<td>WhatsApp Management</td>
<td>Send Contacts</td>
<td>Sends contacts to a WhatsApp number.</td>
</tr>
<tr>
<td>WhatsApp Management</td>
<td>Send Location</td>
<td>Sends geographic coordinates of a location to a WhatsApp number.</td>
</tr>
<tr>
<td>WhatsApp Management</td>
<td>Send Media Message</td>
<td>Sends a media message to a WhatsApp number.</td>
</tr>
<tr>
<td>WhatsApp Management</td>
<td>Send Text Message</td>
<td>Sends a text message to a WhatsApp number.</td>
</tr>
<tr>
<td>WhatsApp Management</td>
<td>Send Text Message Using Template</td>
<td>Sends a text message using the template to a WhatsApp number.</td>
</tr>
</tbody>
</table>

Spoke module

Bi-directional webhooks can be set up to be notified about the required events. Routing policy defines conditions that must be met to notify the ServiceNow instance. These conditions are based on the events in Vonage that you want to be notified about. When the conditions are met, routing policy triggers the associated subflow, which in turn automates the Vonage tasks. By default, the Vonage Spoke application is available and has the following modules:

- Vonage Webhook Registries
- Vonage WebHook Routing Policies
Use the Vonage Webhook Registries module to assign a token and provide the API path. You must generate a Callback URL here and provide this URL in Vonage. Default routing policies are provided as a reference in the Vonage WebHook Routing Policies module. Customize these routing policies as per your requirement. The routing policy supports these fields:

- Keywords
- Call Direction
- Call Status
- Event Type
- From
- SMS Status
- SMS Text
- To
- WhatsApp Message Status
- WhatsApp Text
- Show Related Fields

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see *Connections and Credentials*.

Two connection and credential aliases are available along with the Vonage spoke:

<table>
<thead>
<tr>
<th>Vonage alias</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VonagePrimary</td>
<td>Required for the actions that manage SMS, number, and account.</td>
</tr>
<tr>
<td>Vonage</td>
<td>Required for the actions that manage calls and WhatsApp.</td>
</tr>
</tbody>
</table>

**Set up the Vonage spoke**

Integrate the ServiceNow instance and Vonage instance by using the API credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate Vonage spoke.
- Role required: admin

Configure the default connection and credential alias records

Configure the default alias records for your Vonage account. The Vonage spoke connection and credential aliases use these connections to perform the actions in Vonage account.

1. Navigate to *Connections & Credentials > Connections & Credentials Aliases*.
2. Open the alias record, *VonagePrimary*.
3. Click the *Create New Connection & Credential* related link.
4. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Vonage Primary Connection.</td>
</tr>
</tbody>
</table>
5. Click Create.

Note: Credential record isn't required for the VonagePrimary alias.

7. Open the alias record, Vonage.
8. Click the Create New Connection & Credential related link.
9. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to your Vonage account. Enter: <a href="https://rest.nexmo.com">https://rest.nexmo.com</a></td>
</tr>
<tr>
<td>API Key</td>
<td>API key of your Vonage account. You can access this value from the Vonage API Dashboard. For more information, see the Authentication page in the Vonage API Developer documentation site.</td>
</tr>
<tr>
<td>API Secret</td>
<td>API secret of your Vonage account. You can access this value from the Vonage API Dashboard. For more information, see the Authentication page in the Vonage API Developer documentation site.</td>
</tr>
</tbody>
</table>

10. Click Create.

- An application with the provided name is created in your Vonage account. You can access this application by logging in to Vonage API Dashboard and navigating to Your applications.
- A credential record with the name as Vonage Credential is created for Vonage alias.
• Application ID and private key are retrieved from the Vonage account and saved in the **Vonage Credential** record.

• JWT token is generated for the **Vonage Credential** record.

**Note:** If you generate another private key, ensure that you update the private key in the **Vonage Credential** record and click **Generate Jwt Token**. It might take sometime, that is 20 minutes approximately, for the new private key to be synchronised.

• Voice and message webhooks are set up and configured in the **Vonage spoke > Vonage webhook Registries**.

  • In the Applications Edit page in **Vonage API Dashboard**, under **Capabilities**, these voice and message URLs are configured to integrate with your ServiceNow instance:

    - Event URL
    - Answer URL
    - Inbound URL
    - Status URL

  For more information, see the **Overview** page in the **Vonage API Developer** documentation site.

---

**Create webhook for SMS management**
Create webhook to manage SMS.

1. Navigate to **Vonage spoke > Vonage webhook Registries**.
2. Click **New**.
3. On the form, fill in these fields.

<table>
<thead>
<tr>
<th>Vonce Webhook Registry form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>Name</td>
<td>Name to uniquely identify the webhook record.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the webhook record.</td>
</tr>
<tr>
<td>Event Type</td>
<td>Type of event for which the webhook is set up. Select <strong>SMS</strong>.</td>
</tr>
<tr>
<td>Secret Key</td>
<td>Secret key to authenticate the webhook requests.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click **Save**.
5. Click **Callback URL**.

   The system displays the webhook callback URL.

6. Copy and record the webhook callback URL.
7. Log in to the **Vonage API Dashboard** and navigate to the account settings.
8. Under **Default SMS Setting**, fill these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delivery receipts</td>
<td>Webhook callback URL</td>
</tr>
<tr>
<td>Inbound messages</td>
<td>Webhook callback URL</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>POST-JSON</td>
</tr>
</tbody>
</table>

9. Click **Save changes**.

   SMS settings for the application are saved.

10. Optional: To configure the SMS settings for a particular number:
a) Log in to the Vonage API Dashboard and navigate to Numbers.
b) Click Your Numbers.
c) Click the Manage icon for the required number.
d) Enter the webhook callback URL in Inbound Webhook URL and Event Webhook URL.

Note: These URLs override the SMS settings specified for the application.

Customize webhooks and routing policies
Customise the webhook routing policy and subflow as per your requirement.

Role required: admin

1. Navigate to Flow Designer > Designer.
2. Click Subflows.
3. Create a copy of the required default subflow.
4. Customize the subflow as per your requirement and publish it. See Subflows for more information about creating and using subflows and Vonage spoke for information about the fields that the default routing policy and subflows support.
6. Click New.
7. On the form, fill in the fields.

Decision form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
<tr>
<td>Default answer</td>
<td>Option to specify if this is the default answer. The default answer is applicable when the conditions are not met.</td>
</tr>
</tbody>
</table>

1. Click the lookup icon.
2. Select the required subflow from the Document list.

Note: Ensure that the Table name is Flow [sys_hub_flow].
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>Conditions to be met when the required events occur in Vonage. The supported Vonage fields are:</td>
</tr>
<tr>
<td></td>
<td>• Keywords</td>
</tr>
<tr>
<td></td>
<td>• Call Direction</td>
</tr>
<tr>
<td></td>
<td>• Call Status</td>
</tr>
<tr>
<td></td>
<td>• Event Type</td>
</tr>
<tr>
<td></td>
<td>• From</td>
</tr>
<tr>
<td></td>
<td>• SMS Status</td>
</tr>
<tr>
<td></td>
<td>• SMS Text</td>
</tr>
<tr>
<td></td>
<td>• To</td>
</tr>
<tr>
<td></td>
<td>• WhatsApp Message Status</td>
</tr>
<tr>
<td></td>
<td>• WhatsApp Text</td>
</tr>
<tr>
<td></td>
<td>• Show Related Fields</td>
</tr>
<tr>
<td>Answer</td>
<td>Subflow that must be triggered when the specified conditions are met.</td>
</tr>
</tbody>
</table>

8. Click Submit.

**Note:** These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

**YouTube spoke**

Manage your videos, channels, subscriptions, and playlists in YouTube account, and access analytics and statistics from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported versions**

This spoke was built for these YouTube versions, but may be compatible with later versions.

- Reporting API version v1
- Data API version v3
- Analytics API version v2
YouTube spoke requirements

The YouTube spoke requires a custom app that you create in Google Cloud Platform.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• Complex Object (com.glide.object)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

⚠ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The YouTube spoke provides actions to automate YouTube tasks when events occurs in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Analytics</td>
<td>Audience Retention Statistics</td>
<td>Retrieves information about the audience retention statistics.</td>
</tr>
<tr>
<td></td>
<td>Basic Statistics</td>
<td>Retrieves information about the basic statistics.</td>
</tr>
<tr>
<td></td>
<td>Demographics</td>
<td>Retrieves information about the demographics. That is, details about the age, gender, and geographical location of your audience.</td>
</tr>
<tr>
<td></td>
<td>Device/OS Statistics</td>
<td>Retrieves information about the devices from which your audience access your content.</td>
</tr>
<tr>
<td></td>
<td>Get Country Codes (Metadata)</td>
<td>Retrieves details of countries and their ISO codes.</td>
</tr>
<tr>
<td></td>
<td>Traffic Source Statistics</td>
<td>Retrieves information about the various traffic sources.</td>
</tr>
<tr>
<td>Captions</td>
<td>Delete Caption</td>
<td>Deletes captions on a video.</td>
</tr>
<tr>
<td></td>
<td>Look up Captions</td>
<td>Retrieves information about the captions on a video.</td>
</tr>
</tbody>
</table>

Note: This is a metadata action.
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comments</td>
<td>Delete Comment</td>
<td>Delete the specified comment on a video.</td>
</tr>
<tr>
<td></td>
<td>Look up Comments</td>
<td>Retrieves details about the top level comments in a comment thread.</td>
</tr>
<tr>
<td></td>
<td>Post Comment</td>
<td>Posts a top level comment on a video.</td>
</tr>
<tr>
<td></td>
<td>Reply to Comment</td>
<td>Posts a reply to a top level comment on a video.</td>
</tr>
<tr>
<td>Groups</td>
<td>Create Groups</td>
<td>Creates a group for videos, channels, or playlists.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes the specified group.</td>
</tr>
<tr>
<td></td>
<td>Delete Group Item</td>
<td>Deletes the specified group item.</td>
</tr>
<tr>
<td></td>
<td>Insert Item into Group</td>
<td>Inserts an item in the specified group.</td>
</tr>
<tr>
<td></td>
<td>Look up Group-Items</td>
<td>Retrieves information about all items in a group.</td>
</tr>
<tr>
<td></td>
<td>Look up Groups</td>
<td>Retrieves information about the specified groups.</td>
</tr>
<tr>
<td>Playlist</td>
<td>Create Playlist</td>
<td>Creates a playlist in your YouTube account.</td>
</tr>
<tr>
<td></td>
<td>Delete Playlist</td>
<td>Deletes a playlist from your YouTube account.</td>
</tr>
<tr>
<td></td>
<td>Delete Playlist Item</td>
<td>Deletes the specified playlist item.</td>
</tr>
<tr>
<td></td>
<td>Insert into Playlist</td>
<td>Inserts an item in the specified playlist.</td>
</tr>
<tr>
<td>Reports</td>
<td>Create Report Job</td>
<td>Creates a report job in YouTube account. YouTube generates the requested report within 24 hours.</td>
</tr>
<tr>
<td></td>
<td>Get Report Types Choice (Metadata)</td>
<td>Retrieves information about the Report Types choice list.</td>
</tr>
<tr>
<td></td>
<td>Look up Reports</td>
<td>Retrieves information about the reports generated for a job.</td>
</tr>
<tr>
<td></td>
<td>View Report</td>
<td>Retrieves data in a report in CSV format.</td>
</tr>
<tr>
<td>Subscriptions</td>
<td>Look up Subscriptions</td>
<td>Retrieves information about the specified subscriptions.</td>
</tr>
<tr>
<td></td>
<td>Subscribe Channel</td>
<td>Subscribes to the required channel.</td>
</tr>
<tr>
<td></td>
<td>Unsubscribe Channel</td>
<td>Unsubscribes to the required channel.</td>
</tr>
<tr>
<td>Video</td>
<td>Delete Video</td>
<td>Deletes an uploaded video.</td>
</tr>
<tr>
<td></td>
<td>Look up Video</td>
<td>Retrieves information about the specified video.</td>
</tr>
<tr>
<td></td>
<td>Look up Videos</td>
<td>Retrieves information about the specified multiple videos.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Rate/Unrate Video</td>
<td>Likes or dislikes the specified video. Also, removes the previous rating for a video.</td>
</tr>
<tr>
<td></td>
<td>Search</td>
<td>Searches for the required video, channel, or playlist.</td>
</tr>
<tr>
<td></td>
<td>Set Thumbnail to Video</td>
<td>Sets a thumbnail image for an uploaded video.</td>
</tr>
<tr>
<td></td>
<td>Set Video Metadata</td>
<td>Sets the metadata of a video.</td>
</tr>
<tr>
<td></td>
<td>Upload Video</td>
<td>Uploads a video to your channel in YouTube.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up the YouTube spoke**

Integrate the ServiceNow instance and YouTube account by creating a custom OAuth application in Google Cloud Platform to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate YouTube spoke.
- Role required: admin

*Configure the YouTube application*

Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the YouTube spoke.

Complete these steps from the *Google Cloud Platform*. See the *Google Cloud Platform* product documentation for instructions on creating and configuring custom applications.

1. Register a new custom application. Navigate to [https://console.cloud.google.com/](https://console.cloud.google.com/), create a project with your administrator credentials, and open the project.
2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.
3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.
4. Select the application type OAuth client ID.
5. Enter the following Authorized redirect URI: [https://<instance>.service-now.com/oauth_redirect.do](https://<instance>.service-now.com/oauth_redirect.do) and click Create.
6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register YouTube as an OAuth provider.

The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.
Register YouTube as an OAuth provider

Use the information generated during the YouTube application configuration to register YouTube as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

1. Navigate to **System OAuth > Application Registry**.
2. Open for the record, **Youtube**.
3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID of the YouTube application.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret of the YouTube application.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do.</td>
</tr>
</tbody>
</table>

4. Ensure that these scopes are available in the **OAuth Entity Scopes** tab.

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>YouTube Partner</td>
<td><a href="https://www.googleapis.com/auth/youtubepartner">https://www.googleapis.com/auth/youtubepartner</a></td>
</tr>
<tr>
<td>YouTube Reporting S1</td>
<td><a href="https://www.googleapis.com/auth/yt-analytics.readonly">https://www.googleapis.com/auth/yt-analytics.readonly</a></td>
</tr>
<tr>
<td>YouTube Reporting S2</td>
<td><a href="https://www.googleapis.com/auth/yt-analytics-monetary.readonly">https://www.googleapis.com/auth/yt-analytics-monetary.readonly</a></td>
</tr>
<tr>
<td>YouTube Scope</td>
<td><a href="https://www.googleapis.com/auth/youtube">https://www.googleapis.com/auth/youtube</a></td>
</tr>
<tr>
<td>YouTube Scope Force SSL</td>
<td><a href="https://www.googleapis.com/auth/youtube.force-ssl">https://www.googleapis.com/auth/youtube.force-ssl</a></td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click **Save**.

Create a credential record for the YouTube spoke

Create a credential record for the YouTube application. The YouTube spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Connections & Credential Aliases**.
2. Open record for the YouTube spoke. For example, **YouTube**.
3. In the **Credentials** tab, click **New**.
4. Select **OAuth 2.0 Credentials**.
5. Enter a unique name for the credential, for example, **Youtube_Cred**.
6. Click the **OAuth Entity Profile** search icon

   ![OAuth Entity Profile search icon](image)

   and select the profile with the name of the OAuth application registry you configured when you registered the YouTube service as an OAuth provider. See **Register YouTube as an OAuth provider** for more information.
7. Right-click the form header and click **Save**.
8. Click **Get OAuth Token**.
Zoom spoke v1.0.3

The Zoom spoke helps you create and manage meetings. Add participants, retrieve details, end or delete a meeting. Use the spoke to fetch the participant details of a conference.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported versions

Zoom API version v2.0.

Spoke flows

This spoke has no sample flows.

Spoke subflows

This spoke has no sample subflows.

Spoke actions

The Zoom spoke provides actions to automate Zoom tasks when events occurs in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Meeting Management</td>
<td>Create Meeting</td>
<td>Create a meeting for a user using their Zoom user ID or the email address.</td>
</tr>
<tr>
<td></td>
<td>Delete Meeting</td>
<td>Delete a specific meeting by using its meeting ID.</td>
</tr>
<tr>
<td></td>
<td>Get Meeting Details</td>
<td>Get details of a specific meeting by its meeting ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Live Meetings by User [Data Stream]</td>
<td>Lists all the live or ongoing meetings for a specific user.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User Management</td>
<td>Look Up Users [Data Stream]</td>
<td>Lists all the users on your Zoom account.</td>
</tr>
<tr>
<td></td>
<td>Get User Details</td>
<td>Get details of a specific user on your account with their user ID.</td>
</tr>
</tbody>
</table>

**Zoom account requirements**

The Zoom spoke requires configuring your Zoom account to generate an OAuth 2.0 token.

**Zoom spoke requirements**

These actions use REST calls, which can run on an instance or Zoom spoke. Use the connection record associated with the Zoom alias to configure where actions run as well as set Zoom spoke selection attributes.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the Zoom Connection & Credential Alias record to authorize actions.

**Setup Zoom spoke**

Integrate your Zoom account with your ServiceNow instance. Create a custom OAuth application in Zoom and authenticate requests from ServiceNow.

Role required: admin

• Request IntegrationHub subscription
• Activate Zoom spoke

*Create a connected app in Zoom*

Create a connected app in your Zoom account to enable OAuth 2.0 authentication with the Zoom spoke

1. Zoom account
2. Role required: Zoom admin

Complete the following steps from your Zoom account to enable OAuth 2.0 authentication with the Zoom spoke.

1. Login to Zoom marketplace
2. Navigate to Develop > Build App
3. Choose OAuth card from the available cards.
4. Use the toggle button to disable the option: Would you like to publish this app on Zoom App Marketplace?
5. Click Create.
6. Name the app and choose the app type as Account-level app. Account level apps must be installed by admin and can manage all users in the account.
7. Optionally, in the subsequent screens, enter the details as appropriate. For example, basic information, description and so on.
8. In the **Add Scopes** screen, add the actions in the scope as in the screenshot.
Add scopes

- Meeting
- Webinar
- Recording
- User
- Account
- Billing
- Contacts
- Dashboard
- Group
- Devices (H323)

- View and manage sub account's user recordings
  recording:master

- View all user recordings
  recording:read:admin

- View and manage all user recordings
  recording:write:admin
Add scopes

- Meeting
- Webinar
- Recording
- **User**
  - Account
  - Billing
  - Contacts
  - Dashboard
  - Group
  - Devices (H323)

- View and manage sub account’s user information
  - user:master
- View all user information
  - user:read:admin
- View users information and manage users
  - user:write:admin

**Note:** The next step is to register Zoom as an OAuth provider. However, ServiceNow ships Zoom as a registered OAuth provider in the Application Registry.

Record the **Client ID** and the **Client Secret** from the App credentials screen to use them for the application registry.

**Register Zoom as OAuth provider**

Use the information generated during Zoom account configuration to register Zoom spoke as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Role required: admin

1. Navigate to **System OAuth > Application Registry**.
2. Click **Zoom**.
3. On the form, fill in the fields.
Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID created during application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret created during application registration.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. This is set to 473,040,000 seconds.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. Enter https://&lt;instance-name&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. Specify the profile for the mutual authentication.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>Client credentials in the request.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.

The instance can request OAuth 2.0 tokens for the spoke.

Create credential records for the Zoom spoke

Create Credential records for the Zoom connected app you created. The Zoom spoke connection and credential alias uses these credentials to authorize actions.

Role required: admin, Zoom admin

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. Enter Zoom Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile you created when you registered the Zoom connected app as an OAuth provider. Select Zoom default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. Select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. Enter 100.</td>
</tr>
</tbody>
</table>

5. Save the record.
6. Click the Get OAuth Token related link to generate the OAuth token.

Create connection records for the Zoom spoke

Create Connection records to your Zoom account. The Zoom spoke connection and credential alias uses these connections to perform actions in Zoom.

Role required: admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Zoom.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. Enter Zoom Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Zoom. Select Zoom Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Note: Do not select the check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to your Zoom instance. Enter <a href="https://api.zoom.us">https://api.zoom.us</a></td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Option to use a MID Server. Define the fields in the Advanced MID Server Configuration related list if you select this option.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Save.

Data Stream actions and pagination

Send REST or SOAP requests from Flow Designer to APIs that return a stream of response data larger than 10 MB, or that return paginated results. Parse stream data into a series of complex object outputs and use the data pills in other actions in a flow.

For example, create a Data Stream action to import a large quantity of employee data from a third-party HR site. The Data Stream action sends a REST request to the third-party site and processes the response to populate records in the User [sys_user] table.

Benefits

Data Stream actions offer these benefits.

- Parse and format a stream of response data larger than 10 MB.
- Automatically send multiple requests to APIs that paginate results.
- Enable flow designers to process large requests without complex coding or configuration.
- Enable flow designers to process each object within a data stream using For each flow logic. For example, you might create a Data Stream action that imports document data from a third-party site. When you add the action to a flow, Flow Designer automatically adds the action to a For each flow logic block, enabling flow designers to easily create a record in ServiceNow for each object in the data stream. See Use a Data Stream action in a flow.
- Enable flow designers to reuse Data Stream actions in multiple flows, using the same source of data in multiple ways.
**Running a Data Stream action**

There are two ways to run a Data Stream action.

**From a flow**

You can process each object within a data stream using **For each** flow logic. For example, you might create a Data Stream action that imports document data from a third-party site. When you add the action to a flow, Flow Designer automatically adds the action to a **For each** flow logic block, enabling flow designers to easily create a record in ServiceNow for each object in the data stream. See *Use a Data Stream action in a flow*.

**From a script**

You can start a Data Stream using the `executeDataStreamAction()` method in the FlowAPI class. For more information, see *FlowAPI*.

**Action outline**

Data Stream actions follow a set structure. Follow prompts to add and remove steps from the action outline. You cannot manually add steps to a Data Stream action.
**Action Preprocessing**

Use the Action Preprocessing category to run a preprocessing script before the action sends the initial API request. For example, validate action inputs or set default values. Preprocessing executes once per action, before the first API request.

Selecting this option adds a script step to the Data Stream action. For more information, see *Script step*.

This is an optional Data Stream action component that runs on either the instance or a MID Server.

**Request**

Use the Request category to configure how the action sends API requests. The Request section executes once per page of results. Request components provide these configuration options.

**Pagination Setup step**

Request results in batches. Once one page of data is processed, the Data Stream action runs the request section again to return the next set of results. Use the pagination setup step to set up pagination options required by the API. Configure the Pagination Setup step manually, or select a pre-built template to apply common configurations. For example, apply the **Limit / Offset** template to specify the number of items you want returned per page (limit), and the starting number for the first item (offset). After applying a template, update the values to ensure that the configuration complies with the API's requirements.

*Note:* For licensing purposes, each request counts as one transaction, including each request for the next page of results.

The value of the reserved, read-only `getNextPage` variable determines whether to request another page of results. As long as the `getNextPage` variable is true and the previous page contains data, the action continues to send requests for the next page.

*Note:* You must explicitly set the value to true in the script or it will default to false.

This is an optional Request component that only runs on the instance.

**Script step**

Run a script before every request for the next page of results. Use this script for data validation and transformation when calling a paginated API. For example, generate a JSON payload for the next page request. Selecting this option adds a script step to the Data Stream action. For more information, see *Script step*.

This is an optional Request component that runs on either the instance or a MID Server.

**REST or SOAP step**

Send a REST or SOAP request to a third-party API. Select a data format to add an associated step to the Data Stream action. For more information, see *REST step* and *SOAP step*.

This is a mandatory Request component that runs on either the instance or a MID Server.
Parsing

Use the Parsing category to configure how the action separates data stream elements into complex data objects. Use the Splitter step to identify and separate items from an XML or JSON stream, and use the Script Parser step to transform each item into a complex object. The Parsing section executes once per item in the stream.

</user>
For more information about complex data, see *Complex data*. Parsing components provide these configuration options.

**Splitter step**

Identify the parent node in the response stream to map to a complex object. For example, identify a user element in an XML payload to create a complex object for each user in the response stream.

Select a splitter type to identify and separate repeated items in an XML or JSON data stream.

- **JSON**: Identifies objects in a stream of JSON data.
- **XML**: Identifies objects in an XML document.

This is a mandatory Parsing component that only runs on the instance.

**Script Parser step**

Use JavaScript and ServiceNow APIs to map items in the response stream to a complex object output represented by the `targetObject` global object. For example, map incident record elements identified in the splitter step to a complex object containing incident fields. If the data stream includes siblings to the item identified in the splitter step that you do not want mapped to a complex object, include conditions to exclude those items.

This is a mandatory Parsing component that only runs on the instance.

**Data Stream outputs**

When designing a Data Stream action, you must create a single output of type Object. The Script Parser step maps items in the stream to this object using the `targetObject` global object.

At runtime, the system splits and parses the stream of response data according to the Data Stream configuration. Each item in the stream maps to the complex object structure defined by the Script Parser step and the object output, resulting in a large series of complex objects. For more information about complex data, see *Complex data*.

**Execution details**

View the configuration and runtime results for each item processed by a Data Stream action. Select a record number to see its configuration and runtime details. By default, the execution details include requests for the last 1000 items. To change the number of items in the execution details, update the `com.snc.process_flow.reporting.datastream.item.lastn` system property.
## ServiceNow Flow Designer

### Daily User Import

**Flow Statistics**
- Executed as: System
- Open Flow Logs
- 11874ms

**Trigger**
- Daily at 16:00:00

**Actions**

   - **Info**
   - **User Name**: lucius.bagnoli
   - **First Name**: Lucius
   - **Last Name**: Bagnoli

   **Logs**
View an overview of the execution that includes this information.

- **Page count**: Number of pages returned by a paginated API.
- **Total item count**: Number of items in the response stream mapped to complex object outputs.
- **Error count**: Number of errors encountered.

**Page details**

View runtime data for each step within the Data Stream action. Select a page to view runtime details for each request to a paginated API. By default, the execution details include requests for the last five pages. To change the number of requests in the execution details, update the `com.snc.process_flow.page.reporting.lastn` system property. Set the value to 0 to remove pages from the execution details and -1 to include all pages.

ℹ️ **Note**: Including all pages can affect performance and is not recommended.

Data Stream action design considerations

Follow these considerations when creating a Data Stream action and when adding a Data Stream action to a flow to prevent errors and performance issues.

Considerations when creating a Data Stream action

Create Data Stream actions with these considerations in mind.

Write pagination logic according to third-party requirements

Evaluate and understand the format required by your third-party endpoint. For example, you may need to write a script that sets the built-in getNextPage variable to true as long as there is a nextPage token in the response. If the response does not contain the token, then set the variable to false. Access variables in script using bracket or dot notation. For example, variables['getNextPage']. This variable only accepts the Boolean data type. The default value is false.

Convert pagination variable data types to perform math operations

Pagination variables only support the string data type. To perform math operations, you must convert the value to an integer, perform any required operations, then convert it back to a string.

variables['offset'] = (parseInt(variables['offset']) + parseInt(variables['limit'])).toString();

Ensure that the pagination script has an end condition

Avoid infinite loops in pagination requests by creating a condition that sets the getNextPage variable to false. Cancel any long-running flows. Always test Data Stream actions before using them in production.

Clear configuration page options carefully

Clearing an option in a configuration page removes the step from the Data Stream outline and deletes all data associated with the step.

Consider the size of each page returned

When configuring pagination options, try to ensure that the size of each page returned is under one GB. This ensures that flow designers who use the action won't encounter size limit issues when retrieving data from a MID Server. If the action returns more than one GB of data per page, the flow designer may need to increase the attachment size limit. For more information, see MID Server support for Data Stream actions.

Note: Nesting Data Stream actions is not supported.

Considerations when adding a Data Stream action to a flow

Add a Data Stream action to a flow with these considerations in mind.

Do not add actions with wait conditions to a Data Stream For Each logic block

You cannot add an action that pauses the flow to a Data Stream For Each flow logic block. Data Stream actions require a constant connection to the response stream. For example, you cannot use the Ask for Approval or Wait for Condition actions within Data Stream For Each flow logic.

Some actions and steps always pause a flow and cannot be added to Data Stream For Each flow logic blocks. However, some actions and steps may pause the flow depending on how they are configured. Check the action configuration to ensure it does not pause the flow at runtime.
### MID Server support for Data Stream actions

Get data through a ServiceNow® MID Server when running a Data Stream action.

When selected, the MID Server retrieves the data and sends each page to the instance as an attachment to process.

**Important:** When running the Data Stream action within flow, the actions in the For Each block always run on the instance.

These steps can run on either the MID Server or the instance:

- Action Preprocessing Script
- Request Script step
- REST or SOAP step

**Note:** Avoid shifting the execution environment between the instance and the MID Server multiple times. For example, you might configure the Request Script step to run on the MID Server, but the REST step to run...
on the instance. In this case, the system shifts environments between the instance and MID Server for every page of data, which may degrade performance.

To learn more about running a step on a MID Server, see Integration steps.

Size limits

If your system encounters a timeout or size limit issue, try making one of these adjustments:

Increase the REST transaction quota rule

If the connection between the instance and the MID Server slows down, you may encounter a timeout while waiting for a response from the REST step. Increase the default timeout by updating the REST Attachment API request timeout transaction quota rule.

- Default: 60 seconds
- Maximum: 300 seconds

Increase the instance timeout

By default, the instance waits for 600 seconds to retrieve a single page of data from a MID Server. If you encounter a timeout when running a Data Stream action through a MID Server, change this default by increasing the `datastream_alternative_env_fetch_page_timeout` system property.

- Default: 600 seconds
- Maximum: 7200 seconds

Increase attachment size

The MID Server sends each page of data to the instance as an attachment. If a page of data is large, it may exceed the allowed attachment size. Increase the allowed size by updating the `com.glide.attachment.max_size` system property.

- Default: 1024 MB
- Maximum: None

Create a Data Stream action

Create a reusable action to process a stream of response data within a flow.

- Setting up an application in Guided Application Creator to store Flow Designer content.
- Disable any conflicting business rules or workflows before creating an action.
- Role required: action_designer or admin

Creating a custom application to contain your Flow Designer content enables you to deploy it using the application repository or the ServiceNow Store.

Note: Clearing an option in a configuration page removes the step from the Data Stream outline and deletes all data associated with the step.

1. Navigate to Flow Designer > Designer.
2. Click the Actions tab and select Data Stream.
3. Fill in the Action Properties and click Submit.
An empty Data Stream action opens.

4. Define action inputs to make data available to the action steps.
   a) Select + Create Input and complete the fields. For more information about action inputs, see Action Designer.

   Inputs are represented as data pills in the right-hand pane. You can add inputs to steps and outputs in the flow by dragging and dropping data pills.

5. Click Action Preprocessing in the Data Stream outline and configure the desired options.
   a) Select Enable preprocessing script to run a preprocessing script before the action sends the initial API request. For example, validate action inputs or set default values. Preprocessing executes once per action, before the first API request.

   Selecting this option adds a script step to the Data Stream action. For more information, see Script step.

   This section can run on either the MID Server or the instance. The environment is determined by the script step's Required Runtime field.

6. Click Request in the Data Stream outline and configure the desired options.
   a) In the How will you get data field, select REST Step or SOAP step. Selecting an option adds the associated step to the Data Stream action. For more information, see REST step and SOAP step.

   This section can run on either the MID Server or the instance. The environment is determined by the Use MID server field in the associated Connection [sys_connection] record.

   b) Select Enable pagination to request results in batches. Once one page of data is processed, the Data Stream action runs the request section again to return the next set of results. This option adds a Pagination Setup step to the Data Stream outline.

   c) Select Run a script before each request to run a script before every request for the next page when calling a paginated API. For example, write a script to transform variable data types from the initial response before sending a request for the next page. Selecting this option adds a script step to the Data Stream action.

   For more information, see Script step.

   This section can run on either the MID Server or the instance. The environment is determined by the script step's Required Runtime field.

   **Caution:** Avoid shifting the execution environment between the instance and the MID Server multiple times. For example, you might configure the Request Script step to run on the MID Server, but the REST step to run on the instance. In this case, the system shifts environments between the instance and MID Server for every page of data, which may degrade performance.
7. Optional: If pagination is enabled, configure the Pagination Setup step.

Configure the Pagination Setup step manually, or select a pre-built template to apply common configurations. For example, apply the **Limit / Offset** template to specify the number of items you want returned per page (limit), and the starting number for the first item (offset). After applying a template, update the values to ensure that the configuration complies with the API's requirements.

a) Create pagination variables. For example, if the third-party API takes a **limit** parameter in the request, create the **limit** variable and set the initial value to limit the number of results per page. The initial value is only used in the first request. **getNextPage** is a reserved, read-only variable. As long as the **getNextPage** variable is true and the previous page contains data, the action continues to send requests for the next page.

b) In the **Next Value From** field, define how pagination variables receive a value for subsequent requests.

Choose from:

- **Script**: Write a Pagination Variables Script to define how variables are populated. Pagination variables only support the string data type. To perform math operations, you must convert the value to an integer, perform any required operations, then convert it back to a string.

- **Response Body**: Use a value in the response from the previous request to populate the variable. If the response is JSON format, set **Extract value using** to **JSONPath Expression** and provide the path to the value in the **Expression** field. If the response is XML format, set **Extract value using** to **XPath Expression** and provide the path to the value.

In this example, the **getNextPage** variable is true until the **nextOffset** variable reaches the total count value returned in the API response header. As long as the **getNextPage** variable is true and the previous page contains data, the action continues to send requests for the next page. This example includes a common limit/offset pagination configuration. The third-party APIs that your Data Stream action interacts with may use a page token or other method.
1. Pagination Setup step

### Pagination Variables

<table>
<thead>
<tr>
<th>Name</th>
<th>Initial Value</th>
<th>Next Value From</th>
</tr>
</thead>
<tbody>
<tr>
<td>getNextPage</td>
<td>false</td>
<td>Script</td>
</tr>
<tr>
<td>limit</td>
<td>100</td>
<td>Script</td>
</tr>
<tr>
<td>offset</td>
<td>0</td>
<td>Script</td>
</tr>
</tbody>
</table>

### Pagination Variables Script

```javascript
function paginate(variables, pageResponse) {
  var limit = parseInt(variables.limit);
  var totalCount = parseInt(pageResponse.response_headers['X-Total-Count']);
  var currentOffset = parseInt(variables.offset);
  var nextOffset = currentOffset + limit;
  if (nextOffset < totalCount) {
    variables.getNextPage = true;
    variables.offset = nextOffset.toString();
  } else {
    variables.getNextPage = false;
  }
}
```
Important: Avoid infinite loops in pagination requests by creating a condition that sets the `getNextPage` variable to false. Cancel any long-running flows. Always test Data Stream actions before using them in production.

8. Click Parsing in the Data Stream outline and configure the desired options.
   a) In the **How will you identify each record** field, select **JSON/XML Splitter**. This adds a Splitter step to the Data Stream outline.
   b) In the **How will you parse each item into an object** field, select **Script Parser**. This adds a Script Parser step to the Data Stream outline.

9. Configure the Splitter step. This step identifies the parent node in the response stream to map to a complex object. For example, identify a user element in an XML payload to create a complex object for each user in the response stream.
   a) In the **Source Format** field, select the format returned by the Request section.
      - **JSON**: Identifies objects in a stream of JSON data.
      - **XML**: Identifies objects in an XML document.
   b) In the **Item Path** field, define the absolute path to the object. For example, use `$.result` in JSON or `/result` in XML to separate a `result` object.

   Note: The system ignores XML namespaces.

If the REST step returns the following JSON content, you would enter `$response.result.companies` as the item path to process each company object.

```json
{
   "response": {
      "result": {
         "companies": [
            {
               "name": "company1"
            },
            {
               "name": "company2"
            },
            {
               "name": "company3"
            }
         ],
         "metadata": {
            "token": 1558666526
         }
      }
   }
}
```

If the REST step returns the following XML document, you would enter `/response/result/companies/company` as the item path to process each company object.

```xml
<n response>
 <result>
  <companies>
   <company>
    <!-- company 1 info -->
   </company>
   <company>
    <!-- company 2 info -->
   </company>
   <company>
    <!-- company 3 info -->
   </company>
  </companies>
</result>
</response>
```
10. In the Script Parser step, use JavaScript and ServiceNow APIs to map items in the response stream to a complex object output represented by the `targetObject` global object. For example, map incident record elements identified in the splitter step to a complex object containing incident fields. If the data stream includes siblings to the item identified in the splitter step that you do not want mapped to a complex object, include conditions to exclude those items.

An example script that parses a JSON response.

```javascript
(function parse(inputs, outputs) {
    var record = JSON.parse(inputs.sourceItem);
    outputs.targetObject.id = record.number;
    outputs.targetObject.name = record.short_description;
})(inputs, outputs)
```

An example script that parses an XML response.

```javascript
(function parse(inputs, outputs) {
    var xmlDoc = new XMLDocument(inputs.sourceItem, false);
    outputs.targetObject.id = xmlDoc.getNodeText("/result/number");
    outputs.targetObject.name = xmlDoc.getNodeText("/result/short_description");
})(inputs, outputs)
```

11. Create a complex object output.
   a) Select **Outputs** in the Action Outline and click + to create an output.
   b) Update the **Label** field to represent the object. For example, if the action parses a stream of company records, add the **Company** label.
   c) Update the **Type** field to **Object**. This is the complex object output represented by the `targetObject` global object in the Script Parser step.
   d) Add child fields to the complex object using the + icon.
   e) Make the name of each child field more user-friendly so that you can meaningfully refer to it in script. The value in the **Name** field is the internal name used in the Script Parser step. For example, to refer to the City output in the Script Parser step, you would use `outputs.targetObject.city`. 
12. Click Save.
   Action Designer saves a draft of the action.

Test a Data Stream action

Test a Data Stream action

Test your Data Stream action to ensure that it works the way you expect before you add it to a flow.

- Create a Data Stream action
- Role required: action_designer or admin

Testing a Data Stream action returns the first 20 items by default. To change this value, add the com.glide.hub.action_type.datastream.test_max_iterations system property with a value between one and 50.

1. Open the Data Stream action you want to test.
   a) Navigate to Flow Designer > Designer.
   b) Select the Actions tab.
   c) Select the row for the Data Stream action you want to test.

2. Select Test.
   The system displays the Test Action dialog. The contents of the Test Action dialog depend on the Data Stream action inputs.

3. In the Test Action dialog, provide values for any action inputs and select Run Test.

4. Open the Execution Details to ensure that the action executed as expected.
   The Execution Details Runtime Value returns the first 20 items returned by the Data Stream action.

Use a Data Stream action in a flow.
Use a Data Stream action in a flow

Data Stream actions use the **For each** flow logic option to process stream data in a flow. For example, suppose that you want to use a Data Stream action that imports document data from a third-party site. When added to a flow, the action appears as a **For each** flow logic block, enabling flow designers to easily create a record in ServiceNow for each object in the data stream.

Role required: flow_designer or admin

1. Open the flow you want to add the Data Stream action to.
2. Add the Data Stream action to the flow. The action appears as a **For Each** flow logic block.

3. Add a child action within the **For Each** flow logic block. This action runs on each object within the data stream.

   **Note:** You cannot add an action that pauses the flow to a Data Stream For Each flow logic block. Data Stream actions require a constant connection to the response stream. For example, you cannot use the Ask for Approval or Wait for Condition actions within Data Stream For Each flow logic. For more information, see *Data Stream action design considerations*.

4. Click **Save**. Flow Designer saves a draft of the flow, trigger, and actions.

Test the flow until it is ready to be activated.

**Note:** The system only triggers active flows.
Integration steps

Enable custom actions to integrate with external systems by activating IntegrationHub, which adds integration steps to the Action Designer interface.

Integration steps can run on the instance or a MID Server. A MID Server is required to communicate with or move data between a ServiceNow instance and external applications, data sources, and services in your network.

**Note:** Only Flow Designer admin and Connection admin can execute flows using .

Steps that perform operations on record data run on the instance, while steps that integrate with systems in your network run on a MID Server. If a step requires a MID Server to run, the instance delegates flow processing to the appropriate MID Server by sending the process plan in a REST call. The MID Server executes the action or step in the process plan and returns results. View log messages and execution status from the instance or the MID Server.

Available integration steps

These integration steps are available from *Action Designer*.

<table>
<thead>
<tr>
<th>Integration step</th>
<th>Description</th>
<th>Step runs from</th>
</tr>
</thead>
<tbody>
<tr>
<td>JDBC step</td>
<td>Create a reusable action to send SQL commands to a relational database.</td>
<td>MID Server</td>
</tr>
<tr>
<td>Payload Builder step</td>
<td>Enable action designers to easily create name-value pairs in JSON and XML payloads using dynamic data.</td>
<td>• Instance • MID Server</td>
</tr>
<tr>
<td>PowerShell step</td>
<td>Run PowerShell scripts on remote machines from your ServiceNow instance through a MID Server.</td>
<td>MID Server</td>
</tr>
<tr>
<td>REST step</td>
<td>Send an outbound REST web service request to an external system.</td>

<td>Identify structured data from an XML payload without having to write script. Map incoming XML elements to a complex object output that you can use in other steps or actions. At runtime, values from an XML payload populate the complex object output.</td>
<td>• Instance • MID Server</td>
</tr>
</tbody>
</table>
Training

Complete a step-by-step training on using the REST step in the REST in IntegrationHub developer training.

Connection attributes

Define connection-specific variables that you can use in IntegrationHub integration steps. When using an integration step, you must establish a connection with an external system. Use a Connection & Credential alias instead of defining the connection inline. An alias enables you to update the connection details once without having to reconfigure every action. Any action step that uses an alias inherits the attributes associated with it. Flow Designer displays attributes as data pills that you can drag into your action step. For example, you can create a page size attribute that becomes a REST step query parameter. For more information about connection attributes, see Create connection attributes for IntegrationHub.

MID Server connection aliases

Action designers can set MID Server selection attributes using a connection record associated with an alias and associate the alias with an integration step. When the flow runs, the system uses the attributes to determine which MID Server runs the step. Learn more about connection and credential aliases.

MID Server selection

Flow designers should avoid shifting the execution environment between MID Servers when a flow runs. Either configure your MID Servers to perform operations on multiple endpoints, or provide multiple capabilities to the MID Servers in your network. You may need a user with the connection_admin role to update the connection records associated with an action, or a network administrator to update the MID Server network configuration. To learn more about how a MID Server is selected during runtime, see MID Server selection.

Design considerations

Design integration steps using the following guidelines.

- Avoid shifting the execution environment between the instance and the MID Server multiple times. Where possible, group similar action steps. For example, group core steps that perform record operations and integration steps that run on the MID Server.
- When creating a spoke that uses an integration step, include a Connection and Credential alias record with the appropriate connection type. Before anyone can use the spoke, a user with the connection_admin role must associate the alias record to a connection record that supports the connection type. If defining the connection inline, use inputs to enable the process analyst to define the connection information when adding the action to a flow.
- The MID Server does not have access to all the values in a GlideRecord object, it only has access to the sys_id reference. Inputs of type Reference do not work on a MID Server. Instead, create action inputs that contain the necessary GlideRecord values.

Roles

To create integration steps, a user must have the action_designer or admin roles. If running steps on a MID Server, the MID Server user must have the connection_admin and credential_admin roles to access the connection and credential information associated with the step.
**JDBC step**

Create a reusable action to send SQL commands to a relational database.

**Note:**

- The JDBC step is not available in the base system and requires the subscription to IntegrationHub Standard Pack Installer (com.glide.hub.integrations.standard) or later. For more information about the ServiceNow® IntegrationHub subscription packages, see *IntegrationHub usage and subscription*. After the required plugin is activated, the step is visible under Integrations.
- The JDBC step runs only on a ServiceNow® MID Server with JDBC step capabilities. Activate the plugin, IntegrationHub Standard Pack Installer (com.glide.hub.integrations.standard) or later to use the JDBC capability for the MID Server.

**Roles and availability**

The JDBC step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

**Sanitizing inputs**

Escape all user inputs to eliminate the possibility of a malicious user from executing malicious SQL statements that can result in SQL injection on your target database. When you use data pills in JDBC step SQL statements, sanitize them first using *Sanitize SQL transform functions*. This transform function category automatically appears when a data pill is dropped into the SQL Statement input.

**Whitelisting SQL operations**

By default, you can run the following SQL operations.

- SELECT
- INSERT
- UPDATE
- DELETE
- SHOW
- DESCRIBE

To enable only some of these SQL operations that the JDBC step can perform, create a MID Server property, `mid.property.jdbc_operations` and enter the whitelisted SQL operations, separated by comma. To learn more about MID Server properties, see *MID Server properties*.

**Fields**

<table>
<thead>
<tr>

</tbody>
</table>

Test JDBC step

Test the JDBC step before testing or publishing an action that contains the JDBC step.

It is mandatory that you test the JDBC step before testing the action. Testing ensures that the relevant complex object output schema is created from table columns, which can be used as data pills in subsequent steps.

1. Navigate to Flow Designer > Designer.
2. Create an action with a JDBC step.
3. Click Test JDBC Step.
   The Test JDBC Step pop-up window is displayed.
4. If the JDBC step takes an action input or output of the previous step as its input, provide required input values in the Step input pills field to test the JDBC step.

   Note: Input values in the Step input pills fields are not needed when records are updated, inserted, or deleted.

5. Click Run Test.
   • When a SELECT query is executed, Sample Result is displayed in the Test JDBC Step pop-up window. Sample Result includes column names, columns types, and the values of the first row.
   • When an UPDATE, INSERT, or DELETE query is executed, a message is displayed mentioning the number of rows affected.

6. To use the sample result as the JDBC step output, click Use Result.
7. To retrieve schema of a different table when a SELECT query is executed in the JDBC step, enter the required value in the Step input pills field and click Run Test.

When a SELECT query is executed in the JDBC step, ResultSet is displayed under Outputs. The relevant complex object output is populated. To learn more about complex objects, see Complex data.

Test and publish the action.

Payload Builder step

Enable action designers to easily create name-value pairs in JSON and XML payloads using dynamic data.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
</table>
| Name Value Pairs      | The name-value pairs to include in the payload. Click the plus icon to add name-value pairs. Drag data pills into either field to produce dynamic payloads. The Name becomes a key in JSON and an element in XML. For example, suppose you create this name-value pair.  
  • Name: short_description  
  • Value: [action]->[short_description]  
  
  When the system formats the name-value pair as JSON:  
  "short_description": "[action]->[short_description]"  
  
  When the system formats the name-value pair as XML:  

| Omit if empty         | The option to exclude a name-value pair if the value is empty or null.       |

Note: This field is only visible after clicking the down arrow to display advanced options.
<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output Format</td>
<td>The payload file format.</td>
</tr>
<tr>
<td></td>
<td>• <strong>JSON</strong>: Select to format the payload as a JSON document.</td>
</tr>
<tr>
<td></td>
<td>• <strong>XML</strong>: Select to format the payload as an XML document.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when the <strong>Output Format</strong> is set to <strong>XML</strong>.</td>
</tr>
<tr>
<td>Namespace</td>
<td>The XML namespace to apply to each element. For example, when the namespace is set to <code>incident:</code></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when the <strong>Output Format</strong> is set to <strong>XML</strong>.</td>
</tr>
<tr>
<td>Include Outer Structure</td>
<td>The option to include or exclude a top level container appropriate to the output format. When the <strong>Output Format</strong> is JSON, curly braces contain the name-value pairs. When the <strong>Output Format</strong> is XML, a specified XML element contains the name-value pairs.</td>
</tr>
<tr>
<td></td>
<td>For example, when the system formats the name-value pair as JSON:</td>
</tr>
<tr>
<td></td>
<td><code>{&quot;short_description&quot;:&quot;[action]-&gt;[short_description]&quot;}</code></td>
</tr>
<tr>
<td></td>
<td>When the system formats the name-value pair as XML:</td>
</tr>
</tbody>
</table>
|                     | `<xml>
|                     | </xml>`
<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
</table>
| Send Empty Structure   | The option to send valid JSON or XML structures when the payload is empty. Enable this option to include JSON or XML structural text in the payload. For example, when the system formats an empty structure as JSON: 

```
{}
```

When the system formats an empty structure as XML:

```
<xml></xml>
```

Disable this option to produce an empty payload. Empty payloads can occur when you select the Omit if empty option for every name-value pair, and all name-value pairs in the payload produce empty values. |
| Parent Node            | The name of the XML element that contains the name-value pairs. The default parent node element is `xml`. Note: This field is only visible when the Output Format is set to XML and the option to Include Outer Structure is enabled. |
| Preview                | The read-only payload the step produces. |

**PowerShell step**

Run PowerShell scripts on remote machines from your ServiceNow instance through a MID Server.

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. ServiceNow supports PowerShell 3.0 to 5.1. PowerShell 3.0 does not support Windows 2003 Server.

**Note:** PowerShell step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Connection</strong></td>
<td>Type of connection to use.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Define Connection Inline</strong>: Define connection information within the action step.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Use Connection Alias</strong>: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action.</td>
</tr>
<tr>
<td></td>
<td>To learn more about connections and credentials, see <a href="#">credentials, connections, and aliases</a>.</td>
</tr>
<tr>
<td><strong>Connection Alias</strong></td>
<td>Connection &amp; Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see <a href="#">credentials, connections, and aliases</a>. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is available when <strong>Use Connection Alias</strong> is selected from the Connection list.</td>
</tr>
<tr>
<td><strong>Credential Alias</strong></td>
<td>Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see <a href="#">credentials, connections, and aliases</a>. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is available when <strong>Define Connection Inline</strong> is selected from the Connection list.</td>
</tr>
<tr>
<td><strong>Host</strong></td>
<td>Specify the fully-qualified domain name of the target host where the system runs the action step. For example, host.domain.com.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when the <strong>Connection</strong> is <strong>Define Connection Inline</strong>.</td>
</tr>
<tr>
<td><strong>Port</strong></td>
<td>Specify the communications port on which the target host listens for connections. For example, 5985. Leave blank to use the default port.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when the <strong>Connection</strong> is <strong>Define Connection Inline</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MID Application</td>
<td>Specify the application the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected application. If you use a data pill for this field, the pill must reference the MID Application's name, not the MID Application record.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is only visible when the Connection is Define Connection Inline.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>Capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is only visible when the Connection is Define Connection Inline.</td>
</tr>
<tr>
<td>Remoting Type</td>
<td>The location where the PowerShell script runs such as the MID or a remote server.</td>
</tr>
<tr>
<td>• Explicit Remoting</td>
<td>Establish a connection with and run the script on a remote server.</td>
</tr>
<tr>
<td>• Implicit Remoting</td>
<td>Run a script on a MID Server while importing necessary modules from a remote server. If selected, define the Remote name prefix and Modules to import fields. For optimal performance, only import modules necessary to the step. If blank, all available modules are imported from the server.</td>
</tr>
<tr>
<td>• Run on a MID Server</td>
<td>Run a script directly on a MID Server, or define remoting specifications within the script. This value is the default.</td>
</tr>
<tr>
<td>Note:</td>
<td>To invoke a function in a PowerShell script command or PowerShell script file, the command must define the function param block if the function has input parameters. This requirement applies to explicit and implicit remoting. For additional information on param block, see Microsoft’s documentation on Windows Powerhell parameters at <a href="https://technet.microsoft.com/">https://technet.microsoft.com/</a>.</td>
</tr>
<tr>
<td>Remote name prefix</td>
<td>The file path, excluding file names, to the modules to load from the remote server.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is only visible when the Remoting Type is Implicit Remoting (Advanced).</td>
</tr>
<tr>
<td>Modules to import</td>
<td>The comma-separated list of modules to import from the remote server at the defined file path.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is only visible when the Remoting Type is Explicit Remoting (Most Common) or Implicit Remoting (Advanced).</td>
</tr>
<tr>
<td>Script type</td>
<td>The type of script to run on the PowerShell host.</td>
</tr>
<tr>
<td>• Inline script</td>
<td>Enter the script to run in the Command field of the step.</td>
</tr>
<tr>
<td>• MID Server Script</td>
<td>Select the PowerShell script to run from the MID Server Script Files [ecc_agent_script_file] table. This is the default value and separates scripting logic from the action, enabling you to update the script without having to modify and redeploy the action.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MID Server Script</td>
<td>Pre-defined PowerShell script from the MID Server Script Files table [ecc_agent_script_file].</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only available if the Script type is MID Server Script File.</td>
</tr>
<tr>
<td>Script path</td>
<td>Read-only path to the selected MID Server script.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when the Script type is MID Server Script File.</td>
</tr>
<tr>
<td>Input variables</td>
<td>The optional name-value pairs that represent the values of PowerShell script variables. You can use action inputs and data from other steps within the PowerShell script. Define the following fields for each variable:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Name:</strong> The name of the script variable to pass a value to. The name cannot match a reserved or prohibited PowerShell variable. Some variable names are reserved for internal processing and should not be used as input variables. See Reserved variables in PowerShell scripting variables.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> The type of PowerShell variable. Select plain text, encrypted, or boolean. If encrypted is selected, the value appears in plain text in this field and is only encrypted when it passes to the ECC Queue.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Value:</strong> The value to map to the variable. Manually enter a value, or drag a data pill into the field.</td>
</tr>
<tr>
<td>Command</td>
<td>The inline PowerShell script to run on the target host.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when the Script type is Inline script.</td>
</tr>
</tbody>
</table>

**PowerShell scripting variables**

To access input variables from the Command field, you must call them using special syntax. The syntax you use depends on the value of a system property. If the Remoting Type is Run on a MID Server or have your script establish a remote session, some reserved variables are available in addition to input variables.

**Input variable syntax**

By default, prefix variable names with a $ character. For example, if an input variable is named message, use $message to access the variable in script.

If the mid.powershell.command.script.parameter_passing parameter is set to false, prefix the variable name with $env:SNC_. For example, if an input variable is named message, use $env:SNC_message to access the variable in script. To learn more about the mid.powershell.command.script.parameter_passing parameter, see MID Server parameters.

**Reserved variables**

When the Remoting Type is Run on a MID Server or have your script establish a remote session, the following variables are available for use in script. Reserved variables cannot be used as custom input variable names.

<table>
<thead>
<tr>
<th>Reserved variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$computer</td>
<td>Host IP address defined in the Connection alias record.</td>
</tr>
<tr>
<td>Reserved variable</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>$cred</td>
<td>Credential object that contains the credentials defined in the connection record. Use this variable with any PowerShell cmdlet that supports the credential parameter. For example, New-PSSession -credential $cred.</td>
</tr>
<tr>
<td>$log_info</td>
<td>If the mid.property.powershell.log_info property is set to true, adds logging information to a PowerShell script.</td>
</tr>
</tbody>
</table>

The following variable names are reserved for internal processing and should not be used as input variables.

- script
- useCred
- isMid
- isDiscovery
- debug
- user
- password
- executingScriptDirectory
- midScriptDirectory
- hresult

**REST step**

Send an outbound REST web service request to an external system.

**Note:** REST step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

*Outbound REST web service* is a platform feature that enables you to retrieve, create, update, or delete data on a web services server that supports the REST architecture.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Connection          | Type of connection to use.  
• **Define Connection Inline**: Define connection information within the action step.  
• **Use Connection Alias**: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see [credentials, connections, and aliases](#). |

| Name, Type, Value             | Content of a multiple part request. For each request part, specify its name, content type, and value. The name can be any valid string and the type can be any valid type. The value must match the content type. For attachments, specify:  
  • **Type**: attachment.  
  • **Value**: The sys_id of the Attachment record containing the content. You can look up this record in a prior step or define it as an input variable.  
  **Note**: These fields are available when you select **Multipart** from the Request Type list. |
| Name, Value                   | Content of a form URL-encoded request. Specify each part of the URL-encoded request with a name-value pair.  
  **Note**: This field is available when you select **Form URL-Encoded** from the Request Type list. |
| Enable Retry Policy           | Option to enable the retry policy. For more information, see **Retry policy**.                                                                       |
| Override Default Policy for Alias | Option to override the default retry policy. This check box is not applicable when **Define Connection Inline** is selected from the Connection list. |
| Retry Policy                  | Default retry policy associated with **Connection Alias**. If **Override Default Policy for Alias** is selected, you can override the default retry policy and select another existing retry policy based on your requirement. |
| Save As Attachment            | Option to specify whether to save the response as a record in the Attachment [sys_attachment] table.  
  **Note**: This field is available when **Save As Attachment** is selected. |
| Attachment File Name          | Name of the attachment created by the REST response. For example, **rest-response.txt**.  
  **Note**: This field is available when **Save As Attachment** is selected. |
| Attachment File Record        | Target record to which the attachment is associated. The target record must be a data pill of type **Record**. For example, a specific incident record. You can look up this record in a prior step or define it as an input variable. The flow execution details display the sys_id of the associated record.  
  **Note**: This field is available when **Save As Attachment** is selected. |

**REST response size limits**

By default, the system limits the size of REST responses that are not saved as attachments to 5 MB. Direct REST responses that exceed this limit generate an error. To support larger response sizes, either save the response as an attachment or increase the response size limit with the **glide.pf.rest.response_payload_max_size** system property. This system property supports a maximum value of 10 MB.
OpenAPI support in the REST step

Populate REST step fields and action inputs with information imported from an OpenAPI Specification. Import specifications by providing a URL to the YAML or JSON, or copying and pasting content.

Benefits

OpenAPI support in the REST step offers these benefits.

• Use information imported from an OpenAPI Specification to configure REST step operations, HTTP methods, parameters, request body, path, and headers.
• Review available API operations without leaving the Flow Designer interface.
• Generate inputs required for the REST step to send valid requests to an OpenAPI service and add them to the REST step in the correct location.

Note: Always review REST step values imported from an OpenAPI Specification before sending a request. Remove parameters, headers, and inputs that the API does not require.

Generated inputs

When you import an OpenAPI Specification, the system creates any required inputs and adds them to the REST step form where appropriate. At runtime, the system sends a REST request that contains input values provided to the action. For example, if an API requires a name parameter passed in the request, the system creates a name input and adds it to the REST step. When you add the action to the flow, name becomes an input to the action.

The system maps OpenAPI data types to Flow Designer data types. For example, if the OpenAPI Specification requires a user object, then the system creates a complex data object as input. For more information, see Complex data.

Specification size limit

By default, the system can import OpenAPI Specifications up to 10 MB. To increase the import size, update the glide.rest.openapi.max_request_size system property. The maximum value is 100 MB.

Specification management

Import an OpenAPI Specification by selecting options in the REST step. For more information, see REST step. Importing an OpenAPI Specification creates a record in the OpenAPIs [sys_openapi] table. You can view or delete specification records directly from this table. To update a specification, delete it and import it again.

Design considerations

Create a REST step from an OpenAPI Specification with these considerations in mind.

Remove unnecessary REST step parameters

When importing an OpenAPI Specification, the system adds all parameters and headers present in the specification to the REST step. Review the final REST step values and remove parameters you do not want to send in the request. For example, if the API accepts content type headers for both JSON and XML, the system adds both headers to the REST step. Remove one of the headers depending on the content type you want to receive in the response.
Make input labels user-friendly

Ensure that input labels required for the REST step are clear and understandable. Clear labels enable flow designers to easily understand the required inputs when using the action in a flow.

Remove inputs that do not require flow designer configuration

When importing an OpenAPI Specification, the system adds all inputs present in the specification to the action input section. Remove any inputs that do not require a flow designer to configure. For example, if a REST step variable receives a value from another step in the action, an action input is not required.

Avoid changing the API operation

Changing the value of the API Operation field removes all values dependent on that operation. If you configure the OpenAPI Specification values in the REST step form, then change the operation, the system does not save your configuration. Values that are entered manually by a user are not affected.

Limitations

Create a REST step from an OpenAPI Specification with these limitations.

Request body media types

The request body only supports JSON and XML-based media types. If the selected operation from the imported OpenAPI Specification contains a request body with a different media type, the system adds a data pill of type String to the Request body field.

OpenAPI 3.0 components

OpenAPI 3.0 adds new components to Swagger 2.0 to describe an API in further detail. OpenAPI support in the REST step supports some, but not all of these components. The REST step does not currently support these components.

- Schema Object: oneOf, anyOf properties
- Discriminator Object
- Info object: termsOfService, contact, license fields
- Example Object
- Link Object
- Callback Object
- Security Scheme Object
- Security Requirements Object
- Tag Object
- External Documentation Object
- Server Object
- Specification extensions
- Recursive references

More information on these components is available in the OpenAPI documentation. See OpenAPI Specification.

SOAP step

Enable action designers to send outbound SOAP web service requests to external systems.

Note: SOAP step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.
Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
- Action designers need the web_service_admin role to perform these web services tasks.
  - Select WSDL
  - Load new WSDL
  - Select a WS-Security policy
- The ServiceNow® MID Server doesn't support WS-Security policies

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Details</td>
<td>The type of connection to use.</td>
</tr>
</tbody>
</table>
| Connection         | - **Define Connection Inline**: Define connection information within the action step.  
                      - **Use Connection Alias**: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action.

To learn more about connections and credentials, see [credentials, connections, and aliases](#).

<table>
<thead>
<tr>
<th>Connection Alias</th>
<th>Connection &amp; Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see <a href="#">credentials, connections, and aliases</a>. The credential value is displayed as a <em>Password (2 Way Encrypted)</em> data pill on the data pane.</th>
</tr>
</thead>
</table>

**Note:** This field is available when Use Connection Alias is selected from the Connection list.
<table>

<tbody>
<tr>
<td>Credential Alias</td>
<td>Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.</td>
</tr>
<tr>
<td>Use MID</td>
<td>Option to use a MID Server to run the SOAP step. Select this check box to display the MID Application and Capabilities fields.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>The URL endpoint for the SOAP request. If Use Connection Alias is selected, this field is read-only and displays the endpoint URL associated with alias. If Define Connection Inline is selected, enter an endpoint URL for the connection.</td>
</tr>
<tr>
<td>Request Details</td>
<td></td>
</tr>
<tr>
<td>Build Envelope</td>
<td>The method to use when building the SOAP envelope.</td>
</tr>
<tr>
<td></td>
<td>• From WSDL: Select this option to display the Select a WSDL and Operation fields.</td>
</tr>
<tr>
<td></td>
<td>• Manually: Select this option to manually enter or paste WSDL text.</td>
</tr>
<tr>
<td>Select a WSDL</td>
<td>The WSDL to use to build the SOAP envelope. Select an existing WSDL record or click Load New WSDL to download or manually enter a WSDL file. The selected WSDL populates the values of the Operation, SOAP action, and SOAP Envelope fields.</td>
</tr>
<tr>
<td>Load New WSDL</td>
<td>Option to download or manually enter a WSDL file.</td>
</tr>
<tr>
<td>Operation</td>
<td>The operation to run from the selected WSDL. Each WSDL has its own list of available operations.</td>
</tr>
<tr>
<td>SOAP Action</td>
<td>The URL to run the SOAP action. If Build Envelope is set to From WSDL, this field is read-only and displays the URL to run SOAP action. If Build Envelope is set to Manually, enter a URL to run the SOAP action.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>SOAP Envelope</strong></td>
<td>The XML text sent to the endpoint. If <strong>Build Envelope</strong> is set to <strong>From WSDL</strong>, the system adds the necessary XML for the <strong>Operation</strong> that you select. If <strong>Build Envelope</strong> is set to <strong>Manually</strong>, enter the XML text that you want to use. Enter record values in the appropriate SOAP envelope elements. For example, enter an incident short description in the <code>&lt;short_description&gt;</code> element.</td>
</tr>
<tr>
<td><strong>Reset Envelope</strong></td>
<td>Option to discard all manual changes that you made to the SOAP envelope. Select this check box to revert the SOAP envelope to its original state.</td>
</tr>
<tr>
<td><strong>New WSDL</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>The name of the WSDL record you want to create.</td>
</tr>
<tr>
<td><strong>Import Method</strong></td>
<td>The method to enter WSDL.</td>

<tr>
<td></td>
<td><strong>Manually Populate WSDL Content</strong>: Select to display the <strong>WSDL Content</strong> field to manually enter or paste WSDL text.</td>
</tr>
<tr>
<td><strong>WSDL URL</strong></td>
<td>The URL to the SOAP web service.</td>
</tr>
<tr>
<td><strong>User name</strong></td>
<td>The user name to authenticate with the SOAP web service.</td>
</tr>
<tr>
<td><strong>Password</strong></td>
<td>The password to authenticate with the SOAP web service.</td>
</tr>
<tr>
<td></td>
<td>The system always masks passwords in the user interface and prevents exporting them as plain text.</td>
</tr>
</tbody>
</table>

**Note:** This field is available when you select **Download from URL** from the Import Method list.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WSDL Content</td>
<td>The XML document describing the SOAP web service and its operations. Note: This field is available when you select Manually Populate WSDL Content from the Import Method list.</td>
</tr>
<tr>
<td>Import</td>
<td>Option to add the SOAP web service WSDL to the instance.</td>
</tr>
<tr>
<td>WS-Security</td>
<td>Option to restrict the SOAP web service to a security policy. Select this check box to display the Policy field.</td>
</tr>
<tr>
<td>Enable WS-Security Policy</td>
<td>Option to restrict the SOAP web service to a security policy. Select this check box to display the Policy field.</td>
</tr>
<tr>
<td>Policy</td>
<td>The policy record that you want to use to restrict web service connections. Select an existing policy record.</td>
</tr>
<tr>
<td>Retry Policy</td>
<td>Default retry policy associated with Connection Alias. If Override Default Policy for Alias is selected, you can override the default retry policy and select another existing retry policy based on your requirement.</td>
</tr>
<tr>
<td>Advanced Options</td>
<td></td>
</tr>
<tr>
<td>Headers</td>
<td>The name-value pairs to include in the SOAP message as HTTP headers. Click the plus icon to add headers. Add a Name and Value for each HTTP header.</td>
</tr>
<tr>
<td>Omit if empty</td>
<td>Option to exclude a name-value pair if the value is empty or null. Note: This check box is available after clicking the down arrow to display the advanced options.</td>
</tr>
</tbody>
</table>

**SOAP response size limit**

The system limits the size of SOAP responses to 5 MB. Direct SOAP responses that exceed this limit generate an error. To support larger response sizes, increase the response size limit with the `glide.pf.soap.response_payload_max_size` system property. This system property supports a maximum value of 10 MB.
SSH step

The SSH step executes SSH commands on an external *nix system through a ServiceNow® MID Server. The step also stores scripts and commands for the *nix systems.

![Note:](image)
- The SSH step is not available in the base system. The step requires the subscription to ServiceNow® IntegrationHub and activation of IntegrationHub Professional Pack Installer (com.glide.hub.integrations.professional) or later. For more information about the IntegrationHub subscription packages, see IntegrationHub usage and subscription. After you activate the required plugin, the step is visible under Integrations.
- IntegrationHub supports ServiceNow SSH only.

Roles and availability

The SSH step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Sanitizing inputs

Escape all user inputs to eliminate the possibility of a malicious user executing arbitrary commands on your target server. Escape and validate data pills before the command field uses them by sanitizing arguments using Sanitize shell arguments transform functions. This transform function category automatically appears when a data pill is dropped into the Command input.

Fields

<table>

<td>Option to disable the SSH connection timeout for commands that might take longer than the default time of 120 seconds to run. When selected, the engine detaches from the execution thread until completion.</td>
</tr>
<tr>
<td>Sudo Mode</td>
<td>Option to elevate privileges to execute the script.</td>
</tr>
</tbody>
</table>

For more information, see [SSH credentials](#).

### Advanced SSH credentials

To run a MID Server script on the target host, specify the script type and pass the name of the script into the `$(syncFile())` parameter. The system uses this parameter to locate the named script in the MID Server Script File [ecc_agent_script_file] table and run it on the target host. For example, a bash script can be expressed as:

```bash
bash $(syncFile("<MID script name>")) argument1 argument2 argument3
```

A base script (main_script.bash) can reference another script (my_include.bash) as well as a separate file (.my_profile) located on the target host. Both scripts and the file referenced must be synced to the MID Server, using the `$(syncFile())` parameter, to execute properly.

```bash
source $(syncFile(".my_profile"))
cp $(syncFile("my_include.bash")) /usr/ssmith/my_include.bash
bash $(syncFile("main_script.bash")) one two three four five six
rm /usr/ssmith/my_include.bash
```

A Python example with inline comments might look like this:

```bash
set $LIB_DIR=/usr/bin;
# Sync a file that is referenced inside myF5CreateLBPool.py
cp $(syncFile("specialFunctions.py")) ~/specialFunctions.py
# set up environment variables
source $(syncFile(".python_profile"))
# call script that sets up dependencies on the box from remote package repos
python $(syncFile("setupPythonDependencies.py")) pycontrol
# call a script that requires functions from the package as well as a function from myIncludedFile
python $(syncFile("myF5CreateLBPool.py")) snow_pool myActualValue
# user is responsible for their own cleanup
rm ~/specialFunctions.py
```

To see the list of available MID Server scripts, navigate to MID Server > Script Files.

### XML parser step

Identify structured data from an XML payload without having to write script. Map incoming XML elements to a complex object output that you can use in other steps or actions. At runtime, values from an XML payload populate the complex object output.

To learn more about complex objects, see [Complex data](#).

**Note:** XML parser step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.
Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Payload size limit

At runtime, XML parser step supports payloads up to 10 MB. For larger payloads, create a Data Stream action. For more information, see Data Stream actions and pagination.

At design time, XML parser step supports sample payloads up to 64,000 characters.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source data</td>
<td>Select or drag a data pill that contains the source XML data. For example, a REST step <strong>Response Body</strong> data pill. At runtime, values from the data source populate the complex object output.</td>
</tr>
<tr>
<td>Payload view</td>
<td>Select a view for the example payload.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Raw (edit mode)</strong>: Displays editable XML.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Structured</strong>: Displays XML in a tree view. Click an element in the tree to copy the element XPath. If creating complex data in the <strong>Target</strong> field manually, you can paste the XPath into the target XPath field.</td>
</tr>
<tr>
<td>Example payload</td>
<td>Enter an example payload to generate a complex object. For example, if parsing the response from a REST API step that returns a list of users, enter the expected XML for a single user. This field accepts XML with the following limitations.</td>
</tr>
<tr>
<td></td>
<td>• XML namespaces are not applied to the complex object. More than one namespace in an XML file is not supported and generates an error message.</td>
</tr>
<tr>
<td></td>
<td>• Multidimensional arrays are not supported.</td>
</tr>
<tr>
<td></td>
<td>• Some special characters are not supported, such as hyphen and period. Double colons (::) are not supported in attribute values.</td>
</tr>
<tr>
<td></td>
<td>• Payloads larger than 64,000 characters cannot be saved and generate an error message. However, if working with a large example, you can generate the complex object and delete the example payload before saving the step.</td>
</tr>
<tr>
<td>Generate Target</td>
<td>Click to generate a complex object from the example payload. Review and edit the <strong>Target</strong> field as necessary. Child elements are generated as type String. Alternatively, manually create the target by adding items in the <strong>Target</strong> field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Target | View the XML payload as a complex object. Generate structured data by clicking **Generate Target**, or manually add items. For more information, see **Complex data**. Each complex data variable contains this information.  
  • **Label**: Data pill label. By default, the system uses the name of the XML element.  
  • **Preview**: Sample value from the example payload.  
  • **Type**: Data type, which must be String, Object, Array.String, or Array.Object. The top-level item must be an Object.  
  • **XPath**: Path to the element. Modify the XPath to change how source data elements map to complex data variables. If manually adding complex data variables, you can copy the XPath from the **Payload view** field and paste it in a complex data variable XPath field to ensure the correct hierarchy. Conditional XPath expressions are not supported. |
|       | Click **Edit Object** to:  
  • Change the label, internal name, or data type  
  • Add or remove complex data variables  
  • Mark a variable mandatory |

**Password reset using IntegrationHub**

Create subflows in IntegrationHub to automate and customize the password reset process for users managed by third-party applications such as Okta or Microsoft Azure AD.

Create subflows in IntegrationHub to automate password reset processes. Use the **Password Reset application** to enable an end user to use a self-service process to reset or change the password. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users. See **Customize password reset processes and integrate third-party credential services** for more information.

**Password reset IntegrationHub usage overview**

Navigate to **Password Reset > Usage Overview** to view the count of password reset transactions performed using IntegrationHub for your instance.

**Note:** Admin must activate the Password Reset - Orchestration Add-on (com.glideapp.password_reset.addon.orchestration) plugin to view the dashboard.

**Client Software Distribution using IntegrationHub**

Use Client Software Distribution (CSD) to distribute software from the Service Catalog using third-party management systems.

Create all the records necessary to deploy software from Service Catalog requests, including software models and catalog items. You can use the CSD application to automate the deployment and **revocation** of software from an SCCM host using the **Microsoft SCCM spoke**. You can define lease periods for software distributed from the Service Catalog and allow lease extensions in some cases, pending approvals. Deployment is accomplished using IntegrationHub flows, subflows, and actions.

Integrates with **Software Asset Management** to manage license counts for deployed software.
Request client software distribution

Client software distribution requires the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution), which is available by request with a subscription to IntegrationHub.

Role required: admin
The Client Software Distribution plugin activates the System Center Configuration Manager plugin that contains the Microsoft SCCM spoke actions to deploy or revoke software using an SCCM server. For additional plugin dependencies, see Plugins installed with client software distribution.

Note: The Client Software Distribution plugin runs in its own application scope.

1. Navigate to System Definition > Plugins.
2. Click Request Plugin.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>

</table>
### Roles installed

These roles are installed with the Client Software Distribution plugin.

**Roles for IntegrationHub - Client Software Distribution**

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains Roles</th>
</tr>
</thead>
</table>
| Client software distribution admin [sn_client_sf_dist.csd_admin] | Administrator role for managing client software distribution application. | • sam  
• agent_admin  
• report_admin  
• catalog_admin  
• itil  
• workflow_admin |

### Script includes installed

These script includes are installed with the Client Software Distribution plugin.

**Script includes for Client Software Distribution**

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSDExtensionPoint</td>
<td>Execute the CSD provider’s specific code</td>
</tr>
<tr>
<td>CSDUtil</td>
<td>Utility functions for the CSD application.</td>
</tr>
<tr>
<td>RefQualsCSD</td>
<td>Reference qualifier filter. This script provides the filter functions for the CSD providers, devices, SCCM application, install collections, and uninstall collections.</td>
</tr>
<tr>
<td>SCCMCatItemHandler</td>
<td>Sets the field values of specific SCCM catalog items. These values are the SCCM catalog item table name, catalog item name, SCCM provider, and SCCM software configuration.</td>
</tr>
<tr>
<td>SoftwareCatItemCreator</td>
<td>Creates software catalog items.</td>
</tr>
<tr>
<td>CSDCatItemHandler</td>
<td>Base class for CSD catalog item creation. This script is used by the Create Catalog Item UI action to create and application catalog.</td>
</tr>
<tr>
<td>Script include</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>CSDDemoDataUtil</td>
<td>Populates demo data.</td>
</tr>
<tr>
<td>CSDDemoDataUtilAjax</td>
<td>Populates demo data.</td>
</tr>
</tbody>
</table>

**Properties installed**

Properties for client software distribution (CSD) manage the installation status of requested software deployments and configure scheduled Discoveries.

To access CSD properties, navigate to **Client Software Distribution > Properties**. The following properties are available:

**Client software distribution properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Status check expiration interval (days)       | sn_client_sf_dist.softwareInstallExpDays | Controls how many days the system waits before ignoring the software installation status. The default time limit for installing software is 30 days before the system stops checking the installation status of a deployment. Installation statuses are:  
  • **Not installed**: User has not installed requested software prior to the expiration of the configured time limit.  
  • **Installed**: Software was installed within the configured time limit.  
  • **Status check expired**: Time limit has expired for the user to install the requested software. The system no longer checks the status of this deployment.  
  • **Revoked**: Software was revoked by the administrator.  
  • **Type**: integer  
  • **Default value**: 30 |
| Reconcile software installation status interval (hours) | sn_client_sf_dist.softwareInstallInterval | Determines when the scheduled job runs that determines the installation status. By default, the system checks the installation status every hour.  
  • **Type**: integer  
  • **Default value**: 24 |
<table>
<thead>
<tr>
<th>Property</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Set scheduled application Discovery interval (days). | sn_client_sf_dist.discoveryExeDay | Sets the repeat interval for the scheduled job that runs application Discovery. By default, Discovery runs at midnight on the day set with this value.  
  - **Type**: integer  
  - **Default value**: 5 |
| Set lease execution schedule job interval (minutes) | sn_client_sf_dist.lease_execution_interval | Interval in which the CSD Lease Schedule scheduled job checks for requested software leases to start, stop, or extend.  
  - **Type**: integer  
  - **Default value**: 1 |
| Set time prior to lease end to notify requester (days) | sn_client_sf_dist.lease_end_notification | Determines how many days prior to the end of a software lease to notify the requester. If lease extensions are allowed, ensure that this period provides enough time for the approval process to complete before the lease expires.  
  - **Type**: integer  
  - **Default value**: 5 |

**Flows and subflows installed**

These flows and subflows are installed with the Client Software Distribution plugin.

**Flows installed with client software distribution**

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order Client Software</td>
<td>Schedules the installation of an ordered application on the selected device. The request requires approvals based on the user input in the catalog item configuration.</td>
</tr>
<tr>
<td>Deploy Client Software</td>
<td>Deploys a software by executing provider-specific subflow. Creates catalog tasks if there is a failure in the execution of the provider subflow.</td>
</tr>
</tbody>
</table>

**Subflows installed with client software distribution**

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discover And Store SCCM Data</td>
<td>Retrieves lists of applications, collections, and deployments from SCCM servers using Microsoft SCCM spoke actions. An administrator runs this subflow from a UI action in a SCCM Server Instance record.</td>
</tr>
<tr>
<td>Subflow</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Deploy SCCM Application</td>
<td>Triggered by the Order Client Software flow to deploy software through SCCM server. This subflow adds either the user or the device into the SCCM collection.</td>
</tr>
<tr>
<td>Revoke Client Software</td>
<td>Begins the software revocation process for software deployed by an external provider. Administrators run this subflow from a UI action on the Requested Software record and the Installed Software Not Entitled record. This subflow triggers the appropriate provider subflow that performs the actual revocation. For example, this subflow triggers the Revoke SCCM Application subflow for applications in SCCM uninstall collections.</td>
</tr>
<tr>
<td>Revoke SCCM Application</td>
<td>Revokes SCCM applications that are members of an uninstall collection. The Revoke Client Software subflow triggers this subflow to revoke software deployed by an SCCM server. This subflow moves either the user or the device from the SCCM collection into the appropriate uninstall collection.</td>
</tr>
<tr>
<td>CSD Lease End Notification</td>
<td>Notifies user about the lease end date of the software and send link to extend lease end date.</td>
</tr>
<tr>
<td>CSD Deploy Software Post Processing</td>
<td>Performs post processing after the software deployment is successful. The Deploy Client Software flow triggers this subflow.</td>
</tr>
<tr>
<td>CSD Lease End Notification</td>
<td>Notifies user about the lease end date of the software and sends link to extend lease end date.</td>
</tr>
<tr>
<td>Prepare Revocation Data</td>
<td>Prepare data required for the revocation flow.</td>
</tr>
</tbody>
</table>

**Create licenses and counters for distributed software**

Licenses and software counters are associated with the software model and must be created if you want to track the license for software deployed by client software distribution (CSD).

Role required: sam or admin

You can create software licenses and counters in Software Asset Management for software items deployed from the service catalog by CSD. CSD depends on the software counter result to determine if the license is available for the requested software. If the license **Valuation** is greater than 0, and the license type is **Not allocated**, CSD assumes that the license is available for the software.

1. Navigate to **Software Asset > Software Licenses**.
2. Add a new software license for the software model you used in CSD.
3. Navigate to **Software Asset > Reconciliation > Software Counters**.
4. Create a software counter for the software model you created.
5. Run the counter to retrieve the software license information.

**Client software distribution ordering process**

Software deployed by Client Software Distribution (CSD) can be ordered from the service catalog by individual users or by approved users on behalf of others.

Client Software Distribution catalog items have different options, depending on how ordering is configured.
**Lease start and end dates**

All software deployed by CSD requires users to specify the beginning date for the lease. This is enforced by the Asset Lease Management plugin that is activated automatically with CSD. The system pre-populates the **Lease start** field with the current date and time.

If the catalog item is configured for revocation (uninstall), the form displays the **Lease end** field, which allows the requester to define an end date and time for the lease. The system validates user input in these fields to ensure that the dates selected define a future window. The **Lease end** field is not mandatory and can be left blank to order software with no end date.

**Note:** For systems deploying software from Microsoft System Center Configuration Management (SCCM), the **Lease end** field is only available if the **SCCM configuration** specifies an uninstall collection.

**Software offered only to the logged in user**

If the **software catalog item** is configured with the **Order on behalf of** check box cleared, the **User** field does not appear on the order form. The logged in user selects the device on which to deploy the software from the **Device to install this software on** field. Only those devices assigned to the logged in user appear in the list.

In this example, a user has logged into the service catalog to order Firefox for a computer that is assigned to her. She selects the machine from a list of devices she owns and selects the date and time the lease should begin. This software is deployed through Microsoft System Center Configuration Management (SCCM), but does not have an uninstall collection configured and cannot be revoked automatically by the system. As a result, the **Lease end** field is not available.
Software ordered on behalf of another user

If the software catalog item is configured with the **Order on behalf of** check box selected, the **User** field appears on the form. The logged in user can select any user from this field. The **Device to install this software on** field only lists the devices assigned to the user selected in the **User** field. If an approval is required for software ordered on behalf of another user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requester is the named user's manager.

In this example, a manager is ordering Google Chrome for a contractor. The manager selects the contractor from the **User** field and then chooses a computer from the list of devices assigned to the contractor. This software has an SCCM uninstall collection configured, which allows the manager to select an end date for the lease that coincides with the end of the user's contract. When the lease expires, SCCM automatically uninstalls the software from the device.
Extend a software lease

Users of software deployed by Client Software Distribution (CSD) can request the extension of a lease window, if the software is revocable by a software distribution system.

Role required: Any system user

If your software has a lease end date defined, and the software status is Installed, you can request an extension of the lease, pending any approvals your organization requires.

1. Navigate to Service Catalog > My Requested Software.
   The list shows only the software you have requested from the service catalog.
2. Select the record for the installed software whose lease you want to extend.
3. Under Related Links click Extend Lease.
4. In the dialog box that appears, select a new lease end date in the calendar and click **OK**. You must select a date later than the current date.

If the lease extension is subject to manager approval, you are notified of the decision. If the request is approved, a notification shows the new lease end date. If the new end date is within 5 days (the default notification period) of the date when you made the request, CSD sends an immediate end-of-lease notification.

**Important:** If lease extensions in your organization require approval, make sure the approver is available and has enough time to process your extension request. If the extension cannot be approved before the original end date expires, the software is revoked.

**Client software distribution from SCCM**

Use Client Software Distribution (CSD) to deploy and revoke software deployments from Microsoft System Center Configuration Management (SCCM) and manage distributions on SCCM hosts.
The **Microsoft SCCM spoke** contains actions that CSD uses to deploy software from a service catalog request and manage user and device collections on SCCM servers. In addition, CSD can manage license counts for deployed software using ServiceNow Software Asset Management, revoke software deployed by SCCM without user interaction, and manage lease periods.

**Configuring SCCM**

Follow the SCCM configuration procedures in the order shown.

*Configure the Application Administrator role on the SCCM server*

To deploy software using ServiceNow® Client Software Distribution (CSD), ensure that an SCCM administrative user has the correct permissions to deploy software and that PowerShell is properly configured.

SCCM role required: Application Administrator

These instructions are for Microsoft 2012 R2 Server.

1. In the System Center Configuration Manager console, navigate to **Administration > Security > Administrative Users**.
2. Right-click the user to whom you want to grant the Application Administrator role.
3. Select **Properties** from the drop-down menu.
4. In the Properties dialog box, select the **Security Roles** tab.
5. Ensure that the user has the Application Administrator role.
6. If the user does not already have this role, click **Add**, select this role from the list, and click **OK**.
Granting the Application Administrator role on the SCCM server
7. Log into SCCM as the user with the Application Administrator role.
8. Open the menu from the upper left corner of the console and select **Connect via Windows PowerShell**.

9. Ensure that the user can access the CM console.
   This action establishes the environment path to PowerShell for the logged in Application Administrator user.

**Update the SCCM cmdlet libraries**
Ensure that the System Center Configuration Manager SCCM Cmdlet Library is up-to-date.

SCCM role required: Either current user or system administrator, depending on settings.

The System Center Configuration Manager SCCM Cmdlet Library installs and updates the Windows PowerShell module for SCCM. SCCM checks for library updates on a daily basis. Out-of-date libraries can cause Discovery of the SCCM server to fail, because the system cannot parse the SCCM activity output. This warning message appears in the ECC queue input records for the SCCM GET activities:

```
WARNING: An update to the System Center 2012 Configuration Manager Cmdlet Library is available. Please go to 'http://go.microsoft.com/fwlink/?LinkId=528947' to download the latest version. 
Running cmdlet version: 5.0.8231.1004 Latest cmdlet version: 5.0.8328.1155
```

If you elect to use an earlier version library, use this procedure to disable the CM update check, which allows Discovery to proceed without issues.

1. Log into the SCCM console as an administrator.
2. Open the menu from the upper left corner of the console.
4. Run one of these commands to disable the update check:
   - **Per-user**: `Set-CMCmdletUpdateCheck -CurrentUser -IsUpdateCheckEnabled 0`
   - **Per-system**: `Set-CMCmdletUpdateCheck -System -IsUpdateCheckEnabled 0`

   **Important**: The per-system cmdlet must run in an elevated Windows PowerShell session.

5. Run the `Get-CMCmdletUpdateCheck` command to refresh the console and check the settings.
6. Ensure that the value of the `IsEnabled` configuration variable has changed to `False`.
   This indicates that the warning for an out of date cmdlet library is disabled for the users specified.
7. To re-enable the update check, run the `-IsUpdateCheckEnabled 1` command for either the current user or for the system.

**Configure the MID Server for SCCM activities**

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

Role required: admin

1. In the navigation filter, enter `cmdb_ci_dns_name.list`.
2. Click New.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the Name field.
4. Right-click in the form header and select Save.
5. In the IP Address related list, click New.
6. In the IP Address field, enter the IP address of the SCCM server.
7. In the Nic field, select eth0 or your preferred network interface controller.
8. Leave the Netmask field blank.
9. Click Submit.

**Create Connection and Credential alias for SCCM deployments**

Microsoft System Center Configuration Manager (SCCM) requires the appropriate credentials to deploy applications using the Client Software Distribution application.

Role required: sn_client_sf_dist.csd_admin or admin

Client software distribution requires Windows credentials that have administrative rights on the SCCM server.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the alias. For example, CSD Alias.</td>
</tr>
</tbody>
</table>
4. Right-click the form header, and click **Save**.
5. Click the **Create New Connection & Credential** related link.
6. On the form, fill in the fields.

**Create Connection and Credential form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCCM Server Instance Name</td>
<td>Name to uniquely identify the SCCM server.</td>
</tr>
<tr>
<td>Host</td>
<td>Fully qualified domain name of the target host where the SCCM server is installed.</td>
</tr>
<tr>
<td>Credential Name</td>
<td>Credential record associated with the connection and credential alias.</td>
</tr>
<tr>
<td>User Name</td>
<td>User name with access to the target Windows host.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for the account.</td>
</tr>
</tbody>
</table>

7. Click **Create**.

Connection record and SCCM Server Instance are created and associated with the connection and credential alias. **Retrieve SCCM data for client software distribution**

Retrieves the collections and the list of applications available for deployment from your SCCM servers.

**Role required**: sn_client_sf_dist.csd_admin or admin

Before starting this procedure:

- Set up your Microsoft System Center Configuration Manager (SCCM) server, create the applications and collections, and configure the deployments you need. For information, see your SCCM documentation.
- **Configure a user** with the Application Deployment Manager role on the SCCM server.
- Set up the MID Server to communicate with the SCCM server.
- Add Powershell credentials to the ServiceNow Credentials [discovery_credentials] table for the SCCM user who has the Application Deployment Manager role.

To populate the Client Software Distribution application with SCCM data:

1. Navigate to **Client Software Distribution > SCCM > SCCM Server Instance**.
2. Click **New**.
3. In the SCCM Server Instance form, identify the server by name and select the connection and credential alias.
4. **Click Submit.**

   The new SCCM server appears in the list.

5. **Open the new SCCM record and click Discover now under Related links.**

   The system runs the Discover SCCM flow that retrieves the application, collection, and deployment data from the SCCM server.

SCCM server Discovery for client software distribution

Discovery flow populates ServiceNow tables with collection, application, and deployment data retrieved from SCCM servers.

Users run the Discover SCCM flow from an SCCM Server Instance record to populate the following ServiceNow tables:
Set up a software model for an SCCM application

Using the applications discovered on the SCCM server, set up a software model used by the Software Asset Management application to manage licenses.

Role required: sn_client_sf_dist.csd_admin or admin

Before creating software models, you must discover the applications available for deployment on the SCCM server. See Retrieve SCCM data for client software distribution for details.

You can link an SCCM application to an existing software model or create a new model.

1. Navigate to Client Software Distribution > SCCM > SCCM Applications.
   A list of applications discovered on the SCCM server appears.
2. Open an SCCM application record.
3. To link to an existing model, click the magnifying glass icon in the Model field and select a model from the list.
To create a model, click **Create Software Model** under **Related Links**.

a) Complete the software model fields. See for details.

b) Click **Submit**. The view returns to the SCCM Applications form.

**Define an SCCM configuration**
To create catalog items for SCCM software deployment or to configure your instance to revoke software through SCCM, you must first associate that software with a collection through an SCCM configuration.

Before you create an SCCM configuration record, make sure you have discovered the SCCM applications, collections, and deployments and set up the necessary software models.

Role required: sn_client_sf_dist.csd_admin or admin

The SCCM configuration process associates software with SCCM collections. To deploy software from an SCCM server, the user or device must be a member of an SCCM collection associated with an **install** deployment. Client Software Distribution (CSD) allows you to **revoke unentitled software** using an SCCM server when that software can be removed using an **uninstall** collection. Users requesting revokable software from the Service Catalog also have the ability to define lease start and stop dates and request lease extensions.
SCCM table references

1. Navigate to Client Software Distribution > SCCM > SCCM Applications.
2. Open an application that has a configured software model.
3. Under Related Links, click Create Software Configuration.
4. Complete the form, using the fields in the table.
SCCM configuration form

SCCM configuration fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Recognizable name for this SCCM software configuration.</td>
</tr>
<tr>
<td>SCCM application</td>
<td>Name of an application hosted on the SCCM server.</td>
</tr>
<tr>
<td>SCCM collection</td>
<td>Name of the collection associated with the install deployment for the selected application on the SCCM server. Only those collections associated with the application are available for selection.</td>
</tr>
</tbody>
</table>
| SCCM uninstall collection     | Name of the collection associated with the uninstall deployment for the selected application on the SCCM server. You must specify an uninstall collection to:  
  • Define a lease end date for deployed software.  
  • Allow lease extensions.  
  • Revoke software from a user's machine. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery model</td>
<td>Discovery model that links the unentitled software installation with the SCCM configuration. From the SCCM configuration record, Client Software Distribution can determine which collection to use to revoke the software. Unentitled software is software found on the user's machine that the user is not entitled to use.</td>
</tr>
</tbody>
</table>

Create a catalog item for an SCCM application

Create a catalog item for an application you want to offer for distribution from the service catalog using the applications discovered on the SCCM server.

Role required: sn_client_sf_dist.csd_admin or admin

Before creating a catalog item, you must link the application to a software model and create at least one software configuration.

1. Navigate to Client Software Distribution > SCCM > SCCM Applications.  
   A list of applications discovered on the SCCM server appears.
2. Open a record for an SCCM application.
3. Under Related Links, click Create Catalog Item.  
   A new SCCM Application Catalog Item record appears with preconfigured information.
4. Add price information and complete the following fields added to the Client Software Distribution Catalog Item [sn_client_sf_dist_cat_item] table by the Client Software Distribution plugin:

**SCCM fields in the catalog item form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skip approval (skip_approval)</td>
<td>Check box that allows skipping approval for this item by the requestor's manager when a user orders it from the service catalog. Use this field in conjunction with the <strong>Order on behalf of</strong> field to ensure that software ordered by a logged in user on behalf of another user is subject to approval. By default, this check box is cleared, requiring manager approval for all new catalog items.</td>
</tr>
<tr>
<td>Check license compliance (check_license_compliance)</td>
<td>Check box that forces the system to determine if deploying this item is allowed under the current license.</td>
</tr>
</tbody>
</table>
| Order on behalf of                         | Check box that allows the logged-in user to order this software from the service catalog for another user. This permits service desk personnel to order SCCM deployments for other users in the system. By default, this feature is enabled. To prevent unauthorized users from ordering software, ensure that approvals are required for this type of deployment by clearing the **Skip approval** check box. If an approval is required for software ordered on behalf of a user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requestor is the named user's manager. Software items requested from the service catalog on behalf of a different user require the following information:  
  • **User**: User selected for deployment. This field is automatically populated with the name of the logged in user. You can select another user from the list.  
  • **Device to install this software on**: Device belonging to the selected user on which to deploy the software. Only devices belonging to that user appear in the choice list.  
  • **Lease start**: Date and time to deploy the software. This is the start time for the lease. A lease can be open-ended or have a lease end time. |

*Note*: There are two levels of approval possible. By default, all category items require group approval for items in excess of $1000. If that approval is given or skipped, the system evaluates the **Skip approval** check box to determine if the software item requires approval by the requestor's manager.
5. If the catalog item requires approval because of cost, be sure to configure an approval group in the **Approved By Group** related list.

By default, the Service Catalog Request flow runs when an item costing more than $1000 is ordered and looks for an appropriate approval group. If no approval group is configured for the item, this flow skips approval altogether and ends. The system then runs the Order Client Software flow, which evaluates the **Skip approval** check box to determine if approval by the requester's manager is required.

6. Click **Update**.

The view returns to the SCCM Applications list.

7. To see all client software distribution (CSD) catalog items, navigate to **Client Software Distribution > Maintain Items > Software Items**.

**SCCM deployment process**

Order an SCCM application from a client software distribution (CSD) catalog item in the service catalog triggers the Order Client Software flow.

This process deploys an SCCM application to a user or device through a service catalog order:

1. If the **Skip approval** check box is cleared in the software catalog item, the Order Client Software flow sends the catalog request to the requesting user's manager for approval.

2. If the **Check license compliance** check box is selected in the software catalog item, the flow performs a software license check. If there is no license available, the flow creates a catalog task to procure more licenses and assigns the task to the CSD Administrators group.

3. The Order Client Software flow triggers the Deploy SCCM Application flow as a subflow. This subflow adds either the user or the device to the SCCM collection using the Add to User Collection or Add to Device Collection actions in the **Microsoft SCCM spoke**.

4. If the software configuration specifies **SCCM uninstall collection** in the software catalog item, the Deploy SCCM Application subflow checks if the user or device exists in the uninstall collection. The flow uses the Is Device in Collection or Is User in Collection in the **Microsoft SCCM spoke**. If the user or device exists in the uninstall collection, the flow removes the device or user. The subflow uses the Remove from Device Collection or Remove from User Collection action in the **Microsoft SCCM spoke** before adding it to the SCCM install collection.

**Client software distribution validation process**

After SCCM deploys software to a target computer, client software distribution (CSD) detects the installation and validates its status.

Client software distribution uses the following methods for detecting software installed on the target machine:

- **Discovery**: CSD is configured to leverage Discovery to detect software installations. You can run Discovery manually at any time, or by a scheduled job.

- **Microsoft SCCM Integration**: You can import SCCM data into the CMDB using the features in the Integration - Microsoft SCCM plugin if Discovery is not active on the instance.

The instance uses the data gathered by Discovery or the SCCM integration plugin to populate the Software Installation [cmdb_sam_sw_install] table. To validate installations using this data, CSD runs a scheduled job called
Reconcile Requested Software that uses CSD property settings. This process reconciles the software installation data accumulated in the CMDB and makes these status updates:

- **Not installed to Installed**: The user has installed the requested software within the time limit configured in the `sn_client_sf_dist.softwareInstallExpDays` property.
- **Not installed to Status check expired**: The time limit has expired for the user to install the requested software. The system stops checking for installation when the time limit expires.

**SCCM software revocation**

Revoke software without any user interaction using Microsoft System Center Configuration Manager (SCCM) if the software configuration specifies an SCCM uninstall collection, even if the software was installed by some other process or user.

*Revoke software deployed through the service catalog*

Software deployed by SCCM can be revoked, but only when the status of software is **Installed** and the application associated with the software configuration has an uninstall collection configured.

- Create an **SCCM configuration record** for the application that names an appropriate uninstall collection.
- Associate the **CSD catalog item** for the application with the SCCM configuration that specifies the uninstall collection.

Role required: `sn_client_sf_dist.csd_admin` or `admin`

A subflow called **Revoke SCCM Application** moves either the user or the device from its respective collection and adds it to the appropriate uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

1. Navigate to **Client Software Distribution > Reports > Requested Software**.
2. Open the record for the SCCM software package you want to revoke.
   - The package must have a **Status of Installed** to be revocable.
3. Under **Related Links**, click **Revoke software**.
   - This action runs the Revoke Client Software flow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

*Revoke unentitled software*

Revoke software using Microsoft System Center Configuration Manager (SCCM) that a user is not entitled to use even if the software was installed by some other process or user.

To revoke software using SCCM, you must create an **SCCM configuration record** for the application, in which the appropriate software Discovery model is defined. See **Software discovery models**.

Role required: `sn_client_sf_dist.csd_admin` or `admin`

Client Software Distribution (CSD) uses **Software Asset Management** to identify unentitled software installations. Discovery detects the software on the user's machine, and SAM determines if the user or device is entitled to use that software. This might include software that was not installed through a catalog request or software that the user installed without approval. If the software installation's Discovery model is associated with an SCCM software configuration that has an uninstall collection defined, then an administrator can use CSD to revoke that software from the user's machine without involving the user.

1. Navigate to **Client Software Distribution > Reports > Installed Software Not Entitled**.
2. Select the record for the installation that has unentitled users.
3. Under **Related Links**, click **Revoke software**.
   - This action runs the Revoke Client Software flow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal...
policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

**SCCM software revocation flow**

The Revoke SCCM Application flow moves a user or device from an install collection to an uninstall collection to revoke software installed from Microsoft System Center Configuration Manager (SCCM).

For the revocation subflow to run, the software package must have a status of *Installed* and must be pre-configured for an appropriate uninstall collection. See *Revoke software deployed through the service catalog* for configuration
ServiceNow Orlando Now Platform capabilities

instructions. When an administrator initiates the revocation process, the system launches the Revoke SCCM Application subflow to move the user or device collection associated with installation to the appropriate SCCM uninstall collection. When the SCCM server performs a policy check, it finds the additions to the user or device uninstall collection and revokes the software package associated with that collection.

The subflow employs two custom actions in the Microsoft SCCM spoke, Remove from User Collection and Remove from Device Collection, to remove either the user or the device from its original collection. The subflow then adds the user or device to the appropriate uninstall collection on the SCCM server with the Add to User Collection or Add to Device Collection activity.

Note: This subflow is triggered by the Revoke Client Software subflow.

Client software distribution dashboard

The CSD dashboard provides a collection of visual reports for the Client Software Distribution application.

CSD dashboard

To access the CSD dashboard, navigate to Client Software Distribution > Requested Software > Dashboard.

**Usage Overview dashboard**

Navigate to **Client Software Distribution > Usage Overview** to view the current transaction count for your instance.
Client software distribution extension framework

Client software distribution (CSD) provides built-in extension points for integrating a ServiceNow instance with client software distribution providers, such as Casper, Altiris, or LANDesk.

Caution: The use of CSD extension points is an advanced procedure intended for use by experienced Now Platform developers only. Instructions for customizing your instance to deploy and revoke software from a software distribution provider can be found in the CSD Extension Implementation Guide.

Configure client software distribution providers

Identify the provider and specify the flows, subflows, and extension points for a customized software distribution process.

Perform the development tasks described in the CSD Extension Implementation Guide before attempting this procedure.

Role required: sn_client_sf_dist.csd_admin, admin

1. Navigate to Client Software Distribution > Extensions > Providers.
2. Click New.
3. Complete the form using the fields in the table.

Note: Ensure that you select the Use Flow option to use the IntegrationHub flows.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the provider.</td>
</tr>
<tr>
<td>Provider server table</td>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provider server table</td>
<td>Table name of the provider server. You must create this table as an extension of the Configuration Item [cmdb_ci] table. For example, you might call your table Casper Server Instance [cmdb_ci_casper_server_instance].</td>
</tr>
<tr>
<td>Discovery flow</td>
<td>Flow that discovers the provider server and returns the data from that server back to the instance. This is the subflow you create with custom activities that query the provider server.</td>
</tr>
<tr>
<td>Software configuration table</td>
<td>Table name of the software configuration for this provider. You create this table as an extension of the Client Software Distribution Software Configuration [sn_client_sf_dist_software_config] table. For example, you might create a table called Casper Software Configuration [sn_client_sf_dist_casper_sf_config].</td>
</tr>
<tr>
<td>Deployment extension key</td>
<td>The SetDeploymentData key provided with CSD. This key sets up the data for the software ordering and deployment flow.</td>
</tr>
<tr>
<td>Deployment flow</td>
<td>Flow that deploys software from the provider server. This is the flow you created with custom activities that tells the provider where to deploy an application requested from the service catalog.</td>
</tr>
<tr>
<td>Revocation extension key</td>
<td>The SetRevocationData key provided with CSD. This key sets up the data for installation revocation.</td>
</tr>
<tr>
<td>Revocation Flow</td>
<td>Flow that revokes an installation from a provider server. This is the subflow you created with custom activities that tells the provider which application to remove from a device.</td>
</tr>
<tr>
<td>Use Flow</td>
<td>Option to use the IntegrationHub flows.</td>
</tr>
</tbody>
</table>

**Note:** Flows or workflows associated with the provider catalog items are affected based on this option.

4. Click **Submit**.

### Client software distribution extension keys

Client software distribution (CSD) extension keys allow you to customize the deployment and revocation of software from distribution providers.

These pre-defined keys allow you to generate input variables for flows that deploy and revoke software from external distribution providers:

- **SetDeploymentData**: Sets the software order information and generates the input variables for the deployment flow.
- **SetRevocationData**: Generates the input variables for the revocation flow.
- **CheckRevocable**: Specifies the conditions that determine if an installation can be revoked. If the software configuration associated with the installed software allows uninstallation, the installed software can be revoked.
**Client software distribution extension points**

The client software distribution (CSD) extension points create the customization code for the specific provider and the extension keys.

The purpose of the extension points is to associate extension keys with a specific provider, and then create a script that sets input variables for your custom deployment and revocation flows. Another extension point script tells CSD if the provider has the capability to revoke software. If this is the case, CSD enables the UI action that triggers revocation from the provider.

**SetDeploymentData**

The script associated with this extension key must set the `csdExtensionResult` object with these attributes:

- **deploymentFlowInputs**: Object that specifies the deployment flow input variables.
- **deploymentWorkflowInputs**: Object that specifies the deployment workflow input variables.
- **softwareModel**: Software model sys_id.
- **softwareType**: An integer. Use 1 for deployment to a user and 2 for deployment to a device.
- **softwareApplication**: Software application sys_id.

**CheckRevocable**

The script associated with this extension key gets the input parameter `csdExtensionInputs.softwareConfiguration`, which is a Client Software Distribution record in the Software Configuration [sn_client_sf_dist_software_config] table. All providers' software configurations are extended from this table, but may have different attributes.

This script must set the `csdExtensionResult` object to true or false, depending on whether the software configuration specifies uninstallation.

**SetRevocationData**

The script associated with this extension key gets the input parameter `csdExtensionInputs.softwareConfiguration`, which is a Client Software Distribution record in the Software Configuration [sn_client_sf_dist_software_config] table. All providers' software configurations are extended from this table, but may have different attributes.

The script must set the `csdExtensionResult` object with these attributes:

- **revocationFlowInput**: Object that specifies the revocation flow input variables.
- **revocationWorkflowInput**: Object that specifies the revocation workflow input variables.
- **softwareModel**: Software model sys_id.
- **deploymentType**: An integer. Use 1 for deployment to a user and 2 for deployment to a device.

**Interaction Management**

Interactions are a centralized location for all communication channels in the platform. Each interaction represents a request for assistance through a given channel, for example, a call or a chat.

The Now Platform offers several forms of queueing and communication management, but each system is tightly coupled to the specific area. Interactions offer an alternative, flexible, and more extensible option so that each product area can use the same framework.
Activate the interaction management system

An administrator can activate the Interaction Logging, Routing, and Queueing plugin [com.glide.interaction] to access the functionality.

Role required: admin

For plugin activation steps, see *Activate a plugin*.

1. Navigate to **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in *Request a plugin*.

3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

   **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise they will receive the following error: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Components installed with Interaction Management

Several types of components are installed with activation of the Interaction Logging, Routing, and Queueing plugin, including tables and user roles.

   **Note:** The Application Files table lists the components installed with this application. For instructions on how to access this table, see *Find components installed with an application*.

Roles installed

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>

</tbody>
</table>
### Interaction configuration overview

Configure the behavior of an interaction by determining the routine behavior for each state that the interaction goes through during the life cycle.

### Interaction framework

Configure each of the following interaction components to determine the behavior and life cycle.

- Lists: Configure the interaction list view. You can also extend the interaction table.
- Forms: Configure the form view to tailor interactions for each application.

### Interaction states

States determine the behavior for interactions. For each state of the interaction life cycle, you determine which routine actions to perform. For example, the **On Created** state would have a script that creates an interaction and then adds the end user as the 'opened for'. The script then sends a message to the end user to let them know that the interaction has been opened.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New</td>
<td>An interaction is inserted into the interaction table</td>
</tr>
<tr>
<td>On Hold</td>
<td>The interaction is waiting for assignment</td>
</tr>
<tr>
<td>Work In Progress</td>
<td>An agent accepts an unassigned interaction</td>
</tr>
<tr>
<td>Closed Complete</td>
<td>The agent or consumer intentionally closes the interaction</td>
</tr>
<tr>
<td>Closed Abandoned</td>
<td>The interaction is closed because the consumer disconnects or is unresponsive</td>
</tr>
</tbody>
</table>

### Interaction context and channel metadata

Context and channel metadata are document ID fields included as part of interactions. Both types of records store information about the interaction.

#### Context

Context for an interaction tracks the information for an interaction, such as the initial question, asset tagging, or device location. Context records are stored on the interaction_json_blob table by default, however you can use any table to store a context record.
Channel metadata

Channel metadata contains the information needed to interact with the channel on which communication is happening on, for example, the chat or phone channels. Channel metadata can be free-form JSON or a reference to another record.

Create an interaction

Most interaction creation takes place in other applications, interactions are merely a method of controlling channels. However, if needed you can create an interaction from the Interaction application.

Role required: interaction_agent
1. Navigate to Interaction > All.
2. Click New.
3. In the Type field, enter the way the interaction began. For example, chat, phone, or walk-up.
4. In the Opened for field, type the name of the user starting the interaction.
5. Include any additional information in the short description and the work notes fields.

View any incidents opened by the same user by clicking the Use the Incidents by Same Caller related list.

Associate a record with an interaction

As an agent, you might need to create a record on another table to work on an interaction. You can associate the record with the interaction.

Role required: interaction_agent
1. Navigate to Interaction > Assigned to me.
2. Open the interaction you want to associate with another record.
3. In the form header, click Associate Record.
4. In the ID of related record field, click the search icon.
5. From the Document Table list, select the table you want to associate a record from.
6. From the Document field, click the search icon.
7. Select an existing record from the list, or click New to create a record.
8. Click OK.
9. Click Submit.

The associated record appears in the Related Tasks related list for the interaction.

Knowledge Management

The ServiceNow® Knowledge Management (KM) application enables the sharing of information in knowledge bases. These knowledge bases contain articles that provide users with information such as self-help, troubleshooting, and task resolution.

Knowledge Management has significantly changed with Knowledge v3, which is enabled by default for all instances starting with the Fuji release.

The Knowledge Management Service Portal enables users to access a portal view of knowledge bases and articles. It is available by default for new customers on the Madrid and later releases. If required, existing and upgrade customers can activate the Knowledge Management Service Portal plugin.

Knowledge Management supports processes for creating, categorizing, reviewing, and approving articles. Users can search and browse articles as well as provide feedback.
To support multiple groups, knowledge bases can be assigned to individual managers. Separate workflows can be used for publishing and retiring articles, and separate access controls can be used to control reading and contributing.

<tr>
<td>Plugin</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>Predictive Intelligence for Knowledge Management [com.snc.knowledge_ml]</td>
<td>Provides various Knowledge Management capabilities driven by machine-learning solutions. For example, capabilities such as similar articles and knowledge demand insights. Activation of this plugin on production instances may require a separate license. Contact ServiceNow for details.</td>
</tr>
<tr>
<td><strong>Note:</strong> When you install and activate the Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml), the Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml) is also activated.</td>
<td></td>
</tr>
<tr>
<td>Performance Analytics - Content Pack - Knowledge Management com.snc.pa.knowledge_v2</td>
<td>Enables the Performance Analytics content pack for the Analytics and Reporting Knowledge Management Solution. Activation of this plugin on production instances might require a separate Performance Analytics license. Contact ServiceNow for details.</td>
</tr>
<tr>
<td>Knowledge Management V3 com.snc.knowledge3</td>
<td>Enables support for Knowledge Management V3. Activate this plugin when you upgrade from Eureka or earlier versions.</td>
</tr>
<tr>
<td>I18N: Knowledge Management Internationalization Plugin v2 com.glideapp.knowledge.i18n2</td>
<td>Helps create and maintain translations of an article in various languages in a way that is easy to manage translations while authoring as well as viewing articles. Activating internationalization plugins for any of the available languages automatically activates this plugin.</td>
</tr>
<tr>
<td>Knowledge Document com.snc.knowledge_document</td>
<td>Adds knowledge-based functionalities to the Managed Documents plugin. You can create a knowledge article from a document or update a knowledge document to a newer revision.</td>
</tr>
<tr>
<td>Knowledge Management - External Content Integration com.snc.knowledge.external_integration</td>
<td>Adds external content search capabilities to the Knowledge Management application. Once configured, this feature creates a copy of the external content on ServiceNow as knowledge articles, and then indexes the articles through Zing Search. You must have appropriate reuse and copy privileges before you configure an external source to be searchable using this feature.</td>
</tr>
<tr>
<td>Knowledge Management Wiki Support com.glideapp.knowledge2.wiki</td>
<td>Enables support for wiki type Knowledge articles.</td>
</tr>
</tbody>
</table>

**Knowledge Management roles**

Certain roles are required to use Knowledge Management functionality.

**Knowledge Management roles**

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>knowledge</td>
<td>Users with the knowledge role can contribute to the default knowledge base and access the Knowledge application menu. The knowledge role is fulfiller role and not a requester role.</td>
</tr>
<tr>
<td>Role</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>knowledge_manager</td>
<td>Knowledge managers perform administrative functions for knowledge bases they manage such as defining categories, pinning important articles, and approving changes to articles. Users selected as managers of a knowledge base receive this role automatically.</td>
</tr>
<tr>
<td>knowledge_admin</td>
<td>Knowledge administrators can create new knowledge bases and manage all knowledge bases.</td>
</tr>
<tr>
<td>knowledge_coach</td>
<td>Knowledge coaches can perform AQI surveys on articles, write, edit and review knowledge articles, and coach the team on best practices.</td>
</tr>
<tr>
<td>knowledge_domain_expert</td>
<td>Knowledge domain experts perform AQI surveys on articles and can write, edit and review knowledge management articles. A knowledge domain expert keeps track on the health of knowledge base.</td>
</tr>
<tr>
<td>admin</td>
<td>Administrators can configure knowledge workflows, set knowledge properties, and manage knowledge forms and homepages.</td>
</tr>
<tr>
<td>knowledge_group_manager</td>
<td>Knowledge group managers can add or remove members in ownership groups managed by them. They cannot change the manager assigned in their groups. The manager can only be reassigned by the knowledge administrator. Knowledge group managers are assigned feedback tasks by default. They can reassign tasks to another group member, or group members can assign a feedback task to themselves.</td>
</tr>
<tr>
<td>knowledge_group_member</td>
<td>Knowledge group members are part of an ownership group that can be associated to knowledge articles. They can approve knowledge articles, assign feedback tasks to themselves and work on them as well as edit any knowledge articles that their ownership group is assigned to.</td>
</tr>
</tbody>
</table>

**Knowledge properties**

As an administrator, you can configure the look and functionality of many knowledge base features with knowledge properties.

You can access knowledge properties by navigating to Knowledge > Administration > Properties.

**Knowledge portal properties**

Knowledge portal properties control the look and functionality of the legacy portal page. This portal page lists recent knowledge articles and their publishing dates, organized by topic.
<table>
<thead>
<tr>
<th>Property</th>

</table>

**Knowledge search properties**

Knowledge search properties give you control over the search options available to users and the presentation of search results.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Knowledge search result order. (glide.knowman.order.search) | Select the order for displaying search results:  
- **Number of Views:** orders search results based on the Number of days used when summing article views property.  
- **Relevancy:** orders search results based on content that is similar to the search term.  
- **Last Modified:** orders search results based on modification date. 
This property is applicable for search within the Knowledge Management application and not the Now Platform global search. |
| Search method used when searching Knowledge from a task or directly in the Knowledge Base. (glide.knowman.search.operator) | Select the search approach to use when the search term includes multiple words:  
- **OR query:** returns articles that contain at least one word from the search term.  
- **AND then OR query:** first searches for articles that include all words in the search term (an AND query). If no matches are found, an OR query is performed. |
| Show author in knowledge search results. (glide.knowman.search.show_author) | Select this check box to include the author of each article in knowledge search results.  
If the article versioning feature is enabled, articles with a version number less than or equal to 1.0 display Authored by <name> and articles with a version number greater than 1.0 display Revised by <name>. |
<p>| Show last modified date and time in knowledge search results. (glide.knowman.search.show_last_modified) | Select this check box to include the date and time each article was last edited in knowledge search results. |
| Show publish date in knowledge search results. (glide.knowman.search.show_published) | Select this check box to include the date each article was published in knowledge search results. |</p>
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show category in knowledge search results. (glide.knowman.search.show_category)</td>
<td>Select this check box to include the category breadcrumbs of each article in knowledge search results.</td>
</tr>
<tr>
<td>Show number of views in knowledge search results. (glide.knowman.search.show_view_count)</td>
<td>Select this check box to include the number of times each article was viewed in knowledge search results.</td>
</tr>
</tbody>
</table>
| How to display attachments in Knowledge Search Results. (glide.knowman.search.attachment) | Select the behavior of how the attachments are shown in the search results:  
  • **Do not show attachment**  
  • **Show only link for attachment**  
  • **Show attachment with text snippet** (default)  
  
  For best performance, select **Do not show attachment**, or **Show only link for attachment**. |
| Show relevancy in knowledge search results. (glide.knowman.search.show_relevancy) | Select this check box to show how relevant each search result is based on the search string.  
  **Relevancy** value is only shown when knowledge search result order property is set to **Relevancy**. |
| Show number of knowledge blocks in the knowledge block search results when creating or updating a knowledge article. Maximum results displayed will be 25. (glide.knowman.add_blocks.search_results) | Define how many search results can be displayed when a knowledge block is searched for. By default, the minimum value is 6 and the maximum is 25. |
| Enable instant search results for knowledge. (glide.knowman.search.instant_results) | Select this check box to enable instant search for search results. The default is **No**. |
| Show Knowledge Base name in Knowledge search results. (glide.knowman.search.show_knowledgebase) | Select this check box to display the knowledge base to which the knowledge base article belongs. For example, **IT**. |
| Show average rating from knowledge search results. (glide.knowman.search.show_rating) | Select this check box to display the average star ratings for knowledge base articles.  
  This property is applicable to the search results for knowledge articles that appear on the Knowledge Management Service Portal search results page and service portal widgets such as Knowledge Featured Articles and Knowledge Most Viewed Articles. For more information, see [Knowledge Management Service Portal search results page features](#) and [Configure the home page widget instance options](#). |
| Show article number in knowledge search results. (glide.knowman.search.show_article_number) | Select this check box to display the article number for each article in the search result.  
  If the article versioning feature is enabled, the article number and the version number are displayed for each article in the search result. |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Specify default language for searching articles. (glide.knowman.search.default_language) | Set the property to the desired default language for searching articles.  
  - **String**  
  - **Default value:** user-specified  
  - **Location:** System Properties  
  
  **Note:** If the glide.knowman.enable_multi_language_search property is set to **True**, then the multi-language search capability overrides the default language search capability.  
|
| Enable multi-language search. (glide.knowman.enable_multi_language_search) | Set the property to **True** to enable search for multiple languages simultaneously.  
  - **Type:** true | false  
  - **Default value:** false  
  - **Location:** System Properties  
  
  **Note:** If this property is set to **True**, it overrides the setting for the glide.knowman.search.default_language property.  
|
| Maximum character limit for meta description used for SEO. (glide.knowman.seo.pages.meta_description.length) | Set the maximum number of characters used as meta description for SEO.  
  - **Type:** integer  
  - **Default value:** 100  
  - **Location:** System Properties  
  
  When you change the character limit, the meta description with the updated limit is only applied to articles published after the change was made. To apply the change to all existing published articles, run the **Populate Meta Description on KB Articles** fix script.  
|

**Knowledge article view properties**

Article view properties give you control over the meta data and rating options that appear with articles. They also enable you to grant access to individual feedback options based on user role.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show tasks to which an article has been recently attached. (glide.knowman.recent_tasks.display)</td>
<td>Select the Yes check box to have article view include a list of tasks associated with the article. The list of associated tasks appears on the Most Recent Tasks widget on the article view page. The widget appears only when a task is attached to the article and this property is set to Yes. Knowledge articles can be attached to a task by clicking the Attach to Task button after searching from a form.</td>
</tr>
<tr>
<td>Number of attached tasks to display when viewing an article. (glide.knowman.recent_tasks)</td>
<td>Specify the maximum number of tasks to list in article view.</td>
</tr>
<tr>
<td>Show article rating section, which may optionally include yes/no rating, star rating, and flagging options. (glide.knowman.show_rating_options)</td>
<td>Select the Yes check box to display the rating options for users with specific roles. Clear this check box to omit the rating section for all users, regardless of role. The Feedback field is always displayed for all users.</td>
</tr>
<tr>
<td>List of roles (comma separated) that can see an article's rating section, which may optionally include yes/no rating, star rating, and flagging option. (glide.knowman.show_rating_options.roles)</td>
<td>Enter role names exactly as they appear in User Administration &gt; Roles. If Show article rating section... is selected, users with the roles listed here see the yes/no rating, star rating, and flagging options, according to related property settings. Be sure to include all roles that should be permitted to see any of these rating options. Separate properties enable you to identify specific roles for each option separately. All roles in those properties must also be listed here.</td>
</tr>
<tr>
<td>Show the &quot;Was this article helpful?&quot; yes/no rating option. (glide.knowman.show_yn_rating)</td>
<td>Select the Yes check box to display the &quot;Was this article helpful?&quot; rating to users with roles set in the associated property. This appears only if the Show article rating section... property is selected.</td>
</tr>
<tr>
<td>List of roles (comma separated) that can see yes/no &quot;Was this article helpful?&quot; rating option. (glide.knowman.show_yn_rating.roles)</td>
<td>Enter role names exactly as they appear in User Administration &gt; Roles. If both Show article rating section... and Show the &quot;Was this article helpful?&quot; properties are selected, users with the roles listed here see the &quot;Was this article helpful?&quot; rating in article view. All roles listed here must also be listed in the List of roles that can see an article's rating section... property.</td>

<td>Enter a title for the Featured Content section of the knowledge homepage.</td>
</tr>
<tr>
<td>(glide.knowman.default_pinned_section_header_title)</td>
<td></td>
</tr>
</tbody>
</table>

### Other knowledge properties

Other knowledge properties let you control general knowledge management features.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When attaching an article to an incident, copy the content into this field.</td>
<td>When a user searches knowledge from a task form (such as an incident, problem, or change) and clicks the <strong>Attach to Task</strong> button for an article, the system copies the article number and content into the field specified in the <strong>Value</strong> column here. This field is generally a journal field such as <strong>Comments</strong> or <strong>Work notes</strong>. Use dot walking to copy the article content into related records. If a specified field does not exist, that field is ignored. If the property has no value, comments is used.</td>
</tr>
<tr>
<td>(glide.knowman.attach.fields)</td>
<td></td>
</tr>
<tr>
<td>Displays a read-only article view page when articles are viewed from contextual search</td>
<td>Displays a read-only article view page when knowledge articles are viewed from contextual search.</td>
</tr>
<tr>
<td>(glide.knowman.contextual_search.show_read_only_article)</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** The **glide.knowman.contextual_search.show_read_only_article** property is activated by default. If the property isn’t available, add it manually and set its value to **true** to display read-only knowledge articles accessed from the contextual search. For more information, see [Add a system property](#).
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Management logo to display if running out of the ServiceNow frames. (glide.knowman.frameless_logo)</td>
<td>Click the reference lookup tool and choose an image file to be displayed on knowledge pages that are used outside of the ServiceNow application frames. For example, the logo image selected here appears if you create a Content Management System site that includes knowledge pages. You can also enter the <strong>Name</strong> of an image stored in the database to use that image. <strong>Note:</strong> This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
</tr>
<tr>
<td>Hide the 'Import' functionality (button and drag-n-drop) for all users. (glide.knowman.import.hide_import_functionality)</td>
<td>Select <strong>Yes</strong> to hide the <strong>Import Articles</strong> button. If you have not yet migrated to Knowledge v3 and are using legacy Knowledge v2, you can configure the visibility of the <strong>Import Articles</strong> button to prevent users from importing articles to knowledge bases.</td>
</tr>
<tr>
<td>Show publish check box on the knowledge import pop-up. (glide.knowman.import.show_publish_checkbox)</td>
<td>Select <strong>No</strong> to remove the <strong>Publish</strong> check box on the knowledge import form so that an article cannot be published as part of the import process. Default is <strong>yes</strong>.</td>
</tr>
<tr>
<td>Use submission workflow. (glide.knowman.submission.workflow)</td>
<td>Select the <strong>Yes</strong> check box to use the knowledge submission workflow instead of the standard knowledge workflow. If this option is selected, each time a user creates knowledge from an incident or problem, the content is placed into a submission record instead of a draft article. Transforming knowledge submissions into articles follows a specific workflow.</td>
</tr>
<tr>
<td>Disable creating or updating articles larger than server size limit. (glide.knowman.check_article_size)</td>
<td>Select <strong>Yes</strong> to disable creating or updating knowledge articles with content more than server limit of the Now Platform. By default, the server limit is 1 MB. Therefore, you can’t create or edit knowledge articles with content more than 1 MB. The limit doesn’t apply to the attachments of a knowledge article. This property is enabled by default. If you disable the property, you might be able to create articles up to 2 MB. However, you can’t perform any UI actions such as submit, check out, update, and publish. <strong>Note:</strong> This property only applies to the Now Platform because of the server limitation.</td>
</tr>
<tr>
<td>The sys_id of the knowledge base when creating knowledge from task records. (glide.knowman.task_kb)</td>
<td>Enter the sys_id of the knowledge base to put new knowledge articles created from tasks in.</td>
</tr>
<tr>
<td>Before displaying the text of the article in search results or the article view, check field-level ACLs on appropriate field: kb_knowledge.text (HTML article) or kb_knowledge.wiki (wiki text article). (glide.knowman.text.check_can_read)</td>
<td>Select this check box if users must have ACL-based permission to view text fields on the Knowledge [kb_knowledge] table to read article previews in knowledge search results.</td>
</tr>
<tr>

### Knowledge Social Q&A properties

You can set the limit for the number of times users can ask, answer, or subscribe to Social Q&A questions, or comment on the questions and answers using the Social Q&A system properties.

**Note:** To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

**Note:** If the Value field for the any of the Social Q&A properties is left blank, then a rate limit does not apply for that particular property.

• **Other possible values:** application/xml, video/mp4, audio/mpeg |
| `sn_km_intg.glide.knowman.external.allow_content_types`                 |                                                                             |
| List of content types not allowed to be processed from the source system. | • **Type:** comma separated values  
• **Default value:** application/octet-stream,application/x-apple-diskimage,application/vnd.microsoft.portable-executable |
| **Note:** This property is read-only and takes precedence over allowed content types. |                                                                             |
| `sn_km_intg.glide.knowman.external.reject_content_types`                |                                                                             |
| UI Label for indicating external articles in Search Results and Article View Pages. | • **Type:** string  
• **Default value:** External Content |
| `sn_km_intg.glide.knowman.external.ui_label_for_external_content`      |                                                                             |

## Actionable Knowledge Feedback Properties

The Knowledge administrator can set configuration properties that would create actionable feedback tasks.
### Properties for Actionable Knowledge Feedback

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create actionable feedback task when an article is flagged.</td>
<td>Select the Yes check box to enable actionable feedback task generation when an article is flagged for incorrect or inappropriate content. Type: true</td>
</tr>
<tr>
<td>Create actionable feedback task when an article is marked as not helpful.</td>
<td>Select the Yes check box to enable actionable feedback task generation when an article is marked as not helpful. Type: true</td>
</tr>
<tr>
<td>Create actionable feedback task when an article is rated at or lower than this value. 0 or no value indicates that actionable feedback tasks are not enabled for Rating type feedback.</td>
<td>An actionable feedback task is created when an article is rated at or lower than this value. The article is rated on a scale of 1-5. Type: integer Default value: none Location: Knowledge &gt; Administration &gt; Properties</td>
</tr>
</tbody>
</table>

### Scoped knowledge bases

To protect knowledge bases containing sensitive articles, use a scoped knowledge base. Even system administrators and knowledge administrators can't administer scoped knowledge bases unless explicitly authorized through user criteria.

For example, say you have a knowledge article with sensitive payroll information that should be seen only by the Payroll department and not by a system administrator or knowledge administrator. You could create a knowledge article with the sensitive information in a scoped knowledge base within the Human Resources: Core application.

Only users with the admin role of an application and the knowledge_admin role can administer a scoped knowledge base. You control access to knowledge bases of an application with application administration enabled, such as HR, through the ACLs of the knowledge tables in the application instead of global ACLs. To define access to a scoped knowledge base, specify appropriate user criteria for users, including system administrators and knowledge administrators.

You can't modify the scope of existing knowledge bases. They remain in the global scope. However, you can create a scoped knowledge base to protect sensitive knowledge articles.

To create a scoped knowledge base for an application, in addition to the knowledge_admin or admin role, you must have access to view and select that application in the application picker (see Application picker). For example, before you create a knowledge base in the Human Resources: Core application, you must select the Human Resources: Core application in the application picker, and then create the knowledge base. Then, when you create a knowledge base, on the Knowledge base form, the application scope of the knowledge base is set in the Application field.
Knowledge Management setup guide for admins

Before users in your organization can start creating knowledge bases and knowledge articles, you must set up Knowledge Management. Work with stakeholders to define requirements for setting up Knowledge Management effectively to meet the needs of users.

Requirements

Role required: admin

Before you begin

Meet with the stakeholders

<table>
<thead>
<tr>
<th>Stakeholder</th>
<th>Responsibilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge manager</td>
<td>Defines and oversees the knowledge management processes for day-to-day operations related to content publishing and usage.</td>
</tr>
<tr>
<td>Knowledge admin</td>
<td>Configures advanced settings for specific Knowledge Management features</td>
</tr>
<tr>
<td>Knowledge coach</td>
<td>Enables users to adhere to content standards.</td>
</tr>
<tr>
<td>Knowledge domain expert</td>
<td>Provides domain knowledge expertise.</td>
</tr>
<tr>
<td>Version author</td>
<td>Contributor to a particular version of an article.</td>
</tr>
<tr>
<td>Content creators and reviewers</td>
<td>Create, review, and update articles in the knowledge bases.</td>
</tr>
<tr>
<td>Community managers</td>
<td>Focus on the creation and curating of social content.</td>
</tr>
<tr>
<td>Line managers</td>
<td>Manage teams that create and use knowledge articles</td>
</tr>
</tbody>
</table>

With stakeholders, determine the following requirements

- Who are the consumers of the content in the knowledge bases?
- Who are the writers, editors, and managers for the knowledge base articles?
- What are the required workflows to publish and retire articles?
- What are the unique behaviors required for your knowledge management implementation? For example, should attachments appear in search results?
- Do you want to translate knowledge articles into other languages?

What to do

Assign knowledge roles to users and groups

Determine which Knowledge Management roles are appropriate for each user, and then assign those roles.

Create custom Knowledge workflows

If the default knowledge workflows for publishing and retiring knowledge articles are not appropriate for your knowledge bases, create custom workflows for those knowledge bases.
Configure Knowledge properties

If the default knowledge properties do not fulfill the requirements of users, reconfigure the properties as necessary.

Activate support for other languages besides English

If languages other than English must be supported, activate the Knowledge Management Internationalization plugins.

Coordinate with knowledge managers for knowledge base setup

Let knowledge managers and administrators know that they can start configuring their knowledge bases. For details, refer them to the Knowledge base setup guide for knowledge admins and managers.

Next steps

Depending on any other requirements for the knowledge bases, you may be asked to help with additional tasks, such as configuring knowledge homepages.

Using guided setup to implement Knowledge Management

Knowledge Management guided setup provides a sequence of tasks that help you configure Knowledge Management on your instance. To open Knowledge Management guided setup, navigate to Knowledge Management > Administration > Guided Setup.

For more information about using the guided setup interface, see Using guided setup.

Domain separation and Knowledge Management

This is an overview of domain separation and Knowledge Management. With domain separation you can separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes Basic level support.
- Business logic: Processes can be created or modified per customer by the service provider (SP). The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The owner of the instance needs to be able to configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Use case: An admin needs to be able to make comments mandatory when a record closes for one tenant, but not for another.

Overview

Domain separation works differently at different access levels of an application. In Knowledge Management, data, requester, and fulfiller access to knowledge bases are domain-separated.

How domain separation works in Knowledge Management

In Knowledge Management, the following rules apply:
Data: At the data level of domain separation, data visibility is separated from one domain to another. Knowledge bases, user criteria, articles, categories, article feedback, article versions, article templates, and external sources are domain-separated in the base system.

**Note:** The data in one domain cannot be seen in any other domain. For example, if you create a Knowledge Management article in Domain A using an article template from Domain B, the article is not visible in Domain A. Similarly, if you create a Knowledge Management article in the global domain using a template that is not in global, the article might not be visible in all the domains.

Requester: Requester activities are supported within tenant domains. Users can search; view; comment; and rate articles of their domain, any child domain, and global domains, if feedback is enabled and the knowledge base settings grant them read-access to articles.

- Users in the global domain can access articles in all the domains if read-access is granted at the knowledge base or article level.
- Users in the parent domain can access articles in that domain, global, and all its child domains if read-access is granted at the knowledge base or article level.
- Users in the child domain can access articles in that domain and the global domain if read-access is granted at the knowledge base or article level.

Fulfiller: The application can be used by the Fulfiller within the tenant domains as a tenant domain-owned application. Users are allowed to author articles in knowledge bases of their domain, any child domain, and the global domain if the knowledge base has user criteria set up to grant contribute access.

- Articles are automatically saved to the user’s current domain when the article is created.
- If the `glide.knowman.allow_edit_global_articles` system property is enabled, users from a domain other than the global domain can check out and edit global articles. Otherwise, system administrators and users from a domain other than the global domain cannot check out global articles and are shown a warning message to that effect. Depending on their access, users can change their domain to the global domain to check out and edit the global articles.
- Domains of versioned articles are maintained as per the latest article version's domain. This includes updating the domain for `kb_version`, `kb_knowledge`, `kb_feedback`, and `sys_attachment` tables.
- If domains contain another domain: If domain A contains domain B, users with access to Domain A can author articles in Domain B by toggling the domain scope. To learn more about toggling domain scope, see Visibility and Contains domains.

See Managing access to knowledge bases and knowledge articles to learn how to control contribute and read access to knowledge bases and knowledge articles.

Use cases

This image demonstrates a basic domain hierarchy that is available in the base system.

**Known Issues**

- The following AQI tables are not domain separated:
  - AQI Checklist [kb_quality_checklist]
  - Checklist Question [kb_checklist_question]
  - Article Checklist Answer [kb_article_checklist_answer]

  **Note:** The Article Checklist Answer table does not contain the Order field. The application shows the list in a random order.

- Comment provided by a user on an article is stored in article's domain instead of user domain.

**Knowledge base setup guide for knowledge admins and managers**

After basic Knowledge Management setup is completed, you can set up a knowledge base for users to create and publish knowledge articles.

Create multiple knowledge bases for different groups within your organization to share information within and between those groups. Create scoped knowledge bases to enable only application administrators to administer the knowledge bases and restrict unauthorized access to application-specific data.
Administrators create knowledge bases, and assign them to individual managers responsible for controlling the behavior and organization scheme of each knowledge base.

Each knowledge base contains knowledge articles that provide information for users, such as policy, release notes, or instructions for a task. Each knowledge base can also use a separate workflow for publishing and retiring articles.

Requirements

Role required: knowledge_administrator, knowledge_manager, or admin

Before you begin

Determine the following requirements for each knowledge base that you want to set up:

- Whether to create a scoped knowledge base? For more information, see Scoped knowledge bases.
- Who are the knowledge base managers that are responsible for approving articles?
- Who are the users and contributors for that knowledge base? Access for these users is defined through user criteria.
- What are the categories to be used to classify articles? Will users be able to create categories?
- Will users of the knowledge base be able to create new content?
- Will Social Q&A be leveraged for this knowledge base?

What to do

Set up the knowledge base

1. Create the knowledge base.
2. Set up which users can read, create, or edit knowledge articles by selecting user criteria for the knowledge base.
3. Define the approval process for articles using workflows.
4. Define the knowledge categories that are needed for organizing articles in the knowledge base.
5. If you want to enable users to ask and answer questions in the knowledge base, activate Social Q&A.
6. If you want a custom knowledge homepage, ask your ServiceNow administrator to create it.

Next steps

Let users in your organization know that they can start creating and searching articles in the knowledge base. For details, refer users to the Knowledge Management guide for users.

If you have the knowledge_manager role, there are many other tasks that you can perform to maintain the knowledge base. You can pin articles so they are featured prominently in the search results and on homepages. You can also assign other users as managers of a knowledge base. For details, see Knowledge manager.

Quick start tests for Knowledge Management

Validate that Knowledge Management still works after you make any configuration change, such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.
Knowledge Management quick start tests require activating the Knowledge Management Core plugin (com.glideapp.knowledge), the Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer), the Knowledge Blocks plugin (com.snc.knowledge_blocks), and the Customer Service Management Demo Data plugin (com.snc.customerservice.demo).

### Configure Knowledge Management

Configure various aspects of Knowledge Management based on the specific requirements of your organization.

The following podcast offers additional information on using Knowledge Management.

You can also use Knowledge Management capabilities within a website built on Adobe Experience Manager (AEM). For more information, see [Integration with Adobe Experience Manager](#).

## Create a knowledge base

Create a knowledge base to provide a self-service platform for users to store, share, and manage content. Configure knowledge bases into product or service categories and manage user access based on permissions. Customize workflows for publishing and retiring articles in the knowledge base.

Understand the *requirements* for setting up a knowledge base.
Role required: knowledge_admin or admin

1. Navigate to Knowledge > Administration > Knowledge bases.
2. In the Knowledge Bases list, click New.
3. On the Knowledge base form, fill in the following fields as appropriate:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Unique name for the knowledge base.</td>
</tr>
<tr>
<td>Article Validity</td>
<td>Number of default days articles will be valid for after their created date.</td>
</tr>
</tbody>
</table>
|                        | ![Note: The Article Validity field is configured to set the Valid to date for an article. The Valid to date is the date this knowledge article expires. When you create an article within a knowledge base, the date value in the Valid to field of the article is calculated as follows: Created (sys_created_on) + Article Validity (in days). An article author or editor can select whether to keep or change the Valid to date (see Create a knowledge article). If the Article Validity field is blank, the date in the Valid to field date is set to January 1, 2100.](image)
<p>| Icon                   | An image that provides a visual reference to describe the knowledge base. This image is displayed next to all articles from this knowledge base in the article search results page. |
| Disable commenting     | Option to disable commenting. If selected, users cannot comment on articles in the knowledge base. |
| Disable suggesting     | Option to disable edit suggestions. If selected, users cannot suggest edits to articles in the knowledge base. |
| Disable category editing| Option to disable editing of knowledge categories. If selected, only knowledge managers can add or edit knowledge categories for the knowledge base. |
| Enable blocks          | Option to enable the knowledge blocks feature. If selected, you can create knowledge blocks to add to knowledge articles within a knowledge base. |
| Checklist              | Checklist to evaluate the quality of articles in the knowledge base.          |
| Application            | Application scope of the knowledge base.                                    |
|                        | <img src="image" alt="Note: This field is automatically set to the application selected in the application picker. For information about a scoped knowledge base, see Scoped knowledge bases." /> |
| Owner                  | The user responsible for the knowledge base. A knowledge base owner can assign other roles to the knowledge base. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Managers</td>
<td>Users who perform administrative functions on the knowledge base.</td>
</tr>
<tr>
<td>Publish workflow</td>
<td>The workflow for publishing the articles in the knowledge base.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Knowledge - Instant Publish</strong>: publishes articles in the knowledge base without requiring an approval.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Knowledge - Approval Publish</strong>: requests approval from the manager of the knowledge base before moving the articles to the published state.</td>
</tr>
<tr>
<td>Retire workflow</td>
<td>The workflow for retiring the articles in the knowledge base.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Knowledge - Instant Retire</strong>: retires articles in the knowledge base without requiring an approval.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Knowledge - Approval Retire</strong>: requests approval from the manager of the knowledge base before moving the articles to the retired state.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to indicate that the knowledge base is active. If not selected, only users with the admin role can create or view its articles.</td>
</tr>
<tr>
<td>Enable social questions and answers</td>
<td>Option to enable social Q&amp;A for articles in the knowledge base.</td>

<tr>
<td></td>
<td>create and modify articles in a knowledge base.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> It is recommended to assign appropriate user criteria to secure contribute access.</td>
</tr>
<tr>
<td></td>
<td>See, <em>Select user criteria for a knowledge base</em>.</td>
</tr>
<tr>
<td>Article Templates</td>
<td>If you have activated the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin, the</td>
</tr>
<tr>
<td></td>
<td><strong>Article Templates</strong> related list is displayed.</td>
</tr>
<tr>
<td></td>
<td>If there are article templates in the related list, articles in that knowledge base can only</td>
</tr>
<tr>
<td></td>
<td>be created using one of the article templates listed.</td>
</tr>
<tr>
<td></td>
<td>If the <strong>Article Templates</strong> related list is empty, articles can be created using any article</td>
</tr>
<tr>
<td></td>
<td>template.</td>
</tr>
<tr>
<td></td>
<td>Click <strong>Edit</strong> to map article templates to the knowledge base.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Admins, knowledge admins, and knowledge managers can edit the article templates for</td>
</tr>
<tr>
<td></td>
<td>the knowledge base.</td>
</tr>
<tr>
<td>Featured Content</td>
<td>List of knowledge articles that appear in the homepage <strong>Featured Content</strong> section based on</td>
</tr>
<tr>
<td></td>
<td>the corresponding keyword search set for each article.</td>
</tr>
<tr>
<td>Knowledge Categories</td>
<td>List of knowledge categories associated with this knowledge base.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

**Create a custom knowledge homepage**

As a system administrator, you can create a module allowing users to open a knowledge homepage for a specific knowledge base or category.
Role required: admin

1. In the application navigator, point to the application name and click the edit application icon.
2. In the Modules related list click New.
3. Enter a Title for the module.
4. In the Link type field, select URL (from Arguments).
5. In the Arguments field, append one or more of the following values to $knowledge.do#/search?.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_kb=&lt;knowledge base sys_id&gt;</td>
<td>Enter the sys_id of a knowledge base to show knowledge articles from that knowledge base by default. If the specified knowledge base does not exist, the default knowledge homepage appears when accessing the custom homepage module.</td>
</tr>
<tr>
<td>sysparm_category=&lt;knowledge category sys_id&gt;</td>
<td>Enter the sys_id of a knowledge category to show knowledge articles from that category by default. If the specified category does not exist, the default category for the selected knowledge base appears when accessing the custom homepage module.</td>
</tr>
<tr>
<td>sysparm_order=&lt;view_count, last_modified, or relevancy&gt;</td>
<td>Enter the default sort order for articles to appear in.</td>
</tr>
</tbody>
</table>

To create a homepage for a Facilities knowledge base with a sys_id of d582764047022100158b949b6c9a7145 and sorting by last modified date, enter $knowledge.do#/search? sysparm_kb=d582764047022100158b949b6c9a7145&sysparm_order=last_modified in the Arguments field on the Module form.

**Knowledge workflows**

The publishing and retirement processes for a knowledge article are controlled by workflows defined for the knowledge base that the article belongs to.

You can assign different workflows to each knowledge base.

You can use one of the default workflows, or create your own workflows to define custom publishing and retirement processes for different types of knowledge.

For the workflows that require approval, you can configure which users can approve or reject by editing the getApprovers() function in the KBWorkflow script include.
### Default knowledge workflows

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge - Approval Publish</td>
<td>Requests approval from a manager of the knowledge base. Articles in approval are <strong>In Review</strong> state before moving to <strong>Published</strong> state once approved or to <strong>Scheduled for publish</strong> if set to publish later. If the manager rejects the request, the workflow is canceled and the article remains in <strong>Draft</strong> state. If ownership groups is enabled, email notifications with a link to the article are sent to the ownership group members for approval. If ownership groups is not enabled, email notifications with a link to the article are sent to knowledge base managers for approval. A notification is also sent to authors or revisers of articles to inform them that their article has been approved or rejected. To turn on approval email notifications, set the <code>glide.knowman.enable_approval_notification</code> property to <code>true</code>.</td>
</tr>
<tr>
<td>Knowledge - Approval Retire</td>
<td>Requests approval from a manager of the knowledge base before moving the article to the retired state. The workflow is canceled and the article remains in the published state if any manager rejects the request.</td>
</tr>
<tr>
<td>Knowledge - Instant Publish</td>
<td>Immediately publishes a draft article without requiring an approval, or publishes on the scheduled publish date if set to publish later.</td>
</tr>
<tr>
<td>Knowledge - Instant Retire</td>
<td>Immediately retires a published article without requiring an approval.</td>
</tr>
<tr>
<td>Knowledge - Publish Knowledge</td>
<td>A subflow that moves the knowledge article to the published state. You can use this subflow when defining your own workflow.</td>
</tr>
<tr>
<td>Knowledge - Retire Knowledge</td>
<td>A subflow that moves the knowledge article to the retired state. You can use this subflow when defining your own workflow.</td>
</tr>
</tbody>
</table>

**Note:**
- Retired knowledge articles are not available to users except for administrators and knowledge administrators who can view them. To reuse a retired article, administrators and knowledge administrators can republish the article. For more information, see [Republish a retired article](#).
- An article and its translations have a parent-child relationship. Retiring a parent article does not automatically retire all its translated child articles.

### Email notifications for approval workflows

You can send email notifications for approval workflows.
• Notify approvers about knowledge articles submitted for their approvals.
• Notify authors about the approval status of their knowledge articles.

To send email notifications for approval workflows, enable the **Send notification to approvers and authors in article approval workflow** property (**glide.knowman.enable_approval_notification**). Beginning with New York, the property is enabled by default. Existing customers on release versions prior to New York can enable this property to send email notifications. Disable any custom notifications for article approvals before enabling this property. If the **glide.knowman.enable_approval_notification** property is not available, an administrator can create the property and set its value to **true**. For more information, see **Knowledge properties**.

**Activate the Knowledge Management Advanced plugin**

Activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) to enable advanced features for Knowledge Management.

Role required: admin

The Knowledge Management Advanced plugin includes feature code and demo data.

The Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer) is used to activate the Knowledge Management Advanced plugin.

**Note:** The Knowledge Management Advanced plugin is not automatically activated with the Knowledge Management v3 application.

The Knowledge Management Advanced Installer plugin performs two validation steps prior to activation.

• Determines if there are any active Knowledge Management v2 knowledge bases.
• Determines if there is a unique database index on the **Number** field. If a unique constraint has been added to the **Number** field, the plugin activation fails. Follow the instructions listed in **KB0634959** to perform corrective steps to resolve the issue.

You need access to **HI** to be able to view KB articles.

The Knowledge Management Advanced plugin activates the following features:

• **Article versioning:** Enables maintaining multiple versions of a knowledge article. For more information, see **Article versioning**.

  **Note:** Migrate to Knowledge Management v3 completely to use article versioning.

• **Article subscriptions:** Enables managing knowledge base and knowledge article subscriptions. For more information, see **Knowledge subscriptions**.

  **Note:** The Knowledge Management Advanced plugin activates the Subscriptions and Activity Feed Framework plugin (com.snc.activity_subscriptions).

• **Article quality index:** Enables maintaining consistent quality of knowledge articles within a knowledge base where articles are written by various authors. For more information, see **Article quality index for knowledge management**.

• **Article templates:** Enables creating article templates for consistent structure of knowledge articles. For more information, see **Knowledge article templates**.

• **Ownership group:** Enables creating ownership groups for knowledge articles. For more information, see **Ownership groups**.

• **In-context article creation:** Enables creating a knowledge article from a customer service case. For more information, see **Enable creating an article from a customer service case**.
• Translation management: Enables managing translation tasks created for published knowledge articles. For more information, see Translation management.

Demo data is included as part of the Knowledge Management Advanced plugin. If the validation step performed by the Knowledge Management Advanced Installer plugin completes successfully, the Knowledge Management Advanced plugin is activated automatically. However, the demo data is not included in this activation. To load the demo data, go to the Knowledge Management Advanced plugin page, click the Load Demo Data Only related link, and then click OK.

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise they will receive the following error: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Knowledge article templates

Article templates have pre-defined fields structured in a specific order. These templates help create a consistent structure for knowledge articles.

Using the Knowledge Article Templates feature, as a knowledge administrator (a user with knowledge_admin role), you can create article templates, add or customize fields in a template, and activate or deactivate a template.

As a security administrator (a user with security_admin role), you can configure field-level security in any template to make it visible to specific users.

As an author, you can create articles using pre-defined article templates or any newly created article templates.

Pre-defined knowledge article templates

Use either the standard template or one of the pre-defined How To, What Is, FAQ or KCS article templates.

Note:
When you upgrade Knowledge Management to Kingston or later releases, all the existing articles from the earlier version automatically use the standard template of the upgraded version. For example, if you upgrade Knowledge Management from Jakarta to Kingston, all existing articles use the standard template available in the Kingston version.

All pre-defined templates are inactive by default. If you do not activate a template, the articles automatically use the standard template. As a knowledge admin, you can activate a template by navigating to Knowledge > Administration > Article Templates. Then in the article template list, set the Active field to true for one or more templates you would like to activate.

The table below lists the fields available in each template and the name of the template table.
Pre-defined knowledge article templates

<table>
<thead>
<tr>
<th>Template name</th>

Activating knowledge article templates

The Knowledge Article Templates feature is activated with the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin. For details, see *Activate the Knowledge Management Advanced plugin*.

Deactivating knowledge article templates

You cannot delete an article template because article templates have an associated child table. Deleting a template would also require deleting the child table. Due to the limitations on dropping tables, article templates and template columns are explicitly made non-deletable. Instead, you can disable the Knowledge Article Templates feature by clearing the **Active** check box on the Article Template form.

**Note:** The Standard template is available by default and can’t be made inactive.

Create an article template and use it to create a knowledge article

Create new article templates in addition to the pre-defined templates. Add new fields based on how you want to customize and display your content.

Role required: knowledge_admin or admin

For each new article template, a child table of the Knowledge [kb_knowledge] table is created. When you add a new field to the template, a new column is added to that table created for the template.

1. Navigate to **Knowledge > Administration > Article Templates**, and click **New**.
2. On the Article Template form, fill in fields.

**Article Template form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the article template.</td>
</tr>
</tbody>
</table>
The **Active** check box is selected by default making the template available for use.

3. Right-click the form header and click **Save**.

4. In the Article Templates Field related list, add fields to the template.
   
a) **Click New**.

   b) On the Article Template Field form, fill in the fields.

---

</thead>
<tbody>
<tr>
<td>Field style</td>
<td>CSS formats applied to the template fields. Any CSS format applied at the field level is automatically applied to the header if not already specified in the Heading style field. For example, to display the 300px page width, 25px solid green border, 25px padding, and 25px page margin, enter the following code: width:300px; border:25px solid green; padding:25px; margin:25px;</td>
</tr>
</tbody>
</table>

c) Click **Submit**.

The field is added to the template.

5. Optional: In the **SEO Description Tag** field, search for and add article template field name. The content in this field is used as meta description tags to search for articles created using this article template.

6. Configure the Knowledge form to display the fields that you added to the template.

Note: You must have the admin role to configure the form layout. If the field is not available in the form layout, use the form designer to configure the fields.

a) Navigate to **Knowledge > Articles > Create New**.

b) Select a knowledge base, and then the newly added article template.

c) Right-click the header and select **Configure > Form Layout**.

d) Select and move the fields you added to the article template from the **Available** column to the **Selected** column.

e) Click the up or down icon to arrange the fields in the order in which you want them to appear in the Knowledge form.

f) Click **Save**.

Note: Authors who started a session before a template was created or activated will see the newly added template upon their next login.

If you want to search for duplicate articles when creating an article from a new template, you must configure the article template table for contextual search. On the Table Configuration form, the **Search context** field must be set to **Knowledge ML Search**. For more information, see **Configure table for a contextual search**.

**Restrict access to fields in an article template**

Use encryption context to set field-level security in article templates and display the fields based on role permissions.

Activate the **Encryption Support plugin** to enable field-level security using an encryption context.

Role required: security_admin

1. Create an encryption context for the article template field to be encrypted.
   a) Navigate to **System Security > Field Encryption > Encryption Contexts** and click **New**.
   b) On the Encryption Context form, fill in the fields.
### Encryption Context form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the encryption context.</td>
</tr>
</tbody>
</table>
| Encryption key| Key used to encrypt the data. Leave blank to generate a key randomly. Based on the desired type of encryption, enter the exact number of characters:  
  • 16 characters for AES 128-bit  
  • 32 characters for AES 256-bit |

**Warning:** You cannot retrieve this key from the instance. If you need access to the key, save it elsewhere before clicking Submit.

<table>
<thead>
<tr>
<th>Application</th>
<th>Defaults to Global and cannot be changed.</th>
</tr>
</thead>
</table>
| Type          | Type of encryption used to encrypt your data:  
  • AES 128-bit: Advanced Encryption Standard  
  • AES 256-bit: Advanced Encryption Standard using 256-bit encryption |

2. Associate the article template field with the encryption context.
   b) On the Encrypted Field Configuration form, fill in the fields.

### Encrypted Field Configuration form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table associated with the article template fields. For example, for the How to article template fields, select How To [kb_template_how_to].</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Column</td>
<td>Article template field to be encrypted. Only String, Date, Date/Time, and URL fields are supported.</td>
</tr>
<tr>
<td></td>
<td>• <strong>String and URL fields:</strong> You can add a new encryption configuration to either a parent table or a child table.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Date and Date/Time fields:</strong> You can create encrypted field configurations to encrypt existing Date and Date/Time fields. You can add a new encryption configuration to a parent table only. You cannot add a new encryption configuration to a child table.</td>
</tr>
</tbody>
</table>

**Note:** Depending on the number of records affected by the Date and Date/Time fields you are encrypting, it may take up to a few minutes to create the encryption configuration. Make sure that you create the encryption configuration for Date and Date/Time fields when transaction volume on the instance is low.

<p>| Encryption context | Encryption context you created for the article template field. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Method        | • **Single Encryption Context**: Enables data to be encrypted with a single encryption context only. The field is encrypted with the encryption context defined in the Encryption context field. Users that do not have the encryption context cannot view or update field values.  
  • **Multiple Encryption Contexts**: Enables data to be encrypted with more than one encryption context. The field is encrypted by the encryption context of the first user to enter data. If the user has multiple encryption contexts, the context defined in the encryption context selector is used. Because the encryption context is set on a per record basis, fields in a list can have different encryption contexts. However, within a single record, the field can be encrypted by only one context.  
  Note: Mass encryption is not available when using the Multiple Encryption Contexts method. After a configuration is created using the single encryption context method, you can update the record to use multiple encryption contexts. However, you cannot change a field using multiple encryption contexts to use a single encryption context.  
  c) Click Submit.  
  3. Define role permissions for the encrypted field.  
     a) Navigate to **User Administration > Roles**.  
     b) In the **Name** column, click the link to the role you want to allow to view this field.  
     c) In the **Encrypted context** field, search for and select the name of the encryption context for the article template field to apply for the selected role.  
     Note: You may need to configure the Role form to add the Encrypted context field.  
     d) Click **Update**.  

Depending on their role permissions defined for the encrypted field, users can view the field on the article template.

**Generate SEO information for articles using article templates**

Improve the searchability of knowledge articles by using the content in an article template field to generate SEO tags for articles created using that template.

Role required: knowledge_admin or admin
You can define the number of characters to be used as tags in the
`glide.knowman.seo.pages.meta_description.length` system property.

1. Navigate to Knowledge > Article Templates.
2. Select an article template.
3. In the SEO Description Tag field, select an article template field.
4. Click Update.

Note: You can change which article template field is used for generating SEO. Changes are applied only
to knowledge articles created or updated after the change was made. To apply the update to all existing
published articles created using this template, run the Populate Meta Description on KB Articles fix
script.

**Article versioning**

Use the Knowledge Management article versioning feature to create and maintain multiple versions of a knowledge
article.

Knowledge contributors can create a new version of a knowledge article from an existing published version. This
existing version can be either the latest published version or an older outdated version. All changes are stored in the
new version of the article and the information in the existing article remains the same.

If you import published knowledge articles from a ServiceNow instance that does not support article versioning, you
must run the Initialize Versions on Articles fix script to enable article checkout and editing.

With the article versioning feature, a knowledge user can:

- Check out a published article and create another version.

  Note: Only the author, knowledge base owner, and users with the knowledge_admin role can edit an
  article in the Draft state.

- Select a previously published (outdated) version of an article and make it current.
- Recall an article that is being reviewed or scheduled for publication.
- Retire the latest published version of an article.

Note: Only the author, knowledge base owner, and users with the knowledge_admin role can edit an article
in the draft state.

There are two types of article revisions: major and minor. Minor revisions include updates to an article that has
not yet been published. Major revisions include updates to an article that has been published and is available to
customers. To track the different revisions, the article versioning feature introduces version numbering.

With the article versioning feature, the knowledge article number also includes the version number. All references to
knowledge articles use this number format. For example, KB0010003 v2.0.

**Activation information**

The article versioning feature requires the Knowledge Management Advanced plugin (com.snc.knowledge_advanced)
to be activated and the `glide.knowman.versioning.enabled` property to be set to true (default value). For more
information, see Activate the Knowledge Management Advanced plugin and Article versioning properties.
Manually update customized files

If you have customized any of the files that are updated as part of the Knowledge Management Advanced Installer plugin, these files are skipped during plugin activation and must be updated manually.

Manually update your customization to include the article versioning-related changes.

• Add the **Version** field to the Knowledge form layout and the Knowledge list view, if it is not already present.
• Add the **outdated** choice to the **Workflow** choice list field on the Knowledge form, if it is not already present. Keep the value as **outdated** because of dependencies that article versioning functionalities have on this choice.
• Update the **Knowledge > My Flagged** and **Self-Service > My Knowledge Articles** modules to include the following condition in the **Filter** field, if these modules do not already reflect this change: **Revised by is (dynamic) me.**

If you have customized any of the Knowledge Management Overview dashboard reports, these files are also skipped during plugin activation and must be updated manually.

Article versioning changes

Article versioning introduces new actions that allow knowledge users to create and revise versions of existing articles. It also introduces new fields and related lists to the Knowledge form, new columns to the Knowledge list, and updates to Knowledge dashboard reports.

New user actions

As part of creating article versions, users can:

• Check out a published article and create another version by clicking **Checkout** on the Knowledge form.

  **Note:** Only the author, knowledge base owner, and users with the knowledge_admin role can edit an article in the Draft state.

• Recall an article that is being reviewed or scheduled for publish by clicking **Recall** on the Knowledge form.
• Select a previously published article in the Outdated state and make it the current published version by clicking **Make this current** in the Knowledge form header.

  **Note:** To edit a published article without having to create a new version, make sure the **glide.knowman.versioning.enable_minor_edits** property is enabled.

Changes to the Knowledge list

The article versioning feature adds the following to the Knowledge list:

• The **Version** column displays the article version number. The Knowledge list displays multiple versions of an article.
• The **Workflow** column includes the new **Outdated** state.

Changes to the Knowledge form

The article versioning feature adds the following to the Knowledge form:

• The **Version** field displays the article version number.
The **Display number** field displays a combination of the article number and the version number. For example, KB0010004 v1.02. All references to a knowledge article use this display number.

The **Base Version** field displays the knowledge article number and version on which the current article is based.

The **Revised By** field displays the name of the user who checked out a published article and created a new version.

The **Article Versions** related list displays a list of all versions for an article. From this list, you can:

- Click the **Version** to view a specific version of an article.
- Click the **View Article** related link to see the article page view.

**Note:** If necessary, configure the form to display the fields and the related list.

### Changes to Knowledge modules

The article versioning feature introduces the following Knowledge module changes:

- **My Knowledge Articles**
  - For a knowledge user, this module includes records for the articles authored by the user as well as records for each article revised by the user.
  - For a knowledge reviser, this module includes records for the articles published by the user as well as records for each article revised by the user.

- **My Flagged**
  - For a knowledge user, this module includes records for each revision made to articles authored by the user.
  - For a knowledge reviser, this module includes records for each article revised by the user.

**Note:** Users that have customized these modules do not see these changes.

### Changes to Knowledge Management dashboard reports

The Knowledge Management Overview dashboard reports have been updated to include article versioning-related changes when the Knowledge Management Advanced plugin is activated.

- Articles Flagged in the Last 30 Days
- Articles Marked Not Useful in the Last 30 Days
- Articles Used per Month
- Knowledge use
- Knowledge view
- Knowledge updated in past 30 days
- Knowledge flagged in past 30 days
- Knowledge by Workflow state
- Knowledge created by Author
- Knowledge created in past 30 days
- New Knowledge Articles Created in the Last 30 Days
- Knowledge Ratings for past 30 days
Versioning information available in the Knowledge Management Service Portal

Knowledge search results show the article number and the version number for each article.

Note:
To display the article version number next to the article number in the search results, enable the `glide.knowman.search.show_article_number` property in the Knowledge Search Properties section of the Knowledge Management Properties page.

If you are accessing an article from the base system or knowledge service portals using the URL to a KB article, you must also include the article version number in the URL. For example, to access the KB0000005 knowledge article, instead of using the `https://<instance name>/sp?id=kb_article&sys_id=KB0000005` as the URL, you must use `https://<instance name>/sp?id=kb_article&sys_id=KB0000005%20V1.0` to view the article.

The article view page shows a version history section for articles that have been updated. This section includes the version numbers, date updated, and the name of the author or reviser.

- Click Latest version or the version number and current state to expand the version history section.
- Click the version number to open that particular version of the article.
- When viewing an outdated article, a message informs the user that a newer updated version is available. The message includes a link to the latest version.

Feedback on article versions

With the article versioning feature, users can view and contribute to feedback on the current versions of knowledge articles.

For more information about feedback options, see Knowledge feedback.

<table>
<thead>
<tr>
<th>Feedback option</th>
<th>How this option works with article versioning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rating an article</td>
<td>The average rating for an article is carried over to the checked out version. The average rating calculation updates and displays on the current version of the article.</td>
</tr>
<tr>
<td>Marking an article as helpful</td>
<td>The helpfulness percentage of a previous version of an article is also considered for a new version when displayed in the helpfulness column on the homepage.</td>
</tr>
<tr>
<td>Comments</td>
<td>The Comments section at the bottom of an article displays comments from previous versions unless Live Feed is enabled. Live Feed only shows comments for the current version.</td>
</tr>
<tr>
<td>Flagging an article</td>
<td>Checking out an article or setting a previous version to the current version resets the flagged value to false.</td>
</tr>
<tr>
<td>View count</td>
<td>The view count is carried over to the checked out article. Any view of a version of an article increments the view count of all subsequent versions. Views to a newer version of an article do not affect the view count of previous versions.</td>
</tr>
<tr>
<td>Use count</td>
<td>The use count is carried over to the checked out article. Any use of a version of an article increments the use count of all subsequent versions. Any use of a newer version of an article does not affect the use count of previous versions.</td>
</tr>
</tbody>
</table>
Knowledge article version numbers

Knowledge article version numbers follow a specific pattern. Increments to the version number depend on the revision type.

Article version numbers follow this pattern: <major release number.minor release number>

The type of revision being made to an article determines the increment. A minor revision increments the version number by 0.01. A major revision, such as publishing an article, increments the version to the next whole number, for example, from version 2.02 to 3.0.

The following example illustrates the life cycle of a versioned article and the changes to the version number.

<table>
<thead>
<tr>
<th>User action</th>
<th>Article state</th>
<th>Version number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge author creates a new article</td>
<td>Draft</td>
<td>0.01</td>
</tr>
<tr>
<td>Knowledge author makes a change and updates the article.</td>
<td>Draft</td>
<td>0.01</td>
</tr>
<tr>
<td>Knowledge author submits the article for review.</td>
<td>Review</td>
<td>0.02</td>
</tr>
<tr>
<td>Knowledge author recalls the article to make another change.</td>
<td>Draft</td>
<td>0.03</td>
</tr>
<tr>
<td>Knowledge article submits the article for review</td>
<td>Review</td>
<td>0.04</td>
</tr>
<tr>
<td>Approver rejects the article and requests a change.</td>
<td>Draft</td>
<td>0.05</td>
</tr>
<tr>
<td>Knowledge author makes the change and submits the article for review.</td>
<td>Review</td>
<td>0.06</td>
</tr>
<tr>
<td>Approver approves the article</td>
<td>Scheduled for publish</td>
<td>0.07</td>
</tr>
<tr>
<td>Article is published</td>
<td>Published</td>
<td>1.0</td>
</tr>
<tr>
<td>Knowledge author checks out the published article.</td>
<td>Draft</td>
<td>1.01</td>
</tr>
<tr>
<td>Knowledge author submits the article for review.</td>
<td>Review</td>
<td>1.02</td>
</tr>
<tr>
<td>Approver approves the article</td>
<td>Scheduled for publish</td>
<td>1.03</td>
</tr>
<tr>
<td>Article is published When the version 2.0 article is published, the state of the version 1.0 article changes to Outdated.</td>
<td>Published</td>
<td>2.0</td>
</tr>
</tbody>
</table>

Any change to the state of an article results in a version increment, except to and from the Pending retirement, Retired, and Outdated states.

Knowledge article version information

Users can view version information for a knowledge article from the Knowledge view page.

The knowledge article number and the version number appear at the top of the article, just below the title. Clicking the version number expands the version history section, which includes a list of the available article versions. User roles determine what is included in this list:

- Users with read access to a knowledge base can see the latest published version and previous major versions.
• Users with read and contribute access to a knowledge base can see the latest published version, previous major versions, and any draft or review versions.

You can view any of the previous versions of an article by clicking the version number in the list. When you view a previous version, a message at the top of the article indicates that an updated version is available.

At the bottom of a knowledge article, you can see additional information about an article, including the name of the author or reviser and the date that the article was last modified.

**Knowledge article states**

Knowledge article versions can be in one of several states as it progresses through the creation cycle.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draft</td>
<td>The article is in the process of being created.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> A versioned knowledge article in the Draft state can be modified only by the author or reviser with the contribute access to the knowledge base, owner of a knowledge base, users with the admin and knowledge_admin role, and ownership group members, if ownership group is added to the article.</td>
</tr>
<tr>
<td>Review</td>
<td>The draft version of the article is sent to reviewers to approve or reject.</td>
</tr>
<tr>
<td>Scheduled for publish</td>
<td>The draft version of a knowledge article is scheduled for publishing on a future date.</td>
</tr>
<tr>
<td>Published</td>
<td>The article is approved and published. When the state of an article changes to <strong>Published</strong>, the state of any previous published versions of that article changes to <strong>Outdated</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> After a knowledge article with an ownership group is approved, only the owner of a knowledge base and ownership group members have contribute access to the article.</td>
</tr>
<tr>
<td>Pending retirement</td>
<td>The published article is selected for retirement, pending approval.</td>
</tr>
<tr>
<td>Retired</td>
<td>The published article is retired.</td>
</tr>
<tr>
<td></td>
<td>Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.</td>
</tr>
<tr>
<td>Outdated</td>
<td>A more recent version of the article has been published. End users can read published articles as well as the outdated versions.</td>
</tr>
</tbody>
</table>

**Check out a published article and create a new version**

Create a new version of a knowledge article by checking out the latest published version.

Users with canContribute permissions, including the knowledge owner, knowledge manager, and knowledge administrator, can check out a published article unless there is already a checked out version. If a version has been checked out, the **Checkout** button does not appear on the Knowledge form header.
When you check out an article, the default value of **Valid to** field of the article is derived from the **Article Validity** field configured for the knowledge base (see *Create a knowledge base*). If the **Article Validity** field is blank, the date in the **Valid to** field date is set to January 1, 2100. An article author or editor can select whether to keep or change the default **Valid to** date.

When you check out an article, attachments from the article's base version are copied into the new article version and relative paths to these attachments are also updated.

**Note:** For article versions that were created in the previous releases, the relative paths to the attachments may not be updated. To update them, activate and run the Fix attachment links on article versions fix script.

1. Navigate to **Knowledge > Articles > Published**.
2. Select the desired article from the list.
3. Click **Checkout** in the Knowledge form header.
   
   The system creates a new version of the knowledge article and displays a message to the user. The article number for the new version remains the same, the version number is increased by 0.01, and the state changes to **Draft**. The new version of the article is added to the Knowledge list and to the **Article Versions** related list on the Knowledge form.

**Revert an outdated article to the current state**

Use an outdated version of an article to create a new version.

Roles required: knowledge base owner, knowledge_manager, knowledge_admin

This action is available for earlier published version that have a state of **Outdated** and only when there is no checked out version. If a version has been checked out, the Make this current button does not appear on the Knowledge form header.

1. Navigate to **Knowledge > Articles > All**.
2. Open an article in the **Outdated** state.
3. Click **Make this current** in the Knowledge form header.
   
   The system displays the Knowledge form. The version number increments to the latest version number plus 0.01 and the state changes to **Draft**. For example, if the latest published version of an article is 3.0 and you select the outdated 1.0 version to become the current version, the version number increments to 3.01.

**View all versions of an article**

View a list of all available versions for a selected knowledge article and then view the selected version in a new tab.

The list of all available versions for a selected knowledge article is displayed in the **Article Versions** related list on the Knowledge form. Users with read access can see major versions. Users with contribute access can see major and minor versions.

1. Navigate to **Knowledge > Articles > All**.
2. Open the desired article.
3. Click the **Article Versions** tab to display the related list.
4. Click **Version** to display the desired article version in a new tab.
5. If desired, click the **View Version** related link to see the article view page.

**Compare two versions of an article**

Select and compare two versions of a knowledge article.

Role required: knowledge_manager, knowledge_admin

1. Navigate to a **Knowledge > Articles > All**.
2. In the Name column, click the link to a knowledge article with multiple versions.
3. In the Article Versions related list, select the check boxes for the two versions of the article to compare.
4. From the Actions on selected rows list, select Compare.
   The Compare versions page opens and lists the fields for the selected article versions in a side-by-side format. Differences between the two article versions are highlighted.

5. When you are finished comparing the two versions, click Done to return to the Knowledge form.

Retire a versioned article

You can retire the latest published version of a knowledge article. Retiring a knowledge article does not create a new version. It simply marks the article as Retired.

This action is available only when there is no checked out version. If a version has been checked out, the Retire button does not appear on the Knowledge form header.

Note: For the Knowledge - Approval Retire workflow, this happens only when the retire request is approved.

In addition to the knowledge administrator and the knowledge manager, the following users can retire a versioned article:

- knowledge owner
- latest publisher of the versioned knowledge article

Users can still access outdated articles that have been attached to incidents by navigating to the article view page with the sys_id of the article. Outdated articles include a message that an updated article is available.

If versioning is disabled, only the latest version of the article is shown in search results and list views.

Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.

1. Navigate to Knowledge > Articles > Published.
2. Open the desired article.
3. Click Retire in the Knowledge form header.
   The system returns to the Knowledge list. The state of the article changes to Pending retirement and the state of previously published versions change to Outdated.

**Note:** You cannot check out or edit a retired article.

### Disable the article versioning feature

Users with the system administrator role can disable the article versioning feature by setting a property.

Role required: admin

The **Enable article versioning feature** property controls the article versioning feature. Setting this property to **false** disables the article versioning feature. Once disabled:

- The Version field is removed from the Knowledge form. The Version column remains on the Knowledge list and can be removed manually.
- The Article Versions related list is removed from the Knowledge form.
- The Recall, Checkout, and Make this current buttons are removed from the Knowledge form.
- Outdated articles are removed from Knowledge list views.
- The version history does not appear on the article view page.

Articles continue to be versioned in the background. Minor versions are incremented until an article is published and then the version number is increased to the next major version.

Users can still access outdated articles that have been attached to incidents. Outdated articles include a message that an updated article is available.

1. Navigate to Knowledge > Administration > Properties.
2. Locate the **Enable article versioning feature** property in the Article Versioning Properties section.
3. Click the check box to disable the property.
4. Click Save.

### Knowledge manager

Having multiple knowledge bases allows an organization to spread management responsibilities across multiple users, known as knowledge managers.

As a knowledge manager, you can assign other managers, define category structures, configure which users can read and contribute articles, move and pin articles, and modify most fields on the Knowledge Base form. You can also approve the publishing or retiring of knowledge articles in those knowledge bases. You can enable Social Q&A for your knowledge bases if the Social Q&A application is active.

The primary manager of a knowledge base is the owner of that knowledge base. Each knowledge base must have one owner. There may be any number of additional managers for each knowledge base. The owner and all managers of a knowledge base automatically receive the knowledge_manager role. If the knowledge base is made inactive later, the knowledge_manager role is not automatically removed for these users.

### Add a knowledge article to featured content

Add a knowledge article to appear in the Featured content section of the knowledge homepage and at the top of knowledge search results page.

Role required: knowledge_manager, knowledge_admin, or admin

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Adding an article to featured content requires associating an article to specific keywords. You can search a keyword in the knowledge service portal or search results page to display articles in the Featured content section or at the top of the knowledge search results list.

**Note:** The articles added to the Featured content section do not appear in the global search results and Virtual Agent conversations.

- To display articles in the Featured content section, add a default keyword in the `glide.knowman.default_keyword` property Value field and add the same keyword to all articles you want to display in that section.
- To display articles at the top of the knowledge search results list, add a list of keywords to each article you want to display at the top of the list.

1. Navigate to **Knowledge > Knowledge Bases**.
2. Select a knowledge base.
3. In the **Featured content** related list, click **New**.
4. In the **Knowledge** field, search for and select the desired article.
   If you know the article number, you can search for the article directly.
5. In the **Keywords** field, click the lock/unlock toggle icon.
6. Click the lookup icon to open the **Knowledge keywords** list.

**Note:** Each keyword must be a single word and cannot contain spaces.

7. Select the keyword to add for this article.
   - Add the default keyword to display this article in the Featured content section during search.
   - Add all related keywords for the article to display it at the top of the knowledge search results page during search.

**Note:** You can create knowledge keywords, if it does not already exist in the list, and then add it to the article.

8. Click the lock/unlock toggle icon to add the keywords to the article.
9. Click **Submit**.

**Define a knowledge article category**

Each knowledge base has a hierarchy of categories that organizes the articles.

You must have **CanContribute** access to the knowledge base or have a knowledge_admin or admin role.

Define a hierarchy for categories by creating parent-child relationships. Each hierarchy consists of a top-level category and a structure of subcategories, which are also named the child categories. The category hierarchy is saved in the **Full category** field in the Knowledge Category [kb_category] table.

You can create and edit categories separately for each knowledge base.

1. Navigate to **Knowledge > Administration > Knowledge Bases**.
2. Select a knowledge base you manage.
3. Create a top-level category.
   a) In the Knowledge Categories related list, click **New**.
   b) On the Knowledge Category form, fill in the fields.
## Knowledge Category form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Label for the category. The label appears as the name of the category.</td>
</tr>
<tr>
<td>Value</td>
<td>Value for the category you use when referencing the category in scripts.</td>
</tr>
<tr>
<td>Parent ID</td>
<td>Top-level component associated with the category. This field is automatically set to the top-level component ID.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to enable the category.</td>
</tr>
</tbody>
</table>

4. Optional: Create a child category.
   a) Expand an existing category and click **New** within the expanded section.
   b) Fill in the *Knowledge Category form*.
   c) Click **Submit**.

In addition to using categories defined by a knowledge manager, knowledge contributors can add and edit categories when editing an article.

### Assign a knowledge base manager

You can assign users as managers of a knowledge base.

Role required: knowledge_admin, or admin

1. Navigate to **Knowledge > Knowledge Bases**.
2. Select a knowledge base you manage.
3. In the **Managers** field, click the unlock icon.
4. Add one or more users.
5. Click **Update**.
   - After you save the knowledge base record, users selected as managers automatically receive the knowledge_manager role if they do not have it already.

You can remove a knowledge base manager by removing that user from the **Managers** field. If the user is not a manager of any other knowledge base, the knowledge_manager role is removed from that user.

### Managing access to knowledge bases and knowledge articles

Determine whether certain users or categories of users can access knowledge bases and knowledge articles by controlling contribute and read access.

At the knowledge base level, you can assign user criteria to control contribute and read access, where:

- Read access determines the ability to view knowledge articles in a knowledge base.
- Contribute access determines the ability to create, modify, and retire knowledge articles in a knowledge base.
  - Contribute access to a knowledge base also provides read access to all articles in the knowledge base.
At the knowledge article level, you can assign user criteria and roles, or both, to control read access. Contribute access to a knowledge base also provides read access to all articles in the knowledge base even when read access is denied at the knowledge article level. If a user doesn’t have contribute access to a knowledge base, both roles and user criteria are evaluated to determine read access to a knowledge article.

Try to use only user criteria, which were introduced in Knowledge Management v3, to control access to knowledge articles. Roles were used for this purpose in Knowledge Management v2.

**Note:** By default, when contribute access isn't provided for a knowledge base, a user must meet both roles and user criteria conditions for read access. However, you can override roles set for a knowledge article and provide access through user criteria only by setting the `glide.knowman.search.apply_role_based_security` system property to `false`. Because this property isn't available by default, you must add it. For more information, see *Add a system property*.

### User criteria for knowledge access

You control access to knowledge bases or knowledge articles for a user through user criteria, which are described in the following table.

#### User criteria definitions

<table>
<thead>
<tr>
<th>User criteria</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cannot Contribute</td>
<td>Cannot contribute (that is can't create, modify, or retire) knowledge articles within a knowledge base. The Cannot Contribute user criteria is available only for knowledge bases.</td>
</tr>
<tr>
<td>Can Contribute</td>
<td>Can contribute (that is can view, create, modify, or retire) knowledge articles within a knowledge base. The Can Contribute user criteria is available only for knowledge bases.</td>
</tr>
<tr>
<td>Cannot Read</td>
<td>At the knowledge base level, cannot view knowledge articles within a knowledge base. At the knowledge article level, cannot view a knowledge article.</td>
</tr>
<tr>
<td>Can Read</td>
<td>At the knowledge base level, can view knowledge articles within a knowledge base. At the knowledge article level, can view a knowledge article.</td>
</tr>
</tbody>
</table>

#### Combining knowledge base and knowledge article user criteria

<table>
<thead>
<tr>
<th>Status</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>The user matches both Can Contribute and Cannot Contribute at the knowledge base level</td>
<td>The user is denied contribute access to the knowledge base and its articles.</td>
</tr>
<tr>
<td>The user matches both Can Read and Cannot Read at the knowledge base level</td>
<td>The user is denied read access to the knowledge base and its articles.</td>
</tr>
<tr>
<td>The user matches Can Read at the knowledge base level and Cannot Read at the knowledge article level</td>
<td>The user is denied read access to the knowledge article.</td>
</tr>
<tr>
<td>The user matches Cannot Read and Can Read at the knowledge article level</td>
<td>The user is denied read access to the knowledge article.</td>
</tr>
</tbody>
</table>
Users with special knowledge privileges

Users with special knowledge privileges aren't evaluated based on user criteria and have knowledge bases and knowledge articles access as described in the following table.

<table>
<thead>
<tr>
<th>User</th>
<th>Access</th>
</tr>
</thead>
</table>
| Knowledge administrator                   | • Contribute to and read all knowledge bases and their articles.  
• Modify the definition of all knowledge bases and assign user criteria to them. |
| Owner of a knowledge base                 | • Contribute to and read that knowledge base.  
• Modify the definition of that knowledge base and assign user criteria to it.                                                     |
| Manager of a knowledge base               | • Contribute to and read that knowledge base.  
• Modify the definition of that knowledge base and assign user criteria to it.                                                                 |
| Members of an ownership group associated with a knowledge article | Read, modify, and retire that knowledge article.                                                                                                                                               |

**Note:** This access doesn’t apply to scoped knowledge bases. For more information, see *Scoped knowledge bases.*

**Note:** If the article versioning feature is enabled, the manager of a knowledge base can’t modify knowledge articles of other authors that are in the *Draft* state. For more information, see *Article versioning.*

Explicit roles and user criteria

Explicit roles (snc_external and snc_internal) are added to your instance when you install a plugin, such as the Customer Service plugin (com.sn_customerservice), that also activates the Explicit Roles plugin. If you create a knowledge base with the Explicit Roles plugin activated, the application automatically adds the following predefined user criteria at the knowledge base level:

- **Users with 'snc_internal' role** – Added to the Can Read user criteria. Assigning this criteria means only users with the snc_internal role have read access to the knowledge base.
- **Users with snc_internal' and another role** – Added to the Can Contribute user criteria. Assigning this criteria means only users with the snc_internal role and at least one additional role have contribute access to the knowledge base.

When you upgrade to product versions that offer the Explicit Roles plugin, the predefined user criteria **Users with 'snc_internal' role** and **Users with 'snc_internal' and another role** aren’t automatically added to any existing
knowledge bases created prior to the activation of the Explicit Roles plugin. To add these predefined user criteria to an existing knowledge base, run the `Fix unsecured knowledge bases` fix script. For more information about explicit roles and fix scripts, see *Explicit Roles* and *Fix scripts*.

**Knowledge access using user criteria**

The flowchart in this section illustrates the user criteria checks that determine contribute access to a knowledge base.

**Note:** In order for an unauthenticated user to view knowledge articles within the knowledge base, ensure that the audience for the Knowledge Management Service Portal pages is set to public; that is, the page can be accessed without the need for authentication. For more information, see *Create and edit a page using the Service Portal Designer*. 
When either Cannot Contribute isn’t set or a user doesn’t match Cannot Contribute and additionally Can Contribute is not set, the `glide.knowman.block_access_with_no_user_criteria` property value is further evaluated to determine contribute access, as explained in the following table.

<table>
<thead>
<tr>
<th>Property value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>No user has contribute access to the knowledge base except users with special knowledge privileges.</td>
</tr>
<tr>
<td>false</td>
<td>Users with at least one role can contribute to the knowledge base.</td>
</tr>
</tbody>
</table>

**Note**: If the Explicit Roles plugin is activated, users who have at least one role other than `snc_internal` can contribute to the knowledge base.

The following flowchart illustrates the user criteria checks that determine read access to a knowledge article.
When either Cannot Read isn’t set or a user doesn’t match Cannot Read and additionally Can Read is not set, the `glide.knowman.block_access_with_no_user_criteria` property value is further evaluated to determine read access, as explained in the following table.

**Read access when user criteria for a knowledge base aren’t set**

<table>
<thead>
<tr>
<th>Property value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>No user has read access except users with special knowledge privileges and users who have contribute access to the knowledge base.</td>
</tr>
<tr>
<td>false</td>
<td>All users, including unauthenticated users, have read access to the knowledge base and the article-level user criteria are further evaluated.</td>
</tr>
</tbody>
</table>

**Important:** After you add user criteria, you can use the user criteria diagnostics feature to verify the access that users have to a knowledge base or a knowledge article. For more information, see *User criteria diagnosis for Knowledge Management*.

### Create user criteria for controlling access to knowledge bases and articles

Control access to knowledge bases and articles by creating user criteria.

Role required: `user_criteria_admin`

**Note:** To create a user criteria record from the Knowledge module, you must have the `user_criteria_admin` role in addition to the knowledge role. For more information about access, see *Managing access to knowledge bases and knowledge articles*.

1. Navigate to `Knowledge > Administration > User Criteria`.
2. Click `New`.
3. On the User Criteria form, fill in the fields.

**User Criteria form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the user criteria.</td>
</tr>
<tr>
<td>Users</td>
<td>Users that must match the user criteria.</td>
</tr>
<tr>
<td>Groups</td>
<td>Groups that must match the user criteria.</td>
</tr>
<tr>
<td>Roles</td>
<td>Roles to match the user criteria.</td>
</tr>
</tbody>
</table>

**Note:**
- Because the evaluation of a role is cached in the session, any change in the role requires you to log in again.
- User criteria are not applicable for elevated privilege roles.

Advanced

Option to display or hide the advanced option that includes the *Script* field on the User Criteria form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script</td>
<td>Script to define any additional user criteria that returns true or false. This field is available when the <strong>Advanced</strong> option is selected on the User Criteria form.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td>• A script is evaluated in the scope that the user criteria is created in.</td>
</tr>
<tr>
<td></td>
<td>• The evaluation of a script is cached in the session, so any change in the evaluation requires you to log in again. If a scripted user criteria is defined for a knowledge base, user access to knowledge bases is evaluated once per session. If the script results in changes after a session cache is built, the result takes effect in the next session.</td>
</tr>
<tr>
<td></td>
<td>• Do not use <code>gs.getUser()</code> or other session APIs because they cause conflicts when used in diagnostic tools. Use the predefined <code>user_id</code> variable available in the script to get the user ID of the user being used to evaluate the script.</td>
</tr>
<tr>
<td></td>
<td>• Scripts are evaluated dynamically. Therefore, including scripts in a user criteria can impact performance.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate or deactivate the user criteria.</td>
</tr>
<tr>
<td>Companies</td>
<td>Companies that the user record must match.</td>
</tr>
<tr>
<td>Locations</td>
<td>Locations that the user record must match.</td>
</tr>
<tr>
<td>Departments</td>
<td>Departments that the user record must match.</td>
</tr>
</tbody>
</table>
### Field Description

**Match All**

Option to determine whether all elements from each populated user criteria field must match. If selected, only users who match all user criteria are given access. If cleared, the user must meet one or more of the set user criteria to be given access.

By default, this check box is cleared so that any condition met provides a match.

For example, consider a user criteria record for the following:
- Locations A or B
- Company C or D

With **Match All** selected, only users meeting all these conditions are matched. For example, a user with a location A and a company C.

If **Match All** is not selected, users meeting any of these conditions are matched. For example, a user with a location B.

**Note:** If you select **Match All**, ensure that you don’t create contradictory conditions that can never be met. For example, if all users in location A work for company G, the conditions in this example can never be met.

### Control access at the knowledge base level through user criteria

You specify user criteria for a knowledge base to control which users are granted access to read and contribute knowledge articles to that knowledge base.

**Role required:** knowledge_manager, knowledge_admin, or admin

**Note:** To administer a scoped knowledge base, you must have the application-specific admin role in addition to the knowledge_admin or admin role. For more information, see *Scoped knowledge bases.*

You can assign user criteria to control read or contribute access. For example, you could enable all users in your Support department to have contribute access to a knowledge base by creating a user criteria record with the required department set to Support, and then including the user criteria record in the Can Contribute user criteria. For more information, see *Managing access to knowledge bases and knowledge articles.* Try to use only user criteria, which were introduced in Knowledge Management v3, to control access to knowledge bases. Roles were used for this purpose in Knowledge Management v2.

1. Navigate to **Knowledge > Administration > Knowledge Bases.**
2. Click the link to knowledge base you manage.
3. Add user criteria to the knowledge base.

   a) Depending on the user criteria you want to set, select one or more of the relevant related lists.

<table>
<thead>
<tr>
<th>Related list</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can Read</td>
<td>Users can read knowledge articles in the knowledge base.</td>
</tr>
</tbody>
</table>
### Related list

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cannot Read</td>
</tr>
<tr>
<td>Users can't read knowledge articles in the knowledge base.</td>
</tr>
<tr>
<td>Can Contribute</td>
</tr>
<tr>
<td>Users can create, modify, and retire knowledge articles in a knowledge base. Contribute access to a knowledge base also provides read access to all articles in the knowledge base.</td>
</tr>
<tr>
<td>Cannot Contribute</td>
</tr>
<tr>
<td>Users can't create, modify, retire, or read knowledge articles in the knowledge base.</td>
</tr>
</tbody>
</table>

b) In the selected related list, add the required user criteria.

- As a user with the admin role, to add a new user criteria record, click **New**, specify the required fields, and then click **Submit**.
- As a user with the knowledge_manager, knowledge_admin, or admin role, to add an existing user criteria record, click **Edit**, move the required user criteria from the **Collection** column to the **Knowledge** column, and then click **Save**.

4. On the Knowledge Base form, click **Update**.

After you add user criteria, you can use the user criteria diagnostics feature to verify the access that users have to a knowledge base or a knowledge article. For more information, see *User criteria diagnosis for Knowledge Management*.

**Important:** After making user criteria additions or changes, you may need to log out and back in to clear the prior configuration.

### Control access at the knowledge article level through user criteria

You specify user criteria for a knowledge article to control which users are granted read access to the knowledge article.

Role required: Users who have Contribute access to the knowledge article

**Note:** You may need to configure the form to add **Can Read** and **Cannot Read** fields.

Try to use only user criteria, which were introduced in Knowledge Management v3, to control access to knowledge articles. Roles were used for this purpose in Knowledge Management v2. For more information, see *Managing access to knowledge bases and knowledge articles*.

1. Open a knowledge article.

**Note:** You can update only the latest version of the knowledge article.

2. Assign access based on user criteria.

<table>
<thead>
<tr>
<th>Access</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow read access</td>
<td>In the <strong>Can Read</strong> field, search for and add user criteria. For example, to allow read access to a user, search for a user criteria that the user matches and add it to this field.</td>
</tr>
</tbody>
</table>
### Deny read access

**Procedure**

In the Cannot Read field, search for and add user criteria. For example, to deny read access to a user, search for a user criteria that user matches and add it to this field.

**Note:**

- If users have contribute access to the knowledge base, they also have read access to the knowledge article regardless of the Cannot Read setting.
- Users who meet both Can Read and Cannot Read user criteria are denied read access to the knowledge article. The Cannot Read setting overrides the Can Read setting for the knowledge article.

3. On the Knowledge form, click **Update**, and then click **Publish** to apply the changes.

After you add user criteria, you can use the user criteria diagnostics feature to verify the access users have to a knowledge base or a knowledge article. For more information, see *User criteria diagnosis for Knowledge Management*.

#### User criteria diagnosis for Knowledge Management

Manage user access to a knowledge base or an article using user criteria diagnostics. Understand what access users have to a knowledge base or an article and determine which user criteria define those permissions.

User access to a knowledge base or an article can be restricted based on:

- Domain separation
- Access control list (ACL) rules
- *Knowledge work flows*
- User criteria set for a **knowledge base** or an **article**

This feature considers domain separation and user criteria to determine the user access to knowledge bases and articles.

#### Activating user criteria diagnostics

The user criteria diagnostics feature is activated with Knowledge Management v3 (com.snc.knowledge3) plugin.

#### Diagnose user access to a knowledge base

Identify which users have access to a knowledge base and what enables that access.

Role required: knowledge_manager, knowledge_admin, or admin

1. Access the **User Criteria Diagnostics** landing page using one of these options:

<table>
<thead>
<tr>
<th>To access</th>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using the application navigator</td>
<td>Knowledge &gt; Administration &gt; User Criteria Diagnostics</td>
</tr>
</tbody>
</table>
To access

<table>
<thead>
<tr>
<th>From a knowledge base</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Knowledge &gt; Administration &gt; Knowledge Bases.</td>
</tr>
<tr>
<td>2. Select the knowledge base to diagnose user access.</td>
</tr>
<tr>
<td>3. In the Related Links section, click Run User Criteria Diagnostics.</td>
</tr>
</tbody>
</table>

The User Criteria Diagnostics landing page appears with the Select knowledge base field pre-populated.

2. To diagnose user access:
   a) In the Select user field, select a user.
   b) From the Select record type choice list, select Knowledge base.
   c) In the Select knowledge base field, select a knowledge base.
      Every time you select a different user, record type, or knowledge base, the page refreshes and displays data for the selected user.
   d) Click Diagnose.
      The page displays these details:
      • Whether the user has access to the knowledge base based on their domain. Only system administrators can view domain information and change the domain to give access to a user.
      • Which user criteria provides read or read and contribute access for this user to the knowledge base and what type of user criteria definition enables this access.
      • Whether a role that the user has (knowledge_manager, knowledge_admin, or owner of the knowledge base) enables this access.
      • For a user with no access to this knowledge base, which user criteria may be modified to grant the access.

The following image shows an example of a diagnosis where the user Alene Reback does not have access to the IT knowledge base.

Alena can get access to the knowledge base if:
• Alena is added to one of the existing user criteria defined in the knowledge base.
• Alena is added to a new user criteria that is defined and added to the knowledge base.

Click the IT knowledge base link and provide the access by adding Alena to a user criteria for this knowledge base.
User Criteria Diagnostics

Select user: Alene Rabeck
Select record type: Knowledge Base
Select knowledge base: IT

No Access

Alene Rabeck does not have access to knowledge base (IT).

△ If ACLs were applied to this Knowledge Base, the ACLs will override the permissions defined by user criteria.

How to Provide Access

To provide access to knowledge base (IT), add Alene Rabeck to one or more of the following user criteria.

<table>
<thead>
<tr>
<th>User Criteria</th>
<th>Access Type</th>
<th>Set on</th>
</tr>
</thead>
<tbody>
<tr>
<td>The ACME North America IT Department</td>
<td>Can Contribute</td>
<td>Knowledge Base</td>
</tr>
<tr>
<td>All ACME North America employees</td>
<td>Can Read</td>
<td>Knowledge Base</td>
</tr>
<tr>
<td>All ACME Corporation employees</td>
<td>Can Read</td>
<td>Knowledge Base</td>
</tr>
</tbody>
</table>

1 to 3 of 3 results
Diagnose user access to an article

 Identify which users have access to an article and what enables that access.

 Role required: knowledge_manager, knowledge_admin, or admin

 1. Access the User Criteria Diagnostics landing page using one of these options:

<table>
<thead>
<tr>
<th>To access</th>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using the application navigator</td>
<td>Knowledge &gt; Administration &gt; User Criteria Diagnostics.</td>
</tr>
<tr>
<td>From an article</td>
<td>1. Knowledge &gt; Administration &gt; Knowledge Bases.</td>
</tr>
<tr>
<td></td>
<td>2. Select the knowledge base that has the article to diagnose for user access.</td>
</tr>
<tr>
<td></td>
<td>3. In the Knowledge related list, select the article.</td>
</tr>
<tr>
<td></td>
<td>4. In the Related Links section, click Run User Criteria Diagnostics.</td>
</tr>
</tbody>
</table>

   The User Criteria Diagnostics landing page appears with the Select article field pre-populated.

 2. To diagnose user access:
   a) In the Select user field, select a user.
   b) From the Select record type choice list, select Article.
   c) In the Select article field, select an article.

   Every time you select a different user, record type, or knowledge base, the page refreshes and displays data for the selected user.

   d) Click Diagnose.

   The page displays these details:

   • Whether or not the user has access to the knowledge article based on their domain. Only system administrators can view domain information and change the domain to give access to a user.
   • Which user criteria provides read or read and contribute access for this user to the article and what type of user criteria definition enables this access.
   • Whether a role of the user has (knowledge_manager, knowledge_admin, or owner of the knowledge base) enables this access.
   • For a user with no access to this article, which user criteria may be modified to grant the access.

   Note: Members of an ownership group are automatically given Can Contribute access to knowledge articles that their ownership group is associated with.

The following image shows an example of a diagnosis where the user Adela Cervantsz has read access to the KB article, KB0000001 v5.0, in the IT knowledge base because Adela belongs to one of the Can Read user criteria defined in the knowledge base.
User Criteria Diagnostics

- Select user: Adela Cervantsz
- Select record type: Article
- Select article: KB0000001 v1.0

Read Access

No user criteria is configured at article level. Adela Cervantsz has read access to article KB0000001 in knowledge base IT, because the user has read access to the knowledge base.

⚠️ If ACLs were applied to this Article, the ACLs will override the permissions defined by user criteria.
⚠️ The article's publication status may also impact the user's access to it. If diagnostic results conflict with the user's access, please check the publication status of the article.

User Criteria Assigned

<table>
<thead>
<tr>
<th>User Criteria</th>
<th>Access Type</th>
<th>Set on</th>
</tr>
</thead>
<tbody>
<tr>
<td>All ACME North America employees</td>
<td>Can Read</td>
<td>Knowledge Base</td>
</tr>
<tr>
<td>All ACME Corporation employees</td>
<td>Can Read</td>
<td>Knowledge Base</td>
</tr>
</tbody>
</table>

I18N - Knowledge internationalization

Organizations with knowledge users who speak multiple languages can activate the optional knowledge internationalization features.

Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2).

When active, knowledge internationalization enables the knowledge management team to create language-specific knowledge articles and keep translations of the same article related to each other so they are easy to manage. Users can view and search within their own language while still being able to view articles in other languages when necessary.

**Note:**
To set the default language for searching articles to a language different from the logged in language of the user, specify the desired language in the `glide.knowman.search.default_language` system property. For example, if you are logged in using the French language and would like the default language for searched articles to be English, specify English in the system property. You can then switch to French from within the UI to see French articles. If no language is specified in the system property, articles default to the logged in language of the user.

To enable search for different languages simultaneously, navigate to **Knowledge Administration > Knowledge Search > Properties > Enable multi language search**. Select the **Yes** check box to enable the feature.

**Note:** If you do not enable this property, you can search in one language at a time. If the property is enabled, you can search for multiple languages simultaneously.

Refer to **Search using Knowledge Management v3** for information on performing a search on all available languages simultaneously.

Social Q&A does not use language-specific questions and answers. All questions and answers appear in the language they were created in. For example, a question in English is not translated when the current user’s selected language is French.

**Activate the knowledge management internationalization plugin**

To enable translation of knowledge articles, you must activate multiple plugins.

- I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2). For more information, see **Activate a plugin**.
- Internationalization plugins for each appropriate language. For more information, see **Activate a language**

**Note:** Activating internationalization plugins for any of the available languages automatically activates the I18N: Internationalization plugin (com.glide.i18n) that instead activates the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2).

**Activate a plugin**

**Installed Components**

Activating the Knowledge Management Internationalization plugin installs these components:

- A relationship named **Translated Versions** that creates a related list on the Knowledge form showing other articles that have the same parent article.
• A business rule named knowledge query that automatically filters the knowledge portal and search results based on the user's selected language.
• A UI macro named kb languages.
• Two fields, named Language and Parent, in the Knowledge [kb_knowledge] table and the Knowledge form.

Knowledge form changes

The I18N:Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) adds the following fields to the Knowledge form:

• Language: Language in which you are creating the knowledge article. The list is populated based on the languages enabled for the selected knowledge base.
• Parent: Number of the article that represents the base language article. This setting keeps translations of the same article related to each other. Consider choosing the same language consistently for the parent article.

Note: The Parent field is used for keeping track of translations of articles.

Additionally, the Translated Versions related list is automatically added to the Knowledge form after you save an article.

Ownership groups

Configure ownership groups and associate them with knowledge articles to maintain article quality, manage approvals, and for timely resolution of feedback.

For the ease of maintenance of knowledge articles, you can assign an ownership group to a knowledge article and shift the ownership of an article from a single person to a group. An ownership group consists of a group of members and a manager who are responsible for knowledge articles. Responsibilities include: approving knowledge articles, performing AQI checks to ensuring article quality, and managing feedback tasks for knowledge articles.

When a knowledge article is assigned to an ownership group:

• Only ownership group members have contribute access to the article even if they don't have contribute access to the knowledge base of the article. They can edit, approve, publish, and retire the knowledge article with which they are associated.
• Users who aren't a member of the ownership group member can't contribute to the article even if they have contribute access to the knowledge base of the article.

When creating or editing a knowledge article, you may need to configure the Knowledge form to add the Ownership Group field.

Activation information

To enable the use of ownership groups, enable the glide.knowman.ownership_group.enabled property. This property is available when the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated. By default, the property is disabled.

Note: If you use ownership groups, try not to disable the glide.knowman.ownership_group.enabled property later. If you must disable the property later, ensure that you manually reassign all knowledge articles associated with any ownership group, close all article approvals sent to ownership groups, and resolve all open feedback tasks assigned to ownership groups.
Contribute access to articles for authors and revisers

If an ownership group is associated with a knowledge article, the author or reviser of the article can't contribute to the article after the article is published.

Manage ownership groups

Create ownership groups and associate them to knowledge articles. Knowledge group managers or knowledge administrators can edit ownership groups.

The Knowledge Management Advanced plugin (com.snc.knowledge_advanced) must be activated.

Role required: Users with the knowledge_domain_expert or knowledge_admin roles can create ownership groups.

Users with the knowledge_group_manager or knowledge_admin roles can edit ownership groups.

Create an ownership group by adding members and a manager. Knowledge administrators approve ownership groups.

When knowledge articles are created, ownership groups can be associated to them. Ownership groups manage article approvals and feedback and can edit and retire knowledge articles that they are associated with.

Knowledge group managers can edit ownership groups managed by them by adding or removing members without the need for approval. They cannot change the manager assigned in their groups. Only knowledge administrators can reassign managers.

1. Navigate to Knowledge > Ownership Groups > Manage Group.
2. To create an ownership group, from the Request Type list, select Create Ownership Group.

   Note: To edit an existing ownership group, from the Request Type list, select Edit Ownership Group.

3. Fill in the fields on the form,

   Manage Knowledge Ownership Group form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the ownership group.</td>
</tr>
<tr>
<td>Group email</td>
<td>An email address for the ownership group. Emails are sent to group members in these cases.</td>
</tr>
<tr>
<td></td>
<td>• Activity on articles they are associated with, for example, comments.</td>
</tr>
<tr>
<td></td>
<td>• Article quality checks (AQI) performed on articles they are associated with.</td>
</tr>
<tr>
<td></td>
<td>If no group email is defined, emails are sent to individual group member emails.</td>
</tr>
<tr>
<td>Description</td>
<td>Description that defines the ownership group.</td>
</tr>
<tr>
<td>Manager</td>
<td>Manager for the ownership group.</td>
</tr>
<tr>
<td>Group members</td>
<td>Members of the ownership group.</td>
</tr>
</tbody>
</table>

4. Click Order Now.

   The ownership group is sent to the knowledge administrator for approval. Once approved, the ownership group is ready to use and associate to a knowledge article.

   Note: You can also create an ownership group from an existing group.

2. Click a group.
3. In the Type field, enter Knowledge.

   **Note:** If the Type field does not appear on the form, configure the form layout to add it.

4. In the Manager field, enter a manager and add the role knowledge_group_manager.

5. In the Roles related list, click Edit and add the role knowledge_group_member to the group.

---

**Configure the Knowledge Management Service Portal**

The Knowledge Management Service Portal enables users to perform the same operations that are available with the Knowledge Management V3 plugin. From the portal, users can view knowledge bases and articles, search for information, sort and filter search results, and provide feedback.

- For new customers on the Madrid and later releases, the Knowledge Management Service Portal plugin (com.snc.knowledge_serviceportal) is active by default.
- For existing customers on release versions prior to Madrid, activate the plugin, if required.
- Configure the Knowledge Management Service Portal properties, including the property that directs users to the Knowledge Management homepage in the Knowledge Management Service Portal.

- Navigate to Service Portal > Portals and click Knowledge Portal. See Service Portal for more information about creating a custom interface.
- System administrators can configure portal pages and configure widgets for searching, sorting, and filtering knowledge base information. To configure widget instance options and configure search, sort, and filter features, see Knowledge Management Service Portal widgets.
- To add knowledge bases to the Knowledge Service Portal, complete the following steps.
  1. Navigate to Service Portal > Portals and click Knowledge Portal.
  2. Click the Knowledge Bases related list.
  3. Click Edit to map one or more knowledge bases to the portal.

   **Note:** If no knowledge bases are added, all knowledge bases are available in the portal.

   If knowledge bases are mapped, only those knowledge bases are available in the portal. All search results and all widgets display results from the mapped knowledge bases only.

---

**Section 508 compliance features**

Users can view and interact with the Knowledge Management article view page in the Knowledge Management Service Portal using Section 508 compliance features. See Enabling accessibility features for more information.

**Enable external or public users to view knowledge articles from the Knowledge Management Service Portal**

Enable knowledge articles on the Knowledge Management Service Portal to be visible to external or public users.

The Knowledge Management Service Portal plugin (com.snc.knowledge_serviceportal) must be enabled.

Role required: admin
If you are using Knowledge Management within the Customer Service application, you can automatically make knowledge public by activating and running the Make KM Service Portal Pages Public fix script after you install the Customer Service Management plugin (com.sn_customerservice).

If you are using Knowledge Management as a standalone application, perform the steps in this procedure.

1. Navigate to Service Portal > Pages.
2. Search for kb_home and open it.
3. You have to be in the Global application to edit. If a message appears, click here to edit.
4. Perform one of the following actions.

<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
</table>
| Make knowledge service portal pages visible to public users | 1. Select the Public check box.  
2. Click Update. |
| Make knowledge service portal pages visible to external users | 1. Click the edit user roles icon.  
2. Select snc_external and click Done.  
3. Click Update. |

5. Repeat these steps for kb_article_view and kb_search.
6. Perform one of the following actions.

<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable access to the knowledge base for public users</td>
<td>Ensure that no Can Read user criteria is defined in the knowledge bases you want to give access to.</td>
</tr>
<tr>
<td>Enable access to the knowledge base for external users</td>
<td>Add Can Read access to the knowledge base.</td>
</tr>
</tbody>
</table>

**Knowledge Management Service Portal properties**

Knowledge Management Service Portal properties determine how information is displayed on the Knowledge portal. You must have the admin role to set configuration properties.

The following system properties are set to direct users to the Knowledge Management Service Portal homepage, and to specify the URL suffix for the homepage.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn_km_portal.glide.knowman.serviceportal.enable_redirect</td>
<td>Directs users to the desired Knowledge homepage. Set to <strong>true</strong> to redirect users navigating to v2 or v3 pages to the Knowledge Management Service Portal homepage.</td>
</tr>
<tr>
<td>sn_km_portal.glide.knowman.serviceportal.portal_url</td>
<td>The URL suffix for the Knowledge Management Service Portal. The default is <strong>kb</strong>.</td>
</tr>
</tbody>
</table>

The Knowledge Management Service Portal supports the Knowledge Management V3 properties. Configuring widget instance options on the portal pages can override these properties.

**Knowledge Management Service Portal widgets**

The Knowledge Management Service Portal uses a number of widgets to enable searches, display search results, and display articles, related articles, related items, and social Q&A.

In the Knowledge Management Service Portal, the Knowledge Management homepage, search results page, and article view page honor the Knowledge Management V3 system properties. If configured, widget instance options can override the system properties.

Users with the knowledge_admin or admin role can configure the widget instance options used on the Knowledge Management Service Portal pages. Use the control + right-click menu to access the widget instance options and **configure a widget instance**.

**Note:** Before configuring widget instance options, switch to the Knowledge Management - Service Portal scope.

**Homepage widgets:**

- **Knowledge Homepage Search**
  Customize search features for the homepage.

- **Knowledge Bases Browse**
  Displays knowledge base tiles in the homepage.

- **Knowledge Featured Articles**
  Displays a list of featured articles in the homepage.

- **Knowledge Most Useful Articles**
  Displays a list of most useful articles in the homepage.

- **Knowledge Most Viewed Articles**
  Displays a list of most viewed articles in the homepage.

**Search results page widgets:**
• Knowledge Breadcrumbs
  Displays navigation path to the current page.

• Knowledge Search
• Knowledge Facet Header
  Displays the title for the filter facets.

• Knowledge Field Facet
  Display search results filtered by knowledge base, knowledge category, and author.

• Knowledge Tags Facet
  Display search results filtered by article tags.

• Knowledge Resource Facet
  Display search results filtered by article resource.

• Knowledge Query Facet
  Display search results filtered by article rating, number of article views, and last modified.

• Knowledge Result Sort
  Displays search results filtered by sort options for returned results.

• Knowledge Selected Filter
  Displays the selected facet filters and allows you to clear the selections.

• Knowledge Result
  Displays search results filtered by returned results.

Article view page widgets:
• Knowledge Breadcrumbs
  Displays navigation path to the current page.

• Knowledge Article Content
  Customize what information users can view and what actions they can perform in the article view page.

• Knowledge Article Helpful
  Enables users to mark the article as helpful.

• Knowledge Article Comments
  Enables users to add comments for the article.

• Knowledge Attachments
  Displays article attachments if the Display Attachment field for the article is enabled.

  **Note:** You must add the Knowledge Attachments widget to any page in addition to Knowledge Article Content widget. After upgrade, if this widget does not get added automatically, you must add it manually.

• Related Catalog Item
  Displays a list of catalog items mapped to the article. The widget appears only when the related catalog items are available for the selected article.

• Knowledge Related Articles
  Displays a list of related articles with information similar to the selected article. The related articles are manually mapped, automatically predicted, or both. The manually mapped articles appear first in the widget. The widget appears only when the related articles are available for the selected article.

• Affected Products
  Displays the products related to the knowledge articles available in the Affected Products related list for the article. The widget appears only when the affected products are available for the selected article.
• Most Recent Tasks
  Displays the tasks attached to the articles available in the Attached Tasks related list for that article. The widget appears only when the related tasks are available for the selected article.

• Most Useful
  Displays a list of knowledge articles that users found most useful.

 Activate the Knowledge Management Service Portal plugin

The Knowledge Management - Service Portal plugin (com.snc.knowledge_serviceportal) is active by default for customers on Madrid and later releases. Existing customers on release versions prior to Madrid can activate the plugin, if required.

Role required: admin

This plugin requires the following plugins:

• Knowledge Management V3 (com.snc.knowledge3)
• Service Portal for Enterprise Service Management (com.glide.service-portal.esm)

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Click Install, and then in the Activate Plugin dialog box, click Activate.

Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise they will receive the following error: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Configure search widget instance options

Configure widget instance options for the search widgets on the Knowledge Management Service Portal homepage and search results page.

Role required: sp_admin or admin

The homepage uses the Knowledge Homepage Search widget and the search results page uses the Knowledge Search widget. Use the widget instance options to customize the search feature for these pages.

1. Navigate to the Knowledge Management Service Portal homepage or search results page.
2. Control + right-click the search bar.
3. Click Instance Options.
4. Configure the desired settings for the search widgets.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the search widget. The default for the homepage is Welcome to Knowledge.</td>
</tr>
<tr>
<td>Glyph</td>
<td>An icon that appears in the search bar.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>The color of the search widget. This field appears on the search results page only.</td>
</tr>
<tr>
<td>Bootstrap size</td>
<td>The size of the search widget. This field appears on the search results page only.</td>
</tr>
<tr>
<td>CSS</td>
<td>See widget CSS for details.</td>
</tr>
</tbody>
</table>
### Instance option | Description
---|---
Search Placeholder | Default text that appears in the search bar. This field appears on the homepage only.
Allow Empty Search | Allow empty knowledge base searches. The default for the homepage uses the system property. The default for the search results page is Yes. For an empty search, the search results page returns all results.
Allow Instant Search On Keypress | Enables instant search results as you type a search term. The default for the search results page uses the system property. This field appears on the search results page only.
Minimum Number of Characters for Search | The minimum number of characters required to generate a search.
Wait time (ms) between searches, if instant search is enabled | The time, in milliseconds, to wait between searches if the instant search feature is enabled. The default wait time is 500 ms. This field appears on the search results page only.
Alternate URL Parameters for Search | Alternate parameters that appear in the search results URL. By default these parameters include keyword and query. This field appears on the search results page only.
Alternate URL Parameters for Language | Alternate parameters that appear in the URL denoting the selected language. This field appears on the search results page only.

5. Click **Save**.

*Configure knowledge base tile widget instance options*

Configure widget instance options for the knowledge base tile widgets on the Knowledge Management Service Portal homepage.

Role required: sp_admin or admin

The homepage uses the Knowledge Bases Browse widget to display knowledge base tiles.

1. Navigate to the Knowledge Management Service Portal homepage.
2. Control + right-click a knowledge base tile.
3. Click **Instance Options**.
4. Configure the desired settings for the knowledge base tile widgets.

### Instance option | Description
---|---
Title | The title that appears above the knowledge base tiles. The default is *Explore our Knowledge Bases*.
Bootstrap color | The color of the widget.
CSS | See widget CSS for details.
Configure the home page widget instance options

Configure widget instance options for the widgets used to display popular articles on the Knowledge Management Service Portal homepage.

Role required: sp_admin or admin

The homepage displays links to the featured, most viewed, and most useful articles using several widgets. The featured articles are displayed based on the keywords associated with the articles. For information on displaying articles in the Featured content section, see *Pin a knowledge article*. Most viewed and most useful articles are displayed based on the highest view and use count of the articles.

1. Navigate to the Knowledge Management Service Portal homepage.
2. Control + right-click one of the widgets.
3. Click **Instance Options**.
4. Configure the desired settings for the widget.
Configure sort widget instance options
Configure widget instance options for the knowledge sort widget on the Knowledge Management Service Portal search results page.

Role required: sp_admin or admin

The search results page uses the Knowledge Result Sort widget to provide sort options for the returned list of results. Use the widget instance options to customize the sort options.

1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click the sort options at the top of the results list.
3. Click Instance Options.
4. Configure the desired settings for the sort widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show even when empty</td>
<td>Enable this check box to display the widget even if there are no articles in the list.</td>
</tr>
<tr>
<td>Show Secondary Fields Label</td>
<td>Enable this check box to display the field labels for the additional information displayed for each article.</td>
</tr>
<tr>
<td>Knowledge Base</td>
<td>To restrict the articles that appear in this list to a specific knowledge base, select the knowledge base from the knowledge base list.</td>
</tr>
</tbody>
</table>

5. Click Save.

Configure article list widget instance options
Configure widget instance options for the article lists on the Knowledge Management Service Portal homepage.

Role required: sp_admin or admin

The homepage uses the Article List widget to display different lists of articles, including Featured, Most Useful, and Most Viewed.

1. Navigate to the Knowledge Management Service Portal homepage.
2. Control + right-click one of the article list headers.
3. Click Instance Options.
4. Configure the desired settings for the article list widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>The color of the search widget.</td>
</tr>
<tr>
<td>CSS</td>
<td>See widget CSS for details.</td>
</tr>
<tr>
<td>Hide Relevancy</td>
<td>Removes the relevancy sort option.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that contains the fields used to sort the list of knowledge items. The default table is Knowledge.</td>
</tr>
<tr>
<td>Sort Fields</td>
<td>The fields used for sorting the list of knowledge items.</td>
</tr>
<tr>
<td>Sort Field Labels</td>
<td>The labels for the fields that appear in the sort options. The default is Views:desc,Newest:desc,Alphabetical. The sort order for the sort field labels is alphabetical. To use a descending order, denote :desc.</td>
</tr>
</tbody>
</table>

5. Click Save.
## Instance option | Description
---|---
Title | The title of the article list.
Bootstrap color | The color of the widget.
Glyph | An icon that appears in the widget.
CSS | See *widget CSS* for details.
Table | The table that stores the list articles.
Display Field | The title displayed for each article in the list. By default, this is the article short description.
Secondary Fields | Additional information displayed for each article in the list below the title. By default, this information includes the author, view count, the date that the article was last modified, and the article rating.
Max number of records to show | The maximum number of articles to include in the list.
Show even when empty | Enable this check box to display the article list even if it does not contain any articles.
Show Secondary Fields Label | Enable this check box to display the field labels for the additional information displayed for each article.
Knowledge Base | To restrict the articles that appear in this list to a specific knowledge base, select the knowledge base from the knowledge base list.

5. Click **Save**.

**Configure search results list widget instance options**

Configure widget instance options for the results list widget on the Knowledge Management Service Portal search results page.

Role required: sp_admin or admin

The search results page uses the Knowledge Result widget to provide display options for the returned list of results. Use the widget instance options to customize the display options.

1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click the list of returned search results.
3. Click **Instance Options**.
4. Configure the desired settings for the results list widget.

## Instance option | Description
---|---
Glyph | An icon that appears in the search bar.
CSS | See *widget CSS* for details.
Show Relevancy Score | Shows how relevant each search result is based on the search term. The default setting uses the system property.
Breadcrumb: Hide Categories | Hides the category in the breadcrumb that appears below the article short description or question in the results list. The default setting uses the system property.
Breadcrumb: Knowledge Base Separator | The character used as a separator between the knowledge base and the category in the breadcrumb.

</table>

### 5. Click Save.

Configure filter facet widget instance options

Configure widget instance options for the filter facet widgets on the Knowledge Management Service Portal search results page.

Role required: sp_admin or admin

The homepage uses several widgets to filter the items in the search results list. There are two types of facet widgets:

- Simple field facets based on the Knowledge table fields
- Advanced query facets based on custom queries of the Knowledge table

Use the widget instance options to customize these facet widgets:
• Knowledge Field Facet (for filtering by knowledge base, knowledge category, and author)
• Knowledge Tags Facet (for filtering by tag)
• Knowledge Resource Facet (for filtering by resource, such as articles and social Q&A)
• Knowledge Query Facet (for filtering by rating, last modified, and number of views)

**Note:** Query facets are displayed when there's at least one knowledge field facet added to the page.

1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click a filter facet widget.
3. Click **Instance Options**.
4. Configure the desired settings for the selected type of facet widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Title of the filter facet widget.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon that appears to the left of the title.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which the filter facet widgets appear on the left side of the search results page. If empty, the filter facet widgets sort alphabetically.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>Color of the filter facet widget header.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
<tr>
<td>Source Table</td>
<td>Table that contains the <strong>Source Field</strong> used to provide the filter facet widget options. The default table is Knowledge (kb_knowledge).</td>
</tr>
<tr>
<td>Source Field</td>
<td>Field in the <strong>Source Table</strong> that provides the filter facet widget options. Field types that can be used as a source field include string, choice, glide list, integer, reference, and boolean.</td>
</tr>
<tr>
<td>Facet Identifier</td>
<td>Unique name for the custom query facet that can be used in script code.</td>
</tr>
<tr>
<td>Facet Template</td>
<td>Template that determines the type of facet interaction. Knowledge Field Facet widget templates:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Single Select</strong>: users can select only one filter from this widget.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Multi Select</strong>: users can select more than one filter from this widget.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Dropdown Select</strong>: users can select more than one filter from a drop-down menu.</td>
</tr>
<tr>
<td></td>
<td>Knowledge Query Facet widget templates</td>
</tr>
<tr>
<td></td>
<td>• <strong>Simple Query</strong>: shows a label for each facet value.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Rating</strong>: shows rating stars.</td>
</tr>
<tr>
<td>Custom Template</td>
<td>Custom template that determines facet interaction and value selection.</td>
</tr>
<tr>
<td>Facet Options</td>
<td>Custom query in JSON format for the label, ID, order, and query for each facet value. Includes the table, value (encoded query), and display value (encoded query).</td>
</tr>
<tr>
<td>Instance option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Order by</td>
<td>Order of the filter options within the facet widget. The default order is label, which sorts the options in alphabetical order. For reference fields, you can also state an order from the reference field table.</td>
</tr>
<tr>
<td>Minimum results for showing filter search bar</td>
<td>Minimum number of results required to display a search bar at the top of the filter facet widget.</td>
</tr>
<tr>
<td>Minimum results for showing scroll bar</td>
<td>Minimum number of results required to display a scroll bar in the filter facet widget.</td>
</tr>
<tr>
<td>Maximum length for string field</td>
<td>Maximum field length. Only fields whose length is less than this value are allowed to be added as a filter facet.</td>
</tr>
<tr>
<td>Alternate URL Parameters</td>
<td>Names of the URL parameters used to initialize this filter facet, if used in the URL as a search parameter.</td>
</tr>
<tr>
<td>Fetch Maximum Values</td>
<td>Option to fetch filter values from all knowledge articles in the search results. Selecting the Fetch Maximum Values option might impact the load time for search results. If this option is disabled, the load time improves based on the glide.knowman.search.facet_depth property value. If the glide.knowman.search.apply_acls property is set to true, a filter value can appear in a filter facet even when there are no search results for that filter value. For example, a knowledge base without any articles might appear as a value in the knowledge base filter facet.</td>
</tr>
<tr>
<td>Show Empty Value</td>
<td>If enabled, shows an empty filter facet option that users can select to filter for articles that do not have this field set. For example, if an article does not have an assigned category, clicking the empty option lists all articles with no assigned category.</td>
</tr>
<tr>
<td>Show Only Facet Values Matching Results</td>
<td>Creates a dynamic filter facet widget that displays only those filter values that match the search results rather than showing all values. If you disable this instance option, the time needed to load the filter facet data is reduced.</td>
</tr>
<tr>
<td>Show category hierarchy (valid for kb_category only)</td>
<td>If enabled, shows categories with their hierarchy list up to the fourth-level. When you enable this option, you can select only one category at a time. Any articles that are included in the subcategories beyond the fourth-level also appear in the fourth-level of category. The search results filtered on a selected parent category include articles within that category and all the associated child categories.</td>
</tr>
</tbody>
</table>

5. Click **Save**.

**Configure a user action for the article view page**
Configure a user action for the Knowledge Management article view page in the Knowledge Management Service Portal.

Role required: sp_admin or admin
The article view page uses the Knowledge Article Content widget to provide user actions. Use the widget instance options to customize these actions.

Ensure that the application scope on the Now Platform is set to Knowledge Management Service Portal.

User actions available for the article view page appear in a menu after clicking the overflow icon (≡) in the article header. These actions enable users to flag an article, edit an article, or create an incident for an article.

1. Navigate to the Knowledge Management Service Portal article view page.
2. Control + right-click the article header.
3. Click **Instance Options**.
4. Configure the desired settings for the Knowledge Article Content widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>The color of the widget header.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
<tr>
<td>Hide All Actions</td>
<td>Hides the user actions in the article header including the Subscribe/Unsubscribe button and the overflow icon.</td>
</tr>
<tr>
<td>Show Version Information</td>
<td>Displays version information for the selected article. Requires the Knowledge Management Advanced plugin (com.snc.knowledge_advanced).</td>
</tr>
<tr>
<td>Show Create Incident Action</td>
<td>Displays the Create Incident user action when a user clicks the overflow icon in the article header.</td>
</tr>
<tr>
<td>Create Incident Action Label</td>
<td>The label for the user action that appears in the overflow icon menu. The default is Create Incident.</td>
</tr>
<tr>
<td>Create Incident Action URL</td>
<td>The target URL for the Create Incident user action. If no URL is specified, the system uses the URL in the glide.knowman.create_incident_link system property.</td>
</tr>
<tr>
<td>Redirect to the latest article</td>
<td>Redirects the article view page to the latest accessible version of the article, if available. Disable the Show Version Information option to hide the version information on the article view page because any version link will redirect to the latest version only.</td>
</tr>
</tbody>
</table>

5. Click **Save**.

**Configure article helpful widget instance options**

Configure the Knowledge Article Helpful widget instance options for the Knowledge Management article view page in the Knowledge Management Service Portal.

Role required: sp_admin or admin

The article view page uses the Knowledge Article Helpful widget to allow users to provide feedback on the helpfulness of the article, display a confirmation message after a feedback is provided, and display the percentage of users who found the article to be useful. Use the widget instance options to customize these actions.

1. Navigate to the Knowledge Management article view page in the Knowledge Management Service Portal.
2. Control + right-click **Helpful?**
3. Click **Instance Options**.
4. Configure the desired settings for the Knowledge Article Helpful widget.
### Instance option | Description
---|---
Bootstrap color | The color of the widget header.
CSS | See widget CSS for details.
Show helpful percentage information | Check box to enable the display of percentage of users who found this article to be helpful.
Helpful Action Label | Label for marking this article as helpful or not.
Feedback Message | Text that displays when the user marks the article as helpful or not.

5. Click Save.

**Configure article comments instance options**
Configure the Knowledge Article Comments widget instance options for the Knowledge Management article view page in the Knowledge Management Service Portal.

Role required: sp_admin or admin

The article view page uses the Knowledge Article Comments widget to allow users to rate an article, add a comment, or view existing comments for the article. Use the widget instance options to customize these actions.

1. Navigate to the Knowledge Management article view page in the Knowledge Management Service Portal.
2. Control + right-click the comments section.
3. Click **Instance Options**.
4. Configure the desired settings for the Knowledge Article Comments widget.

### Instance option | Description
---|---
Bootstrap color | The color of the widget header.
CSS | See widget CSS for details.

**Other Options**

### Instance option | Description
---|---
Show User Comments | Displays the field for users to enter comments. Available options:
• Yes - displays the field that enables users to enter comments for the article.
• No - hides the field that enables users to enter comments for the article.
• Use system property - display or hide the comments field using article view properties.
Add Comment Label | Label for the field to add comments.
Maximum number of attachments that can be attached to a comment | Maximum number of attachments that can be attached to a comment included for a knowledge article.
Maximum attachment file size in MB that can be attached to a comment | Maximum attachment file size in MB that can be attached to a comment included for a knowledge article.

5. Click Save.

**Configure related catalog item widget instance options**
Configure the Related Catalog Item widget instance options for the Knowledge Management article view page in the Knowledge Management Service Portal. These options relate to the list of catalog items mapped to an article.
Role required: sp_admin or admin

The knowledge article view page displays the Related Items section when an article has related catalog items. Use the widget instance options to customize the Related Items section on the article view page.

1. Navigate to the Knowledge Management homepage in the Knowledge Management Service Portal by adding /kb to the end of your instance URL.

   Note: Your administrator might have changed this default navigation.

2. Search for and click the article for which you want to modify the instance options for the Related Catalog Item widget.
3. Press Control and right-click the Related Items section.
4. Click **Instance Options**.
5. Configure settings for the Related Catalog Item widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Table</td>
<td>Source table containing related catalog items. The source table specified in the base system is Related Catalog Items (kb_2_sc).</td>
</tr>
<tr>
<td>Source Column</td>
<td>Field in the source table referring to the source record. The source column specified in the base system is Knowledge article (kb_knowledge).</td>
</tr>
<tr>
<td>Title</td>
<td>Title that appears on the widget header. The default title is Related Items.</td>
</tr>
<tr>
<td>Max Number</td>
<td>Maximum number of catalog items to include in the Related Items section on the article view page. The maximum number specified in the base system is 5.</td>
</tr>
<tr>
<td>Use Full Width</td>
<td>Option for displaying the widget in a 12-column grid at 100% of the available width. If you clear the check box, the widget displays at 75% of the available width.</td>
</tr>
<tr>
<td>Target Column</td>
<td>Field in the source table referring to the target record. The target column specified in the base system is Catalog item (sc_cat_item).</td>
</tr>
<tr>
<td>Source Id</td>
<td>URL parameter containing the unique record identifier (sys_id) of the source record. For the article view page, the URL parameter containing the source ID is sys_kb_id.</td>
</tr>
</tbody>
</table>

6. Click **Save**.

**Configure knowledge related articles widget instance options**

Configure the Knowledge Related Articles widget instance options for the Knowledge Management article view page in the Knowledge Management Service Portal. These options relate to the list of related articles mapped to an article.

Role required: sp_admin or admin

The knowledge article view page displays the Related Articles section when an article has related articles. Use the widget instance options to customize the Related Articles section on the article view page.

1. Navigate to the Knowledge Management homepage in the Knowledge Management Service Portal by adding /kb to the end of the URL for your instance.
2. Search for and click the article for which you want to modify the instance options for the Knowledge Related Articles widget.
3. Press Control and right-click the Related Articles section.
4. Click **Instance Options**.
5. Configure settings for the Knowledge Related Articles widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>

</tr>
</tbody>
</table>

6. Click Save.

Search using the Knowledge Management Service Portal

Enter one or more words in the search bar on the Knowledge Management Service Portal homepage to view all search results.

Search results include items in which the short description, content, or attached files include the search term. By default, knowledge search results include articles, pinned articles, and social Q&A.

You can also filter the search results.

Enable multi-language search

The multi-language search facet is available when more than one supported language is enabled. All available languages are displayed in the facet and you can select which languages you want your search results to appear in. Your selection is maintained per session, but not across logins.

1. To enable different languages, activate the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) or activate one of the internationalization plugins for the language you require.

   **Note:** Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.

2. Navigate to Knowledge > Administration > Knowledge Search Properties > Enable multi language search.
3. Select the Yes check box to enable the feature.

   **Note:** If this property is not enabled, you can only search for one language at a time.

Search auto-correct feature

The Knowledge Management Service Portal homepage search tool also includes an auto-correct feature. When enabled, users can auto-correct a typing error in a search term by clicking one of the suggestions.

When a search term contains a misspelling, the search tool displays the search results page and includes one or more suggested terms at the top of the page under the heading Did you mean. Clicking one of these suggestions shows all the search results that match the selected term.

Users with the system administrator role can enable this feature.

1. Navigate to System Properties > Text Search.
2. Set the following properties to true:
   * Suggest alternate search spellings for knowledge or global search (glide.ts.dym.enable_spell_correct).
- Suggest related searches for knowledge or global search (glide.ts.dym.enable_chain_suggest).

3. Click Save.

**Integrating Knowledge Management features with the Service Portal**

To create a consistent user experience for Knowledge Management, integrate Knowledge Management Service Portal in your end-user facing Service Portal.

The Knowledge Management Service Portal includes the following features:

- Multiple knowledge bases
- A Knowledge Management article view page with feedback options
- A Knowledge Management search results page with options to filter and sort search results
- A number of widgets to enable searches, display search results, display knowledge articles, and so on

By default, all knowledge articles in the Service Portal are redirected to the Knowledge Management article view page using the **Knowledge Article View** page route map. If upgrading from a previous release, a system administrator can activate the **Knowledge Article View** page route map to take advantage of the features of the Knowledge Management article view page. For more information, see *Activate the Knowledge Article View page on upgrade*.

System administrators perform the following tasks to integrate the Knowledge Management Service Portal features with the Service Portal:

- **Integrate the Knowledge Management homepage with the Service Portal homepage**.
- **Integrate the Knowledge Management search results page with the Service Portal search results page**.
- **Add the Knowledge Management Service Portal widgets to quickly access knowledge articles from the Service Portal homepage** (Optional).

**Note:** These configurations apply to the base system pages within the Service Portal only.

**Integrate the Knowledge Management homepage with the Service Portal homepage**

Use a page route map to access the enhanced Knowledge Management homepage from the Service Portal homepage.

The Knowledge Management - Service Portal plugin (com.snc.knowledge_serviceportal) is activated.

**Note:** This plugin is activated by default for customers on Madrid and later releases. Existing customers on release versions prior to Madrid must activate the plugin to perform this configuration task. For more information, see *Activate the Knowledge Management Service Portal plugin*.

Role required: admin

The Knowledge Management homepage displays knowledge articles and social Q&A items organized by knowledge base and category, featured content, and popular articles. You use a page route map to access the Knowledge Management homepage from the Service Portal homepage.

1. Navigate to Service Portal > Page Route Maps.
2. Click New.
3. On the Page Route Map form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Portal(s)</td>
<td>Service Portal</td>
</tr>
<tr>
<td>Route from</td>
<td>kb_view2</td>
</tr>
</tbody>
</table>
ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Route to</td>
<td>kb_home</td>
</tr>
<tr>
<td>Active</td>
<td>Selected</td>
</tr>
</tbody>
</table>

**Note:** On the Page Route Map form, you can fill in the **Short Description** and **Order** fields as appropriate.

4. Click **Submit**.

You can now open the Knowledge Management homepage from the Service Portal homepage by clicking the Knowledge link or Knowledge Base icon link.

**Integrate the Knowledge Management search results page with the Service Portal search results page**

Use a custom knowledge search widget to access the enhanced Knowledge Management search results page from the Service Portal search results page.

**Role required: admin**

The Knowledge Management search results page in the Knowledge Management Service Portal includes options to filter and sort search results and a number of widgets to enable searches, display search results, display articles, and so on. In this procedure, to access the Knowledge Management search results page from the Service Portal search results page, you create a custom knowledge search widget named Search Within and add it to the Service Portal search results page.

1. Create a custom knowledge search widget named Search Within.
   a) Navigate to **Service Portal > Service Portal Configuration**.
   b) On the Service Portal page, click **Widget Editor**.
   c) Click **Create a new widget**.
   d) In the Add a Widget dialog box, in the **Widget Name** field, enter **Search Within**.

   The **Widget ID** field is automatically populated based on the widget name.
   e) Click **Submit**.

   The widget HTML template, client script, and server script display in the widget editor.
   f) In the widget editor, enter the following field values to replace any existing text.

   • In the **HTML Template** field, enter the following code to add a link to the Knowledge Management search results page in the Search Within widget from the Service Portal.

   ```html
   <div role="list" class="list-group">
       <span class="list-group-item active">${Search Within}</span>
       <a role="link" class="list-group-item" ng-href="{{data.url}}">${Knowledge}</a>
   </div>
   ```

   • In the **Server Script** field, enter the following code to set the URL parameters for the Knowledge Management search results page:

   ```javascript
   (function() {
       var q = encodeURIComponent($sp.getParameter('q'));
       var kb = $sp.getValue('kb_knowledge_base') || "";
       data.url = '/sp?id=kb_search';
       if(q)
           data.url += "&keyword="+q;
       if(kb)
           data.url += "&kb_knowledge_base="+kb;
   })()
   ```
Note: For more information about these fields, see *Widget developer guide*.

2. Add the custom knowledge search widget to the Service Portal search results page.
   a) Navigate to Service Portal > Service Portal Configuration.
   b) Click Designer.
   c) In the Filter by title or ID field, enter `sp_search`, the ID for the Service Portal search results page, and then select Search.
   d) In the Filter Widget field, search for the Search Within widget and drag it onto the container where you want the widget to appear on the Service Portal search results page.

Tip: To verify the location and appearance of the newly added Search Within widget on the Service Portal search results page, click the Preview tab.

The Search Within knowledge search widget is added to the Service Portal search results page. Clicking Knowledge in the widget and searching for a keyword will redirect you to the Knowledge Management search results page in the Knowledge Management Service Portal.

Add widgets to access knowledge articles from the Service Portal homepage

Add the Knowledge Management Service Portal widgets Featured Articles, Most Useful Articles, and Most Rated Articles to the Service Portal homepage to quickly access knowledge articles.

Role required: admin

For more information about Knowledge Management Service Portal widgets, see *Knowledge Management Service Portal widgets*.

1. Navigate to Service Portal > Service Portal Configuration.
2. Click Designer.
3. Select the Service Portal homepage.
4. In the Filter by title or Id field, enter index, the ID for the Service Portal homepage, and then select Service Portal.

5. In the Filter Widget field, search for the following Knowledge Management Service Portal widgets, and then drag them onto the container where you want them to appear on the Service Portal homepage.

<table>
<thead>
<tr>
<th>Widget Name</th>
<th>Widget Display Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Featured Articles</td>
<td>Featured Articles</td>
</tr>
<tr>
<td>Knowledge MostUseful Articles</td>
<td>Most Useful Articles</td>
</tr>
<tr>
<td>Knowledge MostViewed Articles</td>
<td>Most Viewed Articles</td>
</tr>
</tbody>
</table>

Tip: To verify the location and appearance of the added widgets on the Service Portal, click the Preview tab.

Clicking a knowledge article link from one of the added widgets on the Service Portal homepage opens the Knowledge Management article view page in the Knowledge Management Service Portal.

Features not yet supported on Knowledge Management Service Portal

The following features are not yet supported on the Knowledge Management Service Portal:

- Article import on the Search results page
- Hierarchical categories on the Article view page
- Live Feed support for Social Q&A on the Article view page
- Tags added in Social Q&A are not honored in search results

The glide.knowman.portal.enable_redirect property is not honored for the following use cases:

- Contextual search in the Incident form
- Connect

Configure knowledge bases for a portal

Select which knowledge bases are displayed in a portal to view the associated knowledge articles. If no knowledge bases are configured, users can view articles from all knowledge bases in the portal.

Role required: admin

1. Navigate to Service Portal > Portals.
2. Select the portal for which you want to enable search for the desired knowledge bases.
3. In the Knowledge Bases related list, click Edit.
4. On the Edit Members form, move the desired knowledge bases from the available items in the Collection column to the Knowledge Bases List column.
5. Click Save.

Configure knowledge subscriptions

Configure knowledge subscriptions by activating the Knowledge Management Advanced plugin and setting the subscription properties.

Ensure that the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated.

Note: The Knowledge Management Advanced plugin activates the Subscriptions and Activity Feed Framework plugin (com.snc.activity_subscriptions).

Role required: knowledge_admin or admin

1. Navigate to Knowledge > Administration > Properties.
2. In the KM Subscription Properties section, configure the following properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable subscribe feature for KM</td>
<td>Enables or disables the Knowledge Management knowledge subscriptions feature.</td>
</tr>
<tr>
<td>[glide.knowman.enable_km_subscription]</td>
<td></td>
</tr>
<tr>
<td>List of roles (comma-separated) who can have subscription feature</td>
<td>A comma-separated list of the roles that can use the knowledge subscriptions feature and subscribe to knowledge bases and articles.</td>
</tr>
<tr>
<td>[glide.knowman.enable_km_subscription.roles]</td>
<td></td>
</tr>
<tr>
<td>List of workflow states (comma-separated) that can have subscription feature</td>
<td>A comma-separated list of the article states for which the knowledge subscription feature is available. The default states include Draft, Review, and Published.</td>
</tr>
<tr>
<td>[glide.knowman.enable_km_subscription.workflow_state]</td>
<td></td>
</tr>
</tbody>
</table>
3. Click Save.

Knowledge subscription email notification templates

The knowledge subscription feature uses email notification templates to send subscription notifications to knowledge users.

<table>
<thead>
<tr>
<th>Email template</th>
<th>Subscription type</th>
</tr>
</thead>
<tbody>
<tr>
<td>KM Subscription: Article created</td>
<td>Knowledge base</td>
</tr>
<tr>
<td>KM Subscription: Article revised in KB</td>
<td>Knowledge base</td>
</tr>
<tr>
<td>KM Subscription: Article checked out</td>
<td>Knowledge article</td>
</tr>
<tr>
<td>KM Subscription: Article revised</td>
<td>Knowledge article</td>
</tr>
<tr>
<td>KM Subscription: Article commented</td>
<td>Knowledge article</td>
</tr>
</tbody>
</table>

Users with the admin or knowledge_admin role can customize these email notification templates. To locate the template, navigate to System Notifications > Email > Notifications. For more information about customizing a template, see Create an email notification.

Subscription notifications include a link at the bottom of the email to the user’s Notification Preferences page.

Knowledge Management Analytics and Reporting Solutions

Analytics and Reporting Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Analytics and Reporting Solutions

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With Analytics and Reporting Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

**Important:** Set up and test Analytics and Reporting Solutions on a non-production instance before enabling them in production. You can set up Performance Analytics on a non-production instance without a subscription.

**Note:** Analytics and Reporting Solutions provide all the configuration records required to analyze default applications. Customize these records for use in your production environment. For more information, see Configure Analytics and Reporting Solutions.

To enable the solution for Knowledge Management, an admin can navigate to Performance Analytics > Guided Setup. Click Get Started then scroll to the section for Knowledge Management. The guided setup takes you through the entire setup and configuration process.

Domain separation and 'Run As' user

By default, System Administrator is the Run As user for data collection jobs in the Analytics and Reporting Performance Analytics Solutions. Verify that this user exists on the instance, and whether this user has the appropriate level of access. An inappropriate Run As user can cause errors or limit the data that is collected. This setting only has an effect if domain separation is enabled.
New and deprecated versions of this solution

In London, this Solution was replaced with a new version, `com.snc.pa.knowledge_v2`. If you activated an earlier version of the Solution and then upgraded your instance, you still have and can still use the earlier Solution. You can also activate the newer version without losing data from existing indicators and breakdowns. If you activate the newer version, run a historical data collection job to populate any new indicators and breakdowns.

Knowledge Management dashboard

The Knowledge Management dashboard helps knowledge content owners and managers to determine the usage and quality of their knowledge content and ensure the proper processes and procedures are being followed for content creation.

CSM Knowledge Management dashboard indicators

The CSM Knowledge Management dashboard provides three views, into content usage, content governance, and content quality.

The Knowledge Management dashboard presents the following key performance indicators:

**% of Knowledge Articles Published**

A daily calculation using the formula $\frac{\text{Number of knowledge articles published}}{\text{Number of knowledge articles active}}$

**% of Knowledge Articles Flagged**

A daily calculation using the formula $\frac{\text{Number of knowledge articles flagged}}{\text{Number of knowledge articles active}}$

**Monthly Average Article Rating**

A monthly calculation of the sum of all article ratings for the month divided by the number of knowledge articles rated for the month.

**Average Click Rank**

A monthly calculation using the formula $\frac{\text{Sum of knowledge search ranks}}{\text{Number of knowledge searches with rank}}$

**Click Through Rate**

A monthly calculation using the formula $\frac{\text{Number of knowledge searches with rank}}{\text{Number of knowledge searches}}$

**Article Quality Index**

A monthly calculation using the formula $\frac{\text{Sum of AQI scores}}{\text{Number of AQI records}}$

**Average Time to Publish**

The average time to publish is recalculated daily, as a number of days. The goal of the indicator is for scores to minimize.

**Sum of AQI Scores - Monthly**

The sum of all Article Quality Index scores created in a month, calculated monthly. The goal is for scores to maximize.
Number of AQI Records - Monthly
The number of Article Quality Index records created in a month, calculated monthly. The goal is for the number to maximize.

Number of Active Users Who Performed Searches - Monthly
The number of knowledge searches made in a month, calculated monthly. The goal is for the number to maximize.

Sum of Knowledge Search Ranks - Monthly
The sum of feedback rankings of knowledge searches made in a month, excluding empty Highest Click Rank values. The goal is for the number to maximize.

Number of Knowledge Searches with Rank - Monthly
The number of knowledge searches in a month where the Highest Click Rank has a value higher than zero. The goal is for the number to maximize.

Number of Knowledge Searches - Monthly
The number of knowledge searches in a month. The goal is for the number to maximize.

Number of Knowledge Articles Rated - Monthly
The number of knowledge feedback records created in a month, excluding records where the Rating field is empty. The goal is for the number to maximize.

Number of Knowledge Articles Published
A daily count of the total number of knowledge articles that have entered the Published state. The goal is for the number to maximize.

Number of Knowledge Articles Flagged
A daily count of the number of active knowledge articles, with up-to-date workflows, that were flagged. The goal is for the number to maximize.

Number of Knowledge Articles Active
A daily count of the number of active knowledge articles with up-to-date workflows. The goal is for the number to maximize.

Breakdowns
The following breakdowns apply to the indicators on the dashboard:

- Time to Publish Groups
- Knowledge Base
- Knowledge Category

Reports
The dashboards include the following reports:
<table>
<thead>
<tr>
<th>Title</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Articles with Inactive Authors</td>
<td>Column</td>
<td>Active = true and Author.Active = False</td>
</tr>
<tr>
<td>Invalid Articles</td>
<td>Column</td>
<td>Active = true and Workflow is one of Draft, Review, Published or Pending</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Retirement and Valid to is before today and latest = true</td>
</tr>
<tr>
<td>Articles Created Over 1 Year</td>
<td>Column</td>
<td>Active = true and Created = before 1 year ago</td>
</tr>
<tr>
<td>Articles not Published</td>
<td>Column</td>
<td>Active = true and Workflow is Draft or Review</td>
</tr>
</tbody>
</table>

**Integration with external knowledge sources**

Use the external content integration feature to integrate content from various external sources and enable unified knowledge search results.

Users store and manage knowledge using various external sources and search each source separately for relevant results. External content integration enables acquiring and searching all WebDAV-compliant source content from a single location. This provides users with a seamless search experience across multiple knowledge sources and drives more usage to the platform.

Using this feature, knowledge administrators can define the external content to be imported into a knowledge base and periodically run a job to import the content. Knowledge users have a seamless user experience searching for relevant content across multiple knowledge sources.

**Activate the External Content Integration plugin**

The External Content Integration feature is activated with the Knowledge Management - External Content Integration plugin (com.snc.knowledge.external_integration).

Role required: admin

The Knowledge Management - External Content Integration plugin is not active by default.

The following plugins are automatically activated when the Knowledge Management - External Content Integration plugin is activated:

- Centralized Connection and Credentials plugin (com.snc.core.automation.connection_credential)
- Knowledge Management V3 plugin (com.snc.knowledge3)
- Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer)
The **Knowledge > Administration** module displays the **External Knowledge Sources** and **External Knowledge Jobs** sub-modules when the Knowledge Management - External Content Integration plugin is activated.

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in *Request a plugin*.  
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise they will receive the following error: *Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.*

---

**Define an external knowledge source**

Before you import content, create and configure the connection between the a Web Distributed Authoring and Versioning (WebDAV) - compliant external knowledge source and the ServiceNow knowledge base into which you want to import content. Define import parameters for the external knowledge source.

Define **basic authentication credentials** and **create an HTTP connection** to the external source.

**Caution:** This feature expects that the external source endpoint is a publicly accessible endpoint. Mid-server configuration is not supported.

Role required: admin

Only basic authentication is supported for the external content integration feature.

1. Define the connection from the external source and the target knowledge base.
   a) Navigate to **Knowledge > Administration > External Knowledge Sources**.  
   b) Click **New**.  
   c) Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Instruction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter unique name for the external source.</td>
</tr>
<tr>
<td>Target Knowledge Base</td>
<td>Select the knowledge base in which you want to create articles for the external content.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Select the connection alias to connect to the external source.</td>
</tr>
</tbody>
</table>

   d) Right-click the form header and click **Save**.

2. Set import parameters for the external content.
   a) In the **Parameter** related list, click **New**.  
   b) In the **Name** field, select the name of the parameter from the drop-down list.  
   c) In the **Value** field, enter the desired value for the parameter.

   The table below lists the parameters and the corresponding values that can be set for the external source.
<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum size limit (in MB) for this source</td>
<td>Set maximum allowed content size for this source. Once this limit is reached, no further content is processed. Default value is 400 MB.</td>
</tr>
<tr>
<td>Maximum size limit (in KB) per file/content in this source</td>
<td>Set maximum allowed size limit for each file from this external source. If a file exceeds this limit, that file is not processed. Default value is 4000 KB.</td>
</tr>
<tr>
<td>Open search results in the original source system</td>
<td>Set value to <code>true</code> to open search results in the external source system. Set value to <code>false</code> to open search results in the target knowledge base. Default value is set to <code>false</code>.</td>
</tr>
<tr>
<td>Include folders with names that match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for folder names that need to be included from this external source.</td>
</tr>
<tr>
<td>Exclude folders with names that match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for folder names that need to be excluded from this external source.</td>
</tr>
<tr>
<td>Create articles when file names match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for file names that need to be included to create articles.</td>
</tr>
<tr>
<td>Do not create articles when file names match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for file names that need to be excluded to create articles.</td>
</tr>
<tr>
<td>Maximum retry limit</td>
<td>Maximum number of retries to send request to the external source.</td>
</tr>
</tbody>
</table>

d) Click **Submit**.

### Import content from an external knowledge source

Run an import job manually or set up a schedule to process the integrated external content.

Role required: admin or knowledge_admin

Each external source is associated with two handlers: the Acquire handler and the Process handler, for running the import job. The acquire handler uses a WebDAV client to acquire external content to create articles. You can customize the process handler to assign categories to articles or populate additional metadata for the knowledge articles.

1. Navigate to **Knowledge > Administration > External Knowledge Sources**.
2. Select the external knowledge source from which you would like to import content.
3. In the **Handler** tab, set a schedule to run the acquire and process handlers.
4. In the Related Links section, click **Run Scheduled Job**.
5. To view all jobs scheduled to run to import content for the external source, click the **Jobs**.
   You can open the most recent job to monitor the status.

For each file in the external content source, a blank knowledge article is created and the external file is added as an attachment to the article. The short description of the article is derived from the file name of the external content source.
Open knowledge search results in source system

Configure the URL to the external source system to open articles from search results directly in the source system.

Make sure the Open search results in the original source system import parameter for the external knowledge source is set to true.

You can follow this procedure when you have a file as a knowledge article in Microsoft SharePoint, for example.

Role required: admin

1. Navigate to System Definition > Script Includes.
2. Open KBWebDAVContentHandler.
3. In the Script window, override the function getFileURL using script shown below.
   The getFileURL function is shown below.

   ```javascript
   getFileURL: function(fileObj) {
   //write your logic here
   },
   ```
4. Click Update.

Sample configuration for integrating external knowledge content

You can integrate content from multiple external sources so your users can acquire and search knowledge from a single location. Use this sample configuration to create a connection to your external account, configure external knowledge sources, and import content to enable search results for unified content.

Requirements for integrating external content

Make sure the Knowledge Management -- External Content Integration plugin (com.snc.knowledge.external_integration) is enabled and your external source is WebDAV-compliant.

Integrate external knowledge sources into the Knowledge Management application

Create authentication credentials and a connection alias to connect your external knowledge source to the ServiceNow Knowledge Management application. Define import parameters for your external source to import integrated content.

Role required: admin

1. Enable basic authentication on your external account.

   Note: Your external account password is not affected when you enable basic authentication.
2. Create the connection to your external account using the basic authentication credentials.
   a) Navigate to Connections and Credentials > Credentials.
   b) Click New.
   c) Click Basic Auth Credentials.
      Fill in the following fields:

      | Field    | Description |
      |----------|-------------|
      | Name     | Name for the credential. For example, Demo_Auth. |
      | User name| The external account user name created for basic authentication. |
      | Password  | The external account password for the user name. |

   d) Click Submit.

3. Create an HTTP connection to your external account.
   a) Navigate to Connections & Credentials > Connection & Credential Aliases.
   b) Select New.
   c) In the Name field, enter the name of the connection alias.
      For example, Demo_Account.
   d) Right-click the form header and click Save.
   e) In the Connections related list, click New.
      Fill in the following fields:

      | Field       | Description |
      |-------------|-------------|
      | Name        | Name for the HTTP connection. For example, Demo_Connection. |
      | Credential  | Credential created to connect to the external account. For example, Demo_Auth. |
      | Connection URL| WebDAV URL to your external account. This is the WebDAV end point of your external account. |

      **Note:** You can also import contents from a specific folder by appending the folder path to the URL. For example, https://<web link to your external_account>/KnowledgeIT.

   f) Click Submit.

4. Configure the external knowledge source for importing content.
   a) Navigate to Knowledge > Administration > External Knowledge Sources.
   b) Click New and fill in the following fields:

      | Field          | Description |
      |----------------|-------------|
      | Name           | Unique name for the external source. For example, Demo_knowledge. |
      | Target Knowledge Base | Knowledge base in which you want to create articles for the external content. For example, IT. |
      | Connection Alias | Connection alias to connect to the external source. For example, Demo_Account. |
c) Right-click the form header and select **Save**.

d) In the Parameter related list, click **New**.

e) On the Parameter form, select the name of the import parameter that you want to configure for your external source and then set the value for the parameter.

The table below lists the parameters and the corresponding values that can be set for the external source.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum size limit (in MB) for this source</td>
<td>Maximum allowable content size to import from your external source. For example, 250 MB.</td>
</tr>
<tr>
<td>Maximum size limit (in KB) per file/content in this source</td>
<td>Maximum allowable size for each article, including attachments, that you can import from this external source. For example, 2000 KB.</td>
</tr>
<tr>
<td>Open search results in the original source system</td>
<td>Opens search results in the external source system if this value is set to true.</td>
</tr>
<tr>
<td>Include folders with names that match these regex patterns</td>
<td>Comma-separated list of regular expressions for folder names to include from this external source. For example, to include all folders names that start with the letters a and b, enter a.<em>,b.</em>.</td>
</tr>
<tr>
<td>Exclude folders with names that match these regex patterns</td>
<td>Comma-separated list of regular expressions for folder names to exclude from this external source. For example, to exclude all folders names that start with the letters a and b, enter a.<em>,b.</em>.</td>
</tr>
</tbody>
</table>
| Create articles when file names match these regex patterns | Comma-separated list of regular expressions for file names that to include when creating articles. For example, to include all file names have .docx and .pdf extensions, enter .*
docx,.*
\pdf. |
| Do not create articles when file names match these regex patterns | Comma-separated list of regular expressions for file names to exclude when creating articles. For example, to exclude file names have .docx and .pdf extensions, enter .*
docx,.*
\pdf. |
| Maximum retry limit | Maximum limit for the number of times a connection request can be sent to the external source. For example, 5. |

*Import content from an external knowledge source.*

**Use extension points for Knowledge Management**

Use UI extension points to add knowledge article headers and footers to knowledge articles and to customize the email template for notifications when a knowledge article is commented on. Use scripted extension points to customize the feedback object used in the email template for notifications when a knowledge article is commented on.

The Knowledge Management Advanced plugin (com.snc.knowledge_advanced) must be activated to view the KMFeedbackNotification UI extension point and the KMFeedbackObject scripted extension point. These notifications are part of the Subscriptions feature, which is activated with this plugin.

Role required: admin
Using extension points makes it easier to integrate customizations without actually altering the base code. You can extend standard base functionality using customized scripts.

To use UI extension points in Knowledge Management, create an implementation and change the data as required. You can create multiple implementations per extension point, but for these scenarios, the use is limited to one implementation only. Example code is provided in the extension point, which can be edited, as required.

An implementation is delivered in the base system for scripted extension points. You can change the data and add additional fields, as required.

1. To use UI extension points to customize headers and footers in knowledge articles, and the email notification that is sent when a knowledge article is commented on:
   a) Navigate to System Extension Points > UI Extension Points.
   b) Click the UI extension point you want to use.
      
      **Note:**
      - Use the KMArticleViewFooter and KMArticleViewHeader UI extension points to add knowledge article headers and footers to the knowledge article view pages (kb_view.do) in Knowledge Management v3.
      - Use the KMFeedbackNotification UI extension point to customize the email template for notifications when a knowledge article is commented on.

   c) Click Create Implementation.
   d) Change the data as required.
   e) Click Update.

2. To use scripted extension points to update the feedback object used in the email template for notifications when a knowledge article is commented on:
   a) Navigate to System Extension Points > Scripted Extension Points.
      
      **Note:** Use the KMFeedbackObject scripted extension point to customize the feedback object used in the email template for notifications when a knowledge article is commented on.

   b) In the API Name column, click global.KMFeedbackObject.
   c) In the Implementations related list, click the KMFeedbackObjectBaseImpl class.
   d) Change the data and add additional fields, as required.
   e) Click Update.

**Duplicate knowledge article numbers**

Importing knowledge articles into an instance can create articles with duplicate numbers.

The Knowledge Number field is auto-generated and is incremented every time you create a new article in an instance. The initial value for the Number field is 10,000. To customize this number:

1. Navigate to System Definition > Number Maintenance.
2. In the Table column, search for and select Knowledge.
3. In the Controls related list, in the Number field, enter a new number.
4. Click Update.

Importing knowledge articles from another instance or as part of the demo data for another application may introduce an article with a number that is already in use. Because the Knowledge Number field is not uniquely indexed, the import completes without error.

With duplicate knowledge article numbers present, links to article view pages that use the knowledge number can behave inconsistently. For example, if there are two articles with the same Knowledge number KB0000033, the following link may open either of these two articles randomly: `kb_view.do?sysparm_article=KB0000033`. This can happen in Knowledge search results where clicking on a result opens a different article instead of the article displayed in the search results.

**Avoiding duplicate Knowledge article numbers**

To avoid inserting Knowledge articles with duplicate numbers into a production environment:

- Do not import demo data articles in production environment.
- Verify the numbers of the articles to be inserted to make sure they are not already in use.
- Create a before insert business rule on the Knowledge table (kb_knowledge) to ensure the new number is not already in use.

You can also update the initial value for the Knowledge Number field so that newly created articles do not conflict with existing articles.

1. Navigate to System Definition > Number Maintenance.
2. In the Table column, search for and select Knowledge.
3. In the Controls related list, in the Number field, update the count to a number greater than the largest value already in the system.
4. Click Update.

**Train the similarity solution for Knowledge Management to find related articles**

Train the Knowledge Similar Articles solution definition included within the Predictive Intelligence for Knowledge Management capability to find related knowledge articles when creating or viewing a knowledge article.

Ensure that the Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml) and Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml) are activated.

Role required: admin

1. Navigate to Predictive Intelligence > Similarity > Solution Definitions.
2. In the Similarity Definitions list, search for and select the Knowledge Similar Articles solution definition (ml_sn_global_knowledge_similar_articles).
3. On the Similarity Definition form, verify the default field values for knowledge articles. For more information about the Similarity Definition form fields, see Create and train a similarity solution.

**Note:** If the application scope isn’t set to Knowledge Management - Machine Learning, you cannot edit the form and a warning message appears. To make the form editable, click the word here at the end of the message.

4. Click Update & Retrain.
5. Open the Similarity Definition form for the Knowledge Similar Articles solution definition (ml_sn_global_knowledge_similar_articles).
6. In the ML Solutions related list, view the training solution progress in the Progress column.
When Progress is 100%, in the ML Solutions related list, you can include more useful related articles by reviewing the similarity examples based on the similarity score and updating the similarity score threshold value.

7. Optional: Update the similarity score threshold.
   a) In the Active column, click the link for the solution.
   b) Review the similarity examples by clicking the Similarity Examples related link on the ML Solution form.
      For more information, see Review solution similarity examples.
   c) In the Solution Statistics related list on the ML Solution form, enter the required value in the Similarity Score Threshold field, right-click the ML Solution form, and then click Save.
      For more information, see Update your similarity score threshold.

When the solution is complete, the related knowledge articles appear in the Knowledge results section on the Knowledge form in the Now Platform, in the Related Articles section on the knowledge article view page in the Knowledge Management Service Portal, and in Agent Assist when the Similar Articles (ML) option is selected.

Automating feedback management to improve content

Manage high volumes of article feedback by enabling task generation for negative feedback. When an article is rated poorly or marked as unhelpful, a feedback task is generated.

If an ownership group is assigned to the article, the feedback task is assigned to the manager of the ownership group. Ownership group managers can reassign tasks to another group member, or group members can assign a feedback task to themselves.

If no ownership group is assigned to the article, the feedback task is assigned to the author or reviser of the article.

The task assignee can update the article, create a new article, request additional feedback, or reassign the task and receives notification after the feedback is updated or resolved.

Note: The actionable feedback feature is available in the Knowledge Management Service Portal and Agent Workspace. To use the actionable feedback feature in other service portals, you can activate the Knowledge Article View page route map.

Beginning with New York, the Knowledge Article View page route map is activated by default. Existing customers on release versions prior to New York can activate the Knowledge Article View page route map. For more information, see Activate the Knowledge Article View page on upgrade.

Enable actionable knowledge feedback

The actionable knowledge feedback feature is available when the Knowledge Management Service Portal (com.snc.knowledge_serviceportal) plugin is activated and the actionable knowledge feedback properties are enabled.

Role required: admin

The actionable feedback feature is available in the Knowledge Management Service Portal and Agent Workspace. To use the actionable feedback feature in other service portals, you can activate the Knowledge Article View page route map. For new customers, the Knowledge Article View page route map is activated by default.

A feedback task is created for an article when the article is flagged. For generating feedback tasks when an article is marked as not helpful or rated below a set value, you must set the following associated properties.

1. Navigate to Knowledge > Administration > Properties.
2. In the Actionable Feedback Properties section, configure the following properties:
<table>
<thead>
<tr>
<th>Property</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create actionable feedback task when an article is flagged</td>
<td>By default, the property is set to Yes and feedback tasks are created when the article is flagged.</td>
</tr>
<tr>
<td>Create actionable feedback task when an article is marked as not helpful</td>
<td>Select Yes.</td>
</tr>
<tr>
<td>Create actionable feedback task when an article is rated at or lower than this value. 0 or no value indicates that actionable feedback tasks are not enabled for Rating type feedback</td>
<td>Enter a value from 1 to 5 to specify the rating threshold for generating a feedback task. For example, if you set this value to 3, a feedback task is generated when a user selects three or less stars to rate an article.</td>
</tr>
</tbody>
</table>

**Note:** If you enter '0', a negative article feedback does not generate a feedback task.

3. Click Save.

### Work on a feedback task

You can change the state of a task and resolve or reassign tasks generated by article feedback.

**Role required:** knowledge

- If no ownership group is assigned to the article, the feedback task is available to you as the author or reviser of the article.
- If an ownership group is assigned to the article, a feedback task is assigned to you as an ownership group manager. As a manager, you can reassign the task to another group member. All group members see the feedback task in All Open Tasks. As a group member, you can reassign the task to yourself to appear in My Assigned Tasks.

1. Navigate to Knowledge > Feedback Management > My Assigned Tasks.
2. Select a feedback task.
3. Review the feedback given by the submitter.

When a feedback task is generated, the information in the article feedback form is copied to the feedback task form as follows:

<table>
<thead>
<tr>
<th>Feedback task form field</th>
<th>Information from article feedback form</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason</td>
<td>The selected reason for the feedback.</td>
</tr>
<tr>
<td>Description</td>
<td>Text in the Details field.</td>
</tr>
</tbody>
</table>

**Note:** If feedback is negative and the Details field is left blank, this field indicates whether the article was not helpful or rated poorly.

4. To work on the feedback task:

<table>
<thead>
<tr>
<th>Change the feedback task state to</th>
<th>If you want to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work in progress</td>
<td>Start working on the feedback task.</td>
</tr>
<tr>
<td></td>
<td>You can save the feedback task and edit the article or <strong>create a new article</strong> if the information in the existing article is irrelevant or obsolete.</td>
</tr>
</tbody>
</table>
Change the feedback task state to | If you want to
--- | ---
Awaiting information | Request clarification from the feedback submitter.

In the Additional Comments field, enter information you need from the submitter and click Update. This triggers an email notification for the feedback task submitter.

Resolved | Resolve the feedback task.

In the Resolution Code field, select the code for resolving the article. In the Resolution notes field, enter the reason for the resolution and click Update. An email notification is sent to the feedback submitter. The email notification includes the portal URL for the article from where the feedback submitter can accept or reject the feedback.

Closed | Close the feedback task without the submitter having to accept the feedback resolution.

Note: If the submitter accepts the feedback resolution, the state for the feedback task is automatically set to Closed. You can view all closed feedback tasks in your queue by navigating to Knowledge > Feedback Management > My Closed Tasks.

Track the progress on a feedback task

Monitor open and closed feedback tasks and track the duration of time a feedback task remains in each state.

Role required: Owner of the knowledge base, knowledge_manager, knowledge_admin, or admin

1. Navigate to the open or closed tasks you want to track.

<table>
<thead>
<tr>
<th>To</th>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td>View open feedback tasks</td>
<td>Knowledge &gt; Feedback Management &gt; All Open Tasks and select a feedback task.</td>
</tr>
<tr>
<td>View closed feedback tasks</td>
<td>Knowledge &gt; Feedback Management &gt; All Closed Tasks and select a feedback task.</td>
</tr>
</tbody>
</table>

2. In the Knowledge Feedback Task Metrics related list section, select a feedback task metric to view the start and end time and the duration of the feedback task.

Note: If you are a knowledge administrator, you can view the feedback tasks and task metrics of articles in the knowledge bases. If you are a knowledge owner or knowledge manager, you can view feedback tasks and task metrics of all articles in the knowledge bases you own or manage.

Knowledge-Centered Service configuration

Knowledge-Centered Service configuration (KCS) is a method for the creation and continuous improvement of knowledge based on the experience of agents and the patterns observed by knowledge reuse.

ServiceNow Knowledge Management is a KCS (V6) verified product. As a KCS (V6) verified product, Knowledge Management provides features to improve knowledge, such as article quality reviews, in-context knowledge capture, and feedback management.
Article quality index for knowledge management

Assess the quality of knowledge articles with the article quality index (AQI). The AQI helps maintain consistent quality of knowledge articles attached to a knowledge base where articles are written by various authors.

Using AQI feature, a knowledge administrator (a user with knowledge_admin role) creates a checklist and adds a set of true or false questions to the checklist to assess the quality of knowledge articles. For each question, the knowledge_administrator assigns a weight based on its importance to the quality measurement and then attaches the checklist to a knowledge base.

A knowledge reviewer (a user with knowledge_coach and knowledge_domain_expert role) performs AQI review on knowledge articles attached to the knowledge base by answering the true or false questions in the checklist. The article quality is then scored based on the cumulative weight of all answers set to true in the checklist.

The average AQI scoring is displayed on the Content Quality tab of the Knowledge Management dashboard (see Knowledge Management dashboard).

Activating article quality index

The article quality index feature is activated with the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin. For details see, Activate the Knowledge Management Advanced plugin.

Create an AQI checklist

Create a checklist of questions that reviewers can use to evaluate the quality of knowledge articles.

Role required: knowledge_admin or admin

1. Navigate to Knowledge > Article Quality Index > AQI checklists, and click New.
2. Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Checklist</td>
<td>Name for the checklist.</td>
</tr>
<tr>
<td>Description</td>
<td>Description for the checklist.</td>
</tr>
</tbody>
</table>

3. Right-click the form header and click Save.
4. In the Checklist Questions related list, add questions to the checklist.

Add questions and adjust the weight of the questions until the combined weight of all questions is equal to 100. The weight defines the score that is added to the total AQI review score of the article when the answer for that question is set to true. The maximum score that can be applied to an article in an AQI review is 100.

Note: The default AQI pass score is 70. You can change the pass score in the Article Quality Index properties.

To add a question:

a) Click New.

b) Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Question</td>
<td>Text for the question to evaluate articles.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description for the question.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Order</td>
<td>Value for the display order of questions in the checklist. The lower the value in the Order field, the higher the question displays in the checklist. <strong>Note</strong>: Before you assign a value for the display order, think about how many questions you would create for the checklist. For example, if you have five questions in a checklist, you can assign the value in increments of 20. This ensures that you have enough values to assign if you add questions to the checklist later.</td>
</tr>
<tr>
<td>Weight</td>
<td>A value for the question to score the article quality. This value is added to the AQI score when the answer for the question is set to true. <strong>Note</strong>: • The combined weight of all questions cannot exceed 100. • The sum of weights of all questions in a checklist must be equal to 100 to be assigned to a knowledge base.</td>
</tr>
</tbody>
</table>

c) Click Submit.

5. After you finish adding questions to the checklist, click Update on the AQI Checklist form.

After you create a checklist, assign it to a knowledge base.

Assign an AQI checklist to a knowledge base

Before a knowledge reviewer can start performing the AQI review, you must assign an AQI checklist to a knowledge base.

You can only assign a checklist to a knowledge base when the weight of all questions in the checklist is equal to 100. Each knowledge base can have one assigned checklist. However, a checklist can be assigned to more than one knowledge base.

Role required: knowledge_admin or admin

1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Click a knowledge base to which you want to assign a checklist.
3. On the Knowledge Base form, click the search icon in the Checklist field and select the AQI checklist to apply.
4. Click Update.

After you assign an AQI checklist to a knowledge base, you can start performing AQI reviews.

Remove an AQI checklist from a knowledge base

Before you can edit a checklist that is assigned to a knowledge base, you must remove it from the knowledge base.
A checklist with pending AQI reviews cannot be removed from the knowledge base until all AQI reviews associated with the checklist are complete.

Role required: knowledge_admin or admin

1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Click a knowledge base from which you want to remove a checklist.
3. On the Knowledge Base form, delete the name of the AQI checklist from the Checklist field.
4. Click Update.

Delete questions from an AQI checklist

Deleting a question in a checklist deletes the text in the question of previously performed AQI reviews that use the checklist. Deleting an AQI question from a checklist will not affect the score of the previously performed AQI reviews. However, the text of the question will not be displayed in the checklist.

You can delete questions from a checklist if the following conditions are met:

• The checklist is not attached to a knowledge base. For more information, see Remove an AQI checklist from a knowledge base.
• There are no AQI reviews using the checklist in progress.

Role required: admin

1. Navigate to Knowledge > Article Quality Index > AQI checklists.
2. Click the AQI checklist from which you want to delete one or more questions.
3. In the Checklist Questions related list, select the check box next to the questions that you want to delete.
4. From the Actions on Selected Rows choice list, select Delete.
5. In the Confirmation window, click Delete.

Perform an AQI review

Perform the AQI review to evaluate the quality of the article.

The knowledge base must have an assigned AQI checklist.

Role required: knowledge_domain_expert, knowledge_coach, knowledge_admin, or admin

Configure the glide.knowman.aqi.article_workflow_states property to set the article workflow states where you could perform AQI reviews. You can perform several AQI reviews for an article. If you perform several AQI reviews for the same version of the article, the latest AQI score appears in the Latest AQI field in the article.

1. Navigate to Knowledge > Articles and click Published.
2. Click an article link.
3. Perform the AQI review.

<table>
<thead>
<tr>
<th>Option</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>The AQI review is not yet started.</td>
<td>Click Perform AQI in the form header.</td>
</tr>
<tr>
<td>The AQI review was started and is pending.</td>
<td>Click Continue AQI in the form header.</td>
</tr>
</tbody>
</table>

4. In the Article Checklist Answers related list, read the questions and evaluate which ones are true. Double-click the Answer cell for each question that is true, select true, and click the green check mark.

Note: The associated Weighted Score is applied to the AQI score when the answer is set to true.
5. Perform one of the following actions:

<table>
<thead>
<tr>
<th>To</th>
<th>Do This</th>
</tr>
</thead>
<tbody>
<tr>
<td>Submit the completed AQI review.</td>
<td>Click Submit.</td>
</tr>
</tbody>
</table>

Click Submit.

The form refreshes and the total score of the AQI review is displayed in the AQI score field.

The system sends an email notification as follows:

- If the AQI review was performed on the first version of the article, the system sends an email notification to the author of the article.
- If the AQI review was performed on subsequent versions of the article, the system sends an email notification to the author and creator of the article versions.

**Note:** The notification includes the AQI review score and AQI review result. You can customize the content and design of the notification emails.
<table>
<thead>
<tr>
<th>To</th>
<th>Do This</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save the pending review to complete later.</td>
<td>Click Update and return to the Article Checklist Summaries list. The checklist with pending reviews is added to the My Pending AQI Checklists queue. When you want to complete the AQI reviews, navigate to Knowledge &gt; My Pending AQI Checklists and complete the reviews.</td>
</tr>
</tbody>
</table>

To view all the AQI reviews you completed, navigate to Knowledge > My Completed AQI Checklists.

**View all pending and completed AQI reviews**

View checklists of all users to monitor the pending and completed reviews.

Role required: knowledge_admin or admin

1. Navigate to Knowledge > Article Quality Index
2. Do one of the following:
   - To view all completed AQI checklists, select All Completed AQI Checklists.
   - To view all pending AQI checklists, select All Pending AQI Checklists.

**Delete AQI reviews**

Delete an AQI review that was created by mistake or is no longer required.

Roles required:
- To delete an AQI in a submitted state: admin or knowledge admin
- To delete an AQI not in a submitted state: knowledge admin or the reviewer who initiated the AQI

1. Navigate to Knowledge > Articles > My Pending AQI Checklists.
2. Select all checklist reviews you would like to delete.
3. Click Delete.

**Enable creating an article from a customer service case**

You can enable authors to reuse information in a case by copying case details into an article template. Use the pre-defined customer service source case table to article template target table configuration or create custom configurations between the two tables to copy information from a case to an article.

- The Knowledge Management Advanced plugin must be active.
- The KCS for Customer Services Management property must be enabled
- The pre-defined KCS article template or a newly created article template must be active.

**Note:** You can do one of the following to create an article from a case:

- Use the pre-defined Case KCS Article mapping as is or modify the field mappings between the case source table and article template target table.
- Create a new article template target table and map it to the case source table and customize the field mappings between them. For information on creating article templates, refer to Create an article template.
- Knowledge users use the Create Knowledge button in a case form to create an article from a case and must have “can contribute” permission for at least one active knowledge base to create an article from a case. For information on user permissions, see Knowledge Management roles.
Role required: sn_customerservice.customer_admin or admin

The pre-defined Case KCS Article mapping is stored in the CSM Table Map [csm_table_map] table. This configuration has the sn_customerservice_case source case table configured to the kb_template_kcs_article target article template table with the four field mappings pre-configured between the tables. You can customize the existing field mappings or map additional fields between the tables.

1. In the application filter navigator, type \( \text{csm\_table\_map\_list} \).
2. Click Case KCS Article.
3. From the Target Table list, use the pre-defined KCS article template table or select the newly created article template table.
4. Map each customer service case field that must be used to create knowledge articles.
   a) In the Basic Field Mapping related list, click New.
      To map fields, fill in the following fields:

      **Customer service case table to article template target table field mapping**

<table>
<thead>
<tr>
<th>Field</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Field</td>
<td>Select the field in the source case table that contains the information to be copied to the field in the article template target table.</td>
</tr>
<tr>
<td>Target Field</td>
<td>Select the field in the article template target table to which you need information copied from the field in the source case table.</td>
</tr>
</tbody>
</table>

b) Click Submit.

c) To map fields using advanced scripts, select the Advanced Field Mapping check box and then map the fields between the source and the target table using advanced scripts in the Advanced Field Mapping tab.

Note:
If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.

If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

d) To customize when and how the Create Knowledge button is displayed, use the condition builder in the Condition tab or select Use Advanced Condition check box and configure using advanced scripts.

Note: If you change the target table in the Case KCS Article mapping, also update the scripts with the configuration changes for display of this button.

5. Click Update.

Enable creating a knowledge article from an incident

Enable users to quickly and easily reuse information from an incident in a knowledge article.

Role required: admin
Perform the following steps to enable creating a knowledge article from an incident. You can also create a knowledge article from an incident using an article template. For more information, see Create a knowledge article from an incident using an article template.

**Note:** Once you have performed the configuration steps, knowledge users can select the Knowledge check box on the Incident form to create an article from an incident. They must have Can Contribute access to at least one active knowledge base to create an article.

Create field mapping from an incident to a knowledge article

Copy information from an incident into a knowledge article by creating custom mapping between the Incident table and the KCS article table.

Role required: admin

- Ensure that the Knowledge Advanced plugin (com.snc.knowledge_advanced) is active.
- Ensure that the KCS Article template is active.

1. Navigate to **Knowledge > Administration > Article Templates**.
2. Set the **Active** field to **true** for the KCS Article template.

1. In the filter navigator, type `csm_table_map.list`.
2. Click **New**.
3. In the **Mapping Name** field, enter **Incident KCS Article**.
4. In the **Source Table** field, enter **Incident**.
5. In the **Target Table** field, enter **KCS Article**.
6. Right-click the form header and **Save**.
7. In the **Basic Field Mapping** related list, click **New**.
8. Create mappings for the following fields.

<table>
<thead>
<tr>
<th>Source Field</th>
<th>Target Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sys ID</td>
<td>Source Task</td>
</tr>
<tr>
<td>Short description</td>
<td>Short description</td>
</tr>
<tr>
<td>Resolution notes</td>
<td>Resolution</td>
</tr>
</tbody>
</table>

**Note:** You can create field mappings for more fields, as required.

- In the **Source** field, select the field in the source Incident table that contains the information to be copied to the field in the article template target table.
- In the **Target** field, select the field in the article template target table to which you need information copied from the field in the source Incident table.

9. To customize when and how the Knowledge check box is displayed, click the **Condition** tab.
10. To map fields using advanced scripts, select the **Advanced Field Mapping** check box.
11. On the **Advanced field Mapping** tab, paste in the following code.

```javascript
(function (source,target) {
    // Get the first comments from incident and use it as Issue description for article
    var notes = source.comments.getJournalEntry(-1);
    var entries = notes.split("\n\n");
    var comment = ""
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
if(entries.length - 2) {
    comment = entries[entries.length - 2];
    var part = comment.toString().indexOf(""");
    if(part !== -1) {
        comment = comment.toString().substring(part + 2).replaceAll("\r\n", "<br/>");
    }
    if(comment)
        target.kb_issue = comment;
}(source, target);

The first comment on an incident is mapped to the Issue Description field in the knowledge article.

**Note:** If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.

If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

### Add a property to enable creating knowledge article from incidents

Add a property, which is required to allow users to create a knowledge article from an incident.

Role required: admin

1. In the Filter navigator, enter `sys_properties.list`
2. Click **New**
3. Fill in the following fields.

<table>
<thead>
<tr>
<th>System Property form</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Name</td>
<td><code>enable_kcs_incident</code></td>
</tr>
<tr>
<td></td>
<td>Description</td>
<td>Enable Knowledge Centered Services (KCS) for Incident Management.</td>
</tr>
<tr>
<td></td>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td></td>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

### Create a UI action to enable creating knowledge articles from incidents

Create a UI action to add the Knowledge check box to the Incident form.

Role required: admin

1. Navigate to **System UI > UI Actions**.
2. Click **New**
3. Fill in the following fields.

<table>
<thead>
<tr>
<th>UI Action form</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Name</td>
<td>Create Knowledge</td>
</tr>
<tr>
<td></td>
<td>Table</td>
<td>Incident</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>--------------</td>
<td>----------------------</td>
<td></td>
</tr>
<tr>
<td>Action name</td>
<td>create_knowledge</td>
<td></td>
</tr>
</tbody>
</table>

4. Select the **Client** check box.
5. Select the **List v3 Compatible** check box.
6. Select the **Form button** check box.
7. In the **Onclick** field, enter `createKnowledgeClient()`.
8. In the **Condition** field, enter `gs.getProperty("enable_kcs_incident") == 'true' && new global.CSMTableMapUtil (current).findMapByName("incident_kcs_article") && new global.KBKnowledge().canCreate()`.
9. In the **Script** field, enter the following code.

```javascript
function createKnowledgeClient() {
  if (g_form.modified) {
    alert(new GwtMessage().getMessage('You have unsaved changes. Please save them to continue.'));
  }else{
    //Call the UI Action again but skip the 'onclick' function
    gsftSubmit(null, g_form.getFormElement(), 'create_knowledge');
    //MUST call the 'Action name' set in this UI Action
  }
}

//Code that runs without 'onclick'
//Ensure call to server-side function with no browser errors
if (typeof window == 'undefined')
  CreateKnowledgeServer();

function CreateKnowledgeServer(){
  current.update();
  var map = new global.CSMTableMapUtil (current);
  map.findMapByName("incident_kcs_article");
  var targetURL = map.getTargetURL();
  if(targetURL)
    action.setRedirectURL(targetURL[0]);
}
```

10. Click **Submit**.

**Enable creating a knowledge article from an HR case**

Enable users to quickly and easily reuse information from an HR case in a knowledge article.

Role required: admin

- Ensure that the Human Resources Scoped App: Core (com.sn_hr_core) plugin is active.
- Ensure that the Developer Application is set to **Human Resources: Core**.

**Note**: To check, navigate to the Settings icon and then **Developer > Application**.

Perform the following steps to enable creating a knowledge article from an HR case.

**Note**: Once you have performed the configuration steps, knowledge users can select the Knowledge check box on the HR Case form to create an article from an HR case. They must have **Can Contribute** access to at least one active knowledge base to create an article.
Create field mapping from an HR case to a knowledge article

Copy information from an HR case into a knowledge article by creating custom mapping between the HR case table and the KCS article table.

Role required: admin

- Ensure that the Knowledge Advanced plugin (com.snc.knowledge_advanced) is active.
- Ensure that the Developer Application is set to Human Resources: Core.
- Ensure that the KCS Article template is active.

1. Navigate to Knowledge > Administration > Article Templates.
2. Set the Active field to true for the KCS Article template.

1. In the filter navigator, type csm_table_map.list.
2. Click New.
3. In the Mapping Name field, enter HR Case KCS Article.
4. In the Source Table field, enter HR Case.
5. In the Target Table field, enter KCS Article.
6. Right-click the form header and Save.
7. In the Basic Field Mapping related list, click New.
8. Create mappings for the following fields.

<table>
<thead>
<tr>
<th>Source Field</th>
<th>Target Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sys ID</td>
<td>Source Task</td>
</tr>
<tr>
<td>Short description</td>
<td>Short description</td>
</tr>
<tr>
<td>Close notes</td>
<td>Resolution</td>
</tr>
<tr>
<td>Description</td>
<td>Cause</td>
</tr>
</tbody>
</table>

Note: You can create field mappings for more fields, as required.

- In the Source field, select the field in the source HR Case table that contains the information to be copied to the field in the article template target table.
- In the Target field, select the field in the article template target table to which you need information copied to from the field in the source Incident table.

9. To customize when and how the Knowledge check box is displayed, click the Condition tab.
10. To map fields using advanced scripts, select the Advanced Field Mapping check box.
11. On the Advanced field Mapping tab, paste in the following code.

```javascript
(function (source) {
    // Get the first comments from HR case and use it as Issue description for article
    target.short_description=source.short_description+"";
    target.kb_resolution=source.close_notes+"";
    target.kb_cause=source.description+"";
    var notes = source.comments.getJournalEntry(-1);
    var entries = notes.split("\n\n");
    var comment = "";
    if(entries[entries.length-2]){
        comment = entries[entries.length-2];
        var part = comment.toString().indexOf(""");

        target.kb_resolution=target.kb_resolution+comment.substring(part);
    }
    // Add the rest of your advanced field mapping logic here...

})(source);
```
if(part != -1){
    comment = comment.toString().substring(part+2).replaceAll("\r\n","<br/>");
}
if(comment)
target.kb_issue = comment;

//Only if selected article type is active
var tem = new GlideRecord("kb_article_template");
tem.addQuery("child_table","kb_template_kcs_article");
tem.addActiveQuery();
tem.query();
if(!tem.hasNext())
    return false;

//Do not allow to create the knowledge again
var gr = new GlideRecord("kb_knowledge");
gr.addQuery("source",source.sys_id);
gr.query();
if(gr.next())
    return false;

return true;
})(source);

The first comment on an HR case is mapped to the **Issue Description** field in the knowledge article.

**Note:** If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.

If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

### Add a property to enable creating knowledge articles from HR cases

Add a property, which is required to allow users to create a knowledge article from an HR case.

Role required: admin

Ensure that the Developer Application is set to **Human Resources: Core**.

1. In the Filter navigator, enter `sys_properties.list`.
2. Click **New**.
3. Fill in the following fields.

#### System Property form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>enable_kcs_hr</td>
</tr>
<tr>
<td>Description</td>
<td>Enable Knowledge Centered Services (KCS) for HR Service Delivery.</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
Create a UI action to enable creating knowledge articles from HR cases

Create a UI action to add the Knowledge check box to the HR case form.

Role required: admin

Ensure that the Developer Application is set to **Human Resources: Core**.

1. Navigate to **System UI > UI Actions**.
2. Click **New**.
3. Fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Knowledge</td>
</tr>
<tr>
<td>Table</td>
<td>HR Case</td>
</tr>
<tr>
<td>Action name</td>
<td>create_knowledge</td>
</tr>
</tbody>
</table>

4. Select the **Client** check box.
5. Select the **List v3 Compatible** check box.
6. Select the **Form button** check box.
7. In the **Onclick** field, enter `createKnowledgeClient()`.
8. In the **Condition** field, enter
   ```java
   new global.CSMTableMapUtil(current).findMapByName("sn_hr_core.hr_case_kcs_article") && new global.KBKnowledge().canCreate().
   ```
9. In the **Script** field, enter the following code.

```javascript
function createKnowledgeClient() {
    if (g_form.modified) {
        alert(new GwtMessage().getMessage('You have unsaved changes. Please save them to continue.'));
    }else{
        //Call the UI Action again but skip the 'onclick' function
        gsftSubmit(null, g_form.getFormElement(), 'create_knowledge');
        //MUST call the 'Action name' set in this UI Action
    }
}
//Code that runs without 'onclick'
//Ensure call to server-side function with no browser errors
if (typeof window == 'undefined')
    CreateKnowledgeServer();

function CreateKnowledgeServer(){
    current.update();

    var map = new global.CSMTableMapUtil (current);
    map.findMapByName("sn_hr_core.hr_case_kcs_article");
    var targetURL = map.getTargetURL();
    var referenceLink = 
        "&sysparm_collection=sn_hr_core_case&sysparm_collectionID="+current.sys_id 
        +"&sysparm_collection_key=task&sysparm_link_collection=m2m_kb_task&sysparm_collection=sn_hr_core_case&sysparm_collectionID="+current.sys_id 
    if(targetURL)
        action.setRedirectURL(targetURL[0]+referenceLink);
}
```

**Use Knowledge Management**

Share your ideas and experience by creating a knowledge article. Search and find information such as self-help, troubleshooting, and task resolution in knowledge bases. Review, provide feedback on knowledge articles, and resolve issues yourselves rather than contacting customer service or an internal helpdesk.

Role required: none

Use Knowledge Management in one or more of the following ways.

**Knowledge Management guide for users**

After knowledge bases are set up, you can start searching and creating articles. If Social Q&A was activated for the knowledge base, you can also submit answers or answer questions for other users.

**Requirements**

**Role required**

All users can read knowledge articles. Users with the knowledge or any other fulfiller role, such as sn_customerservice_agent, can create and edit knowledge articles in a knowledge base, unless the knowledge manager has restricted access to the knowledge base or knowledge articles.

If you need these permissions, contact the knowledge manager or knowledge administrator for the knowledge base.

**What to do**

**Create knowledge articles**

If you have the required permissions for a knowledge base, you can create articles for it. You can create articles from the **Self-Service application menu** or by importing **Word documents**.

You can also create knowledge articles from **incidents and problems**.

**Search for knowledge articles**

From the **Knowledge homepage**, you can select a knowledge base to **search for articles and answers**. You can view only the knowledge bases to which you have access.

Access to knowledge using **your mobile device** is supported.

**Ask and answer questions**

If **Social Q&A** was activated for a knowledge base, you can ask and answer questions. You can also browse and vote on answers.

**Next steps**

After articles are created, you can perform the following tasks to make sure that articles are organized in the right knowledge bases and retired when appropriate. If existing knowledge bases do not fit your needs, you can request a new knowledge base.

- **Move a knowledge article**
- **Retire a knowledge article**
• Request a knowledge base

Knowledge Management Service Portal homepage features

The Knowledge Management Service Portal homepage displays knowledge articles and social Q&A items organized by knowledge base and category, as well as featured content and popular articles. Learn how to navigate the homepage to search for and find useful and relevant information quickly.

To use the Knowledge Management Service Portal, the Knowledge Management — Service Portal plugin (com.snc.knowledge_serviceportal) must be activated.

**Note:** It is active by default for customers on the Madrid and later releases. Existing or upgrade customers must activate the plugin and enable the glide.knowman.serviceportal.enable_redirect property.

Your organization can customize the homepage, so it may look different to the following image. You must be logged in to view the knowledge homepage.

### Knowledge Management homepage features

| Other filter facet widgets         | Use filter facets to refine your search results. The selections you make filter the items displayed in the search results list. The search results list updates to display only those items that match your selections. Deleting a selection from the filter facet or breadcrumb reverses the filtering in the list. Clear selected filter options by:  
• Deleting a single option from the search results list header.  
• Clicking **Clear all** in the search results list header.  
• Clicking **Clear** in the filter facet widget header.  
• **Author:** lists the names of the authors for the knowledge articles included in the search results list  
• **Tags:** lists the available knowledge tags  
• **Resource:** lists the types of items available, such as knowledge articles and social Q&A  
• **Rating:** lists article ratings from 0-5 stars (clicking a rating displays articles that have the selected rating and higher)  
• **Last Modified:** lists selections based on the timing of knowledge item modifications such as Past Month or Past Week  
• **View Count:** lists the knowledge item view counts such as More Than 50 or Less Than 10. Set the number of days to consider when calculating view count using the glide.knowledgeman.view_age.days property. |
| View additional search results     | Depending on the system setup, view additional search results using one of these options:  
• **Standard Pagination:** displays the search results in multiple pages.  
• **Infinite Scroll:** displays the search results while scrolling. |

**Note:** If a custom widget on the knowledge search results page uses the **KnowledgeSearchService** angular service, you must add the **sn.knowledgeApplication** dependency to enable the functionality of the custom widget.

1. Navigate to **Service Portal > Dependencies**.
2. In the **Name** field, search for the **sn.knowledgeApplication** dependency.
3. If a message appears, click **here** to edit.  
   You have to be in the **Knowledge Management - Service Portal** application to edit.
4. Click **Update**.

The search functionality in Knowledge Management Service Portal pages uses the **Knowledge Base Search** search context to fetch results. As an administrator, you must not update the definition of this search context because it may impact the search behavior. For more information about contextual search, see **Contextual search concepts**.
Knowledge Management Service Portal article view page features

View the knowledge article you selected, including the article number, short description, and article content. Give feedback or comment on an article.

**Note:** If you select a question, the article view page displays the question, any answers to the question, and a text box for providing an answer.

"Note": You must have Can Contribute access to the knowledge base and article.
UI component | Description
--- | ---
Search bar | Use the search bar to start a new search.

Note:
- If enabled, users can subscribe to articles, view article versions, and create feedback for articles that are rated as not helpful.
- The dynamic titles don’t apply to the knowledge article view page in the Knowledge Management Service Portal.

Knowledge article URL parameters

You can add parameters to an article URL to view the latest version and an existing translation.

Knowledge article URL structure

The knowledge article URL appears in the following structures:

- **Accessed from Service Portal**: https://<instance-name>.service-now.com/kb?id=kb_article_view&amp;sysparm_article=<article number>&sysparm_language=<language code>

  For example, the URL https://yourbusiness.service-now.com/kb?id=kb_article_view&amp;sysparm_article=KB0010053&amp;sysparm_language=EN returns the article with the most recent version in the selected language, if the translation for the selected language exists.

- **Accessed from Knowledge Base View (kb_view) UI page**: kb_view.do?sysparm_article=<article number>&sysparm_language=<language code>’

  For example, the URL https://yourbusiness.service-now.com/kb_view.do?sysparm_article=KB0010044&amp;sysparm_language=en returns the article with the most recent version in the selected language, if the translation for the selected language exists.

Note: The listed parameters can include the sys_id in the url parameter.

Parameters

The following parameters are available for knowledge article URLs.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Possible values</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_article</td>
<td>Returns the most recent article version. For example, <a href="https://yourbusiness.service-now.com/kb?id=kb_article_view&amp;amp;sysparm_article=KB0010053">https://yourbusiness.service-now.com/kb?id=kb_article_view&amp;amp;sysparm_article=KB0010053</a>.</td>
</tr>
<tr>
<td>sysparm_language</td>
<td>Returns the most recent article version in the input language if a translation exists. For example, <a href="https://yourbusiness.service-now.com/kb?id=kb_article_view&amp;amp;sysparm_language=3b07857187032100dedd82">https://yourbusiness.service-now.com/kb?id=kb_article_view&amp;amp;sysparm_language=3b07857187032100dedd82</a>.</td>
</tr>
</tbody>
</table>
Create a knowledge article

Knowledge contributors can create and edit knowledge articles within a knowledge base to share information across your organization.

You must have Can Contribute access to at least one active knowledge base.

To view an article template, you must activate the article templates feature and enable the desired templates.

Users with at least one role can create and edit knowledge articles. These users are known as knowledge contributors. Users without any role can read articles and submit feedback, but cannot create or edit articles.

Some knowledge bases may allow only certain users to contribute. For example, a member of the IT department can create knowledge articles in the IT knowledge base, such as desktop support information or articles describing company IT processes.

1. There are three ways of creating knowledge articles.
   - Navigate to Self-Service > Knowledge and click the Create an Article icon.
   - Navigate to Knowledge > Articles > Create New.
   - From the Knowledge Management homepage, click the more icon ( ) and then select Create Article.

2. On the Create new article page, select a knowledge base. The list of article templates to select in the next step is filtered according to the article templates available for the selected knowledge base.

   Note:
   On the Create new article page, you can select to Switch to older version of this page or Switch to updated version of this page (recommended).

3. Select an article template.
4. Click Next.
   The Knowledge form is displayed based on the article template selected.
5. On the Knowledge form, fill in the fields.

Knowledge form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Base</td>
<td>The knowledge base selected for this article.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> An article can only be associated with one knowledge base.</td>
</tr>
<tr>
<td></td>
<td>You can change the knowledge base, but only if the selected article template is available in the knowledge base.</td>
</tr>
<tr>
<td>Category</td>
<td>The category for this article. Select a Knowledge Base before you can select a category. Articles without a category appear on the knowledge homepage in the (empty) category.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Ownership Group</td>
<td>The ownership group for this knowledge article. An ownership group consists of a group of members and a manager who are responsible for approvals, ensuring article quality, and feedback tasks. Ownership groups can publish, edit, and retire knowledge articles that they are associated with.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>If no ownership group is assigned, the article automatically goes to the knowledge administrator and knowledge manager for approval.</td>
</tr>
<tr>
<td>Language</td>
<td>Language in which you are creating the article. The list is populated based on the languages enabled for the selected knowledge base. This field appears only when the I18N:Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) is activated. For more information, see I18N - Knowledge internationalization.</td>
</tr>
<tr>
<td>Schedule publish date</td>
<td>Date in future when the article is published automatically. If approvals are enabled, the approval process must be completed before this date.</td>
</tr>
<tr>
<td>Valid to</td>
<td>The date this knowledge article expires. Articles do not appear in search results after the Valid to date or if the Valid to date is blank. The default value of the Valid to field is derived from the Article Validity field configured for the knowledge base (see Create a knowledge base). The Valid to date starts from the date the article was created until the number of days specified in the Article Validity field. If the Article Validity field is blank, the default date in the Valid to field for the knowledge article is set to January 1, 2100. An article author or editor can select whether to keep or change the default Valid to date.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>If the system date format or user preferences is set to use yy year format, you might face issues when the Valid to date is set to the default date. Contact your system administrator or modify the user preferences to use a date format with the yyyy year format. For more information, see Global date and time field format and Personalize the system date format topics.</td>
</tr>
<tr>
<td>Version</td>
<td>Version of the article. This field appears only when the article versioning feature is enabled. For more information, see Article versioning.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Parent</td>
<td>Number of the article that represents the base language article. This setting keeps translations of the same article related to each other. Consider choosing the same language consistently for the parent article. This field appears only when the I18N:Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) is activated. For more information, see <a href="#">I18N - Knowledge internationalization</a>.</td>
</tr>
<tr>
<td>Article type</td>
<td>The type of article, either HTML or wiki. Note: This field is only visible in the standard template.</td>
</tr>
<tr>
<td>Workflow</td>
<td>[Read-Only] The publication state of the article, such as Draft, In Review, or Published. When inserting a new article from an existing article, the state of the new article is reset to Draft.</td>
</tr>
<tr>
<td>Source</td>
<td>The task this knowledge article was created in response to, if any. This field is set automatically when you create the knowledge article from a task record.</td>
</tr>
<tr>
<td>Attachment link</td>
<td>Check box for downloading an attached file automatically when a user accesses the article, instead of opening the article view. Add one or more attachments to the article to use this option. Note: You may attach multiple files, but most web browsers permit users to download only the first one. To ensure download of all the files, bundle them into an archive, such as with WinZip, and attach the archive. The Attachment link option applies to articles accessed from search links only. Articles accessed from links within other knowledge articles will not automatically download an attached file.</td>
</tr>
<tr>
<td>Display attachments</td>
<td>Check box for displaying attachments to users viewing this knowledge article. Attachments appear below the article text. Add one or more attachments to the article to use this option.</td>
</tr>
<tr>
<td>Short description</td>
<td>The title of the article. This title appears when browsing and searching for knowledge articles, and at the top of the article. You can enter up to 100 characters in this field. Note: If contextual search is enabled, the knowledge articles similar to the entered short description text appear in the Knowledge results section.</td>
</tr>
</tbody>
</table>
6. Optional: To search for similar articles, enter the text in the **Related Search** field or continue with the default text in the Knowledge results section. If the Knowledge results section is not displayed on the Knowledge form, a system administrator can configure the form layout to add the **Contextual Search Results** field to the form.

   - To find knowledge articles that have high text similarity with the entered search text, choose **Similar Articles (ML).**

   ![Note: This option is available only when the Predictive Intelligence feature is enabled and your system administrator has trained the similarity solution for Knowledge Management. For more information, see Train the similarity solution for Knowledge Management to find related articles.]

   - To find knowledge articles that match the entered search text, choose **Search Articles.**

7. Optional: To view the entire article in a pop-up window, click the link to the article title.

8. Click **Submit** to create the article.

After saving the article record, you can add tags to further organize the article.

Any additional steps required to publish the article, such as approvals, depend on the publishing workflow for the knowledge base.

   - If there is no approval workflow set up, the article is immediately published.
   - If an approval workflow is set up and Ownership Group is configured, an email notification with a link to the article is sent to the ownership group members assigned to the article for approval.
   - If an approval workflow is set up and Ownership Group is not configured, an email notification with a link to the article is sent to the knowledge base manager for approval.
   - If the article is approved, it is published and an email notification is sent to the author or reviser of the article.
   - If the article is rejected, an email notification is sent to the author or reviser of the article to revise and resubmit it for publishing.

### Edit a knowledge article

Edit knowledge articles within a knowledge base to update information shared across your organization.
Role required: knowledge

Users with at least one role can edit knowledge. These users are known as knowledge contributors. Users without any role can read articles and submit feedback, but cannot edit articles.

However, knowledge managers can configure User Criteria to restrict access to certain knowledge bases. For example, only members of the IT department can create or edit knowledge articles in the IT knowledge base, such as desktop support information or articles describing company IT processes.

Note:

• If the article versioning feature is enabled, only the knowledge administrator, knowledge managers, and author can edit the checked-out version of an article. If the feature is disabled, any users with contribute access to an article can edit the draft version of the article. An administrator can disable the article versioning feature by setting the glide.knowman.versioning.enabled property (from the System Property [sys_properties] table) to false.
• If an article is associated with any ownership group, only ownership group members have contribute access to the article even if they don’t have contribute access to the knowledge base of the article. They can edit, approve, publish, and retire the knowledge article with which they are associated. For more information, see Ownership groups.
• If the glide.knowman.translation.enable_translation_task property is enabled, you can’t modify the knowledge base of existing articles.

1. Navigate to Knowledge > Articles.
2. Select an article from the Published or Unpublished category.
3. On the Knowledge form, click Edit.
4. If the article versioning feature is enabled, click Checkout for a published knowledge article.
   You can only edit the latest version of a knowledge article.
5. Click Update.
   When you edit a knowledge article, a default value appears in the Valid to field. You can select whether to keep or change the default Valid to date.

Note: If the article versioning feature is enabled, the default value of the Valid to date in the updated article version is automatically set based on the following criteria:

• If the Article Validity field in the knowledge base associated with the article is blank, the Valid to date value from the earlier version of the article is retained.
• If the Article Validity field in the knowledge base associated with the article is not blank, the Valid to date is automatically updated to start from the date the article was updated until the number of days specified in the Article Validity field (Article updated date + article validity).

If you move a knowledge article to another knowledge base, the default value of the Valid to date in the updated article is automatically set based on the following criteria:

• If the Article Validity field in the selected knowledge base is blank, the earlier Valid to date value is retained for the knowledge article.
• If the Article Validity field in the selected knowledge base isn't blank, the Valid to date is automatically updated to start from the date the article was updated until the number of days specified in the Article Validity field (Article updated date + article validity).

If the dictionary value of the Valid to field is modified, this dictionary value overrides the default value of the Valid to field calculated according to the Article Validity field.

The article is saved. If the article versioning feature is enabled, the version of the knowledge article is incremented by 0.01. For more information, see Knowledge article version numbers.
6. Optional: Publish the article by clicking Publish. The knowledge article is published depending on the workflow setting of its knowledge base:

- **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.
- **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

For more information, see *Schedule a knowledge article for publishing*.

When published, the knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). For more information, see *Knowledge article version numbers*.

### Map related articles

Discover similar information across articles on a topic while viewing an article. You can manually map related articles or have the application automatically present related articles using machine learning (ML) algorithms.

**Role required:** knowledge

To edit the article, you must have knowledge contributor access for the associated Knowledge Base.

If you have manually mapped related articles when editing an article, those articles are listed in the Related Articles section on the knowledge article view page before the related articles that are predicted thorough the Knowledge Management similarity solution.

**Note:** An administrator can train the solution definition for Knowledge Management within the Predictive Intelligence feature to find related articles. For more information, see *Train the similarity solution for Knowledge Management to find related articles*.

This task provides steps to manually map related articles when editing an article.

1. On the Now Platform, open the knowledge article for which you want to map related articles.
2. On the Knowledge form, click the Related Articles related list.
3. Click **Edit**.
4. On the Edit Members form, move the desired articles from the available articles in the **Collection** column to the **Related Articles List** column.
5. Click the up or down icon to arrange the articles in the order in which you want them to appear in the Related Articles section on the article view page, and then click **Save**.

**Note:** Knowledge administrators can configure the number of articles shown in the Related Articles section using the instance options.

### Map catalog items related to an article

Manually map catalog items related to a knowledge article to enable employees to request the related product or service.

**Role required:** knowledge

To edit the article, you must have knowledge contributor access for the associated Knowledge Base.

1. On the Now Platform, open the knowledge article for which you want to map related catalog items.
2. On the Knowledge form, click the Related Catalog Items related list.
3. Click **Edit**.
4. On the Edit Members form, move the desired catalog items from the available catalog items in the **Related Catalog Items List** column to the **Collection** column.

5. Click the up or down icon to arrange the articles in the order in which you want them to appear in the Related Items section on the article view page, and then click **Save**.

   **Note:** Knowledge administrators can configure the number of catalog items shown in the Related Items section using the instance options.

---

### Schedule a knowledge article for publishing

Set a specific time and day for a knowledge article to be published automatically.

You must have contribute access to the knowledge base that stores the knowledge article you want to schedule for publishing.

Ensure that the system administrator verifies the following settings:

- Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated. For more information, see [Activate the Knowledge Management Advanced plugin](#).
- The article versioning feature is enabled. For more information, see [Article versioning](#).

Role required: knowledge

1. Navigate to **Knowledge > Articles** and click **Unpublished**.
2. Click an article link.
3. In the **Scheduled publish date** field, click the select date and time icon 📅.
4. Select any future date from the calendar.
5. In the **Time** field, enter a time in the format hh:mm:ss.
6. Click the save (enter) icon ✅.
7. Click **Publish** to enable the publishing workflow.

The article is available in the All list. Go to **Knowledge > Articles > All**.

   **Tip:** If you want to cancel an article’s scheduled publication and move the article back to the Draft state, click **Recall**.

The knowledge article is published on the scheduled publish date depending on the following workflow settings of its knowledge base:

- If the knowledge base workflow is set to **Knowledge - Instant Publish**, the knowledge article is automatically published on the scheduled publish date. The **Workflow** field on the Knowledge form of the article is updated to **Scheduled for publish**.
- If the knowledge base workflow is set to **Knowledge - Approval Publish**, the knowledge article is published on approval completion. The **Workflow** field on the Knowledge form of the article is updated to **Review**.

The approval completion affects the scheduled publishing as follows:

- If the approvals are completed before the scheduled publish date, the **Workflow** field on the Knowledge form of the article is updated to **Scheduled for publish** and the article is published on the scheduled publish date.
- If the approvals are completed after the scheduled publish date, the article is published immediately on the approval completion.
Recall an article that is being reviewed

Recall an article that is being reviewed to make additional changes.

If ownership groups is not enabled, only the author of the article, knowledge administrators, or system administrators can recall the article.

If ownership groups is enabled, the author of the article, the ownership group manager, ownership group members, knowledge administrators, or system administrators can recall an article.

Recalling an article in the Review state results in a minor version increment.

When a revised article is in Review state, only the corresponding versions reviser can recall the article to make additional changes.

1. Navigate to Knowledge > Articles > All.
2. Open an article in the Review state.
3. Click Recall in the Knowledge form header.
   The system returns the state of the article to Draft, increments the version number by 0.01, and displays a message to the user.

Approve an article that is being reviewed

Approve an article that is being reviewed and create a new published version.

When an article is in the Review state, only those users who are included in the Approvals related list can modify the article.

1. Navigate to Knowledge > Articles > Unpublished.
2. Open an article in the Review state and review the text.
3. In the Approvals related list, click Requested in the State column to display the Approval form for the article.
4. Click Approve.

The system displays the Knowledge form. The version number of the article increments to the next whole number (for example, from 2.02 to 3.0) and the state changes to Published. The new published version of the article is added to the Knowledge list and to the Article Versions related list on the Knowledge form.

Retire a knowledge article

You can initiate the retirement workflow to retire a knowledge article. Only administrators and knowledge administrators can view articles after they are retired.

A knowledge article has an associated retirement workflow, similar to the publishing workflow. This allows administrators to configure these workflows, defining an approval and review process for retiring knowledge if appropriate.

When editing an article, click Retire to launch the retirement workflow associated with that article. If the article requires approval prior to retirement, the article goes to a pending approval state, and the workflow either finishes upon approval or cancels if rejected by a required approver. The article number associated with the retired article is not available for reuse.

Note:
- Retired knowledge articles are not available to users except for administrators and knowledge administrators who can view them. To reuse a retired article, administrators and knowledge administrators can republish the article. For more information, see Republish a retired article.
An article and its translations have a parent-child relationship. Retiring a parent article does not automatically retire all its translated child articles.

Instant retire and Approval retire workflows
Republish a retired article

Instantly republish a retired article.

Role required: admin or knowledge admin

There may be cases where you'll need to republish a retired article. For example, an admin may want to temporarily retire an article when its information doesn't currently apply, but will at a later date. An administrator or knowledge administrator who can view retired articles can instantly republish these without having to go through an approval workflow.

1. Navigate to Knowledge > Articles > Retired.
2. Select a retired article and click Republish.

The article is instantly published as the previous last published version.

Move a knowledge article

You can move articles between knowledge bases.

1. Edit a knowledge article.
2. Change the Knowledge Base field value.
   After moving an article, the Apply Default Values dialog box prompts you to populate certain fields in the article with default values from the new knowledge base. If the new knowledge base has no default values, the dialog box does not appear.
3. Click OK to overwrite fields with the default values, or Cancel to leave all fields unchanged.
   A knowledge manager can define default values for articles in knowledge bases you manage using the Set default knowledge field values field on the Knowledge Base form.
4. Click Update.

Comment on a knowledge article

Comment on a knowledge article or reply to a comment.

Role required: Admin

1. Navigate to the Knowledge Management Service Portal.
2. Click the article you want to comment or reply to a comment on.
3. Click Click here to comment on this article or Reply.
4. Enter your comment or reply and add links, images, and attachments as required.

5. Click Submit.

Note: Attachments to comments posted in the Knowledge Management Service Portal are not displayed in the Live Feed. If attachments to comments are posted in Live Feed, they are displayed in the Knowledge Management Service Portal.

If antivirus protection is enabled, all attachments are automatically scanned for viruses once the comment is posted. Attachments are only displayed once the scan is finished and successful.

If you are the author of the comment, you can delete it. All comments and replies underneath are automatically deleted.

Note: You can only view comments in the Live Feed if the Use Live Feed for Knowledge feedback property is active. It is inactive by default.
Comments posted in Live Feed before upgrading to release version New York are not shown hierarchically in the Knowledge Management Service Portal. Comments posted in Live Feed after upgrading to release version New York are shown hierarchically in the Knowledge Service Portal.

The following table illustrates how comments and replies to comments are displayed depending on where you are viewing them.

Create knowledge from an incident, problem, or case

Create a knowledge article, so the next time the issue comes up the resolution is easy to find.

Depending on the value of the `glide.knowman.submission.workflow` property, knowledge created from an incident, problem, or case may require additional approval. When this property is true, a submission record is created instead of a knowledge article. A user with the knowledge role must approve the submission to create a knowledge article.

1. Open a resolved incident, problem, or case.
2. Select the Knowledge check box on the form.
3. Close the incident, problem, or case.
   A new draft knowledge article is created.
4. If additional approval is required, navigate to Knowledge > Open Submissions.
5. Select a submission record.
6. Review the submission to ensure the content and settings are correct.
7. Click Create Article.
   A new draft knowledge article is created. Articles created this way are added to the knowledge base specified in the property `glide.knowman.task_kb`.

Knowledge feedback

You can view and contribute to feedback on knowledge articles.

Feedback options

You can submit feedback for knowledge articles in these ways:

- Flag an article as incorrect or inappropriate.
- Provide a rating value for the article.
- Mark an article as helpful or not helpful.
- View comments, add a new comment, or reply to existing comments.

Users can view comments directly on the article. Knowledge managers can view the other types of feedback by navigating to Knowledge > Feedback.
Administrators and knowledge managers can disable some feedback options using fields on the Knowledge Base form. Administrators can configure feedback options using properties.

Flagging articles

You can flag an article for incorrect or inappropriate content. Click Flag Article in the article header to open a new window, allowing you to enter suggested changes.

- Flagged comments do not appear on the Article View page. Users with the admin, knowledge_admin, and knowledge_manager roles can access flagged articles by navigating to Knowledge > Articles > All Flagged. Users with the knowledge role can access their flagged articles by navigating to Knowledge > Articles > My Flagged.
- If disabled, the author of the article and users with the admin, knowledge_admin, and knowledge_manager roles can see all flagged comments. Other users can see only their own flagged comments.

Note: You cannot disable flagging for an article until you have disabled the flagging for all feedback comments for that article.

Flagged comments are stored in the Knowledge Feedback (kb_feedback) table but not the Live Feed Messages (live_message) table.

Rating articles

The five stars below the article title allow you to indicate the article's effectiveness on a scale of 1 to 5.

Marking articles

The question Helpful? at the bottom of the article allows you to indicate the usefulness of the article with a simple Yes or No answer. The Yes and No options are always available on the knowledge article view page even when you had selected an option earlier.

Comments

Knowledge comments at the bottom of the article use live feed to enable a conversation around a knowledge article. For example, you can post replies to comments, add attachments, or Like comments. The glide.knowman.use_live_feed property controls the display of knowledge article comments. If enabled, the system uses live feed to manage and display feedback on knowledge articles.

Note: Unauthenticated users and users with only the snc_external role can't add or view attachments for comments.

Import a Word document to a knowledge base

Import a Word document to create a knowledge article.

You must have Can Contribute access to at least one active knowledge base.

Role required: knowledge

Beginning with Madrid, the Import a Word document feature is enabled by default and the Import Articles module is displayed in the application navigator. The Import a Word document feature isn’t enabled automatically for the existing customers who can continue using the Import Articles option on the Knowledge Management v3
homepage. To enable the Import a Word document feature for existing customers prior to Madrid, an administrator must first disable the Import Articles option on the Knowledge Management v3 homepage by setting the glide.knowman.import.hide_import_functionality property to true and adding the Import Articles module to the application navigator.

These styles and elements are preserved when importing a .doc or .docx file into a knowledge base. Styles and elements not included in this list may not be preserved when importing a document.

- Titles
- Headings
  
  **Note:** For any headings and subheadings with numbers, the numbers are not imported.

- Images
  
  **Note:** Images may not be aligned exactly as in the Word document you import.

- Links
- Bold text
- Italic text
- Underlined text
- Ordered and unordered lists
  
  **Note:** After import, the bullets in an unordered list are replaced with dots.

- Tables
  
  **Note:** Only default heading settings are supported. Custom heading styles are imported using the default settings for those styles. Table styling and borders are not supported.

1. Navigate to Knowledge > Articles > Import Articles.
2. Enter the knowledge base to add the article to.
3. Optional: Select a Category from within the knowledge base.

   **Note:** Use the category picker to add a category. The picker does not differentiate between the different category levels. You can select a category or sub category and add it to the Category field.

4. Optional: Select the Publish check box to start the publishing workflow for each imported article immediately after the import finishes.

   **Note:** The Publish check box appears only when the Show publish checkbox on the knowledge import pop-up property is enabled. To enable the property, navigate to Knowledge > Administration > Properties and select the check box for the Show publish checkbox on the knowledge import pop-up property.

5. Select one or more Word files to import.
6. Click Import.

An article is created in the selected knowledge base and category using the content from the uploaded document.

- If you uploaded multiple documents, one article is created for each.
- If you use knowledge internationalization, the language of the article is set to the system language selected.
- When the upload completes, a pop-up window displays the number and short description of the articles. Click an article to view the full record.
- If any errors occur during the upload, a pop-up window displays the error.
• If the Publish check box is activated, knowledge articles go into Review or Published state, depending on the workflow attached to the knowledge base.
• If the Publish check box is not activated, the knowledge articles go into Draft state and are then reviewed before publishing.

Create an article version by importing a Word document

Import a Word document to a knowledge article to create a new version.

• Ensure that the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is installed.
• You can only upload new versions to articles that are in Draft or Published state.
• You cannot upload new versions to articles that are created using an article template or if the article type is Wiki.

Role required: admin

1. Navigate to Knowledge > Articles.
2. Click an article.
3. Click the Upload New Version related link.

   Note: Any text written in TinyMCE is overwritten once the file is imported.

4. Add the file you want to import.
5. Optional: Select the Copy Attachments check box to copy all attachments to the knowledge article.

   Note: If the article is published, the attachments are added to a new article version. If the article is in draft, the attachments are added to the existing knowledge article. The draft article does not appear in the knowledge base (KB) for users until it is reviewed and published.

6. Click Import.

   A draft version is created and sent to approvers to approve or reject. Once the article is approved, it is displayed in the Article Versions related list.

Social Q&A question view page

View the question you selected as well as any answers. Answer a question or give feedback to a question.
How long does it usually take to set up my router?

Let's face it: Each router is different, and getting the right combination of settings, while setting up the router, can be confusing. For example, even some reasonably experienced PC hands may not understand the differences between security settings or know that WPA-2 offers better protection than WEP and ordinary WPA.

With these considerations in mind how long does it usually take to setup my routers?

Various vendors have tried to make things simpler with easy-setup CDs or one-click connection buttons, but they can not cover every possible circumstance. Router setup instructions go the extra mile by explicitly detailing the order in which you need to you plug everything in before you run the CD. (Cable modems in particular should be powered on before you connect your router to them.) That is a nice touch – but it assumes you have read the printed instructions that came with the router. This helps in setting up the router relatively quickly.

Knowledge Management email notifications

Reminders enable relevant users to review knowledge articles and complete tasks associated with them.

By default, the Knowledge Management application includes the following types of email notifications:

- Email notifications for knowledge article feedback tasks.
- Email notifications for knowledge subscriptions.
- Email notifications for knowledge article approval publishing workflow.
- Email notifications for translation tasks.
- Email notifications for article quality index (AQI) reviews.

You can decide if you must receive any knowledge notifications by setting notification preferences. For more information, see Set knowledge notification preferences.

Email notifications for knowledge article feedback tasks

The email notifications for knowledge article feedback tasks are available when your administrator activates the Knowledge Management Core plugin (com.glideapp.knowledge).

The following table describes the recipient list of notifications for knowledge article feedback tasks and the associated conditions when a notification is sent.
Recipient list of the email notification for knowledge article feedback tasks

<table>
<thead>
<tr>
<th>Notification</th>

Email notifications for knowledge subscriptions

The email notifications for knowledge subscriptions are available when your administrator activates the Knowledge Management Core plugin (com.glideapp.knowledge). For notifications associated with ownership groups, your administrator must also activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced).

The following table describes the recipient list of notifications for knowledge subscriptions and the associated conditions when a notification is sent.

Recipient list of the email notification for knowledge subscriptions

<table>
<thead>
<tr>
<th>Notification</th>

</tbody>
</table>
Notification | Condition | Recipients
--- | --- | ---
KM Subscription: Article created | A knowledge article was created in a subscribed knowledge base. | • Knowledge base owner  
• Knowledge base subscribers
KM Subscription: Article revised | A subscribed knowledge article was edited. | • Knowledge base owner  
• Knowledge base subscribers  
• Author  
• Revisers
KM Subscription: Article revised in KB | A knowledge article in a subscribed knowledge base was edited. | • Knowledge base owner  
• Knowledge base subscribers  
• Author  
• Revisers

Note: An email notification is sent to a reviser of a knowledge article when the article versioning feature is enabled.

Email notifications for knowledge article approval publishing workflow

The email notifications for knowledge article approval publishing workflow are available when your administrator activates the Knowledge Management Core plugin (com.glideapp.knowledge).

The following table describes the recipient list of notifications for the knowledge article approval publishing workflow and the associated conditions when a notification is sent.

Recipient list of the email notification for the knowledge article approval publishing workflow

<table>
<thead>
<tr>
<th>Notification</th>
<th>Condition</th>
<th>Recipients</th>
</tr>
</thead>
</table>
| KM: Approve article for publishing | A knowledge article was approved for publishing with the ownership group feature disabled. | Knowledge base owner and managers  
A knowledge article was approved for publishing with the ownership group feature enabled. | Ownership group manager and members |
| KM: Article approved for publish | A knowledge article was approved for publication. | User (author or reviser) who submitted the article for approval |
| KM: Article rejected for publish | A knowledge article was rejected for publication. | User (author or reviser) who submitted the article for approval |

Note: An email notification is sent to a reviser of a knowledge article when the article versioning feature is enabled.
Email notifications for translation tasks

The email notifications for translation tasks are available when your administrator activates the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) and I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2). The I18N: Internationalization plugin (com.glide.i18n) activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.

The following table describes the recipient list of notifications for translation tasks on knowledge articles and the associated conditions when a notification is sent.

### Recipient list of the email notification for translation tasks

<table>
<thead>
<tr>
<th>Notification</th>
<th>Condition</th>
<th>Recipients</th>
</tr>
</thead>
<tbody>
<tr>
<td>KM Translation Task: Assigned to me</td>
<td>A translation task was assigned.</td>
<td>User who was assigned the translation task</td>
</tr>
</tbody>
</table>
| KM Translation Task: Closed        | A translation task was closed after the translated version of the knowledge article was published. | • User who was assigned the translation task  
• User who submitted the translation task |

Email notifications for article quality index (AQI) reviews

The email notifications for an article quality index review on knowledge articles are available when your administrator activates the Knowledge Management Advanced plugin (com.snc.knowledge_advanced).

The following table describes the recipient list of notifications for an AQI review on knowledge articles and the associated conditions when a notification is sent.

### Recipient list of the email notification for AQI reviews

<table>
<thead>
<tr>
<th>Notification</th>
<th>Condition</th>
<th>Recipients</th>
</tr>
</thead>
<tbody>
<tr>
<td>KM: AQI on Article</td>
<td>An AQI was performed and submitted on a knowledge article with the ownership group feature disabled.</td>
<td>• User (author or reviser) who last updated the article</td>
</tr>
</tbody>
</table>
| KM: AQI on Ownership Group Article    | An AQI was performed and submitted on a knowledge article with the ownership group feature enabled. | • User (author or reviser) who last updated the article  
• Ownership group |

**Note:** An email notification is sent to a reviser of a knowledge article when the article versioning feature is enabled.

Set knowledge notification preferences

Set notification preferences for knowledge bases and knowledge articles.

Role required: knowledge
Users can set notification preferences from the Knowledge menu or from the Knowledge Management Service Portal.

1. Navigate to the Notification Settings page.

<table>
<thead>
<tr>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From the Knowledge application</td>
<td>Click the Notification Settings module.</td>
</tr>
<tr>
<td>From the Knowledge Management Service Portal</td>
<td>Click the user name in the portal header and then click Notification Settings.</td>
</tr>
</tbody>
</table>

2. Click the Notification Preferences tab.
3. Click Knowledge Base and enable or disable the knowledge base notification options.
4. Click Knowledge Articles and enable or disable the knowledge article notification options.

**Knowledge subscriptions**

Subscribe to knowledge bases and knowledge articles and receive email notifications about new articles and article revisions or comments.

- Subscribed to a knowledge base:
  - Knowledge base owners are auto-subscribed to all articles in the knowledge bases they own. They receive email notifications when new articles are created or revised (published) in the knowledge base.
  - Users who subscribe to a knowledge base receive email notifications when new articles are created in the knowledge base or if the existing articles are revised (published).

- Subscribed to a knowledge article:
  - Knowledge authors are auto-subscribed to the articles they create. They receive email notifications when the articles they created are checked out or revised (published) by other authors, and if the articles receive user comments.
  - Users who subscribe to an article receive email notifications when the article is revised (published).

Users can set their Knowledge notification preferences using System Settings. For more information, see Knowledge Management email notifications and Set knowledge notification preferences.

The knowledge subscription feature is available for both the Knowledge Management v3 user interface and the Knowledge Management Service Portal.

If the article versioning feature is enabled, the following notifications are also sent:

- An article is checked out
- An article is revised
- A new version of an article is published

**Activation information**

The knowledge subscriptions feature requires the Knowledge Management Advanced plugin (com.snc.knowledge_advanced). For more information, see Configure knowledge subscriptions.

**Subscribe to a knowledge base**

Subscribe to a knowledge base and receive notifications when articles are added to that knowledge base.

Role required: knowledge
Users can subscribe to a knowledge base from either the Knowledge Management V3 user interface or the Knowledge Management Service Portal.

1. Navigate to Knowledge > Homepage.
2. Click the Subscribe link on the knowledge base tile.
   The link changes to Subscribed and includes a check mark.

Unsubscribe from a knowledge base

Unsubscribe from a knowledge base.
Role required: knowledge

Users can unsubscribe from a knowledge base from either the Knowledge Management V3 user interface or the Knowledge Management Service Portal.

Note: If you subscribe to an article and then subscribe to the knowledge base, unsubscribing from the knowledge base also unsubscribes you from the article.

1. Navigate to Knowledge > Homepage.
2. Point to and click the Subscribed link on the knowledge base tile, which toggles to Unsubscribe.
   After unsubscribing you from the knowledge base, the link toggles to Subscribe.

Subscribe to a knowledge article

Subscribe to a knowledge article within a knowledge base.
Role required: knowledge

Users can subscribe to a knowledge article from either the Knowledge Management V3 user interface or the Knowledge Management Service Portal.

Note:
Users who are already subscribed to a knowledge base are also subscribed to the articles within that knowledge base.

To subscribe to articles from the base service portal (https://<instance name>/sp?), you must navigate to the Knowledge Management Service Portal pages (for example, https://<instance name>/sp?id=kb_home) from the base service portal.

1. Navigate to Knowledge > Homepage.
2. Click Subscribe at the top of the knowledge article.
   The system shows an information message about the article subscription and the button toggles to Subscribed.
   If the email notification contains an article link, the link points to the Knowledge Management Service Portal.
   The email notification for a subscribed article includes the knowledge article ID, short description, and link to the article.

Unsubscribe from a knowledge article

Unsubscribe from a knowledge article.
Role required: knowledge

Users can unsubscribe from a knowledge article from either the Knowledge Management V3 user interface or the Knowledge Management Service Portal.
Note: If you are subscribed to a knowledge base and you unsubscribe from an article in that knowledge base, you must also unsubscribe from the parent knowledge base.

1. Navigate to Knowledge > Homepage.
2. Point to and click Subscribed, which toggles to Unsubscribe.
   If you are subscribed to the knowledge article, this action results in an information message that the article subscription has been removed. If you are also subscribed to the parent knowledge base, proceed to the next step.
3. If you are subscribed to the parent knowledge base, click Yes on the Unsubscribe pop-up window.
   This action results in an information message that the knowledge base subscription has been removed.

Manage knowledge subscriptions

Manage knowledge base and knowledge article subscriptions from the Notification Settings page.

Role required: knowledge

Users can manage knowledge subscriptions from the Knowledge application or from the Knowledge Management Service Portal.

1. Navigate to the Notification Settings page.

<table>
<thead>
<tr>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From the Knowledge application</td>
<td>Click the Notification Settings module.</td>
</tr>
<tr>
<td>From the Knowledge Management Service Portal</td>
<td>Click the user name in the portal header and then click Notification Settings.</td>
</tr>
</tbody>
</table>

2. Click the Subscriptions tab.
3. Click Knowledge Base or Knowledge Articles to see a list of current subscriptions.
4. To unsubscribe from a knowledge base or knowledge article, click Subscribed.
   The link toggles to Unsubscribed.

Knowledge blocks

Simplify knowledge authoring for writers and knowledge consumption for readers with knowledge blocks.
Knowledge blocks are reusable pieces of content secured by user criteria that you can add to knowledge articles in a knowledge base. The user criteria controls which users can read or not read the block content in an article or search, enabling users to more easily view content that is relevant to them.

Knowledge blocks are available for use in Now Platform only.

How to use knowledge blocks

To use knowledge blocks, a knowledge administrator or manager must enable the knowledge blocks feature for each knowledge base in which the blocks will be used.

- Enable knowledge blocks for each knowledge base

Knowledge contributors can create knowledge blocks and insert them into articles in a knowledge base:

Note: Knowledge blocks are not supported in articles of type wiki.

- Create a knowledge block
- Add knowledge blocks to a knowledge article
- Preview a knowledge article with knowledge blocks
Knowledge block content can be read or not read in an article or search based on user criteria set at the knowledge base and knowledge block level. See *Select user criteria for a knowledge block* for more information.

**Holiday calendar with location-specific knowledge block content**

You are part of an enterprise HR organization that maintains a company knowledge base. You want to create a holiday calendar so that employees know which days of the year are company holidays. Since the company has multiple locations and holiday dates vary based on where the employee is located, there are several ways that you could create the knowledge article.

One way is that you could create a knowledge article for each location, with an article for Location A, Location B, and so on.

- Pros: simplified consumption. Employees have a single article to search for and read.
- Cons: more work for HR. HR has multiple articles to manage and update for each location where the company has employees.

Another way is that you could create a single knowledge article that includes sections for each location.

- Pros: simplified authoring. HR has a single article to manage and update.
- Cons: more work for employees. Employee must scroll through and disregard extraneous content to find the section in the article that pertains to them.

With knowledge blocks, you can create a single knowledge article with location-specific block content secured by user criteria. This approach helps to reduce the workload for both HR and employees. As an HR agent, you have a single article to manage and update. Employees have a single article to search for and read, with the user criteria ensuring that they only view content that is relevant to them.

**If you are using a custom search or knowledge article viewer**

If you are using a custom search or knowledge article viewer with your application, you should integrate it with the appropriate knowledge or knowledge blocks API. (Integration is only necessary if you are using a custom search or knowledge article viewer.)

- *Integrating a custom search or knowledge article viewer with knowledge blocks*

**Activation information**

To use knowledge blocks in your application, you must *activate knowledge blocks*. For information on what components are installed with the feature, see *Components installed with knowledge blocks*.

**Note:** Activating knowledge blocks automatically activates Knowledge Management Advanced, which enables advanced features such as article versioning. Knowledge blocks can be used with or without the article versioning feature. To disable the feature, see *Disable the article versioning feature*.

**Activate knowledge blocks**

You can activate knowledge blocks [com.snc.knowledge_blocks] if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

Knowledge blocks activates these related plugins if they are not already active.
### Plugins for knowledge blocks

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Management Advanced</td>
<td>Enables advanced features for Knowledge Management, such as article versioning. For a full list of features, see activate the Knowledge Management Advanced plugin.</td>
</tr>
<tr>
<td>[com.snc.knowledge_advanced]</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** Knowledge blocks can be used with or without the article versioning feature. To disable the feature, see Disable the article versioning feature.

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise they will receive the following error: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

### Components installed with knowledge blocks

Several types of components are installed with activation of the knowledge blocks plugin, including tables.

**Note:** The Application Files table lists the components installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

### Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Block</td>
<td>Knowledge blocks table.</td>
</tr>
<tr>
<td>[kb_knowledge_block]</td>
<td></td>
</tr>
<tr>
<td>KB Knowledge to Block</td>
<td>KB knowledge to block table.</td>
</tr>
<tr>
<td>[m2m_kb_knowledge_to_block]</td>
<td></td>
</tr>
<tr>
<td>KB Knowledge to Block History</td>
<td>KB knowledge to block history table.</td>
</tr>
<tr>
<td>[m2m_kb_to_block_history]</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** This table extends the Knowledge [kb_knowledge] table.

For further information on table administration and how to manage data, see Table administration.
Enable knowledge blocks for each knowledge base

Enable the knowledge blocks feature for each knowledge base where you plan to use the blocks. Once enabled, you can create knowledge blocks to add to knowledge articles within a knowledge base.

Make sure that the knowledge blocks [com.snc.knowledge_blocks] plugin is activated.

Role required: knowledge_admin or knowledge_manager

1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Open the knowledge base record.
3. In the Knowledge Base form, select the Enable blocks check box.

**Note:** If the Enable blocks check box is not visible, you can add the field to the form by right-clicking the form header and navigating to Configure > Form Layout.

4. Click Update.

**Note:** If you decide to later disable the knowledge blocks feature, all knowledge blocks within the knowledge base must be deleted before you can clear the box.
Create knowledge blocks to use within the enabled knowledge base.

Create a knowledge block

Create or modify a knowledge block to define a reusable piece of content that can be inserted into knowledge articles in a knowledge base. The knowledge block is secured by user criteria, which controls what users, groups, roles, companies, locations, or departments can read or not read the content in an article or search, enabling users to more easily view content that is relevant to them.

Role required: user must have contributor access to the knowledge base.

1. Navigate to Knowledge > Knowledge Blocks > Create New.
2. Click New or open a record.
3. Fill in the fields on the form.

Knowledge Block form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>This field is automatically set to a knowledge block number.</td>

</tr>
</tbody>
</table>
| Valid to      | Date that the knowledge block expires. After the valid to date:  
|               | • Knowledge article viewer will no longer display expired knowledge block content in the associated knowledge article.  
|               | • Search will no longer return knowledge articles if the keywords are contained in the expired blocks.                                                                                                    |
| Short Description | Description of the knowledge block.                                                                                                                                                                         |
| Text          | Text of the knowledge block.                                                                                                                                                                               |
| Version       | This field is automatically set to a version number when the article versioning feature is enabled.                                                                                                       |
| Article type  | This field is automatically set to HTML.                                                                                                                                                                    |
| Workflow      | This field is automatically set to the publication state of the block, such as Draft, Published, or Retired.                                                                                                 |
| Source task   | Not applicable.                                                                                                                                                                                           |

4. Click **Save** or **Update** to create or update the block.  
5. Click **Publish** to publish the block.  

**Note:** Any additional steps required to publish the knowledge block, such as approvals, depend on the publishing workflow for the knowledge base. See **Knowledge workflows** for more information.

After the knowledge block is published, you can add the block to an article within the knowledge base.  
**Select user criteria for a knowledge block**  
Control which users can read or not read knowledge block content within an article in a knowledge base by setting user criteria at the knowledge base and knowledge block level. As a knowledge contributor, you can apply user criteria at the knowledge block level.  
Role required: user must have contributor access to the knowledge base.

1. Navigate to **Knowledge > Knowledge Blocks > All.**  
2. Open a knowledge block.  
3. Apply the desired user criteria for the **Can Read** and **Cannot Read** fields.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can Read</td>
<td>User criteria to apply for read access at the knowledge block level.</td>
</tr>
<tr>
<td>Cannot Read</td>
<td>User criteria to apply for cannot read access at the knowledge block level.</td>
</tr>
</tbody>
</table>

**Note:**
• You can use existing or create new user criteria records. To create a new record, see Create user criteria for controlling access to knowledge bases and articles.
• If a user meets any Can Contribute criteria at the knowledge base level, they can read all knowledge block content, regardless of the Can read and Cannot read criteria set at the knowledge block level.
• If a user meets any Cannot read criteria at the knowledge block level, they cannot read the block content, regardless of the Can read criteria set at the knowledge block level.
1 User meets any of the following:
- admin role
- knowledge_admin role
- knowledge base owner
- knowledge base manager
- Can Contribute user criteria
  (if no user criteria is set, then any user with at least one role can contribute articles.)

2 (if no user criteria is set, then any user can read articles.)

Can Contribute access at knowledge base level?

Yes

Can Read access at knowledge base level?

Yes

Cannot read block

No

Can Read access at knowledge base level?

No

Cannot read access at block level?

Yes

Can read block

No

Can read access at block level?
4. Right-click the form header and click Save.

- To finish and publish the block, see Create a knowledge block.
- To add the block to an article, as well as preview the article by impersonating different users, see Add knowledge blocks to a knowledge article.

Retire a knowledge block

You can retire a published knowledge block so that it is no longer available for users to view or search. A knowledge block can only be retired if it is not being used in any knowledge articles.

Role required: user must have contributor access to the knowledge base.

1. Navigate to Knowledge > Knowledge Blocks > Published.
2. Open the applicable record.
3. In the Articles related list, verify that the knowledge block is not being used in any knowledge articles.

   Note: A knowledge block can only be retired or deleted if it is not being used in any knowledge article, including any retired article or previous version of an article.

4. Click Retire to retire the knowledge block.

   Note: Any additional steps required to retire the knowledge block, such as approvals, depend on the workflow for the knowledge base. See Knowledge workflows for more information.

Add knowledge blocks to a knowledge article

You can insert one or more knowledge blocks into a knowledge article within a knowledge base. Each knowledge block is secured by user criteria, which controls who can read or not read the content in an article.

Role required: user must have contributor access to the knowledge base.

1. Navigate to Self-Service > My Knowledge Articles.
2. Click New or open a record.
   
   On clicking New, you are provided options to select an article template. The article templates appear when you activate them in the Knowledge > Article templates.
3. Select an article template.

   Note: You can add or remove knowledge blocks in more than one HTML field of any article template including custom templates.

4. Fill in the fields on the form, as appropriate.
   
   For further details on creating a knowledge article, see Create a knowledge article.

   Note: Knowledge blocks are only supported with HTML knowledge articles. Make sure that the Article type field is set to HTML.

5. Click Add Blocks to open the Add Blocks side panel.

   Note: If the Add Blocks button is not visible, make sure that the knowledge blocks feature is enabled for the knowledge base that the article is in. See Enable knowledge blocks for each knowledge base for more information.
6. In the **Add Blocks** side panel, you can search for, do an advanced search, view, and insert knowledge blocks into the article. You can also create blocks directly from the side panel.

**Note:**
- You can configure the number of search results displayed in the **Add Blocks** side panel using the `glide.knowman.add_blocks.search_results` property. By default, the minimum number of search results displayed is 6 and the maximum number of search results displayed is 25. See *Knowledge properties* for more information.
7. In the **Article body**, you can rearrange knowledge blocks within an article.

<table>
<thead>
<tr>
<th>Option</th>
<th>Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>If you are using a mouse</strong></td>
<td>1. Click the block to select it.</td>
</tr>
<tr>
<td></td>
<td>2. Drag and drop the block within the article.</td>
</tr>
<tr>
<td><strong>Option</strong></td>
<td><strong>Steps</strong></td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>If you are using a keyboard</strong></td>
<td>1. Place your cursor to the left of the block.</td>
</tr>
<tr>
<td></td>
<td>2. Press the right arrow key to select the block.</td>
</tr>
<tr>
<td></td>
<td>3. Use Ctrl+x and Ctrl+v to cut and paste the block within the article.</td>
</tr>
</tbody>
</table>

The following GIF shows an example of a user moving a knowledge block within an article using a keyboard.
List ready for your next day off! Here’s a list of company holidays in your region:

**KBB0010002**
Company Holiday Calendar - Location A

**Holiday**

**KBB0010003**
Company Holiday Calendar - Location B
8. Click **Save** or **Update** to create or update the article.

   **Note:** You can preview the article with the blocks by user or, if published, date. See *Preview a knowledge article with knowledge blocks* for more information.

9. Click **Publish** to publish the article.

   **Note:** Any additional steps required to publish the knowledge article, such as approvals, depend on the publishing workflow for the knowledge base. See *Knowledge workflows* for more information.

### Preview a knowledge article with knowledge blocks

Preview a knowledge article with knowledge blocks by user or, if published, by date. For an unpublished article, you can preview the article by user by impersonating different users to see how the article displays or hides block content (based on the user criteria set at the knowledge base and knowledge block level). For published articles, you can preview the article by both user and date to see how the article appears in past versions for different users.

- **Role required:** user must have contributor access to the knowledge base.
- **1.** Navigate to **Knowledge > Articles**, and open one of the modules, such as **Unpublished** or **Published**.
- **2.** Open the knowledge article with knowledge blocks.
- **3.** In the **Related Links** section, click **Preview Article with Blocks**.
4. Preview the article as one of the following.

<table>
<thead>
<tr>
<th>Option</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Unpublished article</strong></td>
<td>Preview the article by user. In the View As field, you can search for and impersonate different users to see how the article appears based on the can and cannot read access of the user.</td>
</tr>
</tbody>
</table>
| **Published article** | Preview the article by user and date:  
  - In the View As field, you can search for and impersonate different users to see how the article appears based on the can and cannot read access of the user.  
  - In the View on date field, you can select different dates to see how the article appears in past versions. |
Integrating a custom search or knowledge article viewer with knowledge blocks

If you are using a custom search or knowledge article viewer with your application, you can integrate that custom search or viewer with the appropriate knowledge or knowledge blocks API.

**Note:** Integration is only necessary if you are using a custom search or knowledge article viewer.

**KBPortalServiceImpl - Global**

The `KBPortalServiceImpl` API is included with Knowledge Management V3 [com.snc.knowledge3] as a script include. It provides methods to use with knowledge, such as integration with a custom search.

**KBPortalServiceImpl - KBPortalServiceImpl()**

Instantiates a `KBPortalServiceImpl` object in a global application.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**KBPortalServiceImpl - getResultData(Object request)**

Returns search results based on keywords from the knowledge article and from relevant knowledge block content that the user has access to read.

If you have activated the knowledge blocks feature and are using a custom search for knowledge with your application, your search may not return relevant articles when keywords are contained in the blocks. To return search results based on keywords from the article and from relevant block content that the user has access to read, you must call the `getResultData()` method inside your custom search.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request</td>
<td>Object</td>
<td>JSON object to refine the search.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Array of search results in JSON format based on keywords from the knowledge article and from relevant knowledge block content that the user has access to read.</td>
</tr>
</tbody>
</table>

Integrating a custom search with knowledge blocks

```javascript
function doKeywordSearch(queryText, count, queryLocation) {
  var results = [];

  // To set up the request.
  var request = {
    keyword: queryText,
    language: "",
  }

  // To pass data to filter on different metadata.
  variables: {
    kb_knowledge_base: ['Knowledge'],
  }
```
KBBlock - Global

The KBBlock API is included with knowledge blocks [com.snc.knowledge_blocks] as a script include. It provides methods to use with the knowledge blocks feature, such as integration with a custom knowledge article viewer.

KBBlock - KBBlock()

Instantiates a KBBlock object in a global application.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**KBBlock - getArticleContent(GlideRecord knowledgeRecord)**

Gets knowledge articles with relevant knowledge block content that a user has access to read.

If you have activated the knowledge blocks feature and are using a custom knowledge article viewer with your application, your viewer may not display articles that expand the relevant block content. To expand block content that a user has access to read, you must call the `getArticleContent()` method inside your custom viewer.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>knowledgeRecord</td>
<td>GlideRecord</td>
<td>GlideRecord of the knowledge article to display.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Knowledge article with relevant knowledge block content that a user has access to read.</td>
</tr>
</tbody>
</table>

### Integrating a custom knowledge article viewer with knowledge blocks

```javascript
// This function returns the article text with expanded block content.
function getArticleText(kbSysId) {
  var knowledgeRecord = new GlideRecord('kb_knowledge');
  var kbText='';
  if(knowledgeRecord.get(kbSysId)) {
    if(new GlidePluginManager().isActive('com.snc.knowledge_blocks')) {
      kbText = new KBBlock();
      kbText.getArticleContent(knowledgeRecord);
    } else
      kbText = knowledgeRecord.getValue('text');
  }
  return kbText;
}
// This is an example of how to call the function defined above.
var kbText = getArticleText('01a1ca5b6710130038876c3b5685efd3');
```

### Knowledge Management V3 homepage

The Knowledge Management V3 homepage displays knowledge articles and social Q&A questions organized by knowledge base and category, as well as featured content and popular articles.

To view the default knowledge homepage, navigate to **Self-Service > Knowledge**.
Note:
The knowledge homepage is not compatible with Internet Explorer 9 or earlier. Using one of these browsers will cause you to be redirected to the legacy knowledge portal.
The Knowledge V3 home page is not customizable. Use the Knowledge Management Service Portal for an easily configurable user experience.

If you access knowledge from a service management application, the knowledge homepage for the associate application opens.

Only published and not yet expired knowledge articles (that is the valid do date not yet reached) appear on the homepage.

From the homepage, you can import a Word document to a knowledge base using the Import Articles button.

Note: From Madrid, you can import a word document from the Import Articles module available in the Application Navigator. This feature is active by default for customers on Madrid and later releases. Existing customers on release versions prior to Madrid use the Word import functionality on the Knowledge V3 homepage. Upgrade customers use the Word import functionality on the Knowledge V3 homepage by default. If required, add the Import Articles module to the Application Navigator. If you add the module, the Import Articles button does not appear on the Knowledge V3 homepage.

You can also create a new article using the Create An Article button, or ask a question using the Post a Question button.

- Import a Word document
- Create an article
- Ask a question

Note: You must have user criteria "Can contribute" permission for at least one active knowledge base, otherwise these buttons do not appear. See Migrate to Knowledge Management v3 and Knowledge manager.

You can select a knowledge base to browse articles and questions within that knowledge base. You can view only knowledge bases you can access.

Articles and questions are organized by category or by tag. Categories are listed alphabetically. While browsing, you can filter content by type to view only knowledge articles, only social Q&A questions, or only unanswered questions. You can sort content by most recent update or by number of views.

You can comment on an article. There is no HTML formatting available for comments on the Knowledge V3 homepage.

Existing customers on release versions prior to New York can view knowledge article feedback comments in the following ways.

- On the Knowledge V3 homepage.
- If the Knowledge Management — Service Portal plugin (com.snc.knowledge_serviceportal) is installed, on the Knowledge Service Portal.
- If the Use Live Feed for knowledge feedback property is active, in the Live Feed.

For new customers on New York and later releases, comments can only be viewed in the Knowledge Service Portal.

An administrator can configure the knowledge homepage to display the number of articles and questions within each category. This count includes articles and questions from subcategories. To display the article and question count, set the knowledge homepage property Display or hide the count of articles and questions in the category and child categories (glide.knowman.show_number_on_categories) to true.
Search using Knowledge Management v3

Search for knowledge articles and social Q&A questions from the knowledge homepage using the search bar on the Knowledge Management v3 homepage.

Search results include only articles and questions you are authorized to read. The search results count do not take into consideration any security rules set for the articles. The number of articles you can access may be lower than the count displayed in the search results page. Documents that are attached to articles are also listed in the search results.

**Note:** To change how the attachments are displayed in the search results, set the `How to display attachments in Knowledge Search Results glide.knowman.search.attachment` property. Attachments can be displayed with a snippet, link only, or not at all.

To use wildcards in your search, navigate to **Contextual Search > Search Contexts > Knowledge Base Search** and select **Enable wildcard searches**.

Sort knowledge content by relevancy, most recent update, or number of views.

Filter results using the check boxes that appear. Filtering options appear depending on the search text.

### Filtering options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>Select if you want to view knowledge articles, social Q&amp;A questions, or both. This option is only available if Social Q&amp;A is enabled.</td>
</tr>
<tr>
<td><strong>Knowledge Bases</strong></td>
<td>Select a knowledge base to search. You can select only knowledge bases you can access. If you do not select a specific knowledge base, search results include articles and questions from all knowledge bases that you can access. You can also select a knowledge base from the choice list in the search bar. For pinned articles, only those in the selected knowledge base in the corresponding language appear.</td>
</tr>
<tr>
<td><strong>Categories</strong></td>
<td>Select one or more knowledge categories. Categories are listed alphabetically.</td>
</tr>
<tr>
<td><strong>Authors</strong></td>
<td>Select one or more authors.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Language</td>
<td>The multi-language search feature is available when more than one supported language is enabled.</td>
</tr>
<tr>
<td></td>
<td>1. To enable multi-languages, activate the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) or activate one of the internationalization plugins for the language you require.</td>
</tr>
<tr>
<td></td>
<td>Note: Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.</td>
</tr>
<tr>
<td></td>
<td>2. To display search results in all available languages simultaneously, enable the glide.knowman.enable_multi_language_search property.</td>
</tr>
<tr>
<td></td>
<td>a. Navigate to Knowledge &gt; Administration &gt; Properties &gt; Knowledge Search Properties &gt; Enable multi language search and select the Yes check box.</td>
</tr>
<tr>
<td></td>
<td>b. Enter sys_properties.list in the filter navigator, search for the property to configure, and in the Value field, enter true.</td>
</tr>
<tr>
<td></td>
<td>Note: By default, the glide.knowman.enable_multi_language_search property is not enabled. Search results are displayed based on the language you select in the language filter on the Search page.</td>
</tr>
</tbody>
</table>

**Import a Word document to a knowledge base using Knowledge Management V3**

Import a Microsoft Word document using Knowledge Management v3 homepage to create a knowledge article.

You must have user criteria “Can contribute” permission for at least one active knowledge base.

The import articles button does not appear in the following conditions:

- The Import Articles module is available in the application navigator.

  **Note:** Beginning with Madrid, the Import a Word document feature is enabled by default and the Import Articles module is displayed in the application navigator. The Import a Word document feature isn’t enabled automatically for the existing customers who can continue using the Import Articles option on the Knowledge Management v3 page. For more information, see Import a Word document to a knowledge base.

- You cannot contribute to any knowledge base.
An administrator can control the visibility of the **Import Articles** button by setting the other knowledge property **Hide the 'Import' functionality (button and drag-n-drop) for all users (glide.knowman.import.hide_import_functionality)** to true.

Role required: None

You can import Microsoft Word .doc and .docx files.

**Note:** The file extension must be lowercase.

When you import a document, text content from the document is used to create the knowledge article. The articles support all editing functions **supported by the TinyMCE editor**. All HTML supported by TinyMCE such as tables, lists, and links, as well as styling such as bold and italics, are preserved. Images from the document are added as attachments to the knowledge article and embedded in the article body.

**Note:**

You can import multiple files at a time. Closing the browser or navigating away cancels any in-progress uploads but does not delete articles created from completed imports.

You cannot import documents to knowledge from mobile devices.

The following styles and elements are preserved when importing a .doc or .docx file into a knowledge base. Styles and elements not included in this list may not be preserved when importing a document.

- Titles
- Headings
  **Note:** For any headings and subheadings with numbers, the numbers are not imported.
- Images
  **Note:** Images may not be aligned exactly as in the Word document you import.
- Links
- Bold text
- Italic text
- Underlined text
- Ordered and unordered lists
  **Note:** After import, the bullets in an unordered list are replaced with dots.
- Tables
  **Note:** Only default heading settings are supported. Custom heading styles are imported using the default settings for those styles. Table styling and borders are not supported.

1. Navigate to **Self-Service** > **Knowledge**.
2. Perform one of the following actions.
   - Click **Import Articles** and select one or more document files.
   - Drag one or more document files onto the knowledge homepage.
3. Select the **Knowledge base** to add the new article to.
   You can select only knowledge bases you can contribute to.
4. Optional: Select a **Category** from within that knowledge base.

   **Note:** Use the category picker to add a category. The picker does not differentiate between the different category levels. You can select a category or sub category and add it to the **Category** field.

5. Optional: Select the **Publish** check box to start the publishing workflow for each imported article immediately after the import finishes.

   This check box applies only when importing to v3 knowledge bases and only if the **Show publish checkbox on the knowledge import pop-up** property is set to **Yes** on the Knowledge Management properties form. You cannot automatically publish articles imported to v2 knowledge bases.

   Knowledge v2 articles go into **Draft** state. Knowledge v3 articles go into **Review** or **Published** state, depending on the workflow attached to the knowledge base (Approval Publish or Instant Publish).

6. **Click Import.**

   A new article is created in the selected knowledge base and category using the content from the uploaded document. If you uploaded multiple documents, one article is created for each. If you use knowledge internationalization, the language of the new article is set to the currently selected system language.

   After the upload completes, a popup window appears displaying the number and short description of the newly-created articles. Click an article to view the full record.

   If any errors occur during the upload, a popup window appears to display the error.

---

**Select a knowledge article category**

Knowledge articles within a knowledge base are grouped by category. These groups can help you define the knowledge base taxonomy, and can help users find articles within that knowledge base.

As a knowledge contributor, when editing a knowledge article you can select categories using the **Category** picker, and add or edit categories if enabled for the knowledge base.

1. Click the reference lookup icon beside the **Category** field.
2. Select an existing category, or click the add category icon (+) to add a new category.

   After you select a category, you can click the pen icon to rename that category. Press the enter key or click outside the selected category to save the change.

   **Note:** Clicking **Cancel** while selecting a category cancels selecting a new category, but does not revert any changes you make to the categories such as renaming or adding new categories.

3. Fill in the fields on the form, as appropriate.
4. Optional: Select or add a subcategory.
5. **Click OK.**

---

**Create a knowledge article from a customer service case**

Reuse information from a customer service case by creating knowledge articles from cases.

Your administrator must enable creation of articles from customer service cases.

Role required: sn_customerservice_agent or knowledge

1. Navigate to **Customer Service > Cases > All.**
2. Select a case from which you want to create a knowledge article.
3. **Click Create Knowledge.**

   The relevant fields are automatically copied from the case to the record that opens.

4. In the **Knowledge base** field, enter the name of the knowledge base in which you want this article to display.
5. Click Submit.

**Request a knowledge base**

If existing knowledge bases do not fit your needs, you can request a new knowledge base through the service catalog. If the request is approved, you are added as the owner of the new knowledge base.

Role required: none

If no knowledge base exists that fit your needs, all users can request a new knowledge base.

1. Navigate to **Self-Service > Service Catalog**.
2. Select **Can We Help You?**.
3. Select the **Request Knowledge Base** catalog item.
4. Enter the reason you want the knowledge base, and a name for the knowledge base.
5. Click Submit.

You are notified when the request is approved or rejected. If the request is approved, you are added as the owner of the new knowledge base. You can then assign managers and manage articles in the new knowledge base.

Knowledge bases created through this request process are inactive by default, so you must activate the knowledge base to make it available for users.

**Use knowledge on mobile devices**

All users can access knowledge from mobile devices to search for and view knowledge articles and social Q&A questions.

**Browse knowledge on mobile devices**

You can browse knowledge bases using a mobile device.

Navigate to **SELF-SERVICE > Knowledge Base**.
Mobile Knowledge View

Browse Knowledge by tapping on a category and browsing articles or subcategories.
Mobile Knowledge Categories

Note: Select the desired category and click the close icon (×) for the selected category to reflect in the search results.

View knowledge articles and questions on mobile devices

You can read knowledge content using a mobile device. Tap a title to view the article or question.
**Note:** You cannot edit or add comments to knowledge articles on the mobile interface. If using *Social Q&A*, you can perform all functions such as adding and editing questions, answers, and comments through the mobile interface.

---

**Search knowledge on mobile devices**

Find a specific article or question by searching on a particular term.
Knowledge demand insights

Identify knowledge gaps and improve content of your knowledge base using the Knowledge Demand Insights feature.

The Knowledge Demand Insights feature automates the discovery of knowledge gaps in your knowledge bases. Knowledge gaps are topics on which knowledge bases are missing knowledge articles.

Addressing knowledge gaps has the following benefits:

• Improve effectiveness of self-service: Self-service users get more relevant information for research, troubleshooting, and how to queries.
• Increase case or incident resolutions: Having relevant information available helps you deflect future cases.
• Improved case resolution: Agents can find more relevant knowledge articles to solve cases, incidents, problems, and so on.

Activation information

The Knowledge Demand Insights feature requires the Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml). For more information, see Predictive Intelligence for Knowledge Management and Additional plugins for Knowledge Management.
Demand insights dashboards

You can use a demand insights dashboard for your tasks to analyze candidate knowledge gaps and create knowledge gap feedback tasks. By default, the Knowledge Demand Insights feature includes Demand Insights for Incidents and Demand Insights for Cases dashboards for incidents and customer service cases, respectively. For other tasks, you can create a dashboard. To access a demand insights dashboard, you must have read access to the tasks and the sn_km_ml.knowledge_curation_user role. For more information, see Analyze knowledge gaps from a demand insights dashboard and create knowledge gap feedback tasks.

Configure Knowledge Demand Insights

Configure the Knowledge Demand Insights feature to identify which topics are missing knowledge articles and creating actionable knowledge gaps for missing topics.

Activate the Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml). For more information, see Predictive Intelligence for Knowledge Management and Additional plugins for Knowledge Management.

To configure the Knowledge Demand Insights feature, use the Knowledge Management guided setup. The guided setup takes you through the entire setup and configuration process.

This task provides general steps to configure the Knowledge Demand Insights feature. For more information about the feature, see Knowledge demand insights.

1. Configure similarity and clustering solution definitions to enable comparing knowledge bases with a task type.
2. Configure the combination of the task table and similarity and clustering solution definitions that are processed in a scheduled job for a task type.
3. Configure scheduled jobs for each task.
4. Configure assignment rules to automatically assign feedback tasks of type Knowledge gap.

**Note:** If no assignment rules are configured, a knowledge admin or knowledge manager can later use the Feedback Management feature in the Knowledge module to manually assign a feedback task.

Configure solution definitions to find gaps in a knowledge base

The Knowledge Demand Insights feature finds knowledge gaps by comparing knowledge bases with existing tasks. To enable comparing knowledge bases with a task type, you must first configure similarity and clustering solution definitions.

This task describes the process for configuring a solution definition.

Instead of doing the configuration through this procedure, consider using a guided setup. Navigate to Knowledge > Administration > Guided Setup, click Get Started, and then scroll to the Knowledge Demand Insights section.

Role required: admin

Configure one similarity type and one clustering type solution definitions for each task type: incidents, customer service cases, or other tasks. A similarity solution definition collects and compares your existing records to new similar records. A clustering solution definition groups similar records into clusters so you can address them collectively or identify patterns.

1. Navigate to Knowledge Demand Insights > Solution Definitions.
2. In the Solution Definitions (ML view) list, search for and select the similarity solution definition for the task type.
   - For customer service cases, select Demand Insights: Similar Cases and Knowledge (ml_sn_global_similar_cases_and_kbs) .
• For incidents, select Demand Insights: Similar Incidents and Knowledge (ml_sn_global_similar_incidents_and_kbs).
• For tasks other than customer service cases and incidents, click New to create another similarity solution definition.

3. On the Similarity Definition form, verify the default field values for customer service cases or incidents, or fill in the values for a custom configuration.

**Note:** If the application scope isn't set to Knowledge Management - Machine Learning, you cannot edit the form and a warning message appears. To make the form editable, click the word here at the end of the message.

### Similarity Definition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique name for your similarity solution.</td>
</tr>
<tr>
<td>Word Corpus</td>
<td>Defines which knowledge articles and tasks are selected for knowledge gap analysis. If you don’t have a relevant word corpus, follow the steps in Create a word corpus.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that contains the knowledge article records. Set the value to Knowledge [kb_knowledge] unless you use a different table for storing knowledge articles. After you assign a table value, the number of records that match the filter conditions is displayed as a link.</td>
</tr>
<tr>
<td>Fields</td>
<td>Fields from the Knowledge table selected for knowledge gap analysis.</td>
</tr>
<tr>
<td>Filter</td>
<td>Filter conditions applied on the Knowledge table to filter knowledge article records for knowledge gap analysis.</td>
</tr>
<tr>
<td>Test Table</td>
<td>Table that contains the task records that you want to compare with knowledge article records.</td>
</tr>
<tr>
<td>Test Fields</td>
<td>Fields from the task table selected for knowledge gap analysis.</td>
</tr>
<tr>
<td>Processing Language</td>
<td>Dominant language of the dataset you're training on the solution definition. Note that English processing is applied to all datasets by default. For example, if you select Italian, the system processes the data in both English and Italian.</td>
</tr>
</tbody>
</table>

**Note:** The term processing indicates some of the language-specific steps used as part of training a solution. These steps might include tokenizing words, removing stop words, and stemming.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stopwords</td>
<td>Common terms in the processing language that are excluded from the search, for example, prepositions. When you select your processing language, the system automatically adds a Stopwords list that uses the same language. For example, if your processing language is Italian, the <strong>Default Italian Stopwords</strong> list appears. The <strong>Default English Stopwords</strong> list also appears in your selection as well.</td>
</tr>
<tr>
<td>Training Frequency</td>
<td>Frequency with which the model for similarity solution definition must be retrained.</td>
</tr>
<tr>
<td>Update Frequency</td>
<td>Frequency with which to include new records in the model for the similarity solution definition.</td>
</tr>
</tbody>
</table>

4. **Submit and train the solution definition.**
   - For a new solution definition record, click **Submit & Train**.
   - For an existing solution definition record, click **Update & Retrain**.

5. **In the Solution Definitions (ML view) list, search for and select the clustering solution definition for the task type.**
   - For customer service cases, select **Demand Insights: Case Clusters Need Knowledge (ml_sn_global_cases_need_knowledge_cluster)**.
   - For incidents, select **Demand Insights: Incident Clusters Need Knowledge (ml_sn_global_incidents_need_knowledge_cluster)**.
   - For tasks other than customer service cases and incidents, click **New** to create another clustering solution definition.

6. **On the Clustering Definition form, verify the default field values for customer service cases or incidents, or fill in the values for a custom configuration.**

   **Note:** If the application scope isn't set to Knowledge Management - Machine Learning, you cannot edit the form and a warning message appears. To make the form editable, click the word **here** at the end of the message.

### Clustering Definition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique name for your clustering solution.</td>
</tr>
<tr>
<td>Word Corpus</td>
<td>Which tasks are selected for collections.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that contains the filtered tasks that require knowledge articles. Set the value to Task knowledge coverage [kb_task_knowledge_coverage] unless you use a different table for storing filtered tasks. After you assign a table value, the number of records that match the filter conditions is displayed as a link.</td>
</tr>
<tr>
<td>Fields</td>
<td>Fields from the Task knowledge coverage table selected for knowledge gap analysis.</td>
</tr>
<tr>
<td>Filter</td>
<td>Filter conditions applied on the Task knowledge coverage table to filter knowledge article records for knowledge gap analysis.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Processing Language</td>
<td>Dominant language of the dataset you're training on the solution definition. Note that English processing is applied to all datasets by default. For example, if you select Italian, the system processes the data in both English and Italian. Note: The term processing indicates some of the language-specific steps used as part of training a solution. These steps might include tokenizing words, removing stop words, and stemming.</td>
</tr>
<tr>
<td>Stopwords</td>
<td>Common terms in the processing language that are excluded from the search, for example, prepositions. When you select your processing language, the system automatically adds a Stopwords list that uses the same language. For example, if your processing language is Italian, the Default Italian Stopwords list appears. The Default English Stopwords list also appears in your selection as well.</td>
</tr>
<tr>
<td>Update Frequency</td>
<td>Frequency with which to include new and updated records in the model for the clustering solution definition.</td>
</tr>
<tr>
<td>Training Frequency</td>
<td>Frequency with which the model for clustering solution definition must be retrained.</td>
</tr>
</tbody>
</table>

7. Submit and train the solution definition.
   • For a new solution definition record, click **Submit & Train**.
   • For an existing solution definition record, click **Update & Retrain**.

Complete the KB curation configuration form to define the scheduled jobs for demand insights. For more information, see **Configure the mapping of solution definitions with task tables**.

**Configure the mapping of solution definitions with task tables**

Configure the combination of the task table and similarity and clustering solution definitions that are processed in a scheduled job for a task type. You can create another demand insights configuration or modify an existing configuration to define a scheduled job for demand insights.

This task describes the process for configuring a scheduled job.

Instead of doing the configuration through this procedure, consider using a guided setup. Navigate to **Knowledge > Administration > Guided Setup**, click **Get Started**, and then scroll to the Knowledge Demand Insights section.

Ensure that you have configured a similarity type and clustering type solution definitions for a task type. For more information, see **Configure solution definitions to find gaps in a knowledge base**.

Role required: admin

A scheduled job for each task type runs business rules and then executes the similarity and clustering solution definitions. In the Demand Insights Configuration module, you configure the combination of the task table and similarity and clustering solution definitions that are processed in a scheduled job for a task type. This configuration is optional for customer service cases and incidents.
Note: For task types other than customer service cases and incidents, a user with the admin role must also perform the following tasks:

- Assign the sn_km_ml.knowledge_curation_user role and the appropriate roles for the task type to the users performing the knowledge gap analysis. To assign roles, perform the Assign knowledge curator roles guided setup task, which are available in the Knowledge Demand Insights section of the Knowledge Management guided setup.
- Create a demand insights dashboard for the task type. To create a dashboard, see Create or configure a responsive dashboard.

1. Navigate to Knowledge Demand Insights > Demand Insights Configuration.
2. Configure the combination of the task table and similarity and clustering solution definitions that are processed in a scheduled job.
   - For customer service cases, select sn_customerservice_case.
   - For incidents, select incident.
   - For tasks other than customer service cases and incidents, click New to create another combination.
3. On the KB curation configuration form, verify the default field values for customer service cases or incidents or fill in the values for a custom configuration.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Curation table</td>
<td>Name of the table you want the data to pull information from. For example, for customer service cases, select Case [sn_customerservice_case] and for incidents select Incident [incident].</td>
</tr>
<tr>
<td>Fields</td>
<td>Fields in the curation table that include the ID of knowledge articles, for example, the knowledge article ID KB07276660 in the field resolution notes,</td>
</tr>
<tr>
<td>Query condition</td>
<td>Conditions for filtering the number of tasks from the curation table. You can create conditions using the condition builder (see Condition builder).</td>
</tr>
<tr>
<td>Similarity solution definition</td>
<td>Similarity solution definition for your task type. For example, for customer service cases, select Demand Insights: Similar Cases and Knowledge.</td>
</tr>
<tr>
<td>Clustering solution definition</td>
<td>Clustering solution definition for your task type. For example, for customer service cases, select Demand Insights: Case Clusters Need Knowledge.</td>
</tr>
</tbody>
</table>

4. Click Update for incidents or customer service cases or Submit to save a custom configuration.

Set the frequency of the scheduled job for your task. For more information, see Set the frequency of knowledge gap analysis.

Set the frequency of knowledge gap analysis

Set the frequency of the scheduled job for your task to automatically run knowledge gap analysis.

This task describes the process for setting the frequency of knowledge gap analysis.

Instead of doing the configuration through this procedure, consider using a guided setup. Navigate to Knowledge > Administration > Guided Setup, click Get Started, and then scroll to the Knowledge Demand Insights section.
Role required: admin

1. Navigate to Knowledge Demand Insights > Scheduled Jobs.
2. In the Scheduled Jobs list, select the scheduled job for your tasks in the Name column.
   - For customer service cases, select [Knowledge Curation]: Generate Case Clusters.
   - For incidents, select [Knowledge Curation]: Generate Incident Clusters.
   - For tasks other than customer service cases and incidents, create another scheduled job. For more information, see Create a scheduled job.

3. On the Scheduled Script Execution form, either accept the default value of running the analysis once a quarter (every 90 days) or change the frequency.
   - **Note:** For best performance results, try not to perform knowledge gap analysis more frequently than once a month.

4. Click Update.
   - **Note:** If the application scope is not set to Knowledge Management - Machine Learning, a warning message appears and the Update button is not available. Click the word here at the end of the message to change the scope and click Update.

5. Optional: To run the job immediately, click Execute Now.

The knowledge gap analysis is repeatedly run at the duration as configured in the scheduled job.

Create assignment rules to assign knowledge gap feedback tasks. For more information, see Assign knowledge gap feedback tasks to content authors.

**Assign knowledge gap feedback tasks to content authors**

Create assignment rules to assign knowledge gap feedback tasks to authors or groups of content creators.

Role required: admin or assignment_rule_admin

Knowledge gap feedback tasks created through the Knowledge Demand Insights feature create feedback tasks of type Knowledge gap.

1. Navigate to Knowledge Demand Insights > Knowledge Gap Assignment.
2. In the Assignment Rules list, click New.
3. On the Assignment rule form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name for the assignment rule.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the assignment rule. Only active assignment rules take effect.</td>
</tr>
<tr>
<td>Applies to tab</td>
<td>Table to store the feedback tasks on knowledge articles. This field is automatically set to Knowledge Feedback Task [kb_feedback_task].</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions for assigning feedback tasks of the Knowledge gap type. This field is automatically set to [Feedback Task Type] [is] [Knowledge gap]. You can add more conditions as appropriate.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Assign to tab</td>
<td>User assigned the feedback task type of knowledge gap.</td>
</tr>
<tr>
<td>User</td>
<td>Ownership group assigned the feedback task type of knowledge gap.</td>
</tr>
<tr>
<td>Group</td>
<td>Script you can use to specify more complex conditions for assignment rules using dynamic variables and loops.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Analyze knowledge gaps from a demand insights dashboard and create knowledge gap feedback tasks**

Use the demand insights dashboard for your tasks to analyze candidate knowledge gaps and create knowledge gap feedback tasks.

You must have read access to the tasks that you want to analyze and the sn_km_ml.knowledge_curation_user role.

A demand insights dashboard displays topics for which your knowledge bases do not have adequate knowledge coverage. You can create and assign knowledge gap feedback tasks for a topic so your knowledge bases can better be used to solve and deflect any issues described in a task. Tasks represent customer service cases, incidents, problems, and so on.

1. Navigate to **Knowledge Demand Insights** and select the demand insights dashboard for your tasks, or navigate to **Self-Service > Dashboards**.
   - For customer service cases, select **Demand Insights for Cases**.
   - For incidents, select **Demand Insights for Incidents**.

   **Note:** For tasks other than customer service cases and incidents, you can create another dashboard or update an existing dashboard. For more information, see **Create and use dashboards**.

2. To view similar tasks grouped together, click a bar in the Pareto chart.

   Each bar represents a collection of similar tasks grouped together because they are likely to be on the same topic. The bars covering the largest number of tasks start from the left in a descending order. The blue line indicates how many bars you must analyze to cover 80% of all tasks that don’t have good knowledge coverage. For more information, see **Pareto chart for Knowledge Demand Insights**.

3. Optional: To generate a representative sample to see a smaller list, in the Knowledge Curation Tasks list, click **Generate representative sample**.

   If the Knowledge Curation Tasks list is large, you can generate a representative sample subset of a Knowledge Curation Tasks list. This smaller list aims to accurately reflect the characteristics of the tasks included in the main list.

4. Analyze the sample and select tasks for which you want to create a knowledge gap feedback task.

5. In the Knowledge Curation Tasks list, click **Create Knowledge Gap for Selected**.

6. In the Create Knowledge Gap dialog box, enter instructions for addressing the knowledge gap and click **OK**.

   Provide a summary of your analysis so that knowledge authors have the necessary information to create an article from the feedback task.
A common feedback task for all the selected tasks is created and appear in the Knowledge Management application. If the assignment rules are set, the feedback tasks are assigned to an ownership group or an author. In the Knowledge Curation Tasks list, the **Is knowledge gap created** column value for the selected tasks is set to **true**.

**Pareto chart for Knowledge Demand Insights**

The Pareto chart for Knowledge Demand Insights enables you to visualize candidate knowledge gaps and prioritize the order in which knowledge gaps should be resolved.

The following information is available in the Pareto chart for Knowledge Demand Insights:

- The left Y axis is the count of tasks with no or insufficient knowledge coverage.
- The right Y axis is the cumulative percentage of the total number of tasks evaluated.
- Each bar represents a collections of similar tasks that don’t have good knowledge coverage. The bars are arranged in a descending order such that the collection with most number of tasks appears in the left. This order enables you to resolve the largest collection first. When you point to a bar, you view the number of tasks included within the bar and the cumulative percentage.
- The line graph shows the cumulative percentage of tasks that are included in each collection.
- The blue line indicates the 80% of total number of tasks that have no or insufficient knowledge coverage. The intersection of the blue line and the line graph indicates the minimum number of collections that need to be resolved so that 80% of tasks can be covered.

**Pareto chart for demand insights**

The following figure displays a Pareto chart for identifying candidate knowledge gaps for incidents.
Demand Insights for Cases dashboard

The Demand Insights for Cases dashboard enables you as a customer service case manager to identify which cases have no or insufficient knowledge coverage. You can then create feedback tasks for knowledge gaps to deflect such cases.

The Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml) includes the Demand Insights for Cases dashboard. For more information, see Predictive Intelligence for Knowledge Management and Additional plugins for Knowledge Management.
Demand Insights for Cases dashboard

End user and roles

<table>
<thead>
<tr>
<th>End user and goal</th>
<th>Required roles</th>

<td>Displays data from the Knowledge Curation Task [kb_curation_task_cluster] table with the following conditions: Curation configuration = sn_customerservice_case AND Solution.Active = true</td>
</tr>
</tbody>
</table>

**Demand Insights for Incidents dashboard**

The Demand Insights for Incidents dashboard enables you as an incident manager to identify which incidents have no or insufficient knowledge coverage. You can then create feedback tasks for knowledge gaps to deflect such incidents.

The Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml) includes the Demand Insights for Incidents dashboard. For more information, see *Predictive Intelligence for Knowledge Management* and *Additional plugins for Knowledge Management*.

Translation management

Translation management allows you to manage translation tasks created for published knowledge articles. You can manage multi-language knowledge bases by using automated translation tasks and translation APIs. You can configure languages for a knowledge base containing the articles.

Knowledge articles are authored and published in various languages. As an administrator you can configure the required languages for a knowledge base and ensure that users can create articles only in the configured languages.

You can choose a default language when you log in to an instance. The list of languages are listed based on the internationalization language plugins you have installed.

The translation management feature allows you to perform the following:

• translate published knowledge articles that are missing translations manually or use the machine translation option to automatically translate the knowledge article
• create translation tasks automatically for the languages you have specified
• configure assignment rules and auto-assign tasks for a language, knowledge base, or category to a translator or a group of translators

The translation management feature is available only if you have installed required plugins and set a system property.

The required plugins are:

• Knowledge Management Advanced plugin
• I18N:Knowledge Management Internationalization Plugin v2 or Internationalization language plugins

Enable the glide.knowman.translation.enable_translation_task property for using the translation management feature.

• All Open Tasks
• My Assigned Tasks
• Translator Mapping

Enable languages for a knowledge base

You can select the languages you want enabled at a knowledge base level. Users can then create articles only for selected languages.

Role required: knowledge_admin or admin

1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Click New to create a knowledge base or select an existing knowledge base.
3. Click the lock icon to unlock the Languages field.
4. Select the languages from the list.

   Note:
   You can also remove languages from the list if you decide that you do not want to create a translation task in that language.

5. Click Submit or Update.

Create translation assignments

To ensure accurate translations, you can assign knowledge articles to language experts. Identify the language experts and create assignment rules to automatically assign translation tasks to language experts and groups.

Role required: knowledge_admin or admin

Assignment rules are applied only if the task is not already assigned to another user or group.

1. Navigate to Knowledge > Translation Management > Translator Mapping.
2. Click New to create a new assignment rule or select an existing rule to modify.
3. Enter a name for the assignment rule in the Name field.
4. In the Applies To tab, perform the following.
   a) Select a table from the Table dropdown for example, Knowledge Translation Task [kb_translation_task].
   b) Specify the conditions that must be met before the task is assigned to the user or group.
5. Click the Assign To tab and select the user or group you want to assign the task to.

   An email notification is sent to the translator with a link to the translation task and source article.

6. Click the Script tab to enter a script to further customize the assignment rule.
7. Click Submit.

   Note: To cancel a task, add an appropriate reason for cancellation in the Cancellation notes field and click Cancel.

Auto-create translation tasks

Manage multi-language knowledge bases by using automated translation tasks and translation APIs. Translate published knowledge articles in languages configured for the knowledge base containing the articles.

Role required: knowledge_admin or admin

You can auto-create translation tasks in specified languages. The available languages are determined by the language plugins you have installed.

1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Click New and fill out the Knowledge Base form to create a knowledge base or click on an existing knowledge base.
3. Unlock the Languages field and select the languages for which you want to create tasks from the dropdown.

   Note: Unlocking the Languages field displays the languages you have installed.

   If Auto-create translation tasks is unchecked, you must create the tasks manually after the article is published.
5. Click Submit or Update.
Note:

- Open a knowledge article and click **Knowledge Translation Tasks** related list to view the associated translation tasks.
- To cancel a task, add an appropriate reason for cancellation in the **Cancellation notes** field and click **Cancel**.

Translate a knowledge article

You can start translating articles once they are published and assigned to you for translation.

Role required: admin, knowledge_admin, or knowledge

1. Navigate to **Knowledge > Translation Management > My Assigned Tasks**.
2. In the Knowledge Translation Tasks page, select one of the listed translation tasks assigned to you.
   - The Knowledge Translation Tasks page lists all knowledge translation tasks assigned to you.
3. Click **Translate**.

   **Note:** If you want to do a translation directly from an article, use the **Translate** related link on the article page.

The **Translate from** and **Translate to** panes are side-by-side for easy viewing, as shown in the following figure.
4. Click **Machine translate**, which automatically translates to the targeted languages.

   **Note:** A default translator configuration should be available. For configuring the translation API, see *Dynamic Translation*.

5. Click **Create draft article** to create a draft version of the translated article.

   If a translated article is already present for that language, a new draft version overwrites an existing translated content.

6. Click **Publish**.

   The newly created draft is listed in the **Translated Versions** tab.

---

**Translate knowledge blocks within an article**

Knowledge blocks may be available within a knowledge article. You can translate these knowledge blocks before translating an article.

Role required: translator
If a selected article indicates that a knowledge block is missing a translation, you must translate the knowledge block before you can translate the article.

1. Navigate to Knowledge > Translation Management > My Assigned Tasks.
2. In the Knowledge Translation Task page, select a translation task and click Translate.

   Note:
   A message stating that the knowledge article contains one or more knowledge blocks that have missing translations is displayed.

3. Click on the link in the message to view the list of blocks that require translation.
4. Click the block that requires translation and click Translate.
   The newly translated blocks appears in the Translated Block Versions related list.

Request missing translations for available languages

You can create translation tasks manually for the languages you have configured. Some of the tasks may not have tasks created for all the languages. You can manually create tasks for the missing languages through the Request Translations option. The option is available even if the auto-create translation task option is enabled.

Role required: admin

Verify that the glide.knowman.translation.enable_translation_task property is set to true.

1. Navigate to Knowledge > Articles > Published.
2. Select an article from the list of published articles.
3. Click Request translations in Related Links.
   The Request translations window displays all the languages. The selected languages already have translation tasks created.
4. Select the languages from the list that are unselected.
5. Click Submit.

   Note: If a task is already open for a particular language, you cannot select the same language again.

   The translation tasks for the article are created and listed in the Knowledge Translation Tasks tab.

Now Mobile for Knowledge Management

Access knowledge articles from anywhere using the Information applet on the Now Mobile app. You can view recently viewed and most popular articles, search for articles, browse articles by category, and provide feedback for articles.

To access articles from the Information applet on the Now Mobile app, you must first download the ServiceNow mobile application on an iOS platform from the Apple App Store or on an Android platform from the Google Play Store.
Make sure your administrator has activated the Now Mobile app. For more information, see *Activate the Now Mobile app*.

After you access an article, you can view the author, published date, number of views, and the overall rating details of the article. In addition, you can respond to and evaluate articles and view related items and related articles.

**Activation information**

The Information applet is available on the Now Mobile app. The ServiceNow Mobile Request - Knowledge Management Screens and Applet Launcher plugin (com.glideapp.knowledge.mobile_requestor) activates the Information applet. The Information applet is activated by default for both new and upgrade customers.
View the most popular or recently viewed articles in the Now Mobile Information applet

The Information applet on the Now Mobile app enables you to access knowledge articles from a mobile device. You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

1. Access your instance using the mobile application.
2. On the Now Mobile app, tap **Information**.
3. Access your recently viewed or the most popular knowledge articles

**Information applet article views**

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recently Viewed</td>
<td>Up to five of the articles you viewed within the last 30 days.</td>
</tr>
<tr>
<td>Popular</td>
<td>Up to five of the most popular knowledge articles. The Now Mobile app homepage includes a similar section that displays up to three of the most popular articles.</td>
</tr>
</tbody>
</table>

**Note:** Tap **See All** to view the complete list of articles within the selected section.

Browse articles in the Now Mobile Information applet

You can browse articles within a category in the Now Mobile Information applet to see articles related to a particular subject or grouping.

You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

1. Access your instance using the mobile application.
2. On the Now Mobile app, tap **Information**.
3. In the Browse section, tap a category from the categories list to view articles and child categories associated with the selected category.

**Note:** Tap **See All** to view the complete categories list.

4. Tap further categories until you view the articles list associated with the desired category.

The articles associated with a parent category are grouped under a dummy child category labeled as **Other**.
5. To view an article, tap the article in the articles list.

Search for an article in the Now Mobile Information applet

You can search for an article in the Now Mobile Information applet.

You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

1. On the Now Mobile app, tap Information.
2. Tap Search for Services, Articles or People, and enter a search term related to the article.
3. Tap the search icon on your app keyboard.
   The app displays search results.
4. Tap Articles to view only articles in the search results.
5. Tap an article in the search results to view the article content.

View an article in the Now Mobile Information applet

You can view the author, published date, number of views, and the overall rating details of the article in the Now Mobile Information applet. In addition, you can respond to and evaluate articles and view related items and related articles.

You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

**Note:** Any attachments to the article are not viewable in the Information applet.

1. On the Now Mobile app, tap Information.
2. Search for or select the desired article from the sections available in the Information applet.

   The article page displays the content and associated information for the selected article such as author, published date, number of views, and the overall rating. The page also displays the following sections:

<table>
<thead>
<tr>
<th>UI component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Related Articles</td>
<td>Up to five related articles that are manually mapped, automatically predicted, or both. The manually mapped articles appear first in the Related Articles section. This section appears only when related articles are available for the selected article.</td>
</tr>
</tbody>
</table>
3. Optional: Respond to and evaluate the article.

**Respond to and evaluate articles in the Now Mobile Information applet**

You can contribute to feedback on knowledge articles by rating an article, marking an article as helpful or not helpful, and posting and replying to comments for an article in the Now Mobile Information applet.

You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

1. On the Now Mobile app, tap **Information**.
2. Select the desired article.
3. Contribute to the article feedback by rating it, marking it as helpful or not helpful, or leaving a comment.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rate the article</td>
<td>Tap the star icons displayed on the article to indicate its effectiveness on a scale of 1 to 5. For ratings between 1 to 3 stars, a feedback task is automatically created for the article and assigned to the author or ownership group, as configured.</td>
</tr>
<tr>
<td>Mark an article as helpful or unhelpful</td>
<td>Tap the helpful icon (👍) or the not helpful icon (👎).</td>
</tr>
<tr>
<td>Type your comment here</td>
<td>Enter a comment and click <strong>Submit</strong>.</td>
</tr>
<tr>
<td>View all comments and replies posted for the article</td>
<td>Scroll down to the Comments section.</td>
</tr>
<tr>
<td>Like a comment on the article</td>
<td>Underneath a comment, tap the like icon (👍).</td>
</tr>
<tr>
<td>Reply to a comment on the article</td>
<td>Underneath a comment, tap the reply icon (💬), enter your comment in the text box that appears, and then tap <strong>Submit</strong>.</td>
</tr>
<tr>
<td>Delete any previous comments or replies you posted earlier</td>
<td>Go to a comment or reply, and then tap the delete icon (🗑️). If a message appears, tap <strong>OK</strong>. Only users who have posted the comment, knowledge administrators, and knowledge owners can delete a comment.</td>
</tr>
</tbody>
</table>

**Knowledge article authoring in Agent Workspace**

Complete your job efficiently by creating, editing, and publishing knowledge articles in Agent Workspace.
Knowledge Management features specific to agents and authors are available in Agent Workspace. Perform any knowledge administration-related tasks such as creating a knowledge base, managing access to knowledge articles, enabling an article template, and so on using the Now Platform interface.

You can perform the following Knowledge-related tasks in Agent Workspace:

- Create a knowledge article using a default or custom article template.
- Manage all unpublished and published knowledge articles authored by you.
- Address feedback tasks assigned to you.
- Compare two knowledge article versions.
- Request translations for published untranslated knowledge articles.
- Complete translation tasks assigned to you.
- Map related articles and related catalog items to a knowledge article.
- Add affected products to a knowledge article.
- Use Agent Assist to avoid creating knowledge articles with duplicate content.

The authoring experience for knowledge articles in Agent Workspace is similar to the one in Now Platform with the following exceptions:

- Knowledge blocks can't be created or associated with knowledge articles. However, you can view articles containing knowledge blocks.
- Knowledge articles of type Wiki aren't supported.
- Knowledge article categories can't be created.

**Activation Information**

The Knowledge list in Agent Workspace is available with the activation of the Agent Workspace plugin (com.glide.core-ui-components). When you install and activate the Agent Workspace plugin, the sn-component-workspace-knowledge plugin for using Knowledge Management in Agent Workspace is also installed and activated.

**View a knowledge article in Agent Workspace**

View a knowledge article in Agent Workspace, including the article number, short description, and article content. You must have read access to the knowledge article.

Role required: agent_workspace_user

1. Navigate to Agent Workspace > Agent Workspace Home.
2. View knowledge articles authored by you or by other people.
   - View all articles by navigating to Lists > Knowledge > All Articles.
   - View articles authored by you by navigating to either Lists > Knowledge > My Articles - Published or Lists > Knowledge > My Articles - Unpublished.
3. Click the link to the knowledge article that you want to view.
4. Optional: View the knowledge article in another language by selecting a language in the Language list.
   
   **Note:** The Language list is populated based on the available translated versions of the article.

5. Optional: Copy the link to the knowledge article to your clipboard by clicking the more actions icon ( ) and then clicking Copy link.

6. Optional: View another version of the knowledge article by selecting the version of the knowledge article in the Version list.
The selected version of the article opens in a knowledge article view page displayed in another tab within Agent Workspace. The tab name includes the knowledge article number and its version number.

**Viewing knowledge article details in Agent Workspace**

View the details of a knowledge article in Agent Workspace.

The knowledge article view page in Agent Workspace provides several details about a displayed article.
Email Interruption Tonight at 11:00 PM

If the site is UP but you can't access the page, try one of the below solutions:

Browser Related Problems
Force a full refresh for the site. This can be achieved by pressing CTRL + F5 keys at the same time on your favourite browser (Firefox, Chrome, Explorer, etc.)
Try alternative urls such as m.outlook.com
Clear the temporary cache and cookies on your browser to make sure that you have the most recent version of the web page. For instructions choose your browser.

Fix DNS Problems
A Domain Name System (DNS) allows a site IP address (192.168.x.x) to be identified with words (*.com) in order to be remembered more easily, like a phonebook for websites. This service is usually provided by your ISP.
Clear your local DNS cache to make sure that you grab the most recent cache that your ISP has. For Windows - (Start > Command Prompt > type "ipconfig /flushdns" and hit enter). For details choose your operating system.
If you can access a website at office or from a 3G network yet it's not working on your computer, it is a good idea to use an alternative DNS service other than your ISPs. OpenDNS or Google Public DNS are both excellent and free public DNS services.
Check our help page for step-by-step instructions on how to change your DNS.

## Article information displayed on the knowledge article view page in Agent Workspace

<table>
<thead>
<tr>
<th>Details</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge base</td>
<td>Knowledge base that stores the knowledge article and the article category. In the figure, IT is the knowledge base and Announcements is the knowledge article category.</td>
</tr>
</tbody>
</table>
| Read time                   | Average time to read the knowledge article, which can help you decide whether you have time to read the article. The read time is calculated based on an average reading speed of 200 words per minute. For articles in languages such as Chinese, Japanese, and Korean, the read time is calculated based on an average speed of 500 characters per minute. If images are present in an article, the read time is calculated using the following rules:  
  • For the first image add 12 seconds, for the second image add 11 seconds, and so on.
  • If there are more than 10 images, after the tenth image add 3 seconds for each image. |
| Last updated time           | Last time the knowledge article was updated in number of days for the current week, number of weeks, or number of years.                       |
| Number of views             | Number of times the knowledge article was viewed in the past number of days set by your system administrator in the glide.knowman.view_age.days property. |
| Average rating              | Result of the weighted average rating of the knowledge article based on numeric 1 through 5 ratings. The average rating is carried on the next version of the article. |
| Knowledge article content   | Text and images of the knowledge article.                                                                                                       |
| Authored by                 | Author of the knowledge article. This field appears only in the first version of a knowledge article.                                             |
| Revised by                  | User who revised the article. This field appears if a knowledge article was later edited.                                                   |
| Article number              | Unique number automatically assigned to the knowledge article. In the figure, KB0010090 is the article number.                                      |
| Version                     | Selected version of the knowledge article. This field appears when the article versioning feature is enabled. In the figure, 1.01 is the selected version of the article. |
| Attachments                  | List of article attachments. This field appears if the knowledge administrator has enabled it to be displayed on the knowledge article view page. |

## Provide feedback for a knowledge article in Agent Workspace

Provide feedback on a knowledge article by rating the article, marking the article as helpful or not helpful, and posting and replying to comments for the article in Agent Workspace.

You must have read access to the knowledge article.

Role required: agent_workspace_user

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > All articles.
3. Click the link to the knowledge article that you want to view.
4. Provide feedback for the article.

<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mark an article as helpful or unhelpful</td>
<td>For the <strong>Helpful</strong> field, click <strong>Yes</strong> or <strong>No</strong>.</td>
</tr>
<tr>
<td></td>
<td>If you mark the article as not helpful, a dialog box is displayed where you can select a reason for your feedback and enter additional details. If actionable knowledge feedback is enabled, a feedback task is automatically created for the article and assigned to the author or ownership group. For more information, see <em>Enable actionable knowledge feedback</em>. After you enter your feedback, a percentage value of how many other users found the article helpful is displayed.</td>
</tr>
<tr>
<td>Flag the article</td>
<td>Click the more actions icon (***), and then click <strong>Flag Article</strong> to report an article that contains incorrect or inappropriate content. A dialog box is displayed in which you can provide the reason for the flag. A feedback task is automatically created for the article and assigned to the author or ownership group, as configured.</td>
</tr>
<tr>
<td>Rate the article</td>
<td>Click the star icons displayed on the article to indicate its effectiveness on a scale from 1 through 5. Administrators can configure the <em>glide.knowman.feedback.enable_actionable_feedback_for_rating</em> property to ensure that feedback tasks are automatically created and assigned when a lower rating is posted. For more information, see <em>Knowledge properties</em>.</td>
</tr>
<tr>
<td>Enter your comment</td>
<td>In the <strong>Type your comment here</strong> text box, enter a comment and click <strong>Post Comment</strong>.</td>
</tr>
<tr>
<td>View all comments and replies posted for the knowledge article</td>
<td>Scroll down to the Comments section. To view or hide replies added to a comment, click <strong>Show replies</strong> or <strong>Hide replies</strong>, respectively. To view replies added to all comments, click <strong>Show all replies</strong>.</td>
</tr>
<tr>
<td>Like a comment on the knowledge article</td>
<td>Underneath the comment, click the like icon (👍).</td>
</tr>
<tr>
<td>Reply to a comment on the article</td>
<td>Underneath the comment, click the reply icon (💬), enter your comment in the text box that appears, and then click <strong>Submit</strong>.</td>
</tr>
<tr>
<td>Delete any previous comments or replies</td>
<td>Go to a comment or reply and then click the delete icon (🗑️). If a message appears, click <strong>Yes, delete</strong>.</td>
</tr>
</tbody>
</table>

**Note:** Only users who have posted the comment, knowledge administrators, and knowledge owners can delete a comment.

Create a knowledge article in Agent Workspace

Create a knowledge article in Agent Workspace to share information across your organization.
You must have contribute access to the knowledge base within which you want to create the knowledge article.

Role required: agent_workspace_user

1. Navigate to **Agent Workspace > Agent Workspace Home.**
2. Optional: Check whether a knowledge article on this subject is already available by going to **Lists > Knowledge > All Articles** and setting a filter to search for possible matching articles.
3. Click **New.**
4. Create the knowledge article by either selecting an article template or using the default template.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Selected article template</strong></td>
<td>Select an article template to create a knowledge article using defined fields and values.</td>
</tr>
<tr>
<td></td>
<td>In the Create Article dialog box:</td>
</tr>
<tr>
<td></td>
<td>1. From the Knowledge Base list, select a knowledge base.</td>
</tr>
<tr>
<td></td>
<td>2. From the Article Template list, select the desired article template.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The Article Template list is populated based on the article templates configured for the selected knowledge base.</td>
</tr>
<tr>
<td></td>
<td>3. Click <strong>Create Article.</strong></td>
</tr>
</tbody>
</table>

The Create Article dialog box is available if the article versioning and the Knowledge Article Templates features are enabled. For more information, see **Article versioning** and **Knowledge article templates**.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default Standard template</strong></td>
<td>Create a knowledge article using the default Standard template.</td>
</tr>
</tbody>
</table>

5. On the Knowledge form, fill in the fields.

**Note:** If you are using an article template, the fields that are available will vary.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge base</td>
<td>Knowledge base in which the knowledge article is stored. You can associate a knowledge article with one knowledge base only. If you are using an article template, you can modify this value only if the template is available in the other knowledge base.</td>
</tr>
<tr>
<td>Category</td>
<td>Category for the knowledge article. This value helps users find the article within a selected category. You can select only categories available within the selected knowledge base. Articles without a category appear in the (empty) category.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Ownership Group</td>
<td>Ownership group for the knowledge article. An ownership group consists of a group of members and a manager who are responsible for approvals and feedback tasks. Ownership groups can publish, edit, and retire knowledge articles that they are associated with.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available only if the glide.knowman.ownership_group.enabled property is enabled. If no ownership group is assigned and approvals are required to publish a knowledge article, it is automatically submitted for approval to the knowledge administrator and knowledge manager. For more information, see Ownership groups.</td>
</tr>
<tr>
<td>Version</td>
<td>Automatically generated article version number. This number is incremented when changes are made to a published article.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available if the article versioning feature has been enabled.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Publishing workflow state of the knowledge article, such as Draft, In Review, or Published. For a new article, the workflow state is set to Draft.</td>
</tr>
<tr>
<td>Language</td>
<td>Language in which you are creating the knowledge article. The list is populated based on the languages enabled for the selected knowledge base.</td>
</tr>
<tr>
<td>Short description</td>
<td>Title of the knowledge article. This title appears when browsing and searching for knowledge article, and at the top of the article. You can enter up to 100 characters in this field.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Knowledge articles similar to the entered short description text will appear in Agent Assist.</td>
</tr>
<tr>
<td>Article body</td>
<td>Content for the knowledge article. Use the editing functions in the HTML editor to create content.</td>
</tr>
<tr>
<td>Source Task</td>
<td>Task this knowledge article was created from. This field is set automatically when you create the knowledge article from a task, such as an incident or a customer service case, or from a submission record.</td>
</tr>
<tr>
<td>Scheduled publish date</td>
<td>Future date when the knowledge article will be published automatically. For more information, see Schedule a knowledge article for publishing in Agent Workspace.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Valid to</td>
<td>The date this knowledge article expires. Articles do not appear in search results after the Valid to date or if the Valid to date is blank. The default value of the Valid to field is derived from the Article Validity field configured for the knowledge base (see Create a knowledge base). The Valid to date starts from the date the article was created until the number of days specified in the Article Validity field. If the Article Validity field is blank, the default date in the Valid to field for the knowledge article is set to January 1, 2100. An article author or editor can select whether to keep or change the default Valid to date. <strong>Note:</strong> If the system date format or user preferences is set to use yy year format, you might face issues when the Valid to date is set to the default date. Contact your system administrator or modify the user preferences to use a date format with the yyyy year format. For more information, see Global date and time field format and Personalize the system date format topics.</td>
</tr>
<tr>
<td>Article type</td>
<td>Type of the article, which is automatically set to HTML. This field is available in the Standard template only. <strong>Note:</strong> The Wiki article type isn't supported in Agent Workspace.</td>
</tr>
<tr>
<td>Display attachments</td>
<td>Option to display attachments in the knowledge article. If the article has attachments, they are listed below the text of a knowledge article on the knowledge article view page.</td>
</tr>
<tr>
<td>Attachment link</td>
<td>Option to automatically download an attached article when a user access an article instead of opening the article. The Attachment link option applies to articles accessed from search links only. Articles accessed from links within other knowledge articles will not automatically download an attached file. <strong>Note:</strong> Although you may attach multiple files, most web browsers permit users to download only the first attachment. To ensure download of all the files, bundle them into an archive and attach the archive.</td>
</tr>
<tr>
<td>Issue</td>
<td>Brief description about an issue. <strong>Note:</strong> This field is available in the KCS Article template only.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>---------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Environment</td>
<td>Details of the environment in place when the issue occurred.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available in the KCS Article template only.</td>
</tr>
<tr>
<td>Cause</td>
<td>The cause of the issue.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available in the KCS Article template only.</td>
</tr>
<tr>
<td>Resolution</td>
<td>Method used to resolve the issue.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available in the KCS Article template only.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as a question.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available in the FAQ template only.</td>
</tr>
<tr>
<td>Answer</td>
<td>Text to display as an answer to an included question.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available in the FAQ template only.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introduction to the topic.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available in the How To and What Is templates only.</td>
</tr>
<tr>
<td>Instructions</td>
<td>Instructions for a how-to topic.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available in the How To template only.</td>
</tr>
<tr>
<td>Explanation</td>
<td>Explanation of a what-is topic.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available in the What Is template only.</td>
</tr>
</tbody>
</table>

6. Optional: Research for content related to knowledge article you're authoring using Agent Assist.
   
a) In the contextual side panel, click the Agent Assist icon (🤖).
   The search results in Agent Assist display default content based on the text-based search.

b) Click the select a search resource icon (🔍), and then select a search resource.
   For example, to view knowledge articles, select Knowledge Articles.

c) Optional: In the search results, you can click a resource item, such as a knowledge article, to view its content in Agent Assist.
Tip: For better readability, you can resize the contextual side panel for Agent Assist. For a full view of the selected resource item content, click Full View. The resource item content opens in another tab within the Agent Workspace.

7. Optional: Check whether your content matches content in an existing article.
   a) Enter search text in the text box available in Agent Assist or retain the default text, which is the short description of the knowledge article.
   b) Click the lookup icon (🔍).
   c) Select a search resource by clicking the Select a search resource icon (🔍).
      • To find knowledge articles that have high text similarity with the entered search text, choose Similar Articles (ML).
      
      Note: This option is available only when the Predictive Intelligence feature is enabled and your system administrator has trained the similarity solution for Knowledge Management. For more information, see Train the similarity solution for Knowledge Management to find related articles.
      
      • To find knowledge articles that match the entered search text, choose Knowledge Articles.

8. Optional: Attach a file with supporting information by clicking the attachments icon (✍) in the contextual side panel and selecting the file.

9. Click Save.
   The article is saved and appears in the My Articles - Unpublished list and additional functionality becomes available on the form.

10. Optional: Either add to or modify the article details or publish the article.
    • Add to or modify the article details.
      For more information, see Edit a knowledge article in Agent Workspace.
    • Publish the article by clicking Publish.
      A knowledge article is published depending on the workflow setting of its knowledge base:
      • Knowledge - Instant Publish: The knowledge article is immediately published unless it is scheduled to be published at a later date.
      • Knowledge - Approval Publish: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

      For more information, see Schedule a knowledge article for publishing in Agent Workspace.

      When published, your knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version number of the knowledge article is updated. For more information, see Knowledge article version numbers.

After you create and publish a knowledge article, you can perform the following actions related to the article:

• Request translations for the knowledge article. For more information, see Request translations for missing languages in Agent Workspace.
• Retire the knowledge article. Click Retire to enable the retirement workflow. For more information, see Retire a knowledge article.
• Translate the knowledge article directly from the knowledge article. For more information, see Translate a knowledge article in Agent Workspace.

• Delete the published knowledge article. Click Delete. If the Delete button isn’t displayed, click the more actions icon (…), and then click Delete.

**Note:** Only users with the admin role can delete a published knowledge article.

---

**Publish a knowledge article in Agent Workspace**

Publish a knowledge article to make it available to users.

You must have contribute access to the knowledge base that stores the knowledge article you want to publish.

Role required: agent_workspace_user

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > My Articles - Unpublished.
3. Click a knowledge article link.
4. On the Knowledge form, click Publish.

A knowledge article is published depending on the workflow setting of its knowledge base:

• **Knowledge - Instant Publish:** The knowledge article is immediately published unless it is scheduled to be published at a later date.

• **Knowledge - Approval Publish:** The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

For more information, see Schedule a knowledge article for publishing in Agent Workspace.

When published, your knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version of the article is incremented based on the version number pattern.

---

**Edit a knowledge article in Agent Workspace**

Edit knowledge articles within a knowledge base in Agent Workspace to update information shared across your organization.

You must have contribute access to the knowledge base that stores the knowledge article you want to edit.

**Note:**

• If the article versioning feature is enabled, only the knowledge administrator, knowledge managers, and author can edit the checked-out version of an article. If the feature is disabled, any users with contribute access to an article can edit the draft version of the article. An administrator can disable the article versioning feature by setting the glide.knowman.versioning.enabled property (from the System Property [sys_properties] table) to false.

• If an ownership group is associated with a knowledge article, the author or reviser of the article can’t contribute to the article after the article is published. An administrator can override this behavior by enabling the glide.knowman.ownership_group.override property. For more information, see Ownership groups.

• If the glide.knowman.translation.enable_translation_task property is enabled, you can’t modify the knowledge base of existing articles.
Role required: agent_workspace_user

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > All Articles.
3. Click a knowledge article link.
4. On the Knowledge form, click Edit.
5. If the article versioning feature is enabled, click Checkout for a published knowledge article.
   You can only edit the latest version of a knowledge article.
6. Access the relevant related lists to modify the information.

<table>
<thead>
<tr>
<th>Related list</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Details</td>
<td>Knowledge article content and its metadata.</td>
</tr>
<tr>
<td>Feedback</td>
<td>Feedback received on the published versions of the article. To view more details about the feedback, in the Comments column, click a link for the desired version of an article.</td>
</tr>
<tr>
<td>Feedback Tasks</td>
<td>Details about the feedback task created for a knowledge article version.</td>
</tr>
<tr>
<td>Approvals</td>
<td>Approval history of the knowledge article.</td>
</tr>
<tr>
<td>Article Versions</td>
<td>Version history of the knowledge article.</td>
</tr>
<tr>
<td>Translated Versions</td>
<td>Translated versions of the knowledge article. This related list appears only when the translation management feature is enabled. To translate a knowledge article, click New. The New button on this related list appears when the glide.knowman.translation.enable_translation_task property is disabled.</td>
</tr>
<tr>
<td>Translation Tasks</td>
<td>Tasks submitted for translating the article. This related list appears when the Translation Management feature and the glide.knowman.translation.enable_translation_task property to enable creation of translation tasks are enabled. For more information, see Knowledge properties.</td>
</tr>
<tr>
<td>Related Articles</td>
<td>Related articles mapped to the knowledge article. For more information, see Map a related article in Agent Workspace.</td>
</tr>
<tr>
<td>Related Catalog Items</td>
<td>Related catalog items mapped to the knowledge article. For more information, see Map a related item in Agent Workspace.</td>
</tr>
<tr>
<td>Affected Products</td>
<td>Products mapped to the knowledge article. For more information, see Add an affected product to a knowledge article in Agent Workspace.</td>
</tr>
</tbody>
</table>

7. Optional: Research for content related to knowledge article you're authoring using Agent Assist.
   a) In the contextual side panel, click the Agent Assist icon (🔍).
      The search results in Agent Assist display default content based on the text-based search.
b) Click the select a search resource icon (🔍), and then select a search resource.
For example, to view knowledge articles, select **Knowledge Articles**.

Optional: In the search results, you can click a resource item, such as a knowledge article, to view its content in Agent Assist.

**Tip:** For better readability, you can resize the contextual side panel for Agent Assist. For a full view of the selected resource item content, click **Full View**. The resource item content opens in another tab within the Agent Workspace.

8. Optional: Check whether your content matches content in an existing article.
   a) Enter search text in the text box available in Agent Assist or retain the default text, which is the short description of the knowledge article.
   b) Click the lookup icon (🔍).
   c) Select a search resource by clicking the Select a search resource icon (🔍).
      - To find knowledge articles that have high text similarity with the entered search text, choose **Similar Articles (ML)**.
      - To find knowledge articles that match the entered search text, choose **Knowledge Articles**.

   
   - Attach a file with supporting information by clicking the attachments icon (🔗) in the contextual side panel and selecting the file.
   - Download, remove, or rename an existing attachment by clicking the menu icon (⋮) displayed for the attachment.

10. Click **Save**.
    The article is saved and appears in the My Articles - Unpublished list. If the article versioning feature is enabled, the version of the knowledge article is incremented by 0.01. For more information, see **Knowledge article version numbers**.

11. Optional: Publish the article by clicking **Publish**.
    The knowledge article is published depending on the workflow setting of its knowledge base:
    
    - **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.
    - **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.
    
    For more information, see **Schedule a knowledge article for publishing in Agent Workspace**.
    
    When published, the knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). For more information, see **Knowledge article version numbers**.
Map a related article in Agent Workspace

Discover similar information across articles on a topic while viewing a knowledge article. You can manually map related articles or have the application automatically present related articles using machine learning (ML) algorithms.

You must have contribute access to the knowledge base that stores the knowledge article for which you want to add related articles.

Role required: agent_workspace_user

If you have manually mapped related articles when editing an article in Agent Workspace, those articles are listed in the Related Articles section on the knowledge article view page in the Knowledge Management Service Portal before the related articles that are predicted thorough the Knowledge Management similarity solution.

Note: An administrator can train the solution definition for Knowledge Management within the Predictive Intelligence feature to find related articles. For more information, see Train the similarity solution for Knowledge Management to find related articles.

This task provides steps to manually map related articles when editing an article in Agent Workspace. You can also manually map related articles when editing an article from the Knowledge Management application in the Now Platform interface. For more information, see Map related articles.

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > All Articles.
3. Click the link to the knowledge article for which you want to map related articles.
4. In the Related Articles related list, click New.
5. On the Related Articles form, fill in the fields.

### Related Articles form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Option to enable the mapping to the related knowledge article.</td>
</tr>
<tr>
<td>Related knowledge article</td>
<td>Knowledge article that contains related information.</td>
</tr>
<tr>
<td></td>
<td>You can click the search for record icon (🔍), to access the list of available knowledge articles.</td>
</tr>
<tr>
<td>Knowledge article</td>
<td>Number of the knowledge article for which you are adding the related knowledge article.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which you want the article to appear in the Related Articles section on the Knowledge Management article view page.</td>
</tr>
<tr>
<td></td>
<td>A lower value means that a knowledge article has the greater priority to appear in the Related Articles section. The default value is 100.</td>
</tr>
</tbody>
</table>

6. Click Save.

The mapped articles are available in the Related Articles section on the Knowledge Management article view page in the Knowledge Management Service Portal. See Knowledge Management Service Portal article view page features.

Note: Because system administrators can configure the number of knowledge articles shown in the Related Articles section, not all mapped related articles might appear in the Related Articles section. For more information, see Configure knowledge related articles widget instance options.
Map a related item in Agent Workspace

Manually map catalog items related to a knowledge article in Agent Workspace to enable employees to request the related catalog item.

You must have contribute access to the knowledge base that stores the knowledge article for which you want to add related articles.

Role required: agent_workspace_user

This task provides steps to map related catalog items when editing an article in Agent Workspace. You can also map related catalog items when editing an article from the Knowledge Management application in the Now Platform interface. For more information, see Map catalog items related to an article.

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > Published for a published article or Lists > Knowledge > Unpublished for an unpublished article.
3. Click the link to the knowledge article for which you want to map a related item.
4. On the Knowledge form, click the Related Catalog Items related list.
5. Click New.
6. On the Related Catalog Items form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Option to enable the mapping to the related catalog item.</td>
</tr>
<tr>
<td>Catalog item</td>
<td>Catalog item related to the knowledge article. You can click the search for record icon (🔍) to access a list of available catalog items.</td>
</tr>
<tr>
<td>Knowledge article</td>
<td>Number of the knowledge article for which you are adding the related catalog item.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which you want the catalog item to appear in the Related Items section on the Knowledge Management article view page. A lower value means that a catalog item has the greater priority to appear in the Related Items section. The default value is 100.</td>
</tr>
</tbody>
</table>

7. Click Save.

The mapped catalog items are listed in the Related Items section on the Knowledge Management article view page in Knowledge Management Service Portal.

Note: Because system administrators can configure the number of catalog items shown in the Related Items section, not all mapped related catalog items might appear in the Related Items section. For more information, see Configure related catalog item widget instance options.

Add an affected product to a knowledge article in Agent Workspace

Add affected products to a knowledge article to view the products associated with the knowledge article.
The Knowledge Product Entitlements plugin (com.snc.kb_product_entitlements) must be activated to use the Knowledge Product Entitlements application. Installing this plugin adds the Affected Products related list to the Knowledge form. For more information, see Knowledge product entitlements.

You must have contribute access to the knowledge base that stores the knowledge article for which you want to add affected products.

Role required: agent_workspace_user

This task provides steps to add affected products to a knowledge article in Agent Workspace. You can also add affected products to a knowledge article from the Knowledge Management application in the Now Platform interface. For more information, see Add a related product to a knowledge base or knowledge article.

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > All Articles.
3. Click the link to the knowledge article for which you want to add a related product.
4. On the Knowledge form, in the Affected Products related list, click New.
5. On the Knowledge Related to Products form, in the Configuration item field, click the search for record icon (🔍).
6. In the Configuration item dialog box, click the related product.
7. Click Save.

Schedule a knowledge article for publishing in Agent Workspace

Set a specific time and day for a knowledge article to be published in Agent Workspace automatically.

You must have contribute access to the knowledge base that stores the knowledge article you want to schedule for publishing.

Ensure that the system administrator verifies the following settings:

- Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated. For more information, see Activate the Knowledge Management Advanced plugin.
- The article versioning feature is enabled. For more information, see Article versioning.

Note: You can also schedule a knowledge article for publishing from the Knowledge Management application in the Now Platform interface. For more information, see Schedule a knowledge article for publishing.

Role required: agent_workspace_user

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > My Articles - Unpublished Articles.
3. Click an article link.
4. In the Scheduled publish date field, click the show calendar icon 📅.
5. Select any future date in the calendar.
6. In the Select Time field, enter a time in the format hh:mm:ss.
7. Click OK.
8. Click Publish to enable the publishing workflow.

Tip: If you want to cancel an article's scheduled publication and move the article back to the Draft state, click Recall.
The knowledge article is published on the scheduled publish date depending on the following workflow settings of its knowledge base:

- If the knowledge base workflow is set to **Knowledge - Instant Publish**, the knowledge article is automatically published on the scheduled publish date. The **Workflow** field on the Knowledge form of the article is updated to **Scheduled for publish**.
- If the knowledge base workflow is set to **Knowledge - Approval Publish**, the knowledge article is published on approval completion. The **Workflow** field on the Knowledge form of the article is updated to **Review**.

The approval completion affects the scheduled publishing as follows:

- If the approvals are completed before the scheduled publish date, the **Workflow** field on the Knowledge form of the article is updated to **Scheduled for publish** and the article is published on the scheduled publish date.
- If the approvals are completed after the scheduled publish date, the article is published immediately on the approval completion.

**Work on a feedback task in Agent Workspace**

Start working on a feedback task, request clarifications, and resolve or close the feedback task in Agent Workspace. You can view all feedback tasks assigned to you or your ownership group.

You must have contribute access to the knowledge base that stores the knowledge article you want to work on.

Role required: agent_workspace_user

A feedback task is created based on the following types of feedback sources.

<table>
<thead>
<tr>
<th>Source</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User feedback</td>
<td>Knowledge article was marked as not helpful or given low ratings.</td>
</tr>
<tr>
<td>Internal feedback</td>
<td>Knowledge article was flagged.</td>
</tr>
<tr>
<td>Knowledge gap</td>
<td>Knowledge gap feedback task was created for one or more tasks using the Knowledge Demand Insights feature.</td>
</tr>
<tr>
<td>Knowledge gap - manual</td>
<td>Knowledge gap feedback task was created manually from a task, such as a customer service case or an incident.</td>
</tr>
<tr>
<td>Other</td>
<td>Feedback for a knowledge article from other sources.</td>
</tr>
</tbody>
</table>

**Note:** When you upgrade your instance, for any existing records that don't have any feedback task type set or don't match with supported types, the feedback task type is automatically set to **Other**.

1. Navigate to **Agent Workspace > Agent Workspace Home**.
2. Click **Lists > Knowledge > My Tasks - Feedback**.
3. Click the link to a feedback task number.
4. On the Knowledge Feedback Task form, review the feedback given by the submitter.
5. Work on the feedback task.
<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start working on the feedback task</td>
<td>From the State list, select <strong>Work in progress</strong>. You can save the feedback task, edit the knowledge article for which the feedback task was added, or create another knowledge article from a feedback task if the information in the existing article is irrelevant or obsolete. For more information, see <em>Create a knowledge article from a feedback task in Agent Workspace</em> and <em>Edit a knowledge article from a feedback task in Agent Workspace</em>.</td>
</tr>
</tbody>
</table>

| Request clarification from the feedback submitter | 1. From the State list, select **Awaiting information**.  
2. In the **Additional comments** field, enter the information you need from the submitter of the feedback task. When you save the feedback task form, an email notification is sent to the feedback task submitter. |

| Resolve the feedback task | 1. From the State list, select **Resolved**.  
2. From the Resolution Code list, select a code for resolving the feedback task.  
3. In the **Resolution notes** field, enter the reason for the resolution. When you save the feedback task form, an email notification is sent to the feedback task submitter to accept or reject the feedback. |

| Close the feedback task without the submitter having to accept the feedback resolution | From the State list, select **Closed**.  
6. Optional: In the Compose section, enter comments, which all viewers can see, or work notes, which only internal users can see.  
7. Optional: Track the time spent on each state for a feedback task by clicking the **Knowledge Feedback Task Metrics** tab and then clicking a link to the state in the **Value** column.  
8. Click **Save**. The feedback task is updated. |

### Create a knowledge article from a feedback task in Agent Workspace

When working on a knowledge article feedback task, if the current knowledge article doesn't address the issue, you can create another knowledge article from within the task. A feedback task is created for a knowledge article when the article is flagged, marked as not helpful, or rated low, or a knowledge gap feedback task is created on a topic. You must have contribute access to the knowledge base that stores the knowledge article.

**Role required:** `agent_workspace_user`

A feedback task is created in the following ways:

- When a user provides a feedback for the knowledge article. For more information, see *Provide feedback for a knowledge article in Agent Workspace*. |
• When knowledge gap feedback tasks are created on a topic from a demand insights dashboard. For more information, see *Analyze knowledge gaps from a demand insights dashboard and create knowledge gap feedback tasks*.

1. Navigate to **Agent Workspace > Agent Workspace Home**.
2. Go to your tasks list.
   - For feedback tasks created through knowledge gaps or if a knowledge article was marked as not helpful or rated low, go to **Knowledge > My Tasks - Feedback**.
   - For tasks created when an article was flagged, go to **Knowledge > My Tasks - Flagged**.
3. In the **Number** column, click the link to a feedback task assigned to you or your ownership group.
4. Click **Create Article**.
5. Create the knowledge article by either selecting an article template or using the default template.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Selected article template | Select an article template to create a knowledge article using defined fields and values.  

   In the Create Article dialog box:

   1. From the Knowledge Base list, select a knowledge base.

   2. From the Article Template list, select the desired article template.

   **Note:** The Article Template list is populated based on the article templates configured for the selected knowledge base.

   3. Click **Create Article**.

   The Create Article dialog box is available if the article versioning and the Knowledge Article Templates features are enabled. For more information, see *Article versioning* and *Knowledge article templates*.

| Default Standard template | Create a knowledge article using the default Standard template. |

6. On the Knowledge form, fill in the fields.

   **Note:** If you are using an article template, the fields that are available will vary.

<table>
<thead>
<tr>
<th>Knowledge form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>Knowledge base</td>
<td>Knowledge base in which the knowledge article is stored. You can associate a knowledge article with one knowledge base only. If you are using an article template, you can modify this value only if the template is available in the other knowledge base.</td>
</tr>
<tr>
<td>Category</td>
<td>Category for the knowledge article. This value helps users find the article within a selected category. You can select only categories available within the selected knowledge base. Articles without a category appear in the (empty) category.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Ownership Group</td>
<td>Ownership group for the knowledge article. An ownership group consists of a group of members and a manager who are responsible for approvals and feedback tasks. Ownership groups can publish, edit, and retire knowledge articles that they are associated with.</td>
</tr>
<tr>
<td>Note: This field is available only if the glide.knowman.ownership_group.enabled property is enabled. If no ownership group is assigned and approvals are required to publish a knowledge article, it is automatically submitted for approval to the knowledge administrator and knowledge manager. For more information, see Ownership groups.</td>
<td></td>
</tr>
<tr>
<td>Version</td>
<td>Automatically generated article version number. This number is incremented when changes are made to a published article.</td>
</tr>
<tr>
<td>Note: This field is available if the article versioning feature has been enabled.</td>
<td></td>
</tr>
<tr>
<td>Workflow</td>
<td>Publishing workflow state of the knowledge article, such as Draft, In Review, or Published. For a new article, the workflow state is set to Draft.</td>
</tr>
<tr>
<td>Language</td>
<td>Language in which you are creating the knowledge article. The list is populated based on the languages enabled for the selected knowledge base.</td>
</tr>
<tr>
<td>Short description</td>
<td>Title of the knowledge article. This title appears when browsing and searching for knowledge article, and at the top of the article. You can enter up to 100 characters in this field.</td>
</tr>
<tr>
<td>Note: Knowledge articles similar to the entered short description text will appear in Agent Assist.</td>
<td></td>
</tr>
<tr>
<td>Article body</td>
<td>Content for the knowledge article. Use the editing functions in the HTML editor to create content.</td>
</tr>
<tr>
<td>Source Task</td>
<td>Task this knowledge article was created from. This field is set automatically when you create the knowledge article from a task, such as an incident or a customer service case, or from a submission record.</td>
</tr>
<tr>
<td>Scheduled publish date</td>
<td>Future date when the knowledge article will be published automatically. For more information, see Schedule a knowledge article for publishing in Agent Workspace.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Valid to</td>
<td>The date this knowledge article expires. Articles do not appear in search results after the Valid to date or if the Valid to date is blank. The default value of the Valid to field is derived from the Article Validity field configured for the knowledge base (see Create a knowledge base). The Valid to date starts from the date the article was created until the number of days specified in the Article Validity field. If the Article Validity field is blank, the default date in the Valid to field for the knowledge article is set to January 1, 2100. An article author or editor can select whether to keep or change the default Valid to date.</td>
</tr>
<tr>
<td>Article type</td>
<td>Type of the article, which is automatically set to HTML. This field is available in the Standard template only.</td>
</tr>
<tr>
<td></td>
<td>Note: The Wiki article type isn't supported in Agent Workspace.</td>
</tr>
<tr>
<td>Display attachments</td>
<td>Option to display attachments in the knowledge article. If the article has attachments, they are listed below the text of a knowledge article on the knowledge article view page.</td>
</tr>
<tr>
<td>Attachment link</td>
<td>Option to automatically download an attached article when a user access an article instead of opening the article. The Attachment link option applies to articles accessed from search links only. Articles accessed from links within other knowledge articles will not automatically download an attached file.</td>
</tr>
<tr>
<td></td>
<td>Note: Although you may attach multiple files, most web browsers permit users to download only the first attachment. To ensure download of all the files, bundle them into an archive and attach the archive.</td>
</tr>
<tr>
<td>Issue</td>
<td>Brief description about an issue.</td>
</tr>
<tr>
<td></td>
<td>Note: This field is available in the KCS Article template only.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Environment</td>
<td>Details of the environment in place when the issue occurred.</td>
</tr>
<tr>
<td>Cause</td>
<td>The cause of the issue.</td>
</tr>
<tr>
<td>Resolution</td>
<td>Method used to resolve the issue.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as a question.</td>
</tr>
<tr>
<td>Answer</td>
<td>Text to display as an answer to an included question.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introduction to the topic.</td>
</tr>
<tr>
<td>Instructions</td>
<td>Instructions for a how-to topic.</td>
</tr>
<tr>
<td>Explanation</td>
<td>Explanation of a what-is topic.</td>
</tr>
</tbody>
</table>

7. Optional: Research for content related to knowledge article you're authoring using Agent Assist.
   a) In the contextual side panel, click the Agent Assist icon (💬).
      The search results in Agent Assist display default content based on the text-based search.
   b) Click the select a search resource icon (🔍), and then select a search resource.
      For example, to view knowledge articles, select **Knowledge Articles**.
   c) Optional: In the search results, you can click a resource item, such as a knowledge article, to view its content in Agent Assist.
8. Optional: Check whether your content matches content in an existing article.
   a) Enter search text in the text box available in Agent Assist or retain the default text, which is the short description of the knowledge article.
   b) Click the lookup icon (🔍).
   c) Select a search resource by clicking the Select a search resource icon (🔍).
      • To find knowledge articles that have high text similarity with the entered search text, choose **Similar Articles (ML)**.
      Note: This option is available only when the Predictive Intelligence feature is enabled and your system administrator has trained the similarity solution for Knowledge Management. For more information, see *Train the similarity solution for Knowledge Management to find related articles*.
      • To find knowledge articles that match the entered search text, choose **Knowledge Articles**.

9. Click **Save**.
    The article is saved and appears in the My Articles - Unpublished list and additional functionality becomes available on the form.

10. Optional: Either add to or modify the article details or publish the article.
   • Add to or modify the article details.
     For more information, see *Edit a knowledge article in Agent Workspace*.
   • Publish the article by clicking **Publish**.
     A knowledge article is published depending on the workflow setting of its knowledge base:
     • **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.
     • **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.
     For more information, see *Schedule a knowledge article for publishing in Agent Workspace*.
     When published, your knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version number of the knowledge article is updated. For more information, see *Knowledge article version numbers*.

After you create and publish a knowledge article, you can perform the following actions related to the article:
• Request translations for the knowledge article. For more information, see *Request translations for missing languages in Agent Workspace*.
• Retire the knowledge article. Click **Retire** to enable the retirement workflow. For more information, see *Retire a knowledge article*.
• Translate the knowledge article directly from the knowledge article. For more information, see *Translate a knowledge article in Agent Workspace*. 
• Delete the published knowledge article. Click **Delete**. If the **Delete** button isn't displayed, click the more actions icon (•••), and then click **Delete**.

**Note:** Only users with the admin role can delete a published knowledge article.

### Edit a knowledge article from a feedback task in Agent Workspace

When working on a knowledge article task, you can edit the knowledge article from within the task. A feedback task is created for a knowledge article when the article is flagged, marked as not helpful, or rated low, or a knowledge gap feedback task is created on a topic.

Role required: You must have contribute access to the knowledge base that stores the knowledge article.

Role required: agent_workspace_user

1. Navigate to **Agent Workspace > Agent Workspace Home**.
2. Go to your tasks list.
   - For feedback tasks created through knowledge gaps or if a knowledge article was marked as not helpful or rated low, go to **Knowledge > My Tasks - Feedback**.
   - For tasks created when an article was flagged, go to **Knowledge > My Tasks - Flagged**.
3. In the **Number** column, click the link to a feedback task assigned to you or your ownership group.
4. Click **Edit Article**.
5. If the article versioning feature is enabled, click **Checkout** for a published knowledge article.
   You can only edit the latest version of a knowledge article.
6. Access the relevant related lists to modify the information.

#### Knowledge form related list

### Related list

<table>
<thead>
<tr>
<th>Related list</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Translation Tasks</td>
<td>Tasks submitted for translating the article. This related list appears when the Translation Management feature and the <code>glide.knowman.translation.enable_translation_task</code> property to enable creation of translation tasks are enabled. For more information, see Knowledge properties.</td>
</tr>
<tr>
<td>Related Articles</td>
<td>Related articles mapped to the knowledge article. For more information, see Map a related article in Agent Workspace.</td>
</tr>
<tr>
<td>Related Catalog Items</td>
<td>Related catalog items mapped to the knowledge article. For more information, see Map a related item in Agent Workspace.</td>
</tr>
<tr>
<td>Affected Products</td>
<td>Products mapped to the knowledge article. For more information, see Add an affected product to a knowledge article in Agent Workspace.</td>
</tr>
</tbody>
</table>

7. Optional: Research for content related to knowledge article you’re authoring using Agent Assist.
   a) In the contextual side panel, click the Agent Assist icon (🔍).
      The search results in Agent Assist display default content based on the text-based search.
   b) Click the select a search resource icon (🔍), and then select a search resource.
      For example, to view knowledge articles, select Knowledge Articles.
   c) Optional: In the search results, you can click a resource item, such as a knowledge article, to view its content in Agent Assist.

   **Tip:** For better readability, you can resize the contextual side panel for Agent Assist. For a full view of the selected resource item content, click Full View. The resource item content opens in another tab within the Agent Workspace.

8. Optional: Check whether your content matches content in an existing article.
   a) Enter search text in the text box available in Agent Assist or retain the default text, which is the short description of the knowledge article.
   b) Click the lookup icon (🔍).
   c) Select a search resource by clicking the Select a search resource icon (🔍).
      - To find knowledge articles that have high text similarity with the entered search text, choose Similar Articles (ML).

      **Note:** This option is available only when the Predictive Intelligence feature is enabled and your system administrator has trained the similarity solution for Knowledge Management. For more information, see Train the similarity solution for Knowledge Management to find related articles.
      - To find knowledge articles that match the entered search text, choose Knowledge Articles.

9. Click Save.
The article is saved and appears in the My Articles - Unpublished list. If the article versioning feature is enabled, the version of the knowledge article is incremented by 0.01. For more information, see Knowledge article version numbers.

10. Optional: Publish the article by clicking Publish.

The knowledge article is published depending on the workflow setting of its knowledge base:

- **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.
- **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

For more information, see Schedule a knowledge article for publishing in Agent Workspace.

When published, the knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). For more information, see Knowledge article version numbers.

### Compare knowledge article versions in Agent Workspace

Select and compare two versions of a knowledge article in Agent Workspace to view the differences between them.

You must have contribute access to the knowledge base that stores the knowledge article.

Role required: agent_workspace_user

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Click Lists > Knowledge > All Articles.
3. Click the link to a knowledge article for which you want to compare two versions.
4. Click Edit to open the Knowledge article form.
5. In the Article Versions related list, select the two versions of the article to compare.
6. Click Compare.

The Compare versions tab opens within Agent Workspace and lists the fields for the selected versions in a side-by-side format. Any differences between the two versions are highlighted as shown in the following example image.
Example: Compare article versions

Recall an article that is being reviewed in Agent Workspace

Recall an article that is being reviewed to stop the approval process.

You must have contribute access to the knowledge base that stores the knowledge article you want to recall.

Ensure that the article versioning feature is enabled. For more information, see Article versioning.

Role required: agent_workspace_user
The author of a knowledge article, knowledge administrators, and system administrators can recall the article. If an ownership group is assigned to a knowledge article, the ownership group manager and ownership group members can also recall the knowledge article.

If a version of a knowledge article is in the Review workflow state, you can recall only the corresponding version to make additional changes. Recalling the article results in a minor version increment.

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > All Articles.
3. Click the link to the article in Review workflow state that you want to recall.
4. On the Knowledge form, click Recall.

The article opens in edit mode and the workflow state of the article is changed to Draft. The version number of the article increments by 0.01.

**Approve a knowledge article in Agent Workspace**

Approve a knowledge article that is awaiting your review in Agent Workspace.

Role required: agent_workspace_user

If the article versioning feature is enabled, only users who are assigned as approvers can modify a knowledge article that is in the Review state. If you are not an approver but need to modify the article, consider recalling the article. For more information, see *Recall an article that is being reviewed in Agent Workspace*.

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > All Articles.
3. Click the link to the article in Review workflow state that you want to approve.
4. Click Edit.
5. In the Approvals related list, in the State column, click Requested.
   The Approval form opens in another tab within Agent Workspace.
6. From the State list, select Approved.
7. Click Save.
   The approved knowledge article is published immediately or on the scheduled publish date, if the article is scheduled for publishing. If the article versioning feature is enabled, the version number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). On the Knowledge form of the article, the workflow state changes to Published. The new published version of the article is added to the Article Versions related list on the Knowledge form. The version is also available in the All Articles list in Agent Workspace, go to Knowledge > All Articles.

**Request translations for missing languages in Agent Workspace**

Request to translate a published knowledge article in available languages by creating a translation task in Agent Workspace.

You must have contribute access to the knowledge base that stores the knowledge article.

Ensure that the system administrator verifies the following settings:

- Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated.
- I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) is activated.

**Note:** The I18N: Internationalization plugin (com.glide.i18n) activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.
• The `glide.knowman.translation.enable_translation_task` property is set to `true` in the Now Platform interface. For more information, see Knowledge properties.

Role required: `agent_workspace_user`

1. Navigate to `Agent Workspace > Agent Workspace Home`.
2. Click `Lists > Knowledge > All Articles`.
3. Click the link to a knowledge article for which you want to create a translation task.
4. On the Knowledge form, click `Edit`.
5. Click `Request translations`.
6. In the Request translation dialog box, select one or more available languages in the `Select languages` list.
   - If a language appears grayed out, a translation is already in progress or has been completed for that language.
   - Some languages might not be available if the system administrator has configured only specific languages for the knowledge base in which the article is contained.
7. Click `Submit`.

The translation task is created for the article in the selected languages and assigned to a group or user based on assignment rules, if configured.

**Translate a knowledge article in Agent Workspace**

Translate published knowledge articles to make them available in other languages.

You must have contribute access to the knowledge base that stores the knowledge article.

Ensure that the system administrator verifies the following settings:

- Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated.
- I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) is activated.

**Note:** The I18N: Internationalization plugin (com.glide.i18n) activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.

• The `glide.knowman.translation.enable_translation_task` property is set to `true` in the Now Platform interface. For more information, see Knowledge properties.

**Note:** When the `glide.knowman.translation.enable_translation_task` property is set to `false`, translate the knowledge article by clicking `New` in the Translated version related list of a Knowledge form. The Knowledge form that is displayed to translate the article is based on the article template of the source knowledge article. You can enter your translation content in the Knowledge form. For more information about the Knowledge form, see Create a knowledge article in Agent Workspace.

Role required: `agent_workspace_user`

If you have contribute access to a knowledge article, you can translate a knowledge article directly from the knowledge form.

If your system administrator has configured languages for the knowledge base, you can translate into those languages only. For more information, see Create a knowledge base.

**Note:** The translation management feature isn't available for knowledge blocks in Agent Workspace.

1. Navigate to `Agent Workspace > Agent Workspace Home`.
2. Click `Lists > Knowledge > All Articles`.
3. In the Number column, click the link to a knowledge article that you want to translate.
4. Click **Edit**.
5. Click **Translate**.

**Note:** The **Translate** button is not available if the `glide.knowman.translation.enable_translation_task` property is disabled, translations of the knowledge article are available in all available languages, or a translation task has already been created for all the available languages.

The Original language and Translated language sections appear side by side for easy viewing, as shown in the following figure. The text in the Translated language section still appears in the original language content.

6. Provide the translation in the Translated language section.
   - If dynamic translation is enabled, click **Machine translate** to automatically replace the draft content in the Translated language section with machine-translated content in the targeted language.

   **Note:** A default translator configuration should be available. For configuring the translation API, see *Dynamic Translation*.

When you click **Machine translate**, any draft content in the Translated language section is automatically replaced with the machine-translated content.
• If dynamic translation is not available, replace the draft content in the Translated language section with your translated text.

7. Click Create draft article to create a draft version of the translated article.
8. Click Publish.

When the translated version of the knowledge article is published, a new knowledge number is assigned to the translated version. The translated version is available in the All Articles list in Agent Workspace. Also, the Translated Versions related list on the Knowledge form of the original and translated knowledge article is updated with all the translated versions.

Translate a knowledge article from a translation task in Agent Workspace

Translate a published knowledge article for which you have been assigned a translation task.

You must have contribute access to the knowledge base that stores the knowledge article.

Ensure that the system administrator verifies the following settings:
• Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated.
• I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) is activated.

Note: The I18N: Internationalization plugin (com.glide.i18n) activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.

• The glide.knowman.translation.enable_translation_task property is set to true in the Now Platform interface. For more information, see Knowledge properties.

Role required: agent_workspace_user

A translation task is created for a knowledge article when a request for translation is submitted or its knowledge base is configured to automatically create translation tasks. For more information, see Request translations for missing languages in Agent Workspace and Create a knowledge base.

Note: The translation management feature isn't available for knowledge blocks in Agent Workspace.

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Click Lists > Knowledge > My Tasks - Translation.
3. In the Number column, click the link to a translation task.
4. Click Translate.

Note: The Translate button is not available if the glide.knowman.translation.enable_translation_task property is disabled, translations of the knowledge article are available in all available languages, or a translation task has already been created for all the available languages.

The Original language and Translated language sections appear side by side for easy viewing, as shown in the following figure. By default, the Translated language section includes the original language content.
5. Provide the translation in the Translated language section.
   • If dynamic translation is enabled, click Machine translate to automatically replace the draft content in the Translated language section with machine-translated content in the targeted language.

   **Note:** A default translator configuration should be available. For configuring the translation API, see Dynamic Translation.

   When you click Machine translate, any draft content in the Translated language section is automatically replaced with the machine-translated content.
   • If dynamic translation is not available, replace the draft content in the Translated language section with your translated text.

6. Click Create draft article to create a draft version of the translated article.

7. Click Publish.

When the translated version of the knowledge article is published, a new knowledge number is assigned to the translated version. The translated version is available in the All Articles list in Agent Workspace. Also, the Translated Versions related list on the Knowledge form of the original and translated knowledge article is updated with all the translated versions.
Migrate to Knowledge Management v3

Knowledge Management has significantly changed with the introduction of knowledge v3 starting with the Fuji release.

Knowledge Management v3 has several key differences from Knowledge Management v2, the version of Knowledge Management that was available until Eureka release. The knowledge v3 plugin is activated by default starting with the Fuji release.

The following podcast provides more information on what is new in Knowledge Management v3.

When upgrading from Eureka or earlier versions, if you intend to use the new features available in knowledge v3, you have to migrate legacy knowledge content and any customizations you have made to the Knowledge Base applications.

The following video provides more information on how to migrate from Knowledge Management v2 to v3.

Key differences

<table>
<thead>
<tr>
<th>Legacy Knowledge</th>
<th>Knowledge v3</th>
</tr>
</thead>
<tbody>
<tr>
<td>One knowledge base.</td>
<td>Multiple knowledge bases.</td>
</tr>
<tr>
<td>A single lifecycle workflow shared by all articles.</td>
<td>Separate, customizable workflows available for each knowledge base.</td>
</tr>
<tr>
<td>Two-level organizational structure with <strong>Topic</strong> and <strong>Category</strong>. A single organizational taxonomy shared by all articles.</td>
<td>Category structure with any number of levels. Each knowledge base has a unique category taxonomy.</td>
</tr>
<tr>
<td>Permissions defined per article using roles and ACLs.</td>
<td>Permissions defined per knowledge base or article using user criteria.</td>
</tr>
</tbody>
</table>

Knowledge Management v3 migration process

When you upgrade from Eureka or earlier, consider a multi-step migration process. This process ensures you can access existing knowledge content and allows you to fully migrate at your own pace.

Review automatic changes before upgrading. These changes are applied immediately when upgrading and may impact existing functionality.

1. Migrate knowledge functionality to use your customized functionality with the Knowledge Management v3 enhancements.
2. Migrate knowledge content to use the Knowledge Management v3 enhancements with your existing knowledge articles.

After migration to Knowledge Management v3

These items are relevant to getting the full range of new functionality after you migrate.

- You must configure knowledge access controls based on user criteria to ensure that users can access existing knowledge content. Since access control in knowledge v3 is intended to be based on user criteria alone, users may be unable to access v2 or v3 knowledge articles, or have restricted access, with preexisting ACLs.
- If the home page was customized in knowledge v2, custom layout and links are not saved in knowledge v3.
• Images added using the Image field in a knowledge article form do not display in the Knowledge v3 or Knowledge Service Portal pages. The article search results page displays the knowledge base icon next to all articles from the knowledge base.

Automatic changes after Knowledge Management v3 migration
Upgrading to Knowledge Management v3 automatically changes knowledge functionality including the knowledge user interface and security model.

Default knowledge base
When you upgrade from Eureka or earlier, a default knowledge base is created, titled Knowledge, that contains all knowledge articles from the previous version.

After the upgrade, you can add and edit articles in this knowledge base.

Articles in the default knowledge base continue to use legacy functionality, such as role-based access controls. Any customizations you made to knowledge functionality before the upgrade are preserved in the default knowledge base.

Knowledge search changes
By default, the legacy knowledge portal uses knowledge v3 search with limited filtering options.

You can filter results only by knowledge base. Search results include only those articles the current user can view based on user criteria. ACLs do not restrict search results.

Knowledge security changes
Knowledge v3 manages access to articles with user criteria rather than roles and ACLs.

Existing ACLs on the Knowledge [kb_knowledge] table are preserved, but with the following changes.

• A version of 3 indicates that a knowledge base uses the knowledge v3 functionality.
• A version of 2 indicates that a knowledge base uses legacy functionality.

New ACLs introduced by knowledge v3, such as field-level controls, apply to all knowledge bases.

When you upgrade from Eureka or earlier, any custom ACLs you implemented for the Knowledge table still apply to any knowledge records in the default knowledge base. Knowledge v3 updates ACLs that exist before upgrade so they only apply to Knowledge [kb_knowledge] records where this field value is 2.

Note: These changes affect the default knowledge base. Even if you are not using the new knowledge functionality, the legacy knowledge behavior may change if you have made customizations to ACLs on the Knowledge [kb_knowledge] table. Ensure you configure knowledge access controls after upgrading to prevent unexpected behavior.

To control access to knowledge articles, try to use user criteria, which were introduced in Knowledge Management v3. For more information, see Managing access to knowledge bases and knowledge articles.

Knowledge article view changes
The Knowledge application uses the kb_view UI page to display knowledge articles.

UI page
The following changes apply automatically when you upgrade from Eureka or earlier:

• The existing kb_view page is renamed to kb_view_customer. The kb_view_customer page is used to display articles in the default knowledge base, preserving the legacy user experience.
Note: By default, the kb_view_customer page is publicly accessible. As an administrator, you can change this behavior by modifying the sys_public table record for this page and clearing the Active field in the record.

- A new kb_view page is used. This is becomes the primary page used to display articles that are not in the default knowledge base.

You should review all customizations introduced around the legacy kb_view UI page.

- URLs should not be updated as the new kb_view page redirects to the correct page depending on the article.
- Customizations made to the kb_view UI page are automatically copied to the kb_view_customer page on upgrade.
- Other customizations that affect kb_view may need to be copied or modified to apply to kb_view_customer. For example, an ACL defined for kb_view may need to be duplicated to provide security coverage for kb_view_customer.

Feedback

Legacy feedback functionality is retained for knowledge articles displayed in the legacy article view. Users can continue to use the feedback options to view, add, and reply to comments on these legacy articles. Legacy comments are retained in the Knowledge Feedback [kb_feedback] table.

To retain the legacy comment functionality with new knowledge articles, set the Use Live Feed for Knowledge feedback property (glide.knowman.use_live_feed) to false. This property is set to false by default.

Knowledge portal changes

While the legacy knowledge portal, kb_home, has not changed in Knowledge v3, we strongly recommend that you consider moving to the new Knowledge v3 home page, $knowledge.do.

UI page

You can search articles from the knowledge portal and filter search results by knowledge base, and by language if the instance uses knowledge management internationalization. This portal also appears for users on older browsers, such as Internet Explorer 9, instead of the knowledge homepage.

Navigation add-ons are available in the legacy knowledge portal. Navigation add-ons of the Link type appear in the top-right of the portal. To add navigation add-ons of the Search type, you must customize the kb_home UI page.

Search

By default, the legacy knowledge portal uses knowledge v3 search with limited filtering options. You can filter results only by knowledge base. Search results include only those articles the current user can view.

Knowledge submissions

Knowledge submissions created from tasks continue to work in knowledge v3 with minor changes.

By default, the Topic and Category fields no longer appear on the Submission form due to the knowledge v3 category changes.

The property glide.knowman.submission.workflow no longer appears on the knowledge properties UI page. To enable knowledge submissions, set this property to true on the System Properties [sys_properties] table.

See creating knowledge from incidents and problems for instructions on using knowledge submission in knowledge v3.
Migrating Knowledge access controls

Access to knowledge articles is controlled based on the user criteria for the knowledge base.

**Important:** If you do not migrate existing knowledge ACLs to user criteria, users may be unable to access knowledge articles, or may be able to access restricted articles.

User criteria records, rather than ACLs, control basic create, read, update, and delete operations for knowledge articles as well as which search results appear. This may lead to unexpected behavior if your configuration depends on ACLs to control access.

To ensure users are able to access the correct knowledge articles, migrate any ACL-based security settings to user criteria. This process may include creating additional knowledge bases and moving existing content to these knowledge bases, depending on your security model. For a detailed explanation and migration examples, refer to *KB0550924 Understanding User Criteria and ACLs in Knowledge v3*.

This video demonstrates how to manage article-level access controls during migration from Knowledge Management v2 to v3.

### Knowledge functionality migration

You can migrate knowledge functionality to use your customized functionality with the knowledge v3 enhancements.

### Replaced knowledge modules

When you are ready to migrate to knowledge v3, you can activate the v3 modules and deactivate the legacy modules.

Use the tables below to identify which knowledge v3 modules to activate and which legacy modules to deactivate. When activating a knowledge v3 module, deactivate the knowledge v2 module with the same name to ensure users access the correct module.

You can use the `enablev3anddisablev2menus.txt` backup script to enable knowledge v3 menus and disable knowledge v2 menus.

#### Knowledge v3 modules

</tbody>
</table>
Knowledge article publish and retire workflows

With knowledge v3, article state is controlled by workflows.

In the legacy knowledge base, article state was controlled by UI actions. UI actions from previous versions are available only in the default knowledge base.

To preserve your article publishing and retirement process in new knowledge bases, create workflows that follow these processes. To create these workflows, copy the default workflow that best matches your process and modify that copy. After creating workflows that use your article publishing and retirement processes, use these workflows as the **Publish workflow** and **Retire workflow** for the new knowledge bases.
Knowledge article category structure

With knowledge v3, all knowledge articles are organized by category and subcategory within knowledge bases. The default knowledge base uses the legacy category structure; knowledge articles are organized by topics and categories.

Before you migrate articles, create a category structure for these articles in the destination knowledge bases. This structure can reproduce your legacy topic and category structure or can be extended to take advantage of the knowledge v3 category functionality.

Knowledge content migration

To use the new functionality available in knowledge v3 with legacy articles, you must migrate these articles out of the default knowledge base.

To migrate knowledge content, move articles out of the default knowledge base by changing the Knowledge Base value for each article. The state of the article remains unchanged when moving articles. After selecting a new knowledge base, assign a category to each article using the category structure defined in the new knowledge base.

After you migrate a knowledge article, the legacy feedback functionality is automatically replaced with the new knowledge feedback mechanisms. Legacy feedback is copied to the Live Feed Message [live_message] table to ensure previously submitted feedback is available for knowledge v3 articles.

Social Q&A

If Social Q&A is activated for a knowledge base, you can ask questions and respond to questions from other users. You can also vote on helpful questions and answers.

Social Q&A extends the Knowledge application. All questions and answers are associated with a knowledge base. Social Q&A uses Knowledge access controls, search, and the knowledge homepage.

Social Q&A is available on mobile devices using the mobile knowledge interface. You can perform all Social Q&A functions on mobile, such as asking and answering questions.

Note: Social Q&A is not compatible with Internet Explorer 9 or earlier. Navigating to a Social Q&A page using one of these browsers will cause a browser support warning to appear.

Enable social Q&A for a knowledge base

As a knowledge manager, you can enable social Q&A for a knowledge base you manage.

Role required: knowledge_manager

You can set the limit for the number of times users can post questions, answers, and comments, or subscribe to the questions using the Knowledge Social Q&A properties section.

All Social Q&A questions and answers are associated with a knowledge base. The Enable social questions and answers check box on the Knowledge Base form controls if users can view and ask questions.

Social Q&A uses user criteria from the knowledge base to determine which users have access to questions.

1. Navigate to Knowledge > Knowledge Bases.
2. Select a knowledge base you manage.
3. Select the Enable social questions and answers check box.
   This check box only appears if the Social Q&A plugin has been activated.
4. Click Update.
You can disable Q&A for a knowledge base by clearing the **Enable social questions and answers** check box. Disabling Q&A does not delete existing questions and answers associated with this knowledge base, but prevents users from browsing or searching for those questions and answers.

**Social Q&A questions**

Social Q&A organizes information by question.

You can browse and search for questions from the Knowledge homepage (**Self-Service > Knowledge**). Questions appear along with knowledge articles organized by knowledge base, category, and tags.

Click on a question to view the question details, as well as responses and comments. You can add responses and comments, vote on existing responses, share questions, and edit your own questions and answers from the question details. Click on a picture profile to view the user's profile.

**Ask a social Q&A question**

As a Social Q&A user, you can ask questions that other users can respond to.

Roles required: None

1. Navigate to **Self-Service > Knowledge**.
2. Click **Post a Question**.
3. Enter a value for the following fields.

   **Question fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Enter the question you have.</td>
</tr>
<tr>
<td>Question details</td>
<td>Enter additional details about the question that may help other users provide an answer.</td>
</tr>
<tr>
<td>Knowledge base</td>
<td>Select the knowledge base this question relates to. You can select only knowledge bases configured to allow Q&amp;A.</td>
</tr>
<tr>
<td>Category</td>
<td>Select the knowledge category this question relates to. You can select only categories within the selected knowledge base. Questions without a category appear on the knowledge homepage in the (empty) category.</td>
</tr>
<tr>
<td>Tags</td>
<td>Enter one or more tags that describe the question.</td>
</tr>
</tbody>
</table>

4. Click **Post Question**.

   To accept the answer, click the **Accept** link from within the answer. The accepted answer moves to the top of the list of answers. You can unaccept an answer by clicking **Unaccept**.

   **Note:** You must be the owner of the question or the knowledge manager to accept an answer.

**Answer a question**

As a user, you can answer a question another user has asked. The owner of the question can then accept the answer.

Roles required: None

As the owner of a question, you can accept an answer as the correct answer. That answer then appears above other answers for the question.

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Enter an answer in the **Your answer** field.
4. Click **Submit**.

**Comment on a question or answer**

You can comment on a question or an answer to provide additional information relevant to that question or answer.

Roles required: None

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Within the question or answer you want to comment on, click the **Comment** link.
4. Enter the comment text.
   Comments have a maximum length of 140 characters.
5. Click **Post comment** or press the Enter key.

**Edit a question, answer, or comment**

You can edit questions, answers and comments you submit, or in knowledge bases you manage.

Role required: None

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Within the question, answer, or comment you want to edit, click **Edit**.
4. Edit the details as needed.
5. Optional: When editing a question, click **Advanced** to make changes to the question record.
6. Click **Update**.
   Click **Undo** to discard the changes and close the editor.

**Vote on a question or answer**

As a Social Q&A user you can vote on a question or answer to promote it.

Role required: None

Vote up questions that you want users to answer, and answers that you believe accurately resolve questions. Alternatively, vote down questions that you do not find useful, or answers that you believe are incorrect. You can vote for each question or answer only once, but you can change your vote.

Answers with a higher score appear above answers with a lower score when viewing a question. A pinned answer appears above other answers regardless of votes.

**Note:** You cannot vote for your own questions or answers.

1. Navigate to **Self-Service > Knowledge**.
2. Select a question.
3. Click the up or down arrow next to the question or answer you want to vote on.
   The score for that question or answer changes depending on your vote.

You can change your vote by clicking the other arrow.
Subscribe to a question

You are automatically subscribed to any question you ask, so you receive notifications when another user votes on, comments on, or answers the question. If you want to receive notifications for a question asked by another user, you can manually subscribe to the question.

Role required: None

You automatically subscribe to any question you ask.

1. Navigate to Self-Service > Knowledge.
2. Select a question.
3. Click the subscribe icon

If you want later to stop receiving notifications about this question, click the unsubscribe icon.

Delete a question, answer, or comment

You can delete questions, answers, or comments that you submitted.

You can delete only questions, answers, and comments you submitted. Knowledge managers can delete any question, answer, or comment within knowledge bases they manage.

Role required: none

1. Navigate to Self-Service > Knowledge.
2. Select a question or answer.
3. Within the question, answer, or comment you want to delete, click the Delete link.

Deleting a question also deletes all answers and comments associated with that question. Deleting an answer also deletes all comments associated with that answer.

Share a question

You can generate a URL directly to a question and related answers.

Role required: None

1. Navigate to Self-Service > Knowledge.
2. Select the question that you want to share.
3. Click Share.

Some browsers do not allow adding content directly to the clipboard. You may need to manually copy the URL from the popup that appears.

Distribute the URL to share the question.

Social Q&A internationalization support

The Social Q&A questions and answers are automatically associated with the language that is set for the interface.

You can only browse and search for questions in the language currently set for the interface. For example, if a Social Q&A user has set French as the interface language, any questions that the user asks is associated with the French language. All Social Q&A users who want to view those questions must have their interface language set to French.

Note: For Social Q&A internationalization to take effect, you must clear the platform cache and browser cache after selecting the desired language.
Social Q&A search

Users can search for specific questions from the knowledge homepage.

Social Q&A uses knowledge search to provide search results. Searching knowledge returns questions that contain the search terms in the question title or the question details, or in the accepted answer.

By default, knowledge search results include both knowledge articles and questions. You can filter results using knowledge search controls, such as filtering by knowledge base or author.

Social Q&A results also appear with knowledge articles when using global search.

Social Q&A uses the Contextual Search feature to generate search results. Questions appear in Contextual Search results, such as when creating an incident. The Social QA Question Search Context and Social QA Question Searcher records define the Social Q&A search. To ensure Social Q&A search functions as intended, do not modify these records.

Social Q&A tags

Tags organize questions and provide information about the question subject matter.

Social Q&A shares available tags with other applications allowing you to organize records consistently across the instance. Tags are stored on the Tags [label] table.

You can view a list of tags and filter by tag from the knowledge homepage. Clicking on a tag displays a list of knowledge articles and questions with that tag.

Only users who can edit a question can edit the associated tags. By default, only the question owner and knowledge managers can add or remove tags on questions.

Legacy: Chat

Chat is deprecated in the Istanbul release.

Note: The Connect feature provides an updated instant messaging platform, which is activated by default for new instances. The legacy chat and Connect features should not be used concurrently. There is no migration path from legacy chat to Connect.

Chat provides real-time communication via instant messaging between users in a ServiceNow instance. Features include:

- One-to-one chats (instant messaging) between users.
- Chat rooms for conversations with multiple users. Chat rooms may be public (any user can join) or private (only invited users can join).
- Chat rooms linked to task records. Users can work together to solve issues, and conversation history can be shared by everyone who needs to reference it.
- Help desk chat. End users can access live support via instant messaging. Service desk staff can resolve basic issues in real-time or create incidents directly from chat requests for more extensive issues.
Legacy: Get started with Chat

Get started with legacy chat.

Role required: admin

1. Establish use guidelines. Social media can improve communication and aid productivity. To get the most out of these tools, establish clear and simple social media guidelines that foster information sharing and a comfortable work environment.

2. Activate the Chat plugin to enable the legacy chat and legacy Help Desk Chat features.

3. Configure security settings. Users must log in to use the legacy chat features in the base system. The standard system security settings and Social IT-specific security settings are available. To learn more about setting up these features, refer to the plugin activation pages.

- Chat rooms may be Public (any user can join) or Private (only invited users can join).
• Administrators can limit who can read chat messages on tasks and who can create chat rooms.

### Legacy: Installed with Chat

What components are installed with legacy chat.

Demo data is available for legacy chat. The demo data creates a chat queue called Help Desk Chat that is supported by the assignment group Chat Support. Additionally, the Help Desk Chat link is added to the header of the Employee Self-Service portal. To learn more, see *Set Up Chat Queues for Help Desk Chat*.

Other:
- Event: A new event called `chat.invite` is registered to trigger an email notification when users are invited into a chat room.
- Email Notification: An email notification called Chat Room Invite is added to send when users are invited to a chat room.

### Legacy: Fields installed with legacy chat

Legacy chat adds fields.

<table>
<thead>
<tr>
<th>Display name [Table name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header [content_block_header]</td>
<td>Adds the Help Desk Chat link to the ESS portal page.</td>

<tr>
<td>Live User [sys_live_user]</td>
<td>System table that stores and maintains chat users. Extending or modifying data in this table is not recommended.</td>
</tr>
<tr>
<td>Stores the last live sequence number [sys_live_last_sequence]</td>
<td>Stores the last sequence ID. Extending or modifying data in this table is not recommended.</td>
</tr>
</tbody>
</table>

### Legacy: Business rules installed with legacy chat

Legacy chat adds business rules.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chat Queue [Task.active] Updater</td>
<td>Chat Queue Entry [chat_queue_entry]</td>
<td>Sets the chat queue entry Action field to Waiting when the action changes.</td>
</tr>
<tr>
<td>SNC - Chat Queue Average Wait Time</td>
<td>Chat Queue Entry [chat_queue_entry]</td>
<td>When a chat queue entry is accepted, calculates the average wait time for the queue by averaging the last 20 chat queue entries.</td>
</tr>
</tbody>
</table>

### Legacy: Chat use

Legacy chat allows you to interact and collaborate through real-time instant messages with other users in an instance.

Use legacy chat to:

- Initiate or participate in chat conversations with one or multiple users.
- Initiate or participate in chat conversations that are attached to task records (such as an incident).
- See when other users are available to chat.

To open the chat desktop, navigate to **Social IT > Chat**.

**Note:** Service desk staff may also provide live support to other users via help desk chat.
Legacy: Update your profile

Your profile identifies your contributions to legacy chat conversations.

Your profile identifies your contributions to conversations. It is created automatically the first time you use chat and consists of:

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>From your user account in ServiceNow. Your name appears on your messages and in the member list of any chat room you join.</td>
</tr>
</tbody>
</table>
To update your profile picture:

1. Click your picture in the top of the favorites list.
2. Browse to the desired picture file and click Open.

**Note:** Changes to your profile picture affect legacy chat and live feed if the Live Feed plugin is activated.

Chat profile picture

**Legacy: Update your status**

In legacy chat, your status lets other users know whether you are available to chat.

Your status lets other users know whether you are available to chat. Your current status is indicated by the color of the icon in the upper right of your favorites list, beside your name. View the status of other users in your favorites list.

To change your status:

1. Click the status icon beside your name.
2. Select a status (see table).
## Change status

**Legacy: Use your favorites list**

In legacy chat, your favorites list appears on your chat desktop and provides certain functions.
Favorites list

- Users:
  - Add another user in the system to your favorites list.
  - See if your favorite users are available to chat. Users are organized alphabetically and in sections by status.
  - Start a conversation by double-clicking a name.
  - Expand or collapse a section by clicking Online or Offline.

- Rooms:
  - See the list of your favorite chat rooms.
  - Join a chat room by double-clicking its name.

- Favorites list toolbar:
  - Options (Chat window menu)
    - access a menu with options to add a favorite user, view online users, create a chat room, and view chat rooms.
  - Add User (Add friend)
    - add a favorite user.
  - Create Room (Add room)
    - create a chat room.
  - Invitations (Chat invitation)
    - respond to invitations to join chat rooms.

To expand or collapse a section in the favorites list, click the section header or click the arrows on the section header.
Legacy: Add a favorite user

How to add a user to your favorite users list in legacy chat.

1. Click the Add User button.

2. Begin typing a user name and select a user from the list, or click the reference lookup and select a user from the table.

3. Click OK.

Legacy: Remove a favorite user

How to remove a favorite user in legacy chat.

To remove a user from your favorite users list, right-click the user's name and select Remove From List.

Legacy: View an online user

How to view a list of all users who are available to chat (status of Online) in legacy chat.

1. Right-click the Users section header or click Options on the toolbar.

2. Select Show Online Users.
   - Start a one-to-one chat with a user on the list by double-clicking a name.
   - Send Message or Add To Friend List by right-clicking a name.
Legacy: View a room

How to view a list of all public chat rooms in legacy chat.

1. Right-click the **Rooms** section header or click **Options** on the toolbar.

   ![Chat window menu](image)

2. Select **Public Rooms**.
   - To join a room, double-click a name or right-click and select **Join Room**. See *Joining Chat Rooms*. 
Legacy: Start a one-to-one chat

How to start a one-to-one chat in legacy chat.

• To start a chat with one user in your favorites list, double-click the user’s name or right-click and select Send Message.
• To start a chat with one available user, double-click the user’s name on the online users list. See Viewing Online Users.

Send a message to start a conversation.

Legacy: Create a chat room

How to start a chat with multiple users from the legacy chat desktop.

To start a chat with multiple users from the chat desktop (requires access rights):

1. Click Create Room on the favorites list toolbar.

2. Enter the room details (see table).

3. Click Create Room. An invitation appears in the favorites list of all invited users and a new chat window opens on your chat desktop.
Create Room

Room name: Chat Room for INC0000003

Description: Wireless access not available on floor 3

Password: *****

Room avatar:

Features:
- Public
- Members Only
- Temporary

Invite:
- Fred Luddy
- Beth Anglin
- ITIL User

Options:
- Assignment group
- Watch list

Create Room  Cancel

<tr>
<td></td>
<td>• <strong>Watch list</strong>: invite all users on the watch list for the task.</td>
</tr>
</tbody>
</table>

Legacy: Create a chat room for a task

How to start a legacy chat with multiple users from a task record.

**Note:** This procedure is not possible if the **Connect** feature is enabled.

1. Open the record (example, an incident on which you are working).
2. Click the **Create or Join Chat Room** related link.

3. If a chat room already exists, click a name to join the existing chat room. If no chat room exists, continue to the next step to create a new room.

Chat task open

4. Click the **create** link at the bottom of the window.

5. Enter the room details as you would for a **chat room**.

6. Click **Create Room**. An email notification is sent and appears in the favorites list for all invited users (the assignment group and the watch list, if selected, and additional invited users).

7. In the **New Room Created** message, click **Join Room**.
   - A new chat window opens on your chat desktop.
• All invited users are listed in the chat member list. Invited users that are not currently participating in the chat are listed in gray.

Legacy: Join one-to-one chats

In legacy chat, when another user starts a chat by sending a message to you, a chat window opens on your chat desktop. To join the chat, click the window.

Legacy: Join a chat room

How to join a chat room in legacy chat.

1. If another user invites you to join a chat room, an invitation appears in your favorites list.

   ![Chat invitation](image)

   Chat invitation

2. To respond, click the invitation.

   A window opens that displays the room name, room description, and the name of the user who invited you.

   • To join the chat, click Join. When the chat window opens on your chat desktop, click the window.
   • To ignore the invitation, click Decline.

![Chat Room](image)

View invitations

To rejoin a favorite chat room that you have left, click the chat room name in the Rooms section of the favorites list.

To join a public chat room without an invitation, right-click the Rooms section header and select Public Rooms. Double-click a room name on the list.

Legacy: Join a chat room for a task

In legacy chat, if another user invites you to join a chat room from a task record, you receive an email notification.

1. Click the link in the email notification.
2. If a prompt for a password appears, enter the password listed in the email notification.
3. When the chat window opens on your chat desktop, click the window.
Legacy: Join a chat room from a task record without an invitation

How to join a chat room in legacy chat without an invitation.

Note: This procedure is not possible if the Connect feature is enabled.

1. Open the task record.
2. Click the Create or Join Chat Room related link.
3. Click a chat room name.
4. If a prompt for a password appears, contact the person who created the chat room for the password.
   If a chat room has a password, only users with the password can join the chat.
5. When the chat window opens on your chat desktop, click the window.

Legacy: Chat windows

In legacy chat, a chat window appears on your chat desktop for each chat conversation that you start or join.
Legacy: Send messages in legacy chat

How to send messages in legacy chat.

To chat with other users that have joined the conversation, enter your message in the text field at the bottom of the window and press Enter. The message appears in the other users’ chat windows.

To send a link, type the full URL (example, http://www.service-now.com). When the message is sent, the text appears blue and any user in the conversation can click it to follow the link.

To send a smiley face, type a colon followed by a close parentheses (:()). When the message is sent, a smiley face (😊) appears in place of the text. For more emoticons, see Sending Emoticons in Messages (Smileys).

Chat activity is indicated with the following alerts:

• When a new message is posted to an inactive browser tab, the tab name blinks.
• When a new message is posted to an inactive chat window, the window header appears in yellow and blinks.
• When a user joins or leaves a room, a message appears in the other room members’ chat windows.

Legacy: Send emoticons in legacy chat messages (smileys)

How to send emoticons (smileys) in legacy chat.

To send an emoticon (smiley), type text from the following table. When your message is sent, the emoticon appears in place of the text. For example, enter colon followed by a close parentheses (:()) and a smiley face (😊) appears in your message.

<table>
<thead>
<tr>
<th>Emoticons</th>
<th>Text</th>
<th>Image</th>
</tr>
</thead>
<tbody>
<tr>
<td>smiley</td>
<td>:) :-D</td>
<td>😊 Smiley</td>

<tr>
<td>;&quot;):&quot;;&gt;</td>
<td>😳</td>
<td>Blush</td>
</tr>
<tr>
<td>:(( :-(('</td>
<td>😢</td>
<td>Crying</td>
</tr>
</tbody>
</table>
Legacy: Change the display

How to change the display of legacy chat.

To view the chat window menu, click the gear button ( 

Chat window menu

) in the bottom left.

• To show or hide timestamps, select Show Timestamps from the chat window menu or press F2.
• To show or hide the chat member list, select Show Members from the chat window menu or press F4.

To resize the window, point to the lower corner (left or right). When the pointer changes shape, drag the window to the desired size.

To move the window, point to the header. When the pointer changes shape, drag the window anywhere on your chat desktop.

To close a chat window, click the X in the upper right corner.

Legacy: Invite a user into a chat

How to invite another user into a chat in legacy chat.

1. Select Invite User from the chat window menu.

Chat window menu

2. Begin typing a user name and select a user from the list, or click the reference lookup and select a user from the table.

Search icon

3. Click OK.

An invitation is sent to the selected user. One-to-one chats are automatically converted into temporary chat rooms.
Legacy: Add a favorite room

How to add a favorite room in legacy chat.

To add a room to your favorites, click the chat window and select **Add To Favorites** from the chat window menu.

Legacy: Remove a favorite room

How to remove a favorite room in legacy chat.

To remove a room from your favorites, right-click the room name and select **Remove From List**.

Legacy: Set your chat preferences

Use the Chat Window Preferences to set audio notifications and default chat window display options in legacy chat. Use the **Chat Window Preferences** to set audio notifications and default chat window display options. The default display options control how a chat window looks when you first open it. You can still control the display options for an individual window as described in *Changing the Display*.

To view your chat preferences, click your name in the upper left corner of the chat desktop and select **Chat Preferences**.

To set your preferences, select or clear the check boxes next to the options, then click **Update**.
### Preferences

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audio</td>
<td>Turn audio notifications on or off.</td>
</tr>
<tr>
<td>Conversation Windows</td>
<td>Set default options for showing timestamps and members in one-to-one chats.</td>
</tr>
<tr>
<td>Group Chat Windows</td>
<td>Set default options for showing timestamps members in chat rooms.</td>
</tr>
</tbody>
</table>

### Legacy: Delete a chat room

You can delete chat rooms in legacy chat.

Role required: chat_admin

Note that when you delete a chat room, the system also deletes the records for any chat members and messages.

1. In the application navigator filter, enter `chat_room.list`.
2. Delete multiple chat rooms from the list or open a chat room record and click **Delete**.

### Legacy chat administration

Users with the chat_admin role can administer various aspects of legacy chat.

#### Define chat room access rights

Control the access rights for creating a chat room so that not all users can create a chat room.

Role required: chat_admin

To define the access rights for creating chat rooms:

1. Navigate to **Social IT > Chat Administration > Properties**.
2. Locate the property **Comma-separated list of roles that are allowed to create chat rooms**.
3. Enter user roles. A user must have one of the specified roles to create a chat room.

#### Change chat room message read access

In legacy chat, you can associate a chat room with a record, such as an incident, and add the chat messages to a **Chat Activity** journal field on the form.

Role required: admin

By default, a user can read the chat messages for a room if either of the following is true:

- The room is public
- The user is a member of the room

To change chat room message read access:

- Modify the Chat message access control rule or create a new rule.
- Read access to the messages displayed is handled by the access control list security operation `chat_messages_read` on the Chat room `[chat_room]` table.
View a legacy chat message as a journal field

You can view all chat messages in one place by viewing them as a journal field. Chat rooms can be linked to any task record in the following ways:

- Create a room from the record.
- Create a record from a chat room, such as creating an incident from a Help Desk Chat.

To view the chat messages as a journal field:

Configure the task record form to select the **Chat Activity** field.

The maximum number of chat messages that are displayed by this field is 1000.

Chat Activity

Chat actions

Chat actions are additional items that appear in the chat window menu (requires the Chat plugin). Administrators and users with the chat_admin role can define chat actions.
Add actions to the legacy chat window menu

You can create new actions and add them to the chat window menu.

1. Navigate to Social IT > Chat Administration > Actions.
2. Select an action to edit or click New.
3. Enter the chat action details and click Update or Submit.

The following example demonstrates how to add a chat action that appears only on windows where the user is a Help Desk Agent. The action appears on the menu as **Show User Type** and opens a popup window that indicates a current user of queue_agent.

- **Action Name:** Show User Type
- **Active:** Select the check box.
- **Order:** 100
- **Client Show Condition:**
  
  ```javascript
  answer = g_chat.getChatType() == 'queue_agent';
  ```
- **OnClick Action Script:**
  
  ```javascript
  alert('The current user is: ' + g_chat.getChatType());
  ```
The page at http://localhost:8080 says:

The current user is: queue_agent

OK
Chat action details

You can define a chat action name and the script that runs when the action is selected.

**Chat action details**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Name</td>
<td>Enter a label for the action as it appears in the menu.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate or clear the check box to deactivate the action. Only active actions may appear in the menu.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order in which the action appears in the menu.</td>
</tr>
<tr>
<td>Client Show Condition</td>
<td>Define the conditions under which this menu option appears. The show condition must set the pre-defined answer variable to a boolean value.</td>
</tr>
<tr>
<td>OnClick Action Script</td>
<td>Enter the JavaScript code that runs when the menu item is selected.</td>
</tr>
</tbody>
</table>

**Available methods associated with the g_chat variable**

The g_chat variable is a legacy chat window object that is available in the Client Show Condition and OnClick Action Script of a chat action definition.

**Method Summary**

The following table defines the available methods associated with this object.

<table>
<thead>
<tr>
<th>Return Object</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>getActiveUsers()</td>
</tr>
<tr>
<td></td>
<td>Returns the active users.</td>
</tr>
<tr>
<td></td>
<td>Returns: Array - Returns the active users.</td>
</tr>
<tr>
<td>String</td>
<td>getChannelJID()</td>
</tr>
<tr>
<td></td>
<td>Returns the channel JID, which is a sys_id for a record chat_channel table.</td>
</tr>
<tr>
<td></td>
<td>Returns: String - Returns the channel JID.</td>
</tr>
</tbody>
</table>
## Return Object Details

<table>
<thead>
<tr>
<th>String</th>
<th>getChatType()</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Determines the chat window type. Returns: String - Returns one of the following values that specifies the type of user:</td>
</tr>
<tr>
<td></td>
<td>• queue_agent: Help Desk Chat support agent</td>
</tr>
<tr>
<td></td>
<td>• queue_user: Help Desk Chat end user</td>
</tr>
<tr>
<td></td>
<td>• group_chat: The individual is a member of a chat room (multiple users)</td>
</tr>
<tr>
<td></td>
<td>• conversation: The individual is a member in a private chat with another user</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>String</th>
<th>getChatQueueAgent()</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Returns the sys_id for agent that is administering this thread. Returns: String - Returns the sys_id of the chat queue agent.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>String</th>
<th>getChatQueueUser()</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Returns the sys_id for end user of the chat queue. Returns: String - Returns the sys_id of the chat queue user.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>String</th>
<th>getThreadID()</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Returns the thread ID. This returns the same value as g_chat.getChannelJID().getID(). Returns: String - Returns the thread ID.</td>
</tr>
</tbody>
</table>

---

### Legacy: Help desk chat

Communicate with service desk staff using instant messaging.

**Note:** The Connect Support feature provides an updated messaging platform similar to help desk chat. The help desk chat and Connect Support features should not be used concurrently. There is no migration path from help desk chat to Connect Support.

Users can communicate directly with service desk staff using instant messaging in a ServiceNow instance (requires the Chat plugin.)

- Users access live support from the Employee Self-Service portal.
- Service desk staff provide support from the chat desktop.

### Legacy: Use help desk chat to get support

You can contact service desk staff.

2. Log in to your ServiceNow account. Only logged in users can use chat.
3. In the upper right, click the **Service Desk Chat** button. A chat window opens.
4. Enter your question in the text field at the bottom of the window and press **Enter**.
   1. A message confirms that you have entered the chat queue and indicates your position and estimated wait time.
   2. When a service desk staff member accepts your chat and begins working on your question, another message appears.
5. Chat with your service desk agent via instant messaging.

   service desk staff may lead you through troubleshooting, ask clarifying questions, or create an incident record to address your question.

**Note:** Administrators can configure Service Desk Chat to be accessible on content management (CMS) pages.

---

**Service Desk Chat Window**

**Legacy: Use help desk chat to provide support**

Staff who are assigned to chat support can provide live support via instant messaging. Administrators and users with the chat_admin role can assign chat support staff (see Set Up Chat Queues for Help Desk Chat).

To provide users with live support using chat:

1. Navigate to **Social IT > Chat** to open your chat desktop.
   - A chat queue agent window appears on your chat desktop for each chat queue you are assigned to. If no agent windows appear, ask an administrator to add you as a member of the assignment group for a chat queue.
• The chat queue agent window displays the number of users in the queue and how long they have been waiting.
• Every member of the assignment group sees the associated chat queue agent window.

2. Click Answer Next User to answer the next user or click Answer beside a specific user in the queue. A chat window opens.
• Only the agent and the user can see the chat window.

Provide support via instant messaging. Chat queue agents can access additional support functions in the chat window menu:

• Invite User: invite another expert to assist with a support chat. An invitation appears in the favorites list of an invited user.
• Create Incident from Chat: create a new incident record with the initial question as the short description and the support chat as a linked chat room (accessible from the Create or Join Chat Room related link on the Incident form).

Note: Administrators can edit this action or add additional actions to the chat window menu.
Chat queues define the schedules, staff, and system messages for help desk chat. Administrators and users with the chat_admin role can set up chat queues.

**Define a chat queue for legacy chat**

How to define a chat queue for legacy chat.

> **Note:** The Chat Queue [chat_queue] table is also used by Connect Support. Legacy chat and Connect Support should not be used concurrently.

1. Navigate to Social IT > Chat Administration > Queues.
2. Select a chat queue to edit or click New.
3. Enter the chat queue details and click Update or Submit.

<table>
<thead>
<tr>
<th>Chat queue details</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>Name</td>
<td>Enter the name that end users see as a title for the queue.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate or clear the check box to deactivate the chat queue.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>Select the group that contains the support staff for the chat queue. Every agent sees the chat queue on their chat desktop and can answer any user that is waiting in the queue. To assign staff members to the group, see Assign Service Desk Staff to a Chat Queue.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Select a schedule that defines when a queue is available (see Use Schedules). If the queue is always available, clear the field.</td>
</tr>
<tr>
<td>Question</td>
<td>Enter the initial question that end users see when they open a new Help Desk Chat. For example, How can I help you?</td>
</tr>
<tr>
<td>Confirm problem</td>
<td>(Optional) Enter the confirmation message that end users see when they enter an initial question. For example, Thank you for contacting support. Your problem has been submitted and an agent will be with you shortly.</td>
</tr>
<tr>
<td>Initial agent response</td>
<td>(Optional) Enter the message that end users see when an agent accepts their chat. For example, Thank you for waiting. I am looking into your question now and will be with you shortly.</td>
</tr>
<tr>
<td>Not available</td>
<td>Enter the message that end users see when a Help Desk Chat request is not accepted because the queue is outside its scheduled availability (defined by the Schedule field).</td>
</tr>
</tbody>
</table>

**Assign service desk staff to a chat queue**

Chat queue agents are Service Desk staff that are members of a chat queue's assignment group.

To assign agents to a chat queue:

1. Navigate to User Administration > Groups.
2. Select an existing assignment group or click New.
3. Enter or modify the group details (see Create a Group).
4. Right-click the header and select Save.
5. In the **Group members** related list, click **Edit**.
6. Using the **slushbucket**, add support staff to the group.
7. Navigate to **Social IT > Chat Administration > Queues**.
8. Select the chat queue for which the group provides support.
9. In the **Assignment Group** field, select the group.

Chat queue group

*Make help desk chat accessible to an end user*

Users access live support from the Employee Self-Service Portal (ESS Portal).

Users access live support from the Employee Self-Service Portal (ESS Portal). To make a Help Desk Chat queue accessible to end users, add a link to the ESS Portal (requires the Content Management Plugin).

To change the default link in the ESS header:

1. Navigate to **Content Management > Headers**.
2. Open **Portal - Header**.
3. In the **Chat queue** field, enter the chat queue that users access by clicking the link in the ESS header. Clear the field to remove the chat queue link.
4. Click **Update**.
Chat queue link

Add a custom link elsewhere on the ESS portal
How to add a custom help desk chat link on the ESS portal.

1. Navigate to Content Management > Static HTML.
2. Click New.
3. Enter a Name.
4. In the Static content field, click Toggle HTML Source to edit the field in HTML source mode.

5. Create a link to the desired Help Desk Chat queue (see Link Syntax).
6. Click Submit.
7. Add the new content block to the desired location on the portal (see Adding Content to the Page).

Link syntax
To open a Help Desk Chat queue from a custom link on the ESS Portal, you must call the CustomEvent.fire method using appropriate arguments.

To open a Help Desk Chat queue from a custom link on the ESS Portal, you must call the CustomEvent.fire method using appropriate arguments. Details of the API call and an example that generates an anchor link are provided below.

API Call:

```javascript
CustomEvent.fire(LiveEvents.LIVE_EVENT, LiveEvents.LIVE_WINDOW_JOIN_QUEUE_QUERY, CHAT_QUEUE_SYS_ID, CHAT_QUEUE_SYS_NAME);
```

where the variables are:

- CHAT_QUEUE_SYS_ID: Specifies the sys_id for the chat queue.
- CHAT_QUEUE_SYS_NAME: Specifies the name of the chat queue (must match the value the Name field of the chat queue record).
Example: This example creates an anchor link that opens the Help Desk Chat queue.

```html
<a href="#" onclick="CustomEvent.fire(LiveEvents.LIVE_EVENT,
    LiveEvents.LIVE_WINDOW_JOIN_QUEUE_QUERY,
    'c54f0abf0a0a0b452db84664f409c79c',
    'Help Desk Chat'); return false;">
    Help Desk Chat
</a>
```

**Monitor chat queues**

Chat queues can yield useful Key Performance Indicators (KPI) for evaluating support effectiveness.

- Queue Wait Time: amount of time a user waits in the queue before a help desk agent accepts the request.
- Percentage of Chats Abandoned: users that exit the queue before an agent responds (user stopped waiting).
- Percentage of Chats Accepted: requests that are answered by an agent.

*Note:* This information is not calculated automatically. Administrators may calculate these values based on data collected by chat queues.

**Monitor help desk chat tasks**

Help Desk Chat requests are tracked in the Chat queue entries table, which appears as a related list on the associated chat queue record.

Help Desk Chat requests are tracked in the Chat queue entries table, which appears as a related list on the associated chat queue record. Because this table extends the Task table, administrators can take advantage of core task functionality. For example, administrators can attach Service Level Agreements (SLAs) to chat queue entries to evaluate the response time of Help Desk Chat support.

**Legacy Notify**

Legacy Notify enables organizations with a Twilio account to send notifications using text and voice messages.

*Note:* This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

Legacy Notify also allows conference calls between ServiceNow users to enable quick communications.

When Legacy Notify is active, you can configure ServiceNow to automatically generate and send notifications to selected contacts, for instance when a new incident communication plan is raised in the incident communications management process.

Users with the notifynow_admin role can set properties and monitor message and conference call activities.

Legacy Notify has been implemented for use within Incident Communications Management. Refer to the Notify API documentation for details on how to implement Legacy Notify for use within other ServiceNow applications.

**Working with Legacy Notify**

Follow this process to enable and use Notify.

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Set up a Twilio account to provide phone connectivity for Notify.
2. Activate Notify.
3. Configure Notify to use Twilio.
4. Begin using Notify immediately within Incident Communications Management.

5. Use the Notify API with other ServiceNow applications to provide SMS, voicemail, email, and conference calls for those applications.

**View a Legacy Notify question**

Questions contain a response action and a set of response choices. Use these questions to simplify communications. Then, you can monitor the resulting communication thread.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

For example, the process can be used to ask members of a specific on-call group to acknowledge or reject an incident. Depending on the answer from the first team member, the incident is assigned to that person or an SMS question is sent to the next on-call member. In this example, the questions are used as part of a workflow.

To see a list of predefined questions both Notify and On-Call Scheduling need to be active.

1. Navigate to Notify > Questions.

2. Click the question **On-Call responsibility Accept/Reject** to see the question details.
3. Click the Notify Response Choices related list to view or edit the choices. The person who receives the SMS question can either choose to accept or reject the assignment. If the assignment is accepted, the Response action can be that the incident is actually assigned to that person. The response action is a script that you can modify or replace. If the assignment is rejected, an SMS question may be sent to the next person in the escalation chain, and so on. You can combine questions with a workflow to automate a process like on-call scheduling escalation.

Create a question in Legacy Notify

Define a question that can be sent to users.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Questions.
2. Click New.
3. Fill in the fields, as appropriate.
Notify New Question form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a description of the question.</td>
</tr>
<tr>
<td>Question</td>
<td>Enter the question you want to send. You can enter variables in the question with the <code>{ }</code> tags, for example, <code>{0}</code>. When using more than one variable, use consecutive numbering. When using multiple variables, reference them by specifying their position in the parameter list, starting from <code>{0}</code>. The variable is picked up by the script and translated into, for example, an incident or a problem number.</td>
</tr>
<tr>
<td>Params</td>
<td>Enter parameters which map to the fields on the record that the workflow was triggered for. This enables the message to show dynamic data. Multiple parameters should be separated by a comma. For example, <code>number</code>, shows the incident number in case the workflow was triggered from an incident. A second parameter could be, for example <code>short_description</code>.</td>
</tr>
<tr>
<td>Response Action</td>
<td>Select the action that must be taken. This is a script that can be modified, or you can create a new script by clicking the search button and selecting New. Several examples of scripts are shown. Write your own script and click Submit.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Create a new response choice in Legacy Notify

Create a new response choice to allow users to select that response for a Notify question.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Questions.
2. Open the notify question you have just created.
3. Click New to create a new notify response choice.
4. Fill in the fields, as appropriate.

Notify New Response Choice form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>The abbreviation for the response choice in the text message. For example, ACC for accept or REJ for reject.</td>
</tr>
<tr>
<td>Text</td>
<td>The text displayed for this response choice.</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating the order in the list of response choices. Choices with lower order numbers are listed before choices with higher order numbers.</td>
</tr>
</tbody>
</table>

5. Click Submit.
View Legacy Notify messages

Applications implementing Notify, such as Incident Communications Management, can send Short Message Service (SMS) text messages to relevant contacts under predefined conditions, such as when a new incident communication plan has been created.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Messages.
2. Click a message to see the message details.

![SMS Outbox Details](image)

View Legacy Notify conversations

The Notify Conversation [notifynow_conversation] table tracks bi-directional communications and adds the ability to have more than one active conversation with the same phone number at the same time.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

The thread number is combined with the phone number to link the SMS or email response to the correct conversation. Conversations remain active until a response is received or until they are automatically deactivated after the thread release time runs out. The default thread release time is 10 days. To change this value, add the `nn.thread.release.age` property.

1. Navigate to Notify > Conversations.
2. Click a conversation record to see the conversation details.
Notify Conversation Details

The State of the conversation can have one of the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ended</td>
<td>The conversation has been completed.</td>
</tr>
<tr>
<td>Failed</td>
<td>The conversation has failed.</td>
</tr>
<tr>
<td>Pending</td>
<td>The SMS or email is waiting to be sent.</td>
</tr>
<tr>
<td>Sent</td>
<td>The SMS or email has been sent.</td>
</tr>
<tr>
<td>Unanswered</td>
<td>The SMS or email has not been answered.</td>
</tr>
</tbody>
</table>

**Note**: The mode of conversation cannot be changed during one conversation thread. For example, you cannot switch between SMS and email during one conversation.

View Legacy Notify conference calls

Applications that use Notify, such as Incident Communications Management, can launch and maintain conference calls between involved parties.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. **Navigate to Notify > Conference Calls.**
   You can also access conference call information from the relevant record, such as the Conference Calls related list in an incident communication plan record.
2. **Click a conference call in the list to view details.**
Notify Conference Call Details

3. Click the arrow beside the check box to expand a Participant entry. This shows participant session information, including details of the conference calls that the participant has been involved in.

4. Click a Participant name to see more detailed information about that participant.
Legacy public conference calls

A Notify conference call can be public.

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

The Private field on the conference call record indicates if a call is private (selected) or public (not selected). By default, all calls created automatically, such as those created through Incident Communications Management, are public. You can create private calls using the Notify API initiateConferenceCall method.

When created, public conference calls generate an associated Code which is sent via SMS to all invited participants. These participants can distribute the code to allow other users to join the public call. An administrator can control the format of the code using the property glide.notifynow.conference_call.code.pattern. Anyone with the code can connect to a public conference call using one of these methods:

- By calling the Twilio phone number and entering the code for that conference call.
- By sending the code in an SMS message to the Twilio phone number. Participants that join a public call this way are considered ad-hoc participants, indicated on the participant record.

Administering Legacy Notify

An administrator can set up Notify, manage Notify properties and conference call participants.

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.
Configuring legacy Notify to use the Twilio service

Each ServiceNow instance using Notify requires a valid Twilio account and telephone number. Refer to the Twilio documentation for detailed instructions.

Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

After the Twilio account is set up, perform the following to use that account with Notify:

- Associate the account with Notify
- Configure Twilio with ServiceNow endpoints

Associate a Twilio account with Legacy Notify

Associate a Twilio account with your instance to use that account for legacy Notify.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Administration > Properties.
2. Enter the **AccountSID**, **AuthToken** and **phone number** values. These values can be obtained from the Twilio dashboard:
Twilio Dashboard

When the Twilio account details are entered in the Notify Properties page, the account status is updated.

3. [Optional] To use Notify on multiple ServiceNow instances, activate Notify on each instance and create a separate Twilio account and telephone number for each instance.

**Note:** Some telephone numbers are voice capable, but not SMS capable. This is shown in the Notify properties with relevant messages. Two methods are available to check this: `isSMSCapable` and `isVoiceCapable`.

Configuring the Twilio service with endpoints in legacy Notify

In order for the Twilio service to receive Notify commands, the **Request URL** field value for every Twilio telephone number must point to the ServiceNow instance that uses Notify with that Twilio telephone number.

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

To set these values, do one of the following:

- Define them manually in the Twilio service dashboard.
- Ensure the fields are blank in the Twilio service dashboard, then open the Notify Properties page. Notify automatically configures the correct endpoints if the **Request URL** fields are blank.

Set these values from within the Twilio service dashboard.
The notifyusa values underlined in the image should be replaced with your ServiceNow instance name, for:

- **Voice Request URL**: https://notifyusa.service-now.com/NotifyNowCallProcessor.do
• Status Callback URL: https://notifyusa.service-now.com/NotifyNowCallStatusProcessor.do
• Messaging Request URL: https://notifyusa.service-now.com/NotifyNowSmsProcessor.do

View and edit legacy Notify properties

You can view and edit Notify properties.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

1. Navigate to Notify > Administration > Properties.

![Notify Properties form](image-url)
2. Fill in the fields.

Notify Properties form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Status</td>
<td>Information showing the status of the associated Twilio account.</td>
</tr>
<tr>
<td>Twilio AccountSID</td>
<td>The Twilio account AccountSID, acting as the user name for that account.</td>
</tr>
<tr>
<td>Twilio AuthToken</td>
<td>The Twilio account AuthToken, acting as the password for that account.</td>
</tr>
<tr>
<td>Twilio SMS and voice enabled phone number</td>
<td>The Twilio number that Notify will use. Telephone numbers must be entered in the E.164 format and need to exist under the Twilio account.</td>
</tr>
<tr>
<td>Number of frequent conference call participants to be displayed</td>
<td>The number of people to display in the frequently called list.</td>
</tr>
<tr>
<td>Voice</td>
<td>The voice used for Notify communications. Select woman or man to provide female or male voice support for English, Spanish, French, German, and Italian. Select alice to provide female voice support for a wider range of languages.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Legacy Notify account status messages

Account status messages are visible on the Notify Properties page.

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Your account is ready for use</td>
<td>Notify is correctly configured and ready for use.</td>
</tr>
<tr>
<td>Your Twilio AccountSID or AuthToken are not valid</td>
<td>An incorrect value has been entered in the AccountSID or AuthToken fields in the Notify properties.</td>
</tr>
<tr>
<td>Your Twilio phone number is not valid</td>
<td>Incorrect telephone number information is defined in the Notify properties.</td>
</tr>
<tr>
<td>Your Twilio phone number does not have properly configured endpoints</td>
<td>The Request URL endpoint settings have not been properly configured.</td>
</tr>
<tr>
<td>Your Twilio account is not configured properly</td>
<td>One or more of your Twilio account settings is incorrect. Open the Twilio dashboard and check the settings.</td>
</tr>
</tbody>
</table>

Manage Legacy Notify conference call participants

As a Notify administrator, you can mute, unmute, and kick participants on a conference call.

Role required: notifynow_admin

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.
Muting a participant prevents that person from speaking on the conference call but does not notify any participants, including the muted participant. Kicking a participant removes that person from the conference call and sets the Response field for the participant session to kicked.

1. Navigate to Notify > Conference Calls.
2. Select an active conference call.
3. In the Notify Conference Call Participants related list, select a participant.
4. Click the button for the action you want to perform, such as Mute to mute the participant.

You can perform these actions for multiple participants as a single operation using the Actions on selected rows choice list on the Notify Conference Call Participants related list.

### Installed with Legacy Notify

Activating the Notify plugin adds or modifies tables, user roles, script includes, and other components.

*Note:* This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

### Tables

Notify adds or modifies the following tables.

<table>
<thead>
<tr>
<th>Display Name [Table Name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Answer [notifynow_answer]</td>
<td>Information for possible answers to the SMS question sent.</td>
</tr>
<tr>
<td>Conversation [notifynow_conversation]</td>
<td>Information for the conversation thread.</td>
</tr>
<tr>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Information for conference call records.</td>
</tr>
<tr>
<td>NotifyNow Participant Session [notifynow_participant_session]</td>
<td>Information regarding conference call sessions for individual conference call participants.</td>
</tr>
<tr>
<td>Participant [notifynow_participant]</td>
<td>Information regarding individual conference call participants.</td>
</tr>
<tr>
<td>Question [notifynow_question]</td>
<td>Information for the possible questions in the SMS.</td>
</tr>
<tr>
<td>Response_action [notifynow_response_action]</td>
<td>Information for the notify response action associated with the question.</td>
</tr>
<tr>
<td>Response_choice [notifynow_response_choice]</td>
<td>Information for the notify response choice associated with the question.</td>
</tr>
<tr>
<td>SMS Messages [notifynow_message]</td>
<td>Information for the actual SMS messages sent.</td>
</tr>
</tbody>
</table>

### Properties

Notify adds the following system properties.
Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.notifynow.frequent_participant_count</td>
<td>The number of frequent conference call participants to be displayed.</td>
</tr>
<tr>
<td>glide.notifynow.voice</td>
<td>The voice used for Notify communications.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.accountsid</td>
<td>The Twilio account AccountSID.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.token</td>
<td>The Twilio account AuthToken.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.phonenumber</td>
<td>The Twilio number that Notify will use.</td>
</tr>
<tr>
<td>glide.notifynow.twilio.answering_machine_detection</td>
<td>A boolean flag to enable or disable answering machine detection. Set to true to use answering machine detection. Set to false to continue the call.</td>
</tr>
<tr>
<td>nn.thread.release.age</td>
<td>The number of days after which the conversation thread release time runs out. Defaults to 10 days.</td>
</tr>
<tr>
<td>glide.notifynow.conference_call.code.pattern</td>
<td>The pattern used to generate a conference call code for public conference calls. Number signs (#) in the pattern are replaced with random numbers when a code is generated.</td>
</tr>
<tr>
<td>glide.notifynow.fix_invalid_phone_number</td>
<td>A boolean flag to enable or disable automatic correction of invalid phone numbers. Twilio might incorrectly prefix non-US phone numbers with 1. When this property is true, the instance automatically removes the 1 for non-US calls. When this property is false, you might be incorrectly identified when reconnecting to a call using SMS.</td>
</tr>
</tbody>
</table>

User Roles

Notify adds the following user roles.

<table>
<thead>
<tr>
<th>Role</th>
<th>Contains Roles</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifynow_admin</td>
<td>None</td>
<td>Administrator with privileges for Notify functionality.</td>
</tr>
</tbody>
</table>

UI Actions

Notify adds the following UI actions.
UI Actions

<table>
<thead>
<tr>
<th>UI Action</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initiate Conference Call</td>
<td>Incident Communication Plan [incident_alert]</td>
<td>Adds a link to the Incident Communication Plan form, if that plugin is activated, which displays a dialog box for starting a conference call with selected participants.</td>
</tr>
<tr>
<td>Invite to Conference Call</td>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Adds a link to the Notify Conference Call form which displays a dialog box for adding more users to an active conference call.</td>
</tr>
</tbody>
</table>

Script Includes

Notify adds the following script includes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IncidentAlertConferenceCall</td>
<td>A utility JavaScript Prototype class allowing users to initiate the conference call and add other users to the conference call. Should be used in conjunction with the slushbucket UI page (notifynow_participant).</td>
</tr>
</tbody>
</table>

Business Rules

Notify adds the following business rules.

<table>
<thead>
<tr>
<th>Business Rule Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMS on new Incident Communication Plan</td>
<td>Incident Communication Plan [incident_alert]</td>
<td>Sends an SMS to any default contacts added when an incident communication plan record is created.</td>
</tr>
<tr>
<td>Conference Call Allowed</td>
<td>Incident Communication Plan [incident_alert]</td>
<td>Displays or hides the initiate conference call UI action by storing true or false in g_scratchpad.conferenceCallAllowed.</td>
</tr>
<tr>
<td>Update Conference Call Started IA Activity</td>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Logs when a conference call started by writing to an incident communication plan's comment field if the source record is from the incident_alert table.</td>
</tr>
</tbody>
</table>
### Business Rule Name

<table>
<thead>
<tr>
<th>Business Rule Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update Conference Call Finished IA Activity</td>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Logs when a conference call ended and what actions the conference call participants took by writing to an incident communication plan's comment field if the source record is from the incident_alert table.</td>
</tr>
</tbody>
</table>

### Workflow Activities

Notify adds the following workflow activities.

#### Workflow Activities

<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Activity Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send Notify SMS</td>
<td>Notify</td>
<td>Sends an SMS message (maximum 1600 Characters) to an E.164 compliant mobile phone number of the selected recipients and/or groups.</td>
</tr>
<tr>
<td>Send Notify SMS Question</td>
<td>Notify</td>
<td>Sends predefined SMS Question message (maximum 1600 Characters) to an E.164 compliant mobile phone number of the selected recipients and/or groups. This is one of two main activities for workflow On-Call Assign by Acknowledgement. In a predefined message, the recipient is asked to assign himself to a newly created incident. The same message also contains predefined answers.</td>
</tr>
<tr>
<td>Send Email Question</td>
<td>Notify</td>
<td>Sends email generated from email template containing notification that recipient is the current On-call resource for a newly created task. This is one of two main activities for the workflow On-Call Assign by Acknowledgement. In a predefined message, the recipient is asked to assign himself to a newly created incident. The email contains two links that enable the user to accept or reject assignment.</td>
</tr>
</tbody>
</table>

### Legacy Notify API

The legacy Notify API provides functionality for sending emails, sending SMS messages, and setting up conference calls.

Use this when you want to use Notify functionality with applications on your system.
Note: This API is included with the legacy Notify functionality. For APIs included in the current Notify feature, see the Notify, NotifyAction, NotifyPhoneNumber, and NotifyClient APIs.

**NotifyNow - getReadyState()**

Indicates whether Notify is set up correctly or not.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message False when trying to run the function in a script.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if Notify is set up correctly, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
def nn = new SNC.NotifyNow();
gs.log(((nn.getReadyState()) ? "OK" : "NOT OK"));
```

**NotifyNow - getStatus()**

Returns the current status of Notify configuration.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message Unauthorized when trying to run the function in a script.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>One of the possible status messages.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_NUMBER_MESSAGE</td>
<td>The account does not have a telephone number set up. Ensure that you set up the telephone number for the account.</td>
</tr>
<tr>
<td>NO_ENDPOINTS_MESSAGE</td>
<td>The account does not have its endpoints set up correctly. Ensure that you set up the endpoints for the account.</td>
</tr>
<tr>
<td>ACCOUNT_OK_MESSAGE</td>
<td>The account is active and ready for use.</td>
</tr>
<tr>
<td>ACCOUNT_NO_AUTH</td>
<td>The Twilio AuthToken is not valid.</td>
</tr>
<tr>
<td>ACCOUNT_NOT_CONFIGURED</td>
<td>Twilio AccountSID or AuthToken is not valid.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
gs.log(nn.getStatus());
```

### NotifyNow - initiateConferenceCall(String[] conferenceCallParticipants, String conferenceCallTitle)

Initiate a new conference call.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallParticipants</td>
<td>String</td>
<td>One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.</td>
</tr>
<tr>
<td>conferenceCallTitle</td>
<td>String</td>
<td>Title of the conference call. This parameter has a maximum length of 40 characters.</td>
</tr>
</tbody>
</table>
This initiates a conference call with E.164-compliant phone numbers for participants, without the optional source record parameter and and does not send any conference call details via SMS or email.

```javascript
var participants = ['+31205655548', '+31205655552', '+31652825393'];
// set up conference call
var nn = new SNC.NotifyNow();
var conferenceCall = nn.initiateConferenceCall(participants, "testing12");
gs.log('started conference call: ' + 
conferenceCall.getUniqueValue());
```

### NotifyNow - initiateConferenceCall(String[] conferenceCallParticipants, String conferenceCallTitle, GlideRecord sourceRecord, Boolean private)

Initiate a new conference call.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallParticipants</td>
<td>String</td>
<td>One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.</td>
</tr>
<tr>
<td>conferenceCallTitle</td>
<td>String</td>
<td>Title of the conference call. This parameter has a maximum length of 40 characters.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>Source record to associate to the conference call such as an incident or problem number.</td>
</tr>
<tr>
<td>private</td>
<td>Boolean</td>
<td>Value to control if a conference call is private. This value defaults to false.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The conference call record, or null if there was an error.</td>
</tr>
</tbody>
</table>
This initiates a conference call with participants that have a E.164-compliant phone number and participants from the sys_user table and sends conference call details via SMS and email to all participants.

```javascript
// define phone number participants
var participants = ['+31205655548', '+31205655552',
                    '+31652825393'];

// we also want to add two Dutch sys_user participants
var user = new GlideRecord('sys_user');
user.addNotNullQuery('mobile_phone');
user.addQuery('mobile_phone', 'STARTSWITH', '+316');
user.setLimit(2);
user.query();

// add users to the participant array
while (user.hasNext() && user.next()) {
  gs.log('adding user ' + user.getValue('name') + ' with phone number ' +
          user.getValue('mobile_phone') + ' to the participant array');
  participants.push(user.getUniqueValue());
}

// define a source record to associate with the conference call
var source = new GlideRecord("cmdb_ci");
source.query("asset_tag", "P1000167");
if (source.hasNext() && source.next()) {
  // set up conference call
  var nn = new SNC.NotifyNow();
  var conferenceCall = nn.initiateConferenceCall(participants,
                                                 "testing 1 2", source);

  // check if the conference call was successfully created
  if (conferenceCall != null) {
    gs.log('started conference call: ' +
           conferenceCall.getUniqueValue());
  } else {
    gs.log('could not start the conference call :(');
  }
}
```

### NotifyNow - isCallable(String participant)

Determines whether a user is callable or not.

A user must have a valid phone number to be callable. A user who is already in an active session is not callable.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>String or GlideRecord</td>
<td>A sys_user or notifynow_participant record, or an E.164-compliant phone number.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Whether this participant can be called or not.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
gs.log('by number: ' + nn.isCallable('+31612345678'));

var user = GlideRecord('sys_user');
user.query('sys_id', '13d39544eb5201003cf587b9d106fea9');
if (user.hasNext() && user.next())
gs.log('by user: ' + nn.isCallable(user));

var participant = GlideRecord('notifynow_participant');
participant.query('sys_id', '33b11430eb1201003cf587b9d106feb9');
if (participant.hasNext() && participant.next())
gs.log('by participant: ' + nn.isCallable(participant));
```

**NotifyNow - isSMSCapable()**

Checks if the telephone number associated with the Twilio account is capable of sending SMS messages.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the telephone number associated with the Twilio account is capable of sending SMS messages.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('The twilio number is SMS capable: ' + ((new SNC.NotifyNow().isSMSCapable()) ? 'yes' : 'no'));
```

**NotifyNow - isSMSCapable(String userID)**

Checks if a user is able to send SMS messages.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of the user you want to check for an SMS-capable phone number.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>If the user can send SMS messages.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('the user is able to send SMS messages (e.g. has a SMS device): ' + ((new SNC.NotifyNow().isSMSCapable('<user sys_id>')) ? 'yes' : 'no'));
```

NotifyNow - isVoiceCapable()

Checks if the telephone number associated with the Twilio account is capable of setting up phone calls.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the telephone number associated with the Twilio account is capable of setting up phone calls.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('the Twilio number is Voice capable: ' + ((new SNC.NotifyNow().isVoiceCapable()) ? 'yes' : 'no'));
```

NotifyNow - isVoiceCapable(String userID)

Checks if a user is able to make voice calls.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of the user you want to check for a voice-call capable phone number.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Whether the user has a voice-call capable phone number.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('the user is able to send SMS messages (e.g. has a SMS device): ' +
  ((new SNC.NotifyNow().isVoiceCapable('someuserid')) ? 'yes' : 'no'));
```

**NotifyNow - kick(GlideRecord participant)**

Removes a participant from a conference call.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The conference call participant to remove from the call.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was removed, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
  // kick participant
  result = new SNC.NotifyNow().kick(participant);
  gs.log('participant kicked: ' + result);
}
```

**NotifyNow - mute(GlideRecord participant)**

Mutes a participant on a conference call.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The conference call participant to mute.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was muted, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // mute participant
    result = new SNC.NotifyNow().mute(participant);
    gs.log('participant muted: ' + result);
}
```

### NotifyNow - umute(GlideRecord participant)

Unmutes a participant on a conference call.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The muted conference call participant to unmute.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was unmuted, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // unmute participant
    result = new SNC.NotifyNow().unmute(participant);
    gs.log('participant unmuted: ' + result);
}
```
NotifyNow - sendEmailQuestion(String emailAddress, String question, GlideRecord sourceRecord, String emailSubject)

Send an email question to an email address.

The sendEmailQuestion method produces a question body and requires users to click a link to indicate their choice.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>emailAddress</td>
<td>String</td>
<td>Email address to send the question to.</td>
</tr>
<tr>
<td>question</td>
<td>String or GlideRecord</td>
<td>The question record to send or the sys_id of a question record.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>An optional source record to associate to the SMS question, such as an incident.</td>
</tr>
<tr>
<td>emailSubject</td>
<td>String</td>
<td>Optional text to override the default email subject.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The conversation sys_id.</td>
</tr>
</tbody>
</table>

This example demonstrates using the default email subject.

```javascript
var user = GlideRecord("sys_user");
user.get("email", "someone@somedomain.com");
new SNC.NotifyNow().sendEmailQuestion(user.getValue('email'), "b6b34500bf3111003cf585ce2c0739ce", user);
```

This example uses dot-walking and specifies a source record and email subject.

```javascript
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com", "b6071733bf1111003cf585ce2c07390f", current, "Please answer this question");
```

This example uses dot-walking and specifies an email subject but no source record.

```javascript
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com", "b6071733bf1111003cf585ce2c07390f", "Please answer this question");
```
**NotifyNow - sendSMS(String phoneNumber, String smsBody)**

Sends an SMS message to an E.164-compliant mobile phone number.

Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>smsBody</td>
<td>String</td>
<td>The message to send, maximum 1600 characters.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```
new SNC.NotifyNow().sendSMS("+31612345678", "This is a message without source record");
```

**NotifyNow - sendSMS(String phoneNumber, String smsBody, GlideRecord source)**

Sends an SMS message to an E.164-compliant mobile phone number.

Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>smsBody</td>
<td>String</td>
<td>The message to send, maximum 1600 characters.</td>
</tr>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>The source record to associate with this SMS message.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
var source = new GlideRecord("my_table");
source.query("my_field", "my_value");

if (source.hasNext() && source.next()) {
   // send a text message
   var nn = new SNC.NotifyNow();
   var message = "this is just a test";
   var number = "+31612345678";
   nn.sendSMS(number, message, source);
}

This example uses dot-walking and the current record as the source record.

new SNC.NotifyNow().sendSMS("+31612345678", "this is a test", current);

**NotifyNow - sendSMSQuestion(String phoneNumber, String question, GlideRecord sourceRecord)**

Sends an SMS question.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>An E.164-compliant phone number to send the message to.</td>
<td></td>
</tr>
<tr>
<td>question</td>
<td>String or GlideRecord</td>
<td>The question record to send or the sys_id of a question record.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>An optional source record to associate to the SMS question, such as an incident.</td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The conversation sys_id, or null if the SMS was not sent successfully.</td>
</tr>
</tbody>
</table>

var question = new GlideRecord("notifynow_question");
question.query();

// get the first question
if (question.hasNext() && question.next()) {
   // send the sms question
   var number = "+31612345678";
   var nn = new SNC.NotifyNow();
}
NotifyNow - addConferenceCallParticipant(String conferenceCall, String participant)

Adds ad-hoc users to an ongoing conference call.

When the method is called with a phone number for the participant parameter and there is exactly one sys_user record that matches the phone number, that sys_user record will be related to the participant. The participant's phone number field will be left blank because the phone number is in the sys_user record. If there are several sys_user records that match the phone number, or if there are no results, the participant's phone number field will be filled in, and there will be no stored reference to sys_user because the user is not known.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCall</td>
<td>String or GlideRecord</td>
<td>The sys_id or GlideRecord of an active conference call.</td>
</tr>
<tr>
<td>participant</td>
<td>String or GlideRecord</td>
<td>The sys_id or GlideRecord of a user with an E.164-compliant phone number, or an E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The participant record of the new participant that was added to the conference call.</td>
</tr>
</tbody>
</table>

// add a new participant by conference call sys_id (string) and phone number (string)
var nn = new SNC.NotifyNow();
gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', '+31612345678'));

// add a new participant by conference call sys_id (string) and user record (GlideRecord)
var user = new GlideRecord('sys_user');
user.query('user_name', 'myUserName');
if (user.hasNext() && user.next()) {
    var nn = new SNC.NotifyNow();
gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', user));

    // you could have added the user by sys_id as well:
    //
    nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', user.getValue('sys_id'));
// add a new participant by conference call record (GlideRecord) and phone number (string)
var conferenceCall = new GlideRecord('notifynow_conference_call');
conferenceCall.query('title', 'IA0001001');
if (conferenceCall.hasNext() & conferenceCall.next()) {
    var nn = new SNC.NotifyNow();
    gs.log(nn.addConferenceCallParticipant(conferenceCall, '+31612345678'));
} else {
    gs.log('no such conference call');
}

NotifyNow - convertLocalPhoneNumberToE164(String userID, String phoneNumber)
Converts a local phone number to an E.164-compliant phone number based on a user's location.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of a sys_user record to get location information from.</td>
</tr>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The phone number.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

var localPhoneNumber = '01784 221600';
var userName = 'Heath Vanalphen';

var user = new GlideRecord('sys_user');
user.get('name', userName);
var E164Number = new SNC.NotifyNow().convertLocalPhoneNumberToE164(user.getUniqueValue(), localPhoneNumber);
gs.log('converted: ' + localPhoneNumber + ' to ' + E164Number + ' based on ' + user.getValue('name') + '
's location (' + user.getValue('location') + ')');
NotifyNow - getConferenceCallParticipants(String conferenceCallId, Boolean isCallable)

Returns all participants for a conference call.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallId</td>
<td>String</td>
<td>The ID of the conference call.</td>
</tr>
<tr>
<td>isCallable</td>
<td>Boolean</td>
<td>An optional flag to return either only the users you can call (true) or those you cannot call (false).</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The participants</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
var user =
nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106fe37');

while (user.hasNext() && user.next()) {
  if (user.getValue('participant')) {
    gs.log('user: ' + user.getValue('sys_id'));
  } else {
    gs.log('phone number: ' +
    user.getValue('phone_number'));
  }
}

var nn = new SNC.NotifyNow();
var user =
nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106fe37',
  true);

while (user.hasNext() && user.next()) {
  if (user.getValue('participant')) {
    gs.log('user: ' + user.getValue('sys_id'));
  } else {
    gs.log('phone number: ' +
    user.getValue('phone_number'));
  }
}

var conferenceCallId = '32b11430eb1201003cf587b9d106feb8';
// get all participants
```
gs.log('all conference call participants:');
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants(conferenceCallId);
gs.log(user);

// get all callable participants
gs.log('all conference call participants we can call:');
user = nn.getConferenceCallParticipants(conferenceCallId, true);
gs.log(user);

// get all un callable participants
gs.log('all conference call participants that are already in an active session and whom we cannot call:');
user = nn.getConferenceCallParticipants(conferenceCallId, false);
gs.log(user);

### NotifyNow - getFrequentlyCalledUsers(Number limit)

Returns a number of frequently-called users, up to the limit parameter, in alphabetical order.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>limit</td>
<td>Number</td>
<td>The maximum number of results.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The frequently called users in alphabetical order.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
var fc = nn.getFrequentlyCalledUsers(10);
while (fc.hasNext() && fc.next()) {
    gs.log("got user "+fc.getValue('name')+' - '+
            fc.getValue('sys_id'));
}
```

### NotifyNow - getPreferredE164VoiceNumber(GlideRecord user)

Returns a user’s preferred E.164-compliant phone number for voice calls.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number or null.</td>
</tr>
</tbody>
</table>

```js
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164VoiceNumber(userID);
gs.log('the preferred phone number for setting up voice calls is ' + E164Number + ' for user with id: ' + userID);
```

**NotifyNow - getPreferredE164SMSNumber(GlideRecord user)**

Returns a user's preferred E.164-compliant phone number for SMS messages.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number or null.</td>
</tr>
</tbody>
</table>

```js
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164SMSNumber(userID);
gs.log('the preferred phone number for sending SMS notifications is ' + E164Number + ' for user with id: ' + userID);
```

**NotifyNow - getPreferredEmailAddress(GlideRecord user)**

Returns a user's preferred email address

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the email address from.</td>
</tr>
</tbody>
</table>

```js
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164SMSNumber(userID);
gs.log('the preferred phone number for sending SMS notifications is ' + E164Number + ' for user with id: ' + userID);
```
## Live Feed

Live Feed is a social IT application that provides a place to post and share content in a ServiceNow instance.

Live Feed content forms a searchable knowledge source for sharing information within an organization. Main features include the following:

- Users can post, reply to, and rate messages, including links and images.
- Administrators can set up automatic messages that are generated when specific records are updated throughout the system.
- Users can subscribe to receive email notifications when new messages are posted.
- Users who take advantage of the accessibility options in the platform can tab through a live feed to navigate.

Live feed includes different types of feeds.
Note: Live Feed v2 is active for all new instances by default. If you are upgrading from an earlier version of ServiceNow, you need to activate live feed v2 to use these features.

Live feed can be domain separated at the data level only. For more information on live feed and domain separation, see Domain separation in Live Feed.

Live Feed browser support

The Live Feed v2 plugin does not support Internet Explorer 7 through 9.

Users who access the instance from those browser versions can use Live Feed v1 functionality. Users who access the instance from browsers that are compatible with HTML5 can use Live Feed v2 functionality.

Activate Live Feed

Live Feed is active for all instances. An administrator can activate the Live Feed plugin if it is not already active.

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise they will receive the following error: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Administrator live feed

Administrators and users with the live_feed_admin role can configure live feed security and provide access to live feed from content management pages. Administrators can also set up live feed table notifications.

Document feeds

A document feed is a live feed group that is associated with a record, such as an incident or change.

Document feeds allow users to work on tasks and other records through the live feed interface. Users can post messages in live feed that are automatically maintained as comments or work notes on the record, if the record has these journal fields.

The benefits of using document feeds include the following.

- Improving communication between users working on the same record.
- Improving visibility into progress for end users.
- Providing a single place to see updates on multiple records.
- Saving conversation history in the record so that knowledge is not lost in an email chain.

To use document feeds, activate the Live Feed Document plugin, which is active by default in new instances. See Use live feed to work on records to learn how to use this feature.

The system automatically creates a document group for the feed when a user follows or shows a record on live feed. The system also creates a document group when a user creates a new record on a table that has live feed enabled.
The following list describes features of the document feed group.

- Is unlisted; it does not appear when users view all groups on live feed.
- Automatically approves membership for every user who can access the record.
- Uses the record number as the group name.
- Uses the record short description as a group description.
- Maintains all messages posted to live feed on the record, if the record has a journal field for comments. If the record has a standard text field for comments, each live post overwrites the field value.
- Maintains all messages posted on the record in live feed if the record has a journal field for comments. When the group is created, existing messages are added to the document feed.

A user who participates in live feed becomes a member of the group.

**Add a live feed UI action on a table**

You can add UI actions on a table to allow users to follow records in live feed.

Role required: ui_action_admin or admin

1. Navigate to System Definition > UI Actions.
2. Open one of the live feed UI actions, for example, the Follow on Live Feed list UI action.
3. In the Table field, select the table name.
4. Right-click the header and select Insert to create a copy of the UI action for the desired table.
5. Repeat steps 1 – 4 for all live feed UI actions.

**Configure document feeds**

You can configure a table to support document feeds.

Role required: personalize_dictionary or admin

Configuring a table to support document feeds includes the following steps:

1. Add live feed to a form header.
2. Add Follow on Live Feed and Show Live Feed as list and form UI actions.

**Security configuration for document feeds**

Document feeds honor the access control rules (ACLs) for the associated record. Users can only view messages on the document feed if they have access to the same information on the record.

Consider the following examples.

- If an ACL allows a user to read and create comments on an incident, then the user can view and add messages posted as comments on the incident feed.
- If an ACL restricts a user from reading work notes, then the user cannot view messages posted as work notes on the incident feed.

**Note:** Access control rules are only checked when a user first accesses the document feed. After users view the feed, an administrator must remove them manually to change their access.

**Disable a record feed**

You can disable live feed functionality from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to System Definition > Dictionary.
2. Open the dictionary entry for the table.
3. Add `live_feed=false` in the `Attributes` field.
4. Click **Update**.

**Note**: If the Collaboration feature is activated, you can remove the show live feed icon (🔒) from all form headers. Set the `glide.live_feed.task_header_button` property to `collaboration`.

### Disable a document feed

You can disable a document feed from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to **System Definition > Tables**.
2. Open the table record.
3. Clear the **Live feed** check box.
4. Click **Update**.

### Business rule installed with Live Feed Document

This business rule is installed with Live Feed Document. There are no tables, roles, or notifications installed with it.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Feed integration</td>
<td>Writes journal comments to the live feed if there is a group for this record.</td>
</tr>
</tbody>
</table>

### Record feeds

A record feed is a live feed group that is associated with a record, such as an incident or change.

Record feeds allow users to work on tasks and other records through the live feed interface. Users can post messages in live feed that are automatically maintained as comments or work notes on the record if the record has these journal fields.

You can use record feeds to:

- Improve communication between users working on the same record.
- Improve visibility into progress for end users.
- Provide a single place to see updates on multiple records.
- Save feed history in the record so that knowledge is not lost in an email chain.
Activate live feed document

The Live Feed Document plugin is active by default.

Administrators can enable record feeds in an instance by activating the Live Feed Document plugin, which activates the Live Feed plugin, if it is not active. For upgrades, administrators must activate the plugin.

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise they will receive the following error: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Configure record feeds

Configure a table to support record feeds. You can add the Show Live Feed button in the form header and add the UI actions Follow on Live Feed and Show Live Feed as List and Form.
By default, the Show Live Feed icon appears on the form header for all tables that extend task, including the Incident, Change Request, and Problem tables, and in the list and form context menus for all task tables.

Add live feed to a form header
Add the Live Feed button in the form header for a table.

1. Type `sys_properties.list` in the Application Navigator.
2. Open the record for `glide.live_feed.task_header_button`.
3. In the Value field, change the value to `both`.

**Note:** By default, the value is `collaboration` so that the property is supported in the Collaboration (com.glide.collaboration) plugin. Changing the value to `both` allows the system property to be supported in Collaboration and Live Feed.

4. Click Update.
5. Navigate to System Definition > Tables.
6. Open the table record.
7. If the Live feed check box does not appear on the form, configure the form layout to add the Live feed field.
8. On the form, select the Live feed check box.
9. Click Update.

Alternatively, you can add `live_feed=true` to the Attributes field in the dictionary entry for the table.

The Live Feed button appears on the overflow menu of the form header.

Add live feed to a context menu
Add live feed UI actions on a table.

1. Navigate to System Definition > UI Actions.
2. Open one of the live feed UI action, for example, Follow on Live Feed.
3. In the **Table** field, select the table name.
4. Right-click the header and select **Insert** to create a copy of the UI action for the desired table.
5. Repeat steps 1 – 4 for all live feed UI actions.

**Disable a record feed**

You can disable live feed functionality from the form of any table.

Role required: personalize_dictionary or admin

1. Navigate to **System Definition > Dictionary**.
2. Open the dictionary entry for the table.
3. Add `live_feed=false` in the **Attributes** field.
4. Click **Update**.

> **Note:** If the Collaboration feature is activated, you can remove the show live feed icon (🔒) from all form headers. Set the `glide.live_feed.task_header_button` property to `collaboration`.

**Configure security**

Record feeds honor the access control rules (ACLs) for the associated record.

Users can only view messages on the record feed if they have access to the same information on the record. For example:

- If an ACL allows a user to read and create comments on an incident, then the user can view and add messages posted as comments on the incident feed.
- If an ACL restricts a user from reading work notes, then the user cannot view messages posted as work notes on the incident feed.

> **Note:** Access control rules are only checked when a user first accesses the record feed. After users view the feed, an administrator must remove them manually to change their access.

**Live feed table notifications**

Live feed table notifications generate automatic live feed messages. The Live Feed plugin must be activated to use table notifications.

When a record is inserted or updated on a specific task table and the notification conditions are met, a message is generated and posted to the specified group or to the company feed. Table notifications are supported for all task tables and all task types by default.

Administrators and users with the `live_feed_admin` or `chat_admin` roles can set up table notifications for any table in an instance.

**Set up table notifications for task tables**

You can set up a table notification for a task table to enable automatic live feed messages.

Role required: `live_feed_admin` or `chat_admin`

1. Navigate to **Live Feed > Feed Administration > Table Notifications**.
2. Click **New** or select a notification to open it.
3. Complete the form.
### Live Table Notification fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the table for which notifications are generated.</td>
</tr>
<tr>
<td>Note:</td>
<td>The list shows only tables and database views that are in the same scope as the table notification.</td>
</tr>
<tr>
<td>Post to chat rooms</td>
<td>Select the check box to generate the notification in chat rooms that are associated with the record. This applies to task records only and requires that the Chat plugin is active.</td>
</tr>
<tr>
<td>Post to live feed</td>
<td>Select the check box to generate the notification on live feed.</td>
</tr>
<tr>
<td></td>
<td>If record feeds are not set up and the <strong>Feed group</strong> field is blank, the notification is posted to the company feed.</td>
</tr>
<tr>
<td>Record Feeds</td>
<td>Select the fields to post for record feeds.</td>
</tr>
<tr>
<td></td>
<td>This field is available only if <strong>Post to live feed</strong> is selected.</td>
</tr>
<tr>
<td>Application</td>
<td>Select the application that contains this record.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to enable the notification.</td>
</tr>
<tr>
<td>Insert</td>
<td>Select the check box to generate the notification when a record is inserted into the database.</td>
</tr>
<tr>
<td>Update</td>
<td>Select the check box to generate the notification when a record is updated.</td>
</tr>
<tr>
<td>Feed</td>
<td>Select the live feed team to which you want to post messages.</td>
</tr>
<tr>
<td></td>
<td>This field is available only if <strong>Post to live feed</strong> is selected.</td>
</tr>
<tr>
<td></td>
<td>Clear the field to post notifications on the company feed.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Create the condition that must be met to generate the notification.</td>
</tr>
<tr>
<td></td>
<td>If you add a condition statement, the system evaluates the condition first and parses the <strong>Before script</strong> field only if the condition is met. You may choose to leave this field blank and include conditions in the script.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description of the table notification.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Message</td>
<td>Construct the automatic message you want to generate. You can include field values as variables and a link to the record. To add a variable, position the cursor in the text and then click the field name in the Select variables field. To add a link to the record, enter ${URI} in the message text as shown in the following example.</td>
</tr>
<tr>
<td></td>
<td>High priority incident opened: ${URI}</td>
</tr>
<tr>
<td></td>
<td>Short description: ${short_description}</td>
</tr>
<tr>
<td>Note</td>
<td>For security reasons, any HTML code is automatically stripped out of a message before it is posted.</td>
</tr>
<tr>
<td>Before script</td>
<td>Create a script that runs before a notification is generated. The script runs only if the condition evaluates to true or is empty. The following variables are available in the script.</td>
</tr>
<tr>
<td></td>
<td>• current: the GlideRecord object that triggered the notification.</td>
</tr>
<tr>
<td></td>
<td>• changedFields: an ArrayList of fields changed on submit. Use changedFields.contains('fieldname') to check for change.</td>
</tr>
<tr>
<td></td>
<td>• answer: set answer to false to cancel the notification.</td>
</tr>
<tr>
<td></td>
<td>• profileSource: set to a valid GlideRecord object to define the profile that is posting the message.</td>
</tr>
<tr>
<td></td>
<td>• profileID: set to a live_profile sys_id to define the profile that is posting the message; by default it is the current record. Overrides profileSource if both are specified.</td>
</tr>
<tr>
<td></td>
<td>Any custom variable created in the script is also exposed to the message in the form of ${myVariableName}.</td>
</tr>
</tbody>
</table>

4. Click Submit or Update.

Set up table notifications for non-task tables

Table notifications are supported for all task tables by default, and you can set up a table notification for any other table.

Role required: live_feed_admin or chat_admin

1. Navigate to System Definition > Business Rules.
2. Open the live feed events business rule.
3. In the Advanced section, select and copy the text in the Script field.
4. Click the back arrow on the top, left to exit the record and return to the Business Rules list.
5. Click New.
6. Enter the following values at the top of the form.
• **Name**: Enter a name, such as *live feed events for my table*.
• **Table**: Select the table for which you are setting up a notification.
• **Active** and **Advanced**: Select these check boxes.

7. In the **When to run** section, enter the following values.
   • **When**: Select *before*.
   • **Insert**, **Update**, and **Delete**: Select the check boxes.

8. In the **Advanced** section, paste the script from the *live feed events* business rule into the script box.
9. Click **Submit**.
   The *live feed events* business rule runs on the non-task table. It fires the *live_feed.update* event, which is associated with the **Live Feed Update** script action. The script action sets up variables and processes the table notifications.

After saving the business rule, create a *live feed table notification record* for the new table as you would for a task table.

**Live feed table notification examples**

The following examples demonstrate how to set up different types of table notifications that are useful for live feed. 

*Workaround posted*

This example demonstrates a table notification that generates an automatic message on live feed whenever a workaround is added to an open problem.

• **Table**: Problem [problem]
• **Active**: Select the check box.
• **Update**: Select the check box.
• **Post to live feed**: Select the check box.
• **Conditions**: [State] [is] [Open]
• **Description**: Workaround Posted
• **Message**:

    ${sys_updated_by} posted a workaround for ${URI}.
    Short description: ${short_description}

• **Before script**:

    `// only post to live feed when the Workaround field changes
    answer  = changedFields. contains ( "work_around" ) ;`
Example workaround message

**Problem resolved (advanced)**
This advanced example demonstrates a table notification that generates an automatic message on live feed whenever a problem is closed.

It also adds a message about the assigned user and posts the message from the assignment group profile instead of the problem record.

- **Table:** Problem [problem]
- **Active:** Select the check box.
- **Update:** Select the check box.
- **Post to live feed:** Select the check box.
- **Conditions:** [Problem State] [is] [Closed/Resolved]
- **Description:** Problem Resolved
- **Message:**

```
Problem ${number} - ${short_description} has been resolved. ${fixedByMsg}
```

- **Before script:**

```
//cancel if we didn't just change the problem state if (!changedFields.contains("problem_state") )
answer = false ;
```
Example problem resolved message

Opportunity won (non-task)
This example demonstrates a table notification on a non-task table. It generates an automatic message on live feed whenever a sales opportunity is won, if you have activated the Sales Force Automation plugin.
Create a **business rule** on the Opportunity [sales_opportunity] table that matches the **live feed events** business rule on the task table.

Create a table notification with the following values:

- **Table**: Opportunity [sales_opportunity]
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions**: [State] [is] [Closed Won]
- **Description**: Opportunity won
- **Message**:

```plaintext
$\{owner\} closed a sale with $\{account\}!
```

- **Before script**:

```plaintext
// make the message appear to come from the assigned salesperson if there is one if (!current. owner. nil () )
profileSource = current. owner. getRefRecord () ; // need GlideRecord object
```

**Example opportunity won message**

**Related feeds table notification**

This example demonstrates table notifications to be sent out to related feeds.
For this example, whenever the status of a story changes to **Complete**, a table notification message is sent to the related sprint, release, or epic. Messages are posted only if the related feed already exists; this notification does not create a new feed.

- **Table**: Story [rm_story]
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Record feeds**: Move Sprint, Release, and Epic to the **Selected** column.
- **Conditions**: [State] [changes to] [Complete]
- **Description**: Story is done; message to Epic, Release, and Sprint
- **Message**: 

```
${URI} status changed to ${state}
```

### Live feed security and table access

By default, administrators and users with the live_feed_admin role can configure live feed security and view all live feed tables.

You can also modify the following live feed tables.

- Live Table Notification [live_table_notification]: set up automatic messages that are generated when specific records are updated throughout the system.
- Live Feed Message [live_message]: modify only if necessary, such as to delete an inappropriate message or restore a message that a user accidentally deleted. This table is typically managed by system functionality.

Extending or modifying data in any live feed chat table is not recommended.

### Domain separation in Live Feed

This is an overview of domain separation and Live Feed. With domain separation you can separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Support level: Standard**

- Includes **Basic** level support.
- **Business logic**: Processes can be created or modified per customer by the service provider (SP). The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The owner of the instance needs to be able to configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Use case: An admin needs to be able to make comments mandatory when a record closes for one tenant, but not for another.

Parent and child domains define the live feed content that can be viewed and shared with other users.

- A user in a parent domain can see users and content within their domain and within all child domains that are lower in the domain hierarchy.
- A user in a child domain can see users and content within their domain but cannot see the parent domain or other child domains at the same level in the domain hierarchy.
Enable domain separation for live feed

Domain separation for the Live Feed application is available starting with the Eureka release. For users upgrading to Eureka, a sys_domain column is added to existing live feed-related database tables. For existing database records, the value of the sys_domain field is set to empty (global). This allows the domain separation feature to work with existing live feed records.

Show or hide the live feed application for a domain

The administrator can live feed visibility for a domain. This includes:
- Displaying live feed in the application navigator.
- Following a document feed for a record.
- Viewing live feed from a record.

Use live feed with domain separation

All of the live feed features are available to users within a domain and work the same way, with some exceptions to visibility.

- **Posting and sharing content**
  - Users in a child domain can interact with other users in the same domain. This includes posting and replying to messages, deleting messages, attaching files and links, and rating content.
  - Users in a parent domain can interact with other users in the same domain and with users in any child domains. Messages that are added to child threads by parent users are given the visibility of the child domain, not the parent domain.

- **Viewing content**
  - Users in a child domain can view content that resides within their domain. This includes filtering by feed, sorting, searching, and viewing older messages.
  - Users in a parent domain can view content that resides within their domain and within any child domains.
  - My Feed shows messages, teams, and hashtags based on the user's domain. Showing another user's feed only shows posts visible in the current user's domain.

- **Using hashtags**
  - Hashtags are separated by domain. Users in a child domain can use all of the hashtag functions within their domain. This includes tagging messages, viewing available hashtags, changing hashtag names, and searching and filtering by hashtag.
  - Users in a parent domain can use all of the hashtag functions within their domain and can see hashtags in any child domains.

- **Using teams**
  - Teams are separated across domains. Users in a child domain can join and follow teams within their domain, and can invite other users within their domain to join teams.
  - Users in a parent domain can join and follow teams that belong to their domain or to any child domains.

- **Exceptions to teams**
  - New teams are created in the user's domain. However, if the team has a record associated with it, the team is created in record's domain.
  - New threads in an existing team are created in the domain of the existing team.
• When a user is creating a new team from a document, if the document domain is not empty or global, the team
domain needs to be changed to be the document’s domain.
• For a document-generated team, when the domain of the document changes, the domain of all related live feed
records changes as well.

• **Subscribing to email notifications**
  • Users can subscribe to email notifications from users and teams within their domain only.

**Limit live feed access by role**

All active users in the instance have access to live feed by default.

live_feed_admin and admin

1. Complete the following steps to define the roles that allow users to see the Live Feed module.
   a) Perform the appropriate action for your version of the UI:
      • UI16: Navigate to **System Definition > Application Menus > Live Feed** and select **Live Feed**.
      • UI15: Right-click the icon beside the Live Feed module and select **Edit Module**.
   b) Enter the roles that have access in the **Roles** field.
   c) Click **Update**.

2. Complete the following steps to define the roles that allow users to see live feed from a mobile device.
   a) Navigate to **System Definition > Applications (Mobile)**.
   b) Click **Live Feed**.
   c) Enter the roles that have access in the **Roles** field.
   d) Click **Update**.

3. Use the following settings in the Access Control form to create access control rules to limit who can view the
live_feed pages.
   • **Type**: ui page
   • **Operation**: read
   • **Name**: create one access control rule record for each of the following pages
     • live_feed
     • live_feed_small
     • $live_feed
     • $live_feed_small
   • **Requires role**: in this related list, add roles to define who can access the live feed pages. Users who do not
     have these roles cannot access live feed.

**Manage live feed message content**

Users can remove their own messages from feeds. If necessary, administrators can remove inappropriate messages
that are posted by any user.

live_feed_admin and admin

For security reasons, any HTML code is automatically stripped out of a message before it is posted. This measure
ensures that users cannot modify any page settings by posting a message.

1. Navigate to **Live Feed > Feed Administration > Messages**.
2. Open the message to be removed.
3. In the State field, select deleted. You may need to configure the form to add this field.
4. Click Update.

Live feed team security

You can restrict who can create teams by modifying an access control rule.

Modify the following access control rule:

- **Table**: Live Group Profile [live_group_profile]
- **Operation**: create

Restrict hashtag renaming

You can restrict who can rename hashtags.

You restrict hashtag rename by modifying the following access control rule:

- **Table**: Live Tag [live_tag]
- **Operation**: write

Provide access to live feed from CMS pages

You can provide access to live feed from pages built in the Content Management System (CMS). For example, allow an end user to access your company feed via the ESS portal.

Role required: content_admin or admin

The ESS Portal template includes the **Portal - Live page** and **Live Feed** dynamic blocks. To provide access to live feed from CMS pages, add the Live Feed dynamic block to a CMS page or include **Portal - Live page** in a site.

1. Navigate to Content Management > iFrames.
2. Click New.
3. Enter the iFrame block details.

**iFrame block fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name such as Live Frame.</td>
</tr>
<tr>
<td>Frame Name</td>
<td>Enter a frame name, such as live_frame.</td>
</tr>
<tr>
<td>URL</td>
<td><a href="https://INSTANCE/live_feed.do?sysparm_doctype=true">https://INSTANCE/live_feed.do?sysparm_doctype=true</a></td>
</tr>
<tr>
<td></td>
<td>where INSTANCE is your instance URL (example, [instance name] .service-now.com)</td>
</tr>
<tr>
<td>Sizing</td>
<td>Select Fixed Size and enter height and width pixel dimensions according to the page where you plan to display the feed (for example, width of 1024 and height of 768).</td>
</tr>
</tbody>
</table>

4. Click Submit.
5. Add the block to a page.
Components installed with live feed

Several types of components are installed with Live Feed.
Demo data is available with Live Feed.

Tables installed with live feed

Live Feed plugin installs the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link attachments</td>
<td>Stores links and attachments that are added to messages.</td>
</tr>
<tr>
<td>[live_link]</td>
<td></td>
</tr>
<tr>
<td>Live Favorite</td>
<td>Stores the favorite conversations, user groups, and messages.</td>
</tr>
<tr>
<td>[live_favorite]</td>
<td></td>
</tr>
<tr>
<td>Live Feed Searches</td>
<td>Stores live feed text searches. Access at <strong>Live Feed &gt; Feed Administration &gt; Search Log.</strong></td>
</tr>
<tr>
<td>[live_feed_search]</td>
<td></td>
</tr>
<tr>
<td>Live Follows</td>
<td>Maintains users' follow preferences for user feeds.</td>
</tr>
<tr>
<td>[live_follow]</td>
<td></td>
</tr>
<tr>
<td>Live Group Profile [live_group_profile]</td>
<td>Stores conversation properties, including name, description, and public status. Also stored are user group properties, such as name, description, and public status.</td>
</tr>
<tr>
<td>Live Group Member [live_group_member]</td>
<td>Maintains the member lists for conversation and user group.</td>
</tr>
<tr>
<td>Live Mention</td>
<td>Stores the profiles mentioned in a message. References sys_user table.</td>
</tr>
<tr>
<td>[live_mention]</td>
<td></td>
</tr>
<tr>
<td>Live Message Tag</td>
<td>Stores messages associated with user-created tags. Appears as a related list on Live Tag records.</td>
</tr>
<tr>
<td>[live_message_tag]</td>
<td></td>
</tr>
<tr>
<td>Live Messages</td>
<td>Stores messages. References sys_user table. Access at <strong>Live Feed &gt; Feed Administration &gt; Messages.</strong></td>
</tr>
<tr>
<td>[live_message]</td>
<td></td>
</tr>
<tr>
<td>Live Poll</td>
<td>Stores a poll question.</td>
</tr>
<tr>
<td>[live_poll]</td>
<td></td>
</tr>
<tr>
<td>Live Poll Cast</td>
<td>Stores profiles of users who voted for a particular option in a poll.</td>
</tr>
<tr>
<td>[live_poll_cast]</td>
<td></td>
</tr>
<tr>
<td>Live Poll Options</td>
<td>Stores poll options.</td>
</tr>
<tr>
<td>[live_poll_option]</td>
<td></td>
</tr>
<tr>
<td>Live Profiles</td>
<td>Stores user live feed profiles. References sys_user table. Access at <strong>Live Feed &gt; Feed Administration &gt; Profiles.</strong></td>
</tr>
<tr>
<td>[live_profile]</td>
<td></td>
</tr>
<tr>
<td>Live Table Notification</td>
<td>Generates automatic table notifications, such as when a user reads live feed for the first time and when a high priority incident is opened. Access at <strong>Live Feed &gt; Feed Administration &gt; Table Notifications.</strong></td>
</tr>
<tr>
<td>[live_table_notification]</td>
<td></td>
</tr>
</tbody>
</table>
### Live Tag

Maintains user-created tags. Access at **Live Feed > Feed Administration > Tags.**

### Live Tag Follows

Maintains users' follow preferences for tags.

### Messages Liked by

Maintains like ratings for posts. Access at **Live Feed > Feed Administration > Likes.**

### User roles installed with Live Feed

Live Feed plugin installs the following user roles.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>live_feed_admin</td>
<td>Can manage live feed functions. For example, users with the live_feed_admin role can:</td>
</tr>
<tr>
<td></td>
<td>• <em>Set up table notifications for task tables.</em></td>
</tr>
<tr>
<td></td>
<td>• <em>Set up table notifications for non-task tables.</em></td>
</tr>
<tr>
<td></td>
<td>• <em>Limit live feed access by role.</em></td>
</tr>
<tr>
<td></td>
<td>• <em>Manage live feed message content.</em></td>
</tr>
<tr>
<td>chat_admin</td>
<td>Can manage chat functions (if the Chat plugin is activated). For example, users with the chat_admin role can:</td>
</tr>
<tr>
<td></td>
<td>• <em>Change chat room message read access.</em></td>
</tr>
<tr>
<td></td>
<td>• <em>Define chat room access rights.</em></td>
</tr>
</tbody>
</table>

### Script includes installed with Live Feed

Live Feed plugin installs the following script includes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LiveMsgUtil</td>
<td>Provides helper functions for working with live_message records.</td>
</tr>
<tr>
<td>LiveFeedFilter</td>
<td>Queries filters for working with live_feed records.</td>
</tr>
<tr>
<td>LiveFeedUtil</td>
<td>Provides helper functions for working with live_feed records.</td>
</tr>
</tbody>
</table>

### Business rules installed with Live Feed

Live Feed plugin installs the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feed Group Creator Becomes Admin</td>
<td>Live Group Profile</td>
<td>Designates the group creator as the group administrator.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>live feed events</td>
<td>Task</td>
<td>Runs on task insert, update, and delete. Triggers event associated with the Live Feed Update Script action that processes Live Table Notifications to auto-generate live feed messages.</td>
</tr>
<tr>
<td>Live feed member update events</td>
<td>Live Group Member</td>
<td>Generates a notification event when member state changes (invited, accepted, declined, left, rejected, request, request_accepted).</td>
</tr>
<tr>
<td>Live feed integration</td>
<td>Journal Entry</td>
<td>Writes journal comments to the live feed if there is a group for this record.</td>
</tr>
<tr>
<td>Live feed new member events</td>
<td>Live Group Member</td>
<td>Generates a notification event when new members are added.</td>
</tr>
<tr>
<td>live feed profile events</td>
<td>Live Profile</td>
<td>Runs on live_profile insert/update/delete, triggers event associated with the Live Feed Update script action that processes Live Table Notifications to auto-generate live feed messages.</td>
</tr>
<tr>
<td>Live Feed message events</td>
<td>Live Feed Message</td>
<td>Runs on live_message, notification event trigger for new live messages.</td>
</tr>
<tr>
<td>Live message like events</td>
<td>Message Liked by</td>
<td>Runs on live_message_like, notification event trigger for new like records.</td>
</tr>
<tr>
<td>LiveFeed Group Member Visibility 2.0</td>
<td>Live Group Member</td>
<td>Ensures users can only see the members list for public groups and groups they belong to.</td>
</tr>
<tr>
<td>LiveFeed Group Profile Validation</td>
<td>Live Group Profile</td>
<td>Ensures that a public group is visible.</td>
</tr>
<tr>
<td>LiveFeed Group Profile Visibility 2.0</td>
<td>Live Group Profile</td>
<td>Ensures that the list of all groups only displays public groups, private groups that are visible, and groups the user belongs to.</td>
</tr>
<tr>
<td>LiveFeed Membership Changes</td>
<td>Live Group Member</td>
<td>Enforces that only the group administrator and users with live_feed_admin role can manage membership for a group.</td>
</tr>
<tr>
<td>LiveFeed Single Group Membership</td>
<td>Live Group Member</td>
<td>Ensures that a user is not added multiple times to the same group.</td>
</tr>
<tr>
<td>Live Message Likes</td>
<td>Live Message Like</td>
<td>Updates the number of likes for a message.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>LiveFeed Join Group Check</td>
<td>Live Group Member [live_group_member]</td>
<td>Ensures that users can not automatically join private visible groups.</td>
</tr>
<tr>
<td>Update Follow/Follower Counts</td>
<td>Live Follow [live_follow]</td>
<td>Updates the following/followers counts.</td>
</tr>
<tr>
<td>Live Feed Group</td>
<td>Assessable Record [asmt_assessable_record]</td>
<td>Creates/Deletes a live feed group for an assessable record</td>
</tr>
<tr>
<td>Live Feed Message Visibility</td>
<td>Live Feed Message [live_message]</td>
<td>Ensures user's access to live feed messages</td>
</tr>
</tbody>
</table>

### Email notifications installed with Live Feed

Live Feed plugin installs the following email notifications.

<table>
<thead>
<tr>
<th>Email notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Feed Feed Member Accepted</td>
<td>Sends an email to the administrator when a user has accepted to join the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Declined</td>
<td>Sends an email to the administrator when a user has declined to join the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Invited</td>
<td>Sends an email to a user when they have been invited to join a feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Left</td>
<td>Sends an email to the administrators when a user has left the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Removed</td>
<td>Sends an email to user when they have been removed from the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Request</td>
<td>Sends an email to administrators when an user requests to join a feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Request Accepted</td>
<td>Sends an email to the user when their request to join a feed is accepted.</td>
</tr>
<tr>
<td>Live Feed Feed Request Rejected</td>
<td>Sends an email to the user when their request to join a feed has been rejected by an administrator.</td>
</tr>
<tr>
<td>Live Feed MsgReply Subscription</td>
<td>Sends an email when a reply or reply_to_reply message is inserted into the thread of a message in a feed.</td>
</tr>
<tr>
<td>Live Feed Team Member Accepted</td>
<td>Sends an email to administrators when a user accepts an invitation to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Declined</td>
<td>Sends an email to administrators when a user declines an invitation to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Invited</td>

</tbody>
</table>

**Use Live Feed**

Live Feed provides many methods you can use to share content with others in your organization.

Depending on your role, there are several different types of feeds you can access, teams you can join and share information with, and hashtags you can use for categorizing messages.
Example image
Note: Live Feed v2 is active for all new instances by default. If you are upgrading from an earlier version of ServiceNow, you need to activate Live Feed v2 to use these features.

Use hashtags in Live Feed

Hashtags are words marked with a hash symbol (#) in messages. Hashtags are a way to categorize messages by keyword or topic for improved search results.

For example, to identify messages associated with VPN questions, add the hashtag #VPN in the message text.

Note: Many of these features are part of live feed v2. If you are using live feed v1, or have not activated live feed v2, see Legacy Live Feed.

Tag messages

To tag a keyword or topic in a message, enter a # symbol before the word. A link to the hashtag is added beneath the message and all feed users can search and filter by the hashtag to find the message.

Tips for using hashtags effectively include:

- Limit the number of hashtags per message (no more than 3 is a good guideline).
- Use hashtags only in messages that are relevant to the tagged topic.
- Write a message first, and then add hashtags only if they add value. Answer the question, "What are you working on?", rather than "What hashtags apply to what you are working on?"
- Use camel case to create a hashtag that is more than one word long. For camel case, remove the space and use an uppercase letter to start each word. For example, to create a topic about the service desk, use #ServiceDesk.
Tag

View an available hashtag

View a hashtag from any feed.

1. Navigate to Live Feed > Live Feed.
2. Click Hashtags in the sidebar.
   Any hashtags already defined are displayed. Up to 36 hashtags can be displayed, and options are available for searching and sorting the hashtags. When searching, you do not need to include the hash symbol (#).
3. Click a hashtag to view all messages containing that hashtag.

Change a hashtag name and merge a hashtag

Over time, users may create many hashtags with similar names, such as competitive, competitor, and competition. To combine hashtags for better searching and filtering, change the names of similar hashtags to a standard name.

Administrators can restrict who can rename hashtags.

1. Navigate to Live Feed > Live Feed.
2. Click Hashtags in the sidebar to reveal the currently defined hashtags.
3. Turn off the filter to show all hashtags.
4. Point to the hashtag you want to change. If you have the rights to edit hashtags, an edit tag (📝) appears.
5. Click the edit tag icon.

### Hashtags

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>2. Lync</td>
<td>1. VPN</td>
<td>1. SAP</td>
<td>1. MacBook</td>
<td>1. Excel</td>
</tr>
</tbody>
</table>

6. Enter a new hashtag name.
7. Press Enter.
   - If the new name is different than the other hashtags, the new hashtag name replaces the old hashtag name on the list and in the text of any messages that include the hashtag.
   - If the name is the same as one of the existing hashtags, the hashtags will be merged. For example, if you have two hashtags called **Competitive** and **Competitors**, and you change the name of **Competitors** to **Competitive**, all of the messages previously tagged **Competitors** are changed to **Competitive** and the **Competitors** hashtag is removed.

**Note:** If a hashtag is removed from the message, renaming that hashtag does not change the message text.

### Add an image to a hashtag

You can add an image at the domain level of already defined hashtags if you have the admin role.

1. Click Hashtags in the sidebar.
2. Select the appropriate hashtag.

### #VPN Feed

3. Do one of the following:
   - Locate the image in your file system, and then drag-and-drop the image onto the add an image icon (🖼).
   - Click the add an image icon (🖼), select the image file, and click Open.
4. To change the image, simply drag-and-drop a new image onto the old one, or click on the existing one and select a new image.

When you view a message that contains a hashtag with an image, that image appears in the hashtag heading bar.

![Message with tag icon](image)

**Follow and unfollow a hashtag**

You can view all postings assigned a specific hashtag by following the hashtag. You can also unfollow the hashtag if you no longer want to view those postings.

1. Navigate to **Live Feed** > **Live Feed**.
2. Click **Hashtags** in the sidebar.
3. Select the hashtag you want to follow.
4. Click **Follow**.
Follow tag

A confirmation message appears.

5. **Click X** to dismiss the message.

To unfollow a hashtag, repeat the same steps and click **Unfollow**.

**Bookmark hashtags**

The live feed interface uses the standard bookmarking functionality for hashtags.

In UI15, the live feed interface uses the standard *bookmarking functionality* for hashtags. You can drag-and-drop group feeds and hashtags from the Feed Summary section to the Edge for quick access.
Bookmark hashtag

Remove a hashtag from a posted message

As a participant in a conversation, you can remove hashtags from messages that have already been posted.

1. Navigate to the posted message.
2. Click Hashtags in the message posting.

The hashtags associated with the message are displayed, along with the removal icon.
Remove tag

3. Click the removal icon.

Use teams in Live Feed

Users can be combined into teams for the purpose of subscribing to specifically-focused feeds.

Teams can be created based on any criteria that makes sense for your organization. For example, you can create a team called IT Developers and subscribe the team to feeds such as Coding Standards, AngularJS Development, and ServiceNow Customization Best Practices. When a new developer is added to the IT Developers team, that user automatically has rights to participate in all of the feeds followed by the team.

Create a live feed team

When you create a team, you become the team administrator.

As team administrator, you can:

• Modify team properties
• Accept or reject membership requests
• Remove members from the team
• Delete the team

1. Navigate to Live Feed > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. Click Create Team.

4. Enter a Name to appear at the top of the feed and in messages posted to the team. This name links to the team feed.

5. Enter a Description to appear at the top of the feed and under the team name in the list of all teams.
6. Select the access level for the team:
   - **Public Team**: In the list of all teams, any user can see the name of this team. Any user can also see the feed and join the team. Messages in a public team appear in the Company Feed with a link to the team feed.
   - **Private Team**: In the list of all teams, any user can see the name of this team, but not the feed. Messages in private teams do not appear on the Company Feed.

   When Private Team is selected, the **Show this team for anyone to find and request to join** check box is displayed. Select this check box to allow any user to search for this team and request to join it. Clear the check box to allow only invited users to see the feed and join the team.

7. Click **Create**.
   The team is created with you as the team administrator.

---

**Documentation**

Users interested in finding ways to improve the product documentation

<table>
<thead>
<tr>
<th>Members</th>
<th>Pending members</th>
<th>Feeds</th>
</tr>
</thead>
</table>

**Administrators**

- **System Administrator**

**Members**

- No active members.

---

**Note**: A team administrator can create one or more group feeds specifically for the members of this team by clicking the **Group Feeds** tab and **Create Group Feed**. Additionally, the team can be invited to join a feed. Having multiple feeds for the team facilitates focused discussions on topics of interest to the team and allows the team to selectively invite other teams and members to collaborate on specific feeds.

---

**Automatic team creation**

If you create a record on a table that has live feed enabled, such as the Incident table, and click Follow/Show Live Feed for the record, a record feed is created for the record.

The record feed name is based on the table name.
Join a team

You can join a public team, accept an invitation, or request access to a team.

As a team member, you can:

• **View messages** posted to the team (team feed). Non-members can also view the feed for a public team.
• **View a list of team members.**
• **Invite another team** to join the team.
• **Subscribe to team email notifications.**
• **Leave** the team.

1. Navigate to **Live Feed > Live Feed**.
2. Click **Teams** and click **All Teams**.
   - If you received an invitation, click **Accept**. You can **Decline** the invitation if you do not want to join the team.
   - If the team is public, click **Join**.
   - If the team is private, click **Request**. The team administrator receives an email notification and must accept your request before you can join the team.

View a team feed

View a team feed to see messages belonging to that team.

1. Navigate to **Live Feed > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
   - To view a team you belong to, select the team name.
   - To view a public team you do not belong to, select **All Teams** and then click the team name.
     You must be a member to view the feed for a private team.

View a team member

View a list of members belonging to a live feed team.

1. Navigate to **Live Feed > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
   You must be a member of the team to view the members.
4. Click **Members**.
   The list of team members appears, organized by team administrators and team members.

Invite a new member

You can invite another user to join a team.

1. Navigate to **Live Feed > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the **Pending members** tab.
5. In the **Add User** field, enter the name of the user you want to invite. The invited member's picture appears.
Remove a member

If you are team administrator, you can remove any member from the team.

1. Navigate to **Live Feed > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the **Members** tab.
5. Click **Remove** below the member name.
6. Click **Remove** again in the confirmation box that opens.

**Note:** You can remove members regardless of their current state. That is, you can remove members who have already joined the team or whose membership is pending.

**Subscribe to team and email notification**

Users can subscribe and unsubscribe to receive email notifications generated by feeds the team participates in.

Email notifications are generated whenever actions such as posting messages, replies, likes, polls, and @mentions are performed.

All notifications related to a top-level message, such as replies, mentions, and likes, are sent out with the same subject. The subject line defaults to **Live Feed** followed by the beginning of the subject line from the top-level message. For example, if the subject of the feed is **IT Support**, the email notification's subject will be **Live Feed IT Support**.

1. Navigate to **Live Feed > Live Feed**.
2. Click **Teams** and select the team name.
3. Click the subscribe icon ( ).
You can click the unsubscribe icon ( ) to stop receiving email notifications.

Subscribe a team to feed notification

A team administrator can subscribe a team to specific feeds so the members of the team receive email notifications.

1. Navigate to Live Feed > Live Feed.
2. Click Teams and select the team name. You can use the advanced search to locate team of which you are the administrator.
3. Click Feeds.
4. Click the subscribe icon ( ) beside the feed name.

You can click the unsubscribe icon ( ) to stop receiving email notifications.

Reply to email notifications using email

After receiving an email about a posted message or a reply, you can reply to live feed with your email client.

The body of the reply email becomes a reply to the live feed message. Any attachments included in your reply email are included in the live feed reply.

Leave a team

You can give up membership to a team by leaving that team.

1. Navigate to Live Feed > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. Click Leave beside the team name.

Modify a team

If you are team administrator, you can modify an existing team.

1. Navigate to Live Feed > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
4. Click the edit icon ( ).
5. Modify the team properties as needed.
6. Click Save.

Manage a membership request

When a user requests membership to a private team, the team administrator receives an email.

If you are the team administrator, you can manage membership requests.

1. Navigate to Live Feed > Live Feed.
2. Click Teams and select the team name.
   If one or more users have been invited to the team, the Pending members tab shows the number of invitations sent.
Pending members

3. **Click Pending members.**

   This shows the users who have received invitations, but who have not yet accepted.
Invited members

4. You can cancel a user’s invitation by clicking **Remove**.
5. You can invite another user to the team by entering their name in the **Add user** field and clicking the **Invite member** button.

Delete a team

If you are the team administrator, you can delete a team.

1. Navigate to **Live Feed** > **Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the edit icon ( ).
5. Click **Delete**.
6. Click **Yes** to confirm deletion.

   The team is deleted from live feed. Messages posted to a private team are deleted; messages posted to a public team remain on the company feed without a team link.

   If you delete a team that is associated with an active record, such as an incident that has not yet been closed, the team becomes active again when any user modifies that record or follows the record on live feed. The first user who modifies the record becomes the team administrator. The previous messages that existed as part of the record feed are not deleted.

**Use live feed to work on records**

A record feed is associated with a record, such as an incident or change.

Record feeds help users collaborate on records by providing a place for anyone who can access the record to share messages and post attachments specific to that record.

With record feeds, users can:

- Follow record feeds and post messages in live feed. These messages can also be automatically maintained in the comments or work notes journal fields on records.
- View live feed from records.
- Work on multiple records from **My Feed**.
- Access live feed team functions, such as sending invitations and subscribing to email notifications.

Any users with access to the record can also use the record feed. By default, record feeds are available on the incident, change, and problem tables. Administrators can configure record feeds for additional tables.
Live Feed Document

**How Document Feeds Work**

The Live Feed application creates a document group for each document feed. The document group:

- Automatically approves membership for every user who can access the record.
- Uses the record number as the group name.
- Uses the record short description as a group description.
• Maintains all messages posted on the record in live feed (if the record has a journal field for comments). When the group is created, existing messages are added to the document feed.
• Lists the group when users select View all groups on their live feed interface, unless the record associated with the document feed has been closed. When the state of the record is closed, the live feed group becomes inactive and unlisted.
• Automatically adds users to the document group when they view the record.

Document Group Creation

When a user follows or shows a record on live feed, a live feed group is automatically created and associated to the record (if one does not already exist). The user becomes a member of the group and can use live feed to work on the record. If the user can access work notes on the record, the user also becomes a group administrator.

A live feed group is also automatically created when a user creates a record on a table that uses document feeds, such as the Incident table. The user who creates the record becomes the administrator of the group, and any other user who modifies the same record automatically joins the group.

Add Live Feed to a homepage

Add live feed to a homepage so it is the first thing you see when you log in.

1. Click Add content at the top of the homepage.
2. Select Live Feed in the left panel.
3. On the bottom of the window, click Add here in the appropriate layout position, then close the window.

Note: Administrators can add live feed to a global homepage to make it available for all homepage users by default. By default, users with any role can add live feed to their homepage. Administrators can restrict this ability.
Modifying and deleting document feeds

The user who creates a record feed becomes the group administrator, which allows the user to modify the following record feed properties.

- **Name**: default value is the record number.
- **Description**: default value is the record short description.
- **Picture**: default value is a thumbnail image of the record.

Feed administrators can also delete the feed. When deleted, the feed is removed from live feed but messages remain in the journal field of the associated record.

Viewing Live Feed from records

Interact with the record feed in any form that has live feed enabled.
The record feed appears in a pop-up window. The record feed also appears on the record form’s activity formatter if the administrator enables the record feed system property (glide.ui.show_live_feed_activity).

To access a record feed from the form, do one of the following:

- Click the **Show Live Feed** button in the form header. This displays the live feed pop-up.
- Right-click the form header and select **Show Live Feed**. This also displays the live feed pop-up.
- Scroll down to the activity formatter area on the form. Click one of the following tabs:
  - **Live Feed**: click to show a text box to type in the feed.
  - **Activity**: click to show the activity summary. The activity filter determines the content in the activity summary.
If the activity formatter or the Live Feed and Activity tabs are not visible, administrators can do the following:

- Configure the form layout and add Activities (filtered) to the form. This adds the activity formatter.
- Personalize the form layout and add Activities (filtered) to the form. This adds the activity formatter.
- Go to System Definition > Tables, access the table associated with the record, and verify that the live_feed dictionary attribute is set to true on the form. This adds live feed to the activity formatter.
• Go to Live Feed > Feed Administration > Properties and enable the following property: **Toggle the display of the live feed tab in the activity formatter**

**Working with record feeds**

When a user follows a record, the user becomes a member of a private group for the record.

Team members can:

• View the record feed from live feed.
• View a list of group members (other users who are following the record).
• Invite another user to join the group. Only users who have access to the record have access to the record feed.
• Subscribe to email notifications.
• Leave the team to stop following the record.

*Follow a record feed from a form*

You can follow records that have a record feed associated with them from within the record form.

1. Navigate to the record in a list or form.
2. Click the **Show on Live Feed** icon in the header.
Follow Task

Follow a record feed from a list
You can follow records that have a record feed associated with them when viewing a list of records. This method allows you to select multiple records to follow.

1. Navigate to a list of records (for example, Assigned to me).
2. Select the Action check box beside each record to follow.
3. In the Actions choice list, select Follow on Live Feed.
Follow My Tasks

*Post a message to a record feed*

Use live feed to post a message to a record feed.

1. Open the record feed in one of the following ways:
   - From your homepage (must already be following the record)
   - As a team in live feed (must already be following the record)
   - From My Live Feed (must already be following the record)
   - From the **Live Feed** pop-up window
   - From the **Live Feed** tab on the activity formatter
   - Click the **Show Live Feed** button

2. Compose the message and add images and links.

3. [My Live Feed only] In the To list, select the record where you want to post the message.

4. [Optional] Select the **Work Notes** check box to post the message as a work note. Only users with access to work notes on the record can post and see work notes. This option is only available for records that have a journal field.

5. Click **Post**.

**Note:** If the record has journal fields for comments or work notes, your message is automatically added to the appropriate field on the record. If the record has a standard text field for comments on the
activity formatter, each live post overwrites the field value. Comments added through live feed start with #LiveFeed on the activity formatter.

Use feeds in Live Feed

Feeds allow users to create focused discussions in Live Feed.

Live feed includes different types of feeds. The user who creates a group or record feed becomes the feed administrator. This user configures the access level for the feed:

- **Public**: any user can see the name on the list of all feeds, view the feed, and join it. Messages appear on the company feed with a link to the public feed.
- **Private**: any user can see the name on the list of all feeds, but only invited members can view the feed and join. Messages do not appear on the company feed.

Note: The concept of groups has changed in live feed v2 (starting with the Fuji release).

Create a group feed

Group feeds are created by users so that members with similar interests can find that information in one place. Individual users or teams can join group feeds.

1. Navigate to Live Feed > Live Feed.
2. Click Group Feeds and click All Feeds.
3. Click Create Group Feed.

Create group feed

4. Enter the feed name and description. These will appear in the list of group feeds.
5. Indicate how members can join the feed:
   - **Public Feed**: Select this to allow anyone to view and join the group feed.
   - **Private Feed**: Select this to restrict membership to only members invited by the administrator.
When Private Feed is selected, the Show this feed for anyone to find and request to join check box is displayed. If it is selected, any user can search for this group feed and join it. If the check box is not selected, only users who are invited can see the feed and join the group feed.

6. Click Create.

Create record feeds

When a user views a record on a table that has live feed enabled, such as the Incident [incident] table, the user can click the Show live feed button at the top of the form to automatically create a record feed.

When a user who has write access to a record's work_notes journal field clicks the Show live feed button, that user becomes the record feed administrator. If, for example, a customer calls technical support to report an incident and the customer clicks Show live feed on a record, a record feed is created, but the customer is not the record feed administrator. When a support representative later opens the incident and participates in the record feed, the user becomes the feed administrator.

Record feeds are, by default, private unlisted. That is, only invited members can see the name of the record feed in the list of feeds, and join it. Record feed administrators, however, have the ability to change the access level at any time. This can be helpful if, for example, a user is working on a sales opportunity and wants customers to be able to participate in a record feed without granting them access to the records.

Control how live feed is enabled for records

A property called glide.ui.show_live-feed_activity controls whether live feed is automatically enabled for all records.

This glide record is disabled by default. If the property is enabled, a record feed is automatically created whenever a record is viewed, and you become a member of that feed.

A second property, glide.live-feed.auto_join_document_group, enables automatic membership to a record feed whenever the associated document is visited and the user clicks Show Live Feed.

View the activity stream in record feeds

When you view record feeds, live feed displays the activity stream for the document.

For example, for an incident feed, the screen displays recent activity for the incident. The activity stream is updated whenever anything is changed in the associated record.
Live feed activity stream

**Note:** The information in the activity stream is subject to the same ACL rules as those for viewing the underlying document.
Participate in a feed

When you join a feed, you become a feed member.

Feed members can:

- **View messages** posted to the feed. Non-members can also view the messages for a public feed.
- **View a list of feed members.**
- Invite another user to join the feed.
- Subscribe to feed email notifications.
- **Leave the feed.**

1. Navigate to **Live Feed > Live Feed.**
2. Click either **Group Feeds** or **Record Feeds**, and then click **All Feeds.**
If you received an invitation, click Accept. You can Decline the invitation if you do not want to join the feed.

- If the feed is public, click Join.
- If the feed is private, click Request. The feed administrator receives an email notification and must accept your request before you can join the feed.

Mark a feed as a favorite

Top-level messages in feeds can be marked as favorites on a per user basis only.

You can also search for messages marked as favorites, and remove the favorite designation as needed.

1. Navigate to Live Feed > Live Feed.
2. Click either **Group Feeds** or **Record Feeds**, and then click **All Feeds**.
3. In the list of feeds, click the star icon (🌟) adjacent to the feed name you want to mark as a favorite.

To unfavorite a message, click the star icon (🌟) of a message that is already a favorite.

View a feed

You have several options for viewing a feed.

1. Navigate to **Live Feed > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**.
   
   This displays a list of feeds you belong to and an option to view all feeds.
   
   - To view a feed you belong to, select the feed name.
   - To view a public feed you do not belong to, select **Show All** and then click the feed name. You must be a member to view the feed for a private feed.

**Note**: If you navigate away from the live feed application and then back again, the system displays the feed you last visited if you are a member of it.

View a feed member

View a specific member of a group feed.

1. Navigate to **Live Feed > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**.
   
   This displays a list of feeds you belong to and an option to view all feeds.
3. Click the feed name.
   
   The list of feed members appears, organized by feed administrators and members.

Invite a new member to a group feed

The feed administrator can invite another user or a group to join a feed.

When a team is added to a feed, all members of the team also indirectly become members of the feed. Only users, and not teams, can be the feed administrators. A team member who is following a feed can become administrator by directly inviting another user to the feed.

1. Navigate to **Live Feed > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click the **Pending members** tab.
4. In the **Add user or team** field, begin entering a user or team name and select a user or team from the suggestion list.
   
   The invited user or team members receive an email notification.

Invite a new member to a record feed

The feed administrator can invite another user or a team to join a record feed.

When a team is added, each of the individual members of the team become members of the feed. That is, if Team ABC is added to a feed, the feed does not show that Team ABC is a member. Instead, the feed shows each of the individual members of Team ABC as members of the feed.
When users are invited, their membership state is initially **Invited**. When they accept the invitation, the system checks their access to the **work_notes** journal field. If they have write access, they become administrator members; otherwise, they become active members.

1. Navigate to **Live Feed > Live Feed**.
2. Click **Record Feeds** and select the record feed name.
3. Click the **Pending members** tab.
4. In the **Add user or team** field, begin entering a user or team name and select a user or team from the suggestion list.

   If you invite a team, the individual members of the team are invited.

   The invited users receive an email notification.

**Remove a member from a feed**

The feed administrator can remove any member from the feed.

1. Navigate to **Live Feed > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click the **Members** tab.
4. Locate the member you want to remove and click **Remove**.

---

*Remove member*
Note: You can remove members regardless of their current state. That is, you can remove members who have already joined the feed or whose membership is pending.

Subscribe to a feed

Direct members of a feed can subscribe and unsubscribe to the feed in order to receive email notifications whenever any activity in the feed occurs, such as new messages being posted, replies, likes, polls, and @mentions.

Individual indirect members—that is, members of a team that is participating in a feed—cannot subscribe or unsubscribe from a feed directly. If the team administrator subscribes the team to a feed, the individual members receive an email notification for activities in the feed such as new messages being posted, replies, likes, polls and @mentions.

All notifications related to a top-level message, such as replies, mentions, and likes, are sent out with the same subject. The subject line defaults to Live Feed followed by the beginning of the subject line from the top-level message. For example, if the subject of the feed is IT Support, the email notification's subject will be Live Feed IT Support.

1. Navigate to Live Feed > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click the subscribe icon ( ).

You can click the unsubscribe icon ( ) to stop receiving email notifications.

Note: If a team is subscribed to receive email notifications for a feed, but a member of the team did not subscribe to the team, that member does not receive the email notifications.

Navigate between live feed and other modules

If you are participating in a feed and navigate to another module, when you return to live feed it displays the feed you were previously viewing if it is public or if it is a private feed that you are a member of.

For example, assume you are viewing a public feed and then navigate to a particular incident record. Upon returning to live feed, the feed you were previously viewing opens. If you were last viewing a private feed that you are not a member of, returning to live feed opens the Company Feed.

Leave a feed

Members can choose to leave a group feed.

1. Navigate to Live Feed > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click Leave.

Note: If you leave a feed associated with a record, such as an incident, you automatically rejoin that feed if you modify the associated record again.

Delete a feed

If you are a feed administrator, you can delete the feed.

1. Navigate to Live Feed > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click Delete.
4. Click Yes to confirm deletion. The feed is deleted from live feed. Messages posted to a private feed are deleted. Messages posted to a public feed remain on the Company Feed without a feed link.

Live Feed UI overview
The Live Feed user interface provides many methods you can use to share content with others in your organization.

Update your Live Feed profile
Your profile information includes a photo or image, and tabs for different types of information including messages, feeds, teams, followers, and those who are following you. You can update your profile information and picture at any time.

Note: The functionality described here applies to HTML5-compliant browsers, such as Chrome, Firefox, Safari and IE10 and above.

1. Navigate to Live Feed > Live Feed.
2. Click your name or title displayed below your picture.

The profile record opens.
3. Click the pencil icon next to **About Me** and type a short description about yourself that you want to share with others who view your profile. This is text that you might not necessarily want to change on a regular basis.

4. You can change your profile photo using either of the following two methods:
   - Locate the photo file you want to use, and drag-and-drop it over the existing photo.
   - Hover over the existing picture (or tap the photo in the case of the smartphone or tablet interface) to display the **Upload a picture** link. Click the link, navigate to the location of the photo you want to use, and click **Open**.
Upload a picture

<i>Note: Your profile picture is used by the Connect and legacy chat features as well if they are activated.</i>

**Work with Live Feed messages**

This portion of the UI gives the user access to various types of messages and tools for grouping and categorizing messages. Also included are methods for identifying which user feeds you are following and which users are following you.
Tools for working with live feed messages

<table>
<thead>
<tr>
<th>Menu section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>My Live Feeds</td>
<td>These are custom feeds that allow you to customize live feed to view the content that is most important to you.</td>
</tr>
<tr>
<td>Company Feed</td>
<td>This feed displays all posts, except those posted to private or unlisted groups.</td>
</tr>
<tr>
<td>Group Feeds</td>
<td>These feeds are created by users. Record Feeds: These feeds are associated with a record, such as an incident or change.</td>
</tr>
<tr>
<td>Record Feeds</td>
<td>These feeds help users collaborate on records by providing a place for anyone who can access the record to share messages and post attachments specific to that record.</td>
</tr>
<tr>
<td>People</td>
<td>This option displays people who are following the current user and people the current user is following.</td>
</tr>
<tr>
<td>Teams</td>
<td>This option is used to combine users into groups for the purpose of subscribing to specifically-focused conversations.</td>
</tr>
<tr>
<td>Hashtags</td>
<td>Hashtags are words marked with a hash (#) symbol in messages. Hashtags are used to categorize messages by keyword or topic for improved search results messages filtered from all conversations that include specific hashtags.</td>
</tr>
</tbody>
</table>

View another Live Feed user

When a requester user, one that has no ServiceNow role, is viewing a feed and points to another user’s picture, information for the user appears from the Business Card view of the User [sys_user] table.

You can customize ACLs to increase the amount of information you want displayed for users with different roles.
If you click a user's name or title, the user's profile appears. Click the tabs to view different types of information for the user.
Follow other Live Feed users

As you use Live Feed, you can follow the message threads of other users.

1. Navigate to a thread that the user you want to follow is engaged in.
2. Click that user's name or point to the user's picture.
   A Follow link appears in the user's profile.
Profile with Follow link

3. Click **Follow**.
4. To stop following the user, navigate to **People > Following**.
Unfollow

5. Click Unfollow.
6. To view people who are following you, navigate to People > Followers.

Select feeds

A feed is a stream of related messages. You can use the feed selector to switch between feed types and to view specific group feeds and record feeds.

1. Use the Search field to locate any type of feed. As you type in the Search field, the results are dynamically displayed. For example, if you type INC, records that are incidents are forced to the top of the results list.
2. You can also select the following types of feed information.

**Feeds types**

<table>
<thead>
<tr>
<th>Feed</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>My Live Feeds</td>
<td>Displays the following posts:</td>
</tr>
<tr>
<td></td>
<td>• messages from users you follow</td>
</tr>
<tr>
<td></td>
<td>• messages with hashtags you follow</td>
</tr>
<tr>
<td>Company Feed</td>
<td>Displays all posts, except those posted to private or unlisted groups.</td>
</tr>
<tr>
<td>Add Group Feed</td>
<td>Allows you to add a group feed.</td>
</tr>
</tbody>
</table>
Follow feeds

You can view users who are following you or other users you are following.

To view users who are following you or other users you are following, click **People** in the sidebar.

The system shows 10 most recent followers or users you are following.

People

If either list contains more than 10 users, a Show More link appears.

**Note:** If you are following a particular user whose profile changes, that user moves to the front of the Following list. This alerts you to changes in the profile of a user you are following.

Bookmark feeds and hashtags

The live feed interface uses the standard bookmarking functionality for feeds and hashtags.

In UI15, you can drag-and-drop group feeds and hashtags from the Feed Summary section to the Edge for quick access.
Bookmark a hashtag

Add Live Feed to your homepage

You can add Live Feed to your own homepage or to a global homepage.

1. Navigate to a homepage.
2. Click the add content icon ( ) in the top left corner of the homepage.
3. Select Live Feed in the left panel.
4. On the bottom of the window, click Add here in the appropriate layout position, then close the window.
Post content in Live Feed

In Live Feed, you can post new messages and replies to existing messages for all users in the feed. You can also send a reply message to a team or record.

Post a live feed message

You can post a message to open a new feed.

1. Navigate to Live Feed > Live Feed.
2. Click the feed to which you want to post your message, for example My Live Feed, Company Feed, and so on.
3. Enter a message in the Share your thoughts field. Use hashtags, if you want.
4. As needed, click , , or to add a poll, attachment, or screenshot image, respectively.
5. Click Post.

Reply to a live feed message

To participate in an existing thread of a feed, you can compose and submit a reply message. By default, the message is visible to all members of the feed.

1. Navigate to Live Feed > Live Feed.
2. Locate the message you want to reply to.
3. Type your reply in the message box and click Reply.
   As needed, you can add hashtags, attachments, links, or knowledge base articles.
4. To limit who can view the reply to a single individual, select a user from the To choice list.
5. Click Reply.
6. By default, 7 replies are visible for each message. To view additional replies, click Show all replies. Any reply to a reply includes a Threads link.
7. Click Threads to view all of the replies within the selected reply in reverse chronological order within the Message Thread pop-up window, similar to an email thread.
ServiceNow Orlando Now Platform capabilities

Message Thread

Navakanth Reddy #suggestion(s) A common black vertical line just before the bars would help with this. Also, line spacing between two options should be more than single-spaced. Also, the bar says 5 people voted and it shows up 5 people and 1 more. Is this a #bug?

Nirupam Biswas I guess we need some visual distinction between the poll question and the options. After voting, I got confused for some moments why there are four options in result. See screenshot.

Shouvik Goswami We have enabled polls in Live Feed. Please review and provide #suggestions and #feedbacks

How do you like the poll in Live Feed?
- Exactly what I was looking for
- Wanted something more
- Did not visualize it this way

Vote

Attach files, links, images, and knowledge articles to messages

In addition to entering text, you can attach files, such as images, documents, and spreadsheet files in any ServiceNow supported file type to live feed messages.

Administrators can manage attachment file settings, such as supported file types and maximum attachment file size, by editing system properties.

You can also include links to user-defined URLs and knowledge articles contained in your instance's knowledge base.

Note: The functionality described here applies to HTML5-compliant browsers, such as Chrome, Firefox, Safari and Internet Explorer 10 and above. Significant differences while using different browsers are highlighted.

Attach a file to a post or reply

You can attach files to a post by dragging a file into a post or pasting an image from the clipboard.

Use the paperclip icon (_attach_file_icon_ ) to drag files into a post. Additionally, you can paste images into a post or reply from the clipboard.

1. Do one of the following:
   - While composing a post or reply (see Reply to a Message), locate one or more images or other supported types of files, and drag them into the message box.
   - Click the paperclip icon in the message box, navigate to the location of the files you want to attach, select them, and click Open.

2. To add more files, drag-and-drop additional files into the text box below the displayed files or images, or click the plus sign.
Attaching files

3. If you want to delete an attachment before posting the message, click the trashcan icon adjacent to the attachment.

4. Enter a comment to share your thoughts about the image.

![Note: The Post button is enabled only after you add the comment.]

5. Click Post or Reply.

6. If you added files that do not contain previews and then posted the message, they will be listed in the message box with a Download link.
7. Click the link to download the files.

Copy an image from the clipboard

In addition to adding files to a message, you can also copy images to the clipboard and paste them into a message or reply.

1. Click into the **Comment** box and add a comment.

2. Click the **Add an image** button.
   
   The **Screenshots** dialog box opens.

3. Right-click the **Paste an image here** box and select **Paste** to paste the image from the clipboard.
4. To add another image, repeat the previous steps.
5. When you finish pasting images into the message, click **Done**.
6. To change the link text, click **Pasted Image** and enter a new label.
7. When you finish, click **Post** or **Reply**.
8. To remove an image, click the trash can icon adjacent to the link.
9. To make changes to an existing image, click the edit icon (edy)

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Add a link to a post or reply

Add or modify a link to a live feed post.

1. Click into the Comment box. The Add a link button appears.
2. Click the Add a link button. The URL and Link text fields appear.

Add a URL.

3. Enter the URL and the text you want to appear as the link.
4. To add another link, click the link icon under the URL field.
5. When you have finished entering your message, click Post or Reply.

Note: The copy/paste functionality is supported in Chrome, Firefox, and Internet Explorer 11.
To remove a link, click the trash can icon adjacent to the link. To make changes to an existing link, click the edit ( ) icon.

**Add a knowledge article link to a post or reply**

Use the ID of a knowledge article to post it as a reply to a live feed conversation.

1. While composing a post or reply, type the ID of the knowledge article you want to link to. You do not need to identify the knowledge article ID as a hyperlink; live feed recognizes it as such and automatically converts it into a link when the message is posted.
2. When you are finished entering your message, click **Post** or **Reply**.

![KB link](image)

**Add a poll to a message**

When you are posting a message, you have the option of creating a poll in order to record your viewers' opinions. As users take the poll, their feedback statistics are displayed within the feed.

1. Open the feed where you want to create a message with a poll.
2. Enter the message with an invitation to take the poll in the **Share your thoughts** box.
3. Click the poll ( ) icon.
Poll

4. In the **Question** field, enter the question on which you are soliciting opinions.

5. In the **Option** fields, enter possible responses to the query.

6. To add more response options, click **Add more options**.

7. Click **Post**.

After the poll is posted, users who view the message can vote. After they vote, their pictures appear next to their response, with others who have voted for the same option.

**Note:** Only the poll creator can view results without casting a vote. Other members can see results only after casting a vote or if the poll is closed.
Close poll

An email notification with the poll result is sent to all participants of the poll informing them that the poll is closed.

Add mentions to a message

An @mention is any posted update that contains @username anywhere in the body of the message. The user's name, with a link to that user's feed, is inserted into the message. Additionally, the mentioned user receives an email notification about the mention. This is a great way of bringing attention to other members in a conversation. All @mentions are included in the logged-in user's My Feed.

**Note:** If an @mention is used by a member of a team, only members of that team appear in the auto-suggest list.

1. While entering a message or reply in a conversation, type @username anywhere in the message. As you type, an auto-suggest list appears with names and pictures of users that match your entries. For example, if you type @t, the auto-suggest list shows the pictures and names of all users with names that start with T.
2. Click the user you want to add.
That user's name is inserted into the @mention in the body of the message.

Note: My Feed displays @mentions of you and the teams you are a member of. Profile feeds for another user display only @mentions of that user.

Like a message
Like a message to provide feedback to the author.

1. Navigate to Live Feed > Live Feed.
2. Click Feeds.
3. Locate the feed that contains the message you want to like.
4. Under the message title, click Like.
   If the message has previously been liked, the number of likes for a message displays next to the Like link.
   For a top-level message, the profile pictures of the first 5 users who liked a message are displayed. Any additional users who liked the message can be viewed by hovering over the #more link. If the logged-in user has liked the message, that user's image will appear first, followed by the image of the user who last liked the message.
   For a reply, you must hover your mouse pointer over the count link to view the users who liked the message.

Note: After a message has been liked, it cannot be unliked.

Delete a message
Users can delete any of their own posts or replies. A conversation administrator can also delete messages.

1. Hover over the message you want to delete.
2. Click the trash can icon in the upper-right-hand corner of the message box.
3. Click Delete in the confirmation box.
Managed Documents

Use the ServiceNow® Managed Documents application to control electronic documents within your instance. After parameters have been set by the administrator and the Knowledge Document plugin installed, documents can move through the managed document cycle.

Note: Step through the process below on your test (or any non-production) instance.

Managed Document features

Managed Documents is a lightweight, ITIL-based solution for creating and managing electronic documents within your instance. This application adds a layer of control around any document by providing workflow, storage, security, and categorization options. It can be used for a variety of internal documents, such as policies and procedures, compliance documentation, and knowledge articles. Because it is integrated within the instance, Managed Documents offers a seamless alternative to 3rd-party systems.

Features

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check-in/Check-out</td>
<td>Track revisions, approval history, and automated notifications for approvers and reviewers. Useful for compliance and risk authors, policy and procedure writers, and contract administrators.</td>
</tr>
<tr>
<td>Categorization</td>
<td>Classify documents for organization and search.</td>
</tr>
<tr>
<td>Access control</td>
<td>Share documents with selected users.</td>
</tr>
<tr>
<td>Revision control</td>
<td>Track changes to documents.</td>
</tr>
<tr>
<td>Digital signature for approval</td>
<td>Integration with the Approval with E-Signature plugin.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Support consistent content review and approval.</td>
</tr>
<tr>
<td>Security</td>
<td>Use high security setting.</td>
</tr>
</tbody>
</table>

Managed Document concepts

The following concepts explain Managed Documents: Managed Document, Document Collection, Document Revisions, and Document Parameters.

Concepts

<table>
<thead>
<tr>
<th>Concept</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Managed Document</td>
<td>The Document [dms_document] table contains the documents controlled through the managed documents process.</td>
</tr>
<tr>
<td>Concept</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Document Collection</td>
<td>The <strong>Document Collection</strong> [dms_collection] table allows related documents to be grouped together.</td>
</tr>
<tr>
<td>Document Revisions</td>
<td>Because managed documents must have clear records of individual versions of a document, revisions (including the file) are attached to the master document record through a related list. Document revisions are controlled to keep a standard naming scheme and consistent version numbers. Once a document revision is ready, it can be submitted for review.</td>
</tr>
</tbody>
</table>
| Document Parameters     | **Attention:** Parameters do not control application or document security. Parameters only organize documents, they do not affect who can access documents. To grant access to the Managed Documents application, you can assign a role. To grant access to a specific document, set user and group permissions. Each document can be associated with predefined parameters. The parameters can help with grouping documents.  
• Type: Defines the type of document being controlled. Documents of the same type use the same controls.  
• Classification: Defines document restriction level, such as public, restricted, or confidential.  
• Audience: Defines the groups with access to the document, such as internal or external.  
• Name Formats: Defines the format of document names, ensuring that documents of the same type have the same name scheme assembled from name components.  
• Name Components: Defines the document values used in the name formats.  
• Approval Rules: Defines the approvals the document must have before it can be published. |

**Install the Managed Documents plugin**

The Managed Documents plugin is available for activation by users with the admin role.

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.
   - If the plugin depends on other plugins, these plugins and their activation status are listed.
3. **[Optional]** Select the **Load demo data** check box.
   - Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when first activating the plugin on a development or test instance.
   - You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click **Activate**.
Managed Documents plugin

This page describes the applications and modules, database table structure, scripts, and roles.

Database table structure

The following tables are added:

<table>
<thead>
<tr>
<th>Display Name (Table Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revision [dms_revision]</td>
<td>The document revisions.</td>
</tr>
<tr>
<td>Classifications [classification]</td>
<td>The document restriction level, such as public or confidential. (Does not define access to the document. Document security is set in user and group permissions.)</td>
</tr>
<tr>
<td>Type [dms_type]</td>
<td>The document purpose.</td>
</tr>
<tr>
<td>Component [dms_component]</td>
<td>The components of name formats. The value field is a dot-walking expression that is evaluated. An exception is made for the revision because it does not exist when the revision name is generated.</td>
</tr>
<tr>
<td>Name format [dms_name_format]</td>
<td>The composition of components to generate revision names.</td>
</tr>
<tr>
<td>Approval sequence [approval_sequence]</td>
<td>The approval sequences that users need to follow.</td>
</tr>
<tr>
<td>Approval Rule [dms_approval_rule]</td>
<td>The criteria that records of the dms_document table must match. Used to automatically add approvers to a document.</td>
</tr>
<tr>
<td>Collection [dms_collection]</td>
<td>The document groups created by the user.</td>
</tr>
</tbody>
</table>

Scripts

Business rules that are added to sys_script

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update Document</td>
<td>Changes the state of a document depending on its revisions.</td>
</tr>
<tr>
<td>Add Approvers</td>
<td>Populates the list of approvers in the document.</td>
</tr>
</tbody>
</table>

Script includes that will be added to sys_script_include

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DocumentManagement</td>
<td>Contains the main logics for the Managed Documents plugin.</td>
</tr>
<tr>
<td>DocumentManagementDB</td>
<td>Contains methods to perform CRUD operations on the database.</td>
</tr>
</tbody>
</table>
### Script include

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DocumentManagementSecurity</td>
<td>Helps manage the security of the Managed Documents system.</td>
</tr>
<tr>
<td>DocumentManagementAjax</td>
<td>Updates the details of the temporary revision that is created when opening the upload/check in revision form.</td>
</tr>
<tr>
<td>DocumentAttachmentAjax</td>
<td>Renames an attachment file.</td>
</tr>
<tr>
<td>DocumentRevisionWorkflowHelper</td>
<td>Helps perform basic workflow operations on a revision.</td>
</tr>
<tr>
<td>DocumentManagementApprovalMatcher</td>
<td>Helps obtain the user and group approvers for a document that matches approval rules.</td>
</tr>
<tr>
<td>DocumentApproverHelper</td>
<td>Contains logics to handle document approvers.</td>
</tr>
<tr>
<td>DocumentManagementUtils</td>
<td>Useful methods.</td>
</tr>
<tr>
<td>DocumentReferenceQualifiers</td>
<td>Static methods that return reference qualifiers.</td>
</tr>
</tbody>
</table>

### Client script that is added to sys_script_client

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document type change</td>
<td>Updates the name format field in the revision settings section of the document. Each type has a default name format.</td>
</tr>
</tbody>
</table>

### Roles

This plugin introduces two new roles:

#### Roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>document_management_user</td>
<td>This role enables a user to access the Managed Documents plugin, create documents, and search for documents. Document reviewers and approvers need the document_management_user role to access the Managed Document plugin. (Please note that reviewers and approvers can also access a document revision from an approval record.)</td>
</tr>
<tr>
<td>document_management_admin</td>
<td>This role enables a user to change administrative settings for the Managed Documents plugin.</td>
</tr>
</tbody>
</table>

**Note:** Each document has individual permissions, so even if a user is given the document_management_user role and has permissions to the application, the user can only view documents to which they have been given access.
Create a new managed document record

Configure the properties and policies for a managed document.

1. Navigate to **Managed Documents > Create New**.
2. In the **Name** field, type *Policy*.
3. In the **Requested by** field, add your name.
4. In the **Owner** field, add your name.
5. In the **Reviewer** field, add your name.
6. In the **Type** field, select *Policy*.
7. In the **Classification** field, select *Confidential*.
8. In the **Audience** field, select *Internal*.
9. Under **Revision Settings**, select the **Auto increment revision** option.

![Revision Settings](image)

10. Click **Submit**.

Check in a document after making changes

After making changes to a document, check the revised document into Managed Documents.

1. Open the document record.
2. Click the **Upload/Check in Revision** related link.
3. Click **Choose File**, select the revised file, and click **Open**.
4. Check that the **Name** and **Revision Number** contain the updated number.
5. Ensure that the **Check in** option is selected.
6. Click **OK**.
   The Document Revisions list updates to contain the most recent revision.

![Document Revisions](image)
Check out a document to make changes

After a document is added to a managed document record, check the file out to make changes. Checking documents in and out keeps a record of document changes and ensures that only one person at a time is editing the document.

1. Open the document record.
2. Select the Check Out Document related link.
4. Click Check Out.
5. Open the file and make a small change.
6. Save the document with the same name, but a new revision number. For example, Policy_POL_02.txt.

Publish a document in Managed Documents

After the document is reviewed and approved, publish the document within Managed Documents.

1. Open the document record.
2. In the Document Revisions list, click the name of the revision that was approved and is listed in the Ready for Publishing stage.
3. In the header bar, click Publish Revision.
4. In the Publish revision dialog box, check that the name and revision number are correct and click Publish. In the Document Revisions list, the revision you just published is now in the Published stage.
Send a document out for review and approval

When a document is ready, send it out for review and approval. If a reviewer or approver is not identified in the document record, the document is moved directly to the publishing stage.

1. In the Document Revisions list, right-click the revised document and select Submit Revision.

Because you identified yourself as the reviewer, you receive an approve request email message.

2. In the email message, click the link next to Click here to view Approval Request.

3. (Optional) View the document by clicking the attachment name under Document Revision.

4. Click Approve.
   - The Approvals page displays and lists the document you just approved.

5. Open the document record.

6. In the Document Revisions list, the revision you approved is now in the Ready for Publishing stage.

Upload a document as an attachment

After creating a document record, add the document to the record as an attachment.

1. Open the document record.

2. Select the Upload/Check in Revision related link.

3. Click Choose File.

4. Select a simple document, such as a text file, and click Open.

5. Check that the name reads Policy_POL_0.1.

6. Click OK.
   - The document is listed under Document Revisions.
Defining Document Parameters

Before using the Managed Documents application, the user with the `document_management_admin` role needs to set the parameters that define the kinds of documents to be managed through the application. Managed Documents provides both base and custom parameter options.

Defining Document Parameters

The following document parameters should be defined:

- **Type**: identifies the purpose of the document. The type also determines the default document format and name format.
- **Classification**: indicates the security level assigned to the document and determines who can view or edit the document.
- **Audience**: specifies the intended readers of the document.
- **Name format**: specifies the name format to use when a document revision is added.
- **Name components**: are individual identifiers used inside a name format. Name components define a reference path (often by dot-walking) that holds the value specific to the document.
- **Approval rules**: determine which approvers are added to documents (in addition to the Reviewers specified on the document record).

Defining Types

To define a new type, navigate to Managed Documents > Administration > Type and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the type.</td>
</tr>
<tr>
<td>Code</td>
<td>A short code for the type. Referenced as a name component for the name format.</td>
</tr>
<tr>
<td>Label</td>
<td>A label to display in the Type choice list.</td>
</tr>
<tr>
<td>Name Format</td>
<td>The name format that documents of this type will use.</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating the type's sequence in the choice list.</td>
</tr>
</tbody>
</table>

The following types are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Code</th>
<th>Label</th>
<th>Name format</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>-- None --</td>
<td>null</td>
<td>-- None --</td>
<td>null</td>
<td>1</td>
</tr>
<tr>
<td>policy</td>
<td>POL</td>
<td>Policy</td>
<td>Default Policy</td>
<td>2</td>
</tr>
<tr>
<td>guideline</td>
<td>GUI</td>
<td>Guideline</td>
<td>Default</td>
<td>3</td>
</tr>
<tr>
<td>procedure</td>
<td>PROC</td>
<td>Procedure</td>
<td>Default</td>
<td>4</td>
</tr>
<tr>
<td>contract</td>
<td>CON</td>
<td>Contract</td>
<td>Default</td>
<td>5</td>
</tr>
</tbody>
</table>

**Note**: For documents with a Type of Contract, a Contracts related list appears on the document record, listing any contracts the document is associated with.
Defining Approval Rules

To define a new approval rule, navigate to Managed Documents > Administration > Approval Rules and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique identifier for the approval rule.</td>
</tr>
<tr>
<td>Active</td>
<td>A check box indicating whether this approval rule is used.</td>
</tr>
<tr>
<td>Condition</td>
<td>A condition builder that determines which documents use this approval rule.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the approval rule.</td>
</tr>
</tbody>
</table>

Once the approval rule is saved, the Approvers related list defines which approvers are added if the conditions in the Condition field are met.

The following approval rules are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internal policy</td>
<td>type=Policy ^ audience=Internal</td>
</tr>
<tr>
<td>Development policy</td>
<td>type=Policy ^ department=Development</td>
</tr>
</tbody>
</table>

Defining Audiences

To define a new audience, navigate to Managed Documents > Administration > Audience and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audience Name</td>
<td>A unique name for the audience.</td>
</tr>
<tr>
<td>Audience Code</td>
<td>A short code for the audience. Referenced as a name component for the name format.</td>
</tr>
<tr>
<td>Label</td>
<td>A label to display in the Audience choice list.</td>
</tr>
<tr>
<td>Order</td>
<td>A number indicating this audience's sequence in the choice list.</td>
</tr>
</tbody>
</table>

The following audiences are available in the base system.

<table>
<thead>
<tr>
<th>Audience</th>
<th>Audience code</th>
<th>Label</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>internal</td>
<td>INT</td>
<td>Internal</td>
<td>1</td>
</tr>
<tr>
<td>external</td>
<td>EXT</td>
<td>External</td>
<td>2</td>
</tr>
</tbody>
</table>

Defining Classifications

Define a new classification on the Classification form.

Navigate to Managed Documents > Administration > Classification and click New.
The following classifications are available in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Code</th>
<th>Label</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>P</td>
<td>Public</td>
<td>1</td>
</tr>
<tr>
<td>restricted</td>
<td>R</td>
<td>Restricted</td>
<td>2</td>
</tr>
<tr>
<td>confidential</td>
<td>C</td>
<td>Confidential</td>
<td>3</td>
</tr>
</tbody>
</table>

**Defining Name Components**

Name components define the document values used in the name format.

For example, the name component `document.audience.code` dot-walks from the document record to the audience `Code`.

To define a new name component, navigate to Managed Documents > Administration > Components and click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique identifier for the name component.</td>
</tr>
<tr>
<td>Short Description</td>
<td>A short description of the name component value.</td>
</tr>
</tbody>
</table>
| Value            | The path to the field holding the value used for the name format. Defined relative to a current revision record. For example:
• Enter `revision` to use the revision `Number` field on the revision record.
• Enter `document.name` to use the `Name` field on the revision's referenced document.
• Enter `document.audience.code` to use the `Code` field for the audience referenced by the document. This dot-walking approach makes it possible to get any value related to the revision into the name format. |

**Note:** The revision component is a special component replaced by the appropriate revision number (rather than querying a value related to the current record). The revision is either automatically incremented or uses the latest revision number, depending on the setting on the document form.
The following components are defined in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Short description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audience code</td>
<td>Displays the code assigned to the document audience.</td>
<td>document.audience.code</td>
</tr>
<tr>
<td>Classification code</td>
<td>Displays the classification code.</td>
<td>document.classification.code</td>
</tr>
<tr>
<td>Document name</td>
<td>Displays the document name.</td>
<td>document.name</td>
</tr>
<tr>
<td>Revision</td>
<td>Displays the document revision.</td>
<td>revision</td>
</tr>
<tr>
<td>Type code</td>
<td>Displays the code assigned to the document type.</td>
<td>document.type.code</td>
</tr>
</tbody>
</table>

**Defining Name Formats**

The name format automatically generates a name for a document revision by arranging name components in a standard code to match naming conventions.

For example, a name format with the name components **Type Code**, **Document Name**, and **Revision Number** and the separator `-`, would be formatted as:

```
TYPECODE-Name-RevNumber.fileformat
```

In this example, a policy (code POL) named **IT Off-Boarding Policy**, with revision number **1.0**, and uploaded as a `.docx` file would have the name:

```
POL-IT Off-Boarding Policy-1.0.docx
```

To define a new name format, navigate to **Managed Documents > Administration > Name Formats** and click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the name format.</td>
</tr>
<tr>
<td>Separator</td>
<td>A separator to put between each of the components.</td>
</tr>
<tr>
<td>Description</td>
<td>A description of the name format.</td>
</tr>
</tbody>
</table>

Use the related list to add name components. Use the **Order** field to set the sequence in which name components are used.

The following name formats are defined in the base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Separator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>_</td>
<td>The default format. Document name and revision separated by an underscore.</td>
</tr>
<tr>
<td>Default Policy</td>
<td>_</td>
<td>The format for the policy document type.</td>
</tr>
<tr>
<td>Development documentation</td>
<td>(no separator)</td>
<td>The format for the software documentation type.</td>
</tr>
<tr>
<td>Name</td>
<td>Separator</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Development Sources</td>
<td>(no separator)</td>
<td>The format for the development and code sources type.</td>
</tr>
<tr>
<td>Intranet Improvement</td>
<td>(no separator)</td>
<td>The format for documents that describe intranet use.</td>
</tr>
</tbody>
</table>

**Defining Document Workflow**

In the base system, all managed documents use the Managed Documents workflow after the Active check box is selected.
Document workflow
The document parameters defined in the workflow are often used as conditions to trigger more specific workflows, such as type-specific workflows or classification-specific workflows. If different kinds of documents should follow different workflows, use the Graphical Workflow Editor to create new workflows.

**Knowledge document**

The Knowledge Document plugin extends the Managed Documents plugin by providing the functionality for managed documents to be published to the knowledge base.

**Installed with knowledge document**

These elements are installed with the knowledge document plugin.

**Dependencies**

The Knowledge Document plugin depends on the Managed Documents plugin. Activating Knowledge Document activates Managed Documents.

**Tables**

<table>
<thead>
<tr>
<th>Display Name [table_name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Records [m2m_document_knowledge]</td>
<td>A many-to-many table storing the relationship between a document and a knowledge article.</td>
</tr>
</tbody>
</table>

**UI Actions**

<table>
<thead>
<tr>
<th>UI action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link to Knowledge</td>
<td>Creates or updates a knowledge article related to the current document, depending on whether a knowledge article already exists.</td>
</tr>
</tbody>
</table>

**Scripts**

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KnowledgeDocument</td>
<td>Holds the main logic for the Knowledge Document plugin.</td>
</tr>
<tr>
<td>KnowledgeDocumentDB</td>
<td>Class that gets, inserts, and updates data for the Knowledge Document plugin.</td>
</tr>
</tbody>
</table>
Link documents to knowledge articles

Manage a document and access the latest version of the document from an article by linking the document to a knowledge article.

Your administrator must have activated the following plugins:

• Knowledge document plugin (com.snc.knowledge_document)
• Knowledge Management Advanced plugin (com.snc.knowledge_advanced)

The document is already uploaded and published. For more information, see Upload a document and Publish an approved revision.

You must have contribute access to the knowledge base within which the article linked to the document is stored.

If a knowledge article is already linked to the document, you must have contribute access to the article.

Role required: document_management_user and knowledge

You can link the initial or revised version of a document to a knowledge article. The document appears as an attachment to the linked article. Revising a document doesn't automatically update the document attached to the linked knowledge article. Therefore, every time you revise a document, you must again link the revised document to the knowledge article.

Note: Only the owner of a document or an administrator can link the document to an article.

1. Navigate to Managed Documents > Documents > All.
2. Click the document.
3. In the Knowledge Settings related list, fill in the fields.

Knowledge settings

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Behavior</td>
<td>Process performed when the Link to Knowledge related link is clicked.</td>
</tr>
<tr>
<td></td>
<td>A behavior is one of the following types:</td>
</tr>
<tr>
<td></td>
<td>• Always create record: A new knowledge article is created and linked with</td>
</tr>
<tr>
<td></td>
<td>the latest published revision of the document as an attachment.</td>
</tr>
<tr>
<td></td>
<td>• Update existing record: The linked knowledge article is updated with the</td>
</tr>
<tr>
<td></td>
<td>latest published revision of the document as an attachment. If no</td>
</tr>
<tr>
<td></td>
<td>knowledge articles exist for the document, a new knowledge article is</td>
</tr>
<tr>
<td>Knowledge base</td>
<td>Knowledge base in which the knowledge article is stored. You can associate</td>
</tr>
<tr>
<td></td>
<td>a knowledge article with one knowledge base only. If you are using an</td>
</tr>
<tr>
<td></td>
<td>article template, you can modify this value only if the template is</td>
</tr>
<tr>
<td></td>
<td>available in the other knowledge base.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type</td>
<td>Article template to create a knowledge article using defined fields and values.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> when a knowledge article is created, the <strong>Type</strong> field becomes read-only.</td>
</tr>
<tr>
<td>Valid to</td>
<td>Date that the article expires. Adds valid to date information to the same field in the knowledge article.</td>
</tr>
<tr>
<td>Short description</td>
<td>A few words or short phrase describing the knowledge article. Adds the short description to the same field in the knowledge article.</td>
</tr>
</tbody>
</table>

4. Click the **Link to Knowledge** related link.

5. Optional: In the information message that is displayed, click the message link to view the knowledge article.

The uploaded document is added as an attachment to a knowledge article. Depending on the **Behavior** field value specified in the Knowledge settings related list, the knowledge article is created or updated with the document.

**Create a document**

After Managed Documents parameters have been set by the administrator, documents can be created, requested, checked out, edited, checked in, copied, and, if necessary, rolled back to an earlier version.

Once documents have been added to the Managed Documents application, they can be grouped into document collections.

**Approval process**

During the approval process, the approver approves or rejects the document. A document goes through the approval process after the review process.

**Approval workflow**

After the document has been reviewed, submit the document for approval. If the document does not have an approver, the approval process is omitted.

When the document is **Active**, the workflow **Document Management Default** is used to manage approvals:
Document Management Default workflow
If the approver rejects the document, the author and owner are notified and the document review is cancelled. The author, owner, and approver should discuss what changes need to be made to the document. When the document is ready, a new review can be initiated.

If the final approver approves the document, the author and the owner are notified. Once final approval is successful, the document stage changes to **Ready for Publishing** in the Document Revisions list:

---

**Document Management Default workflow result**

**Process modification for multiple approvers**

If there are multiple approvers, the approval process works in sequence and multiple approvers can be assigned to a single sequence. For example:

Sequence 1: approvers A and B

Sequence 2: approvers C and D

Sequence 3: approver E

Because the sequences take place in ascending chronological order, approvers A and B receive the approval request first (approvers C, D, and E are not part of the process yet). Similar to the review process, the first approver to act within a sequence dictates what happens to the document. If approver A acts first and rejects the document, the approval process stops and the state is set to Cancelled. Approver B’s status is changed to No Longer Required. If approver A acts first and approves the document, the process stops and approver B’s status is changed to No Longer Required. Then, the document moves to approval sequence 2. After at least one approver in each sequence approves the document, the author and the owner are notified that the document has been approved.
Review process

During the review process, the reviewer approves or rejects the document. Sometimes a document will have multiple reviewers.

If the reviewer rejects the document, the author and owner are notified and the review is cancelled. The author, owner, and reviewer should discuss what changes need to be made to the document. If the reviewer approves the document, the author and owner are notified that the review was successful and the document can move to the approval stage.

If multiple reviewers are assigned to a document, the first reviewer to act dictates what happens to the document. For example, there are two reviewers, A and B. If reviewer A acts first and rejects the document, the review process stops and the revision state is set to Cancelled. Reviewer B receives a notification email stating that the review was rejected and their status is changed to No Longer Required. If reviewer A acts first and approves the document, the review process stops and the document can move to the approval stage. Reviewer B's status is changed to No Longer Required.

Enable electronic signature for approval

This topic explains how to enabling electronic signatures for approval. Electronic signatures are helpful if you must obtain a digital signature for compliance or auditing purposes.

You can activate the Approval with E-Signature plugin to require that users type in a user name and password when reviewing and approving documents.

The digital signature is not tracked or stored in the document record. Users must simply type in a user name and password after clicking the Approve or Reject button.

Digital signature

After activating the Approval with E-Signature plugin, ensure that a row in the e-signature registry table is created for the dms_document_revision table.

1. Navigate to System Definition > e-Signature Registry.
2. Check if dms_document_revision is already listed and Enabled is set to true.
3. If not listed, click New.
4. In Table name, select Document Revision.
5. Select Enabled.
6. Click Submit.

**Publish an approved revision**

This topic explains how to publish a document revision that has been approved.

Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

Publish the approved revision from the Document Revisions list.

**Note:** Publishing documents to the Knowledge Base requires the Knowledge Document Plugin.

1. Navigate to the document record.
2. In the Document Revisions List, click the revision marked **Ready for Publishing**.
3. Click **Publish Revision** to display the **Publish** dialog box.

The revision number matches the latest revision number. If your standard is to change the revision number when the document is published, such as incrementing the version number to 1.1 or 1.0.1, the change can be made on this dialog box manually.

4. Click **Publish**.

The published revision is highlighted in green and the stage of previous revisions is automatically changed to **Retired**.
Submit a revision for draft review

This topic explains how to submit a document draft for review.

Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

When a draft of the document is ready, submit the draft for review. If the document does not have reviewers identified in the Reviewers field of the document record, the review process is omitted.

1. Navigate to the document record.
2. Right-click the appropriate revision.
3. Select Submit Revision.

   The revision stage is set to Awaiting Review.

Note: If the approval and publishing process is repeated, the published revision is retired when the new revision is published. Any workflows running against previous revisions are canceled when the document is published.
Create or request a new document

Once an administrator has set parameters for the Managed Documents application, you can create or request new documents.

1. Navigate to Managed Documents > Create New.
2. Complete the following fields:

New document fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>An identifying number for the document. Automatically generated using number maintenance.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Name</td>
<td>A name for the document. Note that the name for the document is combined with other naming components (as defined by the name format) to create the names for each document revision.</td>
</tr>
<tr>
<td>Requested by</td>
<td>The person asking that the document be created or updated.</td>
</tr>
<tr>
<td>Owner</td>
<td>The approver of the document request. Also responsible for setting completion date with requesters and authors.</td>
</tr>
<tr>
<td>Reviewers</td>
<td>The user or users who review the document and provide feedback to owners and authors.</td>
</tr>
<tr>
<td>Department</td>
<td>The department responsible for the document.</td>
</tr>
<tr>
<td>Type</td>
<td>The document purpose. This is a choice list derived from the type parameters.</td>
</tr>
<tr>
<td>Classification</td>
<td>The document classification, based on security, audience, and confidentiality. This is a choice list derived from the classification parameters.</td>
</tr>
<tr>
<td>Audience</td>
<td>The document readers, such as external or internal. This is a choice list derived from the audience parameters.</td>
</tr>
<tr>
<td>State</td>
<td>The current status of the document in the editing and publication process.</td>
</tr>
<tr>
<td>Checked out by</td>
<td>The user who currently has the document checked out.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the document.</td>
</tr>
<tr>
<td>Revision Settings</td>
<td></td>
</tr>
<tr>
<td>Name format</td>
<td>The format for the name of each individual revision of the document. For more information, see Defining Name Formats.</td>
</tr>
<tr>
<td>Revision format</td>
<td>A choice between the two digit (0.x) or the three digit (0.0.x) revision format.</td>
</tr>
<tr>
<td>Auto increment revision</td>
<td>If selected, the revision number automatically increments each time the document is revised.</td>
</tr>
</tbody>
</table>

The **User Permissions** related list determines which users have rights to view and contribute to the document:

**User permissions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>A reference to a user who is entitled to read and contribute to the document.</td>
</tr>
<tr>
<td>Type</td>
<td>A choice list describing how the user can interact with the document. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Reader - The user can read the document versions.</td>
</tr>
<tr>
<td></td>
<td>• Editor - The user can upload new versions.</td>
</tr>
<tr>
<td></td>
<td>• Owner - The user can edit the document.</td>
</tr>
</tbody>
</table>
The **Group Permissions** related list determines which groups have rights to view and contribute to the document:

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group</td>
<td>A reference to a group of users who are entitled to read and contribute to the document.</td>
</tr>
<tr>
<td>Type</td>
<td>A choice list describing how group members can interact with the document. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Reader - Group members can read the document versions.</td>
</tr>
<tr>
<td></td>
<td>• Editor - Group members can upload new versions.</td>
</tr>
<tr>
<td></td>
<td>• Owner - Group members can edit the document.</td>
</tr>
</tbody>
</table>

**Specify an approver**

You can specify approvers for a document record after you save it.

You can have one approver or multiple approvers. For example, set multiple approvers to have one person do a quality check of the document and a different individual to serve as a final approver. Approvers are assigned a number. The lowest number (usually number one) approver always goes first, then any other approvers in ascending chronological order. Multiple approvers can have the same sequence number. For example, two approvers can do a quality check and be assigned sequence number 1. Then, two individuals can be final approvers and be assigned sequence number 2.

1. Navigate to the document record.
2. Right-click in the document header bar and select **Add Approver**.
3. Add a user name.
4. Select a sequence number from the drop-down list. (Lower numbers approve before higher numbers. For example, approver number one approves before number two.)
5. Click **Add User**.
6. Repeat steps 2-5 to add more approvers.

**Check in a document**

Check in the document after you revise it so other users can check out the document.

1. Navigate to the document record.
2. Select the **Upload/Check In Revision** related link.
3. Click **Browse** and navigate to the revised file.
4. Click **Open**.
5. Check the Name and Revision Number.
6. Click **OK**.

The **Document Revisions** related list updates to contain the most recent revision:
Copy a document

A document can be duplicated at any time. This is useful if you have an existing document that you want to use as a base for a new document.

1. Navigate to the document record.
2. Right-click the header bar and select Copy Document.
   
   An information message with a link to the new document displays:
3. Click OK.

   The new document is renamed and includes the word "Copy."

   Note: Only the latest revision is copied.

Deactivate a document

To change the document state to Inactive, deactivate the document. This is useful when changes to a document have been put on hold. An inactive document can be reopened at any time.

1. Navigate to the document record.
2. Right-click the header bar and select Deactivate Document.

   Note: To activate a document, right-click on the header and click Reopen Document.

Reopen a deactivated document

A document that has been deactivated can be reopened.

1. Navigate to the document record.
2. Right-click the header bar and select Reopen Document.
Roll back a document

A document can be rolled back to an earlier revision at any time. Before rolling back to an earlier revision, ensure that the document is not checked out and that you have Editor or Owner permissions for the document.

1. Navigate to the document record.
2. In the Document Revisions list, click the revision to which you want to roll back.
3. Right-click the header bar and select Rollback. The Rollback to Revision dialog box displays. The name and revision number are new. The note specifies the revision to which you are rolling back.

   ![Rollback to revision dialog box](image)

4. Change any information on the Rollback to Revision dialog box as necessary.
5. Click OK. The latest revision is now the revision you selected for rollback.

Cancel a document

Change the document state to Cancelled when no more changes will be made to the document.

When canceling a document, there is no confirmation message, so ensure that you want to cancel the document.

1. Navigate to the document record.
2. Right-click the header bar and select Cancel Document.

   An info message confirms the cancellation:

   The State is set to Cancelled:

   ![State set to Cancelled](image)

MDOC cancel 3
Check out a document

Documents in the Managed Documents application can only be revised by one user at a time. Check out the document to revise it.

1. Navigate to the document record.
2. Select the Check Out Document related link.
3. Select Download file to download the current version of the document when it is checked out.

4. Click Check Out.
   After checking out a document, you can edit the document and make any necessary changes.

Create a document collection

A document collection is a set of individual documents. After documents have been uploaded into Managed Documents, organize the documents by grouping them into collections.

1. Navigate to Managed Documents > Document > My Collections.
2. Select New.
3. Type in a Name.
4. (Optional) Type in a Description.
5. Click Submit.
6. Click the name of the collection you created.
7. Click Edit.
8. On the left, double-click an available document or select a document and click Add.
9. Click Save. The Document Collection page displays and the individual documents in the collection are listed:
Upload a document

Upload a document into a saved record. You can upload text files, spreadsheets, presentations, PDF files, and more.

1. Navigate to the document record.
2. Click the Upload/Check In Revision related link.
3. Click Choose File and navigate to the file.
4. Click Open.
5. Check the Name and Revision Number.
6. Click OK.

After the initial document is uploaded, subsequent revisions can be created by checking out the document.

Domain separation and Managed Documents

This is an overview of domain separation in Managed Documents. With domain separation you can separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Support level: No support

- The domain field may exist on data tables, but there is no business logic to manage data.
- This level is not considered domain-separated.

For more information, see Application support for domain separation.

MetricBase

The MetricBase application stores time-series data, which is data that is sampled at regular intervals. You can graph the stored data or use it with triggers to execute Flow Designer flows. MetricBase helps developers working with IoT-based applications that monitor or act on large amounts of machine-generated data.

How MetricBase works

You use MetricBase to deal with large amounts of data by using a smaller summary of that data that is stored in the MetricBase database. For example, an instance might store CPU usage. With MetricBase, you might summarize that data by storing the average CPU usage for every five-minute interval. You can graph the data or you can use it with Flow Designer to trigger flows.

MetricBase works with:

- An instance that stores machine-generated data
- A server that has the MetricBase application and database

On a very high level, when using MetricBase, you can:

1. Define the sampling rate for the data (float) on an instance. For example, you can sample the machine-generated data that is stored on an instance once every five minutes. This sampling rate is called the time-series definition.

2. Use a MetricBase API to send data from the instance to the MetricBase database at the rate that is prescribed by the time-series definition. If you send the data to MetricBase at a different rate, you get an error.

3. Use the Reporting application to graph the time-series data that is stored in MetricBase, or create triggers that execute Flow Designer flows. The time-series data remains in the MetricBase database for a prescribed amount of time, after which MetricBase deletes the data.
This figure shows that machine-generated data is sampled every 4 seconds. You send the average of the values in each sampling period to the MetricBase database, which stores the data until its expiration date.

**Benefits**

- MetricBase integrates seamlessly with ServiceNow IoT-based applications that monitor or act on large amounts of machine-generated data.
- MetricBase collects, retains, analyzes, graphs, and acts on time-series data.
- MetricBase works with Flow Designer to trigger flows and with Reporting to generate reports.

**Use cases**

- Create graphs about metrics, such as about CPU usage over time.
- Generate an email if the average CPU usage is more than 85% in the last 5 minutes.
- Train a machine language model to detect anomalies and execute a Flow Designer trigger when an anomaly is detected.
- If MetricBase detects a gap in data submitted for 10 minutes or more, generate an email.
- If the average of the collected data is less than 10 or greater than 500 in the last 5 minutes, generate an alert.
- If memory usage is likely to exceed 90% in the next 10 minutes, generate an alert.

**MetricBase demo**

Use the *MetricBase Demo* plugin to familiarize yourself with MetricBase. The demo contains sample metrics, triggers, and a scheduled job that collects and stores data. Use the demo to explore MetricBase before you set it up. The *Data Explorer*, which comes with the demo plugin, provides a place to experiment with MetricBase JavaScript APIs. The demo plugin is separate from the MetricBase plugin. Make sure to request both.
Next

*Request the installation* of the MetricBase and MetricBase Demo plugins.

**Purchase the MetricBase product**

The MetricBase application requires a separate subscription and must be activated by ServiceNow personnel. Be sure to request the MetricBase Demo plugin, which includes sample tables, metrics, triggers, and data.

Role required: none

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

When ServiceNow personnel install the MetricBase Demo plugin, they also connect your instance to the server that contains the MetricBase database. A MetricBase database can connect with only one other instance. For example, a clone of the original instance can't talk to the same database as the original instance.

- *Play with MetricBase* to get familiar with it.
- *Define and collect MetricBase data.*

**Getting familiar with MetricBase**

After ServiceNow personnel install the MetricBase and MetricBase Demo plugins, you can use the demo to get familiar with MetricBase.

**Prerequisites**

- MetricBase and the MetricBase demo plugins must be installed by ServiceNow personnel.
- Role required: admin

**MetricBase Demo**

With the MetricBase Demo plugin, you can experiment with MetricBase without configuring it or knowing much about it. The plugin includes sample time-series data and triggers in your MetricBase database to help you visualize the data and see how triggers operate. The demo also includes scheduled time-series data updates, as if they had been received from an instance, so you can test the functionality of the included triggers.

In the demo, a fictional fleet of drones has been outfitted with sensors that broadcast their metrics, including their speed, altitude, and battery life over time.

1. Navigate to **MetricBase Demo > Drones**
   
   to see the name, model, length, width, altitude, and speed for all drones in the fleet.
2. **Click MetricBase Demo > Metrics** to see how the metrics are defined.
   
in the Time Series Metrics list, the column values specify the table where the drone's time-series metrics are stored, the names of all the metrics that are stored for each drone, and the retention policy for each metric. The retention policy specifies how frequently measurements are taken, and how long MetricBase retains that data.

3. **Click a retention policy.**
   
The Retention Policy form shows the definition for the policy. In the following example, this metric is measured once a minute for the first 8 days, then once every 10 minutes for the following 94 days, and then once an hour for the following 397 days. After that, the system discards the data.
For more information on retention policies, see *Define and collect time-series data.*

4. To see how the data is aggregated during the Retention Durations, click the left arrow (<) at the top of the Retention Policy Schedules window to return to the Time Series Metrics list.

5. Click a table name.

The Time Series Metric definition shows the **Retention policy aggregator**. This aggregator summarizes the data as, for example, the average, maximum, or minimum value in the aggregation period. In the following example, the admin clicked the table for the speed metric. The result is that MetricBase stores the speed averages during each sampling period in the MetricBase database.

Now that you understand how the data was collected using retention policies, let's see how to display the data in lists and graphs.

6. Notice the parameter fields that start with **Display**. In this example, they mean that the speed values that are displayed in the list view of drones are the last speeds recorded in every hour interval for each drone.

These **Display** fields control what appears in the list view of the drones only. They have nothing to do with the retention policy.
7. Display the list view of a table by entering `<table-name>.list` in the Field navigator field. For example, `<table-name>.list`.
All drone data appears. In the example from the previous step, the speed column would contain the Last value of the sampling period.

8. Click MetricBase Demo > Drones and look at the speed (kph) column.
From the previous step, you know that these values are the last speeds recorded for each drone up to an hour ago. The values are the same as you would get by using the `.list` command.

9. Click the speed value of the first drone.
The following graph shows the speed of the drone that was measured hourly.

Note: You might need to select a different Time Span field value to get a clearer graph. For example, try 1 Day. The speed is a sine wave because it's artificially generated. Hover over the sine wave to see the actual measurements.

10. Click the left arrow (<) to return to the list of drone metrics, right click on one drone type (Model column), and select Show Matching.
Only the drones of the selected type appear.

11. Click the menu icon (≡) next to the Altitude column heading and select Time Series Chart.
You see a graph that shows the altitude measurements of the Warbler-T7-type drones.

You might like to change the Time Span value for a clearer graph.

12. In the Transform field, select Envelope.
You see a graph that shows the minimum and maximum (envelope) altitudes for the fleet of Warbler T7 drones over time.
13. Click the left arrow (↵) to return to the list of drone metrics.

14. Click the menu icon (≡) next to the Altitude column heading and select Time Series Chart Designer to see another way of visualizing the data.

15. In the Create a Report page that displays in the Reporting application, vary with the graph parameters.  

**Note:** In the following steps, to stay on the same page, click Run. To advance to the next page when designing the graph, click Next.  

a. Change the Last value to one day and click Next.
b. In the Style pane, change the **Chart color** value and click **Run**.

c. Click **Type**, select the kind of graph to display, and click **Run**.
d. Click **Configure**, select a transform to run on the data from the **Transform** list, and click **Run**.

e. Edit the report title, which is above the graph, and click **Run**.

f. Click **Configure**. In **Time range**, select the time line to display on the graph.

**Note:** **Relative** uses the **Last** timespan relative to the present time. For example, if **Last** is 1 hour, the time line in the graph always spans the previous hour. You can add this report to your dashboard to show the metrics in the previous hour.
You've displayed drone data in lists and graphs. Now, let's define a trigger that executes when data that you monitor reaches a threshold value.

16. Click **MetricBase Demo > Trigger Definitions**.

   The MetricBase Trigger Definitions list shows the name (Name) of the trigger, the metric (Metric) the trigger monitors, the table (Table name) the metric that it is in, the trigger description, and whether the trigger is active. Triggers kick off flows when metrics meet trigger thresholds. An example is when a drone flies too low. For more information about triggers, see *Trigger Workflows*.

17. Click **Low-Battery Drone**.

   The MetricBase Linear Predictor trigger form displays the definition of the Low-Battery Drone trigger.
In this example, the trigger monitors the **Remaining Battery (%)** metric (**Metric**) in the **Drone** table (**Table name**) every 10 minutes (**Window**). If the battery life is trending downward (**Trend**) and is 80% likely (**Confidence Level**) to reach **20%** (**Threshold**) within 20 minutes (under **Window** for **Level** 1), the trigger executes. Although it fires, nothing happens until you associate this trigger with a flow. The flow defines the actions to take.

18. Click **MetricBase > Triggers**.

   Flow Designer opens.
19. Click + New > New flow to associate a trigger that is defined in the system to a flow.

20. In the Name field, name the flow and click Submit.
21. Click **Click to add a Trigger** and select **MetricBase** in the list.

22. In **MetricBase Trigger**, select a trigger that already exists and click **Done**. 
   Alternately, you could click the plus sign to the right of **MetricBase Trigger** to create a new trigger.

23. Click **Click to add an Action, Flow Logic, or Subflow**.

24. Click **Action** to specify the actions to take when the trigger fires. 
   The Action modal appears.
25. Select a domain of actions from the left column and the specific action to take in the right column.

26. Click **Save** and **Activate**.

The flow doesn't execute unless it is activated. For more information about Flow Designer, see *Flow Designer*.

The following table summarizes the modules in the MetricBase demo.

**MetricBase demo modules**

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drones</td>
<td>Table that keeps metrics on drones, such as speed and altitude. Each record is a different drone. You can add records.</td>
</tr>
<tr>
<td>Fleets</td>
<td>Table that maintains metrics about groups of drones. Each record is a different fleet. You can add records.</td>
</tr>
<tr>
<td>Data Generators</td>
<td>Table that defines how data is created for the drone records. This field is provided for informational purposes. You cannot change or add records.</td>
</tr>
<tr>
<td>Metrics</td>
<td>List of metrics that are defined in the system. This list is the same table as MetricBase &gt; Time Series Metrics. You can add metric fields.</td>
</tr>
<tr>
<td>Scheduled Jobs</td>
<td>Scheduled job that is created for the demonstration application. The job runs every five minutes to add data to the demo tables in the MetricBase database. You can change the schedule.</td>
</tr>
<tr>
<td>Trigger Definitions</td>
<td>List of triggers that are defined in the demo. This list is the same table as MetricBase &gt; MetricBase Triggers &gt; Trigger Definitions. You can create additional triggers.</td>
</tr>
<tr>
<td>Anomaly Logs</td>
<td>List of logs that result from triggers firing. The <strong>Low-Flying Drone</strong> trigger creates the anomaly logs.</td>
</tr>
<tr>
<td>Module</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>

<tr>
<td>Data Explorer</td>
<td>Widget that enables you to experiment with MetricBase JavaScript APIs using the demonstration application data. See <em>Get Familiar with MetricBase APIs</em> for more information.</td>
</tr>
</tbody>
</table>

**Next topics**

- *Set up MetricBase.*
- Explore the MetricBase JavaScript APIs.

**Define and collect MetricBase data**

MetricBase stores time-series summaries of much larger data collections. In MetricBase, you specify the metric that you want to store, how often to collect it, and how long to store it in the MetricBase database. Then, you send the data from an instance to the MetricBase server at the rate that you define using MetricBase REST or JavaScript APIs. In this way, you can monitor a much large data collection with MetricBase summaries of it.

- *Install MetricBase*
- Role required: clotho_admin

You use MetricBase to work with large amounts of machine-generated data by storing a smaller summary of that data in MetricBase.

You use MetricBase to define how often you will send data to MetricBase and what the aggregation of that data is, for example, maximum, minimum, average, or last. This data is called *time-series data.* For example, if you collect drone speeds on an instance, you might send the average the drone speed for every two minutes to the MetricBase database. This data might be one of many time-series metrics that you collect. You might also collect altitude and battery life. MetricBase stores each metric as a column in its database.
Retention schedules specify how long MetricBase stores the time-series data in the MetricBase database. The syntax is `<retention duration> @ <time-series-definition>`. For example, `30 Days @ 5 Minutes`, means that the specified metric is sampled every 5 minutes and that data remains in the MetricBase database for 30 days.

Retention policies include multiple retention schedules with coarser granularity the longer that the data is kept. For example, the Coarse retention policy stores sampled data every:

- Hour for one week (`7 Days @ 1 Hour interval`)
- Two hours for one month (`31 Days @ 2 Hour interval`)
- Day for 13 months (`397 Days @ 1 Day interval`)

In this policy, the specified metric is measured every hour for the first 7 days, every other hour for the next 31 days, and once a day for next 397 days. MetricBase deletes data that is older than 435 days.

To see the list of all supported retention policies, navigate to **MetricBase > Retention Policies**.

1. Navigate to **MetricBase > Time Series Metrics** and click **New** to create a time-series definition.
2. On the form, fill in the fields.

**Time series metric form**

<table>

</tr>
<tr>
<td>Display value aggregate duration</td>
<td>Duration that is used to calculate the aggregation only when using the list view. For example, &lt;table-name&gt;.list where &lt;table-name&gt; is a table in the MetricBase database. This value is unrelated to the retention policy.</td>
</tr>
</tbody>
</table>

You’ve created a time-series specification for a metric that you want to track.

3. Click **Submit**.

4. Sample the data according to the time-series specification and send it from an instance to the MetricBase database server.

There are many ways to send the data to the MetricBase database. The following example shows how to use REST and JavaScript APIs. For information about the MetricBase REST APIs, see the Clotho Time Series API. For information on the MetricBase JavaScript APIs, see Client, Data, DataBuilder, Transformer, TransformPart, TransformResult.

**Note:** You must send the data at the rate that is prescribed by the time-series definition. If you send the data at a different rate or for a different duration, you receive an error. Make sure to aggregate the data according to the time-series metric definition. Also, the MetricBase database only stores values of data type float.

You can gain experience with the APIs by using the Data Explorer. For more information, see *Get familiar with MetricBase APIs*.

### Store time-series data using REST and JavaScript APIs

The following examples store time-series data in the MetricBase database using REST and JavaScript APIs. The following example uses REST.

```bash
curl -X POST -H "Content-Type: application/json" -H "Accepts: application/json" 
  "https://<your_instance.servicenow.com>/api/now/v1/clotho/put?align_time"
  -d [{"seriesRef": {"subject": "<sys_id-of-data-source>", "table": "<metricbase-table>", "metric": "<metric-name>", "start": "<start-time-of-data>", "values": [0.0, 1.4, 1.1, 1.0, 0.9]}] -u username:passwd
```
• sys_id-of-data-source—Sys ID of the object that generates the metric. For example, in the MetricBase Demo, this would be the sys_id of a drone.
• metricbase-table—Name of the table in the MB database that stores the time-series data.
• metric-name—Metric field name of the metric that is recorded in the database.
• start-time-of-data—Time that the data was sampled from the instance, for example, 2019-04-02T03:00:00Z.

Note: Line returns were introduced into the curl statement to make it fit on the page. To use the code, remove the line returns.

If you prefer to use a JavaScript API to store the time-series data in the MetricBase database, here’s a similar example:

```javascript
var count = 60 * 48; // 2 days of data
var values = [];
for (var i = 0; i < count; i++) {
    values.push(Math.random());
}

var gr = new GlideRecord('<metricbase-table>');
gr.get('<sys_id-of-data-source>');

var start = new GlideDateTime();
start.addSeconds(-1 * 60 * count);

var dataBuilder = new sn_clotho.DataBuilder(gr, '<metric-name>').add(start, values);
new sn_clotho.Client().put(dataBuilder);
```

• sys_id-of-data-source—Sys ID of the object generating the metric. For example, in the MetricBase Demo, this would be the sys_id of a drone.
• metricbase-table—Name of the table in the MB database that stores the time-series data.
• metric-name—Metric field name of the metric that is recorded in the database.

• If you use a predictive model to detect anomalies, create a predictive model. To see how, refer to Detect anomalies using predictive models.
• View the metrics that are stored in the MetricBase database. To see how, refer to View the metrics.
• Set up triggers that execute Flow Designer flows. To see how, refer to Set up triggers.

Detect anomalies in MetricBase data using predictive models

Use statistical models to determine significant anomalies in real-time using MetricBase triggers. You will need to train a model using representative data that has already been stored in MetricBase.

Role required: admin

MetricBase creates a model by training a representative sample of your time series data to determine the model parameters. The training process determines the model parameters that best fit your data, to distinguish normal data from anomalous data. MetricBase supports the following model types:

• Probabilistic Exponentially Weighted Moving Average (PEWMA), a moving average algorithm that uses a probability factor to determine how it reacts to change in data
• Autoregressive Integrated Moving Average (ARIMA), a moving average algorithm that factors in previous errors and values
• Seasonal Trend decomposition using Loess (STL), a seasonal algorithm for decomposing time series data into seasonal and trend components
• Holt-Winters (HW), a seasonal algorithm that decomposes the trend and seasonal components to determine the level

**Note:** MetricBase selects the most appropriate model type when you select **Find Best Fit Model** from the model class list.

After you have a model trained from your data, you can trigger flows when new data is significantly different than the trained data.

1. Navigate to **MetricBase > MetricBase Models** and click **New**.
2. On the form, fill in the fields.

**Model New Record form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model name</td>
<td>Name of the model. The name can be any combination of alphanumeric characters. This model name is not the same as the model class. In general, the name relates to the value in <strong>Group by</strong>.</td>
</tr>
<tr>
<td>Table name</td>
<td>Name of the table that contains the training data.</td>
</tr>
<tr>
<td>Metric</td>
<td>Name of the metric that you use to train the model. The metric must belong to the table.</td>
</tr>
<tr>
<td>Created</td>
<td>Date that you trained the model.</td>
</tr>
<tr>
<td>Filter</td>
<td>Filters that you use to exclude some of the data in the dataset.</td>
</tr>
</tbody>
</table>

**Note:** When choosing data to train your model, try to select data that demonstrates an expected behavior to reduce anomalies in the training set.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group by</td>
<td>You can use <strong>Group by</strong> as a discriminator field for your model data. For example, if you want to create a data model over a group of production servers whose performance differs by role (such as database or application server roles) then you would choose role as the <strong>Group by</strong> field. The training process creates one model per role in the group of records selected by the filter. You do not have to manually create a model for each role.</td>
</tr>
<tr>
<td>Model Class</td>
<td>The algorithm to use when training data. Select a moving average algorithm (PEWMA, ARIMA), a seasonal algorithm (STL, HW), or choose <strong>Find Best Fit Model</strong>. The default is <strong>Find Best Fit Model</strong>, which tries each algorithm and selects the one which appears to have the best fit over the training set.</td>
</tr>
<tr>
<td>Training Dataset Start Date</td>
<td>MetricBase time series data for the metric starting with this date.</td>
</tr>
<tr>
<td>Training Dataset End Date</td>
<td>MetricBase time series data for the metric ending with this date.</td>
</tr>
<tr>
<td>Valid until</td>
<td>Date that serves as a reminder to consider retraining the model. If the model is performing well, there's no need to retrain it. The model can continue working past this date.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to use the trained model. Once the model is active it becomes available for use as a Flow Designer trigger.</td>
</tr>
</tbody>
</table>

3. Click **Submit and Train**.
   MetricBase trains the model. When complete, the model appears on the **MetricBase Model Instances** tab.
4. Click the model name.
   The modeling data appears as does the model string with the parameters optimized by the training.
5. Optional: Click the model name and then click **Set Model** to change the model parameters.

   You can edit the model parameters when you want to override the settings for training your model. The graph does not update, you are saving the revised model string.
You can create a Flow Designer trigger for this model. For more information, see *Create a model trigger*. 

**Access MetricBase data**

Access the time-series data that you sent to the MetricBase database in the way that is convenient to you.

Role required: admin

You can access and visualize time-series data in the MetricBase database by using:

- **Reporting application**
  
  You can generate reports and graphs from the time-series data that is stored in the MetricBase database. For more information, see *Create reports from MetricBase time-series data*.

- **Table lists using the** `.list` **command**
  
  For more information, see *View MetricBase data using the list command*.

- **REST or JavaScript APIs**
  
  For more information, see *View MetricBase data using REST and JavaScript*.

**Access MetricBase data using the** `.list` **command**

Use the `.list` command on a table in the MetricBase database to view time-series data. The data reveals the behavior of the entity that supplies the data.

Role required: admin

1. On the MetricBase instance, in the **application navigator**, type `<table-name>.list`, and press the Enter key.
   
   `<table-name>` is the name of the table in the MetricBase database that contains the metric you want to view.

2. Click the menu icon

   (≡)

   above the metric column, and select **Time Series Chart**.
3. Change the **Time Span** and **Transform** fields to evaluate the data.

4. Optional: Adjust the data:
   a) Select one of the transforms: **Add**, **Multiply**, or **Divide**.
   b) In the **Value** field, enter the number to add, multiply, or divide the metric data by and click **Submit**.

   ![Note] The adjusted data is not saved in the MetricBase database.

**Retrieving MetricBase data using REST and JavaScript**

Use JavaScript or REST APIs to retrieve time-series data from the MetricBase database and to run transforms on the data. The transformations enable you to visualize time-series data in a variety of ways.

For more information about MetricBase time-series data transformations, see [MetricBase transforms](#).

**Using REST**

For information about the MetricBase REST APIs that return time-series data from the MetricBase database, see:

- **Clotho Time Series API**, which inserts, retrieves, and transforms data in the MetricBase database.
- **MetricBase Data Explorer** that comes with the MetricBase Demo, and enables you to experiment with the APIs.

**Using JavaScript**

For information about the MetricBase JavaScript APIs that return time-series data from the MetricBase database, see:

- **Client** — Execute transforms on the MetricBase database and receive the results.
- **Data** — Return the object that contains the result of a transform.
- **DataBuilder** — Create a series of data points for a metric.
- **Transformer** — Manipulate time-series data to prepare the data for evaluation and analysis.
- **TransformPart** — Specify details of the transform to be done.
- **TransformResult** — Return the object that contains the result of the transformation.

**Analyze time series data with JavaScript APIs**

This example returns the average CPU usage over the specified time for each XYZ computer.

```javascript
// Query the cmdb_ci_computer table for the records for
var gr = new GlideRecord('cmdb_ci_computer');
gr.addEncodedQuery('manufacturer=xyz');
gr.query();

// Create a DataSelector object and specify the metric
cpu_percentage),
// the transform (avg), and label (avg cpu)
var transform = new
sn_clotho.Transformer(gr).addMetric('cpu_percentage').avg()
 .label('avg-cpu-percentage');

// Run the transform between startTime and endTime.
startTime and endTime are GlideDateTime
var data = transform.execute(startTime, endTime);
```

Filter data

Developers can use SQL WHERE clauses in transformation scripts to filter data in report visualizations. Transformations in clotho aggregations apply mathematical functions on metric records. Use SQL WHERE clauses in transformation scripts to filter data. In the following example, the WHERE clause filters out all results except those results where mb_demo_mt_speed equals 100.

```javascript
var eqCon = new sn_clotho.Condition().eq(100);
var builder = new sn_clotho.Transformer(drones);
var fit = builder.metric("mb_demo_mt_speed").where(eqCon);
```

MetricBase triggers

Time-series data that is stored in the MetricBase database can trigger Flow Designer flows. These triggers can log incidents, send emails, and create other alerts.

You use MetricBase to define a trigger on an instance. When you associate the trigger with a Flow Designer flow, the trigger definition transfers from your instance to the MetricBase server. When you make the trigger and flow active, the trigger monitors the time-series data that is stored in the MetricBase database. When data meets the triggering conditions, MetricBase adds the trigger alert to the Trigger queue. The instance regularly polls that queue. When the polling finds a trigger waiting in the queue, the Flow Designer flow executes on the instance.

For more information about time-series policies, see Define and collect MetricBase data.
High-level overview of implementing triggers

1. Define one or more of the following triggers on an instance:
   - **Band trigger** — Triggers when a metric value falls within a range of values.
   - **Linear Predictor trigger** — Triggers when a series of values trend toward and are expected to reach a specified value.
   - **Gap trigger** — Triggers when values are not received for a period of time.
   - **Model trigger** — Triggers when a trained model detects anomalous behavior.

2. Create a trigger condition to add additional requirements for a trigger to execute a flow.
   For example, data often fluctuates over time. Small fluctuations can cause unwanted, duplicate triggering events. A Condition Script can prevent that erroneous duplication.

3. **Associate the trigger with the flow it executes** using Flow Designer.

4. Test the trigger and workflow.

5. Activate the trigger.

Deleting triggers

You can't delete a trigger in MetricBase if it is associated with a flow in Flow Designer. To delete a trigger, you must first delete the flow in Flow Designer and then you can delete the trigger in MetricBase.

Legacy triggers

Legacy triggers are deprecated. You can't create new ones; you can only carry forward ones that already exist. To see them, navigate to **Legacy triggers**.

Create a MetricBase band trigger

Create a MetricBase band trigger that detects when a metric value falls within a range of values.

Role required: admin

Band triggers execute when metrics fall outside of or within a range of values.
2. On the MetricBase Trigger Creation form, click Band Trigger - Detects and takes action when metric value meet certain threshold or is within a range.
   On the MetricBase Band Trigger form, you can see the table and tracked metric but not the band trigger parameters.
3. On the form, fill in the fields.

**MetricBase Band Trigger form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the band trigger.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table in the MetricBase database that contains the metric that you want to monitor. The only tables that appear when you click the search icon are the tables that you specified in the time-series metrics. If you select a metric before you select a table, only tables that have that metric appear in the <strong>Table name</strong> modal.</td>
</tr>
<tr>
<td>Metric</td>
<td>Table metric that you want to monitor that is specified by the <strong>Table name</strong>. The only metrics that appear when you click the search icon are the metrics in that table. If you select a metric before you specify a <strong>Table name</strong>, the metrics in all your time-series metrics appear. After you select a metric, only the tables that contain that metric appear when you click the search icon that is next to the <strong>Table name</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the trigger.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the trigger.</td>
</tr>
<tr>
<td>Aggregator</td>
<td>Aggregation value that you select: None, Max, Min, or Average. None means that you use the last value in the collection interval.</td>
</tr>
</tbody>
</table>

4. Click Save.

5. In the MetricBase Band Trigger Levels area, double-click each cell to add values that specify trigger parameters.

<table>
<thead>
<tr>
<th>MetricBase Band Trigger Levels</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>Level</td>
<td>Numbers that indicate increasing severity. For example, you might define the CPU usage for level 1 to be above 85% and the CPU usage for level 2 above 90%. Each level should trigger a different flow. Level is often used in Conditional Scripts.</td>
</tr>
<tr>
<td>Function</td>
<td>Function that makes the Value the maximum or minimum value of the lower end of the band and defines whether trigger values are inside or outside of the band. For example, if the Function is Less than, the trigger executes when the metric goes below band.</td>
</tr>
<tr>
<td>Value</td>
<td>Lower end of the band. See the following image.</td>
</tr>
<tr>
<td>Band Function</td>
<td>Function that makes the Band Value the maximum or minimum value of the upper end of the band and defines whether trigger values are inside or outside of the band. For example, if the Band Function is Greater than, the trigger executes when the metric goes above the band. See the following image.</td>
</tr>
<tr>
<td>Band Value</td>
<td>Upper end of the band. See the following image.</td>
</tr>
<tr>
<td>Tolerance</td>
<td>Tolerance range, plus or minus the Value and Band Value. Select a tolerance to prevent repeatedly executing a trigger for small fluctuations in the data. Once a trigger executes, the data must exceed the tolerance to execute the trigger again. See the following image.</td>
</tr>
</tbody>
</table>
For example, if the **Function** is **Less than**, the **Value** is 100, the **Band Function** is **Greater than**, the **Band Value** is 200, and the **Tolerance** is 0, the trigger executes for all values that are less than 100 and greater than 200.

6. Optional: Add additional rows in the table to create multi-layered triggering behavior.
   Typically, each additional row indicates a more severe condition and the Flow Designer flow that is associated with the level warns with increasing severity. For example, level 1 might define the band from 100 through 200. Level 2 might define the level from 50 through 250.

7. Click **Update**.

8. Optional: Add a triggering condition that determines whether or not a trigger executes a Flow Designer flow.
   For more information, see *Create a triggering condition*.

Associate this trigger with a Flow Designer flow. For more information, see *Assign a trigger to a flow*.

**Create a MetricBase linear predictor trigger**

Create a MetricBase linear predictor trigger to detect when a metric is likely to cross a specified threshold within a specified period of time.

Role required: admin

The linear predictor trigger uses past data to generate a line that predicts future values. When MetricBase predicts that the linear value will reach a **threshold**, the trigger executes.
If the most recent data point reaches the threshold, the trigger executes regardless of the linear prediction.

Trigger parameters include how much past data to use in the calculation of the prediction, how far ahead to look, and the level of confidence that you accept.

2. Click Linear Predictor Trigger - Predicts and takes action when a metric follows an upward or downward trend and is expected to reach a given threshold in the future.
3. On the form, fill in the fields.

### MetricBase Linear Predictor Trigger form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name that you give the trigger.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table in the MetricBase database that contains the metric that you want to monitor. The only tables that appear when you click the search icon are the tables that you specified in the time-series metrics. If you select a metric before you select a table, only tables that have that metric appear in the Table name modal.</td>
</tr>
<tr>
<td>Metric</td>
<td>Table metric that you want to monitor that is specified by the Table name. The only metrics that appear when you click the search icon are the metrics in that table. If you select a metric before you specify a Table name, the metrics in all your time-series metrics appear. After you select a metric, only the tables that contain that metric appear when you click the search icon that is next to the Table name.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the trigger.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Window | Length of time that you want to use to calculate the line that predicts the future course of the value. For example, you might want to use the last 10 minutes of data to calculate the linear predictor. If the value is too long, the line does not reflect current trends. If the value is too short, the line might follow the raw values too closely and not accurately reflect the overall trend of the values. The value must be at least 10 times the sampling period that is defined by the sampling rate of your Metric. The format is hours:minutes:seconds. Do not confuse this value with the value of Window in the trigger level. That value specifies how far into the future that you want the linear predictor to look to see if the Metric is likely to cross the Threshold.
Confidence Level (%) | Percentage that specifies how tolerant you are of the real data fitting the linear prediction of the data. For example, a confidence level of 95% means that the real value must be within 5% of the predicted value in order to execute a trigger. If you only want to trigger when the real values are close to the predicted values, choose a high confidence percentage. If you are willing to accept real data that varies more significantly from the predicted values as being valid, select a lower confidence level, for example, 80%.
Trend | Direction of the trend: increasing or decreasing. For example, the value is increasing or decreasing toward the Threshold.
Threshold | Target value that the metric is expected to reach before the trigger executes.
Description | Description of the trigger.

4. Click Save.
In the MetricBase Linear Predictor Trigger Levels form, you can create multiple trigger levels of increasing severity. For example, you can configure the battery level to be 80% for level one and at 90% for level two.

5. In the MetricBase Linear Predictor Trigger Levels area, double-click each cell to add values that specify trigger parameters.

MetricBase Linear Predictor Trigger Levels

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>Numbers that indicate increasing severity. For example, you might define level 1 to be CPU use is predicted to reach 85%. Level 2 might be CPU use is predicted to reach 90%. Each level can trigger a different Flow Designer flow.</td>
</tr>
<tr>
<td>Function</td>
<td>Function to use on the value. For example, Less than or is.</td>
</tr>
<tr>
<td>Window</td>
<td>How far into the future that you want the linear predictor to look to see if the metric is predicted to cross the threshold. Do not confuse this value with the Window value in the trigger definition form. That value specifies how much data to use (measured in time) to calculate the slope of the predictor line.</td>
</tr>
</tbody>
</table>

6. Click Update.
7. Optional: Add a triggering condition that determines whether or not a trigger executes a Flow Designer flow.
For more information, see Create a triggering condition.

Associate this trigger with a Flow Designer flow. For more information, see Assign a trigger to a flow.

Create a MetricBase gap trigger
Create a MetricBase gap trigger to alert you when MetricBase stops receiving data.
Role required: admin

Gap triggers execute when MetricBase stops receiving data for a specified period.

You can define multiple trigger levels to indicate different severities. For example, you can set a gap of 15 minutes as level 1, a gap of 30 minutes as level 2, and so on. Each level should trigger a different Flow Designer flow. The difference between gap durations on different levels must be at least 10 minutes. For example, if you set level 1 to a gap of 15 minutes, you must set level 2 to a gap of 25 minutes or more.

**Note:** If you make the gap durations between levels less than 10 minutes, MetricBase displays an error message and deletes the level that you added.

MetricBase calculates how often to poll data by taking the difference between gap durations on different levels and dividing them by 2. For example, if level 1 triggers after 20 minutes of missing data and level 2 triggers after 40 minutes of missing data, the polling frequency is \((40-20)/2 = 10\) minutes. The maximum polling frequency is every 5 minutes, and the minimum frequency is every 30 minutes. If a trigger has only one level, the polling frequency is 30 minutes.

MetricBase searches through the data that is stored in the MetricBase database, not through incoming data. For that reason, a gap trigger might execute after the gap when data is missing. For example, if MetricBase polls the database every 10 minutes and the gap is 30 minutes of missing data, the trigger might execute as late as 40 minutes after the data was last received.

2. In the MetricBase Trigger Creation form, click Gap Trigger - Detects and takes action when no data is received for a metric.
3. On the form, fill in the fields.

**MetricBase gap trigger form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the trigger.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table in the MetricBase database that contains the metric that you want to monitor. The only tables that appear when you click the search icon are the tables that you specified in the time-series metrics. If you select a metric before you select a table, only tables that have that metric appear in the Table name modal.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Option to activate the trigger.</td>
</tr>
<tr>
<td>Metric</td>
<td>Value the trigger monitors in the MetricBase database.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the trigger.</td>
</tr>
</tbody>
</table>

4. Click **Save**.

5. In the MetricBase Gap Trigger Levels area, double-click each cell to add values that specify trigger parameters.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>Numbers that indicate increasing severity. For example, you might define level 1 to be no data for 1 minute. Level 2 might be no data for 5 minutes. Each level should trigger a different flow.</td>
</tr>
<tr>
<td>Function</td>
<td>Function, <strong>Greater than or is</strong>, which means that this trigger executes when the gap in received data is greater than the value that you specify in the <strong>Window</strong> field.</td>
</tr>
<tr>
<td>Window</td>
<td>Length of time that no data has been received that executes the trigger. The format is hours:minutes:seconds. For example, 00:20:00 means that this trigger executes after 20 minutes of missing data.</td>
</tr>
</tbody>
</table>

6. Click **Update**.

7. Optional: Add a triggering condition that determines whether or not a trigger executes a Flow Designer flow. For more information, see **Create a triggering condition**.

Associate this trigger with a Flow Designer flow. For more information, see **Assign a trigger to a flow**.

### Create a MetricBase model trigger

Model triggers execute when the time-series data deviates from expected values.

Role required: admin

Probabilistic exponentially-weighted moving average (PEWMA) is the only model type supported. MetricBase uses this model to create a definition of expected, normal values.

1. Click **MetricBase > Flow Designer > Trigger Definitions** and click **New**.

2. Click **Model Trigger - Detects and takes action when a metric value deviates from the trained model**.

The MetricBase Model Trigger form specifies the table and metric used to train the model.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name the model trigger.</td>
</tr>
<tr>
<td>Model</td>
<td>Trained model this trigger uses.</td>
</tr>
<tr>
<td>Metric</td>
<td>Automatically filled in based on the model.</td>
</tr>
<tr>
<td>Table name</td>
<td>Automatically filled in based on the model.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the trigger.</td>
</tr>
<tr>
<td>Description</td>
<td>Explanation of the trigger.</td>
</tr>
<tr>
<td>Spike Direction</td>
<td>Trigger execution criteria. Specify whether you want to trigger only on anomalies that occur above predicted values, only on anomalies that occur below predicted values, or both.</td>
</tr>
<tr>
<td>Window</td>
<td>Amount of data to use when calculating the moving, weighted average; the longer the window, the more data. The recommendation is 30 times the sampling interval. For example, if the time-series data is sampled every minute, make this value 30 minutes. Values must be multiples of the sampling interval.</td>
</tr>
<tr>
<td>Active</td>
<td>Turns on the trigger.</td>
</tr>
</tbody>
</table>

**Note:** For the **Window** value, very short durations make the weighted average move with the data itself and fail to detect anomalies. Very long durations make the weighted average unresponsive to current trends in the data and may cause false triggers.

4. Click **Save**.
5. In the MetricBase Model Trigger Levels area, double-click each cell to add values that specify trigger parameters.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>Numbers that indicate increasing severity. For example, you might define level 1 to be 3 standard deviations from the mean. Level 2 might be 5 standard deviations. Each level should trigger a different Flow Designer flow. Level is often used in Conditional Scripts.</td>
</tr>
<tr>
<td>Function</td>
<td>Always Greater than or is, meaning that in order to trigger, the time-series metric must be greater than or equal to the number of standard deviations from the mean specified in Number of Standard Deviations.</td>
</tr>
<tr>
<td>Number of Standard Deviation</td>
<td>Float value specifying the number of standard deviations the time-series metric must be away from the mean to trigger an alert at this level.</td>
</tr>
</tbody>
</table>

6. Optional: Add additional rows in the table to create multi-layered triggering behavior. Each successive row should indicate a more severe condition.

7. Click Update. The MetricBase Trigger Definitions page displays the list of defined triggers.

8. Test your model and trigger on real data before deploying to production.

9. Optional: Add a triggering condition that determines whether or not a trigger executes a Flow Designer flow. For more information, see Create a triggering condition.

Associate this trigger with a Flow Designer flow. For more information, see Assign a trigger to a flow.

### Execute triggers conditionally

MetricBase triggers execute based on a single metric. Condition Scripts impose additional requirements that determine whether a trigger kicks off a flow.

Role required: admin

Condition Scripts execute when conditions for a trigger are met but before the trigger executes a Flow Designer flow. In that way, Condition Scripts can prevent triggers from executing flows even when trigger conditions are met. For example, data often fluctuates over time. Small fluctuations can cause unwanted, duplicate triggering events. A Condition Script can prevent that erroneous duplication.

Condition Scripts always return True (trigger) or False (do not trigger). To learn how to write these scripts, see Scripting in ServiceNow Fundamentals. To experiment with scripts, see Get familiar with MetricBase APIs.

You can create and save Condition Scripts in MetricBase but you associate them with triggers using Flow Designer.

1. Click MetricBase > MetricBase Triggers > Trigger Condition Script > New.
2. On the Additional MetricBase Trigger Filtering Condition New Record form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the Condition Script.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of the Condition Script. The value, Global, means that the action applies to all applications.</td>
</tr>
<tr>
<td>Description</td>
<td>Explanation of what the Condition Script does.</td>
</tr>
<tr>
<td>Script</td>
<td>Field to enter the JavaScript. Make it returns True to execute a flow. See the next step.</td>
</tr>
</tbody>
</table>

3. Write the Condition Script.
The key part of these scripts is the conditional statements. If all evaluate true, the script returns True and the flow executes, otherwise it does not. The following example script triggers a flow when a drone is traveling too fast at a low altitude (defined by level 1). The example shows a typical approach to writing a Condition Script.

a) Get the trigger definition.

b) Get the record (current) that is causing the triggering event.

c) Get the time from the record that the trigger conditions were satisfied.

d) Get the trigger level, which defines the trigger parameters.

e) Use these parameters to return True if the level 1 trigger conditions are met and travel_state equals traveling or speeding.

```javascript
function filter(/*GlideRecord*/ triggerDefinition, /*GlideRecord*/ current, /*GlideDateTime*/ start, /*int*/ level) {
    // retrieve current travel state of drone
    var travel_state = String(current.travel_state);

    // the drone is traveling at a significant speed, and the altitude just went below the threshold
    if (((travel_state === 'traveling') || (travel_state === 'speeding'))
    && (level === 1)) {
        return true; // process this trigger
    }
    return false; // don't process this trigger
}
```

Note: Condition Scripts must execute quickly.

4. Click Submit.

Use Flow Designer to associate a flow with a trigger. When configuring a flow, you can select a Condition Script you created.
Assign a trigger to a flow

Now that you created a trigger, use Flow Designer to specify the flow a trigger executes. The flows provide alerts for unexpected behavior.

Role required: admin

Triggers, by themselves, execute nothing. After defining a trigger in MetricBase, you use Flow Designer to associate the trigger with a flow.

   Flow Designer displays a list of triggers associated with Flow Designer flows.
2. Click New > New Flow.

   Note: If the list contains triggers, click +New and then New Flow in the list.
3. Enter values for the modal fields and click **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the flow to execute. The system computes the internal name of the flow from the name.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope to create your flow in. Global is the default.</td>
</tr>
<tr>
<td>Protection</td>
<td>Option to make the flow read-only. Selecting read-only prevents users who do not own the application scope from making changes to the flow. You can only select a value when you create the flow in an application scope you own.</td>
</tr>
<tr>
<td>Description</td>
<td>Explanation of why you are associating this flow with the trigger.</td>
</tr>
<tr>
<td>Run As</td>
<td>Choose whether the flow runs as System User or the user who initiates the session. Use the user who initiates the session option when the update should come from the user who triggered the flow. For example, comments to incident records that should come from the current user, or approval emails that should originate from the approver. Settings on a flow do not apply to child subflows. When run as the user who initiates the session, flow actions are limited by the user's ACL restrictions. Flows run by the initiating user respect user-specific settings like date/time format.</td>
</tr>
</tbody>
</table>

**Note:** When choosing the option to run as the user who initiates the session, ensure that security restrictions do not prevent users who will trigger the flow from performing the flow actions.

A tab opens and the tab name is the value for **Name**.

4. Click **Click to add a trigger** to specify the trigger that kicks off this flow.
   A modal displays that enables you to find and select a trigger type.

5. Scroll and select MetricBase for the trigger type.
   The Flow Designer form displays.
6. Under **TRIGGER**, fill in the form to define the trigger to associate with this flow.
   
   a) Beside **MetricBase Trigger**, click the magnifying glass to select an existing trigger or click the plus sign (+) to define a new trigger.
   
   b) Optionally, add requirements for the flow to execute by clicking **Add Filter** and adding filter conditions, for example, **flight-status is-not landed**.
   
   c) Optionally, beside **Condition Script**, click the magnifying glass to select a **condition script** or click the plus (+) to **create a script**.

   Condition scripts add additional requirements for a trigger to execute a flow.

7. Under **ACTIONS**, click **Click to add an Action, Flow Logic, or Subflow** and select a category in the first column and a flow action in the second column.
8. Click Done.

9. Test the flow.
   a) Navigate to Flow Designer > Designer, and double-click the flow.
   b) Click Test.
      The Test flow dialog box displays. The contents of the Test flow dialog depend on the type of trigger: Data or Schedule. If the trigger is a Data trigger, the dialog asks for a record to use for the test.
   c) Select a record in the dialog box and click Submit.

   **Note:** When you test a flow, the system does not execute the trigger, and therefore does not create a new record. By selecting a record in the Test flow dialog box, the system acts as if that record was just created. For more information, see Test a flow.

10. Click Activate to activate the trigger.
    The flow will not execute unless you activate it.
Maintain MetricBase

View the status of MetricBase and debug its triggers.

View MetricBase status and statistics

You can view the status of the MetricBase database.

Role required: admin

1. View the status of the MetricBase instance.
   a) Navigate to System Diagnostics > Stats > Stats
   b) Scroll down to find MetricBase Statistics

![MetricBase Statistics](image)

Status: ONLINE
Name: clotho
Connection Pool stats: [leased: 0; pending: 0; available: 1; max: 42]

2. View the metrics monitored by MetricBase and statistics about them.
   a) Click MetricBase > MetricBase Status
   The MetricBase Status page displays all of the metrics tracked in MB.

   ![MetricBase Status](image)

   b) Click the gear icon.
The Personalize List Columns modal displays.

c) Select and move metrics from the **Available** column to the **Selected** column to display the metric and click **OK**.
The metrics display on the MetricBase Status page.
View trigger logs

Trigger logs show different levels of trigger malfunctions.

Role required: admin

1. Navigate to MetricBase > MetricBase Triggers > Trigger logs.
2. Click one of the trigger logs.
4. Optional: Change the default values in the Enter parameters for log file entries to browse form to select the log entries to view and click Submit.

Debug MetricBase

You can display the results of debugging scripts in MetricBase.

Role required: admin

1. Navigate to System Diagnostics > Session Debug > Debug MetricBase.
When the page you are on submits queries to MetricBase, you see the transforms and how long they took on the bottom of the page. Submitting a lot of MetricBase queries may slow down the page load time significantly.

2. To view a history of the debug script’s execution, click available here.

3. Click Update.
   Session debug tracking for MetricBase activities starts and the MetricBase Status page displays.

Get familiar with MetricBase APIs

Experiment with MetricBase APIs using Data Explorer that is part of the MetricBase Demo application. Data Explorer uses the data installed with the MetricBase Demo application.

Role required: clotho_admin

Data Explorer is a playground where you can see and edit example scripts that visualize data included with the MetricBase Demo application. The example scripts use the MetricBase JavaScript APIs. For information on the MetricBase JavaScript APIs, see Client, Data, DataBuilder, Transformer, TransformPart, TransformResult.

Example scripts use either:
- Transforms, which use the Transformer method.
- Machine Language, trained models that predict expected behavior. All the scripts without "Transform" in their title use Machine Language.

1. Navigate to MetricBase Demo > Data Explorer.
   The Data Explorer displays.
When you run a script, the data visualization appears under **Data Explorer Script Result Display**.

2. Select one of the sample scripts to run in the **Example Script** menu.
3. Click **Load Example**.

4. Click **Run**.

   The script displays the data visualization under **Data Explorer Script Result Display**.

5. Optional: Change the values or statements in the script or write an entirely new script and click **Run**.

   **Note:** If you want to save the changes you made in the script, click **Save**.

6. Under **Server Output**, look at the server's response that might include error information.
## Example scripts

<table>
<thead>
<tr>
<th>Example script</th>
<th>Definition and visualization</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simple Transform</td>
<td>Uses the transformer API to display a single time-series metric, the average speed of the drones: transformer.metric('mb_demo_mt_speed').avg()</td>

</tr>
</thead>
<tbody>
<tr>
<td>Seasonal Trend Decomposition Model</td>
<td>Uses a seasonal trend model so that data can be subtracted to reveal non-seasonal trends. This model is similar in purpose to the Holt Winters model but arrives at the result using different algorithms.</td>
</tr>
<tr>
<td>var builder = new sn_clotho.Transformer(drones); var metric = &quot;nb_demo_mt_rem_battery&quot;; var fit = builder.metric(metric).fit({model:&quot;STL&quot;,periodicity:&quot;PT2H&quot;, innerCycles:1, outerCycles:10})</td>
<td></td>
</tr>
<tr>
<td>Holt Winters Model</td>
<td>Uses the Holt Winters, seasonal trend model so that data can be subtracted to reveal non-seasonal trends. This model is similar in purpose to the Seasonal Trend Decomposition model but arrives at the result using different algorithms.</td>
</tr>
<tr>
<td>ARIMA Model</td>
<td>The most general class of models for predicting time-series data that has no trend, meaning all the data has the same value or the values fluctuate sinusoidally around the mean.</td>
</tr>
</tbody>
</table>
### Domain separation and MetricBase

This is an overview of domain separation and the MetricBase application. With domain separation you can separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Support level: Basic**

- Business logic: Ensure that data goes into the proper domain for the application’s service provider use cases.
- The application supports domain separation at run time. This includes domain separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Use case: When a service provider (SP) uses chat to respond to a tenant-customer’s message, the client must be able to see the SP’s response.

Example script

```javascript
var metric = "nb_demo_mt_rem_battery";
builder.metric(metric).deviation(model, "chiSquare");
```
MID Server

The Management, Instrumentation, and Discovery (MID) Server is a Java application that runs as a Windows service or UNIX daemon on a server in your local network. The MID Server enables communication and the movement of data between a ServiceNow instance and external applications, data sources, and services.

The MID Server initiates all communications with the ServiceNow® instance. This communication is recorded as records in the ECC Queue, which acts as the communication log between the instance and the MID Server. The MID Server picks up any work it has to do from the ECC Queue and returns the results of that work to the queue.

This video gives you an overview of the MID Server:

Setting up the MID server

1 Connect  
2 Install  
3 Configure  
4 Encrypt

Ensure that the MID Server can connect to elements inside and outside your network
Download and install the MID Server on a Linux or Windows host
Configure your MID Server
Configure MID Server security
Ensure that the MID Server can connect to elements inside and outside your network
Download and install the MID Server on a Linux or Windows host
Configure your MID Server
Configure MID Server security

This documentation provides detailed instructions for setting up a functioning MID Server for use with ITOM applications. Click the icons to go to each task's portal page. These procedures help you prepare your system, download and run the installer, and configure MID Servers to run in your environment. After you get a valid MID Server up and running, you can add security and encryption to protect your data.

At the bottom of each page is a link to the reference materials you need, such as MID Server system requirements, configuration parameters, and instructions for monitoring your MID Server. Use the additional links at the bottom to move through the content within a specific category or return to the MID Server setup to access a different portal.

If you are new to the MID Server or an experienced user who wants to set up a MID Server quickly, you can use the MID Server Guided Setup. This wizard walks you through the process of installing and configuring a MID Server with default settings in just a few steps.
Upgrading the MID Server

The MID Server checks with the instance periodically to see if an upgrade is necessary. If the MID Server detects that a new version is available for upgrade, it downloads the installer from install.service-now.com and runs the package automatically. You can also elect to upgrade the MID Server manually. See MID Server upgrades for details.

Resolving MID Server issues

You can search the HI Knowledge Base for troubleshooting articles or monitor the MID Server status and track active issues from within the instance. See Resolving MID Server issues for details.

ServiceNow applications that use the MID Server

- Discovery
- Orchestration
- Service Mapping
- Event Management
- Operational Intelligence
- Cloud Management
- IntegrationHub
- Cloud Insights

External applications that use the MID Server

- Import Sets
- Microsoft SMS/SCCM
- LANDesk Maintenance Suite
- Microsoft System Center Operations Manager (SCOM)
- Microsoft MIIS

MID Server version compatibility

The version of the MID Server must be compatible with the version of the instance. Otherwise, the MID Server cannot process commands or communicate with the instance.

The instance determines which version of the MID Server is allowed. The MID Server version must at a minimum belong to the same major release, such as Madrid. If the MID Server version belongs to the same major release, it can, but does not have to, belong to the same minor version, such as Madrid Patch 1. In this case, communication with the instance might still be possible, but it is always suggested that you upgrade to the latest version.

Caution: You can pin the MID Server to a specific version, but you should be aware that the version might become out of date.

Configure MID Server network connectivity

Prepare the network for MID Servers to connect with the instance and access the download site. The network must be prepared before installing or configuring the MID Server. If computers or devices have additional security measures, that security may interfere with MID Servers on those systems.
Role required: admin

Ensure that the MID Server can connect to elements inside and outside your network
Configure MID Server security
Configure your MID Server
Download and install the MID Server on a Linux or Windows host
Configure your MID Server
Configure MID Server security

Prerequisites: Make sure that the host machine meets the requirements specified in the MID Server system requirements.

The MID Server host computer must have access to the ServiceNow download site at install.service-now.com to upgrade automatically. If you have a self-hosted ServiceNow environment that blocks access to the download site, you must import the MID Server installer package into your MID Server hosts manually. For instructions, see KB0760123 in the Self-Hosted knowledge base.

Firewalls and proxy configurations may block calls to the OCSP Entrust server, which prevents the MID Server from working. You may need to change your firewall permissions so the OCSP traffic to go through properly. For more information and resolutions, see the HI Knowledge Base article [KB0813636].

The host machine must have these network privileges:

- Firewall access: Configure any firewalls between the MID Server and the target devices to allow a connection. If your network uses a DMZ, and if your network security protocols limit port access from within the network to the DMZ, you might have to deploy a MID Server to a machine within the DMZ to probe the devices there.
- Network access: Configure target devices to allow the MID Server probe to connect. If network security prevents you from configuring new machines that can connect to the targets, install the MID Server on an existing machine with connection privileges.
- Network account: Install the MID Server with the proper account, either local or domain administrator.

Additionally, for the MID Server to access your ServiceNow instance, satisfy these prerequisites:

- Network access to the ServiceNow instance: Configure the network that the MID Server uses to allow traffic over TCP port 443.
- A MID user: Create a ServiceNow user record for the MID Server to use. This user record must have the mid_server and import_admin roles.

Note: Verify that the baseline public page InstanceInfo is active for the MID Server to connect to the instance.

1. Configure the network to allow MID Server network connectivity to the ServiceNow instance over TCP port 443.
2. Configure basic authentication for SOAP communications with the ServiceNow instance.
3. Navigate to **System Web Services** > **Scripted Web Services** > **Scripted SOAP Services**.
4. Confirm that the following web services are active:
   - GetMIDInfo
   - InstanceInfo
   - MIDAssignedPackages
   - MIDFieldForFileProvider
   - MIDFileSyncSnapshot
   - MIDServeCheck
   - MIDServeFileProvider
5. Type **sys_public.list** in the navigation search field and press **Enter**.
   
   The Public Pages record list appears.
6. Verify that the **InstanceInfo** public page is active, to allow the MID Server to validate its version.
7. Ensure that the MID Server host computer can access the download site at **install.service-now.com**.

After the network is prepared, proceed to **Installing the MID Server**.

**Prepare network connections for MID Servers**

Before you install the MID Server, perform the necessary prerequisites that it needs to connect to elements inside and outside your network. This includes network privileges and security considerations.

**Security considerations**

Sometimes computers or devices have additional security measures configured, and these measures may interfere with the MID Server's ability to run commands or queries on those systems.

For example, a Linux server might be configured to allow only certain IP address to connect to it via SSH. Similarly, a network router might be configured to allow only certain IP address to query SNMP on it. To allow access in such cases, use one of the following methods:

- Update the configuration of those computers or devices to allow the desired MID Server to run commands or query them. For example, a network router may be configured to only allow the network management systems to query SNMP on it. In that case, add the MID Server as though it were another network management system.
- Install a MID Server on a computer that already has access to the computers or network devices with such restrictions. For example, to use Discovery within a DMZ (where communication from outside the DMZ will be severely restricted), install a MID Server on a computer that is already in the DMZ.

**External connectivity requirements**

These requirements are specifically for the use of MID Servers with the ServiceNow® Discovery and Orchestration products.

The MID Server communicates securely on port 443 to the instance and requires no inbound connections. In some cases, it might be necessary to allow this communication through the firewall if the MID Server fails to register on the instance. To determine if the application or a network security restriction is to blame for connection failure, attempt to telnet to the instance on port 443 from the server that is hosting the MID Server application. If this connection fails, then the problem could be a web proxy (since 443 is an https connection) or a Firewall rule preventing external TCP connections from that host. Contact network security personnel for the proxy information to add to the config.xml file, or request that the firewall be configured to allow access using one of the following syntaxes:

- `<source IP> to <any>`
Internal connectivity requirements

These methods are used for discovering various devices on a network and are specifically for the use of MID Servers with the Discovery and Orchestration products.

- **SSH**: For UNIX-like machines, Discovery and Orchestration use SSH protocol, version 2 to access target machines. SSH is a network protocol that allows data to be exchanged using a secure channel between two networked devices. SSH communicates on port 22 within an encrypted datastream and requires a login to access the targets using two available methods of authentication: a user name and password combination and a user name and shared private key. Specify SSH authentication information and type in the Credentials module. If multiple credentials are entered, the platform tries one after the other until a successful connection is established or all are ultimately denied. To provide for application relationships a limited number of SUDO commands must be available to be run. Additional details to these requirements can be found in UNIX/Linux commands requiring root privileges for Discovery and Orchestration.

- **WMI**: For Windows machines, Discovery uses the Windows Management Instrumentation (WMI) interface to query devices. Due to security restrictions for WMI, the MID Server application executing the WMI queries must run as a domain user with local (target) administrator privileges. When Discovery detects activity on port 135, it launches a WMI query. The response from the Windows device is sent over a Distributed Component Object Model (DCOM) port configured for WMI on Windows machines. This can be any port. Ensure that the MID Server application host machine has access to the targets on all ports due to the unique nature of the WMI requirements.

- **Windows PowerShell**: PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. Orchestration uses PowerShell to run Workflow activities on Windows machines. PowerShell must be installed on any MID Server that executes these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 3.0 to 5.1. Orchestration activities for PowerShell require a credentials Type of Windows.

- **SNMP - Network**: For network devices, Discovery uses an SNMP scan to get device specific MIBs and OIDs. SNMP is a common protocol used on most routers, switches, printers, load balancers and various other network enabled devices. Use a community string (password) for authentication when scanning a device via SNMP. Many devices have a default community string of public which Discovery uses by default when querying a target. Define additional community strings in the SNMP credentials form which are tried in succession, along with public, until a successful query returns. In addition to the credentials, the platform also requires the ability to make SNMP requests on port 161 from the MID Server to the target. If Access Control Lists (ACLs) are in place to control the IP addresses that can make these queries, ensure that the IP address of the MID Server is in the ACL. Discovery supports SNMP versions 1, 2c, and 3.

- **WBEM**: Web-Based Enterprise Management (WBEM) defines a particular implementation of the Common Information Model (CIM), including protocols for discovering and accessing each CIM implementation. WBEM requires either of two ports, 5989 or 5988 and uses the HTTP transport protocol. WBEM supports SSL encryption and uses CIM user name/password credentials. Discovery launches a WBEM port probe to detect activity on the target ports and to append gathered data to a classification probe that explores CIM Servers.
Installing the MID Server

Download and install the MID Server on the host machine, test the connection, and then validate the MID Server. Use the manual procedures or the guided setup. Set up multiple MID Servers for load balancing and domain separation. These procedures prepare it for use with any application.

Prerequisites: Ensure the MID Server system requirements and MID Server connection prerequisites are met before you install the MID Server manually or use the guided setup utility.

MID Server manual installation

The manual process requires these setup tasks, performed in the order shown here:

1. Create the MID Server user account and grant the appropriate role to this user.
2. Download the installer file for the host machine.
3. Install the MID Server on a Linux or Windows host.
4. Validate the MID Server to ensure that it is trusted to access credentials used by the instance for automations.
5. Test connectivity between the MID Server and the instance for automatic upgrades.
6. Optionally, deploy multiple MID Servers in your network for load balancing or when domain separation is enabled.

MID Server guided setup

Alternatively, the MID Server Guided Setup streamlines the process and allows you to set up a basic MID Server quickly.
Create the MID Server user and grant the role

To communicate with the instance, MID Servers need a user ID and the appropriate role. Create the user ID for a MID Server and grant the ID the `mid_server` role. To prevent MID Server validation failure, the system runs business rules to monitor the settings selected for MID Server users.

Role required: admin

The MID Server connects to an instance by using the SOAP web service. To allow authentication with the instance, create a separate user account for each MID Server or share the same account across multiple MID Servers. Grant each MID Server user the `mid_server` role, which is required for the MID Server user on any instance on which basic authentication is enabled. The `mid_server` role allows the MID Server to access protected tables when strict SOAP security is in place. The system adds the necessary SOAP roles automatically with this role.

**Note:** The strict SOAP security feature, enabled by default for any instance that uses basic authentication, protects all tables with Access Control Lists (ACL).

1. From the instance, navigate to **User Administration > Users**.
2. Click **New**.
3. Complete the fields in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>User name for the MID Server user. This name is specified in the <code>mid.instance.username</code> parameter of the configuration file that the MID Server installer creates. For details, see <strong>MID Server parameters</strong>.</td>
</tr>
<tr>
<td>First name</td>
<td>The user's first name.</td>
</tr>
<tr>
<td>Last name</td>
<td>The user's last name.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for the MID Server user. This password is specified in the <code>mid.instance.password</code> parameter of the configuration file that the MID Server installer creates.</td>
</tr>
</tbody>
</table>
4. Right-click the header and select Save.
5. Under the Roles related list, click Edit.
6. Select the mid_server role for this user.
   Each MID Server account must have this role to access protected tables.
7. Click Save.
8. Confirm that the MID Server account was created successfully and the account has connectivity to the instance.
   a) On the host machine where you intend to install the MID Server, open a browser and navigate to the instance.
   b) Use your new MID Server user credentials to log in.
      If the login is successful, then any MID Servers you install on that host will be able to connect to the instance.

MID Server role validation

Real-time system validation of MID Server role assignments prevents incompatible settings.

To prevent MID Server validation failure and ensure that your MID Server is configured correctly, the system runs several business rules that monitor the roles and settings you select for your MID Server user. The instance displays a warning and blocks the change when you attempt to save an incompatible configuration.

Elevated privileges not permitted

The mid_server role cannot be configured for elevated privileges. The Invalid MID Server settings business rule runs on the Role [sys_user_role] table and prevents the elevated_privileges field from being set to true for the mid_server role.
Warning for elevated privileges on the mid_server role

Relationship table protection

The User Role [sys_user_has_role] table creates the relationship between the User [sys_user] and the Role [sys_user_role] tables.

- **Incompatible role**

  The mid_server and security_admin roles are incompatible and cannot be assigned to the same user. The system determines the user's current role and runs the **Security Admin incompatible with MID** business rule on the User Role [sys_user_has_role] table. This rule prevents an administrator from adding the security_admin role for a user who currently has the mid_server role.
Warnings for incompatible security_admin role assignment

- Incompatible user role and user record settings

  The **Incompatible MID Server user role** business rule runs on the User Role [sys_user_has_role] table to protect its data from incompatible configurations. Validation for this related table ensures that an administrator cannot assign the mid_server role to a user who already holds the security_admin role.

**What to do next**

*Download* the MID Server files for your operating system.

**Download the MID Server files**

Download the MID Server installer package through the instance and make it available for installation on the host. Allow the local network to access the authorized IP addresses to ensure that you can download the installation package and receive automatic upgrades.

Role required: admin
The IP address of the MID Server download site (install.service-now.com) can change without notice. To ensure that you can download the MID Server installation package and receive automatic MID Server upgrades, allow local network access to these IP addresses:

- 149.96.5.98
- 149.96.6.98

**Note:** Download the MID Server first and then enable Discovery, Orchestration, or any integration that requires the use of the MID Server.

1. On the ServiceNow instance, navigate to **Mid Server > Downloads**.
2. Select and download the MID Server for the appropriate operating system.
   For the best performance, install the 64-bit MID Server for your operating system.
   
   **Note:** ServiceNow will discontinue support for 32-bit MID Servers in a future release.

---

**Download MID Server**

Select and download the MID Server for the appropriate operating system. If the download does not begin immediately, try the download at a later time as the system may be busy. Refer to the installation instructions for more details.

Install a Java 1.8 family version later than 1.8.0.152 on the mid server host.

<table>
<thead>
<tr>
<th>Operating System</th>
<th>32 bit</th>
<th>64 bit</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Linux</strong></td>
<td>![Image]</td>
<td>![Image]</td>
</tr>
<tr>
<td><strong>Windows</strong></td>
<td>![Image]</td>
<td>![Image]</td>
</tr>
</tbody>
</table>

See contextual / embedded help on right for supported host OS versions

---

**MID Server downloads**

3. Save the download file to a temporary file on the local drive.
4. Move the file into the designated MID Server folder you create for your operating system and run the installer from that location.

You can manually verify the signature of an installation package with the jarsigner tool to ensure its authenticity. For more information about verifying the signature, see the **MID Server upgrades** section on manual verification.

Then, install the MID Server on the host computer.

- **Linux**
**Install a MID Server on Linux**

Install MID Servers with the MID Server installation package and verify it is active. The package includes an installer that automatically configures OpenJDK to run in the environment. The MID Server can use an existing JRE rather than the provided OpenJDK. Uninstall the MID Server to redeploy it.

Verify that the host computer satisfies the **MID Server system requirements**.

Role required: admin, mid_server

---

OpenJDK version 1.8.0_231 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. See the HI Knowledge Base article [KB0719830](https://service-now.com/knowledge_base) for more information on OpenJDK version support. The installer automatically configures OpenJDK to run in your environment. No additional configuration is required. This version supports both 32-bit and 64-bit MID Servers. For the best performance, install the 64-bit MID Server for your operating system. The MID Server requires a minimum JRE version 1.8.0_161, and recommended version 1.8.0_231. If you are using a lower version than 1.8.0_161, you may see encryption related issues. If the MID Server is configured to use an external JRE and the JRE is detected to be incompatible, the MID Server instead uses the bundled JRE. If this fails, or the MID remains on an incompatible JRE version, the MID automatically stops.

**Note:** ServiceNow will discontinue support for 32-bit MID Servers in a future release.

Testing showed that the MID Server works as expected with Oracle Java 11 version 11.0.5 and Oracle JRE 8 version 1.8.0_231. However, Oracle JRE 8 version 1.8.0_231 requires the workaround described in the HI Knowledge Base article [MID Server running Oracle JRE version 8](https://service-now.com/knowledge_base) [KB0784442](https://service-now.com/knowledge_base). In order to use Java 11 on Windows MID Servers, refer to [Install Java 11 on Windows MID servers](https://service-now.com/knowledge_base) [KB0752451](https://service-now.com/knowledge_base).

Upgraded MID Servers might use different Java versions depending on their release level.

- MID Servers upgraded from Kingston and earlier use the OpenJDK provided with the MID Server installer. This version of the OpenJDK was tested and certified for use with these MID Servers.
- MID Servers upgraded from London continue to use the same JRE you configured for London. The MID Server supports JRE 1.8.
Click this link to view the installation video:

1. From the Linux command line, type `mkdir -p /servicenow/mid server name` to create the installation directory. You need to have read/write/execute permissions on this folder.

2. Extract the downloaded MID Server archive file, `mid.os.zip` into the `servicenow/mid server name` directory. Use the MID Server name created in the instance or create a new name that you will use for this MID Server moving forward.
   The resulting directory structure is `/servicenow/<mid server name>/agent`.

3. Change to the `servicenow/mid server name /agent` directory, and enter the following command to start the MID Server installer: `./installer.sh`.
   If you prefer to manually configure the MID Server instead, skip to step 13.

4. Use the installer to enter the following information.
Configure Instance Connectivity

Field | Description
--- | ---
ServiceNow instance URL | Enter the full URL of your instance, for example: https://[inst.name].service-now.com/
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNow MID Server username</td>
<td>Enter the user name of the MID Server user that you already created. The MID Server user must have the mid_server role.</td>
</tr>
<tr>
<td>ServiceNow MID Server password</td>
<td>Enter the password for the user in the ServiceNow MID Server username.</td>
</tr>
<tr>
<td>Use proxy</td>
<td>Select this check box if your MID Server communicates through a proxy to connect to the instance.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Your proxy server must use Basic Authentication for the MID server to connect to the instance.</td>
</tr>
<tr>
<td>Proxy host</td>
<td>Enter the proxy server host name or IP address. Do not include the protocol in the host name. For example, enter proxyserver.domain.com, not <a href="https://proxyserver.domain.com">https://proxyserver.domain.com</a>.</td>
</tr>
<tr>
<td>Proxy port</td>
<td>Enter the port through which the proxy server communicates. If you leave this field blank, it should use the proxy server's default port number.</td>
</tr>
<tr>
<td>Proxy username</td>
<td>Enter the user name that has administrator rights to the proxy server.</td>
</tr>
<tr>
<td>Proxy password</td>
<td>Enter the password for the user name.</td>
</tr>
</tbody>
</table>

5. Click **Test your connection** to validate the credentials and instance information. If you encounter any errors, verify the information that you input.

6. Click **Next**.

7. Configure the MID name parameters (see table).
   The wrapper settings are not applicable for Linux operating systems and are disabled for this installation.
Configure MID Name Parameters

*MID Server name: My_LINUX_mid_server
MID service wrapper name: snc_mid
MID service wrapper display name: ServiceNow MID Server

Wrapper settings have been disabled as they are not being used for this OS.

View Installer Logs  Prev  Next
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>MID Server name</td>
<td>Enter a MID Server name.</td>
</tr>
<tr>
<td></td>
<td><strong>Caution:</strong> MID Server names cannot begin with <code>mid.server</code>.</td>
</tr>
<tr>
<td>MID Service wrapper name</td>
<td>Modify this field if necessary. It is populated automatically by prefixing <code>snc_mid_</code> to the MID Server name. In most cases, you do not need to modify this.</td>
</tr>
<tr>
<td>MID Server wrapper display name</td>
<td>Modify this field if necessary. It is populated automatically by prefixing <code>ServiceNow MID Server_</code> to the MID Server name. In most cases, you do not need to modify this.</td>
</tr>
</tbody>
</table>

8. Click **Next** to view the summary.
Your MID Server has been successfully configured!

To begin using the MID Server:

1. Click Start MID Server.
2. Click MID Servers List Page. It may take a few seconds for your MID Server to appear.
3. Click on the record for "MyLinux_mid_server" then click Validate under Related Links.

For installation details, you may check the log files at: /agent

Start MID Server

MID Servers List Page

View Installer Logs
9. Click **Start MID Server**.
The local host starts the MID Server.

   **Note:** If the MID Server fails to start, the cause might be a duplicate name or multiple services that point to the same executable path. See *MID Server fails to start* for details.

10. Click **Mid Servers List Page**.
The installer opens the MID Server list from your instance.

11. Select the MID Server name from the list.

   **Note:** It may take a few seconds for the MID Server time to establish a connection with your instance.

   The system displays the MID Server record.

12. From **Related Links**, click **Validate**.
   The MID Server **Validated** changes to **Yes**.

13. To configure the MID Server manually, change to the `servicenow/mid server name /agent` directory, and then edit the `config.xml` file as follows:
   a) Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` and change the value to the URL of your instance.
   b) Enter the MID user credentials in the `mid.instance.username` and `mid.instance.password` parameters.
      By default, the MID Server, uses basic authentication for SOAP messages. The password value is also encrypted authentication.
   c) Find the `<parameter name="name" value="YOUR_MIDSERVER_NAME_GOES_HERE" />` element and change the value for the MID Server name.
   d) Optional: Enter connection information for the proxy server. Remove the appropriate comment tags from the proxy configuration information.
      For example, you can configure these parameters:
      - `mid.proxy.use_proxy`
      - `mid.proxy.host`
      - `mid.proxy.port`
      - `mid.proxy.username`
      - `mid.proxy.password`

14. Start the MID Server and verify that it is active.
   a) In the MID Server home directory (`agent`), execute the shell script `start.sh` to start the new MID Server.
   b) Log into the instance and navigate to **MID Servers > Servers** to verify that your new MID Server has a **Status** or **Up**.
      Additional log information appears here:
      - The MID Server log on the instance.
      - The corresponding `agent0.log.0` and wrapper logs (`wrapper.log`) in the MID Server `agent/logs` folder.

15. To configure the MID Server to restart automatically when the host is restarted, run `${base_install_dir}/agent/bin/mid.sh install` as root.
    This command installs the MID Server as a daemon service and adds the auto start scripts to the `init.d` directory.
16. To stop the MID Server, navigate to the MID Server home (agent) directory and execute the `stop.sh` shell script.

17. To restart a stopped MID Server, navigate to the MID Server home (agent) directory and execute the `restart-service.sh` script, using one of these commands:
   - `./restart-service.sh`
   - `sh restart-service.sh`
   - `bash restart-service.sh`

Configure a Linux MID Server to use an existing JRE

You can choose to use an existing JRE for your MID Server rather than the OpenJDK provided with the MID Server installer.

Ensure that your JRE version is supported. See **MID Server system requirements** for details.

Role required: admin

By electing to use your own JRE, you are responsible for upgrading it as necessary. For a detailed procedure and cautions regarding changing the JRE, see **KB0778272**.

1. Navigate to this file in the MID Server installation directory:
   
   `agent/conf/wrapper-override.conf`

2. To specify the existing Java executable that you want to use, add this line to the file:
   
   `wrapper.java.command={your_java_executable}`

   For more information, see the Java service wrapper property documentation.

3. Save the file.

Run Linux MID Servers as non-root users

Run MID Servers as non-root user on a Linux machine to improve security. Multiple MID Server can be installed as services so they can start by themselves after system reboots.

Role required: root

The MID Server must be installed on the host machine using the procedure in **Install a MID Server on Linux**.

Supported versions for this procedure are Linux Red Hat 6 or newer, Ubuntu 1404 or newer, and CentOS 6 or newer.

1. Stop any MID Server running on the host with the command `bin/mid.sh stop`.
2. Remove any MID Servers on the host with the command `bin/mid.sh remove`.
3. Edit the file `mid.shconf_override`. 

**Note:** You cannot install more than one MID Server service as a daemon on a Linux host. This is a limitation of the Tanuki wrapper service.
4. Add the MID Server's name using the lines `APP_NAME=` and `APP_LONG_NAME=` to run it as a service. To prevent errors, the `APP_NAME` of each MID Server must be unique.

5. Optional: To run multiple MID Servers as services on the same host, add an `APP_NAME` and `APP_LONG_NAME` for each instance.
6. Add the name of the non-root user to operate the account using the line `RUN_AS_USER=`.  
7. Optional: Add the name of the group to own the entire agent directory using the line `GROUP_NAME=`.  
8. Set the line `PROMPT_BEFORE_OWNERSHIP_CHANGE= true` to prompt the user for confirmation before any changes to file permissions are applied.  
   The file permission change is applied to the entire agent folder and everything inside recursively. The changes include blocking other users' access to the entire agent folder, changing the owner to `$RUN_AS_USER` if specified, and changing the group to `$GROUP_NAME` if specified.  
9. Reinstall the MID Server with the command `bin/mid.sh install`.  

   ![Note:]
   To prevent errors, make sure to stop and remove any existing MID Server services before start new ones. During the first installation, a root user is required to call `bin/mid.sh install`. Reinstalling the MID Server applies the changes in `mid.shconf_override`. Then the non-root user specified in `mid.shconf_override` is able to start/stop/restart the service without elevated privileges.

For more information about managing the whitelist and file permission enforcement, see File permission enforcement for Windows MID Servers. Running a Linux MID Server with a non-root account may result in issues with PolicyKit in some systems. See PolicyKit issues with Linux MID Servers using non-root accounts for more information.

Uninstall a Linux MID Server

The MID Server runs as a stand-alone service. You can remove a stand-alone MID Server service to accommodate such tasks as redeploying the MID Server to another host machine or changing the unique name of a MID Server when deploying multiple MID Servers.

Role required: admin

1. To stop the running MID Server service, navigate to the MID Server home (agent) directory and run `stop.sh`.  
2. From a command prompt, go to the `\agent\bin` directory in the MID Server installation directory.  
3. Confirm that the MID Server is stopped by executing the `bin/mid.sh status` shell script.  
4. After the MID Server stops, delete the files in the `agent` directory.

   Validate the MID Server to prepare it for use.

Install a MID Server on Windows

Install MID Servers with the MID Server installation package and verify it is active. The package includes an installer that automatically configures OpenJDK to run in the environment. The MID Server can use an existing JRE rather than the provided OpenJDK. Uninstall the MID Server to redeploy it.
• Verify that the host computer satisfies the MID Server system requirements.
• The MID Server requires the minimum PowerShell version 3.0 and supports versions up to PowerShell 5.1.
• Ensure that the Microsoft Application Experience Lookup Service is enabled on the MID Server host. If this service is disabled, the MID Server auto-upgrade might fail, causing the MID Server to go down. For information on managing issues with the Application Experience service, see KB0597552.

Role required: admin or mid_server

Ensure that the MID Server can connect to elements inside and outside your network
Download and install the MID Server on a Linux or Windows host
Configure your MID Server
Configure MID Server security

OpenJDK version 1.8.0_231 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. See the HI Knowledge Base article KB0719830 for more information on OpenJDK version support. The installer automatically configures OpenJDK to run in your environment. No additional configuration is required. This version supports both 32-bit and 64-bit MID Servers. For the best performance, install the 64-bit MID Server for your operating system. The MID Server requires a minimum JRE version 1.8.0_161, and recommended version 1.8.0_231. If you are using a lower version than 1.8.0_161, you may see encryption related issues. If the MID Server is configured to use an external JRE and the JRE is detected to be incompatible, the MID Server instead uses the bundled JRE. If this fails, or the MID remains on an incompatible JRE version, the MID automatically stops.

Note: ServiceNow will discontinue support for 32-bit MID Servers in a future release.

Testing showed that the MID Server works as expected with Oracle Java 11 version 11.0.5 and Oracle JRE 8 version 1.8.0_231. However, Oracle JRE 8 version 1.8.0_231 requires the workaround described in the HI Knowledge Base article MID Server running Oracle JRE version 8 [KB0784442]. In order to use Java 11 on Windows MID Servers, refer to Install Java 11 on Windows MID servers [KB0752451].

Upgraded MID Servers might use different Java versions depending on their release level.
• MID Servers upgraded from Kingston and earlier use the OpenJDK provided with the MID Server installer. This version of the OpenJDK was tested and certified for use with these MID Servers.
• MID Servers upgraded from London continue to use the same JRE you configured for London. The MID Server supports JRE 1.8.

Click this link to view the installation video:
1. Log in to the Windows host machine where you want to install the MID Server.
2. Create a folder for the MID Server on the top level of the drive such as ServiceNow\MID Server1.
3. Download the MID archive file into the new folder.
4. Right-click the archive and select **Extract All**.
5. Navigate to the `service-now\<mid server name>\agent` folder that was created when the file was extracted.
6. Run `installer.bat` to start the MID Server installer.
   To configure the MID Server manually, skip to step 16.
7. Use the installer to enter the following information.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNow instance URL</td>
<td>Enter the full URL of your instance, for example:</td>
</tr>
<tr>
<td></td>
<td>https://[inst.name].service-now.com/</td>

<tr>
<td>-----------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ServiceNow MID Server username</td>
<td>Enter the name of the <em>MID Server user</em> that you already created. The MID Server user must have the <em>mid_server</em> role.</td>
</tr>
<tr>
<td>ServiceNow MID Server password</td>
<td>Enter the password for the user in the <strong>ServiceNow MID Server username</strong>.</td>
</tr>
<tr>
<td>Use proxy</td>
<td>Select this check box if your MID Server communicates through a proxy to connect to the instance.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Your proxy server must use Basic Authentication for the MID server to connect to the instance.</td>
</tr>
<tr>
<td>Proxy host</td>
<td>Enter the proxy server host name or IP address. Do not include the protocol in the host name. For example, enter <code>proxyserver.domain.com</code>, not <code>https://proxyserver.domain.com</code>.</td>
</tr>
<tr>
<td>Proxy port</td>
<td>Enter the port through which the proxy server communicates. If you leave this field blank, it should use the proxy server's default port number.</td>
</tr>
<tr>
<td>Proxy username</td>
<td>Enter the user name that has administrator rights to the proxy server.</td>
</tr>
<tr>
<td>Proxy password</td>
<td>Enter the password for the user name.</td>
</tr>
</tbody>
</table>

8. Click **Test your connection** to validate the credentials and instance information. If you encounter any errors, verify the information that you input.

9. Click **Next**.

10. Configure the MID name parameters (see table).
### ServiceNow MID Server Installer

#### Configure MID Name Parameters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server name</td>
<td>Enter a MID Server name.</td>
</tr>
<tr>
<td>MID service wrapper name</td>
<td>snc_mid_My WINDOWS_mid_server</td>
</tr>
<tr>
<td>MID service wrapper display name</td>
<td>ServiceNow MID Server_My WINDOWS_mid_server</td>
</tr>
</tbody>
</table>

**Caution:** MID Server names cannot begin with **mid.server**.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Service wrapper name</td>
<td>Modify this field if necessary. It is populated automatically by prefixing <code>snc_mid_</code> to the MID Server name. In most cases, you do not need to modify this.</td>
</tr>
<tr>
<td>MID Server wrapper display name</td>
<td>Modify this field if necessary. It is populated automatically by prefixing <code>ServiceNow MID Server_</code> to the MID Server name. In most cases, you do not need to modify this.</td>
</tr>
</tbody>
</table>

11. Click **Next** to view the summary.
12. Click **Start MID Server**.

The local host starts the MID Server.

**Note:** If the MID Server fails to start, the cause might be a duplicate name or multiple services that point to the same executable path. See *MID Server fails to start* for details.
13. **Click Mid Servers List Page.**
The installer opens the MID Server list from your instance.

14. **Select the MID Server name from the list.**

   ![Note: It may take a few seconds for the MID Server time to establish a connection with your instance.]

   The system displays the MID Server record.

15. From **Related Links**, click **Validate**.
    The MID Server **Validated** changes to **Yes**.

16. To configure the MID Server manually, edit the config.xml file with a text editor such as WordPad:
    a) Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` element and change the value to the URL of your instance.
    b) Enter the MID user credentials in the `mid.instance.username` and `mid.instance.password` parameters.
       By default, the MID Server, uses basic authentication for SOAP messages. The password value is also encrypted authentication.
    c) Optional: Find the `<parameter name="name" value="YOUR_MIDSERVER_NAME_GOES_HERE" />` element and change the value for the MID Server name.
    d) Optional: Enter connection information for the proxy server. Remove the appropriate comment tags from the proxy configuration information.
       For example, you can configure these parameters:
       - `mid.proxy.use_proxy`
       - `mid.proxy.host`
       - `mid.proxy.port`
       - `mid.proxy.username`
       - `mid.proxy.password`

17. **Start the MID Server and verify that it is active.**
    a) In the MID Server home directory (`agent`), execute the batch file `start.bat` to start the new MID Server.
    b) Log into the instance and navigate to **MID Server > Servers** to verify that the **Status** of your new MID Server is **Up**.
       Additional log information appears here:
       - The MID Server log on the instance.
       - The corresponding `agent0.log.0` and wrapper logs (`wrapper.log`) in the MID Server `agent\logs` folder.

18. **To stop the MID Server, use either of these procedures:**
    - **Windows command line:** From the MID Server home directory (`agent`) run `stop.bat`.
    - **Windows Services console:** Right click **ServiceNow <MID Server name>**, and then select **Stop**.

19. **To restart a stopped MID Server, use either of these procedures:**
    - **Windows command line:** In the MID Server home directory (`agent`), run `Restart.bat`.
    - **Windows Services console:** Right click **ServiceNow <MID Server name>**, and then select **Start**.
Configure Windows MID Server service credentials

MID Server service credentials are required to manage the MID Server service on the host machine, including its ability to successfully auto-upgrade.

By default, the MID Server service runs as a **Local System** account. This account has privileges to create and run the MID Server service and to download, create, and move files for the MID Server auto-upgrade process.

Windows service credentials are not the same as the MID Server user credentials, which allow communication between the MID Server and the instance. You must configure both of these credentials separately. See *Create the MID Server user and grant the role* for instructions on MID Server user credentials.

**Attention:** This procedure is optional. Allowing the MID Server service to run as a Local System account is sufficient for a majority of users.

1. Open the Windows Services console.
2. Double-click the *ServiceNow <MID Server name>* service for each MID Server.
3. Select the **Log On** tab.
4. Set **Log on as** privileges with the user account (local or on a domain) that has local admin access to the MID Server host.
   
The MID Server upgrade process deploys a temporary Windows service which requires local administrator privileges.
5. In the **General** tab, set the **Startup type**.
   
The field is set to **Automatic** by default.
6. Click **OK**.
7. Restart the *ServiceNow <MID Server name>* service, and make sure that *ServiceNow\<MID Server name>\agent\logs\agent0.log* does not have error messages. If the MID Server does not start, see the *ServiceNow knowledge article Review the agent log for MID Server errors* (article KB0535148).
8. On the instance to which this MID Server is connected, navigate to **MID Server > Servers**. If Discovery is installed, alternately navigate to **Discovery > MID Servers**.
   
   All MID Servers connected to this instance are listed.
9. Make sure that the Status of the MID Server you just installed is **Up**.

**Manually install a MID Server as a Windows Service**

If you did not start the MID server at the end of the installation procedure, you can manually install the MID Server to run as a Windows service.

Role required: admin

You can install a MID Server as a Windows service in these operating systems:

- Windows Server 2008
- Windows Server 2012
- Windows Server 2016
- Windows Server 2019

1. Open the agent directory in the directory you created for the MID Server installation files. For example, the path might be *C:\ServiceNow\MID Server1\agent*.
2. Right-click the *start.bat* file, and select **Properties**.
3. Select the option to **Run as administrator**.
4. Double-click the *start.bat* file to install the Windows service.
Configure a MID Server on Windows to use an existing JRE

You can choose to use an existing JRE for your MID Server rather than the OpenJDK provided with the MID Server installer.

Ensure that your JRE version is supported. See MID Server system requirements for details.

Role required: admin

By electing to use your own JRE, you are responsible for upgrading it as necessary. For a detailed procedure and cautions regarding changing the JRE, see KB0778272.

1. Navigate to this file in the MID Server installation directory:
   `agent/conf/wrapper-override.conf`
2. To specify the existing Java executable that you want to use, add this line to the file:
   `wrapper.java.command={your_java_executable}`
   
   For more information, see the Java service wrapper property documentation.
3. Save the file.

Run a Windows MID Server as a non-admin

MID Servers can be configured to run using non-administrative accounts. Using non-admin accounts in conjunction with file permission enforcement can improve security by restricting access to MID Server files.

Role required: admin

Install the MID Server on a Windows machine using an administrator account. Create a Windows user account without administrative privileges.

Running a MID Server with a non-admin account has limitations and changes the behavior of other applications. The following behavior changes can occur:

• The MID Server account needs appropriate credentials to run a Discovery schedule. If the credentials are insufficient, the MID Server falls back to the user account's privileges. A non-admin user account may not have the necessary privileges to access the Discovery target.
• Enhanced Application Dependency Mapping (ADME) and File Based Discovery (FBD) may not work by default. To correct this issue, non-admin users need to be given permission to read/write to the Admin Share folder.
• Non-admin accounts cannot initiate upgrade services in versions prior to the Orlando release.

1. Run the MID Server service as LocalSystem or as a user with admin rights.
2. Add the non-admin account name to the MID Server parameter `mid.windows_host.file_permissions.allow_list` in the MID Server host's config.xml file.
   
   This step adds the non-admin account to the whitelist. See MID Server parameters for more information about `mid.windows_host.file_permissions.allow_list` as well as instructions for adding a parameter to the config.xml file.
3. Restart the MID Server.
   The new file permission enforcement rules take effect when the MID Server starts.
4. Switch the MID Server to the non-admin service account.
5. Restart the MID Server.

For more information about managing the whitelist and file permission enforcement, see File permission enforcement for Windows MID Servers.

Uninstall a Windows MID Server

The MID Server runs as a stand-alone service. You can remove a stand-alone MID Server service to accommodate such tasks as redeploying the MID Server to another host machine or changing the unique name of a MID Server when deploying multiple MID Servers.
Role required: admin

1. Stop the running MID Server service, using either of these procedures:
   - **Windows command line**: From the MID Server home (`agent`) directory, run `stop.bat`.
   - **Windows Services console**: From the Windows Services console, right-click the **ServiceNow MID Server name** and then select **stop**.

2. From a command prompt, go to the `\agent\bin` directory in the MID Server installation directory and double-click the `UninstallMID-NT.bat` file.

**Validate** the MID Server to prepare it for use.

**Validate the MID Server**

You must manually validate the MID Server after it is installed to enable it to execute automation tasks. You can invalidate a MID Server you suspect has been compromised to prevent it from accessing automation credentials in the instance or executing outbound ECC probes.

Role required: `agent_admin`, `admin`

Make sure that the **MID Server version** is compatible with the instance.

Validation restricts access to automation credentials to trusted MID servers only.

When you validate a MID Server, you specify the capabilities it can use, the applications that use it, and the IP ranges it is allowed to explore. You will be prompted to set the initial selection criteria when you validate MID Servers that do not already have capabilities, applications, or IP ranges already configured. You do not have to set the initial selection criteria to actually validate the MID Server. See **MID Server selection** for more information on capabilities, applications, and IP ranges.

**Note:** When you upgrade, MID Servers that are already configured in your instance are automatically validated. This prevents the interruption of automation tasks that MID Servers might be performing. See **MID Server upgrades** for more information.

1. Navigate to **MID Server > Servers**.
2. Open the new MID Server you created from the list of MID Servers.

3. Under Related Links click Validate.
   The Set Initial Selection Criteria window appears if there are no records in the Supported Applications, IP Ranges, or Capabilities related lists.

4. On the Set Initial Selection Criteria window, use the switches to enable or disable selection criteria for this MID Server:
   - **Allow ALL capabilities**: Allow all capabilities for Orchestration and Event Management to use this MID Server.
     
     **Note**: Service Mapping and Event Management alert aggregation and RCA, which used capabilities in previous releases, rely on the application for MID Server selection.
     
     - **Allow ALL applications**: Allow all applications that use MID Servers to use this MID Server.
     - **Allow ALL IP ranges**: Make all IP ranges valid for this MID Server, meaning that it can target any IP address.

5. Click OK.
   The Validated field on the dashboard is set to Validating, and then set to Yes after the validation completes.

6. To invalidate a MID Server, open the record for the MID Server you suspect has a security issue.

7. Under Related Links, click Invalidate.
   Invalidating a MID Server forces it to clear its memory and restart. The MID Server generates a new keypair on restart.

   **Test network connectivity** to ensure that the MID Server can upgrade automatically.

**Test MID Server connectivity**

Confirm that the MID Server host is able to communicate with the instance. Resolve any issues with the network connectivity such as conflicts with firewalls, access control lists, and routing errors. Successful communication is necessary for automatic upgrades.

Role required: admin
The computer that hosts the MID Server must be able to access one of these URLs to upgrade automatically:

- HTTPS: https://install.service-now.com on the default HTTPS port (443)
- HTTP: http://install.service-now.com on the default HTTPS port (80)

1. Use PING to test connectivity with the host on the network (ping<host IP>).
2. If no ping response is returned, use TRACEROUTE to see where traffic might be stopped (traceroute<host>).
3. Use TELNET to connect to any of the TCP ports (telnet<host> <port>).
4. Use an SNMP scanning tool to determine if a potential network device is responsive.
5. Resolve the most likely issues around network connectivity:
   - **Routing**: Confirm that the MID Server host has network access to the IP ranges you are attempting to discover.
   - **Firewalls**: Confirm access to the physical firewalls that protect a large environment such as the Data Center. Confirm access to any logical firewalls that protect an individual computer. MID Server communications are initiated inside the firewall and therefore do not require any special firewall rules or VPNs.
   - **Access Control Lists (ACL)**: Confirm that ACLs contain the IP addresses based list on SNMP network devices that allows communication to a particular target.
   - **Resolve all issues with your network teams to better understand your topology**. Deploy additional MID Servers if necessary to help keep your network secure. Configure access from your existing MID Server host to networking components.

6. Verify that the MID Server service is running on the host:
   - **Windows**: In the Windows Services console, locate the ServiceNow [MID Server name] and confirm that each MID Server has the Started Status value.
   - **Linux**: Ensure that the agent0.log.0.lck appears in the /servicenow/MID Server name]/agent folder.

7. After each MID Server restart, open the agent0.log.0 and address all error messages.
8. From the ServiceNow instance, navigate to MID Server > Servers.
9. Review and verify that all MID Servers that are connected to the instance are listed.
10. Verify that the Status is Up for the MID Servers.
This concludes the installation of a single MID Server. If necessary, continue to deploy multiple MID Servers from a single host in your network. Otherwise, begin configuring your MID Server.

**Install multiple MID Servers on a single system**

Install multiple MID Servers on the same host computer. Multiple MID Servers can support each other with load balancing, as well as use domain separation. The number of MID Servers required is determined by factors like network policies, security restraints, and the reliability of the host computer.

Role required: admin, mid_server

You can install multiple MID Servers on a Linux or Windows host or on a virtual machine. Installing multiple MID Servers may involve other setup steps depending on your network configuration.

**Important:** Only one MID Server service can be a daemon on a Linux host. This is a limitation of the Tanuki wrapper service.

1. Log in to the host system or virtual machine where you want to install multiple MID Servers.
2. Create a directory for each MID Server on the top level of the drive.
   
   Make sure you create a unique and descriptive name for each MID Server, such as MIDS\Server_SMS_Int or MIDS\Server_Disc1.
3. Extract the downloaded MID Server archive file into each MID Server directory.
   
   When the extract completes, there should be a directory path similar to the following for each MID Server: ServiceNow<MID Server name>\agent.
4. For each MID Server, run the installer appropriate to the host's operating system.

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Installer path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>/agent/installer.bat</td>
</tr>
<tr>
<td>Linux</td>
<td>/agent/installer.sh</td>
</tr>
</tbody>
</table>

5. Use the installer to enter the following information.
• URL to your instance
• User credentials to run the MID Server
• Proxy server connection details
• MID server name
• MID server service wrapper name and display name (Windows systems only)

**Note:** The MID Server user must have the mid_server role.

6. From the installer, click **Start MID Server**.
The local host starts the MID Server.

7. Click **Mid Servers List Page**.
   The installer opens the MID Server list from your instance.

8. Select the MID Server name from the list.
**Note:** It may take a few seconds for the MID Server time to establish a connection with your instance.

The system displays the MID Server record.

9. From **Related Links**, click **Validate**.
   The MID Server **Validated** changes to **Yes**.

All MID Server installation procedures are complete. Proceed to **configure your MID Server**.

**Multiple MID Server deployments**

Depending upon how you use the MID Server (for an external integration, Discovery, Service Mapping, or Orchestration) and the load placed on it, you might find it necessary to deploy multiple MID Servers in your network.

Factors determining the number of MID Servers your network will require to support external applications that integrate with ServiceNow include the following:

- The security constraints in your network.
- Your network policies.
- The amount of traffic between ServiceNow and the integrations.
- The reliability of the MID Server machines.

**Network policies and security**

Security policies in your network (firewalls between network segments, for example) might make direct communication impossible between your instance and an integration's data source (JDBC, LDAP, etc.). To retrieve data for the instance, you can install a MID Server that has access to both the data source and the instance.

These network policies can determine if you need to install multiple MID Servers in your environment:

- **Access control lists (ACL):** If your security policy controls access to network devices (e.g. switches and routers) with an ACL, it might be necessary to install one or more MID Servers on a machine in the network that is already on the ACL.
- **DMZ:** Your network policy might require you to install one or more MID Servers in your DMZ to probe the devices there. This is common in networks that tightly regulate the ports that are opened on the inside firewall.
- **Probe types:** If you are conducting probes of different operating systems, your network policy might require a separate MID Server for each type of probe (e.g., one MID server for Windows WMI probes and another for SSH probes on UNIX).

**Load balancing**

Deploy multiple MID Servers where capacity is an issue, as when Discovery has to gather information about thousands of configuration items quickly. In a high volume environment, it might be necessary to deploy multiple MID Servers as load balancers for certain transactions. For example, JDBC data transfers can tie up the resources of a MID Server, making it unable to respond to other requests. The following operations between an integration might require separate MID Servers in a busy network:

- File exports
- Running scripts
- JDBC data sources
- Reading files
High availability model

Avoid installing MID Servers for critical integrations on a machine that might experience any type of planned outage or an outage caused by overloaded processes. If necessary for reliability, consider deploying these types of MID Servers to dedicated machines for high reliability

Note: Do not integrate with an external application on a MID Server provisioned for ServiceNow Discovery or Orchestration.

Wide area network (WAN)

When determining where to deploy MID Servers in a WAN, consider the bandwidth available between your local area networks. In most cases, install a MID Server on each LAN to probe devices locally, rather than deploying MID Servers that must probe devices across slow WAN connections. An alternative to this type of deployment is to install MID Servers that probe other LANs via VPN connections that take advantage of fast Internet connections. If the bandwidth of your WAN connections is comparable to that of your Internet connection, then there is no performance impact in running MID Server probes across WAN connections.

Domain separation

In deployments where domain separation is enabled and domains are configured to form a hierarchy, place the MID Servers at the lowest domain level.
Deploying MID Servers with domain separation

**Use MID Server guided setup**

MID Server guided setup provides a sequence of tasks that help you install a MID Server with the proper user account and validate the MID Server. If you are setting up a MID Server for the first time, this is a good way to get one up and running in your environment quickly.

Role required: admin
You are guided through a series of configuration activities that create a fully qualified MID Server. A progress indicator on each screen allows you to monitor your progress on each task.

Each configuration activity provides the following resources to help you:

- Contextual embedded help.
- Links to comprehensive documentation on the ServiceNow product documentation site.

**Important:** You must complete MID Server configuration before you can launch any other IT Operations Management guided setup.

1. Navigate to **Guided Setup > ITOM Guided Setup**.
   The IT Operations Management Guided Setup welcome screen appears.

2. Take one of the following actions:
   - If none of the MID Server installation and configuration tasks are complete, click **Get Started**.
   - If you have completed any of the MID Server installation and configuration tasks, click **Continue** to return to the task list.
   - Select the MID Server icon in the progress bar on the left side of the category screen to display the MID Server category pane at any time.
3. Click **Continue**.
   The IT Operations Management Guided Setup category screen appears. The controls for starting the MID Server tasks are at the top of the list. These task must be completed before you can set up the other applications that rely on the MID Server.

4. In the MID Server pane, click **Get Started**.
   The MID Server task list appears with a description of each task.
The MID Server runs as a Windows service or a UNIX daemon to facilitate communication and the movement of data between a ServiceNow Instance and external applications, data sources, and services. Complete the activities in this category to create a user for the MID Server, download the installation package, and validate the MID Server after installation.

- **Create MID User**
  - Add Notes
  - Last updated 20 mins ago by System Administrator
  - Create the user account that the MID Server needs to authenticate on the ServiceNow instance.

- **Download & Install MID**
  - Add Notes
  - Unlock by completing Create MID User
  - Select and download the appropriate MID Server installer archive for the operating system.

- **Validate MID**
  - Add Notes
  - Unlock by completing Download & Install MID
  - You must validate the network connection between the MID server and your instance before the MID server is permitted to access automation credentials or execute any outbound SEC probes.
5. Click **Configure** to create the MID Server user and follow the instructions in the help pane that appears on the right side of the screen.

   **Attention:** If you configured MID Servers manually prior to starting Guided Setup, select from that information to complete each specific task.

6. When you have provided the requested information for the MID Server user, click **Submit**, and then click **Mark as Complete** at the bottom of the help pane.

   The view returns to the task list. Notice that the circular progress indicator for the category shows 33% of the MID Server configuration complete. The progress indicator on the left side of the screen shows the completion percentage for all the IT Operations Management tasks.

7. Click **Configure** for the next task, **Download & Install MID**.

   OpenJDK version 1.8.0._231 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. See the HI Knowledge Base article [KB0719830](#) for more information on OpenJDK version support. The installer automatically configures OpenJDK to run in your environment. No additional configuration is required. This version supports both 32-bit and 64-bit MID Servers. For the best performance, install the 64-bit MID Server for your operating system. The MID Server requires a minimum JRE version 1.8.0._161, and recommended version 1.8.0._231. If you are using a lower version than 1.8.0._161, you may see encryption related issues. If the MID Server is configured to use an external JRE and the JRE is detected to be
incompatible, the MID Server instead uses the bundled JRE. If this fails, or the MID remains on an incompatible JRE version, the MID automatically stops.

**Note:** ServiceNow will discontinue support for 32-bit MID Servers in a future release.

8. Validate your new MID Server.

   If necessary, **deploy multiple MID Servers from a single host** in your network. Otherwise, proceed to **configure your MID Server**.

### Configuring MID Servers

After installing and validating your MID Servers, ensure that they have access to sufficient system resources, probe the proper targets, and communicate with the instance as expected. Configure MID Server selection criteria, create clusters for failover protection, and set up MID Servers in different domains to protect data.

Ensure that the MID Server can connect to elements inside and outside your network.

Download and install the MID Server on a Linux or Windows host.

Configure your MID Server.

Configure MID Server security.

Some of these configuration procedures rely on data found in the MID Server *references home page*. See that page for links to the parameters, properties, and privileged commands you need to fine tune the behavior of your MID Servers. You can apply controls to individual MID Servers or to all the MID Servers in your environment. Remember to restart the MID Server after any configuration change for those changes to take effect.

### MID Server selection

MID Servers are selected for use based on three criteria: applications, IP address or range, and capabilities. You can designate specific applications for a given MID Server, such as Discovery or Orchestration. You can specify an IP address or a range that a MID Server is allowed to work within. Some applications require specific capabilities, and so are restricted to MID Servers with those capabilities.

**MID Server selection**

Configure the way your instance selects a MID Server, either by application, IP address ranges, network capability, or behavior.

**MID Server capabilities**
Create capabilities that define the specific functions of a MID Server within an IP address range.

**MID Server IP range auto-assignment**

Configure the system to automatically assign a qualified MID Server to a subnet by that subnet's IP address range.

**Map an IP address to a DNS name**

Map host server DNS names to IP addresses if your MID Server manages resources within defined IP ranges.

**Configure MID Server as WinRM trusted host**

Add servers, which are part of WinRM, as trusted hosts on all MID Servers that Discovery or Service Mapping use for discovery.

**File permission enforcement for Windows MID Servers**

To improve security, Windows MID Servers will enforce Windows file permission restrictions. This will prevent compromised accounts from accessing unauthorized files by restricting their permissions to the minimum necessary for their role.

**MID Server clusters**

MID Server clusters are groups of MID Servers which provide support to each other in the forms of load balancing and fail-over protection. Work sent to a MID Server that is part of a cluster is automatically balanced between all the MID Servers in that cluster. MID Servers in a fail-over cluster each have a configured order that the platform uses to determine which MID Server to use next in case of failure.

**Create a MID Server cluster**

Create a MID Server cluster for load balancing and fail-over protection.

**Set thread use**

Set the number of threads your MID Server uses for the desired MID Server speed, based on hardware capabilities and competing applications running on the host.

**Domain separation**

Domain separation segregates MID Servers based on the records they can access. The credentials configured in a MID Server's config.xml file determine which records that MID Server can read, update, or create. You can specify MID Server policy records that only MID Servers from the same domain can use.

**MID Server domain separation**

Set up your MID Servers in different domains to restrict the records and credentials that a MID Server can access.

**Synchronize a JAR file to MID Servers**

Upload a JAR file to an instance and synchronize it to all MID Servers connected to that instance. Use JAR file synchronization to create policies that only a MID Server from the same domain can use.

**MID Servers used for credential-less Discovery**

MID Servers that are used for credential-less Discovery require special configuration to run Network Mapper (Nmap) commands on target computers.

**Install and uninstall Nmap on a MID Server**
You must install Nmap on each MID Server running on a Windows host. When given the proper capability, those MID Servers can discover some basic information about CIs in your network if normal authentication fails.

**MID Server extensions**

**vCenter event collector**

The vCenter event collector listens for vCenter-related events and updates the CMDB accordingly. The event collector allows the CMDB to be updated with changes to virtual machines (VMs), in addition to the updates detected by Discovery. A change to a VM is sent as an event from the vCenter server to the vCenter event collector. When an event is received, the CMDB is updated accordingly. Full vCenter Discovery does not need to rerun. For some events, such as powered on and powered off events, Discovery does not need to run again at all. For most events, Discovery runs only on the necessary vCenter resource.

**SNMP trap collector extension**

The SNMP trap collector is a MID Server extension that listens for SNMP traps from the devices on your network. Upon receiving a trap, the MID Server sends the trap to the instance for further processing by Event Management. If Event Management is not active, traps are not processed and are discarded by the instance.

**MID Server selection**

You can configure MID Server selection by application, IP address ranges, network capability, or behavior. Specific MID Servers can be assigned to particular tasks, or the MID Server can be selected automatically. MID Servers can use domain separation to limit the scope of discoveries and event management.

**MID Server criteria**

MID Servers offer these types of criteria that help an application determine which MID Server to use:

- **Application**: The application that you specify on the MID Server. You can designate these applications for a specific MID Server:
  - Discovery
  - Orchestration
- Service Mapping
- Event Management
- Operational Intelligence
- Cloud Management

An **ALL** application option is also available. By default, this option includes all applications. You can **configure which applications** are included in the **ALL** designation.

- **IP address or range**: The IP address or the IP ranges that the MID Server is allowed to work within. You can specify an IP address or IP range in the application, such as on a Discovery schedule or an Orchestration activity, and for the MID Server. If the IP configured in the application matches the IP address or falls within the allowable IP range configured on the MID Server, a match is possible, and that MID Server passes this criteria. To have the instance automatically assign IP ranges (subnets) to available MID Servers, see **Using MID Server IP range auto-assignment**.

- **Capabilities**: The **network capability** an application needs to use, such as the **PowerShell Orchestration activity** or the Flow Designer **PowerShell step**. Some applications, like Cloud Management, require a specific capability.

**Note**: Discovery and Service Mapping can also use behaviors, which determine the type of port probes used during the port scan phase of Discovery. Both Discovery and Service Mapping use a behavior to discover **load balancers running on Linux**. Other applications do not use behaviors. Behaviors are not used for auto-selection, default MID Servers, or specific MID Servers as described below. See **Discovery behaviors** for more information.

### How an application selects a MID Server

If you do not specify a specific MID Server for an application to use, the application tries to select one. Each application relies on different criteria to select an appropriate MID Server.

<table>
<thead>
<tr>
<th>Application</th>
<th>Supported Application on the MID Server</th>
<th>IP address range</th>
<th>Capability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery (Select <strong>Auto-Select MID Server</strong> on the Discovery schedule)</td>
<td><strong>The Discovery</strong> or <strong>ALL</strong> application must be <strong>specified on the MID Server</strong>.</td>
<td>Discovery uses IP ranges that you configure on the <strong>Discovery Schedule form</strong> to see if they fall within the IP ranges that you configure on the MID Server, or the <strong>ALL</strong> IP ranges option must be selected on the MID Server.</td>
<td>N/A</td>
</tr>
<tr>
<td>Orchestration</td>
<td><strong>The Orchestration</strong> or <strong>ALL</strong> application must be specified on the MID Server.</td>
<td>The target IP address that you configure in an Orchestration activity must fall within the IP ranges that you configure on the MID Server, or the <strong>ALL</strong> option must be selected on the MID Server.</td>
<td>The capability that is required for an Orchestration activity must match the <strong>capabilities you configure on the MID Server</strong>, or the MID Server capability must be set to <strong>ALL</strong>.</td>
</tr>
<tr>
<td>Application</td>
<td>Supported Application on the MID Server</td>
<td>IP address range</td>

<td>One of the supported Service Mapping capabilities (for new installs) must be configured on the MID Server, or the MID Server capability must be set to <strong>ALL</strong>.</td>
</tr>
<tr>
<td>Event Management</td>
<td>The <strong>Event Management</strong> or ALL application must be specified on the MID Server.</td>
<td>The IP configured in the event connector instances, such as HPOM, must fall within the IP range configured on the MID Server.</td>
<td></td>
</tr>
<tr>
<td>Cloud Management</td>
<td>N/A</td>
<td>N/A</td>
<td>The <strong>Cloud Management</strong> or <strong>ALL</strong> capability must be added.</td>
</tr>
</tbody>
</table>

### Using a specific MID Server

Discovery and Event Management can use a MID Server that you specifically call out.

**Note:** Selecting a specific MID Server is not the same as specifying the default MID Server for an application. A specific MID Server is always used. If it is **Down** or not validated, the application does not execute commands against the MID Server. A default MID Server is fallback that is used when the auto-selection of MID Servers does not find any eligible MID Server.

<table>
<thead>
<tr>
<th>Application</th>
<th>How you specify a specific MID Server</th>
<th>Criteria that the default MID Server must meet</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery</td>
<td>Choose the MID Server on the Discovery schedule.</td>

<td>N/A</td>
</tr>
<tr>
<td>Event Management</td>
<td>Choose one or more MID Servers on the connector instance event collection, such as HPOM.</td>
<td>N/A</td>
</tr>
<tr>
<td>Cloud Management</td>
<td>N/A</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Note:** If a MID Server manages resources within defined IP ranges for Orchestration, you must map the fully-qualified domain name (FQDN) of a server with its IP address to run certain activities, such as Exchange activities.
Domain separation

If you are using domain separation, you can configure MID Servers to be in separate domains. The domain that the MID Server is in affects how the application selects the domain:

- **Discovery and Service Mapping**: On the Discovery schedule, the MID Servers and clusters that available for selection are limited to the same domain of the user who is configuring the schedule. This also applies to the auto-selection option: only MID Servers in the same domain as the user can be automatically selected.

MID Server selection test

If Service Mapping is active, you can preview which MID Server that Service Mapping uses for a specific target device or computer. To do this, navigate to **Service Mapping > MID Servers** and click **MID Selection Test**. Enter the IP address and an optional application and capability, and then click **OK**. The name of the MID Server that Service Mapping will use appears in the window.

Configure a default MID Server for each application

You can configure a default MID Server that an application can use if all other possible MID Servers are unavailable. You can narrow down the list of applications that are included in the definition of **ALL**.

Role required: agent_admin or admin

Applications are only available when their respective plugins are activated.

The default MID Server is used when applications fail to find a suitable MID Server that matches configured criteria during auto-select. The default MID Server for the **ALL** application is used if the default MID Server for the specific application is not available. Some applications also offer a property to set the default MID Server.

**Important**: If you configure a MID Server for ALL IP ranges (type **Include**) and also create an IP range of type **Exclude** for the same MID Server, the system ignores the excluded IP range for that MID Server.

The default MID Server does not need to meet any criteria (application, IP range, behavior, or capability) to be used. Specifying a default MID Server is optional, and you can use a MID Server as the default for more than one application.
<table>
<thead>
<tr>
<th>Application</th>
<th>Additional notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery</td>
<td>Discovery attempts to use the default MID Server when the Discovery schedule specifies <strong>Auto-Select MID Server</strong> and Discovery cannot find any MID Servers with the correct application and IP range.</td>
</tr>
<tr>
<td>Orchestration</td>
<td>Orchestration attempts to use the default MID Server when it cannot find any MID Servers with the capabilities that you define in the Orchestration activity. You can also specify a default MID Server. The value in that property automatically synchronizes with the default MID Server you select in the Orchestration application.</td>
</tr>
<tr>
<td>Alert aggregation and RCA</td>
<td>Not applicable. The MID Server is selected if it has the RCA capability. Route to right MID by domain.</td>

<td>If there are no MID Servers with matching application, capability, or IP range, Service Mapping uses the default MID Server.</td>
</tr>
<tr>
<td>Event Management</td>
<td>You can specify a default MID Server for Event Management using the mid.server.connector_default system property. Event Management does not use the default MID Server in the application record.</td>
</tr>
<tr>
<td>Cloud Management</td>
<td>N/A</td>
</tr>
</tbody>
</table>

1. **Navigate to MID Server > Applications.**
   The list of installed applications that can use MID Servers appears.
2. Click the name of an installed application.
3. Select a MID Server from the list in the **Default MID Server** field.
4. To select additional MID Servers for this application, click **Edit** in the **MID Servers** related list and select alternate MID Servers that this application is allowed to use.
5. Click **Update**.

*Select applications to include in the definition of **ALL** for a MID Server*
You can narrow down the list of applications that are included in the definition of **ALL**.
Role required: agent_admin or admin
You can specify the **ALL** application for a MID Server, which means that the MID Server is allowed to work with any of the applications that require MID Servers, such as Discovery, Event Management, Service Mapping, and so on. But you might not want all applications to be included in the definition of **ALL**. For example, you might want to exclude Service Mapping from the **ALL** definition if you already have a dedicated MID Server to work with Service Mapping.

1. **Navigate to MID Server > Applications.**
   The list of installed applications that can use MID Servers appear.
2. If you do not see the **Included in application **ALL** column, you can personalize the list and add it.
3. For each application, double-click the value in the **Included in application ALL** column.

4. Change the value to **true** (to include) or **false** (to exclude).

### Configure an IP address range for the MID Server

You can manually configure an IP address range for the MID Server to explore.

Role required: agent_admin or admin

---

Applications, such as Discovery and Orchestration, can specify an IP range or the specific IP address of a target. When the application looks for a MID Server to use during auto-selection, it chooses a MID Server whose IP range includes the application's range or specific IP address. Applications also use other criteria, such as the MID Server's supported application or capability. See **MID Server selection** for more information.

**Note:** This is a manual configuration procedure. To learn how the system can assign IP address ranges to selected MID Servers automatically, see **Using MID Server IP range auto-assignment.**

These applications use IP ranges as follows:
• **Orchestration**: Use the IP address of the target machine (together with the capability) to select the correct MID Server for Orchestration activities. See the procedure in this topic to configure the IP address.

• **Service Mapping**: Select the MID Server whose IP address range matches the IP in the discovery request. See *MID Server configuration for Service Mapping* for more information.

• **Discovery**: Can select an IP address range using the same criteria as Service Mapping. Discovery can also use a *quick IP range* that you specify in the Discovery schedule.

**Tip**: You can also use the **ALL** IP range, which allows the MID Server to be used with any range of IP addresses that an application specifies. This only allows the MID Server to access IP ranges, it does not mean that the MID Server can actually reach all of the IP ranges. To function with an application, the MID server must have access to the IP ranges that the application needs.

Valid IP address ranges can be as follows:

- An IP address in dotted decimal or hexadecimal format. The hexadecimal format can be explicitly prefixed with 0x, this is not mandatory. Here are examples:
  - 10.11.144.155
  - 0xA0B909B
  - 0A0B909B

- An IP address range in dotted decimal or hexadecimal format. Here are examples:
  - 10.11.144.150-10.11.144.160
  - 0xA0B9096-0xA0B90A0
  - 10.11.144.150-0xA0B90A0

- An IP network address with the net mask specified after a slash (/) in regular notation (0-32 inclusive) or in IP address notation. Here are examples:
  - 10.11.144.0/24 10.11.144.0/255.255.255.0
  - 0xA0B9000/24
  - 0xA0B9000/0xFFFFF00

1. Navigate to **MID Server > IP Ranges**.
2. Click **New**.
3. Complete the form, using the fields in the table.
When associating MID Servers with IP address ranges, Orchestration uses the IP address of the target machine to select the correct MID Server to use for Orchestration activities. This functionality ensures that a MID Server with connectivity to the target is chosen to perform the Orchestration activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for this IP range. The default is <em>Global</em>.</td>
</tr>
</tbody>
</table>
### Field Table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Type    | Select the type of range:  
  - Include: Include the specified IP range.  
  - Exclude: Exclude the IP address range.  |
| Range   | Enter the range in a valid format. |
| Related list | MID Servers | The MID Servers that can use this IP address range. |

4. **Click Save.**

**Important:** IP ranges assigned manually prior to using auto-assignment in the *Discovery Quick Start* are affected as follows:

- Individual IP ranges are retained and appended to the ranges assigned automatically by the system for the designated MID Server.
- If the MID Server was configured with the **ALL** ranges selection, the auto-assignment feature overwrites that designation with the ranges it finds.

Open the **ALL** IP range record and configure the MID Servers that you want to use with any set of IP addresses.

**Override the MID Server selection filter**

You can use the override feature to write your own filter condition that overrides the normal MID Server selection criteria for an application. An override has precedent over the default filter and can be defined for a specific selection condition.

Before attempting to create an override filter, be sure you understand the criteria the platform uses to select MID Servers. See *MID Server selection* for details.

Role required: admin
Note: The override feature is intended for Cloud Management and Cloud Discovery only. The Override by capability filter is provided by default.

There are four MID Server selection filters included in the base ServiceNow system. These filters are applied to all MID Servers in order until the system finds a matching condition:

- Status Filter
- App Filter
- Capability Filter
- IP Filter

Important: The override feature allows multiple filter types but only one override filter for each filter type. The Override selector filter type overrides all other filters and takes complete control of the MID Server selection. If this type is active, it is the only filter applied.

1. Navigate to MID Server > Mid Selector Override.
   The list of MID Server overrides appears.
2. Click New to create a new filter.
3. Complete these fields:
   - Name: Unique name for this override. Ensure that you can identify the override type by the name.
   - Script: Condition for this filter. Create the MID Server selection logic for your override in this field, using the directions provided in the function template. Look at the Override by capability filter as an example before starting to create your filter.
   - Type: Type of override being configured. Select one of the four default filters to override with your condition, or select Override selector to create a filter that overrides all the others.
4. Click Submit.
<table>
<thead>
<tr>
<th>Name</th>
<th>Override by capability</th>
<th>Application</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>✓</td>
<td>Global</td>
<td>Capability Filter</td>
</tr>
</tbody>

```javascript
// (function filter(/= MIDServerJS Array */ candidateMIDList, /= MIDServerJS Array */ defaultSelectedMIDList, /= 0
// Native JS object */ #selectorsContext, /= MIDSelectorParamJS */ requestedParameters) {
// If anything matching no need to do anything
if (defaultSelectedMIDList.length > 0)
  return defaultSelectedMIDList;

  // Check if this is cloud capability - if not nothing to do
  if (!hasCloudCapability(requestedParameters.capabilities))
    return defaultSelectedMIDList;

  // get first non cloud capability (e.g AWS) - there should be only one more
  var capability = getNonCloudCapability(requestedParameters.capabilities);
  if (capability) {
    var warn = MID Selection filterOnCapability could not find a capability for provider!
    warn;
    return defaultSelectedMIDList;
  }

  // Get mid with AWS capability
  var ids = getMidsWithCapability(capability);
  if (ids.length > 0)
    return ids;

  ids = getMidsWithCapability('Cloud Management');
  getMidsWithoutCapability(ids, capability);
```
Using MID Server IP range auto-assignment

Discovery Quick Start can automatically assign ranges of IP addresses, called subnets, to qualified MID Servers. This subnet auto-assignment requires SNMP credentials for read-only access to routers Discovery uses. The Automation Status Set form shows summary details of subnet Discoveries and the IP range assignments for associated MID Servers.

To be automatically assigned to a subnet, a MID Server must be:

- In a running (Up) state.
- Successfully validated.
- Able to access one or more subnets in your network.

The subnet assignments that the instance makes for your MID Servers are stored in the Automation Status Set [automation_status_set] table. For details about MID Server auto-assignment, see Discovery Quick Start.

**Important:** You must auto-assign at least one MID Server to create a schedule automatically.

**Required SNMP OIDs for MID Server IP range auto-assignment**

Customers who use network service providers must request specific SNMP access to use MID Server IP range auto-assignment.

IP range auto-assignment requires SNMP credentials for read-only access to all routers that Discovery uses to identify subnets. In addition, your service provider must grant the following SNMPWALK access:

- iso.org.dod.internet.mgmt.mib-2.ip.ipRouteTable (1.3.6.1.2.1.4.21)
  - ipRouteDest (1.3.6.1.2.1.4.21.1.1)
  - ipRouteNextHop (1.3.6.1.2.1.4.21.1.7)
  - ipRouteType (1.3.6.1.2.1.4.21.1.8)
  - ipRouteMask (1.3.6.1.2.1.4.21.1.11)
- iso.org.dod.internet.mgmt.mib-2.ip.ipForward.ipCidrRouteTable (1.3.6.1.2.1.4.24.4)
  - ipCidrRouteDest (1.3.6.1.2.1.4.24.4.1.1)
  - ipCidrRouteMask (1.3.6.1.2.1.4.24.4.1.2)
View automation status sets and IP range assignments

The Automation Status Set form shows summary details of a subnet Discovery and the subsequent IP range assignments for MID Servers selected for automatic subnet assignment.

Role required: admin

1. Navigate to MID Server > Automation Status Sets.
2. Select a status record for a subnet Discovery you want to view.

The form contains read-only status information about the selected Discovery, the subnets found, and the range assignment process for the MID Servers you selected for auto assignment.

**Important:** IP ranges assigned manually prior to using auto-assignment in the Discovery Quick Start are affected as follows:

- Individual IP ranges are retained and appended to the ranges assigned automatically by the system for the designated MID Server.
- If the MID Server was configured with the ALL ranges selection, the auto-assignment feature overwrites that designation with the ranges it finds.
The Automation Status Set shows the IP range assignments for the MIO Servers selected for automatic range configuration. All auto-populated MIO Server ranges from this process are subnets only. This form includes summary details of the Discovery that identified the available subnets and their ranges.

Actions on selected rows...
3. Select the **Subnets Discovered** related list to view the list of subnets available for assignment.

![Subnets Discovered table]

4. Select the **IP Range Assignments** related list to view the IP ranges that were assigned to a MID Server.

   **Caution:** IP ranges identified by Discovery are stored in the IP collection \( [\text{ip_address_collection}] \) table, which is only used for MID Server IP range auto-assignment in the Jakarta release. This table is intended for future development and **should not** be used in any customizations, including column additions, business rules, or scripting actions.
File permission enforcement for Windows MID Servers

To improve security, Windows MID Servers enforce Windows file permission restrictions. The enforcement limits access to the MID Server files to a restricted whitelist of users and groups.

File permission enforcement for Windows MID Servers goes into effect on the MID Server on start up in Orlando. By default the agent folder is locked to three user accounts and groups: the local admin group, the system account, and the user account the Windows MID Server is using. The list of permitted user accounts is managed by a whitelist, which is controlled by the MID Server parameter `mid.windows_host.file_permissions.allow_list`. This parameter takes a string of comma separated group names, user names, and security identifiers (SID). Group and user names must follow SAM account naming requirements. Domain accounts must be specified by using the SID.

Roll back file permission changes

Changes to the file permissions are recorded, and the last used settings are saved in the `/etc` folder as a backup. The file is `fileperm.aclsave`. Open a command prompt and run the command `icacls <agent_folder> /restore <agent_folder>/etc/fileperm.aclsave` where `<agent_folder>` is name of your agent folder.

Run a MID Server as a non-admin

To run a MID Server as a non-admin user, it must first be installed using an admin account. Then add the non-admin user to whitelist and restart the MID Server. Once the new enforcement rules run, the MID Server can be switched to the non-admin service account. See Run a Windows MID Server as a non-admin for more information on setting up non-admin Windows MID Servers, or Run Linux MID Servers as non-root users for Linux MID Servers.
Map an IP address to a DNS name

Associate the IP address to a DNS name to ensure the appropriate MID Server is selected. The IP Address range configuration determines which MID Server is selected. If the MID Server manages resources within defined IP ranges, all host servers must have their DNS names mapped to an IP address.

Role required: admin

The association of an IP address to a DNS name ensures that the appropriate MID Server is selected based on the IP Address range configuration. If this is not done, Orchestration reverts to the default MID Server.

If Discovery cannot discover the server and resolve the DNS name to an IP address, you must create the mapping manually.

**Important:** The platform does not map `localhost` to 127.0.0.1 automatically. You must create that mapping using this procedure.

1. Enter `cmdb_ci_dns_name.list` in the navigation filter.
   A list of DNS names appears.
2. Check the list for your host server.
   If the server does not appear in the list, continue with this procedure.
3. Click New.
4. Enter the fully-qualified domain name (FQDN) of the host server in the Name field.
5. Right-click in the form header and select Save from the context menu.
6. In the IP Address related list, click New.
7. In the IP Address field, enter the IP address of your host server.
8. In the Nic field, select eth0 or your preferred network interface controller.
9. Leave the Netmask field blank.
10. Click Submit.
Configure MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range, allowing an application to select the most appropriate MID Server. Configure capabilities on MID Servers for applications like Orchestration, Cloud Management, and Service Mapping.

Role required: admin or sm_admin

Several applications use capabilities, IP ranges, and MID Server selection to narrow the pool of MID Servers the applications need.

Note: At least one capability is required for each MID Server used by Orchestration. See MID Servers for Orchestration for more information.

The following capabilities are available by default with Discovery:

<table>
<thead>
<tr>
<th>All</th>
<th>IBM</th>
<th>Resolve DNS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ansible</td>
<td>JDBC</td>
<td>REST</td>
</tr>
<tr>
<td>AWS</td>
<td>NetApp</td>
<td>SNMP</td>
</tr>
<tr>
<td>Azure</td>
<td>Nmap</td>
<td>SOAP</td>
</tr>
<tr>
<td>Chef</td>
<td>OpenStack</td>
<td>SSH</td>
</tr>
<tr>
<td>Cloud Management</td>
<td>PowerShell</td>
<td>VMware</td>
</tr>
<tr>
<td>Google</td>
<td>RCA</td>
<td>WMI</td>
</tr>
</tbody>
</table>

1. Navigate to MID Server > Capabilities.
2. Select an existing capability. You can also select ALL to include all capabilities.

Note: Ensure that each IP address range has MID Servers with the necessary capabilities to complete the Orchestration activities on that network segment.

3. Create a new capability:
a) Click New.

b) Configure the value for a custom capability.
   An example is a capability for DOMAIN, with a value of service-now.

c) Click Submit.

4. Click Edit in the MID Servers related list to add MID Servers to the capability.
5. Select one or more MID Servers for this capability from the Available list.
6. Click Save.

   The capability defined here also appears in the primary record for this MID Server.

MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range.

Nmap capability

The Nmap capability is only assigned to MID Servers for which the Network Mapper (Nmap) scanner has been installed for credential-less Discovery. This capability cannot be added to or removed from any MID Server manually. For instructions on installing or uninstalling Nmap, see Install and uninstall Nmap on a MID Server

MID Server capability values

Capabilities provided in the base system do not have a defined value string. A MID Server configured to use a capability that has no value can locate any device using that capability's protocol. If a capability has a defined value, the MID Server using that capability finds only those devices using that protocol that match the value string exactly. The exception to this is the Resolve DNS capability, which is configured to resolve any DNS name into an IP address using a partial string match.

Starting with the madrid release, the [capability name]:[value] combination appears in the slushbucket when you add a capability to a MID Server. This combination allows you to see all the capabilities that have different values, even if the capability name is the same. For example, if you are using the Cloud Management capability, and you use the value field to specify the us-west logical datacenter on one of the capability records, you can see the combination in the Collection list.
Scripted MID Server capability value matching

You can use value tests to create capabilities that find devices using values without requiring exact string matching. Action on these values is controlled by a user-defined script.

The Resolve DNS capability is provided in the base system and is configured to resolve DNS names into IP addresses for devices whose names end with a specified domain name. The capability Value entered is automatically prefaced with a dot during processing to match domain syntax. This value can contain one or more sub-domains, but must include the end of the domain string. Matching devices must end with the identical syntax. The script for the Resolve DNS capability determines if a device name matches the criteria defined by Value. If a match exists, the platform performs the address resolution automatically. For example, if the value for the Resolve DNS capability is service-now.com, the MID Server with this capability finds lnxlab01.sandiego.service-now.com and dbsrv101.sanjose.service-now.com. If the value is changed to sandiego.service-now.com, then the MID Server finds only lnxlab01.

Note: If Value in the Resolve DNS capability is blank, then all domains match.

To view the script for evaluating this capability, navigate to MID Server > Capability Value Tests and select Resolve DNS from the list.
Configure a MID Server cluster

Group multiple MID Servers to form clusters, then configure clusters for fail-over protection or load balancing. Load-balancing clusters automatically balance work between each MID Server to improve stability and performance. Fail-over clusters have a configured order used to determine which MID Server to use next if a failure occurs.
Ensure that each MID Server in the cluster has the appropriate capabilities for the job. A MID Server in a fail-over cluster must have the same capabilities (or expanded capabilities) as the MID Server it is expected to replace.

Role required: admin

You can select a MID Server cluster from the Discovery Schedule form.

1. Navigate to **MID Server > Clusters**.
2. Click **New**.
3. Name the cluster and select the cluster type: **Failover** or **Load Balance**.
4. Right click in the header bar and select **Save** from the context menu.
5. Click **Edit** in the **Includes MID Servers** Related List.
6. Select appropriate MID Servers for this cluster from the slushbucket.

**MID Server clusters**

MID Server clusters enable multiple MID Servers with the appropriate capabilities to be grouped together for load balancing and fail-over protection.

**External data sources**

For performance and reliability reasons, these data sources should not be used with MID Server clusters. These external data sources should only be used with dedicated MID Servers.

- LDAP
- Export sets
- JDBC data sources

**Note:** If a MID Server in a cluster fails, the fail-over MID Server starts over at the beginning of the ECC queue task even if much of the information from the JDBC data source was already returned. This can result in duplicate data. For more details, see the Using MID Server clusters for JDBC data sources can cause duplicate and out-of-date data [KB0727739] article in the HI Knowledge Base.
How clusters work

MID Servers in clusters must be able to connect to the instance and to all the devices with which they are expected to communicate. If all MID Servers in a cluster are down, the discovery is canceled. Make sure all the MID Servers are added to any Access Control List (ACL) in use. MID Server clusters are managed by a business rule called MID Server Cluster Management, which checks to see if the MID Server assigned to a job in the ECC Queue belongs to a cluster.

Load balancing

If the cluster business rule determines that a MID Server is part of a load balancing cluster, the application using the MID Server automatically balances the work between the MID Servers in that cluster. It is good practice to put MID Servers with the same capabilities in a load balancing cluster.

Fail-over protection

MID Servers in a fail-over cluster each have a configured order that the platform uses to determine which MID Server to use next in case of failure. MID Servers in a fail-over cluster work independently and do not load balance with other MID Servers in that cluster (although they might also be members of load balancing clusters). When a MID Server fails, the MID Server Cluster Management business rule selects the highest available MID Server in the order to take over the work. The selected MID Server checks the ECC Queue and starts with jobs that are either Processing or Ready.

Note: MID Server clustering does not support the ECC queue topics Command or SystemCommand. If these commands are received, the clustered MID Servers do not redirect the ECC queue to another MID Server. The ECC queue records stay on the ECC queue without being processed.

Configure a fail-over MID Server with at least the same capabilities as the MID Server it is intended to relieve.

Note: If a MID Server fails while the Shazzam probe is running and auto-selection is configured, failover is not available. The Shazzam discovery stops. Discovery does not automatically choose another MID Server.

MID Server cluster event

The following event is triggered when the platform cannot find a MID Server with the appropriate capabilities to replace a MID Server in a fail-over cluster. Use this event to create an email to notify appropriate users that the cluster has failed.

<table>
<thead>
<tr>
<th>Event</th>
<th>Table</th>
<th>Description</th>
<th>Business Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid_server.cluster.down</td>
<td>[ecc_agent_cluster]</td>
<td>A MID Server cluster has failed</td>
<td>MID Server Cluster Management</td>
</tr>
</tbody>
</table>

Combining clusters

A MID Server can be added to both types of clusters at the same time. This diagram shows a scenario in which a MID Server from a load balancing cluster (MID Server D) is also present in a fail-over cluster. If MID Server D fails, MID Server E in the failover cluster is available to the load balancing cluster to perform the tasks previously assigned to MID Server D.
Specifying a specific MID Server cluster

You can specify a specific MID Server cluster for a Discovery schedule. The discovery process uses that cluster only. You cannot chain clusters or specify a single MID Server that belongs to multiple clusters.

Distributed MID Server clusters for Operational Intelligence

The *distributed* MID Server cluster type is used exclusively in Operational Intelligence, which analyzes Event Management events and generates anomaly alerts. These MID Servers communicate with one another to distribute and balance the workload. For details, see *MID Server distributed clusters for Operational Intelligence*

Set MID Server thread use

The three parameters: threads.interactive.max, threads.expedited.max, and threads.max define the maximum numbers of worker threads that can run simultaneously in each pool. Change the number of threads used by the MID Server according to performance requirements. MID Servers which compete with other programs for CPU time can use fewer threads than the default. MID Servers which need more speed, and have a host computer powerful enough, can use more threads.

Role required: admin
Changing the thread parameters can affect the MID Server performance. The interactive thread pool is designed for executing interactive messages including system commands and heartbeats. They are typically lightweight, so usually there is no need to change the default value. The expedited thread pool is designed for executing messages that have higher priority than the standard ones but less than interactive ones. Unless you have applications that produce a lot of expedited messages, there is no need to change the default value for threads.expedited.max. The standard thread pool is the busiest pool. Most probes are using it and they can take a lot of system resources such as CPU, memory, and so on. You can set the MID Server to use as few as five threads without issue. To increase the speed of the MID Server if the host is powerful enough or lightly loaded with other programs, you can increase the threads setting. The threads setting depends on the limitation of the CPU speed, memory, and operating system of the host machine. You might have to experiment to find the optimal threads count that works best when the MID Server is busy so it does not exhaust the host machine’s hardware limitations. This means you may have to refine the thread count to best meet your situation. The following general observations may be useful:

- PowerShell is resource intensive and threads may not scale linearly.
- Most MID Server tasks require file handles to do their job.
  - Windows: On the Windows operating system, file handles are available in a fixed quantity. If you configure too many MID Server threads on a Windows host, the MID Server can consume all the file handles before approaching maximum CPU usage. This situation appears as an Out of file handles error in the MID Server log and indicates that the MID Server is trying to use too many threads.
  - UNIX and Linux: UNIX and Linux hosts have a much different scheme for allocating file handles. Generally, you can increase MID Server thread use on these operating systems until the CPU of the host is overloaded. See your OS documentation for monitoring CPU usage.
  - Each thread on the MID Server requires some memory. Exactly how much memory varies considerably from task to task and depends on the equipment being discovered. To increase the number of threads, you might have to increase the amount of memory that Java uses. If you configure insufficient memory, an Out of memory error appears in the MID Server log.
  - You can set threads.max as high as 200, however, this setting may need to be changed depending on the OS. For example, Windows-based MID Servers running Discovery uses Powershell which is resource intensive. In this case, you may exhaust the CPU power of the host machine with just 50 threads count.

Follow the steps below to change the config.XML file. Alternatively, use the threads.max connection parameter. See MID Server Connection parameters for more details.

1. Open the agent/config.xml file using any text editor.
2. Locate the following lines:

   <!-- MID Server Threads -->

   <parameter name="threads.max" value="25"/>

3. Edit the value. Keep in mind the cautions described above.
4. Save the record.
5. Restart the MID Server service.

**Install and uninstall Nmap on a MID Server**

If you decide to use credential-less Discovery in your network, you must install Nmap on each Windows MID Server that you want to use for this purpose. Self-hosted customers whose network security does not permit downloads from install.service-now.com must use a specific manual process to install and configure Nmap.

Role required: mid_admin
• Assign MID Server IP ranges to all deployed MID Servers. The quickest and most reliable way to do this is with the **Using MID Server IP range auto-assignment** feature available in the **Discovery Quick Start** wizard. This method ensures that the set of MID Servers configured to access an IP address range is comprehensive.

• Identify the IP ranges you want to explore with credential-less Discovery. Ensure that these ranges can only be accessed by MID Servers with Nmap installed, running on supported Windows hosts.

• Use the **All** option for selecting IP ranges and observe these requirements:
  • Restrict the use of this feature to Windows MID Servers only.
  • Ensure that Nmap is installed on each of these MID Servers.
  • Ensure that the MID Servers can access the entire customer network.

• When you create a Discovery schedule with Nmap enabled, observe these requirements for the MID Server selection options:
  • **Specific MID Cluster**: Verify that Nmap is installed on all MID Servers in the cluster, where each MID Server in the cluster is configured to access the same set of IP ranges.
  • **Auto-Select Mid Server**: When running horizontal Discovery, verify that Nmap is installed on at least one of the MID Servers that can access the Discovery schedule’s configured MID Server IP ranges.
  • **Specific MID Server**: Verify that Nmap is installed on each MID Server that can access the schedule’s configured MID Server IP Ranges.

**Note**: To use credential-less Discovery for Service Mapping, install Nmap on all MID Servers that can access the Discovery schedule’s configured MID Server IP ranges.

Role required: **agent_admin**

The Discovery - IP Based [com.snc.discovery.ip_based] plugin provides connection to the installer for Nmap and the programming elements that allow a Windows MID Server to run approved scripts on target CIs for credential-less Discovery. MID Servers on which Nmap is installed can execute an Nmap command configured to perform reverse DNS name resolution, discover MAC addresses, or gather OS information on target CIs without using credentials. The Discovery - IP Based plugin is activated automatically when the Discovery [com.snc.discovery] or Event Management and Service Mapping Core [com.snc.service-watch] plugins are activated.

**Service Mapping and Nmap**
Service Mapping does not check for the presence of the **Nmap** capability and selects the MID Server based on the IP address only. To ensure that Service Mapping does not select a MID Server without the **Nmap** capability, install Nmap on all MID Servers assigned to the IP address ranges for which you want credential-less Discovery to be available. If Service Mapping selects a MID Server for credential-less Discovery that does not have Nmap capabilities, this error message appears in the map at the site of the CI being discovered: **Nmap is not installed on MID Server. Verify all MIDs configured to handle selected IP Address have Nmap Capability. Nmap root directory path does not exist:**

**Amazon Web Service AWS**

Running Nmap scans to or from any resource within the Amazon Web Service AWS environment is tightly regulated and requires the permission of AWS through the *AWS Vulnerability/Penetration Testing Request* form. AWS only permits testing of EC2 and RDS instances that you own. Tests against any other AWS services or AWS-owned resources are prohibited. In addition, any Nmap scan of a permitted instance must be performed within an approved time window. For these reasons, credential-less Discovery within an AWS environment is not appropriate, and if a violation of their policy occurs, could result in expulsion from the service.

**Supported operating systems**

Nmap is supported on all editions of these operating systems, including virtual machines and 64 bit systems:

- Windows 2008
- Windows 2012
- Windows 2016

**MID Server requirements**

Nmap can be installed on MID Servers that meet these requirements:

- Status is *Up*.
- MID Server is validated.
- MID Server does not already have the **Nmap** capability.

**Warning:** The MID Server installation path must not contain the following characters:

- ( )
- { }
- [ ]

The Nmap installer replaces these characters with spaces. This prevents the installer from finding the correct path, and the installation fails. An example of a path that will fail is `C:\MIDServers\MID(1)\agent`.

1. Navigate to **MID Server > Servers**.
2. Open the desired MID Server record.
3. Under **Related Links**, select **Enable Credential-less Discovery**.
   A confirmation dialog box appears.
4. Click Yes to continue with the installation.

The instance runs the Nmap installer from https://install.service-now.com, a site within a ServiceNow datacenter that contains installers for the platform. This progress notice appears during installation:

The Logs tab in the MID Server record shows the message: Running system command: installNmap.

5. Click OK if you want to hide the dialog box while the installer continues to run in the background.

Installing Nmap also installs Npcap on the host, if it is not already installed. Npcap is Nmap's packet capture library for Windows that allows Nmap to perform port scans quickly and to identify the family of the operating system running on the target. Npcap is installed once on the host and can be used by any other application that requires it, such as Wireshark.

Note: If a more recent version of Npcap is already installed on the Windows MID Server host, Nmap is installed without Npcap. If an older version of Npcap is installed on the host, the Nmap installer upgrades it to the newer version.

The installation process has either of these outcomes:

- **Success:** These conditions indicate a successful installation:
  - The version of Nmap that is installed appears in the Nmap version field in the MID Server record
  - The Related Link changes to Disable Credential-less Discovery.
  - The Nmap capability is assigned to the MID Server and appears in the Capabilities tab of the MID Server record.

- **Failure:** If the installation fails, an error message is logged to the MID Server Issue [ecc_agent_issue] table. If you run the installer again with success, the issue is marked as Resolved.
6. To uninstall Nmap for a selected MID Server, select **Disable Credential-less Discovery** under **Related Links** in the MID Server record.

   This dialog appears during the uninstallation process:

   ![Disable Credential-less Discovery](image)

   The **Logs** tab in the MID Server record shows the message:
   
   Running system command: uninstallNmap.

   **Attention:** Because Npcap can be used by other applications, uninstalling Nmap does not automatically uninstall Npcap. You must uninstall Npcap manually, after determining that no other dependencies exist.

### Install Nmap on a self-hosted system

Use this procedure to install Nmap on MID Server host machines in a self-hosted environment that does not allow network access to the ServiceNow® install.service-now.com download site.

**Role required:** admin, maint

You must install Nmap manually on each MID Server host, and then configure the instance to execute credential-less Discovery.

**Note:** This procedure does not apply to self-hosted customers whose MID Server hosts can access install.service-now.com from within their network.

1. Navigate to **MID Server > Properties** (MID Server Property [ecc_agent_property] table) and open the record for the **mid.nmap.version** property.

   This property contains the version of Nmap that you must install. Record the version number.

2. Download the correct installer executable from one of these URLs:

   - **https://nmap.org/dist/**: If the Nmap version in the property is 7.50, the executable you need is **https://nmap.org/dist/nmap-7.50-setup.exe**.
   - **https://install.service-now.com/glide/distribution/builds/package/thirdparty/nmap/nmap-setup-xxx-windows.exe**: If the Nmap version in the property is 7.50, the executable you need is **https://install.service-now.com/glide/distribution/builds/package/thirdparty/nmap/nmap-setup-7.50-windows.exe**.

3. Create a folder called **nmap** in the MID Server agent folder of every MID Server you want to use for credential-less Discovery.
4. Copy the Nmap installer file that you downloaded to the nmap folder and rename it to nmapInstaller.exe.

5. Run the agent\scripts\PowerShell\NmapInstallation.ps1 script and pass it the following parameters in the order in which they appear.

   - **$operation**: Task that NmapInstallations.ps1 will process. To install Nmap, the task is install.
   - **$nmap_root_path**: Complete path for the nmap folder that you create in step 4.
   - **$nmap_self_installer**: Complete path for nmapInstaller.exe file that you copied in step 5.
4. \$nmap_command: Complete path for the Nmap install command. The NmapInstallations.ps1 script installs Nmap in the nmap folder created in step 4. This parameter is $nmap_root_path\nmap.exe.

5. \$nmap_uninstall_command: Complete path for the Nmap uninstall command. This command is $nmap_root_path\Uninstall.exe.

6. \$nmap_npcap_version: The Npcap version installed with Nmap. This value must be the same as the value of the mid.nmap.npcap.version property in the MID Server Property [ecc_agent_property] table.

7. \$nmap_safe_scripts: List of safe scripts that Nmap uses. You can retrieve this list from the mid.nmap.safe.scripts property in the MID Server Property [ecc_agent_property] table.

6. Set up the parameters in the NmapInstallation.ps1 script in this order:

   ./NmapInstallations.ps1 $operation $nmap_root_path $nmap_self_installer $nmap_command $nmap_uninstall_command $nmap_npcap_version $nmap_safe_scripts

   For example, the script might look like this:

   PS C:\MidServers\mid1\agent\scripts\PowerShell> .\NmapInstallations.ps1 "install" "C:\MidServers\mid1\agent\nmap" "C:\MidServers\mid1\agent\nmap\nmapInstaller.exe" "C:\MidServers\mid1\agent\nmap\nmap.exe" "C:\MidServers\mid1\agent\nmap\Uninstall.exe" "0.91" "allseeingeye-info.nse,amqp-info.nse,db2-das-info.nse,drda-info.nse,freelancer-info.nse,ike-version.nse,mcafee-epo-agent.nse,mqtt-subscribe.nse,openlookup-info.nse,oracle-tns-version.nse,quake1-info.nse,quake3-info.nse,rfc868-time.nse,rpcinfo.nse,snmp-info.nse,ventrilo-info.nse,weblogic-t3-info.nse,xmpp-info.nse"

7. After installation is complete, add the Nmap capability to each MID Server you want to use for credential-less Discovery.

   **Attention:** Only a maint user can add the Nmap capability to a MID Server. Contact ServiceNow Technical Support to request temporary maint access to your instance.

   a) On the instance, open the MID Server record.
   b) Select the Capabilities related list.
   c) Click Edit.
   d) Select Nmap from the list of available capabilities and click Save.
Uninstall Nmap on a self-hosted system

Use this procedure to uninstall Nmap in a self-hosted environment that does not allow network access to the ServiceNow install.service-now.com download site.

Role required: admin, maint

Nmap must be manually uninstalled from each MID Server host machine and then disabled on the ServiceNow instance.

1. Run Uninstall.exe in the nmap folder on each MID Server host configured for credential-less Discovery.
2. After uninstallation is complete, delete the nmap folder from the agent folder.
3. Remove the Nmap capability from each MID Server record.

Attention: Only a maint user can remove the Nmap capability from a MID Server. Contact ServiceNow Technical Support to request temporary maint access to your instance.

   a) On the instance, open the MID Server record.
   b) Select the Capabilities related list.
   c) Click Edit.
   d) Remove Nmap from the active capabilities list and click Save.

Configure MID Server as WinRM trusted host

In environments using Windows Remote Management (WinRM), Discovery or Service Mapping can discover servers using the WinRM protocol. Add servers, which are part of WinRM, as trusted hosts on all MID Servers that Discovery or Service Mapping use for discovery.

Role required: mid_admin
MID Server cannot access servers using the WinRM protocol unless these servers are configured as trusted hosts for this MID Server.

Perform this procedure on each MID Server used by Service Mapping or Discovery.

1. On the MID Server, open the command-line shell.
2. To add all servers to the TrustedHosts lists, run the following command:
   ```sh
   winrm s winrm/config/client @{TrustedHosts="*"}
   ```
3. To add specific servers to the TrustedHosts list, run the command with the comma-separated hosts instead of the asterisk (*), for example:
   ```sh
   winrm s winrm/config/client @{TrustedHosts="serverA,serverB,serverC"}
   ```

**MID Server domain separation**

Use the MID Server user role to configure MID Servers to access separate domains. The credentials in the `config.xml` file of a MID Server determine which domains it can access. Specific MID Server policy records can be restricted for use only by MID Server from the same domain.
The records that can be read, updated, or created by a MID Server are determined by the credentials configured for that MID Server in the `config.xml` file. These are the user credentials that a MID Server uses to access the instance and specify which domain's records that MID Server can access.

You can create versions of these specific MID Server policy records that only a MID Server from the same domain can use. This process separation is supported for records in tables that extend MID Server Synchronized Files:

- MID Server MIB File [ecc_agent_mib]
- MID Server JAR File [ecc_agent_jar]
- MID Server Script File [ecc_agent_script_files]

**Note:** Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. The attachments do not appear because the `Attachments` [sys_attachment] table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

### Set up domain separation for MID servers

Set up domain separation through the MID server user role and the MID Server configuration file.

Role required: admin, agent_admin

1. Configure a MID Server user within a specified domain with the proper `mid_server` role.
2. Specify this user within the MID Server `config.xml` file. When you set the MID Server user credentials in the `config.xml` file, make sure they are in the proper domain.

If you must change the MID Server domain:

1. Stop the MID Server and delete the `ecc_agent` record.
2. Update the MID Server `config.xml` with the new user in the new domain and restart the MID Server service.

If you need to create versions of specific MID Server files that only MID Servers in your domain can use:

1. Open or create a record in one of these MID Server modules:
   - SNMP MIBs
• JAR Files
• Script Files

2. Update an existing domain policy or submit a new record.

   **Note:** Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. The attachments do not appear because the Attachments [sys_attachment] table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

**Configure a multi-domain MID Server**

You can create a MID Server in the global domain that can explore targets in other domains.

Before configuring a multi-domain MID Server:

• Ensure that your instance is domain separated.

Role required: admin

1. Type `sys_properties.list` in the navigation filter and press Enter.
2. Locate the `glide.ecc.enable_multidomain_mid` property.
3. Set the value of the property to `true`.

   **Note:** Enabling this property has no effect on existing MID Servers. MID Servers in a domain prior to setting this property, remain in that domain.

4. Create a MID Server in the global domain.
   
   A MID Server created in the global domain after this property is set to `true` can explore any domain for which it has the credentials. However, this MID Server is restricted to trying only the credentials for the target domains requested by ECC Queue inputs.

   **Caution:** If you reset the `glide.ecc.enable_multidomain_mid` property to `false` after creating a multi-domain MID Server in the global domain, that MID Server writes all the data it receives to the global domain and not to the correct domains.

**Synchronize a JAR file to MID Servers**

You can upload a JAR file to an instance and synchronize it to all MID Servers, or write custom probes that use the synchronized JAR file.

Role required: admin, agent_admin
The MID Server JAR File [ecc_agent_jar] table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see Set up domain separation for MID servers.

**Caution:** Synchronizing a JAR file with this procedure causes all MID Servers connected to the instance to restart automatically.

1. Navigate to MID Server > JAR Files.
2. Click New.
3. Complete the following fields:
   - **Name:** A unique and descriptive name for identifying the file in the instance.
   - **Version:** A version number for the file, if one is available.
   - **Source:** Location of the JAR file for reference purposes. Source information is not used by the system.
   - **Description:** Short description of the JAR file and its purpose in the instance.
4. Click the paper clip icon in the banner.
5. In the Attachments dialog box, click Browse and select the file you want to attach.
The platform attaches the JAR file to the record and restarts the MID Servers to synchronize the file. It is not necessary to update the record to attach the file.

**vCenter event collector**

The vCenter event collector is a MID Server extension that listens for vCenter-related events and updates the CMDB accordingly.

The event collector allows the CMDB to be updated with changes to virtual machines (VMs), in addition to the updates detected by Discovery. A change to a VM is sent as an event from the vCenter server to the vCenter event collector. When an event is received, the CMDB is updated accordingly. Full vCenter Discovery does not need to rerun. For some events, such as powered on and powered off events, Discovery does not need to run again at all. For most events, Discovery runs only on the necessary vCenter resource.

For example, if a VM is turned off, the vCenter server sends the event `VmPoweredOffEvent`. The vCenter event collector receives and processes the event and the CMDB is updated to reflect that the state of the corresponding VM is set to off.

**Important:** With this extension, Discovery can only modify the state of a VM which exists in the CMDB. When an event with "CreatedEvent" occurs in its name, such as `VmCreatedEvent`, Discovery scans that VM and then creates the CI using the data it collects. When a new event occurs involving that CI, Discovery can update the existing record without launching another scan.

**Note:**

vCenter event collector supports *domain separation* by inheriting the domain of the specified Mid Server in the event collector context. However, it does not support multi-domain Mid Server configuration.

See *Discovery for VMware vCenter* for supported versions of vCenter.

**How vCenter events are processed**

The MID Server listens for the vCenter events configured in the vCenter Event Collector form. When one of these events is returned from vCenter, the instance parses the payload with a business rule that converts the vCenter event into a system event (sysevent). The instance then uses that sysevent to perform tasks, such as email notification.

**Note:** If the MID server is paused when a vCenter event occurs, the MID server still processes the event. In this case, it is possible for the event collector to display a status of *Started*.

The resulting sysevents contain these values:

- **Name**: Name of the system event created from the vCenter event. This value is always `automation.vcenter`.
- **Parm1**: vCenter event that was returned. This event must be associated with an event collector record.
- **Parm2**: Event data provided by vCenter, in JSON format.
Log entries for vCenter events

Supported vCenter events

The following events are the only vCenter events handled by the base system when Discovery is activated. If you have upgraded your instance from an earlier version, you might not have the default events added with later releases. To use the missing events, manually add them.

vCenter events

<table>
<thead>
<tr>
<th>Event name</th>
<th>Description</th>
<th>Launches probe</th>
</tr>
</thead>
<tbody>
<tr>
<td>VmPoweredOnEvent</td>
<td>The VM has been powered on from the powered off state or resumed from the suspended state. This event is sent when the VM is powered on. It does not account for the time it may take to boot the host operating system.</td>
<td>None</td>

</tbody>
</table>

### Configure and run the vCenter event collector extension

Configure the vCenter event collector extension in the MID Server module, and then add or remove supported events.

Before configuring event collectors, perform these tasks:

- Deploy and start a MID Server.
- Ensure that the MID Server has access to the vCenter.
- Run discovery on the vCenter.

Role required: agent_admin, admin

Multiple MID Servers can listen to the same vCenter instance, but each MID Server and each vCenter can have only one event collector record associated with it. Make sure you configure the events on the event collector record that specify the correct MID Server.

**Note:** You can add events to the vCenter event collector. However, not every event is supported by the base system event handlers. If you want to handle events other than those supported in the base Discovery system, you must create a script action to process the events. For instructions, see [Script actions](#). As a reference, the instance processes the vCenter events in the base system with a script action called `Discovery: Process vCenter events`. Do not edit or delete this script action.

To configure the vCenter event processor extension:

1. Navigate to **MID Server > Extensions > vCenter Event Collectors**.
2. Click **New** or open an existing extension.
3. Fill in the fields, as appropriate from the table.
4. Right-click in the header bar and click **Save** in the context menu.
   
   The **vCenter Event** related list appears, containing the default events that the system is configured to handle.
5. To select a different vCenter event, click **Edit** in the **vCenter Event** related list and browse for the event.
   
   The slushbucket does not display all the available events in the opening list. Use the filter to browse for events not displayed.
6. Under **Related Links** click **Start** to save the events in this collection and start the collector.
   
   The Related Links in this form work as follows:
## Commands available in the vCenter event processor extension

<table>
<thead>
<tr>
<th>Related Link</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Start</strong></td>
<td>Starts the collector if it is not running. The extension connects to the specified vCenter server by enumerating the VMware credentials in the credential set until a connection can be made. Next, the extension tells the vCenter server to supply the events specified in the Collector Context.</td>
</tr>
<tr>
<td><strong>Stop</strong></td>
<td>Stops the running collector on the configured MID Server. No action is taken if the extension is not running.</td>
</tr>
<tr>
<td><strong>Restart</strong></td>
<td>Stops, then starts the collector on the configured MID Server.</td>
</tr>
<tr>
<td><strong>Test</strong></td>
<td>Tests the parameters for validity. If the IP address, hostname, and the set of events is valid then the test returns a successful status. If any of the parameters are incorrect, an error is shown. Running a test does not affect any extensions that are currently running.</td>
</tr>
</tbody>
</table>
| **Update parameters** | Sends updated parameters to the collector. Any changes you make to the collector while the MID Server is running do not take effect immediately when they are saved. If you click this control when the collector is not running, no update is made.  
In the case of the vCenter extension, the collector first tests the parameters for validity. If the parameters are valid, the extension disconnects from the vCenter server and reconnects with the new parameters. |
### vCenter Event Collector Context

**vCenter ITOM**

- **Name**: vCenter ITOM

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for this vCenter event collector extension for easy identification.</td>
</tr>
<tr>
<td>Short description</td>
<td>A description of this collector.</td>
</tr>
<tr>
<td>Extension</td>
<td>[Read-Only] The collector type is automatically set to vCenterExtension.</td>
</tr>
</tbody>
</table>
| Status       | This field auto-populates with the status of the collector. This field is blank until the collector is started. After issuing a command to the collector, you see one of these values:  
• Started: The collector is running.  
• Stopped: The collector is not running.  
• Offline: The MID Server is down.  
• Error: The collector failed with an error. |
| Error Message | Message describing any error that causes a command, such as Start or Stop, to fail. This field only appears when the value in the Status field is Error. |
| Execute on   | Location for running this collection. The possible options are Specific MID Server or Specific MID Server Cluster. |
| MID Server   | The name of the designated MID Server if you selected Specific MID Server in the Execute on field. The name of the designated MID Server cluster if you selected Specific MID Server Cluster. If you selected the MID Server cluster option, an algorithm determines which server in the cluster runs the collector. |
| vCenter      | The IP address or hostname of the vCenter server.                           |
| Executing on | [Read-Only] The name of the MID Server on which the collector is running. This field shows the name of the MID Server even if the MID Server is down. If the collector is stopped by the user, this field is empty. |

**SNMP trap collector extension**

The SNMP trap collector is a MID Server extension that listens for SNMP traps from the devices on your network.

Upon receiving a trap, the MID Server sends the trap to the instance for further processing by Event Management. If Event Management is not active, traps are not processed and are discarded by the instance.

For the SNMP trap collector extension to receive traps from network devices, each device must designate the MID Server that runs the SNMP trap collector extension as a recipient of the trap. See the documentation for the network device to configure your hardware to do this. Generally, the SNMP trap collector extension should run on only one MID Server per VLAN. Multiple MID Server recipients on the same VLAN causes duplicate data in the CMDB. If network devices are separated by VLANs, multiple MID Servers may have trap collectors installed.

© 2020 ServiceNow, Inc. All rights reserved.
To configure multiple SNMP trap collector extensions, configure each in a separate record, with a unique name, and a designated MID Server.

**Configure the SNMP Trap Collector Extension**

For the SNMP trap collector extension to receive traps from network devices, each device must designate the MID Server that runs the SNMP trap collector extension as a recipient of the trap.

Role required: admin

1. Navigate to **MID Server > Extensions. > MID SNMP Trap Listener**
2. Click **New** or open an existing extension.
3. Fill in the fields from the table, as appropriate.
4. Click **Submit** or **Update**.

<table>
<thead>
<tr>
<th>Field name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for this SNMP trap collector extension for easy identification.</td>
</tr>
<tr>
<td>Short description</td>
<td>A description of the MID Server extension, if more description than the <strong>Name</strong> is necessary.</td>
</tr>
<tr>
<td>Extension</td>
<td>[Read-Only] The extension type is automatically set to <strong>TrapExtension</strong>.</td>
</tr>
<tr>
<td>UDP port</td>
<td>The port number that your network hardware uses when sending a trap to the designated MID Server. Port numbers 1024 and above are recommended. Port numbers 1023 and lower may be system reserved and can result in access violations for MID Servers that are not running with administrative credentials.</td>
</tr>
</tbody>
</table>
### Status

[Read-Only] The status of the trap collector extension. This field is blank until the extension is run. After it is run, the value may be:

- **Started**: The extension is running.
- **Stopped**: The extension is not running.
- **Offline**: The MID Server is down.
- **Error**: The extension failed with an error.

### Execute on

The location for running this extension: a **Specific MID Server** or a **Specific MID Server Cluster**. The recommended setting is **Specific MID Server**. Network hardware typically has to be configured to send to a specific IP address. If the listener moved to a different MID Server in the cluster, the trap would not be received.

### MID Server

The name of the designated MID Server if you selected **Specific MID Server** in the **Execute on** field. The name of the designated MID Server cluster if you selected **Specific MID Server Cluster** in the **Execute on** field. If you selected **Specific MID Server Cluster**, a ServiceNow algorithm determines which server in the cluster runs the extension.

### Executing on

[Read-Only] The name of the MID Server on which the extension is running. This field shows the name of the MID Server even if the MID Server is down. If the extension is stopped by the user, this field is empty.

---

5. **In Related Links**, run any of the following actions against the SNMP trap collector extension:

<table>
<thead>
<tr>
<th>Related Link</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start</td>
<td>Starts the extension if it is currently not running. The extension is started on the configured MID Server and port number.</td>
</tr>
<tr>
<td>Stop</td>
<td>Stops the running extension on the configured MID Server. No action is taken if the extension is not running.</td>
</tr>
<tr>
<td>Restart</td>
<td>Stops, then starts the extension on the configured MID Server and port number.</td>
</tr>
<tr>
<td>Test</td>
<td>Verifies that the configured MID Server can run the SNMP trap collector extension on the specified port. Running a test does not affect any extensions that are currently running.</td>
</tr>
<tr>
<td>Update parameters</td>
<td>If you make changes to the extension configuration, use this option to update the parameters of the currently running extension. First, the parameters are tested for validity. If the parameters are valid, the extension disconnects and reconnects with the new parameters.</td>
</tr>
</tbody>
</table>
Securing and encrypting MID Server data

After configuring your MID Server, you can add security by encrypting MID Server parameter values in the config.xml file. Encryption protects data that the MID Server returns to the ECC Queue. Other available security options include the authorization of SOAP requests, restricting access to the MID Server configuration file, and establishing secure socket layer (SSL) connections.

How MID Server password encryption works

The username and password are initially set in the config.xml file on the MID Server. When the MID Server retrieves the credentials, it replaces the clear-text password with an encrypted password automatically, using an AES128 encryption algorithm. In continued efforts to improve MID Server security, the encryption algorithm has been enhanced. The MID Server also maintains an encryption key that is generated each time it starts and remains in memory and not on the hard disk. When credentials need to be sent from the instance to the MID Server, the following process takes place:

1. The instance retrieves the encrypted password and the unencrypted username from the instance database table.
2. The instance decrypts the encrypted password, and then re-encrypts it using the MID Server encryption key.
3. The username and re-encrypted password are sent to the MID Server through the encrypted TLS session was already established between the MID server and the instance.
4. The MID Server receives the credentials and decrypts the password in memory before using the credentials for remote operations. At no point is the credential password stored on the disk in an unencrypted format.

Note: In the Orlando release, the MID Server requires a minimum JRE version 1.8.0_161, and recommended version 1.8.0_181. If you are using a lower version than 1.8.0_161, you may see encryption related issues.
Security options

The MID Server provides built-in security options for other content in the configuration file, such as the default encryptor, Windows Data Protection API, and options for custom encryption.

*Encrypt or decrypt MID Server configuration file values*

You can encrypt and decrypt any value in the MID Server config.xml file.

*ECC queue data encryption with the automation API*

Use the automation API to encrypt sensitive probe data that is sent from an instance to the MID Server through the ECC Queue.

*MID Server configuration file security*

Protect sensitive MID Server configuration data in the config.xml file using internal and external data encryption and external data storage.

*Rekey a MID Server*

Rekey a MID Server to force it to restart and generate a new private key. Typically, this process is only necessary if the MID Server keystore is compromised.

*Add SSL certificates for the MID Server*

Add certificates to the MID Server to communicate over SSL.

*MID Server authentication credentials and SOAP requests*

For added security, enforce basic authentication on each incoming SOAP request to the MID Server.

*Attach a script file to a file synchronized MID Server*

Attach a script file and synchronize it to a MID Server to prevent Windows enhanced security from blocking MID Server download files it determines are dangerous.

*Encrypt or decrypt MID Server configuration file values*

The value of any MID Server parameter in the config.xml file can be encrypted. The attributes for all encrypted values are managed from within the configuration file, including the security attribute of the login password.

Role required: admin
1. Navigate to the agent directory that was created when the MID Server was installed and open the config.xml file using a text editor such as WordPad.

2. Locate or add the parameter you want to encrypt. For example, you might want to protect your proxy server passwords by configuring this parameter:

   ```xml
   <parameter name="mid.proxy.password" value="securepassw0rd"/>
   ```

3. Add the encryption attribute `secure="true"`.

   ```xml
   <parameter name="mid.proxy.password" secure="true" value="securepassw0rd"/>
   ```

4. Restart the MID Server.

5. Open the config.xml file

   The encrypted password appears as follows:

   ```xml
   <parameter name="mid.proxy.password" secure="true" value="encrypted:rhrfUNYRzZAI8/BkTtZmNA=="/>
   ```

6. To decrypt this or any other value in the config.xml file and display the value in clear text:
   a) Stop the MID Server.
   b) Set the `secure="true"` attribute to `false`.
   c) Replace the encrypted value with the clear text value.
   d) Restart the MID Server.

**ECC queue data encryption with the automation API**

The automation API encrypts sensitive probe data that is sent from an instance to the MID Server through the ECC Queue.
You can use the automation API to encrypt data that you send from a custom application to the ECC queue and prevent that data from appearing in clear text. For example, you can encrypt a password used by a MID Server to authenticate on a REST endpoint.

**Methods**

The API provides these methods:

- `encrypt()`
- `isEncrypted()`

The following example shows how you might call these methods:

```javascript
var automation_api = new sn_automation.AutomationAPI();
var password = 'xyz';
var encrypted_password;
if (automation_api.isEncrypted(password))
    encrypted_password = password;
else
    encrypted_password = automation_api.encrypt(password);
```

The `encrypted_password` value can then be passed safely to the ECC Queue and on to the desired MID Server.

**MID Server configuration file security**

Sensitive MID Server configuration data can be protected using several different schemes, including internal and external data encryption and external data storage.
The MID Server provides the following built-in security options for content in the `config.xml` file:

- **Default security provider**: Secures the data in the `config.xml` file by encryption. When the MID Server is restarted, any unencrypted data is encrypted and written to the `config.xml` file. The default security provider offers these encryption options:
  - **Default encryptor**: Default process for encrypting data in the MID Server `config.xml` file. See Encrypt or decrypt MID Server configuration file values for details.
  - **Windows Data Protection API (DPAPI)**: The operating system performs the data encryption, rather than the MID Server. DPAPI encryption is based on the logged in user's account. When this scheme is used, the data can only be decrypted by the same user account. If the account changes, the data must be re-encrypted.
  - **Custom encryption**: Implement the `IMidServerEncrypter` interface to create your own custom encryption scheme to manage sensitive `config.xml` data.

- **CyberArk**: Data security is provided by CyberArk’s Privileged Account Security system, which moves sensitive data from the `config.xml` file to a secure CyberArk vault. This solution does not encrypt the data.

- **Custom external storage**: Implement the `ISecuredConfigProvider` interface to create your own custom external storage system to manage sensitive `config.xml` data.
Secured content and encryption schemes

Encrypt MID Server configuration data with DPAPI

Windows Data Protection API (DPAPI) encrypts sensitive data from the config.xml file, based on the MID Server user account.

Role required: admin

DPAPI encryption provides another level of security for data such as credentials, IP addresses, and URLs in the MID Server config.xml file. The operating system performs the data encryption, rather than the MID Server. DPAPI encryption is based on the logged in user's account. When this scheme is used, the data can only be decrypted by the same user account. If the account changes, the data must be re-encrypted.

1. Open the config.xml file in a text editor.
   This file is located in the /agent folder in your MID Server installation path.

2. Enable this parameter and value:
   `<parameter name="mid.secure_encrypter" value="com.service_now.mid.services.config.WindowsDPAPIEncrypter"/>

3. Save the configuration file.
4. Restart the MID Server.
   Any values in clear text in the **config.xml** file are encrypted by the operating system.

5. Follow this procedure if you need to change the MID Server user account that is used for encryption.
   a) Stop the MID Server service.
   b) Open the **config.xml** file in a text editor.
      This file is located in the /agent folder in your MID Server installation path.
   c) Re-enter all the encrypted values in clear text.
   d) Make the changes to the MID Server user account in the ServiceNow® instance.
   e) Restart the MID Server service.
      The data is re-encrypted by the operating system, based the new MID Server user account.

Use CyberArk as a secure configuration provider

You can use a CyberArk vault to secure any sensitive data from the MID Server **config.xml** file.

Role required: admin

CyberArk is commonly used to secure credentials in its external vault. However, a MID Server parameter in the **config.xml** file enables you to store other types of data in CyberArk.

1. Open the **config.xml** file in a text editor.
   This file is located in the /agent folder in your MID Server installation path.

2. Enable this parameter and value:
   ```
   <parameter name="mid.secure_config.provider" value="com.service_now.mid.services.config.CyberArkSecuredConfigProvider"/>
   ```

3. Configure specific data to secure in the CyberArk vault, as shown in these examples.
   a) Secure the MID Server credentials by setting this parameter to match the ID and Type for that data in your CyberArk configuration.
      ```
      <parameter name="mid.instance.username" secure="true" value="cyberark: id=<CyberArk ID>, type=<CyberArk type>"/>
      <parameter name="mid.instance.password" secure="true" value="cyberark: id=<CyberArk ID>, type=<CyberArk type>"/>
      ```
   b) Secure the URL of the instance by setting this parameter to match the ID and Type for that data in your CyberArk configuration.
      ```
      <parameter name="url" secure="true" value="cyberark: id=<CyberArk ID>, type=<CyberArk type>"/>
      ```

4. Save the configuration file.

5. Restart the MID Server.

Change MID Server configuration file security schemes

The MID Server provides several schemes for securing sensitive data in the **config.xml** file and allows you to switch between these options to suit your security requirements.

Role required: admin

1. Stop the MID Server service.

2. Open the **config.xml** file in a text editor.
   This file is located in the /agent folder in your MID Server installation path.
3. Re-enter all the encrypted values in clear text.
4. Disable the previous security scheme and configure the MID Server to use the new provider.
5. Restart the MID Server service.

The data is re-secured or encrypted, based on the security scheme you have selected.

**MID Server ISecuredConfigProvider interface**

Use the methods in this interface to create custom providers that manage secured parameter values in the MID Server `config.xml` file.

> **Note:** These methods are contained in the `snc-automation-api.jar` file, located in the MID Server installation folder.

### initialize

This method initializes the provider with additional configuration parameters and does not return a value.

**Example**

```java
void initialize(java.util.Properties properties, IMidServerEncrypter encrypter)
throws java.lang.Exception
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>Initialization properties.</td>
</tr>
<tr>
<td>encrypter</td>
<td>Encrypter to use if the provider is encryption based.</td>
</tr>
</tbody>
</table>

**Exception**

`java.lang.Exception`

### isParameterValueSecured

This method checks to see if the parameter value has been secured or not. This method returns a `boolean` type value.

**Example**

```java
boolean isParameterValueSecured(java.lang.String paramValue)
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>paramValue</td>
<td>The parameter value.</td>
</tr>
</tbody>
</table>

Returns
The parameter returns `true` if the parameter value is secured.

**secureParameterValue**

This method secures the parameter value if it has not been secured. This method returns a `string` type value.

Example

```java
java.lang.String secureParameterValue(java.lang.String unsecuredParameterValue) throws java.lang.Exception
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unsecuredParameterValue</td>
<td>The unsecured parameter value.</td>
</tr>
</tbody>
</table>

Returns
This method returns the unsecured parameter value.

Exception

`java.lang.Exception`

**unsecuredParameterValue**

This method returns the unsecured value of the parameter. This method returns a `string` type value.

Example

```java
java.lang.String unsecuredParameterValue(java.lang.String parameterName) throws java.lang.Exception
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameterName</td>
<td>The parameter name.</td>
</tr>
</tbody>
</table>

Returns

This parameter returns the unsecured value.

Exception

java.lang.Exception

MID Server IMidServerEncrypter interface

Use the methods in this interface to create a custom external encrypter for the MID Server config.xml file.

Note: These methods are contained in the snc-automation-api.jar file, located in the MID Server installation folder.

initialize

This method initializes the encrypter with additional configuration parameters and does not return a value.

Example

```java
void initialize(java.util.Properties properties)
    throws java.lang.Exception
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>Initialization properties.</td>
</tr>
</tbody>
</table>

Exception

java.lang.Exception

crypt

This method encrypts the unencrypted data and returns a byte[] type value.
encrypt

```java
byte[] encrypt(byte[] unencryptedData)
throws java.lang.Exception
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unencryptedData</td>
<td>The data unencrypted.</td>
</tr>
</tbody>
</table>

### Returns

Encrypted data

### Exception

java.lang.Exception

decrypt

This method decrypts encrypted data and returns a `byte[]` type value.

```java
byte[] decrypt(byte[] encryptedData)
throws java.lang.Exception
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>encryptedData</td>
<td>The data decrypted.</td>
</tr>
</tbody>
</table>

### Returns

Decrypted data.

### Exception

java.lang.Exception
Rekey a MID Server

Rekey a MID Server to generate a new private key. Private keys are used to decrypt automation credentials, so that MID Servers can transmit information securely. Key pairs are initially generated when a MID Server is validated, and MID Servers should be rekeyed periodically to meet security requirements.

Role required: admin

When the MID Server comes back online, the system automatically validates the new key, and the MID Server resumes processing automation tasks.

Automation credentials are secured by encrypting them in the instance with the MID Server’s trusted public key prior to transmission. When the MID Server is created, it generates a keypair, consisting of a public and private key. After the MID Server is validated, it can use the private key to decrypt automation credentials. You should occasionally rekey the MID Server to meet your organizations security requirements.

1. Navigate to MID Server > Servers.
2. Open the MID Server whose keypairs you want to rotate.

Add SSL certificates for the MID Server

Configure the MID Server to connect to a source over SSL.

Role required: admin
You can add certificates to the MID Server if you want communication to occur over SSL. You can add these certificates to the cacerts keystore file:

- Signing Certificate Authority (CA) certificate
- MID Server certificate

1. Open a command prompt and navigate to the folder containing the JRE `keytool`. This is the location of the JRE you installed. An example path might be: C:\Program Files\Java\jre1.8.0_161\bin

2. Import a certificate into the MID Server's cacerts keystore, using this command:

```
keytool -import -alias <certificate alias> -file "<path to certificate>" -keystore "<path to the JRE>\lib\security\cacerts"
```

For example, you might enter: `keytool -import -alias MyCA -file "C:\myca.cer" -keystore "C:\Program Files\Java\jre1.8.0_161\lib\security\cacerts"

**Note:** The keytool prompts you for a certificate password. If the certificate is for a CA, the keytool also asks whether to trust the certificate authority. To add a certificate to an instance, see [Upload a certificate to an instance](#).

### MID Server authentication credentials and SOAP requests

Set basic authentication credentials to update the web service invocation data. For added security, you can enforce basic authentication on each incoming SOAP request to the MID Server.
Basic authentication credentials and SOAP requests

You can enforce basic authentication on each request. The MID Server is not able to communicate through a proxy server if the proxy server supports only NTLM authentication. You can use basic authentication with a proxy server or create an exception for the MID server host.

Supplying basic authentication information, regardless of whether it is required, has an added advantage. The web service invocation creates or updates data using the supplied credentials. For example, when you create an incident record, the journal fields have the user id of the basic authenticated user instead of the default Guest user. This behavior allows you to identify data added by a specific MID Server.

You can set basic authentication credentials for SOAP requests. Each SOAP request contains an Authorization header as specified in the Basic Authentication protocol.

**Note:** The setting for enforcing strict security controls how the instance uses the credentials you provide for the MID Server. When the setting is enabled, you must provide a user ID with access to the tables the MID Server is trying to access. When the setting is disabled, any valid user ID allows the MID Server to access to all tables.

**Note:** To learn more about properties that affect SOAP request processing, see Basic auth: SOAP requests (instance security hardening) in Instance Security Hardening Settings.

Require basic authorization for incoming SOAP requests

Enforce basic authentication on each incoming SOAP request to the MID Server.

Role required: admin

1. Navigate to System Properties > Web Services.
2. Select the check box for Require basic authorization for incoming SOAP requests.
3. Click Save.
4. To provide basic authentication credentials for a MID Server, navigate to C:\Program Files\ServiceNow\<MID Server name>\agent and edit the config.xml file, as follows:
   a) Find the element `<parameter name="mid.instance.username" value=""/>` and enter the instance administrator user name as the value.
For example, you might enter `<parameter name="mid.instance.username" value="admin"/>`.

b) Find the element `<parameter name="mid.instance.password" value=""/>` and enter the configured password for this instance as the value.

For example, you might enter `<parameter name="mid.instance.password" value="abc123"/>`.

**Attach a script file to a file synchronized MID Server**

You can attach a script file to synchronize to a connected MID Server. Windows Internet Explorer enhanced security blocks downloaded files that it determines are potentially dangerous. However, synchronizing the files avoids this security problem.

Role required: admin

---

Enhanced security in Windows browsers, such as Internet Explorer, blocks downloaded files that it determines are potentially dangerous. This would block files downloaded for use by the MID Server. You would need to unblock each file manually through the browser.

To get around this issue, use file synchronization. File synchronization requires you to proactively take script files from your instance and save them on the MID Server. The files on the instance and the MID server stay synchronized, but there is no longer any need for the MID Server to download the whole file. File synchronization also protects any updates you make in those script files from being overwritten during the upgrade of an instance.

You can attach multiple files, but the last attached file gets synchronized to the MID Server. If you delete the attachment, the script file becomes inactive, and the synchronized file is deleted from the MID Server.

1. Navigate to **MID Server > Script Files**.
2. Open the file to which you would like to attach the script file, or click **New** to create a new file.
3. Select **Use attachment**, and then click the paperclip icon to add the attachment.

   When **Use attachment** is checked, an attached script file overrides the script contained in the **Script** field. If this check box is cleared, the script in the **Script** field is used instead of the attachment.

   The script file attachment name must match the MID Server script file name, since the record can contain other attachments.

4. Click **Update** to initiate the synchronization process.
Ensure that the file name matches the script name. If you receive the error message: File type not permitted or mime type does not match the file content, request that your administrator turn off mime type validation on attachments. The system property `glide.security.file.mime_type.validation` controls this setting.

Enable script file synchronization for Windows enhanced security

Windows Internet Explorer enhanced security blocks downloaded files that it determines are potentially dangerous. Script files synchronized with the MID Server are stored on the instance in the MID Server Script File [ecc_agent_script_file] table, which you can access in the MID Server > Script Files module.

When the MID Server first connects to the instance, the instance creates a directory called \scripts in the MID Server root. The instance then creates a parent directory in the path \scripts\<parent name> using definitions from the ecc_agent_script_file table. Finally, the instance creates the script files themselves inside the parent directory using the records from the ecc_agent_script_file table.

The record for the parent directory looks like this:

![Parent Directory Record](image)

The instance creates each script file in the parent directory on the MID Server using the record Name from the ecc_agent_script_file table as the file name and the Script field payload as the file contents. A script file record looks like this:

![Script File Record](image)
The synchronization of the script file continues to work as if the script was manually added to the form.

See Attach a script file to a file synchronized MID Server for instructions on how to attach a script file.

**Note:** The MID Server Script File [ecc_agent_script_file] table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see Set up domain separation for MID servers.

**MID Server upgrades**

Upgrade MID Servers manually, or automatically through their host computers. The instance automatically tests to identify issues before MID Servers upgrade. Pin MID Servers to specific versions using system properties.

**Warning:** The MID Server cannot auto-upgrade on a Windows host if the Windows Application Experience service is disabled. For information on the error that is displayed and instructions for re-enabling this service, see KB0597552.
Access to the MID Server download site

The MID Server host computer must have access to the ServiceNow download site at install.service-now.com to upgrade automatically. If you have a self-hosted ServiceNow environment that blocks access to the download site, you must import the MID Server installer package into your MID Server hosts manually. For instructions, see KB0760123 in the Self-Hosted knowledge base.

MID Server access to OCSP blocked

Firewalls and proxy configurations may block calls to the OCSP Entrust server, which prevents the MID Server from working. You may need to change your firewall permissions so the OCSP traffic to go through properly. For more information and resolutions, see the HI Knowledge Base article [KB0813636].

Upgrade methods

• **Automatic:** Allow the instance to automatically upgrade the MID Server. This functionality is available by default. Automatic upgrade occurs:
  
  • Every hour, when the MID Server checks with the instance to see if there is a different version available for upgrade. You cannot modify this time period.
  
  • When the instance is upgraded and the MID Server for that version is different than the version currently on the MID Server.
  
  • When the MID Server pre-upgrade test passes without an error. Any errors encountered during this automatic test prevent the upgrade from occurring until the issues are resolved. The pre-upgrade test is enabled by default, but can be disabled by adding and setting a system property.
  
  • During an automatic upgrade, the MID Server automatically verifies the digital signature of upgrade packages to ensure they haven’t been tampered with. The MID Server downloads upgrade patches one by one and stores them in the file system. After a patch is downloaded, the MID Server verifies its digital signature and throws an exception if the verification fails. The error will be recorded in the agent log and the MID Server issue table. Set the property **mid.log.level=trace** to see detailed verification debug messages.

• **Manual:** Manually start the upgrade by clicking a related link on the MID Server record. Use this method when you do not want to wait until the next hourly automatic update or if your upgrade failed and you want to force an upgrade. The MID Server automatically runs the pre-upgrade test before upgrading. Any errors encountered during this test prevent the upgrade from occurring until the issues are resolved. See Upgrade the MID Server manually for instructions.

To manually verify the signature of an installation or upgrade package, use the jarsigner tool which is available for free with JDK. The following is the jarsigner command to initiate the verification: Jarsigner -verify -verbose -certs -strict <zip-file>

The output should be similar to the following example:

```
- Signed by "CN=ServiceNow Inc., O=ServiceNow Inc., L=Santa Clara, ST=California, C=US"
   Digest algorithm: SHA-256
   Signature algorithm: SHA256withRSA, 2048-bit key
   Timestamp digest algorithm: SHA-256
   Timestamp signature algorithm: SHA256withRSA, 2048-bit key

jar verified.

The signer certificate will expire on 2021-08-09.
```
The Upgrade state

The instance initiates the upgrade by sending the autoUpgrade system command to the MID Server. Starting with MID Servers upgrading from an Istanbul version MID Server, the MID Server Status is changed to Upgrading while the upgrade is running. The Upgrading state is similar to the Paused state. This is done to avoid potential miscommunication between the new version of the instance and the previous version of the MID Server during upgrade. For the upgrade to run, MID servers must be in the Up state and must be validated.

While in the Upgrading state, you cannot resume or restart the MID Server. However, you can perform the same actions that you can when the MID Server is in the Paused state. After a successful upgrade, the queued output is sent to the instance and the MID Server starts retrieving new commands to process. The status also changes to Up.

When the instance sends the autoUpgrade system command to the MID Server, if it is Down or Paused, or if it has not been validated, the command remains in the ECC Queue until the MID Server status changes to Up. Then the command is processed.

Note: If you are using an Istanbul instance but you are upgrading a pre-Istanbul MID Server to Istanbul, these upgrade states are not available. They are only available for MID Servers that are already on Istanbul.

Failed upgrades

Failed upgrades are handled differently based on the version you are upgrading to:

- Upgrade to another major release (such as Istanbul to the next full release): the status changes to Upgrade Failed.
- Upgrade from a minor version within a release (such as Jakarta patch 1 to patch 2): the MID Server continues using the version it is currently running. It does not perform the upgrade and the status eventually changes to Up, assuming the MID Server was already functioning properly.
- Automatic upgrade on Linux systems from Madrid or lower to New York: the MID Server will fail to automatically upgrade. The MID Server service must be manually reinstalled to complete the upgrade.

Upgrading MID Servers in the Down state

If a MID Server is in the Down state, it cannot process the upgrade command. When the MID Server changes to Up, it immediately checks to see if an upgrade is necessary. If it does need to upgrade, the upgrade process starts before the MID Server processes any other commands.

Upgrade error messages

The MID Server can display the following upgrade error messages.

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unable to refresh packages</td>
<td>Generic error when the error is not handled by a defined error message.</td>
</tr>
<tr>
<td>Failed to query instance for MID Server buildstamp</td>
<td>Instance is unavailable or there is a major version mismatch between the MID Server and the instance.</td>
</tr>
</tbody>
</table>
Message | Description
--- | ---
Not a valid package buildstamp | InstanceInfo returned an assigned buildstamp that was not in the correct format, such as a version mismatch.
Method failed (\texttt{<instance URL>}) HTTP/1.1 409 Conflict with code: 409 | MID Server auto-upgrade request rejected when number of concurrent upgrades exceeds 2. The configured number of available semaphores for MID Server upgrades on the instance is set at 2 to prevent performance degradation.

**Note:** The MID Server re-sends the request every 20 seconds until it can get the semaphore.

---

**MID Server Upgrade History**

Use the MID Server Upgrade History module for troubleshooting problems with MID Server upgrades. The module contains a record of each instance upgrade. Those records provide step-by-step status details for each MID Server's upgrade process. If an error occurs, it is noted in the step and a message is dynamically generated with further details. The table cleanup job automatically deletes issues that haven't been detected for 30 days, regardless of their state. For further information, see *MID Server Upgrade History*.

**MID Server pre-upgrade check**

The instance automatically tests the MID Server's ability to upgrade on your system prior to the actual upgrade, to identify issues that could cause a MID Server outage or require re-installation.

Each MID Server contains an AutoUpgrade monitor that compares the MID Server version with that of the instance to determine if the MID Server needs to upgrade. If the AutoUpgrade monitor discovers that the MID Server version is out of date, the monitor runs pre-upgrade validation tests for that MID Server. If an issue is detected, a message is logged to the MID Server Issue [ecc_agent_issue] table, and the upgrade is blocked. The AutoUpgrade monitor continues to run every hour, until all the tests pass. If there are no blocking issues, the MID Server downloads the appropriate upgrade package and begins the upgrade process.

Failed tests leave the MID Server in one of these states:

- **Upgrade Failed**: For upgrades to a different release family, such as from London to Madrid.
- **Up**: For upgrades within the same release family, such as an upgrade to a patch.

Errors, such as insufficient disk space for the installer or lack of connectivity to the download server, are written to both the MID Server agent log and to the *MID Server Issue [ecc_agent_issue]* table. These errors are published before the actual MID Server upgrade occurs and must be resolved before the upgrade can continue. You can view issues from the MID Server Issue [ecc_agent_issue] table in any of these locations:

- **MID Server Issues** related list in a MID Server record.
- **MID Server > Server Issues** navigation module.
- **MID Server Issues** gauge on the MID Server dashboard.

**Pre-upgrade tests**

The pre-upgrade validation tests check these requirements:

- At least 1 GB of free disk space
- Access to the download site at install.service-now.com
• Permission to execute these file operations:
  • Extract a ZIP archive to a temp folder.
  • Copy files from the temp folder to the agent folder.
  • Read a text file.
  • Delete the pre-upgrade contents.

• For Windows, ensure that the Log On As user for the Windows service is either LocalSystem or a user that is part of the local Administrator group. By default, domain administrators are added to the local Administrator group when joining a computer to a domain. If the PowerShell script that performs this test does not return the expected output, the system logs a warning to the MID Server Issue [ecc_agent_issue] table, but the test passes.

**Data provided**

When the instance encounters issues during the pre-upgrade check, it populates these fields in the MID Server Issue [ecc_agent_issue] table:

**MID Server issue fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last detected</td>
<td>Date and time the issue was last detected.</td>
</tr>
<tr>
<td>Short description</td>
<td>Contents of the generated message that specifies a possible issue with available disk space, download server access, or file permissions.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Name of the MID Server affected by a pre-upgrade test failure.</td>
</tr>
<tr>
<td>Issue source</td>
<td>The process that identified the issue. For all issues with MID Server pre-upgrade testing, the source is UpgradeCheck.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the issue. Possible states are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>New</strong>: Starting state when the instance creates the issue.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Acknowledged</strong>: State set by the administrator when they first examine the issue.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Resolved</strong>: Ending state indicating that the issue has been resolved. If the scheduled job does not encounter the issue when it runs again, the instance automatically sets the state to this value. If the issue cannot be resolved automatically, the administrator must resolve the issue and manually set the state to this value.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain for the MID Server. For all issues derived from MID Server pre-upgrade testing, the domain value is inherited from the domain of the MID Server user.</td>
</tr>
<tr>
<td>Count</td>
<td>Number of times an issue has been detected. Each time the pre-upgrade tests run and encounter the same issue, the AutoUpgrade monitor increments this field.</td>
</tr>
</tbody>
</table>
Errors that block the upgrade

These messages describe issues detected by the pre-upgrade test and published to the MID Server Issue [ecc_agent_issue] table. Failure of any of these tests blocks the upgrade.

- **Not enough free disk space. The system reports \(<n>\) bytes free**: This message is displayed when less than 1 GB of free disk space is detected on the MID Server host. This error is also written to the MID Server agent log.

- **Unable to download updates from the install server**: This message indicates that either the MID Server host does not have permission to download the installation package from install.service-now.com, or network problems prevent connection. This error is also written to the MID Server agent log.

- **Unable to extract contents of pre upgrade check zip**: This message indicates that the service account on the MID Server host does not have permission to extract the pre-upgrade ZIP archive to the temporary folder specified by the system property, `java.io.tmpdir`. On a UNIX host, the value for this property is typically `/tmp` or `/var/tmp`. On Microsoft Windows hosts, the path is `c:\WINNT\TEMP`.

- **Unable to create folder \(<\text{upgrade check file path}>\)**: This message indicates that the MID Server service account does not have permission to create the `upgradeCheck` folder for the pre-upgrade checking files in the `agent/package` path.

- **Unable to verify file permissions: \(<\text{message}>\)**: This message indicates an exception has occurred when checking file permissions, such as a file that does not exist or access failure.

- **MID Server Windows Service is not running as LocalSystem or a local Administrator**: This message warns that the Windows service is not running with the desired permissions.

Non-blocking warnings

These warnings are displayed in the MID Server Issue [ecc_agent_issue] table and do not prevent a Windows MID Server from upgrading:

- **WARN: Unable to parse $logOnAsUser**: This message warns that the Log On As User value for the Windows service is not in either of these expected formats:
  
  - `user@domain.company.com`
  - `domain\user`

- **WARN: Unable to look up Log On As user's groups**: When the instance attempts to look up the logged on user's group memberships, it executes the `net user <username>` command. The instance expects a certain output structure by the Windows service from this command and issues this warning if the expected output does not match the actual output.

These PowerShell warnings are written only to the MID Server agent log. Because PowerShell is not required to use a MID Server, these configuration issues do not prevent a Windows MID Server from upgrading. However, these warnings might indicate issues in your environment that require attention.

- **Skipping PowerShell upgrade checks since PowerShell is not usable**: PowerShell 3.0 (at a minimum) is not installed or `powershell.exe` is not available to the MID Server service user.

- **Continuing with upgrade, but the following issue was encountered during upgradeCheck: \(<\text{exception message}>\)**: This message indicates that there was an issue running the PowerShell portion of the pre-upgrade tests.

Disabling the pre-upgrade check

A MID Server configuration parameter called `mid.upgrade.run_precheck` is set to `true` by default, which allows the automatic pre-upgrade test to run. To disable these tests for a single MID Server, add this parameter to that MID Server's `config.xml` file and set it to `false`. To disable these tests for all MID Servers, add a new record to the MID
ServiceNow Orlando Now Platform capabilities

Server Property [ecc_agent_property] table called mid.upgrade.run_precheck. Set the value of this property to false and leave the MID Server field blank.

**Pinning a MID Server to a specific version**

You can pin all the MID Servers in your environment to a specific version by setting a system property, or you can configure specific versions for individual MID Servers.

**Note:** Do not pin the MID Server to a specific version for a significant amount of time, especially if you upgrade the instance. Under most circumstances, let the instance determine which MID Server version to use.

**Version control properties**

These system properties control the version for all MID Servers:

- **mid.buildstamp**: Identifies the MID Server version with an identifier based on the date of the build. This property uses the format of mm-dd-yyyy-hhmm. The MID Server checks for version information hourly. If no override version is configured, the MID Server looks at the mid.buildstamp property for the version to use. This property resets itself to the default version (the version that matches your instance version) when the instance is restarted or upgraded, so any user changes are lost at that time. The system appends the release name and patch information to the date and time format.

  **Caution:** This property is not visible by default and should not be configured.

- **mid.version.override**: Sets an override condition for the current version for all MID Servers in your environment. This action pins the MID Servers to a single version and disables the automatic upgrade feature. This property is not visible in the base system and must be added to the System Property [sys_properties] table when it is set. For details, see *Add a system property*.

  When the MID Servers check the version each hour, they look at the mid.version.override property first. If this property is empty, the MID Servers get their version information from the mid.buildstamp property. If an override version is configured, the MID Servers use this value and ignore the version information in the mid.buildstamp property. This override value remains when the instance is restarted and is passed to the MID Servers.

  **Attention:** The value in the mid.version.override property is cleared during an upgrade, which forces the MID Server to reset itself to the version in the mid.buildstamp property.

**Version control configuration parameter**

To pin specific MID Servers on a desired version, set the mid.pinned.version parameter with the name of that version in the config.xml file of each MID Server. Use the format <version>-mm-dd-yyyy. This setting overrides the property setting for the pinned MID Server version. For instructions, see *Add a MID Server parameter*.

**Note:** The value set in this parameter is not affected by an upgrade.

**Upgrade the MID Server manually**

You can manually upgrade MID Servers at any time if you do not want to wait for the automatic upgrade.

Role required: mid_server or admin
For the upgrade to run, MID servers must be in the Up state and must be validated. The MID Server automatically runs the pre-upgrade test before upgrading. Any errors encountered during this test must be resolved for the upgrade to proceed.

The MID Server is upgraded to the version specified by build stamp on the instance, or by the upgrade property that you specify.

1. Navigate to Discovery > MID Servers or Orchestration > MID Server Configuration > MID Servers.
2. Open the record of the MID Server that you want to upgrade.
3. Click Upgrade MID under Related Links.
4. Confirm that you want to perform the upgrade.

Resolving MID Server issues

Troubleshoot problems with the MID Server to find solutions. Monitor the MID Server to receive alerts about issues as they occur. Troubleshooting procedures exist to resolve specific problems with the MID Server. The Knowledge Base on Hi contains several articles to help you troubleshoot MID Server issues.

Monitor the MID Server

Monitoring a MID Server involves verifying entries in log files, confirming network connectivity, and checking MID server status.

• If the MID Server is on a Windows host, navigate to the Windows Services console, locate the service name that matches the name that appears from the wrapper-override.conf file. If the MID Server process is the only Java process running on the host, monitor the memory used by java.exe and alert on less than the maximum configured memory defined in the \~\agent\conf\wrapper-override.conf folder.
• Ensure that the agent0.log.0.lck file appears in the \~\agent\logs folder to confirm that the MID Server running and logging system activity in the agent0.log.0 file.
• Review the following logs for warning, critical, and severe errors: \~\agent\logs\agent0.log.0 \~\agent \logs\wrapper.txt See Manage ECC Queue content for a MID Server to see how to open log entries from the instance.
• Test MID Server connectivity to confirm that the MID Server host is able to communicate with the instance. Resolve any issues with the network connectivity such as conflicts with firewalls, access control lists, and routing errors.
• From the MID Server instance, navigate to the MID Servers page, and review the status of the MID Server. For additional information, click a Name.
• Set up email, SMS, and push notifications to alert you when issues occur with MID servers. The MID Server Down notification is enabled by default. See Notifications for details.

Troubleshooting procedures

The following procedures provide information on resolving specific problems with the MID Server. Knowledge Base articles also cover a wide range of issues. If you are encountering problems which are not covered in these procedures, search the Knowledge Base for related articles. For instance, if you are experiencing symptoms such as the MID Server going down or not responding, or CIs being duplicated during discovery, see KB0597571 for information and recommended solutions.

MID Server active issues

The ServiceNow® instance has a dedicated table that publishes active issues with MID Servers and alerts administrators when a MID Server is in danger of exceeding its resources.
Active MID Server post-cloning credential issues
The system provides automatic processes to detect and notify you of possible MID Server credential issues after instance cloning.

MID Server resource threshold alerts
The instance displays warnings when a MID Server breaches its resource thresholds for CPU and JVM memory usage, enabling users to create email notifications or custom scripts when a breach occurs.

MID Server user connectivity issues
The instance writes issues involving MID Server user logins and network connectivity to the MID Server Issue [ecc_agent_issue] table and creates events you can use in custom scripts or to send email notifications.

Interpreting MID Server user debugging output
Debugging output from the system log is available in either a summary or detailed view for MID Server user issues, but must be enabled manually.

MID Server Upgrade History
Use this module to troubleshoot errors that occur during the MID Server upgrade process. The MID Server Upgrade Histories table contains a record of each instance upgrade. The MID Server Upgrade Stages table shows the status of each MID Server and its upgrade progress, including any errors encountered.

MID Server active issues
The ServiceNow® instance has a dedicated table that publishes active issues with MID Servers and alerts administrators when a MID Server is in danger of exceeding its resources.

The MID Server Issue [ecc_agent_issue] table displays a number of common issues that a MID Server can experience, as they occur. Error checking processes attempt to pinpoint the most likely cause of the issue. Informative error messages name the affected MID Server and explain the possible cause of the issue. The ecc_agent_issue table retains its records for 30 days.

To access records in this table, navigate to MID Server > Server Issues.

Supported MID Server active issues:
• Bad user credentials after instance cloning.
• Unsupported Java Runtime Environment (JRE) on the MID Server host.
• Approaching resource thresholds for CPU usage and JVM memory.
• Errors detected during pre-upgrade testing.
• User authentication and authorization failures.
• Network connectivity interruptions and role configuration errors.
### Example MID Server Issue record

<table>
<thead>
<tr>
<th>MID Server</th>
<th>Domain</th>
</tr>
</thead>
<tbody>
<tr>
<td>snc_rba_mid</td>
<td>global</td>
</tr>
</tbody>
</table>

**Issue source**

- MemoryMIDResourceThresholdBreach

**Last detected**

- 2017-04-21 16:11:32

**Count**

- 4

**Short description**

Mean of Memory 'Max used %' has exceeded threshold (99 => 3) for a 10 minute interval span, occurring after start date 2017-04-21 16:00:30

---

**MID Server fails to start**

When a newly installed MID Server fails to start or shuts down prematurely, improper configuration could be to blame.

**Duplicate MID Server names**

When the MID Server service starts, it verifies that it is the only active (not down) MID Server with that name. If the MID Server discovers another active MID Server with the same name, the starting MID Server waits 5 minutes and sends another query. The MID Server repeats this query three times and logs each attempt in the agent log. If the MID Server still detects a duplicate after this cycle, it creates a record in the **MID Server Issue [ecc_agent_issue]** table and shuts down.
Upgraded MID Servers running multiple services

Beginning with the New York release, a batch file in the MID Server installer package ensures that only one Windows MID Server service is configured for an executable path (MID Server installation folder). Previous versions have not checked for this configuration. Upgraded MID Servers that run multiple services with the same executable path are prevented from starting. If you experience this issue, follow this procedure to reconfigure the MID Server to use only one service:

1. Delete the unwanted Windows service by running `sc.exe delete <service name>` from the command line.
2. Open the `wrapper-override.conf` file in the MID Server installation folder.
3. Change the `wrapper.name` and `wrapper.displayname` parameters to the service name that you want to keep.
4. Restart the MID Server.

Active MID Server post-cloning credential issues

The system provides automatic processes to detect and notify you of possible MID Server credential issues after instance cloning.

During an instance clone, the MID Server [ecc_agent] table is not copied from the source instance, but the User [sys_user] table is copied. As a result, the source MID Server user credentials copied into the target instance might not match those used by the existing set of MID Servers used by the target. Bad credentials can cause those MID Servers to be down for the target instance. Processes on the instance notify you if a MID Server is down from suspected bad credentials following an instance clone.

Table for post-cloning credential issues

The MID Server Issue [ecc_agent_issue] table stores active MID Server issues after an instance clone. Records in this table show a MID Server's current state, evaluation times, and the Issue source. For cases in which a MID Server for a cloned instance is down because of possible bad credentials, the Issue source is InstanceClone. Data from the MID Server Issue [ecc_agent_issue] table are displayed in a related list on a MID Server record. Records in this table are removed if they have not been detected for 30 days. Ongoing issues reappear as they occur.

Post-cloning cleanup script and scheduled jobs

A cleanup script called Bad MID Server credentials after clone runs on the target instance after cloning and calls a script include called BadMIDCredentialAfterClone. This script include schedules the execution of the following jobs on the Schedule Item [sys_trigger] table:

- `BadMIDCredentialAfterClone-1`: Runs 15 minutes after clone execution.
- `BadMIDCredentialAfterClone-2`: Runs 75 minutes after clone execution.

These jobs log to the MID Server Issue [ecc_agent_issue] table any MID Servers that existed on the target instance prior to the clone that are in the Down state. These MID Servers are not ready for normal processing and might be down due to invalid credentials resulting from the cloning process. The state of MID Servers added to the target instance after the clone is not evaluated.
**Note:** The MID Server log shows that the MID Server user associated with the target instance could not be authenticated or was missing the proper role.

**Business rule that checks for bad credentials**

The Check for bad MID credential after clone business rule monitors the MID Server [ecc_agent] table for MID Servers that are transitioning from Down to Up. If the business rule finds a MID Server making that transition, the rule attempts to find a matching MID Server in the MID Server Issue [ecc_agent_issue] table that has an issue source of InstanceClone and a state other than Resolved. If a match is found, the business rule updates the state of the MID Server in the [ecc_agent_issue] table to Resolved.

**Resolving MID Server issues**

The error message in the MID Server Issue [ecc_agent_issue] table names the affected MID Server user. This message appears each time the business rule runs and finds a MID Server that is down from suspected bad credentials:

MID Server not operational (status: Down), possibly due to recent clone. Verify credentials for logged in User 'local-midserver'.

Attempt to resolve the issue first by comparing the user's credentials with the credentials that the affected MID Server is expecting. If the credentials are incorrect, fix the problem and check the MID Server status again. If the credentials are correct, but the MID Server remains down, check the Knowledge Base for other possible causes.

**MID Server resource threshold alerts**

The instance displays warnings when a MID Server breaches its resource thresholds for CPU and JVM memory usage, enabling users to create email notifications or custom scripts when a breach occurs.

The MID Server Issue [ecc_agent_issue] table warns users when a MID Server exceeds configured thresholds of its allocated CPU and memory resources. These warnings are published before the MID Server experiences performance degradation or an out-of-memory error, enabling the administrator to increase resources and avoid downtime.

Administrators can use a registered event to send email notification to selected recipients, advising them of any threshold breaches, or to create a custom script to do some other type of work. The instance continues to update the MID Server Issue [ecc_agent_issue] table to keep unresolved issues current.

By default, CPU and memory threshold alerts are disabled and no alerts are published to the MID Server Issue [ecc_agent_issue] table. To enable both types of alerting, add these properties to the System Property [sys_properties] table, and then set their values to true:

- mid.threshold.resource.breach.enable.cpu.alerts
- mid.threshold.resource.breach.enable.memory.alerts

For details on adding system properties to the platform, see Add a property using sys_properties.list.

**Evaluation process**

This processing occurs whether or not alerting is enabled:

1. Every 10 minutes, each MID Server transmits its CPU and memory consumption metrics to the instance. The instance inserts CPU metrics into the Mean CPU used % field of the ECC Agent Scalar Metrics [ecc_agent_scalar_metric] table and memory metrics into the Max memory used % field of the ECC Agent Memory Metrics [ecc_agent_memory_metric] table.
2. After a successful insert, the following business rules run on each table, invoking a script include that calls an appropriate function. Each function takes an average of the metric sets inserted into the tables, based on the configured sampling intervals.

- **Update cpu mean on MID Server Status**: Calls the MIDResourceThresholdBreach.checkCpuUsage() script include.
- **Update max memory on MID Server Status**: Calls the MIDResourceThresholdBreach.checkMemoryUsage script include.

Each function takes an average of the metric sets inserted into the tables, based on the configured thresholds and sampling intervals. The instance first looks at each MID Server for configuration parameters that set custom threshold values or sampling intervals for that MID Server. If no configuration parameters for these attributes are found, the instance looks in the System Properties [sys_properties] table for custom values to use. If no properties are found, the instance uses the default threshold and interval values from the code.

**Note:** Both the threshold percentages and the sampling intervals are configurable. See Configuring thresholds and sampling intervals for details.

### Alerting process

When alerting for CPU or memory thresholds is enabled, this processing occurs:

1. If the aggregated average metric value equals or exceeds the configured percent threshold, the instance triggers the mid.threshold.resource.breach event. Administrators can use this event to create email notifications for threshold breach alerts or to create a custom script.

2. The instance inserts a record of the breach into the MID Server Issue [ecc_agent_issue] table with a State value of New and a Count of 1, and then publishes a message containing all the pertinent details of the breach. An example of this message is Mean CPU used % has exceeded threshold (96>=91) for a 40 minute interval span, occurring after start date 2017-01-11 14:25:19. This message appears in the Short description field of the MID Server Issue form and in the event. You can copy any part of the message into your email notifications.

### MID Server issue states

When the administrator first examines an issue in the MID Server Issue [ecc_agent_issue] table, the administrator can change the State of the issue to Acknowledged to indicate that the issue is being addressed. Each time the instance detects a breach, it attempts to match the breach with an existing issue. If a MID Server already has an issue record for that breach in a State of New or Acknowledged, the instance updates the Last Detected field with the current date/time and increments the Count field in the existing record. This prevents the creation of duplicate records in the MID Server Issue [ecc_agent_issue] table and records the number of times after the initial incident that the breach reoccurred. The administrator can increase MID Server resources gradually and watch the effect on the Count field. When the counter stops incrementing, the administrator knows that the MID Server has adequate resources. When the MID Server resource have been adjusted appropriately, the administrator sets the State to Resolved. If a new threshold breach is logged that matches a MID Server issue with a State of Resolved, the instance creates a new issue record.

**Note:** Any record in the MID Server Issue [ecc_agent_issue] table that has not been updated in 30 days is deleted, regardless of its state.
Recommendations for resolving resource issues

Administrators have the opportunity to resolve any resource issues with a MID Server when they receive notification of the event. Follow these recommendations for reducing the strain on MID Server resources:

- **JVM memory**:
  - Allocate more max memory to the MID Server. For more information, see [Set the MID Server JVM memory size](#).
  - Add additional MID Servers to share the workload. For more information, see [MID Server clusters](#).
  - Reduce the amount of concurrent processing for the MID Server. This includes segmenting IP Address ranges into smaller segments for a Discovery schedule or loading smaller segments of data within an import job.

- **CPU**: Reduce the activity on the host or migrate the MID Server to a new host with more available resources.

### Tables used for resource threshold evaluation

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>

</thead>
</table>
| MID Server Issue [ecc_agent_issue] | Stores data on various types of MID Server issues, including breaches of configured CPU and memory thresholds. Fields used for resource threshold breaches are:  
  - **count**: Number of times a previously reported threshold breach occurs, if the event is not marked **Resolved**.  
  - **last_detected**: Current date and time a threshold breach is detected. This field is updated each time a previously detected breach is found, if it is not marked **Resolved**.  
  - **message**: Descriptive message summarizing the conditions that triggered the threshold breach event. This message includes the actual percentage of CPU and memory calculated and the configured thresholds that were breached.  
  - **mid_server**: Name of the MID Server experiencing the resource threshold breach.  
  - **source**: The issue source for the breach. These are the possible sources:  
    - **CpuMIDResourceThresholdBreach**: CPU threshold issue sources.  
    - **MemoryMIDResourceThresholdBreach**: Memory threshold issue sources. |
| MID Server Status [ecc_agent_status] | Stores the percentages used for the CPU and memory resources, averaged over configurable intervals for each resource. The fields used are:  
  - Mean CPU used %  
  - Max Memory used % |
| ECC Agent Scalar Metric [ecc_agent_scalar_metric] | Stores the CPU usage data inserted by each MID Server every 10 minutes. The table field used by resource threshold alerting is **mean**. |
Table

</tbody>
</table>

Business rules that check for threshold breaches

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update cpu mean on MID Server Status</td>
<td>Runs after the MID Server inserts a record into the ECC Agent Scalar Metric [ecc_agent_scalar_metric] table. This business rule triggers the MIDResourceThresholdBreach script include function that evaluates threshold settings to determine if the MID Server has breached its configured CPU resource thresholds.</td>
</tr>
<tr>
<td>Update max memory on MID Server Status</td>
<td>Runs after the MID Server inserts a record into the ECC Agent Memory Metric [ecc_agent_memory_metric] table. This business rule triggers the MIDResourceThresholdBreach script include function that evaluates threshold settings to determine if the MID Server has breached its configured memory resource thresholds.</td>
</tr>
</tbody>
</table>

Configuring thresholds and sampling intervals

You can use the default threshold percentages and sampling intervals or configure custom values using either of these methods:

- Add system properties to the instance and change the default values for all MID Servers.
- Add configuration parameters to change the default resource values for individual MID Servers.

The system properties and the configuration parameters use the same names.

<table>
<thead>
<tr>
<th>Property/configuration parameter</th>
<th>Description</th>
</tr>

<td>Usage percentage of the total memory resources that initiates a threshold breach alert. Default: 95</td>
</tr>
</tbody>
</table>

### MID Server resource reporting

The **MID Server dashboard** contains two reports that give you views into the consumption of CPU and JVM memory resources. These reports show usage over the previous 30 days.

- **Avg Percentage of CPU Used**: Trending the daily average on CPU usage helps illustrate the amount of CPU processing that the MID Server host consumes. MID Servers deployed on the same host will report the same CPU usage.
- **Avg Percentage of Max Memory Used**: The maximum used percentage (max_used_pct) is a useful metric for determining if the MID Server has enough memory resources. This metric is a percentage of the max used memory over the total available memory. Trending this over time provides a visualization of how much memory is needed by the MID Server.

### MID Server user connectivity issues

The instance writes issues involving MID Server user logins and network connectivity to the MID Server Issue [ecc_agent_issue] table and creates events you can use in custom scripts or to send email notifications.

Records in the MID Server Issue [ecc_agent_issue] table can provide insight into why your MID Server user cannot log in or why a MID Server cannot connect to the instance. The system displays records for connectivity problems in this table that include informative error messages suggesting possible causes. By default, a scheduled job called MIDUserConnectivity runs every four hours and launches the MIDUserConnectivity script include to evaluate MID Server connection activity. Records in the MID Server Issue [ecc_agent_issue] table reflect the status of MID Server login attempts and connectivity at the time the scheduled job runs.

From the perspective of the instance, the MID Server is Down when:

- User authentication fails
- User authorization fails.
- Network issues prevent MID Server from establishing a TCP/IP connection.

**Note:** To associate a user with a MID Server, navigate to the servicenow/<mid server name>/agent/config.xml file and enter the user credentials in the mid.instance.username and mid.instance.password parameters. Make sure to restart the MID Server to activate your changes.

### How issues are logged

User authentication failures and authorization issues are logged automatically to the MID Server agent log file. The message for both is the same: User cannot be authenticated or is missing the proper roles. If the issue is related to authorization, the agent.log file shows the list of missing roles.

When debugging is enabled, MID Server issues are logged to the system log (syslog) and are available for display in either a summary or a detailed format. You can also change the sampling interval from the default 4 hours to something shorter for tracking your remediation efforts. For instructions on enabling and configuring debugging for MID Server user issues, see Test remediation efforts for MID Server user connectivity issues.
Data provided

When the instance encounters user connectivity issues, it opens a record in the MID Server Issue [ecc_agent_issue] table.

Example user authentication error message

The MID Server Issue table contains these fields:

**MID Server issue fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last detected</td>
<td>Date and time the issue was last detected.</td>
</tr>
<tr>
<td>Short description</td>
<td>Contents of the generated message that specifies a possible issue with the named user or the MID Server.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Empty in the Jakarta release.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Issue source | The process that identified the issue. For all issues with MID Server user connectivity, the source is MIDUserConnectivity.
State | The current state of the issue. Possible states are:
  - **New**: Starting state when the instance creates the issue.
  - **Acknowledged**: State set when the administrator first examines the issue.
  - **Resolved**: Ending state, set by the instance, indicating that the issue has been resolved. If the scheduled job does not encounter the issue when it runs again, the instance automatically sets this value.
Domain | Domain associated with the MID Server user account.
Count | Number of times an issue has been detected. Each time the scheduled job runs and encounters the same issue, it increments this field.

### User authentication failure

The credentials that the instance uses to authenticate a MID Server user are configured in the MID Server Configuration Parameters [ecc_agent_config] table. If the MID Server user attempts to log into the instance with invalid credentials, the instance rejects the connection, and writes the login.failed event to the Events [sysevents] table for the user. Administrators can use this event in a custom script or in email notifications for authentication failure.

**Note:** If user authentication fails, user authorization is not attempted.

### User accounts associated with a MID Server

Either of the following messages in the MID Server Issue [ecc_agent_issue] table indicate authentication failure for user accounts that are associated with a MID Server:

- Login authentication failure for User `<user name>` associated with 1 down MID Server. Check password on MID server.
- Login authentication failure for User `<user name>` associated with `<n>` down MID Servers. Check password on MID servers.

The necessary conditions for these messages to appear are:

- The Status field in the MID Servers [ecc_agent] table that is associated with the MID Server indicates that the MID Server is **Down**.
- The user identified in the MID Server Configuration Parameters [ecc_agent_config] table is the user that one or more MID Servers is configured to use for authentication and authorization when connecting to the instance. The record in the [ecc_agent_config] table must have these values:
  - Parameter name [param_name] field set to mid.instance.username.
  - Value [value] field set to the user’s name, corresponding to the User ID [user_name] field in Users [sys_user] table.
- The Events [sysevent] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The record created in the [sysevent] table contains these field values:
• Event Name [name] field is set to `login.failed`.
• Parm1 [parm1] field is set to the user’s name.

**Note:** The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

### User accounts with the mid-server role not associated with a MID Server

The following message appears when a user with the mid_server role who is not associated with a MID Server fails to authenticate: **Login authentication failure for User <user name> with mid_server role not associated with a MID Server.**

The necessary conditions for this message to appear are:

- The User Roles [sys_user_has_role] table contains a record linking the sys_id associated with the user record stored in the [sys_user] table, with the sys_id associated with the mid_server role record stored in the [sys_user_role] table.
- The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events [sysevent] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period.
- The [sysevent] table contains a record with the Event Name [name] field set to `login.failed`.
- The Parm1 [parm1] field is set to the user’s name, corresponding to the User ID [user_name] field in Users [sys_user] table.

**Note:** The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

### User authorization failure

The user authorization check occurs after the MID Server has successfully authenticated on the instance. In this step, the system ensures that the user account associated with a MID Server is granted the minimum roles required. A SOAP web service called `MIDServerCheck` performs the role checking on the instance. If the MID Server user has the proper roles, the connection is allowed and a `login` event is written to the Events [sysevents] table. If the user does not have the proper roles, the instance writes a `login.authorization.failed` event to the Events [sysevents] table. This event provides a comma separated list of the user’s missing roles. Administrators can use this event in custom scripts or in email notifications for authorization failure.

Authorization can fail if a user is missing the mid_server role or any of the important SOAP roles, as in these cases:

- If the user has the soap_script role, the `MIDServerCheck` SOAP web service runs to check for the appropriate MID Server roles. If the user lacks the mid_server role or any of the other SOAP roles, authorization fails, and the `login.authorization.failed` event is created.
- If the user is missing the soap_script role, that user is not authorized to launch the `MIDServerCheck` SOAP web service, which checks for all required MID Server roles. Authorization fails, but the `login.authorization.failed` event is not created. When this occurs, the instance displays this message: **Connectivity of MID Server user <user name> cannot be detected by the instance.**

### Users associated with one or more down MID Servers

Either of the following messages in the MID Server Issue [ecc_agent_issue] table indicate authorization failure for user accounts that are associated with a MID Server that is **Down**:

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
• Login authorization failure for User <user name> associated with 1 down MID Server. Re-assign mid_server role to grant all required roles.
• Login authorization failure for User <user name> associated with <n> down MID Servers. Re-assign mid_server role to grant all required roles.

The MIDUserConnectivity script include identifies active users associated with one or more down MID Servers whose last login attempt within the reporting period failed user authorization. This message is generated when user authorization failures are detected and reported by the MIDServeryCheck scripted web service. However, user authorization failures are not reported for users who are not assigned the soap_script role. Should this occur, problems with the user are reported by the network connectivity message.

This message appears in the MID Server Issue [ecc_agent_issue] table when:
• The user may or may not have the mid_server role.
• The user is identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
• The Events [sysevent] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The [sysevent] table contains a record with these settings:
  • Event Name [name] field set to login.authorization.failed.
  • Parm1 [parm1] field set to the user’s name, corresponding to the User ID [user_name] field in Users [sys_user] table.

Note: The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

Users with the proper role not associated with a MID Server

The following message appears when a user with the mid_server role who is not associated with a MID Server fails authorization: Login authorization failure for User <user name> with mid_server role not associated with a MID Server.

This message is generated when user authorization failures are detected in which the user account, with the mid_server role, is not identified as a configured MID Server user in the [ecc_agent_config] table. It is possible that the user account was associated with a MID Server at the time of the failure.

This message appears in the MID Server Issue [ecc_agent_issue] table when:
• The user has the mid_server role. The User Roles [sys_user_has_role] table has a record linking the sys_id associated with the user record stored in the [sys_user] table, with the sys_id associated with the mid_server role record stored in the [sys_user_role] table.
• The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
• The Events [sysevent] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The [sysevent] table contains a record with these settings:
  • Event Name [name] field set to login.authorization.failed.
  • Parm1 [parm1] field set to the user’s name, corresponding to the User ID [user_name] field in Users [sys_user] table.

Note: The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).
Network issues

A network issue can prevent the MID Server from connecting to the instance's TCP/IP server to begin a session. In this case, the instance marks the MID Server as **Down**, because the instance failed to receive the MID Server heartbeat within the prescribed 5 minute interval.

**Users associated with down MID Servers who have not attempted to log in**

Either of the following messages in the MID Server Issue [ecc_agent_issue] table name users associated with MID Servers who have not attempted to log in during the reporting period:

- User `<user name>` is associated with 1 down MID Server. No login attempts within reporting period.
- User `<user name>` is associated with `<n>` down MID Servers. No login attempts within reporting period.

The MIDUserConnectivity script include reports active users associated with down MID Servers where network connectivity cannot be detected by the instance.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

- The user may or may not have the mid_server role.
- The user is identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user which one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- There are no login attempts, either failed or successful, recorded in the Events [sysevent] table for the user during the scheduled reporting period.

**Note:** The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

**Users not associated with MID Servers who have not attempted to log in**

The following message appears when a user with the mid_server role who is not associated with a MID Server has not attempted to login during the configured reporting interval: **User `<user name>` with mid_server role is not associated with a MID Server. No login attempts within reporting period.**

The MIDUserConnectivity script include reports active users with the mid_server role not associated with a MID Server, where connectivity cannot be detected by the instance.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

- The user has the mid_server role. The User Roles [sys_user_has_role] table has a record linking the sys_id associated with the user record stored in the [sys_user] table, with the sys_id associated with the mid_server role record stored in the [sys_user_role] table.
- The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- There are no login attempts, either failed or successful, recorded in the Events [sysevent] table for the user during the scheduled reporting period.

**Note:** The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

Configuration issues

Any of the following messages, discussed above, can indicate a configuration issue:

- Login authentication failure for User `<user name>` with mid_server role not associated with a MID Server.
- Login authorization failure for User <user name> with mid_server role not associated with a MID Server.
- User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.

These are some common configuration errors:

- An administrator neglected to associate the user record with the MID Server record as shown in the MID Server Configuration Parameters [ecc_agent_config] table. This table is read-only and cannot be updated directly. To associate a user with a MID Server, configure the user name and password in the MID Server's config.xml file and restart the MID Server.
- During the process of reconfiguring a MID Server to use a different account for TCP/IP connection, the administrator has not yet removed the mid_server role from the account or deleted the account.
- A multipurpose user account was created and granted a large number of roles, including the mid_server role, although this account was never intended to be used as a MID Server account.

User who successfully authenticates and authorizes but might not need mid_server role

The following message appears when a user with the mid_server role who is not associated with a MID Server successfully logs in: User <user name> with mid_server role successfully connected but not associated with a MID Server. The mid_server role should be reserved for MID Server use only.

The MIDUserConnectivity script include reports active users with the mid_server role who are not identified as a configured MID Server user, and whose last login attempt was successful during the scheduled time period. This message suggests that the user’s credentials are being used by a system administrator or a process that is not running on a MID Server. The assumption here is that the mid_server role should only be used for applications deployed to a MID Server. The presence of this message reminds the system administrator to remove extraneous mid_server roles from user accounts that do not require them.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

- The user has the mid_server role.
- The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events [sysevent] table contains posts showing that the last login attempt associated with the user succeeded during the scheduled time period. The [sysevent] table contains a record with these settings:
  - Event Name [name] field set to login.
  - Parm1 [parm1] field set to the user’s name, corresponding to the User ID [user_name] field in Users [sys_user] table.

Note: The Mid Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

Test remediation efforts for MID Server user connectivity issues

After attempting to resolve a user connectivity issue that appears in the MID Server Issue [ecc_agent_issue] table, you can test your remediation efforts without having to wait until the next scheduled reporting period by shortening the sampling interval.

Role required: admin

Reconfigure the sampling interval using this procedure and then examine the results in the MID Server Issue [ecc_agent_issue] table. You can set any time span for the sample, but you should define a window of not less than 5 minutes, since this is the default interval of the MID Server heartbeat that reports its status. The recommended method for configuring a shorter sampling interval is to copy and modify the code from the MIDUserConnectivity scheduled job, and then run it manually in the background script utility.
Caution: Avoid editing the script in the MIDUserConnectivity schedule record. If you make any change to this record, it will not be updated when you upgrade the instance.

1. Navigate to System Definition > Scheduled Jobs.
2. Open the MIDUserConnectivity scheduled job.
3. Copy this line from the Run this script field:
   ```javascript
   MIDUserConnectivity(0).checkConnectivity(4 * (60 * 60 *1000));
   ```
   This code sets the 4 hour sampling interval in milliseconds and turns debugging off with the MIDUserConnectivity(0) value.
4. Navigate to System Definition > Scripts - Background.
5. Paste the code from the scheduled job into the Run script field.
6. Set the sampling interval to 5 minutes by changing the time calculation to (5 * 60 *1000).
   The modified command looks like this: `MIDUserConnectivity(0).checkConnectivity (5 * 60 *1000);`
7. Click Run script.
8. Open the record of the MID Server that had the issue and select the MID Server Issues related list.
   The issue is updated as follows:
   - If the issue persists, the Count column is incremented, and the Last detected column shows the current date and time.
   - If the issue no longer exists, the system changes the State to Resolved.
9. Optionally, you can enable debugging by selecting a level, and then run the script again to see the breakdown for each condition evaluated.
   Use these settings to select a debugging level:
   - For a summary view, enter MIDUserConnectivity(1).
   - For a detailed view, enter MIDUserConnectivity(2).

   For details about the type of debugging information provided, see Interpreting MID Server user debugging output.

Interpreting MID Server user debugging output

Debugging output from the system log is available in either a summary or detailed view for MID Server user issues, but must be enabled manually.

To enable debugging and display all connectivity issues in either of the available formats, you must run a method manually on your instance. For instructions on enabling debugging, see Test remediation efforts for MID Server user connectivity issues. For information about each error condition and how records are created in the MID Server Issue [ecc_agent_issue] table, see MID Server user connectivity issues.

Available formats

You can configure the instance to generate a simple summary of the issue or a detailed output that identifies users and MID Servers. Summaries provide a quick look at the issue conditions, by count, while the detailed view allows you to examine roles, MID Server associations, and login activity by named users.

In this summary example of an authorization issue, the instance evaluates each condition and indicates how many users met that condition. You can see that a MID Server is down and that one of two users configured for a MID Server failed authorization. Because this is a summary, neither the MID Server nor the users are named.
Sample summary debug output

Authentication failure

When a MID Server user cannot authenticate on the instance, the system displays these error messages in the detailed output:

- Login authentication failure for User <user name> associated with 1 down MID Server. Check password on MID server.
- Login authentication failure for User <user name> associated with <n> down MID Servers. Check password on MID servers.
- Login authentication failure for User <user name> with mid_server role not associated with a MID Server.

In this example, three users with the mid_server role, midserver2, local-midserver, and ardis.maison, failed to authenticate. Two of these users were configured for MID Servers that were Down, and the other user was not configured for any MID Servers. Each of these users has an authentication failure and is named in the appropriate error message.

MID Server ID map

The debugging output lists all MID Servers that are marked as Down and maps them to their user accounts by the MID Server sys_id. This map includes all user accounts that have the mid_server role, whether or not they are associated with a MID Server. If there are no Down MID Servers, the map is not displayed in the debugging output.

The map is presented in three sections:

- User accounts not associated with any MID Servers.
- User accounts associated with Down MID Servers, identified by their sys_id.
- The sys_id of each Down MID Server, identified by name.

Authorization failure

If a user is missing any of the required roles, the instance generates these authorization failure messages:

- Login authorization failure for User <user name> associated with 1 down MID Server. Re-assign mid_server role to grant all required roles.
- Login authorization failure for User <user name> associated with <n> down MID Servers. Re-assign mid_server role to grant all required roles.
- Login authorization failure for User <user name> with mid_server role not associated with a MID Server.

In this example, three users with the mid_server role, midserver2, local-midserver, and ardis.maison have failed authorization. One user is not associated with any MID Server, but the other two users are. The system has logged an authorization failure, indicating that the user is missing at least one critical role. To see what roles are missing, look at the comma separated list in the Parm2 field in the login.authorization.failed event record. This record is the most recent login attempt in the Event [sysevent] table for the user account within the reporting period.

Network issues

Network issues may exist for these users who are associated with MID Servers, but who have not attempted to log in during the reporting period:

- User <user name> is associated with 1 down MID Server. No login attempts within reporting period.
- User <user name> is associated with <n> down MID Servers. No login attempts within reporting period.

Network issues may also exist for these users who are NOT associated with MID Servers, and who have not attempted to log in during the reporting period: User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.

In this example, no login attempts have been detected for midserver2, local-midserver, and ardis.maison, all of whom have the mid_server role. Two of those users are associated with MID Servers that are marked Down. The other user is not associated with any MID Server. None of these users has attempted to log in to the system within the configured reporting interval. The system assumes that these users would make an attempt to log in unless network issues prevented them from doing so.

Note: By default, the sampling period is 4 hours. However, during debugging or remediation, the sampling period can be reset to a value that matches the MID Server heartbeat interval of 5 minutes, or greater.
Configuration issues

Any of the following messages can indicate a user configuration issue:

- Login authentication failure for User <user name> with mid_server role not associated with a MID Server.
- Login authorization failure for User <user name> with mid_server role not associated with a MID Server.
- User <user name> with mid_server role successfully connected but not associated with a MID Server. The mid-server role should be reserved for MID Server use only.
- User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.

In this example, a user with the mid_server role has logged in successfully within the configured sampling interval. However, this user is not configured for a MID Server and might have the role in error.

Detailed debugging log for MID Server user account login
MID Server Upgrade History

Use this module to troubleshoot errors that occur during the MID Server upgrade process. The MID Server Upgrade Histories table contains a record of each instance upgrade. The MID Server Upgrade Stages table shows the status of each MID Server and its upgrade progress, including any errors encountered.

MID Server Upgrade Histories

Users with admin or agent-admin roles can find detailed information for any MID Server upgrade in the Upgrade History module for MID Server. Whenever an instance is upgraded, all MID Servers in the Up state are upgraded automatically. The Upgrade History module uses the MID Server Upgrade Histories table [ecc_agent_upgrade_history]. This table shows the following information:

- The old instance version.
- The new version.
- The number of successfully upgraded MID Servers.
- The number of MID Servers with pending upgrades. MID Servers have pending upgrades if the upgrade has failed or is in progress.

MID Server Upgrade Stages

Select an instance record to see more details about the MID Servers upgraded with that instance. The Pending Upgrades and Complete Upgrade Details related lists use the MID Server Upgrade Stages table [ecc_agent_upgrade_history_stage]. MID Servers pinned to a specific version generate an entry with a blank MID Upgrade History on the MID Server Upgrade Stages table [ecc_agent_upgrade_history_stage].

<table>
<thead>
<tr>
<th>MID Upgrade History</th>
<th>Refers to a corresponding record in the [ecc_agent_upgrade_history] table.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stage</td>
<td>Shows the progress of the MID Server through each stage of the upgrade process.</td>
</tr>
<tr>
<td>State</td>
<td>Shows the status of each stage.</td>
</tr>
<tr>
<td>Message</td>
<td>Displays dynamically generated messages about the upgrade stages, such as the file path to download directories or extract folders. It also displays information about any errors encountered, even if those errors do not block the upgrade.</td>
</tr>
</tbody>
</table>

MID Server reference information

MID Server reference information includes system requirements and other information you need to configure a MID Server for your specific needs.
System clones and the MID server

See KB0547597 for information on what to do with MID Servers when you are cloning your instance.

Reference topics

System requirements

Use the minimum system requirements to allocate resources for computers hosting MID Servers.

ECC Queue

Learn about the External Communication Channel (ECC) Queue, which is the connection point between the MID Server and the instance. Jobs that the MID Server needs to perform are saved in this queue until the MID Server is ready to handle them.

MID Server Dashboard

Use the reports and gauges in the MID Server dashboard to monitor ongoing operations.

MID Server properties

Use MID Server properties to control the behavior of all MID Servers or a particular MID Server.

MID Server parameters

Use MID Server parameters to control the behavior of a particular MID Server.

MID Server protected records and reserved characters

Some MID Server records cannot be altered. Certain special characters are pre-defined in XML and cannot be used in passwords.

MID Server privileged commands

To discover certain information on a host server, the MID Server must run SSH commands with higher privileges. The platform provides default privileged commands for the MID Server to use and the ability to add additional commands to the system.

MIDSystem methods
MID System variables (referred to by the variable name ms.) provide a variety of methods to get information about the MID Server.

**MID Server heartbeat**

Configure the interval that the instance uses when it checks the "heartbeat" of MID Server. By default, the instance checks the MID Server for a response every 5 minutes.

**Set JVM memory size**

Modify the JVM setting for your MID Server from the default size to suit the amount of work your MID Server does in your network.

**Pause the MID Server**

Pause the MID Server to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

**MID Server system requirements**

Use these minimum system requirements to allocate resources for computers hosting MID Servers.

---

[Images: Connect, Install, Configure, Encrypt]

- Ensure that the MID Server can connect to elements inside and outside your network
- Download and install the MID Server on a Linux or Windows host
- Configure your MID Server
- Configure MID Server security
- Ensure that the MID Server can connect to elements inside and outside your network
- Download and install the MID Server on a Linux or Windows host
- Configure your MID Server
- Configure MID Server security

---

**MID Server supported systems**

**Windows server**

To discover Windows-based servers, run Service Mapping patterns, or execute Orchestration commands on Windows devices, the MID Server must be installed on a Windows server. The MID Server supports these Windows operating systems, including virtual machines and 64-bit systems:

- Windows Server 2008
- Windows Server 2012
- Windows Server 2016
- Windows Server 2019

**Note:** .NET Framework version 3.5, 4.0, 4.5, 4.6, or 4.7 is required for Service Mapping support and for Windows pattern-based discovery.
Linux

The MID Server is supported on these Linux versions for virtual machines and 64-bit systems:

- Linux Red Hat 6 and above
- Ubuntu 1404 (Ubuntu 14) and above
- CentOS 6 and above

Note: On 64-bit Linux systems, you must install the 32-bit GNU C library (glibc). The installation command for CentOS is: `yum install glibc.i686`.

OCSP connectivity requirements

The Online Certificate Status Protocol (OCSP) is the protocol used to determine the revocation status of SSL/TLS certificates. When certificates are exchanged and validated, the MID Server needs to determine if the certificate has been revoked and shouldn't be trusted.

OCSP works by using a client, such as a MID Server, to receive a certificate from an HTTP website. The client sends a request to an OCSP responder: a server operated by the certificate authority (CA) that issued the certificate. The OCSP responder’s response to the client indicates whether the certificate is valid or has been revoked.

In order to connect, the MID Server requires access to:

- servicenow.com
- install.service-now.com
- ocsp.entrust.net (or other OCSP CA)

While SSL/TLS certificates are always issued with an expiration date, there are certain circumstances in which a certificate must be revoked before it expires (for example, if its associated private key may have been compromised). Therefore, the current validity of a website’s certificate must always be checked by clients regardless of its expiry date.

Clients fail a connection when they can’t check the revocation status of a certificate. Firewalls and proxy configurations may block calls to the OCSP Entrust server, which prevents the MID Server from working. You may need to change your firewall permissions so the OCSP traffic to go through properly. For more information and resolutions, see the HI Knowledge Base article [KB0813636].

PowerShell requirements

The MID Server requires the minimum PowerShell version 3.0 and supports versions up to PowerShell 5.1.

Java version support

OpenJDK version 1.8.0_231 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. See the HI Knowledge Base article [KB0719830] for more information on OpenJDK version support. The installer automatically configures OpenJDK to run in your environment. No additional configuration is required. This version supports both 32-bit and 64-bit MID Servers. For the best performance, install the 64-bit MID Server for your operating system. The MID Server requires a minimum JRE version 1.8.0_161, and recommended version 1.8.0_231. If you are using a lower version than 1.8.0_161, you may see encryption related issues. If the MID Server is configured to use an external JRE and the JRE is detected to be incompatible, the MID Server instead uses the bundled JRE. If this fails, or the MID remains on an incompatible JRE version, the MID automatically stops.
Testing showed that the MID Server works as expected with Oracle Java 11 version 11.0.5 and Oracle JRE 8 version 1.8.0_231. However, Oracle JRE 8 version 1.8.0_231 requires the workaround described in the HI Knowledge Base article *MID Server running Oracle JRE version 8 [KB0784442]*. In order to use Java 11 on Windows MID Servers, refer to *Install Java 11 on Windows MID servers [KB0752451]*.

Upgraded MID Servers might use different Java versions depending on their release level.

- MID Servers upgraded from Kingston and earlier use the OpenJDK provided with the MID Server installer. This version of the OpenJDK was tested and certified for use with these MID Servers.
- MID Servers upgraded from London continue to use the same JRE you configured for London. The MID Server supports JRE 1.8.

MID Server supports Java 8 and Java 11 on any supported operating system. However, CPU monitoring is disabled by default on Windows with Java 11 because an outdated SIGAR library causes the MID Server to crash. If you decide to patch the SIGAR library, you can re-enable CPU monitoring. See *CPU and maximum memory usage* for more information on how to enable CPU monitoring.

### Java Service Wrapper

The MID Server installer includes the Tanuki Software Java Service Wrapper, version 3.5.40.

### Setting the JVM Memory size

The MID Server installs with 1 GB of JVM memory. If the suggested memory size for your product is greater than 1 GB, see *Set the MID Server JVM memory size* for the procedure to override the default setting.

### Deployment types

System requirements for your instance are determined by the needs of the individual products you use that require a MID Server.

#### Standard deployments

The following products are considered "standard" because their MID Servers share the same minimum disk space and memory requirements:

- Discovery
- Event Management
- Integrations
- Orchestration
- Service Mapping

The minimum standard requirements pertain to both a single product and a combined product deployment. You can deploy a single MID Server for multiple standard products without significantly increasing the disk or memory requirements.

#### High resource deployments

Cloud Management Platform (CMP) and Operational Intelligence are processing intensive and require more resources for each MID Server than the standard products. Install MID Servers for these products on dedicated hosts that do not support MID Servers for other products.
Recommended MID Server minimum requirements

All configurations listed here require a quad core processor with a speed of 2 GHz or greater and were calculated for a Windows Server 2012 R2 host.

**Note:** The MID Server minimum system requirements for 25 concurrent threads includes resource overhead that is independent of the number of threads. As a result, the system requirements for 200 threads do not require a linear increase in resources. You can set the MID Server to use as few as 5 threads without issue. To increase the speed of the MID Server if the host is powerful enough or lightly loaded with other programs, you can increase the threads setting. The threads setting depends on the limitation of the CPU speed, memory, and operating system of the host machine. You might have to experiment to find the optimal threads count that works best when the MID Server is busy so it does not exhaust the host machine’s hardware limitations. This means you may have to refine the thread count to best meet your situation.

**IMPORTANT:** You can set threads.max as high as 200, however, this setting may need to be changed depending on the OS. For example, Windows-based MID Servers running Discovery uses Powershell which is resource intensive. In this case, you may exhaust the CPU power of the host machine with just 50 threads count.

| MID Server minimum system requirements for 25 concurrent threads (base system) |
|---------------------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| **Product**                     | **Disk space (GB)** | **Memory (GB)** | **Total**       | **OS memory**  | **JVM memory**  | **Total**       |
| OS                              | MID Server + product | Total          | **OS memory**  | **JVM memory**  | **Total**       |
| Cloud Management Platform (CMP) | 36 GB              | 4 GB            | 40 GB          | 4 GB            | 4 GB            | 8 GB            |
| Operational Intelligence        | 36 GB              | 16 GB           | 52 GB          | 4 GB            | 8 GB            | 12 GB           |
| Standard                        | 36 GB              | 4 GB            | 40 GB          | 4 GB            | 1 GB            | 5 GB            |

| MID Server minimum system requirements for 200 concurrent threads (customer configured) |
|---------------------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| **Product**                     | **Disk space (GB)** | **Memory (GB)** | **Total**       | **OS memory**  | **JVM memory**  | **Total**       |
| OS                              | MID Server + product | Total          | **OS memory**  | **JVM memory**  | **Total**       |
| Cloud Management Platform (CMP) | 36 GB              | 4 GB            | 40 GB          | 4 GB            | 4 GB            | 8 GB            |
| Operational Intelligence        | 36 GB              | 16 GB           | 52 GB          | 4 GB            | 8 GB            | 12 GB           |
| Standard                        | 36 GB              | 4 GB            | 40 GB          | 4 GB            | 4 GB            | 8 GB            |
Use case 1: Single MID Server deployed for multiple standard products

In this example, Service Mapping, Discovery, and Orchestration share a MID Server with 25 threads that is installed on a dedicated host. The disk space and memory requirements specified here satisfy the minimum recommended requirements for the combined product deployment.

### One MID Server for multiple standard products

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>
</tr>
<tr>
<td>Service Mapping + Discovery + Orchestration</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
</tbody>
</table>

Use case 2: Multiple MID Servers deployed to a single host

In this example, three MID Servers (not clustered) are assigned to different standard products. All three MID Servers are deployed to a single host, where each MID Server has 25 threads. The required resources are calculated as follows:

- **Total disk space required**: Add the recommended disk space for the operating system from the **OS** column to the sum of the values in the **MID Server + product** column for all products mapped.
- **Total memory required**: Add the recommended memory for the operating system from the **OS memory** column to the sum of the values in the **JVM memory** column for all products mapped.

### Calculating resources for multiple MID Servers on a single host

<table>
<thead>
<tr>
<th>Product</th>
<th>Disk space (GB)</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>OS</td>
<td>MID Server + product</td>
</tr>
<tr>
<td>MID Server 1</td>
<td>36 GB</td>
<td>4 GB</td>
</tr>
<tr>
<td>MID Server 2</td>
<td>4 GB</td>
<td></td>
</tr>
<tr>
<td>MID Server 3</td>
<td>4 GB</td>
<td></td>
</tr>
<tr>
<td>Recommended minimum</td>
<td>36 GB</td>
<td>12 GB</td>
</tr>
</tbody>
</table>
Monitoring performance

To ensure that the MID Server resource allocations are sufficient for your environment, monitor performance during peak periods of product execution from the MID Server dashboard.

MID Server supports Java 8 and Java 11 on any supported operating system. However, CPU monitoring is disabled by default on Windows with Java 11 because an outdated SIGAR library causes the MID Server to crash. If you decide to patch the SIGAR library, you can re-enable CPU monitoring. See CPU and maximum memory usage for more information on how to enable CPU monitoring.

MID Server ECC Queue

The External Communication Channel (ECC) Queue is a connection point between an instance and the MID Server. Jobs that the MID Server needs to perform are saved in this queue until the MID Server is ready to handle them.

Asynchronous Message Bus

The MID Server subscribes to messages published by the Asynchronous Message Bus (AMB), which notifies the MID Server that it has pending tasks in the ECC Queue. If a job exists in the ECC Queue for that MID Server, the MID Server sets the status to "I'm working on it." When finished working on a requested job, the MID Server reports back to the ECC queue with the results.

The MID Server opens a persistent connection to the instance through the AMBClient and listens on the /mid/server/<mid_sys_id> AMB channel. When an output record is inserted into the Queue [ecc_queue] table, an AMB message is sent to the MID Server's channel. The MID Server receives this message and immediately polls the ecc_queue table for work.

The MID Server polls the ECC queue on the regular interval defined in the mid.poll.time configuration parameter, regardless of AMB message activity. The default polling interval is set to 40 seconds, but can be reconfigured. This polling of the ECC queue at a regular interval is done in case the AMB connection is dropped.
MID Server ECC queue polling process

**Note:** The AMB client on the MID Server does not work in all environments and might need to be disabled to avoid performance issues. To disable AMB in your environment, set the `mid.disable_amb` parameter to `true`. When you disable AMB, the MID Server reverts to a default polling interval of 5 seconds, unless the `mid.poll.time` parameter is set to a different value.
ECC Queue information

You can access the ECC Queue by navigating any of these paths:

- Discovery > Output and Artifacts > ECC Queue
- Discovery > Discovery Schedules > {schedule name} > {Discovery status record}
- ECC > Queue
- {Discovery Status record} > ECC Queue

An ECC Queue provides the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent</td>
<td>The name of the external system that this messages is either from or to. If the message is from or to a MID Server, the agent name is in the form mid.server.xxx, where xxx is the name of a particular MID Server.</td>
</tr>
<tr>
<td>Topic</td>
<td>The name of the probe the MID server ran. If you are using a pattern for discovery, the Horizontal Pattern probe appears.</td>
</tr>
<tr>
<td>Name</td>
<td>The actual command the probe ran. For example, if Topic is SSHCommand, then the Name field contains the actual shell command to run. If you are using a pattern for discovery, the following appears: Pattern Launcher: followed by the name of the pattern and the multipage number.</td>
</tr>
<tr>
<td>Source</td>
<td>The IP address that the discovery is to run against. A few probes run against multiple IP addresses; in those cases, this field contains a human-readable description.</td>
</tr>
<tr>
<td>Response to</td>
<td>This optional field contains a reference (sys_id) to the ECC Queue message that this message is in response to. Discovery makes extensive use of this field to track the hierarchy of messages that result from a given scheduled Discovery. Click the record icon for the value in this field to open the ECC Queue record for the activity that spawned the current probe or sensor record.</td>
</tr>
<tr>
<td>Queue</td>
<td>An indicator of whether this message was an input message or an output message.</td>
</tr>
<tr>
<td>State</td>
<td>The state of the current ECC queue record. States update automatically.</td>
</tr>
<tr>
<td>Processed</td>
<td>The time when this message was processed.</td>
</tr>
<tr>
<td>Created</td>
<td>The time when this message was created.</td>
</tr>
<tr>
<td>Sequence</td>
<td>The unique sequence number for this message. This value is automatically generated when an ECC Queue record is inserted. Its use is deprecated.</td>
</tr>
<tr>
<td>Error string</td>
<td>An error message, if an error occurred during processing. This field is hidden on the standard form unless there was an error.</td>
</tr>
</tbody>
</table>
### ECC queue controls

The ECC Queue form contains these related links:

<table>
<thead>
<tr>
<th>Related link</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run again</td>
<td>Runs the probe again. You can re-run probes when you encounter a failed discovery or other unexpected results.</td>
</tr>
<tr>
<td>Go to CMDB item</td>
<td>Open the CI record for the CI that was updated during the discovery.</td>
</tr>
<tr>
<td>Go to Sensor</td>
<td>Open the record for the associated sensor.</td>
</tr>
</tbody>
</table>

### Manage ECC Queue content for a MID Server

The ECC Queue allows you to create ECC Queue messages, access MID Server log entries, and retrieve statistics from an individual MID Server record.

Role required: admin, mid_server

1. Send remote commands through a MID Server to a hosting device directly from the ECC Queue without running Discovery.
   a) Navigate to the ECC Queue and click **New**.
   b) Create a message with these settings:
      - **Agent**: The name of the MID Server that executes the command.
      - **Topic**: Command
      - **Name**: The actual command that you want to process. For Windows, this is expressed in a DOS command line structure. For Linux, the structure could be a bash command line entry.
      - **Queue**: Output
      - **Payload**: With proper XML tags, you can specify the command here instead of in the **Name** field. The advantage to this is that the command is not restricted by the **Name** field length of 120 characters. Use the following XML format for the command:

```
<parameters>
  <parameter name="name" value="ACTUAL_COMMAND_LINE"/>
</parameters>
```

2. Access entries in the ECC Queue that show **agent0.log.0** logs and **wrapper.log** logs for an individual MID Server.
   a) Open a MID Server record.
b) Under **Related Links**, click **Grab MID Logs**.
ECC queue records appear in the list using the following filter:

- [Topic] [is] [SystemCommand]
- [Source] [is] [grabLog]
- [Agent] [is] [your MID Server]

Only `agent0.log.0` and `wrapper.log` entries appear. These logs are also accessible in the `~\agent\logs\` file path.

c) To open a log entry, click the link under the **Created** column.

3. Access the **queue.stats** topic for useful information about individual MID Servers, such as memory and CPU usage data.
   a) Open a MID Server record.
   b) Under **Related Links**, click **MID Statistics**.
ECC queue records appear in the list using the following filter:

- [Topic] [is] [queue.stats]
- [Agent] [is] [your MID Server]

**MID Server dashboard**

The MID Server dashboard is a central place for MID Server users to monitor ongoing operations. The dashboard consists of reports and gauges that display information from the MID Server Status table.

The MID Server Dashboard is available from the **MID Server > Dashboard** module.

**MID Server status gauge**

The MID Server Status gauge on the dashboard displays basic information about each MID Server. This information comes from the MID Server Status [ecc_agent_status] table.
If the version is not compatible, the MID Server status is not changed to **Down** in the MID Server dashboard. So it might still appear to be processing commands when it actually is not doing so. You must check the MID Server **Version** on the dashboard.

See [KB0535181](https://knowledgecentre.servicenow.com/view/KB0535181) for additional MID Server troubleshooting information.

The icons in the **Version** column indicates the following:

- **Red**: Incompatible. The MID Server and instance do not belong to the same release. You must upgrade the MID Server and verify that it is not pinned to an older version with the `mid.version.override` property. The MID Server will not be upgraded until the parameter is cleared.
- **Yellow**: Compatible, but an upgrade is recommended. This indicates that the MID Server version belongs to the same family as the instance, but not the same version.
- **Green**: Compatible. No upgrade necessary.
- **Gray**: Incompatible. The instance cannot detect the version.

### Column Description

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the MID Server.</td>
</tr>
<tr>
<td>Host name</td>
<td>The name of the system that hosts the MID Server.</td>
</tr>
<tr>
<td>Status</td>
<td>The status of the MID Server.</td>
</tr>
<tr>
<td>Validated</td>
<td>Whether or not the MID Server was validated.</td>
</tr>
<tr>
<td>Max memory used %</td>
<td>The highest percent usage of memory on the system that hosts the MID Server.</td>
</tr>
<tr>
<td>Mean CPU used %</td>
<td>The average percent usage of CPU on the system that hosts the MID Server.</td>
</tr>
<tr>
<td>Pending jobs</td>
<td>Number of pending ECC queue jobs for that MID Server.</td>
</tr>
<tr>
<td>Column</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Processing jobs</td>
<td>Number of processing ECC queue jobs for that MID Server.</td>
</tr>
<tr>
<td>Version</td>
<td>The version of the MID Server. An icon indicates the validity of the MID Server:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Red</strong>: Incompatible. The MID Server and instance do not belong to the same release. You must upgrade the MID Server and verify that it is not pinned to an older version with the mid.version.override property. The MID Server will not be upgraded until the parameter is cleared.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Yellow</strong>: Compatible, but an upgrade is recommended. This indicates that the MID Server version belongs to the same family as the instance, but not the same version.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Green</strong>: Compatible. No upgrade necessary.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Gray</strong>: Incompatible. The instance cannot detect the version.</td>
</tr>
<tr>
<td>User</td>
<td>The login name of the user. An icon indicates the validity of the user:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Red</strong>: Incompatible. The user does not have the mid_server role or the user does not match the value in the mid.instance.username parameter (in the config.xml configuration file). Reconfigure the MID Server user and verify that it works.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Green</strong>: Compatible. The user has the mid_server role and matches the user in the configuration file.</td>
</tr>
</tbody>
</table>

**Note**: The user can also have any of the SOAP roles that the mid_server role inherits.

**CPU and maximum memory usage**

MID Server supports Java 8 and Java 11 on any supported operating system. However, CPU monitoring is disabled by default on Windows with Java 11 because an outdated SIGAR library causes the MID Server to crash. If you decide to patch the SIGAR library, you can re-enable CPU monitoring. To re-enable CPU monitoring, set the MID Server parameter `mid.monitoring.force_sigar_cpu_monitoring` to True. See Add a MID Server parameter for instructions on how to set MID Server parameters.

This graph shows the average percentage of CPU usage on all the systems that host MID Servers in the last 30 days.
This graph shows the average percentage of maximum memory used by all the systems that host MID Servers in the last 30 days.
MID Server properties

Properties control the behavior of all MID Servers or a particular MID Server.
The MID Server properties are in the MID Server Property [ecc_agent_property] table and can be accessed by navigating to **MID Server > Properties**. To set these properties, you must add them, if they are not already present.

**MID Server properties**

**alias_filtering_behavior**

Sets the behavior of Discovery aliases. Behaviors define how strictly the system enforces the use of credential aliases in Discovery schedules.

The choices for behaviors are:

- **strict**: Aliases defined for the credential must match the aliases configured for the probe.
- **loose**: The probe's credential is used if it contains all the aliases specified in the schedule.

- Type: string
- Default value: loose

**com.glide.closure_max_rows_per_table**

Sets the maximum number of rows allowed in a table. This property is not visible by default and must be added.

- Type: integer
- Default value: 200000

**concurrent.dist.download**

Sets the number of concurrent MID Server auto-upgrades permitted by the instance. The default value of this property is 2, which allows the MID Server to use 2 of the 4 semaphores available on the instance for upgrading. If your instance has more than 4 INT semaphores, you can increase the value in this property to allow more concurrent upgrades.

- Type: integer
- Default value: 2

**glide.stored_proc.data_type.validation**
Stops validation of data types in stored procedure parameters. Use this property if you use Orchestration to run a stored procedure on MySQL, Oracle DB, and MS-SQL databases and you want to avoid performing data type validation. Restart the MID Server service after you change the value of this property.

- Type: true | false
- Default value: false

**max_ci_count_per_page**

Defines the maximum CI count per page

- Type: integer (bytes)
- Default value: 500

You can also configure this as a configuration parameter on a individual MID Server.

**mid.aws.sts.assume_role.disableCredentialCaching**

Set this property to true to prevent the caching of temporary AWS credentials for Cloud Discovery.

- Type: true | false
- Default: false

**mid.aws.sts.assume_role.credential_ttl_minutes**

Set the number of minutes you want to cache temporary AWS credentials for Cloud Discovery.

- Type: integer
- Default: 60

**mid.ca.certificate.api.request.retry.count**

Indicates how many times the Certificate Import query will retry after the rate limit has occurred.

- Type: integer
- Default: 3

**mid.ca.certificate.api.request.retry.interval**

Used to delay Certificate import from CAs when the rate limit has occurred.

- Type: integer
- Default: 30000

**mid.discovery.max_pattern_payload_size**

Defines the maximum overall payload size for the payload of results that come from patterns.

- Type: integer (bytes)
- Default value: 300000

You can also configure this as a configuration parameter on a individual MID Server.

**mid.discovery.max_payload_size**

Specifies the maximum string length of Discovery results that the MID Server sends to the instance. If the Discovery probe results exceed the limit, the MID Server discards them and returns a warning message.

For probes, this applies only to those probes where the Used by Discovery field is true. For patterns, this applies to the Horizontal Pattern probe.
Set the value to any negative number to disable the payload limit and allow payloads of any size to be sent to the instance. For example, -1.

- Type: integer (bytes)
- Default value: 5000000

You can also configure this as a **configuration parameter on a individual MID Server**.

**mid.discovery.multprobe.skip_others_on_error**

Prevents probes in a **multi-probe** from iterating through available credentials when another member probe has already failed or timed out. If this property is set to **false**, each probe in the multi-probe attempts to connect to the target with the same invalid credentials. This condition results in longer probe execution times on the MID Server. This property is not visible by default and must be added to the sys_properties table to change the value.

- Type: true | false
- Default value: true

**mid.eccq.max_payload_size**

Specifies the maximum string length of a payload that the MID Server sends to the instance. The MID Server verifies the size of the payload before sending it to the instance. If the payload size exceeds the limit, the MID Server discards it and returns an error message in the payload.

- Type: integer (bytes)
- Default value: 20000000

You can also configure this as a **configuration parameter on a individual MID Server**.

**mid.powershell.target_base_dir**

Specifies the location of the target base folder used for Discovery using WMI. If another network share is mounted on each Window's target, the folder may be changed by updating this property.

- Type: string
- Default value: admin$\temp

**mid.probe.collect_debug_info**

An optional property to collect debug information. If this property is set to true, the probe collects credential debug information when it runs and puts that information in the payload of ECC input message. It doesn't affect how Discovery works.

- Type: true | false
- Default value: false

**mid.probe.use_legacy_forward_dns**

Enables the legacy DNSNameResolver probe and disables the default DNSNameResolver probe. See **Probes used by Orchestration** for more information.

- Type: true | false
- Default value: false

**mid.probe.use_legacy_reverse_dns**

Enables the legacy DNS probe and disables the default DNS probe. If you experience problems with the features of the default DNS probe, use this property to disable those features. The default DNS probe's features include being lightweight and faster due to executing in parallel, while the legacy probe is throttled by the MID Server because
it executes in serial. The default probe utilizes DNS lookup by the MID Server host OS to make use of the OS maintained DNS cache, while the legacy probe does not. Consequently, after a DNS lookup by the default probe fails in Windows systems, the OS also tries looking up by NETBIOS name.

- Type: true | false
- Default value: false

**mid.process_flow.log_listener.max_size**

Sets the maximum size in bytes of memory available to save log messages for Flow Designer actions running on a MID Server. The MID Server stores up to the limit in memory and discards additional log messages, then sends the messages back to the instance along with the execution plan.

- Type: integer (bytes)
- Default value: 10485760

**mid.property.jdbc_operations**

Tells the JDBCOrchestrationProbe what JDBC operations it is allowed to execute. Edit this property value to allow JDBC Orchestration activities to perform more operations. All operations are comma separated. Select a MID Server in the MID server field to define specific operations for that MID Server, or leave the field empty to apply the list of operations to all MID Servers. This property requires the Orchestration plugin.

- Type: string
- Default value: select,update,insert,delete,show,create,describe,begin,if,end,not,exists

**mid.property.jms.command.allowed_factory_names**

Comma delimited list of Java Messaging Service (JMS) connection factories that the MID Server requires for a custom JMS activity or action. This property requires the Orchestration plugin.

- Type: string
- Default value: connectionFactory, queueConnectionFactory, topicConnectionFactory

**mid.property.ssh.use_snc**

Enables the use of the SNCSSH client for Discovery and Orchestration. Change this property to false to use J2SSH. This property applies to all MID Servers connected to the instance.

- Type: true | false
- Default value: true

**mid.sa.prefer_powershell**

Enables MID Server to use PowerShell Remoting.

- Type: True | False
- Default value: true

**mid.sa.ssh.use_sncssh**

Toggles SSH between non-interactive and interactive modes. True corresponds to non-interactive mode and allows probes to open sessions with the device without waiting for a prompt. False corresponds to interactive mode, which requires interactive sessions with the device for network devices and servers.

- Type: True | False
mid.security.validation.endpoints

Allows for a list of external endpoints to enforce strict verification security checks. The default value is *.servicenow.com, so all requests that initiate at the MID Server going to any ServiceNow domains and subdomains automatically go through validation checks. You can also enter a comma-separated list of other endpoints that you want to enforce with these same checks including direct URLs or * wildcard for example, samsung.aws.com or *aws.com. To turn this feature off, remove all listed values. If you deleted the property, contact Support to reimport it.

- Type: string
- Default value: *.servicenow.com

mid.servicewatch.max_concurrent_connections

Defines the maximum number of concurrent tasks sent to an individual host by a single MID Server.

- Type: integer
- Default value: 7

mid.shazzam.regulator.interval_ms

Sets the interval, in milliseconds, in which Shazzam can launch packets.

- Type: integer
- Default value: 1

mid.shazzam.regulator.packets_per_interval

Sets the number of packets that Shazzam can launch in the time interval specified by the mid.shazzam.regulator.interval_ms property.

- Type: integer
- Default value: 1

mid.shazzam.threads

Specifies the number of concurrent threads that Shazzam uses. Setting this or the mid.shazzam.max_scanners_per_thread parameter to 0 disables Shazzam multi-thread optimization.

- Type: Integer
- Default value: 5

mid.shazzam.max_scanners_per_thread

Specifies the number of concurrent scanners processed by each Shazzam thread. Setting this or the mid.shazzam.threads parameter to 0 disables Shazzam optimization.

- Type: Integer
- Default value: 100

mid.sm.discolog.max_log_size

Limits the length of the log statements in the Horizontal Discovery Log. If the results are truncated, the Command results reports, "Result is larger than [value] characters and was truncated by the logger."

- Type: integer (characters)
mid.sm.discolog.max_object_size

Limits the length of the object in the Horizontal Discovery Log. Objects in the log statement are truncated to the number of characters set by this property's value. This property only affects the object character size in the Horizontal Discovery Log. The following message appears if an object is limited by this property "The max object size reached the maximum limit of [value]. To adjust this use the mid property mid.sm.discolog.max_object_size."

- Type: integer (characters)
- Default value: 1000

mid.snmp.use_getbulk

Specifies whether to use GETBULK to receive a large amount of data in batches. This can be used to globally configure all MID servers.

- Type: true | false
- Default value: true

GETBULK can also be set at the probe level or for an individual MID Server. Settings are listed in the order of precedence:

- SNMP probe parameter
- MID Server configuration parameter
- MID Server properties

shazzam.chunk_size

Maximum number of IP addresses Shazzam can scan in parallel. This property primarily controls outbound port consumption.

- Type: integer
- Default value: 100

Create a MID Server property

Use a MID Server property to control either the behavior of all MID Servers or a particular MID Server.

Role required: admin

You set MID Server properties to override MID Server parameters. Configure MID Server properties in the MID Server plugin. Do not configure MID Server properties in the glide.properties file that is located in the properties folder of the agent. The glide.properties file gets overwritten during the upgrade process.

1. Navigate to MID Server > Properties.
2. Click New.
3. Fill in the fields, as appropriate (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the property name.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Value</td>
<td>You can enter the value you want the property to have.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If you are amending JDBC operations through the mid.property.jdbc_operations properties, you can enter verbs like BEGIN, END, IF, or common PL/SQL block statements. This will assist in being able to run CREATE or ALTER statements. You might have to restart the MID server before running some of the statements.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Leave this field blank to set a MID Server property that affects all MID Servers. To set a MID Server property for a particular MID Server, select the MID Server.</td>
</tr>
</tbody>
</table>

4. After setting any MID Server properties, restart the MID Server to ensure the properties sync with the instance.

**MID Server parameters**

Parameters control the behavior of a particular MID Server and have lower precedence than MID Server properties.

- Ensure that the MID Server can connect to elements inside and outside your network
- Download and install the MID Server on a Linux or Windows host
- Configure your MID Server
- Configure MID Server security
- Ensure that the MID Server can connect to elements inside and outside your network
- Download and install the MID Server on a Linux or Windows host
- Configure your MID Server
- Configure MID Server security

To add a parameter to a MID Server, see *Add a MID Server parameter.*

**Important:** Changes to parameters only take effect when the MID Server is started (or restarted).

**Note:** The value of any MID Server parameter in the config.xml file can be encrypted. See *Encrypt or decrypt MID Server configuration file values* for more information.
Required parameters

url
Specifies the URL to the associated instance. Normally the URL is similar to https://instance.service-now.com, where you replace instance with the instance name. If you host your own instance, use the URL set by your organization.
  • Type: string
  • Default value: none

mid_sys_id
Records the MID Server record's unique identifier. This parameter should be empty when you initially configure a MID Server. Do not change the value.
  • Type: string
  • Default value: automatically set (GUID)

name
Use this parameter to supply a name that is meaningful for you. If you do not supply this parameter, the MID Server uses the default value. A set of business rules synchronizes the name in the configuration file with the name in the MID Server record. The business rules ensure that changing the name in one location also changes the name in the other location.
  • Type: string
  • Default value: YOUR_MIDSERVER_NAME_GOES HERE

mid.instance.username or glide.glidesoap.username
If the ServiceNow instance has authentication enabled, as it is by default, set this parameter to define the user name the MID Server should use to log in to the instance. This user should have the mid_server role on the ServiceNow instance in order to access necessary tables and fields. You can use this parameter to define user names with special characters.
  • Type: string
  • Default value: none

mid.instance.password or glide.glidesoap.password
If your ServiceNow instance has authentication enabled, as it is by default, set this parameter to define the password the MID Server should use to log in to the instance. You can use this parameter to define passwords with special characters.
  • Type: string
  • Default value: none

CIM parameters

mid.cim.batch.size
Specifies the maximum number of messages sent at once to a CIM server.

Note: Using special characters in an XML configuration file requires you to encode them.
mid.cim.request.interval

Specifies the number of milliseconds to wait between requests to the same Common Information Model Object Manager (CIMOM).

- Type: integer
- Default value: 1

mid.cim.host.connection.limit

Specifies the maximum number of simultaneous connections to each CIMOM. A value of zero disables simultaneous connections.

- Type: integer
- Default value: 0

Connection parameters

glide.mid.fast.responses

Instructs the MID Server to try sending messages to the instance as soon as they are ready. Normally the MID Servers end messages to the ServiceNow instance serially (that is, one message at a time). Since many probes can be run in parallel, there can be multiple messages transmitted simultaneously to the instance. Setting this parameter to true may decrease the time between a probe's completion and its response arriving at the instance. However, the multiple simultaneous messages consume resources, decreasing the overall instance responsiveness. If there are communications problems, this parameter's value can also cause a logjam on the MID Server, as threads normally used for running probes may become consumed for sending messages. Generally, leave this parameter out of your configuration. Setting it to true is meaningful only under very special circumstances.

- Type: true | false
- Default value: false

glide.mid.max.sender.queue.size

Places an upper limit on how large the queue is allowed to get. The MID Server starts deleting queued messages if this limit is exceeded. When the MID Server generates messages to the ServiceNow instance faster than it can send them, it queues them temporarily on the file system of the MID Server's host. This queue is normally quite small, and is completely emptied as soon as the MID Server processing slows for a short period. However, this queue can grow in size when there are communication problems between the MID Server and the instance, and especially if there is an integration running on the MID Server.

The parameter is of the form {number}{multiplier}, where {number} is any positive decimal number including non-integers, and the optional multiplier is any spelling of bytes, kilobytes, megabytes, gigabytes, or terabytes (only the first character is tested, and the test is case-insensitive). The default multiplier is bytes. White space is liberally tolerated. The following strings all represent valid parameters: "1000000000", "0.5m", "5 GB", "7.67gigas", "145.69392 meg", and "1.1 terra".

- Type: string
- Default value: 0.5 GB

instance.date.format
Specifies the format the instance uses for dates and times. The primary impact of setting this parameter is to allow the MID Server to correctly refresh its start and stop times on the MID Server record in ServiceNow. The format of this date/time string is identical to that used by the Java SimpleDateFormat class.

- **Type:** string (Date format)
- **Default value:** yyyy-MM-dd HH:mm:ss

### mid.disable_amb

Disables the Asynchronous Message Bus (AMB) Client. When AMB is enabled, the MID Server uses a default polling interval of 40 seconds. When the AMB client is disabled, the default polling interval switches to 5 seconds. If you set a polling interval with the **mid.poll.time** parameter, the MID Server uses that value whether or not the AMB client is enabled.

- **Type:** true | false
- **Default value:** false

### mid.https.truststore.password

Sets the trustStore password that is required for HTTPS connections with the Asynchronous Message Bus (AMB) Client.

- **Type:** string
- **Default value:** none

### mid.https.truststore.path

Path to the trustStore to be used by the MID Server for TLS transactions (Asynchronous Message Bus (AMB) Client). Add this parameter only if you want to change the default path.

- **Type:** string
- **Default:** Path to the JRE trustStore bundled with the MID Server

### mid.instance.skip_basic_auth

Allows the MID Server to connect to an instance using cookies instead of basic authentication credentials. When set to **true**, it uses cookies first. However, if the connection fails, the MID Server will try to connect again using basic authentication credentials.

- **Type:** true | false
- **Default value:** true

### mid.jmx.enabled

Enables a JMX server on the MID Server, which exposes some management information to JMX consoles. Implementing JMX requires additional configuration of the Java runtime environment. Setting this parameter to **true** is only recommended for those with detailed knowledge of the Java security architecture and a specific need for JMX.

- **Type:** true | false
- **Default value:** false

### mid.poll.time

Sets the default MID Server polling interval (in seconds). The polling interval is the amount of time the MID Server waits before checking the ECC queue for work when the ECC queue is not busy. The MID Server polls the ECC queue using this interval if the AMB client connection is dropped.
Note: The default polling interval resets to 5 seconds when the AMB client is disabled. If you configure the `mid.poll.time` parameter, the MID Server uses this polling interval whether or not the AMB client is connected.

- Type: integer (seconds)
- Default value: 40

`threads.interactive.max`

Sets the maximum number of interactive worker threads that can run simultaneously in the interactive thread pool. See *Set MID Server Thread Use*.

- Type: integer
- Default value: 10

`threads.expedited.max`

Sets the maximum number of expedited worker threads that can run simultaneously in the expedited thread pool. See *Set MID Server Thread Use*.

- Type: integer
- Default value: 20

`threads.max`

Sets the maximum number of standard worker threads that can run simultaneously in the standard thread pool. This parameter provides direct control over what CPU resources the MID Server consumes on the computer that hosts it. See *Set MID Server Thread Use*.

- Type: integer
- Default value: 25

Important: You can set `threads.max` as high as 200, however, this setting may need to be changed depending on the OS. For example, Windows-based MID Servers running Discovery uses Powershell which is resource intensive. In this case, you may exhaust the CPU power of the host machine with just 50 threads count.

**Credentials parameters**

`mid.aws.instance_profile_name`

Name of the AWS IAM role configured on the EC2 instance. When configured, the MID Server uses the temporary credentials granted to this role by the AWS instance profile to Discover cloud resources.

- Type: string
- Default value: None (User must provide a non-blank value)

`mid.credentials.provider`

Specifies the Java class name of the credentials provider.

- Type: string
- Default value: com.service_now.mid.creds.standard.StandardCredentialsProvider
mid.secure_credentials.key_pairs.provider

Class that the MID Server uses to generate secure key pairs.

- Type: string
- Default value: com.service_now.mid.keypairs.provider.standard.StandardKeyPairsProvider

Debug parameters

debug.logging

[Deprecated] Specifies whether to enable logging of MID Server events and messages (both sent and received). Normally this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.

- Type: true | false
- Default value: false

This parameter has been replaced by the mid.log.level parameter.

debug

[Deprecated] Specifies whether to enable debug logging on the MID Server. Normally this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.

- Type: true | false
- Default value: false

This parameter has been replaced by the mid.log.level parameter.

file.probe.template.debug

Specifies whether to debug file probe templates.

- Type: true | false
- Default: false

mid.cim.debug

Specifies whether to enable debug logging for CIM, WBEM, SLP, or SMI-S.

- Type: true | false
- Default: false

mid.ssh.debug

Enables SSH debug information in the log file. The parameter usage depends on whether the ServiceNow SSH client is enabled.

When the ServiceNow SSH client is enabled, the parameter functions as follows:

- Type: string
- Default: false

The following string values are valid for the ServiceNow SSH client:

- true: Enables SSH debug information in the log file.
false: Disables SSH debug information in the log file.
• <IP Addresses>: Specify which IP ranges to enable SSH debug information in the log file. You can enter IP addresses in the following formats:
  • An IP range defined by a slash and the number of bits in the subnetwork. For example, the string 10.10.10.0/24 scans 24 bits of IP addresses from 10.10.10.0 to 10.10.10.254.
  • An IP range defined by a dash. For example, the string 10.10.11.0-10.10.11.165 scans the IP addresses from 10.10.11.0 to 10.10.11.165.
  • A comma-separated list of specific IP addresses. For example the string 10.10.11.200,10.10.11.235 scans the IP addresses 10.10.11.200 and 10.10.11.235.
• deferred: Logs SSH debug information in memory unless an error or warning occurs. If an error or warning occurs, the platform publishes the debug information to the log file. This ensures that only the part of the log file pertaining to the error or warning is recorded. If no error or warning is detected, the platform deletes the unused log data from memory when the session closes. Each session stores up to 1000 log messages. If the session exceeds 1000 log messages, the deferred log discards the oldest log message to make room for the newest log message.

When the ServiceNow SSH client is disabled, the parameter enables or disables SSH debug information in the log file:
• Type: true | false
• Default value: false

mid.log.level
Specifies the logging level for the MID Server. Possible values are:
• debug
• info
• warn
• error

Note: Values are case insensitive.

• Type: string
• Default value: info

mid.http.idle_connection_monitor.debug
Enables debug logging for the Idle Connection Monitor.
• Type: true | false
• Default value: false

DNS parameters

mid.dns_scan.regulator.interval_ms
Specifies the interval between DNS scans in milliseconds.
• Type: integer
• Default value: 10
mid.dns_scan.regulator.packets_per_interval
Specifies the number of regulator packets per DNS scan.
  • Type: integer
  • Default value: 1

mid.dns_scan.default_name_servers
Specifies the host names or IP addresses of the default name servers.
  • Type: string
  • Default value: none

mid.dns_scan.default_name_servers
Specifies the host names or IP addresses of the default name servers.
  • Type: string
  • Default value: none

mid.dns_scan.additional_name_servers
Specifies the host names or IP addresses of any additional name servers.
  • Type: string
  • Default value: none

mid.dns_scan.load_balancing_enable
Specifies whether to enable load balancing of name servers.
  • Type: true | false
  • Default value: false

mid.probe.use_legacy_forward_dns
Enables the legacy DNSNameResolver probe and disables the default DNSNameResolver probe. See Probes used by Orchestration for more information.
  • Type: true | false
  • Default value: false

mid.probe.use_legacy_reverse_dns
Enables the legacy DNS probe and disables the default DNS probe. If you experience problems with the features of the default DNS probe, use this parameter to disable those features. The default DNS probe's features include being lightweight and faster due to executing in parallel, while the legacy probe is throttled by the MID Server because it executes in serial. The default probe utilizes DNS lookup by the MID Server host OS to make use of the OS maintained DNS cache, while the legacy probe does not. Consequently, after a DNS lookup by the default probe fails in Windows systems, the OS also tries looking up by NETBIOS name.
  • Type: true | false
  • Default value: false
### Event Management parameters

**mid.probe.event.bulk_size**

Specifies the maximum size of an event payload, in MB.
- Type: integer
- Default value: 120

**mid.probe.event.wait_time**

Waiting period on an empty queue for sending events.
- Type: integer
- Default value: 1000

**mid.probe.event.send.enabled**

Enables or disables the sending of events.
- Type: true | false
- Default value: true

**mid.probe.event.queue.max_size**

Specifies the maximum size permitted for the event queue before incoming events are rejected.
- Type: integer
- Default value: 100,000

**mid.probe.event.queue.use_bulk**

Specifies whether events are sent to the server singly or in bulk. If this parameter evaluates to true then events are sent to the server in bulk.
- Type: true | false
- Default value: true

**mid.probe.event.suppress.whitespaces**

 Allows line breaks in description fields for multi-line events. Apply this parameter to each MID Server used with event connector instances. Choices are:

- **all**
  - This setting removes all whitespaces.

- **leave_as_is**
  - This setting keeps all whitespaces.

- **keep_newline**
  - This setting keeps only new_line and removes all other whitespaces.

- Type: string
- Default: all

**mid.em.metric.metric_to_ci_map_limit**
Specifies the maximum number of active metrics allowed per CI map.

- Type: integer
- Default value: 200,000

**mid.em.metric_binding_timeout_seconds**

Specifies the number of seconds to wait before resending unhandled events

- Type: integer
- Default value: 300

**mid.em.metric_binding_timeout_max_seconds**

Specifies the maximum number of seconds to wait before resending unhandled events.

- Type: integer
- Default value: 10800

**mid.em.metric_max_elapsed_time_before_refresh**

Specifies the maximum number of seconds before the metric source type cache is refreshed in memory.

- Type: integer
- Default value: 60

**mid.em.metric_max_sql_string_length_for_types**

Specifies the maximum length of the string (composed of types) used for an SQL command

- Type: integer
- Default value: 30000

**mid.em.statistics_report_period_sec**

Specifies the period, in seconds, between statistics reports to the instance. Use 0 to disable reporting. This parameter requires a restart.

- Type: integer
- Default value: 60

**mid.em.metric_connector_max_run_time_seconds**

Specifies the maximum number of seconds to collect metrics in every cycle.

- Type: integer
- Default value: 300

**mid.em.metric_connector_history_min**

Specifies the number of minutes to go back in history to retrieve metrics.

- Type: integer
- Default value: 180

**mid.em.metric_event_logging**

Specifies the level of metric and event logging. Choices are:

- none
- all
- events
- metrics
- metrics:<filter>
- events:<filter>

- Type: string
- Default value: none

mid.em.metric_connector_late_arrivals_delay
Specifies the number of seconds to delay when collecting metrics.
- Type: integer
- Default value: 30

FTP connection parameters

mid.ftp.max_pool_size
Specifies the maximum size of the FTP Connection Pool, in megabytes.
- Type: integer
- Default value: 25

mid.ftp.max_per_target
Specifies the maximum number of the FTP connections per target.
- Type: integer
- Default value: 5

mid.ftp.max_conn_idle_time
Specifies the maximum amount of time, in milliseconds, that an FTP connection can sit idle in the pool.
- Type: integer
- Default value: 300000

mid.filesystem.max.ls
Specifies the maximum number of files that can be returned in the filesystem list directory command.
- Type: integer
- Default value: 10000

Logging parameters

disable_monitors
Specifies whether to disable the MID Server from actively checking for monitors on the instance.
- Type: true | false
ServiceNow Orlando Now Platform capabilities

- Default value: true

**mid.show.queries**

Instructs the MID Server whether to log details about every query it makes to the ServiceNow instance. Typically this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to *true* causes intensive logging on the MID Server, potentially using considerable disk space.

- Type: true | false
- Default value: false

**disable.remote.logging**

Prevents the MID Server from logging any information to the MID Server log on the instance. Relatively little information is logged on the instance in any case, but setting this parameter to *true* eliminates all logging to the instance.

- Type: true | false
- Default value: false

**disable.status**

Prevents the MID Server from sending a status report to the instance every 10 minutes.

- Type: true | false
- Default value: false

**Pattern parameters**

**mid.parsing.max_field_size**

Sets the maximum character length of strings stored as temporary variables while patterns are run. Strings longer than this parameter's value are truncated to equal the value. Use the parameter to increase the limit when parsing longer strings.

⚠️ Warning: Exceeding the max field size limits of the SQL database implementation cause errors.

- Type: integer
- Default value: 1024

**mid.sa.discovery.pattern_string_attributes.deduplicate**

Reduces memory consumption for pattern execution context attributes by eliminating duplicate strings.

- Type: true | false
- Default: true

**Proxy server parameters**

**mid.instance.use_proxy or mid.proxy.use_proxy**
If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to `true` to instruct the MID Server to use the proxy. You must also set the proxy server's host and port, and perhaps the user name and password as well.

- **mid.proxy.host**
  If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to define the proxy's host.
  - Type: string
  - Default value: none

- **mid.proxy.password**
  If your MID Server must go through a web proxy to access the ServiceNow instance, and your proxy requires a password, set this parameter to define that password.
  - Type: string
  - Default value: none

- **mid.proxy.port**
  If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to define the proxy's port.
  - Type: integer (0-65535)
  - Default value: 80

- **mid.proxy.username**
  If the MID Server must go through a web proxy to access the ServiceNow instance, and the proxy requires a user name, set this parameter to define that user name.
  - Type: string
  - Default value: none

**Request timeout override parameters**

- **mid.sa.cloud.request_timeout**
  Sets the timeout in milliseconds for cloud requests. This parameter overrides the `glide.http.timeout` system property, which specifies the maximum number of milliseconds to wait before an outbound REST transaction times out.
  - Type: integer
  - Default value: 30000

- **mid.http_classy.request_timeout**
  Sets the timeout in milliseconds for HTTP classification requests with the HTTP - Classify probe. This parameter overrides the `glide.http.timeout` system property, which specifies the maximum number of milliseconds to wait before an outbound transaction times out.
  - Type: integer
• Default value: 30000

Security parameters

**mid.windows_host.file_permissions.allow_list**

Sets a white list for Windows file permissions enforcement to improve security. The parameter takes a string of comma separated group names, user names, and SIDs. Group and user names must follow SAM account naming requirements. Domain accounts can be specified by using the SID.

- Type: string (comma separated group and user names)
- Default value: None

**mid.windows_host.file_permissions.enforce**

Enables the MID Server to use Windows file permissions enforcement to improve security. Setting this parameter to `false` will prevent the MID Server from updating the file permissions white list, but will not revert the file permissions.

- Type: true | false
- Default value: true

Shazzam parameters

**mid.shazzam.regulator.interval_ms**

Sets the interval, in milliseconds, in which Shazzam can launch packets. This parameter works with the **mid.shazzam.regulator.packets_per_interval** parameter to set the number of packets allowed in this interval. By default, Shazzam launches one packet each millisecond.

- Type: integer
- Default value: 1

**mid.shazzam.regulator.packets_per_interval**

Sets the number of packets that Shazzam can launch in the configured time interval. This parameter works with the **mid.shazzam.regulator.interval_ms** parameter, which sets that interval. By default, Shazzam launches one packet each millisecond.

- Type: integer
- Default value: 1

**mid.shazzam.chunk_size**

Specifies the maximum number of IP addresses that Shazzam scans in parallel. This parameter primarily controls outbound port consumption.

- Type: integer
- Default value: 100

**mid.shazzam.threads**

Specifies the number of concurrent threads that Shazzam uses. Setting this or the **mid.shazzam.max_scanners_per_thread** parameter to 0 disables Shazzam multi-thread optimization.
mid.shazzam.max_scanners_per_thread
Specifies the number of concurrent scanners processed by each Shazzam thread. Setting this or the mid.shazzam.threads parameter to 0 disables Shazzam multi-thread optimization.

- Type: integer
- Default value: 5

SNMP configuration parameters

mid.snmp.enable_auto_public
 Specifies whether to use the SNMP public community string automatically if no other SNMP credentials were successful.

- Type: true | false
- Default value: true

mid.snmp.request.timeout
 Specifies the timeout value for the first OID request, in milliseconds. For subsequent requests (for example, table OIDs), the mid.snmp.session.timeout configuration parameter (see below) takes effect.

Note: You can override this parameter with the timeout SNMP probe parameter.

- Type: integer
- Default value: 1500

mid.snmp.session.timeout
 Specifies the timeout value for subsequent OID request, in milliseconds. SNMP communication is stateless and does not have a session or connection in the normal sense. The system regards a positive response from the first OID request as a sign that it should expect prompt responses to subsequent requests. While the default is short, it may be useful to increase this parameter value to the same value as that used for mid.snmp.request.timeout.

Note: You can override this parameter with the establish_session_timeout SNMP probe parameter.

- Type: integer
- Default value: 500

mid.snmp.use_getbulk
 Specifies whether to use GETBULK to receive a large amount of data in batches. This can be used to configure an individual MID Server.

- Type: true | false
- Default value: True

GETBULK can also be set at the probe level or globally for all MID servers. Settings are listed in the order of precedence:

- SNP probe parameter
- MID Server configuration parameter
- MID Server properties

**mid.snmp.use_snmp4j**

Use the Snmp4j library for SNMP communication. This is a strict requirement for SNMPv3. This parameter should only be set to `false` based on advice from ServiceNow Technical Support.

- Type: true | false
- Default value: true

**mid.snmp.use_snmp_v1_v2c**

Use the Snmp4j library for SNMP communication. This is a strict requirement for SNMPv3. This parameter should only be set to `false` based on advice from ServiceNow Technical Support.

- Type: true | false
- Default value: true

**mid.snmp.use_snmp_v3**

Attempt communication using the SNMPv3 protocol version. Requires configuration of SNMPv3 credentials.

- Type: true | false
- Default value: true

**SSH Discovery parameters**

By default, the MID Server is configured to search for SSH commands in the following paths and the logged-on user's default paths:

- /usr/sbin
- /usr/bin
- /bin
- /sbin

**mid.connection_cache**

Specifies whether to cache connections. Set to `false` to disable connection caching. This parameter applies to SSH connections only.

- Type: true | false
- Default value: true

**mid.ssh.set_path**

Specifies whether to set the PATH environment variable for SSH commands.

- Type: true | false
- Default value: true

**mid.ssh.local**

Specifies whether to execute commands for the MID Server host machine (localhost) via SSH rather than from a console. This allows long-running commands to execute properly. This parameter applies to the legacy SSH client only.
mid.ssh_connections_per_host
Controls the number of concurrent probes the MID Server can run against a given host. Lowering the number of concurrent connections can slow Discovery.

- Type: integer
- Default value:
  - 7 for the ServiceNow client
  - 3 for the legacy SSH client

mid.ssh.sudo_preserve_environment
Specifies whether to use sudo to preserve the environment for SSH.

- Type: true | false
- Default value: false

mid.ssh.path_override
Overides the default paths set before executing a command. Enter one or more override paths delimited by a colon (:) The default path is /usr/sbin: /usr/bin: /bin: /sbin.

The ServiceNow SSH client accepts the following prefixes in front of the path_override value.

- append: Appends the override path to the end of the host’s path. This is the default behavior.
- replace: Replaces the host path with the path_override value.
- prepend: Appends the override path to the front of the host path.

- Type: string (a colon-separated list of directories)
- Default value: None

mid.ssh.use_snc
Enables the ServiceNow SSH client (SNCSSH) on individual MID Servers. SNCSSH is a ServiceNow implementation of an SSH client and is active by default for all MID Servers on new instances, via a MID Server property. Enabling the ServiceNow SSH client disables the legacy J2SSH client.

**Important:** Mixing SSH client types for MID Servers connected to the same instance is not a good practice.

- Type: true | false
- Default value: false

mid.ssh.max_retries
Specifies the maximum amount of times to retry an SSH operation after a time-out. The system sleeps two seconds between each connection attempt. By default, the MID Server retries once only. Set the parameter to 0 to disable retries.

- Type: integer
- Default value: 1

mid.ssh.alt_rm
Sets a different SSH remove file command.

- Type: string
- Default value: none

**mid.ssh.initial_delay_ms**

Delays sending any SSH probe commands to a server after connecting to the target for the time specified, in milliseconds. This parameter applies to the legacy SSH client only.

- Type: integer (milliseconds)
- Default value: 0

**mid.ssh.suppress_history**

Suppresses the generation of the SSH history file. This parameter applies to the legacy SSH client only.

- Type: true | false
- Default value: false

**mid.ssh.socket_timeout**

Specifies the timeout value for the SSH socket to prevent issues created by a socket timeout. Some devices, such as systems with embedded controllers like UPSs and PDUs, that have SSH enabled require more time to respond to an authentication request. The default value of 2 minutes ensures such requests do not timeout prematurely.

- Type: integer (milliseconds)
- Default value: 120000 (2 minutes)

**mid.ssh.channel_timeout**

Specifies the amount of time that the MID Server waits for activity on the SSH socket before closing the connection. If there has been no activity on the SSH socket for the specified timeout value, the MID Server closes the connection. Some devices, such as systems with embedded controllers like UPSs and PDUs, that have SSH enabled may require more time to respond to an authentication request.

- Type: integer (milliseconds)
- Default value: 120000 (2 minutes)

**mid.ssh.session_timeout**

Specifies the amount of time that a cached session remains in memory after last use. Excessively small values tend to decrease performance. This parameter applies to the ServiceNow SSH client only.

- Type: integer (milliseconds)
- Default value: 300000 (5 minutes)

**mid.ssh.command_timeout_ms**

The timeout duration, in milliseconds, for the execution of an SSH command.

- Type: integer (milliseconds)
- Default value: 300000 (5 minutes)

**mid.ssh.use_keyboard_interactive**

Uses the keyboard interactive authentication mode in SSH daemons on which it is activated.

- Type: true | false
Caution: An issue exists in Mac OS X Sierra and later with the authentication order of the password and keyboard-interactive modes that can cause Discovery to fail. For details about this issue and the configuration required for proper SSH authentication, see KB0623600.

**mid.ssh.dh_group_length_min**

Specifies the minimum group length in bits used for generating a "shared secret" key in Diffie-Hillman key exchange. The larger the key the more secure the SSH connection is but at the cost of performance.

- Type: integer (bits)
- Default value: 1024

**mid.ssh.dh_group_length_max**

Specifies the maximum group length in bits used for generating a "shared secret" key in Diffie-Hillman key exchange. The larger the key the more secure the SSH connection is but at the cost of performance.

- Type: integer (bits)
- Default value: 2048

**mid.ssh.shells_supported**

Defines the bourne-compatible shells supported by the MID Server. This value is a comma-separated list of supported shells, such as ksh, dsh, bash and sh.

- Type: string
- Default value: ksh,bash,sh

**mid.ssh.discard_lrc_error**

Discard long running command error output, emulating legacy behavior.

- Type: string
- Default value: j2ssh - true, snccssh - false

**mid.ssh.pool_thread_ratio**

Ratio of the SSH session pool capacity to the configured MID Server thread number (threads.max), expressed as a percentage. The number of permitted pool capacity sessions is set in this parameter. Regardless of the value set in this parameter, the system never permits the pool capacity to fall below 25 sessions.

- Type: integer
- Default value: 150

**mid.ssh.disable_privilege_check**

This parameter has no effect if the target is using a privileged command other than sudo. For more information, see *MID Server privileged commands*.

The remainder of this section only applies to targets which run sudo. When this parameter is set to true, the MID Server assumes that the user configured in the credential has the privilege to run the given command using sudo. The MID Server assumes the target user can run any command string following sudo on the target. When this parameter is set to false, the MID Server runs "sudo -l" on the target to verify the command which follows sudo has permission to run on the target. Regardless of this parameter's value, the MID Server always validates that sudo by itself can be run on the target.
Some releases do not show this parameter in the MID Configuration Parameters pull down list. In this case, you may optionally add this parameter in MID Properties.

- Type: true | false
- Default value: false

### Upgrade parameters

#### mid.pinned.version

Name of the version to which this MID Server is pinned.

- Type: string
- Default value: MID buildstamp

**Note:** To see the MID buildstamp for your instance, type `stats.do` in the navigation filter. An example of the buildstamp format is `london-06-27-2018__patch3-10-24-2018_11-11-2018_0542`.

#### mid.upgrade.use_proxy

If your MID Server must go through a web proxy to access the upgrade URL, set this parameter to `true` to instruct the MID Server to use the proxy. You must also set the proxy server’s host and port. If the instance proxy user name and password are set, they are used for the upgrade proxy as well.

- Type: true | false
- Default value: false

#### glide.mid.autoupgrade.proxy_host or glide.glidesoap.proxy_host

If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's host here.

- Type: string (URL)
- Default value: none

#### glide.mid.autoupgrade.proxy_port or glide.glidesoap.proxy_port

If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's port here.

- Type: integer (0-65535)
- Default value: 80

#### glide.mid.autoupgrade.proxy_user

If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's user name here.

- Type: string (URL)
- Default value: none

#### glide.mid.autoupgrade.proxy_password

If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's password here.

- Type: string
- Default value: none
Windows Discovery parameters

**mid.monitoring.force_sigar_cpu_monitoring**

Enables CPU monitoring on Windows MID Server hosts using Java 11. An outdated SIGAR library causes the MID Server to crash. If you patch the SIGAR library, set this value to `true` to enable CPU Monitoring for Windows with Java 11.

- Type: true | false
- Default value: false

**mid.powershell_api.session_pool.max_size**

Specifies the maximum number of sessions allowed in the session pool.

Note: Setting or changing this parameter requires restarting the MID Server.

- Type: integer
- Default value: 25

**mid.powershell_api.session_pool.target.max_size**

Specifies the maximum number of sessions allowed in the pool per target host.

Note: Setting or changing this parameter requires restarting the MID Server.

- Type: integer
- Default value: 2

**mid.sa.prefer_powershell**

Enables MID Server to use PowerShell Remoting.

- Type: true | false
- Default value: false

**mid.powershell_api.winrm.use_ssl**

Requires the use of SSL certificates for HTTPS connections using WinRM.

- Type: true | false
- Default value: false

**mid.powershell_api.winrm.additional_pssession_options**

Controls advanced options for a PSSession. For more information about advanced PSSession options, see https://docs.microsoft.com/en-us/powershell/module/microsoft.powershell.core/new-pssessionoption?view=powershell-6.

**mid.powershell_api.winrm.remote_https_port**

Configures the port for connecting to Windows servers using PowerShell over HTTPS.

- Type: integer
- Default value: 5986

**mid.powershell_api.winrm.remote_port**
Configures the port for connecting to Windows servers using PowerShell over HTTP.

- Type: integer
- Default value: 5985

**mid.powershell_api.winrm.skip_ssl_cert_check**

Skips the SSL certificate check when using WinRM for HTTPS connections.

- Type: true | false
- Default value: false

**mid.powershell_api.winrm.skip_ssl_cert_check_options**

Skips specific SSL certificate checks when using WinRM for HTTPS connections. Configure the MID Server to skip checks for certificates from a Certification Authority (CA), from the Common Name (CN) that identifies the host associated with the certificate, and for revoked certificates.

- Type: string
- Default value: -SkipCACheck -SkipCNCheck -SkipRevocationCheck

**mid.powershell.use_credentials**

Determines the credentials to use for Discovery with PowerShell. A setting of true directs the MID Server to run probes with the Windows credentials from the credentials table. To run probes with the credentials of the user for the MID Server service, set this parameter to false.

- Type: true | false
- Default value: true

**mid.powershell.path**

Enables an administrator to point to a specific PowerShell on a MID Server in cases where more than one PowerShell is installed. Supply the path to the folder containing the PowerShell executable, for example, C:\mypowershell or C:\mypowershell\. ServiceNow automatically appends the string powershell.exe to the path. Configure this parameter when both a 32-bit and 64-bit PowerShells are active on the same MID Server, and it becomes necessary to launch the correct PowerShell for the context. 64-bit Windows employs file system redirection and the MID Server runs as a 32-bit application. If trying to specify a path in %WinDir%\System32, Windows automatically redirects to %WinDir%\SysWOW64. To avoid redirection, specify the path as %WinDir%\Sysnative. For example, instead of C:\WINDOWS\system32\WindowsPowerShell\v1.0, specify C:\WINDOWS\sysnative\WindowsPowerShell\v1.0.

**Note:** On a 64-bit version of Windows XP, a Microsoft hotfix may be required to enable this.

To discover applications running on a 64-bit Windows machine, the MID Server must be running on a 64-bit Windows host machine.

- Type: string (path)
- Default value: none

**mid.powershell.enforce_utf8**

Enable this parameter to force commands on a target Windows system to return UTF-8 encoded output. Disabling it allows the target system to use its default encoding. This parameter is only valid when PowerShell is enabled.

Setting this value to false may result in incorrect values in the CMDB when non-ASCII characters are returned by a probe.

- Type: true | false
• Default value: true

**mid.powershell.local_mid_service_credential_fallback**

Enables automatically falling back to MID Server service credentials if all other credentials fail.

• Type: true | false
• Default value: true

**mid.powershell_api.idle_session_timeout**

Specifies the timeout value of idle PowerShell sessions in seconds.

*Note:* Setting or changing this parameter requires restarting the MID Server.

• Type: integer
• Default value: 60

**mid.powershell.command.parameter_passing**

Enable this parameter to allow passing PowerShell parameters from the command line.

• Type: true | false
• Default value: false

**mid.powershell.command.script.parameter_passing**

Enable this parameter to allow passing PowerShell scripts from the command line.

• Type: true | false
• Default value: true

**mid.windows.management_protocol**

Enables administrators to select the Windows management protocol used for device and process classification. Options include: WMI and WinRM.

• Type: string
• Default value: WMI

**mid.windows.probe_timeout**

Sets the timeout interval for all Windows probes on a specific MID Server. This value is overridden by the values configured for individual probes with the wmi_timeout probe parameter.

• Type: integer
• Default value: 300

**mid.powershell.jea.append_username**

Specifies whether user name of the current user will be appended to the JEA endpoint.

• Type: true | false
• Default value: False

**mid.powershell.jea.endpoint**
JEA configuration name (endpoint) on remote servers that the MID Server will connect to. Set to JEA_DISCO_BASIC.

- Type: string
- Default value: ""

Add a MID Server parameter

Use a MID Server parameter to control the behavior of a particular MID Server.

Role required: admin

1. Navigate to **MID Server > Servers**.
2. From the list of MID Servers, select a MID Server to configure.
3. Select the **Configuration Parameters** related list.

This shows all the parameters currently in the MID Server's configuration file. If there are any passwords, they are displayed in asterisks for security reasons. See **MID Server parameters** for a list of available parameters.
Defining MID Server configuration parameters

4. To add parameters, click **New**, and then complete the form.

   After the form is submitted, the configuration file for that MID Server is modified to include the new parameter. Changes to existing parameters are reflected in the MID Server configuration file as well. Changes made to the MID Server configuration file do not take place immediately, but rather the next time the MID Server is restarted. The MID Server form has a related link for restarting the MID Server.

   **Note:** ServiceNow prevents you from saving changes, such as modifying or deleting parameters, that would cause the MID Server to lose communications with the instance. For example, you cannot
change the url parameter. Any changes to these protected parameters must be made directly in the config.xml file for that MID Server.

5. (Optional) Set parameters in the config.xml file.

MID Server configuration is controlled by an XML file called config.xml. This file is located in the /agent directory, in the MID Server installation directory. You can edit this file directly to make any configuration changes to protected parameters. Many configuration changes, such as those that do not disrupt communication between the MID Server and the ServiceNow instance, may also be made from the instance.

The structure of the config.xml file is simply an outer parameters tag and a series of inner parameter tags. Each parameter tag has name and value attributes.

- To change the value of a parameter, edit the value attribute.
- To add a parameter, add another parameter tag with its name and value.
- To delete a parameter, delete the entire parameter tag.

The order of the parameters within the file is not important. Notice the green comment sections in the sample. Use these elements to add useful comments to the configuration file.

Note: When configuring the MID Server for use with a proxy server, be sure to remove the comment tags around the proxy sections that you configure.
MID Server config.xml file

Note: The sample file here is from a Firefox browser. Conventional text editors, such as Notepad, WordPad, or TextEdit, do not display colors and variable fonts.

MID Server protected records and reserved characters

Some MID Server records cannot be altered. Certain special characters are pre-defined in XML and cannot be used in passwords.
MID Server Records that cannot be altered

These records cannot be modified or deleted.

Using special characters in an XML file

The XML specification defines five predefined entities that represent special characters, and requires that all XML processors honor them. If these characters are used in a password, you will experience unexpected results.

The following characters represent the five pre-defined entities:

- "
- &
- '
- <
- >

If you use the pre-defined entity characters in an XML file, such as the MID Server configuration file, you need to encode them. To encode pre-defined entities into an XML document:

- replace " with &quot;
- replace & with &amp;
• replace ' with &apos;
• replace < with &lt;
• replace > with &gt;

For example, to specify the password as test& in the MID Server config.xml file:

```xml
<parameter encrypt="true" name="mid.instance.password" value="test&;"/>
```

### MID Server privileged commands

To discover certain information on a host server, the MID Server must run SSH commands with higher privileges. The platform provides default privileged commands for the MID Server to use and the ability to add additional commands to the system.

An example of information that requires elevated privileges is information about storage disks on a host server, retrieved with the `fdisk -l` command. If your system cannot use sudo commands, you must configure the hosts in your network to use one of the other privileged commands. You can configure different privileged commands for different hosts. However, Discovery supports only one privileged command per host.

**Important:** You can edit supported privileged commands, but do not delete them.

For a list of possible SSH commands requiring root privileges, see [SSH credentials](#).

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **sudo**   | Host must support the `sudo -S -p <password>` command and return the correct list of allowed SSH commands. Credentials provided for Discovery must be able to run the command `sudo -S -p <password> <commands>`.

## Command Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| pbrun   | • Host must support the `pbrun -v` command and return the correct version of PowerBroker.  
• Credentials provided for Discovery must be able to run `pbrun <commands>`.  
• Discovery does not support any other `pbrun -` options, such as a password prompt.  
• The instance must be able to reach the target host via SSH. |
| pfexec  | • Host must support the `pfexec id -a` command and return the correct ID.  
• Credentials provided for Discovery must be able to run `pfexec <commands>`.  
• Discovery does not support any other `pfexec -` options, such as a password prompt. |
| dzdo    | • Host must support the command `dzdo -v` command and return the path to dzdo in standard output.  
• Credentials provided for Discovery must be able to run `dzdo <commands>`.  
• Discovery does not support any other `dzdo -` options, but Discovery supports password authentication for dzdo. |

## Long-running commands with sudo

Configure J2SSH and ServiceNow SSH to prevent long running commands using sudo from failing when the MID Server disconnects.

ServiceNow SSH allows probes to run sudo against individual commands or an entire, long-running script. This is also supported for the `pbrun` and `pfexec` privileged commands.

### Sudo for individual commands

You can run sudo against individual commands within a probe, but only if all the following sudoer configurations are performed on the target:

- **The `!requiretty` option is required.**
- **Allow individual commands to be run by the user in the provided credential with `NOPASSWD` configured.**
- **The target specifies an individual sudo call in the command or referenced scripts.** For example, set sudo as "sudo fdisk -I" or "${sudo:fdisk -I}" rather than "must_sudo" for the entire script.

### Note:

Running sudo against individual commands with ServiceNow SSH produces detailed and useful entries in the sudo logs on the target computer.
Running sudo on an entire script

If any of the required sudoer configuration requirements for individual commands is not in place, Discovery applies sudo to the initial and complete probes, and does not execute sudo remotely inside the command. This condition can be forced by setting `must_sudo` on the probe and eliminating any sudo commands within the probe.

This approach prevents long running commands from failing when the probe disconnects, but cannot specify individual commands in the sudoers configuration.

Logging

The logs from ServiceNow SSH sudo activity run against an entire script show cryptic entries, such as `/tmp/.run.aef13123fe124123`, which prevent administrators from controlling permissible commands and knowing the exact command that was run. Sudo run against individual commands produces more detailed log entries, such as `/sbin/fdisk –l`.

Add a new privileged command for use by the MID Server

Add a new privileged command to the Privileged Command `[privileged_command]` table that is available to your MID Servers.

Role required: admin

**Important**: Do not delete any of the supported commands.

1. Navigate to MID Server > Privileged Command and click New.
2. Complete these fields:
   - **Command**: The name of the privileged command.
   - **Password Prompt**: The password prompt displayed to the user for this privileged command, or a regular expression that matches this password prompt. If this field is empty, no password is required for this privileged command, and no prompt is displayed. SUDO commands do not require a password prompt.
3. Click Submit.

Configure the MID Server to use specific privileged commands

You can configure the MID Server to use specific commands in a defined order.

Role required: admin

1. Navigate to the list of MID Servers using one of the following paths:
   - MID Server > Servers
   - Discovery > MID Servers
   - Orchestration > MID Servers
2. Select the MID Server you want to configure.
3. Click the menu icon in the header bar and select View > Advanced from the context menu.
4. In the **Privileged Command** related list, click **Edit**.

5. Select the command you want this MID Server to use and click **Save**.

The default order of privileged commands is 100, but you can change the order as necessary. The privileged command with the smallest order number is tried first.
Create a pbrun profile privileged command

You can create a special configuration for the `pbrun` privileged command that allows it to run as a profile.

Role required: discovery_admin, admin

Of all the privileged commands, only the `pbrun` command can be configured to run as a profile, and only one of these special `pbrun` configurations can function on a MID Server.

**Important:** Edit the existing `pbrun` record for this purpose. The system ignores any additional commands you create for `pbrun`.

1. Navigate to MID Server > Privileged Command.
2. Select `pbrun` from the list.
3. In the Privileged Command record, edit the value in the Command field to use the format `pbrun -u <profile>`.
   
   For example, you can set `pbrun -u admin` as a command to run with an admin profile.
4. Click Update.

Return to Configuring MID Servers.

MIDSystem methods

MIDSystem variables (referred to by the variable name `ms.`) provide a variety of methods to get information about the MID Server.
Ensure that the MID Server can connect to elements inside and outside your network
Download and install the MID Server on a Linux or Windows host
Configure your MID Server
Configure MID Server security

<table>
<thead>
<tr>
<th>Method summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log(String message)</td>
<td>Logs the given message with a standard prefix to indicate that the message was generated by JavaScript.</td>
</tr>
<tr>
<td>getConfigParameter(String parameter name)</td>
<td>Returns the value of the named configuration parameter.</td>
</tr>
<tr>
<td>include(String script include)</td>
<td>Include the MID Server script include with the given name into the current context.</td>
</tr>
<tr>
<td>getName()</td>
<td>Returns the name of the MID Server.</td>
</tr>
<tr>
<td>getSysID()</td>
<td>Returns the sys_id of the MID Server.</td>
</tr>
<tr>
<td>toJavaScript(Object)</td>
<td>Converts the given Java object into the equivalent JavaScript object.</td>
</tr>
</tbody>
</table>

This example writes a message to the log:

```javascript
ms.log('Attempting to log in with user: ' +
   this.getParameter('user'));
```

**MID Server heartbeat**

The instance checks the MID Server for a response every 5 minutes, using a synthetic transaction monitoring system.
Checking for a heartbeat

ServiceNow instances send a synthetic transaction via the Heartbeat probe to every MID Server every 5 minutes. The Heartbeat probe functions exactly as a normal probe does and is sent by writing an output record to the ECC queue. A MID Server retrieves the record when it queries the ECC queue for work. The MID Server processes the probe just as it would any other probe and responds back to the instance. If the instance does not detect a response from a MID Server, the instance marks that MID Server as Down. If the MID Server responds, the instance considers the MID Server to be functioning and communicating properly with the instance.

Note: Make sure that your MID Server can communicate on port 443. See Configure MID Server network connectivity and MID Server system requirements for more information.

System events

When a MID Server transitions from one state to another, one of these events is triggered:

- **mid_server.up**: The MID Server goes from a status of Down, Paused, or Upgrading to a status of Up.
- **mid_server.down**: The MID Server goes from a status of Up to a status of Down.
- **mid_server.paused**: The MID Server is paused.
- **mid_server.upgrading**: The MID Server is being automatically upgraded because the instance is being upgraded.

You can use these events to send notifications or trigger actions that you specify in scripts.

Scheduled job

To change the trigger interval for the Heartbeat probe, navigate to System Scheduler > Scheduled Jobs > Scheduled Jobs. Open the MID Server Monitor record and edit the interval.
MID Server heartbeat trigger interval

Set the MID Server JVM memory size

The MID Server starts with a default JVM memory allocation, but you can modify this setting in the configuration file.

Role required: admin
In the base ServiceNow system, the MID Server JVM memory is set to 1024 MB, which is configured in the `\agent\conf\wrapper-override.conf` file in the MID Server installation directory. This setting might not be appropriate for the way your organization uses the MID Server. If you want the MID Server to work harder, allocate more resources to it. If the MID Server is located in a small branch office and runs in an environment where memory allocation is shared between a print server, mail server, or web proxy server, the allocation might have to be reduced.

**Note:** For a complete list of minimum MID Server requirements, see [MID Server system requirements](#).

1. Open the `\ServiceNow\<MID Server name>\agent\conf\wrapper-override.conf` file in a text editor. For more information about this file, see [Installing Multiple MID Servers on a Single System](#).
2. Locate the following lines in the file:

   ```
   # OPTIONAL: Maximum Java Heap Size (in MB)
   wrapper.java.maxmemory=1024
   ```

3. Edit the memory allocation.
4. Remove the comment tag (#) from the memory allocation parameter.
5. Save the file.
6. Restart the MID Server service.

### Pause the MID Server

Pause the MID Server to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

Role required: agent_admin
You can only pause validated MID Servers. You might want to pause the MID Server when your network infrastructure is undergoing changes. This prevents applications like Discovery from throwing errors during a particular maintenance window.

A paused MID Server continues processing commands that it had already retrieved before it was paused. When you resume the MID Server, the MID Server starts retrieving new commands to process.

**Note:** Discovery continues to assign jobs to MID Servers that are **Paused**. MID Servers that are **Down** are not assigned jobs.

1. Open the MID Server record.
2. Select a running MID Server that has been validated.
3. On the MID Server form, select **Pause MID** under **Related Links**.
   The state of the MID Server changes to **Paused**.

<table>
<thead>
<tr>
<th>Name</th>
<th>Version</th>
<th>Host name</th>
<th>Status</th>
<th>Validated</th>
</tr>
</thead>
<tbody>
<tr>
<td>MidServer1</td>
<td>Version</td>
<td>MidServer1hostname.com</td>
<td>Paused</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**A paused MID Server**

4. To resume MID Server processing, select **Resume MID** under **Related Links**.

**MID Server pause**

The MID server can be put into a **Paused** state to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

Unlike stopping the MID Server from the *Windows or Linux* server command line on the MID Server machine, pausing the MID server is something that you can do from the instance. The MID Server pause feature is available starting with the Istanbul release.
You can only pause validated MID Servers.

You can still perform these actions when the MID Server is paused:

- Access the MID Server logs and delete log entries.
- View MID server statistics. While the MID Server is in the Paused state, it stops generating statistics. But you can still view the statistics generated before you paused the MID Server.
- Retrieve the MID Server thread dump.
- Make and save configuration changes and property changes to the server. The changes take effect after the MID Server is resumed.
- Clear the ECC queue.

The MID server heartbeat continues to function while the MID Server is in the Paused state. If the MID Server is upgraded while it is in the Paused state, the MID Server state automatically changes to Up after successful upgrade. It does not return to the Paused state.

During MID Server selection, paused MID Servers can still be selected but are prioritized below MID Servers that are not paused.

Events that occur during MID Server pause

The vCenter and SNMP event collectors continue to run and process events when you pause the MID Server. These events are not part of the normal synchronous communication that the MID Server has with the instance that you see in the ECC queue. Events are still relayed to the instance and can even trigger actions on records in the instance, such as a CI update. For example, if vCenter detects that a virtual machine goes down or is deleted, a vCenter event makes a change to the status of the corresponding CI record for that virtual machine.

To prevent these events from being processed, stop the extensions from running. For more information, see:

- Configure and run the vCenter event collector extension
- Configure the SNMP Trap Collector Extension

Notifications

Use ServiceNow® Notifications to manage system email, create system notifications, and configure how your system responds to inbound email.

Email setup

All email notifications use the email properties that you define for your instance and the email accounts that you set up. Your email service can also affect the successful transmission of incoming and outgoing email.

Email accounts

Email administrators set up email accounts to allow the system to connect to external mail services such as POP3, SMTP, or IMAP servers. You can use the ServiceNow-provided email accounts or create your own accounts for your own email services.

Email properties

Use Email Properties to configure settings for inbound and outbound email. Email properties apply to all email accounts.

Email service size restrictions

Your email service, whether you are using a standard ServiceNow email configuration or an alternate email configuration, determines the successful transmission of incoming or outgoing emails based on a maximum email size. An email configuration consists of your instance, email server, and email client.

- **Standard email configurations** – For instances that use the standard email configuration, the ServiceNow mail servers cannot send or receive emails larger than approximately 50 MB (before encoding), including the email header, body text, and attachments. Email messages are encoded by an email client, which increases total email message size. The maximum ServiceNow mail server size restriction is 75 MB (after encoding). The maximum email size limit is enforced regardless of any configured attachment size limits.

- **Alternate email configurations** – If your email service uses a company-owned or third-party server, the approximate size restriction of 50 MB (including the email header, body text, and attachments) may still apply. However, your service might support different maximum total file sizes for inbound and outbound emails. Check with the email administrator of your email service to verify email size limits.

For details on how encoding can affect email message size and email transmission, see KB0521772.

Email service availability

Email service is intentionally shut down on instance clones to prevent resending already delivered email. Upgrades no longer require an extended interruption of email service. Instances continue to process email during an upgrade. For a possible explanation for undelivered emails, see the blog post Whitelisting emails sent from the ServiceNow infrastructure by a ServiceNow Technical Support Engineer in the Now Community.

For instructions on creating and sending custom emails when events on the instance occur, see the tasks in Email and SMS notifications.
Instance-to-instance communication via email

Use Web services to communicate between two instances.

Designate untrusted and trusted email domains

Using Instance Security Center, you can monitor the blocked and allowed incoming email metrics for your instance. For more information, see Designate email domains as untrusted or trusted.

Next steps after enabling email

After enabling email on your instance, consider performing several of these important tasks.

• Test the email configuration by routing all email to a single user (set the glide.email.test.user property).
• Review the baseline notification categories, email notifications, and templates to determine if they meet your business needs.
• Review the baseline inbound email actions to determine if they meet your business needs.
• Determine if you want to use email layouts to add consistent content elements.
• Determine if you want to use email filters to restrict the email the instance receives.
• Determine if you want to implement a retention policy to archive and destroy email at certain intervals.
• Determine what kind of watermarks outbound email uses to associate records with email messages.
• Determine if you want to create users when the instance receives an email from an unrecognized user.
• Set the precedence of outgoing mail. By default, the instance sends email with a precedence of bulk (set the glide.smtp.precedence_bulk property).
• Consider preventing untrusted users from triggering inbound actions to prevent unwanted email from affecting your instance.
• Implement a spam filter to restrict unwanted messages sent to your custom email addresses.

Basic email setup

All production instances can send and receive email using ServiceNow-provided resources. The instance has an email address of instance@service-now.com.
Network layout for standard email configuration
Basic email services and features

- Mail servers maintained by ServiceNow.
  - Encrypt mail with opportunistic TLS (Transport Layer Security) if supported by your mail servers.
    If your internal mail servers send and receive messages via a TLS-encrypted channel, ServiceNow mail servers support that communication.
  - Provide a dedicated mailbox for your instance.

- Pre-configured email accounts to connect to ServiceNow mail servers.
  - An SMTP account sends email to your primary Mail Exchange (MX) server from your instance email address of instance@service-now.com.
  - A POP3 account receives email sent to your instance email address of instance@service-now.com.

- High availability features from ServiceNow datacenters.
- Spam detection for incoming email.

Administrators who want to use basic email services can do so by enabling the email properties for sending and receiving email.

Enable basic email

Enable basic email to use ServiceNow-provided email servers and accounts.

Role required: admin

1. Navigate to System Properties > Email.
2. Configure these email properties and click Save.

Email property descriptions

<table>
<thead>
<tr>
<th>Property section</th>

</tbody>
</table>

Advanced email setup

With an advanced email setup, you can use your own SMTP server, POP3 server, or both.

Setting up your own email environment can be useful if you want to use existing filtering, retention, or compliance aspects of your internal email architecture. You can set up email in several ways:

- Use your own SMTP server to forward email to ServiceNow servers.
- Use your own SMTP server to send email.
- Use your own POP3 server to receive email.
- Use your own SMTP and POP3 servers to send and receive email.
- Use an OAuth 2.0-enabled SMTP server to send email from a third-party service.
- Use an OAuth 2.0-enabled IMAP server to receive email from a third-party service.

The following procedures assume that you enabled basic email properties.
Enable using your own SMTP server

Enable using your own SMTP server so that you can leverage the existing filtering, retention, or compliance aspects of your own SMTP server while also using the ServiceNow POP3 server.

- Role required: admin
- Email server required: SMTP
- Basic email properties: enabled

You can combine your own internal email architecture with the ServiceNow email architecture to handle email. The following diagram demonstrates how you would use your own SMTP server alongside the ServiceNow POP3 server.
1. Navigate to System Mailboxes > Administration > Email Accounts.
The system displays the list of available email accounts.

2. Locate the record for ServiceNow SMTP and change Active to false.

3. Click New.

4. Create an email account record for your SMTP server where the Type is SMTP.

5. From Related Links, click Test Connection.
   If the email account is valid, the system returns a success message.

Configure the SMTP server in your internal email architecture to forward email from the custom email address to the instance email address. Implement a spam filter on the custom email address.
Enable using your own POP3 server

You can use your own POP3 server to store and receive email for the instance.

- Role required: admin
- Email server required: POP3
- Basic email properties: enabled

1. On your POP3 server, create a mailbox for your instance that has a custom email address. For example, create a mailbox for service-desk@company.com.
2. Navigate to System Mailboxes > Administration > Email Accounts. The system displays the list of available email accounts.
3. Optional: If you do not want to receive email sent to the instance@service-now.com mailbox, locate the record for ServiceNow POP3 and change Active to false.

An instance can receive email from multiple POP3 accounts at the same time. Leaving the ServiceNow POP3 account active allows the instance to receive email sent to the instance default email address.

4. Click New.
   The system displays a blank Email Account form.
5. Create an email account record for your POP3 server where the Type is POP3.
6. From Related Links, click Test Connection.
   If the email account is valid, the system returns a success message.
Connection Test

Connection Successful

Enable using your own SMTP and POP3 servers

You can use your own SMTP and POP3 servers to send email from the instance and to store and receive email for the instance.

- Role required: admin
- Email servers required:
  - SMTP
  - POP3
- Basic email properties: enabled

1. On your POP3 server, create a mailbox for your instance. For example, create a mailbox for service-desk@company.com.
2. Navigate to System Mailboxes > Administration > Email Accounts.
   The system displays the list of available email accounts.
3. Locate the record for ServiceNow SMTP and change Active to false.

![Email Accounts](image)

4. Optional: If you do not want to receive email sent to the instance@service-now.com mailbox, locate the record for ServiceNow POP3 and change Active to false.
   An instance can receive email from multiple POP3 accounts at the same time. Leaving the ServiceNow POP3 account active means that the instance receives email sent to its default email address.
5. Click New.
The system displays a blank Email Account form.

6. Create an email account record for your SMTP server where the Type is SMTP.

7. From Related Links, click Test Connection.
   If the email account is valid, the system returns a success message.

8. Click New.
The system displays a blank Email Account form.

9. Create an email account record for your POP3 server where the Type is POP3.

10. From Related Links, click Test Connection.
If the email account is valid, the system returns a success message.

Connection Test

Connection Successful

Close
OAuth email authentication

OAuth enables your instance to receive and send email through a third-party email account.

Open Authentication (OAuth) is an open standard for authorization that provides administrators with an authorization method when connecting to incoming IMAP and outgoing SMTP servers. OAuth enables an instance to receive and send email from a third-party account, such as Gmail, without having to enter the credentials for that account.

The OAuth 2.0 implementation requires you to obtain an access and refresh token from your third-party email provider for each third-party email account. The tokens are automatically saved to the instance database. They provide authorization for all email communication between the instance and the authorized third-party account. A scheduled job regularly checks to see if email access tokens are valid. If the access token is not valid, but the refresh token is, the instance automatically regenerates a new access token.

OAuth 2.0 support is available starting with the Geneva release. The OAuth implementation supports IMAP and SMTP accounts only. POP3 is not supported. OAuth 1.0 is no longer supported.

Note: Customer email accounts configured to use OAuth 1.0 authentication with Gmail cease to function as of April 20, 2015. See KB0546976 for more information.

Activating the Email - OAuth support for IMAP and SMTP plugin allows you to use OAuth with email. If you upgrade to Geneva or later instances and are already using OAuth 1.0, activate the plugin again.

See Outbound REST with OAuth 2.0 profile tutorial - integrating with Google Contacts API for an example of using an OAuth 2.0 profile to authenticate an outbound REST message with Google to retrieve contact information. Also see OAuth 2.0 for more information on OAuth 2.0 support in the instance.

Activate the OAuth email authentication plugin

OAuth email authentication requires the Email - OAuth support for IMAP and SMTP plugin.

Role required: admin

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Click Install, and then in the Activate Plugin dialog box, click Activate.

Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise they will receive the following error: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Enable OAuth 2.0 for email

Setting up OAuth 2.0 for email requires you to obtain access and refresh tokens from your email provider.

- Role required: admin
- Plugin required: Email - OAUTH support for IMAP and SMTP

1. Log in to your third-party email account, such as Gmail, and enable OAuth 2.0.
2. Obtain the following from your third-party email account:
   - client ID
   - client secret
   - authorization URL
   - token URL
   - redirect URL
• token revocation URL

3. Navigate to System OAuth > Application Registry.
4. Click New.
5. Click Connect to a third party OAuth Provider to create an application registry record that email uses.
6. Use the information you obtained from your third-party email account to fill in the fields on the form. See Use a third-party OAuth provider for instructions. Create the OAuth application registry record and its associated OAuth Entity Profile and OAuth Entity Scope records.
7. Click Submit.
8. Navigate to System Mailboxes > Administration > Email Accounts.
The system displays the list of available email accounts.
9. Optional: If you do not want to receive email sent to the default instance email address, locate the record for ServiceNow POP3 and change Active to false.
The system can receive email from multiple POP3 and IMAP email accounts.
10. Locate the records for ServiceNow SMTP and change Active to false.

![Image of email accounts]

11. Click New.
The system displays a blank Email Account form.
12. Create an email account record for your OAuth 2.0 SMTP server where the Type is SMTP.
13. For Authentication, select OAuth 2.0.
14. For OAuth Profile, select the application registry record you created.
15. Click Authorize Email Account Access to obtain the access and refresh tokens.

Another browser window opens asking you to authorize the account access on the third-party email account.
16. Authorize the access.

After the authorization is successful and the tokens are saved to the instance, the Authorize Email Account Access button no longer appears on the Email Account form.
17. Click New.
The system displays a blank Email Account form.
18. Create an email account record for your OAuth 2.0 IMAP server where the **Type** is **IMAP**.
Use the same **Authentication** and **OAuth profile** settings as the OAuth SMTP email account.

**Email accounts**

Email accounts store the connection details and credentials the system uses to access external email servers and services.

By default, instances come with email accounts for ServiceNow-managed SMTP and POP3 servers to send and receive email. These accounts cannot be modified, but can be deactivated if you do not want to use them. To connect to other email servers and services you must create email accounts for them. You can create email accounts for servers and services that use these protocols:

- **SMTP**
- **POP3**
- **IMAP**

**Note:** The system only allows one SMTP email account to be active at a time and sends all email through this account. You can however receive email from multiple POP3 or IMAP accounts.

The system stores individual email accounts in the `sys_email_account` table. Create separate email accounts to send and receive email. Use **email properties** to define how the system processes email for all email accounts.

By default, the ServiceNow POP3 server provides each instance with its own mailbox at the address instance@service-now.com. Likewise, the ServiceNow SMTP server sends email from the address instance@service-now.com. To create another mailbox, provision your own POP3 or IMAP server and create an email account to the server on the instance. To change the sent from email address, update the address in the email account you use for sending email.

Emails received via a POP3 or IMAP server account are stored in the Email [sys_email] table and then deleted from the account.
A ServiceNow configured email account

**Configure an email account**

You can create email accounts in addition to the accounts provisioned for you.

- **Role required:** admin
- **Email server:** a compatible email server
  - SMTP
  - POP3
  - IMAP
Warning: An SMTP server that uses a localhost or loopback (127.0.0.1) IP address is not accepted as a compatible email server. For more information, see KB0724199.

1. Navigate to System Mailboxes > Administration > Email Accounts.
2. Click New.
3. Fill in the fields on the form (see table).

### Email Account fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name to identify this Email Account.</td>
</tr>
</tbody>
</table>
| Type                | The type of mail server. The choices are:  
  - Email Reader  
  - POP3  
  - IMAP  
  - Email Sender  
  - SMTP (only one active account permitted) |
| Authentication      | The type of authentication used for the email account to connect to the email server. The choices are Password, OAUTH, and OAUTH 2.0. The Email - OAuth support for IMAP and SMTP plugin must be active for the OAuth options to be visible. |
| OAuth Provider      | Select the OAuth application registry record for this account. This field appears if you selected OAuth 2.0. |
| Server              | The remote server to which this account connects. To activate a server for an on-premise installation, enter the full address (FQDN) of the node (for example, node.customerdomain). |
| Active              | Determines if this Email Account is active. |
| ServiceNow Configured | Indicates if this account is provisioned by ServiceNow. This field is read-only. If you create an account, this option is not selected. |
| Email user label    | A display value used for outgoing messages. This field is for SMTP type accounts only. |
| User name           | The user name or ID to authenticate an email address. The value in this field is also the From address when the instance sends email. If you are using SMTP, this must be a full email address. The value in the From field can override this (for SMTP accounts). |

Note: The address in the From field on the Notification form takes precedence over this field.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password</td>
<td>The password when the <strong>Authentication</strong> type is <strong>Password</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You may need to increase the size of this field to accommodate longer passwords. By default, this field has a size of 40 characters.</td>
</tr>
<tr>
<td>From</td>
<td>(SMTP only) The From address used for notifications sent with this account. This address takes precedence over the <strong>User name</strong> field. If nothing is present in this field, the User name is used as the return address for notifications sent from the instance.</td>
</tr>
<tr>
<td>Connection Security</td>
<td>The type of secure connection. Choose a setting:</td>
</tr>
<tr>
<td></td>
<td>• None: No secure protocol is used.</td>
</tr>
<tr>
<td></td>
<td>• STARTTLS: Upgrades an insecure connection to a secure connection using the SSL/TLS encryption protocol, if your email server supports TLS.</td>
</tr>
<tr>
<td></td>
<td>• SSL/TLS: Connect to an SSL/TLS encrypted port to secure the connection. Email is encrypted between the ServiceNow instance and your mail server.</td>
</tr>
<tr>
<td></td>
<td><strong>Warning:</strong> Selecting a less secure protocol like <strong>STARTTLS</strong> or <strong>None</strong> may expose your data. To better ensure the security of data in your email server, select <strong>SSL/TLS</strong>.</td>
</tr>
<tr>
<td>Port</td>
<td>Connection TCP port.</td>
</tr>
</tbody>
</table>
4. Click **Submit**.

5. Click the test connection link at the bottom to test the SMTP, POP3, or IMAP account.

   The system displays a pop-up window with the results of the connection test.

   ![Connection Test](image)

   **Connection Successful**

   If the test succeeds, click **Close** to return to the email account record. If the test fails, click **View Logs** to display more information about the test results.
The system uses the email account to send or receive email.
Enable the system to send or receive email.

Multiple email readers

Organize POP3/IMAP email accounts into email account groups (subsets of email accounts) that can be processed by multiple email reader jobs. To improve the performance of inbound email account processing, you can incrementally add email account groups and if needed, email reader jobs to process email account groups concurrently.

How email account group processing works

By default, the email reader job processes POP3/IMAP email accounts serially, which can result in longer processing times when you have many email accounts. It can also be difficult to identify any problematic email accounts that might contribute to slower processing times.

To reduce email account processing time, you can create one or more email account groups that contain subsets of your email accounts. Organizing your email accounts into groups enables the default email reader job to process each email account group separately. After creating one or more email account groups, you can then add another email reader job to process account groups concurrently.

Use the glide.email.inbound.account_group_processing system property to activate email account group processing.

During email account group processing:

- The system stores the email accounts in the Email Account Groups [sys_email_account_group] table.
- The default email reader job runs every two minutes. The email reader chooses the account group to be processed based on the account group processing state and the date and time that the group was last processed.
  - Claimed state: If an account group has a claimed state, the email reader is processing the account group. If you defined other email reader jobs, no other email reader job can claim the group for processing.
  - Unclaimed state: If an account group is unclaimed, the account group is available for processing by the email reader.
- The email reader job processes the email accounts contained in the selected account group.
- The email reader job chooses the next available account group for processing and continues processing that account group.

You can monitor the processing of each email account group by using the Email Account Groups [[sys_email_account_group]] table. Each account group record includes the processing duration (how long it takes for the email reader to process all the accounts in the group).

After you review the processing times for your email account groups, determine whether to make further adjustments in email account group processing. For example, you can create another email account group or create another email reader job to process your email account groups in parallel. You define additional email reader jobs using the Schedule [sys_trigger] table.

Set up email account group processing

To set up email account group processing, you must have the email_account_admin or admin role.

1. Create email account groups.

Define one or more email account groups that contain a subset of your POP3/IMAP email accounts. Your base system includes a default email account group. Any POP3/IMAP accounts not contained in an email account group are processed as part of the default email account group.

2. Enable email account group processing
Navigate to sys_properties.list and locate the glide.email.inbound.account_group_processing system property. Set the Value to true. The email reader job starts processing the email account groups that you created.

3. **Monitor email account group processing.**

Check the status of your email account groups to see if processing time has been reduced. Determine whether the additional groups sufficiently reduce account processing time or consider adding another email reader job to further reduce processing time.

4. **Create an email reader job.**

As part of fine-tuning email account group processing, create an email reader job to process email account groups concurrently, in addition to the default email reader job.

**Create email account groups**

Define an email account group that contains a subset of your POP3/IMAP email accounts. The email reader job automatically processes each email account group as scheduled.

Role required: admin or email_account_admin

1. Navigate to **System Mailboxes > Administration > Email Account Groups** and click New.
2. Fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the account group.</td>
</tr>
<tr>
<td>Email Accounts</td>
<td>A subset of POP3/IMAP email accounts. Select the email accounts that make up the group.</td>
</tr>
<tr>
<td>Note:</td>
<td>When you add an email account to a group, it cannot be reused in other account groups.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that enables the email account group for processing. New account groups are active by default.</td>
</tr>
<tr>
<td>Default</td>
<td>Read only. Check box that indicates the account is the default email account.</td>
</tr>
<tr>
<td>Status</td>
<td>Read only. Processing state of the email account group: Unclaimed or Claimed.</td>
</tr>
<tr>
<td>Claimed by</td>
<td>Read only. ID of the email reader job currently in progress.</td>
</tr>
<tr>
<td>Last Processed</td>
<td>Read only. The last time that the email reader job processed this group.</td>
</tr>
<tr>
<td>Processing Duration</td>
<td>Read only. The length of time taken by an email reader job to process the account group.</td>
</tr>
</tbody>
</table>

3. Click **Create**.

The system updates the Email Account Group [sys_email_account_group] table with the new account group. Use the this table to monitor email account group processing.

- Review **email account group processing**.
- Determine if you want to continue fine-tuning email account processing. You could add another email account group or another email reader job to process email account groups concurrently.

**Enable email account group processing**

Enable the email reader job to start processing your email account groups so that you can reduce the time it takes to process inbound email accounts.
Create email account groups.

Role required: admin

*Add a system property* with the following settings:

- Name: `glide.email.inbound.account_group_processing`
- Type: true | false
- Value: true

Check the status of your email account groups to see if processing time has been reduced. For more information, see *Monitor email account groups*.

To further reduce processing time, consider creating another email reader job to process inbound email accounts. For more information, see *Create an email reader job*.

*Monitor email account groups*

Use the Email Account Groups [sys_email_account] table to check the status of email account groups processed by email reader jobs.

1. *Create email account groups.*
2. *Enable email account group processing.*

Role required: email_account_admin or admin

1. Navigate to **System Mailboxes > Administration > Email Account Groups**.
2. Review the processing details for each account group:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the email account group.</td>
</tr>
<tr>
<td>Active</td>
<td>The operational state of the email account group. The value true indicates</td>
</tr>
<tr>
<td></td>
<td>that the account is enabled for email account processing.</td>
</tr>
<tr>
<td>Claimed by</td>
<td>The ID of the email reader job if the job is running on the account group.</td>
</tr>
<tr>
<td>Default</td>
<td>The default indicator. The value true indicates that the email account</td>
</tr>
<tr>
<td></td>
<td>group is the default.</td>
</tr>
<tr>
<td>Email Accounts</td>
<td>The names of the email accounts contained in the email account group.</td>
</tr>
<tr>
<td>Last Processed</td>
<td>The day and time that the email reader job last processed this account group.</td>
</tr>
<tr>
<td>Processing Duration</td>
<td>The length of time (in hours, minutes, seconds) to process the account group.</td>
</tr>
<tr>
<td>Status</td>
<td>Processing state of the email account group:</td>
</tr>
<tr>
<td></td>
<td>• Unclaimed: The account group is available for processing by the next email</td>
</tr>
<tr>
<td></td>
<td>reader job.</td>
</tr>
<tr>
<td></td>
<td>• Claimed: An email reader job is processing the current account group.</td>
</tr>
</tbody>
</table>
Email account group — unclaimed processing state

Email account group — claimed processing state

If fine-tuning email accounts, consider doing one of the following:

- Create another email account group.
- Create another email reader job to process email account groups concurrently.

Create an email reader job
If you created email account groups to fine-tune inbound email account processing, you can create an email reader job to process those account groups concurrently, in addition to the default email reader job.

1. Create email account groups.
2. Enable email account group processing
Role required: email_account_admin or admin

1. In the Navigation filter, type sys_trigger.list.
2. In the sys_trigger table, select the Email Reader job record.
3. In the Email Reader job form:
   1. Enter a unique name for the email reader job to be added so that you can differentiate it from the default email reader job.
   2. If needed, change the time interval for this email reader job.
4. From the form context menu, click **Insert**.
   Another email reader job is created. This job runs concurrently with the default email reader job to process email account groups.

**Monitor email account group processing** and determine if the additional reader job reduces processing time. If needed, you can continue fine-tuning email account processing. For example, you might consider adding another email account group.

**Email properties**

The Email Properties page is where you can configure settings for inbound and outbound email.

Email properties are available from either of these modules:

- **System Mailboxes > Email Properties**
- **System Properties > Email Properties**
Email Properties

Email accounts can be created or modified in the Email Accounts table. Email account connection status and diagnostics information can be found on the Email Diagnostics page.

Outbound Email Configuration

- Email sending enabled
- Send all email to this test email address (non-production testing)
- Append timestamp to dates and times in sent email
- Create visible watermark in sent email. If false, create invisible watermark via hidden div tag
- Resend email if server returns these SMTP error codes (''
- Do not resend email if server returns these SMTP error codes
- Resend email when server returns unknown SMTP error codes
- Roles that can view email in the Activity formatter when including “Sent/Received Emails”
- Number of journal entries (Additional comments, Work notes, etc. included in email notifications; '-' means all)
- Email sending enabled
- Send all email to this test email address (non-production testing)
- Append timestamp to dates and times in sent email
- Create visible watermark in sent email. If false, create invisible watermark via hidden div tag
- Resend email if server returns these SMTP error codes
- Do not resend email if server returns these SMTP error codes
- Resend email when server returns unknown SMTP error codes
- Roles that can view email in the Activity formatter when including “Sent/Received Emails”
- Number of journal entries (Additional comments, Work notes, etc. included in email notifications; '-' means all)

Inbound Email Configuration

- Identify email as a reply by these subject prefixes
- Identify email as a forward by these subject prefixes
- Discard everything below this text if found in a reply body (comma separated, case sensitive)
- Automatically create users for incoming emails from trusted domains
- Default password for users created from email sent from trusted domains (must reset upon login)
- Trusted domains when creating new users from incoming email (ignore email from untrusted domains unless from an existing user; use '-' for all domains)

Email accounts are configured in the System Mailboxes > Administration > Email Accounts module. For more information and instructions, see Configure an email account.

Email diagnostics are available from the System Mailboxes > Email Diagnostics module.

**Note:** To learn more about the security properties that affect email processing, see Email security (instance security hardening) and SMTP authentication (deprecated) in the Instance Security Hardening Guide.

**Outbound mail configuration**

The **Outbound Mail Configuration** section of the Email Properties page contains properties for sending email.
Outbound Email Configuration

Email sending enabled  
☑ Yes | No

Send all email to this test email address (non-production testing)  

Append timezone to dates and times in sent email  
☑ Yes | No

Create visible watermark in sent email. If false, create invisible watermark via hidden div tag.  
☑ Yes | No

Resend email if server returns these SMTP error codes  
421,450,451,452

Do not resend email if server returns these SMTP error codes  
500,501,502,503,504,550,551,552,553,554

Resend email when server returns unknown SMTP error codes.  
☑ Yes | No

Roles that can view email in the Activity formatter when including "Sent/Received Emails"  
itil

Number of journal entries (Additional comments, Work notes, etc.) included in email notifications (-1 means all).

**Inbound mail configuration**

The **Inbound Mail Configuration** section of the Email Properties page contains properties to control inbound email.
Inbound Email Configuration

Email receiving enabled  

☑ Yes | No

Identify email as a reply by these subject prefixes  

re:, aw:, r:, Accepted:, Tentative:, Declined:

Identify email as a forward by these subject prefixes  

fw:, fwd:

Discard everything below this text if found in a reply body (comma separated, case sensitive)  

Original Message-----

From:

Automatically create users for incoming emails from trusted domains  

☐ Yes | No

Default password for users created from email sent from trusted domains. (must reset upon login)  

********

Trusted domains when creating new users from incoming email (Ignore email from untrusted domains unless from an existing user; use * for all domains)  

servicenow.com
### Inbound email properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.read.active</td>
<td>Email receiving enabled</td>
<td>Specifies whether to enable or disable the inbound mail server.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td>glide.email.reply_subject_prefix</td>
<td>Identify email as a reply by these subject prefixes</td>
<td>Specifies the comma-separated list of prefixes in the subject line that identify an email reply.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default value: re:, aw:, r:, Accepted:, Tentative:, Declined:</td>
</tr>
</tbody>
</table>

**Note:** The case of the reply prefix in the email, for example RE:, must exactly match the case of the prefixes defined in this property. If, for example, an email contains the Re: prefix and only RE: is defined in the property, the email will not be recognized as a reply. Therefore, it is a best practice to define multiple versions of the prefix, including mixed-case versions, such as RE:, Re:, and so on.
<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.email.forward_subject_prefix | Identify email as a forward by these subject prefixes | Specifies the comma-separated list of prefixes in the subject line that identify a forwarded email.  
• Type: string  
• Default value: `fw:,fwd:`  

<i>Note:</i> The case of the forward prefix in the email, for example `fw:`, must exactly match the case of the prefixes defined in this property. If, for example, an email contains the `Fwd:` prefix and only `fwd:` is defined in the property, the email will not be recognized as a forward. Therefore, it is a best practice to define multiple versions of the prefix, including mixed-case versions, such as `FWD:`, `Fwd:`, and so on. |

| glide.pop3.reply_separators | Discard everything below this text if found in a reply body (comma separated, case sensitive) | Specifies the comma-separated list of separators that cause the instance to disregard everything below the text string in the message body. This list is case sensitive.  
• Type: string  
• Default value: `\n\n-----Original Message-----,\n\n _____ ,\n
From:  

<i>Note:</i> Some email service providers don't support this default format. If your reply emails aren't formatting as expected, edit this property manually. |
<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.pop3readerjob.create_caller | Automatically create users for incoming emails from trusted domains   | Controls the behavior when an instance receives an email from an email address not associated with a user record. If this property is set to **true**, the instance creates a new user record for the email address and places that new user in the **Caller** field of any tickets created. If the property is set to **false**, the instance places **Guest** in the **Caller** field of any tickets created.  
  • Type: true | false  
  • Default value: false  
  • Learn More: Enabling Automatic User Creation |
| glide.user.default_password    | Default password for users created from email sent from trusted domains. (must reset upon login) | Specifies the password for new users created from incoming email. Users must reset the password at first login.  
  • Type: string  
  • Default value: password  
  • Learn More: Enabling Automatic User Creation |
| glide.user.trusted_domain      | Trusted domains when creating users from incoming email.              | Comma-separated list of trusted domains for which the instance automatically creates a user based on incoming emails. Use an asterisk (*) to trust all domains. If an email is not from a trusted domain, the instance processes the inbound email as a "guest user" but it does not create a guest user in the instance.  
  • Type: string  
  • Default value: asterisk (*)  
  • Learn More: Enabling Automatic User Creation |

**Note:** To learn more about the security properties that affect email processing, see *Email security (instance security hardening)* in the Instance Security Hardening Guide.

**Email image filtering properties**

Use email image filtering properties to control how inbound email images attach to a target record.

When a user sends an email to the system, email images (such as logos or email signatures) attach to the target record by default. These images are also visible in the activity stream of the target record. The system then replicates these images, which can cause duplicate image attachments to the target record and also duplicate images in the activity stream.
To filter images from emails and reduce duplicate image attachments to target records, configure the following properties in the System Properties [sys_properties] table. Use these properties to:

- Specify the email image sizes eligible for filtering.
- Choose an action that controls image attachment behavior and image visibility in the activity stream.

**Note:** These properties do not delete attachments. You can verify attachment records in the Attachments [sys_attachment] table.

### Email image filtering properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.inbound.image_sys_attachment.filter.minimum_bytes</td>
<td>Sets the minimum image size in bytes for inbound email images to attach to the target record. Any image that is below this size limit is subject to the image filtering behavior that you set in the glide.email.inbound.image_sys_attachment.filter.action property. To disable image filtering entirely and attach all email images to the target record, set the minimum byte size to 0.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> Integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> 0</td>
</tr>
<tr>
<td>glide.email.inbound.image_sys_attachment.filter.action</td>
<td>Specifies the image filtering behavior.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Regardless of the action you select, the image is visible when you choose to <strong>Preview HTML Email</strong> or <strong>Show Email Details</strong> in the activity formatter.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> Choice list</td>
</tr>
<tr>
<td></td>
<td>• AttachTarget - Associate the image to the target record. The image is visible in the activity formatter and in the attachment to the target record.</td>
</tr>
<tr>
<td></td>
<td>• AttachEmail - Attach the image to the email record. The image is not visible in the activity formatter of the target record nor in the attachment to the target record.</td>
</tr>
<tr>
<td></td>
<td>• AttachNone - Do not attach the image to a record. You can select this option to attach the image manually at a later time.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> AttachEmail</td>
</tr>
</tbody>
</table>

### Email digest properties

Several properties are available to manage digest intervals for email digests.

The following properties are available for the *email digest feature*.

**Note:** To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.
Properties for email digest intervals

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>glide.email.digest.default_interval</td>
<td>The sys_id of the default email digest interval available to users.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: 28d157e07f1332007f005212bd8a9116</td>
</tr>
<tr>
<td></td>
<td>• Location: System Property [sys_properties] table</td>
</tr>
<tr>
<td>glide.email.digest.max_intervals</td>
<td>The maximum number of email digest intervals that can be defined.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 100</td>
</tr>
<tr>
<td></td>
<td>• Location: System Property [sys_properties] table</td>
</tr>
<tr>
<td></td>
<td>• Learn more: For details on digest intervals, see Create or modify email digest intervals.</td>
</tr>
</tbody>
</table>

Advanced email properties

Use advanced email properties to fine-tune the way your instance sends or receives email.

Add these properties to the System Property [sys_properties] table before they can be used to overwrite the defaults.

**com.glide.email.max_read**

Specifies the maximum number of emails a POP3 reader should process concurrently.

- Type: integer
- Default value: 20

**com.snc.on_call_rotation.reminders.showtz**

Specifies whether to show a user's time zone.

- Type: true | false
- Default value: false

**glide.email.allow_duplicate_message_ids**

Allows storing of emails with duplicate message IDs and adds error message "Duplicate message-id encountered, prevented loop."

- Type: true | false
- Default value: false

**glide.email.email_client.check_attachment_availability**

Enables a system scan of each file that a user attaches to an email draft in the email client. If a file is found to be infected with a virus, the user can't send the email with the attached file. The user must remove the attachment to send the email.

- Type: true | false
- Default value: true
glide.email.email_with_no_target_visible_to_all

Email that is missing a target record or whose target record is the email are made visible to any user regardless of their roles. By turning this property to false, the user is restricted unless they sent in the record or have an admin role.

- Type: true | false
- Value: false

glide.email.inbound.calendar_behavior

Specifies how the system stores calendar data, such as an invitation or an invitation response. Enter one of these options (not case sensitive):

- Attach: Store the calendar data as an attachment on the associated record, such as the incident or change that triggers an invitation.
- Ignore: Discard the calendar data.
- Inline: Store the calendar data as text in the email Body field.
- Type: string
- Default value: Attach

glide.email.inbound.check_attachment_availability

Prevents users from downloading and using virus-infected files that are attached to inbound emails. The system detects infected files in an email by checking the ServiceNow virus header. If there are multiple email attachments, the system scans the files via Antivirus Scanning. All attachments that are found to be infected are made unavailable for use.

- Type: true | false
- Default value: true

glide.email.inbound.convert_html_inline_attachment_references

Specifies whether to convert inbound email HTML so email images appear in the email HTML body preview. The system displays broken cid (content ID) links in place of images received when this property is disabled. The format in which the system displays an email image depends on the property setting at the time the email is received, not the current property setting.

- Type: true | false
- Default value: true

glide.email.inbound.generate.missing.html.part

Enables the system to generate HTML text for inbound emails that contain only a plain text message.

- Type: true | false
- Default value: true

glide.email.inbound.generate.missing.text.part

Enables the system to generate plain text for inbound emails that contain only an HTML message.

- Type: true | false
- Default value: true

glide.email.inbound.max_attachment_count

Sets the maximum number of attachments allowed per inbound email.
- **Type:** integer
- **Default value:** 30
- **Location:** System Property [sys_properties] table

`glide.email.inbound.max_body_chars`

Sets the maximum body size in characters allowed per inbound email.

- **Type:** integer
- **Default value:** 524288

`glide.email.inbound.max_total_attachment_size_bytes`

Sets the maximum total attachment size in bytes allowed per inbound email.

- **Type:** integer
- **Default value:** 18874368
- **Location:** System Property [sys_properties] table

`glide.email.mail_to`

Specifies the email address for sending notifications that use the ${mailto:} variable.

- **Type:** string
- **Default value:** SMTP email address that is active by default

`glide.email.name_split`

Specifies the delimiter used between first and last names in an email address. For example, a delimiter of "." (period) in the email address john.smith@company.com tells the system to look for a user record for John Smith.

- **Type:** string
- **Default value:** period (.)

`glide.email.notification.save_when_no_recipients`

Controls whether a notification-generated `sys_mail` record is saved even if there are no recipients. Used along with other notification recipient logging properties, this property enables investigating problems with notifications.

- **Type:** true | false
- **Default value:** false

`glide.email.outbound.check_attachment_availability`

Prevents users from sending emails that contain virus-infected files.

If an outbound email contains an attachment that was previously marked as infected via *Antivirus Scanning*, then the system doesn't send the email. An event is created to indicate that the email attachment is not available for use.

- **Type:** true | false
- **Default value:** true

`glide.email.outbound.header.auto_submitted`

Stores the value used in the "Auto-submitted" outbound email header. Clear the property value to remove the "Auto-submitted" header from all outbound emails. Some spam filters flag auto-generated email as spam.

- **Type:** string
• Default value: auto-generated

**glide.email.outbound.max_attachment_count**

Sets the maximum number of attachments allowed per outbound email.

- Type: integer
- Default value: 30
- Location: System Property [sys_properties] table

**glide.email.outbound.max_body_chars**

Sets the maximum body size in characters allowed per outbound email.

- Type: integer
- Default value: 524288

**glide.email.outbound.max_total_attachment_size_bytes**

Sets the maximum total attachment size in bytes allowed per outbound email.

- Type: integer
- Default value: 18874368
- Location: System Property [sys_properties] table

**glide.email.override.url**

Sets the URL to use in emailed links in place of the instance URL. The URL should end with nav_to.do. An example value is `https://servicenow.customerdomain.com/production.nav_to.do`. This property is suitable for customers who use custom redirect URLs for their instances.

- Type: string
- Default value: instance URL

**glide.cms.use_email_override_url**

Forces the system to use the `glide.email.override.url` property, rather than the `glide.servlet.uri` property, when a notification has a link to a CMS page in an instance.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

**glide.email.append.timezone**

Appends the user time zone to all date and time values in outbound email messages (for example, 2018-07-02 04:01:14 PST). The time zone does not show if the system property `glide.sys.time_format` does not have a "z" value. For more information on configuring the time zone in email notifications, see Time zone for email notifications.

- Type: true | false
- Default value: false

**glide.email.remove_illegal_address_quotes**

Removes invalid quotation marks from an inbound email address, thus allowing the inbound email address to be accepted as valid. For example, when you set the property to true, the address "john.doe@example.com" is changed to john.doe@example.com. However, addresses that are formatted as John Doe <'john.doe@example.com'> are removed entirely.
- Type: true | false
- Default: false

**glide.email.smtp.max_recipients**

Specifies the maximum number of recipients the instance can list in the To: line for a single email notification. Notifications that would exceed this limit instead create duplicate email notifications addressed to a subset of the recipient list. Each email notification has the same maximum number of recipients.

- Type: integer
- Default value: 100

**glide.email.smtp.max_send**

Specifies how many emails to send through each new SMTP connection. If there are more emails to send than the specified value, the instance establishes a new SMTP connection.

- Type: integer
- Default value: 100

**glide.email.text_plain.strip_xhtml**

Converts the XML of both outbound and inbound emails that are shown in comments to plain text. If false, the system preserves the XML.

- Type: true | false
- Default value: true

**glide.imap.secure**

Specifies whether to enable SSL encryption for connections to the IMAP server.

- Type: true | false
- Default value: false

**glide.imap.secure.port**

Specifies the communications port for IMAP secure connections.

- Type: string
- Default value: 995

**glide.imap.tls**

Specifies whether to start the IMAP server in Transport Layer Security (TLS) mode.

- Type: true | false
- Default value: false

**glide.notification.recipient.exclude_logging**

Enables or disables logging all reasons a recipient was excluded. If set to true, the subsequent properties dealing with the exclusion of logging are enabled. If false, the properties are disabled. This property cannot suppress log messages generated by the glideemail.test.user property.

- Type: true | false
- Default value: true

**glide.notification.recipient.exclude_logging.device_inactive**
Logs recipients who are excluded because their chosen notification device record is marked as inactive.

- Type: true | false
- Default value: true

**glide.notification.recipient.exclude_logging.device_schedule**

Logs recipients who are excluded based on the **Schedule** field on the Notification Device [cmn_notif_device] record for their chosen notification device.

- Type: true | false
- Default value: true

**glide.notification.recipient.exclude_logging.event_creator**

Logs recipients who are excluded because they initiated the notification event, such as updating an incident record. The **Send to Event Creator** check box is then cleared on the notification record.

- Type: true | false
- Default value: true

**glide.notification.recipient.exclude_logging.invalid_email**

Logs recipients who are excluded because the email address for that user is invalid, for example the @ is missing, or empty.

- Type: true | false
- Default value: true

**glide.notification.recipient.exclude_logging.user_calendar_integration_disabled**

Logs recipients of calendar invitations who are excluded. Recipients are excluded because the **Calendar Integration** field is set to **None** on the user record.

- Type: true | false
- Default value: true

**glide.notification.recipient.exclude_logging.user_inactive**

Logs recipients who are excluded because the **Active** check box is cleared on the user record.

- Type: true | false
- Default value: true

**glide.notification.recipient.exclude_logging.user_notification_disabled**

Logs recipients who are excluded because the **Notification** field is set to **Disabled** on the user record.

- Type: true | false
- Default value: true

**glide.notification.recipient.include_logging**

Enables or disables logging all reasons a recipient was included. If set to true, the subsequent properties dealing with the inclusion of logging are enabled. If false, the properties are disabled.

- Type: true | false
- Default value: true
glide.notification.recipient.include_logging.delegate
Logs recipients who are included because they are delegates of another user.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.event_parm
Logs recipients who are included because they are in the parm1 or parm2 fields of the event record.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_fields
Logs recipients who are specified in the Users/Groups in Field field for the notification record. The recipient_fields are fields in the target record that contain a recipient to add. For example, to include an incident assignee as a recipient, set the Users/Groups in Field field to Assigned to.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_groups.group_email
Logs users who are included in a notification that is sent to a group. The property also logs users in the event parm1 or parm2 field.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_groups.manager
Logs recipients who manage a recipient group. The property also logs users in the event parm1 or parm2 field.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_groups.membership
Logs recipients who are part of a notification recipient group. The property also logs users in the event parm1 or parm2 field.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_users
Logs recipients who are included via notification record’s Users field (recipient_users).

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.subscription
Logs recipients because they are subscribed via the user notification preferences.

- Type: true | false
- Default value: true
glide.pop3.parse_start
Specifies the text that indicates the beginning of the email body section. The instance parses name:value pairs within this section to set or update field values when processing inbound email actions.

- Type: string
- Default value: none

glide.pop3.parse_end
Text indicating the end of the email body section where the instance should parse name:value pairs to update field values when processing inbound email actions.

- Type: string
- Default value: none

glide.smtp.dateformat
Specify the date format to use for outgoing email notifications.

- Type: string
- Default value: date format listed in email sender's user record [sys_user.date_format]

glide.smtp.precedence_bulk
Specifies whether outbound email includes the header "Precedence: bulk". Some spam filters flag bulk email as spam. Set the value to false to remove this header from outbound email.

- Type: true | false
- Default value: true

glide.smtp.send_partial
Splits outgoing email between valid and invalid recipients. The email is sent only to the valid recipients. A new email containing the invalid recipients is created in the send-ready state and attempts to send again.

- Type: true | false
- Default value: false

glide.smtp.timeformat
Specify the time format to use for outgoing email notifications.

- Type: string
- Default value: time format listed in email sender's user record [sys_user.time_format]

glide.ui.activity.email.use_display
Specifies whether to display email addresses or user IDs (display value from the User table) in email headers. If true, the instance searches for a user record with a matching email address. If it cannot find a matching user record, it displays the email address.

- Type: true | false
- Default value: false

glide.ui.email_client.email_address.disambiguator
Sets the columns from the User [sys_user] table that the auto-complete list displays. Separate each column name with a semicolon character (;).
• Type: string
• Default value: name

**glide.ui.incident_activity.max_addresses**

Specifies the maximum number of addresses to list in an email audit record. If the number of addresses exceeds this limit, the instance truncates the list after the maximum value and displays an ellipsis character (...).

• Type: string
• Default value: 5

**NotifyAffectedCI.max_rel_level**

Sets a value that is used by the [Affected ci notifications] business rule. The business rule notifies subscribers when tasks affect configuration items (CIs). The business rule generates notifications for parent CIs up to the level defined by this property. You can adjust the property value according to the complexity and depth of your CI relationships.

• Type: integer
• Default value: 5

**Email size limits**

To prevent issues with large email messages, the system enforces configured limits on the maximum allowed email body size, total attachment file size, and number of attachments per email.

An email or attachment that exceeds the system capacity may not be processed as expected. To ensure that your emails and attachments are processed as expected, you can configure properties that limit the size of emails and attachments.

**Message body size limit properties**

Add properties to control the maximum email body size allowed for inbound and outbound email messages.

**Properties**

By default, the system processes up to 524,000 characters in the email body and body_text fields (524 KB each).

You can add and configure system properties **glide.email.inbound.max_body_chars** and **glide.email.outbound.max_body_chars** to increase or decrease the email body size limits. The system truncates the email body when it exceeds the configured limit. For example, if you configure the body size limit of **glide.email.inbound.max_body_chars** to 1,000 characters but receive an inbound email that is 2,000 characters, then the system truncates the email body at 1,000 characters.

Also note that the system cannot process email body or body text larger than 16 MB.

**Message body size limit properties**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.inbound.max_body_chars</td>
<td>Sets the maximum body size in characters allowed per inbound email.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 524288</td>
</tr>
</tbody>
</table>
### Glide.email.outbound.max_body_chars

Sets the maximum body size in characters allowed per outbound email.
- **Type:** integer
- **Default value:** 524288

**Note:** A different property, `com.glide.attachment.max_size`, sets the maximum file size allowed for any attachment in the system and overrides any larger values of `glide.email.inbound.max_total_attachment_size_bytes` and `glide.email.outbound.max_total_attachment_size_bytes`.

### Inbound email body processing

For inbound emails, the system enforces the maximum body size as set by the `glide.email.inbound.max_body_chars` property. When the body size exceeds the configured value:
- The system does not run inbound email actions that would otherwise be triggered by the email.
- The system truncates the Body text on the Email form.
- The system logs a warning and sets the Error string field on the Email form. The log message for such an email might look like this:
  
  Email set to receive-ignored because its size exceeds the value set in `glide.email.inbound.max_body_chars`. 1995 character(s) were truncated from the body field.

### Outbound email body processing

For outbound emails, the system enforces the maximum body size as set by the `glide.email.outbound.max_body_chars` property. When the body size exceeds the configured value:
- The system does not send the email.
- The system truncates the Body text on the Email form.
- The system logs a warning and sets the Error string field on the Email form. The log message for such an email might look like this:

  Email set to send-ignored because its size exceeds the value set in `glide.email.outbound.max_body_chars`. 1337 character(s) were truncated from the body field.

### Attachment limit properties

Several properties control email attachment limits.

To see the status of all email attachments, go to the Email Attachments [sys_email_attachment] table.

### Properties

All the properties are located in the System Property [sys_properties] table. Setting any of the following properties to an excessively large value may cause performance issues.
### Attachment limit properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.email.inbound.max_attachment_count               | Sets the maximum number of attachments allowed per inbound email.  
  - **Type:** integer  
  - **Default value:** 30  
  - **Learn more:** Inbound Email Attachment Processing                                                                                                                                                                                                                         |
| glide.email.inbound.max_total_attachment_size_bytes   | Sets the maximum total attachment size in bytes allowed per inbound email.  
  - **Type:** integer  
  - **Default value:** 18874368  
  - **Learn more:** Inbound Email Attachment Processing                                                                                                                                                                                                                         |
| glide.email.outbound.max_attachment_count              | Sets the maximum number of attachments allowed per outbound email.  
  - **Type:** integer  
  - **Default value:** 30  
  - **Learn more:** Outbound Email Attachment Processing                                                                                                                                                                                                                         |
| glide.email.outbound.max_total_attachment_size_bytes  | Sets the maximum total attachment size in bytes allowed per outbound email. To send an email, the system must encode the contents of the email. This process may significantly increase the size of the email, including any attachments. It is best to set this property to a value well below the maximum email size.  
  - **Type:** integer  
  - **Default value:** 18874368  
  - **Learn more:** Outbound Email Attachment Processing                                                                                                                                                                                                                         |

**Note:** A different property, `com.glide.attachment.max_size`, sets the maximum file size allowed for any attachment in the system and overrides any larger values of `glide.email.inbound.max_total_attachment_size_bytes` and `glide.email.outbound.max_total_attachment_size_bytes`.

### Inbound email attachment processing

For inbound emails, the system enforces the maximum number and size of attachments as set by the `glide.email.inbound.max_attachment_count` and `glide.email.inbound.max_total_attachment_size_bytes` properties. When an attachment for an inbound email exceeds either value, the attachment is discarded. A record is created in the Email Attachments [sys_email_attachment] table containing the discarded file name and the reason it was discarded. The discarded file remains in the Email [sys_email] record. The order in which the system processes the attachments determines which attachments are discarded. This order may not be consistent from email to email.

When an inbound email attachment is discarded, the system also fires the `inbound.email_attachments.discarded` event. You can use the event to trigger a notification that alerts the email sender. For an example of a notification that can be triggered by the event, see the inactive "Demo Email Attachment(s) Discarded" notification.
Inbound email attachments are prevented from attaching to the target record if an identical attachment exists.

**Outbound email attachment processing**

For outbound emails, the system enforces the maximum number and size of attachments as set by the `glide.email.outbound.max_attachment_count` and `glide.email.outbound.max_total_attachment_size_bytes` properties. Email records are created from various sources and may exceed the configured attachment limits.

Emails that are ready to be sent from the Email [sys_email] table are subject to the outbound attachment limits. Emails that exceed either limit trigger a warning in the email system log and are sent with attachments up to the maximum number or total file size.

The log message for such an email might look like this: `Maximum combined attachment size exceeded. (max:15728640 bytes). One or more attachment records ignored.`

**Emails for notifications, scheduled reports, and exported tables**

Notifications can be set to include all the attachments from the record that triggers the notification. If the attachments exceed either of the outbound email attachment limits, the system excludes the excess attachments from the email and logs a warning message.

Reports can be scheduled for email distribution as attachments. Large reports may exceed the outbound attachment size limit. In this case, the system sends the scheduled report email without the report attached and logs a warning message. To avoid the issue, send links to large reports instead of sending the reports as attachments.

If a user attempts to export numerous records from a list that exceeds a configured warning threshold, a dialog box offers the option to email the exported records as an attachment. If the attachment exceeds the outbound attachment size limit, the system sends the email without the exported record list attached and logs a warning message.

**System mailboxes**

Email messages can be seen in the System Mailboxes menu, which gives you access to the system Inbox, Outbox, and Sent mail box.

Each provides a filtered view of emails to let you see only what you need to at any given time, including list fields applicable to each. The system mailboxes menu shows your current POP and SMTP status.

The System Mailbox is hosted by ServiceNow, who have sole access to the mailboxes. By default, once the instance pulls an email message, it is deleted from the mail server and stored in the application on the Email [sys_email] table.

For information about the fields that are shown in the System Mailbox, see [System email log and mailboxes](#). You can configure the layout of a system mailbox to show any of the email log fields, not only the ones that are shown by default.

- **Inbound emails**: All inbound mail is placed into the Inbox until it is processed. After it is cleared, the email moves to the Received state. If the email message matches the criteria in an inbound email action, the email is changed to Processed. If not, it is changed to Ready. If the system is restarted for any reason (such as during a system upgrade), all inbound mail waits on the external mail server until the system can request delivery.

- **Outbound emails**: All outbound mail is placed into the Outbox until it is processed. Once cleared, it is moved to Sent (if sent) or Skipped (not sent, as in the case of no valid recipients). If the system is restarted for any reason (such as during a system upgrade), all outbound mail waits in the instance database until the system comes online, and the scheduler looks for mail to deliver.

**Email Service**

Email Service installs the Email API on the instance.
By default, Email Service only allows admin users to access the Email API. Administrators can grant access to the Email API by:

1. Adding an access control for creating records in the Email [sys_email] table linked to the email_api_send role.
2. Assigning the email_api_send role to the non-admin user.
3. Verifying the non-admin user has read access to the notification target table. For example, an email notification for an incident, requires read access to the Incident table.

Non-admin users with the email_api_send role can access the Email API from the REST API Explorer.

Activate Email Service

Users with the admin role can activate the Email Service plugin (com.glide.email.service) to enable the Email API.

Role required: admin

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise they will receive the following error: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Grant access to the Email API

To grant non-admin users access to the Email API, administrators must create an access control and assign a special role.

Role required: admin

For additional details, see Email API.

1. Elevate privileges to security_admin.
3. Click New.
4. Create an access control for the Email [sys_email] table.

**Access control values**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>record</td>
</tr>
<tr>
<td>Operation</td>
<td>create</td>
</tr>
<tr>
<td>Admin overrides</td>
<td>Selected</td>
</tr>
<tr>
<td>Name</td>
<td>sys_email</td>
</tr>
<tr>
<td>Requires role</td>
<td>email_api_send</td>
</tr>
</tbody>
</table>

5. Assign the email_api_send role to the non-admin user.
6. Verify the non-admin user either has read access to all records in the notification target table or has read access to a specific record in the table.
For example, to work with incident notifications the non-admin user needs access to the Incident table. You can provide record access by:

- Granting the user an appropriate role, such as the itil role.
- Selecting a specific incident that was opened on behalf of the user.

**System notifications**

Set up notifications to alert users of record changes that may concern them. You can notify users via email, SMS text message, push notification, or messaging app.

**Email and SMS notifications**

Use email notifications to send selected users email or SMS notifications about specific activities in the system, such as updates to incidents or change requests.

Email notifications allow administrators to specify:

- When to send the notification
- Who receives the notification
- What content is in the notification
- Whether the notification can be delivered in an email digest and if so, the digest content

Additional email notification options are available. Users can subscribe to notifications, and administrators can make some notifications mandatory.

Administrators also have the option of converting existing email notifications to a rich HTML format. This format provides several advantages, including:

- Raw HTML content is converted into a WYSIWYG format.
- The content can be edited in a feature-rich HTML editor.
- Mail scripts are condensed into a single, easy-to-read line that can be reused in multiple email notifications.
- To prevent broken links, items like images and incidents, that are linked with URLs relative to an instance are converted to absolute links. For example, if an incident is linked using a relative URL, the link is converted to an absolute link.

**Note:** The rich HTML format is the default for all new email notifications.

**Note:** Instances cannot send or receive encrypted email messages. The system strips out the body of the encrypted email because it cannot process the encrypted content in plain text or HTML.

An email notification can also send as an SMS notification if the recipient has subscribed to the notification on an SMS channel. The system uses the subject line of the email notification and converts it to an SMS message. If the administrator doesn't want to use the email notification subject for the SMS notification, they can define an alternate SMS message in the email template form or email notification form. For more information, see *Create an email notification*.

For more information on creating an SMS channel, see *Create notification channels*.

If you want to change how the instance processes incoming email, see *Inbound email actions*. See *System email log and mailboxes* for examples of messages the system displays when notifications or inbound email actions are not processed.
Create notification categories

You can create notification categories to identify and group related notifications that are listed in the notification settings for your users.

Role required: admin

Before adding new categories, review the base system notification categories in the Notification Categories [sys_notification_category] table to determine if you need a new category.

1. Navigate to System Notification > Email > Notification Categories.
2. Click New.
3. Enter the Name of the category to identify the family of notifications. Provide a category name that is meaningful to your users, so that they can easily find their notifications under the appropriate category in their notification settings.
4. Enter a Short description to identify the category.
5. Click Submit.

The system adds the new category to the Notification Categories [sys_notification_category] table. After you create at least one, active notification that uses the new category, the category and notification are listed in the notification settings for users (Notifications tab in the System Settings window).

Create an email notification

Creating an email notification involves specifying when to send it, who receives it, what it contains, and if it can be delivered in an email digest.

Role required: admin

Consider the following items when you create or update a notification:

• Your notification recipients must be active users and have a valid email address defined.

ServiceNow users or members of groups must be defined as active users in the User [sys_user] table. They must also have a valid email address defined for their primary channel (device) in the Notification Device [cmn_notif_device] table. If users do not have an active profile and a valid email address, they will not receive notifications.

• Your notification recipients must have the appropriate notification preferences enabled.

If the notification is subscribable, each ServiceNow user or group member must have the notification and channels (devices) for the notification enabled in their notification preferences. Admins can impersonate users to review and configure their notification preferences.

• To have your email notification also send as an SMS notification, recipients must subscribe to the notification on an SMS channel. For more information on creating an SMS channel, see Create notification channels.

• After you create or update the notification, use the Preview Notification option to examine it. For example, you can test links that you may have added and verify the notification recipients. For details, see Preview email notifications.

Use the following tabs in the Notification form to configure an email notification:

• When to send — Conditions required to send the notification.
• Who will receive — Recipients of the notification.
• What it will contain — Contents of the notification.
• What Digest will contain — Contents of the email digest if the notification can be delivered in a digest.

Note: If you do not see all the fields on the form, switch to the Advanced view.
Watch this six-minute video to learn about the actions that the instance can take in response to messages from users and shows how to create or modify email notifications to users. In the video, skip to 3:29 for details on configuring email notifications.

1. Navigate to System Notification > Email > Notifications.
2. Click New.

3. Fill in the fields at the top of the Notification form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the email notification. Descriptive names help identify the purpose of the email notification. For example, Incident Opened &amp; Unassigned.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Table      | Select the database table to link the notification to, for example Incident [incident].
|            | **Attention:** Do not select the Task [task] table. This table is for extending other tables. Notifications that run on the Task table directly are not supported. |
|            | **Note:** Only tables and database views that are in the same application scope appear in the list. |
| Type       | Select the type of notification you are creating: EMAIL or Meeting Invitation. |
| Active     | Select the check box to enable the email notification. |
| Category   | Select the category to which this notification belongs. A category identifies and groups related notifications. This notification, if active and subscribable, is listed in the selected **Category** in the notification preferences for each user (**Notifications** tab in the System Settings window). |
|            | **Note:** Do not leave the category as **Uncategorized**, as users may not be able to find the notification in their list of notifications. |
|            | If you need a new category, see Create notification categories. |
| Allow Digest | Select the check box if an email digest is to be created for the notification. If selected, the What Digest will contain tab is displayed for creating the digest content. |
| Description | Type a description for this notification. |

4. Fill in the fields on the **When to send** tab.
Note: If the same trigger generates multiple notifications, the system only sends one notification. The system considers all other notifications, even if they have a different subject and body, as duplicates. The Ignore Duplicates business rule controls this functionality.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send when</td>
<td>Select under what condition the notification is sent:</td>
</tr>
<tr>
<td></td>
<td>• When a record is inserted or updated</td>
</tr>
<tr>
<td></td>
<td>• When a particular event is fired</td>
</tr>
<tr>
<td></td>
<td>• When triggered as an action step in Flow Designer</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Weight</td>
<td>[Required] Set a numerical value for the notification priority relative to duplicate notifications. Notifications that have the same target table and recipients, or the same subject and body, are considered duplicates. When there are duplicate notifications, the system only sends the notification with the highest weight. All other notifications are moved from the Outbox to the Skipped mailbox. The default value 0 causes the system to always send the notification (assuming the conditions are met). For example, suppose that a service desk agent adds a comment to an incident and shortly thereafter closes it. By default, these actions trigger both the Incident commented and Incident Closed notifications. However, both notifications are from the Incident table and also notify the incident caller. The system only sends the notification with the highest weight, which in this case is the Incident Closed notification.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Use the condition builder to select the conditions under which this notification is sent. For example, select <strong>Priority &gt; greater than &gt; 3 - Moderate</strong> to send the notification only for High and Critical priority incidents.</td>
</tr>
<tr>
<td>Inserted</td>
<td>Select the check box to enable email notification when a record is inserted. This field appears when you set the Send when field to <strong>Record inserted or updated</strong>.</td>
</tr>
<tr>
<td>Updated</td>
<td>Select the check box to enable email notification when a record is updated. This field appears when you set the Send when field to <strong>Record inserted or updated</strong>.</td>
</tr>
<tr>
<td>Event name</td>
<td>Select the event that triggers this notification. This field appears when you set the Send when field to <strong>Event is fired</strong>.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced condition</td>
<td>Create a script to perform certain actions, like sending a notification based on the current email record, changing field values, or changing system properties. The advanced condition script must return true or set a global answer variable to true to send the notification. The advanced condition script uses the following global variables: • current: Contains the current record from the table to which the notification is linked. • event: Contains the event that triggered the notification. Note: The Advanced condition field is evaluated in addition to other conditions you set on the notification. Both the condition and advanced condition must evaluate to true to send the notification.</td>
</tr>
</tbody>
</table>

5. Fill in the fields on the **Who will receive** tab.

The following example shows the default view of the tab. The advanced view contains additional fields (see table).

**Tip:** Consider limiting the recipient list of any notification to 1000 users. By default, if a notification has more than 100 intended recipients, the system creates multiple notification messages with up to 100 recipients each. If you want to change the recipient limit, set the system property glide.email.smtp.max_recipients.

<table>
<thead>
<tr>
<th>When to send</th>

<tr>
<td>Send to event creator</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users</td>
<td>Select the users you want to receive the email notification. You can search for users with the reference lookup icon or manually add their email addresses. This list of users is static.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Users/groups in fields</td>
<td>Select fields from the target record that reference the User [sys_user] or Group [sys_user_group] tables. The system sends the notification to users or groups in each field that you select. For example, if a notification uses the Incident [incident] table, you can select the <strong>Opened by</strong> field to send the notification to users or groups who opened the incident. This list of users or groups is variable and depends upon the values of the associated task record. You can also select a field that includes an email address string to send a notification to that address. <strong>Note:</strong> You can dot-walk to values in reference fields by clicking the plus sign in the field selector and then selecting the related field. If you address the notification to a user with an inactive record in the User [sys_user] table, the system does not send the notification to that user.</td>
</tr>
<tr>
<td>Groups</td>
<td>Select the groups you want to receive the email notification. You can search for groups with the reference lookup icon or by manually entering the group name. This list of groups is static. <strong>Note:</strong> Group members receive individual notifications only if <strong>Include members</strong> is selected in the group record.</td>
</tr>
<tr>
<td>Exclude delegates</td>
<td>Select this option to prevent the instance from sending email notifications to delegates of the users and members of the groups you selected.</td>
</tr>
<tr>
<td>Send to event creator</td>
<td>Select this check box to send the notification to the person who performed the action that started the notification process if the person is also a recipient. If the event creator is not specified in one of the recipient fields, the event creator does not receive a notification regardless of the setting in this field. For new notifications, this option is selected by default. If you want to know why you may not be receiving certain email notifications, see the blog post <em>Troubleshooting email notifications - Send to the Event Creator</em> by a ServiceNow Technical Support Engineer in the Now Community.</td>
</tr>
<tr>
<td>Event parm 1 contains recipient</td>
<td>Select this check box if the event parameter 1 contains one or more notification recipients (in a comma separated-list). This field is visible only when the <strong>Send when</strong> field is set to <strong>Event is fired.</strong></td>
</tr>
<tr>
<td>Event parm 2 contains recipient</td>
<td>Select this check box if the event parameter 2 contains one or more notification recipients (in a comma-separated list). This field is visible only when the <strong>Send when</strong> field is set to <strong>Event is fired.</strong></td>
</tr>
</tbody>
</table>
The system does not exclude recipients based on access controls. Recipients can receive email about records that they cannot normally access from the user interface. For example, requesters can receive email about incidents and catalog requests opened on their behalf even though they normally do not have access to these records. If a notification includes record details, verify that all recipients need these details.

**Note:** By default, the system does not send email notifications to itself. For example, an email notification from instanceABC@service-now.com does not send to instanceABC@service-now.com. The system prevents this behavior to avoid looping.

6. Fill in the fields on the **What it will contain** tab.
   The following example shows the default view of the tab. The advanced view contains additional fields (see table).
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Email template | If you want to reuse existing content, select an email template to add content to the email notification. You can only select an email template that meets one of the following conditions:  
  * shares the same scope and table as the notification  
  * shares the same scope but has no specified table  
  * shares the same table and is in the global scope |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subject</td>
<td>Enter the subject line for the email message. The subject can include variables from the Select variables column. If empty, the system uses the Subject value from the Email template. If you enter a value in this field, it overrides the template value. If your recipients subscribe to the email notification on an SMS channel, then the system sends the email notification subject as an SMS message. To send a different SMS message, fill in the SMS alternate field on the email template form or the email notification form.</td>
</tr>
<tr>
<td>Message HTML</td>
<td>Enter the content of the email notification message. The message can include variables from the Select variables column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. The Message HTML field is visible only if you set the content type to HTML and plain text or HTML only. If empty, the system uses the Message HTML value from the Email template. If you enter a value in this field, it overrides the template value. To prevent adding extra <code>&lt;p&gt;</code> and <code>&lt;div&gt;</code> elements to your email notifications, see the blog post Extra line spacing with paragraph tags in email client by a ServiceNow employee in the Now Community.</td>
</tr>
<tr>
<td>SMS alternate</td>
<td>Enter the notification message to send to an SMS device. The SMS alternate message is limited to 140 characters. If empty, the system uses the SMS alternate value from the Email template. If you enter a value in this field, it overrides the template value. If you don't fill in the SMS alternate field on this form or the email template, then the system uses the email notification subject as the SMS message.</td>
</tr>
<tr>
<td>Importance</td>
<td>Set the importance of the email message to low or high.</td>
</tr>
<tr>
<td>Content type</td>
<td>Select the content type for the email notification: • HTML and plain text • HTML only • Plain text only By default, HTML only is enabled.</td>
</tr>
<tr>
<td>Include attachments</td>
<td>Select this check box to send all attachments from the triggering record as email attachments.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Omit watermark</td>
<td>Use this check box to apply or remove the watermark attached to each email. If the email does not contain a watermark, the system reviews the conditions of the inbound actions to create or update task records. For more information, and an alternative way to hide watermarks, see <a href="#">Watermarks on notification emails</a>.</td>
</tr>
<tr>
<td>Message Text</td>
<td>Enter the notification message to send in plain text. This field appears when you set the content type to HTML and plain text or Plain text only. If empty, the system uses the Message Text value from the Email template. If you enter a value in this field, it overrides the template value.</td>
</tr>
<tr>
<td>From</td>
<td>Enter the email address that you want the email notification to use in the From field. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email must be in a valid format, otherwise a notification message appears near the field. Changing this address may require an advanced email setup such as enabling email forwarding, for example when using Sender Policy Framework (SPF) records for spam detection.</td>
</tr>
<tr>
<td>Reply to</td>
<td>Enter the email address you want people to use when replying to the email notification. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email must be in a valid format, otherwise a notification message appears near the field. You can add no more than one email address in this field. Changing this address requires an advanced email setup such as enabling email forwarding.</td>
</tr>
<tr>
<td>Push message only</td>
<td>Select this option to send this notification only as a push notification to a mobile device. The Push Notification feature must be active.</td>
</tr>
<tr>
<td>Push messages</td>
<td>Associate one or more push messages with this notification. The Push Notification feature must be active.</td>
</tr>
</tbody>
</table>

7. If you selected the **Allow Digest** check box, fill in the fields on the **What Digest will contain** tab to create the email digest content for the notification. The following example shows the default view of the tab. The advanced view contains additional fields (see table).
<table>
<thead>
<tr>
<th>When to send</th>
<th>Who will receive</th>
<th>What it will contain</th>
<th>What Digest will contain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digest Template</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Digest Subject</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Digest HTML</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Digest Separator (HTML)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
<td></td>
<td></td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Digest Template</td>
<td>If you want to reuse existing content, such as headers or footers, select an email template to add content to the email digest.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Digest Subject</td>
<td>Enter the subject line for the email digest. The subject can include variables from the Select variables column. If empty, the system uses the Subject value from the Email template. If you enter a value in this field, it overrides the template value.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Digest HTML</td>
<td>Enter the recurring content for the email digest. The digest content can include variables from the Select variables column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. To prevent adding extra <code>&lt;p&gt;</code> and <code>&lt;div&gt;</code> elements to your email digest, see the blog post Extra line spacing with paragraph tags in email client by a ServiceNow employee in the Now Community.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Digest Separator (HTML)</td>
<td>Use the line to separate each item summarized in the digest.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Digest From</td>
<td>Enter the email address to be used in the From field of the email digest. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email address must be in a valid format, otherwise a notification message appears near the field. Changing this address requires an advanced email setup such as enabling email forwarding.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Digest Reply To</td>
<td>Enter the email address that you want people to use when replying to the email digest. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email must be in a valid format, otherwise a notification message appears near the field. Changing this address requires an advanced email setup such as enabling email forwarding.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Digest Text</td>
<td>Enter the recurring content of the email digest to send in plain text. This field appears when you set the content type to HTML and plain text or Plain text only.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Digest Separator (text)</td>
<td>[Optional] Use the dash character as a line to separate each item summarized in the digest. This field appears when you set the content type to HTML and plain text or Plain text only.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

When you save or update the notification, the email Digest option is available for the notification in the notification settings of your users.
8. When you finish creating the notification, click **Submit**. Or, if you are done modifying the notification, click **Update**.

Use the **Preview Notification** option to **check your notification**. For example, you can see:

- How the **Subject** and **Message** fields are displayed.
- Which users will or will not receive the notification, including the reasons why users will not receive it.

**Convert legacy email notifications to rich HTML**

By default, new email notifications are created in the rich HTML format. But you can also convert legacy notifications to rich HTML.

Role required: admin

1. Navigate to **System Notification > Email > Notifications**.
2. On the **Email Notifications** list screen, click the name of the email notification you want to convert.
3. Click the **What it will contain** tab.
### Notification - Notify test case user

<table>
<thead>
<tr>
<th>When to send</th>
<th>Who will receive</th>
<th>What it will contain</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Content type
- HTML and plain text

#### Importance
- -- None --

#### Include attachments
- unchecked

#### From
- textbox

#### Omit watermark
- unchecked

#### Reply to
- textbox

#### Push Message Only
- unchecked

#### Push Messages
- Notify test case user

#### Email template

**Subject**
- Test notification: New test assigned to you on [metric_type] - due by [due_date]

**Message**
- You have been assigned to complete tests on [metric_type]. Please follow the link below and complete the tests by [due_date]. You can save your results until you are ready to submit them. When you have completed the test, and filled in all final results, submit the test.

Click here to begin the test:
- `<email_script>
  var link = new AssessmentUtil().getAssessmentInstanceURL(current_sys_id);
  var url = "a.href=" + link + ""/store/jar;template-print(";
  email_script(url);
</email_script>

To view your test queue at any time, sign in and navigate to Sell-Service > My Tests.

#### SMS alternate

- checkbox

- Select variables: [Fields]
4. Click **Switch to Rich HTML Editor**.

The system copies any raw HTML from the Message field and converts it to rich HTML in the Message HTML field. Additionally, any mail scripts in the body are automatically saved to the Email Script [sys_script_email] table and are replaced in the notification body with an embedded script tag. This makes the notification body easier to read.
<table>
<thead>
<tr>
<th>When to send</th>
<th>Who will receive</th>
<th>What it will contain</th>
</tr>
</thead>
<tbody>
<tr>

<td>Select variables:</td>
</tr>
</tbody>
</table>

You have been assigned to complete tests on $(metric_type). Please follow the link below and complete the tests by $(due_date). You can save your results until you are ready to submit them. When you have completed the test, and filled in all final results, submit the test.

Click here to begin the test:
$(mail_script:Notify test case user_script_1)

To view your test queue at any time, sign in and navigate to Self-Service > My Tests.
When you convert an email notification that was created in a version prior to Eureka to rich HTML, mail scripts are automatically moved to the Email Script [sys_script_email] table and an embedded script tag with the name of the script is automatically inserted into the body of the notification.

When creating new email notifications, write mail scripts using System Notification > Email > Notification Email Scripts. When the scripts are completed, add a ${mail_script:script name} embedded script tag to the email notification body. This makes it easy to use the same scripts in multiple email notifications. All you need to do is copy and paste from one notification to the next and the embedded script tag.

If you manually enter a mail script, any text bounded by <mail_script> </mail_script> in the body of a new or converted email notification or template which is saved to the record, a message asks whether the mail script should be converted.

In many cases, an unconverted mail script fails to run from inside the HTML editor. If you select Yes, the script is added to the Email Script [sys_script_email] table and is automatically replaced in the body with an embedded script tag. You can view the mail scripts in their original form by opening the email notification and clicking the Show Notification Scripts related link.

Control visibility to email records generated by notifications

Define conditions that restrict read access to target email records containing sensitive information.

Role required: admin

Use the Email Access Restriction [email_access_restriction] table to define conditions that control read access to an email record generated by a notification containing sensitive information. These conditions are processed by the base system ACL for the Email [sys_email] table.

When you specify conditions to restrict access for a notification, the email records are visible only to users that match the conditions specified for the notification.

1. Navigate to System Notification > Email Access Restriction.
2. Click New.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notification</td>
<td>Choose the notification that generates the email record that should be restricted.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Application</td>
<td>Displays the application scope.</td>
</tr>
<tr>
<td>Table</td>
<td>Displays the target table for the notification that you selected.</td>
</tr>
<tr>
<td>Condition</td>
<td>Use the condition builder to determine who can access the email record. The conditions must evaluate to true to enable read access to the email record.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a short description of the read access restriction.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Advanced conditions for email notifications**

Use an advanced condition to send a notification based on the current email record, changing field values, or system properties.

To send a notification using an advanced condition, you can:

- Call a function that returns a value, or
- Set the global variable `answer` using a script

For example, in the following code, you call a function to prevent the system from sending an email notification if the sender of a self-service request is a member of the XYZ group:

```javascript
(function() {
    var groupMember = gs.getUser();
    return !groupMember.isMemberOf('XYZ');
})();
```

Alternatively, you can script the same advanced condition by using the `answer` variable:

```javascript
var groupMember = gs.getUser();
if(groupMember.isMemberOf('XYZ')){
    answer = false;
} else {
    answer = true;
};
```

Note that the script must set the `answer` variable to `true` to send the notification. If you script no conditionals, the value of `answer` is equal to the last value that you set for the variable.

You can add a script-based condition in the **Advanced condition** field by configuring the Email Notification form and adding the field. You can access the field in the Advanced view without configuring the form.

The advanced condition script uses the following business rule global variables:

- `current`: contains the current record from the table to which the notification is linked.
- `event`: contains the event that triggered the notification.

**Note:** The **Advanced condition** field is evaluated in addition to other conditions you set on the notification. Both the **Condition** and **Advanced condition** must evaluate to true in order to send the notification.

**Edit HTML content in an email notification**

For added control over the content of an email notification, you can edit the underlying HTML.

Role required: admin

1. Navigate to **System Notification > Email > Notifications**.
2. Open an email notification record.
3. On the form, open the **What it will contain** tab.
4. In the **Message HTML** field, click the source code icon (‡) to open the HTML source code editor.

5. Make the needed changes to the HTML.
6. On the window, click **Ok**.
7. On the form, click **Update**.

**Document attachments on an email notification**

You can attach documents and reports to email notifications by scripting or linking to the sys ID of the record.

You can include all attachments from the source record with the notification. For example, if an incident update generates a notification, you can include all attachments from the incident record with the notification. To include all attachments from the source record, select the check box for the **Include attachments** field. Note that email messages, including attachments, cannot exceed the maximum email size. This size includes MIME encoding. For details on MIME encoding, see [Email service size restrictions](#).
Attaching documents with scripting

Using scripting, you can attach documents by linking to them, or you can attach various types of reports by specifying their IDs in the system.

Linking to an attachment

You can add an attachment to a notification by linking to the attachment record in the message of the notification. Upon clicking the link, email recipients log in to the instance to view the attachment record.

Linking to attachment records in this fashion requires using email notification scripting. For example:

```javascript
template.print ( 'Attachment: <a href="/sys_attachment.do?sys_id=' + gr.sys_id + '"></a>' + gr. file_name + '</a>\n') ;
```

Attaching reports using the Sys ID

You can also attach various types of reports, including gauges, dashboards, and charts, to a notification. The scripts to attach these reports take the following syntax:

```javascript
${report:X:Y}
```

where:

- X is the type of report you want to attach (reportID, gaugeID, dashboardID, or chartID).
- Y is the sys ID of the report, gauge, dashboard, or chart to be attached.

For example:

- `{report:reportID:<abc123>}`
- `{report:gaugeID:<abc123>}`
- `{report:dashboardID:<abc123>}`
- `{report:chartID:<abc123>}`

**Note:** Multilevel pivot reports can’t attach to email notifications.

Line breaks in email notifications and rich HTML

Rich HTML provides additional control over line breaks in your email notifications and templates.

To provide control over line breaks, a Newlines to HTML check box is available in the Email Script form.
### Newlines to HTML option

Selecting the **Newlines to HTML** check box indicates that the method for handling line breaks in earlier versions carries forward for email notifications and templates. When an email notification or template is converted to rich HTML, the **Newlines to HTML** check box is automatically selected.

For new mail scripts, add correct HTML line breaks to `template.print()` statements.

If an email notification or template is not converted to rich HTML, newlines are automatically wrapped with `<div>` tags, the same as previous versions. The old mail scripts still work. However, the administrator does not enjoy the benefits of working in the rich HTML format, and does not have as much control over exact HTML formatting.

### HTML line breaks in new scripts

When writing new scripts, insert explicit HTML line breaks and clear the **Newlines to HTML** check box so that no HTML tags are injected when email notifications are generated. For existing notifications and templates, replace `template.print("\n")` JavaScript function calls with `template.print("<br/>")`. This replacement gives you better control over the HTML formatting of your email notifications.
Preview email notifications
You can preview what notifications look like before you actually enable the instance to send them.

Role required: admin

You can preview both types of notifications as specified by the **Send when** field on the Notification form:

- **Record inserted or updated**: A change to record in the instance triggers the notification.
- **Event is fired**: An event, such as expiration of a certificate or an inbound email action, triggers the notification.

1. Navigate to **System Notification > Email > Notifications**.
2. Open the notification or create one.
   You must save the record before you can view the preview accurately.
3. Click **Preview Notification** on the form header.
4. On the Notification Preview window, verify that the notification works as expected.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preview records for this breakdown source</td>
<td>The type of event that triggers the notification. This choice list appears if you preview an event-triggered notification. Select one of the following:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Generated Event</strong>: Preview the notification with a generic event that the previewer creates. This does not actually generate an event record.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Existing Event</strong>: Preview with an existing event record in the instance. If you select this option, select the event in the <strong>Event Record</strong> field.</td>
</tr>
<tr>
<td>Event Record</td>
<td>An existing event to preview an event-created notification. This option appears if you select <strong>Existing Event</strong> as the event type (for event-triggered notifications only).</td>
</tr>
<tr>
<td>Event Creator</td>
<td>The user triggering the notification for the purpose of the preview. The event creator defaults to the user who clicked <strong>Preview Notification</strong>. You can change the creator as needed. You can change the preview record as needed to see the changes in the notification content.</td>
</tr>
<tr>
<td>Preview Record</td>
<td>The record triggering the notification for the purpose of the preview. The preview record defaults to one of the records in the table specified in the <strong>Table</strong> field on the Email Notification form. You can change the preview record as needed to see the changes in the notification content.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Users</td>
<td>The users who will receive the notification, as specified in the <strong>Who will receive</strong> section of the Email Notification form:</td>
</tr>
<tr>
<td></td>
<td>• All users that you specify on the form appear, but only the users that will actually receive the notification with the current preview settings appear in black text.</td>
</tr>
<tr>
<td></td>
<td>• Users that are specified but for whatever reason will not receive the notification appear in red, strikethrough text. Place the cursor over any of these names to see the reason the user will not receive the notification. For example, one reason could be that the user's notification settings are disabled.</td>
</tr>
<tr>
<td>Subject and Body</td>
<td>The content of the notification as defined by the template. The <strong>Subject</strong> and <strong>Body</strong> sections on the preview display the content in the corresponding <strong>Subject</strong> and <strong>Message</strong> fields on the template.</td>
</tr>
<tr>
<td></td>
<td>If the template includes a link to the record that triggered the notification, the <strong>Preview Record</strong> link is used. Click the link to go to that record.</td>
</tr>
</tbody>
</table>

5. After you have reviewed the notification, exit the preview window.
6. Make the necessary changes to the notification or template, if necessary.

*Time zone for email notifications*

A system property controls the time zone that the instance uses for the date and time stamp of a message.

The date and time stamp of a notification uses the system time zone, not the time zone of any recipient. The email property `glide.email.append.timezone` controls whether to append the time zone. If true, the system time zone of the instance is appended to any Date/Time fields in outbound email messages (for example, 2018-07-02 04:01:14 PST).

*Specify alternative outbound email addresses for notifications*

By default, the system sends all outbound email notifications from the default email address of the instance, but you can specify an alternative address.

Role required: admin

For organizations that need to send email messages from specific email addresses, such as from multiple service desks, or they want to send notifications in different languages, the platform supports configuring multiple outbound addresses.

1. Navigate to **System Notification > Email > Notifications**.
2. Select an existing notification record for the desired event, such as **Incident Closed**.
3. Create a copy of this notification for each outbound email address.
4. Open one of the notification copies, and click the **Advanced view** related link.
5. In the **What it will contain** section, add an email address to the From field that is different from the default instance address.

   For more information on how to construct the From address, refer to section 3.6.2 of RFC 2822.

6. Add a different email address than the **From** address to the **Reply to** field if you want replies to this notification to go to a different address.
The system checks the **From** field for an address. If this field is empty, then the system uses the default address for the instance. If the **Reply to** field is empty, then all replies are sent to the address from which the notification was sent. If the **Reply to** field contains an email address, then the system sends all replies to the notification to this address.

7. Create mutually-exclusive conditions for notifications of the same type, so only the desired notification is sent when the event is fired.

   For example, if the **Company** is a certain value, then the notification comes from a unique email address entered in the **From** field.

8. Click **Update**.

   **Specify an outbound email address for a particular language**

   You can specify a different email address for each language your instance supports.

   Role required: admin

   1. Create or copy a notification record for the desired event.

   2. In the **What will it contain** section, enter a new email address in the **From** field.

   3. Create the **Subject** and **Message** content in the desired language.

   4. In the **When to send** section, create a condition as follows:

      1. In the list of **Condition** fields, select **Show Related Fields** from the bottom of the choice list.

      2. From the choice list of **Related Fields**, select the field that identifies the recipient.

          For example, select **Caller > User** fields to send the notification to the user who called in an incident, or **Assigned to > User** fields to send the notification to the user to whom an incident is assigned.

      3. From the choice list of user fields, select **Language**.

      4. Select the **is** operator.

      5. Complete the condition by selecting the language of the desired user.

      5. Click **Update**.

      All notifications for that event originate from the specified email address and go out in the language of the recipient.

   **Notification variables**

   Use notification variables to display dynamic information in the body of a notification such as a field value, a link to a record, or a link to system preferences.

   **Syntax**

   Specify a notification variable using this syntax:

   ```
   ${variable-name+variable-parameters}
   ```

   The **variable-name** portion is always required. Not all notification variables support the **variable-parameters** portion. When available, most variable parameters are optional. See the list of available notification variables for variable names and available parameters.

   **Available variables**

   The system provides these notification variables.
### Available notification variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>${field-name}</code></td>
<td>Display the value of the specified field.</td>
<td>None</td>
</tr>
<tr>
<td><code>${image-field-name}</code></td>
<td>Display an image associated with a record. This variable is typically used with HTML to specify the source of an image element.</td>
<td>None</td>
</tr>
<tr>
<td>• <code>${URI}</code></td>
<td>Display a link to the current record.</td>
<td>Any valid <code>sysparm</code> URL parameter. For example:</td>
</tr>
<tr>
<td>• <code>${URI_REF}</code></td>
<td>• <code>URI</code>: The link text is the word <code>LINK</code>.</td>
<td>• <code>sysparm_scriptlet</code></td>
</tr>
<tr>
<td>• <code>${reference-field.URI}</code></td>
<td>• <code>URI</code>: The link text is the word <code>LINK</code>.</td>
<td>• <code>sysparm_view</code></td>
</tr>
<tr>
<td>• <code>${reference-field.URI_REF}</code></td>
<td>• <code>URI_REF</code>: The link text is the display value of the record.</td>
<td></td>
</tr>
<tr>
<td>Note: These variables don't apply to records in Workspace. To link to a record in Workspace, create a mail script that prints a URL to a notification. For more information, see Linking to a record in Workspace.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• <code>${reference-field.URI_REF}</code></td>
<td>Display a link to the record listed in a reference field.</td>
<td>Any valid <code>sysparm</code> URL parameter. For example:</td>
</tr>
<tr>
<td>• <code>${reference-field.URI_REF}</code></td>
<td>• <code>URI</code>: The link text is the word <code>LINK</code></td>
<td>• <code>sysparm_scriptlet</code></td>
</tr>
<tr>
<td>• <code>${reference-field.URI_REF}</code></td>
<td>• <code>URI_REF</code>: The link text is the display value of the record.</td>
<td>• <code>sysparm_view</code></td>
</tr>
<tr>
<td><code>${CMS_URI}</code></td>
<td>Display a link to the specified record within a CMS page.</td>
<td><code>&lt;CMS-site&gt;/&lt;CMS-page&gt;</code>: The required relative path to the CMS page.</td>
</tr>
<tr>
<td><code>${notification:body}</code></td>
<td>Display the body contents of an email template or email notification. Use this notification variable to specify where to display body content in an email layout.</td>
<td>None</td>
</tr>
<tr>
<td><code>${mail_script:script-name}</code></td>
<td>Run the specified mail script.</td>
<td>None</td>
</tr>
<tr>
<td><code>${NOTIF_UNSUB}</code></td>
<td>Display a link unsubscribe from this notification.</td>
<td><code>link_text</code>: specify the text to display as a link within quotation marks.</td>
</tr>
<tr>
<td><code>${NOTIF_PREFS}</code></td>
<td>Display a link to set notification preferences.</td>
<td><code>link_text</code>: specify the text to display as a link within quotation marks.</td>
</tr>
<tr>
<td><code>${comments:n}</code></td>
<td>Display the most recent comments that were made on the target record. The number of comments to display is n. For example, <code>${comments:3}</code> displays the last three comments that were made to the record. To display all comments, use the variable <code>${comments}</code>.</td>
<td>Any number greater than 0.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
<td>Available parameters</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td><code>${comments_and_work_notes}</code></td>
<td>Display the most recent comments and work notes that were made on the target record. The number of comments and work notes to display is $n$. For example, <code>${comments_and_work_notes:3}</code> displays the last three comments and work notes that were made to the record. To display all comments and work notes, use the variable <code>${comments_and_work_notes}</code>.</td>
<td>Any number greater than 0.</td>
</tr>
</tbody>
</table>

### Examples

Refer to the following examples to see how each notification variable is rendered in the output:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>${field-name}</code></td>
<td>Source: Incident <code>${number}</code> - comments added</td>
</tr>
<tr>
<td></td>
<td>Output: Incident INC1000001 - comments added</td>
</tr>
<tr>
<td><code>${image-field-name}</code></td>
<td>Source: <code>&lt;img src='${picture}?t=medium'/&gt;</code></td>
</tr>
<tr>
<td></td>
<td>Output: <img src="image-url" alt="Image Example" /></td>
</tr>
</tbody>
</table>
### Variable | Example
--- | ---
- `${URI}`  
- `${URI_REF}` | `${URI}` Source: Click here to view incident: `${URI}`  
`${URI}` Output: Click here to view incident: ![LINK](image)

`${URI_REF}` Source: Click here to view incident: `${URI_REF}`  
`${URI_REF}` Output: Click here to view incident: ![INC0000055](image)

- `${reference-field.URI}`  
- `${reference-field.URI_REF}` | Source: Click here to view Incident: `${URI_REF}`  
Click here to view Related Problem: `${problem_id.URI_REF}`  
Output: Click here to view Incident: ![INC0010002](image)  
Click here to view Related Problem: ![PRB0040001](image)

`${CMS_URI}` | Source: `${CMS_URI}+ess/incident_detail`  
Output: a link to a target CMS page such as  
https://<instance name>.service-now.com/ess/incident_detail.do?sysparm_document_key=incident,46e18c6fa9fe19810066a0083f76bd56
<table>
<thead>
<tr>
<th>Variable</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>${notification:body}</code></td>
<td></td>
</tr>
<tr>
<td><code>${mail_script:script-name}</code></td>
<td></td>
</tr>
<tr>
<td><code>${NOTIF_UNSUB}</code></td>
<td></td>
</tr>
<tr>
<td><code>${NOTIF_PREFS}</code></td>
<td></td>
</tr>
</tbody>
</table>

![Variable Example](image-url)
Links to records in email notifications

Adding the ${URI} parameter to an outbound email body or template creates a link to a specific record.

When a user clicks the word LINK, the instance prompts the user to log in if not already logged in, and then redirects the user to the record specified in the URI.

The ${URI} parameter has an extension called the ${URI+} format to specify additional arguments in the email link, such as sysparm terms, in addition to the automatically created URI. For example (whitespace added for improved readability):

```javascript
${URI+&sysparm_scriptlet=current.assigned_to=gs.getUserID()
&sysparm_scriptlet_condition=current.assigned_to.nil()
&sysparm_view=incident_active}
```

This example executes the JavaScript:

```javascript
current.assigned_to=gs.getUserID()
```

when the condition of

```javascript
current.assigned_to.nil()
```

is satisfied. Additionally, the script sets the view to `incident_active`.

Linking to a record in Workspace

The ${URI} and ${URI_REF} variables don't apply to records in Workspace. To link to a record in Workspace, create a mail script and reference it in your notification. For more information on using mail scripts, see JavaScript in emails.

The mail script that you create should print a URL to the notification. The URL must have the following format:

```plaintext
https://<instance_name>/now/workspace/<workspace_name>/record/<table_name>/
<sys_id>
```

The following example script shows the logic that a mail script must include to create a link to a record in Workspace.

```javascript
// Dynamically construct an Agent Workspace URL and insert a link in the notification
var agentURL = '<a href="' + gs.getProperty('glide.servlet.uri') + '/now/workspace/agent/record/'+ current.getTableName() + '/' + current.sys_id + '">' + current.number + '</a>';
template.print(agentURL + "<br />");
```

Enable links to records

Adding the special ${URI} parameter to an outbound email body or template creates a link to a specific record.
When a user clicks the word **LINK**, the instance prompts the user to log in if not already logged in, and then redirects the user to the record specified in the URI.

### URI email notification

The `$URI` parameter has an extension called the `$URI+` format to specify additional arguments in the email link, such as sysparm terms, in addition to the automatically created URI. For example (whitespace added for improved readability):

```text
${URI+&sysparm_scriptlet=current.assigned_to=gs.getUserID()
 &sysparm_scriptlet_condition=current.assigned_to.nil()
 &sysparm_view=incident_active}
```

This example executes the JavaScript:

```javascript
current.assigned_to=gs.getUserID()
```

when the condition of

```javascript
current.assigned_to.nil()
```

is satisfied. Additionally, the script sets the view to **incident_active**.

### Change the link text

To show the display value of the record as the link text instead of the word **LINK**, use the `$URI_REF` parameter instead of the `$URI` parameter.

### URI_REF email notification

For example, if the URL displays an incident record, the link text is the incident number, which is the display value for incidents. If the URL displays a user record, then the link text is the user name.

### Link to related records

A notification can link to a related record by specifying a reference field in front of the `$URI` or `$URI_REF` parameters.

Format the related record link as follows:

- `$<reference field that contains the related record you want to display>.URI`
• ${<reference field that contains the related record you want to display>.URI_REF}

For example:

**Related records**

<table>
<thead>
<tr>
<th>Related record to provide link to</th>
<th>Notification record table</th>
<th>Reference field</th>
<th>Samples</th>
</tr>
</thead>
</table>
| Related task record to be approved from an approval notification | Approval [sysapproval_approver] | Approval for [sysapproval] | • ${sysapproval.URI}  
• ${sysapproval.URI_REF} |
| Related problem record in an incident notification | Incident | Problem [problem_id] | • ${problem_id.URI}  
• ${problem_id.URI_REF} |

For example, the following notification template produces the email links in the picture below:

Click here to view Incident: ${URI_REF}
Click here to view Related Problem: ${problem_id.URI_REF}

Click here to view Incident: **INC0010002**  
Click here to view Related Problem: **PRB0040001**

**Related record link**

**Content page links in email notifications**

Links to CMS pages can be put in notifications to make it easy for the reader to access the pages.

The link takes the following format: ${CMS_URI+<site>/<page>}.  

For example, to link the email recipient to a page called Incident in the content site ESS, with the current incident as the target document, use the following format: ${CMS_URI+ess/incident_detail}  

The resulting email URL has this format: https://<instance name>.service-now.com/ess/  
incident_detail.do?  
sysparm_document_key=incident,46e18c0fa9fe19810066a0083f76bd56

**Email unsubscribe**

Administrators can add unsubscribe links to notifications so that users can stop receiving particular email messages.

**Note:** The base system notifications include unsubscribe and notification preferences links.

The system offers two types of macros to create unsubscribe links.

• An unsubscribe link that creates an email message to the instance.
• An unsubscribe link that opens the notification preferences for the user on the instance.
Available unsubscribe macros

<table>
<thead>
<tr>
<th>Unsubscribe type</th>
<th>Macro used</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unsubscribe by email (Unauthenticated)</td>
<td>${NOTIF_UNSUB}</td>
<td>The system generates an HTML mailto hyperlink. When users click the link, their browser or email client creates a pre-formatted unsubscribe email message to the instance.</td>
<td>link_text: specify the text to display as a link within quotation marks.</td>
</tr>
<tr>
<td>Unsubscribe by notification preferences (Authenticated)</td>
<td>${NOTIF_PREFS}</td>
<td>The system generates an instance link directly to the notification preferences for this notification type.</td>
<td>link_text: specify the text to display as a link within quotation marks.</td>
</tr>
</tbody>
</table>

Administrators can add unsubscribe macros to any notification record type such as:
- Email layouts
- Email templates
- Email notifications

**Unsubscribe by email**

Unsubscribe by email requires the user email client or browser to create a pre-formatted email message containing these elements:
- The **To** field has the email address of the instance.
- The **Subject** starts with the string Unsubscribe from.
- The **Body** has a JSON string with a name-value pair of Unsubscribe and an array value that contains two more name-value pairs.
  - The **notification_id** parameter specifies the Sys ID of the notification the user wants to unsubscribe from.
  - The **unsub_token** parameter specifies an instance ID the system uses to verify that the email came from a ServiceNow instance.

**Note:** Some email clients and web browsers, such as GMail on Chrome, require extra client configuration to support mailto hyperlinks. Administrators can provide an alternative unsubscribe method for users whose email client or browser does not support mailto links. See RFC6068 for information about the mailto URI scheme.

The **Unsubscribe from Notification** inbound action processes the email and unsubscribes the sender from the listed notification.

**Note:** Unsubscribing by email message does not require users to authenticate with the instance first.

**Unsubscribe by notification preferences**

Unsubscribe by notification preferences requires the user's browser to navigate to the notification preferences page on the instance. After logging in, the system displays the notification preferences for this particular notification.

Users can set preferences for this notification such as disabling notifications for a particular device. Users must save their notification preferences for changes to take effect.
**Unsubscribe links**

This email layout adds several unsubscribe links to the bottom of each email notification.

```
${NOTIF_UNSUB} from this notification by email or ${NOTIF_UNSUB +link_text="click here"}.
Manage your ${NOTIF_PREFS} or ${NOTIF_PREFS+link_text="click here"}.
```

When rendered in an email notification, the unsubscribe links only display the link text.
Notification Preview

Preview records for this breakdown source

Incident INC00000060 commented

Body

You can view all the details of the incident by following the link below:

Go to Instance

Unsubscribe | Manage Preferences
If a user clicks the **Unsubscribe** link, the email client creates a message such as this:

![Sample unsubscribe by email message](image)

**Sample unsubscribe by email message**

*Scripting for email notifications*

Email scripts allow for business rule-like scripting within an outbound email message. With mail scripts, you can dynamically change the email output of your system based on different criteria. Mail scripts allow you to perform simple tasks, such as displaying incident data, and complex ones, such as making advanced database queries.

You can add a `${mail_script:script_name}` embedded script tag to the body of the email notification or template, replacing `script_name` with the name of the script you created. This makes it easy to use the same scripts in multiple email notifications or templates.

If you manually enter a mail script bounded by `<mail_script>` and `</mail_script>` in the body of a new or converted email notification or template, and then attempt to save the record, a message asks whether the mail script should be converted. In many cases, an unconverted mail script fails to run from inside the HTML editor. If you select **Yes**, the script is added to the Email Script [sys_script_email] table and is automatically replaced in the body with an embedded script tag (`${mail_script:script_name}`).

**JavaScript in emails**

Create mail scripts in **System Notifications > Email > Notification Email Script**, and refer to them by using `${mail_script:script_name}` in the script field.

To print text into the body of the message, use the `template.print("a string")` function.
JavaScript in templates

The `event.parm1` and `event.parm2` parameters that come from the originating event can also be used.

Mail script API

Certain variables are available when processing mail_script scripts.

**Mail script variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Object Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template</td>
<td>Handles printing from the mail script to the email message.</td>
</tr>
<tr>
<td></td>
<td>template.print(&quot;message&quot;); //outputs message to the email body.</td>
</tr>
<tr>
<td></td>
<td>template.space(&quot;number of spaces&quot;); //outputs spaces to the email body.</td>
</tr>
<tr>
<td>email_action</td>
<td>GlideRecord object for the email notification (sysevent_email_action).</td>
</tr>
<tr>
<td>event</td>
<td>GlideRecord object for the event that fired the notification (sysevent).</td>
</tr>
<tr>
<td>Variable</td>
<td>Object Description</td>
</tr>
<tr>
<td>----------</td>
<td>--------------------</td>
</tr>
<tr>
<td>email</td>
<td>EmailOutbound object</td>
</tr>
</tbody>
</table>

Available methods:

- **addAddress(String type, String address, String displayname):** type can be cc or bcc.
- **setFrom(String address):** override the sender address.
- **setReplyTo(String address):** override the reply to address.
- **setSubject(String subject):** override the subject of the message.
- **setBody(String message):** override the body of the message.

The email address that is passed by setFrom and setReplyTo needs to be in a valid form such as helpdesk@sn.com or Display Name <helpdesk@sn.com>. If the email address includes a 'Display Name', then that value overrides the instance's display name.

Example scripting for email notifications
Examples of scripting for email notifications.

**Scripting examples for email notifications**

A simple text string is the most basic example of the way a mail script works. This script prints out "Incident number - INC00001".

```java
template.print("Incident number - "+ current.number);
```

More advanced scripts, like this one, can be found by browsing through the base system email templates.

```java
template.print("Summary of Requested items:<br />
var gr = new GlideRecord("sc_req_item");
gr.addQuery("request", current.sysapproval);
gr.query();
while(gr.next()) {
    template.print(gr.number + ": " + gr.quantity + " X " +
gr.cat_item.getDisplayValue() + ": " + gr.cat_item.price.getDisplayValue() + " each <br />
}
```

To dynamically change field values within an email, use the following functions within `<mail_script>` syntax:

```java
...
email.setFrom(current.caller_id.email);
email.setReplyTo("joe.employee@yourcompany.com");
email.setSubject("This is the new subject line");
email.setBody("This is the new body");
```
Using the **instance_name** property ensures that the notification still works when migrated between instances.

```javascript
function dothis()
{
    var gr =new GlideRecord('sys_attachment');
    gr.addQuery('table_sys_id',current.sys_id);
    gr.query();
    while(gr.next()){
        template.print('Attachment: <a href="https://'+
        gs.getProperty('instance_name')+'.service-now.com/sys_attachment.do?sys_id='+
        gr.sys_id+'">' +
        gr.file_name+'</a>');}
}
```

You can specify copied and blind copied recipients by using the email object within a mail script.

```javascript
//email.addAddress(type, address, displayname);
email.addAddress("cc","john.copy@example.com","John Roberts");
email.addAddress("bcc","john.secret@example.com","John Roberts");
```

The following is an example script to add users from **watch_list** as copied recipients.

```javascript
if(!current.watch_list.nil()){
    //get watch list addresses and add to cc
    var watcherIds = current.watch_list.split(",");
    
    //get user records
    var user =new GlideRecord("sys_user");
    user.addQuery("sys_id", watcherIds);
    user.addQuery("notification",2);
    //email
    user.addQuery("email","!=","");  
    user.query();
    while(user.next()){
        //add to cc list
        email.addAddress("cc", user.email, user.getDisplayValue());}
}
```

### Useful attachment scripts

This is a searchable version of the Useful Attachment Scripts.

**Caution:** The customization described here was developed for use in specific instances, and is not supported by ServiceNow Technical Support. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.

**Copy attachments from record to record**

Use the following script to copy an attachment from one record to another record:

```javascript
GlideSysAttachment.copy('sourcetable','sys_id','destinationtable','sys_id');
```

**Note:** GlideSysAttachment.copy copies all attachments; it cannot select specific attachments.
Delete duplicate attachments

Use the following script in a business rule, scheduled job, or background script to delete duplicate attachments located in the Attachments [sys_attachment] table:

```javascript
function fixDuplicateImages(){
    var gr = new GlideRecord('sys_attachment');
    gr.addQuery('table_name', 'LIKE', 'ZZ_YY%');
    gr.orderBy('table_sys_id');
    gr.orderByDesc('sys_created_on');
    gr.query();
    var lastID = 'not_a_match';
    var lastFile = 'not_a_match';
    while(gr.next()){
        var isDuplicate = (lastID == gr.table_sys_id) && (lastFile == gr.file_name);
        lastID = gr.table_sys_id;
        lastFile = gr.file_name;
        gs.print(gr.table_sys_id+' '+ gr.table_name+' '+ gr.file_name+' '+
                 gr.sys_created_on+' '+ isDuplicate);
        if(isDuplicate)
            gr.deleteRecord();
    }
}
```

Display whether tasks have attachments in list view

Use the following script in a business rule to display whether tasks have attachments when viewed in the record list view. Note that the script needs a custom field on the Has Attachments [u_has_attachments] table.

```javascript
function checkAttachment(){
    if(current.operation()=='insert'){
        hasAttachment('true');
    }
    else if (current.operation()=='delete'){
        var timeNow3 = new GlideDateTime();
        gs.log('has_attachment br: gliderecord query start date time
                 is: '+ timeNow3.getNumericValue(),'jwtest');
        var attachCount = new GlideAggregate('sys_attachment');
        attachCount.addQuery('table_sys_id', current.sys_id);
        attachCount.addAggregate('COUNT');
        attachCount.query();
        var numAttachments = '0';
        if(attachCount.next()){
            numAttachments =
                attachCount.getAggregate("COUNT");
            if(numAttachments >0){
                hasAttachment = 'true';
            }else{
                hasAttachment = 'false';
            }
            var timeNow4 = new GlideDateTime();
            gs.log('has_attachment br: gliderecord query start date time
                    is: '+ timeNow4.getNumericValue(),'jwtest');
        }
    }
    function hasAttachment(answer){
        var task = new GlideRecord('task');
        task.addQuery('sys_id', current.table_sys_id);
        task.query();
        if(task.next()){
            task.u_has_attachment= answer;
            task.autoSysFields(false); //Don't set the lastUpdatedTime or the
            Simultaneous Update Alert will likely get triggered
            task.setWorkflow(false); //Don't allow other business rules to run,
            otherwise multiple notifications will likely be sent
            ```
task.update();}}

Note: Schedule the business rule to run after insert/delete.

Link to attachments in an email notification

Use the following script in an email notification or template to include links to attachments:

```javascript
printattachments();
function printattachments(){var gr =new GlideRecord('sys_attachment');
gr.addQuery('table_sys_id',current.sys_id);
gr.query();while(gr.next()){template.print('Attachment: <a href="http://'+gs.getProperty("instance_name")+'.'+gs.instance+'/sys_attachment.do?sys_id='+ gr.sys_id+'">'+ gr.file_name+'</a>');}
}
```

Note: Replace "instance_name" with your instance name.

Attachment Logging

Whenever a user downloads an attachment, the action writes an `attachment.read` event record to the event log. If desired, you can process these events with a Script Action or an Email Notification. This can be useful if you want to do something when an attachment is read. For example, you can record when and by whom certain attachments are downloaded. For this functionality, the `current` variable must point to a `sys_attachment` record, and the event record must use the following parameters:

- parm1: File name
- parm2: Table name

Baseline email notifications

The baseline system provides several email notifications.

Some events listed in this table do not appear in a business rule and are fired by other conditions in the platform. Some events are hardcoded and are not user configurable.

**Baseline email notification descriptions**

<table>
<thead>
<tr>
<th>Email notification</th>
<th>Description</th>

**Notification example:** 
**notify an assignment group of updates to Priority 1 Incidents**

Notify users by email when there are updates to high priority incidents.

**Role required:** admin

Send emails to an assignment group whenever there are updates to an incident in which the **Priority** is **1 - Critical**.

Include information that is of interest to the recipients, such as the incident number, category, assignees, and any comments that were added to the incident.

1. Navigate to **System Notification > Email > Notifications**, and then click **New**.
2. On the email notification form, enter the following values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Priority 1 Incident Updated</td>
</tr>
<tr>
<td>Table</td>
<td>Incident [incident]</td>
</tr>
<tr>
<td>Active</td>
<td>Selected</td>
</tr>
<tr>
<td>Category</td>
<td>Incident Alert</td>
</tr>
<tr>
<td>Send when</td>
<td>Record inserted or updated</td>
</tr>
<tr>
<td>Inserted</td>
<td>Selected</td>
</tr>
<tr>
<td>Updated</td>
<td>Selected</td>
</tr>
<tr>
<td>Conditions</td>
<td>[Priority][is][1 - Critical] AND [Updated][changes]</td>
</tr>
<tr>
<td>Users/Groups in fields</td>
<td>Assignment group</td>
</tr>
<tr>
<td>Subject</td>
<td>Priority ${priority} Incident updated</td>
</tr>
</tbody>
</table>

*Note: In this notification, the variable ${priority} returns the value 1 - Critical.*

3. In the **Message HTML** field, enter the following message and script:

Short Description: ${short_description}
Click here to view incident: ${URI}
Incident number: ${number}
4. From the form context menu, click **Save**.

5. Preview the email notification to ensure it includes all the needed information.
   a) On the notifications form, click **Preview Notification**.
   b) Note that the email includes the following information:
      - Short description
      - A link to the incident record
      - Incident number
      - Category
      - The name of the user to whom the incident is assigned
      - The group assigned to the incident
      - Comments from the incident record

6. Test that the email notification sends to an assignment group when its Priority 1 Incident is updated.
   a) **Create a user** who has an email address that you can monitor, and then **create a group** that includes the user that you created.
   b) Navigate to **Incident > Open**, and then open an incident in which the **Priority** is **1 - Critical**.
   c) In the **Assignment group** field, enter the group that you created.
   d) From the form context menu, click **Save**.
   e) Add comments to the form to update the incident, and then click **Update**.
   f) Check the email account of the user member in the assignment group.

**Notification example: notify task assignees**

Notify users who are assigned a Task [task] record.

**Role required: admin**

Set up your email as a test email address. Navigate to **System Properties > Email Properties**, and then enter your email address under **Send all email to this test email address**.

1. Navigate to **System Notification > Email > Notifications**, and then click **New**.
2. On the form, enter the following values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Task Assigned</td>
</tr>
<tr>
<td>Table</td>
<td>Task [task]</td>
</tr>
<tr>
<td>Active</td>
<td>Selected</td>
</tr>
<tr>
<td>Category</td>
<td>Uncategorized</td>
</tr>
<tr>
<td>Send when</td>
<td>Record inserted or updated</td>
</tr>
<tr>
<td>Inserted</td>
<td>Selected</td>
</tr>
<tr>
<td>Updated</td>
<td>Selected</td>
</tr>
<tr>
<td>Conditions</td>
<td>[Assigned to][changes]</td>
</tr>
</tbody>
</table>
3. In the **Message HTML** field, add a message to send to whomever the task is assigned to.
4. From the form context menu, click **Save**.
5. To see a mock version of the system email that you created, click **Preview Notification** on the notification form.
6. Test the notification sends to a task assignee.
   a) Assign some task records.
   b) Check your email for assignment notifications.

### Email templates

Email templates enable administrators to create reusable content for the subject line and message body of email notifications.

Templates deliver consistent information on specific system activities and improve the efficiency of creating multiple email notifications for similar actions. If necessary, you can make minor changes on the fly to an email that uses a template by overriding the subject line and message body content in the notification form. A common practice is to define the message body in a template and create new subject lines for different types of recipients. There is no limit to the number of templates that you can create.

Email templates are created in rich HTML format, and administrators have the option of converting existing email templates to rich HTML (starting with the Eureka release). This format provides several advantages, including:

- Raw HTML content is converted into a WYSIWYG format.
- The content can be edited in a feature-rich HTML editor.
- Mail scripts are condensed into a single, easy-to-read line that can be reused in multiple email notifications.
- To prevent broken links, images linked using URLs relative to a particular instance are converted to absolute links.

**Create an email template**

You can create an email template with rich HTML formatting, rather than plain text.

**Role required:** admin

1. Navigate to **System Notifications > Email > Templates**.
2. Click **New**.
3. Fill in the form fields (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users/Groups in fields</td>
<td>Assigned to</td>
</tr>
<tr>
<td>Subject</td>
<td>Task Assigned</td>
</tr>
</tbody>
</table>
Email Template form with the HTML editor

Subject: ${sys_class_name} ${number} has been ${approval}

Message HTML:

Short Description: ${short_description}
Click here to view ${sys_class_name}: ${URL_REF}

Priority: ${priority}
Category: ${approval.category}
Description: ${description}

div

Message text

SMS alternate

Submit
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the template. For example, change.update.risk.</td>
</tr>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
<tr>
<td>Email layout</td>
<td>If the message body for the template is to be formatted using a predefined email layout, select the layout.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the name of the table involved. For example, Change Request [change_request].</td>
</tr>
</tbody>
</table>
| Subject            | Enter a subject line that explains the purpose of the email. Select the appropriate variables for the subject line from the fields available on the selected table. Place the cursor where you want the variable to appear, and click the field name in the Select variables column. For example:  
   ```
   ${sys_class_name} ${number}
   with ${risk} risk has been assigned to you.
   ``` |
| Message HTML       | Enter the content of the email template message. You can use the HTML editor toolbar to format the HTML, and you can include variables from the Select variables column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. Notes:  
   - When a template is applied to a notification, the contents of this field are used when you select HTML and plain text or HTML in the Content Type field in the Email Notification form.  
   - You cannot use HTML code to control the appearance of the contents in the ${comments} variable.  
   - If you want to include a link to the record that triggered the notification, see Enable links to records. |
| Message Text       | Enter the notification message to send in plain text.                      |

**Note:** When a template is applied to a notification, the contents of this field are used when you select HTML and plain text or Text in the Content Type field in the Email Notification form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMS alternate</td>
<td>Create a different message to be delivered to an SMS device. Enter a brief</td>
</tr>
<tr>
<td></td>
<td>message, showing the most important information only. If this message field is</td>
</tr>
<tr>
<td></td>
<td>blank, the contents of the <strong>Message Text</strong> field are used for the SMS</td>
</tr>
<tr>
<td></td>
<td>message.</td>
</tr>
</tbody>
</table>

**Note:** The message in this field is used when the message is sent to a device configured as SMS.

---

**Apply a template to an email notification**

After you create an email template, you can apply it to a notification.

Role required: admin

1. Navigate to **System Notification > Email > Notifications**.
2. Open the email notification record that should use the template.
3. Navigate to the **What it will contain** section.
4. From the **Email template** field, select the appropriate template.
5. Click **Update**.

**Convert an email template to rich HTML**

If you have an email template created prior to the Eureka release, you can convert it to rich HTML.

Role required: admin

1. Navigate to **System Policy > Email > Templates**.
2. Open the email template you want to convert.
Email Template
notify.change

Name: notify.change
Table: Incident [incident]

Email layout: Unsubscribe and Preferences

Subject: ${TABLE_NAME} ${DISPLAY_VALUE} Change Notification

Message:
Click here to view ${TABLE_NAME}: ${URI}

SMS alternate:

Select variables:

Fields
3. Click **Switch to Rich HTML Editor**.

When content is converted, these changes are made to the content:

- **HTML Editor**: Any raw HTML in the **Message** field is rendered as WYSIWYG text in the **Message HTML** field. The content can be edited in a feature-rich HTML editor.

- **Simplified Mail Scripts**: Any mail scripts in the body are automatically saved to the Email Script [sys_script_email] table and are replaced in the notification body with an embedded script tag. This makes the template body easier to read and makes it easier to reuse scripts in multiple email templates.
<table>
<thead>
<tr>
<th><strong>Name</strong></th>
<th>Email Template notify.change</th>
<th><strong>Table</strong></th>
<th>Incident [incident]</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Email layout</strong></td>
<td>Unsubscribe and Preferences</td>
<td><strong>Subject</strong></td>
<td>$(TABLE_NAME) $(DISPLAY_VALUE) Change Notification</td>
</tr>
<tr>
<td><strong>Message HTML</strong></td>
<td><img src="image" alt="Message HTML" /></td>
<td><strong>Select variables:</strong></td>
<td><img src="image" alt="Select variables" /></td>
</tr>
</tbody>
</table>
4. Modify the message text, as needed, using the WYSIWYG editor or by editing the underlying HTML.

Note: The letter "P" at the bottom of the screen shows the location of your cursor within the Message field. In this case, the cursor is in a line containing an <HTML> tag.

Note: Email templates that are already formatted with rich HTML do not show the Switch to Rich HTML Editor button.

Whether you are working with templates converted from earlier versions or creating new templates in the rich HTML format, it is a good practice to write mail scripts in System Notification > Email > Notification Email Scripts. When the scripts are completed, a ${mail_script:script name} embedded script tag should be added to the email template body. This makes it easy to use the same scripts in multiple email templates. All that needs to be copied and pasted from one template to the next is the embedded script tag.

If you manually enter a mail script in the body of a new or converted email notification or template, and then attempt to save the record, a message asks whether the mail script should be converted. Unconverted mail scripts often fail to run from inside the HTML editor. If you select Yes, the script is added to the Email Script [sys_script_email] table and is automatically replaced in the body with an embedded script tag.

You can view the mail scripts in their original form by opening the email template and clicking the Show Notification Scripts related link.

**Construct an email message with a template**

Email templates provide a list of the fields from database tables that are available for constructing an email message.

An email template can include a mailto automatic response link, which enables the email recipient to simply choose a link that sends a preformatted response back to the instance. An example is the email template used for notification that an approval is required. The following example shows the base email:
## ServiceNow Orlando Now Platform capabilities

### Notification - Approval Request [Advanced view]

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Approval Request</td>
</tr>
<tr>

<tr>
<td>Description</td>
<td></td>
</tr>
</tbody>
</table>

### When to send

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content type</td>
<td>HTML and plain text</td>
</tr>
<tr>
<td>Importance</td>
<td>-- None --</td>
</tr>
<tr>
<td>Include attachments</td>
<td></td>
</tr>
<tr>
<td>Omit watermark</td>
<td></td>
</tr>
<tr>
<td>Push Message Only</td>
<td></td>
</tr>
</tbody>
</table>

### Email template

- **Email template**: `change.itl.approve.role`

### Message HTML

- **Message HTML**

### Subject

- **Subject**: 

### Push Messages

- **Push Messages**: Approval Request
In this case, when a change request approval is requested, an update is made to the `sysapproval_approval` table. The "approval events" business rule is then executed, which creates the "approval.inserted" event. The "Approval Request" email event is defined to process the approval.inserted event, and this email event is defined to use the following change.itil.approve.role email template. Notice that this template has two mailto: items specified. One for "mailto.approval" and one for "mailto.rejection." This email template builds an automatic response that lets the email receiver simply click a link in the email to either approve or reject the change request.

Here is what the `change.itil.approve.role` template looks like using the rich HTML editor:
Email Template
change.itl.approve.role

Name: change.itl.approve.role
Application: Global

Email layout:
Unsubscribe and Preferences

Subject: ${sysapproval.sys_class_name} ${sysapproval} Approval Request

Message HTML

$(mail_script:change_request_summary)
Comments:
$(sysapproval.description)

$(mailto:mailto.approval)

$(mailto:mailto.rejection)

Click here to view Approval Request: ${URI}
Click here to view ${sysapproval.sys_class_name}: ${sysapproval.URI}

div

Select variables:

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The selection list on the right shows the available fields from the `sysapproval_approver` table.

Notice the `change.itil.approve.role` template also uses a predefined email layout (Unsubscribe and Preferences), which provides links for the recipient to unsubscribe from approval notifications and set notification preferences.

And here is the `mailto.approval` template:

```
Click here to approve ${sysapproval}:
```

**Note:** If you put text on the lines following the `Click here to approve ${sysapproval}` line, this text forms the actual body of the email.

The combination of templates used would generate an email similar to the following example:
Template generated email message

Notice that the email recipient can use the following links in the mail:

- A link to view all the details of the change request
- A link to view the approval record
- A link that generates an automatic email response to approve the change
- A link that generates an automatic email response to reject the change
- A link to unsubscribe from approval notifications and another link to set notification preferences

Add blank lines in an email template

You can easily add blank lines in an email template using HTML tags.

Judicious use of these HTML tags can make your email easier to read.

- You can use `<br/>` to insert a line break
- You can wrap paragraphs in `<p>` . . . `</p>` tags to format your email nicely.

Calendar integration

With email notifications, you can use import export maps to leverage information about records and integrate with Outlook or another calendar.

For example, an email notification can create a calendar event based on the planned start and end dates of a change request. To enable integration with a calendar, the following iCalendar variables are available to be added to an email template message and reference the email template from the notification. The variables must be added to the Message Text field.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>${dtstart}</td>
<td>Start Date</td>
</tr>
<tr>
<td>${dtend}</td>
<td>End Date</td>
</tr>
</tbody>
</table>

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>${location}</td>
<td>Location</td>
</tr>
<tr>
<td>${alarm_time}</td>
<td>Alert or reminder time</td>
</tr>
</tbody>
</table>

By default, the instance computes the value of iCalendar variables using import and export maps for the Appointment [itil_appointment] and Change Request [change_request] tables. The instance also uses import and export maps for other tables, depending on which plugins you activate. For example, if you activate the Incident (com.snc.incident) plugin, the instance uses the import and export maps of the Incident [incident] table.

**Import export maps**

Each import export map can specify a different set of iCalendar fields. For example, the icalendar.change_request import export map only maps two iCalendar fields.
iCalendar change request mappings

The instance uses the **External Name** value as the variable name in the email template. For example, the icalendar.change_request import export map defines the *dtstart* and *dtend* variables.

<table>
<thead>
<tr>
<th>External name</th>
<th>Associated variable name</th>
<th>Table</th>
<th>Field mapped</th>
<th>Field label</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtstart</td>
<td>${dtstart}</td>
<td>change_request</td>
<td>start_date</td>
<td>Planned start date</td>
</tr>
<tr>
<td>dtend</td>
<td>${dtend}</td>
<td>change_request</td>
<td>end_date</td>
<td>Planned end date</td>
</tr>
</tbody>
</table>

Map date fields to iCalendar variables

You can specify what fields provide the date information in calendar invitation notifications by changing the field mappings of the *dtstart* and *dtend* variables in the import export map for the iCalendar invitation.

Role required: admin

1. In the navigation filter, enter `sys_impex_map.list`.
2. Open a map to edit.
3. In the Field Maps related list, click either the **end_date** or **start_date** mapped field to change the mapping for **dtstart** or **dtend**, as needed.

4. Change the **Database** field to the field you want to use to set the start date or end date.

5. Click **Update**.

Create iCalendar invitations for custom tables

To generate iCalendar invitations that use field values from custom tables, create an import export map that computes the values of the iCalendar fields.

Role required: admin

1. Create the custom table and fields using the **Date/Time** field type for the fields that map to the **${dtstart}** and **${dtend}** variables.

2. In the navigation filter, enter `sys_impex_map.list`.

3. Click **New**.

4. Set the following fields:
   - **Name**: Use the following naming convention: `icalendar.<table_name>`. For example, `icalendar.u_my_custom_table`.
   - **Table**: Select the custom table you created.
   - **Type**: Select `icalendar`.

5. Right-click the form header and select **Save**.

6. In the Field Maps related list, click **New**.

7. In the Mapping Entry Wizard, select **Mapping to a Database Field**.

8. Create field mappings for **dtstart** and **dtend**. These variables are required.

   For example, map the **External Name** **dtstart** to the **u_meeting_start_time** field in `u_my_custom_table`.

9. Click **Submit**.

10. Create field mappings for any other iCalendar fields as necessary.

11. Click **Update**.

   Here are sample field mappings between iCalendar variables and custom fields in a custom table, `u_my_custom_table`:
Sample field mappings

<table>
<thead>
<tr>
<th>External name</th>
<th>Database field</th>
<th>Type</th>
<th>Map</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtstart</td>
<td>u_meeting_start_time</td>
<td>field</td>
<td>icalendar.u_my_custom_table</td>
</tr>
<tr>
<td>dtend</td>
<td>u_meeting_end_time</td>
<td>field</td>
<td>icalendar.u_my_custom_table</td>
</tr>
<tr>
<td>description</td>
<td>u_meeting_description</td>
<td>field</td>
<td>icalendar.u_my_custom_table</td>
</tr>
</tbody>
</table>

12. Create an email template that defines what to include in the iCalendar invitation.
   a) Set the Table field to the custom table you created.
   b) In the Message text field, use the following format to define the iCalendar invitation.

```
BEGIN:VCALENDAR
PRODID:-//Service-now.com//Outlook 11.0 MIMEDIR//EN
VERSION:2.0
METHOD:REQUEST
BEGIN:VEVENT
ATTENDEE;ROLE=REQ-PARTICIPANT;RSVP=TRUE:MAILTO:{$to}
DTSTART:${dtstart}
DTEND:${dtend}
UID:${sys_id}
DTSTAMP:${dtstamp}
DESCRIPTION:${description}
SUMMARY:${u_meeting_summary}
END:VEVENT
END:VCALENDAR
```

**Note:** Mail script is not allowed or processed in meeting invitation email templates.

**iCalendar invitation template details**

<table>
<thead>
<tr>
<th>iCalendar template line</th>
<th>Required?</th>

</table>

### Email layouts

Create reusable content for the message body of email templates.

13. Create an email notification to trigger the iCalendar invitation and ensure the following fields are set accordingly:

- **Table:** Select the custom table.
- **Type:** Select Meeting Invitation.
- **Content type:** Select Plain text only.
- **Email template:** Select the template you created.

Footer

Subscribe / Manage Preferences
Administrators can use email layouts to:

- Ensure all email notifications have a consistent layout such as always displaying a header, body, and footer.
- Display static content on all email notifications such as a company logo or a background.
- Declare inline styles available for use in the message body of an email template such as setting a text font, size, and color.
- Provide users with links to common response actions such as unsubscribe from a notification or manage notification preferences.

**Note:** To display dynamic content such as mail scripts, use email templates. For more information, see [Create an email template](#).

Email layouts insert HTML elements into the message body of email templates. Any style elements you define in the email layout are available to the email template. Email layouts support style sheets in these formats:

- Internal style sheets defined within a `<style>` element.
- Inline styles within a `style` attribute.

By default, the system includes several sample layouts administrators can use to create their own layouts. Administrators can create email layouts using an inline HTML editor or manually entering HTML code. The system stores email layout records in the Email Layout [sys_email_layout] table.

**Create an email layout**
Create an email layout to specify the HTML content you want to appear in the body of one or more email templates.

- Role required: admin
- Record required: email template record

1. Navigate to **System Policy > Email > Layouts**.
   The system displays the list of existing email layouts.
2. Click **New**.
   The system displays a blank email layout form.
3. Fill in the form.

**Email layout fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specify a unique name for the record.</td>
</tr>
<tr>
<td>Application</td>
<td>Lists the parent application to which this record belongs.</td>
</tr>
<tr>
<td>Description</td>
<td>Specify an optional description of the layout.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select whether to display the Advanced Layout field.</td>
</tr>
<tr>
<td>Layout</td>
<td>Use the inline editor to add HTML elements. The system displays HTML from this field in the body of any email template that uses the layout. Include notification variables to show content from the related record. For more information notification variables see Notification variables. <strong>Note:</strong> The editor automatically formats any HTML code you enter from the Source code view.</td>
</tr>
</tbody>
</table>
### Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced Layout</td>
<td>Use this field to manually enter HTML code. The system displays HTML from this field in the body of any email template that uses the layout.</td>
</tr>
</tbody>
</table>

**Note:** To enter text in this field, select **Click here to disable syntax highlighting and script formatting**.

4. **Click Submit.**  
The system creates the email layout record.

5. **Navigate to System Policy > Email > Templates.**  
The system displays the list of existing email templates.

6. **Select the email template which you want to use an email layout.**  
The system displays the email template record.

7. **In Email layout**, select the email layout you want to use to format the body of email messages.

8. **Click Update.**  
The email template uses the selected email layout to format the body of email messages.

---

### Email Filters

Email filters enable administrators to specify when to move email to particular mailboxes or to ignore it using a condition builder or a condition script. The Email Filters (com.glide.email_filter) plugin is active by default.

When an email is *ignored*, the email is saved to your instance but is not processed. You can access an ignored email by viewing its Email [sys_email] record.

#### Default Email Filters

By default, the following filters are available from the System Mailboxes > Filters module:

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore VCAL</td>
<td>Ignores all email containing vCalendar requests. This filter prevents <em>inbound email actions</em> from creating unnecessary incident records when the instance receives a response to sent email. vCalendar requests in email responses are identified by the EmailUtils script include.</td>
</tr>
<tr>
<td>Ignore header</td>
<td>Ignores email that contains specific headers. This filter overrides the <code>glide.pop3.ignore_headers</code> property.</td>
</tr>
<tr>
<td>Ignore sender</td>
<td>Ignores email from specific senders. This filter overrides the <code>glide.pop3.ignore_senders</code> property.</td>
</tr>
<tr>
<td>Ignore subject</td>
<td>Ignores email with specific terms or phrases in the subject line. This filter overrides the <code>glide.pop3.ignore_subjects</code> property. This filter might not apply to emails arriving from unknown users. Unknown users can be locked out.</td>
</tr>
<tr>
<td>Filter</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Move spam to junk folder</td>
<td>Moves email identified as spam to the Junk folder. This filter checks for</td>
</tr>
<tr>
<td></td>
<td>the value of the ServiceNow spam header. If the header is</td>
</tr>
<tr>
<td></td>
<td>X-ServiceNow-Spam-Status:Yes, the filter moves the email to the Junk folder</td>
</tr>
</tbody>
</table>

**Note:** To learn more about enabling spam scoring and filtering, see Email spam scoring and filtering (instance security hardening) in the Instance Security Hardening Guide.

**Email filter script include**

Email filters use a script include called EmailUtils that contains a simple utility function to determine if vCalendar is in the body of the response email. The results of this query are used in a condition script in the Ignore VCAL email filter.

**Spam scoring and virus scanning**

Every message sent through email servers is assessed for the likelihood of being spam. Based on this assessment, the instance adds headers to each message that can be used for filtering within the customer instance using the Email Filters plugin.

The system also adds the X-ServiceNow-Virus:INFECTED header to an email that contains one or more virus-infected attachments. The system ignores the email.

Spam scoring and virus scanning are available only for instances that use the ServiceNow email infrastructure. For more information on spam scoring and filtering, see KB0549426.

**Activate email filters**

Administrators can activate the Email Filters plugin (com.glide.email_filter).

Role required: admin

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   - You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise they will receive the following error: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

**Create an email filter**

You can create email filters to apply a custom action script or filter actions when email matches your filter's conditions.

Role required: admin

1. Navigate to System Mailboxes > Administration > Filters.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the email filter.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the email filter.</td>
</tr>
<tr>
<td>Order</td>
<td>Priority that the email filter takes over other filters for the same table. To give the filter higher priority over other filters, enter a lower number.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the email filter.</td>
</tr>
<tr>
<td>Short description</td>
<td>Description of what the filter does.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions to define which emails to filter. Note that conditions are case sensitive.</td>
</tr>
<tr>
<td>Condition script</td>
<td>Script to define which emails to filter. Use this script to access other tables, variables, or methods. For example, the condition script for the Ignore VCAL filter looks for the results of the EmailUtils script include, which detects vCalendar attachments.</td>
</tr>
<tr>
<td>Action script</td>
<td>Script to define additional behavior to be performed when the filter condition evaluates to true. This might include an email action not included in the default filter actions. In the base system, the action script is used to produce the error string that is published to the email log (System Logs &gt; Email).</td>
</tr>
</tbody>
</table>

4. Right-click in the header bar and select **Save** from the context menu.

   The **Filter Actions** related list appears.

5. Click **New** in the related list.

6. Select how the system should react when the conditions of this filter evaluate to true.

   The two choices in the base system are: **Mark as Ignored** and **Move to Junk**. You can use the **Action script** to perform additional email tasks.

   **Note:** Before creating additional email actions with a script, see *Inbound Email Actions*. Like business rules, inbound email actions use both conditions and scripts and can provide a number of useful actions on emails the instance receives.

### Email retention

You can archive and eventually destroy email messages that you no longer need or if your Email table is excessively large.

Email retention is available starting with the Helsinki release.

### Email archive and destruction plugins

The email archiving and destruction feature uses the **Data Archiving** and **Email Retention** plugins. The Data Archiving plugin must be active to archive and destroy email records. The Email Retention plugin provides a set of rules that specify when the system archives and destroys email records.

   **Note:** The Email Retention plugin also prevents the system from deleting watermarks, which are required for inbound email actions to continue to function.

The Email Retention plugin and associated archive and destroy rules are active by default on new instances. On upgraded instances, you must manually activate both the plugin and the archive and destroy rules. ServiceNow recommends that you review and approve these rules before activating them.
If your instance already has a process to manage email records, you do not need to activate the Email Retention plugin. If you want to replace your current process with Email Retention, be sure to deactivate the current process before activating the archive and destroy rules.

Archiving and destroying email records

Archiving means moving records from the Email [sys_email] table to the Archive Email [ar_sys_email] table when they exceed the archive rule time limit. Destroying means deleting records in the Archive Email table when they exceed the destroy rule time limit.

**Note:** When a destroy rule deletes email records, associated watermarks are not deleted. They are preserved to ensure that your inbound email actions continue to function.

Default archive and destroy rules

Email Retention provides these email archive rules:

- **Emails - Ignored and over 90 days old:** archives email message records that were created more than 90 days prior to the current date and are of type received-ignored or sent-ignored.
- **Emails - Over a year old:** archives email message records that were created more than 365 days prior to the current date.

Email Retention also provides this email destroy rule:

- **Email Archive - Over a year old:** destroys email records that have been archived for more than 365 days prior to the current date.

With these default settings, your email messages are kept on the instance for a total of two years: one year in the Email table, and one year in the Email archive table. At the end of this period, the system deletes the expired email records from the Email archive table.

**Note:** By default these rules are active on new instances and inactive on upgrades. The system runs archive and destroy rules when you activate them.

Compatibility with other record management implementations

If you are already using another method to manage email records, such as table cleaners, you do not have to use the Email Retention feature. To prevent unexpected record deletion, ServiceNow recommends that you avoid using multiple email management processes on the same instance at the same time.

**Note:** For assistance replacing your existing record management implementation with Email Retention, contact your professional services or sales representative.

Effects of archiving and deleting email records

Inbound email actions copy the body of an email to the work notes of the related record. If the inbound email record is later deleted, the work notes still contain a text copy of the email.

When the system sends an email message about a record, the activity formatter displays a **Sent Email** section with a link to the email message. If the system archives the email message, the activity formatter removes **Sent Email**
section. When the system deletes the email message, it is no longer visible in the activity formatter nor the work notes.

**Note:** Set the archive time length long enough so your users can access sent emails though the activity formatter.

Archiving email records changes the methods available to the system to identify inbound email as a reply. After archiving an email record, the system can no longer use the **In-Reply-To** field to match an incoming email to an email record. However, the system can still match incoming email to an existing record from a record number or watermark.

*Activate the Email Retention plugin*

The Email Retention plugin provides archive and destruction rules for email messages. It is active by default for new instances, but must be activated for upgrades.

Required role: admin

The Email Retention plugin requires these plugins:

- *Data Archiving*
- *System Mailboxes*

1. Navigate to **System Applications > All Available Applications > All.**
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise they will receive the following error: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

*Archive email manually*

You can archive email messages manually on demand instead of waiting for the instance to archive them based on a scheduled job.

Role required: admin

Email Retention provides these email archive rules:

- **Emails - Ignored and over 90 days old:** archives email message records that were created more than 90 days prior to the current date and are of type received-ignored or sent-ignored.
- **Emails - Over a year old:** archives email message records that were created more than 365 days prior to the current date.

You can manually archive email messages that meet these archive rules or any additional archive rules that you create.

**Note:** An archive record must be active for the instance to be able to process records with it.

1. Navigate to **System Archiving > Archive Rules.**
2. Open the email archiving rule that you want to modify.
3. Click **Recalculate Estimate** to see how many records in the Email [sys_email] table are going to be archived. The estimate appears in the **Record estimate** field.
4. Click **Run Archive Now.**
Note: You can also archive related records.

### Watermarks on notification emails

By default, the system generates a watermark label at the bottom of each notification email to allow matching incoming email to existing records. Each watermark includes a random 20-character string that makes it unique.

Starting with the Jakarta release, the system automatically generates randomized watermarks for notification emails in base systems. The random 20-character string reduces the possibility of a watermark being guessed or coincidentally matching the watermark of an email from another instance.

Note: If you are upgrading from a release before Jakarta, random watermark support is optional and requires the Random Watermark Support plugin to be activated.

### Watermark format

The email watermark always begins with "Ref:" to identify the label as a watermark. After this identifier, the default label is 31 characters in length and consists of:

- Customizable prefix — The default prefix is **MSG**.
- Auto-numbered identifier — The numeric string identifying the source record, such as incident, problem, or change request.
- An underscore character followed by a random 20-character string

![Watermark format](image)

**Randomized watermark example**

When inbound emails are processed, the system matches random watermarks to the appropriate source records.
Watermark configuration

Watermarks are always generated, but you can configure them to:

- Create a custom watermark prefix for each instance to prevent accidentally triggering events in the wrong instance.
- Have custom prefix characters after MSG
- Be hidden globally
- Be omitted from individual email messages

If watermarks are omitted from email notifications, inbound email actions might not work properly. Without a watermark, the system processes inbound email messages as described in *Criteria for matching email to inbound actions*.

**Note:** Email clients that use the plain text version of the email still show the watermark.

Create a custom watermark prefix for email notifications

By default, email notifications use the watermark prefix MSG, but you can create a custom watermark prefix.

Role required: admin

Any email notifications that are forwarded from one instance to another might be more easily distinguished with different prefixes for each instance. To avoid unintentionally triggering events in the wrong instance, create a unique watermark prefix for each instance.

**Note:** Do not use colons (:) in custom watermark prefixes. Colons are a reserved character and may cause the watermark to be ignored.

1. Navigate to System Definition > Number Maintenance.
2. Open the MSG record in the Email Watermark [sys_watermark] table.
3. Enter the unique Prefix for this instance.
4. Click Update.

Your custom watermark applies to all new email notifications. Email notifications that existed before you created a custom watermark keep the same watermarks as before.

**Omit an email notification watermark**

You can omit watermarks on email notifications if you do not want the instance to match the notification to an existing record.

**Role required:** admin

1. Navigate to System Notification > Email > Notifications.
2. Select the email notification to update.
3. Click the Advanced View related link.
4. In the What it will contain section, select the Omit watermark check box.

When incoming email does not contain a watermark, the system searches the subject line and message body for a record number. The system attempts to match any record number that it finds to an existing record. If there is a matching record number, the system updates the record with the values in the incoming email. To ensure that response email messages don't update records, remove the record number variable ${number} from the **Subject** and **Message HTML** fields.

**Hide email watermarks globally**

Rather than omitting watermarks, it is possible to hide watermarks on a global basis using HTML markup.

**Role required:** admin

Watermarks can only be hidden in the HTML message. The text version of the message, because it does not have markup allowing show/hide semantics, will always have the watermark.

1. Navigate to sys_properties.list in the Application Navigator.
2. Create a new property named glide.email.watermark.visible and set it to false.
This ensures that all watermarks are hidden on all email messages. This cannot be done on a per-email basis.

**Email digests**

An email digest is a single email that summarizes the activity for a selected notification and its target record during a specified time interval. You can enable an email digest to reduce the number of notifications received when frequent updates to the associated record occur within a short time period.

![Example email digest](image)

**Note:** Email digests apply to email notifications only and are not supported for SMS messages, push notifications, and activity streams.
How email digests work

In new and upgraded instances, the Email digest (com.glide.email_digest) plugin is activated by default. Your instance must use the UI16 interface, since the email digest feature involves setting user notification preferences in the System Settings window.

Admins determine which notifications can be delivered in an email digest and configure the digest content for those notifications. Admins can also control the intervals for digests. An interval is the length of time that notifications are collected for the digest, such as daily or hourly.

Users enable the digest and select the digest interval for a specific notification in their notification preferences. The system accumulates the notifications that normally would be sent during the specified interval and summarizes them in the email digest.

When processing an email digest, the system:

- Stores the digest configuration for the notification in the Notifications [sysevent_email_action] table.
- Temporarily stores the notification content accumulated for a user in the Email Digest Parts [sys_email_digest_part] table and the Email Digest Part Users [sys_email_digest_part_user] table.
- Runs an email digest job every 15 minutes to check when a digest is ready to be sent to a user.

The system uses the digest interval to determine when the digest is ready to be sent. The digest interval begins when the first notification is triggered for the user and stops at the end of the interval time.

- Sends the email digest to the user soon after the selected digest interval ends.

For example, if a user selects an hourly digest interval and the first notification is triggered at 08:15, the interval starts at 08:15. When the digest interval ends, the system generates the email digest approximately one hour later, at about 09:15 or shortly after, depending on when the email digest job ran.

Set up email digests

What to do — admins

1. Review the base system digest intervals and if needed, create or modify intervals.

   The base system digest intervals are one day (24 hours), one hour, every four hours, and seven days (weekly).

2. Determine the email notifications that can be delivered in a digest and configure the email digest content for those notifications.

   When determining which notifications are appropriate for an email digest, consider the notification content and intervals that your users can select. For example, digests that can be generated weekly might be better suited for notifications that are non-urgent.

What to do — all users

For a notification that can be delivered in an email digest, enable the email digest in your notification preferences (Notifications tab in the System Settings window). You also specify the interval time that the notifications are accumulated.

Next step

If you are an admin, begin the digest setup process by reviewing the base system email digest intervals and create or modify the intervals.
Create or modify email digest intervals
Admins can create or modify the email digest intervals (length of time) during which activity for a selected notification is accumulated in an email digest. Users select a digest interval when they enable an email digest in their notification preferences.

Role required: admin

Before adding an email digest interval, review the base system digest intervals in the Digest Intervals [sys_email_digest_interval] table. You can modify intervals, including the base system intervals, which are one day (24 hours), one hour, every four hours, and seven days (weekly).

1. Navigate to System Notification > Email > Digest Intervals.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To add an interval</td>
<td>Click New.</td>
</tr>
<tr>
<td>To modify an interval</td>
<td>Select the interval to be changed.</td>
</tr>
</tbody>
</table>

2. Enter the new or changed interval information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Interval name that describes the interval length of time, for example: Every 2 hours.</td>
</tr>
<tr>
<td>Interval</td>
<td>Length of the interval, either number of Days or Hours (hours, minutes, and seconds). The minimum time length allowed is one hour, and the maximum time length allowed is seven days (one week).</td>
</tr>
</tbody>
</table>

3. If you created an interval, click Submit. Or, if you changed an interval, click Update.

The system updates the Digest Intervals [sys_email_digest_interval] table with the new or modified interval. The digest interval is listed as an option in the notification preferences (Notifications tab in the System Settings window) when a user enables a digest for the notification. For example:
4. To delete an interval, select the interval to be deleted in the Digest Intervals [sys_email_digest_interval] table and click **Delete**.

   **Note**: If the interval is in use, the system does not remove the interval.

Determine the email notifications that can be delivered in a digest and configure the email digest content for those notifications.

**Configure email digests**

Use the Notification form to create or modify the content of an email digest for a notification. You can also disable the email digest for a notification so that it is not available in the notification preferences of your users.

**Role required**: admin

When you **create or update a notification**, use the **What Digest will contain** tab of the Notification form to configure the email digest for the notification. After you define the digest content, the digest option for the notification is available in the notification settings of your users.

1. Navigate to **System Notification > Email > Notifications**.
<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you are creating a notification</td>
<td>Click <strong>New</strong> to open the Notification form.</td>
</tr>
<tr>
<td>If you are modifying a notification</td>
<td>Select the notification to be changed.</td>
</tr>
</tbody>
</table>

2. In the Notification form, select the **Allow Digest** check box to display the **What Digest will contain** tab and define the digest content.

3. Complete the fields in the **What Digest will contain** tab. The example shows the default view of the tab. The advanced view contains additional fields (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digest Template</td>
<td>If you want to reuse existing content, such as headers or footers, select an email template to add content to the email digest.</td>
</tr>
<tr>
<td>Digest Subject</td>
<td>Enter the subject line for the email digest. The subject can include variables from the Select variables column. If empty, the system uses the Subject value from the Email template. If you enter a value in this field, it overrides the template value.</td>
</tr>
<tr>
<td>Digest HTML</td>
<td>Enter the recurring content for the email digest. The digest content can include variables from the Select variables column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. To prevent adding extra <code>&lt;p&gt;</code> and <code>&lt;div&gt;</code> elements to your email digest, see the blog post Extra line spacing with paragraph tags in email client by a ServiceNow employee in the Now Community.</td>
</tr>
<tr>
<td>Digest Separator (HTML)</td>
<td>Use the line to separate each item summarized in the digest.</td>
</tr>
<tr>
<td>Digest From</td>
<td>Enter the email address to be used in the From field of the email digest. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email address must be in a valid format, otherwise a notification message appears near the field. Changing this address requires an advanced email setup such as enabling email forwarding.</td>
</tr>
<tr>
<td>Digest Reply To</td>
<td>Enter the email address that you want people to use when replying to the email digest. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email must be in a valid format, otherwise a notification message appears near the field. Changing this address requires an advanced email setup such as enabling email forwarding.</td>
</tr>
<tr>
<td>Digest Text</td>
<td>Enter the recurring content of the email digest to send in plain text. This field appears when you set the content type to HTML and plain text or Plain text only.</td>
</tr>
<tr>
<td>Digest Separator (text)</td>
<td>[Optional] Use the dash character as a line to separate each item summarized in the digest. This field appears when you set the content type to HTML and plain text or Plain text only.</td>
</tr>
</tbody>
</table>

4. When you finish creating the notification, click Submit. Or, if you are done modifying the notification, click Update.

The email Digest option is displayed in the notification settings of your users.
Enable an email digest
In your notification preferences, you can enable an email digest that summarizes the activity for a selected notification during a specified time interval. The digest is a single email that you receive instead of the individual notifications generated during the specified interval.

Role required: none

The email digest option is available for a notification (in your notification preferences) only when your admin has configured the email digest content for that notification.

Consider enabling an email digest to reduce the number of emails you would normally receive when the target record for a notification is frequently updated within a short time period.

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the Notifications tab.

2. Select the notification:
   a) In the Notifications By Category section, click the row or right arrow (►) of the category that you want to view.
   b) In the list of notifications for the category, click the row or right arrow (►) next to the notification that you want to edit.

3. To enable or disable an email digest for the notification, if an email digest is available:
   a) Click the Email Digest switch.
      The email digest is enabled when the switch is green and disabled when the switch is grey.
   b) If you enabled the digest, select the Interval (length of time) during which the notifications are accumulated.
The digest interval begins with the first occurrence of notification activity. For example, if you select the daily (1 Day) interval and the first notification occurs at 07:00, the system begins accumulating notifications at 07:00 and stops at 07:00 the next day.

Soon after the interval ends, the system sends the email digest to you instead of sending the individual notifications generated during the digest interval. If you disabled the digest, the system immediately stops accumulating the notifications for the digest and does not send the email digest. The system resumes sending the notifications as they are generated.

**Domain separation and Notifications**

This is an overview of domain separation and the Notifications application. With domain separation you can separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Support level: Standard

- Includes Basic level support.
- Business logic: Processes can be created or modified per customer by the service provider (SP). The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The owner of the instance needs to be able to configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Use case: An admin needs to be able to make comments mandatory when a record closes for one tenant, but not for another.

How domain separation works in Notifications

There are two basic components of domain separation and Notifications.

- Notifications are process-separated (not data-separated).
- Notifications are triggered in two main ways:
  1. When a record is Inserted or Updated
     a. Notifications with matching conditions AND in the same domain as the inserted/updated record are processed.
  2. When an event defined in the notification is triggered
     a. Events typically have a target record. For example, [incident.inserted] event references the incident record being inserted.
     b. When an event is fired, notifications configured for that event in the same domain as the event’s target record are processed.

Domains and email accounts

Domain separation is not supported in email accounts for these reasons:

1. Sending mail: There is only one SMTP sender per account. This prohibits providing domains for each account, and they are not configurable.
2. For receiving Inbound mail: You can set up multiple email accounts but cannot meaningfully set the domain of an inbound email action. Inbound Actions are processed in the domain of the user who sent the email. For example: User_A in Domain A sends an email to a ServiceNow email account which executes the “Create an incident” inbound email action. The resulting new incident created by the inbound action is in Domain A.

To learn more see Inbound email actions.

**Note:** If the number of email accounts exceeds 20, reception of email slows down.

Use case

- If an instance is using the Domain separation plugin and a new email notification is defined for a domain that has the same event as the notification on the global domain, the user receives two emails for the same event.
Solution: Set the [sys_overrides] field on the notification that belongs to the domain so it overrides the setting on global. For more information, see Process administration.

Troubleshooting notification emails

Logs and diagnostics are provided to help determine whether notification emails are being sent and received successfully, what any issues are, and who receives the email.

Diagnostics help monitor the overall health of the system and troubleshoot general problems, such as not receiving any incoming mail. Logs help identify problems with individual emails, and different logs are useful for diagnosing different types of problems.

Log checking scenarios

<table>
<thead>
<tr>
<th>Problem</th>
<th>Log</th>
</tr>
</thead>
<tbody>
<tr>
<td>Need to check whether an individual notification email was successfully sent</td>
<td>Check the <strong>Sent</strong> System Mailbox for that email. Also check the <strong>Failed</strong> System Mailbox for failure notifications.</td>
</tr>
<tr>
<td>Individual email failed</td>
<td>• Check the message log of the individual email.</td>
</tr>
<tr>
<td></td>
<td>• Check the <strong>Error string</strong> field of the email record.</td>
</tr>
<tr>
<td>Email not received by end user</td>
<td>• Check the <strong>Junk</strong> System Mailbox for notifications about returned emails. These emails also appear in the Emails log with a <strong>Type</strong> of received-ignored.</td>
</tr>
<tr>
<td></td>
<td>• Check the <strong>Error string</strong> field of the email record.</td>
</tr>
<tr>
<td></td>
<td><strong>Warning:</strong> Some email servers do not return error strings</td>
</tr>
<tr>
<td></td>
<td>• Check the message log of the individual email for the reasons different recipients were included or excluded.</td>
</tr>
<tr>
<td></td>
<td><strong>Warning:</strong> Some email servers do not return error strings</td>

</tbody>
</table>

**Email diagnostics**

The Diagnostics and Connection page provides information on the current state of your email configuration. This page includes status on email properties, scheduled jobs, and email account connections that affect how your instance receives and sends email.

Email diagnostic information can help you identify problems with inbound or outbound email. The following video shows different steps to determine why your instance is not receiving inbound emails. One of the steps uses email diagnostics to check the email connection status and email reader scheduled job.

Navigate to the Diagnostics and Connection page from either of these modules:

- **System Mailboxes** > **Email Diagnostics**
- **System Diagnostics** > **Email Diagnostics**

**Email Diagnostics and Connection page**
### Email Sending is Operational

### Diagnostic | Description
--- | ---
**Email Reader Status** | Current state of the email reader job, which downloads any email waiting on the mail server and creates email.read events. To update the Email Reader Status job, click the **Email Reader Job** related link, and in the Schedule table, open the email reader record to be changed.

**Email Reader Processing Time** | Duration of the last reader job run. This value should be shorter than the reader interval.

**Job Last Run** | Date and time when the reader job last ran.

### Connection Status

| {Accounts} | The result of the test connection to the accounts. The connection is tested every time you load the page.

---

**System email log and mailboxes**

The system email log records all emails that the instance creates or receives. System mailboxes are filtered views of this log.

Every notification email that the instance creates or receives is recorded in an Email [sys_email] record. You can navigate to a log of these records at **System Logs > Emails**.

The System Mailboxes are filtered views of the Emails [sys_email] table. The instance assigns an email record to a system mailbox depending on the values of the **Type** and **State** fields. For more information, see **System mailboxes**.

The following fields can be included in the layout of the system log and any of the system mailboxes:

### Email log

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mailbox</td>
<td>The system mailbox that lists this email record. The instance sets the value of this field according to the values of the <strong>Type</strong> and <strong>State</strong> fields.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the email (Error, Ignored, Processed, or Ready).</td>

</tbody>
</table>

**Message logs for individual emails**

The email log entries for an individual notification email are accessible as a related list in the email record. The **Error string** field in the email record can provide additional information.

Every email record contains an **Email Log** related list. This list shows the Email Log Entry [syslog_email] records. For troubleshooting purposes, the most useful fields are probably **Level** and **Message**.

To diagnose problems with outbound emails, also examine the **Error string** field in the email record. However, not every receiving email server sends back an error string.

ℹ️ **Note:** The Email Log Entry record is available for only 7 days after the email record is created.

**Inbound actions on received emails**

Check these logs as the first step to diagnose issues with inbound actions. The logs show which inbound action did or did not apply and for what reason.

ℹ️ **Note:** If an inbound action did not update any field on the target record, the log indicates that the inbound action was skipped.
Inbound email log

Reasons for including or excluding recipients

For outbound notifications, the email system log provides reasons that recipients were included or excluded. Each log entry corresponds to a reason for inclusion or exclusion. For example, all users who were excluded because they are inactive appear in a single log entry.
A series of system properties can be used to fine-tune the information to be logged. Two master switch properties, `glide.notification.recipient.include_logging` and `glide.notification.recipient.exclude_logging`, control all recipient inclusion and exclusion logging. Several other properties allow you to tailor the information reported in the logs to meet your needs. All of the properties are enabled by default.

Outbound email log

**Push notifications**

In addition to sending email and SMS notifications, an instance can send push notifications to mobile devices. A push notification is a text message that appears on a user's mobile device to alert them about something important or to ask them to perform an action. Your instance supports push notifications.
An example push notification

Use push notifications to send messages to users when certain conditions are triggered on your instance, such as the assignment of an incident to the user. A push notification can even ask for a reply, and the instance can process the reply by acting on the related records. For example, you can have the instance send an approval request for a Change to a user. You can let the user approve or deny the Change by clicking a response button on the push notification. The user's response can then update the status of the Change record.

You can set up push notifications in a similar manner to email and SMS notifications. Determine:

- who to send the notification to
- when it should be sent
- what it should contain

The ServiceNow mobile app is available as ServiceNow Classic and as ServiceNow Agent. By default, ServiceNow Classic supports push notifications, but you can also develop your own push application and configure your instance to send push notifications to it. For more information on setting up push notifications in ServiceNow Agent, go to Mobile push notifications.
Push notification setup

Push notification setup differs depending on the mobile or push application that you want your users to use. For an overview, see:

- **Push notification setup with the ServiceNow Classic mobile app**

  **Note**: Push notifications for on-premise instances are not supported.

- **Push notification setup with a custom push application**. If you create your own application, you must understand how push notifications and the Apple Push Notification Service system work. For more information, see the APNs Overview in the *Local and Remote Notification Programming Guide* for Apple developers.

**Attention**: Apple does not guarantee delivery of all push notifications. Review the Quality of Service (QoS) information in the *Local and Remote Notification Programming Guide* for Apple developers.

Push notification system

The push notification system involves several key elements that manage the delivery of push messages, push notification responses, and push feedback.

**Customer instance**

Your ServiceNow instance.

**Push proxy**

An instance that collects all push notifications that go to the ServiceNow Classic mobile application and forwards them to the ServiceNow applications for Apple iOS or Android. If you create a custom push application, you do not use the push proxy.

**Push provider**

The provider of push messages, which is the Apple Push Notification service (APNs) or Firebase Cloud Messaging (FCM) service, for the ServiceNow Classic mobile app or custom mobile apps.

**Feedback provider**

The provider of feedback messages, which tells the instance what devices are no longer valid. The Apple feedback or FCM server handles feedback messages for the ServiceNow Classic mobile app on iOS and Android devices respectively.

**Feedback proxy**

The ServiceNow instance that handles feedback messages from the Apple feedback server.

**Push application on a mobile device**

The application, such as the ServiceNow Classic mobile application. You can also build and customize your own push application.

Push notification process

The push notification process is as follows:

1. Activity on the instance triggers a push notification.
2. The instance looks for who to send the notification to and checks the user notification preferences to find their push device settings.
3. The instance sends the push notification to the push notification service, either the Apple Push Notification service (APNs) or Firebase Cloud Messaging (FCM) service. If you are using the ServiceNow Classic mobile app, the instance sends the notification through a push proxy instance, which then forwards the notification to the APNs or FCM service.

4. The push notification service sends the notification to the user’s push application. When the instance sends the notification to the push notification service, it includes message content along with the instance name and ID. This information ensures that a response to the notification is sent back to the correct instance. If the user can reply to the notification, such as sending an approval to a change request, the response is sent via REST message back to the instance.

5. The instance identifies a script to run to handle the response.

6. The script performs an action on the instance, such as marking a change request approved. If there is invalid JSON or if the script fails, an error response is sent back to the device.

The following diagram shows the elements of the push notification system with the ServiceNow Classic mobile application. Within the ServiceNow infrastructure is your instance, the optional push proxy instance, and the ServiceNow feedback proxy. External to ServiceNow are the messaging services (APNs or FCM) and user mobile devices, which include the application that is registered to receive push notifications. See Push feedback for an explanation of the feedback service.

Push notification system with the ServiceNow Classic mobile app
Push notification responses

With custom push applications, you can have your users act on records in the instance by responding to a push notification.

The actions that they can take are defined in a script that you associate with the notification message. The response is sent to the instance in this format:

```
https://{instance_name}/api/now/v1/push/{application Name}/action/{action}
```

The application name is the push application the user is using. The application name must match the application name in the Push Application [sys_push_application] table. The action is the Sys ID of the action in the Push Notifications Actions [sys_push_notif_act_script] table.

Push feedback

Feedback refers to the information about failed iOS message delivery and the iOS push applications that can no longer receive push notifications.

The instance uses a scheduled job to pull feedback data every hour from the APNs. When the APNs determines that a device can no longer receive push messages, the corresponding device is set to inactive, making it unable to receive push notification messages. The Push Feedback [sys_push_feedback] table shows the token for the device that failed. If the same device is again able to receive push notifications, the device might receive the same token from the APNs. A new record is inserted into the Push Notification Installation [sys_push_notif_app_install] table.

Activate push notifications

Several plugins must be activated to use push notifications. If you have the Mobile UI (com.glide.ui.m) plugin active, push notification plugins are automatically activated.

Role required: admin

Ensure the following plugins are active on your instance:

- Push Notification: Provides the necessary components and REST APIs to send push notifications to mobile devices.
- Notification System Push Addon: Adds support for push notifications to the existing notification system.
- Push Feedback: Handles feedback from Apple on which devices are no longer valid so they do not keep receiving push notifications.

1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click Request Plugin to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>you would like this plugin</td>
<td></td>
</tr>
<tr>
<td>to be enabled</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

| Reason/Comments | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments. |

5. Click **Submit**.

**Installed with push notifications**

Several types of components are installed with the push notifications plugins.

**Tables installed with push notifications**

These tables are installed with push notifications.

<table>
<thead>
<tr>
<th>Table name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Push Applications [sys_push_application]</td>
<td>Push applications registered to the instance to receive push messages.</td>
</tr>
<tr>
<td>Push Default Registrations [sys_pushnotif_default_reg]</td>
<td>Contains all the notifications users are automatically subscribed to for a given push application. You can add notifications to this table on the Push Default Registrations related list on the Push Application form.</td>
</tr>
<tr>
<td>Table name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Push Feedbacks [sys_push_feedback]</td>
<td>Feedback from the APNs that tells the instance which push devices can no longer receive push messages. The feedback is handled either on the same instance where your notifications are triggered, or on a central instance that uses a REST call to tell your instance which push applications to deactivate.</td>
</tr>
<tr>
<td>Push Message Attribute Definitions [sys_pushnotif_msg_attr_def]</td>
<td>The attribute definitions used for push message content specification.</td>
</tr>
<tr>
<td>Push Message Attribute Values [sys_pushnotif_msg_attr_val]</td>
<td>The values associated with push messages.</td>
</tr>
<tr>
<td>Push Notifications [sys_push_notification]</td>
<td>The push notifications that the instance attempted to send to users.</td>
</tr>
<tr>
<td>Push Notification Actions [sys_pushnotif_act_script]</td>
<td>The action scripts that the instance uses in response to an actionable push message.</td>
</tr>
<tr>
<td>Push Notification Installations [sys_pushnotif_app_install]</td>
<td>The devices with push apps where users agreed to receive push notifications. This table lists the records by the token for the push app. The instance uses this information to know which push device and app to send notifications to. Records are created in this table when a user logs on an instance with the push app. The Mobile Devices [sys_mobile_devices] table, which is installed with the Mobile UI plugin, contains all the user devices that logged in to the instance with the ServiceNow Classic mobile application.</td>
</tr>
<tr>
<td>Push Notification Messages [sys_pushnotif_msg]</td>
<td>Messages customized for push notifications. These messages can be associated with a notification.</td>
</tr>

</tr>
</thead>
<tbody>
<tr>
<td>ConnectMessagePushNotification</td>
<td>Live Feed Message [live_message]</td>
<td>Sends a push notification when a new live feed message</td>
</tr>
</tbody>
</table>

**Push notification properties**

Push notifications provides several properties to customize the setup.

Add these properties to the System Properties [sys_properties] table.

`glide.push.debug`
Creates entries in the system log for push notification errors.

- Type: true | false
- Default value: false

**glide.push.feedback.debug**

Creates entries in the system log for feedback sent by the APNs for custom iOS push applications.

- Type: true | false
- Default value: false

**glide.push.notification.ttl_seconds**

Specifies the number of seconds after which a queued push notification expires. After a push notification is triggered, it is queued and finally processed by a scheduled job. If the time the notification sits in the queue exceeds this value, the notification is not sent. Check the *Push Notifications log* for more information.

- Type: integer
- Default value: 21600

**glide.push.enabled**

Enables or disables push notifications.

- Type: true | false
- Default value: true

### Push notification setup with the ServiceNow Classic mobile app

The ServiceNow Classic mobile application automatically enables push notifications and configures mobile devices for push notifications when users initially log in to the instance with ServiceNow Classic.

**Note:** Push notifications with the ServiceNow Classic mobile application are not supported in on-premise instances.

Setting up push notifications involves both the system administrator and users.

- Admin creates or updates push notifications for the ServiceNow Classic mobile app. The admin does not need to set up the mobile devices for users nor update their user preferences for receiving push notifications.
- Users install the ServiceNow Classic mobile app on their iOS or Android mobile devices and set their preferences for receiving notifications on the ServiceNow Classic mobile app.
What to do — admins

Admins create push notifications, similar to setting up email notifications. A push notification has two main parts: the push message and the notification, which includes the push message.

*Note:* The push message and notification must be for the same table.

Create the push message

Before creating a push notification, create the *push message* with the actual message content (JSON payload) to be included in the push notification.

Create the push notification that includes the push message

Create the *push notification* that includes the push message and message content. A push notification specifically sends the push message. You can update a standard platform notification and use it as a push notification that includes the push message.

Add the new push notification to the Push Default Registration table
To ensure that a new push notification is included and enabled in the notification preferences of your users, register a new push notification in the Push Default Registration table. The notification is listed in the notification preferences of your users the next time that they log in to the ServiceNow Classic mobile app.

What to do — ServiceNow Classic mobile app users

**Download the ServiceNow Classic mobile app**

*Install* the ServiceNow Classic mobile app on an iOS or Android mobile device.

**Agree to accept push notifications**

After installing the ServiceNow Classic mobile app, users are asked to accept push notifications. When the instance receives the push notification acceptance message from a user, it creates a record in the Push Notification Installations [sys_push_notif_app_install] table. This record is what the instance uses to identify the device + mobile application combination necessary to identify a push notification recipient.

The device then performs the following actions:

- Obtains a token that identifies the device.
- Triggers the creation of the device in the user notification preferences.

**Log in to the company instance from the ServiceNow Classic mobile app**

Logging in automatically subscribes users to the push-specific notifications registered in the Push Default Registration table.

**Update preferences for receiving notifications on the ServiceNow Classic mobile app**

Users can *enable or disable notifications* through Notification Settings in the ServiceNow Classic mobile app. They can set additional notification preferences, such as conditions or filters that affect notification delivery, by using the System Settings window on a desktop or mobile browser. For details, see Setting notification preferences in UI16.

**Next steps**

If you are an admin, review the base system notifications and determine if new push message content and push notifications are needed.

*Create a push message*

Before you create a push notification, create the push message with the actual message content for the notification.

The Push notification plugin must be active. The plugin is active by default.

Role required: admin

The push message and notification must be for the same table.

2. Fill out the fields on the form (see table).
3. Click Submit.

### Push Notification Message form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the message.</td>
</tr>
<tr>
<td>Push App</td>
<td>Select the ServiceNow Classic mobile application.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Push Message Content</td>
<td>Select the JSON content to be included in the push notification payload.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For details on defining payloads that control push notification behavior, see <a href="https://servicenow.com">KB0622333</a>. For example, you can specify predefined button pairs (Yes/No, Approve/Reject, Accept/Decline) as part of the push message content.</td>
</tr>
<tr>
<td>Message</td>
<td>Enter the message. You can add variables just as you would for other notifications. Any message you enter here overrides the message in the notification.</td>
</tr>
<tr>
<td>Related list</td>
<td>Optional. Select the attributes that apply to this notification. For details, see <a href="https://servicenow.com">Create an attribute value or action for a push message</a>.</td>
</tr>
<tr>
<td>Push Message Attribute Values</td>
<td></td>
</tr>
</tbody>
</table>

*Set up the push notification* that contains the message created or update an existing push notification to use the push message.

*Create a notification using a push message*

Email administrators can create a notification that specifically sends a push notification.

Configure the *push message* before performing these steps.

Role required: admin

You can associate a push message with a standard notification. A push message specifies the text the system sends as part of the push notification to the mobile device.

1. Navigate to **System Notification > Create Push Notification**.
2. Fill out the notification form as necessary (see *Create an email notification* for descriptions of the form fields.
3. Click the **What it will contain** tab.
4. Next to **Push Messages**, click the lock icon and select a push message.

   **Note:** The push message and notification must be for the same table.

5. If you want this notification to be sent only as a push notification and not as any other type of notification, select **Push Message Only**.
6. Click **Submit**.

   If the notification fails, the user is not notified. If the message fails to send because it exceeds the maximum payload, the instance logs the failure in the System Log.

*Add the push notification to the Push Defaults Registrations table* so that the push notification is listed in the notification preferences for users. Users can then select which notifications they want to receive for the ServiceNow Classic mobile app.

*Add a push notification to the Push Default Registrations table*

After you create a new push notification, add it to the Push Default Registration table. Push notifications registered in this table are listed and automatically enabled in the notification settings of your ServiceNow Classic mobile app users.
Role required: admin

2. Select the ServiceNow Classic Mobile Application.
3. In the Push Application form for the ServiceNow Classic mobile app, select the Push Default Registrations tab and click New.

4. In the Push Default Registration New record, select the notification to be registered.
5. Click Submit.
The next time that users log in to their instance, the new push notification is included in their list of notifications.

**Push notification setup with a custom push application**

If you are using your own custom mobile or push application, you must configure your app for use and set up the push contents.

Setting up a push notification infrastructure that uses a custom push app involves a push admin (also called push app developer or mobile app developer) and system administrator. When push admins create a customized push app, they also configure the app, its push message content (payload generators), and optional attributes, such as push action scripts. The admin creates and updates the push notifications for the custom push app. After users install the custom push app and initially log in to their instance from their mobile device, the system automatically creates a device (channel) for the custom app.

**Note:** These instructions are intended for users who develop their own customized push application. You do not need to configure the ServiceNow Classic mobile application.
Before you begin

Complete the steps in *Activate push notifications*. The Push Feedback (com.glide.push.feedback) plugin enables the system to receive push feedback from Apple and is required if you have an iOS app.

Assign the push_admin role to your organization's mobile app developer.

**What to do — push admin**

Configure push notifications for your custom push app. This process differs for iOS and Android devices.

1. *(iOS only) Upload a push certificate to your instance*
Upload a push certificate to your instance so that you can use it later to connect your iOS device to the push notification system.

2. **Create a push application record for your custom app**
   Register your customized mobile application with your instance to receive push notifications for the application. The instance uses this push application record to identify the device + push application combination necessary to determine a push notification recipient.

3. **Create push message content**
   Create a JSON content payload for different types of push notifications. The content determines how a push notification appears on the push application, and whether the user can send a message in response to the push notification. The push admin can create attribute definitions that specify a default push action script or string, for use in the push message content.

4. **(Optional) Create a push message attribute definition**
   Push message attribute definitions allow you to create reusable properties for push message content specification.

5. **(Optional) Create an attribute value or action for a push message**
   You can create attribute values that override the default attribute definitions used in the push message content.

6. **(Optional) Create a push action**
   A push action is a server-side script that runs when the instance receives a response to an actionable push message.

**What to do — admin**

**Create the push messages and push notifications**

The administrator *creates the push messages, sets up push notifications* for the custom push app, and if desired, the content.

**Next steps**

Use the Push Installation API to opt users in to receive push notifications. For more information, see *Push Installation API*.

Monitor push feedback to track push notifications that are failing to send to your custom push app. For more information, see *Monitor push feedback*.

**Upload a push certificate to your instance**

Upload a push certificate to your instance so that you can use it later to connect your iOS device to the push notification system.

Using your Apple developer environment, create a push certificate and convert it to a PKCS (.p12) file. For details on generating the .p12 file with the required certificate and private key, see *Enable push notifications* and *Communicate with APNs using a TLS certificate* in the Apple documentation.

**Note:** Ensure that your certificate is a push certificate and not a developer certificate. Also, if you're developing an app for testing purposes, ensure that you create a Sandbox certificate. If you're developing an app that you plan to launch in the Apple App Store, ensure that you create a Production certificate.

Role required: push_admin or admin
After you create a PKCS (.p12) file that contains the iPhone developer certificate and the private key used to sign the certificate, you need to upload the file to your instance. The system uses the information in the PKCS file to communicate with the APNs.

1. Navigate to **System Definition > Certificates**, and then click **New**.
2. On the form, fill in the following fields:
   - Name: Enter a certificate name.
   - Type: Select **PKCS12 Key Store**.
3. Attach the PKCS (.p12) file to the record.
4. Click **Submit**.

**Create a push application record for your custom app**

Register your customized mobile application with your instance to receive push notifications for the application.

Complete the following:

1. **Activate push notifications**
2. (iOS only) **Upload a push certificate to your instance**

**Role required: admin or push_admin**

Push notifications are application-specific: They are sent to one type of mobile application, regardless of how many users have this application installed. If you develop your own mobile application, you must configure it for use by creating a record for it in the Push Application [sys_push_application] table. By default, ServiceNow mobile applications are automatically set up and ready to use.

1. Navigate to **System Notification > Push > Push Application**, and then click **New**.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name of the push application.</td>
</tr>
<tr>
<td>Name</td>
<td>Database name of the push application. Enter a name that doesn't include spaces.</td>
</tr>
<tr>
<td>Push</td>
<td>Type of push service to enable for the application. Because you're setting up a custom push app, select <strong>Direct</strong>.</td>
</tr>
<tr>
<td>Feedback</td>
<td>Type of push feedback to use for the application. Select one of the following:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Apple</strong>: Send push notifications directly to the APNs without going through an intermediary.</td>
</tr>
<tr>
<td></td>
<td>• <strong>REST API</strong>: Not applicable to custom push apps.</td>
</tr>
<tr>
<td></td>
<td>• <strong>None</strong>: Do not handle feedback for this push application.</td>
</tr>
<tr>
<td>Apple Certificate</td>
<td>The X.509 certificate that you created on the Apple notifications portal. The certificate enables a device to talk to the APNs.</td>
</tr>
<tr>
<td>Sandbox Certificate</td>
<td>Sandbox certificate that you created on the Apple notifications portal. The certificate enable a device to talk to the APNs.</td>
</tr>
<tr>
<td>Google API key</td>
<td>FCM API key you obtained from Google for the Android push notification.</td>
</tr>
</tbody>
</table>
3. Click **Submit**.

*Create push message content* that contains the JSON content in the push notification payload.

In the Push Default Registrations related list, you can select the notifications that you want automatically subscribed to users who use this application. Users are subscribed to only active notifications.

*Create push message content*  
Push message content specifies additional JSON content in the push notification payload that is sent to the push provider.

Complete the following:

1. **Activate push notifications**  
2. (iOS only) **Upload a push certificate to your instance**  
3. **Create a push application record for your custom app**

You must know how to use JSON with push messages.

Role required: admin or push_admin

Push message content defines the style of push notification that can be sent out for your custom app. You can add custom content, such as a picture, icons, or action buttons for the user to respond to the notification. Use the following variables in the script:

- **current**: properties of the current record.
- **message**: push message sent as the body of the entire push content.
- **attributes**: object of the push message attributes that you define.

1. Navigate to **System Notification > Push > Push Message Content**.  
2. In the Push Notification Message Contents table, click **New**.  
3. Fill out the fields on the Push Notifications Message Content form (see table).  
4. Click **Submit**.
```javascript
1+ function buildJSON(dataName, current, message, attributes) {
2     var json = {};
3     json = {
4         "type": "default",
5         "record": {
6             "tableName": current.getTableName(),
7             "sys_id": current.sys_id
8         }
9     };
10     return json;
11 }
12 (current, message, attributes);
```
Notification Message form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the message content.</td>
</tr>
<tr>
<td>Push app</td>
<td>The push application the content can be used with.</td>
</tr>
<tr>
<td>Push Message Generation</td>
<td>Enter a script that determines the message content. See the example scripts.</td>
</tr>
<tr>
<td>Related list</td>
<td></td>
</tr>
<tr>
<td>Push Message Attribute Definitions</td>
<td>Select the attributes that apply to this notification. Attributes can be a value or an action. These attributes are used as default values for the content items you create in the content script. However, any attributes you create with the push message can override these attributes. See Create a push message attribute definition for information on creating attributes.</td>
</tr>
</tbody>
</table>

The following is an example of a content record that creates a two-button layout, one to approve something, such as a change request, and one to decline it.

```javascript
var json = {
    "table": current.getTableName(),
    "sys_id": current.sys_id,
    "template": {
        "type": "2 button",
        "button1": {
            "title": "Approve",
            "action": attributes.button_action,
            "parameters": { "response": "approve" }
        },
        "button2": {
            "title": "Decline",
            "action": attributes.button_action,
            "parameters": { "response": "decline" }
        }
    }
};

json;
```

Define a push message attribute to specify a default push action script or string that you can use in the push message content.

Create a push message attribute definition
Push message attribute definitions allow you to create reusable properties for push message content specification.

1. Activate push notifications
2. (iOS only) Upload a push certificate to your instance
3. Create a push application record for your custom app
4. **Create push message content**

Role required: admin or push_admin

Use an attribute definition to specify a default push action script or string that you can then use in the push message content.

You can override these attributes by creating any *push message attribute values*.

1. Navigate to **System Notification > Push > Push Message Content**.
2. Select a content record or script record.
3. In the Push Message Attribute Definitions related list, click **New**.
4. Fill out the fields on the form (see table).
5. Click **Submit**.

### Push Message Attribute Definition form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute Name</td>
<td>Enter a descriptive name for the layout.</td>
</tr>
<tr>
<td>Attribute Type</td>
<td>Select the type of attribute:</td>
</tr>
<tr>
<td>Default Script</td>
<td>Select the mobile action script that tells the instance what to do when it receives a response from the push notification. This option appears if you select <strong>Action</strong> for the Type.</td>
</tr>
</tbody>
</table>

- **Action**: An action to take on the instance, as defined by a script.
- **String**: An arbitrary string to send as part of the message content. The string can specify items like a button label in the message.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Specify an arbitrary string value to be placed in the attribute that is used by the message content. For example, the string could specify a button label. This option appears if you select String for the Type.</td>
</tr>
</tbody>
</table>

If you want to override default attribute definitions, see Create an attribute value or action for a push message.

Create an attribute value or action for a push message

Attribute values are associated with push messages to provide a way for the message to include certain types of information in the push notification.

Complete the following:

1. Activate push notifications
2. (iOS only) Upload a push certificate to your instance
3. Create a push application record for your custom app
4. Create push message content
5. Create a push message attribute definition

Role required: admin or push_admin

These push message attribute values override values that you set in an attribute definition on the Push Content form.

2. Select a message.
3. In the Push Message Attribute Values related list, click New.
4. Fill out the fields on the form (see table).
5. Click Submit.
Push Message Attribute Values form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute</td>
<td>Select a push message attribute definition.</td>
</tr>
<tr>
<td>Value/Action</td>
<td>Enter the value for the attribute or select the push action. This field changes to Value or Action depending on the type of attribute you select in the Attribute field.</td>
</tr>
</tbody>
</table>

(Optional) Create a push action to perform an action on the instance.

Create a push action
A push action is a server-side script that runs when the instance receives a response to an actionable push message.

Complete the following:

1. Activate push notifications
2. (iOS only) Upload a push certificate to your instance
3. Create a push application record for your custom app
4. Create push message content
5. Create a push message attribute definition
6. **Create an attribute value or action for a push message**

Role required: admin or push_admin

Create a push action to perform an action on the instance. For example, you might have an actionable push message that lets the user approve a change request. The action that handles the response should update the **Approval** field on the relevant Change Request record.

You can use global variables or, optionally, current variables and parameters passed through the **JSON content**.

1. Navigate to **System Notification > Push > Push Action**.
2. Fill in the form fields (see table).
3. Click **Submit**.

**Push Notification Action form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the action.</td>
</tr>
<tr>
<td>Script</td>
<td>Enter the script.</td>
</tr>
</tbody>
</table>

**Monitor push feedback**

Monitor push feedback to track push notifications that are failing to send to your custom push app.

Complete the steps in **Activate push notifications**. The Push Feedback (com.glide.push.feedback) plugin enables the system to receive push feedback from Apple and is required if you have an iOS app.

Role required: push_admin or admin

The information presented on the Push Feedback table is delivered to your system by the push notification service that is associated with your device. If you linked your instance to an iOS device, the information is delivered via the Apple Push Notification service (APNs). If you linked your instance to an Android device, the information is delivered via Firebase Cloud Messaging (FCM).

![Note:](image-url) The push feedback received from the APNs uses what Apple refers to as its "legacy binary protocol." For more information on how the legacy binary protocol works, see the Apple documentation.

1. In the navigation filter, enter **sys_push_feedback.list**.
2. On the list header, click the gear icon

   ![Icon](image-url)

   and add the following columns to the list view:
   - Sys push application ID
   - Push Platform

3. On the list, refer to the following columns to monitor push feedback:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Failure updated on</td>
<td>Date and time when the push feedback arrived to the system from Apple or Google.</td>
</tr>
<tr>
<td>Token</td>
<td>Unique key to identify the device + push application combination that the system sends the push notification to. The token is generated by Apple or Google.</td>
</tr>
<tr>
<td>When failed</td>
<td>Date and time when Apple or Google reported the push delivery failure.</td>
</tr>
<tr>
<td>Sys push application ID</td>
<td>Sys_id of the push application record that identifies the push app.</td>
</tr>
</tbody>
</table>
Requeue failed push notification messages

Push notification delivery might fail for various reasons. You can view which messages failed and requeue them to be sent out if necessary.

Role required: admin

Note: There is no way for the instance to guarantee or confirm push message delivery. For more information on how Apple handles push notifications, see the Local and Remote Notification Programming Guide for Apple developers.

Messages can also fail to send for several reasons, such as a large message queue or other issue with the instance. You can use a system property to control how long the instance queues a push notification after it is triggered.

Push notification message payload size is limited by provider:
- Apple iOS: 2,048 bytes
- Google: 4,096 bytes

Your instance does not send push messages that exceed this limitation. System logs save any failed messages. For details on Apple payload limitations, see the Local and Remote Notification Programming Guide for Apple developers.

1. Navigate to System Logs > Push Notifications.
   By default, the messages that were created today appear. You can change the filter if necessary. The Type column can have these values:
   - failure: The message could not be sent.
   - pending: The message is queued for processing.
   - success: The message was successfully sent, although not necessarily received by the mobile device.

2. Put any failed messages back into the queue to be resent by selecting the check boxes next to the failed messages, and then selecting Re-queue failed push notifications from the choice list.

3. If some push notifications continue to fail, consider increasing the value in the glide.push.notification.ttl_seconds property. See Push notification properties for more information.

Push notification retention

You can archive and eventually destroy push notifications that you no longer need or if your Push Notification table is excessively large.

Push notification retention is available starting with the Jakarta release.

Push notification archive and destruction plugins

The push notification archiving and destruction feature uses the Data Archiving and Push Retention plugins. The Data Archiving plugin must be active to archive and destroy push notification records. The Push Retention plugin provides a set of rules that specify when the system archives and destroys push notification records.

In new instances, the Push Retention plugin and associated archive and destroy rules are active by default. On upgraded instances, you must manually activate both the plugin and the archive and destroy rules. Be sure to review and approve the archive and destroy rules before activating them.
If your instance already has a process for managing push notification records, you do not need to activate the Push Retention plugin. If you want to replace your current process with Push Retention, be sure to deactivate the current process before activating the archive and destroy rules.

### Archiving and destroying push notification records

Archiving means moving records from the Push Notification [sys_push_notification] table to the Push Notification Archive [ar_sys_push_notification] table when they exceed the archive rule time limit. Destroying means deleting records in the Push Notification Archive table when they exceed the destroy rule time limit.

### Default archive and destroy rules

Push retention provides the following push archive rules:

- **Push Notification - Over a year old**: archives push notification records that were created more than 365 days prior to the current date.
- **Push Notification Archive - Over a year old**: destroys push notification records that have been archived for more than 365 days prior to the current date.

With these default settings, your messages are kept on the instance for a total of two years: one year in the Push Notification table, and one year in the Push Notification Archive table. At the end of the period, the system deletes the expired notification records from the Push Notification Archive table.

**Note:** By default these rules are active on new instances and inactive on upgrades. The system runs archive and destroy rules when you activate them.

### Compatibility with other record management implementations

If you are already using another method for managing push notification records, such as table cleaners, you do not have to use the Push Retention feature. To prevent unexpected record deletion, avoid using multiple push notification management processes on the same instance at the same time.

**Note:** For assistance replacing your existing record management implementation with push notification retention, contact your professional services or sales representative.

### Activate the Push Retention plugin

The Push Retention plugin (com.glide.push_retention) provides the retention policy for push notifications, so that you can specify when the system archives and destroys push notification records.

Role required: admin

The Push Retention plugin requires the **Data Archiving** plugin.

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.
   
   Note: You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise they will receive the following error: Application
**Archive push notifications manually**

You can manually archive push notifications on demand instead of waiting for the instance to archive them based on a scheduled job.

Role required: admin

Push retention provides these push notification archive rules:

- **Push Notification - Over a year old**: archives push notification records that were created more than 365 days prior to the current date.
- **Push Notification Archive - Over a year old**: destroys push notification records that have been archived for more than 365 days prior to the current date.

You can manually archive push notification messages that meet the default archive and destroy rules or any additional archive rules that you create.

1. Navigate to System Archiving > Archive Rules.
2. Open the push notification archiving rule, for example Push Notification - Over a year old
3. Click **Recalculate Estimate** to see how many records in the Push Notification [sys_push_notification] table are going to be archived. The estimate appears in the **Record estimate** field.
4. Click **Run Archive Now**.

**Subscription-based notifications**

Subscription-based notifications enable users to proactively subscribe to items that interest them and unsubscribe from messages that are not mandatory.

Users can also specify additional notification channels that each of their notifications can be configured to use.

Before users can manage the notifications that are sent to them, administrators must create email notifications to which users can subscribe. Administrators can also make subscription-based notifications mandatory so users cannot unsubscribe to them. Then users can subscribe or unsubscribe to the notifications, and add schedules and filters to the subscription to limit the notifications that can be received.

Notifications that administrators mark as subscribable are automatically available in user notification settings. Users are limited to one subscription per notification.

Administrators should create subscription-based notifications when they do not want to specify users for a notification and want to let users proactively subscribe to the notification.

**Note:** Subscription-based notifications are not domain aware and cannot support domain-specific settings.

**Subscriptions 2.0 plugin**

The Subscription Based Notifications 2.0 plugin must be active to use subscribable notifications. This plugin is active by default on all new and upgraded instances.

The plugin installs the Notification Subscription [sys_notif_subscription] table, which holds user subscriptions to all notifications.
Subscriptions and notification preferences

Users can subscribe to notifications available to them through their notification preferences. In the UI16 interface, all users can set and modify their notification preferences through the **Notifications** tab of the System Settings window. In the UI15 interface and earlier, admins and users set their notification preferences through the **Notification Preferences** link in the User form.

Setting notification preferences in UI16

You can set your own notification preferences, including personal subscriptions and channels for receiving them. All users can set these preferences through the **Notifications** tab of the System Settings window.

With the **Notifications** tab, you can:

- Search for a specific notification in the list of your notifications.
- Use a global switch to enable or disable all your notifications.
- Enable or disable a particular channel for receiving notifications, as well as create, edit, or delete channels.
- Control the notifications that you receive and apply conditions to restrict notification delivery.
- Create personal notifications, which are subscriptions to notifications that are important to you.

Comparison between notification preferences in UI16 and earlier interfaces

In new and upgraded instances that use the UI16 interface, the System Settings window is the central location for managing your notification preferences. The Notification Preference User Interface (com.glide.notification.preference.ui) plugin is activated by default.
Notification preferences in UI16 and UI15

In UI15 and earlier interfaces:

- Users set notification preferences through the Notification Preferences link in the User form (Self service > My Notification Preferences).
• Admins created user devices and set notification preferences for users through the Notification Preferences link in the User form, accessed through the User Administration module (User Administration > Users).

Note: Admins can revert to the UI15 notification preferences interface by setting the glide.notification.preference.UI.enabled property to false.

Manage your notification preferences in UI16

To access your notification preferences, click the gear icon (⚙️) in the banner frame, and in the System Settings window, click the Notifications tab. You can also access the System Settings by navigating to Self Service > My Notification Preferences.
Notifications tab in System Settings window

In the **Notifications** tab, use the following settings to manage your notifications:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| Search             | Search bar for finding notifications. To find a notification:  
|                    | • Enter the name of the notification you are searching for. When you type the first three characters, the system automatically returns a list of notifications matching the characters entered.  
|                    | • Enter two asterisks to return a list of all notifications in alphabetic order (the notifications are not organized by category).             |
| Allow notifications| Global switch for enabling or disabling all notifications.                                                                                   |
| Notification       | List of your channels for receiving notifications. Use this section to:  
| channels           | • Enable or disable a channel by using its toggle switch. If you disable a channel, notifications are not delivered through that channel.  
|                    | • Add channels using the Create Channel option.                                                                                               |
|                    | • Modify channel information. Click the channel row or the right arrow (>) next to the appropriate channel to edit or delete it.              |
| Notifications by   | List of notification categories that identify and group related notifications. Each category contains the notifications that you can subscribe to.  
| category           | To view the notifications in a given category, click the category row or the right arrow (>) next to the appropriate category. You can:  
|                    | • Edit settings for a notification:  
|                    |   • Enable or disable channels for the selected notification.  
|                    |   • Apply notification conditions, such as schedules and filters, that affect the delivery of the notification.  
|                    | • Create personal notifications, which are subscriptions to specific notifications that matter to you.                                         |

Create notification channels

You can add channels to receive your notifications. A notification channel is an email account or voice message system that you have access to.

Role required: none

Notification channels include email addresses, service providers for SMS messages, and mobile applications. You can create voice notification channels to support applications like Notify.

Note: If you are using the ServiceNow mobile application or a custom push application, you do not need to create a push channel for your mobile device. The system automatically creates a channel for the mobile app after you initially log in to your instance from your mobile device.

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.
2. Click **Create Channel**.
3. Complete the fields on the New Channel form.
### Field Table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name for the channel, such as the device or email account.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>The type of channel:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Email</strong>: for email messages.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: All users with an email address have a primary email channel, which</td>
</tr>
<tr>
<td></td>
<td>is created automatically after a notification is sent to them.</td>
</tr>
<tr>
<td></td>
<td>• <strong>SMS</strong>: for SMS messages.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Voice</strong>: for phone messages.</td>
</tr>
<tr>
<td>Email address</td>
<td>The email address of the channel.</td>
</tr>
<tr>
<td>Phone number</td>
<td>The phone number for SMS messages or for voice messages.</td>
</tr>
<tr>
<td>Service provider</td>
<td>The service provider for SMS messages.</td>
</tr>
</tbody>
</table>

4. Click **Save**.
   The system creates and enables the channel, and adds it to the list of notification channels.

To receive notifications on your new notification channel, you must enable the channel for individual notifications. After you enable the channel for a notification, you can set conditions to further control the notifications that you receive on the channel. For more information, see *Apply notification conditions*.

#### Modify notification channels

You can update channel information for your notifications.

**Role required**: none

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.
2. In the Notification Channels section, click the channel row or the right arrow (➡️) next to the channel name.
3. In the Edit Channel form, update the fields (see *Create notification channels* for descriptions of the form fields).
4. Click **Save**.

The system updates and saves the channel information that you modified.

#### Delete a notification channel

Delete a notification channel so that you no longer receive notifications through the channel.

**Role required**: admin

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.
2. In the Notification Channels section, click the channel row or the right arrow (➡️) next to the channel name.
3. On the Edit Channel form, click **Delete**.
The system deletes the channel from the list of notification channels and no longer delivers notifications to that channel.

Apply notification conditions
You can set various conditions and filters to control the notifications you receive. You can also enable or disable an email digest and the delivery of individual notifications by channel.

Role required: none

You can choose to enable certain features and set different conditions that control the notifications you receive. You can:
• Enable or disable an email digest if a digest is available for the notification. An *email digest* is a single email that summarizes the activity for the notification during a time interval that you specify. Admins configure the email digest content for a notification.
• Enable or disable a channel on which the notification is received.
• Set preconfigured schedules and filters that determine when you receive your notifications.
• Set more advanced filter conditions to limit the notifications delivered to you.

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.

2. Select the notification:
   a) In the Notifications By Category section, click the row or right arrow (>) of the category that you want to view.
   b) In the list of notifications for the category, click the row or right arrow (>) next to the notification that you want to edit.

3. To enable or disable an email digest for the notification, if an email digest is available:
   a) Click the **Email Digest** switch.
      The email digest is enabled when the switch is green and disabled when the switch is grey.
   b) If you enabled the digest, select the **Interval** (length of time) during which the notifications are accumulated.
The interval begins with the first occurrence of notification activity during the specified interval. For example, if you selected the Daily interval and the first notification occurs at 07:00, the system begins accumulating notifications at 07:00 and stops at 07:00 the next day. Soon after the interval ends, the system sends the email digest instead of sending the individual notifications that were triggered during the digest interval. If you disabled the digest, the system immediately stops accumulating the notifications and does not send the email digest.

4. To enable or disable a channel on which the notification is received, click the switch for the channel. The notification is enabled when the switch is green and disabled when the switch is grey. If you previously disabled an entire channel, you cannot enable that channel for the notification.

5. To set more criteria for notification delivery, click the row or the right arrow (>) next to the channel for the notification.
   a) Complete the Apply Conditions form (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schedule</td>
<td>Select a schedule that determines when the notification can and cannot be received.</td>
</tr>
<tr>
<td>Filter</td>
<td>Select a pre-configured filter with the criteria that determines when the notification can be sent. For example, you might select a filter whose conditions send notifications when an incident with a priority of 1 - Critical is opened for a network issue.</td>
</tr>
<tr>
<td>Advanced filter</td>
<td>Select this check box to use the condition builder to create additional criteria. When you select the check box, the Table and Conditions fields are displayed.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the table for the notification. For example, if you selected an incident-related notification, you might select the Incident [incident] table.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Conditions</td>
<td>Define as many conditions as needed to limit the notifications you receive. For example, you can choose to be notified only when an incident communication plan is created for a specific configuration item.</td>
</tr>
</tbody>
</table>

b) Click **Save**.

To navigate back, click the left arrow (<) at the top of the Notifications window.

---

**Create personal notifications**

You can create personal notifications, which are subscriptions to notifications of importance to you. You can apply conditions that control specific content included in your personal notification, and also enable or disable the channels for delivery.

Role required: none

A personal notification is a subscribable notification that you can customize. You can assign the notification a name that is meaningful to you and filter the information received in that notification.

**Note:** Users are limited to one subscription per notification.

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.
2. Click **Create Personal Notification**.
3. Complete the New Personal Notification form (see table).
### Field Descriptions

**Name**
- A descriptive name for your personal notification. Use a meaningful name to distinguish it from system notifications.

**Notification**
- The notification to subscribe to. You can subscribe only to notifications that are configured to allow subscriptions. Depending on the notification you select, the **Table**, **Affected record**, and **Send when** fields are displayed.

**Table**
- The database table that the notification is linked to.

**Affected record**
- The specific record that the notification is based on. This field appears when you select a notification that has an affected record (for example, a notification for a problem record that has multiple affected CIs). Click the lookup icon, select the table and specific document (record) in that table, and click **OK**.
4. **Click Save.** The system creates the personal notification and adds it to the appropriate notification category. In the following example, notice the category in which the system placed the personal notification.

5. **Enable or disable the channels for your personal notification.**

6. **Navigate back to the list of notifications for the category by clicking the left back arrow (φ) at the top of the form.**

   Notice that your Personal Notifications are listed above the System Notifications in the given category.
7. Navigate back by clicking the left back arrow (〈) at the top of the form or by clicking the **Notifications** tab.

**User notification preferences in UI15 and earlier**

In UI15 and earlier interfaces, use the **Notification Preferences** link in the User form to manage the notifications that you can subscribe to.

The following instructions explain how to use **Notification Preferences** to manage notifications.

*Set up a notification device in UI15 and earlier*

You can add devices for a user to receive notifications. A *device* is a mobile device, email account, or voice message system that the user has access to.

Role required: admin

Notification devices include email addresses, service providers for SMS messages, and mobile applications.

1. Navigate to **User Administration > Users**.
2. Select a user.
3. Click Notification Preferences.
4. Click Create New Device.
5. Fill in the fields on the form (see table).
6. Click Submit.

### New Device form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name of the device or account.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of device:</td>
</tr>
<tr>
<td></td>
<td>• Email: for email messages.</td>
</tr>
<tr>
<td></td>
<td>• SMS: for SMS messages.</td>
</tr>
<tr>
<td></td>
<td>• Mobile: for push notifications.</td>
</tr>
<tr>
<td>Email address</td>
<td>The user's email address.</td>
</tr>
<tr>
<td>Mobile application</td>
<td>The mobile application for push notifications.</td>
</tr>
<tr>
<td>Phone number</td>
<td>The user's phone number for SMS messages.</td>
</tr>
<tr>
<td>Service provider</td>
<td>The service provider for SMS messages.</td>
</tr>
<tr>
<td>User</td>
<td>The user's record in the system.</td>
</tr>
<tr>
<td>Order</td>
<td>A number that determines which device receives the notification when multiple devices are configured. The device with the lowest number receives the notification.</td>
</tr>
<tr>
<td>Active</td>
<td>A flag that indicates if the device is active.</td>
</tr>
</tbody>
</table>

### Field: Notification Device Variables

**Description:** Additional, optional attributes of an SMS device used inside an advanced script from the SMS service provider. These attributes are generally used to deliver SMS notifications to an internal SMS distribution technology. This advanced scripting procedure is not necessary for configuring external SMS providers.

---

**Note:** If you inactivate a device, it still appears in the user preferences, but the switches that allow users to select the notifications are grayed out for that device column.

---

**Edit a notification device in UI15 and earlier**

All users can edit their notification preferences, including notification devices.

**Role required:** none

1. Navigate to **Self-Service > My Profile**.
2. Click **Notification Preferences**.
3. Click the name of the existing device.

The device form opens allowing you to make certain modifications, depending on your user role. See *Set up a notification device in UI15 and earlier* for a description of all fields.

---

**Add personal subscriptions in UI15 and earlier**

After setting up your devices, you can subscribe to notifications that are configured as subscribable.

The Subscription Based Notifications 2.0 plugin must be active.

If you have subscribed to messages, your list of notification messages can build over time. You can create preferences for how and when these messages are delivered, or unsubscribe to messages that are not configured as mandatory.

**Note:** Conditions that you apply to personal subscriptions do not override the filters that the administrator creates for the subscribable notifications. Your conditions are evaluated after the conditions on the subscribable notification are met. If the notification filter set by the administrator fails, the filter conditions on your personal subscription are not evaluated.

---

1. Navigate to **Self-Service > My Profile** to open your user profile.
2. Click the **Notification Preferences** related link.

The Notification Preferences page opens. You can see your personal subscriptions and the general notifications that you are subscribed to.

3. Click **Subscriptions**.
4. Click **Add Personal Subscriptions**.
5. Fill in the fields as described in the table.
Add personal subscriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name for the subscription.</td>
</tr>
<tr>
<td>Notification</td>
<td>The notification to subscribe to. You can only subscribe to notifications that are configured to allow subscriptions.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that the incident is configured to run on. You cannot modify the table from this form. To select another table, configure the notification. See Create an email notification.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box indicating whether the subscription is active. Users can receive notifications for subscriptions only if the subscription is active. If it is not active, the on-off switch for the subscription is set to off and is read-only.</td>
</tr>
<tr>
<td>Send to</td>
<td>The devices that this subscription is sent to. Selecting the devices in this field is the same as turning on the switch for the subscription on the Subscriptions page.</td>
</tr>
<tr>
<td>Affected record</td>
<td>The specific record that the subscription is based on. Click the lookup icon, and then select the table and the specific record in that table.</td>
</tr>
<tr>
<td>Send when</td>
<td>Another condition that must be met to send the notification. For example, you might select a filter whose conditions send notifications when an incident with a priority of 1 - Critical is opened for a network issue. The system evaluates the conditions in this filter after the conditions set in the notification filter by the administrator.</td>
</tr>
</tbody>
</table>

6. Click Submit.
7. You can turn the subscription for active subscribable notifications on or off using the switch on the Subscriptions management section of the Notification Preferences page.

![Subscription switch]

**Personal subscriptions**

Personal subscriptions are saved in the Notification Subscriptions [sys_notif_subscription] table. The records in this table are made active or inactive when you slick the switch to subscribe or unsubscribe from the notification.

8. You can edit the subscription at any time by clicking **Edit** next to it.

**Select notifications in UI15 and earlier**

Administrators can configure notification preferences for each user and users can also select which notifications they want to receive for various devices.

1. Navigate to **Self-Service > My Profile** to select your own notifications, or if you have admin access, navigate to **User Administration > Users** to select notifications for another user.

2. Click a user record to open it.

3. On the User form, click **Notification Preferences** under Related Links.

The notification preferences page appears. The preferences pages show all the notifications available to the user and the devices that the user has configured, such as email or mobile phone. If a user does not have read access to the table on which the notification is based, the notification does not appear.

Every user has the **Primary email** device, where subscriptions to email notifications can be enabled.

![Notification Preferences]

**Notification preferences**
4. Click the switch next to the notification to subscribe the user to it.

Modify notifications for a user device in UI15 and earlier
After you set up the devices through which users receive notifications, you can assign the notifications to each device and add advanced conditions to limit what notifications are received.

Role required: admin

1. On the Notification Preferences page for a user, find the notification from the list of notifications.
2. Click Edit next to the notification. The preferences for that notification appear.
3. Fill in the fields on the form (see table).
4. Click Submit.
## Form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notification Message</td>
<td>Select the notification. Related fields appear for certain notifications. For example, if you select <strong>CI affected</strong> or <strong>Location affected</strong>, a field appears for selecting the CI or the location. Duplicate messages are not permitted on a device.</td>
</tr>
<tr>
<td>Device</td>
<td>Modify the device if necessary.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Select a schedule that determines when the notification can and cannot be received.</td>
</tr>
<tr>
<td>Filter</td>
<td>Select a pre-configured filter with the criteria that determines when the notification can be sent. For example, you might select a filter whose conditions send notifications when an incident with a priority of <strong>1 - Critical</strong> is opened for a network issue. The system evaluates the conditions in this filter after the conditions in the notification filter set by the administrator. This field is not available when an advanced filter is configured.</td>
</tr>
<tr>
<td>Advanced filter</td>
<td>Select this option if you want to use the condition builder to create additional criteria. When you select the check box, the <strong>Table</strong> and <strong>Conditions</strong> fields replace the <strong>Filter</strong> field.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the table for the notification. For example, if you select the <strong>CI affected</strong> notification message, you might select the Incident [incident] or Change Request [change_request] table. This field appears when you check the <strong>Advanced filter</strong> check box.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Define as many conditions as needed to limit the notifications you receive.</td>
</tr>
</tbody>
</table>

### Create a service provider

Administrators can configure service providers for devices that use SMS.

**Role required:** admin

Administrators also have the option of configuring how a device’s service provider affects the construction of the device's email address.

1. Navigate to the Notification Service Provider [cmn_notif_service_provider] table by typing `cmn_notif_service_provider.list` in the application navigator filter.
2. Fill out or change the fields on the form (see table).
3. Click **Update**.
4. Click **Save** on the Notification Preferences page.
<table>
<thead>
<tr>
<th>ServiceNow Notification Service Provider</th>
<th>AT&amp;T</th>
<th>Application</th>
<th>Global</th>

<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Configured name of the service provider.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of device, in this case SMS.</td>
</tr>
<tr>
<td>Active</td>
<td>Enables or disables this notification device.</td>
</tr>
<tr>
<td>Advanced notification</td>
<td>Removes all the previous options and displays the Advanced script field.</td>
</tr>
<tr>
<td>Advanced script</td>
<td>Used for custom notifications that run a script rather than construct a traditional SMS/email. This is generally used when all outbound SMS messages must run through a central SMS hub, as opposed to being sent directly from the instance to the SMS provider. Advanced users can construct a script in this field that will send a notification to an old style numeric pager that cannot receive SMS communications. This field is rarely used and employs advanced scripts. Contact your representative to assist you with any advanced SMS scripting.</td>
</tr>
<tr>
<td>Construct address manually</td>
<td>Removes the prefix and suffix options and displays the Construction script field.</td>
</tr>
<tr>
<td>Construction script</td>
<td>Allows you to script the email address construction as you would in a business rule. For example, abc + current.phone_number + <a href="mailto:def@text.att.net">def@text.att.net</a> would construct an email address of <a href="mailto:abc2223334444def@text.att.net">abc2223334444def@text.att.net</a>. <strong>NOTE</strong>: Current is a reference to the device, not the service provider, hence the current.phone_number variable that uses the device's phone_number value.</td>
</tr>
<tr>
<td>SMS Provider Email Prefix</td>
<td>Places the provided text before the device's specified phone number; for example: <a href="mailto:PREFIX2223334444@text.att.net">PREFIX2223334444@text.att.net</a></td>
</tr>
<tr>
<td>SMS Provider Email Suffix</td>
<td>Places the provided text after '@' sign; for example: 2223334444@SUFFIX</td>
</tr>
<tr>
<td>Notification Device Variables</td>
<td>Additional, optional attributes of an SMS device used inside an SMS service provider's Advanced script. This is generally used to deliver SMS notifications to an internal SMS distribution technology. This is an advanced scripting procedure and is not necessary for configuring external SMS providers.</td>
</tr>
</tbody>
</table>

Select a service provider
You can configure how a device's service provider affects the construction of the device's email address.

Role required: admin

1. Navigate to User Administration > Users and open any user's record.
2. Under Related Links, click Notification Preferences, and then click an SMS notification device.
3. If no SMS device is present, click New Device and configure one.
4. Select the appropriate service provider, and then click the reference icon for the **Service provider** field. The service providers are saved in the Notification Service Provider [cmn_notif_service_provider] table. Only active providers are visible.

**SMS notification advanced scripting**
You can use these objects and their attributes in your advanced notification scripts on the SMS Notification Service Provider form.

**Objects and attributes**

          | • email.instance  
          | • email.importance |
### Make a notification mandatory

To prevent users from turning off or deleting a subscription to a notification, make the notification mandatory.

Role required: admin

When you make a notification mandatory, the notification is locked in user notification preferences, preventing the user from removing or unsubscribing to the notification, filtering it, or changing the schedule.

Users receive mandatory notifications even if they disable notifications.

**Note:** Mandatory notifications apply to only the primary device of the user. You cannot make a notification mandatory for secondary devices.

1. Navigate to **System Notification > Email > Notifications**.
2. Open the appropriate notification.
3. Configure the form and add the **Mandatory** field. This field does not display by default.
   a) Click the context menu icon ( ) and select **Configure > Form Layout**.
   b) Using the slushbucket, select the **Mandatory** field and the order in which you want the field to appear.
   c) Click **Save**.
4. Select the **Mandatory** check box.

When a user checks their notification preferences, the control button for the mandatory notification is on and is read only.

---

<table>
<thead>
<tr>
<th>Object</th>
<th>Example attributes</th>
</tr>
</thead>
</table>
| device | • device.service_provider  
         • device.group  
         • device.order  
         • device.sys_id  
         • device.sys_updated_by  
         • device.sys_created_by  
         • device.primary_email  
         • device.schedule  
         • device.name  
         • device.sys_created_on  
         • device.email_address

         • device.type |
### Force a notification to be sent

To force a notification to be sent to the specified users, enable forced delivery.

Role required: admin

Forcing a notification means that the relevant users receive the notification, even if they have not subscribed to the notification or have turned off the subscription. In addition, the users receive the notification even if the **Notification** field is set to **Disable**.

Note: Forced delivery applies to only the primary device of the user. You cannot force a notification to be sent to secondary devices.

1. Navigate to **System Notification > Email > Notifications**.
2. Open the appropriate notification.
3. Configure the form and add the **Force delivery** field.
4. Select the **Force delivery** check box.
5. Click Update.

   Unlike using the Mandatory option, forcing the delivery does not lock the user's preference or prevent the user from unsubscribing from the notification.

Create a notification filter

Notification filters enable a user to control the delivery of messages by creating special conditions on multiple tables in a single, reusable filter.

Role required: admin

For example, you can create a filter that controls message delivery when active incidents, problems, and change requests for network issues reach a critical state. For UI15 and earlier interfaces, notification filters are available for selection in the Filter field of a user's Notification Preferences form. For UI16, filters for notifications or channels are set through the Notifications tab of the System Settings window. For details, see Apply notification conditions.

**Note:** The system applies the user's filter conditions after the administrator's conditions have been evaluated. If the administrator's conditions fail, the system ignores notification filters.

1. Navigate to System Notification > Email > Notification Filters and create a record.
2. In the Notification conditions related list of the new record, create and submit filter conditions on one or more tables.

   ![Notification condition form](image)

3. Repeat the procedure to create additional conditions on other tables for this filter.
Filter device notifications using a schedule

You can associate devices, such as Email, SMS, and Voice, to schedules that define when the devices can and cannot receive notifications.

Role required: admin

Notifications that are triggered outside of the scheduled days and times for the device are not queued up for delivery at a later time. For example, if an administrator selects the Weekdays schedule for an email device, the device receives email notifications triggered between Monday and Friday. If notifications are triggered on Saturday, they are not delivered to the device.

1. Define schedules as needed using System Scheduler > Schedules > Schedules.
2. Add or edit a device.
3. Configure the New Device for System Administrator form and add the **Schedule** field.
4. In the **Schedule** field, select the schedule for the device.
5. Click **Submit**.

*Edit the schedule or filter of an existing notification message*

You can update a schedule or filter that was previously created for an email notification.

Role required: admin

To edit the schedule or filter of an existing notification message:

1. In the Notification Preferences screen, click the message to edit.
   You cannot edit any attributes of a mandatory message.
2. Make the appropriate changes in the form.
3. Click **Update**.

**Email unsubscribe**

Administrators can add unsubscribe links to notifications so that users can stop receiving particular email messages.

!*Note:* The base system notifications include unsubscribe and notification preferences links.*

The system offers two types of macros to create unsubscribe links.

- An unsubscribe link that creates an email message to the instance.
- An unsubscribe link that opens the notification preferences for the user on the instance.

**Available unsubscribe macros**

<table>
<thead>
<tr>
<th>Unsubscribe type</th>
<th>Macro used</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unsubscribe by email</td>
<td>${NOTIF_UNSUB}</td>
<td>The system generates an HTML <code>mailto</code> hyperlink. When users click the link, their browser or email client creates a pre-formatted unsubscribe email message to the instance.</td>
<td><code>link_text</code>: specify the text to display as a link within quotation marks.</td>
</tr>
<tr>
<td>(Unauthenticated)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Unsubscribe by notification preferences</td>
<td>${NOTIF_PREFS}</td>
<td>The system generates an instance link directly to the notification preferences for this notification type.</td>
<td><code>link_text</code>: specify the text to display as a link within quotation marks.</td>
</tr>
<tr>
<td>(Authenticated)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Administrators can add unsubscribe macros to any notification record type such as:

- Email layouts
- Email templates
- Email notifications

**Unsubscribe by email**

Unsubscribe by email requires the user email client or browser to create a pre-formatted email message containing these elements:

- The **To** field has the email address of the instance.
• The **Subject** starts with the string *Unsubscribe from*.
• The **Body** has a JSON string with a name-value pair of *Unsubscribe* and an array value that contains two more name-value pairs.
  • The **notification_id** parameter specifies the Sys ID of the notification the user wants to unsubscribe from.
  • The **unsub_token** parameter specifies an instance ID the system uses to verify that the email came from a ServiceNow instance.

**Note:** Some email clients and web browsers, such as GMail on Chrome, require extra client configuration to support mailto hyperlinks. Administrators can provide an alternative unsubscribe method for users whose email client or browser does not support mailto links. See [RFC6068](https://tools.ietf.org/html/rfc6068) for information about the mailto URI scheme.

The **Unsubscribe from Notification** inbound action processes the email and unsubscribes the sender from the listed notification.

**Note:** Unsubscribing by email message does not require users to authenticate with the instance first.

**Unsubscribe by notification preferences**

Unsubscribe by notification preferences requires the user's browser to navigate to the notification preferences page on the instance. After logging in, the system displays the notification preferences for this particular notification.

Users can set preferences for this notification such as disabling notifications for a particular device. Users must save their notification preferences for changes to take effect.

**Unsubscribe links**

This email layout adds several unsubscribe links to the bottom of each email notification.

```
${NOTIF_UNSUB} from this notification by email or ${NOTIF_UNSUB+link_text="click here"}.
Manage your ${NOTIF_PREFS} or ${NOTIF_PREFS+link_text="click here"}.
```

When rendered in an email notification, the unsubscribe links only display the link text.

Go to Instance

Unsubscribe | Manage Preferences
If a user clicks the **Unsubscribe** link, the email client creates a message such as this:

![Sample unsubscribe by email message](image)

### Notifications in messaging applications

Enable users to receive their ServiceNow platform notifications in Slack or Microsoft Teams messaging applications. Use the Now Actions app to configure the messaging apps for your instance.

### Admin setup

To enable ServiceNow notifications within Slack or Teams, you must be an administrator for both ServiceNow and the third-party application.

1. **Request IntegrationHub**

   Integrations with third-party systems require a separate IntegrationHub subscription. To activate IntegrationHub, see *Request an IntegrationHub plugin*.

2. **Request the Messaging Notification plugin**

   To activate this feature, request the Messaging Notification plugin (com.glide.notification.messaging) through the HI Customer Service system. This plugin activates related plugins if they are not already active.
3. Install the Now Actions messaging app for Slack or Teams

As an administrator for both ServiceNow and the third-party application, find and install the Now Actions app. Install the application in ServiceNow to associate the app with your instance.

**Note:** The primary owner of a Slack workspace or organization owns and manages the application. To avoid losing admin access to the workspace or organization, transfer primary ownership before any administration changes occur. If you transfer primary ownership, update the JSON payload for the Slack installation in the Notification Integration page. For more information about editing the Slack installation, see [Install the Now Actions messaging app](#).

If the Now Actions app is uninstalled, the workspace or team displays as inactive in the Notification Integration page. To view the Notification Integration page, navigate to **System Notification > Messaging > Messaging Integration Configuration**.

4. Configure message content

Create a message in the Message Contents [messaging_content] table that you can use in multiple notifications. Messages can be informative, or they can request action from an individual Slack or Teams user. For example, the Approval Request message includes Approve and Reject buttons to take the associated action in ServiceNow. Only users that have linked their Slack or Teams account with their ServiceNow account can take action in ServiceNow from the third-party application.

5. Create a messaging notification

Notifications define when a message is sent, who it is sent to, and what it contains. To send a notification to Slack or Teams, add a messaging content record to the notification and configure the notification messaging channel. Notifications that require action must be sent to individual users instead of groups.

**User setup**

To enable individual ServiceNow notifications in Slack or Teams, and to take action on notifications, configure your system settings and link your user accounts.

**Link your ServiceNow user account to your Slack or Teams account**

Link your ServiceNow account to your Slack or Teams account to take action on ServiceNow notifications from within Slack or Teams. If you do not link accounts, you can still receive notifications within group channels. However, you cannot to approve ServiceNow requests or take action on notifications from within Slack or Teams.

**Configure system settings**

Each user can enable ServiceNow notifications in a third-party application by configuring the communication channel in their system settings. Opt in to receive approval requests and other actionable notifications in third-party channels.

**Notification channels**

In ServiceNow, a notification channel is a method or device for receiving notifications. For example, in the base system you can elect to receive notifications through email or SMS channels. If messaging applications are enabled on your instance, you can enable notifications to Slack and Teams using Notification Channels in your system settings.
Actions and events

The Message Actions [messaging_observer_handler] table processes communication channel events, such as adding or deleting a Slack channel, to keep the instance and the third-party application in sync. Only developers creating Slack or Teams applications should add actions to this table. Register new actions with the instance through the Message Event Registry [messaging_observable] table. To remove a base system action, clear the active flag instead of deleting the record.

Logging

The Inbound and Outbound message logs contain information on actions, events, and activities between ServiceNow and the third-party application. Use the logs to identify the content, state, and origin of communications to and from your instance.

Request the Messaging Notification plugin

To activate this feature, request the Messaging Notification plugin (com.glide.notification.messaging) through the HI Customer Service system. This plugin activates related plugins if they are not already active.

Role required: admin

There are two ways to request a plugin:

• Access the HI Service Catalog directly by clicking Service Catalog > Activate Plugin on HI.
• Access the HI Service Catalog through the All Applications page on your instance by following these steps.

1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click Request Plugin to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

5. Click **Submit**.

**Install the Now Actions messaging app**

As an administrator for both ServiceNow and the third-party application, find and install the Now Actions app. Install the application in ServiceNow to associate the app with your instance.

To activate this feature, request the Messaging Notification plugin (com.glide.notification.messaging) through the HI Customer Service system. This plugin activates related plugins if they are not already active. For more information, see [Request the Messaging Notification plugin](#).

Roles required:
- Admin or messaging_admin in ServiceNow
- Administrator for Slack or Teams

**Install the Now Actions messaging app for Slack**

Install the Now Actions messaging app from the Slack App Directory and associate the app with your instance.

1. Install the Now Actions app from the Slack App Directory.
   a) Find and install the Now Actions app in the Slack App Directory.
b) Click Authorize when prompted.
c) Enter a customized name, app description, and icon (optional).
d) Configure your Now Actions web address. This is the base URL for your instance. For example, https://<instance_name>.service-now.com/.
e) Copy the JSON configuration found in the Add your Slack credentials to your app section for use in later steps.

2. Associate your Slack app with your instance.
   a) Navigate to System Notification > Messaging Integration Configuration.
   b) Click the Install button next to Slack.
   c) In the JSON Configuration pop-up, paste in the JSON configuration you copied in earlier steps.

3. Check for installation verification. The Slack workspace should appear below the Slack heading on the Notification Integration page.

   During installation, the instance synchronizes with all public Slack channels in the workspace. New public channels added after installation will automatically synchronize with the instance. You can browse to System Notification > Messaging Channels on your instance to verify that the new channel appears on the instance.

To update the app after installation, use the Configure JSON Payload and Settings on Slack icons on the Notification Integration page. You can view the JSON payload, view app credentials, change app appearance, or delete the app.

**Install the Now Actions messaging app for Microsoft Teams**

Associate the Now Actions messaging app with your instance.

1. Associate your Microsoft Teams app with your instance.
   a) Navigate to System Notification > Messaging Integration Configuration.
   b) Click the Install button next to Microsoft Teams.
   c) A pop-up message appears to confirm redirection to Microsoft Teams to verify your identity. Click OK.
d) When prompted, log in to Microsoft Teams with your Teams admin account.

e) Click **Accept** to accept the permissions for the app.
f) If the selected workspace has already been assigned, you are asked whether you want to proceed to overwrite the previous assignment. Click **Override** to change the workspace, or click **Cancel** to leave the current assignment in place.

g) After authentication, installation will start in the background. Once installation completes, a message appears confirming the installation.
h) Click the **app package** link to access a knowledge base article *KB0690098*, containing the application package for Microsoft Teams. Follow the steps in the article to make this package available for your Microsoft Teams users.

2. Check for installation verification. The new team should appear below the Teams heading on the Notification Integration page.
During installation, the instance synchronizes with all public Teams channels. To add channels created after the install, open Microsoft Teams and @mention the app from the new channel. You can browse to **System Notification > Messaging Channels** on your instance to verify that the new channel appears on the instance.

To receive a ServiceNow notification in Microsoft Teams, create a message and a notification. See [Configure message content](#) and [Create a messaging notification](#).

### Configure message content

Create a message in the Message Contents [messaging_content] table that you can use in multiple notifications. Messages can be informative, or they can request action from an individual Slack or Teams user. For example, the Approval Request message includes Approve and Reject buttons to take the associated action in ServiceNow.

Role required: admin or messaging_admin

To enable users to take actions in Slack or Teams, use the Buttons message type and define scripted behavior. Only users that have linked their Slack or Teams account with their ServiceNow account can take action in ServiceNow from the third-party application.

1. Navigate to **System Notification > Messaging Content**.
2. Open an existing notification record or click **New** to create a new record.
3. Fill in or modify the fields as appropriate.

#### Messaging content fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the message.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Select a type of message.</td>
</tr>
<tr>
<td>• Simple</td>
<td>Send an informative message to an entire Team or Slack channel.</td>
</tr>
<tr>
<td>• Buttons</td>
<td>Send a message to an individual user in Slack or Teams and define the desired behavior in the <strong>Script</strong> field. Associate buttons in the message with actions in ServiceNow. Use the Approval Request as an example.</td>
</tr>
<tr>
<td>Target table</td>
<td>To use record content in your message, select the appropriate table.</td>
</tr>
<tr>
<td>Fields</td>
<td>Select which fields from the <strong>Target table</strong> appear in a simple message. Changing the order of the fields changes the display order in the notification.</td>
</tr>
<tr>
<td>Message heading</td>
<td>Enter text to appear at the top of the message.</td>
</tr>
<tr>
<td><strong>Message</strong></td>
<td>Enter the content of the message. Use notification variables to include dynamic information in your message. For example, use <strong>Incident ${{number}}</strong> to include the incident number in the message. For available variables, see <a href="#">Notification variables</a>.</td>
</tr>
<tr>
<td><strong>Buttons</strong></td>
<td>Select or create buttons to use on the form. After selecting or creating a button, you must define button behavior in the <strong>Script</strong> field. Only visible when <strong>Buttons</strong> is selected in the <strong>Type</strong> field.</td>
</tr>
</tbody>
</table>
**Field** | **Description**
--- | ---
Script | This field is only visible when Buttons is selected in the *Type* field.
Enter a script to define what happens in your instance when a user selects a button in Slack or Microsoft Teams. Use the `actions.get` method to return the name of the button selected by the user.

```javascript
if (actions.get('button') == 'Approve') {
    target.state = 'approved';
    target.update();
}
```
In this example, the script conditionally executes when the "Approve" button is selected.

Use the method `sn_notification.Messaging.send` to send information to the messaging window.

```javascript
var content = new GlideRecord("messaging_content");
content.get("1bb10839572213007f004758ef94f9c4");
sn_notification.Messaging.send(application, userId, content, target);
```
In this example, the script stores a Message Content record in the `content` variable. It then posts a message from that Message Content record.

Application | Select the application scope for this notification.

4. **Click Submit**

This example shows the output of a message in Microsoft Teams. This message is of the buttons type, which shows buttons and performs scripted actions based on the user selection. In this case, the script uses the `sn_notification.Messaging.send` method to display the change in state for the record.
Use the message in a notification. For more information about creating notifications, see Create a messaging notification.

Create a messaging notification

Notifications define when a message is sent, who it is sent to, and what it contains. To send a notification to Slack or Teams, add a messaging content record to the notification and configure the notification messaging channel. Notifications that require action must be sent to individual users instead of groups.

Role required: admin

2. Click New.
3. Fill in or modify the fields as appropriate.
Use Notifications to notify users about specific activities in ServiceNow, such as updates to incidents or change requests. Notifications allow administrators to specify:
- When to send the notification
- Who receives the notification
- What content is in the notification

### Messaging notification fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the notification. Use descriptive names to ensure that your users are able to easily distinguish between notifications.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table to trigger the message. Must be a table or database view within the same application scope.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Notifications running on the task [task] table are not supported. Instead, use a table extended from task.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category for the notification. A category groups related notifications in the system settings.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Do not leave the category as Uncategorised, as users may not be able to find the notification in their list of notifications.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description for this notification.</td>
</tr>
</tbody>
</table>

**Note:** Notification records are shared between messaging, email, and push notifications. Some fields on the form are not relevant to messaging notification records. Leave fields not described here at their default values.

4. Click **Advanced view** under **Related links** to switch the advanced view. Switching to the Advanced view saves the current record.

5. Open the **When to send** tab and complete the form.
**Note:** If the same trigger generates multiple notifications, the system only sends one notification. The system considers all other notifications, even if they have a different subject and body, as duplicates. The Ignore Duplicates business rule controls this functionality.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send when</td>
<td>Select under what condition the notification is sent:</td>
</tr>
<tr>
<td></td>
<td>• When a record is inserted or updated</td>
</tr>
<tr>
<td></td>
<td>• When a particular event is fired</td>
</tr>
<tr>
<td></td>
<td>• When triggered as an action step in Flow Designer</td>
</tr>
<tr>
<td>Weight</td>
<td>Set a numerical value for the notification priority relative to other</td>
</tr>
<tr>
<td></td>
<td>notifications with the same target table and recipients. The system</td>
</tr>
<tr>
<td></td>
<td>only sends the notification with the highest weight. The default value</td>
</tr>
<tr>
<td></td>
<td>0 causes the system to always send the notification (assuming the</td>
</tr>
<tr>
<td></td>
<td>conditions are met).</td>
</tr>
<tr>
<td>Conditions</td>
<td>Use the condition builder to select the conditions under which this</td>
</tr>
<tr>
<td></td>
<td>notification is sent. For example, select Priority &gt; greater than &gt; 3 -</td>
</tr>
<tr>
<td></td>
<td>Moderate to send the notification only for High and Critical priority</td>
</tr>
<tr>
<td></td>
<td>incidents.</td>
</tr>
<tr>
<td>Inserted</td>
<td>Select the check box to enable messaging notification when a record is</td>
</tr>
<tr>
<td></td>
<td>inserted. This field appears when you set the Send when field to Record</td>
</tr>
<tr>
<td></td>
<td>inserted or updated.</td>
</tr>
<tr>
<td>Updated</td>
<td>Select the check box to enable messaging notification when a record is</td>
</tr>
<tr>
<td></td>
<td>updated. This field appears when you set the Send when field to Record</td>
</tr>
<tr>
<td></td>
<td>inserted or updated.</td>
</tr>
<tr>
<td>Event name</td>
<td>Select the event that triggers this notification. This field appears when</td>
</tr>
<tr>
<td></td>
<td>you set the Send when field to Event is fired.</td>
</tr>
</tbody>
</table>
### Advanced condition

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced condition</td>
<td>Create a script to define more filter conditions, like sending a notification based on the current messaging record, changing field values, or changing system properties.</td>
<td></td>
</tr>
</tbody>
</table>

The advanced condition script must return *true* or set a global answer variable to *true* to send the notification.

The advanced condition script uses the following global variables:

- **current**: Contains the current record from the table to which the notification is linked.
- **event**: Contains the event that triggered the notification.

**Note:** The Advanced condition field is evaluated in addition to other conditions you set on the notification. Both the condition and advanced condition must evaluate to *true* to send the notification.

---

6. Open the **Who will receive** tab and fill in or modify the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Messaging Channels</td>
<td>Select the messaging channels to receive the messaging notification. Only complete this field if creating a simple notification to send to a channel. Simple notifications use a Messaging Content record of Type Simple.</td>
<td></td>
</tr>
<tr>
<td>Users</td>
<td>Select the users you want to receive the messaging notification. Only complete this field if creating a notification that requires user action. Notifications that require user action use a Messaging Content record of Type Buttons.</td>
<td></td>
</tr>
<tr>
<td>Users/groups in fields</td>
<td>Select users or groups from reference fields. For example, if a notification uses the Incident [incident] table, you can select users or groups from incident fields like Opened by and Assignment group.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** You can dot-walk to values in reference fields by clicking the plus sign in the field selector and then selecting the related field.

If you address the notification to a user with an inactive record in the User [sys_user] table, the system does not send the notification to that user.

<p>| Groups | Select the groups you want to receive the messaging notification. You can search for groups with the reference lookup icon or by manually entering the group name. This list of groups is static. |   |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send to event creator</td>
<td>Select this check box to send the notification to the person who performed the action that started the notification process if the person is also a recipient. If the event creator is not specified in one of the recipient fields, the event creator does not receive a notification, regardless of the setting in this field. For new notifications, this option is selected by default.</td>
</tr>
<tr>
<td>Event parm 1 contains recipient</td>
<td>Select this check box if the event parameter 1 contains one or more notification recipients (in a comma separated-list). This field is visible only when the Send when field is set to Event is fired.</td>
</tr>
<tr>
<td>Event parm 2 contains recipient</td>
<td>Select this check box if the event parameter 2 contains one or more notification recipients (in a comma-separated list). This field is visible only when the Send when field is set to Event is fired.</td>
</tr>
</tbody>
</table>

7. Open the **What it will contain** tab and fill in or modify the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Messaging content</td>
<td>Select a messaging content record to be used in this notification.</td>
</tr>
</tbody>
</table>

8. Click **Update**.

**Link your ServiceNow user account to your Slack or MS Teams account for Now Actions**

Link your ServiceNow account to your Slack or Teams account to take action on ServiceNow notifications from within Slack or Teams. If you do not link accounts, you can still receive notifications within group channels. However, you cannot to approve ServiceNow requests or take action on notifications from within Slack or Teams.

Role required: none

1. Open the Slack or Teams application
2. Find the Now Actions bot. This bot is found in the left panel of Slack under Apps, and in the left panel of Teams in the Chat tab.
3. Start a conversation with the Now Actions bot. The bot then presents a link to authenticate.
4. Click the **Connect to ServiceNow** link.
   A new browser tab opens and prompts the user to Deny or Confirm the connect between your Slack or Teams account and your ServiceNow account. This link will expire five minutes after it is displayed.

5. Click **Confirm** to link the accounts.

6. After confirmation, you are directed to the instance user record. A confirmation message is displayed at the top of the screen.
Configure system settings

Each user can enable ServiceNow notifications in a third-party application by configuring the communication channel in their system settings. Opt in to receive approval requests and other actionable notifications in third-party channels.

You can only enable notifications in notification channels you have permission to access.

1. Select the gear icon in the banner frame to access the System Settings window.
2. Select the Notifications tab.
3. Under Notification Channels, enable notifications for the desired channels.

4. Opt in to individual notifications.

To receive notifications for Button type messages, you must opt in for each individual notification that you wish to receive. For example, to receive an approval request as a direct message in Slack, you must find the notification and set the Slack workspace as an enabled channel for that specific notification.

**Note:** To receive notifications for Simple type messages, you need only to enable the notification channel. You don't need to opt in for individual notifications. For more information on message types, see *Configure message content.*
a) In the Notifications by Category section, select the category containing the notification you want to enable. The category is defined on the notification record. You can also search notifications to find individual notifications by name.
b) Select the notification you wish to enable a channel for.
c) Enable the notification channels where you want to receive this notification.

Unlink your ServiceNow user account from your Slack or MS Teams account for Now Actions

Unlink your ServiceNow account from your Slack or MS Teams account to stop receiving actionable ServiceNow notifications in Slack or Teams.

Role required: none

If you unlink your account to a messaging app for Now Actions, you must also disable the corresponding messaging channel in your notification preferences.

1. Navigate to **Self-Service > My Profile**.
2. Click the **View Linked Accounts** related link.
3. In the Linked Accounts page, check the selection box for the messaging integration to be unlinked.
4. Select **Actions on selected rows...**, then click **Unlink account**.
   Your ServiceNow account is unlinked from the Now Actions messaging integration (the link is inactive).

   **Note:** Even though you unlinked your account, you still receive notifications in any group channels to which you belong.

5. Disable the messaging channel in your Notification Preferences.
   a) Select the gear icon in the banner frame to access the System Settings window.
   b) Under Notification Channels, disable the appropriate messaging channel.

   **Note:** If you want to link your ServiceNow account again, follow the steps in **Link your ServiceNow user account to your Slack or MS Teams account for Now Actions**.

The email client

The email client enables you to send email directly from any record, such as an incident, change request, problem, or user record.

The email client is available by default, and enabled by default on the incident table.

The email client can be useful in cases where you want to send an email:

- To engage more people in a piece of work
- That includes Cc and Bcc recipients
- That includes personalized comments
- To a third party who doesn't have an account in your instance
- To someone about an incident where you don't have an email notification set up to do exactly what you want

The email client always uses the multipart/mixed content type and supports HTML markup in the message body.

**Note:** Line breaks do not appear for multi-line fields such as `${description}` and `${comments}` in the email client template.
Enable the email client for a table

Enable the email client for a table so that users can send emails directly from the table record.

Role required: admin

The email client is enabled by default on the Incident [incident] table. You can enable the email client for another table by adding the email_client dictionary attribute to the table.

Note: This capability is not inherited by tables that extend the current table. For example, enabling the email client on the Task table does not enable it for the Incident or Problem tables.

1. Open a record in the table that you want to enable the email client for.
   For example, to enable the email client for the Problem [problem] table, navigate to Problem > Open, and then open any problem record.
2. On the form, click the menu icon
   and then click Configure > Dictionary.
3. On the Dictionary Entries list, open the first record.
   The first record has the record type Collection and does not have any entry for Column name.
4. On the form, in the Related Links section, click Advanced view.
5. In the Attributes field, enter email_client=true. If there are other values in the field, separate the attribute with a comma.
6. Click Update.

Components installed with the email client

Several types of components are installed with activation of the Email Client (com.glide.email_client) and Email Client Template (com.glide.email_client_template) plugins, including tables and user roles.

Note: The Application Files table lists the components installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>

</table>

Email client interface

The instance's email client interface looks like a standard email interface, which contains a toolbar for text formatting and adding attachments.

Users see an email icon based on the UI version.

- UI16: The email icon (✉️) appears in the more options menu.
- UI15: The email icon (✉️) appears in the form header.

Users click the email icon to launch the email client as a pop-up window.

This is an email message using the TinyMCE editor.
Email client configurations

Use email client configurations to manage the behavior of your email client. Each configuration consists of different email controls for setting allowable email recipients and email addresses.

In new and upgraded instances, the Email Client Configuration module is activated by default through the Email Client (com.glide.email_client) and Email Address Filter (com.glide.email_address_filter) plugins.

Note: If you upgraded to the Madrid release, a default email client configuration is created automatically during upgrade. This default email configuration is used if you do not define any other email client configurations. Also, if you previously defined certain email client properties to control email address auto-complete, disambiguation, and the display of the From and Reply-To email addresses, those settings are retained in the default email client configuration.

How email client configurations work

Email client configurations determine how your email client behaves, such as whether the From address or Reply-To address should be displayed, and the allowable addresses that can be entered by your users. A configuration applies to a specific ServiceNow table, which enables you to define email client behavior for a specific context, purpose, or application. For example, if you have email client users who send email about Customer Service case records, you can create a configuration that applies email client controls specific to customer service. You can select the email client recipient qualifiers for controlling the auto-complete recipient results from a selected table, such as the Customer Contact table. You can also set email address filters that determine the allowable addresses from a table, such as the Customer Contact table.

An email client configuration consists of the following components:

**Email client recipient qualifiers**

Recipient qualifiers control the email recipients returned in the auto-complete results for the To, Cc, and Bcc fields of the email client. You can provide additional qualifiers displayed in the auto-complete results to differentiate recipients that have the same names and narrow the results.

**Email client From addresses**

This control enables the display of the From and Reply-To addresses. Use the Email Client Template to create a set of allowable From addresses that can be used when a user sends an email with the email client. You can provide a specific From address to be used in the email client, or you can choose to hide it entirely.

**Email client attachment handling**

By default, attachments that are sent from the email client are attached to the target record. Instead, you can select to attach files to the Email [sys_email] record, or you can set conditions that define which email client attachments are added to the target record. To see the status of all email attachments, go to the Email Attachments [sys_email_attachment] table.

**Email address filters**

Email address filters allow or disallow certain email addresses that users can enter in the email client. You can specify an email whitelist that specifies allowable domains or an email blacklist that disallows certain domains.

You can also use an Email Client Template to define the content of an email client message and set other message characteristics, such as an email sender (From address) configuration.
Email client configuration process

Users with the admin role define and edit email client configurations. Users with the email_client_admin role can edit configuration information in selected tables.

1. Build the various email client controls that can be used to create an email client configuration.
   - Define email client recipient qualifiers.
   - Set email address filters that allow or disallow email addresses that can be entered in the email client.

2. Create the email client configuration.

Define an email client configuration that determines how your email client behaves when users create an email message.

Define email client recipient qualifiers

Create a configuration that controls the auto-complete list of recipients displayed in the email client. You can specify recipient qualifiers that display additional fields (from a selected ServiceNow table) in the auto-complete list. These fields differentiate email recipients who have the same first and last names.

Role required: email_client_admin or admin

Use the following tabs in the Email Client Recipient Qualifier form to define a recipient configuration.

- **Display Configuration** – Set up the email recipient auto-complete behavior and optionally select additional fields to differentiate recipients who have the same name. The additional fields ensure that users select the proper recipient for an email.
- **Query Configuration** – Specify a condition or script that queries the selected table and filters the recipient results returned.

You can define different recipient configurations, which can be used in an email client configuration.

1. Navigate to Email Client > Email Client Recipient Qualifier and click New.
2. Fill in the fields at the top of the Recipient Qualifier form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for this email client recipient configuration.</td>
</tr>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
<tr>
<td>Table</td>
<td>The ServiceNow table to be queried for recipients.</td>
</tr>
<tr>
<td>Description</td>
<td>A brief description of this recipient configuration.</td>
</tr>
</tbody>
</table>

3. Fill in the fields in the **Display Configuration** tab to control the autocomplete display in the email client.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Address field</td>
<td>The field on the table that contains the recipient email address.</td>
</tr>
<tr>
<td>Display Name Field</td>
<td>The field on the table used for the recipient name displayed.</td>
</tr>
<tr>
<td>Order</td>
<td>The order of results returned relative to other recipient qualifiers defined.</td>
</tr>
</tbody>
</table>
Additional Display Fields | A content list for choosing additional fields from the table to be displayed in the auto-complete list. Differentiates recipients who share the same name.

Search Additional Fields | A checkbox for enabling additional fields to be searched. Expands the recipients returned in the auto-complete list by querying (searching) the Additional Display Fields.

### Field Configuration

**4.** Fill in the fields in the Query Configuration tab.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Type    | Select the method for filtering the recipients returned in the auto-complete list:  
- Condition  
- Script |
| Conditions | If you selected Condition for the **Type**, use the condition builder to specify the conditions that must be met to return the appropriate recipients. |
| Script | If you selected Script for the **Type**, enter a script that uses these variables to return the appropriate recipients:  
- `recipientQuery`: GlideRecord for the table being queried.  
- `targetRecord`: GlideRecord for the target record from which the email client was opened.  

For example, this `recipientQuery` is a GlideRecord that represents the Customer Contact table. The `targetRecord` variable is a Customer Service case from which the email client was opened. This query limits the email client autocomplete results to contacts who belong to the same account as the Customer Service case.

```javascript
(function (recipientQuery, targetRecord) {
    // Limit results to contacts belonging to the account for the case.
    var account = targetRecord.getValue('account');
    recipientQuery.addQuery('account', account);
})(recipientQuery, targetRecord);
```

**5.** Click **Submit**.

The recipient qualifier configuration is added to the Recipient Qualifier [sys_recipient_qualifier] table and is available for use in an email client configuration.
Define email client from addresses

Set an allowable email address that is displayed in the From address of a message sent from the email client.

Role required: admin

1. Navigate to Email Client > Email Client From Address and click New.
2. In the Display name, enter the name to be displayed in the From field of the email client message.
3. Enter a valid Email address for the From address in the email client.
4. Click Submit.

The From address is added to the Email Client From Address [sys_email_client_from_address] table.

Set email address filters

Define email filters that restrict the email recipients that users can enter in the email client. You can filter by domain or by specifying certain addresses.

Role required: email_client_admin or admin

You can specify two types of email address filters:

- Whitelist: A list of allowed domains for email recipients who can be selected in the email client.
- Blacklist: A list of disallowed domains for email recipients who cannot be selected in the email client.

You can also specify email address exceptions to the allowed or disallowed domain.

1. Navigate to Email Client > Email Address Filters, and then click New.
2. Enter the Name of the address filter.
3. Select the filter Type:
   - Whitelist: Allow all specified domains. All other domains are disallowed.
   - Blacklist: Disallow all specified domains. All domains that do not match the blacklisted domains are allowed.
4. In the Domains field:
   a) Click the lock icon to unlock it and access the domains controlled by this filter.
   b) Select an existing domain or enter a new domain:
      - If the filter Type is Whitelist, click the Search icon. Select the domains for which all email addresses are allowed. To add a new domain, click New, enter the Domain, and click Submit.
      - If the filter Type is Blacklist, click the Search icon. Select the domains for which all email addresses are disallowed. To add a new domain, click New, enter the Domain, and click Submit.
   c) Click the lock icon to lock the Domains field.
5. Specify any email addresses that are Exceptions to the domains specified in step 4.
   a) Click the lock icon to open the Email Address Filter Exceptions [sys_email_address_filt_except] table.
   b) Click the search icon to choose an existing email address. To add a new email address, click New, enter the email address exception, and click Submit.
c) Click the lock icon to lock the **Exceptions** field.
   The exception is added to the Email Address Filter Exceptions [sys_email_address_filt_except] table.

6. Click **Submit**.
   The email address filter is added to the Email Address Filters [sys_email_address_filter] table.

---

**Create an email client configuration**

Define a configuration that controls the display and behavior of the email client that is based on a selected ServiceNow table. The configuration determines the recipient auto-complete results that are displayed, email addresses that can be entered, and a set of allowable From addresses to be used when sending a message with the client.

---

**Note:** You can specify a wildcard (*) in an email address exception.
Role required: email_client_admin or admin

You can create one email client configuration per ServiceNow table.

1. Navigate to **Email Client > Email Client Configuration** and click **New**.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for this email client configuration.</td>
</tr>
<tr>
<td>Application</td>
<td>Type of scoped application.</td>
</tr>
<tr>
<td>Active</td>
<td>Option that indicates that the configuration is active. The configuration is active by default.</td>
</tr>
<tr>
<td>Table</td>
<td>ServiceNow table that this client configuration applies to. Select a table from the list.</td>
</tr>
</tbody>
</table>

3. In the Recipient Configuration section, select **Recipient Qualifiers** to be used for this client configuration.
   a) Click the lock icon
      ![lock_icon](image1)
      By default, two types of recipients are available: Active Users with email accounts and Active Groups with email accounts.
   b) Click the search icon
      ![search_icon](image2)
      and select a recipient configuration from the list of available recipient configurations.
   c) Click the lock icon
      ![lock_icon](image3)
      to lock it.

4. In the Display Configuration section:
   a) Select the **Display From** option to display the From email address in the email client. To hide the From email address in the email client, clear the check box.
   b) Select the **Display Reply-To** option to display the Reply To address in the email client. To hide the Reply To email address in the email client, clear the check box.

5. In the Attachment Handling section, select from one of three choices for the **Attachment Send Action** field:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attach to Email Record</td>
<td>Keep email client attachments on the Email [sys_email] record when you send an email.</td>
</tr>
<tr>
<td>Attach to Target Record</td>
<td>Attach email client attachments to the target record when you send an email. This option is the default value.</td>
</tr>
<tr>
<td>Conditionally Attach to Target Record</td>
<td>Set conditions that define which email client attachments are moved to the target record when you send an email. Attachments that do not meet the conditions remain on the email record when you send an email.</td>
</tr>
</tbody>
</table>

6. In the Filter Configuration section, select **Email Address Filters** to be applied to the email client.
   a) Unlock the lock icon
      ![lock_icon](image4)

b) Click the search icon
   and select one or more Email Address Filters.

c) Click the lock icon
to lock Email Address Filters.

Each filter that you select evaluates a given email address and determines whether or not the given address is valid to apply to an outbound email.

7. Click Submit.
The configuration is added to the Email Client Configuration [sys_email_client_configuration] table.

**Customize the email client**
The email client has default properties and values that you can customize to suit your needs.

**Email client default properties and values**

<table>
<thead>
<tr>
<th>Property</th>
<th>Default Value</th>
<th>How to Customize</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACL access</td>
<td>Defaults to allowing only users with the itil role to access the email client. Change the ACL rule to control access to the email client.</td>
<td>To control who can see the email client, see Control access to the email client.</td>
</tr>
<tr>
<td>Email icon</td>
<td>Allows only users with write access to the current table to see the email icon.</td>
<td>To remove the email icon, see Email icon display.</td>
</tr>
<tr>
<td>To</td>
<td>Defaults to the email address of the caller.</td>
<td>To edit the default value, create an email client template.</td>
</tr>
<tr>
<td>Cc</td>
<td>Defaults to the email addresses of the user who opened the incident and all users in the watch_list.</td>
<td>To edit the default value, create an email client template.</td>
</tr>
<tr>
<td>Subject</td>
<td>Defaults to the incident number and short description.</td>
<td>To edit the default value, create an email client template.</td>
</tr>
</tbody>
</table>

**Control access to the email client**
You can control access to the email client by changing an ACL rule.

Only users with the itil role can access the email client. The following ACL rule controls this access:

**ACL rule**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>EmailClientProcessor</td>
<td>processor</td>
<td>execute</td>
</tr>
</tbody>
</table>
Create an email client template

You can create a different template for each table that uses the email client.

Role required: admin

The email client uses its own email templates to define default values for fields. Use the following sections in the Email Client Template form to build a client template:

- **Content**: The message body.
- **Recipients**: The email addresses of users receiving the email message. The email addresses are displayed in the To, Cc, and Bcc fields of the message.
- **Sender Configuration**: The method used to generate the email sender (From email address) of the message.

1. Navigate to Email Client > Email Client Templates.
2. Click New.
3. Fill in the fields at the top of the Email Client Template form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique template name.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that the template applies to. Enable the email client for the same table.</td>
</tr>
<tr>
<td>Conditions</td>
<td>The conditions that determine when this client template is used. Use the condition builder to identify the target record that must match before this template is applied to the email client.</td>
</tr>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
</tbody>
</table>
4. Fill in the fields in the **Content** tab.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Execution Order</td>
<td>A number that indicates the order in which template conditions are evaluated.</td>
</tr>
</tbody>
</table>
## ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Subject</strong></td>
<td>Enter a description of the email.</td>
</tr>
<tr>
<td><strong>Content Type</strong></td>
<td>Select the format of the message body content: HTML or plain text.</td>
</tr>
<tr>
<td><strong>Body HTML</strong></td>
<td>If you selected HTML for the <strong>Content type</strong>, enter the content of the message body using the HTML editor toolbar to format the HTML. To reference field values, select variables from the variables list or manually type variable references using the syntax <code>${table_name.variable_name}</code>. To reference the user who launches the email client, enter the variable <code>${current_user}</code>. You can call a mail script by using <code>${mail_script:script_name}</code> in the <strong>Body HTML</strong> field.</td>
</tr>
<tr>
<td><strong>Body text</strong></td>
<td>If you selected plain text for the <strong>Content type</strong>, enter any text or mail script that you want to appear in the message body. You can insert a mail script in the <strong>Body text</strong> field by using the following syntax: <code>&lt;mail_script&gt;[code] &lt;/mail_script&gt;</code></td>
</tr>
</tbody>
</table>

5. Fill in the fields in the **Recipients** tab.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the To field. Your script must start with the <code>javascript:</code> prefix. The script must return email addresses in a comma-separated string.</td>
</tr>
<tr>
<td>Cc</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the Cc field. Your script must start with the <code>javascript:</code> prefix. The script must return email addresses in a comma-separated string. This field cannot have the same addresses as the To field.</td>
</tr>
</tbody>
</table>
### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bcc</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the Bcc field. Your script must start with the javascript: prefix. The script must return email addresses in a comma-separated string. This field cannot have the same addresses as the To or Cc fields.</td>
</tr>
</tbody>
</table>

6. In the **Sender Configuration** tab, select the **From Generation Type** to determine how the sender (From address) in the email client message is generated. Use this field only if you want a different From address than the one defined in your SMTP email account.

   - None: The From address is not generated in the email client message.
   - SMTP Email Account: Use the From address of the SMTP email account for the instance as the sender.
   - Select From List: Choose from a list of allowable From addresses defined in the Email Client From Address [sys_email_client_from_address] table.
   - Script: Run a GlideRecord query on the Email Client From Address [sys_email_client_from_address] table. For example, the following script sets the From address based on the location of the incident caller:

     ```javascript
     (function (fromAddressQuery, targetRecord) {
       var location = targetRecord.caller_id.country;
       if (location == 'us')
         fromAddressQuery.addQuery('email_address', 'servicedesk.us@example.com');
       else if (location == 'japan')
         fromAddressQuery.addQuery('email_address', 'servicedesk.jp@example.com');
       else if (location == 'uk')
         fromAddressQuery.addQuery('email_address', 'servicedesk.uk@example.com');
     })(fromAddressQuery, targetRecord);
     ```
   - Text: Enter the email From address to be used in the client.

**Note:** The From email address does not appear in the email client unless you configure email client to display the From address. For more information on managing the behavior of email client, see *Email client configurations*.

**Note:** If the domain for the From address is not the domain of the SMTP email account server, the owner of the From domain must configure the SPF record for the domain. The owner changes the domain settings to allow the instance to send email as if from that domain. For details on using SPF records, see ServiceNow KB0535456.

7. Click **Submit**. The template is added to the Email Client Templates [sys_email_client_template] table.
SMS delivery with the email client

A property is available that lets the user select an option to send a notification via SMS. The *Subscription Based Notifications plugin* activates the following *system property*:

### Email client system property

<table>
<thead>
<tr>
<th>Property</th>

Attachments

Configuring the email client
Composing emails with quick messages

Insert predefined content into the message body of emails that you send from the email client.

Using quick messages

In the email client, you can select a quick message to fill the email body with the content that is specified in the quick message. After you define one or more quick messages, the Quick Message selector appears in the email client so that you can construct an email with multiple quick messages.

By default, the quick message content is inserted at the place of the cursor. It doesn't replace content that you created before selecting the quick message. To replace message content with a quick message, highlight the text to replace and then select a quick message.

Note: To instead have quick message content replace all existing content in an email draft, set the glide.email_client.quick_message.insert property to false.
Adding quick messages to an email
Creating quick message content

Define quick messages by creating records in the Email Client Canned Messages [sys_email_canned_message] table. When you define a quick message, you can add any of the following types of content into the message body:

- Icons
- Logos
- Pictures
- Rich-text HTML
- Hyperlinks
- Variables
- Any other HTML constructs

**Note:** If you add attachments to the quick message, the attachments are not sent as part of the email distribution.

Assign the email_client_quick_message_author role to business managers so that they can create quick messages for users in their group.

Setting quick message conditions

When you define a quick message, you can limit the availability of the quick message according to:

- The user who launches the email client
- The group of the user who launches the email client
- The table of the record from which you launch the email client
- The target record from which you launch the email client

For example, if you designate Beth Anglin as the user for a certain quick message, the quick message is available in the email client only for Beth Anglin.

If you associate a quick message to the Incident [incident] table, the quick message is available in the email client only after you launch from an incident record. If you specify a target record from the Incident table for the quick message, the quick message becomes available in the email client only for matching incident records.

Define a quick message

Create predefined content to add in the email client so that users can write emails consistently and efficiently.

Role required: email_client_quick_message_author or admin

1. Navigate to Email Client > Quick Messages.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name that appears in the Quick Message selector.</td>
</tr>
<tr>
<td>Active</td>
<td>Option for activating the quick message. When selected, the quick message is available for selection in the Quick Message selector.</td>
</tr>
<tr>
<td>Application</td>
<td>Type of scoped application.</td>
</tr>
</tbody>
</table>
### Field Description

**User**
User who has access to this quick message. Selecting a user restricts access to that user only. Leave the field blank to have no user-based restrictions.

**Group**
Group whose members have access to this quick message. Selecting a group restricts access to members of that group only. Leave the field blank to have no group-based restrictions.

**Table**
Table to which the quick message applies. To make the quick message available for all tables, leave blank.

**Conditions**
Target record that must match the conditions before the quick message appears for selection in the email client.

**Body**
Content to insert in the Message Text field in the email client. By default, the field supports HTML format.

---

4. Click **Submit**.

### Email icon display

You can use access control rules to hide or display the email icon on forms.

Users with write access to the current table can see the email icon. To remove the icon, remove the user's write access to the table. Typically you do this in one of two ways:

- Make the user an Employee Self-Service (ESS) user. ESS users do not have a user role, and without a role they do not have write access to the Incident table. Making a user an ESS users, therefore, hides the email icon on the Incident form.
- Create a custom ACL rule and user role that does not have write access to the table. The default ACL rule for the email client checks to see if the user has the itil role. If you grant users a custom role other than itil, then any such users will not see the email icon.

Remove or display the email icon for a table by setting the **email_client** dictionary attribute to true or false on the table's collection record. This will not display the email icon for users without write access to the table. For more detail see **Dictionary attributes**.

### Automating system responses to inbound email

Save time from responding to emails manually when you configure your instance to send replies, create incidents, or update records automatically in response to inbound emails.

You can define system responses to inbound emails in two ways:

- Create an inbound email flow in Flow Designer.
• Script an *inbound email action*

**Inbound email trigger in Flow Designer**

With the inbound email trigger in Flow Designer, you can create flows that define the automated processes that your instance takes when it receives an email.

Inbound email flows take priority over inbound email actions. If you create flows with inbound email triggers, emails are first processed by the inbound email triggers before they are processed by inbound email actions.

The following diagram shows the processing order for inbound emails. When an email is sent to your instance, the system first classifies the email as a reply, forward, or new email. Then the system runs the inbound email through an inbound email flow. If the flow issues stop processing, the email is finished being processed. If the flow does not issue stop processing, the system tries to match the email to another inbound email flow. If at any point the email does not match with an inbound email flow, the system matches the email to an inbound email action instead.
The benefits to automating system responses to inbound emails in Flow Designer are:

- Provides an easy and accessible interface that uses natural language.
- Consolidates configuration and runtime information into a single environment so process owners and developers can create, operate, and troubleshoot flows from a single interface.
- Reduces upgrade costs, with upgrade-safe Now Platform logic replacing complex custom script.
- Reduces development costs by providing a library of reusable actions.

For more information on creating inbound email flows in Flow Designer, see *Flow trigger types* or follow the steps in *Create a flow with an inbound email trigger*. To view or manage your inbound email flows, navigate to *Flow Designer > Inbound Email Flows*. 
Inbound email actions

Define an inbound email action to script how the system responds to an inbound email.

**Note:** Inbound email flows take priority over inbound email actions. If you create flows with inbound email triggers, emails are first processed by the inbound email triggers before they are processed by inbound email actions.

Inbound email actions are similar to business rules: both use conditions and scripts that take action on a target table. An inbound email action checks the email for a watermark that associates it with a task and checks for other conditions. If the conditions are met, the system takes the inbound email action that you configure. The system can take two types of actions:

- Record action: setting a value for a field in the target table.
- Email reply: sending an email back to the source that triggered the action.

By default, if an email has no identifiable watermark, an inbound email action attempts to create an incident from the message. If the email has a watermark of an existing incident, an inbound email action updates the existing incident according to the action's script.

Watch this six-minute video to learn about the actions that the instance can take in response to messages from users and shows how to create or modify email notifications to users.

Inbound email receive types

The system classifies all incoming email into one of three types: forward, reply, or new.

**Inbound action classifications**

<table>
<thead>
<tr>
<th>Order</th>
<th>Type</th>
<th>Criteria</th>
</tr>
</thead>
</table>
| 1     | Forward | The system classifies an email as a forward only when it meets all these criteria:  
- The subject line contains a recognized forward prefix such as FW:.  
- The email body contains a recognized forward string such as From:.  
The system classifies any email that meets these criteria as a forward, even if the message contains a watermark or record number that otherwise classifies it as a reply. |
| 2     | Reply  | The system classifies an email as a reply when it fails to match it to the forward receive type and it meets any one of these criteria:  
- The subject line or email body contains a recognized watermark such as Ref:MSG0000008.  
- There is no watermark and the Reply-To header contains a recognized message ID of an email with a target record.  
- There is no watermark and the subject line contains a recognized reply prefix such as RE: and a recognized record number such as INC0005574 |
| 3     | New    | The system classifies an email as new when it fails to match it to the forward and reply receive types. |
Determining the type of incoming email

Attachments

If an inbound email contains one or more email attachments, the inbound email action adds the attachments to the first record the action produces.

Character encoding

- If the email encoding is ASCII-7 or UTF-8, inbound email actions preserve the character encoding in any associated task records they produce.
- If the email encoding is ISO-8859-1, the inbound email action attempts to convert the email to Windows 1252.
• Inbound email actions convert any other encodings (for example, Mac OS Roman) to plain text, which may or may not be readable.

See the System email log and mailboxes for examples of what you might see if a notification or inbound email action is not processed.

**Note:** The state of all incoming emails that have been run against inbound email actions, even if there is no matching action, is changed to Processed.

### Domain separation

The system ignores the domain that the inbound email action record is in when it creates a record based on the inbound email action. Keep inbound actions in the global domain. For example, if your inbound email action creates an incident, the system creates the incident in the same domain as the user in the Caller field. If that user is not in the User [sys_user] table, the incident is in the global domain.

### Inbound email action processing

The system determines which inbound actions to run by comparing the inbound email type and inbound action conditions to the incoming email message. Certain properties are available to set the reply and forwarding prefixes in the email subject lines that your instance recognizes when processing inbound emails.

**Note:** Inbound email flows take priority over inbound email actions. If you create flows with inbound email triggers, emails are first processed by the inbound email triggers before they are processed by inbound email actions.

The system follows this processing flow to determine whether to run an inbound action.
Inbound action processing workflow

The system only runs an inbound action when:

- The incoming email type matches the inbound action **Type**.
- If present, the watermark or record number refers to a record in the **Target table**.
- The inbound action **Conditions** evaluates to true.

If any of these criteria are not met, the system skips the current inbound action and evaluates the next active inbound action. The system processes inbound actions from the lowest to highest **Order** value. If the inbound action has **Stop processing** enabled, the system updates the **State** of the email record to **Processed** after running the inbound action **Script**.

The following video shows how an inbound action condition prevents an incident from being created.
Prefixes recognized in email subject lines

Email reply prefixes

When no watermark is present or the In-Reply-To email header is present, the instance recognizes email containing a prefix from the `glide.email.reply_subject_prefix` property as reply email. You can use this property to set non-standard reply prefixes in your email system.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>glide.email.reply_subject_prefix</code></td>
<td>Specifies the list of prefixes (comma-separated) in the subject line that identify an email reply.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: <code>re:,aw:,r:</code></td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Properties <code>[sys_properties]</code> table</td>
</tr>
</tbody>
</table>

Note: Prefixes are case insensitive.

Email forward prefixes

Emails with certain prefixes trigger the forward type of inbound email action. The instance recognizes any email whose subject line contains a prefix from the `glide.email.forward_subject_prefix` property as forwarded email. Emails with these prefixes trigger inbound email actions of the type forward. Use this property to set non-standard forward prefixes in your email system or you want email forwards to behave like replies. If the value of the system property is empty, then the system reverts to using the values `fw:` and `fwd:`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>glide.email.forward_subject_prefix</code></td>
<td>Specifies the list of prefixes (comma-separated) in the subject line that identify a forwarded email.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: <code>fw:,fwd:</code></td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Properties <code>[sys_properties]</code> table</td>
</tr>
</tbody>
</table>

Note: Prefixes are case insensitive.

Email forwards as replies

Properties are available to force inbound actions to process forwarded mail as replied mail. These properties control the subject prefix that the inbound actions use.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value needed</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>glide.email.reply_subject_prefix</code></td>
<td><code>re:,Re:,aw:,r:,fw:,fwd:,Fwd:,FWD:</code></td>
</tr>
<tr>
<td><code>glide.email.forward_subject_prefix</code></td>
<td>[any text that is not a forward prefix]</td>
</tr>
</tbody>
</table>
These properties cause the Update Incident inbound action to process all forwarded and replied-to mail.

Note: The glide.email.forward_subject_prefix property must contain some text so that the forwarded email can be processed as a Reply. It can be any text except a forward prefix (that is, fw:,fwd:,Fwd:,FWD:).

Matching a sender email address to a user

The instance matches a senders email address to an active user in the User [sys_user] table using inbound actions.

Note: The Email Automatic User Creation plugin must be active.

When processing an email, the instance sets the current user to the user whose email address matches email.from. Inbound actions can then reference that current user. For example, the base system inbound action Create Incident sets the caller_id of the incident to the value returned by gs.getUserID().

If multiple users have the same email address, the instance first searches for an active user with the email address. The instance does not match inactive users.

Note: Each user record must have a unique email address so that the instance can reliably match the email to the correct user.

If a unique email address for each user is not possible, assign a shared email address to only one active user so that the instance always matches incoming email from that address to the active user.

Matching watermarks in the Subject line or Body

The following examples illustrate how the instance matches randomized watermarks in an email subject line or body.

Note: For instances upgraded from a release before Jakarta, the system can recognize both randomized and non-randomized watermarks during a watermark transition period.

Examples of matching watermarks in the Subject line or body

<table>
<thead>
<tr>
<th>Subject Line or Body Contents</th>
<th>Matching Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ref: MSG0000008_aLJe130zDhCVuh3spXmt</td>
<td>The instance recognizes this string as a watermark and searches the Email Watermarks [sys_watermark] table for a record with the number MSG0000008_aLJe130zDhCVuh3spXmt. If this watermark exists, the instance matches the email to the associated record. If this watermark does not exist, the system processes inbound email messages as described in Criteria for matching email to inbound actions.</td>
</tr>
</tbody>
</table>
Matching record numbers in the Subject line or Body

The following examples illustrate how the instance matches record numbers in the subject line of an email to an existing record when no watermark is present.

Examples of matching record numbers in the Subject line

<table>
<thead>
<tr>
<th>Subject line contents</th>
<th>Matching results</th>
</tr>
</thead>
<tbody>
<tr>
<td>RE: Example INC0005574</td>
<td>The instance recognizes this subject line as a reply and recognizes the INC prefix as belonging to the Incident table. The instance searches the Incident table for an existing record INC0005574. If this incident exists, the email is associated with this incident. If this incident record does not exist, the instance uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: Example &quot;INC0005574&quot;</td>
<td>The instance recognizes this subject line as a reply but does not recognize the &quot;INC prefix as belonging to the Incident table because of the quotation mark. The same error occurs for any character other than a space before the record number. The instance instead uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: Example *INC0005574</td>
<td>The instance recognizes this subject line as a reply and recognizes the INC prefix as belonging to the Incident table. The instance searches the Incident table for an existing record INC0005574&quot;, which it cannot find because of the quotation mark. The same error occurs for any character other than a space at the end of the record number. The instance instead uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
</tbody>
</table>
The instance recognizes this subject line as a reply and recognizes one, but not both, of the number prefixes. There is no way to predict which prefix the instance matches first. Whichever prefix it matches, it searches the corresponding table for a matching record. If the record exists, the email is associated with the table. If the record does not exist, the instance uses the inbound action for new emails to create an incident and associates the new incident with the email.

**Note:** The instance does not support processing email with multiple numbers in the subject line because there is no way to predict which record the instance matches first. For this reason, do not include more than one $number variable in your notifications.

The instance recognizes this subject line as a forward because of the FW: prefix. It uses the inbound action for forwarded emails to create an incident and associates the new incident with the email.

The instance recognizes this subject as a new email because it does not contain a matching reply or forward prefix. It uses the inbound action for new emails to create an incident and associates the new incident with the email.

### Criteria for matching email to inbound actions

The system matches incoming email to the conditions of the active inbound actions.

The default inbound actions create or update task record under these conditions.
Default matching criteria

If you customize or deactivate the default inbound actions, the system checks the conditions of the active inbound actions. If the system cannot find an inbound action with matching conditions, it sets the state to **Processed**.
Custom matching criteria

Inbound action type criteria

<table>
<thead>
<tr>
<th>Inbound email action type</th>
<th>Required matching criteria</th>
<th>Name of default action (Incident table)</th>
<th>Result of default action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forward</td>
<td>The email contains the following conditions: 1. A subject starting with a recognized forward prefix (even if a watermark or an In-Reply-To header is present). 2. From &lt;user email&gt; appears anywhere in the email body.</td>
<td>Create Incident (Forwarded)</td>
<td>Create new record</td>
</tr>
</tbody>
</table>
### Inbound email action type

<table>
<thead>
<tr>
<th>Inbound email action type</th>
<th>Required matching criteria</th>
<th>Name of default action (Incident table)</th>
<th>Result of default action</th>
</tr>
</thead>
</table>
| Reply                     | The email contains one of the following conditions and the table specified in the email matches the table of the inbound action:  
  1. A valid watermark that matches an existing record.  
  2. An In-Reply-To email header (when no watermark is present) that matches an existing record.  
  3. A subject line starting with a recognized reply prefix (when neither a watermark nor an In-Reply-To header is present) and a valid record number that matches an existing record. | Update Incident (BP) | Update existing record |
| New                       | The email does not meet the conditions for either a reply or forward type inbound email action | Create Incident | Create new record |

If more than one inbound action is available for a particular type, the instance uses the Table field to match the email to a particular table. If there is also more than one action for the inbound action's table, the instance uses the **Order** field to determine the order in which the actions run.

### Create an inbound email action

You can create inbound email actions to define the actions that the system takes when an email is received.

Role required: admin

1. Navigate to **System Policy > Email > Inbound Actions**.
2. Click **New**.
3. Fill in the fields as described in the table.
<table>
<thead>
<tr>
<th>Name</th>
<th>Create Incident</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Global</td>
</tr>
<tr>
<td>Target table</td>
<td>Incident [incident]</td>
</tr>
<tr>
<td>Action type</td>
<td>Record Action</td>
</tr>
<tr>
<td>When to run</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>New</td>
</tr>
<tr>
<td>Execution Order</td>
<td>100</td>
</tr>
<tr>
<td>Conditions</td>
<td></td>
</tr>
<tr>
<td>Add Filter Condition</td>
<td>Add &quot;OR&quot; Clause</td>
</tr>
<tr>
<td>-- choose field --</td>
<td>-- oper --</td>
</tr>
</tbody>
</table>

Condition

Update  Delete
### Inbound Email Actions form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When to run</td>
<td>Enter a descriptive name for this email action.</td>
</tr>
<tr>
<td>Name</td>
<td>Select the table where the action adds or updates records.</td>
</tr>
<tr>
<td>Target table</td>
<td>Select the type of action the instance takes. Select Record Action to modify a record in the instance, or select Reply Email to have the instance send an email back to the source of the inbound email.</td>
</tr>
<tr>
<td>Action type</td>
<td>Select the type of action required to run the action. The action runs only if the inbound email is of the selected type. Available types are:</td>
</tr>
<tr>
<td></td>
<td>• New: An email that is not recognized as a reply or forward.</td>
</tr>
<tr>
<td></td>
<td>• Reply: An email with a watermark with an In-Reply-To email header, or whose subject line begins with a recognized reply prefix.</td>
</tr>
<tr>
<td></td>
<td>• Forward: An email whose subject line begins with a recognized forward prefix, even if the email also contains a watermark or In-Reply-To header.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate the inbound email action. Clear the check box to disable the action.</td>
</tr>
<tr>
<td>Stop processing</td>
<td>Select this check box to prevent the system from running additional inbound email actions after this action runs.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the required roles the sender must have to trigger the inbound action.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number that specifies when this inbound action runs relative to other inbound actions that use the same target table. The instance processes the action with the lowest order number first.</td>
</tr>
</tbody>
</table>

**Note:** You might need to configure the form to see all fields.

**Note:** By default, inbound emails of the Forward type always generate new incidents regardless of the presence of a watermark. If this behavior does not match your business logic, you can change the recognized reply and forward prefixes to treat forwards like replies.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| From  | Select the user required to run the action. If a user is selected, the action runs only when the email sender matches the user name. Leave this field blank to perform the action for all users.  

**Note:** If the selected user is later archived or deleted, the restriction is removed and anyone can trigger the inbound email action. |
| Condition | Specify the condition that must evaluate to true to trigger the inbound action. Build a condition with the choice lists or enter a statement that determines when the inbound email action runs. For example:  

```python
email.subject. startsWith ( "chg:" )
``` |
| Actions | This field appears if the **Action type** is **Record Action**. Specify how information in the email is inserted into the record.  
For example, select [Created by] [From email] [Sender], so that when the request is inserted, you can see who it is for. |
<p>| Field actions | This field appears if the <strong>Action type</strong> is <strong>Reply Email</strong>. Compose the email message to send to the source that triggered the inbound email action. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script</td>
<td>Enter the script the action runs. Typically, this script uses the validators script include and email variables. A template is provided:</td>
</tr>
</tbody>
</table>
|              | (function runAction(/
|              | *GlideRecord*/ current, /
|              | *GlideRecord*/ event, /
|              | *EmailWrapper*/ email, /
|              | *ScopedEmailLogger*/ logger) {
|              |   // Implement email action here
|              | })(current, event, email, logger);                                                                                                         |
| Description  | Enter a detailed explanation of what this inbound email action does.                                                                          |
| Order        | Enter a number to define the order in which this email action should be processed. Actions with lower numbers are processed first. The Ordered Email Processing plugin does not install this field. |

**Accessing email object variables**

An inbound email action script contains the email object to access various pieces of an inbound email through variables. You can use the global variable `sys_email` with inbound email actions.
## Accessing email objects with variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>email.to</code></td>
<td>Contains a comma-separated list of email addresses in the To: and Cc: boxes.</td>
</tr>
<tr>
<td><code>email.direct</code></td>
<td>Contains a comma-separated list of email addresses in the To: box.</td>
</tr>
<tr>
<td><code>email.copied</code></td>
<td>Contains a comma-separated list of email addresses in the Cc: box.</td>
</tr>
<tr>
<td><code>email.body_text</code></td>
<td>Contains the body of the email as a plain text string.</td>
</tr>
<tr>
<td><code>email.body_html</code></td>
<td>Contains the body of the email as an HTML string.</td>
</tr>
<tr>
<td><code>email.from</code></td>
<td>Contains an email address that depends on the following conditions:</td>
</tr>
<tr>
<td></td>
<td>• If the address listed in the email Headers field matches an existing user's Email address, this variable contains the user's email address.</td>
</tr>
<tr>
<td></td>
<td>• If the address listed in the email Headers field does not match an existing user's Email address, this variable contains the address listed in the email Headers field.</td>
</tr>
<tr>
<td><code>email.from_sys_id</code></td>
<td>Contains the Sys ID of the user who sent the email to the instance.</td>
</tr>
<tr>
<td><code>email.origemail</code></td>
<td>Contains the address of the email sender as listed in the email Headers field.</td>
</tr>
<tr>
<td><code>email.subject</code></td>
<td>Contains the subject of the email as a plain text string.</td>
</tr>
<tr>
<td><code>email.recipients</code></td>
<td>Contains a comma-separated list of recipient addresses as a plain text string.</td>
</tr>
<tr>
<td><code>email.recipients_array</code></td>
<td>Contains the recipient addresses as an array.</td>
</tr>
<tr>
<td><code>email.content_type</code></td>
<td>Contains the MIME content type of the email (for example, text/plain; charset=&quot;us-ascii&quot; or text/html; charset=&quot;us-ascii&quot;).</td>
</tr>
<tr>
<td><code>email.headers</code></td>
<td>Contains details about the sender, route, and receiver as a plain text string in the format of the sending email client.</td>
</tr>
<tr>
<td><code>email.importance</code></td>
<td>Contains an indication from the sender about how important a message is. The value can be High, Low, or empty.</td>
</tr>
</tbody>
</table>

**Note:** The instance follows RFC 2822 (Internet Message Format), which requires multiple email addresses in a group to be separated by commas, not semicolons. The instance can set the values of the `email.to`, `email.direct`, and `email.copied` variables only if emails addressed to groups follow the expected RFC format.
Inbound `email.recipient` variables

The recipients variables (`email.recipients`, `email.recipients-array`) allow processing of inbound email based on the email recipients. For example, you can create a script to process email based on the array values:

```javascript
var rarray = email.recipients_array; for (var i = 0; i < rarray.length; i++) {
  var recipient = rarray[i]; // do something with it
}
```

The `sys_email` variable

This variable lets you access the received sys_email record that triggered the inbound email action. It can be used to reference fields on the email record, such as `uid`, `sys_id`, `content_type`, and so on.

Email user matching

When the instance receives an email message, the system searches for an existing user record with the same email address as the sender.

<table>
<thead>
<tr>
<th>Value of email.from Variable</th>
<th>Matching User ID</th>
<th>Email Address</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td>Michael Tossi</td>
</tr>
<tr>
<td>&quot;Michael Tossi&quot;<a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td>Michael Tossi</td>
</tr>
<tr>
<td>&quot;Tossi, Michael&quot;<a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td><a href="mailto:michael.tossi@company.com">michael.tossi@company.com</a></td>
<td>Michael Tossi</td>
</tr>
<tr>
<td>&quot;Tossi&quot;<a href="mailto:mtossi@company.com">mtossi@company.com</a></td>
<td><a href="mailto:mtossi@company.com">mtossi@company.com</a></td>
<td><a href="mailto:mtossi@company.com">mtossi@company.com</a></td>
<td>Tossi</td>
</tr>
</tbody>
</table>

**Note:** This functionality requires that you activate the Email Automatic User Creation plugin.

Inbound Email Action scripts no longer support the `gs.createUser()` method. Use either the automatically-generated email variables or the `gs.GetUserID()` method instead.

User impersonations and inbound actions

When the instance receives an email, it can take a variety of actions by impersonating the sender.

If the sender of an incoming email matches an existing user, the instance impersonates the matching user to complete any inbound email actions. If the sender does not match an existing user, the instance impersonates the Guest user to complete any inbound email actions. If the impersonated user is locked out, the inbound email action fails.

**Note:** If inbound email comes from an untrusted domain, the instance impersonates the Guest user unless you explicitly prevent users from untrusted domains from triggering inbound actions. For more information on filtering domains, see Designate email domains as untrusted or trusted.

Enable automatic user creation

An administrator can set an email property to automatically create users from incoming email. The administrator provides a list of trusted domains to prevent untrusted users from being automatically created.
Role required: admin

For example, you can prevent email from users outside your company domain from creating incidents. When an instance receives a message and there is no matching email address from the sender, the instance can create a user with the User ID [sys_user.user_name] set to the sender's full email address.

Users in your instance must still have write and update access to the records that they create or update through inbound email actions.

### Creating users from incoming email

<table>
<thead>
<tr>
<th>Value of email.from Variable</th>
<th>User ID Created</th>
<th>Email Address</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;New User&quot; <a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;User, New&quot; <a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;User&quot; <a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td><a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td><a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td>User</td>
</tr>
</tbody>
</table>

1. Navigate to **System Properties > Email Properties**.
2. Select the check box for **Automatically create users for incoming email from trusted domains (glide.pop3readerjob.create_caller)**.

   Property name: glide.pop3readerjob.create_caller

   Automatically create users for incoming emails from trusted domains

   Yes | No

3. Enter the list of trusted domains in **Trusted domains for creating users from incoming emails (glide.user.trusted_domain)**.

   Property name: glide.user.trusted_domain

   Trusted domains when creating new users from incoming email (ignore email from untrusted domains unless from an existing user; use * for all domains)

   `*`
Note: The glide.user.trusted_domain property only prevents user creation if the sender is not from a trusted domain. The system processes the inbound actions of the email as a guest user. If you want the system to ignore these email messages, use the email filters plugin, specifically the "ignore sender" setting. You can also prevent untrusted users from triggering inbound actions by locking out the guest user.

4. Click Save.
5. Optional: Complete the following steps to lock out the guest user.
   a) Navigate to User Administration > Users and select the user guest.
   b) Select the Locked out field to disable the guest account.

When the property glide.pop3readerjob.create_caller is set to false, the instance runs inbound actions from users who do not match an existing user by impersonating the guest user.

If the property glide.pop3readerjob.create_caller is set to true, but a user has a valid email address associated with a non-primary device, the instance creates a new user record for that email address if there is no matching email address in the Users [sys_user] table. The instance does not validate non-primary email addresses against the Notification Devices [cmn_notif_device] table.

The method the instance uses to create users can be upgraded to use the full email address by activating the Email Automatic User Creation plugin.

The plugin sets the property glide.email.create_userid_from_email to true by default. After activating the plugin, enable automatic user creation from email.

Warning: Review your existing user records to reconcile any that contain identical email addresses. If you activate the plugin prior to reconciling email addresses, your instance cannot distinguish between users with identical email addresses and randomly selects one of the users with the matching email address.

Allowing locked out users to process inbound email actions

A property is available to allow locked out users to trigger inbound actions. For example, enabling the property can allow locked out users to reset their password and send email to the instance asking for assistance.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.pop3.process_locked_out</td>
<td>Enables (true) or disables (false) the ability for locked out users to trigger inbound actions.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td></td>
<td>• System Properties [sys_properties] table</td>
</tr>
</tbody>
</table>

Warning: Enabling this property (glide.pop3.process_locked_out) also enables users from untrusted domains to trigger inbound actions.

Redirecting email to the instance POP3 account

Configure other mailboxes to forward email to the instance's POP3 account.
By default, the **POP Reader** scheduled job checks for new email every two minutes. It connects to the mail server and account specified in email properties. The **POP Reader** downloads any email waiting on the mail server and creates `email.read` events. After the instance processes the events, the inbound email actions run.

The **POP Reader** shows the number of emails processed during the reader's last run. The message shows the number of emails the reader processed or **0 processed** if no emails were available. The reader resets the status each time it runs.

While it is not possible to specify more than one POP3 account for the instance, you can forward other mailboxes to the designated POP3 account. This script can be added to the Create Incident inbound email action to differentiate the content based on the original recipient, and then set an **assignment_group** value.

```javascript
if(email.direct.indexOf('facilities@anycorp.com')>-1)
current.assignment_group.setDisplayValue('Facilities Management');
```

### Setting field values from the email body

Values in an inbound email can set field values in a task record.

Any name:value pair in an inbound email body gets parsed into a variable/value pair in the inbound email script. The name:value pair must be on its own line. Note that most email clients limit the number of characters allowed per line and may truncate excessively long name:value pairs.

**Tip:** To prevent unexpected parsing, ensure that all the names in the name:value pairs are unique.

To populate a reference field, use `setDisplayValue()` instead. See *Redirecting Emails* for an example of using `setDisplayValue()` in an inbound email action.

**Note:** The action always generates a lowercase variable name. Also, this functionality does not work on reference fields.

For example, if an email body contains this line:

```plaintext
Foo:bar
```

The inbound email script creates the variable `email.body.foo` with the value of **bar**. You can use these variables to create conditions such as:

```javascript
if(email.body.foo!=undefined){
current.[field]=email.body.foo;}
```

In this example, the script sets the value of `[field]` to the value **bar**.

**Note:** Spaces are rendered as underscores when a name:value pair gets parsed into a variable/value pair. For example, if an email body contains a line with spaces like `my variable:data`, then the inbound email script creates the variable `email.body.my_variable`. The value of the variable is **data**.

### Integrate inbound events

This example illustrates how to create a notification from an inbound JSON request.

**Role required:** admin

When complete, you will be able to:

- Send a JSON request to the [imp_notification] web service import set with the JSON processor
- Create a new import set in the [imp_notification] table in the instance using data from the JSON request
The following example steps assume you have your own demonstration instance.

1. Activate the JSON Web Service plugin.
2. Install the RESTClient Firefox plugin.
3. Open the RESTClient.
4. Create the following JSON request.
   - **Method**: POST
   - **URL**: `http://<instance name>.service-now.com/imp_notification.do?JSON`
   - **Headers**: Authorization: Basic
   - **Body**:
     ```json
     {"sysparm_action":"insert","message":"this is an event","uuid":"abc"}
     ```

5. Click Send.
6. Navigate to **Response > Response Body (Raw)**.
7. Verify that the instance sends back a response with a `sys_id`. 
8. Login to your development instance.
10. Verify that the import set table has an event matching your JSON request.

Reprocess received emails

When a email has been processed incorrectly, fix the underlying problem, then reprocess the email. You can reprocess emails individually or in a batch.

Role required: admin

Various scenarios can result in improperly processed emails. After taking corrective action, reprocess the emails to get correct email records. Two of the most common scenarios are:

- The inbound action failed to trigger correctly. After you update or fix the inbound action, reprocess the affected emails to create the correct records.
- Emails have accidentally ended up on a development instance, usually due to the username or password of a production or test instance being reused on the development instance. In this case, you first export the emails from the development instance as XML and import them to the correct instance. On the correct instance, reprocess the imported emails to obtain correct email records.

You can reprocess emails with the types received or received-ignored. Such emails are processed to the system mailboxes Received and Junk, respectively.

Take the following steps only after fixing the underlying problem. This procedure only reprocesses the emails.

1. Navigate to the relevant System Mailbox or navigate to System Logs > Email.
2. Decide whether to reprocess emails individually or in a batch.
   - To reprocess an individual email, open that email and click **Reprocess**
   - To reprocess several emails at once, select them from the mailbox or the email log and apply the **Reprocess received emails** action.
Remember that you can reprocess only received or received-ignored emails.

**Inbound email action examples**

Various examples of inbound email actions are available to help you build your own inbound email actions. These examples show how to set up inbound email actions to handle email replies, create (log) a problem record, request a change, and update an incident.

**Inbound email action example: handling email replies**

This example shows you how to set up inbound email actions to handle replies that users send back to the instance.

**Role required: admin**

The inbound email action parses the email and responds using a script. By default, an email received by the instance creates a new incident, and the body of the email is added to the **Additional Comments** text box. More refined Inbound Email Actions can create incident tickets with more data, thus saving the incident management team valuable time.

Normally, when a user responds to an email sent by the instance, the inbound email action matches the watermark to an existing incident, and updates the incident rather than creating a new record. However, if the watermark is missing, this inbound email action attempts to match a reply to the original incident.

This inbound email action is replicated in Flow Designer as the sample flow **Inbound Email Flow Example: handling email replies**. To view the sample flow, navigate to **Flow Designer > Designer**.

1. Navigate to **System Policy > Inbound Actions** and click **New**.
2. Populate the form as follows:

   **Inbound action field values**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Update Incident</td>
</tr>
<tr>
<td>Type</td>
<td>Reply</td>
</tr>
<tr>
<td>Target table</td>
<td>Incident [incident]</td>
</tr>
</tbody>
</table>

3. In **Script**, enter this code.

   ```javascript
   gs.include('validators');
   //Note: current.caller_id and current.opened_by are already set to the first UserID that matches the From: email address
   if (current.getTableName() == "incident") {
     current.comments = "reply from: " + email.origemail + "\n\n" + email.body_text;
     if (email.body.assign != undefined)
       current.assigned_to = email.body.assign;
     if (email.body.priority != undefined && isNumeric(email.body.priority))
       current.priority = email.body.priority;
     if (email.body.category != undefined)
       current.category = email.body.category;
     if (email.body.short_description != undefined)
       current.short_description = email.body.short_description;
   }
   ```
Inbound email action example: logging a problem

This example shows you how to set up inbound email actions to create a problem record.
Role required: admin

Inbound email actions allow users to log or update incidents on an instance via email. The inbound email action parses the email and responds using a script.

This inbound email action is replicated in Flow Designer as the sample flow Inbound Email Flow Example: logging a problem. To view the sample flow, navigate to Flow Designer > Designer.

1. Navigate to System Policy > Inbound Actions and click New.
2. Populate the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Log Problem</td>
</tr>
<tr>
<td>Type</td>
<td>New</td>
</tr>
<tr>
<td>Active</td>
<td>True</td>
</tr>
<tr>
<td>Target Table</td>
<td>Problem [problem]</td>
</tr>
<tr>
<td>Condition</td>
<td>email.subject.indexOf(&quot;Problem: &quot;) == 0</td>
</tr>
<tr>
<td>Script</td>
<td>current.description = email.body_text;</td>
</tr>
<tr>
<td></td>
<td>current.short_description = email.subject.toString().substring(9);</td>
</tr>
<tr>
<td></td>
<td>current.assignment_group.setDisplayValue(&quot;Development&quot;);</td>
</tr>
<tr>
<td></td>
<td>if (email.body.assign != undefined)</td>
</tr>
<tr>
<td></td>
<td>current.assigned_to = email.body.assign;</td>
</tr>
<tr>
<td></td>
<td>current.insert();</td>
</tr>
</tbody>
</table>

Inbound email action example: requesting a change

This example shows you how to set up inbound email actions to create a change request record.
Role required: admin

Inbound Email Actions allow users to log or update incidents on an instance via email. The inbound email action parses the email and responds using a script.

1. Navigate to System Policy > Inbound Actions and click New.
2. Populate the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Request Change</td>
</tr>
</tbody>
</table>
### Values automatically set from incoming email

The default inbound action for the Incident table automatically sets the following field values when it receives an incoming email.

<table>
<thead>
<tr>
<th>Field value set</th>
<th>Value used from incoming email</th>
</tr>
</thead>
<tbody>
<tr>
<td>current.caller_id</td>
<td>User ID of the first user whose email address matches the email.from variable.</td>
</tr>
<tr>
<td>current.opened_by</td>
<td>User ID of the first user whose email address matches the email.from variable.</td>
</tr>
</tbody>
</table>

If multiple users have the same email address, the instance first searches for an active user with the email address. Use unique email addresses for each user record whenever possible. If not, having only one active user with the shared email address guarantees that the instance always matches incoming email from this address to the active user.

### Specifying the inbound email processing order

You can configure a processing order for inbound email actions and use the order to manage multiple filters in inbound email actions.
The Ordered Email Processing (com.glide.email_ordered_processing) plugin is enabled by default for new instances. Users with the admin role can activate the plugin for upgraded instances. The plugin adds the \textbf{Order} column to the Rules \texttt{[sysrule]} table, which the instance uses to determine when to process emails. Admins can also add a command to an action script that halts processing after the script runs.

\textbf{Configure the processing order}

Configure the processing order for inbound email actions to force them to run in a prescribed order.

Role required: admin

1. Navigate to \texttt{System Policy \textgreater Email \textgreater Inbound Actions}.
2. Open an existing inbound action or create one.
3. Complete the form and assign an order number to the \texttt{Order} field to establish when this inbound rule should run in relation to other rules. If you upgraded and activated the plugin, the \texttt{Order} field might be named \textbf{Execution Order}.

\begin{itemize}
  \item \textbf{Note}: Ensure each inbound action has a unique \texttt{Order} value to ensure the system stops processing as expected. If multiple inbound actions have the same \texttt{Order} value, the system might evaluate all of the inbound actions, even if one of them contains the \texttt{event.state="stop_processing";} script or has the \texttt{Stop processing} option selected.
\end{itemize}

4. To stop rule processing when an inbound email action runs successfully: add the following line to the bottom of the script:

- Select the \texttt{Stop processing} check box.
- Add the following line to the bottom of the \texttt{Actions} script:

\begin{verbatim}
event.state="stop_processing";
\end{verbatim}
### Inbound Email Actions

**Create Incident**

<table>
<thead>
<tr>
<th>Name</th>
<th>Application</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Incident</td>
<td>Global</td>
</tr>
</tbody>
</table>

**Target table**

Manage multiple filters in an inbound email action

Use process ordering and the `stop_processing` command to manage multiple filters in inbound email actions.

Role required: admin

In this example, you can create new problem records when `prb:` appears in the subject line and new change requests when `chg:` appears in the subject line. All other emails are used to create an incident. The actions are set up as follows:

1. Create an action with a condition of `Subject > starts with > chg:` and the `event.state="stop_processing";` command appended to the script.
2. Assign this action an Order value of 100.
3. Create an action with a condition of `Subject > starts with > prb:` and the `event.state="stop_processing";` command appended to the script.
4. Assign this action an Order value of 200.
5. Create an action for incident with no conditions and an Order value of 300.

It is not necessary to add the `stop_processing` command to the script for the incident action unless you want processing to stop at this rule to avoid continuing to another action.

If either a change request or a problem is created, the `stop_processing` command stops processing, and no incident record is created. If neither a change request nor a problem is created, the inbound email action for incident creates a record.

Notify

Notify provides support for SMS and voice channels on the Now Platform for communicating internally with team members and externally with customers and contractors. The plug-in also provides APIs and workflow activities to achieve the above. Some customers directly make use of the APIs in their products others via products like Major Incident Management, On-Call and CTI Softphone.

Explore

- Differences between Legacy Notify and Notify
- How Notify processes incoming calls
- Outbound communication requirements

Set up

- Activate Notify
- Configure Notify with Twilio
- Notify Number and Number groups
- Notify Provider Selector
- Notify Properties

Use

- Using Notify with tasks
- Using Notify with Incident Communications Management
- Using Notify with On-Call Scheduling
- Notify conference calls
- Use SMS with Notify

Develop

- Developer training
- Developer documentation
- Components installed with Notify

Administer

- Notify workflow activities

Integrate

- Notify-Twilio Direct driver

Troubleshoot and get help

Migrate

- Migrating from Legacy Notify
- Migrate to Notify-Twilio Direct driver
Activate Notify

You can activate the Notify (com.snc.notify) plugin if you are an administrator. This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

Notify activates these related plugins if they are not already active.

Plugins for Notify

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>E164 Compliant Phone Number</td>
<td>Provides E-164 compliant phone number support.</td>
</tr>
<tr>
<td>[com.glide.phone_number]</td>
<td></td>
</tr>
<tr>
<td>SMS Preferences</td>
<td>Provides ability to set SMS preferences for receiving messages from different providers.</td>
</tr>
<tr>
<td>[com.snc.sms_pref]</td>
<td></td>
</tr>
</tbody>
</table>

Note: If you are upgrading from an earlier version of Notify, the Notify-Twilio driver remains active.

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise they will receive the following error: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Differences between Notify and Legacy Notify

Describes the differences between the Notify and Legacy Notify applications, including architecture, workflows, Twilio support, and task-initiated conference calls.

<table>
<thead>
<tr>
<th>Legacy Notify (com.snc.notifynow)</th>
<th>Notify (com.snc.notify)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is deprecated. Supported only telephony services.</td>
<td>Supports pure conferencing solutions such as Zoom in addition to the Telephony providers like Twilio.</td>
</tr>
<tr>
<td>Manage a single number from a Twilio account per instance.</td>
<td>Provides support for multiple numbers per Twilio account, especially cross-geographical scenarios.</td>
</tr>
<tr>
<td>Does not include support for customizable workflows for Voice and SMS incoming or outgoing scenarios.</td>
<td>Workflow-driven approach for handling incoming and outgoing Voice and SMS events, making the integration easy to customize.</td>
</tr>
<tr>
<td>Legacy Notify (com.snc.notifynow)</td>
<td>Notify (com.snc.notify)</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>Hard-coded join conference SMS and IVR prompts for joining a conference call.</td>
<td>Includes a configurable workflow for handling SMS and Voice IVR prompts.</td>
</tr>
<tr>
<td>Support for SMS-based answers.</td>
<td>Notify On Task support for sending SMS and initiating conference calls from any task.</td>
</tr>
</tbody>
</table>

### Migrating from Legacy Notify

When migrating to Notify from the Legacy Notify functionality, several changes are made to the instance.

If the Legacy Notify functionality is already enabled, several automatic changes occur when you activate Notify:

- The Legacy Notify menu is removed from the application navigator.
- Two separators are added to the new Notify menu: **Legacy Notify** and **Legacy Notify Admin**. New modules that replace the Legacy Notify modules are added to these sections.

  **Note:** The added modules are not the same modules that were in the Legacy Notify menu. Any customizations made to the Legacy Notify modules are not preserved.

- The notify_admin role allows access to Notify modules.
- The notifynow_admin role allows access to Legacy Notify modules.
- All workflow activities from the Legacy Notify application are moved to the **Legacy Notify** group.

### Notify-Twilio Direct driver

The Notify-Twilio integration with the Notify-Twilio Direct driver provides APIs and workflow activities for applications to handle various notification features.

The Notify-Twilio Direct driver provides the following notification features:

- Start and manage a conference
- Send and receive SMS messages
- Send and receive calls

Notify automatically creates a TwiML application in the Twilio account and configures the application to use the instance as an endpoint.

Phone numbers associated with the Twilio account are imported to Notify. To manage phone numbers per instance, set up one Twilio account for each instance and configure all relevant phone numbers for the instance under that account.

  **Note:** Only one Twilio account (or subaccount) can be configured on a given Notify driver at a time. Both the old and new driver can be used simultaneously because they can be configured with different accounts.

### Activation Information

For new customers, only the Notify-Twilio Direct driver is available by default. For customers upgrading to the latest version, both the Notify-Twilio Direct and Notify-Twilio drivers are available.

The Notify plugin must be active to access Notify.
Differences between Notify-Twilio and Notify-Twilio Direct

Describes the differences between the Notify-Twilio and Notify-Twilio Direct drivers, including architecture, workflows, Twilio support, and task-initiated conference calls.

### Differences between Notify-Twilio and Notify-Twilio Direct

<table>
<thead>
<tr>

<th>Notify-Twilio Direct (com.snc.notify.twilio_direct)</th>
</tr>
</thead>
<tbody>
<tr>
<td>This plugin is deprecated. Notify - Twilio Direct Driver now replaces this plugin.</td>
<td>Provides next generation integration with Twilio and Notify.</td>
</tr>
<tr>
<td>Uses Java SDK based integration with Twilio.</td>
<td>It is a JavaScript based driver which uses platform provided outbound REST APIs to connect to Twilio.</td>
</tr>
<tr>
<td>NA</td>
<td>Adds support for various advanced SMS features such as Co-pilot messaging, Twilio Notify bulk SMS.</td>
</tr>
<tr>
<td>NA</td>
<td>Adds support for various functionalities in conference calls such as view the participant who is speaking on the conference call, disable beep when someone enters/exits a conference, advanced call features like machine detection and so on.</td>
</tr>
</tbody>
</table>

### Migrate to Notify-Twilio Direct driver

Migrating to Notify-Twilio Direct driver provides next-generation integration with Twilio and Notify.

Role required: notify_admin

You must be connected to Twilio using the Notify Twilio Driver.

1. Click Migrate Now.
2. Click Ok on the confirmation dialog.
   A disconnection of the Twilio driver is initiated and the Account SID and Auth Token are copied to Twilio Direct’s configuration page. Twilio Direct is then autoconnected to that account, and you are redirected to the driver’s configuration page.

### Configure Notify with Twilio

Configure Notify to use the Twilio telephony service.

You must have an SID and authentication token for an active Twilio account (https://www.twilio.com/). You must have a separate contract with Twilio.

**Important:** Ensure that each instance on which you configure Notify uses a different Twilio account. Each account specifies a unique account SID, authentication token, telephone numbers, and endpoint. Using the same account across multiple instances may cause your Twilio service configuration to be overwritten.

**Note:** Account and sub-account are Twilio categorizations, and both act the same for a ServiceNow instance.

Role required: notify_admin

1. Navigate to Notify > Administration > Twilio Direct Configuration.
2. On the Twilio Account Properties page, enter your Account SID.
3. Enter your Auth Token.
4. Click Connect.
If the account is not associated with an instance and the connection is successful, a read-only list of E.164 and short code phone numbers associated with this Twilio account appears. This list displays the phone number, supported capabilities such as voice or SMS, the country for each Twilio number, and the Notify number group to which the number belongs.

If the account is already associated with an instance, the system displays an error message. To connect to this account,
- **Disconnect the account from the instance.**
- Delete the TwiML apps in the Twilio account.

**Note:** If you buy or release numbers on the Twilio account, open the configuration page again to refresh the list of numbers. Numbers removed from the Twilio service remain as Notify Number records, but with the Active field set to false. Use only active phone numbers for inbound or outbound communication.

Phone numbers and short codes are provided by Twilio once the account is successfully connected and are stored on the Notify Phone Numbers [notify_number] table. Assign each number to a number group. Number groups allow you to control which workflows run when using the phone numbers in each number group.

**Twilio-Direct callback testing**

Make an outgoing call or send an SMS using Twilio and trigger callbacks to ServiceNow to test whether Twilio can reach the instance. You can also view when the last callback test was run, its status, and the test logs.

Role required: admin, notify_admin
1. Navigate to **Notify > Administration > Twilio Direct Configuration.**
2. Click **Test Callbacks.**
3. Select the SMS option and click **Initiate SMS.**
4. Select the call option and click **Initiate Test Call.**

**Note:** The callbacks can be tested only after a connection is established with Twilio.

**Advanced configuration for SMS**

Use the Twilio copilot features to improve SMS delivery with phone number like using multiple numbers to send high-volume messages and content intelligence to automatically format every message without writing custom code. Reach large lists of users with one API request.

Role required: notify_admin

The Twilio co-pilot features are enabled in your instance once configured. An example of a copilot feature is that you can configure which identity (phone number, shortcode, or alpha sender ID) to use to send a message. You can also spread the messaging traffic over several phone numbers or prioritize an alpha sender ID when sending messages to countries where alpha senders are commonly used. To know more about these features, visit [https://www.twilio.com/copilot](https://www.twilio.com/copilot).

**Important:** All the Twilio numbers must be part of the same messaging service for which you have enabled the Advance SMS Features feature.

The Twilio Notify bulk SMS feature is used to send SMS in bulk to customers. Use the passthrough `sendBulkSMS` API to reach large number of users across using a single API request. For more information on these features visit [https://www.twilio.com/notify](https://www.twilio.com/notify)

1. Navigate to **Notify > Administration > Twilio Direct Configuration.**
2. On the Twilio Account Properties page, enter your **Account SID**.
3. Enter your **Auth Token**.
4. Click **Connect**.
5. On the **Advance SMS Features** tab, check the **Intelligent SMS Handling** box.

   **Note:** To setup Alpha Sender ID, you need to go to the Twilio console.

6. On the **Advance SMS Features** tab, check the **Twilio Notify Bulk SMS** box.

   **Note:** This feature uses Twilio Notify feature and might have an associated cost. Contact Twilio Support for more details.

### Advanced configuration for voice

Configure Answering Machine Detection (AMD) to determine if a human has picked up the call or not.

**Role required:** notify_admin

1. Navigate to **Notify > Administration > Twilio Direct Configuration**.
2. On the Twilio Account Properties page, enter your **Account SID**.
3. Enter your **Auth Token**.
4. Click **Connect**.
5. On the **Advance Voice Features** tab, check the **Detect answering machine** box.
6. On the **Advance Voice Features** tab, enter the number of seconds in the **Machine detection timeout** field to set a timeout value.

### Disconnect from a Twilio account

If a Twilio account is already associated with a different system, disconnect the account from the other system before connecting to the current instance.

**Role required:** notify_admin

1. Navigate to **Notify > Administration > Twilio Direct Configuration**.
2. On the Twilio Account Properties page, click **Disconnect**.
3. In the Disconnecting Twilio account pop-up window, click **OK**.

   The account is disconnected from the instance. The system clears the **Account SID** and **Auth Token** fields and deactivates the list of associated phone numbers.

### Public URLs

On-premise customers should ensure that the URLs are accessible from the Internet for the Notify-Twilio driver to work correctly.

The Notify-Twilio drivers (both new and old) require that specific URLs on the instance be accessible from the Internet by the Twilio server without authentication. If the instance is within a private network, you need to either port forward or set up a reverse proxy.

For the Notify-Twilio driver, the URLs are:

- `/NotifyTwilioCallProcessor.do`
- `/NotifyTwilioCallStatusProcessor.do`
- `/NotifyTwilioSMSProcessor.do`
For the Notify-Twilio Direct driver, the URLs are:
- /api/sn_twilio_direct/twilio_callbacks/process/twiml/{callback_name}
- /api/sn_twilio_direct/twilio_callbacks/process/xml/{callback_name}

**Note:** The `glide.notify.endpoint` property needs to be set to an Internet visible name because the instance name inside a private network can be different from the Internet domain.

### Components installed with Twilio Direct driver

Several types of components are installed with the Twilio Direct driver for integration with Notify.

### Business rules installed with Twilio-Direct driver

Twilio installs the following business rules:

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Connected Disconnected Message</td>
<td>[sn_twilio_direct_twilio_config]</td>
<td>Verifies if Twilio is completely configured and displays an info message.</td>
</tr>
<tr>
<td>Calculate test duration</td>
<td>[sn_twilio_direct_callback_test]</td>
<td>Sets the duration for Twilio Callback tests.</td>
</tr>
<tr>
<td>Machine detection timeout range check</td>
<td>[sn_twilio_direct_twilio_config]</td>
<td>Verifies the timeout values for detecting the answering machine if the Detect answering machine is enabled. The valid range of the timeout is 3-120 seconds.</td>
</tr>
<tr>
<td>Move credentials</td>
<td>[sn_twilio_direct_twilio_config]</td>
<td>Moves the account credentials to [sn_twilio_direct_basic_auth]</td>
</tr>
<tr>
<td>Populate Credentials</td>
<td>[sn_twilio_direct_twilio_config]</td>
<td>Populates the current SID and Auth token from the [sn_twilio_direct_basic_auth] table to display them.</td>
</tr>
<tr>
<td>Set outbound calculated fields &amp; auth</td>
<td>[sn_twilio_direct_twilio_config]</td>
<td>Sets the account credentials in the basic auth profile</td>
</tr>
<tr>
<td>Set Reset JWT Key</td>
<td>[sn_twilio_direct_basic_auth]</td>
<td>Copies the auth token from [sn_twilio_direct_basic_auth] to signing key password in [jwt_keystore_aliases].</td>
</tr>
<tr>
<td>Validate &amp; set inbound calculated fields</td>
<td>[sn_twilio_direct_twilio_config]</td>
<td>Populates the callback_endpoint field based on the inbound rest field value. Displays an error message if the endpoint URLs are not in the correct format.</td>
</tr>
</tbody>
</table>
### Table: ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Validate Fast Bulk SMS option</td>
<td>[sn_twilio_direct_twilio_config]</td>
<td>When Twilio Notify bulk SMS is enabled, validates the Twilio messaging and Notify service id.</td>
</tr>
<tr>
<td>Validate Intelligent SMS option</td>
<td>[sn_twilio_direct_twilio_config]</td>
<td>When Intelligent SMS handling is enabled, validates the Twilio messaging service id.</td>
</tr>
</tbody>
</table>

### Tables installed with Twilio Direct driver

Tables installed with Twilio Direct driver are described below.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[sn_twilio_direct_callback_processor]</td>
<td>Extends the application file. Contains scripts which process callback payloads from Twilio and generate appropriate response XML or TwiML document. Note: Use caution when editing, deleting or adding new Callback Processor scripts as they are one of the key core components of the driver.</td>
</tr>
<tr>
<td>[sn_twilio_direct_twilio_config]</td>
<td>Extends the application file. Contains configuration option values for the driver.</td>
</tr>
<tr>
<td>[sn_twilio_direct_basic_auth]</td>
<td>Extends the basic auth credentials. The Account SID and Auth token are stored in this table.</td>
</tr>
<tr>
<td>[sn_twilio_direct_callback_test]</td>
<td>Stores the history of callback test runs.</td>
</tr>
</tbody>
</table>

### Notify Zoom connector

The Notify Zoom Connector expands Notify communication channel by managing and initiating a Zoom meeting directly from any task record such as an incident or a change.

### Compatibility

New York and later

### Key Features

- Start and end Zoom meeting directly from any task record such as incident, or a change or from the Major incident Workbench.
- Manage a Zoom meeting by adding or removing participants.
- Track and report meeting details, like meeting duration, attendees, and so on for further analysis.

### System Requirements

- Install and activate the Notify plugin (com.snc.notify) before you install the application.
• Ensure that the system has Zoom spoke, version 1.0.2, for ServiceNow IntegrationHub plugin (sn_zoom_spoke) installed and the necessary IntegrationHub license to use Zoom for meeting management.

Plugins

• ServiceNow IntegrationHub Installer (com.glide.hub.integrations): Suite of plugins necessary to design integration flows in the Flow Designer application.
• The Zoom spoke, version 1.0.2 (com.sn.zoom.spoke) for ServiceNow IntegrationHub provides actions that allow user to create and manage the conference meetings.

Set up Notify Zoom connector in Zoom

Use the Notify Zoom connector to expand the Notify communication channel by managing and initiating a Zoom meeting directly from any task record such as an incident or a change.

Role required: admin, Zoom admin

1. Ensure that you have Zoom spoke installed on your instance.
2. Make sure you have the required credentials and connections to Zoom on your instance.
3. Configure the Notify Zoom connector with the same Zoom account with which you created the OAuth app for Zoom spoke.

1. On your Zoom OAuth app, navigate to Feature > Add Feature > Event Subscription.
2. Use the toggle button to enable the event subscription feature.
3. In the form that appears, fill in the URL. The URL is used to post information about events in Zoom to your instance. The format of the URL is: https://yourinstancename.com/api/sn_notify_zoom/notify_zoom/ZoomEvent
4. Use the Add Events button to list all the events which Zoom is informing Notify about.
5. In the categories that appear, select Meeting and select all the meeting-related events from the list and click Done.
6. Under Recording, select All Recordings have completed and Recording Transcript files have completed from the list and click Done.
7. Click Save on the Add feature screen.
8. A Verification Token appears on the Add Feature screen. Record the token by clicking Copy

Configure Notify with the verification token from Zoom.

Configure Notify Zoom connector in Notify

Configure Notify to receive the event information from Zoom. An event is usually any action that is related to a meeting.

Role required: admin

1. Navigate to Notify > Zoom > Configuration.
2. Paste the verification token that you recorded on Zoom Event Subscription screen in the Webhook validation token field.
3. Save the record.

Configure and use Zoom as a conference provider from any of the task records.
Disable Zoom meeting password

Disable Zoom meeting password so that you can join a Zoom meeting without any meeting password.

Role required: notify_admin or admin

1. Navigate to Notify > Zoom > Configuration.
2. Select Do not set password.
3. Click Update.

Notify voice and SMS capabilities

Notify provides support for SMS and voice channels for communicating internally with team members and externally with customers and contractors.

Notify provides a way for applications to start and manage a conference, send/receive SMS, send/receive calls and present them with IVR like system.

How Notify processes incoming calls

Notify processes incoming calls using workflow activities.

Any Notify activity that manages incoming phone calls creates a record on the Notify Workflow Activity [notify_wf_activity] table. Each notify_wf_activity record is associated with a single call. These records store JSON data detailing the actions to send to the telephony provider.

Notify processes incoming calls in the following way:

1. A person calls a Notify phone number.
2. Notify launches the incoming call workflow associated with that Notify phone number.
3. The workflow reaches a Notify activity and invokes the activity onExecute() function.
4. The activity creates a new notify_wf_activity record detailing any actions to take, with a State value of execute.
5. Notify sends the specified actions to the telephony provider.
6. The notify_wf_activity record State changes to processed.
7. The telephony provider sends a response.
8. Response arguments, such as user input or recording info, are stored as JSON data in the notify_wf_activity response_args field.
9. The notify_wf_activity State changes to complete.
10. The JSON data from the notify_wf_activity record is copied to the Last action field in the Notify call record that triggered the workflow.
11. The workflow invokes the onUpdate() function in executing activities.
12. The activity confirms that the associated notify_wf_activity record has completed, and changes the activity state to finished.
13. The workflow transitions to the next activity.
Notify conference calls

Notify administrators, major incident managers, or communications managers can manage conference calls. Conference call records are stored on the Notify Conference Calls [notify_conference_call] table. Conference call participant records are stored on the Notify Conference Call Participants [notify_participant] table.

Conference call and participant records are created automatically when starting and connecting to a conference call. Most fields, such as the Duration of a call, are set automatically using business rules.

Note: If a participant attempts to join a conference call using an invalid phone number, the caller is added to the participant list and the phone number is marked with a status of Invalid.

Notify administrators, major incident managers, or communications managers can manage conference call participants. Several conference call workflows are available by default. These workflows can be used for incoming and outgoing calls and incoming SMS messages. Conference call workflows are:

• Notify: (Re)join Conference Call
• Notify: Join Conference Call Via SMS
• Notify: (Re)join Conference Call with muting

Note: Notify: (Re)join Conference Call with muting is available only with demo data.

The number groups Conference Call Group and Notify On Task Group use these conference call workflows by default.

Start a conference call

Start a conference call from a task or an incident communication plan by inviting one or more users to join a call. The conference will not start until at least two participants join.

Call participants can include:

• Users who have been assigned specific responsibilities
• Ad-hoc user contacts
• Other involved parties who are not recorded as users, such as third-party contacts

1. Navigate to Incident Communications Management > Open.
2. Open the relevant incident communication plan.
3. Click the Initiate Conference Call related link.
4. From the dialog box that appears, choose the Conference Bridge that you want to dial from.
5. Select the participants for the conference.
Initiate conference call

System Administrator (Open)
Lucy Barnes (Incident Manager)

Lucy Barnes (Incident Manager)

Users displayed in red do not have a mobile phone number

Include a brief message for participants

160 characters remaining of 160 characters

Cancel  Start Call
The dialog box displays the Recommended and Selected participants for the conference. All users from the User Contacts list in the incident communication plan are in the Recommended section by default. The user who initiates the conference call is added to the selected list of participants.

If a shift exists for the group contacts, the primary and secondary on-call resources are shown in the Recommended list.

Calls are placed to the number in the Mobile phone field on the user record. If that information is blank, the user cannot be contacted through Notify. The mobile phone number has to be an E.164 compliant phone number. If the phone number is a local number, without the + prefix, the number will be retrieved based on the user's location and, if possible, converted into a valid E.164 number.

6. To select ad-hoc participants,

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click the reference lookup icon, and select the relevant user.</td>
<td>Click Add to selected.</td>
</tr>
<tr>
<td>Enter the participant’s phone number</td>
<td>Click Add to selected.</td>
</tr>
</tbody>
</table>

7. After the participant list is finalized, click Start Call.

The conference call starts and a Conference call initiated message is displayed at the top of the incident communication plan form. Each user is called and can accept the call to join the conference.

8. Click the Conference call initiated message to see details of that conference call.

When the final participant leaves the conference, the conference call closes.

**Note:** VoIP phone systems, which do not use touch tone phones, may encounter issues with recognizing key presses. To avoid problems, ensure that conference call users use touch tone phones, or configure your VoIP system settings to recognize key presses, as described in your VoIP system documentation.

### Add participants to a conference call

Add a participant to a conference call using Notify.

Role required: notify_admin, major_incident_manager, or communication_manager

You can add the following participants:

- Users who have been assigned specific responsibilities
- Required ad-hoc user contacts
- Other involved parties who are not recorded as users, such as third-party contacts

1. Navigate to Notify > Conference Calls.
2. Open the conference call that you want to add a participant to.
3. Click the Add Participant related link.
4. In the dialog box that appears, select the participants you want to add to the conference.
   You can add a single participant, a group of participants, or a phone number.
Add Participants dialog box

Users displayed in red do not have a mobile phone number

Include a brief message for participants

160 characters remaining of 160 characters

Add Participants
5. You can send an optional message for the participant who you want to add in the **Include a brief message for participants** field.

6. Click **Add Participant**.
   The selected user, group, or phone number is added to the selected conference call.

**Mute or unmute all participants**

As a communications manager or a conference call host, mute/unmute all the conference participants from the workbench.

Role required: notify_admin, major_incident_manager, or communications_manager

Before starting this procedure, ensure there is an active conference call with one or more participants.

1. Navigate to **Major Incident Management** in the application filters.
2. Select the incident that you are trying to resolve.
3. On the incident, click **View Workbench**
4. In the **Conferences** tab, select a conference

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mute All</td>
<td>Click this button to mute all the participants in the conference</td>
</tr>
<tr>
<td>Unmute All</td>
<td>Click this button to unmute all the participants in the conference</td>
</tr>
</tbody>
</table>

**Mute All**

![Conference Calls](image)

**Unmute All**

![Conference Calls](image)
Mute or kick a conference call participant

As a communications manager, you can mute or kick conference call participants.

Role required: notify_admin, major_incident_manager, or communication_manager

Before starting this procedure, ensure there is an active conference call with one or more participants.

**Note:** Any participant with the host flag set to active, can mute or kick a participant from a conference call.

1. Navigate to Notify > Conference Calls.
2. Select a conference call.
3. In the Notify Conference Call Participants related list, select a participant.
4. Click Mute or Kick.

**Note:** You can unmute a muted participant. A kicked participant may rejoin the conference call by calling in again.

Send a message to conference call participants

Send a brief message as a text or voice message to the participants of a conference call to set a context to the call.

Role required: major incident manager

You must configure a telephony provider like Twilio so that you can use one of the Notify numbers to send SMS to the conference call participants.

1. Navigate to Major Incident Management > View Workbench.
2. In the Conference tab, select the type of the call and click Start Call.
3. In the **Include a brief message for participants** field, type the message that you want to send to the conference call participants and click **Start Call**.
Initiate conference call

Lucy Barnes (Incident Manager)

Users displayed in red do not have a mobile phone number

Include a brief message for participants

160 characters remaining of 160 characters

Cancel Start Call
Note: Upon clicking **Start Call** the message text entered will be stored as description on the conference call record. If the OOB workflow is not modified, then the workflow takes care of sending this message text as SMS to the user. This is applicable if you have configured a telephony provider.

**Viewing conference call information**

Conference calls are listed as system activities in the **Activity** section of the Incident Communication Plan form and also are listed in the **Conference Calls** related list.

List of Notify calls

If you are a Notify administrator, you can view a list of calls and the status of a call made to or from Notify. The call records help in reporting and analytics.

To view a list of calls, navigate to Notify > Calls.

Call records are generated automatically when a user calls a Notify number or when a user makes an outbound call through Notify. You cannot create call records manually.

Note: Although you can delete a call record, doing so may result in cascade deletion of related records.

For Notify calls where the source is specified, such as a task number, the source is added to the Notify Calls [notify_call] table in the Source column. For Notify conference calls where the source is specified, the source is added to the records for each of the calls in the conference.

<table>
<thead>
<tr>
<th>Call status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>initiated</td>
<td>The number has just been dialed</td>
</tr>
<tr>
<td>ringing</td>
<td>The call is currently ringing.</td>

<tr>
<td>in_progress</td>
<td>The call was answered and is currently in progress.</td>
</tr>
<tr>
<td>no_answer</td>
<td>The call was not answered.</td>
</tr>
<tr>
<td>completed</td>
<td>The call was answered and has ended normally.</td>
</tr>
<tr>
<td>busy</td>
<td>The caller received a busy signal.</td>
</tr>
<tr>
<td>failed</td>
<td>The call could not be completed as dialed, most likely because the phone number was non-existent.</td>
</tr>
<tr>
<td>invalid</td>
<td>The call could not be connected since input is invalid.</td>
</tr>
<tr>
<td>unknown</td>
<td>The driver does not support the status</td>
</tr>
</tbody>
</table>

Use SMS with Notify

Send and receive SMS messages using Notify.

Notify stores inbound and outbound SMS messages in the Notify Messages [notify_message] table.

Notify supports sending concatenated SMS messages. Messages that exceed 160 characters, or 70 unicode characters, are split into multiple messages. This may affect your total telephony cost because each message can incur a cost. Some mobile carriers, such as Sprint, do not support concatenated SMS messages.

To send SMS messages to an individual recipient, use the Notify API sendSMS method. This method takes one recipient as an input parameter. You can also use the send SMS workflow activity.

To send SMS messages to one or more recipients, use the Notify API sendBulkSMS method. This method takes a list as an input parameter and uses one API call to send multiple messages. Include the list of phone numbers in an array in the API call. This method improves performance by streamlining platform checks and Notify number validation.

Note: When using SNC.Notify.sendBulkSMSAPI, instead of simply iterating over the numbers, all the given numbers will be sent for SMS to Twilio in one API call. This happens only when Twilio Direct driver is active and Twilio Notify bulk SMS is enabled for the number in Advanced SMS features.
The Notify-Twilio integration provides programmable SMS outbound message status tracking with Status Callbacks. These callbacks can be helpful to see if a message has been delivered, failed, or ran into some other delivery issues.

**SMS Statuses**

Every Twilio SMS or MMS message request has a status value which describes the current state of the message. Use this information for troubleshooting SMS related incidents/ issues. Here are few descriptions of possible statuses of SMS sent from Notify through Twilio REST API.

<table>
<thead>
<tr>
<th>Outbound message status progression</th>
</tr>
</thead>
<tbody>
<tr>
<td>queued</td>
</tr>
<tr>
<td>accepted</td>

</tr>
</tbody>
</table>

**Send an SMS with Zoom meeting invite**

Send an SMS with Zoom meeting invite to ensure that the meeting participants or any newly added participant is updated with the meeting details when the meeting host starts the conference or adds a participant to the conference.

Role required: notify_admin or admin

*Note:* You need a telephony provider like Twilio or Nexmo.

1. Navigate to **Notify > Zoom > Configuration**.

2. In the **Run Workflow on conference change** field, enter **Notify Zoom: Send SMS on Conference Change**.

   The Notify Zoom: Send SMS on Conference Change workflow is available with the demo data of the Notify Zoom Connector plugin (sn_notify_zoom).

3. Click **Update**.
Outbound communication requirements

Outbound communications initiated through Notify, such as phone calls and SMS messages, must satisfy recipient number requirements.

Recipient number requirements

These requirements apply to any number that receives a Notify phone call or message.

• The number must be E.164 compliant.
• The number must be different than the phone number used to initiate the call or message.

These requirements apply to all outbound communication initiated through Notify, such as by using Notify workflow activities or the Notify JavaScript API.

Invalid numbers prevent Notify workflows from running and cause an error to be logged. Set the glide.notify.debug property to true to create detailed error logs.

Using Notify with tasks

Notify allows you to initiate conference calls and send SMS alerts from task records.

This functionality is available for all tables that extend the Task table, such as incident, problem, or change request. All calls and messages made from tasks are initiated using a single Notify phone number (E.164 or short code). You can configure which phone number is used by setting the property glide.notify.task.phone_number.

Start a conference call from a task

Use Notify to start conference calls from a task record.

Role required: itil

Notify must be set up before you can use Notify on task. Ensure there are Notify phone numbers (E.164 or short code) in number groups with phone call workflows.

Use glide.enable.notify_on_task property to enable Notify integration for Task table and its extensions. Entering phone number in glide.notify.task.phone_number property is equivalent to setting glide.enable.notify_on_task to true.

1. Navigate to any task record, such as an incident or change request.
2. Click the Start conference call related link.
3. Select one or more Recipients to participate in the conference call.
4. Click Start.

Any conference call records created from a task are associated with that task. You can view associated conference calls from the task record in the Conference calls related list. You may need to configure the form to add the related list.

Manage conference calls on task

Add and manage multiple participants on the conference including self-joining in to the conference call and end the conference call when the discussion is over.

• Role required: itil, itil_admin, or admin
• A conference call is already initiated.
The **Manage Conference Calls** UI action is available for any table that extends the Task [task] table. If at least one conference call is active on a task record, the link appears on the related links section of the form. Out of the tables that extend the task table, the **Manage Conference Calls** UI action is intentionally hidden for Incident Communication Plan [incident_alert] table and Communication Task [comm_task] table. For these two tables, the functionality is already available as **Join conference call** and **End conference call** UI actions.

1. Navigate to any task record such as Incident, Problem, or Change Request.
2. Open the record on which the conference call is active.
3. In the related links, click **Manage Conference Calls**.
4. In the Manage Conferences window, you can perform the following activities:

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Join Conference Call</td>
<td>If the logged in user is not already a part of the conference call, the user can join the conference.</td>
</tr>
<tr>
<td>Add Participants</td>
<td>Add participants to the conference who can contribute to the discussion.</td>
</tr>
<tr>
<td>End Conference Call</td>
<td>End the conference when the discussion is over.</td>
</tr>
</tbody>
</table>

5. Optional: In the Manage Conferences window, click the conference call number to know the details of the conference.

**Send an SMS alert from a task**

Use Notify to send information related to a call through SMS alerts from a task record.

Role required: itil

Ensure that there are Notify phone numbers (E.164 or short code) in number groups with SMS workflows.

Use `glide.enable.notify_on_task` property to enable Notify integration for Task table and its extensions. Entering phone number in `glide.notify.task.phone_number` property is equivalent to setting `glide.enable.notify_on_task` to true.

1. Navigate to any task record such as an incident or a change request.
2. Click the **Send SMS** related link.
3. In the **From** choice list, select the phone number from which you want to send the SMS message.
4. Select and add the participants to whom you want to send the SMS message.
   - All users from the **User Contacts** list in the incident communication plan are in the Recommended section by default.
   - The dialog box displays the Recommended and Selected participants you selected to send an SMS message.
5. To select ad-hoc participants, choose one of the following actions:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Click the reference lookup icon and select the relevant user</strong></td>
<td><strong>Click Add to selected.</strong></td>
</tr>
<tr>
<td><strong>Enter the participant's phone number</strong></td>
<td><strong>Click Add to selected.</strong></td>
</tr>
</tbody>
</table>

6. After the participant list is finalized, type the message you want to send to the participants in the **Message** field and click **Send SMS**.

Any SMS records created from a task are associated with that task. You can view associated SMS messages from the task record in the **SMS Messages** related list. You might need to configure the form to add this related list.
Using Notify with Incident Communications Management

Use Notify with incident communication plan to send SMS messages or start conference calls.

Certain configuration steps are required to use Notify with an incident communication plan.

- Both Notify and Incident Communications Management must be active.
- Notify must be configured and able to initiate and receive phone calls and SMS messages.
- The property `com.snc.iam.notify_number` must be set to an active Notify number with outgoing voice and SMS capability.
- This Notify number must belong to a number group configured with inbound and outbound conference call workflows.

**Note:** The Conference Call Group number group is configured with conference call workflows by default.

Initiate a conference call from incident communication plan

Use Notify to initiate a conference call from an incident communication plan by inviting one or more users.

Role required: admin

1. Navigate to **Incident Communications Management > All**.
2. Open the relevant incident communication plan.
3. Click the **Conference** tab.
4. For the relevant incident communications task, under **Actions**, click **Initiate Conference Call**.
5. Select the conference bridge and the participants for the conference call.

   Available options in the conference bridge depend on the conference providers configured. For more information, refer [Configure a provider in Notify](#).

Join and end a conference call from incident communications management

After a conference call is initiated, join the call to participate in the discussion or end the call when the conference is no longer required.

Role required: ia_admin or admin

1. Navigate to **Incident Communications Management > All**.
2. Open the relevant incident communication plan.
3. Click the **Conference** tab.
4. For the relevant incident communications task, under **Actions**, perform one of the following actions:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Join Conference Call</td>
<td>If you are not already logged into the conference call, you can join the conference.</td>
</tr>
<tr>
<td>End Conference Call</td>
<td>End the conference when the discussion is over.</td>
</tr>
</tbody>
</table>

   **Note:** The work notes get updated with the details of the conference call such as duration and participants.
Send communication updates for an incident communications plan

Update users on the latest communication on an incident through selected communication channels.

- Role required: admin
- Activate the Notify plugin (com.snc.notify) if you want to send communication through SMS.
- Set at least one communication channel for a communication task as SMS or email.

1. Navigate to Incident Communications Management > All.
2. Open an incident communication plan record.
3. From the Incident Communication Tasks related list, open the incident communication task for which you want to send updates.
4. In the related links, click Start Updates.
5. Fill the required information and click Send.
   For sending an SMS communication, in the From choice list, select a number from which you want to send the communication.
6. Click Send.

Using Notify with On-Call Scheduling

When using both Notify and On-Call Scheduling, you can send On-call escalation notifications as SMS messages, in addition to emails.

Certain configuration steps are required to use Notify with On-Call Scheduling.

- You must add at least one Notify phone number to the On-Call Group number group. This group is configured by default to handle inbound SMS responses (via On-Call: Check Assignment Response) that accepts or rejects an on-call assignment and to handle outbound voice calls (via On-Call: Assign by Acknowledgement Voice) to accept or reject assignments.
- You must configure workflows, such as the On-Call: Assign by Acknowledgement to drive escalations via SMS and Voice.

Set up Notify with On-Call Scheduling

You can configure on-call scheduling to use Notify functionality to send SMS alerts and assign users to tasks based on the SMS responses.

Ensure that the Notify and On-Call Scheduling plugins on your instance are activated.

Role required: admin

Set up Notify with On-Call Scheduling for the first time or migrate from On-Call Scheduling with NotifyNow.

1. Navigate to Notify > Numbers.
2. Select the phone number you want to use to send and receive on-call scheduling messages.
3. In the Notify group field, select the On-Call Group.
   The On-Call Group is configured with the on-call workflows: On-Call: Check Assignment Response and On-Call: Assign by Acknowledgement Voice by default.
4. Navigate to Workflow > Workflow Editor.
5. Select the On-Call: Assign by Acknowledgement workflow.
   If migrating from NotifyNow, and you have previously customized this workflow, you must import the new version of the workflow manually. See KB0551603 for more information.
6. Click the workflow menu icon in the title bar and select **Copy** to copy the **On-Call: Assign by Acknowledgement per rota** workflow. Save the copied workflow under a different name than what it is named by default.

**Note:** You must avoid modifying default workflows and instead choose to copy and then modify the required workflow.

7. Select a **Send SMS** activity.
8. In the **To (script)** field, modify the `getRecipientsAndNumberToSendFrom()` to use the correct from number's sys ID.
9. Close the **Workflow Editor**
10. Navigate to **On-Call Scheduling > Trigger Rules.**
11. Select a trigger rule that launches an assignment workflow
12. In the **Trigger action** field, select **Workflow**.
13. In the **Trigger workflow** field, select the **On-call: Assign by Acknowledgement workflow.**
14. Click **Update.**
15. Repeat the previous 3 steps for each assignment trigger rule.

Each time the conditions for one of these trigger rules is met, the **On-call: Assign by Acknowledgement workflow** runs.

### Controlling the on-call communication channel with Notify

Configure On-Call Scheduling with Notify to always use a user's preferred communication channel.

If **Force communication channel** is specified in the **Escalation settings** for rosters, the preferred user device is used, either SMS, Voice or email.

For example, if the preferred device is SMS, and the on-call member does not have an SMS device defined, the user is not contacted even if the user has an email address. When forcing a communication channel on an escalation level does not succeed, no further communication attempts are made. The fact that the user could not be reached is logged.

### On-call: Assign by Acknowledgement workflow

The **On-Call: Assign by Acknowledgement** workflow is provided with Notify.

The workflow uses data from the escalation settings, including overlapping shifts and custom escalation settings, of shifts and rosters. Depending on these escalation settings, the workflow iterates through the defined escalation chain and sends notifications by SMS, email, or voice to users asking them for incident assignment. The workflow respects time-off as specified in the rosters. People who have time-off are not included in the escalation chain and no notifications are sent to them.

When you install both On-Call Scheduling and Notify, the `message_number` column is added to the Notify Messages [notify_messages] table to track responses to on-call assignment requests. This column indicates if the contacted user accepted or rejected the assignment. Before you can send notifications, you must define trigger rules. Trigger rules determine the conditions that must be met before a notification is sent and what action must be taken.

### Call a user from the WebRTC UI

Make outbound calls and receive a voice call in the browser through the WebRTC interface from On-Call Schedules landing page, Roster and Escalation Details modal and on-call calendar.

Role required: itil

1. Navigate to **On Call scheduling > On Call calendars.**
2. In the calendar that opens, click the name of the user you want to call.
3. Choose **Call** to call the user.
Key differences between on-call scheduling with NotifyNow and with Notify

There are key differences between on-call scheduling with NotifyNow and on-call scheduling with Notify.

Tracking responses to questions

The On call:Assign by Acknowledgement workflow no longer uses the Notify Question tables to track assignment responses. When you install On-Call Scheduling with Notify, the message_number column is added to the Notify Messages [notify_messages] table to track responses to on-call assignment requests. This column indicates if the contacted user accepted or rejected the assignment.

Notify administration

As a Notify administrator, you can create number and number groups, create and modify workflows, update the tables and so on.
Numbers and number groups

Number groups allow you to group Notify phone numbers and share workflows across grouped numbers.

Each phone number within Notify has an associated number group. Numbers within a group use the same workflows for handling incoming and outgoing calls and SMS messages.

Numbers associated with a group appear on the Notify Phone Numbers related list on the Notify Phone Number Group form.

If the number group workflows have incorrect conditions, a warning appears.

Create a number group

Group Notify phone numbers and share workflows across grouped numbers.

Role required: notify_admin

Each phone number within Notify has an associated number group. Numbers within a group use the same workflows for handling incoming and outgoing calls and SMS messages.

Numbers associated with a group appear on the Notify Phone Numbers related list on the Notify Phone Number Group form.

1. Navigate to Notify > Number Groups.
2. Click New.

3. Enter a Name, and select Notify: (Re)join Conference Call for the Incoming call workflow field.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the number group.</td>
</tr>
<tr>
<td>Incoming call workflow</td>
<td>Workflow to run when there is an incoming phone call for this group.</td>
</tr>
<tr>
<td>Incoming SMS workflow</td>
<td>Workflow to run when there is an incoming SMS message for this group.</td>
</tr>
<tr>
<td>Outgoing call workflow</td>
<td>Workflow to run when there is an outgoing phone call for this group.</td>
</tr>
<tr>
<td>Outgoing SMS workflow</td>
<td>Workflow to run when there is an outgoing SMS message for this group.</td>
</tr>
</tbody>
</table>

Short codes can only be associated with SMS workflow groups. You cannot add an incoming or outgoing call to a short code group.

4. Click **Submit**.

**Associate a number to a number group**

After creating a number group, associate numbers with that group to use the selected workflows.

**Note:** Each phone number can only be associated with one number group.

**Associate a number to a number group**

Associate a Notify number to a number group to use inbound and outbound workflows.
Role required: notify_admin

1. Navigate to Notify > Numbers.

2. Click the listed phone number and assign it to a **Number Group**, as appropriate.

Note: Each phone number can only be associated with one number group.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Number for the entry.</td>
</tr>
<tr>
<td>Phone number</td>
<td>E.164 phone number, if applicable.</td>
</tr>
<tr>
<td>Notify group</td>
<td>(Optional) Group to which this number is assigned.</td>
</tr>
<tr>
<td>Number owner</td>
<td>Service provider of the number.</td>
</tr>
<tr>
<td>Short Code</td>
<td>Short code number, if applicable.</td>
</tr>
</tbody>
</table>
Configure a provider in Notify

Configure a conference provider or a phone number to be used as choices for initiating a conference call. For sending SMS, configure preferences for phone numbers.

Role required: notify_admin

1. Navigate to Notify > Provider Selector.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box that indicates whether the number is active or not.</td>
</tr>
</tbody>
</table>

Provider selector fields

4. Click Submit.
5. In the Provider Selector Choices related link, click New.
6. Search for the conference provider or the Notify group that contains the phone numbers for initiating a conference.
   For sending SMS, search for the Notify group that contains the phone numbers.
7. Click Submit.

Configure SMS opt-out preferences

Allow recipients to opt out of receiving text messages.

Role required: admin, notify_admin

According to regulations in the CTIA Short Code Monitoring Handbook, recipients must be allowed to opt out of receiving text messages. The opt-out functionality is applicable only to Notify. When the user sends an SMS message with an opt-out keyword to any Notify number, the user is opted out of receiving messages from only the Notify number to which the message has been sent, not from all Notify numbers on that instance.

Important: The Advanced opt-out feature is automatically enabled for short code and long code numbers associated with a Messaging Service. For more information, refer Getting Started with Advanced Opt-Out for
**Messaging Services.** As this feature is a duplicate of the Twilio's new Advanced Opt-out feature, you should not activate the feature for numbers that are part of Messaging Service. For long code numbers that are not part of a Messaging service, Twilio handles the opt-out for default stop keywords listed at [Twilio support for opt-out keywords](https://support.twilio.com/docs/sms-stop-words).

**Note:** This feature is disabled by default and holds significance for short-code and long codes that are not part of Messaging Service. To enable this feature, the Notify admin needs to create a configuration for short and long codes using the given procedure.

1. Navigate to **Notify > Administration > SMS Preference Configuration.**
2. Click **New** in the SMS Preference Configuration window.
3. Fill in the form fields.

**SMS configuration preference fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provider</td>
<td>Select the provider for which you are configuring the SMS preferences.</td>
</tr>
<tr>
<td>Name</td>
<td>A user-friendly name for the configuration.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which the preference configurations apply. If you have multiple configurations, this field indicates which configuration to consider first.</td>
</tr>
<tr>
<td>Default preference</td>
<td>The default preference for the configuration. The two options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Opt-in:</strong> Users by default will receive SMS messages.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Opt-out:</strong> Users by default will not receive SMS messages. They can start receiving SMS messages from a specific Notify number after sending a message with an opt-in keyword like START or BEGIN.</td>
</tr>
<tr>
<td>Enable for long code</td>
<td>Option that enables the opt-out feature for long code or toll-free numbers.</td>
</tr>
<tr>
<td>Enable for short code</td>
<td>Enables the opt-out feature for short codes only.</td>
</tr>
<tr>
<td>Opt-out keywords</td>
<td>Keyword replies that prevent a customer from receiving new messages from the phone number they're responding to. You can configure standard keywords such as STOP, STOPALL, END, CANCEL, QUIT, and UNSUBSCRIBE.</td>
</tr>
<tr>
<td>Opt-out confirmation message</td>
<td>Customized confirmation message to send to customers when they opt out of receiving SMS messages.</td>
</tr>
<tr>
<td>Opt-in keywords</td>
<td>Customized confirmation responses that enable customers to receive the messages coming from a phone number. You can configure standard keywords such as START, UNSTOP, and YES.</td>
</tr>
<tr>
<td>Opt-in confirmation message</td>
<td>A customized confirmation message to send to customers when they opt in to receiving SMS messages.</td>
</tr>
</tbody>
</table>
4. Click Submit.

Notify workflow activities

Notify workflow activities manage calls and SMS messages in Notify.

All Notify workflows that manage a phone call must run on the notify_call table. Call-related Notify activities can be added only to workflows where the Table field value is Notify Call [notify_call].

You can identify if an outbound call was answered by a human or by an answering machine from within a Notify workflow by evaluating the current.is_human variable, such as with an If workflow activity. This variable is set by the telephony provider when an outbound call is answered. This variable is always true for inbound calls.

Note: Do not add a Timer activity between multiple Notify activities that interact with active phone calls.

Important: When creating a Notify workflow, set the workflow If condition matches field to -- None --. Notify controls which workflow to run based on the configured number groups.

Join conference call workflow activity

The Join Conference Call activity connects an incoming or outgoing call to a Notify conference call.

Notify includes the workflows Notify: (Re)join Conference Call and Notify: Join Conference Call Via SMS to demonstrate how to use the join conference call activity to connect inbound and outbound calls, and inbound SMS messages to a conference call.

Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Select this check box to record the conference call.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to display advanced configuration options.</td>
</tr>
<tr>
<td>Script</td>
<td>Specify advanced configuration options using JavaScript, such as if the new participant should be muted upon joining the conference call. You can access values from the workflow scratchpad.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity. The join conference call activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the conference_call scratchpad variable is not set.
Scratchpad entries

The activity uses the workflow scratchpad to read persistent values.

### Values read from scratchpad

<table>
<thead>
<tr>
<th>Scratchpad variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.conference_call</td>
<td>A GlideRecord for a single conference call record. A call processed by this activity is added to this conference call. If this value is not specified, the $join conference call$ activity will log an error.</td>
</tr>
<tr>
<td></td>
<td>When initiating an outgoing call workflow using the Notify API call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall) method, this scratchpad value is set automatically to the conference call GlideRecord. For incoming call workflows, or workflows initiated using a different mechanism, you must explicitly set this scratchpad value.</td>
</tr>
</tbody>
</table>

Enable different attributes available with Join Conference Call activity

System administrators can enable any or all of the below attributes and use them in the Join Conference Call workflow activity.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hangupOnStar</td>
<td>When hangupOnStar is enabled (set to true), participants in a conference call can press the * button to disconnect from the call. Control is returned to the workflow, which can be used to trigger customer-defined actions.</td>
</tr>
<tr>
<td>muted</td>
<td>When muted is enabled (set to true), the participant will join the conference in a muted state.</td>
</tr>
<tr>
<td>beepOnEnter</td>
<td>When beepOnEnter is enabled (set to true), a notification beep is played when a user joins the conference.</td>
</tr>
<tr>
<td>beepOnExit</td>
<td>When beepOnExit is enabled (set to true), a notification beep is played when a user leaves the conference.</td>
</tr>
<tr>
<td>enableImmediateInput</td>
<td>When enableImmediateInput is enabled (set to true), it allows input of a single digit immediately after the conference ends for this user and sets that in workflow.scratchpad.confDigits. This option will be ignored if hangupOnStar is false.</td>
</tr>
</tbody>
</table>

To enable any of the above attributes, perform the following steps

1. Navigate to Workflow > Administration > Workflow Versions.
2. Open the Notify: (Re)join Conference Call workflow.
3. Click the Show Workflow related link.
4. To modify the workflow, click the WorkFlow Actions icon and click **Checkout**.
5. Open the Join Conference Call workflow activity.
6. Enable the **Advanced** check box to display the **Script** field.
7. Set the **hangupOnStar** attribute to true in the **config** variable in the script. The default setting is false.
8. Click **Update**.
9. Click the WorkFlow Actions icon and click **Publish** to save the changes.

Similarly, you can enable the other attributes.

**Call workflow activity**
The **Call** activity makes outbound phone calls using a Notify workflow. This workflow activity can be added to any table.

**Input variables**
Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify Number</td>
<td>The Notify phone number to make the call from. When you initiate a call, the outgoing call workflow for the number group associated with this number runs.</td>
</tr>
<tr>
<td>Phone number to call</td>
<td>The E.164-compliant phone number to call.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine number to call, and the Notify number to call from instead of using the <strong>Phone number to call</strong> and <strong>Notify Number</strong> variables.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which number to call. This script should return a string listing the Notify number <strong>sys_id</strong>, as well as the phone number to call, such as <code>{notify_number: 'sys_id', phone_number: '+316...'}</code></td>
</tr>
</tbody>
</table>

**Conditions**
The conditions determine which transition comes after this activity. The **call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the call could not be set up due to invalid data returned by the advanced script.

**Send SMS workflow activity**
The **send SMS** workflow activity to send short text messages using Notify to users' phones. This workflow activity can be added to any table.

**Input variables**
Input variables determine the initial behavior of the activity.
Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>Select the Notify phone number to use to send the SMS message.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use JavaScript to determine which numbers to send the message to, and the Notify number to use to send the message.</td>
</tr>
<tr>
<td>To</td>
<td>Select any number of users to send the message to. The user record must have a E.164-compliant phone number or notification device configured for SMS messages.</td>
</tr>
<tr>
<td>To (groups)</td>
<td>Select any number of groups to send the message to. All members of that group with an E.164-compliant phone number or SMS notification device receive the message.</td>
</tr>
<tr>
<td>Message</td>
<td>Enter the message to send. You can add field values from the current record by using the Select variables box. You can also add values from the workflow scratchpad. If a field and a scratchpad variable have the same name, the field value is used. Because you can use variables in this message, it is not possible to determine the length of the message at design time. If the activity sends a message that is longer than supported by the telephony provider, the message is truncated and the instance logs a warning.</td>
</tr>
<tr>
<td>To (script)</td>
<td>Enter a script to determine which numbers to send the message to, and the Notify number to use to send the message. The script should return a JavaScript object with the format <code>{notify_number: '\...sys_id...', users: [...], groups: [...], numbers: [...]}</code>. Specify the users or groups to send the message to as an array of sys_id values. Specify other numbers as an array of E.164-compliant phone numbers. This field appears only if Advanced is selected.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity. This activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the Notify number used to make the call is not configured correctly or unable to send SMS messages, or if an error occurs while sending the SMS.

Forward call workflow activity

The Forward Call activity forwards a Notify call to an E.164-compliant phone number.
If the person receiving a forwarded call hangs up, the forward call activity completes and transitions to the next activity. Any further Notify activities in the workflow run for the caller only.

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phone number to call</td>
<td>Enter the phone number to forward the call to.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be answered before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the conversation.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The forward call activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the phone number to call is invalid.

**Input workflow activity**

The Input activity creates a phone menu by presenting a list of options on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of digits</td>
<td>Specify the maximum number of digits the caller can enter. A caller can enter fewer digits than the maximum and press the Finish key to complete the entry.</td>
</tr>
<tr>
<td>Finish key</td>
<td>Specify the key a caller can press on their phone when finished selecting a menu option.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Specify the amount of time to wait before closing the menu automatically when the caller does not select a menu option.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to build the phone menu, instead of using the activity conditions.</td>
</tr>
</tbody>
</table>
### Variable

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script</td>
<td>Define the script to build the phone menu. The script must specify an <code>answer</code> variable as a JavaScript object with the following format:</td>
</tr>
</tbody>
</table>

```javascript
answer = {
  "1": {
    "play": "https://some_url.com/options/one.mp3",
    "myCustomData": "some data here"
  },
  "2": {
    "play": "https://some_url.com/options/two.mp3",
    "myCustomData": "some other data here"
  },
  "3": {
    "speak": "type 3 to speak to a representative",
    "language": "en-US",
    "myCustomData": "some more data here"
  }
};
```

The script may specify either a text-to-speech string and language code using the `speak` attribute or URL of the music to be played using the `play` attribute. You can also add optional attributes to store related information, such as `myCustomData` in the example above.

Note: The script object continues to support `say` attribute for backward compatibility.

### Conditions

The conditions determine the transition that comes after this activity.

The **input** activity does not specify any conditions by default. You must define conditions to build the phone menu. Each condition is one option on the phone menu. Notify reads the text from each condition **Name** to the caller, up to 100 characters per condition.

You can specify a language for each condition by prefixing the message with the language code, in the format `xx-XX:<Message>`. For example, add `fr-CA:` for Canadian French. Available languages are stored on the Notify Language [notify_language] table.

The condition that the activity transitions through depends on the digits entered by the caller. Set the condition **Condition** value to `parseInt(workflow.scratchpad.digits) == <expected digits>`. For example, to transition through a condition when the caller presses the number 3, set the **Condition** to `parseInt(workflow.scratchpad.digits) == 3`.

You can add an error condition to this activity. The activity transitions through the error condition if the advanced script returns an invalid value, or if the text to say for a condition is empty.
Scratchpad Entries

The activity uses the workflow scratchpad to write persistent values.

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.digits</td>
<td>The digits entered by the caller, as a string.</td>
</tr>
<tr>
<td>workflow.scratchpad.menu&lt;activity name&gt;</td>
<td>The entire answer variable, if using the advanced script option. You can access this menu from other activities after this activity successfully executes. For example, if the activity name is choices, you can access values from the menu using: var previousActivity = &quot;choices&quot;; var choicesMenu = workflow.scratchpad.menu[previousActivity]; var menuItem = choicesMenu[workflow.scratchpad.digits]; // Selects the menu item based on the caller's input. var selectedValue = menuItem.myCustomData; // get the custom data for the selected menu item.</td>
</tr>
</tbody>
</table>

Hangup workflow activity

The Hangup activity disconnects an active Notify phone call.

You can use the hangup activity to disconnect only calls that have been answered. Use the reject activity to disconnect calls that have not been answered.

Play workflow activity

The Play activity plays a sound file on a Notify call.

Input Variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the URL of a sound file to play. If the URL is inaccessible, or if the audio file mime type is not supported by the telephony provider, the play activity is skipped.</td>
</tr>
<tr>
<td>Loop</td>
<td>Enter the number of times the sound file should play.</td>
</tr>
</tbody>
</table>
Conditions

The conditions determine which transition comes after this activity. The play activity does not specify any conditions by default.

You can create an error condition to handle errors with the sound file. The activity transitions through the error condition if the specified sound file is not available, or has an unsupported mime type. Supported mime types are listed on the Notify Audio MIME Types [notify_mime_type] table.

Record workflow activity

The Record workflow activity records audio from a user on a Notify call.

Note: The Record workflow activity records Notify call but not the Notify conference call. To record the Notify conference call, you can set the Record activity variable on the Join Conference Call workflow activity.

Input Variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max duration (in seconds)</td>
<td>Enter the maximum duration, in seconds, allowed for a recording.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait before ending a recording automatically when the caller is silent.</td>
</tr>
<tr>
<td>Finish Key</td>
<td>Specify the key a caller can press on their phone to end the recording.</td>
</tr>
</tbody>
</table>

Scratchpad Entries

The activity uses the workflow scratchpad to store persistent values.

The record activity adds the recording variable to the workflow scratchpad. This variable stores metadata about the recording, such as URL, ID, and duration. You can access the following values from this variable.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recording.recordingDuration</td>
<td>The duration of the recording, in seconds.</td>
</tr>
<tr>
<td>recording.from_number</td>
<td>The caller's phone number, including country code.</td>
</tr>
<tr>
<td>recording.notify_number</td>
<td>The Notify phone number used to respond to the call, including country code.</td>
</tr>
<tr>
<td>recording.recordingID</td>
<td>The ID used by the telephony provider to identify the recording.</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>recording.recordingURL</td>
<td>The URL from the telephony provider to access the recording.</td>
</tr>
</tbody>
</table>

**Reject workflow**

The **Reject** workflow activity rejects an incoming Notify call. You can use the **reject** activity to disconnect only calls that have not yet been answered. Use the **hang up** activity to disconnect calls that have been answered.

**Input variables**

Input variables determine the initial behavior of the activity.

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reason</td>
<td>Select a reason for rejecting the call, such as <strong>busy</strong>.</td>
</tr>
</tbody>
</table>

**Say workflow activity**

The **say** workflow activity allows you to play a message, using text to speech, on a Notify call.

**Input variables**

Input variables determine the initial behavior of the activity.

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text to say</td>
<td>Specify the text to read.</td>
</tr>
<tr>
<td>Language</td>
<td>Select the language and locale to use when reading text.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to define the language and message, instead of using the <strong>Text to say</strong> and <strong>Language</strong> values.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script to set what text is read on the call. The script must return a string that defines the language and the text to read. For example, to play an English-language message, return <code>{language: 'en-US', text: 'Text to read'}</code>.</td>
</tr>
</tbody>
</table>

**Forward to notify client workflow activity**

The **forward to notify client** workflow activity connects a phone call to a Notify WebRTC client.

**Input variables**

Input variables determine the initial behavior of the activity.
Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Select the user to connect the call to.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine which client to connect to, instead of using the User variable.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which client to connect to. This script should return a GlideRecord for a single User [sys_user] record.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be connected before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the call.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity. The **Forward to Notify Client** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if there is an issue with the Notify client.

Queue workflow activity

The **Queue** activity places an active Notify call in a queue.

Add the **Queue** activity to a workflow on the Notify Call [notify_call] table to put the current call on hold. This activity does not specify any input variables.

The queue that the call is added to is given a random ID.

Notify activity event handlers

Notify workflow activities provide JavaScript functions that are invoked automatically when your telephony provider broadcasts certain events.

When the telephony provider broadcasts an event related to a Notify call, such as the caller hanging up, the event is processed by the workflow associated with that Notify call. All currently-executing Notify activities in that workflow invoke a JavaScript function associated with that event.

Not all activities that support an event provide a default event handler implementation. You can provide an implementation for those event handlers when creating custom Notify activities.

Creating Notify activities

Default Notify workflow generally performs a single action, such as initiating a phone call. You can create custom Notify workflow activities to implement more complex functionality.

Use event handler functions in each Notify activity definition to design your own activity behavior. For example, you can set the activity result if the caller hangs up by using the **onCompleted** function.

```javascript
onCompleted: function() {
    activity.result = 'call_ended';
},
```

When creating a new Notify workflow activity, follow these design principles.
• Within `onExecute` event handler function, create a new NotifyAction object. Use this object to create a simple or complex action, then serialize the object to the `notify_wf_activity` table.

• Within the `onUpdate` event handler function, deserialize the NotifyAction object from the `notify_wf_activity` table and use this object to perform any other operations.

• Use the other event handler functions and the Notify as needed to implement the desired activity behavior.

### Notify languages

Notify supports multiple languages when using text-to-speech.

For example, when using the `input` or `say` workflow activities, you can specify which language to use when reading the text.

The list of available languages is stored on the Notify Languages `[notify_language]` table. By default, languages supported by all Notify telephony providers are available. You can add additional languages if they are supported by your specific telephony provider.

### Available Notify activity event handlers

When creating Notify workflow activities, you can use event-handler functions to respond to events from a telephony provider.

Not all activities or telephony providers support all events. For example, the `Reject` activity ends the call before the caller connects so the `onNoAnswer` function is never invoked from this activity.

**Note:** When configuring an activity to respond to an event, ensure that your telephony provider supports that event.

The following table describes available event handlers and lists the Notify workflow activities that can invoke each handler.

<table>
<thead>
<tr>
<th>Event handlers</th>
<th>Description</th>
<th>Activities</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>onExecute</code></td>
<td>Runs when the activity first runs.</td>
<td>All call-related activities</td>
</tr>
<tr>
<td><code>onUpdate</code></td>
<td>Runs when the call record associated with the workflow is updated.</td>
<td>All call-related activities</td>
</tr>
<tr>
<td><code>onCompleted</code></td>
<td>Runs when a call ends.</td>
<td>All call-related activities</td>
</tr>
<tr>
<td><code>onRinging</code></td>
<td>Runs when a call starts ringing.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
<tr>
<td><code>onInProgress</code></td>
<td>Runs when both parties are connected on a call.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
<tr>
<td><code>onNoAnswer</code></td>
<td>Runs when a call is not answered.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
<tr>
<td><code>onBusy</code></td>
<td>Runs when a called number is busy.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
<tr>
<td><code>onFailed</code></td>
<td>Runs when an error occurs.</td>
<td>All call-related activities</td>
</tr>
</tbody>
</table>

### Components installed with Notify

Several types of components are installed with the Notify application.
Roles installed with Notify

Notify adds the following roles.

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify administrator [notify_admin]</td>
<td>Administrator with privileges for Notify 2 functionality.</td>
<td>• workflow_admin</td>
</tr>
<tr>
<td>Notify viewer [notify_view]</td>
<td>Can view notify content. This role has read-only access to the Notify Conference Calls table [notify_conference_call] and the Notify Conference Call Participants table [notify_participant]. The itil role inherits the notify_view role when the Incident Communications Management and the Notify plugins are activated.</td>
<td>• workflow_creator</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• workflow_publisher</td>
</tr>
</tbody>
</table>

Tables installed with Notify

Notify adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify Conference Calls [notify_conference_call]</td>
<td>A list of conference calls started using Notify</td>
</tr>
<tr>
<td>Notify Calls [notify_call]</td>
<td>A list of calls started using Notify</td>
</tr>
<tr>
<td>Notify Call Queue [notify_queue]</td>
<td>A list of calls that are in queue</td>
</tr>
<tr>
<td>Notify Call Status [notify_call_status]</td>
<td>List of possible statuses of calls, such as; initiated, ringing, etc.</td>
</tr>
<tr>
<td>Notify Client Connected Sessions [notify_client_session]</td>
<td>List of the connected sessions</td>
</tr>
<tr>
<td>Notify Conference Call Participants [notify_participant]</td>
<td>List of the participants in a conference call</td>
</tr>
<tr>
<td>Notify Conference Call Participant Sessions [notify_participant_session]</td>
<td>List of the associations of a call record and Notify participant record</td>
</tr>
<tr>
<td>Notify Messages [notify_message]</td>
<td>List of messages sent from/to Notify</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Notify Phone Numbers</td>
<td>List of phone numbers used by Notify to make calls and send messages</td>
</tr>
<tr>
<td>[notify_number]</td>
<td></td>
</tr>
<tr>
<td>Notify Phone Number Groups</td>
<td>List of phone number groups used by Notify to make calls and send messages</td>
</tr>
<tr>
<td>[notify_group]</td>
<td></td>
</tr>
<tr>
<td>Notify Languages</td>
<td>List of the languages that Notify supports when using text-to-speech workflow activities.</td>
</tr>
<tr>

<tr>
<td>[notify_mime_type]</td>
<td></td>
</tr>
<tr>
<td>Temporary Serialized Notify Action Cache</td>
<td>List of serialized Notify actions waiting to be processed</td>
</tr>
<tr>
<td>[notify_action]</td>
<td></td>
</tr>
<tr>
<td>Notify SMS Template</td>
<td>Contains the templates which are used while sending a Notify SMS.</td>
</tr>
<tr>
<td>[notify_sms_template]</td>
<td></td>
</tr>
</tbody>
</table>
Notify call sequence

Properties installed with Notify

Notify adds the following properties.

Properties for Notify

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn_twilio_driver.max_conference_participants</td>
<td>Twilio maximum limit for number of participants in the conference call.</td>
</tr>
<tr>
<td>com.snc.iam.notify_number</td>
<td>The Notify number to use for conference calls.</td>
</tr>
</tbody>
</table>

Note: This number must have a group configured with conference call workflows.
## Property | Description
--- | ---
| glide.notify.task.phone_number | Notify phone number used for sending SMS-s and starting conference calls from any record that belongs to the task table (or a table that extends the task table). The number must be entered in E.164-compliant format.
| glide.notify.sms.max_concatenation | Notify supports the concept of SMS concatenation. When the SMS body exceeds the maximum length of a single SMS (160 characters for plaintext SMS messages or 70 characters for Unicode SMS messages) Notify can concatenate up to 10 SMS messages which will be joined on the receiver's mobile phone. This property configured the maximum number of SMS messages that will be concatenated into one large SMS message. If the body length is exceeded the body will be truncated and a message will be logged.
| Note: | The charges are per sms, which means that 1600 character SMS will be 10 times as expensive as a 160 character SMS. Also note that not all providers support SMS concatenation.
| glide.enable.notify_on_task | Use this property to enable Notify integration for Task table and its extensions. Entering phone number in ‘glide.notify.task.phone_number’ property is equivalent to setting this to true.
| glide.notify.endpoint | If the instance is accessible on public internet using some other name, which can happen if the instance is within a private network and is accessible via a reverse proxy from outside. In that case the public name needs to be provided here. e.g. https://some_public_domain.com
| glide.notify.sms.save_confirmation_in_db | Check Yes if you want track the confirmation of opt-in/out requests SMS. The confirmations are saved in notify_message table.
| com.snc.iam.enable_notify | Use this property to enable Notify integration for Incident Communications Management. Entering phone number in 'com.snc.iam.notify_number' property is equivalent to setting this to true.
| com.snc.iam.notify_number | The Notify number to use for conference calls. Note that this number needs to have a group configured with conference call workflows.
| com.snc.on_call_rotation.notify_webrtc_number | Specify a valid Notify number with voice capability. This will enable On-Call integration with Notify which allows On-Call users to directly call people on rosters from the browser.
| sn_major_inc_mgmt.notify_webrtc_number | Specify a valid Notify Number with voice capability. This will enable a specific Major Incident Management integration with Notify which allows Workbench users to directly call people from the browser.

### Business rules installed with Notify

Notify adds the following business rules.
<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
</table>
| No Call Workflows for Shortcodes                 | [notify_group]             | Checks and displays an error if the call is being triggered by a short code.
| Update Participant Duration                      | [notify_participant]       | Updates participant duration when it becomes inactive.                      |
| Check if Notify call exists and active           | [notify_participant_session] | Checks if Notify call has valid reference record and updates it if the call is inactive currently.
<p>| Update Last Active On                            | [notify_participant]       | Sets the last active before insertion/update of Notify participant.          |
| Show info msg about selection in choice          | [notify_group_selector_choice] | Displays a message if either Notify group or conference provider is not selected. |
| Validate values in the choice                    | [notify_group_selector_choice] | Checks if either of Notify group or conference provider is filled.          |
| Set scratchpad values                            | [notify_group_selector_choice] | Checks if conference provider is available by iterating through service provider list. |
| Show message for empty choices                   | [notify_group_selector]    | Displays an info message if there are no choices for the provider selector. |
| Clear fields when Manual Selection is set        | [notify_group_selector]    | Clears out some fields when manual selection is set in Notify group selector table. |
| Update Participant Duration                      | [notify_participant_session] | Calculates the duration of participant on conference call.                 |
| Update session muted state                       | [notify_participant]       | Sets the value of mute and expelled to true once the conference call participant becomes inactive. |
| Update conference call                           | [notify_participant]       | Sets the state of conference call based on the participant leaving or joining the call. |
| Validate Order field value                       | [notify_group_selector]    | Validates order field value to be unique amongst all provider selectors.     |
| Restrict Workflows For only Voice Nums           | [notify_number]            | Restricts association of voice only capable number with number group having inbound/outbound SMS workflows. |
| Restrict Workflows For only SMS Numbers          | [notify_number]            | Restricts association of SMS only capable number with number group having inbound/outbound voice workflows. |
| Validations on default record                    | [notify_group_selector]    | Validates that source table and order field are mandatory in case of default set to false and both fields empty in case of default set to true. |</p>
<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clearing fields when Default is true</td>
<td>[notify_group_selector]</td>
<td>Clears out some fields when default is set to true.</td>
</tr>
<tr>
<td>No Default selector set</td>
<td>[notify_group_selector]</td>
<td>Ensures one active provider selector is set as default.</td>
</tr>
<tr>
<td>Check active default selector is unique</td>
<td>[notify_group_selector]</td>
<td>Ensures only one provider selector is set as default.</td>
</tr>
<tr>
<td>Process SMS preferences for incoming SMS</td>
<td>[notify_message]</td>
<td>When an SMS preference configuration defined for a particular telephony provider, then apply it for every incoming SMS.</td>
</tr>
<tr>
<td>Check default notify group is unique</td>
<td>[notify_group]</td>
<td>Validates that not more than one group is set as default Notify group.</td>
</tr>
<tr>
<td>Trigger conference end</td>
<td>[notify_conference_call]</td>
<td>When a conference call ends, triggers the notify.conference.end event.</td>
</tr>
<tr>
<td>Update Call Active State</td>
<td>[notify_call_status]</td>
<td>Updates the status of the call in notify_call_status with the status received from Twilio.</td>
</tr>
<tr>
<td>Update Conference Call Active State</td>
<td>[notify_participant]</td>
<td>Updates the active flag in notify_participant table. Also calculates the duration when the call is ended by a participant.</td>
</tr>
<tr>
<td>Update Participant Active State</td>
<td>[notify_participant_session]</td>
<td>Updates the active flag for the participant (notify_participant), and calculates the total time on the call upon disconnecting from the call.</td>
</tr>
<tr>
<td>Update Participant Session Active State</td>
<td>[notify_call]</td>
<td>Synchronizes the state of the call between notify_call and notify_participant_session. Upon disconnecting from the call, updates notify_participant_session with the duration of the call.</td>
</tr>
<tr>
<td>Warn for incorrectly configured workflow</td>
<td>[notify_group]</td>
<td>Checks notify_group table and displays an error if the a workflow is not configured correctly</td>
</tr>
</tbody>
</table>

**Orchestration**

ServiceNow® Orchestration extends the workflow engine to manage processes and to automate things outside of a ServiceNow instance.

Orchestration is available as a separate subscription from the rest of the Now Platform. See *Activate Orchestration* for details.

**Explore**
- Introduction to Orchestration
- Orchestration applications

**Set up**
- Activate Orchestration
- MID Servers for Orchestration

**Administer**

Introduction to Orchestration

Orchestration automates simple or complex multi-system tasks on remote services, servers, applications, and hardware.

An Orchestration process can cross all management disciplines and interact with hosted services and all types of infrastructure elements. These capabilities provide a powerful system for managing IT and Business processes quickly and reliably.

Orchestrated solutions aide collaboration among teams by providing reusable data and versioning for both the workflows and the activities within them. Subject matter experts can create activities that are reusable to numerous workflow developers. When an activity requires a change, developers can see the downstream implication of the change immediately by knowing which workflows use the activity. Well-designed orchestrations never fail and apply human tasks to address errors as they arise.

Orchestration tools

Orchestration can make calls outside of a ServiceNow instance, directly to web services or through a MID Server to systems within corporate firewall. Orchestration also enables the creation reusable activities that wrapper Java Script functions for manipulating things inside the platform. Orchestration extends the Workflow editor by providing these features:

- **Activity packs** containing ready-to-use activities.
- **Activity Designer**, which enables developers to create custom activities without an over dependence to create scripts to orchestrate to third-party systems.
- Ability to create activity packs using *Scoped Applications*.
- A **Databus** for following the flow of data across orchestration activities.

Orchestration Core provides entitlements to use specific applications:

**Client Software Distribution**

An application that automates software delivery from the Service Catalog. Provides OOB support for SCCM. Partner solutions support Macs using JAMF. Other third-party solutions provide support through the extension framework.

**Password Reset**

An application for users to reset their password in Active Directory. It can expand to communicate with other third-party systems.

**Orchestration ROI**
Enables users to evaluate estimated costs and actual costs for tasks, automate these tasks, and track the ROI of these tasks.

**Systems that Orchestration can automate**

Orchestration can automate tasks such as employee onboarding, user access rights, server management, managed file transfers, and Security Operations Orchestration activities. For example, you might use the Active Directory and Exchange activities provided in the base Orchestration system to set up network accounts and mailboxes for new employees.

If Orchestration does not provide the activities you need for an integration, create the necessary activities using the templates in the *Orchestration Activity Designer*. The external systems that Orchestration can automate for:

- Any system exposing web services (*SOAP*, *REST*)
- Any system accessible from the command line (such as a UNIX system accessible through *SSH*, a Windows system enabled for *PowerShell* remoting or WMI)
- Numerous proprietary services: Windows *Active Directory*, Microsoft *Exchange* mail servers, *InfoBlox*, and *F5 Networks*.

**Note:** For a full list of Activity Pack service offerings, see *Orchestration Core Activity Packs*.

- Any filesystem accessible by *SFTP*
- Any database with a compliant *JDBC* driver
- Additional Activity Packs are also available with other ServiceNow products, such as Security Operations
Orchestration capabilities
**Orchestration workflow**

When an Orchestration activity starts within a workflow, Orchestration launches a *probe* and writes a probe record to the ECC Queue. The workflow pauses as the MID Server picks up the request and executes the probe. When the probe reports back, the workflow resumes as the results are analyzed. The workflow can exit or continue at this point.

**Orchestration video tutorial**

Watch the introductory video for Orchestration.

**Domain separation in Orchestration**

This is an overview of domain separation and Orchestration. With domain separation you can separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Support level: Standard**

The support level is Standard but has some exceptions or special conditions.

- Includes Basic level
- Business logic: Processes can be created or modified per customer by the service provider (SP). The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The owner of the instance needs to be able to configure minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Use case: An admin needs to be able to make comments mandatory when a record closes for one tenant, but not for another.

**Activate Orchestration**

The Orchestration (com.snc.runbook_automation) plugin is available as a separate subscription from the rest of the Now Platform.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.
Role required: none

1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click Request Plugin to open the request form on HI.

3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

5. Click **Submit**.

**List of Orchestration plugins**

This table lists all plugins available for Orchestration and their dependencies.

These Orchestration plugins are available for purchase or can be requested as part of your Orchestration subscription. Contact your account representative for details.

<table>
<thead>
<tr>
<th>Name</th>

<td>Orchestration - System Center Configuration Manager</td>
<td>Installs the <strong>System Center Configuration Manager (SCCM)</strong> activity pack. These activities manage software deployments and collections on an SCCM server.</td>
<td>Orchestration</td>
</tr>
</tbody>
</table>

**Orchestration Runtime plugin**

The Orchestration – Runtime plugin enables other applications on the ServiceNow® platform to automate tasks, without requiring an Orchestration subscription.

The Orchestration – Runtime plugin can be activated as part of another plugin or application. It is used by strategic technology partners and ServiceNow applications to distribute activity packs to customers who may not own Orchestration. For example, the Security Incident Response Management (SIRM) application provides orchestration content, which includes activities that are available from the **Packs** tab in the Workflow Editor. Customers who purchase SIRM can consume and modify the activities that SIRM ships without having to purchase an Orchestration license.

**Included with the plugin**

The Orchestration – Runtime plugin provides access to the **Packs** and **Data** tabs in the Workflow Editor. This plugin gives users access to custom activities for their applications and enables them to reuse data from the **Databus**. This plugin does not provide access to custom Orchestration **activity packs** or to the **activity designer**. The **Custom** tab in the Workflow Editor is not available without an Orchestration subscription.
Orchestration plugin relationships

Dependencies

The Orchestration – Runtime plugin activates these application plugins:

- Security Incident Response Orchestration
- Service Release Automation

Access to activities

Custom activities shipped with ServiceNow® applications are available in the Packs tab of the Workflow Editor for use in workflows. To edit these activities, navigate to Orchestration > Activity Designer Activities and select the activity you want to modify. For information about the provider templates used to create these activities, see Orchestration custom activity templates.
List of Orchestration activities

Use Orchestration activities in a Workflow to integrate with third-party systems.

Several Orchestration activities have been rewritten as *scoped* activities using the *activity designer* and grouped into *activity packs*. Other non-scoped activities are deprecated and may or may not appear in the Workflow Editor. However, all deprecated activities still function in existing workflows that use them.

Global activities

These activities run in the global scope only. Any activities you create in the global scope are organized in the Global category in the Packs and Custom tabs in the Workflow Editor.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test Server Alive</td>
<td>Runs a command (including shell scripts) on a Linux or UNIX computer via SSH to validate whether the target system is alive.</td>
</tr>
</tbody>
</table>

Active Directory (AD) activities

All AD Orchestration activities were rewritten in the Geneva release as scoped activities and are available in the Active Directory activity pack. All previous version AD activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>
<thead>
<tr>
<th>Activity</th>

### PowerShell activities

These PowerShell activities were rewritten as scoped activities and are available in the PowerShell activity pack. All previous version PowerShell activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Install Windows App</td>
<td>Installs an application on a Windows target machine.</td>
</tr>
<tr>
<td>Join Domain</td>
<td>Joins a Windows machine to a domain.</td>
</tr>
<tr>
<td>Uninstall Windows App</td>
<td>Uninstalls an application from a Windows target machine.</td>
</tr>
<tr>
<td>Change Service State</td>
<td>Starts or stops a Windows service on a remote system.</td>
</tr>
</tbody>
</table>

### Probe activities

These probe activities were rewritten as scoped activities and are available in the Probe activity pack. All previous versions of these activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resolve DNS Name</td>
<td>Resolves an IP address or a fully qualified domain name (FQDN) into one or more IP addresses.</td>
</tr>
<tr>
<td>SNMP Query</td>
<td>Queries an SNMP device.</td>
</tr>
</tbody>
</table>

### SCCM activities

All these activities are scoped and part of the SCCM activity pack. They do not have legacy versions.
<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add to Device Collection</td>
<td>Adds a device to a Microsoft System Center Configuration Manager (SCCM) device collection.</td>
</tr>
<tr>
<td>Add to User Collection</td>
<td>Adds a user to a Microsoft System Center Configuration Manager (SCCM) user collection.</td>
</tr>
<tr>
<td>Get Applications</td>
<td>Returns a list of all the applications available on a Microsoft System Center Configuration Manager (SCCM) server.</td>
</tr>
<tr>
<td>Get Deployments</td>
<td>Returns the list of deployments performed by Orchestration using a Microsoft System Center Configuration Manager (SCCM) server.</td>
</tr>
<tr>
<td>Get Device Collections</td>
<td>Returns the list of available device collections on a Microsoft System Center Configuration Manager (SCCM) host.</td>
</tr>
<tr>
<td>Get User Collections</td>
<td>Returns the list of available user collections on a Microsoft System Center Configuration Manager (SCCM) host.</td>
</tr>
<tr>
<td>Remove from Device Collection</td>
<td>Removes a device from a Microsoft System Center Configuration Manager (SCCM) device collection.</td>
</tr>
<tr>
<td>Remove from User Collection</td>
<td>Removes a user from a Microsoft System Center Configuration Manager (SCCM) user collection.</td>
</tr>
</tbody>
</table>

**SSH activities**

These SSH activities were rewritten as scoped activities and are available in the SSH activity pack. The SSH activities not converted to scoped activities were moved to the Orchestration - Deprecated category, but are still available for all workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Copy</td>
<td>Copies a file on a Linux or Unix computer, via SSH.</td>
</tr>
<tr>
<td>File Read</td>
<td>Reads a file on a Linux or Unix computer, via SSH.</td>
</tr>
<tr>
<td>File Write</td>
<td>Writes a file on a Linux or UNIX computer.</td>
</tr>
<tr>
<td>File Replace String</td>
<td>Finds and replaces a string in a file on a Linux or UNIX computer.</td>
</tr>
<tr>
<td>Files Compare</td>
<td>Compares two files on a Linux or Unix computer, via SSH.</td>
</tr>
<tr>
<td>Reset Linux User Password</td>
<td>Resets the password for a given user on a Linux computer.</td>
</tr>
<tr>
<td>Activity</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Secure Copy</td>
<td>Copies a file from one host to another, without storing the copied file on the MID Server.</td>
</tr>
</tbody>
</table>

### SFTP activities

All these activities are scoped and part of the SFTP File Transfer activity pack. They do not have legacy versions.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copy File</td>
<td>Copies a file from an SFTP server (source host) to another SFTP server (target host).</td>
</tr>
<tr>
<td>Create Directory</td>
<td>Creates a directory on an SFTP server.</td>
</tr>
<tr>
<td>Get File List</td>
<td>Returns a list of files from a given directory and its subdirectories on an SFTP server (source host).</td>
</tr>
<tr>
<td>Remove File or Directory</td>
<td>Removes a file or a directory on an SFTP server, including subdirectories, when configured.</td>
</tr>
<tr>
<td>Rename File or Directory</td>
<td>Renames a file or directory to a new name on an SFTP server.</td>
</tr>
<tr>
<td>Set File Attributes</td>
<td>Sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.</td>
</tr>
</tbody>
</table>

### Deprecated activities

These activities have been removed from the Workflow Editor and are not available for new workflows, but continue to work normally in existing workflows. You can reactivate the deprecated activity or duplicate the functionality of a deprecated activity as a scoped activity by recreating it using the activity designer.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run Probe</td>
<td>Launches a MID Server probe on behalf of a document.</td>
</tr>
<tr>
<td>SOAP Request</td>
<td>Executes a SOAP request on a target server. The SOAP Message activity replaces this activity.</td>
</tr>
<tr>
<td>Run Command</td>
<td>Runs a command (including shell scripts) on a Linux or UNIX computer.</td>
</tr>
<tr>
<td>Run SCP</td>
<td>Uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides. The Secure Copy activity replaces the Run SCP activity.</td>
</tr>
<tr>
<td>Run Powershell</td>
<td>Executes Windows PowerShell commands on a MID Server.</td>
</tr>
</tbody>
</table>

### Available activity packs

Activity packs are available with your subscription to Orchestration.

Role required: admin

The following activity packs are available and active with your Orchestration subscription:

- *Orchestration - Active Directory* (com.snc.orchestration.ad)
1. Navigate to **System Applications > All Available Applications > All.**
2. On the All Applications page, click **Request Plugin** to open the request form on HI.

3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

| Reason/Comments | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments. |

5. Click Submit.

**Deprecated Orchestration activities**

These Orchestration activities have been deprecated.

**Run Probe**

The Run Probe activity launches a MID Server probe on behalf of a document. All Orchestration activities that launch a probe on a target machine are based on the Run Probe activity. Your ServiceNow instance must have access to a MID Server configured to use SSH to run this activity.

**Attention:** This activity is deprecated and is unavailable for new workflows. To replace the functionality of this probe, use the **Probe activity template** to create a custom activity. Workflows from a previous release that use the Run Probe activity can continue to do so.
Run Probe input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Probe</td>
<td>Select a MID Server probe from the list. This is the name of the probe as it appears in the discovery_probes table.</td>
</tr>
<tr>
<td>Source for probe</td>
<td>Enter the IP address of the host system against which the probe runs (the probe's target).</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called output. Any error from the probe is contained in a variable called error.</td>
</tr>
</tbody>
</table>

SOAP Request

The SOAP Request activity executes a SOAP request on a target server.

**Attention:** This activity is deprecated and is replaced by the SOAP Message workflow activity. Workflows from a previous release that use the SOAP Request activity can continue to do so. However, this activity is not available for new workflows.

 SOAP Request input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP URL</td>
<td>The SOAP endpoint.</td>
</tr>
<tr>
<td>Username</td>
<td>User name for basic authentication credentials.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for basic authentication credentials.</td>
</tr>
<tr>
<td>Envelope Script</td>
<td>Script for setting up parameters for the web service.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>The script to execute after the request has been made and a response has been received.</td>
</tr>
</tbody>
</table>

Reactivate a deprecated activity

Orchestration activities that were converted to activity packs are deprecated for upgraded and new instances but can be reactivated for use in new workflows.

Role required: workflow_admin, admin

**Note:** Reactivation of deprecated activities for use in new workflows is discouraged. Legacy activities cannot use the unique features of the scoped applications, such as reuse of data from the databus and input variable testing.

1. Navigate to Workflow > Administration > Activity Definitions.
2. In the list of activities, clear the condition Category !=deprecated from the filter.
3. Open the definition record for the activity you want to reactivate.
4. Select the What to Display tab.
5. In the Category field, replace the value deprecated with another category. This can be an arbitrary string.
6. Click Update.

The system creates a new category using the value provided and reactivates the activity, which becomes available in the Core tab of the Workflow Editor.

SOAP Message workflow activity

The SOAP Message activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.

Your instance must have access to a MID Server configured to use SOAP.

Input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP Message</td>
<td>soap_message</td>
<td>The SOAP Message defined under the System Web Services plugin's Outbound SOAP Message [sysSoapMessage] table. (System Web Services &gt; Outbound &gt; SOAP Message)</td>
</tr>
<tr>
<td>SOAP Message Function</td>
<td>soap_message_function</td>
<td>The function to call that is defined in the SOAP Message. Functions are listed in the SOAP Message Functions related list in each SOAP Message record.</td>
</tr>
<tr>
<td>SOAP Endpoint</td>
<td>soap_endpoint</td>
<td>Endpoint to use instead of the SOAP endpoint value in the SOAP Message Function record. Leave this field blank to use the defined endpoint in the SOAP Message Function record.</td>
</tr>
<tr>
<td>Field</td>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Variables | variables     | Variables to substitute into the SOAP Envelope defined in the SOAP Message Function record. Use this format for the string: 

\[
\text{name1=value1, name2=value2, ...}
\]

If either the name or value contains a comma or equal sign, escape these characters with a backslash. |
| Use MID Server | use_midserver | Check box for using a MID Server to send the SOAP message. A MID Server might be necessary to reach an endpoint within a firewall or a sub-network that is not visible from the instance. If this check box is selected (true), but no MID Server is defined in the MID Server field, workflow automatically attempts to find a MID Server. |
| MID Server   | midserver     | Name of the MID Server to use. This field appears when you select the Use MID Server check box. The workflow ignores this parameter if the use_midserver parameter is disabled. |
| Sensor Script | sensor_script | The script to execute after the request has been made and a response has been received. You can access the full XML response body from the activity.output object. |

**Probes used by Orchestration**

Certain probes, controlled by MID Servers, perform Orchestration tasks on remote computers, such as restarting a server or creating virtual machines from templates.

**How Orchestration probes work**

When a Workflow executes an Orchestration activity, that activity launches a probe, which writes an output record to the ECC Queue. The MID Server selected for the activity checks the ECC Queue for assignments, and then executes
the appropriate probe to do the work on the target machine. The information about the activity (machine restarted, files copied, etc.) that is returned from the target machine by the probe is written to the ECC Queue as an input record. This information is then sent from the ECC Queue to a sensor that is built into the Workflow activity. The Workflow is updated, and the next activity is executed.

**Note:** The probe parameters are set by the activities that launch the probe.

![Diagram of Orchestration process]

### How Orchestration uses probes

### Probe List

The base system includes the following Orchestration probes (*Orchestration > Definition > Probes*).

#### Probe List

<table>
<thead>
<tr>
<th>Probe Name</th>
<th>ECC Queue Topic</th>
<th>ECC Queue Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>Command</td>
<td></td>
<td>A probe that runs a local command on the MID server.</td>
</tr>
<tr>
<td>DNS Name Resolver</td>
<td>DNSNameResolver</td>
<td></td>
<td>A probe that resolves a fully qualified domain name (FQDN) into an IP address. The probe executes MID Server queries in parallel. It utilizes DNS lookup by the MID Server host OS to make use of the OS maintained DNS cache. It also leverages the hosts file on the OS.</td>
</tr>
<tr>
<td>SCPCommand</td>
<td>SCPCommand</td>
<td></td>
<td>A probe that copies files securely from one machine to another. The copy function is performed using the MID Server as a tunnel.</td>
</tr>
<tr>
<td>Probe Name</td>
<td>ECC Queue Topic</td>
<td>ECC Queue Name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------</td>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Shazzam</td>
<td>Shazzam</td>
<td></td>
<td>A probe that identifies active devices.</td>
</tr>
<tr>
<td>SNMPProbe</td>
<td>SNMP</td>
<td>SNMP Query</td>
<td>This is a generic SNMP probe.</td>
</tr>
<tr>
<td>SOAPProbe</td>
<td>SOAPProbe</td>
<td></td>
<td>A probe that sends a SOAP request to target machine.</td>
</tr>
<tr>
<td>SSHCommand</td>
<td>SSHCommand</td>
<td></td>
<td>A probe that executes shell scripts from a command line after logging in to a target machine via SSH.</td>
</tr>
<tr>
<td>SSHCommandLong</td>
<td>SSHCommandLong</td>
<td></td>
<td>A probe that executes long running shell scripts from a command line after logging in to a target machine via SSH.</td>
</tr>
<tr>
<td>VMWare</td>
<td>VMWareProbe</td>
<td></td>
<td>A generic VMware probe that executes the MID Server script include in the ECC queue name that is set by a VMware Orchestration activity. This probe can run any MID Server script include.</td>
</tr>
</tbody>
</table>
| Windows - PowerShell       | PowerShell      | Windows - PowerShell | A probe that runs a Windows PowerShell script on the MID Server. The PowerShell script is provided as the value of a parameter with name ending in .ps1. Two variables are available to the script:  
  * $computer: The computer pointed to as the source for this probe  
  * $cred: A PowerShell credential, using a user name and password from the Credentials table, that logs into $computer successfully. |

**PowerShell activities**

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

PowerShell must be installed on any MID Server that uses these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 3.0 to 5.1.
The ServiceNow *Orchestration* plugin adds these basic PowerShell activities to workflows. For instructions on using activities from the PowerShell activity pack, see *PowerShell activity pack*.

**Legacy Run PowerShell activity**
The Run PowerShell activity executes Windows PowerShell commands on a MID Server.

**Attention**: This activity is deprecated and is unavailable for new workflows. To replace the functionality of this activity, use the *Powershell activity template* to create a custom, scoped activity. Workflows from a previous release that use the Run PowerShell activity can continue to do so.

**Result Values**
The workflow designer can assign a result value using `activity.result` from within a script field of the activity. By default, the success or failure of the PowerShell commands used determines the result value of the Run PowerShell activity. Possible result values are:

- Success
- Failure

**Scratchpad Entries**
Information written to `stdout` by the executing script is captured and returned to the activity in the `activity.output` variable. This information can be parsed, processed, or saved (to a scratchpad variable, for example) for future processing in the activity’s sensor script.

An example would be to run the `get-date` command to get the MID Server’s current time. This sensor script saves the full output received, but we can process it to return and save only the time.

```
// Save full output for a later processing in scratchpad variable 'currentdatetime'
workflow_scratchpad['currentdatetime'] = activity.output

// Process the output and fetch the time and store it in a scratchpad variable 'time'
var time = $('\d{4}/\d{2}/\d{2} [A|P]M\s|\d{2}:\d{2}:\d{2}$', activity.output);
workflow_scratchpad['time'] = time[0].match(/\d{4}/)[0];
```

**PowerShell activity**
Note: This is an over-simplified example. In most cases, the script operates against some remote Windows computer. However, the principal is the same – whatever is written to stdout is returned in activity.output and available to process.

Input Variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>IP address of the target Windows machine. This value is mapped to the $computer variable for use in commands (see the example in the Command field). A PowerShell credential variable called $cred that is based on information in the ServiceNow Credentials table will authenticate on the computer pointed to by Hostname.</td>
</tr>
<tr>
<td>Command</td>
<td>Enter the PowerShell command to run. For example, to execute a simple WMI query against a remote machine pointed to by the hostname variable, the command is: get-wmiobject &lt;class&gt; -computer $computer -credential $cred. If no credentials authenticate on the computer, the command runs in the context of the MID Server user. You cannot run both a command and a script file. Specifying a command hides the Script file variable.</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called output. Any error from the probe is contained in a variable called error.</td>
</tr>
<tr>
<td>Script file</td>
<td>The MID Server script file to run. You cannot run both a script file and a command. Selecting a script file hides the Command variable.</td>
</tr>
<tr>
<td>PowerShell script variables</td>
<td>Additional parameters, in JSON format, used by the specified script file.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>State</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was cancelled.</td>
</tr>
</tbody>
</table>

Add workflow variables for the command line using the normal workflow variable syntax. In the example above, if the `<class>` was in a workflow input variable called `myclass`, the command would look like:

```
get-wmiobject $(workflow. inputs. myclass ) -computer $computer -credential $cred
```

Similarly if the variable is a scratchpad variable named `myclass`, the command would look like:

```
get -wmiobject $(workflow. scratchpad. myclass ) -computer $computer -credential $cred
```

**HResult codes**

When a PowerShell script encounters an error, the Windows machine may return an HResult code as part of the error message.

PowerShell activities can read and interpret this code. Not all PowerShell errors include an HResult code. In the event of a failed PowerShell script, you can use the HResult code to move the workflow through a specific condition.

For example, when resetting an Active Directory password to a password that does not meet policy requirements, such as minimum length or complexity, the PowerShell script returns the HResult code `-2146022651`. To use this code, create an activity condition with the **Condition** value of `activity.hresult = -2146022651`. If the PowerShell script returns this code when the activity runs, the workflow transitions through this new condition.

**SSH activities**

SSH activities allow workflows to perform operations on Linux and Unix computers.

Your ServiceNow instance must have access to a MID Server configured to use SSH to run these Orchestration activities.

**Run Command activity**

The **Run Command** activity runs a command (including shell scripts) on a Linux or UNIX computer.

**Attention:** The Run Command activity is deprecated in this release. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading to Helsinki. However, to use this functionality in a new workflow, you must create a custom activity using the *SSH activity template* in the ServiceNow® activity designer.

**Input variables**

**Run command input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Long running</td>
<td>Select this check box to disable the SSH connection timeout if you think the command will take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of destination server for SSH activity.</td>
</tr>
<tr>
<td>Directory</td>
<td>Name of the working directory.</td>
</tr>
<tr>
<td>Command</td>
<td>The command to run from this activity.</td>
</tr>
<tr>
<td>Sudo</td>
<td>Select this check box to use <code>sudo</code> to run the command on the host machine.</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called <code>output</code>. Any error from the probe is contained in a variable called <code>error</code>.</td>
</tr>
</tbody>
</table>

**Run SCP activity**

The Run SCP activity uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides.

**Note:** This activity is deprecated in the Geneva release and is not available for use in new workflows. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading. The custom Secure Copy activity replaces the Run SCP activity in the Geneva release.

**Input variables**

**Run SCP input variables**

<table>
<thead>
<tr>
<th>Field</th>

</table>

**Orchestration applications**

Orchestration provides several applications with your subscription.

**Orchestration ROI**

The Orchestration ROI application allows you to estimate and compute cost savings for tasks in your system that could be automated with Orchestration.
After you automate the tasks, you can track cost savings by associating Orchestration workflows with corresponding task areas. Configuration in the application allows you to select the hourly rate for performing the task manually, the rules the system uses to select tasks for evaluation, and the time period of the evaluation. Orchestration ROI estimates your savings by multiplying the cost of performing repetitive tasks manually by the estimated number of times the system performs those tasks automatically during a specific date/time range. The system also calculates the actual savings of your automations. Orchestration ROI is included with the base Orchestration subscription.

Orchestration ROI reports offer a number of views of the comparative data and allow you to access the associated records directly from the reports. The *standard reports* included with the Orchestration - ROI plugin provide summaries, estimated costs, and calculated costs for automated processes. The *ROI premium dashboard* uses Performance Analytics to provide detailed reports on calculated savings over time. Performance Analytics requires a different plugin and subscription.

**Note:** When Orchestration ROI is activated as a dependent plugin of Orchestration, demo data is not installed. If you want to use demo data as a template for your own ROI evaluation, submit a request to ServiceNow® technical support for an Orchestration ROI plugin upgrade with demo data selected.

To set up Orchestration ROI, complete the configuration tasks in the order shown here.

### Create Orchestration ROI labor rate cards

Before calculating your Orchestration ROI, you must create labor rate cards for the manual work that would be required to complete the tasks correlated to the ROI calculations.

Role required: orchestration_manager

The hourly rates defined in the rate cards are used to determine the savings from your orchestrated tasks.

1. Navigate to **Orchestration > ROI > Labor Rate Cards**.
2. Complete the fields in the form using the descriptions in *Manage a labor rate card*.
3. Click **Submit**.
4. Create additional rate cards as needed.

### Create an Orchestration ROI automation entry record

The ROI automation entry record couples the cost of performing a task with the specific workflow that automates the task, for the purpose of calculating the resulting savings.

Role required: orchestration_manager

Before starting this procedure, verify that the appropriate *labor rate cards* were created.

Use this record to apply a manual hourly rate to a task that is performed automatically by your instance. To determine the savings realized from orchestrating a task, the system can evaluate whether those savings were estimated or calculated.

- **Estimated savings**: Uses the labor rate, the time estimates for completion of the task, and the number of automations that have been run to determine savings.
- **Calculated savings**: Uses the labor rate, the time calculated for completion of the task, based on the configured evaluation period, and the number of automations that have been run to determine savings.

1. Navigate to **Orchestration > ROI > Automation Entry Form**.
2. Fill in the fields on the form, as appropriate.
## Automation Entry Form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Category of the selected workflow automation. The following categories are provided in the base Orchestration - ROI system:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Access &amp; Identity Management</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>Datacenter Automation</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>IT Service Management</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>Other</strong></td>
</tr>
<tr>
<td>Item</td>
<td>Unique name for the specific task within the category. This value represents the work to which the labor rate card applies, such as <strong>Password Reset</strong>.</td>
</tr>
<tr>
<td>Resource</td>
<td>Labor rate card to apply to this automation entry. You must have IT Cost Management active on the instance for this field to appear.</td>
</tr>
<tr>
<td>Associated Workflows</td>
<td>Workflow automations created to automate this manual task. The system uses this field to identify the number of automations that have been run.</td>
</tr>
<tr>
<td>Estimated Duration (min) per Task</td>
<td>Estimated time to perform this task manually.</td>
</tr>
<tr>
<td>Estimated Volume per Month</td>
<td>Estimated number of times needed to perform this task manually per month.</td>
</tr>
<tr>
<td>Read-only fields</td>
<td></td>
</tr>
<tr>
<td>Start time</td>
<td>Start time for the evaluation period. Configure this value in the Time Range for Calculated Averages module.</td>
</tr>
<tr>
<td>End time</td>
<td>End time of the evaluation period. Configure this value in the Time Range for Calculated Averages module.</td>
</tr>
<tr>
<td>Calculated average duration per task (min)</td>
<td>Actual time required to perform this task manually.</td>
</tr>
<tr>
<td>Calculated average volume per month</td>
<td>Actual average number of times this task is performed manually per month.</td>
</tr>
</tbody>
</table>

### 3. Select one of these submission options:

- **Submit**: Saves the record to the table without running any calculations.
- **Submit and process now**: Saves the record and calculates the savings based on the hourly rate and the number of workflow contexts for this automation entry.

### Create an Orchestration ROI correlated task rule

The correlated task rule applies configurable conditions to fields in a selected table that tell the instance which manual tasks correspond to an automation entry record.
Role required: orchestration_manager

Before starting this procedure, make sure you have created labor rate cards and the appropriate automation entry records for the automated tasks you want to evaluate.

Create conditions that the system can use to correlate manual tasks to the automation entry. For example, a rule on the Incident [incident] table uses these conditions to correlate the employee on-boarding task to values configured in the Employee OnBoarding automation entry record:

- [Subcategory] [is] [Employee OnBoarding]
- [Sort description] [contains] [new employee]

When a new employee opens an incident to request services or assets which are typically handled manually, Orchestration applies the usual labor rate for the manual work to the potential automated solution, and then computes the actual savings.

1. Navigate to Orchestration > ROI Task Correlation > Correlated Tasks Rules.
2. Click New.
3. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automation entry</td>
<td>Automation entry record that correlates to the manual task defined by these conditions. The entry record names the workflow used to automate the task and defines the labor rate used to calculate the cost of the task.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to filter, using these conditions. The rule selects records from this table that match the conditions. Information from these records is used to calculate the actual time to perform a manual task and the actual volume for that manual task.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder to use to filter records for this table. Use these conditions to identify all manual tasks correlated to this automation entry.</td>
</tr>
<tr>
<td>Read-only fields</td>
<td></td>
</tr>
<tr>
<td>Processed on</td>
<td>Date and time that the system performs the matching records lookup. The system automatically searches for new manual tasks matching these conditions.</td>
</tr>
</tbody>
</table>

4. Select one of these submission options:
   - Submit: Saves the record to the table without running any calculations.
   - Submit and process now: Saves the record, looks up all matching tasks, and saves matching record information to the Correlated Tasks [manual_mapping_records] table.

5. To view a rule, select the link in the Table column of the Correlated Tasks Rules related list for the automation entry you want to see.

6. To view the list of tasks that match all correlated rules in the system, navigate to Orchestration > ROI Task Correlation > Correlated Tasks.

7. To view the list of tasks that match this rule in the system, click Correlated Tasks under Related Links in this form

**Configure the time range for Orchestration ROI calculations**

Select a date range to calculate the average number of tasks and the duration per month for the correlated tasks.
Role required: orchestration_manager

By default, the system creates a range ending at the current date and time and extending back over the previous month. You can change this range at any time and recalculate the ROI instantly.

1. Navigate to Orchestration > ROI Task Correlation > Time Range for Calculated Averages.
2. Enter a new start or end date and time or click the icon to select a date using the calendar.
3. Click Calculate to recalculate the ROI based on the new time range and to save your settings.

Installed with Orchestration ROI

Several types of components are installed with the Orchestration - ROI plugin (com.snc.runbook_automation.roi). 

*Tables installed with Orchestration ROI*

Tables are added with activation of Orchestration ROI.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expense and Savings [run_rate_predicted_savings]</td>
<td>Contains the data for the reports in Orchestration &gt; ROI Reports &gt; Predicted Savings.</td>
</tr>
<tr>
<td>Savings Report [savings_report]</td>
<td>Contains the number of automations that have been run before the date specified in the Processed On column, based on:</td>
</tr>
<tr>
<td></td>
<td>• Each automation entry’s associated workflows</td>
</tr>
<tr>
<td></td>
<td>• Estimated savings based on the estimated duration per task.</td>
</tr>
<tr>
<td></td>
<td>• Calculated savings based on calculated duration.</td>
</tr>
<tr>
<td>Detailed Savings Report [detailed_savings_report]</td>
<td>Contains a detailed list for the Savings Report [savings_report] table. This list contains each automation’s run date and savings for that automation.</td>
</tr>
<tr>
<td>Automation Entries [automation_entry_form]</td>
<td>Contains automation entries that couple labor resources to specific manual tasks. You can specify the estimated duration to perform a task manually and the estimated number of times that a task is performed per month. If this automation entry already has workflow automations implemented, you can specify the associated workflows. The system calculates the savings, based on the labor rate card and the number of workflow automations that have been performed.</td>
</tr>
<tr>
<td>Roadmap Planning [roadmap_planning]</td>
<td>Contains roadmap planning for each automation entry to be implemented. You can provide estimated hours to implement a workflow automation, the automation percentage anticipated by the end of the year, and the starting month to implement the workflow.</td>
</tr>
<tr>
<td>Correlated Tasks [manual_mapping_records]</td>
<td>Contains all matching manual tasks for each automation entry. Each task’s information is stored in this table for the system to use to calculate the actual duration and volume for each manual task.</td>
</tr>
<tr>
<td>Correlated Tasks Rules [manual_mapping_conditions]</td>
<td>Contains the correlated task rules the system uses to look up manual tasks corresponding to each automation entry.</td>

Orchestration ROI reports
Orchestration ROI provides a collection of standard and premium reports to help you calculate savings from automating services in your organization.

The ROI standard reports are included with Orchestration ROI. The premium reports provide enhanced views generated with Performance Analytics and require the Orchestration - ROI Premium plugin.
Orchestration ROI standard reports
The dashboard of standard ROI reports provides summaries, estimated costs, and calculated costs for automated processes. To access the ROI standard dashboard, navigate to **Orchestration > ROI Reports > Dashboard**.

Summary tab
The Summary tab contains four reports on automation categories.

Schedule Orchestration ROI calculations for standard reports

The scheduled job that calculates Orchestration ROI standard reports is active by default and controlled by system properties.

Role required: orchestration_manager, admin

The system provides a default scheduled job called Processing ROI Schedule that allows you to configure when Orchestration calculates the ROI for standard reports. This schedule allows scripting for advanced conditions. To modify the schedule or write a script to run, open Processing ROI Schedule from System Scheduler > Scheduled Jobs > Scheduled Jobs and click Configure Job Definition. To execute the schedule directly from the job definition, click Execute Now

To control the running of the schedule job with the Orchestration properties.

1. Navigate to Orchestration ROI > Properties.
2. Configure the following properties:
ROI schedule properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>roi.processing.active</td>
<td>Activate scheduled job for ROI processing. This property activates the Processing ROI Schedule scheduled job.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default: true</td>
</tr>
<tr>
<td>roi.processing.interval</td>
<td>Scheduled ROI processing interval (hours). This property sets the repeat interval for the scheduled job that processes savings reports and correlated tasks.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default: 24</td>
</tr>
</tbody>
</table>

3. Click **Save** to save your changes.

*Orchestration ROI premium reports*

The premium dashboard provides detailed reports on calculated savings over time.

The ROI premium reports require the Orchestration - ROI Premium plugin and are built using *Performance Analytics concepts*. The Orchestration - ROI Premium plugin is dependent on the *Performance Analytics - Premium* plugin which requires a separate subscription.

**Important:** You must activate the Performance Analytics *scheduled collection job* before Orchestration ROI premium can display data.

To access the ROI premium dashboard, navigate to **Orchestration > ROI Reports > Premium Dashboard**.

**ROI By Category tab**

The ROI By Category tab contains three reports showing the calculated savings over time by category.
Calculated savings monthly by category

Premium reports for calculated savings over time by category

<table>
<thead>
<tr>
<th>Report</th>

Request Orchestration ROI premium reports

To view the Orchestration ROI premium reports, you must request activation of the Orchestration - ROI Premium (com.snc.runbook_automation.roi_premium) plugin. The Orchestration - ROI Premium plugin is included with an Orchestration subscription, but must be activated by request.
The Orchestration - ROI Premium plugin requires the Performance Analytics - Premium plugin, which must be purchased separately.

Role required: admin

1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click Request Plugin to open the request form on HI.

3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specifying date</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

5. Click **Submit**.

Schedule Orchestration ROI calculations for premium reports

Orchestration ROI premium reports use a Performance Analytics job that must be activated before premium reports can be generated.

Role required: orchestration_manager, admin

The scheduled job required to calculate premium ROI reports is called [PA ROI] Historic Data Collection and is installed with the Orchestration - ROI Premium [com.snc.runbook_automation.roi_premium] plugin. This job is not active by default.

1. Navigate to **Performance Analytics > Data Collector > Jobs**.
2. Search for the [PA ROI] Historic Data Collection job.
3. Select the **Active** check box.
4. The scheduling options appear for the value selected in the **Run** field.
   For instructions on creating a schedule, see **Create or schedule a data collection job**.
5. To execute the schedule directly from the job definition, click **Execute Now**.
6. Click **Update**.
