). The time zone does not show if the system property `glide.sys.time_format` does not have a 'z' value. For more information on configuring the time zone in email notifications, see *Time zone for email notifications*.

- **Type:** true | false
- **Default:** false

### glide.email.remove_illegal_address_quotes

Removes invalid quotation marks from an inbound email address, thus allowing the inbound email address to be accepted as valid. For example, when you set the property to true, the address "john.doe@example.com" is changed to john.doe@example.com. However, addresses that are formatted as John Doe <©john.doe@example.com©> are removed entirely.

- **Type:** true | false
- **Default:** false

### glide.email.smtp.max_recipients

Specifies the maximum number of recipients the instance can list in the To: line for a single email notification. Notifications that would exceed this limit instead create duplicate email notifications addressed to a subset of the recipient list. Each email notification has the same maximum number of recipients.

- **Type:** integer
- **Default value:** 100

### glide.email.smtp.max_send

Specifies how many emails to send through each new SMTP connection. If there are more emails to send than the specified value, the instance establishes a new SMTP connection.

- **Type:** integer
- **Default value:** 100

### glide.email.text_plain.strip_xhtml

Converts the XML of both outbound and inbound emails that are shown in comments to plain text. If false, the system preserves the XML.

- **Type:** true | false
- **Default value:** true

### glide.imap.secure

Specifies whether to enable SSL encryption for connections to the IMAP server.

- **Type:** true | false
• Default value: false

**glide.imap.secure.port**
Specifies the communications port for IMAP secure connections.

• Type: string
• Default value: 995

**glide.imap.tls**
Specifies whether to start the IMAP server in Transport Layer Security (TLS) mode.

• Type: true | false
• Default value: false

**glide.notification.recipient.exclude_logging**
Enables or disables logging all reasons a recipient was excluded. If set to true, the subsequent properties dealing with the exclusion of logging are enabled. If false, the properties are disabled. This property cannot suppress log messages generated by the **glide.email.test.user** property.

• Type: true | false
• Default value: true

**glide.notification.recipient.exclude_logging.device_inactive**
Logs recipients who are excluded because their chosen notification device record is marked as inactive.

• Type: true | false
• Default value: true

**glide.notification.recipient.exclude_logging.device_schedule**
Logs recipients who are excluded based on the **Schedule** field on the Notification Device (cmn_notif_device) record for their chosen notification device.

• Type: true | false
• Default value: true

**glide.notification.recipient.exclude_logging.event_creator**
Logs recipients who are excluded because they initiated the notification event, such as updating an incident record. The **Send to Event Creator** check box is then cleared on the notification record.

• Type: true | false
• Default value: true

**glide.notification.recipient.exclude_logging.invalid_email**
Logs recipients who are excluded because the email address for that user is invalid, for example the @ is missing, or empty.

• Type: true | false
• Default value: true

**glide.notification.recipient.exclude_logging.user_calendar_integration_disabled**
Logs recipients of calendar invitations who are excluded. Recipients are excluded because the **Calendar Integration** field is set to **None** on the user record.

- Type: true | false
- Default value: true

**glide.notification.recipient.exclude_logging.user_inactive**

Logs recipients who are excluded because the **Active** check box is cleared on the user record.

- Type: true | false
- Default value: true

**glide.notification.recipient.exclude_logging.user_notification_disabled**

Logs recipients who are excluded because the **Notification** field is set to **Disabled** on the user record.

- Type: true | false
- Default value: true

**glide.notification.recipient.include_logging**

Enables or disables logging all reasons a recipient was included. If set to true, the subsequent properties dealing with the inclusion of logging are enabled. If false, the properties are disabled.

- Type: true | false
- Default value: true

**glide.notification.recipient.include_logging.delegate**

Logs recipients who are included because they are delegates of another user.

- Type: true | false
- Default value: true

**glide.notification.recipient.include_logging.event_parm**

Logs recipients who are included because they are in the **parm1** or **parm2** fields of the event record.

- Type: true | false
- Default value: true

**glide.notification.recipient.include_logging.recipient_fields**

Logs recipients who are specified in the **Users/Groups in Field** field for the notification record. The recipient_fields are fields in the target record that contain a recipient to add. For example, to include an incident assignee as a recipient, set the **Users/Groups in Field** field to **Assigned to**.

- Type: true | false
- Default value: true

**glide.notification.recipient.include_logging.recipient_groups.group_email**

Logs users who are included in a notification that is sent to a group. The property also logs users in the event **parm1** or **parm2** field.

- Type: true | false
• Default value: true

**glide.notification.recipient.include_logging.recipient_groups.manager**
Logs recipients who manage a recipient group. The property also logs users in the event parm1 or parm2 field.
- Type: true | false
- Default value: true

**glide.notification.recipient.include_logging.recipient_groups.membership**
Logs recipients who are part of a notification recipient group. The property also logs users in the event parm1 or parm2 field.
- Type: true | false
- Default value: true

**glide.notification.recipient.include_logging.recipient_users**
Logs recipients who are included via notification record’s Users field (recipient_users).
- Type: true | false
- Default value: true

**glide.notification.recipient.include_logging.subscription**
Logs recipients because they are subscribed via the user notification preferences.
- Type: true | false
- Default value: true

**glide.pop3.parse_start**
Specifies the text that indicates the beginning of the email body section. The instance parses name:value pairs within this section to set or update field values when processing inbound email actions.
- Type: string
- Default value: none

**glide.pop3.parse_end**
Text indicating the end of the email body section where the instance should parse name:value pairs to update field values when processing inbound email actions.
- Type: string
- Default value: none

**glide.smtp.dateformat**
Specify the date format to use for outgoing email notifications.
- Type: string
- Default value: date format listed in email sender’s user record [sys_user.date_format]

**glide.smtp.precedence_bulk**
Specifies whether outbound email includes the header “Precedence: bulk”. Some spam filters flag bulk email as spam. Set the value to false to remove this header from outbound email.
- Type: true | false
  - Default value: true

**glide.smtp.send_partial**

Splits outgoing email between valid and invalid recipients. The email is sent only to the valid recipients. A new email containing the invalid recipients is created in the send-ready state and attempts to send again.

- Type: true | false
  - Default value: false

**glide.smtp.timeformat**

Specify the time format to use for outgoing email notifications.

- Type: string
  - Default value: time format listed in email sender’s user record [sys_user.time_format]

**glide.ui.activity.email.use_display**

Specifies whether to display email addresses or user IDs (display value from the User table) in email headers. If true, the instance searches for a user record with a matching email address. If it cannot find a matching user record, it displays the email address.

- Type: true | false
  - Default value: false

**glide.ui.email_client.email_address.disambiguator**

Sets the columns from the User [sys_user] table that the auto-complete list displays. Separate each column name with a semicolon character (;).

- Type: string
  - Default value: name

**glide.ui.incident_activity.max_addresses**

Specifies the maximum number of addresses to list in an email audit record. If the number of addresses exceeds this limit, the instance truncates the list after the maximum value and displays an ellipsis character (...).

- Type: string
  - Default value: 5

**NotifyAffectedCI.max_rel_level**

Sets a value that is used by the Affected CI notifications business rule. The business rule notifies subscribers when tasks affect configuration items (CIs). The business rule generates notifications for parent CIs up to the level defined by this property. You can adjust the property value according to the complexity and depth of your CI relationships.

- Type: integer
  - Default value: 5
Email size limits

To prevent issues with large email messages, the system enforces configured limits on the maximum allowed email body size, total attachment file size, and number of attachments per email.

An email or attachment that exceeds the system capacity may not be processed as expected. To ensure that your emails and attachments are processed as expected, you can configure properties that limit the size of emails and attachments.

Message body size limit properties
Add properties to control the maximum email body size allowed for inbound and outbound email messages.

Properties

By default, the system processes up to 524,000 characters in the email body and body_text fields (524 KB each).

You can add and configure system properties glide.email.inbound.max_body_chars and glide.email.outbound.max_body_chars to increase or decrease the email body size limits. The system truncates the email body when it exceeds the configured limit. For example, if you configure the body size limit of glide.email.inbound.max_body_chars to 1,000 characters but receive an inbound email that is 2,000 characters, then the system truncates the email body at 1,000 characters.

Also note that the system cannot process email body or body text larger than 16 MB.

Message body size limit properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.inbound.max_body_chars</td>
<td>Sets the maximum body size in characters allowed per inbound email.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 524288</td>
</tr>
<tr>
<td>glide.email.outbound.max_body_chars</td>
<td>Sets the maximum body size in characters allowed per outbound email.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 524288</td>
</tr>
</tbody>
</table>

Note: A different property, com.glide.attachment.max_size, sets the maximum file size allowed for any attachment in the system and overrides any larger values of glide.email.inbound.max_total_attachment_size_bytes and glide.email.outbound.max_total_attachment_size_bytes.
Inbound email body processing

For inbound emails, the system enforces the maximum body size as set by the `glide.email.inbound.max_body_chars` property. When the body size exceeds the configured value:

- The system does not run inbound email actions that would otherwise be triggered by the email.
- The system truncates the Body text on the Email form.
- The system logs a warning and sets the Error string field on the Email form. The log message for such an email might look like this: `Email set to receive-ignored because its size exceeds the value set in glide.email.inbound.max_body_chars. 1995 character(s) were truncated from the body field.`

Outbound email body processing

For outbound emails, the system enforces the maximum body size as set by the `glide.email.outbound.max_body_chars` property. When the body size exceeds the configured value:

- The system does not send the email.
- The system truncates the Body text on the Email form.
- The system logs a warning and sets the Error string field on the Email form. The log message for such an email might look like this: `Email set to send-ignored because its size exceeds the value set in glide.email.outbound.max_body_chars. 1337 character(s) were truncated from the body field.`

Attachment limit properties

Several properties control email attachment limits.

To see the status of all email attachments, go to the Email Attachments (sys_email_attachment) table.

Properties

All the properties are located in the System Property (sys_properties) table. Setting any of the following properties to an excessively large value may cause performance issues.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>glide.email.inbound.max_attachment_count</code></td>
<td>Sets the maximum number of attachments allowed per inbound email.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: integer</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default value</strong>: 30</td>
</tr>
<tr>
<td></td>
<td>- <strong>Learn more</strong>: Inbound Email Attachment Processing</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>glide.email.inbound.max_total_attachment_size_bytes</td>
<td>Sets the maximum total attachment size in bytes allowed per inbound email.</td>
</tr>
<tr>
<td>glide.email.outbound.max_attachment_count</td>
<td>Sets the maximum number of attachments allowed per outbound email.</td>
</tr>
<tr>
<td>glide.email.outbound.max_total_attachment_size_bytes</td>
<td>Sets the maximum total attachment size in bytes allowed per outbound email. To send an email, the system must encode the contents of the email. This process may significantly increase the size of the email, including any attachments. It is best to set this property to a value well below the maximum email size.</td>
</tr>
</tbody>
</table>

**Note:** A different property, com.glide.attachment.max_size, sets the maximum file size allowed for any attachment in the system and overrides any larger values of glide.email.inbound.max_total_attachment_size_bytes and glide.email.outbound.max_total_attachment_size_bytes.

**Inbound email attachment processing**

For inbound emails, the system enforces the maximum number and size of attachments as set by the glide.email.inbound.max_attachment_count and glide.email.inbound.max_total_attachment_size_bytes properties. When an attachment for an inbound email exceeds either value, the attachment is discarded. A record is created in the Email Attachments (sys_email_attachment) table containing the discarded file name and the reason it was discarded. The discarded file remains in the Email (sys_email) record. The order in which the system processes the attachments determines which attachments are discarded. This order may not be consistent from email to email.

When an inbound email attachment is discarded, the system also fires the inbound.email_attachments.discarded event. You can use the event to trigger a notification that alerts the email sender. For an example of a notification that can be triggered by the event, see the inactive "Demo Email Attachment(s) Discarded" notification.
Inbound email attachments are prevented from attaching to the target record if an identical attachment exists.

**Outbound email attachment processing**

For outbound emails, the system enforces the maximum number and size of attachments as set by the `glide.email.outbound.max_attachment_count` and `glide.email.outbound.max_total_attachment_size_bytes` properties. Email records are created from various sources and may exceed the configured attachment limits.

Emails that are ready to be sent from the Email (sys_email) table are subject to the outbound attachment limits. Emails that exceed either limit trigger a warning in the email system log and are sent with attachments up to the maximum number or total file size.

The log message for such an email might look like this: `Maximum combined attachment size exceeded. (max:15728640 bytes). One or more attachment records ignored.`

**Emails for notifications, scheduled reports, and exported tables**

Notifications can be set to include all the attachments from the record that triggers the notification. If the attachments exceed either of the outbound email attachment limits, the system excludes the excess attachments from the email and logs a warning message.

Reports can be scheduled for email distribution as attachments. Large reports may exceed the outbound attachment size limit. In this case, the system sends the scheduled report email without the report attached and logs a warning message. To avoid the issue, send links to large reports instead of sending the reports as attachments.

If a user attempts to export numerous records from a list that exceeds a configured warning threshold, a dialog box offers the option to email the exported records as an attachment. If the attachment exceeds the outbound attachment size limit, the system sends the email without the exported record list attached and logs a warning message.

**System mailboxes**

Email messages can be seen in the System Mailboxes menu, which gives you access to the system Inbox, Outbox, and Sent mail box.

Each provides a filtered view of emails to let you see only what you need to at any given time, including list fields applicable to each. The system mailboxes menu shows your current POP and SMTP status.

The System Mailbox is hosted by ServiceNow, who have sole access to the mailboxes. By default, once the instance pulls an email message, it is deleted from the mail server and stored in the application on the Email (sys_email) table.

For information about the fields that are shown in the System Mailbox, see `System email log and mailboxes`. You can configure the layout of a system mailbox to show any of the email log fields, not only the ones that are shown by default.

- **Inbound emails**: All inbound mail is placed into the Inbox until it is processed. After it is cleared, the email moves to the `Received` state. If the email message matches the criteria in an inbound email action, the email is changed to `Processed`. If not, it is changed to `Ready`. If the system is restarted for any reason (such as during a system upgrade), all inbound mail waits on the external mail server until the system can request delivery.

- **Outbound emails**: All outbound mail is placed into the Outbox until it is processed. Once cleared, it is moved to `Sent` (if sent) or `Skipped` (not sent, as in the case of no valid recipients). If the system is restarted for any reason (such as during a system upgrade), all outbound mail
waits in the instance database until the system comes online, and the scheduler looks for mail to deliver.

Email Service

Email Service installs the Email API on the instance.

By default, Email Service only allows admin users to access the Email API. Administrators can grant access to the Email API by:

1. Adding an access control for creating records in the Email (sys_email) table linked to the email_api_send role.
2. Assigning the email_api_send role to the non-admin user.
3. Verifying the non-admin user has read access to the notification target table. For example, an email notification for an incident, requires read access to the Incident table.

Non-admin users with the email_api_send role can access the Email API from the REST API Explorer.

Activate Email Service

Users with the admin role can activate the Email Service plugin (com.glide.email.service) to enable the Email API.

Role required: admin

1. Navigate to System Definition > Plugins.
   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   ![Note: To redirect to the legacy list view for plugins, click the link.]

   - You have been redirected to All Applications. To see the Plugins list click here

2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.
   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.
   - If you’re certain that you have the correct plugin, click Install, then in the Activate Plugin dialog box, click Activate.
To view plugin details before activation:
1. Click the plugin name.
2. On the form, click the Activate/Update related link.
3. In the dialog box, review the dependent plugins.
   If your plugin requires dependent plugins, they're activated automatically when you activate your plugin if they're not active already.
4. If demo data is available and you want to install it, click Load demo data.
   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.
5. Click Activate.

Grant access to the Email API
To grant non-admin users access to the Email API, administrators must create an access control and assign a special role.
Role required: admin
For additional details, see Email API.
1. Elevate privileges to security_admin.
3. Click New.
4. Create an access control for the Email (sys_email) table.

</table>
### System notifications

Set up notifications to alert users of record changes that may concern them. You can notify users via email, SMS text message, push notification, or messaging app.

### Email and SMS notifications

Use email notifications to send selected users email or SMS notifications about specific activities in the system, such as updates to incidents or change requests.

Email notifications allow administrators to specify:

- When to send the notification
- Who receives the notification
- What content is in the notification
- Whether the notification can be delivered in an email digest and if so, the digest content

Additional email notification options are available. Users can subscribe to notifications, and administrators can make some notifications mandatory.

Administrators also have the option of converting existing email notifications to a rich HTML format. This format provides several advantages, including:

- Raw HTML content is converted into a WYSIWYG format.
- The content can be edited in a feature-rich HTML editor.
- Mail scripts are condensed into a single, easy-to-read line that can be reused in multiple email notifications.
- To prevent broken links, items like images and incidents, that are linked with URLs relative to an instance are converted to absolute links. For example, if an incident is linked using a relative URL, the link is converted to an absolute link.

**Note:** The rich HTML format is the default for all new email notifications.

---

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>Operation</td>
<td>create</td>
</tr>
<tr>
<td>Admin overrides</td>
<td>Selected</td>
</tr>
<tr>
<td>Name</td>
<td>sys_email</td>
</tr>
<tr>
<td>Requires role</td>
<td>email_api_send</td>
</tr>
</tbody>
</table>
Note: Instances cannot send or receive encrypted email messages. The system strips out the body of the encrypted email because it cannot process the encrypted content in plain text or HTML.

An email notification can also send as an SMS notification if the recipient has subscribed to the notification on an SMS channel. The system uses the subject line of the email notification and converts it to an SMS message. If the administrator doesn't want to use the email notification subject for the SMS notification, they can define an alternate SMS message in the email template form or email notification form. For more information, see Create an email notification.

For more information on creating an SMS channel, see Create notification channels.

If you want to change how the instance processes incoming email, see Inbound email actions. See System email log and mailboxes for examples of messages the system displays when notifications or inbound email actions are not processed.

Create notification categories

You can create notification categories to identify and group related notifications that are listed in the notification settings for your users.

Role required: admin

Before adding new categories, review the base system notification categories in the Notification Categories (sys_notification_category) table to determine if you need a new category.

1. Navigate to System Notification > Email > Notification Categories.
2. Click New.
3. Enter the Name of the category to identify the family of notifications. Provide a category name that is meaningful to your users, so that they can easily find their notifications under the appropriate category in their notification settings.
4. Enter a Short description to identify the category.
5. Click Submit.

The system adds the new category to the Notification Categories (sys_notification_category) table. After you create at least one, active notification that uses the new category, the category and notification are listed in the notification settings for users (Notifications tab in the System Settings window).

Create an email notification

Creating an email notification involves specifying when to send it, who receives it, what it contains, and if it can be delivered in an email digest.

Role required: admin

Consider the following items when you create or update a notification:

- Your notification recipients must be active users and have a valid email address defined.
  - ServiceNow users or members of groups must be defined as active users in the User (sys_user) table. They must also have a valid email address defined for their primary channel (device) in the Notification Device (cmn_notif_device) table. If users do not have an active profile and a valid email address, they will not receive notifications.
  - Your notification recipients must have the appropriate notification preferences enabled.

- If the notification is subscribable, each ServiceNow user or group member must have the notification and channels (devices) for the notification enabled in their notification preferences. Admins can impersonate users to review and configure their notification preferences.
To have your email notification also send as an SMS notification, recipients must subscribe to the notification on an SMS channel. For more information on creating an SMS channel, see Create notification channels.

After you create or update the notification, use the Preview Notification option to examine it. For example, you can test links that you may have added and verify the notification recipients. For details, see Preview email notifications.

Use the following tabs in the Notification form to configure an email notification:

- **When to send** — Conditions required to send the notification.
- **Who will receive** — Recipients of the notification.
- **What it will contain** — Contents of the notification.
- **What Digest will contain** — Contents of the email digest if the notification can be delivered in a digest.

*Note:* If you do not see all the fields on the form, switch to the Advanced view.

Watch this six-minute video to learn about the actions that the instance can take in response to messages from users and shows how to create or modify email notifications to users. In the video, skip to 3:29 for details on configuring email notifications.

1. Navigate to System Notification > Email > Notifications.
2. Click New.
3. Fill in the fields at the top of the Notification form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the email notification. Descriptive names help identify the purpose of the email notification. For example, Incident Opened &amp; Unassigned.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Table            | Select the database table to link the notification to, for example Incident (incident).  

**Attention:** Do not select the Task (task) table. This table is for extending other tables. Notifications that run on the Task table directly are not supported.

**Note:** Only tables and database views that are in the same application scope appear in the list. |
| Type             | Select the type of notification you are creating: EMAIL or Meeting Invitation.                                                                                                                                   |
| Active           | Select the check box to enable the email notification.                                                                                                                                                            |
| Category         | Select the category to which this notification belongs. A category identifies and groups related notifications. This notification, if active and subscribable, is listed in the selected Category in the notification preferences for each user (Notifications tab in the System Settings window). |

**Note:** Do not leave the category as Uncategorized, as users may not be able to find the notification in their list of notifications.

If you need a new category, see Create notification categories. |
| Allow Digest     | Select the check box if an email digest is to be created for the notification. If selected, the What Digest will contain tab is displayed for creating the digest content.                                               |
| Description      | Type a description for this notification.                                                                                                                                                                        |

4. Fill in the fields on the **When to send** tab.
Note: If the same trigger generates multiple notifications, the system only sends one notification. The system considers all other notifications, even if they have a different subject and body, as duplicates. The Ignore Duplicates business rule controls this functionality.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send when</td>
<td>Select under what condition the notification is sent:</td>
</tr>
<tr>
<td></td>
<td>• When a record is inserted or updated</td>

<tr>
<td></td>
<td>• When triggered as an action step in Flow Designer</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Weight</td>
<td>(Required) Set a numerical value for the notification priority relative to duplicate notifications. Notifications that have the same target table and recipients, or the same subject and body, are considered duplicates. When there are duplicate notifications, the system only sends the notification with the highest weight. All other notifications are moved from the Outbox to the Skipped mailbox. The default value 0 causes the system to always send the notification (assuming the conditions are met). For example, suppose that a service desk agent adds a comment to an incident and shortly thereafter closes it. By default, these actions trigger both the Incident commented and Incident Closed notifications. However, both notifications are from the Incident table and also notify the incident caller. The system only sends the notification with the highest weight, which in this case is the Incident Closed notification.</td>
</tr>
<tr>
<td></td>
<td>Note: The SMTP Sender scheduled job determines how often to send email. By default, this job runs every minute.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Use the condition builder to select the conditions under which this notification is sent. For example, select <strong>Priority &gt; greater than &gt; 3 - Moderate</strong> to send the notification only for High and Critical priority incidents.</td>
</tr>
<tr>
<td>Inserted</td>
<td>Select the check box to enable email notification when a record is inserted. This field appears when you set the <strong>Send when</strong> field to <strong>Record inserted or updated</strong>.</td>
</tr>
<tr>
<td>Updated</td>
<td>Select the check box to enable email notification when a record is updated. This field appears when you set the <strong>Send when</strong> field to <strong>Record inserted or updated</strong>.</td>
</tr>
<tr>
<td>Event name</td>
<td>Select the event that triggers this notification. This field appears when you set the <strong>Send when</strong> field to <strong>Event is fired</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Advanced condition  | Create a script to perform certain actions, like sending a notification based on the current email record, changing field values, or changing system properties. The advanced condition script must return true or set a global answer variable to true to send the notification. The advanced condition script uses the following global variables:  
  · current: Contains the current record from the table to which the notification is linked.  
  · event: Contains the event that triggered the notification.  

Note: The Advanced condition field is evaluated in addition to other conditions you set on the notification. Both the condition and advanced condition must evaluate to true to send the notification.

5. Fill in the fields on the Who will receive tab.

The following example shows the default view of the tab. The advanced view contains additional fields (see table).

Tip: Consider limiting the recipient list of any notification to 1000 users. By default, if a notification has more than 100 intended recipients, the system creates multiple notification messages with up to 100 recipients each. If you want to change the recipient limit, set the system property glide.email.smtp.max_recipients.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users</td>
<td>Select the users you want to receive the email notification. You can search for users with the reference lookup icon or manually add their email addresses. This list of users is static.</td>
</tr>
<tr>
<td>Users/groups in fields</td>
<td>Select fields from the target record that reference the User (sys_user) or Group (sys_user_group) tables. The system sends the notification to users or groups in each field that you select. For example, if a notification uses the Incident (incident) table, you can select the <strong>Opened by</strong> field to send the notification to users or groups who opened the incident. This list of users or groups is variable and depends upon the values of the associated task record. You can also select a field that includes an email address string to send a notification to that address. <a href="#">Note: You can dot-walk to values in reference fields by clicking the plus sign in the field selector and then selecting the related field.</a> If you address the notification to a user with an inactive record in the User (sys_user) table, the system does not send the notification to that user.</td>
</tr>
<tr>
<td>Groups</td>
<td>Select the groups you want to receive the email notification. You can search for groups with the reference lookup icon or by manually entering the group name. This list of groups is static. <a href="#">Note: Group members receive individual notifications only if Include members is selected in the group record.</a></td>
</tr>
<tr>
<td>Exclude delegates</td>
<td>Select this option to prevent the instance from sending email notifications to delegates of the users and members of the groups you selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Send to event creator</td>
<td>Select this check box to send the notification to the person who performed the action that started the notification process if the person is also a recipient. If the event creator is not specified in one of the recipient fields, the event creator does not receive a notification regardless of the setting in this field. For new notifications, this option is selected by default. If you want to know why you may not be receiving certain email notifications, see the blog post Troubleshooting email notifications - Send to the Event Creator by a ServiceNow Technical Support Engineer in the Now Community.</td>
</tr>
<tr>
<td>Event parm 1 contains recipient</td>
<td>Select this check box if the event parameter 1 contains one or more notification recipients (in a comma separated-list). This field is visible only when the Send when field is set to Event is fired.</td>
</tr>
<tr>
<td>Event parm 2 contains recipient</td>
<td>Select this check box if the event parameter 2 contains one or more notification recipients (in a comma-separated list). This field is visible only when the Send when field is set to Event is fired.</td>
</tr>
<tr>
<td>Subscribable</td>
<td>Select this check box to allow all users to subscribe to this notification. See Subscription-based notifications for more information.</td>
</tr>
</tbody>
</table>

Note: If the record contains sensitive or protected data, consider restricting the recipient list only to those users and groups who normally have access to it, and do not enable the Subscribable option. You can also configure your notification content so that private or sensitive data is not exposed. For example, you could insert a link back to the associated record, so that details are not revealed in the notification.

The system does not exclude recipients based on access controls. Recipients can receive email about records that they cannot normally access from the user interface. For example, requesters can receive email about incidents and catalog requests opened on their behalf even though they normally do not have access to these records. If a notification includes record details, verify that all recipients need these details.

Note: By default, the system does not send email notifications to itself. For example, an email notification from instanceABC@service-now.com does not send to instanceABC@service-now.com. The system prevents this behavior to avoid looping.

6. Fill in the fields on the What it will contain tab.
The following example shows the default view of the tab. The advanced view contains additional fields (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Email template| If you want to reuse existing content, select an email template to add content to the email notification. You can only select an email template that meets one of the following conditions:  
  - shares the same scope and table as the notification  
  - shares the same scope but has no specified table  
  - shares the same table and is in the global scope                                                                                                                                                                                                                       |
| Subject       | Enter the subject line for the email message. The subject can include variables from the Select variables column.  
  If empty, the system uses the Subject value from the Email template. If you enter a value in this field, it overrides the template value.  
  If your recipients subscribe to the email notification on an SMS channel, then the system sends the email notification subject as an SMS message. To send a different SMS message, fill in the SMS alternate field on the email template form or the email notification form. |
| Message HTML  | Enter the content of the email notification message. The message can include variables from the Select variables column.  
  Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes.  
  The Message HTML field is visible only if you set the content type to HTML and plain text or HTML only.  
  If empty, the system uses the Message HTML value from the Email template. If you enter a value in this field, it overrides the template value.  
  To prevent adding extra `<p>` and `<div>` elements to your email notifications, see the blog post Extra line spacing with paragraph tags in email client by a ServiceNow employee in the Now Community. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMS alternate</td>
<td>Enter the notification message to send to an SMS device. The SMS alternate message is limited to 140 characters. If empty, the system uses the SMS alternate value from the Email template. If you enter a value in this field, it overrides the template value. If you don’t fill in the SMS alternate field on this form or the email template, then the system uses the email notification subject as the SMS message.</td>
</tr>
<tr>
<td>Importance</td>
<td>Set the importance of the email message to low or high.</td>
</tr>
</tbody>
</table>
| Content type     | Select the content type for the email notification:  
  - HTML and plain text  
  - HTML only  
  - Plain text only  

By default, HTML only is enabled.                                                                 |
| Include attachments | Select this check box to send all attachments from the triggering record as email attachments.                                                                                                               |
| Omit watermark   | Use this check box to apply or remove the watermark attached to each email. If the email does not contain a watermark, the system reviews the conditions of the inbound actions to create or update task records. For more information, and an alternative way to hide watermarks, see Watermarks on notification emails. |
| Message Text     | Enter the notification message to send in plain text. This field appears when you set the content type to HTML and plain text or Plain text only.  

If empty, the system uses the Message Text value from the Email template. If you enter a value in this field, it overrides the template value. |
| From             | Enter the email address that you want the email notification to use in the From field. For example, helpdesk@yourcompany.com. The email must be in a valid format, otherwise a notification message appears near the field.  

Changing this address may require an advanced email setup such as enabling email forwarding, for example when using Sender Policy Framework (SPF) records for spam detection. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reply to</td>
<td>Enter the email address you want people to use when replying to the email notification. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email must be in a valid format, otherwise a notification message appears near the field. You can add no more than one email address in this field. Changing this address requires an advanced email setup such as enabling email forwarding.</td>
</tr>
<tr>
<td>Push message only</td>
<td>Select this option to send this notification only as a push notification to a mobile device. The Push Notification feature must be active.</td>
</tr>
<tr>
<td>Push messages</td>
<td>Associate one or more push messages with this notification. The Push Notification feature must be active.</td>
</tr>
</tbody>
</table>

7. If you selected the **Allow Digest** check box, fill in the fields on the **What Digest will contain** tab to create the email digest content for the notification. The following example shows the default view of the tab. The advanced view contains additional fields (see table).
<table>
<thead>
<tr>
<th>When to send</th>
<th>Who will receive</th>
<th>What it will contain</th>
<th>What Digest will contain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digest Template</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Digest Subject</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Digest HTML</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Digest Separator</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
<td></td>
<td></td>
</tr>
<tr>
<td>----------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Digest Template</td>
<td>If you want to reuse existing content, such as headers or footers, select an email template to add content to the email digest.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Digest Subject       | Enter the subject line for the email digest. The subject can include variables from the Select variables column.  
If empty, the system uses the Subject value from the Email template. If you enter a value in this field, it overrides the template value. |
| Digest HTML          | Enter the recurring content for the email digest. The digest content can include variables from the Select variables column.  
Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes.  
To prevent adding extra `<p>` and `<div>` elements to your email digest, see the blog post Extra line spacing with paragraph tags in email client by a ServiceNow employee in the Now Community. |
| Digest Separator (HTML) | Use the line to separate each item summarized in the digest.                                                                                           |
| Digest From          | Enter the email address to be used in the From field of the email digest. For example, helpdesk@yourcompany.com. The email address must be in a valid format, otherwise a notification message appears near the field.  
Changing this address requires an advanced email setup such as enabling email forwarding. |
| Digest Reply To      | Enter the email address that you want people to use when replying to the email digest. For example, helpdesk@yourcompany.com. The email must be in a valid format, otherwise a notification message appears near the field.  
Changing this address requires an advanced email setup such as enabling email forwarding. |
| Digest Text          | Enter the recurring content of the email digest to send in plain text. This field appears when you set the content type to HTML and plain text or Plain text only. |

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digest Separator (text)</td>
<td>(Optional) Use the dash character as a line to separate each item summarized in the digest. This field appears when you set the content type to HTML and plain text or Plain text only.</td>
</tr>
</tbody>
</table>

When you save or update the notification, the email Digest option is available for the notification in the notification settings of your users.

8. When you finish creating the notification, click Submit. Or, if you are done modifying the notification, click Update.

Use the Preview Notification option to check your notification. For example, you can see:

- How the Subject and Message fields are displayed.
- Which users will or will not receive the notification, including the reasons why users will not receive it.

Convert legacy email notifications to rich HTML
By default, new email notifications are created in the rich HTML format. But you can also convert legacy notifications to rich HTML.

Role required: admin

1. Navigate to System Notification > Email > Notifications.
2. On the Email Notifications list screen, click the name of the email notification you want to convert.
3. Click the What it will contain tab.
You have been assigned to complete tests on $metric_type. Please follow the link below and complete the tests by $due_date. You can save your results until you are ready to submit them. When you have completed the test, and filled in all final results, submit the test.

Click here to begin the test:
<email_script>
  var link = new AssessmentTest().getAssessmentInstanceURL(current.sys_id);
  var url = "<a href=" + link + ">Link<\/a>";
  template.print(url);
<\/email_script>

To view your test queue at any time, sign in and navigate to SelfService > My Tests.
4. **Click Switch to Rich HTML Editor.**

The system copies any raw HTML from the **Message** field and converts it to rich HTML in the **Message HTML** field. Additionally, any mail scripts in the body are automatically saved to the **Email Script** [sys_script_email] table and are replaced in the notification body with an embedded script tag. This makes the notification body easier to read.
### Notification - Notify test case user

<table>
<thead>
<tr>
<th>When to send</th>
<th>Who will receive</th>
<th>What it will contain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content type</td>
<td>HTML and plain text</td>
<td>Importance: None</td>
</tr>
<tr>
<td>Include attachments</td>
<td>From:</td>
<td>Reply to:</td>
</tr>
<tr>
<td>Omit watermark</td>
<td>Push to:</td>
<td>Push Messages: Notify test case user</td>
</tr>
<tr>
<td>Push Message Only</td>
<td>Email template:</td>
<td>Subject: Test notification: New test assigned to you on ${metric_type} due by ${due_date}</td>
</tr>
<tr>
<td>Message HTML</td>
<td></td>
<td>Select variables:</td>
</tr>
</tbody>
</table>

You have been assigned to complete tests on ${metric_type}. Please follow the link below and complete the tests by ${due_date}. You can save your results until you are ready to submit them. When you have completed the test, and filled in all final results, submit the test.

Click here to begin the test:

${mail_script:Notify test case user_script_1}

To view your test queue at any time, sign in and navigate to Self-Service > My Tests.
Note: The string "div" at the bottom of the screen shows the location of your cursor within the Message HTML field. In this case, the cursor is in a line containing an HTML <div> tag.

When you convert an email notification that was created in a version prior to Eureka to rich HTML, mail scripts are automatically moved to the Email Script (sys_script_email) table and an embedded script tag with the name of the script is automatically inserted into the body of the notification.

When creating new email notifications, write mail scripts using System Notification > Email > Notification Email Scripts. When the scripts are completed, add a ${mail_script:script name} embedded script tag to the email notification body. This makes it easy to use the same scripts in multiple email notifications. All you need to copy and paste from one notification to the next is the embedded script tag.

If you manually enter a mail script, any text bounded by <mail_script> </mail_script> in the body of a new or converted email notification or template which is saved to the record, a message asks whether the mail script should be converted.

In many cases, an unconverted mail script fails to run from inside the HTML editor. If you select Yes, the script is added to the Email Script (sys_script_email) table and is automatically replaced in the body with an embedded script tag. You can view the mail scripts in their original form by opening the email notification and clicking the Show Notification Scripts related link.

Control visibility to email records generated by notifications
Define conditions that restrict read access to target email records containing sensitive information.
Role required: admin

Use the Email Access Restriction (email_access_restriction) table to define conditions that control read access to an email record generated by a notification containing sensitive information. These conditions are processed by the base system ACL for the Email (sys_email) table.

When you specify conditions to restrict access for a notification, the email records are visible only to users that match the conditions specified for the notification.

1. Navigate to System Notification > Email Access Restriction.
2. Click New.
3. Complete the form.
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notification</td>
<td>Choose the notification that generates the email record that should be restricted.</td>
</tr>
<tr>
<td>Application</td>
<td>Displays the application scope.</td>
</tr>
<tr>
<td>Table</td>
<td>Displays the target table for the notification that you selected.</td>
</tr>
<tr>
<td>Condition</td>
<td>Use the condition builder to determine who can access the email record. The conditions must evaluate to true to enable read access to the email record.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a short description of the read access restriction.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Advanced conditions for email notifications**

Use an advanced condition to send a notification based on the current email record, changing field values, or system properties.

To send a notification using an advanced condition, you can:

- Call a function that returns a value, or
- Set the global variable `answer` using a script

For example, in the following code, you call a function to prevent the system from sending an email notification if the sender of a self-service request is a member of the XYZ group:

```javascript
(function() {
  var groupMember = gs.getUser();
  return !groupMember.isMemberOf('XYZ');
})();
```

Alternatively, you can script the same advanced condition by using the `answer` variable:

```javascript
var groupMember = gs.getUser();
if(groupMember.isMemberOf('XYZ')){
  answer = false;
} else {
  answer = true;
};
```

Note that the script must set the `answer` variable to `true` to send the notification. If you script no conditionals, the value of `answer` is equal to the last value that you set for the variable.

You can add a script-based condition in the **Advanced condition** field by configuring the Email Notification form and adding the field. You can access the field in the **Advanced** view without configuring the form.

The advanced condition script uses the following business rule global variables:

- `current`: contains the current record from the table to which the notification is linked.
- `event`: contains the event that triggered the notification.

**Note:** The **Advanced condition** field is evaluated in addition to other conditions you set on the notification. Both the **Condition** and **Advanced condition** must evaluate to true in order to send the notification.
Edit HTML content in an email notification

For added control over the content of an email notification, you can edit the underlying HTML.

Role required: admin

1. Navigate to System Notification > Email > Notifications.
2. Open an email notification record.
3. On the form, open the What it will contain tab.
4. In the Message HTML field, click the source code icon ( ) to open the HTML source code editor.

5. Make the needed changes to the HTML.
6. On the window, click Ok.
7. On the form, click Update.
Document attachments on an email notification

You can attach documents and reports to email notifications by scripting or linking to the sys ID of the record.

You can include all attachments from the source record with the notification. For example, if an incident update generates a notification, you can include all attachments from the incident record with the notification. To include all attachments from the source record, select the check box for the **Include attachments** field. Note that email messages, including attachments, cannot exceed the maximum email size. This size includes MIME encoding. For details on MIME encoding, see [Email service size restrictions](#).

Attaching documents with scripting

Using scripting, you can attach documents by linking to them, or you can attach various types of reports by specifying their IDs in the system.

Linking to an attachment

You can add an attachment to a notification by linking to the attachment record in the message of the notification. Upon clicking the link, email recipients log in to the instance to view the attachment record.

Linking to attachment records in this fashion requires using email notification scripting. For example:

```javascript
template.print ( 'Attachment: <a href="/sys_attachment.do?sys_id=' + gr. sys_id + '">' + gr. file_name + '</a>\n' ) ;
```

Attaching reports using the Sys ID

You can also attach various types of reports, including gauges, dashboards, and charts, to a notification. The scripts to attach these reports take the following syntax:

```
${report:X:Y}
```

where:

- **X** is the type of report you want to attach (reportID, gaugeID, dashboardID, or chartID).
- **Y** is the sys ID of the report, gauge, dashboard, or chart to be attached.

For example:

- `${report:reportID:<abc123>}`
- `${report:gaugeID:<abc123>}`
- `${report:dashboardID:<abc123>}`
- `${report:chartID:<abc123>}`

**Note:** Multilevel pivot reports can’t attach to email notifications.

Line breaks in email notifications and rich HTML

Rich HTML provides additional control over line breaks in your email notifications and templates.

To provide control over line breaks, a **Newlines to HTML** check box is available in the **Email Script** form.
Newlines to HTML option

Selecting the **Newlines to HTML** check box indicates that the method for handling line breaks in earlier versions carries forward for email notifications and templates. When an email notification or template is converted to rich HTML, the **Newlines to HTML** check box is automatically selected.

For new mail scripts, add correct HTML line breaks to template.print() statements.

If an email notification or template is not converted to rich HTML, newlines are automatically wrapped with `<div>` tags, the same as previous versions. The old mail scripts still work. However, the administrator does not enjoy the benefits of working in the rich HTML format, and does not have as much control over exact HTML formatting.

**HTML line breaks in new scripts**

When writing new scripts, insert explicit HTML line breaks and clear the **Newlines to HTML** check box so that no HTML tags are injected when email notifications are generated. For existing notifications and templates, replace template.print("\n") JavaScript function calls with
template.print("<br />"). This replacement gives you better control over the HTML formatting of your email notifications.

**Preview email notifications**
You can preview what notifications look like before you actually enable the instance to send them.

Role required: admin

You can preview both types of notifications as specified by the **Send when** field on the Notification form:

- **Record inserted or updated**: A change to record in the instance triggers the notification.
- **Event is fired**: An event, such as expiration of a certificate or an inbound email action, triggers the notification.

1. Navigate to System Notification > Email > Notifications.
2. Open the notification or create one.
   You must save the record before you can view the preview accurately.
3. Click **Preview Notification** on the form header.
4. On the Notification Preview window, verify that the notification works as expected.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preview records for this breakdown source</td>
<td>The type of event that triggers the notification. This choice list appears if you preview an event-triggered notification. Select one of the following:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Generated Event</strong>: Preview the notification with a generic event that the previewer creates. This does not actually generate an event record.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Existing Event</strong>: Preview with an existing event record in the instance. If you select this option, select the event in the Event Record field.</td>
</tr>
<tr>
<td>Event Record</td>
<td>An existing event to preview an event-created notification. This option appears if you select <strong>Existing Event</strong> as the event type (for event-triggered notifications only).</td>
</tr>
<tr>
<td>Event Creator</td>
<td>The user triggering the notification for the purpose of the preview. The event creator defaults to the user who clicked <strong>Preview Notification</strong>. You can change the creator as needed. You can change the preview record as needed to see the changes in the notification content.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Preview Record</td>
<td>The record triggering the notification for the purpose of the preview. The preview record defaults to one of the records in the Table field on the Email Notification form. You can change the preview record as needed to see the changes in the notification content.</td>
</tr>
</tbody>
</table>
| Users         | The users who will receive the notification, as specified in the Who will receive section of the Email Notification form:  
  - All users that you specify on the form appear, but only the users that will actually receive the notification with the current preview settings appear in black text.  
  - Users that are specified but for whatever reason will not receive the notification appear in red, strikethrough text. Place the cursor over any of these names to see the reason the user will not receive the notification. For example, one reason could be that the user's notification settings are disabled. |
| Subject and Body | The content of the notification as defined by the template. The Subject and Body sections on the preview display the content in the corresponding Subject and Message fields on the template.  
  If the template includes a link to the record that triggered the notification, the Preview Record link is used. Click the link to go to that record. |

5. After you have reviewed the notification, exit the preview window.
6. Make the necessary changes to the notification or template, if necessary.

**Time zone for email notifications**

A system property controls the time zone that the instance uses for the date and time stamp of a message.

The date and time stamp of a notification uses the system time zone, not the time zone of any recipient. The email property `glide.email.append.timezone` controls whether to append the time zone. If true, the system time zone of the instance is appended to any Date/Time fields in outbound email messages (for example, 2018-07-02 04:01:14 PST).

**Specify alternative outbound email addresses for notifications**

By default, the system sends all outbound email notifications from the default email address of the instance, but you can specify an alternative address.

Role required: admin
For organizations that need to send email messages from specific email addresses, such as from multiple service desks, or they want to send notifications in different languages, the platform supports configuring multiple outbound addresses.

1. Navigate to **System Notification > Email >Notifications**.
2. Select an existing notification record for the desired event, such as **Incident Closed**.
3. Create a copy of this notification for each outbound email address.
4. Open one of the notification copies, and click the **Advanced view** related link.
5. In the **What it will contain** section, add an email address to the From field that is different from the default instance address.
   
   For more information on how to construct the From address, refer to section 3.6.2 of RFC 2822.
6. Add a different email address than the From address to the **Reply to** field if you want replies to this notification to go to a different address.
   
   The system checks the From field for an address. If this field is empty, then the system uses the default address for the instance. If the Reply to field is empty, then all replies are sent to the address from which the notification was sent. If the Reply to field contains an email address, then the system sends all replies to the notification to this address.
7. Create mutually-exclusive conditions for notifications of the same type, so only the desired notification is sent when the event is fired.
   
   For example, if the **Company** is a certain value, then the notification comes from a unique email address entered in the From field.
8. Click **Update**.

**Specify an outbound email address for a particular language**

You can specify a different email address for each language your instance supports.

Role required: admin
1. Create or copy a notification record for the desired event.
2. In the **What will it contain** section, enter a new email address in the From field.
3. Create the **Subject** and **Message** content in the desired language.
4. In the **When to send** section, create a condition as follows:
   
   1. In the list of **Condition** fields, select **Show Related Fields** from the bottom of the choice list.
   2. From the choice list of **Related Fields**, select the field that identifies the recipient.
      
      For example, select **Caller > User** fields to send the notification to the user who called in an incident, or **Assigned to > User** fields to send the notification to the user to whom an incident is assigned.
   3. From the choice list of user fields, select **Language**.
   4. Select the is operator.
   5. Complete the condition by selecting the language of the desired user.
5. Click **Update**.

All notifications for that event originate from the specified email address and go out in the language of the recipient.

**Notification variables**

Use notification variables to display dynamic information in the body of a notification such as a field value, a link to a record, or a link to system preferences.
Syntax

Specify a notification variable using this syntax:

\`${variable-name+variable-parameters}\`

The `variable-name` portion is always required. Not all notification variables support the `variable-parameters` portion. When available, most variable parameters are optional. See the list of available notification variables for variable names and available parameters.

Available variables

The system provides these notification variables.

### Available notification variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>`${field-name}`</td>
<td>Display the value of the specified field.</td>
<td>None</td>
</tr>
<tr>
<td>`${image-field-name}`</td>
<td>Display an image associated with a record. This variable is typically used with HTML to specify the source of an image element.</td>
<td>None</td>
</tr>
<tr>
<td>`${URI}`</td>
<td>Display a link to the current record.</td>
<td>Any valid <code>sysparm</code> URL parameter. For example:</td>
</tr>
<tr>
<td>`${URL_REF}`</td>
<td>URI: The link text is the word <code>LINK</code>.</td>
<td>sysparm_scriptlet, sysparm_view</td>
</tr>
<tr>
<td>`${reference-field.URI}`</td>
<td>Display a link to the record listed in a reference field.</td>
<td>Any valid <code>sysparm</code> URL parameter. For example:</td>
</tr>
<tr>
<td>`${reference-field.URL_REF}`</td>
<td>URI: The link text is the word <code>LINK</code> URI_REF: The link text is the display value of the record.</td>
<td>sysparm_scriptlet, sysparm_view</td>
</tr>
<tr>
<td>`${CMS_URI}`</td>
<td>Display a link to the specified record within a CMS page.</td>
<td><code>&lt;CMS-site&gt;/&lt;CMS-page&gt;</code>: The required relative path to the CMS page.</td>
</tr>
<tr>
<td>`${notification:body}`</td>
<td>Display the body contents of an email template or email notification.</td>
<td>None</td>
</tr>
<tr>
<td>`${mail_script:script-name}`</td>
<td>Run the specified mail script.</td>
<td>None</td>
</tr>
<tr>
<td>`${NOTIF_UNSUB}`</td>
<td>Display a link unsubscribe from this notification.</td>
<td><code>link_text</code>: specify the text to display as a link within quotation marks.</td>
</tr>
</tbody>
</table>
### Variable Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>${NOTIF_PREFS}</code></td>
<td>Display a link to set notification preferences.</td>
<td>link_text: specify the text to display as a link within quotation marks.</td>
</tr>
<tr>
<td><code>${comments:n}</code></td>
<td>Display the most recent comments that were made on the target record. The number of comments to display is n. For example, <code>${comments:3}</code> displays the last three comments that were made to the record. To display all comments, use the variable <code>${comments}</code>.</td>
<td>Any number greater than 0.</td>
</tr>
<tr>
<td><code>${comments_and_work_notes:n}</code></td>
<td>Display the most recent comments and work notes that were made on the target record. The number of comments and work notes to display is n. For example, <code>${comments_and_work_notes:3}</code> displays the last three comments and work notes that were made to the record. To display all comments and work notes, use the variable <code>${comments_and_work_notes}</code>.</td>
<td>Any number greater than 0.</td>
</tr>
</tbody>
</table>

### Examples

Refer to the following examples to see how each notification variable is rendered in the output:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Example</th>
</tr>
</thead>
</table>
| `${field-name}` | Source: Incident ${number} - comments added  
Output: Incident INC1000001 - comments added |
<table>
<thead>
<tr>
<th>Variable</th>
<th>Example</th>
</tr>
</thead>
</table>
| `${image-field-name}`   | Source: `<img src='${picture}?t=medium'/>`  
Output: |
|                         | · `${URI}`                        | 
|                         | Source: Click here to view incident: `${URI}` |
|                         | · `${URI_REF}`                    | 
|                         | Source: Click here to view Related Problem: `${problem_id.URI_REF}` |
| · `${URI}`              | `${URI}` Source: Click here to view incident: `${URI}` |
| · `${URI_REF}`          | `${URI_REF}` Source: Click here to view incident: `${URI_REF}` |
| · `${reference-field.URI}` | Source: Click here to view Incident: `${URI_REF}`  
Click here to view Related Problem: `${problem_id.URI_REF}` |
| · `${reference-field.URI_REF}` | Output: |
|                         | · `${reference-field.URI_REF}`   | 
|                         | Source: Click here to view Incident: `${URI_REF}`

Links to records in email notifications
Adding the \($\{URI\}$\) parameter to an outbound email body or template creates a link to a specific record.

When a user clicks the word LINK, the instance prompts the user to log in if not already logged in, and then redirects the user to the record specified in the URI.

The \($\{URI\}$\) parameter has an extension called the \($\{URI+\}$\) format to specify additional arguments in the email link, such as sysparm terms, in addition to the automatically created URI. For example (whitespace added for improved readability):

\[
\begin{align*}
\text{\($\{URI+\}$\)} & \text{= } \\
&  \text{current.assigned_to=} \text{gs.getUserID()} \\
&  \text{sysparm_scriptlet=}\text{current.assigned_to.nil()} \\
&  \text{sysparm_view=incident_active}
\end{align*}
\]

This example executes the JavaScript:

\[
\begin{align*}
\text{current.assigned_to=} & \text{gs.getUserID()} \\
\text{when the condition of } & \text{current.assigned_to.nil()}
\end{align*}
\]

is satisfied. Additionally, the script sets the view to \text{incident_active}.

Enable links to records
Adding the special \($\{URI\}$\) parameter to an outbound email body or template creates a link to a specific record.

When a user clicks the word LINK, the instance prompts the user to log in if not already logged in, and then redirects the user to the record specified in the URI.

The \($\{URI\}$\) parameter has an extension called the \($\{URI+\}$\) format to specify additional arguments in the email link, such as sysparm terms, in addition to the automatically created URI. For example (whitespace added for improved readability):

\[
\begin{align*}
\text{\($\{URI+\}$\)} & \text{= } \\
&  \text{current.assigned_to=} \text{gs.getUserID()} \\
&  \text{sysparm_scriptlet=}\text{current.assigned_to.nil()}
\end{align*}
\]
This example executes the JavaScript:

```javascript
current.assigned_to=gs.getUserID()
```

when the condition of

```javascript
current.assigned_to.nil()
```

is satisfied. Additionally, the script sets the view to `incident_active`.

Change the link text

To show the display value of the record as the link text instead of the word LINK, use the `${URI_REF}` parameter instead of the `${URI}` parameter.

**URI_REF email notification**

For example, if the URL displays an incident record, the link text is the incident number, which is the display value for incidents. If the URL displays a user record, then the link text is the user name.

**Link to related records**

A notification can link to a related record by specifying a reference field in front of the `${URI}` or `${URI_REF}` parameters.

Format the related record link as follows:

- `${<reference field that contains the related record you want to display>}.URI`
- `${<reference field that contains the related record you want to display>}.URI_REF`

For example:

<table>
<thead>
<tr>
<th>Related record to provide link to</th>
<th>Notification record table</th>
<th>Reference field</th>
<th>Samples</th>
</tr>
</thead>
</table>
| Related task record to be approved from an approval notification | Approval (sysapproval_approver) | Approval for (sysapproval) | • `${sysapproval.URI}`  
  • `${sysapproval.URI_REF}` |
| Related problem record in an incident notification | Incident | Problem (problem_id) | • `${problem_id.URI}`  
  • `${problem_id.URI_REF}` |

For example, the following notification template produces the email links in the picture below:

```
Click here to view Incident: ${URI_REF}
```
Related record link

Content page links in email notifications
Links to CMS pages can be put in notifications to make it easy for the reader to access the pages. The link takes the following format: \${CMS_URI+<site>/<page>}. For example, to link the email recipient to a page called Incident in the content site ESS, with the current incident as the target document, use the following format: \${CMS_URI+ess/incident_detail}
The resulting email URL has this format: https://<instance name>.service-now.com/ess/incident_detail.do?sysparm_document_key=incident,46e18c0fa9fe19810066a0083f76bd56

Email unsubscribe
Administrators can add unsubscribe links to notifications so that users can stop receiving particular email messages.

Note: The base system notifications include unsubscribe and notification preferences links.

The system offers two types of macros to create unsubscribe links.
- An unsubscribe link that creates an email message to the instance.
- An unsubscribe link that opens the notification preferences for the user on the instance.

Available unsubscribe macros

<table>
<thead>
<tr>
<th>Unsubscribe type</th>
<th>Macro used</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unsubscribe by email (Unauthenticated)</td>
<td>${NOTIF_UNSUB}</td>
<td>The system generates an HTML mailto hyperlink. When users click the link, their browser or email client creates a pre-formatted unsubscribe email message to the instance.</td>
<td>link_text: specify the text to display as a link within quotation marks.</td>
</tr>
<tr>
<td>Unsubscribe by notification preferences (Authenticated)</td>
<td>${NOTIF_PREFS}</td>
<td>The system generates an instance link directly to the notification preferences for this notification type.</td>
<td>link_text: specify the text to display as a link within quotation marks.</td>
</tr>
</tbody>
</table>

Administrators can add unsubscribe macros to any notification record type such as:
- Email layouts
- Email templates
- Email notifications
Unsubscribe by email

Unsubscribe by email requires the user email client or browser to create a pre-formatted email message containing these elements:

- The **To** field has the email address of the instance.
- The **Subject** starts with the string **Unsubscribe from**.
- The **Body** has a JSON string with a name-value pair of **Unsubscribe** and an array value that contains two more name-value pairs.
  - The **notification_id** parameter specifies the Sys ID of the notification the user wants to unsubscribe from.
  - The **unsub_token** parameter specifies an instance ID the system uses to verify that the email came from a ServiceNow instance.

**Note:** Some email clients and web browsers, such as GMail on Chrome, require extra client configuration to support mailto hyperlinks. Administrators can provide an alternative unsubscribe method for users whose email client or browser does not support mailto links. See [RFC6068](https://tools.ietf.org/html/rfc6068) for information about the mailto URI scheme.

The **Unsubscribe from Notification** inbound action processes the email and unsubscribes the sender from the listed notification.

**Note:** Unsubscribing by email message does not require users to authenticate with the instance first.

Unsubscribe by notification preferences

Unsubscribe by notification preferences requires the user’s browser to navigate to the notification preferences page on the instance. After logging in, the system displays the notification preferences for this particular notification.

Users can set preferences for this notification such as disabling notifications for a particular device. Users must save their notification preferences for changes to take effect.

**Unsubscribe links**

This email layout adds several unsubscribe links to the bottom of each email notification.

```html
${NOTIF_UNSUB} from this notification by email or ${NOTIF_UNSUB +link_text="click here"}.
Manage your ${NOTIF_PREFS} or ${NOTIF_PREFS+link_text="click here"}.
```

When rendered in an email notification, the unsubscribe links only display the link text.
Notification Preview

Preview records for this breakdown source

Subject

Incident INC0000060 commented

Body

You can view all the details of the incident by following the link below:

Go to Instance

Unsubscribe | Manage Preferences
If a user clicks the **Unsubscribe** link, the email client creates a message such as this:

![Sample unsubscribe by email message](image)

**Scripting for email notifications**

Email scripts allow for business rule-like scripting within an outbound email message.

With mail scripts, you can dynamically change the email output of your system based on different criteria. Mail scripts allow you to perform simple tasks, such as displaying incident data, and complex ones, such as making advanced database queries.

You can add a `$\{mail_script:script_name\}` embedded script tag to the body of the email notification or template, replacing `script name` with the name of the script you created. This makes it easy to use the same scripts in multiple email notifications or templates.

If you manually enter a mail script bounded by `<mail_script>` and `</mail_script>` in the body of a new or converted email notification or template, and then attempt to save the record, a message asks whether the mail script should be converted. In many cases, an unconverted mail script fails to run from inside the HTML editor. If you select **Yes**, the script is added to the Email Script (sys_script_email) table and is automatically replaced in the body with an embedded script tag (`$\{mail_script:script_name\}`).

**JavaScript in emails**

Create mail scripts in **System Notifications > Email > Notification Email Script**, and refer to them by using `$\{mail_script:script_name\}` in the script field.

To print text into the body of the message, use the `template.print("a string")` function.
### Mail script API

Certain variables are available when processing mail_script scripts.

#### Mail script variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Object Description</th>
</tr>
</thead>
</table>
| template  | Handles printing from the mail script to the email message.  
            | template.print("message"); //outputs message to the email body.  
<pre><code>        | template.space(&quot;number of spaces&quot;); //outputs spaces to the email body. |
</code></pre>
<p>| email_action | GlideRecord object for the email notification (sysevent_email_action). |
| event     | GlideRecord object for the event that fired the notification (sysevent). |</p>
<table>
<thead>
<tr>
<th>Variable</th>
<th>Object Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>email</td>
<td>EmailOutbound object</td>
</tr>
<tr>
<td></td>
<td>Available methods:</td>
</tr>
<tr>
<td></td>
<td>· addAddress(String type, String address, String displayname): type can be cc or bcc.</td>
</tr>
<tr>
<td></td>
<td>· setFrom(String address): override the sender address.</td>
</tr>
<tr>
<td></td>
<td>· setReplyTo(String address): override the reply to address.</td>
</tr>
<tr>
<td></td>
<td>· setSubject(String subject): override the subject of the message.</td>
</tr>
<tr>
<td></td>
<td>· setBody(String message): override the body of the message.</td>
</tr>
</tbody>
</table>

The email address that is passed by setFrom and setReplyTo needs to be in a valid form such as helpdesk@sn.com or Display Name <helpdesk@sn.com>. If the email address includes a 'Display Name', then that value overrides the instance’s display name.

Example scripting for email notifications
Examples of scripting for email notifications.

**Scripting examples for email notifications**

A simple text string is the most basic example of the way a mail script works. This script prints out "Incident number - INC00001".

```plaintext
template.print("Incident number - "+ current.number);
```

More advanced scripts, like this one, can be found by browsing through the base system email templates.

```plaintext
template.print("Summary of Requested items:<br />
var gr = new GlideRecord("sc_req_item");
gr.addQuery("request", current.sysapproval);
gr.query();
while(gr.next()) {
    template.print(gr.number + ": " + gr.quantity + " X " +
    gr.cat_item.getDisplayValue()
    + " at " + gr.cat_item.price.getDisplayValue() + " each<br />
}
```

To dynamically change field values within an email, use the following functions within <mail_script> syntax:

```plaintext
...
email.setFrom(current.caller_id.email);
email.setReplyTo("joe.employee@yourcompany.com");
```
(email.setSubject("This is the new subject line");
email.setBody("This is the new body");
...)

Using the **instance_name** property ensures that the notification still works when migrated between instances.

dothis();

function dothis(){
    var gr = new GlideRecord('sys_attachment');
gr.addQuery('table_sys_id', current.sys_id);
gr.query();
    while(gr.next()){template.print('Attachment: <a href="https://'+
gs.getProperty('instance_name')+'/'.service-now.com/sys_attachment.do?sys_id='+ gr.sys_id+'">'+
gr.file_name+'</a>');}}

You can specify copied and blind copied recipients by using the email object within a mail script.

//email.addAddress(type, address, displayname);
email.addAddress("cc","john.copy@example.com","John Roberts");
email.addAddress("bcc","john.secret@example.com","John Roberts");

The following is an example script to add users from **watch_list** as copied recipients.

if(!current.watch_list.nil()){ //get watch list addresses and add to cc
    var watcherIds = current.watch_list.split(",");

    //get user records
    var user = new GlideRecord("sys_user");
user.addQuery("sys_id", watcherIds);
user.addQuery("notification",2);
    //email
user.addQuery("email","!="","");
user.query();

    while(user.next()){ //add to cc list
        email.addAddress("cc", user.email, user.getDisplayValue());}}

Useful attachment scripts
This is a searchable version of the Useful Attachment Scripts.

**Caution:** The customization described here was developed for use in specific instances, and is not supported by ServiceNow Technical Support. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.

**Copy attachments from record to record**

Use the following script to copy an attachment from one record to another record:

GlideSysAttachment.copy('sourcetable','sys_id','destinationtable','sys_id');
Delete duplicate attachments

Use the following script in a business rule, scheduled job, or background script to delete duplicate attachments located in the Attachments (sys_attachment) table:

```javascript
function fixDuplicateImages(){
var gr = new GlideRecord('sys_attachment');
gr.addQuery('table_name', 'LIKE', 'ZZ_YY%');
gr.orderBy('table_sys_id');
gr.orderByDesc('sys_created_on');
gr.query();
var lastID = 'not_a_match';
var lastFile = 'not_a_match';
while(gr.next()){
var isDuplicate = (lastID == gr.table_sys_id) && (lastFile == gr.file_name);
lastID = gr.table_sys_id;
lastFile = gr.file_name;
gs.print(gr.table_sys_id + ' ' + gr.table_name + ' ' + gr.file_name + ' ' +
        gr.sys_created_on + ' ' + isDuplicate);
if(isDuplicate)
gr.deleteRecord();
}
}
```

Display whether tasks have attachments in list view

Use the following script in a business rule to display whether tasks have attachments when viewed in the record list view. Note that the script needs a custom field on the Has Attachments (u_has Attachments) table:

```javascript
function checkAttachment(){
// if inserting then the task has an attachment
if(current.operation() == 'insert'){
    hasAttachment = 'true';
// if deleting attachment check for other attachments
if(current.operation() == 'delete'){
    var timeNow3 = new GlideDateTime();
    gs.log('has_attachment br: gliderecord query start date time
        is: ' + timeNow3.getNumericValue(),'jwtest');
    var attachCount = new GlideAggregate('sys_attachment');
    attachCount.addQuery('table_sys_id', current.sys_id);
    attachCount.addAggregate('COUNT');
    attachCount.query();

    var numAttachments = 0;
    if(attachCount.next()){
        numAttachments = attachCount.getAggregate("COUNT");
        if(numAttachments > 0){
            hasAttachment = 'true';
        }else{
            hasAttachment = 'false';
        }
    }
    var timeNow4 = new GlideDateTime();
    gs.log('has_attachment br: gliderecord query start date time is: '+
        timeNow4.getNumericValue(),'jwtest');
}

function hasAttachment(answer){
var task = new GlideRecord('task');
task.addQuery('sys_id', current.table_sys_id);
task.query();
if(task.next()){
    hasAttachment = 'true';
    var currentTask = task.getSysId();
    var attachCount = new GlideAggregate('sys_attachment');
    attachCount.addQuery('table_sys_id', currentTask);
    attachCount.addAggregate('COUNT');
    attachCount.query();

    var numAttachments = 0;
    if(attachCount.next()){
        numAttachments = attachCount.getAggregate("COUNT");
        if(numAttachments > 0){
            hasAttachment = 'true';
        }else{
            hasAttachment = 'false';
        }
    }
    var timeNow4 = new GlideDateTime();
    gs.log('has_attachment br: gliderecord query start date time is: '+
        timeNow4.getNumericValue(),'jwtest');
}
```

```javascript
function checkAttachment(){
// if inserting then the task has an attachment
if(current.operation() == 'insert'){
    hasAttachment = 'true';
// if deleting attachment check for other attachments
if(current.operation() == 'delete'){
    var timeNow3 = new GlideDateTime();
    gs.log('has_attachment br: gliderecord query start date time
        is: ' + timeNow3.getNumericValue(),'jwtest');
    var attachCount = new GlideAggregate('sys_attachment');
    attachCount.addQuery('table_sys_id', current.sys_id);
    attachCount.addAggregate('COUNT');
    attachCount.query();

    var numAttachments = 0;
    if(attachCount.next()){
        numAttachments = attachCount.getAggregate("COUNT");
        if(numAttachments > 0){
            hasAttachment = 'true';
        }else{
            hasAttachment = 'false';
        }
    }
    var timeNow4 = new GlideDateTime();
    gs.log('has_attachment br: gliderecord query start date time is: '+
        timeNow4.getNumericValue(),'jwtest');
}

function hasAttachment(answer){
var task = new GlideRecord('task');
task.addQuery('sys_id', current.table_sys_id);
task.query();
if(task.next()){
    ```
task.u_has_attachment= answer;
    task.autoSysFields(false);//Don't set the lastUpdatedTime or the
    Simultaneous Update Alert will likely get triggered
    task.setWorkflow(false);//Don't allow other business rules to run,
    otherwise multiple notifications will likely be sent
    task.update();}}

**Note:** Schedule the business rule to run after insert/delete.

### Link to attachments in an email notification

Use the following script in an email notification or template to include links to attachments:

```javascript
function printattachments(){var gr =new GlideRecord('sys_attachment');
    gr.addQuery('table_sys_id',current.sys_id);
    gr.query();while(gr.next()){ 
        template.print('Attachment: <a href="http://'+gs.getProperty("instance_name")+'.service-now.com/
            sys_attachment.do?sys_id='+ gr.sys_id+'">'+ gr.file_name+'</a>');
    }}
```

**Note:** Replace "instance_name" with your instance name.

### Attachment Logging

Whenever a user downloads an attachment, the action writes an attachment.read event record to the event log. If desired, you can process these events with a Script Action or an Email Notification. This can be useful if you want to do something when an attachment is read. For example, you can record when and by whom certain attachments are downloaded. For this functionality, the current variable must point to a sys_attachment record, and the event record must use the following parameters:

- parm1: File name
- parm2: Table name

### Baseline email notifications

The baseline system provides several email notifications.

Some events listed in this table do not appear in a business rule and are fired by other conditions in the platform. Some events are hardcoded and are not user configurable.
## Baseline email notification descriptions

*Notification example:* notify an assignment group of updates to Priority 1 Incidents  
Notify users by email when there are updates to high priority incidents.  
Role required: admin
Send emails to an assignment group whenever there are updates to an incident in which the **Priority** is **1 - Critical**. Include information that is of interest to the recipients, such as the incident number, category, assignees, and any comments that were added to the incident.

1. Navigate to **System Notification > Email > Notifications**, and then click **New**.
2. On the email notification form, enter the following values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Priority 1 Incident Updated</td>
</tr>
<tr>
<td>Table</td>
<td>Incident (incident)</td>
</tr>
<tr>
<td>Active</td>
<td>Selected</td>
</tr>
<tr>
<td>Category</td>
<td>Incident Alert</td>
</tr>
<tr>
<td>Send when</td>
<td>Record inserted or updated</td>
</tr>
<tr>
<td>Inserted</td>
<td>Selected</td>
</tr>
<tr>
<td>Updated</td>
<td>Selected</td>
</tr>
<tr>
<td>Conditions</td>
<td>(Priority) (is) (1 - Critical) AND (Updated) (changes)</td>
</tr>
<tr>
<td>Users/Groups in fields</td>
<td>Assignment group</td>
</tr>
<tr>
<td>Subject</td>
<td>Priority ${priority} Incident updated</td>
</tr>
</tbody>
</table>

**Note:** In this notification, the variable ${priority} returns the value **1 - Critical**.

3. In the **Message HTML** field, enter the following message and script:

   ```plaintext
   Short Description: ${short_description}
   Click here to view incident: ${URI}
   Incident number: ${number}
   Category: ${category}
   Assigned to: ${assigned_to}
   Assignment group: ${assignment_group}
   <hr/>
   Comments: ${comments}
   ```

4. From the form context menu, click **Save**.
5. Preview the email notification to ensure it includes all the needed information.
   a) On the notifications form, click **Preview Notification**.
   b) Note that the email includes the following information:
      - Short description
      - A link to the incident record
      - Incident number
      - Category
      - The name of the user to whom the incident is assigned
      - The group assigned to the incident
      - Comments from the incident record
6. Test that the email notification sends to an assignment group when its Priority 1 Incident is updated.
   a) Create a user who has an email address that you can monitor, and then create a group that includes the user that you created.
   b) Navigate to Incident > Open, and then open an incident in which the Priority is 1 - Critical.
   c) In the Assignment group field, enter the group that you created.
   d) From the form context menu, click Save.
   e) Add comments to the form to update the incident, and then click Update.
   f) Check the email account of the user member in the assignment group.

Notification example: notify task assignees
Notify users who are assigned a Task (task) record.
Role required: admin

Set up your email as a test email address. Navigate to System Properties > Email Properties, and then enter your email address under Send all email to this test email address.

1. Navigate to System Notification > Email > Notifications, and then click New.
2. On the form, enter the following values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Task Assigned</td>
</tr>
<tr>
<td>Table</td>
<td>Task (task)</td>
</tr>
<tr>
<td>Active</td>
<td>Selected</td>
</tr>
<tr>
<td>Category</td>
<td>Uncategorized</td>
</tr>
<tr>
<td>Send when</td>
<td>Record inserted or updated</td>
</tr>
<tr>
<td>Inserted</td>
<td>Selected</td>
</tr>
<tr>
<td>Updated</td>
<td>Selected</td>
</tr>
<tr>
<td>Conditions</td>
<td>(Assigned to)(changes)</td>
</tr>
<tr>
<td>Users/Groups in fields</td>
<td>Assigned to</td>
</tr>
<tr>
<td>Subject</td>
<td>Task Assigned</td>
</tr>
</tbody>
</table>

3. In the Message HTML field, add a message to send to whomever the task is assigned to.
4. From the form context menu, click Save.
5. To see a mock version of the system email that you created, click Preview Notification on the notification form.
6. Test the notification sends to a task assignee.
   a) Assign some task records.
   b) Check your email for assignment notifications.

Email templates
Email templates enable administrators to create reusable content for the subject line and message body of email notifications.
Templates deliver consistent information on specific system activities and improve the efficiency of creating multiple email notifications for similar actions. If necessary, you can make minor changes on the fly to an email that uses a template by overriding the subject line and message body content in the notification form. A common practice is to define the message body in a template and create new subject lines for different types of recipients. There is no limit to the number of templates that you can create.

Email templates are created in rich HTML format, and administrators have the option of converting existing email templates to rich HTML (starting with the Eureka release). This format provides several advantages, including:

- Raw HTML content is converted into a WYSIWYG format.
- The content can be edited in a feature-rich HTML editor.
- Mail scripts are condensed into a single, easy-to-read line that can be reused in multiple email notifications.
- To prevent broken links, images linked using URLs relative to a particular instance are converted to absolute links.

Create an email template
You can create an email template with rich HTML formatting, rather than plain text.

Role required: admin

1. Navigate to System Policy > Email > Templates.
2. Click New.
3. Fill in the form fields (see table).

Name: change.itil.approvo.action.role
Application: Global
Email layout: Table: Change Request (change_request)
Subject: {$sys_class_name} {$number} has been {$approval}
Message HTML:
**Short Description**: {$short_description}
Click here to view {$sys_class_name}: {$URL_REF}
Priority: {$priority}
Category: {$sysapproval.category}
Description: {$description}
SMS alternate:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the template. For example, change.update.risk.</td>
</tr>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
<tr>
<td>Email layout</td>
<td>If the message body for the template is to be formatted using a predefined email layout, select the layout.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the name of the table involved.</td>
</tr>
</tbody>
</table>
| Subject        | Enter a subject line that explains the purpose of the email. Select the appropriate variables for the subject line from the fields available on the selected table. Place the cursor where you want the variable to appear, and click the field name in the Select variables column. For example:  

```
${sys_class_name} ${number}
with ${risk} risk has been assigned to you.
```

| Message HTML   | Enter the content of the email template message. You can use the HTML editor toolbar to format the HTML, and you can include variables from the Select variables column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes.  

**Notes:**  
- When a template is applied to a notification, the contents of this field are used when you select HTML and plain text or HTML in the Content Type field in the Email Notification form.  
- You cannot use HTML code to control the appearance of the contents in the ${comments} variable.  
- If you want to include a link to the record that triggered the notification, see Enable links to records. |
| Message Text   | Enter the notification message to send in plain text.                      |

**Note:** When a template is applied to a notification, the contents of this field are used when you select HTML and plain text or Text in the Content Type field in the Email Notification form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMS alternate</td>
<td>Create a different message to be delivered to an SMS device. Enter a brief message, showing the most important information only. If this message field is blank, the contents of the Message Text field are used for the SMS message.</td>
</tr>
</tbody>
</table>

**Apply a template to an email notification**

After you create an email template, you can apply it to a notification.

Role required: admin

1. Navigate to System Notification > Email > Notifications.
2. Open the email notification record that should use the template.
3. Navigate to the What it will contain section.
4. From the Email template field, select the appropriate template.
5. Click Update.

**Convert an email template to rich HTML**

If you have an email template created prior to the Eureka release, you can convert it to rich HTML.

Role required: admin

1. Navigate to System Policy > Email > Templates.
2. Open the email template you want to convert.
<table>
<thead>
<tr>
<th>Name</th>
<th>notify.change</th>
<th>Table</th>
<th>Incident [incident]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email layout</td>
<td>Unsubscribe and Preferences</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Subject</td>
<td>${TABLE_NAME} ${DISPLAY_VALUE} Change Notification</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Message</td>
<td>Click here to view ${TABLE_NAME} ${URI}</td>
<td>Fields</td>
<td></td>
</tr>
<tr>
<td>SMS alternate</td>
<td>-</td>
<td>Select variables:</td>
<td>Fields</td>
</tr>
</tbody>
</table>
3. Click **Switch to Rich HTML Editor**.

When content is converted, these changes are made to the content:

- **HTML Editor**: Any raw HTML in the **Message** field is rendered as WYSIWYG text in the **Message HTML** field. The content can be edited in a feature-rich HTML editor.

- **Simplified Mail Scripts**: Any mail scripts in the body are automatically saved to the **Email Script (sys_script_email)** table and are replaced in the notification body with an embedded script tag. This makes the template body easier to read and makes it easier to reuse scripts in multiple email templates.
<table>
<thead>
<tr>
<th>Name</th>
<th>notify.change</th>
<th>Table</th>
<th>Incident [incident]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email layout</td>
<td>Unsubscribe and Preferences</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Subject</td>
<td>${TABLE_NAME} ${DISPLAY_VALUE} Change Notification</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Message HTML</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Click here to view ${TABLE_NAME}: ${URL}
4. Modify the message text, as needed, using the WYSIWYG editor or by editing the underlying HTML.

**Note:** The letter “P” at the bottom of the screen shows the location of your cursor within the Message field. In this case, the cursor is in a line containing an `<HTML>` tag.

**Note:** Email templates that are already formatted with rich HTML do not show the Switch to Rich HTML Editor button.

Whether you are working with templates converted from earlier versions or creating new templates in the rich HTML format, it is a good practice to write mail scripts in System Notification > Email > Notification Email Scripts. When the scripts are completed, a `{mail_script:script name}` embedded script tag should be added to the email template body. This makes it easy to use the same scripts in multiple email templates. All that needs to be copied and pasted from one template to the next is the embedded script tag.

If you manually enter a mail script in the body of a new or converted email notification or template, and then attempt to save the record, a message asks whether the mail script should be converted. Unconverted mail scripts often fail to run from inside the HTML editor. If you select Yes, the script is added to the Email Script (sys_script_email) table and is automatically replaced in the body with an embedded script tag.

You can view the mail scripts in their original form by opening the email template and clicking the Show Notification Scripts related link.

**Construct an email message with a template**

Email templates provide a list of the fields from database tables that are available for constructing an email message.

An email template can include a mailto automatic response link, which enables the email recipient to simply choose a link that sends a preformatted response back to the instance. An example is the email template used for notification that an approval is required. The following example shows the base email:
### ServiceNow - Approval Request (Advanced view)

<table>
<thead>
<tr>
<th>Name</th>
<th>Approval Request</th>
<th>Type</th>
<th>EMAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Approval [sysapproval approvals]</td>
<td>Active</td>
<td>✓</td>
</tr>
<tr>
<td>Category</td>
<td>Approval</td>
<td>Allow Digest</td>
<td>-</td>
</tr>
<tr>
<td>Description</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### When to send | Who will receive | What it will contain

```

---

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
In this case, when a change request approval is requested, an update is made to the `sysapproval_approval` table. The "approval events" business rule is then executed, which creates the "approval.inserted" event. The "Approval Request" email event is defined to process the approval.inserted event, and this email event is defined to use the following `change.itil.approve.role` email template. Notice that this template has two mailto: items specified. One for "mailto.approval" and one for "mailto.rejection." This email template builds an automatic response that lets the email receiver simply click a link in the email to either approve or reject the change request.

Here is what the `change.itil.approve.role` template looks like using the rich HTML editor:
Email Template
change.itl.approve.role

Name: change.itl.approve.role
Application: Global

Email layout: Unsubscribe and Preferences
Table: Approval [sysapproval.approver]
Subject: ${sysapproval.sys_class_name} ${sysapproval} Approval Request

Message HTML:

B / I / U / " Password: False
Font Family: Default
Font Sizes: Default

$({sysapproval.short_description})
Priority: ${sysapproval.priority}
Category: ${sysapproval.category}

${mail.script:change_request.summary}
Comments:
${sysapproval.description}

${mailto:mailto.approval}

${mailto:mailto.rejection}

Click here to view Approval Request: ${URI}
Click here to view ${sysapproval.sys_class_name}: ${sysapproval.URI}

div
The selection list on the right shows the available fields from the `sysapproval_approver` table.

Notice the `change.itil.approve.role` template also uses a predefined email layout (Unsubscribe and Preferences), which provides links for the recipient to unsubscribe from approval notifications and set notification preferences.

And here is the `mailto.approval` template:

```
Name: mailto.approval
Application: Global
Email layout: Unsubscribe and Preferences
Table: Approval (sysapproval_approver)
Subject: Re$(${sysapproval}) - approve

Click here to approve ${sysapproval}
```

**Note:** If you put text on the lines following the `Click here to approve ${sysapproval}` line, this text forms the actual body of the email.

The combination of templates used would generate an email similar to the following example:
Template generated email message

Notice that the email recipient can use the following links in the mail:

- A link to view all the details of the change request
- A link to view the approval record
- A link that generates an automatic email response to approve the change
- A link that generates an automatic email response to reject the change
- A link to unsubscribe from approval notifications and another link to set notification preferences

Add blank lines in an email template

You can easily add blank lines in an email template using HTML tags. Judicious use of these HTML tags can make your email easier to read.

- You can use `<br/>` to insert a line break
- You can wrap paragraphs in `<p> . . . </p>` tags to format your email nicely.

**Calendar integration**

With email notifications, you can use import export maps to leverage information about records and integrate with Outlook or another calendar.

For example, an email notification can create a calendar event based on the planned start and end dates of a change request. To enable integration with a calendar, the following iCalendar variables are available to be added to an email template message and reference the email template from the notification. The variables must be added to the **Message Text** field.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>${dtstart}</td>
<td>Start Date</td>
</tr>
<tr>
<td>${dtend}</td>
<td>End Date</td>
</tr>
</tbody>
</table>
### Variable Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>${location}</td>
<td>Location</td>
</tr>
<tr>
<td>${alarm_time}</td>
<td>Alert or reminder time</td>
</tr>
</tbody>
</table>

By default, the instance computes the value of iCalendar variables using import and export maps for the Appointment (iti_appointment) and Change Request (change_request) tables. The instance also uses import and export maps for other tables, depending on which plugins you activate. For example, if you activate the Incident (com.snc.incident) plugin, the instance uses the import and export maps of the Incident (incident) table.

Import export maps

Each import export map can specify a different set of iCalendar fields. For example, the icalendar.change_request import export map only maps two iCalendar fields.
iCalendar change request mappings

The instance uses the **External Name** value as the variable name in the email template. For example, the `icalendar.change_request` import export map defines the `dtstart` and `dtend` variables.

<table>
<thead>
<tr>
<th>External name</th>
<th>Associated variable name</th>
<th>Table</th>
<th>Field mapped</th>
<th>Field label</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtstart</td>
<td><code>${dtstart}</code></td>
<td>change_request</td>
<td>start_date</td>
<td>Planned start date</td>
</tr>
<tr>
<td>dtend</td>
<td><code>${dtend}</code></td>
<td>change_request</td>
<td>end_date</td>
<td>Planned end date</td>
</tr>
</tbody>
</table>

Map date fields to iCalendar variables

You can specify what fields provide the date information in calendar invitation notifications by changing the field mappings of the `dtstart` and `dtend` variables in the import export map for the iCalendar invitation.

Role required: admin

1. In the navigation filter, enter `sys_impex_map.list`.
2. Open a map to edit.
3. In the Field Maps related list, click either the end_date or start_date mapped field to change the mapping for dtstart or dtend, as needed.

4. Change the Database field to the field you want to use to set the start date or end date.

5. Click Update.

Create iCalendar invitations for custom tables

To generate iCalendar invitations that use field values from custom tables, create an import export map that computes the values of the iCalendar fields.

Role required: admin

1. Create the custom table and fields using the Date/Time field type for the fields that map to the $(dtstart) and $(dtend) variables.

2. In the navigation filter, enter sys_impex_map.list.

3. Click New.

4. Set the following fields:
   - Name: Use the following naming convention: icalendar.<table name>. For example, icalendar.u_my_custom_table.
   - Table: Select the custom table you created.
   - Type: Select icalendar.

5. Right-click the form header and select Save.

6. In the Field Maps related list, click New.

7. In the Mapping Entry Wizard, select Mapping to a Database Field.

8. Create field mappings for dtstart and dtend. These variables are required.

   For example, map the External Name dtstart to the u_meeting_start_time field in u_my_custom_table.

9. Click Submit.

10. Create field mappings for any other iCalendar fields as necessary.

11. Click Update.

Here are sample field mappings between iCalendar variables and custom fields in a custom table, u_my_custom_table:
Sample field mappings

<table>
<thead>
<tr>
<th>External name</th>
<th>Database field</th>
<th>Type</th>
<th>Map</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtstart</td>
<td>u_meeting_start_time</td>
<td>field</td>
<td>icalendar.u_my_custom_table</td>
</tr>
<tr>
<td>dtend</td>
<td>u_meeting_end_time</td>
<td>field</td>
<td>icalendar.u_my_custom_table</td>
</tr>
<tr>
<td>description</td>
<td>u_meeting_description</td>
<td>field</td>
<td>icalendar.u_my_custom_table</td>
</tr>
</tbody>
</table>

12. Create an email template that defines what to include in the iCalendar invitation.
   a) Set the **Table** field to the custom table you created.
   b) In the **Message** text field, use the following format to define the iCalendar invitation.

```
BEGIN:VCALENDAR
PRODID:--://Service-now.com//Outlook 11.0 MIMEDIR//EN
VERSION:2.0
METHOD:REQUEST
BEGIN:VEVENT
ATTENDEE;ROLE=REQ-PARTICIPANT;RSVP=TRUE:MAILTO:${to}
DTSTART:${dtstart}
DTEND:${dtend}
UID:${sys_id}
DTSTAMP:${dtstamp}
DESCRIPTION:${description}
SUMMARY:${u_meeting_summary}
END:VEVENT
END:VCALENDAR
```

**Note:** Mail script is not allowed or processed in meeting invitation email templates.

iCalendar invitation template details

<table>

</tr>
</tbody>
</table>

13. Create an email notification to trigger the iCalendar invitation and ensure the following fields are set accordingly:
   - **Table**: Select the custom table.
   - **Type**: Select **Meeting Invitation**.
   - **Content type**: Select **Plain text** only.
   - **Email template**: Select the template you created.

**Email layouts**

Create reusable content for the message body of email templates.
Administrators can use email layouts to:

- Ensure all email notifications have a consistent layout such as always displaying a header, body, and footer.
- Display static content on all email notifications such as a company logo or a background.
- Declare inline styles available for use in the message body of an email template such as setting a text font, size, and color.
- Provide users with links to common response actions such as unsubscribe from a notification or manage notification preferences.

Note: To display dynamic content such as mail scripts, use email templates. For more information, see Create an email template.

Email layouts insert HTML elements into the message body of email templates. Any style elements you define in the email layout are available to the email template. Email layouts support style sheets in these formats.

- Internal style sheets defined within a `<style>` element.
- Inline styles within a `style` attribute.

By default, the system includes several sample layouts administrators can use to create their own layouts. Administrators can create email layouts using an inline HTML editor or manually entering HTML code. The system stores email layout records in the Email Layout (sys_email_layout) table.

Create an email layout
Create an email layout to specify the HTML content you want to appear in the body of one or more email templates.

- Role required: admin
- Record required: email template record

1. Navigate to System Policy > Email > Layouts. The system displays the list of existing email layouts.
2. Click New. The system displays a blank email layout form.
3. Fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specify a unique name for the record.</td>
</tr>
<tr>
<td>Application</td>
<td>Lists the parent application to which this record belongs.</td>
</tr>
<tr>
<td>Description</td>
<td>Specify an optional description of the layout.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select whether to display the Advanced Layout field.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layout</td>
<td>Use the inline editor to add HTML elements. The system displays HTML from this field in the body of any email template that uses the layout. Include notification variables to show content from the related record. For more information notification variables see Notification variables.</td>
</tr>
<tr>
<td>Advanced Layout</td>
<td>Use this field to manually enter HTML code. The system displays HTML from this field in the body of any email template that uses the layout.</td>
</tr>
</tbody>
</table>

#### Notes:
- The editor automatically formats any HTML code you enter from the Source code view.
- To enter text in this field, select Click here to disable syntax highlighting and script formatting.

4. Click **Submit**.
The system creates the email layout record.

5. Navigate to **System Policy > Email > Templates**.
The system displays the list of existing email templates.

6. Select the email template which you want to use an email layout.
The system displays the email template record.

7. In **Email layout**, select the email layout you want to use to format the body of email messages.

8. Click **Update**.
The email template uses the selected email layout to format the body of email messages.

### Email filters

Email filters enable administrators to specify when to move email to particular mailboxes or to ignore it using a condition builder or a condition script. The Email Filters (com.glide.email_filter) plugin is active by default.

When an email is ignored, the email is saved to your instance but is not processed. You can access an ignored email by viewing its Email (sys_email) record.

### Default email filters

By default, the following filters are available from the **System Mailboxes > Filters** module:
### Default email filters

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore VCAL</td>
<td>Ignores all email containing vCalendar requests. This filter prevents <em>inbound email actions</em> from creating unnecessary incident records when the instance receives a response to sent email. vCalendar requests in email responses are identified by the EmailUtils script include.</td>
</tr>
<tr>
<td>Ignore header</td>
<td>Ignores email that contains specific headers. This filter overrides the <code>glide.pop3.ignore_headers</code> property.</td>
</tr>
<tr>
<td>Ignore sender</td>
<td>Ignores email from specific senders. This filter overrides the <code>glide.pop3.ignore_senders</code> property.</td>
</tr>
<tr>
<td>Ignore subject</td>
<td>Ignores email with specific terms or phrases in the subject line. This filter overrides the <code>glide.pop3.ignore_subjects</code> property. This filter might not apply to emails arriving from unknown users. Unknown users can be locked out.</td>
</tr>
<tr>
<td>Move spam to junk folder</td>
<td>Moves email identified as spam to the Junk folder. This filter checks for the value of the ServiceNow spam header. If the header is <code>X-ServiceNow-Spam-Status:Yes</code>, the filter moves the email to the Junk folder</td>
</tr>
</tbody>
</table>

---

**Note:** To learn more about enabling spam scoring and filtering, see *Email spam scoring and filtering* in the Instance Security Hardening Guide.

---

### Email filter script include

Email filters use a script include called `EmailUtils` that contains a simple utility function to determine if vCalendar is in the body of the response email. The results of this query are used in a condition script in the *Ignore VCAL* email filter.

### Spam scoring and virus scanning

Every message sent through email servers is assessed for the likelihood of being spam. Based on this assessment, the instance adds headers to each message that can be used for filtering within the customer instance using the Email Filters plugin.

The system also adds the `X-ServiceNow-Virus:INFECTED` header to an email that contains one or more virus-infected attachments. The system ignores the email.

Spam scoring and virus scanning are available only for instances that use the ServiceNow email infrastructure. For more information on spam scoring and filtering, see KB0549426.

*Activate email filters*

Administrators can activate the Email Filters plugin (com.glide.email_filter).
Role required: admin

1. Navigate to **System Definition > Plugins**.

   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   ![Note: To redirect to the legacy list view for plugins, click the link.](image)

   You have been redirected to All Applications. To see the Plugins list click here

2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in *Request a plugin*.

3. Activate the plugin.

   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

   - If you’re certain that you have the correct plugin, click **Install**, then in the Activate Plugin dialog box, click **Activate**.

   ![Activate Plugin](image)

   - To view plugin details before activation:
     1. Click the plugin name.
     2. On the form, click the **Activate/Update** related link.
     3. In the dialog box, review the dependent plugins.

        If your plugin requires dependent plugins, they’re activated automatically when you activate your plugin if they’re not active already.

        4. If demo data is available and you want to install it, click **Load demo data**.

           Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.
Create an email filter

You can create email filters to apply a custom action script or filter actions when email matches your filter's conditions.

Role required: admin

1. Navigate to System Mailboxes > Administration > Filters.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the email filter.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the email filter.</td>
</tr>
<tr>
<td>Order</td>
<td>Priority that the email filter takes over other filters for the same table.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the email filter.</td>
</tr>
<tr>
<td>Short description</td>
<td>Description of what the filter does.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions to define which emails to filter. Note that conditions are case sensitive.</td>
</tr>
<tr>
<td>Condition script</td>
<td>Script to define which emails to filter. Use this script to access other tables, variables, or methods. For example, the condition script for the Ignore VCAL filter looks for the results of the EmailUtils script include, which detects vCalendar attachments.</td>
</tr>
<tr>
<td>Action script</td>
<td>Script to define additional behavior to be performed when the filter condition evaluates to true. This might include an email action not included in the default filter actions. In the base system, the action script is used to produce the error string that is published to the email log (System Logs &gt; Email).</td>
</tr>
</tbody>
</table>

4. Right-click in the header bar and select Save from the context menu.
5. Click New in the related list.
6. Select how the system should react when the conditions of this filter evaluate to true.

The two choices in the base system are: Mark as Ignored and Move to Junk. You can use the Action script to perform additional email tasks.

Note: Before creating additional email actions with a script, see Inbound Email Actions. Like business rules, inbound email actions use both conditions and scripts and can provide a number of useful actions on emails the instance receives.

Email retention

You can archive and eventually destroy email messages that you no longer need or if your Email table is excessively large.

Email retention is available starting with the Helsinki release.
Email archive and destruction plugins

The email archiving and destruction feature uses the Data Archiving and Email Retention plugins. The Data Archiving plugin must be active to archive and destroy email records. The Email Retention plugin provides a set of rules that specify when the system archives and destroys email records.

Note: The Email Retention plugin also prevents the system from deleting watermarks, which are required for inbound email actions to continue to function.

The Email Retention plugin and associated archive and destroy rules are active by default on new instances. On upgraded instances, you must manually activate both the plugin and the archive and destroy rules. ServiceNow recommends that you review and approve these rules before activating them.

If your instance already has a process to manage email records, you do not need to activate the Email Retention plugin. If you want to replace your current process with Email Retention, be sure to deactivate the current process before activating the archive and destroy rules.

Archiving and destroying email records

Archiving means moving records from the Email (sys_email) table to the Archive Email (ar_sys_email) table when they exceed the archive rule time limit. Destroying means deleting records in the Archive Email table when they exceed the destroy rule time limit.

Note: When a destroy rule deletes email records, associated watermarks are not deleted. They are preserved to ensure that your inbound email actions continue to function.

Default archive and destroy rules

Email Retention provides these email archive rules:

- **Emails - Ignored and over 90 days old:** archives email message records that were created more than 90 days prior to the current date and are of type received-ignored or sent-ignored.
- **Emails - Over a year old:** archives email message records that were created more than 365 days prior to the current date.

Email Retention also provides this email destroy rule:

- **Email Archive - Over a year old:** destroys email records that have been archived for more than 365 days prior to the current date.

With these default settings, your email messages are kept on the instance for a total of two years: one year in the Email table, and one year in the Email archive table. At the end of this period, the system deletes the expired email records from the Email archive table.

Note: By default these rules are active on new instances and inactive on upgrades. The system runs archive and destroy rules when you activate them.
Compatibility with other record management implementations

If you are already using another method to manage email records, such as table cleaners, you do not have to use the Email Retention feature. To prevent unexpected record deletion, ServiceNow recommends that you avoid using multiple email management processes on the same instance at the same time.

Note: For assistance replacing your existing record management implementation with Email Retention, contact your professional services or sales representative.

Effects of archiving and deleting email records

Inbound email actions copy the body of an email to the work notes of the related record. If the inbound email record is later deleted, the work notes still contain a text copy of the email.

When the system sends an email message about a record, the activity formatter displays a Sent Email section with a link to the email message. If the system archives the email message, the activity formatter removes Sent Email section. When the system deletes the email message, it is no longer visible in the activity formatter nor the work notes.

Note: Set the archive time length long enough so your users can access sent emails through the activity formatter.

Archiving email records changes the methods available to the system to identify inbound email as a reply. After archiving an email record, the system can no longer use the In-Reply-To field to match an incoming email to an email record. However, the system can still match incoming email to an existing record from a record number or watermark.

Activate the Email Retention plugin
The Email Retention plugin provides archive and destruction rules for email messages. It is active by default for new instances, but must be activated for upgrades.

Required role: admin

The Email Retention plugin requires these plugins:

- Data Archiving
- System Mailboxes

1. Navigate to System Definition > Plugins.

A banner notifies you that you're in the All Applications page, which contains plugins and ServiceNow Store applications.

Note: To redirect to the legacy list view for plugins, click the link.

2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.
You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

- If you're certain that you have the correct plugin, click **Install**, then in the Activate Plugin dialog box, click **Activate**.

To view plugin details before activation:

1. Click the plugin name.
2. On the form, click the **Activate/Update** related link.
3. In the dialog box, review the dependent plugins.
   - If your plugin requires dependent plugins, they're activated automatically when you activate your plugin if they're not active already.
4. If demo data is available and you want to install it, click **Load demo data**.
   - Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.
5. Click **Activate**.

**Archive email manually**

You can archive email messages manually on demand instead of waiting for the instance to archive them based on a scheduled job.

Role required: admin

Email Retention provides these email archive rules:

- **Emails - Ignored and over 90 days old**: archives email message records that were created more than 90 days prior to the current date and are of type **received-ignored** or **sent-ignored**.
- **Emails - Over a year old**: archives email message records that were created more than 365 days prior to the current date.
You can manually archive email messages that meet these archive rules or any additional archive rules that you create.

**Note:** An archive record must be active for the instance to be able to process records with it.

1. Navigate to **System Archiving > Archive Rules**.
2. Open the email archiving rule that you want to modify.
3. Click **Recalculate Estimate** to see how many records in the Email (sys_email) table are going to be archived. The estimate appears in the **Record estimate** field.
4. Click **Run Archive Now**.

**Note:** You can also archive related records.

---

### Watermarks on notification emails

By default, the system generates a watermark label at the bottom of each notification email to allow matching incoming email to existing records. Each watermark includes a random 20-character string that makes it unique.

Starting with the Jakarta release, the system automatically generates randomized watermarks for notification emails in base systems. The random 20-character string reduces the possibility of a watermark being guessed or coincidentally matching the watermark of an email from another instance.

**Note:** If you are upgrading from a release before Jakarta, random watermark support is optional and requires the Random Watermark Support plugin to be activated.

### Watermark format

The email watermark always begins with **Ref:** to identify the label as a watermark. After this identifier, the default label is 31 characters in length and consists of:

- Customizable prefix — The default prefix is **MSG**.
- Auto-numbered identifier — The numeric string identifying the source record, such as incident, problem, or change request.
- An underscore character followed by a random 20-character string.
Randomized watermark example

When inbound emails are processed, the system matches random watermarks to the appropriate source records.

Watermark configuration

Watermarks are always generated, but you can configure them to:

- Create a custom watermark prefix for each instance to prevent accidentally triggering events in the wrong instance.
- Have custom prefix characters after MSG
- Be hidden globally
- Be omitted from individual email messages

If watermarks are omitted from email notifications, inbound email actions might not work properly. Without a watermark, the system processes inbound email messages as described in Criteria for matching email to inbound actions.

Note: Email clients that use the plain text version of the email still show the watermark.

Create a custom watermark prefix for email notifications

By default, email notifications use the watermark prefix MSG, but you can create a custom watermark prefix.

Role required: admin

Any email notifications that are forwarded from one instance to another might be more easily distinguished with different prefixes for each instance. To avoid unintentionally triggering events in the wrong instance, create a unique watermark prefix for each instance.
Note: Do not use colons (:) in custom watermark prefixes. Colons are a reserved character and may cause the watermark to be ignored.

Note: To learn more about enabling custom watermarks on notification emails, see Custom watermarks on notification emails in Instance Security Hardening Settings.

1. Navigate to System Definition > Number Maintenance.
2. Open the MSG record in the Email Watermark (sys_watermark) table.
3. Enter the unique Prefix for this instance.

<table>
<thead>
<tr>
<th>Table</th>
<th>MSG</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prefix</td>
<td>MSGTEST</td>
</tr>
<tr>
<td>Number</td>
<td>0</td>
</tr>
<tr>
<td>Application</td>
<td>Global</td>
</tr>
<tr>
<td>Number of digits</td>
<td>7</td>
</tr>
</tbody>
</table>

4. Click Update.

Your custom watermark applies to all new email notifications. Email notifications that existed before you created a custom watermark keep the same watermarks as before.

Omit an email notification watermark

You can omit watermarks on email notifications if you do not want the instance to match the notification to an existing record.

Role required: admin

1. Navigate to System Notification > Email > Notifications.
2. Select the email notification to update.
3. Click the Advanced View related link.
4. In the What it will contain section, select the Omit watermark check box.

When incoming email does not contain a watermark, the system searches the subject line and message body for a record number. The system attempts to match any record number that it finds to an existing record. If there is a matching record number, the system updates the record.
with the values in the incoming email. To ensure that response email messages don't update records, remove the record number variable `${number}` from the Subject and Message HTML fields.

**Hide email watermarks globally**

Rather than omitting watermarks, it is possible to hide watermarks on a global basis using HTML markup.

Role required: admin

Watermarks can only be hidden in the HTML message. The text version of the message, because it does not have markup allowing show/hide semantics, will always have the watermark.

1. Navigate to `sys_properties.list` in the Application Navigator.
2. Create a new property named `glide.email.watermark.visible` and set it to `false`.

   This ensures that all watermarks are hidden on all email messages. This cannot be done on a per-email basis.

**Email digests**

An email digest is a single email that summarizes the activity for a selected notification and its target record during a specified time interval. You can enable an email digest to reduce the number of notifications received when frequent updates to the associated record occur within a short time period.
Example email digest

Note: Email digests apply to email notifications only and are not supported for SMS messages, push notifications, and activity streams.

How email digests work

In new and upgraded instances, the Email digest (com.glide.email_digest) plugin is activated by default. Your instance must use the UI16 interface, since the email digest feature involves setting user notification preferences in the System Settings window.

Admins determine which notifications can be delivered in an email digest and configure the digest content for those notifications. Admins can also control the intervals for digests. An interval is the length of time that notifications are collected for the digest, such as daily or hourly.
Users enable the digest and select the digest interval for a specific notification in their notification preferences. The system accumulates the notifications that normally would be sent during the specified interval and summarizes them in the email digest.

When processing an email digest, the system:

- Stores the digest configuration for the notification in the Notifications (sysevent_email_action) table.
- Temporarily stores the notification content accumulated for a user in the Email Digest Parts (sys_email_digest_part) table and the Email Digest Part Users (sys_email_digest_part_user) table.
- Runs an email digest job every 15 minutes to check when a digest is ready to be sent to a user.
- The system uses the digest interval to determine when the digest is ready to be sent. The digest interval begins when the first notification is triggered for the user and stops at the end of the interval time.
- Sends the email digest to the user soon after the selected digest interval ends.

For example, if a user selects an hourly digest interval and the first notification is triggered at 08:15, the interval starts at 08:15. When the digest interval ends, the system generates the email digest approximately one hour later, at about 09:15 or shortly after, depending on when the email digest job ran.

Set up email digests

What to do — admins

1. Review the base system digest intervals and if needed, create or modify intervals.
   
   The base system digest intervals are one day (24 hours), one hour, every four hours, and seven days (weekly).

2. Determine the email notifications that can be delivered in a digest and configure the email digest content for those notifications.

   When determining which notifications are appropriate for an email digest, consider the notification content and intervals that your users can select. For example, digests that can be generated weekly might be better suited for notifications that are non-urgent.

What to do — all users

For a notification that can be delivered in an email digest, enable the email digest in your notification preferences (Notifications tab in the System Settings window). You also specify the interval time that the notifications are accumulated.

Next step

If you are an admin, begin the digest setup process by reviewing the base system email digest intervals and create or modify the intervals.

Create or modify email digest intervals

Admins can create or modify the email digest intervals (length of time) during which activity for a selected notification is accumulated in an email digest. Users select a digest interval when they enable an email digest in their notification preferences.

Role required: admin
Before adding an email digest interval, review the base system digest intervals in the Digest Intervals (sys_email_digest_interval) table. You can modify intervals, including the base system intervals, which are one day (24 hours), one hour, every four hours, and seven days (weekly).

1. Navigate to **System Notification > Email > Digest Intervals**.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To add an interval</td>
<td>Click <strong>New</strong>.</td>
</tr>
<tr>
<td>To modify an interval</td>
<td>Select the interval to be changed.</td>
</tr>
</tbody>
</table>

2. Enter the new or changed interval information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Interval name that describes the interval length of time, for example: Every 2 hours.</td>
</tr>
<tr>
<td>Interval</td>
<td>Length of the interval, either number of Days or Hours (hours, minutes, and seconds). The minimum time length allowed is one hour, and the maximum time length allowed is seven days (one week).</td>
</tr>
</tbody>
</table>

3. If you created an interval, click **Submit**. Or, if you changed an interval, click **Update**. The system updates the Digest Intervals (sys_email_digest_interval) table with the new or modified interval. The digest interval is listed as an option in the notification preferences (Notifications tab in the System Settings window) when a user enables a digest for the notification. For example:
4. To delete an interval, select the interval to be deleted in the Digest Intervals (sys_email_digest_interval) table and click **Delete**.

**Note:** If the interval is in use, the system does not remove the interval.

Determine the email notifications that can be delivered in a digest and **configure the email digest content** for those notifications.

**Configure email digests**

Use the Notification form to create or modify the content of an email digest for a notification. You can also disable the email digest for a notification so that it is not available in the notification preferences of your users.

Role required: admin
When you create or update a notification, use the What Digest will contain tab of the Notification form to configure the email digest for the notification. After you define the digest content, the digest option for the notification is available in the notification settings of your users.

1. Navigate to System Notification > Email > Notifications.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you are creating a notification</td>
<td>Click New to open the Notification form.</td>
</tr>
<tr>
<td>If you are modifying a notification</td>
<td>Select the notification to be changed.</td>
</tr>
</tbody>
</table>

2. In the Notification form, select the Allow Digest check box to display the What Digest will contain tab and define the digest content.

3. Complete the fields in the What Digest will contain tab. The example shows the default view of the tab. The advanced view contains additional fields (see table).
### Digest Template

<table>
<thead>
<tr>
<th>When to send</th>
<th>Who will receive</th>
<th>What it will contain</th>
<th>What Digest will contain</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Digest Template</th>
<th>Search</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Digest Subject</th>
<th>Search</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Digest HTML</th>
<th>Search</th>
</tr>
</thead>
</table>

- **Fields**
  - Active
  - Activity due
  - Actual end
  - Actual start
  - Additional
  - assignee list
  - Additional
  - comments
  - Approval
  - Approval history
  - Approval set

### Digest Separator

(HTML)

<table>
<thead>
<tr>
<th>Digest Separator (HTML)</th>
<th>Search</th>
</tr>
</thead>
</table>

- **Fields**
  - Active
  - Activity due
  - Actual end
  - Actual start
  - Additional
  - assignee list
  - Additional
  - comments
  - Approval
  - Approval history
  - Approval set
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digest Template</td>
<td>If you want to reuse existing content, such as headers or footers, select an email template to add content to the email digest.</td>
</tr>
</tbody>
</table>
| Digest Subject           | Enter the subject line for the email digest. The subject can include variables from the Select variables column.  
If empty, the system uses the Subject value from the Email template. If you enter a value in this field, it overrides the template value.                                                                                                             |
| Digest HTML              | Enter the recurring content for the email digest. The digest content can include variables from the Select variables column.  
Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes.  
To prevent adding extra `<p>` and `<div>` elements to your email digest, see the blog post Extra line spacing with paragraph tags in email client by a ServiceNow employee in the Now Community. |
| Digest Separator (HTML)  | Use the line to separate each item summarized in the digest.                                                                                                                                                                                                                                                                                |
| Digest From              | Enter the email address to be used in the From field of the email digest. For example, helpdesk@yourcompany.com. The email address must be in a valid format, otherwise a notification message appears near the field.  
Changing this address requires an advanced email setup such as enabling email forwarding.                                                                                                                                                                |
| Digest Reply To          | Enter the email address that you want people to use when replying to the email digest. For example, helpdesk@yourcompany.com. The email must be in a valid format, otherwise a notification message appears near the field.  
Changing this address requires an advanced email setup such as enabling email forwarding.                                                                                                                                                                |
| Digest Text              | Enter the recurring content of the email digest to send in plain text. This field appears when you set the content type to HTML and plain text or Plain text only.                                                                                                                                                        |
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digest Separator (text)</td>
<td><em>(Optional)</em> Use the dash character as a line to separate each item summarized in the digest. This field appears when you set the content type to <strong>HTML and plain text</strong> or <strong>Plain text only</strong>.</td>
</tr>
</tbody>
</table>

4. When you finish creating the notification, click **Submit**. Or, if you are done modifying the notification, click **Update**. The email **Digest** option is displayed in the notification settings of your users.

**Note:** The email recipients identified in the **Who will receive** tab will receive the digest after they **enable the digest** in their notification preferences. If the user is not a designated recipient for the notification, a digest is not generated even though the user may have the digest enabled for a notification. In this case, the user receives the actual notifications when they are generated.

5. *(Optional)* To disable the email digest for a notification, unselect the **Allow Digest** check box and click **Update** when you finish your changes to the notification. When you disable the digest content, the digest option is also no longer available for the notification and is not listed in the notification preferences for your users. If a user previously enabled the digest option for the notification, the system stops collecting those notifications for a digest and does not generate the digest.

**Note:** If you disabled the digest and want to make the digest available again, select the **Allow Digest** check box. The system retains the previously saved digest content and displays it in the **What Digest will contain** tab.

---

**Enable an email digest**

In your notification preferences, you can enable an email digest that summarizes the activity for a selected notification during a specified time interval. The digest is a single email that you receive instead of the individual notifications generated during the specified interval.

Role required: none

The email digest option is available for a notification (in your notification preferences) only when your admin has configured the email digest content for that notification.

Consider enabling an email digest to reduce the number of emails you would normally receive when the target record for a notification is frequently updated within a short time period.

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.
2. Select the notification:
   a) In the Notifications By Category section, click the row or right arrow (➡️) of the category that you want to view.
   b) In the list of notifications for the category, click the row or right arrow (➡️) next to the notification that you want to edit.
3. To enable or disable an email digest for the notification, if an email digest is available:
   a) Click the **Email Digest** switch.
      The email digest is enabled when the switch is green and disabled when the switch is grey.
b) If you enabled the digest, select the **Interval** (length of time) during which the notifications are accumulated.

The digest interval begins with the first occurrence of notification activity. For example, if you select the daily (1 Day) interval and the first notification occurs at 07:00, the system begins accumulating notifications at 07:00 and stops at 07:00 the next day.

Soon after the interval ends, the system sends the email digest to you instead of sending the individual notifications generated during the digest interval. If you disabled the digest, the system immediately stops accumulating the notifications for the digest and does not send the email digest. The system resumes sending the notifications as they are generated.

**Domain separation and Notifications**

This is an overview of domain separation and the Notifications application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called
domains. You can then control several aspects of this separation, including which users can see and access data.

**Support level: Standard**

- Includes Basic level
- Processes can be created or modified per customer by the service provider. The use cases reflect proper use of the application by multiple service provider customers in a single instance.
- The owner of the instance needs to be able to configure MVP business logic and data parameters per tenant as expected for the specific application

Use case: As an admin, I need the ability to make comments mandatory on close of a record for one tenant, but not for another. Business logic:

**How domain separation works in Notifications**

There are two basic components of domain separation and Notifications.

- Notifications are process-separated (not data-separated).
- Notifications are triggered in two main ways:
  1. When a record is Inserted or Updated
     - Notifications with matching conditions AND in the same domain as the inserted/updated record are processed.
  2. When an event defined in the notification is triggered
     - Events typically have a target record. For example, (incident.inserted) event references the incident record being inserted.
     - When an event is fired, notifications configured for that event in the same domain as the event’s target record are processed.

**Domains and email accounts**

Domain separation is not supported in email accounts for these reasons:

1. Sending mail: There is only one SMTP sender per account. This prohibits providing domains for each account, and they are not configurable.
2. For receiving Inbound mail: You can set up multiple email accounts but cannot meaningfully set the domain of an inbound email action. Inbound Actions are processed in the domain of the user who sent the email. For example: User_A in Domain A sends an email to a ServiceNow email account which executes the “Create an incident” inbound email action. The resulting new incident created by the inbound action is in Domain A.

To learn more see Inbound email actions.

**Note:** If the number of email accounts exceeds 20, reception of email slows down.
Use case

- If an instance is using the `Domain separation plugin` and a new email notification is defined for a domain that has the same event as the notification on the global domain, the user receives two emails for the same event.

Solution: Set the `sys_overrides` field on the notification that belongs to the domain so it overrides the setting on global. For more information, see `Process administration`.

Troubleshooting notification emails

Logs and diagnostics are provided to help determine whether notification emails are being sent and received successfully, what any issues are, and who receives the email.

Diagnostics help monitor the overall health of the system and troubleshoot general problems, such as not receiving any incoming mail. Logs help identify problems with individual emails, and different logs are useful for diagnosing different types of problems.

Log checking scenarios

<table>
<thead>
<tr>
<th>Problem</th>
<th>Log</th>
</tr>
</thead>
<tbody>
<tr>
<td>Need to check whether an individual notification email was successfully sent</td>
<td>Check the <strong>Sent</strong> System Mailbox for that email. Also check the <strong>Failed</strong> System Mailbox for failure notifications.</td>
</tr>
<tr>
<td>Individual email failed</td>
<td>• Check the message log of the individual email.</td>
</tr>
<tr>
<td></td>
<td>• Check the <strong>Error string</strong> field of the email record.</td>
</tr>
<tr>
<td></td>
<td><strong>Warning</strong>: Some email servers do not return error strings.</td>
</tr>
<tr>
<td>Email not received by end user</td>
<td>• Check the <strong>Junk</strong> System Mailbox for notifications about returned emails. These emails also appear in the Emails log with a <strong>Type</strong> of received-ignored.</td>
</tr>
<tr>
<td></td>
<td>• Check the <strong>Error string</strong> field of the email record.</td>
</tr>
<tr>
<td></td>
<td><strong>Warning</strong>: Some email servers do not return error strings.</td>
</tr>
<tr>
<td></td>
<td>• Check the message log of the individual email for the reasons different recipients were included or excluded.</td>
</tr>
</tbody>
</table>

Troubleshooting resources

See the following resources on troubleshooting inbound and outbound email problems.
<table>
<thead>
<tr>
<th>Error or symptom</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance not receiving inbound email</td>

<td>See Troubleshooting Outbound Email, ServiceNow KB0521382. This KB article also provides links to a video series on troubleshooting outbound emails.</td>
</tr>
<tr>
<td>Email from Outlook produces an empty Incident record containing an attachment named winmail.dat.</td>
<td>Configure the local Outlook client or Exchange server to not send Rich Text formatted (RTF) data to the instance.</td>
</tr>
</tbody>
</table>

**Email diagnostics**

The Diagnostics and Connection page provides information on the current state of your email configuration. This page includes status on email properties, scheduled jobs, and email account connections that affect how your instance receives and sends email.

Email diagnostic information can help you identify problems with inbound or outbound email. The following video shows different steps to determine why your instance is not receiving inbound emails. One of the steps uses email diagnostics to check the email connection status and email reader scheduled job.

Navigate to the Diagnostics and Connection page from either of these modules:

- **System Mailboxes > Email Diagnostics**
- **System Diagnostics > Email Diagnostics**

**Email Diagnostics and Connection page**
Email Sending is Operational

- **Email Sending Stats**
  - Email Sending: Enabled
  - Email in Queue: 0
  - Last Sent Email: None Sent

- **SMTP Sender**
  - SMTP Sender: Ready

- **SMS Sender**
  - SMS Sender: Ready

Email Receiving is Non-Operational

- **Email Receiving Stats**
  - Email Receiving: Disabled
  - Last Received Email: None Received

- **Email Reader**
  - Email Reader: Ready

- **Processing Time**
  - 16ms

- **Job Last Run**

Connection Status

- **Status**
- **Account**
- **Type**
- **Details**
  - ServiceNow SMTP
  - Connection Successful
  - Email POP3 password SSL
  - Inactive
  - Test Account
  - pop3
  - Inactive
  - ServiceNow POP3
  - Connection Successful

</tbody>
</table>

**Connection Status**

| (Accounts) | The result of the test connection to the accounts. The connection is tested every time you load the page. |

---

**System email log and mailboxes**

The system email log records all emails that the instance creates or receives. System mailboxes are filtered views of this log.

Every notification email that the instance creates or receives is recorded in an Email (sys_email) record. You can navigate to a log of these records at **System Logs > Emails**.

The System Mailboxes are filtered views of the Emails (sys_email) table. The instance assigns an email record to a system mailbox depending on the values of the **Type** and **State** fields. For more information, see **System mailboxes**.

The following fields can be included in the layout of the system log and any of the system mailboxes:

**Email log**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mailbox</td>
<td>The system mailbox that lists this email record. The instance sets the value of this field according to the values of the <strong>Type</strong> and <strong>State</strong> fields.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the email (Error, Ignored, Processed, or Ready).</td>
</tr>
<tr>
<td>Receive type</td>
<td>The type of inbound email (None, Forward, New, or Reply).</td>
</tr>
<tr>
<td><strong>Field</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>--------------</td>
<td>----------------</td>
</tr>
</tbody>
</table>
| Type         | The status of the email. Choices are:  
|              | - received: The server received this email.  
|              | - received - ignored: The server received this email, but it was ignored by the instance for inbound email action purposes. Typically, these emails are either spam or auto-replies. See the Error String field for details.  
|              | - send - failed: The server has attempted to send the email and failed. See the Error String field for details.  
|              | - send - ignored: The server skipped sending this email. Typically, this is for an email which was generated but lacked a recipient email address or is a duplicate email. See the Error String field for details.  
|              | - send - ready: The email is ready to be sent, but has not been sent out by the mail server. Typically, an email remains in this state for only a short time.  
|              | - sent: The email was sent by the instance without any errors or issues. |
| Target       | A Document ID reference to the record if the email is generated by an insert, update, or delete of a particular record. |
| User         | The name of the user, from the user record, of the instance from which the email notification was sent.  
|              | Note: This is a string field. |
| Notification Type | The type of notification. Choices are:  
|              | - None  
|              | - SMS  
|              | - SMTP |
| UID          | The unique ID of the email stored on the server. |
| Created      | The date and time of the email activity for the locale of the machine running the instance. |
| Deleted      | For inbound email, indicates whether the email was deleted from the email server. |
| Weight       | The weight of the email, which determines the sending priority relative to other notifications on the same table. |
| Importance   | An indication that the email was sent with a changed level of importance, such as Urgent. |
## Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Originating Event and Notification</td>
<td>For emails generated by notifications, an embedded list that stores the event and notification that created the email.</td>
</tr>
<tr>
<td>Subject</td>
<td>The email subject. For notifications, you create the subject text in System Notification &gt; Email &gt; Notifications.</td>
</tr>
<tr>
<td>Error String</td>
<td>The error string captured from the email server to determine why the email was not sent. This is logged only if the email is send-failed.</td>
</tr>
<tr>
<td>Recipients</td>
<td>The email addresses of the recipients.</td>
</tr>
<tr>
<td>Body</td>
<td>The body of the email, displayed in raw HTML markup. Use the related link Preview HTML Body to see the body text as rendered HTML.</td>
</tr>
<tr>
<td>Content type</td>
<td>The email content type.</td>
</tr>
<tr>
<td>Headers</td>
<td>Any headers embedded in the email.</td>
</tr>
</tbody>
</table>

**Message logs for individual emails**

The email log entries for an individual notification email are accessible as a related list in the email record. The **Error string** field in the email record can provide additional information.

Every email record contains an **Email Log** related list. This list shows the Email Log Entry (syslog_email) records. For troubleshooting purposes, the most useful fields are probably **Level** and **Message**.

To diagnose problems with outbound emails, also examine the **Error string** field in the email record. However, not every receiving email server sends back an error string.

_info: The Email Log Entry record is available for only 7 days after the email record is created._

**Inbound actions on received emails**

Check these logs as the first step to diagnose issues with inbound actions. The logs show which inbound action did or did not apply and for what reason.

_info: If an inbound action did not update any field on the target record, the log indicates that the inbound action was skipped._
Inbound email log

Reasons for including or excluding recipients

For outbound notifications, the email system log provides reasons that recipients were included or excluded.

Each log entry corresponds to a reason for inclusion or exclusion. For example, all users who were excluded because they are inactive appear in a single log entry.
A series of system properties can be used to fine-tune the information to be logged. Two master switch properties, `glide.notification.recipient.include_logging` and `glide.notification.recipient.exclude_logging`, control all recipient inclusion and exclusion logging. Several other properties allow you to tailor the information reported in the logs to meet your needs. All of the properties are enabled by default.

**Outbound email log**

**Push notifications**

In addition to sending email and SMS notifications, an instance can send push notifications to mobile devices.

A push notification is a text message that appears on a user's mobile device to alert them about something important or to ask them to perform an action. Your instance supports push notifications.
An example push notification

Use push notifications to send messages to users when certain conditions are triggered on your instance, such as the assignment of an incident to the user. A push notification can even ask for a reply, and the instance can process the reply by acting on the related records. For example, you can have the instance send an approval request for a Change to a user. You can let the user approve or deny the Change by clicking a response button on the push notification. The user's response can then update the status of the Change record.

You can set up push notifications in a similar manner to email and SMS notifications. Determine:

- who to send the notification to
- when it should be sent
- what it should contain

The ServiceNow mobile app is available as ServiceNow Classic and as ServiceNow Agent. By default, ServiceNow Classic supports push notifications, but you can also develop your own push application and configure your instance to send push notifications to it. For more information on setting up push notifications in ServiceNow Agent, go to Mobile push notifications.
Push notification setup

Push notification setup differs depending on the mobile or push application that you want your users to use. For an overview, see:

- **Push notification setup with the ServiceNow Classic mobile app**

  **Note:** Push notifications for on-premise instances are not supported.

- **Push notification setup with a custom push application.** If you create your own application, you must understand how push notifications and the Apple Push Notification Service system work. For more information, see the APNs Overview in the *Local and Remote Notification Programming Guide* for Apple developers.

  **Attention:** Apple does not guarantee delivery of all push notifications. Review the Quality of Service (QoS) information in the *Local and Remote Notification Programming Guide* for Apple developers.

Push notification system

The push notification system involves several key elements that manage the delivery of push messages, push notification responses, and push feedback.

**Customer instance**

Your ServiceNow instance.

**Push proxy**

An instance that collects all push notifications that go to the ServiceNow Classic mobile application and forwards them to the ServiceNow applications for Apple iOS or Android. If you create a custom push application, you do not use the push proxy.

**Push provider**

The provider of push messages, which is the Apple Push Notification service (APNs) or Firebase Cloud Messaging (FCM) service, for the ServiceNow Classic mobile app or custom mobile apps.

**Feedback provider**

The provider of feedback messages, which tells the instance what devices are no longer valid. The Apple feedback or FCM server handles feedback messages for the ServiceNow Classic mobile app on iOS and Android devices respectively.

**Feedback proxy**

The ServiceNow instance that handles feedback messages from the Apple feedback server.

**Push application on a mobile device**

The application, such as the ServiceNow Classic mobile application. You can also build and customize your own push application.

Push notification process

The push notification process is as follows:

1. Activity on the instance triggers a push notification.
2. The instance looks for who to send the notification to and checks the user notification preferences to find their push device settings.
3. The instance sends the push notification to the push notification service, either the Apple Push Notification service (APNs) or Firebase Cloud Messaging (FCM) service. If you are using the ServiceNow Classic mobile app, the instance sends the notification through a push proxy instance, which then forwards the notification to the APNs or FCM service.

4. The push notification service sends the notification to the user’s push application. When the instance sends the notification to the push notification service, it includes message content along with the instance name and ID. This information ensures that a response to the notification is sent back to the correct instance. If the user can reply to the notification, such as sending an approval to a change request, the response is sent via REST message back to the instance.

5. The instance identifies a script to run to handle the response.

6. The script performs an action on the instance, such as marking a change request approved. If there is invalid JSON or if the script fails, an error response is sent back to the device.

The following diagram shows the elements of the push notification system with the ServiceNow Classic mobile application. Within the ServiceNow infrastructure is your instance, the optional push proxy instance, and the ServiceNow feedback proxy. External to ServiceNow are the messaging services (APNs or FCM) and user mobile devices, which include the application that is registered to receive push notifications. See Push feedback for an explanation of the feedback service.
Push notification responses

With custom push applications, you can have your users act on records in the instance by responding to a push notification.

The actions that they can take are defined in a script that you associate with the notification message. The response is sent to the instance in this format:

```
https://{instance_name}/api/now/v1/push/{application Name}/action/{action}
```

The application name is the push application the user is using. The application name must match the application name in the Push Application (sys_push_application) table. The action is the Sys ID of the action in the Push Notifications Actions (sys_push_notif_act_script) table.

Push feedback

Feedback refers to the information about failed iOS message delivery and the iOS push applications that can no longer receive push notifications.

The instance uses a scheduled job to pull feedback data every hour from the APNs. When the APNs determines that a device can no longer receive push messages, the corresponding device is set to inactive, making it unable to receive push notification messages. The Push Feedback (sys_push_feedback) table shows the token for the device that failed. If the same device is again able to receive push notifications, the device might receive the same token from the APNs. A new record is inserted into the Push Notification Installation (sys_push_notif_app_install) table.

Activate push notifications

Several plugins must be activated to use push notifications. If you have the Mobile UI (com.glide.ui.m) plugin active, push notification plugins are automatically activated.

Role required: admin

Ensure the following plugins are active on your instance:

- Push Notification: Provides the necessary components and REST APIs to send push notifications to mobile devices.
- Notification System Push Addon: Adds support for push notifications to the existing notification system.
- Push Feedback: Handles feedback from Apple on which devices are no longer valid so they do not keep receiving push notifications.

1. From your instance, navigate to System Definition > Plugins.
2. On the All Applications page, click Request Plugin to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Installed with push notifications**

Several types of components are installed with the push notifications plugins.

**Tables installed with push notifications**

These tables are installed with push notifications.

<table>
<thead>
<tr>
<th>Table name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Push Applications (sys_push_application)</td>
<td>Push applications registered to the instance to receive push messages.</td>
</tr>
<tr>
<td>Push Default Registrations (sys_push_notif_default_reg)</td>
<td>Contains all the notifications users are automatically subscribed to for a given push application. You can add notifications to this table on the Push Default Registrations related list on the Push Application form.</td>
</tr>
</tbody>
</table>
**Table name** | **Description**
---|---
Push Feedbacks (sys_push_feedback) | Feedback from the APNs that tells the instance which push devices can no longer receive push messages. The feedback is handled either on the same instance where your notifications are triggered, or on a central instance that uses a REST call to tell your instance which push applications to deactivate.

**Table name** | **Description**
---|---
Push Message Attribute Definitions (sys_push_notif_msg_attr_def) | The attribute definitions used for push message content specification.

**Table name** | **Description**
---|---
Push Message Attribute Values (sys_push_notif_msg_attr_val) | The values associated with push messages.

**Table name** | **Description**
---|---
Push Notifications (sys_push_notification) | The push notifications that the instance attempted to send to users.

**Table name** | **Description**
---|---
Push Notification Actions (sys_push_notif_act_script) | The action scripts that the instance uses in response to an actionable push message.

**Table name** | **Description**
---|---
Push Notification Installations (sys_push_notif_app_install) | The devices with push apps where users agreed to receive push notifications. This table lists the records by the token for the push app. The instance uses this information to know which push device and app to send notifications to. Records are created in this table when a user logs on an instance with the push app.

The Mobile Devices (sys_mobile_devices) table, which is installed with the Mobile UI plugin, contains all the user devices that logged in to the instance with the ServiceNow Classic mobile application.

**Table name** | **Description**
---|---
Push Notification Messages (sys_push_notif_msg) | Messages customized for push notifications. These messages can be associated with a notification.

**Table name** | **Description**
---|---
Push Notification Message Contents (sys_push_notif_msg_content) | The entire content, including JSON, for push messages.

**Table name** | **Description**
---|---
Push Platforms (sys_push_platform) | The platforms that are supported for push notifications, and the maximum payload size.

---

**Business rules installed with push notifications**
These business rules are installed with push notifications.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
</table>
| Build Device and Subscriptions | Push Installation (sys_push_notification_installation) | Automatically creates a notification device on a user’s notification preferences when the user registers a mobile application with the instance.

---

**Outbound REST messages installed with push notifications**
These outbound REST messages are installed with push notifications.

<table>
<thead>
<tr>
<th>REST message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNowMobileApp Push</td>
<td>The REST message that you can use with your custom iOS mobile app.</td>
</tr>
</tbody>
</table>

These roles are installed with push notifications.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>push_admin</td>
<td>Can create and modify push notifications.</td>
</tr>
</tbody>
</table>

Push components installed with push notifications
These components are installed with push notifications.

Push applications installed with push notifications

<table>
<thead>
<tr>
<th>Push application</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNowPushApp</td>
<td>The push application record for the ServiceNow Classic mobile application.</td>
</tr>
</tbody>
</table>

Note: The ServiceNow Classic mobile app automatically subscribes users to several push notifications. You can see the list of these notifications in the Push Default Registrations related list on the ServiceNowPushApp application record.

Message content installed with push notifications

<table>
<thead>
<tr>
<th>Message content</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectMessageContent</td>
<td>The payload for ServiceNow connect messages.</td>
</tr>
<tr>
<td>Generic Approval (Background)</td>
<td>The payload that provides an approval and rejection option to the user receiving the push message.</td>
</tr>
<tr>
<td>Generic Approval (Foreground)</td>
<td>The payload that provides an approval and rejection option to the user receiving the push message.</td>
</tr>
<tr>
<td>Generic Record Payload</td>
<td>A generic payload that you can use to send push messages to users.</td>
</tr>
</tbody>
</table>

Push notification actions installed with push notifications

<table>
<thead>
<tr>
<th>Push notification action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval - Approve</td>
<td>Allows an administrator to approve a request.</td>
</tr>
<tr>
<td>Approval - Reject</td>
<td>Allows an administrator to reject a request.</td>
</tr>
</tbody>
</table>

Push notifications installed with push notifications

<table>
<thead>
<tr>
<th>Push notifications</th>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectMessagePushNotification</td>
<td>Live Feed Message (live_message)</td>
<td>Sends a push notification when a new live feed message</td>
</tr>
</tbody>
</table>
Push notification properties

Push notifications provides several properties to customize the setup. Add these properties to the System Properties (sys_properties) table.

**glide.push.debug**

Creates entries in the system log for push notification errors.

- Type: true | false
- Default value: false

**glide.push.feedback.debug**

Creates entries in the system log for feedback sent by the APNs for custom iOS push applications.

- Type: true | false
- Default value: false

**glide.push.notification.ttl_seconds**

Specifies the number of seconds after which a queued push notification expires. After a push notification is triggered, it is queued and finally processed by a scheduled job. If the time the notification sits in the queue exceeds this value, the notification is not sent. Check the Push Notifications log for more information.

- Type: integer
- Default value: 21600

**glide.push.enabled**

Enables or disables push notifications.

- Type: true | false
- Default value: true

Push notification setup with the ServiceNow Classic mobile app

The ServiceNow Classic mobile application automatically enables push notifications and configures mobile devices for push notifications when users initially log in to the instance with ServiceNow Classic.

**Note:** Push notifications with the ServiceNow Classic mobile application are not supported in on-premise instances.

Setting up push notifications involves both the system administrator and users.

- Admin creates or updates push notifications for the ServiceNow Classic mobile app. The admin does not need to set up the mobile devices for users nor update their user preferences for receiving push notifications.
- Users install the ServiceNow Classic mobile app on their iOS or Android mobile devices and set their preferences for receiving notifications on the ServiceNow Classic mobile app.
What to do — admins

Admins create push notifications, similar to setting up email notifications. A push notification has two main parts: the push message and the notification, which includes the push message.

**Note:** The push message and notification must be for the same table.

**Create the push message**

Before creating a push notification, create the *push message* with the actual message content (JSON payload) to be included in the push notification.

**Create the push notification that includes the push message**

Create the *push notification* that includes the push message and message content. A push notification specifically sends the push message. You can update a standard platform notification and use it as a push notification that includes the push message.

**Add the new push notification to the Push Default Registration table**
To ensure that a new push notification is included and enabled in the notification preferences of your users, register a new push notification in the Push Default Registration table. The notification is listed in the notification preferences of your users the next time that they log in to the ServiceNow Classic mobile app.

**What to do — ServiceNow Classic mobile app users**

**Download the ServiceNow Classic mobile app**

Install the ServiceNow Classic mobile app on an iOS or Android mobile device.

**Agree to accept push notifications**

After installing the ServiceNow Classic mobile app, users are asked to accept push notifications. When the instance receives the push notification acceptance message from a user, it creates a record in the Push Notification Installations (sys_pushnotif_app_install) table. This record is what the instance uses to identify the device + mobile application combination necessary to identify a push notification recipient.

The device then performs the following actions:

- Obtains a token that identifies the device.
- Triggers the creation of the device in the user notification preferences.

**Log in to the company instance from the ServiceNow Classic mobile app**

Logging in automatically subscribes users to the push-specific notifications registered in the Push Default Registration table.

**Update preferences for receiving notifications on the ServiceNow Classic mobile app**

Users can enable or disable notifications through Notification Settings in the ServiceNow Classic mobile app. They can set additional notification preferences, such as conditions or filters that affect notification delivery, by using the System Settings window on a desktop or mobile browser. For details, see Setting notification preferences in UI16.

**Next steps**

If you are an admin, review the base system notifications and determine if new push message content and push notifications are needed.

Create a push message

Before you create a push notification, create the push message with the actual message content for the notification.

The Push notification plugin must be active. The plugin is active by default.

Role required: admin

The push message and notification must be for the same table.

2. Fill out the fields on the form (see table).
3. Click Submit.
Push Notification Message form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the message.</td>
</tr>
<tr>
<td>Push App</td>
<td>Select the ServiceNow Classic mobile application.</td>
</tr>
<tr>
<td>Push Message Content</td>
<td>Select the JSON content to be included in the push notification payload.</td>
</tr>
<tr>
<td></td>
<td>Note: For details on defining payloads that control push notification behavior, see KB0622333. For example, you can specify predefined button pairs (Yes/No, Approve/Reject, Accept/Decline) as part of the push message content.</td>
</tr>
<tr>
<td>Message</td>
<td>Enter the message. You can add variables just as you would for other notifications. Any message you enter here overrides the message in the notification.</td>
</tr>
<tr>
<td>Related list</td>
<td></td>
</tr>
<tr>
<td>Push Message Attribute Values</td>
<td>Optional. Select the attributes that apply to this notification. For details, see Create an attribute value or action for a push message.</td>
</tr>
</tbody>
</table>

Set up the push notification that contains the message created or update an existing push notification to use the push message.

Create a notification using a push message
Email administrators can create a notification that specifically sends a push notification.

Configure the push message before performing these steps.

Role required: admin

You can associate a push message with a standard notification. A push message specifies the text the system sends as part of the push notification to the mobile device.

1. Navigate to System Notification > Create Push Notification.
2. Fill out the notification form as necessary (see Create an email notification for descriptions of the form fields.
3. Click the What it will contain tab.
4. Next to Push Messages, click the lock icon and select a push message.

Note: The push message and notification must be for the same table.

5. If you want this notification to be sent only as a push notification and not as any other type of notification, select Push Message Only.
6. Click Submit.

If the notification fails, the user is not notified. If the message fails to send because it exceeds the maximum payload, the instance logs the failure in the System Log.
Add the push notification to the Push Defaults Registrations table so that the push notification is listed in the notification preferences for users. Users can then select which notifications they want to receive for the ServiceNow Classic mobile app.

Add a push notification to the Push Default Registrations table
After you create a new push notification, add it to the Push Default Registration table. Push notifications registered in this table are listed and automatically enabled in the notification settings of your ServiceNow Classic mobile app users.

Role required: admin

2. Select the ServiceNow Classic Mobile Application.
3. In the Push Application form for the ServiceNow Classic mobile app, select the Push Default Registrations tab and click New.
4. In the Push Default Registration New record, select the notification to be registered.
5. Click **Submit**.
   The next time that users log in to their instance, the new push notification is included in their list of notifications.

**Push notification setup with a custom push application**

If you are using your own custom mobile or push application, you must configure your app for use and set up the push contents.
Setting up a push notification infrastructure that uses a custom push app involves a push admin (also called push app developer or mobile app developer) and system administrator. When push admins create a customized push app, they also configure the app, its push message content (payload generators), and optional attributes, such as push action scripts. The admin creates and updates the push notifications for the custom push app. After users install the custom push app and initially log in to their instance from their mobile device, the system automatically creates a device (channel) for the custom app.

**Note:** These instructions are intended for users who develop their own customized push application. You do not need to configure the ServiceNow Classic mobile application.

1. **Push admin creates custom push application**
2. **Push admin or admin creates/updates push messages and notifications for custom mobile app**
3. **Users install custom mobile app**
Before you begin

Complete the steps in Activate push notifications. The Push Feedback (com.glide.push.feedback) plugin enables the system to receive push feedback from Apple and is required if you have an iOS app.

Assign the push_admin role to your organization's mobile app developer.

What to do — push admin

Configure push notifications for your custom push app. This process differs for iOS and Android devices.

1. (iOS only) **Upload a push certificate to your instance**
   
   Upload a push certificate to your instance so that you can use it later to connect your iOS device to the push notification system.

2. **Create a push application record for your custom app**
   
   Register your customized mobile application with your instance to receive push notifications for the application. The instance uses this push application record to identify the device + push application combination necessary to determine a push notification recipient.

3. **Create push message content**
   
   Create a JSON content payload for different types of push notifications. The content determines how a push notification appears on the push application, and whether the user can send a message in response to the push notification. The push admin can create attribute definitions that specify a default push action script or string, for use in the push message content.

4. (Optional) **Create a push message attribute definition**
   
   Push message attribute definitions allow you to create reusable properties for push message content specification.

5. (Optional) **Create an attribute value or action for a push message**
   
   You can create attribute values that override the default attribute definitions used in the push message content.

6. (Optional) **Create a push action**
   
   A push action is a server-side script that runs when the instance receives a response to an actionable push message.

What to do — admin

Create the push messages and push notifications

The administrator creates the push messages, sets up push notifications for the custom push app, and if desired, the content.

Next steps

Use the Push Installation API to opt users in to receive push notifications. For more information, see Push Installation API.
Monitor push feedback to track push notifications that are failing to send to your custom push app. For more information, see Monitor push feedback.

Upload a push certificate to your instance
Upload a push certificate to your instance so that you can use it later to connect your iOS device to the push notification system.

Using your Apple developer environment, create a push certificate and convert it to a PKCS (.p12) file. For details on generating the .p12 file with the required certificate and private key, see Enable push notifications and Communicate with APNs using a TLS certificate in the Apple documentation.

Note: Ensure that your certificate is a push certificate and not a developer certificate. Also, if you're developing an app for testing purposes, ensure that you create a Sandbox certificate. If you're developing an app that you plan to launch in the Apple App Store, ensure that you create a Production certificate.

Role required: push_admin or admin

After you create a PKCS (.p12) file that contains the iPhone developer certificate and the private key used to sign the certificate, you need to upload the file to your instance. The system uses the information in the PKCS file to communicate with the APNs.

1. Navigate to System Definition > Certificates, and then click New.
2. On the form, fill in the following fields:
   - Name: Enter a certificate name.
   - Type: Select PKCS12 Key Store.
3. Attach the PKCS (.p12) file to the record.
4. Click Submit.

Create a push application record for your custom app
Create a push application record for your custom app
Register your customized mobile application with your instance to receive push notifications for the application.

Complete the following:
1. Activate push notifications
2. (iOS only) Upload a push certificate to your instance

Role required: admin or push_admin

Push notifications are application-specific: They are sent to one type of mobile application, regardless of how many users have this application installed. If you develop your own mobile application, you must configure it for use by creating a record for it in the Push Application (sys_push_application) table. By default, the ServiceNow Classic mobile application is automatically set up and ready to use.

2. Fill out the fields on the form (see table).
3. Click Submit.
## Push Application form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Enter a descriptive name for the application.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a descriptive name, without spaces, for the application.</td>
</tr>
<tr>
<td>Push</td>
<td>Select an option:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Direct</strong>: Send push notifications directly to the push service without going through an intermediary. If you select this option, you must specify an X.509 <strong>Certificate</strong> or a FCM API key.</td>
</tr>
<tr>
<td></td>
<td>- <strong>REST API</strong>: Not applicable to custom push apps.</td>
</tr>
<tr>
<td></td>
<td>- <strong>None</strong>: Do not enable push notifications for this application.</td>
</tr>
<tr>
<td>Feedback</td>
<td>Select an option:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Apple</strong>: Send push notifications directly to the APNs without going through an intermediary.</td>
</tr>
<tr>
<td></td>
<td>- <strong>REST API</strong>: Not applicable to custom push apps.</td>
</tr>
<tr>
<td></td>
<td>- <strong>None</strong>: Do not handle feedback for this push application.</td>
</tr>
<tr>
<td>Apple</td>
<td>The X.509 <strong>Certificate</strong> and <strong>Sandbox Certificate</strong> you created on the Apple notifications portal. The certificate enables a device to talk to the APNs. This option appears only if you select <strong>Direct</strong> for the <strong>Push</strong> field.</td>
</tr>
<tr>
<td>Google</td>
<td>Select the FCM API key you obtained from Google for the Android push notification.</td>
</tr>
</tbody>
</table>

## Create push message content

That contains the JSON content in the push notification payload.

**Create push message content**

Push message content specifies additional JSON content in the push notification payload that is sent to the push provider.

Complete the following:

1. **Activate push notifications**
2. (iOS only) **Upload a push certificate to your instance**
3. **Create a push application record for your custom app**

You must know how to use JSON with push messages.

Role required: admin or push_admin

Push message content defines the style of push notification that can be sent out for your custom app. You can add custom content, such as a picture, icons, or action buttons for the user to respond to the notification. Use the following variables in the script:

- **current**: properties of the current record.
- **message**: push message sent as the body of the entire push content.
- **attributes**: object of the push message attributes that you define.

2. In the Push Notification Message Contents table, click New.
3. Fill out the fields on the Push Notifications Message Content form (see table).
4. Click Submit.
function buildJSON(sysGlideRecord, current, message, attributes) {
  var json = {
    "aps": {
      "sound": "default"
    },
    "record": {
      "table": current.getTableName(),
      "sys_id": current.sys_id
    }
  };
  return json;
}
Notification Message form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the message content.</td>
</tr>
<tr>
<td>Push app</td>
<td>The push application the content can be used with.</td>
</tr>
<tr>
<td>Push Message Generation</td>
<td>Enter a script that determines the message content. See the example scripts.</td>
</tr>
<tr>
<td>Related list</td>
<td></td>
</tr>
<tr>
<td>Push Message Attribute Definitions</td>
<td>Select the attributes that apply to this notification. Attributes can be a value or an action. These attributes are used as default values for the content items you create in the content script. However, any attributes you create with the push message can override these attributes. See Create a push message attribute definition for information on creating attributes.</td>
</tr>
</tbody>
</table>

The following is an example of a content record that creates a two-button layout, one to approve something, such as a change request, and one to decline it.

```javascript
var json = {
  "table" : current.getTableName(),
  "sys_id" : current.sys_id,
  "template" : {
    "type": "2 button",
    "button1" : {
      "title" : "Approve",
      "action" : attributes.button_action,
      "parameters" : {
        "response" : "approve"
      }
    },
    "button2" : {
      "title" : "Decline",
      "action" : attributes.button_action,
      "parameters" : { "response" : "decline" }
    }
  }
};
json;
```

Define a push message attribute to specify a default push action script or string that you can use in the push message content.

Create a push message attribute definition
Push message attribute definitions allow you to create reusable properties for push message content specification.

1. Activate push notifications
2. **(iOS only)** Upload a push certificate to your instance
3. Create a push application record for your custom app
4. Create push message content

Role required: admin or push_admin

Use an attribute definition to specify a default push action script or string that you can then use in the push message content.

You can override these attributes by creating any *push message attribute values*.

1. Navigate to **System Notification > Push > Push Message Content**.
2. Select a content record or script record.
3. In the Push Message Attribute Definitions related list, click **New**.
4. Fill out the fields on the form (see table).
5. Click **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute Name</td>
<td>Enter a descriptive name for the layout.</td>
</tr>
<tr>
<td>Attribute Type</td>
<td>Select the type of attribute:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Action</strong>: An action to take on the instance,</td>
</tr>
<tr>
<td></td>
<td>as defined by a script.</td>
</tr>
<tr>
<td></td>
<td>• <strong>String</strong>: An arbitrary string to send as part</td>
</tr>
<tr>
<td></td>
<td>of the message content. The string can specify</td>
</tr>
<tr>
<td></td>
<td>items like a button label in the message.</td>
</tr>
</tbody>
</table>
### Field | Description
---|---
Default Script | Select the mobile action script that tells the instance what to do when it receives a response from the push notification. This option appears if you select Action for the Type.

Default Value | Specify an arbitrary string value to be placed in the attribute that is used by the message content. For example, the string could specify a button label. This option appears if you select String for the Type.

If you want to override default attribute definitions, see [Create an attribute value or action for a push message](#).

**Create an attribute value or action for a push message**

Attribute values are associated with push messages to provide a way for the message to include certain types of information in the push notification.

Complete the following:

1. **Activate push notifications**
2. (iOS only) **Upload a push certificate to your instance**
3. **Create a push application record for your custom app**
4. **Create push message content**
5. **Create a push message attribute definition**

Role required: admin or push_admin

These push message attribute values override values that you set in an attribute definition on the Push Content form.

1. Navigate to **System Notification > Push > Push Messages.**
2. Select a message.
3. In the Push Message Attribute Values related list, click **New.**
4. Fill out the fields on the form (see table).
5. Click **Submit.**
Push message attribute values override values that you set in an attribute definition.

### Push Message Attribute Values form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute</td>
<td>Select a push message attribute definition.</td>
</tr>
<tr>
<td>Value/Action</td>
<td>Enter the value for the attribute or select the push action. This field changes to Value or Action depending on the type of attribute you select in the Attribute field.</td>
</tr>
</tbody>
</table>

(Optional) Create a push action to perform an action on the instance.

Create a push action

A push action is a server-side script that runs when the instance receives a response to an actionable push message.

Complete the following:

1. Activate push notifications
2. (iOS only) Upload a push certificate to your instance
3. Create a push application record for your custom app
4. Create push message content
5. Create a push message attribute definition
6. Create an attribute value or action for a push message

Role required: admin or push_admin

Create a push action to perform an action on the instance. For example, you might have an actionable push message that lets the user approve a change request. The action that handles the response should update the Approval field on the relevant Change Request record.

You can use global variables or, optionally, current variables and parameters passed through the JSON content.

2. Fill in the form fields (see table).
3. Click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the action.</td>
</tr>
<tr>
<td>Script</td>
<td>Enter the script.</td>
</tr>
</tbody>
</table>

**Monitor push feedback**

Monitor push feedback to track push notifications that are failing to send to your custom push app.

Complete the steps in Activate push notifications. The Push Feedback (com.glide.push.feedback) plugin enables the system to receive push feedback from Apple and is required if you have an iOS app.

Role required: push_admin or admin

The information presented on the Push Feedback table is delivered to your system by the push notification service that is associated with your device. If you linked your instance to an iOS device, the information is delivered via the Apple Push Notification service (APNs). If you linked your instance to an Android device, the information is delivered via Firebase Cloud Messaging (FCM).

**Note:** The push feedback received from the APNs uses what Apple refers to as its ‘legacy binary protocol.’ For more information on how the legacy binary protocol works, see the Apple documentation.

1. In the navigation filter, enter sys_push_feedback.list.
2. On the list header, click the gear icon ![gear icon]
   and add the following columns to the list view:
   - Sys push application ID
   - Push Platform
3. On the list, refer to the following columns to monitor push feedback:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Failure updated on</td>
<td>Date and time when the push feedback arrived to the system from Apple or Google.</td>
</tr>
</tbody>
</table>
Requeue failed push notification messages

Push notification delivery might fail for various reasons. You can view which messages failed and requeue them to be sent out if necessary.

Role required: admin

Note: There is no way for the instance to guarantee or confirm push message delivery. For more information on how Apple handles push notifications, see the Local and Remote Notification Programming Guide for Apple developers.

Messages can also fail to send for several reasons, such as a large message queue or other issue with the instance. You can use a system property to control how long the instance queues a push notification after it is triggered.

Push notification message payload size is limited by provider:

- Apple iOS: 2,048 bytes
- Google: 4,096 bytes

Your instance does not send push messages that exceed this limitation. System logs save any failed messages. For details on Apple payload limitations, see the Local and Remote Notification Programming Guide for Apple developers.

1. Navigate to System Logs > Push Notifications.

By default, the messages that were created today appear. You can change the filter if necessary. The Type column can have these values:

- failure: The message could not be sent.
- pending: The message is queued for processing.
- success: The message was successfully sent, although not necessarily received by the mobile device.

2. Put any failed messages back into the queue to be resent by selecting the check boxes next to the failed messages, and then selecting Re-queue failed push notifications from the choice list.

3. If some push notifications continue to fail, consider increasing the value in the glide.push.notification.ttl_seconds property. See Push notification properties for more information.

Push notification retention

You can archive and eventually destroy push notifications that you no longer need or if your Push Notification table is excessively large.
Push notification retention is available starting with the Jakarta release.

Push notification archive and destruction plugins

The push notification archiving and destruction feature uses the Data Archiving and Push Retention plugins. The Data Archiving plugin must be active to archive and destroy push notification records. The Push Retention plugin provides a set of rules that specify when the system archives and destroys push notification records.

In new instances, the Push Retention plugin and associated archive and destroy rules are active by default. On upgraded instances, you must manually activate both the plugin and the archive and destroy rules. Be sure to review and approve the archive and destroy rules before activating them.

If your instance already has a process for managing push notification records, you do not need to activate the Push Retention plugin. If you want to replace your current process with Push Retention, be sure to deactivate the current process before activating the archive and destroy rules.

Archiving and destroying push notification records

Archiving means moving records from the Push Notification (sys_push_notification) table to the Push Notification Archive (ar_sys_push_notification) table when they exceed the archive rule time limit. Destroying means deleting records in the Push Notification Archive table when they exceed the destroy rule time limit.

Default archive and destroy rules

Push retention provides the following push archive rules:

- **Push Notification - Over a year old**: archives push notification records that were created more than 365 days prior to the current date.
- **Push Notification Archive - Over a year old**: destroys push notification records that have been archived for more than 365 days prior to the current date.

With these default settings, your messages are kept on the instance for a total of two years: one year in the Push Notification table, and one year in the Push Notification Archive table. At the end of the period, the system deletes the expired notification records from the Push Notification Archive table.

**Note**: By default these rules are active on new instances and inactive on upgrades. The system runs archive and destroy rules when you activate them.

Compatibility with other record management implementations

If you are already using another method for managing push notification records, such as table cleaners, you do not have to use the Push Retention feature. To prevent unexpected record deletion, avoid using multiple push notification management processes on the same instance at the same time.
Activate the Push Retention plugin
The Push Retention plugin (com.glide.push_retention) provides the retention policy for push notifications, so that you can specify when the system archives and destroys push notification records.

Role required: admin

The Push Retention plugin requires the Data Archiving plugin.

1. Navigate to System Definition > Plugins.
   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   Note: To redirect to the legacy list view for plugins, click the link.

   You have been redirected to All Applications. To see the Plugins list click here

2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.

   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

   • If you’re certain that you have the correct plugin, click Install, then in the Activate Plugin dialog box, click Activate.

   * To view plugin details before activation:
     1. Click the plugin name.
     2. On the form, click the Activate/Update related link.
3. In the dialog box, review the dependent plugins.
   If your plugin requires dependent plugins, they’re activated automatically when you activate your plugin if they’re not active already.

4. If demo data is available and you want to install it, click **Load demo data**.
   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.

5. Click **Activate**.

---

**Archive push notifications manually**

You can manually archive push notifications on demand instead of waiting for the instance to archive them based on a scheduled job.

Role required: admin

Push retention provides these push notification archive rules:

- **Push Notification - Over a year old**: archives push notification records that were created more than 365 days prior to the current date.
- **Push Notification Archive - Over a year old**: destroys push notification records that have been archived for more than 365 days prior to the current date.

You can manually archive push notification messages that meet the default archive and destroy rules or any additional archive rules that you create.

1. Navigate to **System Archiving > Archive Rules**.
2. Open the push notification archiving rule, for example Push Notification - Over a year old
3. Click **Recalculate Estimate** to see how many records in the Push Notification
(subsys_push_notification) table are going to be archived. The estimate appears in the **Record estimate** field.
4. Click **Run Archive Now**.

---

**Subscription-based notifications**

Subscription-based notifications enable users to proactively subscribe to items that interest them and unsubscribe from messages that are not mandatory.

Users can also specify additional notification channels that each of their notifications can be configured to use.

Before users can manage the notifications that are sent to them, administrators must create email notifications to which users can subscribe. Administrators can also make subscription-based notifications mandatory so users cannot unsubscribe to them. Then users can subscribe or unsubscribe to the notifications, and add schedules and filters to the subscription to limit the notifications that can be received.

Notifications that administrators mark as subscribable are automatically available in user notification settings. Users are limited to one subscription per notification.

Administrators should create subscription-based notifications when they do not want to specify users for a notification and want to let users proactively subscribe to the notification.
Subscriptions 2.0 plugin

The Subscription Based Notifications 2.0 plugin must be active to use subscribable notifications. This plugin is active by default on all new and upgraded instances.

The plugin installs the Notification Subscription (sys_notif_subscription) table, which holds user subscriptions to all notifications.

Subscriptions and notification preferences

Users can subscribe to notifications available to them through their notification preferences. In the UI16 interface, all users can set and modify their notification preferences through the Notifications tab of the System Settings window. In the UI15 interface and earlier, admins and users set their notification preferences through the Notification Preferences link in the User form.

Setting notification preferences in UI16

You can set your own notification preferences, including personal subscriptions and channels for receiving them. All users can set these preferences through the Notifications tab of the System Settings window.

With the Notifications tab, you can:

- Search for a specific notification in the list of your notifications.
- Use a global switch to enable or disable all your notifications.
- Enable or disable a particular channel for receiving notifications, as well as create, edit, or delete channels.
- Control the notifications that you receive and apply conditions to restrict notification delivery.
- Create personal notifications, which are subscriptions to notifications that are important to you.

Comparison between notification preferences in UI16 and earlier interfaces

In new and upgraded instances that use the UI16 interface, the System Settings window is the central location for managing your notification preferences. The Notification Preference User Interface (com.glide.notification.preference.ui) plugin is activated by default.
Notification preferences in UI16

In UI15 and earlier interfaces:

- Users set notification preferences through the Notification Preferences link in the User form (Self service > My Notification Preferences).
• Admins created user devices and set notification preferences for users through the Notification Preferences link in the User form, accessed through the User Administration module (User Administration > Users).

**Note:** Admins can revert to the UI15 notification preferences interface by setting the glide.notification.preference.UI.enabled property to false.

**Manage your notification preferences in UI16**

To access your notification preferences, click the gear icon (⚙️) in the banner frame, and in the System Settings window, click the Notifications tab. You can also access the System Settings by navigating to Self Service > My Notification Preferences.
In the **Notifications** tab, use the following settings to manage your notifications:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search</td>
<td>Search bar for finding notifications. To find a notification:</td>
</tr>
<tr>
<td></td>
<td>• Enter the name of the notification you are searching for. When you type the first three characters, the system automatically returns a list of</td>
</tr>
<tr>
<td></td>
<td>notifications matching the characters entered.</td>
</tr>
<tr>
<td></td>
<td>• Enter two asterisks to return a list of all notifications in alphabetic order (the notifications are not organized by category).</td>
</tr>
<tr>
<td>Allow notifications</td>
<td>Global switch for enabling or disabling all notifications.</td>
</tr>
<tr>
<td>Notification channels</td>
<td>List of your channels for receiving notifications. Use this section to:</td>
</tr>
<tr>
<td></td>
<td>• Enable or disable a channel by using its toggle switch. If you disable a channel, notifications are not delivered through that channel.</td>
</tr>
<tr>
<td></td>
<td>• Add channels using the Create Channel option.</td>
</tr>
<tr>
<td></td>
<td>• Modify channel information. Click the channel row or the right arrow (&gt;) next to the appropriate channel to edit or delete it.</td>
</tr>
<tr>
<td>Notifications by</td>
<td>List of notification categories that identify and group related notifications. Each category contains the notifications that you can subscribe to.</td>
</tr>
<tr>
<td>category</td>
<td>To view the notifications in a given category, click the category row or the right arrow (&gt;) next to the appropriate category. You can:</td>
</tr>
<tr>
<td></td>
<td>• Edit settings for a notification:</td>
</tr>
<tr>
<td></td>
<td>• Enable or disable channels for the selected notification.</td>
</tr>
<tr>
<td></td>
<td>• Apply notification conditions, such as schedules and filters, that affect the delivery of the notification.</td>
</tr>
<tr>
<td></td>
<td>• Create personal notifications, which are subscriptions to specific notifications that matter to you.</td>
</tr>
</tbody>
</table>

Create notification channels
You can add channels to receive your notifications. A notification channel is an email account or voice message system that you have access to.

Role required: none

Notification channels include email addresses, service providers for SMS messages, and mobile applications. You can create voice notification channels to support applications like Notify.

**Note:** If you are using the ServiceNow mobile application or a custom push application, you do not need to create a push channel for your mobile device. The system automatically creates a channel for the mobile app after you initially log in to your instance from your mobile device.

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the Notifications tab.
2. Click Create Channel.
3. Complete the fields on the New Channel form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name for the channel, such as the device or email account.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type</td>
<td>The type of channel:</td>
</tr>
<tr>
<td></td>
<td>· <strong>Email</strong>: for email messages.</td>
</tr>
<tr>
<td></td>
<td>· <strong>SMS</strong>: for SMS messages.</td>
</tr>
<tr>
<td></td>
<td>· <strong>Voice</strong>: for phone messages.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> All users with an email address have a primary email channel, which is created automatically after a notification is sent to them.</td>
</tr>
<tr>
<td></td>
<td>If you are using the ServiceNow mobile application or a custom push application, the system automatically creates a channel for the mobile app after you initially log in to your instance from your mobile device.</td>
</tr>
<tr>
<td>Email address</td>
<td>The email address of the channel.</td>
</tr>
<tr>
<td>Phone number</td>
<td>The phone number for SMS messages or for voice messages.</td>
</tr>
<tr>
<td>Service provider</td>
<td>The service provider for SMS messages.</td>
</tr>
</tbody>
</table>

4. **Click** **Save**.
   The system creates and enables the channel, and adds it to the list of notification channels.

To receive notifications on your new notification channel, you must enable the channel for individual notifications. After you enable the channel for a notification, you can set conditions to further control the notifications that you receive on the channel. For more information, see **Apply notification conditions**.

**Modify notification channels**
You can update channel information for your notifications.

Role required: none

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.
2. In the Notification Channels section, click the channel row or the right arrow (➤) next to the channel name.
3. In the Edit Channel form, update the fields (see **Create notification channels** for descriptions of the form fields).
4. **Click** **Save**.
   The system updates and saves the channel information that you modified.

**Delete a notification channel**
Delete a notification channel so that you no longer receive notifications through the channel.

Role required: admin

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.
2. In the Notification Channels section, click the channel row or the right arrow (➤) next to the channel name.
3. On the Edit Channel form, click **Delete**.

The system deletes the channel from the list of notification channels and no longer delivers notifications to that channel.

**Apply notification conditions**

You can set various conditions and filters to control the notifications you receive. You can also enable or disable an email digest and the delivery of individual notifications by channel.

**Role required:** none

You can choose to enable certain features and set different conditions that control the notifications you receive. You can:
Enable or disable an email digest if a digest is available for the notification. An email digest is a single email that summarizes the activity for the notification during a time interval that you specify. Admins configure the email digest content for a notification.

Enable or disable a channel on which the notification is received.

Set preconfigured schedules and filters that determine when you receive your notifications.

Set more advanced filter conditions to limit the notifications delivered to you.

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the Notifications tab.

2. Select the notification:
   a) In the Notifications By Category section, click the row or right arrow (►) of the category that you want to view.
   b) In the list of notifications for the category, click the row or right arrow (►) next to the notification that you want to edit.

3. To enable or disable an email digest for the notification, if an email digest is available:
   a) Click the Email Digest switch.
      The email digest is enabled when the switch is green and disabled when the switch is grey.
   b) If you enabled the digest, select the Interval (length of time) during which the notifications are accumulated.
The interval begins with the first occurrence of notification activity during the specified interval. For example, if you selected the Daily interval and the first notification occurs at 07:00, the system begins accumulating notifications at 07:00 and stops at 07:00 the next day. Soon after the interval ends, the system sends the email digest instead of sending the individual notifications that were triggered during the digest interval. If you disabled the digest, the system immediately stops accumulating the notifications and does not send the email digest.

4. To enable or disable a channel on which the notification is received, click the switch for the channel. The notification is enabled when the switch is green and disabled when the switch is grey. If you previously disabled an entire channel, you cannot enable that channel for the notification.

5. To set more criteria for notification delivery, click the row or the right arrow (>) next to the channel for the notification.
   a) Complete the Apply Conditions form (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schedule</td>
<td>Select a schedule that determines when the notification can and cannot be received.</td>
</tr>
<tr>
<td>Filter</td>
<td>Select a pre-configured filter with the criteria that determines when the notification can be sent. For example, you might select a filter whose conditions send notifications when an incident with a priority of <strong>1 - Critical</strong> is opened for a network issue.</td>
</tr>
<tr>
<td>Advanced filter</td>
<td>Select this check box to use the condition builder to create additional criteria. When you select the check box, the <strong>Table</strong> and <strong>Conditions</strong> fields are displayed.</td>
</tr>
</tbody>
</table>
Create personal notifications
You can create personal notifications, which are subscriptions to notifications of importance to you. You can apply conditions that control specific content included in your personal notification, and also enable or disable the channels for delivery.

Role required: none

A personal notification is a subscribable notification that you can customize. You can assign the notification a name that is meaningful to you and filter the information received in that notification.

**Note:** Users are limited to one subscription per notification.

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.
2. Click **Create Personal Notification**.
3. Complete the New Personal Notification form (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name for your personal notification. Use a meaningful name to distinguish it from system notifications.</td>
</tr>
<tr>
<td>Notification</td>
<td>The notification to subscribe to. You can subscribe only to notifications that are configured to allow subscriptions. Depending on the notification you select, the Table, Affected record, and Send when fields are displayed.</td>
</tr>
<tr>
<td>Table</td>
<td>The database table that the notification is linked to.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Affected record</td>
<td>The specific record that the notification is based on. This field appears when you select a notification that has an affected record (for example, a notification for a problem record that has multiple affected CIs). Click the lookup icon, select the table and specific document (record) in that table, and click OK.</td>
</tr>
<tr>
<td>Send when</td>
<td>Another condition that must be met to send the notification. For example, you might create a filter whose conditions send notifications when an incident with a priority of 1 - Critical is opened for a network issue.</td>
</tr>
</tbody>
</table>

4. Click **Save**. The system creates the personal notification and adds it to the appropriate notification category.

In the following example, notice the category in which the system placed the personal notification.
5. Enable or disable the channels for your personal notification.
6. Navigate back to the list of notifications for the category by clicking the left back arrow («) at the top of the form.
   Notice that your Personal Notifications are listed above the System Notifications in the given category.
7. Navigate back by clicking the left back arrow (<) at the top of the form or by clicking the Notifications tab.

User notification preferences in UI15 and earlier

In UI15 and earlier interfaces, use the Notification Preferences link in the User form to manage the notifications that you can subscribe to.

The following instructions explain how to use Notification Preferences to manage notifications.

Set up a notification device in UI15 and earlier

You can add devices for a user to receive notifications. A device is a mobile device, email account, or voice message system that the user has access to.

Role required: admin

Notification devices include email addresses, service providers for SMS messages, and mobile applications.

1. Navigate to User Administration > Users.
2. Select a user.
3. Click Notification Preferences.
4. Click Create New Device.
5. Fill in the fields on the form (see table).
6. Click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name of the device or account.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of device:</td>
</tr>
<tr>
<td></td>
<td>- Email: for email messages.</td>
</tr>
<tr>
<td></td>
<td>- SMS: for SMS messages.</td>
</tr>
<tr>
<td></td>
<td>- Mobile: for push notifications.</td>
</tr>
<tr>
<td>Email address</td>
<td>The user's email address.</td>
</tr>
<tr>
<td>Mobile application</td>
<td>The mobile application for push notifications.</td>
</tr>
<tr>
<td>Phone number</td>
<td>The user's phone number for SMS messages.</td>
</tr>
<tr>
<td>Service provider</td>
<td>The service provider for SMS messages.</td>
</tr>
<tr>
<td>User</td>
<td>The user's record in the system.</td>
</tr>
<tr>
<td>Order</td>
<td>A number that determines which device receives the notification when multiple devices are configured. The device with the lowest number receives the notification.</td>
</tr>
<tr>
<td>Active</td>
<td>A flag that indicates if the device is active.</td>
</tr>
<tr>
<td>Related list</td>
<td></td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Notification Device Variables | Additional, optional attributes of an SMS device used inside an advanced script from the SMS service provider. These attributes are generally used to deliver SMS notifications to an internal SMS distribution technology. This advanced scripting procedure is not necessary for configuring external SMS providers.

**Note:** If you inactivate a device, it still appears in the user preferences, but the switches that allow users to select the notifications are grayed out for that device column.

Edit a notification device in UI15 and earlier

All users can edit their notification preferences, including notification devices.

Role required: none

1. Navigate to Self-Service > My Profile.
2. Click Notification Preferences.
3. Click the name of the existing device.

The device form opens allowing you to make certain modifications, depending on your user role. See *Set up a notification device in UI15 and earlier* for a description of all fields.

Add personal subscriptions in UI15 and earlier

After setting up your devices, you can subscribe to notifications that are configured as subscribable.

The Subscription Based Notifications 2.0 plugin must be active.

If you have subscribed to messages, your list of notification messages can build over time. You can create preferences for how and when these messages are delivered, or unsubscribe to messages that are not configured as mandatory.

**Note:** Conditions that you apply to personal subscriptions do not override the filters that the administrator creates for the subscribable notifications. Your conditions are evaluated after the conditions on the subscribable notification are met. If the notification filter set by the administrator fails, the filter conditions on your personal subscription are not evaluated.

1. Navigate to Self-Service > My Profile to open your user profile.
2. Click the Notification Preferences related link.
   The Notification Preferences page opens. You can see your personal subscriptions and the general notifications that you are subscribed to.
3. Click Subscriptions.
4. Click Add Personal Subscriptions.
5. Fill in the fields as described in the table.
Add Personal Subscription

Use Personal Subscriptions to subscribe to notifications that have been configured for specific activities in ServiceNow.
- Name this Personal Subscription something meaningful that clearly identifies its purpose.
- Choose a Notification to subscribe to. You can only subscribe to notifications that are configured to allow subscriptions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name for the subscription.</td>
</tr>
<tr>
<td>Notification</td>
<td>The notification to subscribe to. You can only subscribe to notifications that are configured to allow subscriptions.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that the incident is configured to run on. You cannot modify the table from this form. To select another table, configure the notification. See <a href="#">Create an email notification</a>.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box indicating whether the subscription is active. Users can receive notifications for subscriptions only if the subscription is active. If it is not active, the on-off switch for the subscription is set to off and is read-only.</td>
</tr>
<tr>
<td>Send to</td>
<td>The devices that this subscription is sent to. Selecting the devices in this field is the same as turning on the switch for the subscription on the Subscriptions page.</td>
</tr>
<tr>
<td>Affected record</td>
<td>The specific record that the subscription is based on. Click the lookup icon, and then select the table and the specific record in that table.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send when</td>
<td>Another condition that must be met to send the notification. For example, you might select a filter whose conditions send notifications when an incident with a priority of <strong>1 - Critical</strong> is opened for a network issue. The system evaluates the conditions in this filter after the conditions set in the notification filter by the administrator.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

7. You can turn the subscription for active subscribable notifications on or off using the switch on the Subscriptions management section of the Notification Preferences page.

![Subscription example](image)

**Personal subscriptions**

Personal subscriptions are saved in the Notification Subscriptions (sys_notif_subscription) table. The records in this table are made active or inactive when you click the switch to subscribe or unsubscribe from the notification.

8. You can edit the subscription at any time by clicking **Edit** next to it.

**Select notifications in UI15 and earlier**

Administrators can configure notification preferences for each user and users can also select which notifications they want to receive for various devices.

1. Navigate to **Self-Service > My Profile** to select your own notifications, or if you have admin access, navigate to **User Administration > Users** to select notifications for another user.
2. Click a user record to open it.
3. On the User form, click **Notification Preferences** under Related Links.

The notification preferences page appears. The preferences pages show all the notifications available to the user and the devices that the user has configured, such as email or mobile phone. If a user does not have read access to the table on which the notification is based, the notification does not appear.

Every user has the **Primary email** device, where subscriptions to email notifications can be enabled.
4. Click the switch next to the notification to subscribe the user to it.

Modify notifications for a user device in UI15 and earlier
After you set up the devices through which users receive notifications, you can assign the notifications to each device and add advanced conditions to limit what notifications are received.

Role required: admin

1. On the Notification Preferences page for a user, find the notification from the list of notifications.
2. Click Edit next to the notification. The preferences for that notification appear.
3. Fill in the fields on the form (see table).
4. Click Submit.
Notification preferences allow users to prevent notifications from being sent to them with Filters and Schedules. Schedule allows users to only have notifications sent to them when generated within a specific schedule. Filters give the ability to prevent notifications from being sent with pre-defined filters. Advanced Filter allows definition of a custom filter.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notification Message</td>
<td>Select the notification. Related fields appear for certain notifications. For example, if you select CI affected or Location affected, a field appears for selecting the CI or the location. Duplicate messages are not permitted on a device.</td>
</tr>
<tr>
<td>Device</td>
<td>Modify the device if necessary.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Select a schedule that determines when the notification can and cannot be received.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Filter | Select a pre-configured filter with the criteria that determines when the notification can be sent. For example, you might select a filter whose conditions send notifications when an incident with a priority of **1 - Critical** is opened for a network issue. The system evaluates the conditions in this filter after the conditions in the notification filter set by the administrator. This field is not available when an advanced filter is configured.

Advanced filter | Select this option if you want to use the condition builder to create additional criteria. When you select the check box, the **Table** and **Conditions** fields replace the **Filter** field.

Table | Select the table for the notification. For example, if you select the **CI affected** notification message, you might select the Incident (incident) or Change Request (change_request) table. This field appears when you check the **Advanced filter** check box.

Conditions | Define as many conditions as needed to limit the notifications you receive.

Create a service provider

Administrators can configure service providers for devices that use SMS.

Role required: admin

Administrators also have the option of configuring how a device’s service provider affects the construction of the device’s email address.

1. Navigate to the Notification Service Provider (cmn_notif_service_provider) table by typing `cmn_notif_service_provider.list` in the application navigator filter.
2. Fill out or change the fields on the form (see table).
3. Click **Update**.
4. Click **Save** on the Notification Preferences page.
<table>
<thead>
<tr>
<th>Name</th>
<th>AT&amp;T</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>SMS</td>
</tr>
<tr>
<td>Active</td>
<td>✓</td>

<td>Global</td>
</tr>
<tr>
<td>SMS Provider Email Prefix</td>
<td></td>
</tr>
<tr>
<td>SMS Provider Email Suffix</td>
<td>txt.att.net</td>
</tr>
</tbody>
</table>
### The Notification Service Provider form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Configured name of the service provider.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of device, in this case <strong>SMS</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Enables or disables this notification device.</td>
</tr>
<tr>
<td>Advanced notification</td>
<td>Removes all the previous options and displays the <strong>Advanced script</strong> field.</td>
</tr>
<tr>
<td>Advanced script</td>
<td>Used for custom notifications that run a script rather than construct a traditional SMS/email. This is generally used when all outbound SMS messages must run through a central SMS hub, as opposed to being sent directly from the instance to the SMS provider. Advanced users can construct a script in this field that will send a notification to an old style numeric pager that cannot receive SMS communications. This field is rarely used and employs advanced scripts. Contact your representative to assist you with any advanced SMS scripting.</td>
</tr>
<tr>
<td>Construct address manually</td>
<td>Removes the prefix and suffix options and displays the <strong>Construction script</strong> field.</td>
</tr>
<tr>
<td>Construction script</td>
<td>Allows you to script the email address construction as you would in a business rule. For example, abc + current.phone_number + <a href="mailto:def@text.att.net">def@text.att.net</a> would construct an email address of <a href="mailto:abc2223334444def@text.att.net">abc2223334444def@text.att.net</a>. <strong>NOTE:</strong> Current is a reference to the device, not the service provider, hence the current.phone_number variable that uses the device's phone_number value.</td>
</tr>
<tr>
<td>SMS Provider Email Prefix</td>
<td>Places the provided text before the device's specified phone number; for example: <a href="mailto:PREFIX2223334444@text.att.net">PREFIX2223334444@text.att.net</a></td>
</tr>
<tr>
<td>SMS Provider Email Suffix</td>
<td>Places the provided text after '@' sign; for example: 2223334444@SUFFIX</td>
</tr>
<tr>
<td>Notification Device Variables</td>
<td>Additional, optional attributes of an SMS device used inside an SMS service provider's <strong>Advanced script</strong>. This is generally used to deliver SMS notifications to an internal SMS distribution technology. This is an advanced scripting procedure and is not necessary for configuring external SMS providers.</td>
</tr>
</tbody>
</table>

---

**Select a service provider**

You can configure how a device's service provider affects the construction of the device's email address.
Role required: admin

1. Navigate to **User Administration > Users** and open any user’s record.
2. Under **Related Links**, click **Notification Preferences**, and then click an SMS notification device.
3. If no SMS device is present, click **New Device** and configure one.
4. Select the appropriate service provider, and then click the reference icon for the **Service provider** field. The service providers are saved in the Notification Service Provider (cmn_notif_service_provider) table. Only active providers are visible.

**SMS notification advanced scripting**
You can use these objects and their attributes in your advanced notification scripts on the SMS Notification Service Provider form.

### Objects and attributes

<table>
<thead>
<tr>
<th>Object</th>
<th>Example attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>current</td>
<td>• current.number&lt;br&gt;• current.assigned_to&lt;br&gt;• current.company&lt;br&gt;• current.state</td>
</tr>
<tr>
<td>email</td>
<td>• email.notify&lt;br&gt;• email.sourceTable&lt;br&gt;• email.contentType&lt;br&gt;• email.attachments&lt;br&gt;• email.HTML&lt;br&gt;• email.dataVersionHeader&lt;br&gt;• email.UID&lt;br&gt;• email.allowSavingNoRecipientEmail&lt;br&gt;• email.recipients&lt;br&gt;• email.ignore&lt;br&gt;• email.save&lt;br&gt;• email.headers&lt;br&gt;• email.sysID&lt;br&gt;• email.attachmentLimits&lt;br&gt;• email.class&lt;br&gt;• email.sysId&lt;br&gt;• email.textBody&lt;br&gt;• email.hashCode&lt;br&gt;• email.weight&lt;br&gt;• email.equals&lt;br&gt;• email.logEmail&lt;br&gt;• email.reset&lt;br&gt;• email.wait&lt;br&gt;• email.body&lt;br&gt;• email.SMSText&lt;br&gt;• email.watermark&lt;br&gt;• email.textBodyLegacy&lt;br&gt;• email.sourceHeader&lt;br&gt;• email.subject&lt;br&gt;• email.instance&lt;br&gt;• email.importance</td>
</tr>
</tbody>
</table>
### Make a notification mandatory

To prevent users from turning off or deleting a subscription to a notification, make the notification mandatory.

**Role required:** admin

When you make a notification mandatory, the notification is locked in user notification preferences, preventing the user from removing or unsubscribing to the notification, filtering it, or changing the schedule.

Users receive mandatory notifications even if they disable notifications.

**Note:** Mandatory notifications apply to only the primary device of the user. You cannot make a notification mandatory for secondary devices.

1. Navigate to **System Notification > Email > Notifications**.
2. Open the appropriate notification.
3. Configure the form and add the **Mandatory** field. This field does not display by default.
   a) Click the context menu icon (⋮) and select **Configure > Form Layout**.
   b) Using the slushbucket, select the **Mandatory** field and the order in which you want the field to appear.
   c) Click **Save**.
4. Select the **Mandatory** check box.
   When a user checks their notification preferences, the control button for the mandatory notification is on and is read only.

---

<table>
<thead>
<tr>

          | • device.sys-meta     
          | • device.type         |
Force a notification to be sent

To force a notification to be sent to the specified users, enable forced delivery.

Role required: admin

Forcing a notification means that the relevant users receive the notification, even if they have not subscribed to the notification or have turned off the subscription. In addition, the users receive the notification even if the Notification field is set to Disable.

Note: Forced delivery applies to only the primary device of the user. You cannot force a notification to be sent to secondary devices.

1. Navigate to System Notification > Email > Notifications.
2. Open the appropriate notification.
3. Configure the form and add the Force delivery field.
4. Select the Force delivery check box.
5. Click **Update**.

Unlike using the **Mandatory** option, forcing the delivery does not lock the user's preference or prevent the user from unsubscribing from the notification.

**Create a notification filter**

Notification filters enable a user to control the delivery of messages by creating special conditions on multiple tables in a single, reusable filter.

Role required: admin

For example, you can create a filter that controls message delivery when active incidents, problems, and change requests for network issues reach a critical state. For UI15 and earlier interfaces, notification filters are available for selection in the **Filter** field of a user's Notification Preferences form. For UI16, filters for notifications or channels are set through the Notifications tab of the System Settings window. For details, see **Apply notification conditions.**

**Note:** The system applies the user's filter conditions after the administrator's conditions have been evaluated. If the administrator's conditions fail, the system ignores notification filters.

1. Navigate to **System Notification > Email > Notification Filters** and create a record.
2. In the **Notification conditions** related list of the new record, create and submit filter conditions on one or more tables.

3. Repeat the procedure to create additional conditions on other tables for this filter.
Filter device notifications using a schedule
You can associate devices, such as Email, SMS, and Voice, to schedules that define when the devices can and cannot receive notifications.

Role required: admin

Notifications that are triggered outside of the scheduled days and times for the device are not queued up for delivery at a later time. For example, if an administrator selects the Weekdays schedule for an email device, the device receives email notifications triggered between Monday and Friday. If notifications are triggered on Saturday, they are not delivered to the device.

1. Define schedules as needed using System Scheduler > Schedules > Schedules.
2. Add or edit a device.
3. Configure the New Device for System Administrator form and add the **Schedule** field.
4. In the **Schedule** field, select the schedule for the device.
5. Click **Submit**.

**Edit the schedule or filter of an existing notification message**
You can update a schedule or filter that was previously created for an email notification.

Role required: admin

To edit the schedule or filter of an existing notification message:

1. In the Notification Preferences screen, click the message to edit.
2. Make the appropriate changes in the form.
3. Click **Update**.

**Email unsubscribe**

Administrators can add unsubscribe links to notifications so that users can stop receiving particular email messages.

**Note:** The base system notifications include unsubscribe and notification preferences links.

The system offers two types of macros to create unsubscribe links.
- An unsubscribe link that creates an email message to the instance.
- An unsubscribe link that opens the notification preferences for the user on the instance.

**Available unsubscribe macros**

<table>
<thead>
<tr>
<th>Unsubscribe type</th>
<th>Macro used</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unsubscribe by email (Unauthenticated)</td>
<td>${NOTIF_UNSUB}</td>
<td>The system generates an HTML <code>mailto</code> hyperlink. When users click the link, their browser or email client creates a pre-formatted unsubscribe email message to the instance.</td>
<td><code>link_text</code>: specify the text to display as a link within quotation marks.</td>
</tr>
<tr>
<td>Unsubscribe by notification preferences (Authenticated)</td>
<td>${NOTIF_PREFS}</td>
<td>The system generates an instance link directly to the notification preferences for this notification type.</td>
<td><code>link_text</code>: specify the text to display as a link within quotation marks.</td>
</tr>
</tbody>
</table>

Administrators can add unsubscribe macros to any notification record type such as:

- Email layouts
- Email templates
- Email notifications

**Unsubscribe by email**

Unsubscribe by email requires the user email client or browser to create a pre-formatted email message containing these elements:
- The **To** field has the email address of the instance.
- The **Subject** starts with the string `Unsubscribe from`.
- The **Body** has a JSON string with a name-value pair of **Unsubscribe** and an array value that contains two more name-value pairs.
  - The **notification_id** parameter specifies the Sys ID of the notification the user wants to unsubscribe from.
  - The **unsub_token** parameter specifies an instance ID the system uses to verify that the email came from a ServiceNow instance.

**Note:** Some email clients and web browsers, such as GMail on Chrome, require extra client configuration to support mailto hyperlinks. Administrators can provide an alternative unsubscribe method for users whose email client or browser does not support mailto links. See [RFC6068](https://tools.ietf.org/html/rfc6068) for information about the mailto URI scheme.

The **Unsubscribe from Notification** inbound action processes the email and unsubscribes the sender from the listed notification.

**Note:** Unsubscribing by email message does not require users to authenticate with the instance first.

### Unsubscribe by notification preferences

Unsubscribe by notification preferences requires the user's browser to navigate to the notification preferences page on the instance. After logging in, the system displays the notification preferences for this particular notification.

Users can set preferences for this notification such as disabling notifications for a particular device. Users must save their notification preferences for changes to take effect.

#### Unsubscribe links

This email layout adds several unsubscribe links to the bottom of each email notification.

```text
${NOTIF_UNSUB} from this notification by email or ${NOTIF_UNSUB+link_text="click here"}.
Manage your ${NOTIF_PREFS} or ${NOTIF_PREFS+link_text="click here"}.
```

When rendered in an email notification, the unsubscribe links only display the link text.

Go to Instance

Unsubscribe | Manage Preferences
If a user clicks the **Unsubscribe** link, the email client creates a message such as this:

![Sample unsubscribe by email message](image)

**Notifications in messaging applications**

Enable users to receive their ServiceNow platform notifications in Slack or Microsoft Teams messaging applications. Use the Now Actions app to configure the messaging apps for your instance.

**Admin setup**

To enable ServiceNow notifications within Slack or Teams, you must be an administrator for both ServiceNow and the third-party application.

1. **Request IntegrationHub**

   Integrations with third-party systems require a separate IntegrationHub subscription. To activate IntegrationHub, see [Request an IntegrationHub plugin](#).

2. **Request the Messaging Notification plugin**
To activate this feature, request the Messaging Notification plugin (com.glide.notification.messaging) through the HI Customer Service system. This plugin activates related plugins if they are not already active.

3. Install the Now Actions messaging app for Slack or Teams

As an administrator for both ServiceNow and the third-party application, find and install the Now Actions app. Install the application in ServiceNow to associate the app with your instance.

**Note:** The primary owner of a Slack workspace or organization owns and manages the application. To avoid losing admin access to the workspace or organization, transfer primary ownership before any administration changes occur. If you transfer primary ownership, update the JSON payload for the Slack installation in the Notification Integration page. For more information about editing the Slack installation, see Install the Now Actions messaging app.

If the Now Actions app is uninstalled, the workspace or team displays as inactive in the Notification Integration page. To view the Notification Integration page, navigate to System Notification > Messaging > Messaging Integration Configuration.

4. Configure message content

Create a message in the Message Contents [messaging_content] table that you can use in multiple notifications. Messages can be informative, or they can request action from an individual Slack or Teams user. For example, the Approval Request message includes Approve and Reject buttons to take the associated action in ServiceNow. Only users that have linked their Slack or Teams account with their ServiceNow account can take action in ServiceNow from the third-party application.

5. Create a messaging notification

Notifications define when a message is sent, who it is sent to, and what it contains. To send a notification to Slack or Teams, add a messaging content record to the notification and configure the notification messaging channel. Notifications that require action must be sent to individual users instead of groups.

User setup

To enable individual ServiceNow notifications in Slack or Teams, and to take action on notifications, configure your system settings and link your user accounts.

**Link your ServiceNow user account to your Slack or Teams account**

Link your ServiceNow account to your Slack or Teams account to take action on ServiceNow notifications from within Slack or Teams. If you do not link accounts, you can still receive notifications within group channels. However, you cannot to approve ServiceNow requests or take action on notifications from within Slack or Teams.

**Configure system settings**

Each user can enable ServiceNow notifications in a third-party application by configuring the communication channel in their system settings. Opt in to receive approval requests and other actionable notifications in third-party channels.
Notification channels

In ServiceNow, a notification channel is a method or device for receiving notifications. For example, in the base system you can elect to receive notifications through email or SMS channels. If messaging applications are enabled on your instance, you can enable notifications to Slack and Teams using Notification Channels in your system settings.

Actions and events

The Message Actions (messaging_observer_handler) table processes communication channel events, such as adding or deleting a Slack channel, to keep the instance and the third-party application in sync. Only developers creating Slack or Teams applications should add actions to this table. Register new actions with the instance through the Message Event Registry (messaging_observable) table. To remove a base system action, clear the active flag instead of deleting the record.

Logging

The Inbound and Outbound message logs contain information on actions, events, and activities between ServiceNow and the third-party application. Use the logs to identify the content, state, and origin of communications to and from your instance.

Request the Messaging Notification plugin

To activate this feature, request the Messaging Notification plugin (com.glide.notification.messaging) through the HI Customer Service system. This plugin activates related plugins if they are not already active.

Role required: admin

There are two ways to request a plugin:

- Access the HI Service Catalog directly by clicking Service Catalog > Activate Plugin on HI.
- Access the HI Service Catalog through the All Applications page on your instance by following these steps.

1. From your instance, navigate to System Definition > Plugins.
2. On the All Applications page, click Request Plugin to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you</td>
<td>Date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>would like this plugin to be</td>
<td></td>
</tr>
<tr>
<td>enabled</td>
<td>Note: Plugins are activated in two batches each business day in the</td>
</tr>
<tr>
<td></td>
<td>Pacific time zone, once in the morning and once in the evening. If the</td>
</tr>
<tr>
<td></td>
<td>plugin must be activated at a specific time, enter the request in the</td>
</tr>
<tr>
<td></td>
<td>Reason/Comments field.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are</td>
</tr>
<tr>
<td></td>
<td>activating the plugin. For example, if you need the plugin activated at</td>
</tr>
<tr>
<td></td>
<td>a specific time instead of during one of the default activation windows,</td>
</tr>
<tr>
<td></td>
<td>specify it in the comments.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Install the Now Actions messaging app

As an administrator for both ServiceNow and the third-party application, find and install the Now Actions app. Install the application in ServiceNow to associate the app with your instance.

To activate this feature, request the Messaging Notification plugin (com.glide.notification.messaging) through the HI Customer Service system. This plugin activates related plugins if they are not already active. For more information, see Request the Messaging Notification plugin.

Roles required:
- Admin or messaging_admin in ServiceNow
- Administrator for Slack or Teams
Install the Now Actions messaging app for Slack
Install the Now Actions messaging app from the Slack App Directory and associate the app with your instance.

1. Install the Now Actions app from the Slack App Directory.
   a) Find and install the Now Actions app in the Slack App Directory.
   b) Click Authorize when prompted.
   c) Enter a customized name, app description, and icon (optional).
   d) Configure your Now Actions web address. This is the base URL for your instance. For example, `https://<instance_name>.service-now.com/`.
   e) Copy the JSON configuration found in the Add your Slack credentials to your app section for use in later steps.

2. Associate your Slack app with your instance.
   a) Navigate to System Notification # Messaging Integration Configuration.
   b) Click the Install button next to Slack.
   c) In the JSON Configuration pop-up, paste in the JSON configuration you copied in earlier steps.

3. Check for installation verification. The Slack workspace should appear below the Slack heading on the Notification Integration page.

   During installation, the instance synchronizes with all public Slack channels in the workspace. New public channels added after installation will automatically synchronize with the instance. You can browse to System Notification > Messaging Channels on your instance to verify that the new channel appears on the instance.

To update the app after installation, use the Configure JSON Payload and Settings on Slack icons on the Notification Integration page. You can view the JSON payload, view app credentials, change app appearance, or delete the app.

Install the Now Actions messaging app for Microsoft Teams
Associate the Now Actions messaging app with your instance.

1. Associate your Microsoft Teams app with your instance.
   a) Navigate to System Notification # Messaging Integration Configuration.
   b) Click the Install button next to Microsoft Teams.
c) A pop-up message appears to confirm redirection to Microsoft Teams to verify your identity. Click **OK**.

![Entering a third-party site](image)

You are about to enter a third-party site to verify identity. Please have your login credentials ready in order to complete the installation process.

<table>
<thead>
<tr>
<th>Cancel</th>
<th>OK</th>
</tr>
</thead>
</table>

d) When prompted, log in to Microsoft Teams with your Teams admin account.

e) Click **Accept** to accept the permissions for the app.
f) If the selected workspace has already been assigned, you are asked whether you want to proceed to overwrite the previous assignment. Click **Override** to change the workspace, or click **Cancel** to leave the current assignment in place.

g) After authentication, installation will start in the background. Once installation completes, a message appears confirming the installation.
h) Click the **app package** link to access a knowledge base article **KB0690098**, containing the application package for Microsoft Teams. Follow the steps in the article to make this package available for your Microsoft Teams users.

2. Check for installation verification. The new team should appear below the Teams heading on the Notification Integration page.
During installation, the instance synchronizes with all public Teams channels. To add channels created after the install, open Microsoft Teams and @mention the app from the new channel. You can browse to System Notification > Messaging Channels on your instance to verify that the new channel appears on the instance.

To receive a ServiceNow notification in Microsoft Teams, create a message and a notification. See Configure message content and Create a messaging notification.

Configure message content

Create a message in the Message Contents (messaging_content) table that you can use in multiple notifications. Messages can be informative, or they can request action from an individual Slack or Teams user. For example, the Approval Request message includes Approve and Reject buttons to take the associated action in ServiceNow.

Role required: admin or messaging_admin

To enable users to take actions in Slack or Teams, use the Buttons message type and define scripted behavior. Only users that have linked their Slack or Teams account with their ServiceNow account can take action in ServiceNow from the third-party application.

1. Navigate to System Notification > Messaging Content.
2. Open an existing notification record or click New to create a new record.
3. Fill in or modify the fields as appropriate.

**Messaging content fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the message.</td>
</tr>
<tr>
<td>Type</td>
<td>Select a type of message.</td>
</tr>
<tr>
<td></td>
<td>· Simple: Send an informative message to an entire Team or Slack channel.</td>
</tr>
<tr>
<td></td>
<td>· Buttons: Send a message to an individual user in Slack or Teams and define the desired behavior in the Script field. Associate buttons in the message with actions in ServiceNow. Use the Approval Request as an example.</td>
</tr>
<tr>
<td>Target table</td>
<td>To use record content in your message, select the appropriate table.</td>
</tr>
<tr>
<td></td>
<td>Note: Notifications running on the Task (task) table are not supported. Instead, use a table extended from task.</td>
</tr>
<tr>
<td>Fields</td>
<td>Select which fields from the Target table appear in a simple message. Changing the order of the fields changes the display order in the notification.</td>
</tr>
<tr>
<td>Message heading</td>
<td>Enter text to appear at the top of the message.</td>
</tr>
<tr>
<td>Message</td>
<td>Enter the content of the message. Use notification variables to include dynamic information in your message. For example, use Incident $ {number} to include the incident number in the message. For available variables, see Notification variables.</td>
</tr>
<tr>
<td>Buttons</td>
<td>Select or create buttons to use on the form. After selecting or creating a button, you must define button behavior in the Script field. Only visible when Buttons is selected in the Type field</td>
</tr>
</tbody>
</table>
**Field** | **Description**
---|---
Script | This field is only visible when Buttons is selected in the **Type** field. Enter a script to define what happens in your instance when a user selects a button in Slack or Microsoft Teams. Use the `actions.get` method to return the name of the button selected by the user.

```
if (actions.get('button') == 'Approve') {
    target.state = 'approved';
    target.update();
}
```

In this example, the script conditionally executes when the 'Approve' button is selected.

Use the method `sn_notification.Messaging.send` to send information to the messaging window.

```
var content = new GlideRecord("messaging_content");
content.get("1bb10839572213007f004758ef94f9c4");
sn_notification.Messaging.send(application, userId, content, target);
```

In this example, the script stores a Message Content record in the `content` variable. It then posts a message from that Message Content record.

| Application | Select the application scope for this notification. |
---|---|

4. **Click Submit**

This example shows the output of a message in Microsoft Teams. This message is of the buttons type, which shows buttons and performs scripted actions based on the user selection. In this case, the script uses the `sn_notification.Messaging.send` method to display the change in state for the record.
Use the message in a notification. For more information about creating notifications, see Create a messaging notification.

Create a messaging notification

Notifications define when a message is sent, who it is sent to, and what it contains. To send a notification to Slack or Teams, add a messaging content record to the notification and configure the notification messaging channel. Notifications that require action must be sent to individual users instead of groups.

Role required: admin

2. Click New.
3. Fill in or modify the fields as appropriate.
Use Notifications to notify users about specific activities in ServiceNow, such as updates to incidents or change requests. Notifications allow administrators to specify:
- When to send the notification
- Who receives the notification
- What content is in the notification

**Field** | **Description**
--- | ---
Name | Enter a unique name for the notification. Use descriptive names to ensure that your users are able to easily distinguish between notifications.
Table | Select a table to trigger the message. Must be a table or database view within the same application scope.

**Note:** Notifications running on the task (task) table are not supported. Instead, use a table extended from task.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Select a category for the notification. A category groups related notifications in the system settings.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Do not leave the category as Uncategorised, as users may not be able to find the notification in their list of notifications.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description for this notification.</td>
</tr>
</tbody>
</table>

**Note:** Notification records are shared between messaging, email, and push notifications. Some fields on the form are not relevant to messaging notification records. Leave fields not described here at their default values.

4. Click **Advanced view** under **Related links** to switch the advanced view. Switching to the Advanced view saves the current record.

5. Open the **When to send** tab and complete the form.
Note: If the same trigger generates multiple notifications, the system only sends one notification. The system considers all other notifications, even if they have a different subject and body, as duplicates. The Ignore Duplicates business rule controls this functionality.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send when</td>
<td>Select under what condition the notification is sent:</td>
</tr>
<tr>
<td></td>
<td>• When a record is inserted or updated</td>
</tr>
<tr>
<td></td>
<td>• When a particular event is fired</td>
</tr>
<tr>
<td></td>
<td>• When triggered as an action step in Flow Designer</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Weight</td>
<td>Set a numerical value for the notification priority relative to other notifications with the same target table and recipients. The system only sends the notification with the highest weight. The default value 0 causes the system to always send the notification (assuming the conditions are met).</td>
</tr>
<tr>
<td>Conditions</td>
<td>Use the condition builder to select the conditions under which this notification is sent. For example, select Priority &gt; greater than &gt; 3 - Moderate to send the notification only for High and Critical priority incidents.</td>
</tr>
<tr>
<td>Inserted</td>
<td>Select the check box to enable messaging notification when a record is inserted. This field appears when you set the Send when field to Record inserted or updated.</td>
</tr>
<tr>
<td>Updated</td>
<td>Select the check box to enable messaging notification when a record is updated. This field appears when you set the Send when field to Record inserted or updated.</td>
</tr>
<tr>
<td>Event name</td>
<td>Select the event that triggers this notification. This field appears when you set the Send when field to Event is fired.</td>
</tr>
</tbody>
</table>
| Advanced condition | Create a script to define more filter conditions, like sending a notification based on the current messaging record, changing field values, or changing system properties. The advanced condition script must return true or set a global answer variable to true to send the notification. The advanced condition script uses the following global variables:  
  - current: Contains the current record from the table to which the notification is linked.  
  - event: Contains the event that triggered the notification. |

Note: The Advanced condition field is evaluated in addition to other conditions you set on the notification. Both the condition and advanced condition must evaluate to true to send the notification.

6. Open the **Who will receive** tab and fill in or modify the following fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Messaging Channels</td>
<td>Select the messaging channels to receive the messaging notification. Only complete this field if creating a simple notification to send to a channel. Simple notifications use a Messaging Content record of Type Simple.</td>
</tr>
<tr>
<td>Users</td>
<td>Select the users you want to receive the messaging notification. Only complete this field if creating a notification that requires user action. Notifications that require user action use a Messaging Content record of Type Buttons.</td>
</tr>
<tr>
<td>Users/groups in fields</td>
<td>Select users or groups from reference fields. For example, if a notification uses the Incident (incident) table, you can select users or groups from incident fields like Opened by and Assignment group.</td>
</tr>
<tr>
<td></td>
<td>Note: You can dot-walk to values in reference fields by clicking the plus sign in the field selector and then selecting the related field.</td>
</tr>
<tr>
<td></td>
<td>If you address the notification to a user with an inactive record in the User (sys_user) table, the system does not send the notification to that user.</td>
</tr>
<tr>
<td>Groups</td>
<td>Select the groups you want to receive the messaging notification. You can search for groups with the reference lookup icon or by manually entering the group name. This list of groups is static.</td>
</tr>
<tr>
<td>Send to event creator</td>
<td>Select this check box to send the notification to the person who performed the action that started the notification process if the person is also a recipient. If the event creator is not specified in one of the recipient fields, the event creator does not receive a notification, regardless of the setting in this field. For new notifications, this option is selected by default.</td>
</tr>
<tr>
<td>Event parm 1 contains recipient</td>
<td>Select this check box if the event parameter 1 contains one or more notification recipients (in a comma separated-list). This field is visible only when the Send when field is set to Event is fired.</td>
</tr>
<tr>
<td>Event parm 2 contains recipient</td>
<td>Select this check box if the event parameter 2 contains one or more notification recipients (in a comma-separated list). This field is visible only when the Send when field is set to Event is fired.</td>
</tr>
</tbody>
</table>

7. Open the **What it will contain** tab and fill in or modify the following fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Messaging content</td>
<td>Select a messaging content record to be used in this notification.</td>
</tr>
</tbody>
</table>

8. Click Update.

**Link your ServiceNow user account to your Slack or MS Teams account for Now Actions**

Link your ServiceNow account to your Slack or Teams account to take action on ServiceNow notifications from within Slack or Teams. If you do not link accounts, you can still receive notifications within group channels. However, you cannot to approve ServiceNow requests or take action on notifications from within Slack or Teams.

Role required: none

1. Open the Slack or Teams application
2. Find the Now Actions bot. This bot is found in the left panel of Slack under Apps, and in the left panel of Teams in the Chat tab.
3. Start a conversation with the Now Actions bot. The bot then presents a link to authenticate.

![Authentication message](image)

4. Click the **Connect to ServiceNow** link.
   A new browser tab opens and prompts the user to Deny or Confirm the connect between your Slack or Teams account and your ServiceNow account. This link will expire five minutes after it is displayed.

5. Click **Confirm** to link the accounts.
6. After confirmation, you are directed to the instance user record. A confirmation message is displayed at the top of the screen.

Configure system settings

Each user can enable ServiceNow notifications in a third-party application by configuring the communication channel in their system settings. Opt in to receive approval requests and other actionable notifications in third-party channels.

You can only enable notifications in notification channels you have permission to access.

1. Select the gear icon in the banner frame to access the System Settings window.
2. Select the Notifications tab.
3. Under Notification Channels, enable notifications for the desired channels.
4. Opt in to individual notifications.
   To receive notifications for Button type messages, you must opt in for each individual notification that you wish to receive. For example, to receive an approval request as a direct message in Slack, you must find the notification and set the Slack workspace as an enabled channel for that specific notification.

   **Note:** To receive notifications for Simple type messages, you need only to enable the notification channel. You don’t need to opt in for individual notifications. For more information on message types, see Configure message content.

   a) In the Notifications by Category section, select the category containing the notification you want to enable. The category is defined on the notification record.
   You can also search notifications to find individual notifications by name.

   b) Select the notification you wish to enable a channel for.

   c) Enable the notification channels where you want to receive this notification.

Unlink your ServiceNow user account from your Slack or MS Teams account for Now Actions

Unlink your ServiceNow account from your Slack or MS Teams account to stop receiving actionable ServiceNow notifications in Slack or Teams.

Role required: none

If you unlink your account to a messaging app for Now Actions, you must also disable the corresponding messaging channel in your notification preferences.

1. Navigate to **Self-Service > My Profile**.
2. Click the View Linked Accounts related link.
3. In the Linked Accounts page, check the selection box for the messaging integration to be unlinked.
4. Select Actions on selected rows..., then click Unlink account.
   Your ServiceNow account is unlinked from the Now Actions messaging integration (the link is inactive).
   
   **Note:** Even though you unlinked your account, you still receive notifications in any group channels to which you belong.

5. Disable the messaging channel in your Notification Preferences.
   a) Select the gear icon in the banner frame to access the System Settings window.
   b) Under Notification Channels, disable the appropriate messaging channel.
   
   **Note:** If you want to link your ServiceNow account again, follow the steps in Link your ServiceNow user account to your Slack or MS Teams account for Now Actions.

### The email client

The email client enables you to send email directly from any record, such as an incident, change request, problem, or user record.

The email client is available by default, and enabled by default on the incident table.

The email client can be useful in cases where you want to send an email:

- To engage more people in a piece of work
- That includes Cc and Bcc recipients
- That includes personalized comments
- To a third party who doesn’t have an account in your instance
- To someone about an incident where you don’t have an email notification set up to do exactly what you want

The email client always uses the multipart/mixed content type and supports HTML markup in the message body.

**Note:** Line breaks do not appear for multi-line fields such as ${description} and ${comments} in the email client template.

### Enable the email client for a table

Enable the email client for a table so that users can send emails directly from the table record.

**Role required:** admin

The email client is enabled by default on the Incident (incident) table. You can enable the email client for another table by adding the email_client dictionary attribute to the table.

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
1. Open a record in the table that you want to enable the email client for. For example, to enable the email client for the Problem (problem) table, navigate to Problem > Open, and then open any problem record.

2. On the form, click the menu icon ( ) and then click Configure > Dictionary.

3. On the Dictionary Entries list, open the first record. The first record has the record type Collection and does not have any entry for Column name.

4. On the form, in the Related Links section, click Advanced view.

5. In the Attributes field, enter email_client=true. If there are other values in the field, separate the attribute with a comma.

6. Click Update.

Components installed with the email client

Several types of components are installed with activation of the Email Client (com.glide.email_client) and Email Client Template (com.glide.email_client_template) plugins, including tables and user roles.

Note: The Application Files table lists the components installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed

<table>
<thead>
<tr>
<th>Role title (name)</th>
<th>Description</th>
<th>Contains roles</th>

**Email client interface**

The instance's email client interface looks like a standard email interface, which contains a toolbar for text formatting and adding attachments.

Users see an email icon based on the UI version.

- UI16: The email icon (✉️) appears in the more options menu.
- UI15: The email icon (✉️) appears in the form header.

Users click the email icon to launch the email client as a pop-up window.
This is an email message using the TinyMCE editor.
Email client configurations

Use email client configurations to manage the behavior of your email client. Each configuration consists of different email controls for setting allowable email recipients and email addresses.

In new and upgraded instances, the Email Client Configuration module is activated by default through the Email Client (com.glide.email_client) and Email Address Filter (com.glide.email_address_filter) plugins.

Note: If you upgraded to the Madrid release, a default email client configuration is created automatically during upgrade. This default email configuration is used if you do not define any other email client configurations. Also, if you previously defined certain email client properties to control email address auto-complete, disambiguation, and the display of the From and Reply-To email addresses, those settings are retained in the default email client configuration.

How email client configurations work

Email client configurations determine how your email client behaves, such as whether the From address or Reply-To address should be displayed, and the allowable addresses that can be entered by your users. A configuration applies to a specific ServiceNow table, which enables you to define email client behavior for a specific context, purpose, or application. For example, if you have email client users who send email about Customer Service case records, you can create a configuration that applies email client controls specific to customer service. You can select the email client recipient qualifiers for controlling the auto-complete recipient results from a selected table, such as the Customer Contact table. You can also set email address filters that determine the allowable addresses from a table, such as the Customer Contact table.

An email client configuration consists of the following components:

**Email client recipient qualifiers**

Recipient qualifiers control the email recipients returned in the auto-complete results for the To, Cc, and Bcc fields of the email client. You can provide additional qualifiers displayed in the auto-complete results to differentiate recipients that have the same names and narrow the results.

**Email client From addresses**

This control enables the display of the From and Reply-To addresses. Use the Email Client Template to create a set of allowable From addresses that can be used when a user sends an email with the email client. You can provide a specific From address to be used in the email client, or you can choose to hide it entirely.

**Email client attachment handling**

By default, attachments that are sent from the email client are attached to the target record. Instead, you can select to attach files to the Email (sys_email) record, or you can set conditions that define which email client attachments are added to the target record. To see the status of all email attachments, go to the Email Attachments (sys_email_attachment) table.

**Email address filters**
Email address filters allow or disallow certain email addresses that users can enter in the email client. You can specify an email whitelist that specifies allowable domains or an email blacklist that disallows certain domains.

You can also use an Email Client Template to define the content of an email client message and set other message characteristics, such as an email sender (From address) configuration.

**Email client configuration process**

Users with the admin role define and edit email client configurations. Users with the email_client_admin role can edit configuration information in selected tables.

1. **Build the various email client controls that can be used to create an email client configuration.**
   - Define email client recipient qualifiers.
   - Set email address filters that allow or disallow email addresses that can be entered in the email client.

2. **Create the email client configuration.**

Define an email client configuration that determines how your email client behaves when users create an email message.

**Define email client recipient qualifiers**

Create a configuration that controls the auto-complete list of recipients displayed in the email client. You can specify recipient qualifiers that display additional fields (from a selected ServiceNow table) in the auto-complete list. These fields differentiate email recipients who have the same first and last names.

Role required: email_client_admin or admin

Use the following tabs in the Email Client Recipient Qualifier form to define a recipient configuration.

- **Display Configuration** – Set up the email recipient auto-complete behavior and optionally select additional fields to differentiate recipients who have the same name. The additional fields ensure that users select the proper recipient for an email.
- **Query Configuration** – Specify a condition or script that queries the selected table and filters the recipient results returned.

You can define different recipient configurations, which can be used in an email client configuration.

1. Navigate to **Email Client > Email Client Recipient Qualifier** and click **New**.
2. Fill in the fields at the top of the Recipient Qualifier form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for this email client recipient configuration.</td>
</tr>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
<tr>
<td>Table</td>
<td>The ServiceNow table to be queried for recipients.</td>
</tr>
<tr>
<td>Description</td>
<td>A brief description of this recipient configuration.</td>
</tr>
</tbody>
</table>
3. Fill in the fields in the **Display Configuration** tab to control the autocomplete display in the email client.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Address field</td>
<td>The field on the table that contains the recipient email address.</td>
</tr>
<tr>
<td>Display Name Field</td>
<td>The field on the table used for the recipient name displayed.</td>
</tr>
<tr>
<td>Order</td>
<td>The order of results returned relative to other recipient qualifiers defined.</td>
</tr>
<tr>
<td>Additional Display Fields</td>
<td>A content list for choosing additional fields from the table to be displayed in the autocomplete list. Differentiates recipients who share the same name.</td>
</tr>
<tr>
<td>Search Additional Fields</td>
<td>A checkbox for enabling additional fields to be searched. Expands the recipients returned in the auto-complete list by querying (searching) the Additional Display Fields.</td>
</tr>
</tbody>
</table>

4. Fill in the fields in the **Query Configuration** tab.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select the method for filtering the recipients returned in the auto-complete list:</td>
</tr>
<tr>
<td></td>
<td>• Condition</td>
</tr>
<tr>
<td></td>
<td>• Script</td>
</tr>
<tr>
<td>Conditions</td>
<td>If you selected Condition for the Type, use the condition builder to specify the conditions that must be met to return the appropriate recipients.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Script</td>
<td>If you selected Script for the <strong>Type</strong>, enter a script that uses these variables to return the appropriate recipients:</td>
</tr>
</tbody>
</table>
|          |   - **recipientQuery**: GlideRecord for the table being queried.  
|          |   - **targetRecord**: GlideRecord for the target record from which the email client was opened.                                              |
|          | For example, this **recipientQuery** is a GlideRecord that represents the Customer Contact table. The **targetRecord** variable is a Customer Service case from which the email client was opened. This query limits the email client autocomplete results to contacts who belong to the same account as the Customer Service case. |

```javascript
(function (recipientQuery, targetRecord) {
  // Limit results to contacts belonging to the account for the case.
  var account = targetRecord.getValue('account');
  recipientQuery.addQuery('account', account);
})(recipientQuery, targetRecord);
```

5. Click **Submit**.
   The recipient qualifier configuration is added to the Recipient Qualifier (sys_recipient_qualifier) table and is available for use in an email client configuration.

**Define email client from addresses**

Set an allowable email address that is displayed in the From address of a message sent from the email client.

Role required: admin

1. Navigate to **Email Client > Email Client From Address** and click **New**.
2. In the **Display name**, enter the name to be displayed in the From field of the email client message.
3. Enter a valid **Email address** for the From address in the email client.
4. Click **Submit**.
   The From address is added to the Email Client From Address (sys_email_client_from_address) table.

**Set email address filters**

Define email filters that restrict the email recipients that users can enter in the email client. You can filter by domain or by specifying certain addresses.
Role required: email_client_admin or admin

You can specify two types of email address filters:

- **Whitelist**: A list of allowed domains for email recipients who can be selected in the email client.
- **Blacklist**: A list of disallowed domains for email recipients who cannot be selected in the email client.

You can also specify email address exceptions to the allowed or disallowed domain.

1. Navigate to Email Client > Email Address Filters, and then click **New**.
2. Enter the **Name** of the address filter.
3. Select the filter **Type**:
   - **Whitelist**: Allow all specified domains. All other domains are disallowed.
   - **Blacklist**: Disallow all specified domains. All domains that do not match the blacklisted domains are allowed.
4. In the **Domains** field:
   a) Click the lock icon to unlock it and access the domains controlled by this filter.
   b) Select an existing domain or enter a new domain:
      - If the filter **Type** is Whitelist, click the Search icon. Select the domains for which all email addresses are allowed. To add a new domain, click **New**, enter the **Domain**, and click **Submit**.
      - If the filter **Type** is Blacklist, click the Search icon. Select the domains for which all email addresses are disallowed. To add a new domain, click **New**, enter the **Domain**, and click **Submit**.

   **Note**: You can specify a wildcard (*) in the domain name, for example * .com.

   If you create an email configuration that has multiple email address filters, all the filters evaluate the given email addresses. The filters determine whether the addresses are valid and the message can be sent as outbound email.
   c) Click the lock icon to lock the **Domains** field.
5. Specify any email addresses that are **Exceptions** to the domains specified in step 4.
   a) Click the lock icon to open the Email Address Filter Exceptions (sys_email_filt_except) table.
   b) Click the search icon to choose an existing email address. To add a new email address, click **New**, enter the email address exception, and click **Submit**.

   **Note**: You can specify a wildcard (*) in an email address exception.
   c) Click the lock icon to lock the **Exceptions** field.

   The exception is added to the Email Address Filter Exceptions (sys_email_filt_except) table.
6. Click **Submit**.

   The email address filter is added to the Email Address Filters (sys_email_address_filter) table.
Create an email client configuration

Define a configuration that controls the display and behavior of the email client that is based on a selected ServiceNow table. The configuration determines the recipient auto-complete results that are displayed, email addresses that can be entered, and a set of allowable From addresses to be used when sending a message with the client.

Role required: email_client_admin or admin

You can create one email client configuration per ServiceNow table.

1. Navigate to Email Client > Email Client Configuration and click New.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for this email client configuration.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Type of scoped application.</td>
</tr>
<tr>
<td>Active</td>
<td>Option that indicates that the configuration is active. The configuration is active by default.</td>
</tr>
<tr>
<td>Table</td>
<td>ServiceNow table that this client configuration applies to. Select a table from the list.</td>
</tr>
</tbody>
</table>

3. In the Recipient Configuration section, select **Recipient Qualifiers** to be used for this client configuration.
   a) Click the lock icon

   ![Lock Icon]

   By default, two types of recipients are available: Active Users with email accounts and Active Groups with email accounts.

   b) Click the search icon

   ![Search Icon]

   and select a recipient configuration from the list of available recipient configurations.

   c) Click the lock icon

   ![Lock Icon]

   to lock it.

4. In the Display Configuration section:
   a) Select the **Display From** option to display the From email address in the email client. To hide the From email address in the email client, clear the check box.

   b) Select the **Display Reply-To** option to display the Reply To address in the email client. To hide the Reply To email address in the email client, clear the check box.

5. In the Attachment Handling section, select from one of three choices for the **Attachment Send Action** field:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attach to Email Record</td>
<td>Keep email client attachments on the Email (sys_email) record when you send an email.</td>
</tr>
<tr>
<td>Attach to Target Record</td>
<td>Attach email client attachments to the target record when you send an email. This option is the default value.</td>
</tr>
<tr>
<td>Conditionally Attach to Target Record</td>
<td>Set conditions that define which email client attachments are moved to the target record when you send an email. Attachments that do not meet the conditions remain on the email record when you send an email.</td>
</tr>
</tbody>
</table>

6. In the Filter Configuration section, select **Email Address Filters** to be applied to the email client.
   a) Unlock the lock icon

   ![Lock Icon]

   b) Click the search icon

   ![Search Icon]

   and select one or more Email Address Filters.
c) Click the lock icon
to lock Email Address Filters.

Each filter that you select evaluates a given email address and determines whether or not the given address is valid to apply to an outbound email.

7. Click Submit.
The configuration is added to the Email Client Configuration (sys_email_client_configuration) table.

Customize the email client
The email client has default properties and values that you can customize to suit your needs.

**Email client default properties and values**

<table>
<thead>
<tr>
<th>Property</th>
<th>Default Value</th>
<th>How to Customize</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACL access</td>
<td>Defaults to allowing only users with the itil role to access the email client. Change the ACL rule to control access to the email client.</td>
<td>To control who can see the email client, see Control access to the email client.</td>
</tr>
<tr>
<td>Email icon</td>
<td>Allows only users with write access to the current table to see the email icon.</td>
<td>To remove the email icon, see Email icon display.</td>
</tr>
<tr>
<td>To</td>
<td>Defaults to the email address of the caller.</td>
<td>To edit the default value, create an email client template.</td>
</tr>
<tr>
<td>Cc</td>
<td>Defaults to the email addresses of the user who opened the incident and all users in the watch_list.</td>
<td>To edit the default value, create an email client template.</td>
</tr>
<tr>
<td>Subject</td>
<td>Defaults to the incident number and short description.</td>
<td>To edit the default value, create an email client template.</td>
</tr>
</tbody>
</table>

Control access to the email client
You can control access to the email client by changing an ACL rule.
Only users with the *itil* role can access the email client. The following ACL rule controls this access:

**ACL rule**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>EmailClientProcessor</td>
<td>processor</td>
<td>execute</td>
</tr>
</tbody>
</table>
Create an email client template

You can create a different template for each table that uses the email client.

Role required: admin

The email client uses its own email templates to define default values for fields. Use the following sections in the Email Client Template form to build a client template:

- **Content**: The message body.
- **Recipients**: The email addresses of users receiving the email message. The email addresses are displayed in the To, Cc, and Bcc fields of the message.
- **Sender Configuration**: The method used to generate the email sender (From email address) of the message.

1. Navigate to Email Client > Email Client Templates.
2. Click New.
3. Fill in the fields at the top of the Email Client Template form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique template name.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that the template applies to. Enable the email client for the same table.</td>
</tr>
<tr>
<td>Conditions</td>
<td>The conditions that determine when this client template is used. Use the condition builder to identify the target record that must match before this template is applied to the email client.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
<tr>
<td>Execution Order</td>
<td>A number that indicates the order in which template conditions are evaluated.</td>
</tr>
</tbody>
</table>

4. Fill in the fields in the **Content** tab.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subject</td>
<td>Enter a description of the email.</td>
</tr>
<tr>
<td>Content Type</td>
<td>Select the format of the message body content: HTML or plain text.</td>
</tr>
<tr>
<td>Body HTML</td>
<td>If you selected HTML for the Content type, enter the content of the message body using the HTML editor toolbar to format the HTML. To reference field values, select variables from the variables list or manually type variable references using the syntax <code>${table_name.variable_name}</code>. To reference the user who launches the email client, enter the variable ${current_user}. You can call a mail script by using <code>${mail_script:script name}</code> in the Body HTML field.</td>
</tr>
<tr>
<td>Body text</td>
<td>If you selected plain text for the Content type, enter any text or mail script that you want to appear in the message body. You can insert a mail script in the Body text field by using the following syntax: &lt;mail_script&gt; [code] &lt;/mail_script&gt;</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>To</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the <strong>To</strong> field. Your script must start with the <code>javascript:</code> prefix. The script must return email addresses in a comma-separated string.</td>
</tr>
</tbody>
</table>
| Cc    | Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the **Cc** field. Your script must start with the `javascript:` prefix. The script must return email addresses in a comma-separated string.  
This field cannot have the same addresses as the **To** field. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bcc</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the Bcc field. Your script must start with the javascript: prefix. The script must return email addresses in a comma-separated string. This field cannot have the same addresses as the To or Cc fields.</td>
</tr>
</tbody>
</table>

6. In the Sender Configuration tab, select the From Generation Type to determine how the sender (From address) in the email client message is generated.

Use this field only if you want a different From address than the one defined in your SMTP email account.

- None: The From address is not generated in the email client message.
- SMTP Email Account: Use the From address of the SMTP email account for the instance as the sender.
- Select From List: Choose from a list of allowable From addresses defined in the Email Client From Address (sys_email_client_from_address) table.
- Script: Run a GlideRecord query on the Email Client From Address (sys_email_client_from_address) table.

For example, the following script sets the From address based on the location of the incident caller:

```javascript
(function (fromAddressQuery, targetRecord) {
    // targetRecord is incident for this template
    var location = targetRecord.caller_id.country;

    if (location == 'us')
        fromAddressQuery.addQuery('email_address', 'servicedesk.us@example.com');
    else if (location == 'japan')
        fromAddressQuery.addQuery('email_address', 'servicedesk.jp@example.com');
    else if (location == 'uk')
        fromAddressQuery.addQuery('email_address', 'servicedesk.uk@example.com');
}
)
```

- Text: Enter the email From address to be used in the client.

**Note:** The From email address does not appear in the email client unless you configure email client to display the From address. For more information on managing the behavior of email client, see Email client configurations.

**Note:** If the domain for the From address is not the domain of the SMTP email account server, the owner of the From domain must configure the SPF record for the domain. The owner changes the domain settings to allow the instance to send email as if from that domain. For details on using SPF records, see ServiceNow KB0535456.
7. Click Submit.
   The template is added to the Email Client Templates (sys_email_client_template) table.

**SMS delivery with the email client**

A property is available that lets the user select an option to send a notification via SMS. The *Subscription Based Notifications plugin* activates the following *system property*:

**Email client system property**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email_client.show_sms_option</td>
<td>Specify whether a check box appears in the email client for sending the message to the user's SMS device. If no SMS device exists, the email client sends the message to the primary email device.</td>
</tr>
</tbody>
</table>
Configuring the email client
Composing emails with quick messages

Insert predefined content into the message body of emails that you send from the email client.

Using quick messages

In the email client, you can select a quick message to fill the email body with the content that is specified in the quick message. After you define one or more quick messages, the Quick Message selector appears in the email client so that you can construct an email with multiple quick messages.

When you select a quick message in the email client, the quick message content is inserted at the place of the cursor. It doesn’t replace content that you created before selecting the quick message.

To replace message content with a quick message, highlight the text to replace and then select a quick message.
ServiceNow - Orlando - Now Platform capabilities

Adding quick messages to an email

© 2020 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Creating quick message content

Define quick messages by creating records in the Email Client Canned Messages (sys_email_canned_message) table.

When you define a quick message, you can add any of the following types of content into the message body:

- Icons
- Logos
- Pictures
- Rich-text HTML
- Hyperlinks
- Variables
- Any other HTML constructs

**Note:** If you add attachments to the quick message, the attachments are not sent as part of the email distribution.

Assign the email_client_quick_message_author role to business managers so that they can create quick messages for users in their group.

Setting quick message conditions

When you define a quick message, you can limit the availability of the quick message according to:

- The user who launches the email client
- The group of the user who launches the email client
- The table of the record from which you launch the email client
- The target record from which you launch the email client

For example, if you designate Beth Anglin as the user for a certain quick message, the quick message is available in the email client only for Beth Anglin.

If you associate a quick message to the Incident (incident) table, the quick message is available in the email client only after you launch from an incident record. If you specify a target record from the Incident table for the quick message, the quick message becomes available in the email client only for matching incident records.

Define a quick message

Create predefined content to add in the email client so that users can write emails consistently and efficiently.

Role required: email_client_quick_message_author or admin

1. Navigate to **Email Client > Quick Messages**.
2. Click **New**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name that appears in the Quick Message selector.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Option for activating the quick message. When selected, the quick message is available for selection in the Quick Message selector.</td>
</tr>
<tr>
<td>Application</td>
<td>Type of scoped application.</td>
</tr>
<tr>
<td>User</td>
<td>User who has access to this quick message. Selecting a user restricts access to that user only. Leave the field blank to have no user-based restrictions.</td>
</tr>
<tr>
<td>Group</td>
<td>Group whose members have access to this quick message. Selecting a group restricts access to members of that group only. Leave the field blank to have no group-based restrictions.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to which the quick message applies. To make the quick message available for all tables, leave blank.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Target record that must match the conditions before the quick message appears for selection in the email client.</td>
</tr>
<tr>
<td>Body</td>
<td>Content to insert in the Message Text field in the email client. By default, the field supports HTML format.</td>
</tr>
</tbody>
</table>

**Note:** To reference field values, select variables from the variables list or manually type variable references using the syntax ${table_name.variable_name}. To reference the user who launches the email client, enter the variable ${current_user}.

4. Click **Submit**.

**Email icon display**

You can use access control rules to hide or display the email icon on forms.

Users with write access to the current table can see the email icon. To remove the icon, remove the user’s write access to the table. Typically you do this in one of two ways:

- **Make the user an Employee Self-Service (ESS) user.** ESS users do not have a user role, and without a role they do not have write access to the Incident table. Making a user an ESS user, therefore, hides the email icon on the Incident form.
- **Create a custom ACL rule and user role that does not have write access to the table.** The default ACL rule for the email client checks to see if the user has the itil role. If you grant users a custom role other than itil, then any such users will not see the email icon.

Remove or display the email icon for a table by setting the **email_client** dictionary attribute to true or false on the table’s collection record. This will not display the email icon for users without write access to the table. For more detail see **Dictionary attributes**.
Automating system responses to inbound email

Save time from responding to emails manually when you configure your instance to send replies, create incidents, or update records automatically in response to inbound emails.

You can define system responses to inbound emails in two ways:

- Create an inbound email flow in Flow Designer
- Script an **inbound email action**

Inbound email trigger in Flow Designer

With the inbound email trigger in Flow Designer, you can create flows that define the automated processes that your instance takes when it receives an email.

Inbound email flows take priority over inbound email actions. If you create flows with inbound email triggers, emails are first processed by the inbound email triggers before they are processed by inbound email actions.

The following diagram shows the processing order for inbound emails. When an email is sent to your instance, the system first classifies the email as a reply, forward, or new email. Then the system runs the inbound email through an inbound email flow. If the flow issues stop processing, the email is finished being processed. If the flow does not issue stop processing, the system tries to match the email to another inbound email flow. If at any point the email does not match with an inbound email flow, the system matches the email to an inbound email action instead.
The benefits to automating system responses to inbound emails in Flow Designer are:

- Provides an easy and accessible interface that uses natural language.
- Consolidates configuration and runtime information into a single environment so process owners and developers can create, operate, and troubleshoot flows from a single interface.
- Reduces upgrade costs, with upgrade-safe Now Platform logic replacing complex custom script.
- Reduces development costs by providing a library of reusable actions.

For more information on creating inbound email flows in Flow Designer, see *Flow trigger types* or follow the steps in *Create a flow with an inbound email trigger*. To view or manage your inbound email flows, navigate to *Flow Designer > Inbound Email Flows*. 
Inbound email actions

Define an inbound email action to script how the system responds to an inbound email.

**Note:** Inbound email flows take priority over inbound email actions. If you create flows with inbound email triggers, emails are first processed by the inbound email triggers before they are processed by inbound email actions.

Inbound email actions are similar to business rules: both use conditions and scripts that take action on a target table. An inbound email action checks the email for a watermark that associates it with a task and checks for other conditions. If the conditions are met, the system takes the inbound email action that you configure. The system can take two types of actions:

- Record action: setting a value for a field in the target table.
- Email reply: sending an email back to the source that triggered the action.

By default, if an email has no identifiable watermark, an inbound email action attempts to create an incident from the message. If the email has a watermark of an existing incident, an inbound email action updates the existing incident according to the action's script.

Watch this six-minute video to learn about the actions that the instance can take in response to messages from users and shows how to create or modify email notifications to users.

Inbound email receive types

The system classifies all incoming email into one of three types: forward, reply, or new.

**Inbound action classifications**

<table>
<thead>
<tr>
<th>Order</th>
<th>Type</th>
<th>Criteria</th>
</tr>
</thead>
</table>
| 1     | Forward | The system classifies an email as a forward only when it meets all these criteria:  
- The **subject line** contains a recognized forward prefix such as FW:.  
- The **email body** contains a recognized forward string such as From:.  
The system classifies any email that meets these criteria as a forward, even if the message contains a watermark or record number that otherwise classifies it as a reply. |
| 2     | Reply   | The system classifies an email as a reply when it fails to match it to the forward receive type and it meets any one of these criteria:  
- The subject line or email body contains a recognized watermark such as Ref:MSG0000008.  
- There is no watermark and the **Reply-To header** contains a recognized message ID of an email with a target record.  
- There is no watermark and the subject line contains a recognized reply prefix such as RE: and a recognized record number such as INC0005574 |
### Determining the type of incoming email

The system classifies an email as new when it fails to match it to the forward and reply receive types.

### Attachments

If an inbound email contains one or more email attachments, the inbound email action adds the attachments to the first record the action produces.
Character encoding

- If the email encoding is ASCII-7 or UTF-8, inbound email actions preserve the character encoding in any associated task records they produce.
- If the email encoding is ISO-8859-1, the inbound email action attempts to convert the email to Windows 1252.
- Inbound email actions convert any other encodings (for example, Mac OS Roman) to plain text, which may or may not be readable.

See the System email log and mailboxes for examples of what you might see if a notification or inbound email action is not processed.

Note: The state of all incoming emails that have been run against inbound email actions, even if there is no matching action, is changed to Processed.

Domain separation

The system ignores the domain that the inbound email action record is in when it creates a record based on the inbound email action. Keep inbound actions in the global domain. For example, if your inbound email action creates an incident, the system creates the incident in the same domain as the user in the Caller field. If that user is not in the User [sys_user] table, the incident is in the global domain.

Inbound email action processing

The system determines which inbound actions to run by comparing the inbound email type and inbound action conditions to the incoming email message. Certain properties are available to set the reply and forwarding prefixes in the email subject lines that your instance recognizes when processing inbound emails.

Note: Inbound email flows take priority over inbound email actions. If you create flows with inbound email triggers, emails are first processed by the inbound email triggers before they are processed by inbound email actions.

The system follows this processing flow to determine whether to run an inbound action.
Inbound action processing work flow

The system only runs an inbound action when:

- The incoming email type matches the inbound action Type.
- If present, the watermark or record number refers to a record in the Target table.
- The inbound action Conditions evaluates to true.

If any of these criteria are not met, the system skips the current inbound action and evaluates the next active inbound action. The system processes inbound actions from the lowest to highest Order value. If the inbound action has Stop processing enabled, the system updates the State of the email record to Processed after running the inbound action Script.

The following video shows how an inbound action condition prevents an incident from being created.
Prefixes recognized in email subject lines

Email reply prefixes

When no watermark is present or the In-Reply-To email header is present, the instance recognizes email containing a prefix from the `glide.email.reply_subject_prefix` property as reply email. You can use this property to set non-standard reply prefixes in your email system.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.reply_subject_prefix</td>
<td>Specifies the list of prefixes (comma-separated) in the subject line that identify an email reply.</td>
</tr>
<tr>
<td></td>
<td>Type: string</td>
</tr>
<tr>
<td></td>
<td>Default value: re:, aw:, r:</td>
</tr>
<tr>
<td></td>
<td>Location: Add to the System Properties (sys_properties) table</td>
</tr>
</tbody>
</table>

Note: Prefixes are case insensitive.

Email forward prefixes

Emails with certain prefixes trigger the forward type of inbound email action. The instance recognizes any email whose subject line contains a prefix from the `glide.email.forward_subject_prefix` property as forwarded email. Emails with these prefixes trigger inbound email actions of the type forward. Use this property to set non-standard forward prefixes in your email system or you want email forwards to behave like replies. If the value of the system property is empty, then the system reverts to using the values `fw:` and `fwd:`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.forward_subject_prefix</td>
<td>Specifies the list of prefixes (comma-separated) in the subject line that identify a forwarded email.</td>
</tr>
<tr>
<td></td>
<td>Type: string</td>
</tr>
<tr>
<td></td>
<td>Default value: fw:, fwd:</td>
</tr>
<tr>
<td></td>
<td>Location: Add to the System Properties (sys_properties) table</td>
</tr>
</tbody>
</table>

Note: Prefixes are case insensitive.

Email forwards as replies

Properties are available to force inbound actions to process forwarded mail as replied mail. These properties control the subject prefix that the inbound actions use.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value needed</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.reply_subject_prefix</td>
<td>re:, Re:, aw:, r:, fw:, fwd:, Fwd:, FWD:</td>
</tr>
<tr>
<td>glide.email.forward_subject_prefix</td>
<td>(any text that is not a forward prefix)</td>
</tr>
</tbody>
</table>
These properties cause the Update Incident inbound action to process all forwarded and replied-to mail.

**Note:** The `glide.email.forward_subject_prefix` property must contain some text so that the forwarded email can be processed as a Reply. It can be any text except a forward prefix (that is, fw:, fwd:, Fwd:, FWD:).

### Matching a sender email address to a user

The instance matches a senders email address to an active user in the User (sys_user) table using inbound actions.

**Note:** The Email Automatic User Creation plugin must be active.

When processing an email, the instance sets the current user to the user whose email address matches `email.from`. Inbound actions can then reference that current user. For example, the base system inbound action Create Incident sets the `caller_id` of the incident to the value returned by `gs.getUserID()`.

If multiple users have the same email address, the instance first searches for an active user with the email address. The instance does not match inactive users.

**Note:** Each user record must have a unique email address so that the instance can reliably match the email to the correct user.

If a unique email address for each user is not possible, assign a shared email address to only one active user so that the instance always matches incoming email from that address to the active user.

### Matching watermarks in the Subject line or Body

The following examples illustrate how the instance matches randomized watermarks in an email subject line or body.

**Note:** For instances upgraded from a release before Jakarta, the system can recognize both randomized and non-randomized watermarks during a watermark transition period.

#### Examples of matching watermarks in the Subject line or body

<table>
<thead>
<tr>
<th>Subject Line or Body Contents</th>
<th>Matching Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ref:MSG00000008_ aLjc130zDhCVuh3spXmt</td>
<td>The instance recognizes this string as a watermark and searches the Email Watermarks (sys_watermark) table for a record with the number MSG00000008_ aLjc130zDhCVuh3spXmt. If this watermark exists, the instance matches the email to the associated record. If this watermark does not exist, the system processes inbound email messages as described in <em>Criteria for matching email to inbound actions.</em></td>
</tr>
</tbody>
</table>
Matching record numbers in the Subject line or Body

The following examples illustrate how the instance matches record numbers in the subject line of an email to an existing record when no watermark is present.

Examples of matching record numbers in the Subject line

<table>
<thead>
<tr>
<th>Subject line contents</th>
<th>Matching results</th>
</tr>
</thead>
<tbody>
<tr>
<td>RE: Example INC0005574</td>
<td>The instance recognizes this subject line as a reply and recognizes the INC prefix as belonging to the Incident table. The instance searches the Incident table for an existing record INC0005574. If this incident exists, the email is associated with this incident. If this incident record does not exist, the instance uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: Example &quot;INC0005574&quot;</td>
<td>The instance recognizes this subject line as a reply but does not recognize the &quot;INC prefix as belonging to the Incident table because of the quotation mark. The same error occurs for any character other than a space before the record number. The instance instead uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: &quot;Example INC0005574&quot;</td>
<td>The instance recognizes this subject line as a reply and recognizes the INC prefix as belonging to the Incident table. The instance searches the Incident table for an existing record INC0005574&quot;, which it cannot find because of the quotation mark. The same error occurs for any character other than a space at the end of the record number. The instance instead uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
</tbody>
</table>
### Criteria for matching email to inbound actions

The system matches incoming email to the conditions of the active inbound actions. The default inbound actions create or update task record under these conditions.

<table>
<thead>
<tr>
<th>Subject line contents</th>
<th>Matching results</th>
</tr>
</thead>
<tbody>
<tr>
<td>RE: CHG0008593 and INC000576</td>
<td>The instance recognizes this subject line as a reply and recognizes one, but not both, of the number prefixes. There is no way to predict which prefix the instance matches first. Whichever prefix it matches, it searches the corresponding table for a matching record. If the record exists, the email is associated with the table. If the record does not exist, the instance uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td><strong>Note:</strong> The instance does not support processing email with multiple numbers in the subject line because there is no way to predict which record the instance matches first. For this reason, do not include more than one $number variable in your notifications.</td>
<td></td>
</tr>
<tr>
<td>FW: Example INC0005574</td>
<td>The instance recognizes this subject line as a forward because of the FW: prefix. It uses the inbound action for forwarded emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>Example INC0005574</td>
<td>The instance recognizes this subject as a new email because it does not contain a matching reply or forward prefix. It uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
</tbody>
</table>
Default matching criteria

If you customize or deactivate the default inbound actions, the system checks the conditions of the active inbound actions. If the system cannot find an inbound action with matching conditions, it sets the state to **Processed**.
**Custom matching criteria**

**Inbound action type criteria**

<table>
<thead>
<tr>
<th>Inbound email action type</th>
<th>Required matching criteria</th>
<th>Name of default action (Incident table)</th>
<th>Result of default action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forward</td>
<td>The email contains the following conditions:</td>
<td>Create Incident (Forwarded)</td>
<td>Create new record</td>
</tr>
<tr>
<td></td>
<td>1. A subject starting with a recognized forward prefix (even if a watermark or an In-Reply-To header is present).</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>2. From &lt;user email&gt; appears anywhere in the email body.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Inbound email action type</td>
<td>Required matching criteria</td>
<td>Name of default action (Incident table)</td>
<td>Result of default action</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------</td>
<td>----------------------------------------</td>
<td>--------------------------</td>
</tr>
</tbody>
</table>
| Reply                     | The email contains one of the following conditions and the table specified in the email matches the table of the inbound action:  
1. A valid watermark that matches an existing record.  
2. An In-Reply-To email header (when no watermark is present) that matches an existing record.  
3. A subject line starting with a recognized reply prefix (when neither a watermark nor an In-Reply-To header is present) and a valid record number that matches an existing record. | Update Incident (BP) | Update existing record |
| New                       | The email does not meet the conditions for either a reply or forward type inbound email action | Create Incident | Create new record |

If more than one inbound action is available for a particular type, the instance uses the Table field to match the email to a particular table. If there is also more than one action for the inbound action’s table, the instance uses the Order field to determine the order in which the actions run.

**Create an inbound email action**

You can create inbound email actions to define the actions that the system takes when an email is received.

Role required: admin

1. Navigate to **System Policy > Email > Inbound Actions**.
2. Click **New**.
3. Fill in the fields as described in the table.
<table>
<thead>
<tr>
<th><strong>When to run</strong></th>
<th><strong>Actions</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td><strong>New</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Execution Order</strong></td>
<td>100</td>
<td></td>
</tr>
<tr>
<td><strong>Conditions</strong></td>
<td><strong>Add Filter Condition</strong></td>
<td><strong>Add &quot;OR&quot; Clause</strong></td>
</tr>
<tr>
<td>-- choose field --</td>
<td>-- oper --</td>
<td>-- value --</td>
</tr>
<tr>
<td><strong>Condition</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Application**
- Global

**Active**
- Yes

**Stop processing**
- No
**Note:** You might need to configure the form to see all fields.

### Inbound Email Actions form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When to run</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Enter a descriptive name for this email action.</td>
</tr>
<tr>
<td>Target table</td>
<td>Select the table where the action adds or updates records.</td>
</tr>
<tr>
<td>Action type</td>
<td>Select the type of action the instance takes. Select <strong>Record Action</strong> to modify a record in the instance, or select <strong>Reply Email</strong> to have the instance send an email back to the source of the inbound email.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate the inbound email action. Clear the check box to disable the action.</td>
</tr>
<tr>
<td>Stop processing</td>
<td>Select this check box to prevent the system from running additional inbound email actions after this action runs.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the message type required to run the action. The action runs only if the inbound email is of the selected type. Available types are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>New</strong>: An email that is not recognized as a reply or forward.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Reply</strong>: An email with a watermark with an In-Reply-To email header, or whose subject line begins with a recognized reply prefix.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Forward</strong>: An email whose subject line begins with a recognized forward prefix, even if the email also contains a watermark or In-Reply-To header.</td>
</tr>
<tr>
<td>Required roles</td>
<td>Specify required roles the sender must have to trigger the inbound action.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number that specifies when this inbound action runs relative to other inbound actions that use the same target table. The instance processes the action with the lowest order number first.</td>
</tr>
</tbody>
</table>

**Note:** By default, inbound emails of the **Forward** type always generate new incidents regardless of the presence of a watermark. If this behavior does not match your business logic, you can change the recognized reply and forward prefixes to treat forwards like replies.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>Select the user required to run the action. If a user is selected, the action runs only when the email sender matches the user name. Leave this field blank to perform the action for all users.</td>
</tr>
<tr>
<td></td>
<td>Note: If the selected user is later archived or deleted, the restriction is removed and anyone can trigger the inbound email action.</td>
</tr>
<tr>
<td>Condition</td>
<td>Specify the condition that must evaluate to true to trigger the inbound action. Build a condition with the choice lists or enter a statement that determines when the inbound email action runs. For example:</td>
</tr>
<tr>
<td></td>
<td><code>email.subject. startsWith ('chg:')</code></td>
</tr>
<tr>
<td>Actions</td>
<td>Field actions</td>
</tr>
<tr>
<td></td>
<td>This field appears if the Action type is Record Action. Specify how information in the email is inserted into the record. For example, select <strong>(Created by)</strong>, <strong>(From email)</strong>, or <strong>(Sender)</strong>, so that when the request is inserted, you can see who it is for.</td>
</tr>
<tr>
<td></td>
<td>Reply email</td>
</tr>
<tr>
<td></td>
<td>This field appears if the Action type is Reply Email. Compose the email message to send to the source that triggered the inbound email action.</td>
</tr>
</tbody>
</table>
### Description

Enter a detailed explanation of what this inbound email action does.

### Other fields

**Order**

Enter a number to define the order in which this email action should be processed. Actions with lower numbers are processed first. The Ordered Email Processing plugin does not install this field.

### Accessing email object variables

An inbound email action script contains the email object to access various pieces of an inbound email through variables. You can use the global variable `sys_email` with inbound email actions.

```plaintext
(function runAction(/ *GlideRecord*/ current, / *GlideRecord*/ event, / *EmailWrapper*/ email, / *ScopedEmailLogger*/ logger) {
    // Implement email action here
})(current, event, email, logger);
```
## Accessing email objects with variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>email.to</td>
<td>Contains a comma-separated list of email addresses in the To: and Cc: boxes.</td>
</tr>
<tr>
<td>email.direct</td>
<td>Contains a comma-separated list of email addresses in the To: box.</td>
</tr>
<tr>
<td>email.copied</td>
<td>Contains a comma-separated list of email addresses in the Cc: box.</td>
</tr>
<tr>
<td>email.body_text</td>
<td>Contains the body of the email as a plain text string.</td>
</tr>
<tr>
<td>email.body_html</td>
<td>Contains the body of the email as an HTML string.</td>
</tr>
<tr>
<td>email.from</td>
<td>Contains an email address that depends on the following conditions:</td>
</tr>
<tr>
<td></td>
<td>• If the address listed in the email Headers field matches an existing user's Email address, this variable contains the user's email address.</td>
</tr>
<tr>
<td></td>
<td>• If the address listed in the email Headers field does not match an existing user's Email address, this variable contains the address listed in the email Headers field.</td>
</tr>
<tr>
<td>email.from_sys_id</td>
<td>Contains the Sys ID of the user who sent the email to the instance.</td>
</tr>
<tr>
<td>email.origemail</td>
<td>Contains the address of the email sender as listed in the email Headers field.</td>
</tr>
<tr>
<td>email.subject</td>
<td>Contains the subject of the email as a plain text string.</td>
</tr>
<tr>
<td>email.recipients</td>
<td>Contains a comma-separated list of recipient addresses as a plain text string.</td>
</tr>
<tr>
<td>email.recipients_array</td>
<td>Contains the recipient addresses as an array.</td>
</tr>
<tr>
<td>email.content_type</td>
<td>Contains the MIME content type of the email (for example, text/plain; charset=&quot;us-ascii&quot; or text/html; charset=&quot;us-ascii&quot;).</td>
</tr>
<tr>
<td>email.headers</td>
<td>Contains details about the sender, route, and receiver as a plain text string in the format of the sending email client.</td>
</tr>
<tr>
<td>email.importance</td>
<td>Contains an indication from the sender about how important a message is. The value can be High, Low, or empty.</td>
</tr>
</tbody>
</table>

**Note:** The instance follows RFC 2822 (Internet Message Format), which requires multiple email addresses in a group to be separated by commas, not semicolons. The instance can set the values of the email.to, email.direct, and email.copied variables only if emails addressed to groups follow the expected RFC format.
Inbound `email.recipient` variables

The recipients variables (email.recipients, email.recipients-array) allow processing of inbound email based on the email recipients. For example, you can create a script to process email based on the array values:

```javascript
var rarray = email.recipients_array; for ( var i = 0; i < rarray.length; i ++ ) { var recipient = rarray[i]; // do something with it }
```

The `sys_email` variable

This variable lets you access the received sys_email record that triggered the inbound email action. It can be used to reference fields on the email record, such as uid, sys_id, content_type, and so on.

Email user matching

When the instance receives an email message, the system searches for an existing user record with the same email address as the sender.

<table>
<thead>
<tr>
<th>Matching email to existing users</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value of email.from Variable</td>
</tr>
<tr>
<td>---------------------------------</td>
</tr>
<tr>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
</tr>
<tr>
<td>&quot;Michael Tossi&quot; <a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
</tr>
<tr>
<td>&quot;Tossi, Michael&quot; <a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
</tr>
<tr>
<td>&quot;Tossi&quot; <a href="mailto:mtossi@company.com">mtossi@company.com</a></td>
</tr>
</tbody>
</table>

Note: This functionality requires that you activate the Email Automatic User Creation plugin.

Inbound Email Action scripts no longer support the `gs.createUser()` method. Use either the automatically-generated email variables or the `gs.GetUserID()` method instead.

User impersonations and inbound actions

When the instance receives an email, it can take a variety of actions by impersonating the sender.

If the sender of an incoming email matches an existing user, the instance impersonates the matching user to complete any inbound email actions. If the sender does not match an existing user, the instance impersonates the Guest user to complete any inbound email actions. If the impersonated user is locked out, the inbound email action fails.

Note: If the inbound email comes from an untrusted domain, the instance impersonates the Guest user unless you explicitly prevent users from untrusted domains from triggering
Enable automatic user creation

An administrator can set an email property to automatically create users from incoming email. The administrator provides a list of trusted domains to prevent untrusted users from being automatically created.

Role required: admin

For example, you can prevent email from users outside your company domain from creating incidents. When an instance receives a message and there is no matching email address from the sender, the instance can create a user with the User ID (sys_user.user_name) set to the sender’s full email address.

Users in your instance must still have write and update access to the records that they create or update through inbound email actions.

<table>
<thead>
<tr>
<th>Value of email.from Variable</th>
<th>User ID Created</th>
<th>Email Address</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;New User&quot; <a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;User, New&quot; <a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;User&quot; <a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td><a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td><a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td>User</td>
</tr>
</tbody>
</table>

1. Navigate to System Properties > Email Properties.
2. Select the check box for Automatically create users for incoming email from trusted domains (glide.pop3readerjob.create_caller).

   Property name: glide.pop3readerjob.create_caller

   Automatically create users for incoming emails from trusted domains

   | Yes | No |

3. Enter the list of trusted domains in Trusted domains for creating users from incoming emails (glide.user.trusted_domain).
4. Click **Save**.

5. Optional: Complete the following steps to lock out the guest user.
   a) Navigate to **User Administration > Users** and select the user **guest**.
   b) Select the **Locked out** field to disable the guest account.

When the property `glide.pop3readerjob.create_caller` is set to **false**, the instance runs inbound actions from users who do not match an existing user by impersonating the guest user.

If the property `glide.pop3readerjob.create_caller` is set to **true**, but a user has a valid email address associated with a non-primary device, the instance creates a new user record for that email address if there is no matching email address in the Users (sys_user) table. The instance does not validate non-primary email addresses against the Notification Devices (cmnnotif_device) table.

The method the instance uses to create users can be upgraded to use the full email address by activating the Email Automatic User Creation plugin.

The plugin sets the property `glide.email.create_userid_from_email` to **true** by default. After activating the plugin, enable automatic user creation from email.

**Warning:** Review your existing user records to reconcile any that contain identical email addresses. If you activate the plugin prior to reconciling email addresses, your instance cannot distinguish between users with identical email addresses and randomly selects one of the users with the matching email address.

**Allowing locked out users to process inbound email actions**

A property is available to allow locked out users to trigger inbound actions. For example, enabling the property can allow locked out users to reset their password and send email to the instance asking for assistance.
Property allowing locked out users to trigger inbound email actions

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.pop3.process_locked_out</td>
<td>Enables (true) or disables (false) the ability for locked out users to trigger inbound actions.</td>
</tr>
<tr>
<td></td>
<td>- Type: true</td>
</tr>
<tr>
<td></td>
<td>- Default value: false</td>
</tr>
<tr>
<td></td>
<td>- System Properties (sys_properties) table</td>
</tr>
</tbody>
</table>

**Warning:** Enabling this property (glide.pop3.process_locked_out) also enables users from untrusted domains to trigger inbound actions.

Redirecting email to the instance POP3 account

Configure other mailboxes to forward email to the instance's POP3 account.

By default, the **POP Reader** scheduled job checks for new email every two minutes. It connects to the mail server and account specified in email properties. The **POP Reader** downloads any email waiting on the mail server and creates `email.read` events. After the instance processes the events, the inbound email actions run.

The **POP Reader** shows the number of emails processed during the reader’s last run. The message shows the number of emails the reader processed or `0_processed` if no emails were available. The reader resets the status each time it runs.

While it is not possible to specify more than one POP3 account for the instance, you can forward other mailboxes to the designated POP3 account. This script can be added to the Create Incident inbound email action to differentiate the content based on the original recipient, and then set an `assignment_group` value.

```java
if(email.direct.indexOf('facilities@anycorp.com')>-1)
current.assignment_group.setDisplayValue('Facilities Management');
```

Setting field values from the email body

Values in an inbound email can set field values in a task record.

Any name:value pair in an inbound email body gets parsed into a variable/value pair in the inbound email script. The name:value pair must be on its own line. Note that most email clients limit the number of characters allowed per line and may truncate excessively long name:value pairs.

**Tip:** To prevent unexpected parsing, ensure that all the names in the name:value pairs are unique.

To populate a reference field, use `setDisplayValue()` instead. See Redirecting Emails for an example of using `setDisplayValue()` in an inbound email action.

**Note:** The action always generates a lowercase variable name. Also, this functionality does not work on reference fields.

For example, if an email body contains this line:

```plaintext
Foo:bar
```
The inbound email script creates the variable `email.body.foo` with the value of `bar`. You can use these variables to create conditions such as:

```javascript
if(email.body.foo!=undefined){
    current.[field]=email.body.foo;
}
```

In this example, the script sets the value of `(field)` to the value `bar`.

**Note:** Spaces are rendered as underscores when a name:value pair gets parsed into a variable/value pair. For example, if an email body contains a line with spaces like `my variable:data`, then the inbound email script creates the variable `email.body.my_variable`. The value of the variable is `data`.

### Integrate inbound events

This example illustrates how to create a notification from an inbound JSON request.

Role required: admin

When complete, you will be able to:

- Send a JSON request to the `imp_notification` web service import set with the JSON processor
- Create a new import set in the `imp_notification` table in the instance using data from the JSON request

The following example steps assume you have your own demonstration instance.

1. Activate the JSON Web Service plugin.
2. Install the *RESTClient* Firefox plugin.
3. Open the RESTClient.
4. Create the following JSON request.

   - **Method:** POST
   - **URL:** `http://<instance name>.service-now.com/imp_notification.do?JSON`
   - **Headers:** `Authorization: Basic`
   - **Body:**

   ```json
   {"sysparm_action":"insert","message":"this is an event","uuid":"abc"}
   ```
5. Click Send.
6. Navigate to **Response > Response Body (Raw)**.
7. Verify that the instance sends back a response with a **sys_id**.

8. Login to your development instance.
10. Verify that the import set table has an event matching your JSON request.
Reprocess received emails

When a email has been processed incorrectly, fix the underlying problem, then reprocess the email. You can reprocess emails individually or in a batch.

Role required: admin

Various scenarios can result in improperly processed emails. After taking corrective action, reprocess the emails to get correct email records. Two of the most common scenarios are:

- The inbound action failed to trigger correctly. After you update or fix the inbound action, reprocess the affected emails to create the correct records.
- Emails have accidentally ended up on a development instance, usually due to the username or password of a production or test instance being reused on the development instance. In this case, you first export the emails from the development instance as XML and import them to the correct instance. On the correct instance, reprocess the imported emails to obtain correct email records.

You can reprocess emails with the types received or received-ignored. Such emails are processed to the system mailboxes **Received** and **Junk**, respectively.

Take the following steps only after fixing the underlying problem. This procedure only reprocesses the emails.

1. Navigate to the relevant **System Mailbox** or navigate to **System Logs > Email**.
2. Decide whether to reprocess emails individually or in a batch.
- To reprocess an individual email, open that email and click **Reprocess**.

  ![Reprocess Email button](image)

- To reprocess several emails at once, select them from the mailbox or the email log and apply the **Reprocess received emails** action.

<table>
<thead>
<tr>
<th>Mailbox</th>
<th>UID</th>
</tr>
</thead>
<tbody>
<tr>
<td>Received</td>
<td>0000003594b3354</td>
</tr>
</tbody>
</table>

**email.**

- To reprocess several emails at once, select them from the mailbox or the email log and apply the **Reprocess received emails** action.
Remember that you can reprocess only received or received-ignored emails.

Inbound email action examples

Various examples of inbound email actions are available to help you build your own inbound email actions. These examples show how to set up inbound email actions to handle email replies, create (log) a problem record, request a change, and update an incident.

Inbound email action example: handling email replies

This example shows you how to set up inbound email actions to handle replies that users send back to the instance.

Role required: admin

The inbound email action parses the email and responds using a script. By default, an email received by the instance creates a new incident, and the body of the email is added to the Additional Comments text box. More refined Inbound Email Actions can create incident tickets with more data, thus saving the incident management team valuable time.

Normally, when a user responds to an email sent by the instance, the inbound email action matches the watermark to an existing incident, and updates the incident rather than creating a new record. However, if the watermark is missing, this inbound email action attempts to match a reply to the original incident.

This inbound email action is replicated in Flow Designer as the sample flow Inbound Email Flow Example: handling email replies. To view the sample flow, navigate to Flow Designer > Designer.

1. Navigate to System Policy > Inbound Actions and click New.
2. Populate the form as follows:

   Inbound action field values

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Update Incident</td>
</tr>
<tr>
<td>Type</td>
<td>Reply</td>
</tr>
<tr>
<td>Target table</td>
<td>Incident (incident)</td>
</tr>
</tbody>
</table>

3. In Script, enter this code.

   ```javascript
   gs.include('validators');

   //Note: current.caller_id and current.opened_by are already set to the first UserID that matches the From: email address
   if (current.getTableName() == "incident") {
       current.comments = "reply from: " + email.origemail + "\n\n" + email.body_text;
       if (email.body.assign != undefined)
           current.assigned_to = email.body.assign;
       if (email.body.priority != undefined && isNumeric(email.body.priority))
           current.priority = email.body.priority;
       if (email.body.category != undefined)
           current.category = email.body.category;
   }
   ```
Inbound email action example: logging a problem

This example shows you how to set up inbound email actions to create a problem record.

Role required: admin

Inbound email actions allow users to log or update incidents on an instance via email. The inbound email action parses the email and responds using a script.

This inbound email action is replicated in Flow Designer as the sample flow Inbound Email Flow Example: logging a problem. To view the sample flow, navigate to Flow Designer > Designer.

1. Navigate to System Policy > Inbound Actions and click New.
2. Populate the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Log Problem</td>
</tr>
<tr>
<td>Type</td>
<td>New</td>
</tr>
<tr>
<td>Active</td>
<td>True</td>
</tr>
<tr>
<td>Target Table</td>
<td>Problem (problem)</td>
</tr>
<tr>
<td>Condition</td>
<td>email.subject.indexOf(&quot;Problem: &quot;) == 0</td>
</tr>
<tr>
<td>Script</td>
<td>current.description = email.body_text;</td>
</tr>
<tr>
<td></td>
<td>current.short_description = email.subject.toString().substring(9);</td>
</tr>
<tr>
<td></td>
<td>current.assignment_group.setDisplayValue(&quot;Development&quot;);</td>
</tr>
<tr>
<td></td>
<td>if (email.body.assign != undefined)</td>
</tr>
<tr>
<td></td>
<td>current.assigned_to = email.body.assign;</td>
</tr>
<tr>
<td></td>
<td>current.insert();</td>
</tr>
</tbody>
</table>

Inbound email action example: requesting a change

This example shows you how to set up inbound email actions to create a change request record.

Role required: admin

Inbound Email Actions allow users to log or update incidents on an instance via email. The inbound email action parses the email and responds using a script.

1. Navigate to System Policy > Inbound Actions and click New.
2. Populate the form as follows:
<table>
<thead>
<tr>
<th>Field</th>
<th>Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Request Change</td>
</tr>
<tr>
<td>Type</td>
<td>New</td>
</tr>
<tr>
<td>Active</td>
<td>True</td>
</tr>
<tr>
<td>Target Table</td>
<td>Change Request (change_request)</td>
</tr>
<tr>
<td>Condition</td>
<td><code>email.subject.indexOf(&quot;Change Request: &quot;) == 0</code></td>
</tr>
</tbody>
</table>

**Script**

```plaintext
current.comments = email.body_text;
current.short_description = email.subject;
current.notify = 2;
if (email.body_text.assign != undefined)
    current.assigned_to = email.body_text.assign;
if (email.body_text.priority != undefined)
    current.priority = email.body_text.priority;
if (email.body_text.category != undefined)
    current.category = email.body_text.category;
current.insert();
```

### Values automatically set from incoming email

The default inbound action for the Incident table automatically sets the following field values when it receives an incoming email.

<table>
<thead>
<tr>
<th>Field value set</th>
<th>Value used from incoming email</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>current.caller_id</code></td>
<td>User ID of the first user whose email address matches the <code>email.from</code> variable.</td>
</tr>
<tr>
<td><code>current.opened_by</code></td>
<td>User ID of the first user whose email address matches the <code>email.from</code> variable.</td>
</tr>
</tbody>
</table>

If multiple users have the same email address, the instance first searches for an active user with the email address. Use unique email addresses for each user record whenever possible. If not, having only one active user with the shared email address guarantees that the instance always matches incoming email from this address to the active user.
Specifying the inbound email processing order

You can configure a processing order for inbound email actions and use the order to manage multiple filters in inbound email actions.

The Ordered Email Processing (com.glide.email_ordered_processing) plugin is enabled by default for new instances. Users with the admin role can activate the plugin for upgraded instances. The plugin adds the Order column to the Rules (sysrule) table, which the instance uses to determine when to process emails. Admins can also add a command to an action script that halts processing after the script runs.

Configure the processing order

Configure the processing order for inbound email actions to force them to run in a prescribed order.

Role required: admin

1. Navigate to System Policy > Email > Inbound Actions.
2. Open an existing inbound action or create one.
3. Complete the form and assign an order number to the Order field to establish when this inbound rule should run in relation to other rules. If you upgraded and activated the plugin, the Order field might be named Execution Order.

   **Note:** Ensure each inbound action has a unique Order value to ensure the system stops processing as expected. If multiple inbound actions have the same Order value, the system might evaluate all of the inbound actions, even if one of them contains the event.state="stop_processing"; script or has the Stop processing option selected.

4. To stop rule processing when an inbound email action runs successfully: add the following line to the bottom of the script:
   - Select the Stop processing check box.
   - Add the following line to the bottom of the Actions script:

     ```java
     event.state="stop_processing";
     ```

Manage multiple filters in an inbound email action

Use process ordering and the `stop_processing` command to manage multiple filters in inbound email actions.

Role required: admin

In this example, you can create new problem records when `prb:` appears in the subject line and new change requests when `chg:` appears in the subject line. All other emails are used to create an incident. The actions are set up as follows:

1. Create an action with a condition of `Subject > starts with > chg:` and the event.state="stop_processing"; command appended to the script.
2. Assign this action an Order value of 100.
3. Create an action with a condition of `Subject > starts with > prb:` and the event.state="stop_processing"; command appended to the script.
4. Assign this action an Order value of 200.
5. Create an action for incident with no conditions and an Order value of 300.

   It is not necessary to add the `stop_processing` command to the script for the incident action unless you want processing to stop at this rule to avoid continuing to another action.

If either a change request or a problem is created, the `stop_processing` command stops processing, and no incident record is created. If neither a change request nor a problem is created, the inbound email action for incident creates a record.

Notify

Notify provides support for SMS and voice channels on the Now Platform for communicating internally with team members and externally with customers and contractors. The plug-in also provides APIs and workflow activities to achieve the above. Some customers directly make use of the APIs in their products others via products like Major Incident Management, On-Call and CTI Softphone.

Activate Notify

You can activate the Notify (com.snc.notify) plugin if you are an administrator. This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

Notify activates these related plugins if they are not already active.

### Plugins for Notify

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>E164 Compliant Phone Number</td>
<td>Provides E-164 compliant phone number support.</td>
</tr>
<tr>
<td>(com.glide.phone_number)</td>
<td></td>
</tr>
<tr>
<td>Notify-Twilio Direct Driver</td>
<td>Provides Notify support for Twilio. This is a pure JavaScript driver that</td>
</tr>
<tr>
<td>(com.snc.notify.twilio_direct)</td>
<td>is more customizable and has more features. Requires a separate contract</td>
</tr>
<tr>
<td></td>
<td>with Twilio for SMS/Voice capabilities.</td>
</tr>
<tr>
<td>SMS Preference Configuration</td>
<td>Allow recipients to opt out of receiving text messages.</td>
</tr>
<tr>
<td>(com.snc.sms_pref)</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** If you are upgrading from an earlier version of Notify, the Notify-Twilio driver remains active.

1. Navigate to **System Definition > Plugins**.

   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:** To redirect to the legacy list view for plugins, click the link.

2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.

   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

   - If you’re certain that you have the correct plugin, click **Install**, then in the Activate Plugin dialog box, click **Activate**.
To view plugin details before activation:

1. Click the plugin name.
2. On the form, click the Activate/Update related link.
3. In the dialog box, review the dependent plugins.

   If your plugin requires dependent plugins, they're activated automatically when you activate your plugin if they're not active already.

4. If demo data is available and you want to install it, click Load demo data.

   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.

5. Click Activate.

Differences between Notify and Legacy Notify

Describes the differences between the Notify and Legacy Notify applications, including architecture, workflows, Twilio support, and task-initiated conference calls.

<table>
<thead>
<tr>
<th>Legacy Notify (com.snc.notifynow)</th>
<th>Notify (com.snc.notify)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manage a single number from a Twilio account per instance.</td>
<td>Provides support for multiple numbers per Twilio account, especially cross-geographical scenarios.</td>
</tr>
<tr>
<td>Supports only telephony services.</td>
<td>Supports pure conferencing solutions.</td>
</tr>
<tr>
<td>Does not include support for customizable workflows for Voice and SMS incoming or outgoing scenarios.</td>
<td>Workflow-driven approach for handling incoming and outgoing Voice and SMS events, making the integration easy to customize.</td>
</tr>
<tr>
<td>Hard-coded join conference SMS and IVR prompts for joining a conference call.</td>
<td>Includes a configurable workflow for handling SMS and Voice IVR prompts.</td>
</tr>
<tr>
<td>Legacy Notify (com.snc.notifynow)</td>
<td>Notify (com.snc.notify)</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>Support for SMS-based answers and threaded conversations.</td>
<td>Notify On Task support for sending SMS and initiating conference calls from any task.</td>
</tr>
</tbody>
</table>

**Migrating from Legacy Notify**

When migrating to Notify from the Legacy Notify functionality, several changes are made to the instance.

If the Legacy Notify functionality is already enabled, several automatic changes occur when you activate Notify:

- The Legacy Notify menu is removed from the application navigator.
- Two separators are added to the new Notify menu: Legacy Notify and Legacy Notify Admin. New modules that replace the Legacy Notify modules are added to these sections.

  **Note:** The added modules are not the same modules that were in the Legacy Notify menu. Any customizations made to the Legacy Notify modules are not preserved.

- The notify_admin role allows access to Notify modules.
- The notifynow_admin role allows access to Legacy Notify modules.
- All workflow activities from the Legacy Notify application are moved to the Legacy Notify group.

**Notify-Twilio Direct driver**

The Notify-Twilio integration with the Notify-Twilio Direct driver provides APIs and workflow activities for applications to handle various notification features.

The Notify-Twilio Direct driver provides the following notification features:

- Start and manage a conference
- Send and receive SMS messages
- Send and receive calls

Notify automatically creates a TwiML application in the Twilio account and configures the application to use the instance as an endpoint.

Phone numbers associated with the Twilio account are imported to Notify. To manage phone numbers per instance, set up one Twilio account for each instance and configure all relevant phone numbers for the instance under that account.

  **Note:** Only one Twilio account (or subaccount) can be configured on a given Notify driver at a time. Both the old and new driver can be used simultaneously because they can be configured with different accounts.

**Activation Information**

For new customers, only the Notify-Twilio Direct driver is available by default. For customers upgrading to the latest version, both the Notify-Twilio Direct and Notify-Twilio drivers are available.

The Notify plugin must be active to access Notify.
Differences between Notify-Twilio and Notify-Twilio Direct

Describes the differences between the Notify-Twilio and Notify-Twilio Direct drivers, including architecture, workflows, Twilio support, and task-initiated conference calls.

<table>
<thead>
<tr>
<th>Notify Twilio (com.snc.notify.twilio)</th>
<th>Notify-Twilio Direct (com.snc.notify.twilio_direct)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provides support for multiple numbers per Twilio account, especially gross-geographical scenarios.</td>
<td>Supports the tracking of the number capabilities so these need not be fetched from external systems every time a call or SMS is sent.</td>
</tr>
<tr>
<td>Easy to customize integration with a workflow-driven approach for handling incoming and outgoing voice and SMS events.</td>
<td>Next level integration with the ability to track message delivery status and to send bulk SMS faster through Twilio-Notify.</td>
</tr>
<tr>
<td>Tracks the participant functions, such as; who is host, is expelled and how they joined a conference.</td>
<td>Additionally tracks the participant function of “is speaking” along with, who is host, is expelled and how they joined a conference.</td>
</tr>

<td>Notify On Task support for sending SMS and initiating conference calls from any task.</td>
<td>Supports copilot features.</td>
</tr>
</tbody>
</table>

Migrate to Notify-Twilio Direct driver

Migrating to Notify-Twilio Direct driver provides next-generation integration with Twilio and Notify. You can migrate to the new driver only after the old driver is connected. You must have a separate contract with Twilio.

Role required: notify_admin

1. Click Migrate Now.
2. Click Ok on the confirmation dialog. A disconnection of the Twilio driver is initiated and the Account SID and Auth Token are copied to Twilio Direct’s configuration page. Twilio Direct is then autoconnected to that account, and you are redirected to the driver’s configuration page.

Configure Notify with Twilio

Configure Notify to use the Twilio telephony service.

You must have an SID and authentication token for an active Twilio account (https://www.twilio.com/). You must have a separate contract with Twilio.

**Important:** Ensure that each instance on which you configure Notify uses a different Twilio account. Each account specifies a unique account SID, authentication token, telephone numbers, and endpoint. Using the same account across multiple instances may cause your Twilio service configuration to be overwritten.

**Note:** Account and sub-account are Twilio categorizations, and both act the same for a ServiceNow instance.

Role required: notify_admin

1. Navigate to Notify > Administration > Twilio Direct Configuration.
2. On the Twilio Account Properties page, enter your Account SID.
3. Enter your Auth Token.
4. Click Connect.
If the account is not associated with an instance and the connection is successful, a read-only list of E.164 and short code phone numbers associated with this Twilio account appears. This list displays the phone number, supported capabilities such as voice or SMS, the country for each Twilio number, and the Notify number group to which the number belongs.

If the account is already associated with an instance, the system displays an error message. To connect to this account,

- Disconnect the account from the instance.
- Delete the TwiML apps in the Twilio account.

**Note:** If you buy or release numbers on the Twilio account, open the configuration page again to refresh the list of numbers. Numbers removed from the Twilio service remain as Notify Number records, but with the **Active** field set to false. Use only active phone numbers for inbound or outbound communication.

Phone numbers and short codes are provided by Twilio once the account is successfully connected and are stored on the Notify Phone Numbers (notify_number) table. Assign each number to a number group. Number groups allow you to control which workflows run when using the phone numbers in each number group.

**Twilio-Direct callback testing**

Make an outgoing call or send an SMS using Twilio and trigger callbacks to ServiceNow to test whether Twilio can reach the instance. You can also view when the last callback test was run, its status, and the test logs.

Role required: admin, notify_admin

1. Navigate to **Notify > Administration > Twilio Direct Configuration**.
2. Click **Test Callbacks**.
3. Select the SMS option and click **Initiate SMS**.
4. Select the call option and click **Initiate Test Call**.

**Note:** The callbacks can be tested only after a connection is established with Twilio.

**Advanced configuration for SMS**

Use the Twilio copilot features to improve SMS delivery with phone number like using multiple numbers to send high-volume messages and content intelligence to automatically format every message without writing custom code. Reach large lists of users with one API request.

Role required: notify_admin

The Twilio co-pilot features are enabled in your instance once configured. An example of a copilot feature is that you can configure which identity (phone number, shortcode, or alpha sender ID) to use to send a message. You can also spread the messaging traffic over several phone numbers or prioritize an alpha sender ID when sending messages to countries where alpha senders are commonly used. To know more about these features, visit [https://www.twilio.com/copilot](https://www.twilio.com/copilot).

**Important:** All the Twilio numbers must be part of the same messaging service for which you have enabled the **Advance SMS Features** feature.
Reach customers over SMS and push notifications. Use the passthrough sendBulkSMS API to reach large number of users across using a single API request. For more information on these features visit https://www.twilio.com/notify

1. Navigate to Notify > Administration > Twilio Direct Configuration.
2. On the Twilio Account Properties page, enter your Account SID.
3. Enter your Auth Token.
4. Click Connect.
5. On the Advance SMS Features tab, check the Intelligent SMS Handling box.
6. On the Advance SMS Features tab, check the Twilio Notify Bulk SMS box.

Note: This feature uses Twilio Notify feature and might have an associated cost. Contact Twilio Support for more details.

Advanced configuration for voice

Configure Answering Machine Detection (AMD), to determine if a human or a machine has picked up an outbound voice API call and tailor your call flow accordingly.

Role required: notify_admin

1. Navigate to Notify > Administration > Twilio Direct Configuration.
2. On the Twilio Account Properties page, enter your Account SID.
3. Enter your Auth Token.
4. Click Connect.
5. On the Advance Voice Features tab, check the Detect answering machine box.
6. On the Advance Voice Features tab, enter the number of seconds in the Machine detection timeout field to set a timeout value.

Disconnect from a Twilio account

If a Twilio account is already associated with a different system, disconnect the account from the other system before connecting to the current instance.

Role required: notify_admin

1. Navigate to Notify > Administration > Twilio Direct Configuration.
2. On the Twilio Account Properties page, click Disconnect.
3. In the Disconnecting Twilio account pop-up window, click OK.

The account is disconnected from the instance. The system clears the Account SID and Auth Token fields and deactivates the list of associated phone numbers.

Public URLs

On-premise customers should ensure that the URLs are accessible from the Internet for the Notify-Twilio driver to work correctly.

The Notify-Twilio drivers (both new and old) require that specific URLs on the instance be accessible from the Internet by the Twilio server without authentication. If the instance is within a private network, you need to either port forward or set up a reverse proxy.

For the Notify-Twilio driver, the URLs are:

• /NotifyTwilioCallProcessor.do
For the Notify-Twilio Direct driver, the URLs are:

- /api/sn_twilio_direct/twilio_callbacks/process/twiml/{callback_name}
- /api/sn_twilio_direct/twilio_callbacks/process/xml/{callback_name}

**Note:** The glide.notify.endpoint property needs to be set to an Internet visible name because the instance name inside a private network can be different from the Internet domain.

### Components installed with Twilio

Several types of components are installed with the Twilio for integration with Notify.

### Business rules installed with Twilio-Direct driver

Twilio installs the following business rules:

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Connected</td>
<td>(sn_twilio_direct_twilio_config)</td>
<td>Verifies if Twilio is completely configured and displays an info message.</td>
</tr>
<tr>
<td>Disconnected Message</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Calculate test duration</td>
<td>(sn_twilio_direct_callback_test)</td>
<td>Sets the duration for Twilio Callback tests.</td>
</tr>
<tr>
<td>Machine detection timeout range check</td>
<td>(sn_twilio_direct_twilio_config)</td>
<td>Verifies the timeout values for detecting the answering machine if the <strong>Detect answering machine</strong> is enabled. The valid range of the timeout is 3-120 seconds.</td>
</tr>
<tr>
<td>Move credentials</td>
<td>(sn_twilio_direct_twilio_config)</td>
<td>Moves the account credentials to (sn_twilio_direct_basic_auth)</td>
</tr>
<tr>
<td>Populate Credentials</td>
<td>(sn_twilio_direct_twilio_config)</td>
<td>Populates the current SID and Auth token from the (sn_twilio_direct_basic_auth) table to display them.</td>
</tr>
<tr>
<td>Set outbound calculated fields &amp; auth</td>
<td>(sn_twilio_direct_twilio_config)</td>
<td>Sets the account credentials in the basic auth profile</td>
</tr>
<tr>
<td>Set Reset JWT Key</td>
<td>(sn_twilio_direct_basic_auth)</td>
<td>Copies the auth token from (sn_twilio_direct_basic_auth) to signing key password in (jwt_keystore_aliases).</td>
</tr>
</tbody>
</table>
### Business rule | Table | Description
--- | --- | ---
Validate & set inbound calculated fields | (sn_twilio_direct_twilio_config) | Populates the `callback_endpoint` field based on the inbound rest field value. Displays an error message if the endpoint URLs are not in the correct format.

Validate Fast Bulk SMS option | (sn_twilio_direct_twilio_config) | When **Twilio Notify bulk SMS** is enabled, validates the Twilio messaging and Notify service id.

Validate Intelligent SMS option | (sn_twilio_direct_twilio_config) | When **Intelligent SMS handling** is enabled, validates the Twilio messaging service id.

### Tables installed with Twilio

The tables installed with Twilio are described below.

#### Tables installed with Twilio

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(sn_twilio_direct_callback_processor)</td>
<td>Extends the application file. Contains scripts which process callback payloads from Twilio and generate appropriate response XML or TwiML document. <strong>Note:</strong> Use caution when editing, deleting or adding new Callback Processor scripts as they are one of the key core components of the driver.</td>
</tr>
<tr>
<td>(sn_twilio_direct_twilio_config)</td>
<td>Extends the application file. Contains configuration option values for the driver.</td>
</tr>
<tr>
<td>(sn_twilio_direct_basic_auth)</td>
<td>Extends the basic auth credentials. The Account SID and Auth token are stored in this table.</td>
</tr>
<tr>
<td>(sn_twilio_direct_callback_test)</td>
<td>Stores the history of callback test runs.</td>
</tr>
</tbody>
</table>

### Notify Zoom connector

The Notify Zoom Connector expands Notify communication channel by managing and initiating a Zoom meeting directly from any task record such as an incident or a change.

### Compatibility

- New York
- Orlando
Key Features

- Start and end Zoom meeting directly from any task record such as incident, or a change or from the Major incident Workbench.
- Manage a Zoom meeting by adding or removing participants.
- Track and report meeting details, like meeting duration, attendees, and so on for further analysis.

System Requirements

- Install and activate the Notify plugin (com.snc.notify) before you install the application.
- Ensure that the system has Zoom spoke, version 1.0.2, for ServiceNow IntegrationHub plugin (sn_zoom_spoke) installed and the necessary IntegrationHub license to use Zoom for meeting management.

Plugins

- ServiceNow IntegrationHub Installer (com.glide.hub.integrations): Suite of plugins necessary to design integration flows in the Flow Designer application.
- The Zoom spoke, version 1.0.2 (com.sn.zoom.spoke) for ServiceNow IntegrationHub provides actions that allow user to create and manage the conference meetings.

Setup Notify Zoom connector in Zoom

Use the Notify Zoom connector to expand the Notify communication channel by managing and initiating a Zoom meeting directly from any task record such as an incident or a change.

Role required: admin, Zoom admin

1. Ensure that you have Zoom spoke installed on your instance.
2. Make sure you have the required credentials and connections to Zoom on your instance.
3. Configure the Notify Zoom connector with the same Zoom account with which you created the OAuth app for Zoom spoke.

1. On your Zoom OAuth app, navigate to Feature > Add Feature > Event Subscription.
2. Use the toggle button to enable the event subscription feature.
3. In the form that appears, fill in the URL. The URL is used to post information about events in Zoom to your instance. The format of the URL is: https://yourinstancename.com/api/sn_notify_zoom/notify_zoom/ZoomEvent
4. Use the Add Events button to list all the events which Zoom is informing Notify about.
5. In the categories that appear, select Meeting and select all the meeting-related events from the list and click Done.
6. Under Recording, select All Recordings have completed and Recording Transcript files have completed from the list and click Done.
7. Click Save on the Add feature screen.
8. A Verification Token appears on the Add Feature screen. Record the token by clicking Copy

Configure Notify with the verification token from Zoom.
Configure Notify Zoom connector in Notify

Configure Notify to receive the event information from Zoom. An event is usually any action that is related to a meeting.

Role required: admin

1. Navigate to Notify > Zoom > Configuration.
2. Paste the verification token that you recorded on Zoom Event Subscription screen in the Webhook validation token field.
3. Save the record.

Configure and use Zoom as a conference provider from any of the task records.

Note: The person creating a conference is the host of the conference and must have their email set in their ServiceNow profile and use the same email for the Zoom account.

Disable Zoom meeting password

Disable Zoom meeting password so that you can join a Zoom meeting without any meeting password.

Role required: notify_admin or admin

1. Navigate to Notify > Zoom > Configuration.
2. Select Do not set password.
3. Click Update.

Notify voice and SMS capabilities

Notify provides support for SMS and voice channels for communicating internally with team members and externally with customers and contractors.

Notify provides a way for applications to start and manage a conference, send/receive SMS, send/receive calls and present them with IVR like system.

How Notify processes incoming calls

Notify processes incoming calls using workflow activities.

Any Notify activity that manages incoming phone calls creates a record on the Notify Workflow Activity (notify_wf_activity) table. Each notify_wf_activity record is associated with a single call. These records store JSON data detailing the actions to send to the telephony provider.

Notify processes incoming calls in the following way:

1. A person calls a Notify phone number.
2. Notify launches the incoming call workflow associated with that Notify phone number.
3. The workflow reaches a Notify activity and invokes the activity onExecute() function.
4. The activity creates a new notify_wf_activity record detailing any actions to take, with a State value of execute.
5. Notify sends the specified actions to the telephony provider.
6. The notify_wf_activity record State changes to processed.
7. The telephony provider sends a response.
8. Response arguments, such as user input or recording info, are stored as JSON data in the notify_wf_activity response_args field.

9. The notify_wf_activity State changes to complete.

10. The JSON data from the notify_wf_activity record is copied to the Last action field in the Notify call record that triggered the workflow.

11. The workflow invokes the onUpdate() function in executing activities.

12. The activity confirms that the associated notify_wf_activity record has completed, and changes the activity state to finished.

13. The workflow transitions to the next activity.

### Notify conference calls

Notify administrators, major incident managers, or communications managers can manage conference calls.

Conference call records are stored on the Notify Conference Calls (notify_conference_call) table. Conference call participant records are stored on the Notify Conference Call Participants (notify_participant) table.

Conference call and participant records are created automatically when starting and connecting to a conference call. Most fields, such as the Duration of a call, are set automatically using business rules.

**Note:** If a participant attempts to join a conference call using an invalid phone number, the caller is added to the participant list and the phone number is marked with a status of Invalid.

Notify administrators, major incident managers, or communications managers can manage conference call participants.

Several conference call workflows are available by default. These workflows can be used for incoming and outgoing calls and incoming SMS messages. Conference call workflows are:

- Notify: (Re)join Conference Call
- Notify: Join Conference Call Via SMS
- Notify: (Re)join Conference Call with muting

**Note:** Notify: (Re)join Conference Call with muting is available only with demo data.

The number groups Conference Call Group and Notify On Task Group use these conference call workflows by default.

### Start a conference call

Start a conference call from a task or an incident communication plan by inviting one or more users to join a call. The conference will not start until at least two participants join.

Call participants can include:

- Users who have been assigned specific responsibilities
- Ad-hoc user contacts
- Other involved parties who are not recorded as users, such as third-party contacts

1. Navigate to Incident Communications Management > Open.
2. Open the relevant incident communication plan.
3. Click the **Initiate Conference Call** related link.
4. From the dialog box that appears, choose the **Conference Bridge** that you want to dial from.
5. Select the participants for the conference.
Initiate conference call

Conference Bridge
+14046204596

Add Participants
- Email
- User
- Group
- Phone
- Email

Selected
- System Administrator (OpenC
- Lucy Barnes (Incident Manage

Lucy Barnes (Incident Manager)

Users displayed in red do not have a mobile phone number

Include a brief message for participants

160 characters remaining of 160 characters

Cancel  Start Call
The dialog box displays the Recommended and Selected participants for the conference. All users from the User Contacts list in the incident communication plan are in the Recommended section by default. The user who initiates the conference call is added to the selected list of participants.

If a shift exists for the group contacts, the primary and secondary on-call resources are shown in the Recommended list.

Calls are placed to the number in the Mobile phone field on the user record. If that information is blank, the user cannot be contacted through Notify. The mobile phone number has to be an E.164 compliant phone number. If the phone number is a local number, without the + prefix, the number will be retrieved based on the user’s location and, if possible, converted into a valid E.164 number.

6. To select ad-hoc participants:
   - **Option**: Click the reference lookup icon, and select the relevant user.
   - **Description**: Click Add to selected.
   - **Option**: Enter the participant’s phone number
   - **Description**: Click Add to selected.

7. After the participant list is finalized, click Start Call.
   The conference call starts and a Conference call initiated message is displayed at the top of the incident communication plan form. Each user is called and can accept the call to join the conference.

8. Click the Conference call initiated message to see details of that conference call. When the final participant leaves the conference, the conference call closes.

   **Note:** VoIP phone systems, which do not use touch tone phones, may encounter issues with recognizing key presses. To avoid problems, ensure that conference call users use touch tone phones, or configure your VoIP system settings to recognize key presses, as described in your VoIP system documentation.

Add participants to a conference call

Add a participant to a conference call using Notify.

Role required: notify_admin, major_incident_manager, or communication_manager

You can add the following participants:

- Users who have been assigned specific responsibilities
- Required ad-hoc user contacts
- Other involved parties who are not recorded as users, such as third-party contacts

1. Navigate to Notify > Conference Calls.
2. Open the conference call that you want to add a participant to.
3. Click the Add Participant related link.
4. In the dialog box that appears, select the participants you want to add to the conference. You can add a single participant, a group of participants, or a phone number.
5. You can send an optional message for the participant who you want to add in the **include a brief message for participants** field.
6. Click **Add Participant**.
The selected user, group, or phone number is added to the selected conference call.

**Mute or unmute all participants**
As a communications manager or a conference call host, mute/unmute all the conference participants from the workbench.

Role required: notify_admin, major_incident_manager, or communications_manager

Before starting this procedure, ensure there is an active conference call with one or more participants.

1. Navigate to **Major Incident Management** in the application filters.
2. Select the incident that you are trying to resolve.
3. On the incident, click **View Workbench**
4. In the **Conferences** tab, select a conference

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mute All</td>
<td>Click this button to mute all the participants in the conference</td>
</tr>
<tr>
<td>Unmute All</td>
<td>Click this button to unmute all the participants in the conference</td>
</tr>
</tbody>
</table>

**Mute All**

![Mute All](image)

**Unmute All**

![Unmute All](image)
Mute or kick a conference call participant

As a communications manager, you can mute or kick conference call participants.

Role required: notify_admin, major_incident_manager, or communication_manager

Before starting this procedure, ensure there is an active conference call with one or more participants.

To mute or kick a participant:

1. Navigate to Notify > Conference Calls.
2. Select a conference call.
3. In the Notify Conference Call Participants related list, select a participant.
4. Click Mute or Kick.

Note: You can unmute a muted participant. A kicked participant may rejoin the conference call by calling in again.

Send a message to conference call participants

Send a brief message as a text or voice message to the participants of a conference call to set a context to the call.

Role required: major incident manager

1. Navigate to Major Incident Management > View Workbench.
2. In the Conference tab, select the type of the call and click Start Call.
3. In the **Include a brief message for participants** field, type the message that you want to send to the conference call participants and click **Start Call**.

**Note:** Upon clicking **Start Call** the messages are stored as a description on the conference call record and then sent as a part of a workflow.

**Viewing conference call information**

Conference calls are listed as system activities in the **Activity** section of the Incident Communication Plan form and also are listed in the **Conference Calls** related list.
List of Notify calls

If you are a Notify administrator, you can view a list of calls and the status of a call made to or from Notify. The call records help in reporting and analytics.

To view a list of calls, navigate to Notify > Calls.

Call records are generated automatically when a user calls a Notify number or when a user makes an outbound call through Notify. You cannot create call records manually.

Note: Although you can delete a call record, doing so may result in cascade deletion of related records.

For Notify calls where the source is specified, such as a task number, the source is added to the Notify Calls (notify_call) table in the Source column. For Notify conference calls where the source is specified, the source is added to the records for each of the calls in the conference.

<table>
<thead>
<tr>
<th>Call status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>initiated</td>
<td>The number has just been dialed</td>
</tr>
<tr>
<td>ringing</td>
<td>The call is currently ringing.</td>
</tr>
<tr>
<td>in_progress</td>
<td>The call was answered and is currently in progress.</td>
</tr>
<tr>
<td>no_answer</td>
<td>The call was not answered.</td>
</tr>
<tr>
<td>completed</td>
<td>The call was answered and has ended normally.</td>
</tr>
<tr>
<td>busy</td>
<td>The caller received a busy signal.</td>
</tr>
<tr>
<td>failed</td>
<td>The call could not be completed as dialed, most likely because the phone number was nonexistent.</td>
</tr>
<tr>
<td>invalid</td>
<td>The call could not be connected since input is invalid.</td>
</tr>
<tr>
<td>unknown</td>
<td>The driver does not support the status</td>
</tr>
</tbody>
</table>

Use SMS with Notify

Send and receive SMS messages using Notify.

Notify stores inbound and outbound SMS messages in the Notify Messages (notify_message) table. Notify supports sending concatenated SMS messages. Messages that exceed 160 characters, or 70 unicode characters, are split into multiple messages. This may affect your total telephony cost because each message can incur a cost. Some mobile carriers, such as Sprint, do not support concatenated SMS messages.

To send SMS messages to an individual recipient, use the Notify API sendSMS method. This method takes one recipient as an input parameter. You can also use the send SMS workflow activity.

To send SMS messages to one or more recipients, use the Notify API sendBulkSMS method. This method takes a list as an input parameter and uses one API call to send multiple messages. Include the list of phone numbers in an array in the API call. This method improves performance by streamlining platform checks and Notify number validation.
The Notify-Twilio integration provides programmable SMS outbound message status tracking with Status Callbacks. These callbacks can be helpful to see if a message has been delivered, failed, or ran into some other delivery issues.

**SMS Statuses**

Every Twilio SMS or MMS message request has a status value which describes the current state of the message. Use this information for troubleshooting SMS related incidents/issues. Here are few descriptions of possible statuses of SMS sent from Notify through Twilio REST API.

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queued</td>
<td>The message has been queued by the provider to be sent to the carrier network.</td>
</tr>
<tr>
<td>accepted</td>
<td>The message is being processed by the provider before sending it to the carrier network.</td>
</tr>
<tr>
<td>sending</td>
<td>The message is being forwarded to the carrier network.</td>
</tr>
<tr>
<td>sent</td>
<td>The message has been successfully forwarded to the carrier network.</td>
</tr>
<tr>
<td>receiving</td>
<td>The provider has received an incoming message from the carrier network and is processing it.</td>
</tr>
<tr>
<td>received</td>
<td>ServiceNow has received the incoming message from the provider.</td>
</tr>
<tr>
<td>delivered</td>
<td>The message has been delivered to the target device.</td>
</tr>
<tr>
<td>undelivered</td>
<td>The message could not be delivered to the target device.</td>
</tr>
<tr>
<td>failed</td>
<td>The message failed to be forwarded to the carrier network.</td>
</tr>
<tr>
<td>unknown</td>
<td>The driver does not support the status</td>
</tr>
</tbody>
</table>

*Note: A provider may not be able to report this status if the upstream carrier does not report this.*

**Send an SMS with Zoom meeting invite**

Send an SMS with Zoom meeting invite to ensure that the meeting participants or any newly added participant is updated with the meeting details when the meeting host starts the conference or adds a participant to the conference.
Role required: notify_admin or admin

Note: You need a telephony provider like Twilio or Nexmo.

1. Navigate to Notify > Zoom > Configuration.
2. In the Run Workflow on conference change field, enter Notify Zoom: Send SMS on Conference Change.
   
   The Notify Zoom: Send SMS on Conference Change workflow is available with the demo data of the Notify Zoom Connector plugin (sn_notify_zoom).
3. Click Update.

Outbound communication requirements

Outbound communications initiated through Notify, such as phone calls and SMS messages, must satisfy recipient number requirements.

Recipient number requirements

These requirements apply to any number that receives a Notify phone call or message.
- The number must be E.164 compliant.
- The number must be different than the phone number used to initiate the call or message.

These requirements apply to all outbound communication initiated through Notify, such as by using Notify workflow activities or the Notify JavaScript API.

Invalid numbers prevent Notify workflows from running and cause an error to be logged. Set the glide.notify.debug property to true to create detailed error logs.

Using Notify with tasks

Notify allows you to initiate conference calls and send SMS alerts from task records.

This functionality is available for all tables that extend the Task table, such as incident, problem, or change request. All calls and messages made from tasks are initiated using a single Notify phone number (E.164 or short code). You can configure which phone number is used by setting the property glide.notify.task.phone_number.

Start a conference call from a task

Use Notify to start conference calls from a task record.

Role required: itil

Notify must be set up before you can use Notify on task. Ensure there are Notify phone numbers (E.164 or short code) in number groups with phone call workflows. Also ensure the property glide.notify.task.phone_number is set to one of these Notify phone numbers.

1. Navigate to any task record, such as an incident or change request.
2. Click the Start conference call related link.
3. Select one or more Recipients to participate in the conference call.
4. Click Start.
Any conference call records created from a task are associated with that task. You can view associated conference calls from the task record in the Conference calls related list. You may need to configure the form to add the related list.

**Manage conference calls on task**
Add and manage multiple participants on the conference including self-joining in to the conference call and end the conference call when the discussion is over.

- Role required: itil, itil_admin, or admin
- A conference call is already initiated.

The Manage Conference Calls UI action is available for any table that extends the Task (task) table. If at least one conference call is active on a task record, the link appears on the related links section of the form. Out of the tables that extend the task table, the Manage Conference Calls UI action is intentionally hidden for Incident Communication Plan (incident_alert) table and Communication Task (comm_task) table. For these two tables, the functionality is already available as Join conference call and End conference call UI actions.

1. Navigate to any task record such as Incident, Problem, or Change Request.
2. Open the record on which the conference all is active.
3. In the related links, click Manage Conference Calls.
4. In the Manage Conferences window, you can perform the following activities:

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Join Conference Call</td>
<td>If the logged in user is not already a part of the conference call, the user can join the conference.</td>
</tr>
<tr>
<td>Add Participants</td>
<td>Add participants to the conference who can contribute to the discussion.</td>
</tr>
<tr>
<td>End Conference Call</td>
<td>End the conference when the discussion is over.</td>
</tr>
</tbody>
</table>

5. Optional: In the Manage Conferences window, click the conference call number to know the details of the conference.

**Send an SMS alert from a task**
Use Notify to send information related to a call through SMS alerts from a task record.

**Role required:** itil

Ensure that there are Notify phone numbers (E.164 or short code) in number groups with SMS workflows. Also ensure that the property glide.notify.task.phone_number is set to one of the Notify phone numbers with outgoing SMS capability.

1. Navigate to any task record such as an incident or a change request.
2. Click the Send SMS related link.
3. In the From choice list, select the phone number from which you want to send the SMS message.
4. Select and add the participants to whom you want to send the SMS message.
   - All users from the User Contacts list in the incident communication plan are in the Recommended section by default.
The dialog box displays the Recommended and Selected participants you selected to send an SMS message.

5. To select ad-hoc participants, choose one of the following actions:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click the reference lookup icon and select the relevant user</td>
<td>Click Add to selected.</td>
</tr>
<tr>
<td>Enter the participant’s phone number</td>
<td>Click Add to selected.</td>
</tr>
</tbody>
</table>

6. After the participant list is finalized, type the message you want to send to the participants in the Message field and click Send SMS.

Any SMS records created from a task are associated with that task. You can view associated SMS messages from the task record in the SMS Messages related list. You might need to configure the form to add this related list.

Using Notify with Incident Communications Management

Use Notify with incident communication plan to send SMS messages or start conference calls. Certain configuration steps are required to use Notify with an incident communication plan.

- Both Notify and Incident Communications Management must be active.
- Notify must be configured and able to initiate and receive phone calls and SMS messages.
- The property com.snc.iam.notify_number must be set to an active Notify number with outgoing voice and SMS capability.
- This Notify number must belong to a number group configured with inbound and outbound conference call workflows.

Note: The Conference Call Group number group is configured with conference call workflows by default.

Initiate a conference call from incident communication plan

Use Notify to initiate a conference call from an incident communication plan by inviting one or more users.

Role required: admin

1. Navigate to Incident Communications Management > All.
2. Open the relevant incident communication plan.
3. Click the Conference tab.
4. For the relevant incident communications task, under Actions, click Initiate Conference Call.
5. Select the conference bridge number and the participants for the conference call and click Start Call.
   Work notes get updated on the incident communication task.

Join and end a conference call from incident communications management

After a conference call is initiated, join the call to participate in the discussion or end the call when the conference is no longer required.
Role required: ia_admin or admin

1. Navigate to Incident Communications Management > All.
2. Open the relevant incident communication plan.
3. Click the Conference tab.
4. For the relevant incident communications task, under Actions, perform one of the following actions:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Join Conference Call</td>
<td>If you are not already logged into the conference call, you can join the conference.</td>
</tr>
<tr>
<td>End Conference Call</td>
<td>End the conference when the discussion is over.</td>
</tr>
</tbody>
</table>

Note: The work notes get updated with the details of the conference call such as duration and participants.

Send communication updates for an incident communications plan

Update users on the latest communication on an incident through selected communication channels.

- Role required: admin
- Activate the Notify plugin (com.snc.notify) if you want to send communication through SMS.
- Set at least one communication channel for a communication task as SMS or email.

1. Navigate to Incident Communications Management > All.
2. Open an incident communication plan record.
3. From the Incident Communication Tasks related list, open the incident communication task for which you want to send updates.
4. In the related links, click Start Updates.
5. Fill the required information and click Send.
   For sending an SMS communication, in the From choice list, select a number from which you want to send the communication.
6. Click Send.

Using Notify with On-Call Scheduling

When using both Notify and On-Call Scheduling, you can send On-call escalation notifications as SMS messages, in addition to emails.

Certain configuration steps are required to use Notify with On-Call Scheduling.

- You must add at least one Notify phone number to the On-Call Group number group. This group is configured by default to handle inbound SMS responses (via On-Call: Check Assignment Response) that accepts or rejects an on-call assignment and to handle outbound voice calls (via On-Call: Assign by Acknowledgement Voice) to accept or reject assignments.
- You must configure workflows, such as the On-Call: Assign by Acknowledgement to drive escalations via SMS and Voice.
Set up Notify with On-Call Scheduling

You can configure on-call scheduling to use Notify functionality to send SMS alerts and assign users to tasks based on the SMS responses.

Ensure that the Notify and On-Call Scheduling plugins on your instance are activated.

Role required: admin

Set up Notify with On-Call Scheduling for the first time or migrate from On-Call Scheduling with NotifyNow.

1. Navigate to Notify > Numbers.
2. Select the phone number you want to use to send and receive on-call scheduling messages.
3. In the Notify group field, select the On-Call Group.
   The On-Call Group is configured with the on-call workflows: On-Call: Check Assignment Response and On-Call: Assign by Acknowledgement Voice by default.
4. Navigate to Workflow > Workflow Editor.
5. Select the On-Call: Assign by Acknowledgement workflow.
   If migrating from NotifyNow, and you have previously customized this workflow, you must import the new version of the workflow manually. See KB0551603 for more information.
6. Click the workflow menu icon in the title bar and select Copy to copy the On-Call: Assign by Acknowledgement per rota workflow. Save the copied workflow under a different name than what it is named by default.
   
   Note: You must avoid modifying default workflows and instead choose to copy and then modify the required workflow.
7. Select a Send SMS activity.
8. In the To (script) field, modify the getRecipientsAndNumberToSendFrom() to use the correct from number's sys ID.
9. Close the Workflow Editor
10. Navigate to On-Call Scheduling > Trigger Rules.
11. Select a trigger rule that launches an assignment workflow
12. In the Trigger action field, select Workflow.
13. In the Trigger workflow field, select the On-call: Assign by Acknowledgement workflow.
14. Click Update.
15. Repeat the previous 3 steps for each assignment trigger rule.
   Each time the conditions for one of these trigger rules is met, the On-call: Assign by Acknowledgement workflow runs.

Controlling the on-call communication channel with Notify

Configure On-Call Scheduling with Notify to always use a user's preferred communication channel.

If Force communication channel is specified in the Escalation settings for rosters, the preferred user device is used, either SMS, Voice or email.

For example, if the preferred device is SMS, and the on-call member does not have an SMS device defined, the user is not contacted even if the user has an email address. When forcing a communication channel on an escalation level does not succeed, no further communication attempts are made. The fact that the user could not be reached is logged.
On-call: Assign by Acknowledgement workflow

The On-Call: Assign by Acknowledgement workflow is provided with Notify.

The workflow uses data from the escalation settings, including overlapping shifts and custom escalation settings, of shifts and rosters. Depending on these escalation settings, the workflow iterates through the defined escalation chain and sends notifications by SMS, email, or voice to users asking them for incident assignment. The workflow respects time-off as specified in the rosters. People who have time-off are not included in the escalation chain and no notifications are sent to them.

When you install both On-Call Scheduling and Notify, the message_number column is added to the Notify Messages (notify_messages) table to track responses to on-call assignment requests. This column indicates if the contacted user accepted or rejected the assignment. Before you can send notifications, you must define trigger rules. Trigger rules determine the conditions that must be met before a notification is sent and what action must be taken.

Call a user from the WebRTC UI

Make outbound calls and receive a voice call in the browser through the WebRTC interface from On-Call Schedules landing page, Roster and Escalation Details modal and on-call calendar.

Role required: itil

1. Navigate to On Call scheduling > On Call calendars.
2. In the calendar that opens, click the name of the user you want to call.
3. Choose Call to call the user.
Key differences between on-call scheduling with NotifyNow and with Notify

There are key differences between on-call scheduling with NotifyNow and on-call scheduling with Notify.

Tracking responses to questions

The On call:Assign by Acknowledgement workflow no longer uses the Notify Question tables to track assignment responses. When you install On-Call Scheduling with Notify, the message_number column is added to the Notify Messages (notify_messages) table to track responses to on-call assignment requests. This column indicates if the contacted user accepted or rejected the assignment.

Notify administration

As a Notify administrator, you can create number and number groups, create and modify workflows, update the tables and so on.
Numbers and number groups

Number groups allow you to group Notify phone numbers and share workflows across grouped numbers.

Each phone number within Notify has an associated number group. Numbers within a group use the same workflows for handling incoming and outgoing calls and SMS messages.

Numbers associated with a group appear on the Notify Phone Numbers related list on the Notify Phone Number Group form.

If the number group workflows have incorrect conditions, a warning appears.

Create a number group

Group Notify phone numbers and share workflows across grouped numbers.

Role required: notify_admin

Each phone number within Notify has an associated number group. Numbers within a group use the same workflows for handling incoming and outgoing calls and SMS messages.

Numbers associated with a group appear on the Notify Phone Numbers related list on the Notify Phone Number Group form.

1. Navigate to Notify > Number Groups.
2. Click New.

3. Enter a Name, and select Notify: (Re)join Conference Call for the Incoming call workflow field.
### Field | Description
--- | ---
Name | Unique name for the number group.
Incoming call workflow | Workflow to run when there is an incoming phone call for this group.
Incoming SMS workflow | Workflow to run when there is an incoming SMS message for this group.
Outgoing call workflow | Workflow to run when there is an outgoing phone call for this group.
Outgoing SMS workflow | Workflow to run when there is an outgoing SMS message for this group.

Incoming call workflows must run on the Notify Call (notify_call) table. Incoming and outgoing SMS workflows must run on the Notify Message (notify_message) or Global (global) tables.

Short codes can only be associated with SMS workflow groups. You cannot add an incoming or outgoing call to a short code group.

4. Click **Submit**.

**Associate a number to a number group**

After creating a number group, associate numbers with that group to use the selected workflows.

*Note:* Each phone number can only be associated with one number group.

**Associate a number to a number group**

Associate a Notify number to a number group to use inbound and outbound workflows.
Role required: notify_admin

1. Navigate to Notify > Numbers.

2. Click the listed phone number and assign it to a Number Group, as appropriate.

   **Note:** Each phone number can only be associated with one number group.

<table>

3. Click Update.

**Configure a provider in Notify**

Configure a provider or a phone number to provide choices for sending an SMS message or initiating a conference call.

Role required: notify_admin

1. Navigate to Notify > Provider Selector.
2. Click New.
3. Fill in the fields.

<table>
<thead>
<tr>
<th>Provider selector fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Order</td>
</tr>
<tr>

<tr>
<td>Active</td>
</tr>
<tr>
<td>Default</td>
</tr>
<tr>
<td>Manual selection</td>
</tr>
</tbody>
</table>

4. Click Submit.
5. In the Provider Selector Choices related link, click New.
6. Search for the group that contains the numbers for initiating a call in a task record and click Submit.

**Configure SMS opt-out preferences**

Allow recipients to opt out of receiving text messages.

Role required: admin, notify_admin

According to regulations in the CTIA Short Code Monitoring Handbook, recipients must be allowed to opt out of receiving text messages. The opt-out functionality is applicable only to Notify. When the user sends an SMS message with an opt-out keyword to any Notify number, the user is opted out of receiving messages from only the Notify number to which the message has been sent, not from all Notify numbers on that instance.

**Important:** The Advanced opt-out feature is automatically enabled for short code and long code numbers associated with a Messaging Service. For more information, refer to *Getting Started with Advanced Opt-Out for Messaging Services*. As this feature is a duplicate of the Twilio’s new Advanced Opt-out feature, you should not activate the...
feature for numbers that are part of Messaging Service. For long code numbers that are not part of a Messaging service, Twilio handles the opt-out for default stop keywords listed at [Twilio support for opt-out keywords](#).

**Note:** This feature is disabled by default and holds significance for short-code and long codes that are not part of Messaging Service. To enable this feature, the Notify admin needs to create a configuration for short and long codes using the given procedure.

1. Navigate to **Notify > Administration > SMS Preference Configuration**.
2. Click **New** in the SMS Preference Configuration window.
3. Fill in the form fields.

<table>
<thead>
<tr>
<th>Field</th>

</table>

4. Click **Submit**.

### Notify workflow activities

Notify workflow activities manage calls and SMS messages in Notify.

All Notify workflows that manage a phone call must run on the notify_call table. Call-related Notify activities can be added only to workflows where the **Table** field value is **Notify Call** (notify_call).

You can identify if an outbound call was answered by a human or by an answering machine from within a Notify workflow by evaluating the **current.is_human** variable, such as with an **If** workflow activity. This variable is set by the telephony provider when an outbound call is answered. This variable is always true for inbound calls.

**Note:** Do not add a **Timer** activity between multiple Notify activities that interact with active phone calls.

**Important:** When creating a Notify workflow, set the workflow **If condition matches** field to **-- None --**. Notify controls which workflow to run based on the configured number groups.

### Join conference call workflow activity

The **Join Conference Call** activity connects an incoming or outgoing call to a Notify conference call.

Notify includes the workflows **Notify: (Re)join Conference Call** and **Notify: Join Conference Call Via SMS** to demonstrate how to use the **join conference call** activity to connect inbound and outbound calls, and inbound SMS messages to a conference call.

### Input variables

Input variables determine the initial behavior of the activity.

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Select this check box to record the conference call.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to display advanced configuration options.</td>
</tr>
<tr>
<td>Script</td>
<td>Specify advanced configuration options using JavaScript, such as if the new participant should be muted upon joining the conference call. You can access values from the workflow scratchpad.</td>
</tr>
</tbody>
</table>
Conditions

The conditions determine which transition comes after this activity. The `join conference call` activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the `conference_call` scratchpad variable is not set.

Scratchpad entries

The activity uses the workflow scratchpad to read persistent values.

Values read from scratchpad

<table>
<thead>
<tr>
<th>Scratchpad variable</th>
<th>Description</th>
</tr>
</thead>
</table>
| workflow.scratchpad.conference_call | A GlideRecord for a single conference call record. A call processed by this activity is added to this conference call. If this value is not specified, the `join conference call` activity will log an error.

When initiating an outgoing call workflow using the Notify API `call( String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall)` method, this scratchpad value is set automatically to the conference call GlideRecord. For incoming call workflows, or workflows initiated using a different mechanism, you must explicitly set this scratchpad value.

Enable the `hangupOnStar` attribute

System administrators can enable the `hangupOnStar` attribute and use it in the `Join Conference Call` workflow activity. When `hangupOnStar` is enabled (set to true), participants in a conference call can press the * button to disconnect from the call. Control is returned to the workflow, which can be used to trigger customer-defined actions.

To enable the `hangupOnStar` attribute:

1. Navigate to Workflow > Administration > Workflow Versions.
2. Open the Notify: (Re)join Conference Call workflow.
3. Click the Show Workflow related link.
4. To modify the workflow, click the Workflow Actions icon and click Checkout.
5. Open the Join Conference Call workflow activity.
6. Enable the Advanced check box to display the Script field.
7. Set the `hangupOnStar` attribute to true. The default setting is false.
8. Click Update.
9. Click the Workflow Actions icon and click Publish to save the changes.
Call workflow activity

The **Call** activity makes outbound phone calls using a Notify workflow. This workflow activity can be added to any table.

### Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify Number</td>
<td>The Notify phone number to make the call from. When you initiate a call, the outgoing call workflow for the number group associated with this number runs.</td>
</tr>
<tr>
<td>Phone number to call</td>
<td>The E.164-compliant phone number to call.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine number to call, and the Notify number to call from instead of using the Phone number to call and Notify Number variables.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which number to call. This script should return a string listing the Notify number sys_id, as well as the phone number to call, such as <code>{notify_number: 'sys_id', phone_number: '+316...'}</code></td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity. The **call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the call could not be set up due to invalid data returned by the advanced script.

Send SMS workflow activity

The **send SMS** workflow activity to send short text messages using Notify to users’ phones. This workflow activity can be added to any table.

### Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>Select the Notify phone number to use to send the SMS message.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use JavaScript to determine which numbers to send the message to, and the Notify number to use to send the message.</td>
</tr>
<tr>
<td>To</td>
<td>Select any number of users to send the message to. The user record must have a E.164-compliant phone number or notification device configured for SMS messages.</td>
</tr>
<tr>
<td>To (groups)</td>
<td>Select any number of groups to send the message to. All members of that group with an E.164-compliant phone number or SMS notification device receive the message.</td>
</tr>
<tr>
<td>Message</td>
<td>Enter the message to send. You can add field values from the current record by using the Select variables box. You can also add values from the workflow scratchpad. If a field and a scratchpad variable have the same name, the field value is used. Because you can use variables in this message, it is not possible to determine the length of the message at design time. If the activity sends a message that is longer than supported by the telephony provider, the message is truncated and the instance logs a warning.</td>
</tr>
<tr>
<td>To (script)</td>
<td>Enter a script to determine which numbers to send the message to, and the Notify number to use to send the message. The script should return a JavaScript object with the format `{notify_number: &quot;...sys_id...&quot;, users: [...], groups: [...], numbers: [...]}. Specify the users or groups to send the message to as an array of sys_id values. Specify other numbers as an array of E.164-compliant phone numbers. This field appears only if Advanced is selected.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. This activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the Notify number used to make the call is not configured correctly or unable to send SMS messages, or if an error occurs while sending the SMS.

**Forward call workflow activity**

The Forward Call activity forwards a Notify call to an E.164-compliant phone number.
If the person receiving a forwarded call hangs up, the **forward call** activity completes and transitions to the next activity. Any further Notify activities in the workflow run for the caller only.

### Input variables

Input variables determine the initial behavior of the activity.

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phone number to call</td>
<td>Enter the phone number to forward the call to.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be answered before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the conversation.</td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity. The **forward call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the phone number to call is invalid.

### Input workflow activity

The **Input** activity creates a phone menu by presenting a list of options on a Notify call.

### Input Variables

Input variables determine the initial behavior of the activity.

**Input Variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of digits</td>
<td>Specify the maximum number of digits the caller can enter. A caller can enter fewer digits than the maximum and press the <strong>Finish key</strong> to complete the entry.</td>
</tr>
<tr>
<td>Finish key</td>
<td>Specify the key a caller can press on their phone when finished selecting a menu option.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Specify the amount of time to wait before closing the menu automatically when the caller does not select a menu option.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to build the phone menu, instead of using the activity conditions.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Script</td>
<td>Define the script to build the phone menu. The script must specify an <code>answer</code> variable as a JavaScript object with the following format:</td>
</tr>
</tbody>
</table>

```javascript
answer = {
    "1": {
        "play": "https://some_url.com/options/one.mp3",
        "myCustomData": "some data here"
    },
    "2": {
        "play": "https://some_url.com/options/two.mp3",
        "myCustomData": "some other data here"
    },
    "3": {
        "speak": "type 4 to speak to a representative",
        "language": "en-US",
        "myCustomData": "some more data here"
    }
};
```

The script may specify either a text-to-speech string and language code or the URL of a prerecorded message for each entry. You can also add optional attributes to store related information, such as `myCustomData` in the example above.

**Note:** The script object continues to support the `say` attribute for backward compatibility.

### Conditions

The conditions determine the transition that comes after this activity.

The **input** activity does not specify any conditions by default. You must define conditions to build the phone menu. Each condition is one option on the phone menu. Notify reads the text from each condition **Name** to the caller, up to 100 characters per condition.

You can specify a language for each condition by prefixing the message with the language code, in the format `xx-XX:<Message>`. For example, add `fr-CA:` for Canadian French. Available languages are stored on the Notify Language `[notify_language]` table.

The condition that the activity transitions through depends on the digits entered by the caller. Set the condition **Condition** value to `parseInt(workflow.scratchpad.digits) == <expected digits>`. For
example, to transition through a condition when the caller presses the number 3, set the Condition to `parseInt(workflow.scratchpad.digits) == 3`.

You can add an error condition to this activity. The activity transitions through the error condition if the advanced script returns an invalid value, or if the text to say for a condition is empty.

**Scratchpad Entries**

The activity uses the workflow scratchpad to write persistent values.

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.digits</td>
<td>The digits entered by the caller, as a string.</td>
</tr>
<tr>
<td>workflow.scratchpad.menu&lt;activity name&gt;</td>
<td>The entire answer variable, if using the advanced script option. You can access this menu from other activities after this activity successfully executes. For example, if the activity name is choices, you can access values from the menu using:</td>
</tr>
<tr>
<td></td>
<td>var previousActivity = &quot;choices&quot;;</td>
</tr>
<tr>
<td></td>
<td>var choicesMenu = workflow.scratchpad.menu[previousActivity];</td>
</tr>
<tr>
<td></td>
<td>var menuItem = choicesMenu[workflow.scratchpad.digits];</td>
</tr>
<tr>
<td></td>
<td>// Selects the menu item based on the caller's input.</td>
</tr>
<tr>
<td></td>
<td>var selectedValue = menuItem.myCustomData; // get the custom data for the selected menu item.</td>
</tr>
</tbody>
</table>

**Hangup workflow activity**

The **Hangup** activity disconnects an active Notify phone call.

You can use the **hangup** activity to disconnect only calls that have been answered. Use the **reject** activity to disconnect calls that have not been answered.

**Play workflow activity**

The **Play** activity plays a sound file on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.
Input Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the URL of a sound file to play. If the URL is inaccessible, or if the audio file mime type is not supported by the telephony provider, the play activity is skipped.</td>
</tr>
<tr>
<td>Loop</td>
<td>Enter the number of times the sound file should play.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity. The play activity does not specify any conditions by default.

You can create an error condition to handle errors with the sound file. The activity transitions through the error condition if the specified sound file is not available, or has an unsupported mime type. Supported mime types are listed on the Notify Audio MIME Types (notify_mime_type) table.

Record workflow activity

The Record workflow activity records audio from a user on a Notify call.

**Note:** The Record workflow activity records Notify call but not the Notify conference call. To record the Notify conference call, you can set the Record activity variable on the Join Conference Call workflow activity.

Input Variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max duration (in seconds)</td>
<td>Enter the maximum duration, in seconds, allowed for a recording.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait before ending a recording automatically when the caller is silent.</td>
</tr>
<tr>
<td>Finish Key</td>
<td>Specify the key a caller can press on their phone to end the recording.</td>
</tr>
</tbody>
</table>

Scratchpad Entries

The activity uses the workflow scratchpad to store persistent values.

The record activity adds the recording variable to the workflow scratchpad. This variable stores metadata about the recording, such as URL, ID, and duration. You can access the following values from this variable.
Values written to scratchpad

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recording.recordingDuration</td>
<td>The duration of the recording, in seconds.</td>
</tr>
<tr>
<td>recording.from_number</td>
<td>The caller's phone number, including country code.</td>
</tr>
<tr>
<td>recording.notify_number</td>
<td>The Notify phone number used to respond to the call, including country code.</td>
</tr>
<tr>
<td>recording.recordingID</td>
<td>The ID used by the telephony provider to identify the recording.</td>
</tr>
<tr>
<td>recording.recordingURL</td>
<td>The URL from the telephony provider to access the recording.</td>
</tr>
</tbody>
</table>

Reject workflow

The **Reject** workflow activity rejects an incoming Notify call.

You can use the **reject** activity to disconnect only calls that have not yet been answered. Use the **hang up** activity to disconnect calls that have been answered.

Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reason</td>
<td>Select a reason for rejecting the call, such as busy.</td>
</tr>
</tbody>
</table>

Say workflow activity

The **say** workflow activity allows you to play a message, using text to speech, on a Notify call.

Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text to say</td>
<td>Specify the text to read.</td>
</tr>
<tr>
<td>Language</td>
<td>Select the language and locale to use when reading text.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to define the language and message, instead of using the Text to say and Language values.</td>
</tr>
</tbody>
</table>
### Forward to notify client workflow activity

The **forward to notify client** workflow activity connects a phone call to a Notify WebRTC client.

### Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>User</strong></td>
<td>Select the user to connect the call to.</td>
</tr>
<tr>
<td><strong>Advanced</strong></td>
<td>Select this check box to use a script to determine which client to connect to, instead of using the <strong>User</strong> variable.</td>
</tr>
<tr>
<td><strong>Script</strong></td>
<td>Define a script that controls which client to connect to. This script should return a GlideRecord for a single User (sys_user) record.</td>
</tr>
<tr>
<td><strong>Timeout (in seconds)</strong></td>
<td>Enter the amount of time to wait for the call to be connected before hanging up.</td>
</tr>
<tr>
<td><strong>Record</strong></td>
<td>Select this check box to record the call.</td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity. The **Forward to Notify Client** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if there is an issue with the Notify client.

### Queue workflow activity

The **Queue** activity places an active Notify call in a queue.

Add the **Queue** activity to a workflow on the Notify Call (notify_call) table to put the current call on hold. This activity does not specify any input variables.

The queue that the call is added to is given a random ID.

### Notify activity event handlers

Notify workflow activities provide JavaScript functions that are invoked automatically when your telephony provider broadcasts certain events.
When the telephony provider broadcasts an event related to a Notify call, such as the caller hanging up, the event is processed by the workflow associated with that Notify call. All currently-executing Notify activities in that workflow invoke a JavaScript function associated with that event.

Not all activities that support an event provide a default event handler implementation. You can provide an implementation for those event handlers when creating custom Notify activities.

Creating Notify activities

Default Notify workflow generally performs a single action, such as initiating a phone call. You can create custom Notify workflow activities to implement more complex functionality.

Use event handler functions in each Notify activity definition to design your own activity behavior. For example, you can set the activity result if the caller hangs up by using the `onCompleted` function.

```javascript
onCompleted: function() {
  activity.result = 'call_ended';
},
```

When creating a new Notify workflow activity, follow these design principles.

- Within `onExecute` event handler function, create a new NotifyAction object. Use this object to create a simple or complex action, then serialize the object to the `notify_wf_activity` table.
- Within the `onUpdate` event handler function, deserialize the NotifyAction object from the `notify_wf_activity` table and use this object to perform any other operations.
- Use the other event handler functions and the Notify as needed to implement the desired activity behavior.

Notify languages

Notify supports multiple languages when using text-to-speech.

For example, when using the `input` or `say` workflow activities, you can specify which language to use when reading the text.

The list of available languages is stored on the Notify Languages (`notify_language`) table. By default, languages supported by all Notify telephony providers are available. You can add additional languages if they are supported by your specific telephony provider.

Available Notify activity event handlers

When creating Notify workflow activities, you can use event-handler functions to respond to events from a telephony provider.

Not all activities or telephony providers support all events. For example, the `Reject` activity ends the call before the caller connects so the `onNoAnswer` function is never invoked from this activity.

**Note:** When configuring an activity to respond to an event, ensure that your telephony provider supports that event.

The following table describes available event handlers and lists the Notify workflow activities that can invoke each handler.

<table>
<thead>
<tr>
<th>Handler</th>
<th>Description</th>
<th>Activities</th>
</tr>
</thead>

</table>
**Notify call sequence**

**Properties installed with Notify**

Notify adds the following properties.

**Properties for Notify**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sn_twilio_driver.max_conference_participants</code></td>
<td>Twilio maximum limit for number of participants in the conference call.</td>
</tr>
<tr>
<td><code>com.snc.iam.notify_number</code></td>
<td>The Notify number to use for conference calls.</td>
</tr>
</tbody>
</table>

**Note:** This number must have a group configured with conference call workflows.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.notify.task.phone_number</td>
<td>Notify phone number used for sending SMS-s and starting conference calls from any record that belongs to the task table (or a table that extends the task table). The number must be entered in E.164-compliant format.</td>
</tr>
<tr>
<td>glide.notify.sms.max_concatenation</td>
<td>Notify supports the concept of SMS concatenation. When the SMS body exceeds the maximum length of a single SMS (160 characters for plaintext SMS messages or 70 characters for Unicode SMS messages) Notify can concatenate up to 10 SMS messages which will be joined on the receiver’s mobile phone. This property configured the maximum number of SMS messages that will be concatenated into one large SMS message. If the body length is exceeded the body will be truncated and a message will be logged.</td>
</tr>
<tr>
<td>Note:</td>
<td>The charges are per sms, which means that 1600 character SMS will be 10 times as expensive as a 160 character SMS. Also note that not all providers support SMS concatenation.</td>
</tr>
<tr>
<td>glide.enable.notify_on_task</td>
<td>Use this property to enable Notify integration for Task table and its extensions. Entering phone number in ‘glide.notify.task.phone_number’ property is equivalent to setting this to true.</td>
</tr>
<tr>
<td>glide.notify.endpoint</td>
<td>If the instance is accessible on public internet using some other name, which can happen if the instance is within a private network and is accessible via a reverse proxy from outside. In that case the public name needs to be provided here. e.g. https://some_public_domain.com</td>
</tr>
<tr>
<td>glide.notify.sms.save_confirmation_in_db</td>
<td>Check Yes if you want track the confirmation of opt-in/out requests SMS. The confirmations are saved in notify_message table.</td>
</tr>
<tr>
<td>com.snc.iam.enable_notify</td>
<td>Use this property to enable Notify integration for Incident Communications Management. Entering phone number in ‘com.snc.iam.notify_number’ property is equivalent to setting this to true.</td>
</tr>
<tr>
<td>com.snc.iam.notify_number</td>
<td>The Notify number to use for conference calls. Note that this number needs to have a group configured with conference call workflows.</td>
</tr>
<tr>
<td>com.snc.on_call_rotation.notify_webrtc_number</td>
<td>Specify a valid Notify number with voice capability. This will enable On-Call integration with Notify which allows On-Call users to directly call people on rosters from the browser.</td>
</tr>
<tr>
<td>sn_major_inc_mgmt.notify_webrtc_number</td>
<td>Specify a valid Notify Number with voice capability. This will enable a specific Major Incident Management integration with Notify which allows Workbench users to directly call people from the browser.</td>
</tr>
</tbody>
</table>
## Business rules installed with Notify

Notify adds the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No Call Workflows for Shortcodes</td>
<td>(notify_group)</td>
<td>Checks and displays an error if the call is being triggered by a short code.</td>
</tr>
<tr>
<td>Update Participant Duration</td>
<td>(notify_participant)</td>
<td>Updates participant duration when it becomes inactive.</td>
</tr>
<tr>
<td>Check if Notify call exists and active</td>
<td>(notify_participant_session)</td>
<td>Checks if Notify call has valid reference record and updates it if the call is inactive currently.</td>
</tr>
<tr>
<td>Update Last Active On</td>
<td>(notify_participant)</td>
<td>Sets the last active before insertion/update of Notify participant.</td>
</tr>
<tr>
<td>Show info msg about selection in choice</td>
<td>(notify_group_selector_choice)</td>
<td>Displays a message if either Notify group or conference provider is not selected.</td>
</tr>
<tr>
<td>Validate values in the choice</td>
<td>(notify_group_selector_choice)</td>
<td>Checks if either of Notify group or conference provider is filled.</td>
</tr>
<tr>
<td>Set scratchpad values</td>
<td>(notify_group_selector_choice)</td>
<td>Checks if conference provider is available by iterating through service provider list.</td>
</tr>
<tr>
<td>Show message for empty choices</td>
<td>(notify_group_selector)</td>
<td>Displays an info message if there are no choices for the provider selector.</td>
</tr>
<tr>
<td>Clear fields when Manual Selection is set</td>
<td>(notify_group_selector)</td>
<td>Clears out some fields when manual selection is set in Notify group selector table.</td>
</tr>
<tr>
<td>Update Participant Duration</td>
<td>(notify_participant_session)</td>
<td>Calculates the duration of participant on conference call.</td>
</tr>
<tr>
<td>Update session muted state</td>
<td>(notify_participant)</td>
<td>Sets the value of mute and expelled to true once the conference call participant becomes inactive.</td>
</tr>
<tr>
<td>Update conference call</td>
<td>(notify_participant)</td>
<td>Sets the state of conference call based on the participant leaving or joining the call.</td>
</tr>
<tr>
<td>Validate Order field value</td>
<td>(notify_group_selector)</td>
<td>Validates order field value to be unique amongst all provider selectors.</td>
</tr>
<tr>
<td>Restrict Workflows For only Voice Nums</td>
<td>(notify_number)</td>
<td>Restricts association of voice only capable number with number group having inbound/outbound SMS workflows.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Restrict Workflows For only SMS Numbers</td>
<td>(notify_number)</td>
<td>Restricts association of SMS only capable number with number group having inbound/outbound voice workflows.</td>
</tr>
<tr>
<td>Validations on default record</td>
<td>(notify_group_selector)</td>
<td>Validates that source table and order field are mandatory in case of default set to false and both fields empty in case of default set to true.</td>
</tr>
<tr>
<td>Clearing fields when Default is true</td>
<td>(notify_group_selector)</td>
<td>Clears out some fields when default is set to true.</td>
</tr>
<tr>
<td>No Default selector set</td>
<td>(notify_group_selector)</td>
<td>Ensures one active provider selector is set as default.</td>
</tr>
<tr>
<td>Check active default selector is unique</td>
<td>(notify_group_selector)</td>
<td>Ensures only one provider selector is set as default.</td>
</tr>
<tr>
<td>Process SMS preferences for incoming SMS</td>
<td>(notify_message)</td>
<td>When an SMS preference configuration defined for a particular telephony provider, then apply it for every incoming SMS.</td>
</tr>
<tr>
<td>Check default notify group is unique</td>
<td>(notify_group)</td>
<td>Validates that not more than one group is set as default Notify group.</td>
</tr>
<tr>
<td>Trigger conference end</td>
<td>(notify_conference_call)</td>
<td>When a conference call ends, triggers the notify.conference.end event.</td>
</tr>
<tr>
<td>Update Call Active State</td>
<td>(notify_call_status)</td>
<td>Updates the status of the call in notify_call_status with the status received from Twilio.</td>
</tr>
<tr>
<td>Update Conference Call Active State</td>
<td>(notify_participant)</td>
<td>Updates the active flag in notify_participant table. Also calculates the duration when the call is ended by a participant.</td>
</tr>
<tr>
<td>Update Participant Active State</td>
<td>(notify_participant_session)</td>
<td>Updates the active flag for the participant (notify_participant), and calculates the total time on the call upon disconnecting from the call.</td>
</tr>
<tr>
<td>Update Participant Session Active State</td>
<td>(notify_call)</td>
<td>Synchronizes the state of the call between notify_call and notify_participant_session. Upon disconnecting from the call, updates notify_participant_session with the duration of the call.</td>
</tr>
</tbody>
</table>
**Orchestration**

ServiceNow® Orchestration extends the workflow engine to manage processes and to automate things outside of a ServiceNow instance.

Orchestration is available as a separate subscription from the rest of the Now Platform. See **Activate Orchestration** for details.

**Introduction to Orchestration**

Orchestration automates simple or complex multi-system tasks on remote services, servers, applications, and hardware.

An Orchestration process can cross all management disciplines and interact with hosted services and all types of infrastructure elements. These capabilities provide a powerful system for managing IT and Business processes quickly and reliably.

Orchestrated solutions aide collaboration among teams by providing reusable data and versioning for both the workflows and the activities within them. Subject matter experts can create activities that are reusable to numerous workflow developers. When an activity requires a change, developers can see the downstream implication of the change immediately by knowing which workflows use the activity. Well-designed orchestrations never fail and apply human tasks to address errors as they arise.

**Orchestration tools**

Orchestration can make calls outside of a ServiceNow instance, directly to web services or through a MID Server to systems within corporate firewall. Orchestration also enables the creation...
Orchestration extends the Workflow editor by providing these features:

- **Activity packs** containing ready-to-use activities.
- **Activity Designer**, which enables developers to create custom activities without an over dependence to create scripts to orchestrate to third-party systems.
- Ability to create activity packs using **Scoped Applications**.
- A **Databus** for following the flow of data across orchestration activities.

Orchestration Core provides entitlements to use specific applications:

**Client Software Distribution**

An application that automates software delivery from the Service Catalog. Provides OOB support for SCCM. Partner solutions support Macs using JAMF. Other third-party solutions provide support through the extension framework.

**Password Reset**

An application for users to reset their password in Active Directory. It can expand to communicate with other third-party systems.

**Orchestration ROI**

Enables users to evaluate estimated costs and actual costs for tasks, automate these tasks, and track the ROI of these tasks.

**Systems that Orchestration can automate**

Orchestration can automate tasks such as employee onboarding, user access rights, server management, managed file transfers, and **Security Operations Orchestration activities**. For example, you might use the Active Directory and Exchange activities provided in the base Orchestration system to set up network accounts and mailboxes for new employees.

If Orchestration does not provide the activities you need for an integration, create the necessary activities using the templates in the **Orchestration Activity Designer**. The external systems that Orchestration can automate for:

- Any system exposing web services (**SOAP, REST**)
- Any system accessible from the command line (such as a UNIX system accessible through **SSH**, a Windows system enabled for **PowerShell** remoting or WMI)
- Numerous proprietary services: Windows **Active Directory**, Microsoft **Exchange** mail servers, **InfoBlox**, and **F5 Networks**.

**Note:** For a full list of Activity Pack service offerings, see **Orchestration Core Activity Packs**.

- Any filesystem accessible by **SFTP**
- Any database with a compliant **JDBC** driver
- Additional Activity Packs are also available with other ServiceNow products, such as Security Operations
When an Orchestration activity starts within a workflow, Orchestration launches a probe and writes a probe record to the ECC Queue. The workflow pauses as the MID Server picks up the
request and executes the probe. When the probe reports back, the workflow resumes as the results are analyzed. The workflow can exit or continue at this point.

Orchestration workflow

Orchestration video tutorial

Watch the introductory video for Orchestration.

Domain separation in Orchestration

This is an overview of domain separation and Orchestration. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Support level: Standard*

- Includes Basic level
- Processes can be created or modified per customer by the service provider. The use cases reflect proper use of the application by multiple service provider customers in a single instance.
- The owner of the instance needs to be able to configure MVP business logic and data parameters per tenant as expected for the specific application

Use case: As an admin, I need the ability to make comments mandatory on close of a record for one tenant, but not for another. Business logic:

Activate Orchestration

The Orchestration (com.snc.runbook_automation) plugin is available as a separate subscription from the rest of the Now Platform.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and subproduction instances, generally within a few days.

If you don’t have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

Role required: none

1. From your instance, navigate to **System Definition > Plugins**.
2. On the All Applications page, click **Request Plugin** to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

| Reason/Comments | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments. |

5. Click **Submit**.

**List of Orchestration plugins**

This table lists all plugins available for Orchestration and their dependencies.

These Orchestration plugins are available for purchase or can be requested as part of your Orchestration subscription. Contact your account representative for details.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Dependencies</th>
</tr>
</thead>
<tbody>
<tr>
<td>Orchestration (com.snc.runbook_automation)</td>
<td>Main plugin for the Orchestration feature. This plugin extends Workflow to automate operations with external systems. Use this plugin to orchestrate business services, applications, and infrastructure. This plugin automates operations such as deployments, configurations, and information gathering. Orchestration can automate Web Services and uses MID Servers to execute commands on devices inside an enterprise's network.</td>
<td>• Orchestration - ROI</td>
</tr>
<tr>
<td>Orchestration - Active Directory (com.snc.orchestration.ad)</td>
<td>Installs the Active Directory activity pack. These activities create, delete, and manage objects in Windows Active Directory.</td>
<td>Orchestration</td>
</tr>
<tr>
<td>Orchestration - Asset Lease Management (com.snc.orchestration.asset_lease_management)</td>
<td>Provides the software lease functionality for Client Software Distribution. Allows users to set the start and end dates of software leases and to request an extension of a lease.</td>
<td>None</td>
</tr>
<tr>
<td>Orchestration - Azure Active Directory (com.snc.orchestration.azure.ad)</td>
<td>Installs the Azure AD activity pack. These activities automate employee onboarding and offboarding functions on Azure Active Directory and manage Office 365 licensing.</td>
<td>Orchestration</td>
</tr>
</tbody>
</table>
| Orchestration - Client Software Distribution (com.snc.orchestration.client_sf_distribution) | Allows the distribution of software from the service catalog using third party management systems, such as Microsoft System Center Configuration Manager (SCCM)                                                                                                                       | • Orchestration - System Center Configuration Manager

<td>Orchestration</td>
</tr>
</tbody>
</table>

**Orchestration Runtime plugin**

The Orchestration – Runtime plugin enables other applications on the ServiceNow® platform to automate tasks, without requiring an Orchestration subscription.

The Orchestration – Runtime plugin can be activated as part of another plugin or application. It is used by strategic technology partners and ServiceNow applications to distribute activity packs to customers who may not own Orchestration. For example, the Security Incident Response Management (SIRM) application provides orchestration content, which includes activities that are available from the Packs tab in the Workflow Editor. Customers who purchase SIRM can consume and modify the activities that SIRM ships without having to purchase an Orchestration license.

**Included with the plugin**

The Orchestration – Runtime plugin provides access to the Packs and Data tabs in the Workflow Editor. This plugin gives users access to custom activities for their applications and enables them to reuse data from the Databus. This plugin does not provide access to custom Orchestration activity packs or to the activity designer. The Custom tab in the Workflow Editor is not available without an Orchestration subscription.
Orchestration plugin relationships

Dependencies

The Orchestration – Runtime plugin activates these application plugins:

- Security Incident Response Orchestration
- Service Release Automation

Access to activities

Custom activities shipped with ServiceNow® applications are available in the Packs tab of the Workflow Editor for use in workflows. To edit these activities, navigate to Orchestration > Activity Designer Activities and select the activity you want to modify. For information about the provider templates used to create these activities, see Orchestration custom activity templates.

List of Orchestration activities

Use Orchestration activities in a Workflow to integrate with third-party systems.
Several Orchestration activities have been rewritten as scoped activities using the activity designer and grouped into activity packs. Other non-scoped activities are deprecated and may or may not appear in the Workflow Editor. However, all deprecated activities still function in existing workflows that use them.

Global activities

These activities run in the global scope only. Any activities you create in the global scope are organized in the Global category in the Packs and Custom tabs in the Workflow Editor.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test Server Alive</td>
<td>Runs a command (including shell scripts) on a Linux or UNIX computer via SSH to validate whether the target system is alive.</td>
</tr>
</tbody>
</table>

Active Directory (AD) activities

All AD Orchestration activities were rewritten in the Geneva release as scoped activities and are available in the Active Directory activity pack. All previous version AD activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create AD Object</td>
<td>Creates a user account in Windows Active Directory when a user account is created in a ServiceNow instance.</td>
</tr>
<tr>
<td>Disable AD User Account</td>
<td>Marks a Windows Active Directory user account disabled, making it inactive.</td>
</tr>
<tr>
<td>Enable AD User Account</td>
<td>Enables a Windows Active Directory user account, making it active.</td>
</tr>
<tr>
<td>Query AD</td>
<td>Retrieves entries from the Windows Active Directory based on a search filter.</td>
</tr>
<tr>
<td>Remove AD Object</td>
<td>Deletes a user account from Windows Active Directory.</td>
</tr>
<tr>
<td>Reset AD User Password</td>
<td>Resets the password of a user account in Windows Active Directory.</td>
</tr>
<tr>
<td>Change AD User Password</td>
<td>Changes the password of a user account in Windows Active Directory.</td>
</tr>
<tr>
<td>Update AD Object</td>
<td>Updates a user account in Windows Active Directory.</td>
</tr>
<tr>
<td>Is AD Account Locked</td>
<td>Determines if an Active Directory user account is locked.</td>
</tr>
<tr>
<td>Unlock AD Account</td>
<td>Unlocks a locked Active Directory user account.</td>
</tr>
</tbody>
</table>
**Azure AD**

All these activities are scoped and part of the Azure AD activity pack. They do not have legacy versions.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add User to Group</td>
<td>Adds a user to an existing security group in Azure Active Directory.</td>
</tr>
<tr>
<td>Assign User License</td>
<td>Assigns an extra Office 365 software license to the named user.</td>
</tr>
<tr>
<td>Create User</td>
<td>Creates a user for the Azure Active Directory tenant.</td>
</tr>
<tr>
<td>Delete User</td>
<td>Deletes the named user’s account from the Azure Active Directory tenant.</td>
</tr>
<tr>
<td>Get User Info</td>
<td>Returns the named user’s information from the Azure Active Directory.</td>

</tbody>
</table>

### Available activity packs

Activity packs are available with your subscription to Orchestration.

Role required: admin

The following activity packs are available and active with your Orchestration subscription:

- **Orchestration - Active Directory** (com.snc.orchestration.ad)
- **Orchestration - Azure Active Directory** (com.snc.orchestration.azure.ad)
- **Orchestration - Exchange** (com.snc.orchestration.exchange)
- **Orchestration - SFTP** (com.snc.orchestration.sftp)
- **Orchestration - Infoblox DDI Activity Pack** (com.snc.orchestration.infoblox)
- **F5 Network Management activity pack** (com.snc.orchestration.f5)
- **Orchestration - SSH** (com.snc.orchestration.ssh)
- **Orchestration - PowerShell** (com.snc.orchestration.powershell)
- **Orchestration - System Center Configuration Manager** (com.snc.orchestration.sccm_mgnt)

1. From your instance, navigate to System Definition > Plugins.
2. On the All Applications page, click Request Plugin to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

Note: Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.

| Reason/Comments | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments. |

5. Click Submit.

**Deprecated Orchestration activities**

These Orchestration activities have been deprecated.

**Run Probe**

The Run Probe activity launches a MID Server probe on behalf of a document. All Orchestration activities that launch a probe on a target machine are based on the Run Probe activity. Your ServiceNow instance must have access to a MID Server configured to use SSH to run this activity.

Attention: This activity is deprecated and is unavailable for new workflows. To replace the functionality of this probe, use the *Probe activity template* to create a custom activity. Workflows from a previous release that use the Run Probe activity can continue to do so.
Run Probe input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Probe</td>
<td>Select a MID Server probe from the list. This is the name of the probe as it appears in the discovery_probes table.</td>
</tr>
<tr>
<td>Source for probe</td>
<td>Enter the IP address of the host system against which the probe runs (the probe’s target).</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called output. Any error from the probe is contained in a variable called error.</td>
</tr>
</tbody>
</table>

SOAP Request

The SOAP Request activity executes a SOAP request on a target server.

**Attention:** This activity is deprecated and is replaced by the SOAP Message workflow activity. Workflows from a previous release that use the SOAP Request activity can continue to do so. However, this activity is not available for new workflows.

SOAP Request input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP URL</td>
<td>The SOAP endpoint.</td>
</tr>
<tr>
<td>Username</td>
<td>User name for basic authentication credentials.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for basic authentication credentials.</td>
</tr>
<tr>
<td>Envelope Script</td>
<td>Script for setting up parameters for the web service.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>The script to execute after the request has been made and a response has been received.</td>
</tr>
</tbody>
</table>

Reactivate a deprecated activity

Orchestration activities that were converted to activity packs are deprecated for upgraded and new instances but can be reactivated for use in new workflows.

Role required: workflow_admin, admin

**Note:** Reactivation of deprecated activities for use in new workflows is discouraged. Legacy activities cannot use the unique features of the scoped applications, such as reuse of data from the databus and input variable testing.

1. **Navigate to Workflow > Administration > Activity Definitions.**
2. In the list of activities, clear the condition Category !=deprecated from the filter.
3. Open the definition record for the activity you want to reactivate.
4. Select the What to Display tab.
5. In the Category field, replace the value deprecated with another category.
   This can be an arbitrary string.
6. Click Update.
   The system creates a new category using the value provided and reactivates the activity, which becomes available in the Core tab of the Workflow Editor.

SOAP Message workflow activity
The SOAP Message activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.
Your instance must have access to a MID Server configured to use SOAP.

Input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP Message</td>
<td>soap_message</td>
<td>The SOAP Message defined under the System Web Services plugin's Outbound SOAP Message (sys_soap_message) table. (System Web Services &gt; Outbound &gt; SOAP Message)</td>
</tr>
<tr>
<td>SOAP Message Function</td>
<td>soap_message_function</td>
<td>The function to call that is defined in the SOAP Message. Functions are listed in the SOAP Message Functions related list in each SOAP Message record.</td>
</tr>
<tr>
<td>SOAP Endpoint</td>
<td>soap_endpoint</td>
<td>Endpoint to use instead of the SOAP endpoint value in the SOAP Message Function record. Leave this field blank to use the defined endpoint in the SOAP Message Function record.</td>
</tr>
<tr>
<td>Field</td>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Variables</td>
<td>variables</td>
<td>Variables to substitute into the SOAP Envelope defined in the SOAP Message Function record. Use this format for the string: [name1=value1, name2=value2, . . .] If either the name or value contains a comma or equal sign, escape these characters with a backslash.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>use_midserver</td>
<td>Check box for using a MID Server to send the SOAP message. A MID Server might be necessary to reach an endpoint within a firewall or a sub-network that is not visible from the instance. If this check box is selected (true), but no MID Server is defined in the MID Server field, workflow automatically attempts to find a MID Server.</td>
</tr>
<tr>
<td>MID Server</td>
<td>midserver</td>
<td>Name of the MID Server to use. This field appears when you select the Use MID Server check box. The workflow ignores this parameter if the use_midserver parameter is disabled.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>sensor_script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full XML response body from the activity.output object.</td>
</tr>
</tbody>
</table>

**Note:** You can only select a specific MID Server in the legacy SOAP message activity and REST messages. These legacy activities do not use the MID Server selection criteria available starting with the Istanbul release.
**Probes used by Orchestration**

Certain probes, controlled by MID Servers, perform Orchestration tasks on remote computers, such as restarting a server or creating virtual machines from templates.

**How Orchestration probes work**

When a Workflow executes an Orchestration activity, that activity launches a probe, which writes an *output* record to the ECC Queue. The MID Server selected for the activity checks the ECC Queue for assignments, and then executes the appropriate probe to do the work on the target machine. The information about the activity (machine restarted, files copied, etc.) that is returned from the target machine by the probe is written to the ECC Queue as an *input* record. This information is then sent from the ECC Queue to a sensor that is built into the Workflow activity. The Workflow is updated, and the next activity is executed.

**Note:** The probe parameters are set by the activities that launch the probe.

How Orchestration uses probes

**Probe List**

The base system includes the following Orchestration probes (*Orchestration > Definition > Probes*).

<table>
<thead>
<tr>
<th>Probe Name</th>
<th>ECC Queue Topic</th>
<th>ECC Queue Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>Command</td>
<td></td>
<td>A probe that runs a local command on the MID server.</td>
</tr>
<tr>
<td>Probe Name</td>
<td>ECC Queue Topic</td>
<td>ECC Queue Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------</td>
<td>----------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DNS Name Resolver</td>
<td>DNSNameResolver</td>
<td></td>
<td>A probe that resolves a fully qualified domain name (FQDN) into an IP address. The probe executes MID Server queries in parallel. It utilizes DNS lookup by the MID Server host OS to make use of the OS maintained DNS cache. It also leverages the hosts file on the OS.</td>
</tr>
<tr>
<td>SCPCommand</td>
<td>SCPCommand</td>
<td></td>
<td>A probe that copies files securely from one machine to another. The copy function is performed using the MID Server as a tunnel.</td>
</tr>
<tr>
<td>Shazzam</td>
<td>Shazzam</td>
<td></td>
<td>A probe that identifies active devices.</td>
</tr>
<tr>
<td>SNMPProbe</td>
<td>SNMP</td>
<td>SNMP Query</td>
<td>This is a generic SNMP probe.</td>
</tr>
<tr>
<td>SOAPProbe</td>
<td>SOAPProbe</td>
<td></td>
<td>A probe that sends a SOAP request to target machine.</td>
</tr>
<tr>
<td>SSHCommand</td>
<td>SSHCommand</td>
<td></td>
<td>A probe that executes shell scripts from a command line after logging in to a target machine via SSH.</td>
</tr>
<tr>
<td>SSHCommandLong</td>
<td>SSHCommandLong</td>
<td></td>
<td>A probe that executes long running shell scripts from a command line after logging in to a target machine via SSH.</td>
</tr>
<tr>
<td>VMWare</td>
<td>VMWareProbe</td>
<td></td>
<td>A generic VMware probe that executes the MID Server script include in the ECC queue name that is set by a VMware Orchestration activity. This probe can run any MID Server script include.</td>
</tr>
<tr>
<td>Probe Name</td>
<td>ECC Queue Topic</td>
<td>ECC Queue Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------</td>
<td>----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Windows - PowerShell | PowerShell       | Windows - PowerShell | A probe that runs a Windows PowerShell script on the MID Server. The PowerShell script is provided as the value of a parameter with name ending in \ps1. Two variables are available to the script:  
• $computer: The computer pointed to as the source for this probe  
• $cred: A PowerShell credential, using a user name and password from the Credentials table, that logs into $computer successfully. |

**PowerShell activities**

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

PowerShell must be installed on any MID Server that uses these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 3.0 to 5.1.

The ServiceNow Orchestration plugin adds these basic PowerShell activities to workflows. For instructions on using activities from the PowerShell activity pack, see [PowerShell activity pack](#).

**Legacy Run PowerShell activity**

The Run PowerShell activity executes Windows PowerShell commands on a MID Server.

**Attention:** This activity is deprecated and is unavailable for new workflows. To replace the functionality of this activity, use the [Powershell activity template](#) to create a custom, scoped activity. Workflows from a previous release that use the Run PowerShell activity can continue to do so.

**Result Values**

The workflow designer can assign a result value using activity.result from within a script field of the activity. By default, the success or failure of the PowerShell commands used determines the result value of the Run PowerShell activity. Possible result values are:

- Success
- Failure
Scratchpad Entries

Information written to stdout by the executing script is captured and returned to the activity in the activity.output variable. This information can be parsed, processed, or saved (to a scratchpad variable, for example) for future processing in the activity’s sensor script.

An example would be to run the get-date command to get the MID Server’s current time. This sensor script saves the full output received, but we can process it to return and save only the time.

```powershell
$credential = Get-Credential -Credential $cred
$computer = $workflow.inputs.host
$cmd = Get-Date
$cmd
```

PowerShell activity

**Note:** This is an over-simplified example. In most cases, the script operates against some remote Windows computer. However, the principal is the same – whatever is written to stdout is returned in activity.output and available to process.

Input Variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>IP address of the target Windows machine. This value is mapped to the $computer variable for use in commands (see the example in the Command field). A PowerShell credential variable called $cred that is based on information in the ServiceNow Credentials table will authenticate on the computer pointed to by Hostname.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Command                   | Enter the PowerShell command to run. For example, to execute a simple WMI query against a remote machine pointed to by the hostname variable, the command is:  
  `get-wmiobject <class> -computer $computer -credential $cred`  
  If no credentials authenticate on the computer, the command runs in the context of the MID Server user.  
  You cannot run both a command and a script file. Specifying a command hides the Script file variable. |
| Sensor script             | The script to run using the results of the probe. The output from the probe is contained in a variable called `output`. Any error from the probe is contained in a variable called `error`.                                   |
| Script file               | The MID Server script file to run. You cannot run both a script file and a command. Selecting a script file hides the Command variable.                                                                       |
| PowerShell script variables | Additional parameters, in JSON format, used by the specified script file.                                                                                                                                  |

**States**

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was cancelled.</td>
</tr>
</tbody>
</table>

Add workflow variables for the command line using the normal workflow variable syntax. In the example above, if the `<class>` was in a workflow input variable called `myclass`, the command would look like:

```
get-wmiobject $ (workflow. inputs. myclass ) -computer $computer -credential $cred
```

Similarly, if the variable is a scratchpad variable named `myclass`, the command would look like:
HResult codes
When a PowerShell script encounters an error, the Windows machine may return an HResult code as part of the error message.

PowerShell activities can read and interpret this code. Not all PowerShell errors include an HResult code. In the event of a failed PowerShell script, you can use the HResult code to move the workflow through a specific condition.

For example, when resetting an Active Directory password to a password that does not meet policy requirements, such as minimum length or complexity, the PowerShell script returns the HResult code -2146022651. To use this code, create an activity condition with the Condition value of activity.hresult = -2146022651. If the PowerShell script returns this code when the activity runs, the workflow transitions through this new condition.

SSH activities
SSH activities allow workflows to perform operations on Linux and Unix computers.

Your ServiceNow instance must have access to a MID Server configured to use SSH to run these Orchestration activities.

Run Command activity
The Run Command activity runs a command (including shell scripts) on a Linux or UNIX computer.

Attention: The Run Command activity is deprecated in this release. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading to Helsinki. However, to use this functionality in a new workflow, you must create a custom activity using the SSH activity template in the ServiceNow® activity designer.

Input variables

### Run command input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Long running</td>
<td>Select this check box to disable the SSH connection timeout if you think the command will take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.</td>
</tr>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of destination server for SSH activity.</td>
</tr>
<tr>
<td>Directory</td>
<td>Name of the working directory.</td>
</tr>
<tr>
<td>Command</td>
<td>The command to run from this activity.</td>
</tr>
<tr>
<td>Sudo</td>
<td>Select this check box to use sudo to run the command on the host machine.</td>
</tr>
</tbody>
</table>
### Run SCP activity
The Run SCP activity uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides.

**Note:** This activity is deprecated in the Geneva release and is not available for use in new workflows. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading. The custom Secure Copy activity replaces the Run SCP activity in the Geneva release.

### Input variables

**Run SCP input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Host</td>
<td>Hostname or IP address of the source computer.</td>
</tr>
<tr>
<td>From File</td>
<td>Absolute path to the file to copy. This value can be a directory.</td>
</tr>
<tr>
<td>To Host</td>
<td>Hostname or IP address of the target computer.</td>
</tr>
<tr>
<td>To File</td>
<td>Path to the target file. This path can be absolute or relative to the logged in user’s home directory. The specified directory must already exist on the target computer.</td>
</tr>
<tr>
<td>Copy Directory</td>
<td>Check box to copy a directory defined in the From File variable and all files contained in that directory.</td>
</tr>
</tbody>
</table>

### Orchestration applications
Orchestration provides several applications with your subscription.

### Orchestration ROI
The Orchestration ROI application allows you to estimate and compute cost savings for tasks in your system that could be automated with Orchestration.

After you automate the tasks, you can track cost savings by associating Orchestration workflows with corresponding task areas. Configuration in the application allows you to select the hourly rate for performing the task manually, the rules the system uses to select tasks for evaluation, and the time period of the evaluation. Orchestration ROI estimates your savings by multiplying the cost of performing repetitive tasks manually by the estimated number of times the system performs those tasks automatically during a specific date/time range. The system also calculates...
the actual savings of your automations. Orchestration ROI is included with the base Orchestration subscription.

Orchestration ROI reports offer a number of views of the comparative data and allow you to access the associated records directly from the reports. The standard reports included with the Orchestration - ROI plugin provide summaries, estimated costs, and calculated costs for automated processes. The ROI premium dashboard uses Performance Analytics to provide detailed reports on calculated savings over time. Performance Analytics requires a different plugin and subscription.

**Note:** When Orchestration ROI is activated as a dependent plugin of Orchestration, demo data is not installed. If you want to use demo data as a template for your own ROI evaluation, submit a request to ServiceNow® technical support for an Orchestration ROI plugin upgrade with demo data selected.

To set up Orchestration ROI, complete the configuration tasks in the order shown here.

**Create Orchestration ROI labor rate cards**

Before calculating your Orchestration ROI, you must create labor rate cards for the manual work that would be required to complete the tasks correlated to the ROI calculations.

Role required: orchestration_manager

The hourly rates defined in the rate cards are used to determine the savings from your orchestrated tasks.

1. Navigate to Orchestration > ROI > Labor Rate Cards.
2. Complete the fields in the form using the descriptions in Manage a labor rate card.
3. Click Submit.
4. Create additional rate cards as needed.

**Create an Orchestration ROI automation entry record**

The ROI automation entry record couples the cost of performing a task with the specific workflow that automates the task, for the purpose of calculating the resulting savings.

Role required: orchestration_manager

Before starting this procedure, verify that the appropriate labor rate cards were created.

Use this record to apply a manual hourly rate to a task that is performed automatically by your instance. To determine the savings realized from orchestrating a task, the system can evaluate whether those savings were estimated or calculated.

- **Estimated savings:** Uses the labor rate, the time estimates for completion of the task, and the number of automations that have been run to determine savings.
- **Calculated savings:** Uses the labor rate, the time calculated for completion of the task, based on the configured evaluation period, and the number of automations that have been run to determine savings.

1. Navigate to Orchestration > ROI > Automation Entry Form.
2. Fill in the fields on the form, as appropriate.
### Automation Entry Form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Category of the selected workflow automation. The following categories are provided in the base Orchestration - ROI system:</td>
</tr>
<tr>
<td></td>
<td>• Access &amp; Identity Management</td>
</tr>
<tr>
<td></td>
<td>• Datacenter Automation</td>
</tr>
<tr>
<td></td>
<td>• IT Service Management</td>
</tr>
<tr>
<td></td>
<td>• Other</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> To create a category, open the dictionary record for the Automation Entry Form (automation_entry_form) table and add an option to the choice list.</td>
</tr>
<tr>
<td>Item</td>
<td>Unique name for the specific task within the category. This value represents the work to which the labor rate card applies, such as Password Reset.</td>
</tr>
<tr>
<td>Resource</td>
<td>Labor rate card to apply to this automation entry. You must have IT Cost Management active on the instance for this field to appear.</td>
</tr>
<tr>
<td>Associated Workflows</td>
<td>Workflow automations created to automate this manual task. The system uses this field to identify the number of automations that have been run.</td>
</tr>
<tr>
<td>Estimated Duration (min) per Task</td>
<td>Estimated time to perform this task manually.</td>
</tr>
<tr>
<td>Estimated Volume per Month</td>
<td>Estimated number of times needed to perform this task manually per month.</td>
</tr>
</tbody>
</table>

### Read-only fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start time</td>
<td>Start time for the evaluation period. Configure this value in the Time Range for Calculated Averages module.</td>
</tr>
<tr>
<td>End time</td>
<td>End time of the evaluation period. Configure this value in the Time Range for Calculated Averages module.</td>
</tr>
<tr>
<td>Calculated average duration per task (min)</td>
<td>Actual time required to perform this task manually.</td>
</tr>
<tr>
<td>Calculated average volume per month</td>
<td>Actual average number of times this task is performed manually per month.</td>
</tr>
</tbody>
</table>

3. Select one of these submission options:

- **Submit**: Saves the record to the table without running any calculations.
Submit and process now: Saves the record and calculates the savings based on the hourly rate and the number of workflow contexts for this automation entry.

Create an Orchestration ROI correlated task rule

The correlated task rule applies configurable conditions to fields in a selected table that tell the instance which manual tasks correspond to an automation entry record.

Role required: orchestration_manager

Before starting this procedure, make sure you have created labor rate cards and the appropriate automation entry records for the automated tasks you want to evaluate.

Create conditions that the system can use to correlate manual tasks to the automation entry. For example, a rule on the Incident (incident) table uses these conditions to correlate the employee on-boarding task to values configured in the Employee OnBoarding automation entry record:

- (Subcategory) (is) (Employee OnBoarding)
- (Sort description) (contains) (new employee)

When a new employee opens an incident to request services or assets which are typically handled manually, Orchestration applies the usual labor rate for the manual work to the potential automated solution, and then computes the actual savings.

1. Navigate to Orchestration > ROI Task Correlation > Correlated Tasks Rules.
2. Click New.
3. Fill in the fields on the form, as appropriate.

### Automation entry form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automation entry</td>
<td>Automation entry record that correlates to the manual task defined by these conditions. The entry record names the workflow used to automate the task and defines the labor rate used to calculate the cost of the task.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to filter, using these conditions. The rule selects records from this table that match the conditions. Information from these records is used to calculate the actual time to perform a manual task and the actual volume for that manual task.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder to use to filter records for this table. Use these conditions to identify all manual tasks correlated to this automation entry.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Read-only fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Processed on</td>
<td>Date and time that the system performs the matching records lookup. The system automatically searches for new manual tasks matching these conditions.</td>
</tr>
</tbody>
</table>

4. Select one of these submission options:

- **Submit**: Saves the record to the table without running any calculations.
- **Submit and process now:** Saves the record, looks up all matching tasks, and saves matching record information to the Correlated Tasks (manual_mapping_records) table.

5. To view a rule, select the link in the **Table** column of the **Correlated Tasks Rules** related list for the automation entry you want to see.

6. To view the list of tasks that match all correlated rules in the system, navigate to **Orchestration > ROI Task Correlation > Correlated Tasks**.

7. To view the list of tasks that match this rule in the system, click **Correlated Tasks** under **Related Links** in this form

**Configure the time range for Orchestration ROI calculations**

Select a date range to calculate the average number of tasks and the duration per month for the correlated tasks.

Role required: orchestration_manager

By default, the system creates a range ending at the current date and time and extending back over the previous month. You can change this range at any time and recalculate the ROI instantly.

1. Navigate to **Orchestration > ROI Task Correlation > Time Range for Calculated Averages**.
2. Enter a new start or end date and time or click the icon to select a date using the calendar.
3. Click **Calculate** to recalculate the ROI based on the new time range and to save your settings.

**Installed with Orchestration ROI**

Several types of components are installed with the Orchestration - ROI plugin (com.snc.runbook_automation.roi).

**Tables installed with Orchestration ROI**

Tables are added with activation of Orchestration ROI.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expense and Savings (run_rate_predicted_savings)</td>
<td>Contains the data for the reports in <strong>Orchestration &gt; ROI Reports &gt; Predicted Savings</strong>.</td>
</tr>
</tbody>
</table>
| Savings Report (savings_report) | Contains the number of automations that have been run before the date specified in the **Processed On** column, based on:  
  - Each automation entry’s associated workflows  
  - Estimated savings based on the estimated duration per task.  
  - Calculated savings based on calculated duration. |
| Detailed Savings Report (detailed_savings_report) | Contains a detailed list for the Savings Report (savings_report) table. This list contains each automation’s run date and savings for that automation. |
# ServiceNow Orlando Now Platform capabilities

## Table

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automation Entries</td>
<td>Contains automation entries that couple labor resources to specific manual tasks. You can specify the estimated duration to perform a task manually and the estimated number of times that a task is performed per month. If this automation entry already has workflow automations implemented, you can specify the associated workflows. The system calculates the savings, based on the labor rate card and the number of workflow automations that have been performed.</td>
</tr>
<tr>
<td>Roadmap Planning</td>
<td>Contains roadmap planning for each automation entry to be implemented. You can provide estimated hours to implement a workflow automation, the automation percentage anticipated by the end of the year, and the starting month to implement the workflow.</td>
</tr>
<tr>
<td>Correlated Tasks</td>
<td>Contains all matching manual tasks for each automation entry. Each task's information is stored in this table for the system to use to calculate the actual duration and volume for each manual task.</td>
</tr>
<tr>
<td>Correlated Tasks Rules</td>
<td>Contains the correlated task rules the system uses to look up manual tasks corresponding to each automation entry.</td>
</tr>
</tbody>
</table>

## Plugins installed with Orchestration ROI

Plugins are installed with activation of Orchestration ROI, if they are not already active.

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cost Management</td>
<td>Provides the labor rate cards Orchestration ROI uses to determine the savings for each automated task. See Cost Management for more information.</td>
</tr>
</tbody>
</table>

## Roles installed with Orchestration ROI

Roles are added with activation of Orchestration ROI.

<table>
<thead>
<tr>
<th>Role title (name)</th>
<th>Description</th>
<th>Contains Roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Orchestration manager</td>
<td>Manages all activities in the Orchestration ROI module.</td>
<td>• pa_admin</td>
</tr>
<tr>
<td>(orchestration_manager)</td>
<td></td>
<td>• report_admin</td>
</tr>
</tbody>
</table>

## UI actions installed with Orchestration ROI

UI actions are added with activation of Orchestration ROI.
## UI actions for Orchestration - ROI

<table>
<thead>
<tr>
<th>UI action</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Savings Report</td>
<td>Automation Entry Form</td>
<td>Displays the savings report specific to this automation entry, if the associated workflows are not empty.</td>
</tr>
<tr>
<td>Estimated and Projected Savings</td>
<td>Automation Entry Form</td>
<td>Displays the estimated savings, based on the estimated duration of the task, and calculated savings, based on the calculated duration of the task.</td>
</tr>
<tr>
<td>Show Workflow Context</td>
<td>Detailed Savings Report</td>
<td>Shows the related workflow context.</td>
</tr>
<tr>
<td>Submit AND process now</td>
<td>Automation Entry Form</td>
<td>Processes this new entry</td>
</tr>
<tr>
<td>Correlated Tasks</td>
<td>Correlated Tasks Rules</td>
<td>Displays all matching tasks from the Correlated Tasks table.</td>
</tr>
<tr>
<td>Detailed Savings Report</td>
<td>Automation Entry Form</td>
<td>Displays the list of automations that have been run, based on associated workflows.</td>
</tr>
<tr>
<td>Task</td>
<td>Correlated Tasks Rules</td>
<td>Displays the task record.</td>
</tr>
<tr>
<td>Submit AND process now</td>
<td>Correlated Tasks Rules</td>
<td>Processes a correlated task rule. This action performs matching on the specified table and the filter conditions.</td>
</tr>
</tbody>
</table>

### Script includes installed with Orchestration ROI

Script includes are added with activation of Orchestration ROI.

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OrchestrationROIAjax</td>
<td>Script that calculates the actual duration and volume of a task.</td>
</tr>
<tr>
<td>OrchestrationROI</td>
<td>Script that calculates the number of workflow contexts, looks up all matching tasks, calculates savings, and other functions used in the UI actions.</td>
</tr>
<tr>
<td>ROIDemoDataUtil</td>
<td>Script that updates demo data timestamps.</td>
</tr>
</tbody>
</table>

### Client scripts installed with Orchestration ROI

Client scripts are added with activation of Orchestration ROI.
<table>
<thead>
<tr>
<th>Client script</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display info for processing rules</td>
<td>Correlated Tasks Rules</td>
<td>Displays annotation on the Correlated Task Rule form advising that new task rules are not evaluated until the time specified in the ROI schedule.</td>
</tr>
</tbody>
</table>

*Business rules installed with Orchestration ROI*

Business rules are added with activation of Orchestration ROI.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete corresponding records</td>
<td>Automation Entry Form</td>
<td>When a record is deleted from the Automation Entry Form (automation_entry_form) table, this business rule deletes all records in other ROI tables that reference this entry.</td>
</tr>
<tr>
<td>Insert into Run Rate &amp; Savings</td>
<td>Automation Entry Form</td>
<td>When a new automation entry is provided, this business rule calculates the estimated savings, based on the estimated duration of a task and its associated labor rate card.</td>
</tr>
<tr>
<td>Insert into Savings Reports</td>
<td>Automation Entry Form</td>
<td>When a new automation entry is provided, this business rule inserts a new record into the Savings Report (savings_report) table with the <code>automations_run</code> field set to 0.</td>
</tr>
</tbody>
</table>

**Orchestration ROI reports**

Orchestration ROI provides a collection of standard and premium reports to help you calculate savings from automating services in your organization.

The ROI standard reports are included with Orchestration ROI. The premium reports provide enhanced views generated with Performance Analytics and require the *Orchestration - ROI Premium* plugin.

**Orchestration ROI standard reports**

The dashboard of standard ROI reports provides summaries, estimated costs, and calculated costs for automated processes. To access the ROI standard dashboard, navigate to *Orchestration > ROI Reports > Dashboard*.

**Summary tab**

The Summary tab contains four reports on automation categories.

</table>
| Predicted Quarterly Expense by Category (Uses Estimated Duration & Volume) | Total predicted quarterly expense for all manual tasks by category, using the estimated duration of each task, estimated volume of each task per month, and the cost from the labor rate card.  
  - **Note:** This report uses negative numbers to express an expense.  
  - **Type:** Bar chart  
  - **Table:** Expense and Savings (run_rate_predicted_savings)                                                                                                                                                                                                         |
| Predicted Hours Spent Annually by Category (Uses Estimated Duration & Volume) | Total predicted hours spent annually on all manual tasks by category, using the estimated duration of each task and the estimated volume of each task per month.  
  - **Type:** Bar chart  
  - **Table:** Expense and Savings (run_rate_predicted_savings)                                                                                                                                                                                                                   |
| Predicted Annual Expense by Category (Uses Estimated Duration & Volume) | Total predicted annual expense for all manual tasks by category, using the estimated duration of each task, estimated volume of each task per month, and the cost from the labor rate card.  
  - **Note:** This report uses negative numbers to express an expense.  
  - **Type:** Bar chart  
  - **Table:** Expense and Savings (run_rate_predicted_savings)                                                                                                                                                                                                         |

**Costs from Correlated Tasks tab**

The Costs from Correlated Tasks tab contains eight reports on time and expense for automations based on actual calculations.
Time Spent by Task Category

- Datacenter Automation = 380.88 (54.31%)
- IT Service Management = 154.30 (26.95%)
- Access & Identity Management = 57.12 (9.64%)

### Schedule Orchestration ROI Calculations for Standard Reports

The scheduled job that calculates Orchestration ROI standard reports is active by default and controlled by system properties.

**Role required:** orchestration_manager, admin

The system provides a default scheduled job called Processing ROI Schedule that allows you to configure when Orchestration calculates the ROI for standard reports. This schedule allows scripting for advanced conditions. To modify the schedule or write a script to run, open Processing ROI Schedule from **System Scheduler > Scheduled Jobs > Scheduled Jobs** and click **Configure Job Definition**. To execute the schedule directly from the job definition, click **Execute Now**.

To control the running of the schedule job with the Orchestration properties:

1. Navigate to **Orchestration ROI > Properties**.
2. Configure the following properties:
### ROI schedule properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>roi.processing.active</td>
<td>Activate scheduled job for ROI processing. This property activates the Processing ROI Schedule scheduled job.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> true</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default:</strong> true</td>
</tr>
<tr>
<td>roi.processing.interval</td>
<td>Scheduled ROI processing interval (hours). This property sets the repeat interval for the scheduled job that processes savings reports and correlated tasks.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default:</strong> 24</td>
</tr>
</tbody>
</table>

3. Click **Save** to save your changes.

**Orchestration ROI premium reports**

The premium dashboard provides detailed reports on calculated savings over time.

The ROI premium reports require the Orchestration - ROI Premium plugin and are built using **Performance Analytics concepts**. The Orchestration - ROI Premium plugin is dependent on the **Performance Analytics - Premium** plugin which requires a separate subscription.

**Important:** You must activate the Performance Analytics **scheduled collection job** before Orchestration ROI premium can display data.

To access the ROI premium dashboard, navigate to **Orchestration > ROI Reports > Premium Dashboard**.

**ROI By Category tab**

The ROI By Category tab contains three reports showing the calculated savings over time by category.
Calculated savings monthly by category

Premium reports for calculated savings over time by category

<table>
<thead>
<tr>
<th>Report</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROI - Monthly By Category</td>
<td>Shows the calculated savings each month by category. The chart displays the total calculated savings against the calculated savings for each category.</td>
</tr>
<tr>
<td></td>
<td><strong>Type:</strong> Column chart</td>
</tr>
<tr>
<td></td>
<td><strong>Table:</strong> Detailed Savings Report (detailed_savings_report)</td>
</tr>
<tr>
<td>ROI - By Category</td>
<td>Shows the trend of calculated savings by category.</td>
</tr>
<tr>
<td></td>
<td><strong>Type:</strong> Spline chart</td>
</tr>
<tr>
<td></td>
<td><strong>Table:</strong> Detailed Savings Report (detailed_savings_report)</td>
</tr>
<tr>
<td>ROI - Running Sum 12 month period</td>
<td>Shows the running sum of calculated savings for all categories in the last 12 months.</td>
</tr>
<tr>
<td></td>
<td><strong>Type:</strong> Area chart</td>
</tr>
<tr>
<td></td>
<td><strong>Table:</strong> Detailed Savings Report (detailed_savings_report)</td>
</tr>
</tbody>
</table>
ROI By Automation Entry

The ROI By Automation Entry tab contains two reports showing the calculated savings over time by automation entry.

<table>
<thead>
<tr>
<th>Report</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROI By Automation Entry</td>

Request Orchestration ROI premium reports

To view the Orchestration ROI premium reports, you must request activation of the Orchestration - ROI Premium (com.snc.runbook_automation.roi_premium) plugin. The Orchestration - ROI Premium plugin is included with an Orchestration subscription, but must be activated by request.
The Orchestration - ROI Premium plugin requires the Performance Analytics - Premium plugin, which must be purchased separately.

Role required: admin

1. From your instance, navigate to System Definition > Plugins.
2. On the All Applications page, click Request Plugin to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

Schedule Orchestration ROI calculations for premium reports

Orchestration ROI premium reports use a Performance Analytics job that must be activated before premium reports can be generated.

**Role required:** orchestration_manager, admin

The scheduled job required to calculate premium ROI reports is called (PA ROI) Historic Data Collection and is installed with the Orchestration - ROI Premium (com.snc.runbook_automation.roi_premium) plugin. This job is not active by default.

1. Navigate to **Performance Analytics > Data Collector > Jobs**.
2. Search for the (PA ROI) Historic Data Collection job.
3. Select the **Active** check box.
4. The scheduling options appear for the value selected in the **Run** field.

For instructions on creating a schedule, see **Create or schedule a data collection job**.

5. To execute the schedule directly from the job definition, click **Execute Now**.
6. Click **Update**.

**Client Software Distribution**

The Client Software Distribution (CSD) application allows administrators to distribute software from the service catalog using third-party management systems.

CSD allows an administrator to create all the records necessary to deploy software from service catalog requests, including software models and catalog items. You can use the CSD application to automate the deployment and **revocation** of software from an SCCM host using the custom **SCCM activity pack**. You can define lease periods for software distributed from the Service Catalog and allow lease extensions in some cases, pending approvals. Deployment is accomplished using Orchestration activities and workflows.

CSD also integrates with **Software Asset Management** to manage license counts for deployed software.
CSD process flow using SCCM

Request client software distribution

Client software distribution requires the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution), which is available by request with a subscription to Orchestration.

Role required: admin
The Orchestration - Client Software Distribution plugin activates the Orchestration - System Center Configuration Manager plugin that contains the custom SCCM activities used to deploy or revoke software using an SCCM server. For additional plugin dependencies, see Plugins installed with client software distribution.

**Note:** The Orchestration - Client Software Distribution plugin runs in its own application scope.

1. From your instance, navigate to System Definition &gt; Plugins.
2. On the All Applications page, click Request Plugin to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

| Reason/Comments | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments. |

5. Click **Submit**.

**Installed with client software distribution**

Several types of components are installed with client software distribution (CSD).

**Tables installed with client software distribution**

These tables are installed with the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution).

**Client software distribution tables**

<table>

</tbody>
</table>
Properties installed with client software distribution

Properties for client software distribution (CSD) manage the installation status of requested software deployments and configure scheduled Discoveries.

To access CSD properties, navigate to Client Software Distribution > Properties. The following properties are available:

<table>
<thead>
<tr>
<th>Property</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Status check expiration interval (days)       | sn_client_sf_dist.softwareInstallExpDays | Controls how many days the system waits before ignoring the software installation status. The default time limit for installing software is 30 days before the system stops checking the installation status of a deployment. Installation statuses are:  
  • Not installed: User has not installed requested software prior to the expiration of the configured time limit.  
  • Installed: Software was installed within the configured time limit.  
  • Status check expired: Time limit has expired for the user to install the requested software. The system no longer checks the status of this deployment.  
  • Revoked: Software was revoked by the administrator.  
  • Type: integer  
  • Default value: 30 |
| Reconcile software installation status interval (hours) | sn_client_sf_dist.softwareInstallIntervalHour | Determines when the scheduled job runs that determines the installation status. By default, the system checks the installation status every hour.  
  • Type: integer  
  • Default value: 24 |
<table>
<thead>
<tr>
<th>Property</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Set scheduled application Discovery interval (days). | sn_client_sf_dist.discoveryExeDay | Sets the repeat interval for the scheduled job that runs application Discovery. By default, Discovery runs at midnight on the day set with this value.  
| | | Type: integer  
| | | Default value: 5 |
| Set lease execution schedule job interval (minutes) | sn_client_sf_dist.lease_execution_interval | Interval in which the CSD Lease Schedule scheduled job checks for requested software leases to start, stop, or extend.  
| | | Type: integer  
| | | Default value: 1 |
| Set time prior to lease end to notify requester (days) | sn_client_sf_dist.lease_end_notification | Determines how many days prior to the end of a software lease to notify the requester. If lease extensions are allowed, ensure that this period provides enough time for the approval process to complete before the lease expires.  
| | | Type: integer  
| | | Default value: 5 |

Workflows installed with client software distribution
These workflows are installed with the Orchestration - Client Software Distribution plugin

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discover SCCM</td>
<td>Retrieves lists of applications, collections, and deployments from SCCM servers using custom CSD orchestration activities. An administrator runs this workflow from a UI action in a SCCM Server Instance record.</td>
</tr>
<tr>
<td>Order Client Software</td>
<td>Runs automatically when a user orders software from the service catalog.</td>
</tr>
<tr>
<td>Deploy SCCM Application</td>
<td>Triggered by the Order Client Software workflow to deploy software through SCCM server. This workflow adds either the user or the device into the SCCM collection.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Revoke Client Software</td>
<td>Begins the software revocation process for software deployed by an external provider. Administrators run this workflow from a UI action on the Requested Software record and the Installed Software Not Entitled record. This workflow triggers the appropriate provider workflow that performs the actual revocation. For example, this workflow triggers the Revoke SCCM Application workflow for applications in SCCM uninstall collections.</td>
</tr>
<tr>
<td>Revoke SCCM Application</td>
<td>Revokes SCCM applications that are members of an uninstall collection. The Revoke Client Software workflow triggers this workflow to revoke software deployed by an SCCM server. This workflow moves either the user or the device from the SCCM collection into the appropriate uninstall collection.</td>
</tr>
</tbody>
</table>

Create licenses and counters for distributed software

Licenses and software counters are associated with the software model and must be created if you want to track the license for software deployed by client software distribution (CSD).

Role required: sam or admin

You can create software licenses and counters in Software Asset Management for software items deployed from the service catalog by CSD. CSD depends on the software counter result to determine if the license is available for the requested software. If the license Valuation is greater than 0, and the license type is Not allocated, CSD assumes that the license is available for the software.

1. Navigate to Software Asset > Software Licenses.
2. Add a new software license for the software model you used in CSD.
3. Navigate to Software Asset > Reconciliation > Software Counters.
4. Create a software counter for the software model you created.
5. Run the counter to retrieve the software license information.

Extend a software lease

Users of software deployed by Client Software Distribution (CSD) can request the extension of a lease window, if the software is revocable by a software distribution system.

Role required: Any system user

If your software has a lease end date defined, and the software status is Installed, you can request an extension of the lease, pending any approvals your organization requires.

1. Navigate to Service Catalog > My Requested Software.
   The list shows only the software you have requested from the service catalog.
2. Select the record for the installed software whose lease you want to extend.
3. Under Related Links click Extend Lease.
4. In the dialog box that appears, select a new lease end date in the calendar and click OK. You must select a date later than the current date.

If the lease extension is subject to manager approval, you are notified of the decision. If the request is approved, a notification shows the new lease end date. If the new end date is within 5 days (the default notification period) of the date when you made the request, CSD sends an immediate end-of-lease notification.

**Important:** If lease extensions in your organization require approval, make sure the approver is available and has enough time to process your extension request. If the extension cannot be approved before the original end date expires, the software is revoked.
Client software distribution from SCCM

You can use Client Software Distribution (CSD) to deploy and revoke software deployments from Microsoft System Center Configuration Management (SCCM) and manage distributions on SCCM hosts.

The SCCM activity pack contains Orchestration activities that CSD uses to deploy software from a service catalog request and manage user and device collections on SCCM servers. In addition, CSD can manage license counts for deployed software using ServiceNow Software Asset Management, revoke software deployed by SCCM without user interaction, and manage lease periods.

**Configuring SCCM**

Follow the SCCM configuration procedures in the order shown.

Configure the Application Administrator role on the SCCM server

To deploy software using ServiceNow® Client Software Distribution (CSD), ensure that an SCCM administrative user has the correct permissions to deploy software and that PowerShell is properly configured.

SCCM role required: Application Administrator

These instructions are for Microsoft 2012 R2 Server.

1. In the System Center Configuration Manager console, navigate to Administration > Security > Administrative Users.
2. Right-click the user to whom you want to grant the Application Administrator role.
3. Select Properties from the drop-down menu.
4. In the Properties dialog box, select the Security Roles tab.
5. Ensure that the user has the Application Administrator role.
6. If the user does not already have this role, click Add, select this role from the list, and click OK.
Granting the Application Administrator role on the SCCM server
7. Log into SCCM as the user with the Application Administrator role.
8. Open the menu from the upper left corner of the console and select Connect via Windows PowerShell.

9. Ensure that the user can access the CM console. This action establishes the environment path to PowerShell for the logged in Application Administrator user.

Update the SCCM cmdlet libraries
Ensure that the System Center Configuration Manager SCCM Cmdlet Library is up-to-date.

SCCM role required: Either current user or system administrator, depending on settings.

The System Center Configuration Manager SCCM Cmdlet Library installs and updates the Windows PowerShell module for SCCM. SCCM checks for library updates on a daily basis. Out-of-date libraries can cause Discovery of the SCCM server to fail, because the system cannot parse the SCCM activity output. This warning message appears in the ECC queue input records for the SCCM GET activities:

WARNING: An update to the System Center 2012 Configuration Manager Cmdlet Library is available. Please go to 'http://go.microsoft.com/fwlink/?LinkId=528947' to download the latest version.

If you elect to use an earlier version library, use this procedure to disable the CM update check, which allows Discovery to proceed without issues.

1. Log into the SCCM console as an administrator.
2. Open the menu from the upper left corner of the console.
4. Run one of these commands to disable the update check:
   - Per-user: `Set-CMCmdletUpdateCheck -CurrentUser -IsUpdateCheckEnabled 0`
   - Per-system: `Set-CMCmdletUpdateCheck -System -IsUpdateCheckEnabled 0`

   **Important:** The per-system cmdlet must run in an elevated Windows PowerShell session.

5. Run the `Get-CMCmdletUpdateCheck` command to refresh the console and check the settings.
6. Ensure that the value of the `IsEnabled` configuration variable has changed to `False`. This indicates that the warning for an out of date cmdlet library is disabled for the users specified.
7. To re-enable the update check, run the `-IsUpdateCheckEnabled 1` command for either the current user or for the system.

Configure the MID Server for SCCM activities

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

Role required: admin

1. In the navigation filter, enter `cmdb_ci_dns_name.list`.
2. Click New.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the Name field.
4. Right-click in the form header and select Save.
5. In the IP Address related list, click New.
6. In the IP Address field, enter the IP address of the SCCM server.
7. In the Nic field, select eth0 or your preferred network interface controller.
8. Leave the Netmask field blank.
9. Click Submit.

Create Windows credentials for SCCM deployments

Microsoft System Center Configuration Manager (SCCM) requires the appropriate credentials to deploy applications using the Client Software Distribution application.

Role required: sn_client_sf_dist.csd_admin or admin

Client software distribution requires Windows credentials that have administrative rights on the SCCM server.

1. Navigate to Orchestration > Credentials.
2. Click New.
3. In the list of credential types, select Windows Credentials.
4. Provide a user name and password with administrative rights on the SCCM server.
Important: Ensure the following:

- This user must have the Application Administrator role on the SCCM server.
- Use the credentials to log into the SCCM Server and connect via Windows PowerShell from the System Center Configuration Manager console at least once to set the path variable for that credential.

5. Fill in the other fields on the form, as appropriate.
   
   For details, see Windows credentials.

6. Click Submit.

Retrieve SCCM data for client software distribution

Retrieve the collections and the list of applications available for deployment from your SCCM servers.

Role required: sn_client_sf_dist.csd_admin or admin

Before starting this procedure:

- Set up your Microsoft System Center Configuration Manager (SCCM) server, create the applications and collections, and configure the deployments you need. For information, see your SCCM documentation.
- Configure a user with the Application Deployment Manager role on the SCCM server.
- Set up the MID Server to communicate with the SCCM server.
- Add Powershell credentials to the ServiceNow Credentials [discovery_credentials] table for the SCCM user who has the Application Deployment Manager role.

To populate the Client Software Distribution application with SCCM data:

1. Navigate to Client Software Distribution > SCCM > SCCM Server Instance.
2. Click New.
3. In the SCCM Server Instance form, identify the server by name and provide the fully qualified domain name.
4. Click Submit.
   
   The new SCCM server appears in the list.
5. Open the new SCCM record and click Discover now under Related links.
   
   The system runs the Discover SCCM workflow that retrieves the application, collection, and deployment data from the SCCM server.
Retrieving SCCM data with Discovery

SCCM server Discovery for client software distribution

A Discovery workflow populates ServiceNow tables with collection, application, and deployment data retrieved from SCCM servers.

Users run the **Discover SCCM** workflow from an **SCCM Server Instance record** to populate the following ServiceNow tables:

### SCCM data populated in ServiceNow tables

<table>
<thead>
<tr>
<th>Table</th>
<th>Fields</th>
</tr>
</thead>
</table>
| SCCM Application (sn_client_sf_dist_sccm_application) | • name  
• publisher  
• version  
• model  
• sccm_server |
| SCCM Collection (sn_client_sf_dist_sccm_collection) | • name  
• type  
• sccm_server |
| SCCM Deployment (sn_client_sf_dist_sccm_deployment) | • application  
• collection  
• type |
Set up a software model for an SCCM application

Using the applications discovered on the SCCM server, set up a software model used by the Software Asset Management application to manage licenses.

Role required: sn_client_sf_dist.csd_admin or admin

Before creating software models, you must discover the applications available for deployment on the SCCM server. See Retrieve SCCM data for client software distribution for details.

You can link an SCCM application to an existing software model or create a new model.

1. Navigate to Client Software Distribution > SCCM > SCCM Applications. A list of applications discovered on the SCCM server appears.
2. Open an SCCM application record.
3. To link to an existing model, click the magnifying glass icon in the Model field and select a model from the list.

To create a model, click Create Software Model under Related Links.

   a) Complete the software model fields. See for details.
   b) Click Submit. The view returns to the SCCM Applications form.

Define an SCCM configuration
To create catalog items for SCCM software deployment or to configure your instance to revoke software through SCCM, you must first associate that software with a collection through an SCCM configuration.

Before you create an SCCM configuration record, make sure you have discovered the SCCM applications, collections, and deployments and set up the necessary software models.

Role required: sn_client_sf_dist.csd_admin or admin

The SCCM configuration process associates software with SCCM collections. To deploy software from an SCCM server, the user or device must be a member of an SCCM collection associated with an install deployment. Client Software Distribution (CSD) allows you to revoke unentitled software using an SCCM server when that software can be removed using an uninstall collection. Users requesting revokable software from the Service Catalog also have the ability to define lease start and stop dates and request lease extensions.
SCCM table references

1. Navigate to Client Software Distribution > SCCM > SCCM Applications.
2. Open an application that has a configured software model.
3. Under Related Links, click Create Software Configuration.
4. Complete the form, using the fields in the table.
SCCM configuration form

SCCM configuration fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Recognizable name for this SCCM software configuration.</td>
</tr>
<tr>
<td>SCCM application</td>
<td>Name of an application hosted on the SCCM server.</td>
</tr>
<tr>
<td>SCCM collection</td>
<td>Name of the collection associated with the <code>install</code> deployment for the selected application on the SCCM server. Only those collections associated with the application are available for selection.</td>
</tr>
</tbody>
</table>
| SCCM uninstall collection | Name of the collection associated with the `uninstall` deployment for the selected application on the SCCM server. You must specify an uninstall collection to:  
  - Define a lease end date for deployed software.  
  - Allow lease extensions.  
  - Revoke software from a user's machine. |
Create a catalog item for an SCCM application

Using the applications discovered on the SCCM server, create a catalog item for an application you want to offer for distribution from the service catalog.

Role required: sn_client_sf_dist.csd_admin or admin

Before creating a catalog item, you must link the application to a software model and create at least one software configuration.

1. Navigate to Client Software Distribution > SCCM > SCCM Applications. A list of applications discovered on the SCCM server appears.
2. Open a record for an SCCM application.
Catalog items are available to order software applications from the service catalog. Update name and short description to display for the item. Configure approval process, license check, order on behalf of, software configuration and other information as needed.

**Name:** Dropbox - 3.2

**Application:**

- **Client Software Distribution:**
  - Price: $0.00
  - Recurring price: $0.00
  - Frequency: Monthly

**License:**

- **License in:**
  - Picture:

**Short description:**

- **Dropbox** is a service that keeps your files safe, synced, and easy to share. Bring your photos, docs, and videos anywhere and never lose a file again.

**Skip approval:**

- **Check license compliance:**

**Order on behalf of:**

- **Software configuration:**
  - Dropbox

**Update** | **Copy** | **Try It** | **Delete**
4. Add price information and complete the following fields added to the Client Software Distribution Catalog Item (sn_client_sf_dist_cat_item) table by the Orchestration - Client Software Distribution plugin:

### SCCM fields in the catalog item form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Skip approval (skip_approval)</strong></td>
<td>Check box that allows skipping approval for this item by the requester's manager when a user orders it from the service catalog. Use this field in conjunction with the <strong>Order on behalf of</strong> field to ensure that software ordered by a logged in user on behalf of another user is subject to approval. By default, this check box is cleared, requiring manager approval for all new catalog items.</td>
</tr>
<tr>
<td><strong>Check license compliance (check_license_compliance)</strong></td>
<td>Check box that forces the system to determine if deploying this item is allowed under the current license.</td>
</tr>
</tbody>
</table>

*Note:* There are two levels of approval possible. By default, all category items require group approval for items in excess of $1000. If that approval is given or skipped, the system evaluates the **Skip approval** check box to determine if the software item requires approval by the requester's manager.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order on behalf of</td>
<td>Check box that allows the logged-in user to order this software from the service catalog for another user. This permits service desk personnel to order SCCM deployments for other users in the system. By default, this feature is enabled. To prevent unauthorized users from ordering software, ensure that approvals are required for this type of deployment by clearing the Skip approval check box.</td>
</tr>
<tr>
<td></td>
<td>If an approval is required for software ordered on behalf of a user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requestor is the named user's manager.</td>
</tr>
<tr>
<td></td>
<td>Software items requested from the service catalog on behalf of a different user require the following information:</td>
</tr>
<tr>
<td></td>
<td>• <strong>User</strong>: User selected for deployment. This field is automatically populated with the name of the logged in user. You can select another user from the list.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Device to install this software on</strong>: Device belonging to the selected user on which to deploy the software. Only devices belonging to that user appear in the choice list.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Lease start</strong>: Date and time to deploy the software. This is the start time for the lease. A lease can be open-ended or have a lease end time.</td>
</tr>
<tr>
<td>SCCM configuration</td>
<td>Name of the SCCM configuration record for this application. This record defines the collection and uninstall collection for this application. This configuration is required for all deployments, revocations, and leases performed by the SCCM server.</td>
</tr>
</tbody>
</table>

5. If the catalog item requires approval because of cost, be sure to configure an approval group in the Approved By Group related list.

   By default, the Service Catalog Request workflow runs when an item costing more than $1000 is ordered and looks for an appropriate approval group. If no approval group is configured for the item, this workflow skips approval altogether and ends. The system then runs the Order Client Software workflow, which evaluates the Skip approval check box to determine if approval by the requester's manager is required.

6. **Click Update**.

   The view returns to the SCCM Applications list.

7. **To see all client software distribution (CSD) catalog items**, navigate to **Client Software Distribution > Maintain Items > Software Items**.

**SCCM deployment**

Ordering an SCCM application from a client software distribution (CSD) catalog item in the service catalog triggers the Order Client Software workflow.
This process deploys an SCCM application to a user or device through a service catalog order:

1. If the **Skip approval** check box is cleared in the software catalog item, the **Order Client Software** workflow sends the catalog request to the requesting user's manager for approval.

2. If the **Check license compliance** check box is selected in the software catalog item, the workflow performs a software license check. If there is no license available, the workflow creates a catalog task to procure more licenses and assigns the task to the Client Software Distribution Administrators group.

3. The **Order Client Software** workflow triggers the **Deploy SCCM Application** workflow as a subflow. This workflow adds either the user or the device to the SCCM collection using the **Add to User Collection** or **Add to Device Collection** SCCM activity.

4. If the software configuration specifies **SCCM uninstall collection** in the software catalog item, the **Deploy SCCM Application** workflow checks if the user or device exists in the uninstall collection. The workflow uses the **Is Device in Collection** or **Is User in Collection** SCCM activity. If the user or device exists in the uninstall collection, the workflow removes the device or user. The workflow uses the **Remove from Device Collection** or **Remove from User Collection** SCCM activity before adding it to the **SCCM install collection**.

---

**Client software distribution validation process**

After SCCM deploys software to a target computer, client software distribution (CSD) detects the installation and validates its status.

Client software distribution uses the following methods for detecting software installed on the target machine:

- **Discovery**: CSD is configured to leverage Discovery to detect software installations. You can run Discovery manually at any time, or by a scheduled job.
- **Microsoft SCCM Integration**: You can import SCCM data into the CMDB using the features in the Integration - Microsoft SCCM plugin if Discovery is not active on the instance.

The instance uses the data gathered by Discovery or the SCCM integration plugin to populate the **Software Installation** (cmdb_sam_sw_install) table. To validate installations using this data, CSD runs a scheduled job called **Reconcile Requested Software** that uses **CSD property** settings. This process reconciles the software installation data accumulated in the CMDB and makes these status updates:

- **Not installed** to **Installed**: The user has installed the requested software within the time limit configured in the **sn_client_sf_dist.softwareInstallExpDays** property.
- **Not installed** to **Status check expired**: The time limit has expired for the user to install the requested software. The system stops checking for installation when the time limit expires.

**SCCM software revocation**

An administrator can revoke software without any user interaction using Microsoft System Center Configuration Manager (SCCM) if the software configuration specifies an SCCM uninstall collection, even if the software was installed by some other process or user.

Revoke software deployed through the service catalog

Software deployed by SCCM can be revoked, but only when the software's status is **Installed** and the application associated with the software configuration has an uninstall collection configured.

- Create an **SCCM configuration record** for the application that names an appropriate uninstall collection.
- Associate the **CSD catalog item** for the application with the SCCM configuration that specifies the uninstall collection.

Role required: sn_client_sf_dist.csd_admin or admin
A workflow called **Revoke SCCM Application** moves either the user or the device from its respective collection and adds it to the appropriate uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

1. **Navigate to Client Software Distribution > Reports > Requested Software.**
2. Open the record for the SCCM software package you want to revoke.
   The package must have a Status of Installed to be revocable.
3. **Under Related Links, click Revoke software.**
   This action runs the Revoke Client Software workflow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

**Revoke unentitled software**

An administrator can revoke software using Microsoft System Center Configuration Manager (SCCM) that a user is not entitled to use even if the software was installed by some other process or user.

To revoke software using SCCM, you must create an **SCCM configuration record** for the application, in which the appropriate software Discovery model is defined. See **Software discovery models**.

**Role required:** sn_client_sf_dist.csd_admin or admin

Client Software Distribution (CSD) uses Software Asset Management to identify unentitled software installations. Discovery detects the software on the user's machine, and SAM determines if the user or device is entitled to use that software. This might include software that was not installed through a catalog request or software that the user installed without approval. If the software installation's Discovery model is associated with an SCCM software configuration that has an uninstall collection defined, then an administrator can use CSD to revoke that software from the user's machine without involving the user.

1. **Navigate to Client Software Distribution > Reports > Installed Software Not Entitled.**
2. Select the record for the installation that has unentitled users.
3. **Under Related Links, click Revoke software.**
   This action runs the Revoke Client Software workflow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.
Revoking a software installation

SCCM software revocation workflow

The Revoke SCCM Application workflow moves a user or device from an install collection to an uninstall collection to revoke software installed from Microsoft System Center Configuration Manager (SCCM).
For the revocation workflow to run, the software package must have a status of *Installed* and must be pre-configured for an appropriate uninstall collection. See [Revoke software deployed through the service catalog](#) for configuration instructions. When an administrator initiates the revocation process, the system launches the Revoke SCCM Application workflow to move the user or device collection associated with installation to the appropriate SCCM uninstall collection. When the SCCM server performs a policy check, it finds the additions to the user or device uninstall collection and revokes the software package associated with that collection.

The workflow employs two custom activities, *Remove from User Collection* and *Remove from Device Collection*, to remove either the user or the device from its original collection. The workflow then adds the user or device to the appropriate uninstall collection on the SCCM server with the *Add to User Collection* or *Add to Device Collection* activity.

**Note:** This workflow is triggered by the Revoke Client Software workflow as a subflow.

---

**Client software distribution dashboard**

The CSD dashboard provides a collection of visual reports for the Client Software Distribution application.

**CSD dashboard**

To access the CSD dashboard, navigate to Client Software Distribution > Requested Software > Dashboard.

### Usage Overview dashboard

Navigate to [Client Software Distribution > Usage Overview](#) to view the current transaction count for your instance.

### Client software distribution extension framework

Client software distribution (CSD) provides built-in extension points for integrating a ServiceNow instance with client software distribution providers, such as Casper, Altiris, or LANDesk.

**Caution:** The use of CSD extension points is an advanced procedure intended for use by experienced Now Platform developers only. Instructions for customizing your instance to deploy and revoke software from a software distribution provider can be found in the CSD Extension Implementation Guide.

Configure client software distribution providers

Identify the provider and specify the workflows and extension points for a customized software distribution process.

Perform the development tasks described in the CSD Extension Implementation Guide before attempting this procedure.

Role required: sn_client_sf_dist.csd_admin, admin

1. Navigate to [Client Software Distribution > Extensions > Providers](#).
2. Click New.
3. Complete the form using the fields in the table.

### Client software distribution provider fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the provider.</td>
</tr>
<tr>
<td>Provider server table</td>
<td>Table name of the provider server. You must create this table as an extension of the Configuration Item (cmdb_ci) table. For example, you might call your table Casper Server Instance (cmdb_ci_casper_server_instance).</td>
</tr>
<tr>
<td>Discovery flow</td>
<td>Flow that discovers the provider server and returns the data from that server back to the instance. This is the flow you create with custom activities that query the provider server.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Software configuration table</td>
<td>Table name of the software configuration for this provider. You create this table as an extension of the Client Software Distribution Software Configuration (sn_client_sf_dist_software_config) table. For example, you might create a table called Casper Software Configuration (sn_client_sf_dist_casper_sf_config).</td>
</tr>
<tr>
<td>Deployment extension key</td>
<td>The SetDeploymentData key provided with CSD. This key sets up the data for the software ordering and deployment workflow.</td>
</tr>
<tr>
<td>Deployment flow</td>
<td>Flow that deploys software from the provider server. This is the flow you created with custom activities that tells the provider where to deploy an application requested from the service catalog.</td>
</tr>
<tr>
<td>Revocation extension key</td>
<td>The SetRevocationData key provided with CSD. This key sets up the data for installation revocation.</td>
</tr>
<tr>
<td>Revocation flow</td>
<td>Flow that revokes an installation from a provider server. This is the flow you created with custom activities that tells the provider which application to remove from a device.</td>
</tr>
<tr>
<td>Use Flow</td>
<td>Option to use IntegrationHub flows for client software distribution. When this option isn't selected, Orchestration workflows are used for client software distribution.</td>
</tr>
</tbody>
</table>

**Note:**

**Client software distribution extension keys**

Client software distribution (CSD) extension keys allow you to customize the deployment and revocation of software from distribution providers.

These pre-defined keys allow you to generate input variables for workflows that deploy and revoke software from external distribution providers:

- **SetDeploymentData**: Sets the software order information and generates the input variables for the deployment workflow.
- **SetRevocationData**: Generates the input variables for the revocation workflow.
- **CheckRevocable**: Specifies the conditions that determine if an installation can be revoked. If the software configuration associated with the installed software allows uninstallation, the installed software can be revoked.

**Client software distribution extension points**

The client software distribution (CSD) extension points create the customization code for the specific provider and the extension keys.

The purpose of the extension points is to associate extension keys with a specific provider, and then create a script that sets input variables for your custom deployment and revocation workflows. Another extension point script tells CSD if the provider has the capability to revoke software. If this is the case, CSD enables the UI action that triggers revocation from the provider.
SetDeploymentData

The script associated with this extension key must set the `csdExtensionResult` object with these attributes:

- **deploymentWorkflowInputs**: Object that specifies the deployment workflow input variables.
- **softwareModel**: Software model sys_id.
- **deploymentType**: An integer. Use 1 for deployment to a user and 2 for deployment to a device.
- **softwareApplication**: Software application sys_id.

CheckRevocable

The script associated with this extension key gets the input parameter `csdExtensionInputs.softwareConfiguration`, which is a Client Software Distribution record in the Software Configuration (sn_client_sf_dist_software_config) table. All providers' software configurations are extended from this table, but may have different attributes.

This script must set the `csdExtensionResult` object to true or false, depending on whether the software configuration specifies uninstallation.

SetRevocationData

The script associated with this extension key gets the input parameter `csdExtensionInputs.softwareConfiguration`, which is a Client Software Distribution record in the Software Configuration (sn_client_sf_dist_software_config) table. All providers' software configurations are extended from this table, but may have different attributes.

The script must set the `csdExtensionResult` object with these attributes:

- **revocationWorkflowInput**: Object that specifies the revocation workflow input variables.
- **softwareModel**: Software model sys_id.
- **deploymentType**: An integer. Use 1 for deployment to a user and 2 for deployment to a device.

Orchestration examples

These examples demonstrate how Orchestration can be used to automate common tasks.

Active Directory automation example

A set of six Orchestration Active Directory activities enables organizations to automate their on-boarding/off-boarding processes with auditable, self-documenting workflows that save time and eliminate mistakes.

The activities in the Active Directory activity pack are designed to manage user accounts and reset user passwords. The following activities cover the most common use cases administrators encounter when managing Active Directory user accounts:

- Create AD User Account
- Update AD User Account
- Remove AD User Account
- Disable AD User Account
- Query AD
Reset AD User Password.

These activities share a common design, have complementary functionality, and share a common set of parameters. They can be used singly or together to create consistent workflows for provisioning and de-provisioning user accounts.

Update Active Directory with Orchestration

An organization plans to make their ServiceNow instance the single system of record for user account data and wants to update Active Directory with the latest changes.

The solution is to create an Orchestration workflow that pushes changes from the ServiceNow user record down to the Active Directory to create a new user record or update an existing record. This is accomplished by creating an Orchestration workflow that can create and update records in Active Directory based on the data in the ServiceNow User (sys_user) table.

Note: This example workflow assumes that ServiceNow is configured for LDAP and an LDAP server is configured to accept the new user accounts. The Active Directory user management activities are not dependent on LDAP, but the presence of LDAP makes this example workflow much easier. You must provide the domain controller’s IP address to the workflow, either by hardcoding it, adding another workflow input, or using a script to look it up from the CMDB.

1. Navigate to Workflow > Workflow Editor.
2. In the Workflow tab, click the + icon to create a new workflow using these variables:
   - Name: Sync AD User
   - Table: Global (global)
3. Click Submit.

A basic workflow with a Begin and End point appears on the canvas.

4. Click the menu icon in the upper left corner of the canvas and select Edit Inputs from the context menu.
5. In the Workflow Inputs form, click **New** in the **Variables** record list, and create a new variable, using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Reference</td>
</tr>
<tr>
<td>Label</td>
<td>User</td>
</tr>
<tr>
<td>Column name</td>
<td>u_user</td>
</tr>
<tr>
<td>Reference Specification &gt; Reference</td>
<td>User (sys_user)</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

7. In the **Custom** tab, expand **Custom Activities > Active Directory**.
8. Drag and drop the Update AD Object activity onto the transition line between the Begin and End points of the new workflow. This action automatically links the activity with the end point and opens the Workflow Activity property form.

9. Complete the form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as <strong>Update user data.</strong></td>
</tr>
<tr>
<td>Domain controller</td>
<td>The ServiceNow LDAP integration adds a reference to the LDAP server to which the user’s account is linked. To identify the LDAP server, enter the following statement: <code>${workflow.inputs.u_user.ldap_server.server_url}</code></td>
</tr>
<tr>
<td>Type</td>
<td>Type of AD object. In this case, the type is <strong>User</strong>, which is the default.</td>
</tr>
<tr>
<td>Object name</td>
<td>This example assumes that the ServiceNow user name matches the Active Directory sAMAccountName. Enter the following: <code>${workflow.inputs.u_user.user_name}</code></td>
</tr>
<tr>
<td>Object data</td>
<td>Updates the user’s account in Active Directory, if the user exists. In this example, the user’s title is updated: <code>{&quot;title&quot; : &quot;QA&quot;}</code></td>
</tr>
</tbody>
</table>

10. Click **Submit**. The workflow looks like this:

![](Updating AD user.png)

**Updating an AD user**

11. Attach both activity outcomes (Success and Failure) to the end point.

At this point, the workflow takes a ServiceNow user record as input and updates the First Name, Last Name, and Title of the corresponding Active Directory account. If the account does not exist in Active Directory, the workflow fails.
12. To prevent the workflow from failing, add a Create AD Object activity to the transition lines between Begin and the Update AD Object activity.

13. Complete the Workflow Activity property form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as Create user data.</td>
</tr>
</tbody>
</table>
| Domain controller | Same as for the update activity.     |\$
| Ou             | The organizational unit to which this object belongs. For the purpose of this example, you can enter OU=HQ,OU=Managed Objects |
| Object name    | Same as for the update activity.     |\$
| Object data    | Creates an account with only the user name in it. For the purpose of this example, you can enter {"givenName": "\$

14. Click Submit.

15. Connect the Failure outcome of the Create AD Object activity to End.

For this example, we are ignoring errors. The workflow now looks like this:

Creating an AD user

This procedure builds a simple workflow that creates a bare-bones Active Directory account consisting of a user name only. The workflow then updates that account with additional information provided by the ServiceNow User (sys_user) table. However, we do not want to
execute the Create AD Object activity if the user account already exists. The workflow needs
to query Active Directory for matching user records and then branch the workflow based on
the results of the query. If an account already exists, then the workflow should update the
account. If the account does not exist, then the workflow should create the account in Active
Directory.

16. Drag and drop the Query AD activity onto the transition between Begin and Create AD
Object.

17. Complete the Workflow Activity property form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as <strong>Search for existing account</strong>.</td>
</tr>
<tr>
<td>Domain controller</td>
<td><code>${workflow.inputs.u_user.ldap_server.server_url}</code></td>
</tr>
</tbody>
</table>
| Properties  | A comma-separated list of Active Directory properties to return. For example,
givenName, SN, title. If the parameter field is blank, then all properties are returned. In this
workflow, we leave the field blank. |
| Search filter | An LDAP filter string that defines the search parameters. Use any valid LDAP filtering
criteria. To find user accounts matching the input record, we use:
(samaccountname=${workflow.inputs.u_user.user_name}) |

18. Click **Submit**.
19. Connect the Failure outcome for the query activity to the End point.
   Remember that we are ignoring errors in this workflow.
20. Connect the Success outcome of the query activity to the Update AD Object activity.
   The workflow now looks like this:
**Querying AD for user accounts**

The Query AD activity returns its results as a JSON string in the workflow data bus. This JSON string is always an array of objects. Each object corresponds to an Active Directory entry that matched the query. Our workflow should branch, whether that array is empty or not.

21. Drag a standard If activity from the Conditions folder in the Core tab and drop it onto the transition between Query AD and Update AD Object.

22. Complete the Workflow Activity properties form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as Account exists.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to open the Script field.</td>
</tr>
<tr>
<td>Script</td>
<td>For the If activity to work correctly, we must return a yes or no in the answer variable (var) which corresponds to the Yes and No outcomes of the query activity. Line 1 converts the Query AD results from a JSON string into a Javascript array called queryResults. Line 2 checks the length of that array. If the array is more than 0, a match to the account was found, and we set our answer to yes. Otherwise, the answer is no.</td>
</tr>
</tbody>
</table>

```javascript
var queryResults = new JSON().decode(data.get(5).output);
answer = (queryResults.length>0 ? 'yes' : 'no');
```
Note: The expression `data.get(5)` in this script identifies the Query AD output in the Databus by order number, since it was the fifth activity added to the workflow.

Query AD outputs in the Databus

23. Click Submit.
24. In the canvas, create a transition from the Yes outcome of the If activity to the Update AD Object activity.
25. Create a transition from the No outcome of the If activity to the Create AD Object activity.
This is the final step. This workflow will query Active Directory to determine if an account already exists. If an account exists, the workflow updates that account. If an account does not exist, the workflow creates the account and then updates the Active Directory with the configured user data set.

Creating the conditional paths

Orchestration activity packs

The base Orchestration system includes packs of custom activities you can use to automate typical IT and business processes in your network.

Activity packs allow you to automate several common business processes, such as managing Active Directory accounts and Exchange server mailboxes. Activity packs can also automate IT functions such as starting and stopping Windows servers, joining domains, assigning IP addresses, and configuring load balancers.

Use an activity pack

The Packs tab of the Workflow Editor contains any activity packs downloaded from the ServiceNow Store and any activity packs that you create.

Roles required: admin, activity_admin, activity_creator

You can organize custom activities into packs and upload them to the ServiceNow Store. Your custom packs do not appear in the tree until at least one activity in the pack is published. Activities added to an existing pack are not displayed until they are published. Activity packs from any application scope can appear in the Packs tab, regardless of the current scope setting for the instance.

1. In the Workflow Editor palette, select the Packs tab.
2. Click the download icon.
The hierarchy in the tab organizes packs by vendor, scope, category, and activity.

### Active Directory activity pack

The Active Directory (AD) activity pack enables an administrator to create, delete, and manage objects in Windows Active Directory, such as users, groups, and computers, using a ServiceNow Orchestration workflow.

Activities in this pack can reset a password automatically from a user request or manage any user account in Active Directory, whether or not it was created by an Orchestration workflow.

Domain controllers are identified by the IP address of the host machine. To use the hostname of the domain controller, add the Resolve DNS Name activity to resolve the hostname into an IP, and then pass the IP into the Active Directory activity.

Your instance must have access to a MID Server configured to use PowerShell to run these activities.

**Note:** All Active Directory activities pass through error messages returned from Active Directory. To view these error messages, point to the failed activity in the workflow canvas or select the Workflow Log tab in a Workflow Context record.
Custom Active Directory activities

Orchestration provides custom Active Directory activities that were created with the Orchestration Create a PowerShell activity, starting with the Geneva release. These activities perform the same functions as AD activities by the same name from previous releases and replace those activities for all new workflows. Existing workflows from earlier versions that were created with legacy AD activities continue to function normally after an upgrade to Istanbul. However, all new workflows must use these custom AD activities. The Powershell activity template gives workflow administrators the ability to store input and output variables from the Query AD activity in the Databus.

Note: To use the Active Directory custom activities, you must request activation of the Orchestration - Active Directory plugin.

Active Directory credentials with LDAP

If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do not use the user name and password configured on LDAP Servers. You must create a Windows type orchestration credential record. The username and password in the credentials record is used for LDAP queries that Orchestration and workflow activities perform.

Connection port used by AD Orchestration activities

All Active Directory activities use port 389 for LDAP access. If you are using AD activities with Oracle Virtual Directory (OVD) as a proxy, set up pass-through on port 389 only.

Add User to Group AD activity

The Add User to Group activity adds a user to a group in Windows Active Directory.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Input variables

Add User to Group input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>UserName</td>
<td>Name of the user to add to the group.</td>
</tr>
<tr>
<td>GroupName</td>
<td>Name of the group to which this user is added.</td>
</tr>
</tbody>
</table>
Output variables

Add User to Group output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Either <strong>success</strong> or <strong>failure</strong>.</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The <code>executionResult.errorMessages</code> from the Activity designer parsing sources.</td>
</tr>
</tbody>
</table>

Conditions

Add User to Group conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>User was successfully added to group.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to add the user to the group. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Change AD User Password activity

The Change AD User Password activity changes the password for an Active Directory user account.

This activity requires the user’s current password to run, unlike the **Reset AD User Password** activity. If the new password violates any Active Directory password requirements, such as length or character combinations, the activity fails and returns the appropriate error message. This error message appears in the ECC queue and in hint text when a user points to the activity in the Workflow Editor.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Active Directory**.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Change AD User Password input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>User</td>
<td>The sAMAccountName of the Active Directory user account.</td>

</table>

### Active Directory credentials with LDAP

If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do not use the user name and password configured on LDAP Servers. You must create a `Windows type orchestration credential record`. The username and password in the credentials record is used for LDAP queries that Orchestration and workflow activities perform.
Create AD Object activity

The Create AD Object activity creates an object in Windows Active Directory.

This activity fails if it finds an existing object with matching input variables.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Create AD Object input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>Type</td>
<td>The object type to create: user, group, or computer.</td>
</tr>
<tr>
<td>OU</td>
<td>The organizational unit to which this object belongs.</td>
</tr>
<tr>
<td>ObjectName</td>
<td>The sAMAccountName of the Active Directory object. Object name is also used for the name attribute in Active Directory. This behavior is available in ActiveDirectory.psm1. Whatever is passed as the Object name becomes both the samAccountName and the name of the new user in Active Directory.</td>
</tr>
<tr>
<td>ObjectData</td>
<td>A JSON object containing Active Directory property names and their corresponding values. For example:</td>
</tr>
<tr>
<td></td>
<td>`{</td>
</tr>
<tr>
<td></td>
<td>&quot;givenName&quot; : &quot;John&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;SN&quot; : &quot;Doe&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;title&quot; : &quot;Sr. Account Specialist&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;allowLogin&quot; : true</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td>This example sets the first name (givenName), last name (SN), and title on the Active Directory user account and allows that user to log in (allowLogin). This field allows expression evaluation via the ${} variable substitution syntax.</td>
</tr>
</tbody>
</table>

<td>Failure</td>
<td>An error occurred while attempting to create the AD object. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Disable AD User Account activity

The Disable AD User Account activity disables a Windows Active Directory user account, making it inactive.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Is AD Account Locked activity

The Is AD Account Locked activity determines whether an Active Directory user account is locked. An account may be locked automatically if a user enters an incorrect password more times than allowed by the Active Directory security policy. You can unlock an account using the Unlock AD User Account activity.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

</tbody>
</table>

Query AD activity

The Query AD activity retrieves entries from the Windows Active Directory based on an LDAP search filter and stores the results as a JSON string that can be used in the data bus.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory > .

**Note:** This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul and will continue to save query results to the scratchpad. However, all new workflows must use the custom version of this activity. This activity was built with the Create a PowerShell activity, which stores input and output variables in the databus instead of the scratchpad.

Input variables

<td>An error occurred while attempting to remove the user from the group.</td>
</tr>
</tbody>
</table>

Reset AD User Password activity

The Reset AD User Password activity resets the password of a user account in Windows Active Directory.

If the new password violates any Active Directory password requirements, such as length or character combinations, the reset activity fails and returns the appropriate error message. This error appears in the ECC Queue and when you point to the activity in the Workflow Editor.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

</table>

Update AD Object activity

The Update AD Object activity updates an object in Windows Active Directory.
This activity only replaces existing values with new values. It cannot add new values to AD records such as adding a new group member to an AD group. For complex AD operations, use the Run PowerShell activity instead. The activity fails if it cannot find an existing account with matching object name and data.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Azure AD activity pack

The Azure AD activity pack enables an administrator to automate employee onboarding and offboarding functions on Azure AD and manage Office 365 licensing.

Use the Azure AD activities to add and remove users to Azure Active Directory, manage security group membership, and assign or remove Office 365 licenses for individual users.

The Azure AD activities were created with the Orchestration REST Web Service activity template.

Add User to Group Azure AD activity

The Add User to Group activity adds a user to an existing security group in Azure Active Directory.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Azure AD. This activity was built with the REST web service activity template.

**Important:** The REST message used for this activity must be configured to use OAuth2 authentication.

Input variables

Add User to Group input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_id</td>
<td>Object ID (GUID) of the member to be added.</td>
</tr>
<tr>
<td>group_id</td>
<td>Object ID (GUID) of the target group.</td>
</tr>
</tbody>
</table>

Get User Info Azure AD activity

The Get User Info activity returns the named user's information from the Azure Active Directory.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Azure AD. This activity was built with the REST web service activity template.

Important: The REST message used for this activity must be configured to use OAuth2 authentication.
## Input variables

**Check If User Exists input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_id</td>
<td>The object ID (GUID) or the user principal name of the target user. An example of a user principal name is <a href="mailto:someuser@a830edad9050849NDA1.onmicrosoft.com">someuser@a830edad9050849NDA1.onmicrosoft.com</a></td>
</tr>
</tbody>
</table>

**Note:** Version 2 of this activity enforces input validation. If empty, the following message appears: "Mandatory input 'user_id' is empty".

## Output variables

**Check If User Exists output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error</td>
<td>Returns the error string from the REST message. If there are no errors, this variable returns a null value.</td>
</tr>
<tr>
<td>body</td>
<td>Contains a string value representing the output from the REST message.</td>
</tr>
<tr>
<td>status_code</td>
<td>Contains the status code returned from the Web service.</td>
</tr>
<tr>
<td>user_info</td>
<td>The <code>user_info</code> array contains attributes that can be leveraged by other activities as inputs. For example, the user <code>object_id</code> output (GUID) can be passed to the Add User to Group activity as the <code>user_id</code> input.</td>
</tr>
</tbody>
</table>

- `accountEnabled`: Boolean variable indicating whether the user's account is active or inactive.
- `displayName`: Users display name, such as jacinto.gawron.
- `userPrincipalName`: User's name in email format, such as jacinto.gawron@wammo.com.
- `mailNickname`: User's email alias.

### Exchange activity pack

The Exchange activity pack allows workflows to manage Microsoft Exchange mail systems. The use of Orchestration Exchange activities requires the following:

- Microsoft Exchange 2010 or 2013.
- A MID Server configured to run Powershell 2.0
- A target Exchange server in the same Active Directory domain as the instance.
- Powershell Remoting enabled on the target Exchange server.

**Note:** These activities cannot be used to interact with Microsoft Exchange Online.

Orchestration provides custom Exchange activities that were created with the Orchestration activity designer template. These activities perform the same functions as Exchange activities by the same name from previous releases and replace those activities for all new workflows. The custom Exchange activities were built with a **Powershell activity template**, which gives workflow administrators the ability to store input and output variables in the **databus**.

**Note:** Existing workflows from earlier versions that were created with legacy Exchange activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom Exchange activities.

To use the Microsoft Exchange custom activities, you must request activation of the Orchestration - Exchange plugin. The custom Exchange activities are available in the Workflow Editor on the **Custom** tab. Expand the **Custom Activities** tree and select the **Exchange** category for the activity you want to use.
Accessing custom Exchange activities

**Configure MID Server for Exchange**

Configure a MID Server with defined IP ranges to use Exchange.
If the MID Server manages resources within defined IP ranges, instead of all computers on your network, you must perform additional configuration steps to run Exchange activities. You do not need to perform these steps if your MID Server uses the default configuration.

1. In the navigation filter, enter `cmdb_ci_dns_name.list`.
2. Click **New**.
3. Enter the fully-qualified domain name (FQDN) of your Exchange server in the **Name** field.
4. Right-click the form header and select **Save**.
5. In the **IP Address** related list, click **New**.
6. In the **IP Address** field, enter the IP address of your Exchange server.
7. In the **Nic** field, select **eth0** or your preferred network interface controller.
8. Leave the **Netmask** field blank.
9. Click **Submit**.

**Pass multivalued properties with an Exchange activity**

To set a multivalued property using an Exchange activity, you must use a specific parameter format.

The Optional parameters shared input variable allows you to set **multivalued properties**.

- To set a multivalued property, replacing any existing values, use this format: 
  "PropertyName":("value1,value2,value3")
- To add values, use this format: "PropertyName":"+(value1,value2,value3);"
- To remove values, use this format: "PropertyName":"-(value1,value2,value3);"
- To both add and remove values, use this format: "PropertyName":"-(value1,value2,value3); + (value1,value2,value3);"

**Create Address List activity**

The Create Address List activity creates a new address list that acts as an alias for emailing all users in the group.

This alias cannot be used to manage user permissions. This activity implements the Microsoft Exchange **New-AddressList** command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Address List**.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the **PowerShell activity designer**, which gives workflow administrators the ability to store input and output variables in the **databus**.

**Input variables**

**Create Address List input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>

### Move Address List activity

The Move Address List activity moves a Microsoft Exchange address list to another location in the address hierarchy.

This activity implements the Microsoft Exchange *Move-AddressList* command.

The Exchange server caches the changes from this activity but does not immediately apply them. Use the *Update Address List* activity after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Address List.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Set Address List activity

The Set Address List activity modifies a Microsoft Exchange address list.

Use the Optional parameters variable to pass specific values to the Microsoft Exchange server. This activity implements the Microsoft Exchange `Set-AddressList` command.

The Exchange server caches the changes from this activity but does not immediately apply them. Use the `Update Address List` after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Address List.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Update Address List activity

The Update Address List activity adds or removes users from the specified address list and immediately applies any cached address list changes to the server.

Use the optional parameters variable to specify which users to add or remove. This activity implements the Microsoft Exchange `Update-AddressList` command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Address List**.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

**Create Mailbox activity**

The Create Mailbox activity creates a new Active Directory user, if that user does not already exist, and a Microsoft Exchange mailbox for that user.

This activity implements the Microsoft Exchange *New-Mailbox* command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Mailbox**.

*Note:* This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity
was built with the *PowerShell activity designer*, which gives workflow administrators the ability to store input and output variables in the *databus*.

<td>Failure</td>
<td>The activity failed to delete the specified user's mailbox.</td>
</tr>
</tbody>
</table>

### Disable Mailbox activity

The Disable Mailbox activity disables the mailbox associated with a specified Active Directory account.
This activity implements the Microsoft Exchange `Disable-Mailbox` command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Mailbox.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

### Input variables

**Disable Mailbox input variables**

</tbody>
</table>

### Enable Mailbox activity

The Enable Mailbox activity creates a new mailbox for an existing Active Directory user.

This activity implements the Microsoft Exchange `Enable-Mailbox` command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Mailbox**.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the `databus`.

</tbody>
</table>

### Get Mailbox activity

The Get Mailbox activity gets the mailbox for the specified user or all mailboxes on a Microsoft Exchange server.

This activity implements the Microsoft Exchange Get-Mailbox command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Mailbox.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the
Deprecated activity: your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the **PowerShell activity designer**, which gives workflow administrators the ability to store input and output variables in the **databus**.

**Input variables**

### F5 Network Management activity pack

Orchestration provides custom activities for configuring elements of an F5 load balancer, including pools, pool members, and the virtual servers contained in the pool.

All F5 custom activities are in the F5 Network Management Application scope and are activated by the Orchestration - F5 network management plugin, which must be activated by request.

ServiceNow provides custom F5 activities, built from the **REST web service activity template**, that you can use to perform the following tasks:
- Add, delete, or verify pools.
- Add, delete, or identify pool members.
- Add or delete virtual servers.
- Add a profile to a virtual server.
- Configure the virtual server for vlans, irules, pool, and persistence.

**Add F5 Pool Member activity**

The Add F5 Pool Member activity adds a member to an F5 load balancer pool.

This activity was built using the *REST web service activity template*. To access the activity in the Workflow Editor, select the *Custom* tab, and then navigate to *Custom Activities > Active Directory*.

**REST settings**

- **REST message**: F5 POOL Membership Management
- **REST function**: post

**Input variables**

**Add F5 Pool Member input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PoolName</td>
<td>Name of this pool, such as <code>testPool</code></td>
</tr>
<tr>
<td>F5IPAddress</td>
<td>IP address of the F5 console.</td>
</tr>
<tr>
<td>MemberName</td>
<td>Pool member IP address and port, such as <code>192.168.2.19:80</code>.</td>
</tr>
</tbody>
</table>

**Output variables**

**Add F5 Pool Member output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Success or failure.</td>
</tr>
<tr>
<td>status_code</td>
<td>The HTTP status code.</td>
</tr>
<tr>
<td>error</td>
<td>The REST error.</td>
</tr>
<tr>
<td>output</td>
<td>The REST output.</td>
</tr>
</tbody>
</table>
Conditions

Add F5 Pool Member conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully added an F5 load balancer pool member.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to add an F5 load balancer pool member.</td>
</tr>
</tbody>
</table>

Get F5 Pool Member activity

The Get F5 Pool Member activity returns the pool members and verifies the pool's status.
Use this activity to verify that a pool member was created properly.
This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

REST settings

Infoblox DDI activity pack

This activity pack supports Infoblox DDI management through ServiceNow Orchestration.

The Infoblox DDI activity pack manages the IP addresses used in a network by integrating DNS and DHCP. Custom Orchestration activities use Infoblox Web API (WAPI) REST web services to access the Infoblox GRID server.

**Important:** Managing IP addresses through the Infoblox server requires a fully functional MID Server.

Starting with the Jakarta release, the Infoblox activity pack updates to version 2. This update supports Infoblox network views, which can restrict the visibility of network data. The view parameter can be passed as a query parameter or payload content, to do operations in a specific view. Version 2 also supports specifying the version of WAPI to use in integration endpoints.

Supported for Infoblox:

- WAPI version 2.0 for REST messages
- NIOS appliance version 7.0

**Note:** To use the Infoblox DDI activities and workflow, you must request activation of the Orchestration - Infoblox DDI Activity Pack plugin.

Create a REST credential for Infoblox activities

All Infoblox activities require a REST credential to manage IP addresses from the Infoblox DDI server.
Before starting this procedure, make sure you have the following:

- A properly configured and running Infoblox DDI Grid Server.
- REST credentials defined on the Infoblox DDI server.

Role required: admin

You must create a REST credential record on the ServiceNow instance that each Infoblox activity can use to access management features on the Infoblox server.

1. Navigate to Orchestration > Credentials and click New.
2. In the list of credential types, select Basic Auth Credentials.
3. Create the credential record with a logical name, such as InfobloxCred.
4. Right-click in the header bar of your new credential record and select Copy sys_id from the context menu. Follow browser instructions to copy the sys_id if browser security measures restrict this function.
5. Paste the sys_id into the restCredentials input field of each activity you use.

**Infoblox workflows**

The Infoblox DDI activity pack includes two default workflows, one that reserves and registers IP addresses and another that releases IP addresses.

To access these workflows, navigate to Workflow > Workflow Editor and select the Workflows tab. Click on a workflow to open it, and then click the information icon in the workflow header to display the properties dialog box.

**Infoblox Reserve/Register IP in IPAM**

Use this workflow to register IPv4 addresses or request the next available IP address on IPAM. Optionally, you can use it to register IP addresses on DNS. The custom Infoblox activities used in this workflow are:

- IPAM Register IP Address
- IPAM Reserve IP Address
- Register DNS A-Record
- Get Network Details

**Infoblox Reserve/Register IP input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infoblox Server</td>
<td>IP address of the Infoblox DDI server.</td>
</tr>
<tr>
<td>Network</td>
<td>Network containing the target IP address.</td>
</tr>
<tr>
<td>Zone</td>
<td>The DNS zone for the IP address being registered.</td>
</tr>
<tr>
<td>Rest Credentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>DNS Host Name</td>
<td>Name of the DNS server machine on which the IP address is being registered.</td>
</tr>
<tr>
<td>IPv4 Address</td>
<td>IP address being reserved or registered.</td>
</tr>
</tbody>
</table>
Infoblox Release IPAM Reservations

Use this workflow to release (delete) all the IPAM reservations associated with an IPv4 address. The custom Infoblox activities used in this workflow are:

- IPAM List IP Reservations
- List DNS Record
- DNS Delete
- IPAM Delete

### Infoblox Release IPAM Reservations input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rest Credentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>

<tr>
<td>IP to Delete</td>
<td>IP address to release.</td>
</tr>
<tr>
<td>Infoblox Server</td>
<td>IP address of the Infoblox DDI server.</td>
</tr>
</tbody>
</table>

### Infoblox roles and permissions

Define the roles and permissions that the Infoblox activities need to access the various resources on the Infoblox server.

#### Admin groups

There are three types of admin groups on an Infoblox server:

- Superuser
- Default
- Limited Access

To perform specific operations on the Infoblox server, the Limited Access user must have a minimum set of privileges for the desired resources, using either the user interface or an API. These privileges are based on read and read/write access. For more information, refer to the “About Admin Groups” section in the Infoblox NIOS Administrator Guide.

#### Permission hierarchy

1. **User**: A user can be part of multiple groups.
2. **Group**: A group can have many roles.
3. **Role**: Each role consists of specific resource permissions.

#### Required permissions

The ServiceNow Infoblox activity pack requires appropriate read and read/write privileges for these resources:

- Network
This example shows a default DHCP admin role, its resources, and the related permissions for each.
Infoblox permissions

<table>
<thead>
<tr>
<th>Group/Role</th>

</tbody>
</table>
Infoblox DHCP activities

The Infoblox DHCP activities manage the IP addresses reserved for DHCP in your network. Use these activities to reserve, list, or delete IP addresses that are used for DHCP assignment in your network.

**DHCP Reserve IP v4 Address Range activity**

The DHCP Reserve IP v4 Address Range activity reserves an IP address range for DHCP use. The DHCP activities use the [REST web service activity template](https://docs.servicenow.com/app/Infoblox-DDI-DHCP) to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DHCP.

### Input variables

**DHCP Reserve IP v4 Address Range input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InfobloxServer</td>
<td>Name of the Infoblox DDI Grid Server.</td>
</tr>
<tr>
<td>startIpAddress</td>
<td>Beginning IPv4 address of the range to reserve.</td>
</tr>
<tr>
<td>endIpAddress</td>
<td>Ending IPv4 address of the range to reserve.</td>
</tr>
<tr>
<td>restCredentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>api_version</td>
<td>Defines the version of WAPI to use for the integration endpoints. The default value is 2.0.</td>
</tr>
</tbody>
</table>

**Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>view</td>
<td>Name of the Infoblox network view. The default value is default.</td>
</tr>
</tbody>
</table>

**Note:** If the field is empty, the operation is treated as happening in the default view.

### Output variables

**DHCP Reserve IP v4 Address Range output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DHCPIpAddressRange</td>
<td>Range of reserved IPv4 addresses.</td>
</tr>
<tr>
<td>error</td>
<td>Displays the message for any REST error encountered.</td>
</tr>
</tbody>
</table>
Conditions

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully reserved the specified IPv4 address range.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to reserve the specified IPv4 address range.</td>
</tr>
</tbody>
</table>

**DHCP Delete IP Reservation activity**

The DHCP Delete IP Reservation activity deletes IP reservations in DHCP using either an IPv4 or IPv6 address range.

An automation can obtain an Infoblox DHCP object to delete from either of these activities:

- **DHCP List IP Reservations**
- **DHCP Reserve IPv4 Address Range**

The DHCP activities use the *REST web service activity template* to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Infoblox DDI > DHCP**.

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>

</tbody>
</table>

DHCP List IP Reservations activity

The DHCP List IP Reservations activity generates a list of all the DHCP range reservations on a specific InfoBlox server.

The DHCP activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DHCP.

Input variables

</table>

### Infoblox DNS activities

The Infoblox DNS activities manage DNS records in your network using an Infoblox DDI Grid Server. Use these activities to register, list, or delete DNS records managed on an Infoblox server.

**List DNS C-records activity**

The List DNS C-records activity retrieves all canonical (CNAME) records from a specified Infoblox server.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Infoblox DDI > DNS**.
### Input variables

Register DNS A-record activity

The Register DNS A-record activity creates a DNS A record on a specified Infoblox server.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DNS.

Input variables

Infoblox IPAM activities

The Infoblox IPAM activities manage IP addresses in your network using an Infoblox DDI Grid Server. Use these activities to register, reserve, list, or delete IP addresses.

**IPAM Register IP Address activity**

The IPAM Register IP Address activity registers an IP address in a network using Infoblox IPAM.

The output of this activity produces an InfoBlox IP address record that can be used for other IPAM functions in the format fixedaddress/<encrypted key>:<reserved ip address>/<view>.

The IPAM activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Infoblox DDI > IPAM**.

IPAM List IP Reservations activity
The IPAM List IP Reservations activity returns an array of all IP Address within the named InfoBlox Server.

The IPAM activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > IPAM.

Infoblox network activities

The Infoblox network activities manage networks using an Infoblox DDI Grid Server. Use these activities to create, list, or delete networks on an Infoblox server.

Create Network activity
The Create Network activity creates new networks on a specified Infoblox server.

The network activities use the REST web service activity template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > Network.

Input variables

## PowerShell activity pack

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

Orchestration provides custom PowerShell activities that were created with the PowerShell activity designer template. These activities perform the same functions as PowerShell activities by the same name from previous releases and replace those activities for all new workflows. These custom activities give workflow administrators the ability to store input and output variables in the databus.

### Note:
Existing workflows from earlier versions that were created with legacy PowerShell activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom PowerShell activities.

Starting with the Orlando release, there are the following updates to the PowerShell activity pack:

- A new PowerShell probe (V2), which takes advantage of IntegrationHub functionality
- The ability to insert debug statements in the PowerShell scripts and produce the resulting messages at runtime

To use the PowerShell custom activities, you must request activation of the Orchestration - PowerShell plugin. These activities are available in the Workflow Editor on the Custom tab. Expand the Custom Activities tree and select the PowerShell category for the activity you want to use.

ServiceNow supports PowerShell 3.0 to 5.1.

## PowerShell activity designer

PowerShell activities are configured to return data to a workflow from a host using Microsoft PowerShell.

You must purchase Orchestration to use this template. For specific information about using the tools in the activity designer, refer to these resources:

- Orchestration activity designer
- Create input variables
- Create a parsing rule

ServiceNow supports PowerShell 3.0 to 5.1.
PowerShell protocols and troubleshooting

PowerShell uses the Windows Management Instrumentation (WMI) and Windows Remote Management (WinRM) protocols to enable Orchestration activities to run commands on remote Windows hosts.

Windows Management Instrumentation (WMI)

WMI provides a uniform interface for any local or remote applications or scripts that obtain management data from a computer system, a network, or an enterprise. WMI contains these components:

- **Managed objects and WMI providers**: A WMI provider is a COM object that monitors one or more managed objects for WMI. A managed object is a logical or physical enterprise component, such as a hard disk drive, network adapter, database system, operating system, process, or service.
- **WMI infrastructure**: The WMI infrastructure is a Microsoft Windows operating system component know as the WMI service (winmgmt). The WMI infrastructure is composed of the WMI Core and the WMI repository. The WMI repository is organized by WMI namespaces. The WMI service creates namespaces, such as `root\default`, `root\cimv2`, and `root\subscription`, at system startup and preinstalls a default set of class definitions, including the Win32 Classes, the WMI System Classes, and others. The remaining namespaces found on your system are created by providers for other parts of the operating system or products.
- **WMI consumers**: A WMI consumer is a management application or script that interacts with the WMI infrastructure. A management application can query, enumerate data, run provider methods, or subscribe to events by calling either the COM API or the Scripting API for WMI.

WMI installation and configuration

For the MID Server to successfully make a remote connection to the target host, TCP port 135 must be open. The Windows firewall automatically creates an inbound rule for WMI connectivity called Windows Management Instrumentation (DCOM-In).

Windows Remote Management (WinRM)

WinRM is the Microsoft implementation of WS-Management Protocol, a standard Simple Object Access Protocol (SOAP) protocol that allows hardware and operating systems from different vendors to interoperate.

WinRM contains these components:

- **WinRM Scripting API**: This scripting API enables Orchestration to obtain data from remote computers, using scripts that perform WS-Management protocol operations.
- **WMI Service**: The WMI service continues to run side-by-side with WinRM and provides requested data or control through the WMI plug-in. You can continue to obtain data from standard WMI classes, such as as Win32_Process.

WinRM configuration

WinRM is automatically installed on Windows 2008 R2 and above operating systems, but must be configured before use.
1. In a command prompt, enter `winrm quickconfig`. This command is not case sensitive.

2. When the console displays `Make these changes (y/n)?`, enter `y`.

   The `winrm quickconfig` command performs the following operations:
   - Starts the WinRM service, and sets the service startup type to `auto start`.
   - Configures a listener for the ports that send and receive WS-Management protocol, using either HTTP or HTTPS on any IP address.
   - Creates a firewall exception for the current user profile.

**MID Server PowerShell files**

PowerShell functions are stored in script files (*.ps1) that use a PowerShell Script module (*.psm1) file name extension.

The PowerShell functions are used by the PowerShell MID Server script files included in these activity packs:

- Active Directory
- Exchange
- SCCM
- PowerShell

**PSScript.ps1**

This script performs a few tasks, such as credential testing, password encryption, and the execution of scripts configured in the Orchestration Activity Designer or in MID Script Files. However, this document focuses on how PSScript.ps1 uses the `credential.psm1` module for testing access to remote hosts.

The PowerShell variables are generally used directly in the `PowerShell execution command` or as arguments in the MID Server script file you specify. There are special variables that are passed to PSScript.ps1, such as `credType.`
Using credType in execution parameters
PowerShell credTypes

The PowerShell credential types:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WMI</td>
<td>testCredentialWMI</td>
</tr>
<tr>
<td>Exchange</td>
<td>testCredentialExchange</td>
</tr>
<tr>
<td>AD</td>
<td>testCredentialAD</td>
</tr>
<tr>
<td>SCCM</td>
<td>testCredentialSCCM</td>
</tr>
</tbody>
</table>

If no credential type is passed to the PSScript.ps1 script, the MID Server defaults to the WMI test function to test access to the target host. If there is a credential type used, the MID Server runs the corresponding test function for that credential type.

Exit codes

These exit codes are returned from the PSScript.ps1 script and logged in the MID Server log file.

<table>
<thead>
<tr>
<th>PSScript.ps1 exit codes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>------</td>
</tr>
<tr>
<td>0</td>
</tr>
<tr>
<td>1</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>3</td>
</tr>
<tr>
<td>4</td>
</tr>
</tbody>
</table>

DiagnosticsUtil.psm1

The MID Server uses this module file to perform PowerShell logging that assists debugging any Orchestration activity using PowerShell scripting. You can also add debugging statements directly to custom scripts.
# PowerShell diagnostic utilities

<table>
<thead>
<tr>
<th>Utility</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNCLog-DebugInfo</td>
<td>Log a debug message for a PowerShell script or PowerShell Orchestration activity. Examples:</td>
</tr>
<tr>
<td></td>
<td>- SNCLog-DebugInfo -message &quot;My debug message...&quot;</td>
</tr>
<tr>
<td></td>
<td>- SNCLog-DebugInfo &quot;My debug message&quot;</td>
</tr>
<tr>
<td>SNCLog-ParameterInfo</td>
<td>Log a function parameter value. For &quot;function getHostName{ param( [String] $target )}&quot;&quot;, the first value to the PowerShell hashtable is a string to indicate which function executes, and the values for each of the function parameters. Examples:</td>
</tr>
<tr>
<td></td>
<td>- Function with single parameter: SNCLog-ParameterInfo @(&quot;Running getHostName&quot;, $target)</td>
</tr>
<tr>
<td></td>
<td>Note: The debug message shows, &quot;Running getHostName $target: [actual value of $target]&quot;.</td>
</tr>
<tr>
<td></td>
<td>- Function with multiple parameters: SNCLog-ParameterInfo @(&quot;Running functionName&quot;, $param1, $param2, $param3)</td>
</tr>
<tr>
<td>SNCObfuscate-Value</td>
<td>Use this utility to encrypt values for security purposes. The function displays &quot;$variableName&quot;: ***, where *** is the obfuscated value. Example:</td>
</tr>
<tr>
<td></td>
<td>- SNCObfuscate-Value $password</td>
</tr>
<tr>
<td></td>
<td>Note: The debug message reads: &quot;$password: ***&quot;.</td>
</tr>
</tbody>
</table>

## Credentials.psm1

The MID Server uses this module file to test access to a target host. The MID Server loops through all Windows credentials stored in its credentials table using the following access type functions, unless the PowerShell activity has a credential type (**credType**) defined. All ServiceNow® authored PowerShell activities are hard-coded to use a specific credential type. As a result, the MID Server only tests credential access against the designated function.
### PowerShell test functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>testCredentialWMI</td>
<td>Tests the given user and password on the target host using the <code>Get-WMI</code> object.</td>
</tr>
<tr>
<td>testCredentialAD</td>
<td>Tests the given user and password on the target host using the built-in <code>DirectoryEntry</code> object.</td>
</tr>
<tr>
<td>testCredentialExchange</td>
<td>Tests the given user and password to create a session on an Exchange host. This test uses the built-in PowerShell remoting feature on a remote host. WinRM is configured on Exchange servers by default.</td>
</tr>
<tr>
<td>testCredentialSCCM</td>
<td>Tests the given user and password to create a session on an SCCM server. This test uses the built-in PowerShell remoting feature on a remote host. This test requires WinRM to be configured.</td>
</tr>
<tr>
<td>testNoCredentialAccessWMI</td>
<td>Tests the given user and password on the target host, using the <code>Get-WMI</code> object. This test is used when no <code>credType</code> is used.</td>
</tr>
</tbody>
</table>

**Note:** If the test passes using one of these functions, that credential is used to run the PowerShell script/command. If the tests fail to access the target host using these functions, the MID Server runs the PowerShell script/command under the account of the MID Server service.

This diagram illustrates the dependency of the credential selection behavior on the host being targeted by the PowerShell activity. If the target host is the IP address or host name of the MID Server, the MID Server bypasses all credentials in the Credentials table and uses the account of the MID Server service. If the target host is not the MID Server, then all Windows credentials are used first. If all credentials in the Credentials table are unsuccessful in running the PowerShell activity, then the MID Server uses the MID Server service account.
PowerShell credential selection criteria
**ActiveDirectory.psm1**

This module file stores the functions used by the PowerShell scripts shipped with the *Active Directory* activity pack.

**Exchange.psm1**

This module file stores the functions used by the PowerShell scripts shipped with the *Exchange* activity pack.

**SCCM.psm1**

This module file stores the functions used by the PowerShell scripts shipped with the *SCCM* activity pack.

*Set up credential tags for a PowerShell activity*

Credential tagging gives an administrator more control over the credentials used in a PowerShell activity.

**Role required:** admin, activity_creator or workflow_admin

Tagging is useful when the activity requires specific credentials to perform a task. By populating the **Credential tag** field you are telling the activity to use a credential that has a specific tag set for it. Additionally, credential tagging allows you to use a different underlying credential in development, testing, and production systems without having to change the activity for a given target system. For example, you can use the *SCCMCred* tag and have it point to both a development and test instance.

1. Navigate to Orchestration > Credentials.
2. Select the credential you want to tag.
3. Enter a unique name in the **Tag** field that is descriptive of the credentials purpose.
Credential tag definition

4. Click **Update**.
5. Open the Workflow Editor and select the PowerShell activity you want to tag.
6. In the activity's Execution Command, add the name of the tag you created to the **Credential tag** field.
Adding a credential tag to an activity

Credential tag: AD User Admin

Required MID Server capabilities: PowerShell
PowerShell troubleshooting

Authentication and access denied errors can prevent PowerShell activities from running a command on a target host.

Use these procedures for troubleshooting authentication failures with Orchestration PowerShell activities and when the Remote Procedure Call (RPC) server is unavailable or when access is denied. The authentication failure error displays when all credentials, including those of the local MID Server service account, do not have the correct permissions to run the Powershell script/command. The same error displays when the target host is unreachable.

Authentication error message

Authentication failure in an Active Directory activity

This example uses the Create AD Object activity to illustrate troubleshooting authentication failure in PowerShell.

Role required: Permissions to access and create accounts on Active Directory

Validate that the account you are using has the proper permissions to run the activity.

1. Log on to the target machine using the account under which you want to run the activity. Active Directory tools must be installed on this machine.
2. Launch the Active Directory Users and Computers application.
3. Navigate to the OU under which you want to create the Active Directory object.
4. Attempt to create the object.

If this procedure is successful under the specified user, the following might be the cause of the authentication failure:

- User name is invalid.
- Password entered incorrectly.
- Domain controller is unreachable.

Note: The majority of the return codes listed in the MID Server log for this error are 1s and 3s. This is because the Active Directory activities use the ADSI provider and not WMI or WinRM. An error code of 1 means the account was able to connect with the test account, but running the script failed.
An error code of 3 means that the MID Server attempted to run the PowerShell activity under the MID Server service account but failed.

Authentication failure in an Exchange activity

This example uses the Create Mailbox activity to illustrate troubleshooting authentication failure in PowerShell.

Role required: Permissions to access and create mailboxes on the Exchange server

1. Validate that the account you are using has the proper permissions to run the PowerShell activity.
2. Log on to a machine that has the Exchange Management Shell (EMS) installed.
3. Create a user using the **New-mailbox** Exchange commandlet.
Creating a new user in Exchange

If this procedure is successful under the specified credential, the following is the likely cause of the failure:

- User name is invalid.
- Password entered incorrectly.
- Exchange server is unreachable.

4. If the Exchange server is unreachable, examine the MID Server logs. Because the Exchange activities use WinRM to access the Exchange server, the logs can provide more troubleshooting information.

Note: Ensure that the error is NOT WinRM cannot process the request.

Remote Procedure Call (RPC) server unavailable or access denied
Typically, this error is logged when running a PowerShell script/command that uses WinRM or WMI.

Possible causes of error

The target host might have one of these issues:

- WinRM isn’t configured.
- Firewall is blocking access to the host over TCP port 135 (WMI) or HTTP/HTTPs and TCP port 5985 (WinRM).
- Kerberos issue, caused by hopping to multiple hosts using WMI.
Example WinRM error

The Create Mailbox activity from the Exchange activity pack has generated an error in the ECC queue involving authentication using the MID Server service credential. This occurred because the MID Server credential is the last to be used if the targeted host is not the MID Server.

Authentication failure error message

The MID Server log shows that the MID Server tried to run the activity under specific credentials, but wasn’t successful and received an exit code of 1.

MID Server error code

```
Attempting to use credential with username 'service-now\joel.zamalloa'

```
Join Domain activity

The Join Domain activity joins a Windows computer to a domain.

If the computer is already a member of a domain, this activity completes without modifying the computer. Joining a domain requires a username and password. This user must have domain administration privileges or privileges to join a computer to the domain.

<i>Note: This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the <i>PowerShell activity designer</i>, which gives workflow administrators the ability to store input and output variables in the <i>databus</i>.

Input variables

Join Domain input variables

<table>
<thead>
<tr>
<th>Variables</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of the Windows server that is joining the domain.</td>

Install Windows App activity

The Install Windows App activity installs an application from an MSI package on a Windows target machine.

Note: This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Install Windows App input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS MID Server capability to resolve hostnames into IP addresses.</td>
</tr>
<tr>
<td>installerpath</td>
<td>Path to the installer. The installer can be on any machine that is visible to both the MID Server and the target machine (local drive, UNC path, mapped drive, etc.).</td>
</tr>
<tr>
<td>installer</td>
<td>Name of the installer file, such as winzip150.msi. The installer must be an MSI package.</td>
</tr>
<tr>
<td>arguments</td>
<td>The parameter that contains the command line arguments to the MSI package. These are name=value pairs, separated by a space. For example, the argument might appear as: INSTALLDIR=c:\myinstallfolder ADDDESKTOPICON=0. These arguments are dependent on the what the actual MSI being installed defines. If there are no arguments, leave the field empty.</td>
</tr>
</tbody>

<tr>
<td>Failure</td>
<td>The Windows application failed to install on the target machine</td>
</tr>
</tbody>
</table>

Enable WMI Windows Installer provider

To install software on Windows machines using the Install Windows App activity, enable WMI Windows Installer provider on all target machines.

- It is recommended that the MID Server, the target machine, and the installer source machine be on the same Active Directory domain. However, if these computers are on separate domains, those domains must have a trust relationship established between them.
- If the installer path is a UNC file sharing machine, the Active Directory account of the target computer must be trusted for delegation. For instructions on this configuration, see the posting on the community for installing and uninstalling Windows applications.

**Note:** See WMI Providers for a list of Windows operating systems that provide this tool by default.

1. Open the Control Panel.
2. Go to Add or Remove Programs.
3. Select Add/Remove Windows Components.
   This action opens a secondary window displaying additional selections.
5. Select WMI Windows Installer Provider check box.
6. Click OK to return to the Windows Components Wizard window.
7. Click Next.
   You might be asked for the Windows installation CD to complete this process.
Change Service State activity

The Change Service State activity starts or stops a Windows service on a remote system. This activity replaces a Powershell activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the **Powershell activity template**, which gives workflow administrators the ability to store input and output variables in the **databus**.

**Input Variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS activity to resolve hostnames into IP addresses.</td>
</tr>
<tr>
<td>service</td>
<td>Name of the Windows service to start or stop. The <code>service</code> parameter is the service name, not the display name of the service affected.</td>
</tr>
<tr>
<td>state</td>
<td>There are two actions to select for a service state change: <code>StartService</code> or <code>StopService</code>.</td>
</tr>
</tbody>
</table>

**Output variables**

</tr>
</tbody>
</table>

**Conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The target service was successfully started or stopped.</td>
</tr>
<tr>
<td>Failure</td>
<td>The update to the target service was unsuccessful, or the service was not found on the target system.</td>
</tr>
</tbody>
</table>
Restart Windows Server activity

The Restart Windows Server activity stops and then restarts a Windows server using Powershell.

**Note:** This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity template, which gives workflow administrators the ability to store input and output variables in the databus.

### Input variables

Probe activity pack

Orchestration provides an activity pack customized using the ServiceNow activity designer that runs probes on target hosts to return specific information.
These custom activities were built with the Create a probe activity, which gives workflow administrators the ability to store input and output variables in the databus.

To use the custom probe activities, you must request activation of the Orchestration - Probe plugin.

Resolve DNS Name activity

The Resolve DNS Name activity takes an IP address or a fully qualified domain name (FQDN), which it resolves into one or more IP addresses.

The domain name is sent through the MID Server to the domain name system (DNS) to resolve the name. If a single IP address is returned, it is stored in two variables: resolved_ip and resolved_ips. If multiple IP addresses are returned, the first IP address is stored in the resolved_ip variable, and all the addresses are stored in the resolved_ips variable. If an IP address is provided instead of an FQDN, this address is output directly to both variables. Your ServiceNow instance must have access to a MID Server configured to use Resolve DNS to run this activity.

This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Probe activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

<table>
<thead>
<tr>

SNMP Query activity

The SNMP Query activity queries an SNMP device.

Your ServiceNow instance must have access to a MID Server configured to use SNMP to run this activity.

This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the `Probe activity template`, which gives workflow administrators the ability to store input and output variables in the `databus`.

Input variables

SNMP Query input variables

<table>

SCCM activity pack

The Microsoft System Center Configuration Management (SCCM) activity pack provides Orchestration activities you can use to manage software deployments and collections on an SCCM server.

You can use SCCM Orchestration activities to deploy and revoke software from an SCCM server or manage user and device collections. The system manages software on an SCCM server using Orchestration activities and workflows.

Client software distribution requires:

- SCCM 2012 R2 and later.
- Powershell 3.x.
- Powershell Remoting enabled.
- The Windows PowerShell x86 execution policy must be set to unrestricted mode.
- Latest version of the SCCM cmdlet library installed on the SCCM server.
- Use the credentials to log onto the SCCM Server and connect via Windows PowerShell from the System Center Configuration Manager console at least once to set the path variable for that credential.

Request SCCM activities

The Orchestration - System Center Configuration Manager plugin installs the SCCM activity pack that deploys software from an SCCM host and manages user and device collections.

Role required: admin

The SCCM plugin is activated automatically when the Orchestration - Client Software Distribution (com.snc.orchestration.sccm_mgnt) plugin is activated, but can be activated separately.

Note: The activities in the SCCM plugin run in the System Center Configuration Manager scope.

1. From your instance, navigate to System Definition > Plugins.
2. On the All Applications page, click Request Plugin to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Date and time to enable</td>
<td>Date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.

5. Click Submit.

**Configure the MID Server for SCCM activities**

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

Role required: admin

1. In the navigation filter, enter `cmdb_ci_dns_name.list`.
2. Click New.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the Name field.
4. Right-click in the form header and select Save.
5. In the IP Address related list, click New.
6. In the IP Address field, enter the IP address of the SCCM server.
7. In the Nic field, select eth0 or your preferred network interface controller.
8. Leave the Netmask field blank.
9. Click **Submit**.

### Add to Device Collection activity

The Add to Device Collection activity adds the specified device into a Microsoft System Center Configuration Manager (SCCM) device collection.

The Add to Device Collection activity uses the **Powershell activity template** to add a specified device to an SCCM device collection. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called **AddToDeviceCollection.ps1** to edit the collection.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > System Center Configuration Manager (SCCM)**.

**Note:** The Add to Device Collection activity does not use pre-processing or post processing scripts.

### Input variables

**Add to Device Collection input variables**

<table>

</table>
Add to User Collection activity

The Add to User Collection activity adds a user to a Microsoft System Center Configuration Manager (SCCM) user collection.

The Add to User Collection activity uses the Powershell activity template to access the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called AddToUserCollection.ps1 to edit the collection.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

**Note:** The Add to User Collection activity does not use pre-processing or post processing scripts.

</tbody>
</table>

Get Applications activity

The Get Applications activity returns a list of all the applications available on a Microsoft System Center Configuration Manager (SCCM) server.

The Get Applications activity uses the Powershell activity template to access the applications on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called GetApplications.ps1. This script filters the results of the GET, so that only specific attributes are returned for the applications on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable application data. The list of available applications is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

Note: The Get Applications activity does not use a pre-processing script.

Input variables

Get Applications input variables

## Get Device Collections activity

The Get Device Collections activity returns the list of available device collections on a Microsoft System Center Configuration Manager (SCCM) host.

The Get Device Collections activity uses the **Powershell activity template** to access the collections on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `GetDeviceCollections.ps1` that returns the device collections on the server. This script filters the results of the GET, so that only specific attributes are returned for the device collections on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable device collection data. The list of available collections is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > System Center Configuration Manager (SCCM)**.

**Note:** The Get Device Collections activity does not use pre-processing scripts.

Get User Collections activity

The Get User Collections activity returns the list of available user collections on a Microsoft System Center Configuration Manager (SCCM) server.

The Get User Collections activity uses the Powershell activity template to access the user collections on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called GetUserCollections.ps1 that returns the user collections on the host. This script filters the results of the GET, so that only specific attributes are returned for the user collections on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable user collection data. The list of available collections is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).
**Note:** The Get User Collections activity does not use pre-processing scripts.

### Input variables

Is Device in Collection activity

This activity verifies if a device exists in an SCCM device collection.

The Is Device in Collection activity uses the PowerShell activity template to verify if a specific device exists in an SCCM device collection. The activity is configured to use a MID Server with PowerShell capabilities and to run a MID Server script called IsDeviceInCollection.ps1 to perform the test.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

Is User in Collection activity

This activity verifies if a user exists in an SCCM user collection.
The Is User in Collection activity uses the *PowerShell activity template* to verify if a specific user exists in an SCCM user collection. The activity is configured to use a MID Server with PowerShell capabilities and to run a MID Server script called *IsUserInCollection.ps1* to perform the test.

To access this activity in the Workflow Editor, select the *Custom* tab, and then navigate to *Custom Activities > System Center Configuration Manager (SCCM)*.

### Remove from Device Collection activity

The Remove from Device Collection activity removes a device from a Microsoft System Center Configuration Manager (SCCM) device collection.

The Remove from Device Collection activity uses the *Powershell activity template* to remove a device from a device collection on a Microsoft SCCM server. The activity is configured to use a MID Server with Powershell capabilites and to run a MID Server script called *RemoveFromUserCollection.ps1* to edit the collection.
To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > System Center Configuration Manager (SCCM)**.

### Input variables

**Remove from Device Collection input variables**

SFTP File Transfer activity pack

Use the SFTP File Transfer activities to manage files and directories on an SFTP server and to move files from one SFTP server to another.

The SFTP activity pack includes scoped activities for common file transfer tasks and a ready-to-use workflow that includes these activities. Use the SFTP workflow to control which files are going to be moved, what conditions the files need to meet, the order in which the files are moved, and which overwrite options are executed.

Note: To use the SFTP File Transfer activities and workflow, you must request activation of the Orchestration - SFTP plugin.
SFTP File Transfer workflow

The SFTP File Transfer activity pack includes a scoped workflow that uses multiple activities to manage files on SFTP servers.

The maximum activity count for the SFTP File Transfer workflow is set to 10,000. This allows the workflow to move up to 1000 files from one server to another.

Accessing the workflow

- Navigate to Workflow > Workflow Editor and select the Workflows tab.
- Click on the SFTP File Transfer workflow to open it.
- Click the information icon in the workflow header to display the properties dialog box.

<tr>
<td>Upon success, remove files from source</td>
<td>Check box to delete original files from the source directory when they are copied to the new location. Clear this check box to keep the source files in their current location in the source host.</td>
<td>false</td>
</tr>
</tbody>
</table>
### File selection logic

When selecting the files to move from the source host, the system uses this logic:

- If the **Source files** and **Excluded files** fields are empty, the system moves all the files in the source directory.
- When the **Include subfolders** check box is selected, the following dependencies exist:
  - If no files are specified in the **Source files** and **Exclude files** fields, the system moves all files in the source directory and all files in all subfolders of the source directory.
  - If the **Source files** field contains file names, the system moves those files from their location on either the source directory or any of its subfolders.
  - If the **Exclude files** field contains file names, the system moves all the files from the source directory and its subfolders except those excluded files.
- When the **Include subfolders** check box is cleared, the system looks only in the source directory for files to move or exclude.

### Copy File activity

The Copy File activity copies a file from an SFTP server (source host) to another SFTP server (target host).

### Input variables

**Copy File input variables**

<table>
<thead>
<tr>
<th>Variable</th>

<tbody>
<tr>
<td>Success</td>
<td>The activity succeeded in renaming the file or directory.</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to rename the file or directory.</td>
</tr>
</tbody>
</table>

**Set File Attributes activity**

The Set File Attributes activity sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.

A good practice is to use the Get File List activity to return a list of files and their attributes first. Then, when you moved a file from a source host to a target host, use the Set File Attributes activity to set the source file attributes on the target file. This is demonstrated in the `SFTP File Transfer` workflow.

**Input variables**

**Set File Attributes input variables**

<table>

SSH activity pack

Orchestration provides an activity pack of SSH activities that were customized using the ServiceNow activity designer.

These activities perform the same functions as SSH activities by the same name from previous releases and replace those activities for all new workflows. The custom SSH activities were built with the Create an SSH activity, which gives workflow administrators the ability to store input and output variables in the databus.

Note: Existing workflows from earlier versions that were created with legacy SSH activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom SSH activities.

To use the SSH custom activities, you must request activation of the Orchestration - SSH plugin.

Secure Copy activity

The Secure Copy activity copies a file from one host to another, without storing the copied file on the MID Server.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer template, which gives workflow administrators the ability to store input and output variables in the databus.

</tr>
</tbody>
</table>

### Files Compare activity

The Files Compare activity compares two files on a Linux or UNIX computer. This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the `SSH activity designer template`, which gives workflow administrators the ability to store input and output variables in the `databus`.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Global > Orchestration - SSH**.

</tbody>
</table>

File Read activity

The File Read activity reads a file on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer template, which gives workflow administrators the ability to store input and output variables in the databus.
To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Global > Orchestration - SSH**.

## Input variables

</tr>
</tbody>
</table>

## File Write activity

The **File Write activity** writes a file on a Linux or UNIX computer.

The source file can be an absolute or relative path from the Directory. If an absolute path is used, then no value is required in the **Directory** field.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the **SSH activity template**, which gives workflow administrators the ability to store input and output variables in the **databus**.

File Copy activity

The custom File Copy activity copies a file on a Linux or UNIX computer.
This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer template, which gives workflow administrators the ability to store input and output variables in the databus.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Global > Orchestration - SSH.

File Replace String activity

The File Replace String activity finds and replaces a string in a file on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows
must use the custom version of this activity. This activity was built with the SSH activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Reset Linux User Password activity

The **Reset Linux User Password** activity resets the password for a given user on a Linux computer. This activity requires that the user executing the command be able to run the `chpasswd` command and, if expiring the password immediately, to run `chage` with `sudo` privileges.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the [SSH activity template](https://github.com/ServiceNow/ssh-activity), which gives workflow administrators the ability to store input and output variables in the databus.

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>IP address of the target Linux machine.</td>
</tr>
<tr>
<td>user</td>
<td>Name of the user whose password is being reset.</td>
</tr>
<tr>

</table>

Global activities

Global activities are Orchestration activities created in the global scope.

Any activities you create in the global scope are listed in the Global category in the Packs and Custom tabs of the Workflow Editor.
Test Server Alive activity

The Test Server Alive activity determines if a target system is alive by its response to a particular protocol.

This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will
continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the *Probe activity template*, which gives workflow administrators the ability to store input and output variables in the *databus*.

### Input variables

**Test Server Alive input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port_probes</td>
<td>A comma separated list of protocols to use to check for signs of activity on the target machine (example: <code>wmi,wins,https,ssh,http,https,snmp,dns</code>)</td>
</tr>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target system to check.</td>
</tr>
</tbody>
</table>

### Output variables

**Test Server Alive output variables**

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity determined that the device is running.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to determine if the target device is running. Failure could be caused by a missing protocol or a device that is not accessible.</td>
</tr>
</tbody>
</table>

### Orchestration activity designer

The Orchestration activity designer enables a user with either the workflow_admin or activity_creator and workflow_creator roles to construct reusable activities that suit an organization's business needs.

Activities created by the activity designer offer the following advantages over core activities offered in previous releases:

- Reuse *custom activities* in multiple workflows.
- Upload and download custom activities from the ServiceNow Store.
- Parse data from standard input formats.
- Test input variables against a target host or endpoint and inspect the payload.
- Automatically map values from a test payload to an activity's output variables.
- Share data between activities.
- View previous versions of an activity.

Access to the activity designer requires activation of ServiceNow Orchestration. For instructions about managing transitions and conditions for all activities, see Workflow activities.

Orchestration provides numerous pre-defined activities, which are reusable components that can be used in numerous workflows without having to understand the complexities of the underlying system. These activities are grouped into activity packs, which address specific business needs, such as: Active Directory, Azure AD, Exchange, Infoblox DDI, and PowerShell. There are other ServiceNow applications which provide and maintain their own separate activity packs, such as Security Incident Response, Cloud Management, or Release Automation.

Customers can also build their own activities and activity packs. You can construct custom activities with a specified template through the Orchestration Activity Designer. Custom-built activities built with the Activity Designer are referred to as activity elements. Activity elements provide optimal operations, enable code reuse, and minimize the need to write code. They also enable you to follow the flow of data within a given workflow across orchestration activities. Incorporating activity elements limits the dependency on the scratchpad which reduces problems in complex workflows. Limit the use of core activities, like `Run Script`, unless you need direct access the scratchpad, for example, for a counter. Activity elements do not have direct access to the scratchpad. You can, however, pass scratchpad variables as inputs into your activities.

Orchestration activities created by the activity designer:
- Can be uploaded and shared in the ServiceNow App Store
- Use the databus, which allows the activity to have well-defined inputs and outputs
- Share data across activities within a workflow
- Use versioning
- Provide a consistent approach for activity development regardless protocol

**Note:** Prior to the Fujirelease, activities were built with Activity Definitions. In Fuji, a new architecture was introduced using the Activity Designer. Orchestration Core activities, built originally as Activity Definitions, have been converted to use the new template format (Activity Elements) and the databus offered with the activity designer. Workflows in upgraded instances that use legacy activities continue to work normally.

For instructions on using activities to construct a workflow, see Add an activity to a workflow.

**Introduction to credentials, connections, and aliases for Orchestration**

All application integrations in Orchestration require connection information, credentials, and connection and credential aliases to their respective applications to access resources.

Before you can execute an application integration in Orchestration, you must create and configure the corresponding connection information and credentials. The Connections pertains to an integration with a system, such as an IP address or endpoint with protocols. It contains specific details, such as database particulars, when integrating with a database. The associated Credentials are the authentication data required to make the connection.

Connection information and credentials can vary between QA/Development/Production environments for the same integration. The tight coupling between this data and application metadata, such as workflow or job scheduling, make application metadata obsolete when you change environments. To alleviate this problem, the concept of an alias is introduced, for
connections and credentials, to decouple this data from application metadata. These aliases allow customers to design their application metadata to couple to an alias, which during runtime resolves to connection and credential data.

There are two types of aliases, a connection and credential alias and a credential alias. There are business rules that enforce certain constraints on these aliases. Names should contain alphabets, numbers, and underscores but cannot have special characters. The alias must be unique in a scope. If you choose to have multiple active connections, you can have more than one active connection in the same domain. If you do not choose this option, you can have only one active connection per domain.

Note: If you enable multiple active connections, when the connection records resolve, your application picks one connection based on an established order. The order of the connections depends on the API you use to retrieve connection data.

You can add additional connection attributes to an alias, which are available in connection data during run time. Variables overridden by connection administration during run time should not affect the alias.

The credential alias resolves only credential data. Along with alias data model, you can use a scriptable API which can get connection and credential data during runtime.

Using Connection and Credential Alias with Orchestration

Define an alias to label a credential or connection record.

The Credential and Connection Alias defines an alias that labels a credential or connection record. It is extended from the sys_metadata table. It requires the admin role. The credential_admin and connection_admin have read access to sys_alias. A connection alias contains:

Name
Name of the alias.

ID
This field is based on the format ‘scope name.alias name’ Unique index on ID to ensure unique record based on scope name + name. If the scope is global, the ID is the alias name.

Type
You can select either ‘Credential’ or ‘Connection and Credential’. The default is Connection and Credential.

Connection type
This field is applicable when the alias type is set to Connection and Credential. There are three connection types: HTTP, JDBC, JMS. The default is HTTP.

If you create a workday alias in global scope, the ID is set to workday

If you create a workday alias in hr app scope, the ID is set to x_hr_app.workday

- Name can only contain alphabets, numbers and underscore.
- During the upgrade, the tag in credential record will be migrated to connection alias. If the tag in previous release’s credential record contains special characters other than alphabets, numbers and underscore, the tag data will be preserved during the upgrade. The user still can use these connection alias, but the user cannot update these alias, unless he removes these special characters when do the update.
Using credentials with Orchestration

Orchestration requires credentials to access resources.

Credential table

The credential table (discovery_credential) defines credentials that can be used for integration. In the previous release, the Credential table contains a string-type tag field, which labels a credential and the tag is used in orchestration activities. In the madrid release, we rename tag to credential alias, and change the type from string to GlideList, which is a reference to connection alias table.

Credential types

The following credential types are provided:

<table>
<thead>
<tr>
<th>Credential type</th>
<th>Description</th>
<th>Supports Test Credential option</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applicative credentials</td>
<td>The credentials to explore the applications on a device or computer.</td>
<td>No</td>
</tr>
<tr>
<td>Amazon Web Service credentials</td>
<td>The Amazon Web Services (AWS) master account, access key ID, and secret access key.</td>
<td>No</td>
</tr>
<tr>
<td>Note: You cannot test AWS credentials through the Test</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Azure Service Principal and Enterprise Agreement credentials</td>
<td>The Azure service principals required for an Azure subscription.</td>
<td>No</td>
</tr>
<tr>
<td>Basic authentication credentials</td>
<td>A user name and password.</td>
<td>No</td>
</tr>
<tr>
<td>CIM credentials</td>
<td>The user name and password required to access a CIMOM - Common Information Model Object Manager (CIM) server, which obtains information about VMware ESX servers.</td>
<td>No</td>
</tr>
<tr>
<td>Cloud credentials</td>
<td>Credentials that Orchestration uses to access cloud resources.</td>
<td>No</td>
</tr>
<tr>
<td>JDBC credentials</td>
<td>A user name and password to access a Java Database Connectivity (JDBC) connection.</td>
<td>Yes</td>
</tr>
<tr>
<td>JMS credentials</td>
<td>A user name and password to access to a Java Message Service (JMS).</td>
<td>Yes</td>
</tr>
<tr>
<td>OAuth 2.0 credentials</td>
<td>OAuth 2.0 credentials enable ServiceNow to obtain access to user accounts on an HTTP service.</td>
<td></td>
</tr>
<tr>
<td>SNMP community credentials</td>
<td>The community string to access devices via SNMP.</td>
<td>Yes</td>
</tr>
<tr>
<td>Credential type</td>
<td>Description</td>
<td>Supports Test Credential option</td>
</tr>
<tr>
<td>-------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------------------------------</td>
</tr>
<tr>
<td>SNMPv3 credentials</td>
<td>The user name and keys required to access devices on your SNMP v3 network.</td>
<td>Yes</td>
</tr>
<tr>
<td>SSH credentials</td>
<td>The user name and password to access Linux and Unix devices.</td>
<td>Yes</td>
</tr>
<tr>
<td>SSH private key credentials</td>
<td>The private key credentials to access Linux and Unix devices.</td>
<td>Yes</td>
</tr>
<tr>
<td><strong>Note:</strong> For better security, SSH private key credentials are recommended over SSH password credentials.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>VMware credentials</td>
<td>Credentials to access vCenter resources. These credentials are required for any work that is performed on vCenter, such as cloning a virtual machine.</td>
<td>Yes</td>
</tr>
<tr>
<td>Windows credentials</td>
<td>The user name and password required to access Windows computers. Several permission requirements must be met to use Windows credentials.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**How MID Servers use credentials**

By default, Windows MID Servers use the login credentials of the MID Server service on the host machine to discover Windows devices in the network. You should configure these service credentials so that they have domain or local administrator privileges. For Linux and UNIX machines and network devices, the MID Server uses the SSH and SNMP credentials configured in the instance in Discovery > Credentials.

MID Servers that Orchestration uses must have access to the necessary credentials to execute commands on computers in the network as specified by the Workflow activities. Orchestration can use the same SSH and SNMP credentials as Discovery, but has two additional credentials designed for specific Workflow activities: Windows (for PowerShell) and VMware.

**Encryption and decryption**

The platform stores credentials in an encrypted field on the Credentials (discovery_credentials) table. Once they are entered, they cannot be viewed.

When credentials are requested by the MID Server, the platform decrypts the credentials using the following process:

1. The credentials are decrypted on the instance with the password2 fixed key.
2. The credentials are re-encrypted on the instance with the MID Server's public key.
3. The credentials are encrypted on the load balancer with SSL.
4. The credentials are decrypted on the MID Server with SSL.
5. The credentials are decrypted on the MID Server with the MID Server's private key.
Note: The platform does not have separate encryption keys for multi-tenant instances.

Credential order

Credentials can be assigned an order value in the Credentials form, which forces the application to try all the credentials at their disposal in a certain sequence. If you do not specify an order value, the application tries the credentials in the Credentials (discovery_credential) table randomly, until it finds one that works, such as when Orchestration attempts to run a command on an SSH server (such as a Linux or UNIX machine), or when Discovery attempts to query an SNMP device (such as a printer, router, or UPS).

After identifying the credentials for a device, Discovery and Orchestration create an affinity between the credentials and the device using the Credential Affinity [dscy_credentials_affinity] table. All subsequent discoveries or Orchestration activities attempt to match the credentials in this table with a device for which an affinity exists. If credentials for a device change, Discovery and Orchestration try all available credentials again until they create a new affinity.

Note: If Orchestration and Discovery are installed, and credential alias is enabled, multiple affinities can exist. In this case, the platform looks up credentials for each affinity and inserts the credential for the affinity with the lowest order into the probe.

Ordering credentials is useful in the following situations:

- The credentials table contains many credentials, with some used more frequently than others. For example, if the table contains 150 SSH credentials, and 5 of those are used to log into 90% of the devices, it is good practice to configure those five with low order numbers, which places them at the top of the execution list. Discovery and Orchestration will work faster if they try these common credentials first. After the first successful connection, the system knows which credentials to use the next time for each device.
- The system has aggressive login security. For example, if the Solaris database servers in the network only allow three failed login attempts before they lock out the MID Server, configure the database credentials with a low order value.

Credential alias

Credential alias allows flow and workflow creators to:

- Assign individual credentials to any activity in an Orchestration workflow
- Assign individual credentials to any action in Flow Designer
- Assign different credentials to each occurrence of the same activity type in an Orchestration workflow.
- Assign different credentials to each occurrence of the same action in designer flow.

Credential alias also works with credential affinities.

External credential stores

If you do not want credentials stored in your instance, you can use external credential repositories. External credential stores save the credentials in an external site that your instance can access. Only CyberArk is supported.
Connections with Orchestration

Use the connections table to setup a JMS, JDBC, or HTTP(s) connection to a target host.

Connection Table

The Connection table (sys_connection) is the base table for all connection tables. You can setup connections for the following protocols:

- JDBC
- JMS
- HTTP(s)

The connection table references the connection alias table, which couples the connection alias to connection information. Every connection records the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the connection. This field must be unique on the table.</td>
</tr>
<tr>
<td>Credential</td>
<td>Specify the credential to use with this connection. This is optional.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>The connection alias resolves your connection and credentials at run time. Only one connection is active per Connection alias at any one time.</td>
</tr>
<tr>
<td>Active</td>
<td>Check to make the current connection active.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain to which the connection belongs.</td>
</tr>
</tbody>
</table>

Credential is unique across active connections, if not empty

Upgrading connection information

The JDBC connection (jdbc_connection) and JMS connection (orch_jms_ds) tables are existing Orchestration connection tables. In madrid, we re-parent them to extend from Connection (sys_connection) table. They move from Orchestration run time plugins to Credentials & Connections plugins. They are originally extended from sys_metadata. The sys_metadata related data will be removed. JDBC field name changes:

- JDBC server is renamed to host
- Database port is renamed to port

Create custom activities using custom activity designer templates

You can create and update different types of custom activities in the Workflow Editor using a custom template.

Roles required: workflow_admin or activity_creator
The Activity Designer contains common steps which are applicable to all the activities that you create. This procedure guides you through the common steps and the order they should be set up. You specify an activity template before you create a custom activity.

1. Navigate to **Orchestration > Workflow Editor**. The **Welcome** tab of the Workflow Editor opens.
2. On the **Custom** tab in the palette, click + to create a new activity select the appropriate template from the list.

The Activity Designer form appears, with a stage indicator at the top. All new activities start at the **General** stage. The current stage shows with a blue underscore.

### Activity designer stage indicator

3. Add the **general properties**.
   This information is standard for each custom activity, include a name, description, and other related information.
4. Create the template *Create input variables* for the template. Create the variables to pass into the activity in the Inputs form of the activity designer.

5. Optional: Add a *pre-processing script*. For input validation or transforming input data, you might need a pre-processing script.

   **Note:** This step is not included in the Run Script activity.

6. Click **Continue** to open the Execution Command form, then fill out the **Execution Command** step based on the corresponding execution templates:
   - Create a SOAP web service activity
   - Create a JDBC activity
   - Create a JavaScript Probe activity
   - Create a PowerShell activity
   - Create a REST web service activity
   - Create a Probe activity
   - Create an SFTP activity
   - Create a Run Script activity
   - Create an SSH activity
   - Create a JMS activity

7. Optional: **Test your inputs.**

8. Optional: In the Outputs form, define local and/or output variables. Local variables can be used for temporary storage when cascading parsing rules. For example, you might extract an XML payload from within a JSON payload. A local variable can access the XML document and use that as a source for another parsing rule. The graphic shows a **Local1** variable source to parse data for **Output2**.

   ![Define local variable](image)

9. Use one of the options to assign values to Outputs:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parsing rule</td>
<td>You can create a parsing rule and map them to the output fields by dragging and dropping the variables into the parsing rules structure. The REST, SOAP, and JDBC templates provide auto-mapping to create the parsing rules automatically. If available from the test inputs form, auto-mapping should be used when possible.</td>
</tr>
</tbody>
</table>
### Option | Description
--- | ---
**Post-processing** | Post-processing scripts allow you to code your own output data validation, output parsing code, and related tasks. Post-processing executes after the execution command results have been returned and before the parsing rules and conditions are run. Click **Go to Post-Processing (Advanced)** to create a post-processing script.

**Note:** If you create a script, this step reflects as a stage in the indicator.

10. Click **Continue** to open the **Conditions** form to create exit condition rules for your activity and then click **Save**.

### General properties for activity designer templates

The following General Property fields are common to all activity designer templates.

**General Property fields common to all activity designer templates**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Descriptive name of the activity. Select a unique name that makes the activity easily identifiable in the palette. If you do not name the activity, it is identified in the <strong>Data</strong> tab of the Workflow Editor with an index number when it is added to a workflow. This index reflects the order in which the custom activity was added to the workflow. Only custom activities and their output variables appear in the <strong>Data</strong> tab.</td>
</tr>
<tr>
<td><strong>Short description</strong></td>
<td>Brief description of what the activity does.</td>
</tr>
<tr>
<td><strong>Image</strong></td>
<td>Icon that identifies an activity of this type in the workflow palette.</td>
</tr>
<tr>
<td><strong>Execution template</strong></td>
<td>Predefined template selected for this activity.</td>
</tr>
<tr>
<td><strong>Application</strong></td>
<td>Current scope set on the instance. To view the scope, click the gear icon on the right side of the title bar in any record or list and look at the value in the <strong>Application</strong> field. The activity runs in this scope within a workflow. You cannot view or change the scope for the instance in the Workflow Editor.</td>
</tr>
</tbody>
</table>
| **Accessible from** | Accessibility setting for this activity, by scope. The following options are available:  
  - **All application scopes**: This activity is available to all application scopes.  
  - **This application scope only**: Use of this activity is restricted to the scope named in the **Application** field. |
### Create input variables

Create the variables to pass into the activity in the **Inputs** form of the activity designer.

You must name your activity in the **General** form before you can advance to the **Inputs** stage.

**Roles required**: workflow_admin or activity_creator

**Note**: Variable strings in the **Inputs** form have a 255 character limit.

1. Click the ‼️ icon to create a new input variable.
   - The designer creates a default variable called `Input1`.

2. Type your new variable name in the field.

3. To change the name of a variable or any of its attributes, double-click the value and then select or enter a new value in the field that appears.

4. Configure your variable using these fields:
Variable configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Data type for this variable. Double-click on the field to display the choice list. In addition to the usual data types, you can create input arrays and encrypt individual variables that contain sensitive data. Encrypted variables are passed to the ECC Queue and then decrypted by the MID Server when they run on the target host. Sensitive data returned from running these variables on the host can then be passed to another activity through encrypted output variables.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Marks an input variable as mandatory. Variables marked as mandatory are required fields in the properties form for the activity in the workflow. The input testing feature allows you to filter on mandatory variables.</td>
</tr>
<tr>
<td>Default</td>
<td>Default value for this input variable. Default values are prepopulated for variables in the properties form for the activity in the workflow. You can override this value when you test the variables.</td>
</tr>
</tbody>
</table>

5. To reorder the variable list, select a row and then drag the row to its new location.

   When you select a row to move it, the pointer icon changes to an up/down arrow icon.

6. To delete a variable, click the delete icon in the row.

7. Click **Continue** to advance to the **Execution Command** stage or click **Go to Pre-Processing (Advanced)** to create a script that runs before the activity executes.

**Map an input variable**

After you create the input variables, map them to the fields in the Execution Command form.

Role required: activity_admin, activity_creator

These fields contain values required by the target host or endpoint to authenticate and query for data. Included in this example are fields for a command to run on the target and the MID Server to use, if one is required.

   To map a variable, drag it into the appropriate field.

   The designer automatically expresses the variable in the syntax the system requires.
Configure the PowerShell execution command

Use the input variables you created to configure the command that Orchestration executes on the Windows target machine.

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: activity_creator, admin

Note: You can test the PowerShell connection between the MID Server and the target computer without having to run the activity in a workflow context. For details, see test template outputs.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.

**Powershell command fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <em>Create variables to map</em> to available fields.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this PowerShell activity.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Script type</td>
<td>Type of script to run on the PowerShell host. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• Custom PowerShell command</td>
</tr>
<tr>
<td></td>
<td>• MID Server script file</td>
</tr>
<tr>
<td>MID Server script file</td>
<td>MID Server script file to run. This field is available when the Script type selected is MID Server script file.</td>
</tr>
<tr>
<td>Command</td>
<td>Command that this activity runs on the target host. This field is available when the Script type selected is Custom PowerShell command. You can drag and drop input variables from the variable builder into this field to create your command.</td>
</tr>
<tr>
<td>Powershell variables</td>
<td>Name-value pairs to pass to the host with PowerShell. You can create these variables manually, or drag input variables into the Value field. Encrypted input variables retain their encryption, regardless of the data type settings in this field. If you type in a value and select the Encrypted data type, your value appears in plain text in this field and is only encrypted when it passes to the ECC Queue.</td>
</tr>
<tr>
<td>Use MID service account</td>
<td>Forces this activity to authenticate on the target host using the credentials of the MID Server service account only, without trying any other credentials. When this check box is selected, the Credential tag field is not available.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>Specific credential alias this activity must use to run PowerShell commands on the host. If this field is left blank, the MID Server tries all the available credentials until it finds a valid one, ending with the MID Server service account. If a credential alias is defined, the MID Server tries the credentials for that alias only and does not try the MID Server service account. This field is not available when the Use MID service account check box is selected.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use for querying PowerShell, by capabilities. By default, the system selects a PowerShell MID Server.</td>
</tr>
</tbody>
</table>

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

**Test activity template inputs**

You can test the input parameters of a custom activity during its development without having to run the activity in a workflow context.

Create input variables and map them to fields in the **Execution Command** form or provide actual values for these fields.

Role required: web_service_admin, activity_admin, activity_creator

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
An input test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. You need to use a workflow to test a pre-processing or post-processing script. You do not need to check out the activity to test it, and you can test input variables from any stage in the activity designer, if your activity is properly configured. Typically, the **Execution Command** stage is the point at which your inputs are ready for testing.

**Note:** If you intend to use auto-mapping, you must test your input variables.

1. Click **Test Inputs**.

   The list of input source variables appears. If you added default values for these variables, those values appear in the **Substitute Value** column. Mandatory variables are marked with a red star. In this example, a SOAP endpoint returns a value for a stock quote variable.

2. Filter the variable list with these controls:
   - **All Inputs:** Displays all input variables. This is the default view.
   - **Mandatory Inputs:** Displays only mandatory input variables.
   - **Inputs Without Defaults:** Shows input variables that do not have assigned default values.

3. Reset values as needed.
   - **Reset default values:** Replaces any test values set in this form with the default values, if they are present.
   - **Clear values:** Clears all values in the input variable list, even if default values exist.

4. When your test values are configured correctly, click **OK**.

   The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the **Raw Output** window.
5. To map appropriate parameter values in the payload to variables in the Outputs stage automatically, select an auto-mapping option.
6. Alternately, you can click Save for parsing rules to copy the entire payload to the parsing rules.

Response payload from inputs test

```json
{
  "status_code": 200,
  "body": "<xml version="1.0" encoding="utf-8">"soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns:xsd="http://www.w3.org/2001/XMLSchema"><soap:Body><GetQuoteResponse xmlns="http://www.webserviceX.NET/"><GetQuoteResult>&lt;StockQuotes&gt;&lt;Stock&gt;&lt;Symbol&gt;MSFT&lt;/Symbol&gt;&lt;Name&gt;Microsoft Corp&lt;/Name&gt;&lt;Last&gt;183.44&lt;/Last&gt;&lt; rugs;uristic Kivamea PSEG PSEG &lt;Date&gt;7/16/2015&lt;/Date&gt;&lt;Time&gt;14:35pm&lt;/Time&gt;&lt;Change&gt;1.36&lt;/Change&gt;&lt;Open&gt;178.15&lt;/Open&gt;&lt;High&gt;180.61&lt;/High&gt;&lt;Low&gt;177.83&lt;/Low&gt;&lt;Volume&gt;66594609&lt;/Volume&gt;&lt;PreviousClose&gt;12.1486&lt;/PreviousClose&gt;&lt;MktCap&gt;12.1486&lt;/MktCap&gt;&lt;MarketChange&gt;1.13%&lt;/MarketChange&gt;&lt;AnnRange&gt;54.05 - 83.526&lt;/AnnRange&gt;&lt;YearLY Range&gt;13.16&lt;/YearLY Range&gt;&lt;Earnings&gt;&lt;/Earnings&gt;&lt;/Stock&gt;&lt;/StockQuotes&gt;&lt;/GetQuoteResponse&gt;&lt;/soap:Body&gt;&lt;/soap:Envelope>",
  "error": null,
  "header": {
    "X-AspNet-Version": "4.0.30319",
    "Date": "Thu, 16 Jul 2015 23:23:01 GMT",
    "Content-Length": "979",
    "Content-Type": "text/xml; charset=utf-8",
    "Server": "Microsoft-IIS/7.0",
    "X-Powered-By": "ASP.NET",
    "Cache-Control": "private, max-age=0"
  }
}
```
This allows you to manually select values for the output variables directly from the payload. This action completely overwrites any previous payload that existed in the parsing rules.

7. Click the X in the upper right corner of the window to close it.

**Data encryption for activity variables**

You can protect sensitive data passed from Orchestration activities by encrypting input and output variables.

The system never stores encrypted variables as clear text. If the MID Server is used to fulfill the activity, the corresponding ECC Queue's input payload is encrypted if an *encrypted output variable* is defined in the template. Output variables passed to a downstream activity as input variables maintain their encryption throughout processing.

Inputs that require data encryption come from one of these sources:

- **Workflows:** These inputs are provided through the Workflow Editor and must be in the password2 format for two-way encryption.
- **Service catalog requests:** These input values are provided to an activity as encrypted variables from a service catalog item.
- **GlideRecord:** These are variables attached to any ServiceNow table. The source column in the table must be a password2 type variable.
- **Activity outputs:** These are variables passed as outputs from one activity to a downstream activity as inputs, through the data bus.
- **Empty string:** The system allows you to define encrypted input variables but never pass a value into the variable.

**Activity designer template pre-processing fields**

Use the **Pre Processing** form of the activity designer to define a script to run before the activity executes.

**Pre-processing fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input process script</td>
<td>Script to run before the activity executes.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution parameters and input variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the pre-processing script with this syntax: <code>activityInput.variable</code>. Before the activity executes and makes a call to the service or host, you can override the effective execution value of this variable by assigning values to the executionParam.variable_name execution parameter. Refer to the specific execution parameters for your template.</td>
</tr>
</tbody>
</table>
Logging

Activity designers can add logging to the pre-processing using the `ActivityLogger` API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

**Important:** To display the debug messages in the workflow log, set the `glide.workflow.log.debug` property to `true`.

The supported messages are:

- `ActivityLogger.debug("Pre Processing Log Message")`;
- `ActivityLogger.info("Pre Processing Log Message")`;
- `ActivityLogger.warn("Pre Processing Log Message")`;
- `ActivityLogger.error("Pre Processing Log Message")`;

### ActivityLogger API

### Template post-processing fields

From the Post Processing form in the activity designer you can define a script to run after the activity executes.

### Post-processing fields

To use the results returned by the activity, append the `executionResult.` prefix to these parameters.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output process script</td>
<td>Script to run after the activity executes.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the output process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution results and the variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the post-processing script with this syntax: <code>activityInput.variable</code>. For parameter descriptions, refer to the table in the post-processing parameters topic for this activity.</td>
</tr>
</tbody>
</table>

---

### Logging

Activity designers can add logging to the post-processing script using the `ActivityLogger` API, which works for scoped or global applications. Logged data from the script appears in the Workflow Log related list in the context records for any workflow that uses the activity. The Source for these messages in the workflow log is `ACTIVITY`.

**Important:** To display the debug messages in the workflow log, set the `glide.workflow.log.debug` property to `true`.

The supported messages are:

- `ActivityLogger.debug("Post Processing Log Message");`
- `ActivityLogger.info("Post Processing Log Message");`
- `ActivityLogger.warn("Post Processing Log Message");`
- `ActivityLogger.error("Post Processing Log Message");`
ActivityLogger API

Auto-map activity output variables

You can map parameter values in a test payload to variables in the Outputs tab automatically.

Role required: admin

1. From the Execution Command in the template, select the Inputs tab.
2. Click Test Inputs to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
3. Provide test values, if requested, and click OK to display the payload.
   The entire payload appears in the Raw Output tab of the Response form.

4. Select an auto-mapping option:
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Auto-Map to Local      | Translates the entire payload into a JSON object and places it in the data bus. This allows for post-processing manipulation in JavaScript. This selection causes the entire data field on the right to disappear and the inputs structure to be auto-populated with these default variables:  
  - output  
  - totalRows  
  - errorMessage  
  - eccSysId                                                                                           |
| Auto-Map to Output     | Automatically populates the output variables in the activity with the same default variables used as inputs for the local variable.                |

**Note:** No parsing rules are available with auto-mapping selections.

**Create an output variable**

The **Outputs** form in the designer contains a variable builder for creating data structures of objects and arrays.

**Roles required:** activity_admin, activity_creator

Elements in this structure are mapped with **Create a parsing rule** to specific data contained in payloads returned from an endpoint or host. These variables and their values are then made available locally or for reuse in other activities.

1. Click the + icon in the **Outputs** column to create a local or output variable.

   Local variables are only available within an activity and are not visible in the data structures displayed in the **Custom** tab. Output variables are available for reuse in other activities, either individually or as an entire data structure. When you create a new variable of either type, the designer provides a default name of **Local1** or **Output1**.

2. Type your new variable name in the field and select a data type.

   Variable names must be unique within an array or an object. You can assign a data type of **Encrypted** to output variables that contain sensitive data. Data protected by encryption is passed to other activities or processes encrypted and is never displayed in plain text.

3. To change the name of a variable or any of its attributes, double-click the value, type a new value in the editing field, and then press Enter.

   The icon to the left of the name reflects the data type of the variable.

4. To reorder the variable list, select a row and then drag the row to its new location.

   When you select a row to move it, the pointer icon changes to an up/down arrow icon (▲▼).

5. Drag and drop the row into another location.

6. To reuse a variable from another activity, drag it from the **Custom** tab in the palette and drop it onto the **Local** or **Output** heading at the top of the variable list. To copy an entire data structure, drag the parent object or array into the variable list header.

   The designer duplicates the copied data structure in the outputs variable builder.
Reuse of data structures

7. To delete a variable, click the delete icon
   (−) in the row.

Activity designer template outputs
Output variables contain messages returned from a destination that are available to other activities in a workflow or internally to the activity.
Activity designer output fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable name</td>
<td>Name of a variable, either Local or Output, that this activity passes.</td>
</tr>
<tr>
<td>Local</td>
<td>Variable that contains a value used within an activity. For example, use a local variable to identify metadata that is processed within an activity before the final value is exported to an output variable.</td>
</tr>
<tr>
<td>Output</td>
<td>Variable that contains a value that is passed to other activities in the workflow.</td>
</tr>
</tbody>
</table>

Map an output field

Mapping is configured with parsing rules that allow you to build expressions in the appropriate data format for the selected payload.

Role required: activity_admin, activity_creator

When you are finished creating the output data structure, map each variable to the specific data you want to extract from the target host.

To map a variable, drag it from the Outputs variable builder and drop it into an empty Variable name field in the Parsing rules section.

See create a parsing rule for instructions on configuring parsing for output variables.
Create a parsing rule

Populate output variables defined in a custom activity with payload data returned from an inputs test on an external host or endpoint.

Roles required: activity_admin, activity_creator

1. Navigate to **Workflow > Workflow Editor**.
2. From the **Custom** tab in the palette, open a custom activity.
3. In the Activity Designer form, advance to the **Output** stage.
4. Drag an output variable from the data structure builder into the **Variable name** field in the **Parsing rules** builder.
Mapping variables to parsing rules

The parsing rules form appears for the selected variable. By default, the parsing type is set to **Direct**, which populates the variable with all the data from the selected payload, without parsing the contents. Each template has a specific default parsing source.

5. Complete the form using the fields in the table.

In this example, the parsing type selected is **XML**, which allows you to select specific parameters from the payload to parse.
## Parsing rules fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parsing source</td>
<td>Source of the data returned from the target host or endpoint. Each template opens to a specific, default payload. Available choices depend on the execution template selected for the activity. You can also use local variables as a parsing source if a parsing rule has previously been defined for them. For a list of the available payloads for each template, see <a href="#">Activity designer parsing sources</a>.</td>
</tr>
<tr>
<td>Expression</td>
<td>Expression used to extract specific data from the selected parsing source. This expression is created from clickable data in the sample payload and appears in the format selected in the Parsing type field. When testing, the expression can return multiple results. Discern which choice gives reliable or predictable results before choosing your expression.</td>
</tr>
<tr>
<td>Variable name</td>
<td>Revised variable name as it is used in the final output expression. The system adds the <code>activityOutput</code> or <code>activityLocal</code> prefix to the variable you specify.</td>
</tr>
<tr>
<td>Parsing type</td>
<td>The language to use for querying the target host's payload. The selections are:</td>
</tr>
<tr>
<td></td>
<td>• Direct: Maps to the entire content of the payload selected in the Parsing source field, without any parsing. This is the default parsing type.</td>
</tr>
<tr>
<td></td>
<td>• XML: XPath query used for selecting nodes from an XML payload.</td>
</tr>
<tr>
<td></td>
<td>• JSON: JSONPath query for selecting parts of a JSON payload.</td>
</tr>
<tr>
<td></td>
<td>• RegEx: Parsing method that uses a regular expression to extract data from a payload. The RegEx parsing type does not support multi-line parsing and is not case sensitive.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of this parsing rule.</td>
</tr>
<tr>
<td>Sample payload data</td>
<td>Sample data from the source containing the data requested. This field is not available for Direct parsing types. After you click Parse sample data, the data in this field cannot be edited, but becomes clickable for the purpose of creating expressions. Click Edit sample data to make the field editable again.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Parsing results</td>
<td>Displays the data returned from the source by the selected expression. This field is not available for Direct parsing types.</td>
</tr>
</tbody>
</table>

6. To retest the inputs, click **Get sample payload from test**. This action reopens the test form, allowing you to substitute different test values and create a different payload.

7. Click **Save** to have the parsing rules overwrite the previous payload with the one you just created.

8. To create an expression for the parsing rule, click the specific parameter you want to see in the sample payload. The value for that parameter appears in the **Parsing result** field, and the system creates the appropriate expression in the **Expression** field.

9. Click **Submit** to save the parsing rule for that variable.

**Activity designer parsing sources**
This table lists the parsing sources available with each execution template.

### Parsing sources

<table>
<thead>
<tr>
<th>Template</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP Web Service</td>

|          | executionResult.eccSysId  
|          | executionResult.errorMessages |

Activity designer parsing rule example
In this example, the parsing rule is configured to populate the `activityOutput.ipv4` variable with the value for the IP address from a domain server, using PowerShell.

Role required: activity_creator, activity_admin

To generate the sample data, the administrator must actually run the command on the host and then paste the data returned into the **Sample payload data** field when creating the parsing rule. The administrator can then create an expression that returns IP addresses from that sample in two formats: ipv4 and ipv6. In this example, the system produces two expressions to use for the parsing rule.

1. Navigate to **Workflow > Workflow Editor** and open the activity that runs on the host.
2. Click the **Inputs** tab, and note the **Command**.
Parsing rule PowerShell inputs command

3. In a PowerShell console, run the **Command** on the host to extract the XML sample that contains the values you need.
4. Copy the data that is returned to the clipboard.
5. In the activity designer, click the **Outputs** tab and paste the returned data into the **Sample payload data** field.
   
   In this example, the data includes IP addresses in two different formats and the domain name.
6. Select the parsing type for the source. In this example, select **XML**.
7. **Click Parse sample data.**

   The system displays the XML in the proper format, and it becomes clickable. In this view, the system can translate clicked data from the sample into an expression.
To create the expression, click the elements in the data sample you want to map to the variable.

Based on the sample data you clicked, the system creates two expressions.
9. Select an expression from the list.

The desired result is the IP address that has a **type** attribute of **ipv4**. The system populates the **Expression** field with this choice.
10. Click **Test expression**.

The system parses the payload using the selected expression and returns the requested data in the **Parsing result** field.
11. Click **Submit**.

The view returns to the **Outputs** tab of the activity designer. The new parsing rule is listed, and a blank row is available for another rule.
Activity conditions

Create the exit conditions for your activity in the **Condition** column and set the order for each..

The system evaluates the condition with the lowest order number first and stops when it finds the first true condition. The system delays evaluation of conditions with an **Else** value set to **true** until all conditions with an **Else** value set to **false** are evaluated. If the system does not find a true condition, it looks for a default condition in which the value for **Else** is **true** and takes this exit. You must have at least one default exit condition, or the activity hangs when the workflow runs.

The following are possible conditions you might create for an activity:

**Sample activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Tests for a success condition. <strong>Else</strong> is set to <strong>false</strong> and the <strong>Order</strong> is set to <strong>100</strong>. If this condition is true, the activity takes the <strong>Success</strong> exit. If this condition is false, the system evaluates the next condition in order.</td>
</tr>
<tr>
<td>Retry</td>
<td>Tests for a condition that runs the activity again. <strong>Else</strong> is set to <strong>false</strong>. If this condition is true, the activity runs again. If this condition is false, the system takes the default <strong>Failure</strong> exit.</td>
</tr>
<tr>
<td>Failure</td>
<td>Default condition that allows the workflow to continue if the other conditions in the activity are false. <strong>Else</strong> is set to <strong>true</strong>.</td>
</tr>
</tbody>
</table>
Orchestration custom activity templates

Orchestration provides customizable activity templates to create and manage custom activities in the Workflow Editor.

You create and update different types of Orchestration activities with the Activity Designer using activity templates for SSH, PowerShell, REST, SOAP, JMS, SFTP, JDBC, JavaScript Probes, and Probes.

Hundreds of workflows can share these activities simultaneously. Before you change an activity, you should check the workflows that they are part of by clicking the form menu icon and selecting Used In. Any central change to a versioned activity automatically updates across workflows unless you have pinned that activity.

All the Orchestration Core activities are built using the Activity Designer in scoped applications. Custom activities can be developed in the global scope or their own application scope even if that scope is different from the scope of the workflow. Use Activity scoping when build your own activity packs.

Create a JDBC activity

Create a custom JDBC activity to automate SQL commands and stored procedure calls to relational databases from workflow.

Role required: activity_admin, activity_creator

The JDBC activity template allows you to execute ANSI SQL statements or stored procedures on a target database. Support for stored procedures with IN, OUT, and INOUT parameters are available in Orlando. To learn how to set up these parameters, see JDBC stored procedure parameters.

Note: If you are transferring bulk data into a ServiceNow instance from an external data source, use Import sets. The JDBC activities allow you to transfer data between external
data sources and ServiceNow within a workflow. It is not intended to replace the bulk import features of data sources.

1. Create or verify your **JDBC credential**.
   Your JDBC credentials must have permission for the target database and proper configuration for the corresponding JDBC connection. Credentials must be set up before you can create a JDBC activity.

2. Create or verify your **JDBC connection**.
   Your JDBC connection must be configured with valid JDBC credentials set up before you can create a JDBC activity.

3. Create a **custom activity**.
   This action creates a custom activity using a template.

4. After setting up **general properties** and **creating input variables**, configure the JDBC Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>JDBC Connection</strong></td>
<td>Configure or reference the appropriate JDBC Connection for the database. The connection selected provides the activity with the following information:</td>
</tr>
<tr>
<td></td>
<td>- Target database information (server and database names)</td>
</tr>
<tr>
<td></td>
<td>- Connection URL</td>
</tr>
<tr>
<td></td>
<td>- Target database port (if different from standard port number)</td>
</tr>
<tr>
<td></td>
<td>- Database instance name</td>
</tr>
</tbody>
</table>

<p>| <strong>Credential</strong> | JDBC credential to use for your JDBC connection.                            |</p>
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SQL statement</strong></td>
<td>Input the ANSI SQL to execute on the JDBC target database.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is hidden when the Stored Procedure check box is selected.</td>
</tr>
<tr>
<td></td>
<td>You can map the input variables you created to configure the SQL statements. By default, you can run the following SQL statements.</td>
</tr>
<tr>
<td></td>
<td>· select</td>
</tr>
<tr>
<td></td>
<td>· insert</td>
</tr>
<tr>
<td></td>
<td>· update</td>
</tr>
<tr>
<td></td>
<td>· delete</td>
</tr>
<tr>
<td></td>
<td>· show</td>
</tr>
<tr>
<td></td>
<td>· create</td>
</tr>
<tr>
<td></td>
<td>· describe</td>
</tr>
<tr>
<td></td>
<td>For added security measure, a MID Server property controls the operations that this JDBCOrchestrationProbe executes, which restricts the SQL commands used. This property protects against potentially destructive commands, such as drop database. The mid.property.jdbc_operations contains the MID Server property controls.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot run multiple statements of different types. For example, you cannot run a select statement and an update statement together, but you can run two insert statements. However, you cannot run multiple select statements in this activity.</td>
</tr>
<tr>
<td><strong>Maximum rows</strong></td>
<td>Maximum number of records to retrieve from database. The default is 1000.</td>
</tr>
<tr>
<td><strong>Maximum payload size (KB)</strong></td>
<td>You can set a limit on the maximum payload size of data retrieved from the database. The default is 64 kilobytes.</td>
</tr>
<tr>
<td><strong>Connection timeout</strong></td>
<td>How long the activity waits to make the connection. This field is populated automatically from the data source, but can be changed for this activity.</td>
</tr>
<tr>
<td><strong>Query timeout</strong></td>
<td>Elapsed time to wait after running the query until the data is returned. This field is populated automatically from the data source, but can be changed for this activity.</td>
</tr>
<tr>
<td><strong>Required MID Server capabilities</strong></td>
<td>MID Server to use for querying JDBC, by capabilities. By default, the system selects a MID Server that has JDBC capability.</td>
</tr>
<tr>
<td><strong>Use stored procedure</strong></td>
<td>If checked, you can run a stored procedure on MySQL, Oracle, or SQL Server databases by entering the procedure name and parameters. See JDBC stored procedure parameters.</td>
</tr>
</tbody>
</table>
• Test JDBC activity inputs
• Use auto-mapping to generate outputs and parsing rules (recommended for JDBC)
• If you do not use auto-mapping, you can manually create output variables and create parsing rules

Create a JDBC connection for an Orchestration activity
The JDBC Connection (jdbc_connection) table provides the information custom JDBC Orchestration activities use to connect to various target databases.

You must have an appropriate JAR file, whether it is supplied with the instance or a custom JAR file.

Note: The ServiceNow instance supplies mysql-connector-java-5.1.21.jar, sql-server-jdbc-4.0.jar, and ojdbc6.jar files as part of the current release, which supports MySQL, SQLServer, and Oracle databases. Other databases, such as Sybase or DB2 Universal, must use a custom JAR file that must be uploaded to the instance before setting the JDBC connection.

Role required: activity_admin, activity_creator

JDBC credentials are retrieved separately by the activity designer template and support external credential storage, such as CyberArk.

1. Navigate to Orchestration > Credentials & Connections > JDBC Connections and click New.
2. Complete the form using the fields in the table.

The database selection in the Format field determines which fields are available.

<table>
<thead>
<tr>
<th>Field</th>
<th>Database Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>All</td>
<td>Unique name of this JDBC connection. For example, you might enter JDBC MySQLProd.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>All</td>
<td>Maximum elapsed time the JDBC query is allowed to run without a response.</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>All</td>
<td>Maximum elapsed time for the JDBC activity to wait while attempting to connect to the target database.</td>
</tr>
<tr>
<td>Application</td>
<td>All</td>
<td>Scope for this table. By default, the JDBC Connection (jdbc_connection) table runs in the Global scope.</td>
</tr>
<tr>
<td>Domain</td>
<td>All</td>
<td>Domain for this table. By default, the JDBC Connection (jdbc_connection) table runs in the global domain.</td>
</tr>
<tr>
<td>Field</td>
<td>Database Format</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Format</td>
<td>All</td>
<td>Database type for this connection. The default choices are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- MySQL</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Oracle</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- SQLServer</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- None</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can add Sybase or DB2 Universal to the choice list by uploading the appropriate JDBC driver JAR file to the instance. Orchestration automatically recognizes these drivers when they are loaded into the system and adds them to this list.</td>
</tr>
<tr>
<td>Server</td>
<td>Oracle, MySQL, SQLServer</td>
<td>Host name or IP address of the database server.</td>
</tr>
<tr>
<td>Oracle sid</td>
<td>Oracle</td>
<td>The Oracle database site identifier. The default value is orcl.</td>
</tr>
<tr>
<td>Oracle port</td>
<td>Oracle</td>
<td>Port that the Oracle database is using. The default value is 1521.</td>
</tr>
<tr>
<td>Database name</td>
<td>MySQL, SQLServer</td>
<td>Name of the database.</td>
</tr>
<tr>
<td>Database port</td>
<td>MySQL, SQLServer</td>
<td>Port that the selected database is using.</td>
</tr>
<tr>
<td>Instance name</td>
<td>SQLServer</td>
<td>Instance name for the selected SQLServer</td>
</tr>
<tr>
<td>Connection URL</td>
<td>All</td>
<td>URL that the MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases.</td>
</tr>
</tbody>
</table>

**Note:** If the format selected is not one of the default databases, you must create the connection URL manually so that the MID Server knows how to create the connection.

| JDBC driver      | None, DB2 Universal, Sybase | The JDBC driver to use for this connection when it is not a default database.                                                               |

**Note:** If you add a Sybase or DB2 Universal database, you must enter the driver name in this field and upload the driver JAR file to the instance.
3. **Click Submit.**

**Auto-map JDBC activity output variables**

The ServiceNow activity designer allows you to map parameter values in a JDBC test payload to variables in the **Outputs** tab automatically.

**Role required:** admin

1. In the JDBC provider template form, select the **Inputs** tab.
2. **Click Test Activity** to test the input parameters.
   
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
3. Provide test values, if requested, and **click OK** to display the payload.
   
   The entire payload appears in the **Raw Output** tab of the Response form.
4. Select one of these auto-mapping options.
   - **Auto-Map to Local**: Directly maps values to a local variable for use within the activity.
   - **Auto-Map to Output**: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

**JDBC stored procedure parameters**
You can use Orchestration to run a stored procedure on MySQL, Oracle DB, and MS-SQL databases.

There is support of multiple data types, with the following limitations:

- Only one result-set is returned.
- The order of input and output data types in the stored procedure parameters must match the activity definition.
- Binary, Blob, Varbinary, and LongBinary should be base64 encoded.
- Date, Time, and Timestamp have a specific format:
  
  **Date format**: `yyyy-mm-dd`
  
  `yyyy-mm-dd` is the supported format.

  **Time format**: `hh:mm:ss(.sss)`
  
  `hh:mm:ss(.sss)` is the supported format. Precision is in milliseconds only, microseconds or nanoseconds cannot be handled.

  **Note**: `10:30:59` and `10:30:59.999000` are correct but `10:30:59.` is incorrect.

  **Timestamp format**: `yyyy-mm-dd hh:mm:ss(.ffffff)`
  
  `yyyy-mm-dd hh:mm:ss(.ffffff)` is the supported format. Precision is to microseconds.

- ResultSet is the first result set coming back from database server.
- MS-SQL does not support INOUT parameters. If you use INOUT parameters, the Activity Template transparently maps them to OUT parameters.

  **Note**: If you do not want to do a validation of data types in stored procedure parameters, like the legacy behavior, you set the `glide.stored_proc.data_type.validation` as false. See **MID Server properties** for more information.
## Stored procedure parameters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Mode</strong></td>
<td>Type of stored procedure parameter. Supported parameters:</td>
</tr>
<tr>
<td></td>
<td>• IN</td>
</tr>
<tr>
<td></td>
<td>• OUT</td>
</tr>
<tr>
<td></td>
<td>• INOUT</td>
</tr>
<tr>
<td><strong>Sql Type</strong></td>
<td>A SQL data type. Supported data types:</td>
</tr>
<tr>
<td></td>
<td>• ARRAY</td>
</tr>
<tr>
<td></td>
<td>• BIGINT</td>
</tr>
<tr>
<td></td>
<td>• BINARY</td>
</tr>
<tr>
<td></td>
<td>• BIT</td>
</tr>
<tr>
<td></td>
<td>• BLOB</td>
</tr>
<tr>
<td></td>
<td>• CHAR</td>
</tr>
<tr>
<td></td>
<td>• CLOB</td>
</tr>
<tr>
<td></td>
<td>• DATE</td>
</tr>
<tr>
<td></td>
<td>• DECIMAL</td>
</tr>
<tr>
<td></td>
<td>• DISTINCT</td>
</tr>
<tr>
<td></td>
<td>• DOUBLE</td>
</tr>
<tr>
<td></td>
<td>• FLOAT</td>
</tr>
<tr>
<td></td>
<td>• INT</td>
</tr>
<tr>
<td></td>
<td>• INTEGER</td>
</tr>
<tr>
<td></td>
<td>• JAVA_OBJECT</td>
</tr>
<tr>
<td></td>
<td>• LONGVARBINARY</td>
</tr>
<tr>
<td></td>
<td>• LONGVARCHAR</td>
</tr>
<tr>
<td></td>
<td>• NULL</td>
</tr>
<tr>
<td></td>
<td>• NUMERIC</td>
</tr>
<tr>
<td></td>
<td>• OTHER</td>
</tr>
<tr>
<td></td>
<td>• REAL</td>
</tr>
<tr>
<td></td>
<td>• REF</td>
</tr>
<tr>
<td></td>
<td>• REF_CURSOR</td>
</tr>
<tr>
<td></td>
<td>• SMALLINT</td>
</tr>
<tr>
<td></td>
<td>• STRUCT</td>
</tr>
<tr>
<td></td>
<td>• TIME</td>
</tr>
<tr>
<td></td>
<td>• TIMESTAMP</td>
</tr>
<tr>
<td></td>
<td>• TINYINT</td>
</tr>
<tr>
<td></td>
<td>• VARBINARY</td>
</tr>
<tr>
<td></td>
<td>• VARCHAR</td>
</tr>
<tr>
<td><strong>Name/Value</strong></td>
<td>Name-value pairs to pass to the host. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.</td>
</tr>
</tbody>
</table>
Note: Not all database providers support the entire realm of JDBC data types. Reference your database reference manual to understand the supported datatypes for your installation.

Test JDBC activity template inputs
You can test the input parameters of a custom JDBC activity during its development without having to run the activity in a workflow context.

Create input variables and map them to fields in the Execution Command form or provide actual values for these fields. Role required: web_service_admin, activity_admin, activity_creator

This test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. It is not necessary to check out the activity to test it.

Note: If you provide enough information for Orchestration to contact the endpoint or host and return data, you can test the input variables. You can test from any stage in the activity designer. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. From the JDBC Execution Command, click Test Inputs.
   The list of input source variables appears. If you added default values for these variables, those values appear in the Substitute Value column. Mandatory variables are marked with a red star.

Note: The test fails if the MID Server cannot be found or if it cannot connect to the target.
2. Filter the variable list with these controls:
   - **All Inputs**: Displays all input variables. This control is the default view.
   - **Mandatory Inputs**: Displays only mandatory variables.
   - **Inputs Without Defaults**: Shows input variables that do not have assigned default values.

3. Reset values as needed.
   - **Reset default values**: If values are present, this control replaces any test values set in this form with the default values.
   - **Clear values**: Clears all values in the input variable list, even if default values exist.

4. When your test values are configured correctly, click **OK**.
The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the **Raw Output** window.
Response payload from inputs test

5. To map appropriate parameter values in the payload to variables in the Outputs stage automatically, select an auto-mapping option.

6.
7. Click the X in the upper right corner of the window to close it.

Create a SOAP web service activity

Use this template to create a custom SOAP activity.

Role required: web_service_admin, activity_admin, activity_creator

For instructions on using the activity template process flow, see create custom activities.

1. Create a custom activity.
   This action creates a custom activity using a template.

2. After setting up general properties and creating input variables, configure the SOAP web service Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Map the input variables</strong></td>
<td>Use the variables you created to configure the command that Orchestration executes on the SOAP web service.</td>
</tr>
<tr>
<td><strong>Web service message</strong></td>
<td>Specify the SOAP web service message to use for this activity. If you need information on SOAP web services messages, see SOAP message.</td>
</tr>
<tr>
<td><strong>Web service message function</strong></td>
<td>Specify the SOAP message function available in conjunction with the SOAP web service.</td>
</tr>
<tr>
<td><strong>Endpoint</strong></td>
<td>If you enter an endpoint in this field, it overrides the endpoint URL configured in the SOAP message web service. Click the lock icon to open the input field and add the endpoint.</td>
</tr>
<tr>
<td><strong>SOAP message parameters</strong></td>
<td>Name-value pairs to pass to the SOAP endpoint. You can create these parameters manually, or drag input variables into the parameter fields and then assign a value. Parameters defined in the SOAP message that use ${ } can be assigned data from this activity template. Use the Additional attribute column to configure the system to not escape the text. By default, text sent to the SOAP message is escaped. The Name column is auto-populated if the users have provided variables using variable substitution in the SOAP message.</td>
</tr>
<tr>
<td><strong>Use MID Server</strong></td>
<td>Check box that determines if a MID Server must be used to invoke the SOAP web service. If the SOAP web service message function defines a MID Server, that MID Server is used instead of the one selected here.</td>
</tr>
<tr>
<td><strong>Required MID Server capabilities</strong></td>
<td>MID Server with the appropriate capabilities for connecting to the SOAP endpoint. By default, the system selects a MID Server with SOAP capabilities. This field is available when the Use MID Server check box is selected.</td>
</tr>
<tr>
<td><strong>Timeout</strong></td>
<td>Allowed duration of the SOAP web service request before it times out, in seconds. The default is 10.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>Authentication</strong></td>
<td>Determines what type of authentication is required for the endpoint. The options are:</td>
</tr>
<tr>
<td>Use existing credentials in SOAP message</td>
<td>Uses credential definitions from the SOAP message definition.</td>
</tr>
<tr>
<td>Override with Basic Authentication credentials</td>
<td>Uses basic authentication credentials. Overrides the credentials in the SOAP message definition. Basic authentication credentials must be provisioned before they are available for selection.</td>
</tr>
<tr>
<td>Override with Certificate Authentication credentials</td>
<td>Overrides the credentials in the SOAP message definition with certificate authentication credentials.</td>
</tr>
<tr>
<td>Override with Both Basic and Certificate Authentication credentials</td>
<td>Overrides the credentials in the SOAP message definition with both basic authentication or certificate authentication credentials.</td>
</tr>
<tr>
<td>Override with WS-Security Username profile</td>
<td>Overrides the credentials in the SOAP message definition with credentials defined a WS Security Profile.</td>
</tr>
<tr>
<td><strong>Credentials</strong></td>
<td>Required REST endpoint basic authentication credentials. This field is available when Override with Basic Authentication credentials is selected in the Authentication field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, newsafe:orch-test-f5. See Configure the MID Server for CyberArk for details.</td>
</tr>
<tr>
<td><strong>Protocol Profile</strong></td>
<td>Protocol profile to use for authentication. This field is available when the authentication type is either Override with Certificate Authentication credentials or Override with Both Basic and Certificate Authentication credentials.</td>
</tr>
</tbody>
</table>

**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See automap output variables.

- Use auto-mapping to generate outputs and parsing rules (recommended for JDBC)
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

**Auto-map SOAP activity output variables**
The ServiceNow activity designer allows you to map parameter values in a SOAP test payload to variables in the Outputs stage automatically.
Role required: web_service_admin, activity_admin, activity_creator

Note: You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint and return data. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. In the activity designer, proceed to the Execution Command stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click Test Activity to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
4. Provide test values, if requested, and click OK to display the payload.
   The entire payload appears in the Raw Output tab of the Response form.

5. Select one of these auto-mapping options.
   - Auto-Map to Local: Directly maps values to a local variable for use within the activity.
   - Auto-Map to Output: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

Provide credentials to access a SOAP message WSDL
If the SOAP WSDL you are requesting in a test payload requires authentication, you must provide basic auth credentials in either the SOAP message or the SOAP activity.

Role required: web_service_admin, activity_admin, activity_creator

The ServiceNow instance only supports basic auth credentials for accessing a WSDL. If the SOAP function or the SOAP message does not provide these credentials, you must configure them in the SOAP activity template. Orchestration uses these priorities for deciding which basic authentication credentials to use:
   - SOAP message: Credentials for a SOAP message are used if no other credentials are defined.
   - SOAP function: Credentials for a SOAP function override the credentials configured for the SOAP message.
   - SOAP activity template: Credentials for a SOAP activity template override both the SOAP function and SOAP message credentials.

1. Navigate to System Web Services > Outbound > SOAP Message.
2. Select the SOAP message you want the activity to use.
3. In the SOAP Message record, select the Download WSDL check box.
4. In the Authentication type field, select Basic.
   The Basic auth profile field appears.
5. Select the basic auth profile to use with this SOAP message.
Basic authentication for a SOAP message

6. Alternately, you can configure basic authentication credentials in `Configure the SOAP execution command`.
   a) In the `Authentication` field, select `Override with Basic Authentication credentials`. 
The **Credentials** field appears.

b) Select the basic auth credentials to use to access the WSDL. This setting overrides any credentials configured in the SOAP message.

Configure the SOAP execution command

Use the input variables you created to configure the command that Orchestration executes on the SOAP endpoint.

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.
Role required: web_service_admin, activity_admin, activity_creator

Note: You can test the SOAP connection between the MID Server and the endpoint without having to run the activity in a workflow context. For details, see test template outputs.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.
### SOAP template execution command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Input</strong></td>
<td>Input variable builder. Create input variables to map to available fields.</td>
</tr>
<tr>
<td><strong>Web service message</strong></td>
<td>SOAP message to use for this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td><strong>Web service message function</strong></td>
<td>SOAP message function to use for this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td><strong>Endpoint</strong></td>
<td>Endpoint URL for the SOAP web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the SOAP message. Click the lock icon to open the input field.</td>
</tr>
<tr>
<td><strong>SOAP message parameters</strong></td>
<td>Name-value pairs to pass to the SOAP endpoint. You can create these parameters manually, or drag input variables into the parameter fields and then assign a value. Parameters defined in the SOAP message that use $${}$$ can be assigned data from this activity template. Use the Additional attribute column to configure the system to not escape the text. By default, text sent to the SOAP message is escaped. The Name column is auto-populated if the users have provided variables using variable substitution in the SOAP message.</td>
</tr>
<tr>
<td><strong>Use MID Server</strong></td>
<td>Check box that determines if a MID Server must be used to invoke the SOAP web service.</td>
</tr>
<tr>
<td><strong>Required MID Server capabilities</strong></td>
<td>MID Server with the appropriate capabilities for connecting to the SOAP endpoint. By default, the system selects a MID Server with SOAP capabilities. This field is available when the Use MID Server check box is selected.</td>
</tr>
<tr>
<td><strong>Timeout</strong></td>
<td>Allowed duration of the SOAP web service request before it times out, in seconds. The default is 10.</td>

<td>- <strong>Override with Both Basic and Certificate Authentication credentials</strong>: Overrides the credentials in the SOAP message definition with both basic authentication or certificate authentication credentials.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Override with WS-Security Username profile</strong>: Overrides the credentials in the SOAP message definition with credentials defined a WS Security Profile.</td>
</tr>
<tr>
<td>Credentials</td>
<td>Required REST endpoint basic authentication credentials. This field is available when <strong>Override with Basic Authentication credentials</strong> is selected in the Authentication field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, newsafe:orch-test-f5.</td>
</tr>
<tr>
<td>Protocol Profile</td>
<td><em>Protocol profile</em> to use for authentication. This field is available when the authentication type is either <strong>Override with Certificate Authentication credentials</strong> or <strong>Override with Both Basic and Certificate Authentication credentials</strong>.</td>
</tr>
</tbody>
</table>

3. Click **Save**.<br>4. Click **Continue** to advance to the **Outputs** stage.

**SOAP template execution parameters**<br>You use execution parameters to create the input process script in the **Pre processing** form of the activity designer.<br><br>For descriptions of the SOAP web service command fields, see the table in *Configure the SOAP execution command*. 
### SOAP execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web service message</td>
<td>web_service_message</td>
<td>Reference</td>
<td>The sys_id of the corresponding SOAP message.</td>
</tr>
<tr>
<td>Web service message function</td>
<td>web-service_message_function</td>
<td>Reference</td>
<td>The sys_id of the SOAP message function.</td>
</tr>
<tr>
<td>Web service endpoint</td>
<td>web_service_endpoint</td>
<td>String</td>
<td>URL of the SOAP endpoint.</td>
</tr>
<tr>
<td>Parameters</td>
<td>parameters</td>
<td>Array of JavaScript objects</td>
<td>Array of JavaScript objects, expressed with the executionParam. prefix. For instructions on creating arrays using this parameter, see Create a JavaScript array in a SOAP template.</td>
</tr>
<tr>
<td>Use mid server</td>
<td>use_mid_server</td>
<td>Boolean</td>
<td>When true, indicates that a MID Server is used.</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of references to required MID Server capabilities.</td>
</tr>
<tr>
<td>Time out</td>
<td>time_out</td>
<td>String</td>
<td>Allowed duration of the SOAP web service request before it times out, in seconds. The default is 10.</td>
</tr>
<tr>
<td>ValueCapabilities</td>
<td>valueCapabilities</td>
<td>Array of hashmap</td>
<td>Capability values used to select the MID Server. For more information, see MID Server capabilities. Use this example to customize the MID Server selection if there are additional capabilities that are assigned by value: var valueCapability = {'NEW_MID_CAPABILITY': 'NEW_MID_CAPABILITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);</td>
</tr>
</tbody>
</table>

**Note:** You must use the `executionParam. prefix with all variables in this table.
Create a JavaScript array in a SOAP template
These are instructions for creating JavaScript arrays using SOAP execution parameters.

Role required: web_service_admin, activity_admin, activity_creator

To add more name-value pairs to the parameter's array, append the values to the existing array.

1. Create a JavaScript object with the following syntax, and add it to the executionParam.parameter array:

```javascript
var newParameter = {
  "name": "parameterName",
  "value": "parameterValue",
  "additional_attribute": "none"
};

executionParam.parameters.push(newParameter);
```

By adding the new parameter JavaScript object to the array, you ensure that any elements already available in the array are not impacted.

2. Make sure to set the value in the Additional attribute column in the SOAP message parameters input field to Do not escape text.

In this case, the system does not escape the value specified for the value attribute. An example of this is:

```javascript
var newParameter = {
  "name": "parameterName",
  "value": "parameterValue",
  "additional_attribute": "do_not_escape_text"
};

executionParam.parameters.push(newParameter);
```

**Note:** If the value for the additional_attribute field is None, then the system escapes the value specified by the value attribute. In the first example, `parameterValue` is escaped.

SOAP template post-processing parameters
Use these parameters to create a post-processing script.

**Activity designer post-processing parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status code</td>
<td>status_code</td>
<td>Integer</td>
<td>Contains the status code returned from the web service.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header</td>
<td>header</td>
<td>Hashmap of JavaScript object</td>
<td>Contains the key value paired hashmap associated with the header values passed into the web service. You can access each value with <code>executionResult.header[keyName]</code>.</td>
</tr>
<tr>
<td>Body</td>
<td>body</td>
<td>String</td>
<td>Contains a string value representing the output from the SOAP message.</td>
</tr>
<tr>
<td>Error</td>
<td>error</td>
<td>String</td>
<td>Returns the error string from the SOAP web service, unless there are no errors, in which case it returns <code>null</code>.</td>
</tr>
</tbody>
</table>

### Create a JavaScript Probe activity

Create a JavaScript Probe activity to instruct a MID server to execute server-side javascript.

**Role required:** activity_creator or workflow_admin

The JavascriptProbe activity has the same functionality as making ‘Packages’ calls into standard Java libraries. It allows you to have more control over the Java libraries on the MID Server. You can load your own JAR files on the MID Server and have the JavascriptProbe make Package calls into those java files.

1. **Create a custom activity.**
   - This action creates a custom activity using a template.

2. **After setting up general properties and creating input variables, configure the JavaScript probe activity Execution Command:**

   **Option**                        **Description**
   ---                                ---
   **Map the input variables**       Use the variables you created to configure the command that Orchestration executes on the MID server.
   **Script type**                   Select the type of script to include. Available options are:
   - Custom JavaScript
   - MID Server script include
   **Script**                        Custom JavaScript to run with this probe.
   **MID Server script include**     Script for the MID Server to run with this probe.

### Option

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select MID Server by host</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
</tr>
<tr>
<td>Parameters</td>
</tr>
</tbody>
</table>

#### Note:
You can map parameter values in a test payload to variables in the Outputs tab automatically. See automap output variables.

Finish creating your JavaScript probe activity by creating output variables, creating a parsing rule, or creating template conditions. Refer to the create custom activities topic to know your template options.

**JavaScript probe template execution parameters**

You use execution parameters to create the input process script in the Preprocessing form of the activity designer.

For descriptions of the JavaScript Probe command fields, see the table in Configure the JavaScript Probe execution command.

#### Note:
You must use the executionParam. prefix with all variables in this table.

**JavaScript template execution parameters**

<table>
<thead>
<tr>
<th>Name</th>

</table>
| Parameters          | parameters | Array of JavaScript   | Object Array of JavaScript objects, expressed with the executionParam. prefix. To add more name-value pairs to the parameters array, append them to the existing array. Create a JavaScript object with the following syntax, and add it to the executionParam.parameters array. This assigns additional parameters to the message:  
    ```javascript
    var newParameter = {
      "name": "parameterName",
      "value": "parameterValue"
    };
    executionParam.parameters.push(newParameter);
    ``` |
| ValueCapabilities   | valueCapabilities | Array of hashmap | Capability values used to select the MID Server. For more information, see MID Server capabilities. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:  
    ```javascript
    var valueCapability = {
      "NEW_MID_CAPABILITY": "NEW_MID_CAPABILITY_VALUE"
    };
    executionParam.valueCapabilities.push(valueCapability);
    ``` |

**JavaScript probe template post-processing parameters**  
Use these parameters to create a post-processing script.

**JavaScript probe post-processing parameters**

<table>
<thead>
<tr>
<th>Name</th>

<td>Contains the reference ID associated with the ECC Queue input message.</td>
</tr>
<tr>
<td>Error Messages</td>
<td>errorMessages</td>
<td>String</td>
<td>Contains the error messages returned from the JavaScript probe. If no error messages are returned, this value is null.</td>
</tr>
</tbody>
</table>

**Configure the JavaScript Probe execution command**

Use the input variables you created to configure the command that Orchestration executes on the JavaScript Probe target host.

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: activity_creator, admin

**Note:** You can test the JavaScript Probe connection between the MID Server and the target without having to run the activity in a workflow context. For details, see test template outputs.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
### Execution Command

**Script type:** Custom JavaScript

```javascript
var str = new Packages.java.lang.String("TestString");
this.probe.createOutputResult(str);
```

**Select MID Server by host**

**Required MID Server capabilities**

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
</table>

[Continue]
2. Complete the fields shown in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <a href="#">Create input variables</a> to map to available fields.</td>
</tr>
<tr>
<td>Script type</td>
<td>Select the type of script to include. Available options are:</td>
</tr>
<tr>
<td></td>
<td>- Custom JavaScript</td>
</tr>
<tr>
<td></td>
<td>- MID Server script include</td>
</tr>
<tr>
<td>Script</td>
<td>Custom JavaScript to run with this probe. This field is available when the Script type selected is Custom JavaScript.</td>
</tr>
<tr>
<td>MID Server script include</td>
<td>Script for the MID Server to run with this probe. This field is available when the Script type selected is MID Server script include.</td>
</tr>
<tr>
<td>Select MID Server by host</td>
<td>MID Server on which the probe runs.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use, by capabilities.</td>
</tr>
<tr>
<td>Parameters</td>
<td>Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag input variables into the Parameters fields and assign a value.</td>
</tr>
</tbody>
</table>

3. Click **Save**.

4. Click **Continue** to advance to the **Outputs** stage.

**Create a PowerShell activity**

Create a custom PowerShell activity return data to a workflow from a host using Microsoft PowerShell.

Role required: activity_creator or workflow_admin

ServiceNow supports PowerShell 3.0 to 5.1.

1. Create a **custom activity**.
   This action creates a custom activity using a template.

2. After setting up **general properties** and **creating input variables**, configure the PowerShell Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that Orchestration executes on the MID Server.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this PowerShell activity.</td>
</tr>
<tr>
<td>Script type</td>
<td>Type of PowerShell script to run on the PowerShell host. Available options are:</td>
</tr>
<tr>
<td></td>
<td>- Custom PowerShell command</td>
</tr>
<tr>
<td></td>
<td>- MID Server script file</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MID Server script file</td>
<td>The MID Server script file contains the PowerShell scripts. This field is available when the <strong>Script type</strong> selected is MID Server script file.</td>
</tr>
<tr>
<td>Command</td>
<td>PowerShell command the activity executes. This field is available when the <strong>Script type</strong> selected is <strong>Custom PowerShell command</strong>. You can create your commands by dragging and dropping input variables from the variable builder into this field.</td>
</tr>
<tr>
<td>PowerShell variables</td>
<td>Name-value pairs to pass to the host with PowerShell. You can create these variables manually, or drag input variables into the <strong>Value</strong> field. Encrypted input variables retain their encryption, regardless of the data type settings in this field. If you type in a value and select the <strong>Encrypted</strong> data type, your value appears in plain text. It is only encrypted when it passes to the ECC Queue.</td>
</tr>
<tr>
<td>Use MID Service Account</td>
<td>If checked, this activity authenticates on the target host using the credentials of the MID Server service account only, without trying any other credentials.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The <strong>Credential tag</strong> field is not available.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>Credential tag this activity must use to run PowerShell commands on the host. If this field is left blank, the MID Server tries all the available credentials until it finds a valid one, ending with the MID Server service account. If a credential tag is defined, the MID Server tries the credentials with that tag specified only and does not try the MID Server service account.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is not available when the <strong>Use MID service account</strong> check box is selected.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use for querying PowerShell, by capabilities. By default, the system selects a PowerShell MID Server.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can map parameter values in a test payload to variables in the <strong>Outputs</strong> tab automatically. See automap output variables.</td>
</tr>
</tbody>
</table>

Finish creating your PowerShell activity by creating output variables, creating a parsing rule, or creating template conditions. Refer to the create custom activities topic to know your template options.

**PowerShell template execution parameters**
You use execution parameters to create the input process script in the **Pre Processing** form of the activity designer.

For descriptions of the PowerShell command fields, see the table in Configure the PowerShell execution command.
### Powershell execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>source</td>
<td>String</td>
<td>Target host on which to execute the command.</td>
</tr>
<tr>
<td>Script type</td>
<td>script_type</td>
<td>Enumeration</td>
<td>Type of script to run. The possible types are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <strong>command</strong>: Custom PowerShell command.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <strong>file</strong>: Identifies the MID Server script file to run.</td>
</tr>
<tr>
<td>Command</td>
<td>command</td>
<td>String</td>
<td>Command sent to the MID Server for it to run on the target host.</td>
</tr>
<tr>
<td>MidScriptFile</td>
<td>midScriptFile</td>
<td>Reference</td>
<td>Reference sys_id of the MID Server script file to execute, when the script_type is file.</td>
</tr>
<tr>
<td>PowershellVariables</td>
<td>powershellVariables</td>
<td>Array of hashmap</td>
<td>Hashmap of JavaScript objects with <strong>name</strong>, <strong>value</strong>, and <strong>type</strong> for each object. The type of each object can be one of <strong>plain</strong>, <strong>encrypted</strong>, <strong>boolean</strong>, or <strong>null</strong>, corresponding to the PowerShell variable type selected in the inputs tab. For example, you might enter: <code>var newParameter = {&quot;name&quot;: &quot;parameterName&quot;,&quot;value&quot;: &quot;parameterValue&quot;,&quot;type&quot;: &quot;plain&quot; }; executionParam.powershellVariables.push(newParameter);</code></td>
</tr>
<tr>
<td>Credential tag</td>
<td>credential_tag</td>
<td>String</td>
<td>Specific credential tag this activity must use to run PowerShell commands on the host.</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of required MID Server capabilities.</td>
</tr>
</tbody>
</table>

**Note:** You must use the `executionParam.` prefix with all variables in this table.
<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>ValueCapabilities</td>
<td>valueCapabilities</td>
<td>Array of hashmap</td>
<td>Capability values used to select the MID Server. For more information, see MID Server capabilities. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:</td>
</tr>
</tbody>
</table>

```javascript
var valueCapability = {
  'NEW_MID_CAPABILITY': 'NEW_MID_CAPABILITY_VALUE'
}
executionParam.valueCapabilities.push(valueCapability);
```

**Powershell post-processing parameters and payload parsing**

Use these parameters to create a post-processing script, payload parsing, and tagging.
### Powershell post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
</table>
| Tags   | tags     | Hashmap | Contains the tags used to extract output using the Powershell commands. The tag output is delimited by double percentage signs, as in `%tagname` %%% ... %%. Set up the command using the format in this example: Write-Host % %tagname1%% output1 line 1 output1 line 2 … Write-Host% Write-Host % %tagname2%% output2 line 1 output2 line 2 … Write-Host% The tags returned are JavaScript hashmap objects in which each key is prefixed with tag appended with the tagname. `{"__text__": "", "tagtagname1":"output1 line1
output1 line2
", "tagtagname2":"output2 line1
output2 line2
"}` |
<p>| Hresult| hresult  | String  | Contains any hresult returned from the Powershell command. If no hresult is returned, this parameter is null.                            |
| Output | output   | String  | Contains the raw output from the Powershell command.                                                                                   |</p>
<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>EccSysID</td>
<td>eccSysID</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message returned by the activity.</td>
</tr>
<tr>
<td>ErrorMessages</td>
<td>errorMessages</td>
<td>String</td>
<td>Contains any error messages retrieved from the PowerShell command. This value is null if there are no error messages.</td>
</tr>
</tbody>
</table>

Create a REST web service activity

Use this procedure to create a custom REST web service Orchestration activity.

Role required: web_service_admin, activity_admin, activity_creator

To create and use a REST web service workflow activity:

- Create a REST message if an appropriate one is not already configured.
- Assign the web_service_admin role to any user who must create or edit a custom REST activity.
- Determine an application, or scope, for this activity.
- Determine the REST endpoint to use for the activity. Use this value to override the endpoint configured in the REST message.
- Optionally, create basic authentication credentials. Use this value to override the credentials configured in the SOAP message.

1. Create a custom activity. This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the REST web service Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that Orchestration executes.</td>
</tr>
<tr>
<td>REST message</td>
<td>Name of an existing REST message to use in this activity.</td>
</tr>
<tr>
<td>REST message function</td>
<td>REST message function to use for this activity.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>Endpoint URL for the REST web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the REST message. Click the lock to open the input field.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Variable substitutions</td>
<td>Name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag input variables into the parameter fields, and then assign a value. Parameters defined in the REST message that use <code>$()</code> can be assigned data from this activity template. Use the <strong>Additional attribute</strong> column to configure the system to not escape the text. By default the text sent to the REST message is escaped. If the users have provided variables using <strong>variable substitution</strong> in the REST message, then the <strong>Name</strong> column is automatically populated.</td>
</tr>
<tr>
<td>Additional Headers</td>
<td>Additional HTTP header parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Additional Query Parameters</td>
<td>Additional query parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check box that determines if a MID Server should be used to invoke the REST web service.</td>
</tr>
<tr>
<td>Note</td>
<td><strong>Note:</strong> If the REST web service message function defines a MID Server, that MID Server is used instead of the one selected here.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the REST endpoint. By default, the system selects a MID Server with REST capabilities. This field is available when the <strong>Use MID Server</strong> check box is selected.</td>
</tr>
<tr>
<td>Timeout</td>
<td>Allowed duration of the REST web service request before it times out, in seconds. The default is <strong>10</strong>.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Authentication</td>
<td>Determines what type of authentication is required for the endpoint. The options are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Use existing credentials in REST message</strong>: Uses credential definitions from the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Override with Basic Authentication credentials</strong>: Uses basic authentication credentials to override the credentials in the REST message definition. Basic authentication credentials must be provisioned before they are available for selection.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Override with Certificate Authentication credentials</strong>: Uses a certificate, such as a private key, to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Override with Both Basic and Certificate Authentication credentials</strong>: Uses both basic authentication and certificate authentication to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Override with OAuth Authentication credentials</strong>: Uses OAuth 2.0 credentials to override the credentials in the REST message definition. The REST message selected for this activity must have its <strong>Authentication type</strong> set to <strong>OAuth 2.0</strong> and its <strong>OAuth profile</strong> configured appropriately.</td>
</tr>
<tr>
<td>Credentials</td>
<td>Required REST endpoint basic authentication credentials. This field is available when <strong>Override with Basic Authentication credentials</strong> is selected in the Authentication field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file. See <strong>Configure the MID Server for CyberArk</strong> for details. Add the name of a different safe as a prefix to the credential ID, separated by a colon. For example, newsafe:orch-test-f5.</td>
</tr>
<tr>
<td>Protocol Profile</td>
<td>Certificate authentication to use. This field is available when the selections in the Authentication are either <strong>Override with Certificate Authentication credentials</strong> or <strong>Override with Both Basic and Certificate Authentication credentials</strong>.</td>
</tr>
<tr>
<td>OAuth profile</td>
<td>Profile for the OAuth provider for this REST message. See <strong>Specify an OAuth profile</strong> for more information.</td>
</tr>
</tbody>
</table>

**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See **automap output variables**.
Finish creating your REST web service activity by creating output variables, creating a parsing rule, or creating template conditions. Refer to the create custom activities topic to know your template options.

**Auto-map REST activity output variables**
The ServiceNow activity designer allows you to map parameter values in a REST test payload to variables in the Outputs stage automatically.

Role required: web_service_admin, activity_admin, activity_creator

Note: You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint and return data. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

1. In the activity designer, proceed to the Execution Command stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click Test Activity to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
4. Provide test values, if requested, and click OK to display the payload.
   The entire payload appears in the Raw Output tab of the Response form.

5. Select one of these auto-mapping options.
   - Auto-Map to Local: Directly maps values to a local variable for use within the activity.
   - Auto-Map to Output: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

**REST template execution parameters**
You use execution parameters to create the input process script in the Pre Processing form of the activity designer.

For descriptions of the REST web service command fields, see Configure the REST execution command.

Note: You must use the executionParam prefix with all variables in this table.
### REST template execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web service message</td>
<td>web_service_message</td>
<td>Reference</td>
<td>The sys_id of the corresponding web service message.</td>
</tr>
<tr>
<td>Web service message function</td>
<td>web_service_message_function</td>
<td>Reference</td>
<td>The sys_id of the REST message function.</td>
</tr>
<tr>
<td>Web service endpoint</td>
<td>web_service_endpoint</td>
<td>String</td>
<td>URL of the REST endpoint.</td>
</tr>
<tr>
<td>Parameters</td>
<td>parameters</td>
<td>Array of JavaScript objects</td>
<td>Array of JavaScript objects, expressed with the executionParam.prefix. For instructions on creating arrays using this parameter see <a href="#">Create a JavaScript array in a REST template</a>.</td>
</tr>
<tr>
<td>Use mid server</td>
<td>use_mid_server</td>
<td>Boolean</td>
<td>Selects whether or not to use the MID Server. A value of true uses the MID Server, and a value of false does not use the MID Server.</td>

<td>auth_type selected is basic_auth_pick_credentials.</td>
</tr>
</tbody>
</table>

Create a JavaScript array in a REST template
These are instructions for creating JavaScript arrays using REST execution parameters.

Role required: web_service_admin, activity_admin, activity_creator

To add more name-value pairs to the parameter's array, append the values to the existing array.

1. Create a JavaScript object with the following syntax, and add it to the executionParam.parameter array:

   ```javascript
   var newParameter = {
       "name": "parameterName",
       "value": "parameterValue",
       "additional_attribute": "none"
   }
   executionParam.parameters.push(newParameter);
   ```

   By adding the new parameter JavaScript object to the array, you ensure that any elements already available in the array are not impacted.

2. Make sure to set the value in the Additional attribute column in the REST message parameters input field to Do not escape text.

   In this case, the system does not escape the value specified for the value attribute. An example of this is:

   ```javascript
   var newParameter = {
       "name": "parameterName",
       "value": "parameterValue",
       "additional_attribute": "do_not_escape_text"
   }
   executionParam.parameters.push(newParameter);
   ```

   **Note:** If the value for the additional_attribute field is None, then the system escapes the value specified by the value attribute. In the first example, parameterValue is escaped.

**REST template post-processing parameters**
Use these parameters to create a post-processing script.

**Activity designer post-processing parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status code</td>
<td>status_code</td>
<td>Integer</td>
<td>Contains the status code returned from the REST web service.</td>
</tr>
<tr>
<td>Name</td>
<td>Variable</td>
<td>Type</td>
<td>Usage</td>
</tr>
<tr>
<td>---------</td>
<td>----------</td>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Header</td>
<td>header</td>
<td>Hashmap of JavaScript object</td>
<td>Hashmap of key value pairs associated with the header values passed into the web service. You can access each value with <code>executionResult.header[keyName]</code>.</td>
</tr>
<tr>
<td>Body</td>
<td>body</td>
<td>String</td>
<td>Contains a string value representing the output from the REST message</td>
</tr>
<tr>
<td>Error</td>
<td>error</td>
<td>String</td>
<td>Returns the error string from the REST web service, unless there are no errors, in which case it returns <code>null</code>.</td>
</tr>
</tbody>
</table>

Configure the REST execution command

Use the input variables you created to configure the command that Orchestration executes on the REST endpoint.

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: web_service_admin, activity_admin, activity_creator

Note: You can test the REST connection between the MID Server and the endpoint without having to run the activity in a workflow context. For details, see test template outputs.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.

**REST execution command fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <a href="#">Create input variables</a> to map to available fields.</td>
</tr>
<tr>
<td>REST message</td>
<td>Name of an existing REST message to use in this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td>REST message function</td>
<td>REST message function to use for this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>Endpoint URL for the REST web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the REST message. Click the lock to open the input field.</td>
</tr>
<tr>
<td>Variable substitutions</td>
<td>Name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag and drop input variables into the parameter fields, and then assign a value. Parameters defined in the REST message that use ${} can be assigned data from this activity template. Use the <strong>Additional attribute</strong> column to configure the system to not escape the text. By default the text sent to the REST message is escaped. The <strong>Name</strong> column is automatically populated if the users have provided variables using variable substitution in the REST message.</td>
</tr>
<tr>
<td>Additional Headers</td>
<td>Additional HTTP header parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Additional Query Parameters</td>
<td>Additional query parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check box that determines if a MID Server should be used to invoke the REST web service.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the REST endpoint. By default, the system selects a MID Server with REST capabilities. This field is available when the <strong>Use MID Server</strong> check box is selected.</td>
</tr>
</tbody>
</table>

**Note:** If the REST web service message function defines a MID Server, that MID Server is used instead of the one selected here.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeout</td>
<td>Allowed duration of the REST web service request before it times out, in seconds. The default is 10.</td>
</tr>
<tr>
<td>Authentication</td>
<td>Determines what type of authentication is required for the endpoint. The options are:</td>
</tr>
<tr>
<td></td>
<td>- Use existing credentials in REST message: Uses credential definitions from the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>- Override with Basic Authentication credentials: Uses basic authentication credentials to override the credentials in the REST message definition. Basic authentication credentials must be provisioned before they are available for selection.</td>
</tr>
<tr>
<td></td>
<td>- Override with Certificate Authentication credentials: Uses a certificate, such as a private key, to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>- Override with Both Basic and Certificate Authentication credentials: Uses both basic authentication and certificate authentication to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>- Override with OAuth Authentication credentials: Uses OAuth 2.0 credentials to override the credentials in the REST message definition. The REST message selected for this activity must have its Authentication type set to OAuth 2.0 and its OAuth profile configured appropriately.</td>
</tr>
<tr>
<td>Credentials</td>
<td>Required REST endpoint basic authentication credentials. This field is available when Override with Basic Authentication credentials is selected in the Authentication field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, newsafe:orch-test-f5.</td>
</tr>
<tr>
<td>Protocol Profile</td>
<td>Certificate authentication to use. This field is available when the selections in the Authentication field is either Override with Certificate Authentication credentials or Override with Both Basic and Certificate Authentication credentials.</td>
</tr>
<tr>
<td>OAuth profile</td>
<td>Profile for the OAuth provider for this REST message. See Specify an OAuth profile for more information.</td>
</tr>
</tbody>
</table>
3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

### Create an SFTP activity

Create an activity that executes basic SFTP commands on a remote server.

Roles required: **activity_creator** or **workflow_admin**

You can create a custom activity that manages files and directories on a target host or copies a file from one SFTP server to another. The file content is streamed through a MID Server, which avoids having to store the data on the hard drive of the MID Server host machine.

**Note:** This activity requires the credentials of a user who can execute SFTP commands on the source host. The **Copy File** activity, provided in the activity pack, requires separate credentials to access the target host.

1. Create a **custom activity**.
   This action creates a custom activity using a template.
2. After setting up **general properties** and **creating input variables**, configure the SFTP Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command</strong></td>
<td>Type of activity to create. The choices are:</td>
</tr>
<tr>
<td></td>
<td>- Copy file</td>
</tr>
<tr>
<td></td>
<td>- Create directory</td>
</tr>
<tr>
<td></td>
<td>- Get file list</td>
</tr>
<tr>
<td></td>
<td>- Remove file or directory</td>
</tr>
<tr>
<td></td>
<td>- Rename file or directory</td>
</tr>
<tr>
<td></td>
<td>- Set file attributes</td>
</tr>
</tbody>
</table>

**Note:** The fields that display on the form depend on the command you select.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Source host</strong></td>
<td>Name or IP address of the server containing the files targeted by the activity.</td>
</tr>
<tr>
<td><strong>Source port</strong></td>
<td>Port number to use to communicate with the source server. The default port number is 22.</td>
</tr>
<tr>
<td><strong>Source file path</strong></td>
<td>Full path to a file (/temp/test_data_file.txt) or directory (/temp/test_dir) on a source host depending on the selected command. Field available on following commands:</td>
</tr>
<tr>
<td></td>
<td>- Copy file</td>
</tr>
<tr>
<td></td>
<td>- Remove file or directory</td>
</tr>
<tr>
<td></td>
<td>- Set file attributes</td>
</tr>
<tr>
<td><strong>Source directory</strong></td>
<td>Path to the directory where the source files are located. Field available on following commands:</td>
</tr>
<tr>
<td></td>
<td>- Create directory</td>
</tr>
<tr>
<td></td>
<td>- Get file list</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Source files</strong></td>
<td>Names of specific source files to include in the file transfer. Separate the file names with semicolons. This field supports a semi-colon separated list of wild-card patterns. For example: <code>.txt</code>, <code>a?.pdf</code>. If this field is blank, all files are included. Field available on following command:</td>
</tr>
<tr>
<td></td>
<td>• Get file list</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>For information about how the values in this field affect options in other fields, see the logic explanation which follows.</td>
</tr>
<tr>
<td><strong>Is a directory</strong></td>
<td>If checked, specifies the file path is a directory. Field available on following command:</td>
</tr>
<tr>
<td></td>
<td>• Remove file or directory</td>
</tr>
<tr>
<td><strong>Credential tag for source</strong></td>
<td>Specific credential tag this activity must use to run SFTP commands on the source host.</td>
</tr>
<tr>
<td><strong>Credential tag for target</strong></td>
<td>Specific credential tag this activity must use to run SFTP commands on the target host. Field available on following command:</td>
</tr>
<tr>
<td></td>
<td>• Copy file</td>
</tr>
<tr>
<td><strong>Excluded files</strong></td>
<td>Names of specific source files to exclude from the file transfer. The activity acts on all other files found in the source directory or subfolders. Separate the file names with commas. This field supports comma-separated list of wild-card patterns. For example: <code>.txt</code>, <code>a?.pdf</code>. Field available on following command:</td>
</tr>
<tr>
<td></td>
<td>• Get file list</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>For information about how the values in this field affect options in other fields, see the logic explanation which follows.</td>
</tr>
<tr>
<td><strong>Include subfolders</strong></td>
<td>If checked, includes the files from subfolders in the source directory. Field available on following command:</td>
</tr>
<tr>
<td></td>
<td>• Get file list</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>For information about how your selection affects other fields in the form, see the logic explanation which follows.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Target host</strong></td>
<td>Name or IP address of the server to which the files are being transferred. Field available on following command:</td>
</tr>
<tr>
<td></td>
<td>• Copy file</td>
</tr>
<tr>
<td><strong>Target port</strong></td>
<td>Port number to use to communicate with the target host. The default port number is 22. Field available on following command:</td>
</tr>
<tr>
<td></td>
<td>• Copy file</td>
</tr>
<tr>
<td><strong>Target file path</strong></td>
<td>Full path to a file on a target host. Field available on following commands:</td>
</tr>
<tr>
<td></td>
<td>• Copy file</td>
</tr>
<tr>
<td></td>
<td>• Rename file or directory</td>
</tr>
<tr>
<td><strong>Suffix for temporary file</strong></td>
<td>If a file exists on a target host, this command enables a temporary suffix to use for a file name. If this field contains a value, the activity first copies the source file to a temporary file on the target host using <code>targetFilePath + tempFileSuffix</code> as the name. Upon completion, the activity renames the file to the actual target file name. If this field is blank, the activity copies the source file directly to the target file and overwrites it, if it exists. Field available on following command:</td>
</tr>
<tr>
<td></td>
<td>• Copy file</td>
</tr>
<tr>
<td><strong>UID</strong></td>
<td>User ID attribute to apply to a file or directory. The UID and GID values must be set together as a pair or they are ignored. The UID and GID numbers are internal values returned by the Get File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on the target file. This flow is demonstrated in the SFTP File Transfer workflow. Field available on following command:</td>
</tr>
<tr>
<td></td>
<td>• Set file attributes</td>
</tr>
<tr>
<td><strong>GID</strong></td>
<td>Group ID attribute to apply to a file or directory. The UID and GID values must be set together as a pair or they are ignored. The UID and GID numbers are internal values returned by the Get File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on the target file. This flow is demonstrated in the SFTP File Transfer workflow. Field available on following command:</td>
</tr>
<tr>
<td></td>
<td>• Set file attributes</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Permissions       | File or directory permissions to set for the user and group specified. This value must be expressed as an integer, such as `16877`, which defines these permissions: `rwxr-xr-x`. The permissions numbers are internal values returned by the Get File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on the target file. This flow is demonstrated in the SFTP File Transfer workflow. Field available on following command:  
  - Set file attributes                                                                                       |
| Access timestamp  | Override the timestamp when the file or directory was last accessed. The access and modification timestamps must be set together as a pair. Field available on following command:  
  - Set file attributes                                                                                           |
| Modification timestamp | Override the timestamp when the file or directory was last modified. The access and modification timestamps must be set together as a pair. Field available on following command:  
  - Set file attributes                                                                                           |
| Size in bytes     | Size of a file, expressed in bytes. Field available on following command:  
  - Set file attributes                                                                                           |
| Required MID Server capabilities | MID Server with the appropriate capabilities for connecting to the source and target servers.                                                                                                     |

The system uses this logic to determine which files to move from the source host:

- If the Source files field is empty, the system selects all the files in the source directory. Otherwise, it only selects those files whose names match one of the file name patterns given in the field.
- If the Excluded files field is empty, the system excludes nothing. Otherwise, it excludes those files whose names match one of the file name patterns given in the field.
- The exclude rule has a higher preference than the include rule. If a file name matches one of the file name patterns in the Excluded files field, it does not get into the selection regardless of the include rule.
- When the Include subfolders check box is cleared, the system looks only in the source directory for files to include or exclude. Otherwise, it looks in the source directory and any of its subfolders for files to include or exclude.

**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See automap output variables.

- Use auto-mapping to generate outputs and parsing rules (recommended for JDBC)
• If you do not use auto-mapping, you can manually create output variables and create parsing rules.

**SFTP template execution parameters**

You use execution parameters to create the input process script in the **Preprocessing** form.

For descriptions of the command fields, see **Configure the SFTP execution command**.

**Note:** You must use the `executionParam` prefix with all variables in this table.

### SFTP execution parameters

<table>

<td>Contains the tags used to extract output using the SSH commands. The tag output is delimited by double percentage signs, as in <code>%%tagname%% ... %</code>. Set up the command using the following format:</td>
</tr>
</tbody>
</table>

```plaintext
%%tagname1%%
output1 line 1
output1 line 2
...
%
%%tagname2%%
output2 line 1
output2 line 2
...
%
```

The tags returned are JavaScript hashmap objects in which each key is prefixed with `tag` appended with the `tagname`. |

```json
{"__text__": "",
	"tagname1": "output1 line1
output1 line2",
	"tagname2": "output2 line1
output2 line2"}
```

Configure the SFTP execution command

Use the input variables you created to configure the command that Orchestration executes on the SFTP target.

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: activity_creator, admin

Note: You can test the JDBC connection between the MID Server and the target without having to run the activity in a workflow context. For details, see test template outputs.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.

### SFTP execution command

- **Command**: Create directory
- **Source host**: 10.1.200.198
- **Source port**: 22
- **Source directory**: /root/test/dev200
- **Credential tag for source**: ssh
- **Required MID Server capabilities**: SSH

<td>Suffix for temporary file</td>
<td>Temporary suffix to use for a file name if the file already exists on a target host. If this field contains a value, the activity deletes the duplicate target file if it exists, and then copies the source file to a temporary file using targetFilePath + tempFileSuffix as the name. Upon completion, the activity renames the file to the actual target file name. If this field is blank, the activity copies the source file directly to the target file and overwrites it, if it already exists.</td>
<td>Copy file</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
<td>Command</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
</tr>
<tr>
<td>UID</td>
<td>User ID attribute to apply to a file or directory. The UID and GID values must be set together as a pair or they are ignored.</td>
<td>Set file attributes</td>
</tr>
<tr>
<td>GID</td>
<td>Group ID attribute to apply to a file or directory. The UID and GID values must be set together as a pair or they are ignored.</td>
<td>Set file attributes</td>
</tr>
<tr>
<td>Permissions</td>
<td>File or directory permissions to set for the user and group specified. This value must be expressed as an integer, such as 16877, which defines these permissions: <code>rwxr-xr-x</code>. The permissions number is an internal value returned by the Get File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on the target file. This is demonstrated in the SFTP File Transfer workflow.</td>
<td>Set file attributes</td>
</tr>
<tr>
<td>Access timestamp</td>
<td>Override the timestamp when the file or directory was last accessed. The access and modification timestamps must be set together as a pair.</td>
<td>Set file attributes</td>
</tr>
<tr>
<td>Modification timestamp</td>
<td>Override the timestamp when the file or directory was last modified. The access and modification timestamps must be set together as a pair.</td>
<td>Set file attributes</td>
</tr>
<tr>
<td>Size in bytes</td>
<td>Size of a file, expressed in bytes.</td>
<td>Set file attributes</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the source and target servers. By default, the system selects an SSH MID Server.</td>
<td>All</td>
</tr>
</tbody>
</table>

The system uses this logic to determine which files to move from the source host:

- If the **Source files** field is empty, the system select all the files in the source directory. Otherwise, it only selects those files whose names match one of the file name patterns given in the field.
- If the **Excluded files** field is empty, the system excludes nothing. Otherwise, it excludes those files whose names match one of the file name patterns given in the field.
- The exclude rule has a higher preference than the include rule. A file whose name matches one of the file name patterns in the **Excluded files** field does not get into the selection, even though it would be selected by the include rule.
- When the **Include subfolders** check box is cleared, the system looks only in the source directory for files to include or exclude. Otherwise, it looks in the source directory and any of its subfolders for files to include or exclude.

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

### Create a probe activity
Create an activity that runs a probe on the target host that is configured to return specific information.

**Role required:** activity_creator or workflow_admin

For instructions on using the activity template process flow, see [create custom activities](#).

1. Create a **custom activity**.
   This action creates a custom activity using a template.
2. After setting up **general properties** and **creating input variables**, configure the Probe Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that Orchestration executes.</td>
</tr>
<tr>
<td>Probe</td>
<td>Probe to run with this activity, from the list of probes in the system</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td>Parameters</td>
<td>MID Server to use, by capabilities.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.</td>
</tr>
</tbody>
</table>

**Note:** You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See [automap output variables](#).

- Use **auto-mapping** to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually [create output variables](#) and [create parsing rules](#)

**Probe template execution parameters**
You use execution parameters to create the input process script in the **Pre Processing** form.

For descriptions of the command fields, see [Configure the Probe execution command](#).

**Note:** You must use the `executionParam` prefix with all variables in this table.
### Probe activity execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Probe</td>
<td>probe</td>
<td>Reference</td>
<td>The sys_id of the MID Server probe.</td>
</tr>
<tr>
<td>Source</td>
<td>source</td>
<td>String</td>
<td>Intended target host</td>
</tr>
</tbody>
</table>
| Parameters      | parameters | Array of JS object | Array of JavaScript objects, expressed with the executionParam.prefix. To add more name-value pairs to the parameters array, append them to the existing array. Create a JavaScript object with the following syntax, and add it to the executionParam.parameters array. This assigns additional parameters to the message:  

```javascript
var newParameter = {
  name: "parameterName",
  value: "parameterValue"
};

executionParam.parameters.push(newParameter);
```

<table>
<thead>
<tr>
<th>MidCapabilities</th>
<th>midCapabilities</th>
<th>String (comma separated)</th>
<th>List of required MID server capabilities.</th>
</tr>
</thead>
</table>
| ValueCapabilities | valueCapabilities | Array of hashmap | Capability values used to select the MID Server. For more information, see MID Server capabilities. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:  

```javascript
var valueCapability = {
  'NEW_MID_CAPABILITY': 'NEW_MID_CAPABILITY_VALUE'
};

executionParam.valueCapabilities.push(valueCapability);
```

### Probe template post-processing parameters

Use these parameters to create a post-processing script.
Probe post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Payload</td>
<td>payload</td>
<td>String</td>
<td>Contains raw payload returned from the probe.</td>
</tr>
<tr>
<td>Output</td>
<td>output</td>
<td>String</td>
<td>Contains output data returned from the probe.</td>
</tr>
<tr>
<td>EccSysId</td>
<td>eccSysId</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message.</td>
</tr>
</tbody>
</table>

Configure the Probe execution command
Use the input variables you created to configure the command that Orchestration executes on the target.

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: activity_creator, admin

**Note:** You can test the activity connection between the MID Server and the target without having to run the activity in a workflow context. For details, see *test template outputs*.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
Probe execution command

2. Complete the fields shown in the table.
Probe execution command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <a href="#">Create input variables</a> to map to available fields.</td>
</tr>
<tr>
<td>Probe</td>
<td>Probe to run with this activity, from the list of probes in the system.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use, by capabilities.</td>
</tr>
<tr>
<td>Parameters</td>
<td>Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.</td>
</tr>
</tbody>
</table>

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

Create an SSH activity

Create an activity that extracts data from a target host that uses the SSH network protocol.

Role required: activity_creator or workflow_admin

For instructions on using the activity template process flow, see [create custom activities](#).

1. Create a **custom activity**.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the SSH Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Map the input variables</strong></td>
<td>Use the variables you created to configure the command that Orchestration executes.</td>
</tr>
<tr>
<td><strong>Target host</strong></td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td><strong>Command</strong></td>
<td>Command this activity runs on the target host. You can invoke a MID Server script from this field using any script type that the SSH command line supports. For more information, see <a href="#">Advanced SSH script options</a> below the table.</td>
</tr>
<tr>
<td><strong>Directory</strong></td>
<td>Directory on the target host where the command is run.</td>
</tr>
<tr>
<td><strong>Credential tag</strong></td>
<td>The Orchestration credential tag to use when running the command.</td>
</tr>
<tr>
<td><strong>Required MID Server capabilities</strong></td>
<td>MID Server with the appropriate capabilities for connecting to the host. By default, the system selects a MID Server with SSH capabilities.</td>
</tr>
<tr>
<td><strong>Long running</strong></td>
<td>If checked, disables the SSH connection timeout for commands that might take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td>Must Sudo</td>
<td>If checked, enables the use of <code>sudo</code> to run commands.</td>
</tr>
</tbody>
</table>

**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See `automap output variables`.

### Advanced SSH script options

To run a MID Server script on the target host, specify the script type and pass the name of the script into the `$syncFile()` parameter. The system uses this parameter to locate the named script in the MID Server Script File (ecc_agent_script_file) table and run it on the target host. For example, a bash script can be expressed as:

```bash
bash ${syncFile("<MID script name>")} argument1 argument2 argument3
```

A base script (`main_script.bash`) can reference another script (`my_include.bash`) as well as a separate file (`.my_profile`) located on the target host. Both scripts and the file referenced must be synced to the MID Server, using the `$syncFile()` parameter, to execute properly.

```bash
source ${syncFile(".my_profile")}
cp ${syncFile("my_include.bash")} /usr/ssmith/my_include.bash
bash ${syncFile("main_script.bash")} one two three four five six
rm /usr/ssmith/my_include.bash
```

A Python example with inline comments might look like this:

```python
set $LIB_DIR=/usr/bin;
# Sync a file that is referenced inside myF5CreateLBPool.py
cp ${syncFile("specialFunctions.py")} ~/specialFunctions.py
# set up environment variables
source ${syncFile(".python_profile")}
# call script that sets up dependencies on the box from remote package repos
python ${syncFile("setupPythonDependencies.py")} pycontrol
# call a script that requires functions from the package as well as a function from myIncludedFile
python ${syncFile("myF5CreateLBPool.py")} snow_pool myActualValue
# user is responsible for their own cleanup
rm ~/specialFunctions.py
```

- Use *auto-mapping* to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

### SSH template execution parameters

Use execution parameters to create the input process script in the Pre Processing form of the activity designer.

For descriptions of the command fields, see `Configure the SSH execution command`.

## SSH execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>source</td>
<td>String</td>
<td>Intended target or host.</td>
</tr>
<tr>
<td>Command</td>
<td>command</td>
<td>String</td>
<td>Comment to run on the host.</td>
</tr>
<tr>
<td>Directory</td>
<td>directory</td>
<td>String</td>
<td>Directory on the host in which to run the command.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>credential_tag</td>
<td>String</td>
<td>Orchestration credential tag to use when running the command.</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of required MID Server capabilities.</td>
</tr>
<tr>
<td>ValueCapabilities</td>
<td>valueCapabilities</td>
<td>Array of hashmap</td>
<td>Capability values used to select the MID Server. For more information, see <a href="#">MID Server capabilities</a>. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:</td>
</tr>
<tr>
<td>Long running</td>
<td>long_running</td>
<td>Boolean</td>
<td>Indicates whether or not the command is long running. A value of true indicates that the command is long running.</td>
</tr>
<tr>
<td>Must sudo</td>
<td>must_sudo</td>
<td>Boolean</td>
<td>Indicates whether or not this activity must use sudo to run root commands. A value of true indicates that sudo must be used.</td>
</tr>
</tbody>
</table>

### SSH post-processing parameters and payload parsing

Use these parameters to create a post-processing script, payload parsing, and tagging.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
## SSH post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output</td>
<td>output</td>
<td>String</td>
<td>Contains the output returned from the SSH command.</td>
</tr>
<tr>
<td>EccSysID</td>
<td>eccSysID</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message returned by the activity.</td>
</tr>
<tr>
<td>ErrorMessages</td>
<td>errorMessages</td>
<td>String</td>
<td>Contains the error messages retrieved from the SSH command. This value is null if there are no error messages.</td>
</tr>
</tbody>
</table>
| Tags          | tags     | Hashmap of tag values returned from the SSH command | Contains the tags used to extract output using the SSH commands. The tag output is delimited by double percentage signs, as in %tagname% ... %%. Set up the command using the following format:  

```
%tagname1%
output1 line 1
output1 line 2
%
%tagname2%
output2 line 1
output2 line 2
%
```

The tags returned are JavaScript hashmap objects in which each key is prefixed with tag appended with the tagname.

```javascript
{
  "__text__": "",
  "tagtagname1": "output1 line 1
 output1 line 2
 ... 
 
 %
 
 %tagname2%%
 output2 line 1
 output2 line 2
 ... 
 
 %

```
Configure the SSH execution command
Use the input variables you created to configure the command that Orchestration executes on the host target.

Create the input variables you need in the **Inputs** form before you advance to the **Execution Command** stage.

Role required: activity_creator, admin

**Note:** You can test the SSH connection between the MID Server and the target without having to run the activity in a workflow context. For details, see test template outputs.

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
SSH execution command

2. Complete the fields shown in the table.
SSH activity inputs

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. Create input variables to map to available fields.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td>Command</td>
<td>Command this activity runs on the target host. You can invoke a MID Server script from this field using any script type that is supported by the SSH command line. For more information, see Advanced SSH script options below the table.</td>
</tr>
<tr>
<td>Directory</td>
<td>Directory on the target host where the command is run.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>The credential alias to use when running the command.</td>
</tr>
<tr>
<td>Select MID Server by capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the host. By default, the system selects a MID Server with SSH capabilities</td>
</tr>
<tr>
<td>Long running</td>
<td>Check box to disable the SSH connection timeout for commands that might take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.</td>
</tr>
<tr>
<td>Must Sudo</td>
<td>Check box to allow the use of sudo to run commands.</td>
</tr>
</tbody>
</table>

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

Create a run script activity

Create an activity that runs any script.

Role required: activity_creator or workflow_admin

1. Create a **custom activity**.
   This action creates a custom activity using a template.
2. After setting up **general properties** and **creating input variables**, configure the Run Script Execution Command:
   Create a script for this activity to execute.

   **Note:** You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See **automap output variables**.

   - Use **auto-mapping** to generate outputs and parsing rules
• If you do not use auto-mapping, you can manually create output variables and create parsing rules.

**Run Script template processing script**

Use the Run Script custom template Script form to enter a script to call and use with other activities.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Processing script</td>
<td>Script that the activity runs.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays input variables you passed into the activity on the <strong>Inputs</strong> form. All activity variables added in the <strong>Inputs</strong> form are read-only and are expressed in the processing script with this syntax: <code>activityInput.variable</code>.</td>
</tr>
</tbody>
</table>

**Create a JMS activity**

Create a custom JMS activity to retrieve or send messages to external systems using the Java Messaging Service.

Role required: activity_creator or workflow_admin

The JMS activity supports third party JMS providers whose JMS client application is written with a typical Java EE pattern and can support these operations:

• Using JNDI to find a ConnectionFactory object.
• Using JNDI to find one or more destination objects.
• Using the ConnectionFactory to create a JMS connection object.
• Using the JMS connection to create one or more JMS session objects.
• Using a JMS session and the destinations to create the MessageProducer and MessageConsumer objects.
• Starting the JMS connection to enable delivery or consumption of messages.

**Note:** The JMS activity designer has been tested with the JMS providers ActiveMQ and Tibco EMS. When connecting to a JMS provider, refer to your third party user documentation.

1. Create or verify your JMS credential.
   
   Your JMS credentials must have permission for the target database and proper configuration for the corresponding JMS connection. Credentials must be set up before you can create a JMS activity.

2. Create or verify your JMS connection.
   
   Your JMS connection must be configured with valid JMS credentials set up before you can create a JMS activity.

3. Create a custom activity.
   
   This action creates a custom activity using a template.
4. After setting up **general properties** and **creating input variables**, configure the JMS Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configure your credential</td>
<td>Fill in the fields necessary for your database connection.</td>
</tr>
<tr>
<td>Connection Factory</td>
<td>Name of the JMS Connection Factory. You should create or verify your JMS connection. This configuration links the name of the Initial Context Factory with the URL of the JMS provider.</td>
</tr>
<tr>
<td>Destination Type</td>
<td>Type of destination used for this message:</td>
</tr>
<tr>
<td></td>
<td>· <strong>Queue</strong>: Message is queued for point-to-point communications.</td>
</tr>
<tr>
<td></td>
<td>· <strong>Topic</strong>: Message is used for publish and subscribe communication.</td>
</tr>
<tr>
<td></td>
